ENGLISH CYCLOPÆDIA.

GEOGRAPHY.

OLONETZ.

OLONETZ, an extensive government of Russia comprised between 60° 30' and 66° 30' N. lat., 29° 40' and 40° 20' E. long.; is bounded N. and N.E. by Archangel, S.E. by Wologda, S. by Novogorod, S.W. by St. Petersburg, and W. by Lake Ladoga and Finland. The area, including the great lakes, amounts to 58,906 square miles. The population in 1846 was only 263,100. The total area of the lakes in this government amounts to 7797 square miles: including Lake Onega 4851 square miles (exclusive of the island of Klinezkoj, 44 square miles); a portion of the Lake of Ladoga 1175 square miles; Sseg-Osero Lake 453 square miles; Wyg-Osero 353 square miles; Latscha 205 square miles; Wodla 198 square miles; Ssjam-Osero 114 square miles, and many others.

As this government extends to the polar circle, its northern half has entirely the character of the high northern latitudes, while the southern part has more of the character of the temperate zone. The Scandinavian Mountains enter the country from the north-west, surround the two great lakes Ladoga and Onega, and run to the borders of St. Petersburg and Novogorod. This range is low and rocky, the highest summits scarcely rising more than from 300 to 420 feet above the general level, yet they are covered during a great part of the year with snow. The country at their base is in general low, wet, and swampy. The summits are clothed with thick forests of fir and other timber: the declivities are in some places open and susceptible of cultivation. Blocks of granite, some of them of enormous size, are scattered all over the mountains. The dry, open, and wooded parts contain under the greenward pure or clayey mould over clay mixed with boulders of the rocks of the country: in the morasses bog-iron ore abounds, with deep sand and clay. The surface may be said to be equally divided between mountains and forests, open tracts, morasses, and water.

This government contains 1998 lakes, and 858 rivers and rivulets. The two greatest lakes are Ladoga and Onega: of the former a large portion is in this government, the remainder is in St. Petersburg and Archangel. Lake Onega is nearly in the centre of the government: its mean length is 130 miles, and the breadth from 70 to 80 miles. Like Lake Ladoga, it contains numerous islands, most of which are covered with forests. The principal rivers are the Svir, which runs from Lake Onega into Lake Ladoga, and though full of boulders is navigable; the Olonka, the Ruskola, and the Janez, all of which run into Lake Ladoga. The following rivers run into Lake Onega:—the Wytegra, the Wode, the Lisch, and the Suma, all flowing from lakes of the same names, and the Losocha. The most considerable river however is the Onega, which issues from Lake Lussa, near Lake Onega, and running through the government of Archangel, falls into the White Sea. In many of these rivers there are waterfalls, the most remarkable of which is that called Kiwatscha, in the river Suna. The climate is pretty uniform: the spring is long and damp, with frequent night frosts; the summer short, with many foggy days, the vegetation being however very vigorous, on account of the length of the days: the autumn is bleak; the winter long and severe. Corn, chiefly barley and rye, ripens well; but unforeseen accidents sometimes destroy the entire harvest. The health of the inhabitants does not suffer by the cold.

Notwithstanding the cold and severe winter and the short summer, agriculture is carried on in all the circles. The inhabitants cannot however raise sufficient corn for their own consumption. Flax and hemp thrive, and are extensively cultivated. There is no fruit except cranberries, bilberries, &c., and these and other wild berries abound.

GEOG. DIV. VOL. IV.

OLYNTHUS.

Turnips, carrots, radishes, onions and some potatoes are cultivated. Timber, which is the principal source of wealth, abounds. Except the oak and beech, almost all the forest trees common in Russia flourish here, the finest larches in the world perhaps, and pines fit for masts 100 feet in length. The forests supply fuel, timber for building houses and boats, resin, turpentine, pitch, tar, charcoal, tanners' bark, barks, planks, and laths for exportation.

The fur-bearing animals furnish a profitable article of commerce. The breeding of cattle is not carried on to any great extent, because their maintenance in the long winter is too expensive. Almost every peasant however has a couple of horses, cows, swine, and some domestic fowls, yet the total number of any of these on such a vast area is altogether insignificant. The number of sheep was stated a few years ago to amount only to 4000. The wild animals are wolves, bears, elks, gluttons, foxes, badgers, and reindeer. Seals are found in the two great lakes. Water-fowl of various kinds abound. The fisheries are very productive; great quantities of sturgeon and salmon are sent to St. Petersburg. The minerals are iron, granite, serpentine, porphyry, sandstone, quartz, lime, clay-slate, alabaster, talc, gypsum, and marble. Iron is smelted, and wrought into various articles for domestic use. Copperas is manufactured. The province has copper- and gold-mines not worked; there are also silver, lead, and sulphur. Salt is obtained from some springs, but not sufficient for the supply of the inhabitants.

The exports are the natural productions of the government, cannon from the imperial foundry of Petrosavodsk, cast-iron, and some tallow. The greater part of the exports goes to St. Petersburg; the remainder to Archangel.

The great majority of the inhabitants are Russians; in the western part there are many Finns. There are a few nomade Laplanders in the circle of Kem.

Olonetz, the former capital, is situated in 61° 0' 45" N. lat., 32° 50' E. long., on the river Olonka. It is an open town, with 8000 inhabitants. There are three stone and five wooden churches. A good deal of fine thread is manufactured here, and a considerable trade is carried on, partly across Lake Ladoga with St. Petersburg, and partly at the two annual fairs. The first dock-yard established by Peter the Great was at Onega, and ship-building is still carried on. *Petrosavodsk*, the present capital, is situated in 61° 47' N. lat., 34° 24' E. long., on a bay of Lake Onega, and was so named by the empress Catharine II. from many manufactories ('zavod') erected here by Peter the Great. It is an ill-built town, remarkable only for the great imperial cannon-foundry: population, 4000. The only other place worth naming is *Kargopol*, in the south-east of the government, near Lake Latscha: population, 3000.

OLONNE-LES-SALLES. [VENDEE.]

OLONO, RIVER. [AUSTRIA.]

OLORON. [PYRENEES, BASSES.]

OLOT. [CALABRIA.]

OLYMPUS. [ANATOLIA; CRETE; THESSALY.]

OLYNTHUS, a town in Macedonia, at the head of the Toronaic Gulf, was probably founded by the Chalcidians and Eretrians of Euboea. (Strabo, x. p. 447.) It was 60 stadia from Potidea, and was visible from the latter place. (Thuc., i. 63.) It fell under the dominion of Athens, but revolted at the beginning of the Peloponnesian war, and secured its independence with the aid of the Spartan Brasidas. From this time it was the most important of the towns of Chalcidice, and the head of a league. The jealousy of the Spartans subsequently

made them attack the freedom of Olynthus, which became a dependency of Sparta, B.C. 379. After the Spartan supremacy had been overthrown by Epaminondas, the Olynthians again recovered their independence. Philip of Macedonia viewed with jealousy the confederacy of the Olynthians, but he made peace with them after his quarrel with the Athenians. In B.C. 349 the Olynthians broke off their alliance with Philip, and sent to Athens for assistance. The Athenians, by the advice of Demosthenes, who advocated the cause of the Olynthians in his three Olynthiac Orations, sent troops to their aid; but the Olynthians were defeated, and obliged to surrender their town, which was destroyed by Philip B.C. 347.

Coin of Olynthus. Actual size.

OMAGH, county Tyrone, Ireland, the assize-town, and the seat of a Poor-Law Union, is situated on the left bank of the Strule, in 54° 36' N. lat., 7° 19' W. long., distant by road 34 miles S. from Londonderry, and 110 miles N.N.W. from Dublin. The population in 1851 was 3385. Omagh Poor-Law Union comprises 29 electoral divisions, with an area of 174,214 acres, and a population in 1841 of 69,499; in 1851 of 56,302. In 1689 a garrison left in the place by James II., on retiring, set fire to and almost completely destroyed the town. In 1743 it was laid waste by an accidental fire. It is now a clean, neat, and well-built town. The river is crossed by a handsome stone bridge. In the town are the parish church, and chapels for Roman Catholics, Baptists, Methodists, and Presbyterians; also several schools partially endowed. The county court house is an elegant building of Grecian architecture. The town contains the county jail (a large modern building), a new district lunatic asylum, the county infirmary, a fever hospital, dispensary, and Union workhouse. Large sales of corn and of brown linens are made at the weekly markets. Quarter and petty sessions are held. Fairs are held on the first Tuesday of every month; Saturday is the market-day.

OMAGO. [ISTRIA.]

OMAN. [ARABIA.]

OMER, St., a fortified town in France, in the department of Pas-de-Calais, 28 miles S.E. by railway from Calais, is situated in 50° 44' 53" N. lat., 2° 15' 20" E. long., at an elevation of 75 feet above the level of the sea, and has 19,226 inhabitants in the commune, but including the suburbs the population probably exceeds 25,000. St. Omer is surrounded by fortifications between two and three miles in circuit, constructed of red bricks. It is strengthened by four forts and by entrenchments, and further protected by marshes, which can easily be flooded. There are four gates, of which only two will admit carriages. The town is traversed by the Aa, and by the canal which unites the Aa to the Lys. The principal streets are broad; the houses are chiefly built of yellow or gray bricks, except some of the public buildings, which are of red bricks. The Place d'Armes at the west of the town is the only large square; the town-hall occupies the east side of it. The former cathedral of Notre-Dame, and the church of the former Jesuit college, are the finest of the public buildings. Other remarkable objects are—the ruins of the church of St. Bertin, formerly the finest gothic church in French Flanders; the hospitals; the theatre; and the public library, which contains 20,000 volumes. The town has tribunals of first instance and of commerce, a consultative chamber of manufactures, a college, an ecclesiastical seminary, and an English college for the education of British Roman Catholics. The ramparts, which are planted with elm-trees, the quays on the banks of the canal, and the Calais road form handsome public walks. There are many fountains. Woollen cloth, blankets, thread, oil, glue, fishing-nets, paper, brandy, beer, leather, and salt are the leading manufactures of the town, which is also the centre of a considerable commerce in wool, corn, wine, flax, coal, &c. The inhabitants of the two suburbs Haut-Pont and Lizel to the north of the town retain the Flemish language, and are mostly engaged in raising garden stuffs on spots of ground which they have recovered by draining from the marshes near the Aa. Between these suburbs and the neighbouring village of Clairmarais were not long ago several floating islands, on which cattle might be seen grazing and trees growing; when the cattle were wanted the islands were drawn to the shore like a boat. Several islands that formerly floated in these marshes have become fixed.

ONEGA LAKE. [RUSSIA.]

ONEGLIA. [NICIA.]

ONEIDA LAKE. [NEW YORK.]

ONGAR, or CHIPPING ONGAR, Essex, a market-town and the seat of a Poor-Law Union, in the parish of Ongar, is situated on the right bank of the river Roding, in 51° 42' N. lat., 0° 14' E. long., distant 11 miles W.S.W. from Chelmsford, and 22 miles N.E. from London. The population of the parish in 1851 was 843. The living is a rectory in the archdeaconry of Essex and diocese of Rochester. Ongar Poor-Law Union contains 26 parishes and townships, with an area of 47,465 acres, and a population in 1851 of 11,855.

A castle built at Ongar in the time of Henry II., was demolished in the reign of Elizabeth. The moat and some earthworks of the castle remain. The town is built on the slope and brow of a hill. The Roding is here crossed by a bridge of three arches. The parish church, a small neat edifice, is of early English character. Roman bricks have been used in the construction of the building. There are a chapel for Independents; an Endowed school, called the King's Trust; and an Infant school. Saturday is the market-day; a fair is held on October 12th.

ONOLZBACH. [ANSBACH.]

ONTARIO LAKE. [CANADA.]

OODIPOOR. [HINDUSTAN.]

OOMAK. [ALEUTIAN ISLANDS.]

OONALASHKA, one of the ALEUTIAN ISLANDS, is situated in 54° N. lat., 138° 20' W. long., and extends from north-east to south-west about 50 miles, but it varies greatly in width. Black masses of rocks rise perpendicularly out of the sea to a great elevation, and their summits are covered with perpetual ice. The highest summit, called Makushinskaja-Sobka, is 5474 feet above the sea-level, and continues to smoke without interruption. There is also another active volcano. There are several hot springs; and earthquakes are common. The rocks consist of granite and porphyry.

Oonalashka and the islands lying west of it are entirely destitute of trees. Dwarf willows occur in damp places. Even the lower hills only support alpine plants. The moisture of the atmosphere maintains a perpetual verdure on the steep mountain summits up to the snow. The Russians have brought cattle to the island. Potatoes, turnips, and radishes are the only vegetables that thrive. No kind of grain succeeds.

The inhabitants live chiefly by fishing. The surrounding sea abounds in cod, halibut, and seals. Whales are also numerous. Wild geese and ducks are very abundant in spring and autumn; they are salted and smoked for winter food. The Russian American Company has an establishment at Illiuliuk, or Illoalak, towards the north-eastern extremity of the island. The harbour is surrounded by high mountains and very safe, but it is difficult of access, owing to the entrance being narrow, tortuous, and there being no bottom at 100 fathoms. The climate is very foggy and damp; mean annual temperature 40° Fahr.

OONIMAK. [ALEUTIAN ISLANDS.]

OOSTERHOUT. [BRABANT, NORTH.]

OPELOUSAS. [LOUISIANA.]

OPHIR, a name indicating a place which was known to the Hebrews and to the neighbouring nations, as early as the time of Job, as producing such an abundance of excellent gold, that 'the gold of Ophir' became a proverbial expression for fine gold. The position of this place is very difficult to determine. We are informed that Solomon, in conjunction with Hiram, king of Tyre, sent a navy from Ezion-Geber, at the head of the Red Sea, to Ophir, and that this navy returned bringing 420 (in Chronicles 450) talents of gold, sandal-wood (called in our translation almug or aljun-trees), and precious stones (1 Kings, ix. 26-28; x. 11, compared with 2 Chron. viii. 17-18; ix. 10); and also that Jehoshaphat built ships of Tarshish to go to Ophir for gold (in Chronicles it is said that he built ships to go to Tarshish), which were wrecked at Ezion-Geber. (1 Kings, xxii. 48-49, compared with 2 Chron. xx. 36-37.) We are also told in 1 Kings, x. 22, that Solomon had at sea a navy of Tarshish with the navy of Hiram; once in three years (or every third year) came the navy of Tarshish, bringing gold and silver, ivory, apes, and peacocks.

Both Solomon and Jehoshaphat built the navies bound for Ophir at Ezion-Geber, at the head of the Red Sea, and nearly all the inquiries into the position of this place have proceeded on the assumption that the passage in 1 Kings, x. 22, refers to the same navy which is spoken of in 1 Kings, ix. 27-28, &c., and consequently that Tarshish and Ophir were visited in the same voyage. It has therefore been necessary for those who make this assumption not only to find a place which suits the description of Ophir, and which produces 'gold, sandal-wood, and precious stones,' but also to account for the 'silver, ivory, apes, and peacocks,' which were brought by the navy of Tarshish, and for the three years consumed in the voyage.

The position of Ophir and Tarshish have occasioned much discussion. Tarshish is generally supposed to be identified with Tartessus in Spain, a colony and trading port of the Phœnicians. But to connect this port with Ophir in one voyage from Ezion-Geber in the Red Sea, would involve the doubling of the Cape of Good Hope, which is by no means likely to have been effected at so early an age, and still less a common trading voyage; and therefore it has been endeavoured to find another Tarshish in the east. The position of Ophir has been placed by different writers on the south-west coast of Arabia; in Eastern Africa, about Sofala; in the Persian Gulf; and

in India. The probability is that, though there may have been places of those names, the names were used to indicate any long voyage, as ships of Tarshiah were large ships for long voyages, as is shown by Solomon having 'a navy of Tarshiah' at sea with that of Hiram, as we now speak of a fleet of East or West Indiamen without meaning to designate any particular port they may be bound to.

OPORTO (O PORTO, 'the Port'), a city and sea-port of Portugal, locally situated in the province of Entre Douro e Minho, but politically included in the province of Beira as the capital of the minor province of Porto. The city is built on the north bank of the Douro, about 2 miles from the mouth of the river, in 41° 9' N. lat., 8° 37' W. long., 175 miles N. by E. from the city of Lisbon. The population, including the suburbs, is about 80,000.

The city extends about a mile along the bank of the river, and covers the acclivities and partly the summits of the rising ground which flanks the river on the north. Viewed from the south, the city presents a very striking and beautiful appearance. The houses, being all white-washed, give it an air of extreme cleanliness, but many of the streets, especially those on the ascent of the hill, are narrow, crooked, and dirty. Oporto is however, on the whole, the cleanest city in Portugal. It contains many broad straight streets, with a number of new and handsome houses, with gardens adjoining them filled with vines, orange-trees, and flowering shrubs. The steep declivity of the hill on which the greater part of the town is built makes it difficult to ride on horseback or in carriages, though this inconvenience has been somewhat remedied by recent improvements. On the east side of the town houses are built against so steep a part of the hill-side, that they can only be approached by steps out of the rock.

The river affords a tolerably secure harbour, without any artificial aid except an elevated and walled quay, to which the ships' cables may be fastened during the floods, which often come down with such force, that, without this support, the vessels would inevitably be carried out into the sea. The mouth of the Douro is obstructed by a bar of shifting sand, which renders its entrance difficult. This obstacle once surmounted, the river is well adapted to the purposes of trade, being sufficiently deep in front of the town. Vessels of from 200 to 300 tons can pass over the bar, but only when the tide is nearly full. Vessels drawing above 16 feet water can scarcely ever enter the river. The quay extends the whole length of the town.

Oporto is defended by a cordon of detached batteries which extend round the city and suburbs. There are some remains of old walls round the ancient part of the city, but they are of no value for purposes of defence.

Oporto has four suburbs, besides the town of Villa Nova do Porto, on the south bank of the river. It has 11 public squares called Campos, or Praças, of which the most spacious are those of As Ortas, San Roque, and Vitoria; 14 hospitals, or charitable asylums; and about 80 churches, besides a large cathedral built by Henry of Be-augon, first count of Portugal, in 1105. It had 17 monasteries, some of which were destroyed during the siege in the civil war of 1832, and the rest have been converted to secular uses. It is the see of a bishop, who resides chiefly at Mezanfrio, but who has a fine modern-built palace within the city. A theatre, in the highest part of the town, built by an Italian architect, is much admired. The English factory is a large and handsome building, with a library, reading-room, and ball-room. The city contains also a new exchange, a mint, and barracks. There is an Italian opera-house, and the performances are considered little inferior to those of Lisbon. There are numerous public fountains, and a handsome new suspension bridge crosses the river.

The town of Villa Nova do Porto is somewhat to the east of the city, on the south bank of the river. It is chiefly inhabited by wine-coopers and other people employed by the merchants of Oporto; and between that town and the suburb of Gaya, on a small plain along the bank of the river, are the immense vaults where the wines are kept.

The principal trade of Oporto consists in wine, chiefly red, which is made in the province of Tras os Montes, and in some districts of Entre Douro e Minho. It is exported in large quantities to various parts of Europe and America, but the greatest consumption is by the inhabitants of Great Britain, where it is known as Port Wine. Oporto exported in 1850 to all parts 37,487 pipes of wine, which was a decrease of 4101 pipes on the exportation of 1849. The customs duties for the year ending June 1849 amounted to 1,891,347 dollars. There are other articles of export, such as oil, sumach, linen, lemons, and oranges. The imports are woollen, cotton, iron, and hardware manufactures, mainly from England; salt-fish, hemp, and flax; wheat and rice from the United States. There are some manufactures of hats, silks, linen stuffs, and pottery, besides rope-walks and dockyards.

Oporto was occasionally the residence of the ancient kings of Portugal, until Alfonso I., assisted by a fleet of English crusaders under the command of William Longsword, wrested Lisbon from the hands of the Almoravides in October, 1147. During the middle ages Oporto was famous for the strength of its fortifications. The walls were high and strong, and flanked by towers, but the city has now extended much beyond them. It was taken by the French in 1808, and retaken by the Anglo-Portuguese in 1809. It became afterwards, in 1831-33, the scene of a fierce contest for the throne of Portugal between Don

Pedro, the ex-emperor of Brazil, and his brother, Don Miguel, who had usurped the crown from his niece, Dona Maria. During the siege, which lasted upwards of one year, the town of Oporto was partly destroyed by the artillery of the assailants; and several wealthy mercantile houses were entirely ruined by the complete stoppage of trade, and the wanton destruction of property by the troops of the usurper, who on their retreat from before the lines of Oporto blew up with gunpowder several wine-cellars belonging to the merchants of the city.

(Mifano, *Diccionario de España y Portugal*; La Clède, *Histoire Générale de Portugal*, vol. ii.; Link, *Travels*.)

OPPELN, one of the four governments of Prussian Silesia, comprises the greater part of Upper Silesia, and almost wholly consists of hills and mountains. It is bounded N. by the government of Breslau, E. by Poland, S. by Galicia, and W. by Austrian Silesia. Its area is 5143 square miles, and the population in 1847 was 937,313, nine-tenths of whom are Catholics. It has extensive forests of fine timber, and abounds in valuable minerals—coal, iron, zinc, &c. This part of the province is less fertile and much colder than Lower Silesia; the valleys however are very fertile, although the grain-produce of the country is insufficient for the consumption. Cattle and sheep are numerous. Many of the mountaineers are weavers of linen. Hardware, steam-engines, leather, and woollen goods also are manufactured. The snow falls early and lies late. There are many tarns and ponds which give rise to numerous small streams. The Oder traverses the country in its whole extent. The Vistula runs on the south-eastern boundary. The Neisse, a feeder of the Oder, drains the west of the government, and forms part of the boundary on the north-west. [SILESIA.] The government is traversed by the railway from Vienna to Berlin through Breslau, from which branches run to Neisse and Craoow.

The administrative capital of the government, *Oppeln*, is situated on the Oder, 51 miles S.E. from Breslau by the Breslau-Vienna railroad, and has about 8000 inhabitants, who manufacture linen, tape, leather, and earthenware, and trade in timber, zinc, lead, hardware, woollen cloth, and Hungarian wines. The town is walled and entered by four gates, and connected by bridges with an island in the river which is laid out as a park. It possesses several churches, a synagogue, a gymnasium, and a school of midwifery. *Neisse*, at the confluence of the Biela with the Neisse, a feeder of the Oder, is about 50 miles W. by S. from Oppeln, and has a population of 12,000. It is a clean well-built fortified town, but the site is marshy and unhealthy. The episcopal palace, six Catholic churches, a Protestant church, a synagogue, and town-hall, are the principal buildings. This town has a gymnasium, a royal manufactory of arms, a powder-mill, several breweries, and manufactures of linen and woollen stuffs, ribands, stockings, and yarn. A branch railway, 29 miles in length, connects Neisse with the Brieg station on the Breslau-Vienna railway. The other towns are:—*Gleiwitz*, 50 miles by the Craoow railway S.E. from Oppeln, which has a population of 7400, a gymnasium, and great iron-foundries: there are valuable coal-mines in the neighbourhood. *Lobschütz*, 30 miles S. from Oppeln, has a gymnasium, a handicraft school, manufactures of linen, woollen cloth, stockings, and leather; and a population of 5781. *Ratibor*, a station on the Breslau-Vienna railroad, on the left bank of the Oder, is a walled town, entered by four gates, with a gymnasium, and a population of about 8000, who manufacture cloth, linen, earthenware, beer, leather, &c.

OPPENHEIM. [HESSE DARMSTADT.]

OPPIDO. [CALABRIA.]

ORAN. [ALGÉRIE.]

ORAN-ELF. [BOTHNIA.]

ORANGE, the Principality of, included the town and neighbourhood of Orange in the south of France. René de Nassau, nephew and successor of Philibert de Chalon, prince of Orange, was killed at the siege of St. Dizier in 1544, and left his heritage to his cousin William of Nassau, the founder of the republic of the Dutch United Provinces. After the death of William III., king of England, the principality passed to Frederick, king of Prussia, William's eldest sister's son, whose successor, Frederick-William, ceded it to Louis XIV. at the peace of Utrecht. The principality then merged in the province of Dauphiné, and is now included in the department of Vaucluse.

ORANGE, the ancient *Arausio*, an ill-built town, with a tribunal of first instance and a college, is situated in the French department of Vaucluse, near the left bank of the Rhône, in a beautiful plain watered by the Aigue and several other small streams, in 44° 8' N. lat., 4° 48' 38" E. long., at a distance of 16 miles by railway N. from Avignon, 147 feet above the sea level, and has 9264 inhabitants in the commune. The town has some manufactures of printed cottons, handkerchiefs, serge, and silk; it has also a good trade in wine, brandy, oil, madder, saffron, honey, wool, corn, truffles, essences, &c. It abounds in Roman remains. A triumphal arch, commonly called the Arch of Marius, 60 feet high, consisting of a central arcade and two smaller lateral ones, separated by four Corinthian pillars, spans the high road at the northern entrance to the town, and is justly dear to archaeologists for the beauty of its architecture and the rich sculptures of its illustrative bas-reliefs. The northern façade of the theatre, which still stands in the centre of the town, and presents a gigantic rectangle 435 feet long and 115 feet high, is a most magnificent piece of masonry. It consists of five stories, and is built of large uncemented stones. The basement story has a grand entrance gateway in the centre supported

by Corinthian pillars with capitals of white marble; on each side of the principal entrance are 9 arcades separated by Doric pilasters. The third story consists of 21 sunk arches of beautiful workmanship. The fifth story presents a row of large projecting square stones, corresponding to a similar row at the top of the fourth story, and pierced by holes intended to receive the poles which sustained the awning (*velaria*) that covered the spectators in the interior of the theatre. The interior has been lately cleared of rubbish and of the huts that were built in it, and now presents a perfect view of the several parts of a Roman theatre, but deprived of all its ornaments. (*Dictionnaire de la France*.)

ORANGE RIVER. [CAPE OF GOOD HOPE.]

ORANMORE. [GALWAY.]

ORBEC. [CALVADOS.]

ORCHIES. [NORD.]

ORCHOMENUS, called 'the Minyeon,' and afterwards 'the Boeotian,' was a city on the western shore of the lake Copais, in Boeotia. In the earliest period of Grecian history it was known as a place of great power and wealth. (Homer, 'Iliad,' ix. 381.) Its ancient magnificence is attested by the treasury of Minyas in it, which is described by Pausanias as being equal to any similar building which he had seen, and by the subterranean outlets of the Lake Copais, the remains of which exist to this day. [BOEOTIA.] In the earliest times Orchomenus was the chief city of the Minyans, to whom the greater part of Boeotia, including Thebes itself, was subject. In the sixtieth year after the Trojan war, the Æolian Boeotians, who had been expelled from Thessaly, drove out the Minyans from Orchomenus, which was then with its territory added to Boeotia. (Thucyd., i. 12; Strabo, ix. 401.) About the time of the Peloponnesian war Orchomenus was one of the most powerful states of the Boeotian confederacy. Its government was oligarchical. After the peace of Antalcidas (B.C. 387), Orchomenus was confederate with Sparta, and had in it a Lacedæmonian garrison. (Plutarch, 'Pelop.,' 16.) In the year B.C. 368, the Thebans destroyed Orchomenus, slaying the men, and selling the women and children into slavery. It was rebuilt after the destruction of Thebes, and is mentioned by Dicaarchus about twenty years after the death of Alexander.

OREGON, a territory of the United States of North America, lies between 42° and 46° N. lat., 110° and 125° W. long. It is bounded E. by the Rocky Mountains, which separate it from the territory of Nebraska; N. by the territory of Washington; W. by the Pacific Ocean; and S. by the state of California and the territory of Utah. The area is about 230,000 square miles. At the census of 1850 the territory of Oregon included the country since separated from it and formed into the territory of WASHINGTON, and comprised altogether an area of 341,463 square miles, with a population of 13,294, or 0.04 to the square mile; but no account was taken of the native Indians, who in 1853 were estimated at 23,000.

Surface and Hydrography.—The territory of Oregon is traversed from south to north by the ranges of the Cascade and the Blue mountains, while a third range, that of the Rocky Mountains, forms its

eastern boundary. The Cascade, or Coast, or as it is sometimes called President's range, is a continuous and very lofty range rising at a distance of 100 to 150 miles from the coast; and almost entirely cutting off direct communication between those portions of the territory which lie east and west of it. Except where the Columbia, which forms here the northern boundary of the state, breaks through the range, the few passes which exist are so difficult as to be of little use to the traveller. The higher peaks are from 12,000 to 14,000 feet above the level of the sea. The country west of this range is a good deal broken by spurs from the main chain. The greater part of this broken country is thickly timbered, in many parts there being dense forests of fir, pine, spruce, oak, ash, and other valuable trees, with close undergrowths of hazel, &c. The valleys and plains afford much excellent farming land, the soil consisting in some places of a black vegetable loam, in others of clays and gravel. The uplands form good pastures. The harbours along the coast are, with the exception of that formed by the mouth of the Columbia, of little value; most of the other rivers have bars at their mouths, over which only vessels of light draught can pass. The coast itself is formed by steep sandy cliffs and beaches and is broken by projecting headlands which rise precipitously from the sea; the principal of these are named Cape Orford, Cape Gregory, Cape Perpetua, and Cape Look-Out, but they afford little shelter, and have mostly numerous rocks scattered about them, while everywhere a heavy surf sets in upon the beach.

The Blue Mountains, which traverse the middle of the territory, are more broken and irregular than the Cascade and Rocky ranges. On the south-west the Blue Mountains are united with the Cascade Mountains by offsets which form the valleys of the Clamet and Umpqua rivers, while the main chain forms the valley of the Willamette. Other offsets, diverging eastward, connect this range with the Rocky Mountains. This middle section of the state differs considerably from that west of the Cascade range. The hills are barren, but in the valleys of the Columbia, Willamette, and Saptin rivers the soil is generally fertile, and in some places extremely rich. Much of the country in the vicinity of the Columbia and Saptin rivers consists of rolling prairie land, and affords good pasturage. The southern portion of this middle section is for the most part broken and desert, with scarcely a tree or vegetable. The general elevation of the section is about 1000 feet above the sea.

The Rocky Mountains have been noticed elsewhere. [AMERICA; NEBRASKA; HUDSON'S BAY TERRITORIES.] They are of great altitude, and only one practicable pass has been discovered over them along this territory. This, known as the Great South Pass, occurs at the south-eastern extremity of Oregon, and is that crossed by the great stream of overland emigration to Utah and California. The country immediately west of the Rocky Mountains is everywhere broken by great spurs from the main chain, and though in some places partially timbered, is for by far the greater part rocky, barren, extremely variable in climate, and incapable of permanent settlement.

The principal river of Oregon is the Columbia, which forms for a considerable distance the boundary between this territory and Washington, and is not only common to both territories, but receives all the rivers of both which rise east of the Cascade Mountains. Its northern and longest branch rises in the Rocky Mountains near 50° N. lat., 116° W. long., its extreme upper course thus belonging to the British territory. It then traverses Washington first in a north-west, and then in a generally northern direction to its confluence with the Saptin, or Lewis River, soon after which it turns to the west and forms the northern boundary of Oregon. At the confluence of the Saptin it is 1286 feet above the sea, and 3500 feet wide. From this point to the Cascade Mountains its course is very rapid and it receives numerous affluents especially from Oregon. The Columbia breaks through the range of the Cascade Mountains in a series of falls and rapids, which are quite impassable by boats even during floods, and to avoid which portages have been constructed. The gorge of the Cascade Mountains through which the river flows is of the grandest kind of natural scenery. For about 40 miles lower the navigation is unimpeded, when rapids again occur. But for the remainder of its course, about 120 miles, the only impediments are the sandy shoals which limit the navigation to vessels drawing 12 feet of water. About 20 miles from its mouth the Columbia increases greatly in width, and at its outlet in the Pacific, the width between capes Adams and Disappointment is 7 miles, but a sand-bar extends from each cape so as to render the navigable channel both narrow and difficult. The Saptin, Snake, or Lewis River, sometimes called the southern fork of the Columbia, is formed by the union of many small branches which rise in the Rocky Mountains between 42° and 43° N. lat., and flows first west and then south through Oregon, passing into Washington near 117° W. long., after a very serpentine course of nearly 800 miles. The Saptin in its course through Oregon receives numerous affluents, all or nearly all of which belong entirely to this territory. Of these the principal are the Waptiacos, Fayette, and Sickly, on the right, and the Malheur on the left. Most of these rivers are very rapid, and run in deep channels, but are of little value for navigation. The Willamette, which rises on the west side of the Blue Mountains near 43° 30' N. lat., is one of the most important tributaries of the Columbia; it has a generally northern course and enters that river nearly opposite to Fort Vancouver, considerably below where it

becomes navigable; is itself navigable by small vessels for a considerable distance; and drains one of the most fertile valleys in the territory. The rivers which rise west of the Cascade Mountains have mostly a short course and are of little service for navigation. The principal are the Umqua and the Clamet. The Umqua, which after the union of its two head branches, flows nearly west to the Pacific, into which it falls by Cape Gregory, about 43° 54' N. lat., is in its lower course a wide but comparatively shallow stream, and like all the other rivers of Oregon which fall into the Pacific, has its mouth obstructed by a sand bar. The Clamet, the most southern river of Oregon, is also the longest south of the Columbia, but there are few settlements along its banks, and its navigable capabilities are very limited.

Of the geological features of Oregon only very partial examinations have been made. The mountain ranges belong generally to the igneous and palæozoic formations. Granite, trap, basalt, hornblende, and other eruptive and metamorphic rocks occur very widely, with slates, limestone, sandstone, &c. Gold is found in the sands of several of the rivers which flow from the Cascade Mountains to the Pacific; and it is said to have been also found in various places east of that range. Other minerals, especially iron, lead, and tin are also said to occur, but none of them have, we believe, been worked. We have not heard that coal has been found, though it is known to exist in Washington. Saline springs occur in the middle section of the territory, and near its south eastern corner occur several soda and magnesia springs.

Climate, Productions, &c.—The climate is very varied in the different sections of the territory. Along the Pacific, and generally west of the Cascade range, it is mild and genial during the entire year. The winter is very short and far from severe, and snow seldom lies long on the ground. In the middle section the changes of temperature are much greater, and the winters much colder; but the air is more bracing and the climate appears to be generally healthy. It is said that no dew falls in this section. In the vicinity of the Rocky Mountains the changes of temperature are extremely great and rapid. In the south-eastern part of the territory along the line of the great emigration route, the climate is very variable, but rain seldom falls, and there is little snow.

Wheat is the principal grain crop; but a considerable quantity of oats is also grown. Maize is cultivated but not to any great extent. The other grains are scarcely cultivated at all. Peas and beans, potatoes, and a few other vegetables are raised. Small quantities of tobacco, flax, &c., are grown. Most of the European fruits flourish in the valleys of the Columbia, Willamette, &c. At present however the chief dependence of the settlers is perhaps upon the rearing of stock, which with scarce any attention thrive abundantly on the excellent pasture. Horses, horned cattle, sheep, and swine are already very numerous; and butter, cheese, and wool receive much attention from the agriculturists.

Oregon was formerly exceedingly rich in fur-bearing animals, but their numbers are rapidly diminishing; beavers, musk-rats, and martins are the chief which are left. Their collection is still carried on almost exclusively by the officers of the Hudson's Bay company. In the forests bears, wolves, foxes, deer, elks, antelopes, and other game are still very abundant. Vast quantities of aquatic birds frequent the rivers in the spring and autumn. Along the coast whales are found; and edible fish are extremely abundant both along the coast and in the rivers: the Columbia especially swarms with fish, which form the chief food of the Indians. The principal fish taken are salmon, sturgeon, cod, ray, carp, smelt, and innumerable other small fish, with crabs, oysters, mussels, and other shell-fish.

At present manufacturing industry is chiefly confined to the production of the articles required in a very thinly peopled agricultural country, and those connected with the shipping trade. The commerce of Oregon is not unimportant, a considerable coasting trade being carried on with California; the exports consist of large quantities of lumber, boards, flour, and provisions generally. There is also a good deal of trade carried on with New York, Boston, &c. The direct foreign trade is of little consequence.

Divisions, Towns, &c.—The territory of Oregon is divided into ten counties. Salem is the political capital. All the towns are as yet but small: we notice some of the principal places; the population is that of 1850:—

Salem, the capital, stands on the right bank of the Willamette; it has a small population, and little trade, but contains the state buildings, &c.

Astoria, on the Columbia, 8 miles from its mouth, population 252, is one of the oldest American trading places in Oregon, having been founded by Mr. J. Astor in 1811, but its present increase is very slow. *Milton City*, Washington county, population 692, is one of the rising towns of Oregon. *Oregon City*, on the right bank of the Willamette River, 35 miles N.E. from Salem, population 692, is the chief town of the Willamette Valley, the best settled and most flourishing district in Oregon. The city possesses a great amount of water power, and appears likely to become a place of considerable importance. *Portland*, on the left bank of the Willamette, above its confluence with the Columbia, 47 miles N. by E. from Salem, population 821, is also a busy and flourishing place, being the port of entry of an extensive and rich country.

The constitution was enacted by Congress in 1846; by it the right

of voting is vested in every white male inhabitant of Oregon, 21 years of age, and a citizen of the United States, or who shall in the usual manner declare his desire to become one. The legislature consists of a council of 9 members, elected for three years; and a house of representatives of not less than 18 nor more than 30 members elected for one year. All laws passed by this legislature must be submitted to Congress for approval. The governor is appointed for four years.

The coast of Oregon was visited both by the English and Spaniards in the 16th century, and it has been much disputed to the mariners of which country the honour of the discovery is to be ascribed. Spanish writers claim its discovery for Ferrello, the pilot of Cabrillo, who they assert reached 43° N. lat. in 1543; while those who claim for England the honour of the discovery show that Drake in 1579 attained to 48° N. lat. The mouth of the Columbia, although Heecets in 1775 and Vancouver early in 1792, suspected the existence of an important river from the general appearance of the bay into which it empties itself, was not actually discovered until later in 1792, when a Captain Baker of the English merchant service and a Captain Gray, the master of an American merchant vessel, entered the estuary of the river. On the priority of Gray's entry the United States government some years later founded its claim to the territory drained by the river and its tributaries; but the river was actually ascended for the first time by Lieutenant Broughton, R.N., who a few months after Captain Gray had entered its mouth, went up it for above 100 miles, and formally took possession of the country in the name of his sovereign George III. The sovereignty of Oregon was in 1789-90 a matter of grave dispute between the governments of England and Spain, but the question was terminated in 1790 by the Convention of Madrid, by which the right of exclusive possession was relinquished by both countries. The Americans subsequently formed a trading settlement at Astoria, which during the war in 1814 was taken possession of by the English, but given up at the close of the war. After the treaty with Spain in 1819 the United States government first set up a claim, founded on the right of discovery, and also on their having by the treaty succeeded to the Spanish right of occupancy, to the exclusive possession of Oregon; and the claim involved the English and American governments on more than one occasion in very serious disputes. The question was not finally settled till 1846, when a treaty was concluded between the two powers, giving to the United States the entire country up to the parallel of 49° N. lat., including therefore the whole tract since formed into the territories of Oregon and Washington, but reserving to England the free navigation of the Columbia River as a line of communication with the Hudson's Bay Territory; and Oregon was constituted a territory by Act of Congress August 14th, 1848.

(*Statistical Gazetteer of the United States; American Almanac; Seventh Census of the United States; Wilkes, Narrative of the United States Exploring Expedition; Greenhow; Falconer; Wallace; Twiss; Nicolay, &c.*)

OREGRUND. [SWEDEN.]

OREL, a government of Great Russia, situated between 51° 50' and 55° N. lat., 32° 50' and 39° E. long., is bounded N. by Kaluga, N.E. by Tula, E. by Tambow, S.E. by Woronetz, S. by Kursk, S.W. by Tschernigov, and N.W. by Smolensk. Its area is 18,176 square miles; the population was stated to be 1,502,900 in 1846.

The country has a considerable elevation, but it contains no mountains. There are some chains of calcareous hills, and some eminences along the banks of the rivers. The soil is generally sandy, and extremely well adapted to all kinds of grain: in some parts it is composed of compact clay and loam. There is very little unproductive land, and few heaths and morasses. A portion of the surface belongs to the basin of the Volga; but the greater part is included in the basin of the Dnieper, and slopes to the south. The principal river is the Desna, which comes from Smolensk, passes through the circles of Briänsk and Trubtschewsk, where it becomes navigable, and, having received several other rivers, runs into the government of Tschernigov. The second river is the Oka, which rises on the frontier of Kursk, and would be navigable at Orel if the stream were not obstructed by numerous mills. It receives several small rivers, by which it is so enlarged, that during the whole summer it is navigable for flat-bottomed boats of 250 to 400 tons: no part of it is obstructed by rocks. The third principal river is the Sosna, the source of which is near that of the Oka; it runs to the north-east, receives on both sides several smaller streams, and falls into the Don on the frontier of Woronetz. There are no large lakes, but the province is extremely well watered by streams. It is of a very uniform temperature and very healthy. A general failure of the crops is extremely rare. The waters are frozen at the end of November, and thaw in the beginning of March.

All kinds of corn are cultivated, a little flax, much hemp, and some tobacco. Horticulture is pretty general; culinary vegetables and fruits are cultivated; also abundance of hops, apples, and cherries, and in some parts pears and plums. There are woods and copses in all the circles. The commonest trees are birches, alders, fir, aspens, limes, elms, and willows. Oak-forests cover the banks of the Desna, but there is so much waste that they are rapidly diminishing. Foxes, hares, and quails are abundant. The horses are a fine breed, fit both for draught and the saddle, and there are many studs, which are supplied with stallions from other countries. The oxen are large and

strong, and are used for draught. The sheep furnish good wool. Swine are very numerous. The inhabitants keep likewise great quantities of bees. The mineral products are lime, millstones and grindstones, alabaster, saltpetre, and some bog-iron. No use is made of the peat which is found in the government.

The country-people make for themselves almost everything that they have need of. There are however some iron-works, mills, &c. In the towns there are manufactories of coarse woollen cloths, linen, sail-cloth, table-linen, leather, cordage, paper, colours, glass, earthenware, soap, &c. There are numerous brandy distilleries. The chief articles of exportation are bar-iron, spirits, bass mats, cordage, corn, flour, hemp, fir masts, balks and planks, tobacco, horses, oxen, tallow, honey, wax, &c. All articles of foreign produce are procured from Moscow.

The inhabitants are partly Great Russians, partly Little Russians and Cossacks; the great majority are of the Russian Greek Church, and the head of the clergy is the bishop of Orel and Siäwsk.

Orel, the chief town of the government, is situated in 52° 56' 40" N. lat., 36° 6' E. long. It stands on the river Oka, where it is joined by the Orlik. The houses are in general of wood, and the interior of the town is gloomy. Up to the 17th century, Orel seems to have been an insignificant place; but it was then fortified, and a citadel built, part of which still remains. During the wars with the Poles, and in the time of the false Demetrius, it was frequently taken and retaken. Since that time it has rapidly increased; in 1840 the population was estimated at 40,000. Great part of the city was destroyed by fire June 7, 1848, when 1237 houses, four bridges, and several large corn granaries were burnt. Orel is well situated for trade; it is the entrepôt for the corn of Little Russia, and the place from which Moscow draws its chief supply. Other exports are corn, hemp, wine from the southern provinces, tallow, butter, honey, wax, wool from Little Russia, hogs' bristles, and leather. There are some manufactories of linen, cordage, and soap. The annual fairs are very well attended. Besides the buildings belonging to the crown, there are 20 churches, two of which are of wood, 2 convents, and a bazaar. The streets are very badly paved. The town, which is a bishop's see and the seat of government, has a gymnasium, a district school, and a seminary for the education of priests for the Greek Church. In the vicinity there are public gardens prettily laid out, and commanding good views.

The other principal towns in this government are Siäwsk, which is the see of a bishop, and has 5000 inhabitants, a seminary for 400 pupils, and manufactories of earthenware, colours, &c.; Briänsk on the Desna, with 5000 inhabitants, has a seminary, a cannon foundry, tanneries, and much trade with Kherson; Karatschew, with 6000 inhabitants; Trubtschewsk, on the Desna, an ancient town, with 3500 inhabitants; Dmitrowsk, with 3000 inhabitants; Liwny, on the Sosna, with 6000 inhabitants; Jelez, on the Sosna, with 8000 inhabitants, has a great trade in iron wares and corn; Mzensk, at the junction of the Mezna and the navigable river Sudzha, has 6000 inhabitants; Bolchow, on the Nugra, a well-built town, with 14,000 inhabitants. These towns, including Orel, are the capitals of circles of the same names. There are 12 circles in the government.

ORELLANA. [AMAZONAS.]

ORENBURG, a government of Russia, partly in Asia and partly in Europe, is situated between 47° and 56° N. lat., 50° 20' and 64° 20' E. long, and is bounded N. by the government of Perm, N.W. by Wiatka; W. by Casan, Simbirsk, Saratov, and Astrakhan; E. and S. by the Kirghiz steppe, and N.E. by Tomsk and Tobolsk. The area of the government is 118,094 square miles. If the country of the Uralian Cossaks, which is generally looked upon as a dependency of Orenburg, and is by some included under that name, be added, the total area of Orenburg will amount to 143,317 square miles. The area given above is taken from the last official return. But since that return was issued a new government named SAMARA has been formed by imperial ukase (December 18, 1850), on the left of the Volga, from districts formerly belonging to Simbirsk, Orenburg, and Saratov. A large portion of Orenburg comprised between the Obchei-Siert Mountains, drained by the Samara and the Kindel (which unite before they join the Volga), and measuring 21,393 square miles, is now included in the government of Samara. Accordingly the area of the government of Orenburg is reduced to 96,701 square miles, with a population of 1,192,323. It is divided into 12 circles.

Towards the south, in the country of the Cossaks of the Ural, the surface is a steppe, which is destitute of trees, and only produces the plants peculiar to saline countries. Beyond the mountains it is a plain intersected by morasses and a great number of lakes; on the European side of the mountains the surface is undulating, remarkably varied, and often very picturesque. To the north, where the Ural chain enters the government, it is called the Baschkirian Ural; the part which runs directly south, parallel with the river Ural to its sudden bend from east to west, is called the Gouberlin Mountains, branches of which, stretching from east to west, extend into the government, and form what is called the Obchei-Siert. The base of the Ural chain is granite; the upper rocks are calcareous and quartz, sometimes bare and covered with erratic blocks, and sometimes covered with a sufficient depth of sand and earth for the trees to take root. Immense caverns open into the interior of these mountains. The whole of the western or European part of the government is fertile. The principal river is the Ural, which forms part of the

boundary between Europe and Asia. It rises in the Ural Mountains in the district of Troitsk, and forming in part of its course the western boundary between Orenburg and Astrakhan, discharges itself by several mouths into the Caspian in 47° N. lat. Its entire course, which is rapid and winding, but without falls, is above 1600 miles; its breadth, which is only 60 feet at Oraknia, and 150 feet at Orenburg, increases to 480 feet, but the water is so shallow that it is navigable only for very light vessels. Other rivers are the Kama, the Sakmara, which falls into the Ural, and the Belaia, at the conflux of which with the Ufa, the chief town Ufa is situated. There are numerous lakes, salt as well as fresh, on both sides of the Ural Mountains. The climate varies considerably between the north and the south; and it is much more rigorous to the east than to the west of the Ural chain. In the steppes the heat in summer is very great. The winter is generally cold, and even in summer the nights are cool. Whirlwinds and hurricanes are frequent, and transitions from heat to cold are sudden. The want of rain and the swarms of locusts are very distressing, especially in the south.

Natural Productions.—Agriculture is tolerably flourishing, and is favoured by the goodness of the soil. The chief grains are rye, barley, oats, buckwheat, and millet. The inhabitants grow but little flax, hemp, tobacco, and vegetables. The forests are of immense extent, but there is an enormous consumption of wood in the forges, for making charcoal, for the preparation of tar and potash, and for building houses and bark. Game is abundant in the forests, and the lakes abound in water-fowl. The golden eagle of the Ural is tamed and trained for the chase. The chief wealth of the government consists in its horses and cattle. The former, which are of Tartar or Baschkirian breed, are handsome and strong; the Baschkirs and Metscheriaks have herds of 200, 1000, and even 2000 horses; the Russians, the Cossaks, and the Tartars, of 50 or 100 horses. All have great numbers of oxen, goats, and more especially sheep, of which a nomad will have from 500 to 4000, and the stationary inhabitants 400 to 500. The Christians possess great numbers of swine; the nomad rears camels or dromedaries. The fishery in the Belaia and the Kama suffices for the consumption of the inhabitants; and that in the Ural is a source of considerable advantage to the Cossaks. This government possesses likewise great mineral wealth—gold in the Ural Mountains, copper, iron, and a great quantity of salt, which is procured from the mines of Iletz, where the rock-salt is found 4 or 5 feet under the sand in beds covered with gypsum; the Cossaks however obtain their salt from the lakes. The other mineral products are asphalt, sulphur, vitriol, marble, alabaster, agates, &c.

The population is extremely mixed. The great majority are Russians; next to them are the Turks or Tartars, and the Baschkirs (about 15,000 families). Almost the whole of these ignorant, rude, and warlike people inhabit a district at the foot of the Ural chain, which is called after them, Baschkiria. They live by the breeding of cattle and bees, by the chase, and agriculture. They dwell in the summer under tents made of felt, and in winter in villages. Other components of the population are Finns, Cossaks, Teptjars, Metscheriaks and Kalmuks, Tchonvaches, Tchoremises, Mordwins, Kissilbaches, and Armenians.

The women are extremely skilful in weaving and dyeing. The working of the mines employs a great number of hands. But manufacturing industry properly so-called is exerted chiefly on operations connected with mining, in smelting-houses and foundries of the Ural Mountains, in the manufactory of arms at Zlutoust, and in the numerous tanneries, potash factories, and distilleries. Some woollen cloth is manufactured for the army. The tallow-melting houses in the government are numerous.

The commerce of the government is carried on partly with the nomad tribes, who exchange their horses, cattle, furs, carpets, and blankets of felt or wool, for manufactured goods, brass, copper, and iron articles, and partly with the Kirghises and people of Bokhara, whose caravans come to Orenburg or Troitsk, the two chief commercial towns, where there are custom-houses. Through the same channel many goods are exported to Kliwa, Bokhara, Tashkend, and the Kirghiz steppe, the caravans numbering altogether several thousand camels exclusive of horses. The articles exported to the interior of Russia in Europe are chiefly the mineral products, many of which are sent to the ports on the Baltic. The caravans from Bokhara bring raw and manufactured silk and cotton, and also Cashmere and Persian shawls, indigo, Chinese goods, tea, &c. Asiatic produce is brought to the fair of Nijnei-Novgorod by way of Orenburg, the merchandise being forwarded thence in waggons.

For public instruction Orenburg depends on the university of Casan, but education is very limited. The Mohammedans study at the high school of Gargali. Most of the Christian inhabitants are of the Russian Greek religion. The Tartars, the Baschkirs, Kalmuks, Teptjars, and Metscheriaks are Mohammedans.

The civil government is organised like those in Great Russia, but does not extend to the Kirghises and Cossaks. These are under a military governor, whose chief business is to provide for the security of the frontier, which is defended towards the Kirghiz steppe by a line of fortresses, and by the Cossaks, the Metscheriaks, the Baschkirs, and the Kalmuks, who in consideration of this service are exempt from all taxes to the government. The forts on the line of the Orenburg

Cossaks extend from Iletakaja-Kreposth to the river Tobol in the north, at the distance of 3 miles from each other. From Iletakaja-Kreposth southward to Gurief on the Caspian, is the line of the Cossaks of the Ural, defended in like manner by a long series of small forts.

Orenburg, formerly the capital of the government, is situated in 51° 46' N. lat., 52° 31' E. long., in a vast plain near the conflux of the Sakmara and the Ural: it is of an oval form, regularly built, and well fortified. The population is stated to amount to 20,000. There are nine Greek churches, one Lutheran church and school, a military academy for 80 pupils, a great European bazaar with 180 shops in the town, and a bazaar on the Asiatic side of the river with 492 shops in the Kirghis territory, a league from the town, which is the depôt for the merchandise of Central Asia and of Russia. The Kirghises bring annually between 300,000 and 400,000 broad-tailed sheep, horses, skins, carpets of divers colours; the Bokharians bring gold in grains, Persian gold and silver coin, lapis lazuli, precious stones, black lamb-akins. The military governor resides here.

Ufa, the present capital, a fortified town at the conflux of the Ufa and the Belala, has 6000 inhabitants, half of whom are Tartars. The public institutions and buildings are a gymnasium, a poor-house, a lunatic asylum, seven churches and two convents. It is the see of the bishop of Orenburg, and the residence of the Mohammedan Tartar Mufti.

Among the other towns are *Wosresensk*, population 3500; *Alenzelinsk*, in the north of the government on a feeder of the Bielala, population 30,000; *Serjinsk*, population 3000; and *Traitskaja*, or *Troitsk*, a free-port in the Asiatic part of the government: population, 3000. *Troitsk* is a fortified town on the left bank of the Oul, a feeder of the Tobol. The steep banks of the river are united by a bridge which connects the town with the Kirghis steppe, and leads to a fortified bazaar, in which the products of the steppes of Bokhara and other countries of Central Asia are exposed for sale.

ORIGNY-EN-THIÉRACHE. [AISNE.]

ORIHUELA. [VALENCIA.]

ORINOCO, a large river of South America, which has its origin, according to the most recent information, not in the centre, but on the southern declivity of the eastern part of the mountain system called Parima. These mountains spread over a great part of the eastern portion of the republic of Venezuela, and the north-east districts of the empire of Brazil. In length they extend nearly 1200 miles, between 51° and 68° 30' W. long. Their width varies between 140 and 450 miles, between the parallels of 1° and 8° N. lat. According to a rough calculation, this mountain system covers a surface of about 400,000 square miles. The mountains are separated from the shores of the Atlantic by a low and flat country varying in width between 30 and 70 miles. The southern portion, as far as is known, is a mass of rock, of which the general level has an elevation of from 1500 to 2000 feet above the sea. Few of the hills and ridges rise more than some hundred feet, and a very few summits attain more than 1000 feet above their base. The country along the water-courses is thickly wooded, as well as the greater part of the country between them; but many of the level tracts are savannahs without trees, or only covered with low bushes, which however display a great luxuriance of vegetation. West of 59° W. long., and near 4° N. lat., a continuous range begins, which runs westward to 64° W. long. nearly under the same parallel, and west of 64° W. long. inclines more to the south, so that at its termination near 66° W. long. it reaches nearly to 3° N. lat. This range is called Sierra Pacaraima. In its eastern part it rises from 1500 to 2000 feet above its base, and from 3000 to 4000 feet above the sea-level. Farther west it rises several thousand feet above the sea, and terminates with the Cerro Maraguaca and the Cerro Duida, whose summits attain an elevation of about 10,000 feet. Along the southern base of the Sierra Pacaraima the Rio Parime runs eastward and the Rio Tokoto westward, and by their junction near 60° W. long. the Rio Branco, an affluent of the Amazonas, is formed.

The source of the Orinoco has never been visited by Europeans, nor has any information respecting it been obtained from the natives, who are an aboriginal race known as the Guaiacas, and who have hitherto prevented all access to foreigners. It is supposed that this river rises near 64° W. long., and between 3° and 4° N. lat. Humboldt advanced up the stream as far as the mission of Esmeraldas, and he says that some monks had penetrated several miles farther to the confluence of the river Chiguire, where the Orinoco is so narrow that the natives have made a bridge over it of creepers at the foot of a cataract. Schomburgk confirms this account.

At this point the river runs in a general western direction, and several miles farther down it divides into two arms, of which that which flows to the south-west is called Cassiquari, and after a rapid course of nearly 100 miles joins the Guainia, or Rio Negro, thus forming a natural water-communication between the Orinoco and the Amazonas, into which latter river the Guainia falls. [BRAZIL.] The Orinoco continues a wide river, running in a western direction along the southern base of the Parime Mountains until it approaches 68°

W. long., when it is joined by the Atabapo from the south and by the Guaviare from the west. From the confluence of the last-mentioned river its course lies to the north, along the western base of the Parime Mountains, and in this part its navigability is interrupted by the Raudales of Maypures and Atures, between 5° and 5° 40' N. lat. The Raudales are a peculiar kind of cataract. The bed of the Orinoco at Maypures and Atures, which is nearly 8500 feet wide, is divided into numerous narrow channels by rocks and rocky islands, between which the water runs with great rapidity, and forms a succession of small cascades. The highest of these cascades does not exceed 9 feet, and the river descends at Maypures in about 6 miles only about 30 feet. But the velocity with which the confined body of water runs in the narrow channels renders it impossible to ascend the raudale. The Raudale of Atures is only half a mile long, and of a similar description. Below these raudales the river continues to flow between low but rocky banks. Opposite the mouth of the river Meta, which joins it from the west, is a powerful whirlpool round an isolated rock, called the Stone of Patience, from the circumstance of its generally taking two days to pass it at low water.

Some distance farther down the whole bed of the river is narrowed by rocks which advance into it from both sides, and the stream flows rapidly through the Narrow of Baraguan, which is 1393 yards wide. From the junction of the Apure the course of the Orinoco lies eastward to the point where it empties itself into the Atlantic Ocean. In this part of its course the navigation for boats is rendered dangerous by the floating rafts, which consist of forest-trees torn from their natural seat by the inundations of the river, and covered with aquatic plants; but vessels of 300 tons can ascend as high as the mouth of the Apure. Near the town of Angostura the river again runs between rocks for a short distance, but though in one place it is not more than 710 yards wide, this narrow (Angostura) may be passed without danger. Below Angostura vessels of considerable burden ascend the river with the trade-wind, which blows constantly from November to May; but the numerous sand-banks are dangerous when the water is low, especially after the month of January.

Several islands occur in the Orinoco below Angostura. They are generally of moderate size, partly low and partly rocky. About 130 miles from its mouth the delta of the Orinoco begins. The river sends off to the north a branch which soon divides into a great number of other branches, all known by the general name of Bocas Chicas (small mouths). They are all narrow when compared with the principal branch of the river, called Boca de Navios, but most of them are deep enough to admit vessels of considerable size. Of late these branches have been much frequented by smugglers, but they can only be navigated under the guidance of the Indians who inhabit the islands of the delta, and who are well acquainted with the numerous channels which the river has formed in the soft alluvial soil of the delta. The Bocas Chicas empty themselves partly into the Atlantic and partly into the Gulf of Paria, between the continent of South America and the island of Trinidad. Nine of them are rather large rivers: their names, enumerating them from east to west, are—Cano de Lauran, Cano de Nuina, Cano Chico de Mariusas, Cano Grande de Mariusas (navigable), Cano de Macareo (navigable), Cano de Cucuina (narrow, but deep), Cano de Pedernales (unavigable), Cano de Manamo Chico, and Cano de Manamo Grande. The three last mentioned fall into the Gulf of Paria. The Boca de Navios, or principal branch of the Orinoco, runs eastward to the ocean, and is divided for a distance of about 40 miles into two channels by a series of islands which lie nearly in the middle of the stream. These channels are known by the Indian names of Zaupana and Imataca, and their eastern extremity is not quite 30 miles from Cape Barima, which is situated at the mouth of the river. Both are navigable, but that on the south, called the Channel of Imataca, though wider has less water; it is however commonly used by large vessels. Each of these two channels is more than 2 miles wide, and the whole width of the river, including the islands, considerably exceeds 5 miles. From this point farther down the breadth continues to increase, and at the mouth, between Runta Barima on the south and the island of Cangrejos on the north, it is more than 60 miles wide. The navigable channel, which lies in the middle, is crossed by a sand-bar with 17 feet of water, and in breadth varying from 2½ miles to 3 miles or a little more. Within the bar the water deepens on the side of the island of Cangrejos to 4 and 5 fathoms, and the navigable channel is more than 12 miles wide. Though no arms branch off from the Boca de Navios to the south, the low country which extends from the Punta Barima to the mouth of the Essequibo River, and is watered by several small streams, is traversed by narrow natural canals called 'etabbos,' which generally lie parallel to the shores of the Atlantic, and connecting the small streams, constitute an internal water-communication for small boats between the Orinoco and Pomeroun rivers.

The tributaries of the Orinoco are very numerous, and many of them have both a long course and a great volume of water. Those which join it on the left are navigable through nearly the whole of their course, and are rarely impeded by rapids; but the rivers which fall into it on the right, originating on the elevated region of the Parime Mountains, descend from them by numerous rapids and cataracts, so as to be, at least for a great part of their course, entirely unfit for navigation. We shall only mention a few of them.

The Guaviare rises near 3° N. lat., in the declivities of the Paramo de Summa Paz, a portion of the great chain of the Andes, but the upper part of its course is not known. The lower course of the Guaviare does not seem to oppose any obstacles to navigation, but as no European settlements have yet been established on the banks, it is only navigated by the native tribes. It falls into the Orinoco near 4° N. lat., after a course of more than 500 miles.

The Rio Meta, which joins the Orinoco near 6° N. lat., originates with its numerous branches in the Andes east of Bogota, the capital of New Granada, and is said to be navigable for about 100 miles from that town. The most northern of its affluents however, the Rio Casanare, is navigated, as it originates not far from one of the most frequented mountain-passes of the Andes, that of Toxillo, which leads to the valley of the Rio Sogamozzo, north of Bogota. English manufactured goods, sent from Trinidad, are carried up the Orinoco, Meta, and Casanare, and over the mountain-pass to Bogota and the adjacent tracts. The course of the Rio Meta exceeds 500 miles, and that of the Casanare perhaps 300 miles.

The Rio Apure, which joins the Orinoco between 7° and 8° N. lat., enters it by a great number of channels, and brings to it the waters of innumerable large streams, which partly originate on the eastern declivity of the Andes north of 6° N. lat., and partly descend from the southern slope of the maritime mountains of Caracas. This river receives all the waters which descend from a mountain range more than 500 miles in length. The Apure itself rises in the Sierra de Merida, and runs more than 100 miles along its base to the south-west, and afterwards from west to east, collecting in its course all the waters which descend from the Andes. Before it joins the Orinoco, after a course of about 450 miles, it enters an extremely low and level country of considerable extent, which for several months of the year is changed into a temporary lake. Through this alluvial country it has cut a number of channels, by which it discharges its own waters and those brought down by other rivers from the maritime mountains of Caracas. Almost all the rivers descending from the last-mentioned range unite at one place, a little above St. Jayme, and form a large body of water, which, about 30 miles lower down, falls into the Apure, about 50 miles from its mouth. All these rivers are navigable through nearly the whole of their course; they drain the Llanos, a country rich in pasturage but without agriculture. The Apure is navigated up to its junction with the Rio San Domingo, and the latter is then navigated to a small place called Torunos, at some distance south of the town of Varinas.

Among the rivers which join the Orinoco from the right, only the Caroni requires to be mentioned; it drains a long valley in the Parime Mountains, rising east of the source of the Orinoco, and north of the upper branches of the Rio Branco, an affluent of the Guainia, in the Sierra Pacaraima, and running mostly in a northern direction. The current is very swift, and much interrupted by rapids; near its mouth it descends by a cataract 15 feet high. The Caroni runs more than 300 miles.

The whole course of the Orinoco, so far as it is known, is estimated by Humboldt to be nearly 1300 miles. The tides are perceptible as far as Angostura, or nearly 250 miles from its mouth, in the month of April, when the river is lowest. At the confluence of the Caroni, more than 150 miles from the mouth, the water at that time rises 15 inches. During the rainy season the Orinoco inundates the greatest part of the Llanos, or plains which lie to the north of it, and likewise a portion of the plains which extend west of its middle course to the base of the Andes. Immediately after the vernal equinox the rising of the water is perceptible: at first it rises slowly, and sometimes the river sinks again in April. It attains its highest level in July, and remains stationary from the end of July until the 26th of August, when it begins to decrease progressively, but more slowly than it increased. It is lowest in January and February. At Angostura the mean rise does not exceed 24 or 25 feet, but in the upper part of its course it rises several feet higher.

(Humboldt's *Personal Narrative, &c.*; Depon's *Voyage à la Partie Orientale de la Terre Ferme dans l'Amérique Méridionale*; Schomburgk, *London Geographical Journal*, vol. x.)

ORISSA. [HINDUSTAN; CUTTACK.]

ORKNEY ISLANDS, Scotland, a group of islands lying to the north of the north-eastern extremity of Scotland, between 58° 44' and 59° 24' N. lat., 2° 23' and 3° 24' W. long. They are separated from the mainland by the Pentland Frith, which is about 7 miles wide at its eastern entrance between Duncansby Head and the island of South Ronaldshay. The flux and reflux of the water during the run of the tides through this strait is broken by the Pentland Skerries, which lie about 4 miles N.E. from Duncansby Head, and 3 miles S. from South Ronaldshay; and farther westward by the islands of Swona and Stromna. [CAITHNESS-SHIRE.] Strong currents are thus produced in various parts of the frith at the same time, a circumstance which causes so much sea in gales of wind as to render the strait dangerous to deep-laden vessels. There is a lighthouse on the Pentland Skerry.

The Orkneys consist of 67 islands and islets, 27 of which are inhabited; the remainder, called 'holms,' are pasture-grounds. The largest of these islands, called Pomona, or Mainland, extends from south-east to north-west about 18 miles, and divides the group into two portions. The islands between Pomona and the mainland of Great Britain are

called the South Isles, and those north of Pomona the North Isles. Eight of the South Islands and three of the Skerries, and 15 of the North Isles, are permanently inhabited. They contained in 1851 a population of 31,455, namely:—

South Isles.—Swona and Pentland Skerry, 57 inhabitants; South Ronaldshay, 2465; Burra, 559; Flotta and Fara, 441; Hoy, 1565; Gremsay, 236; Pomona, or Mainland, 16,757; Hunda, 5.

North Isles.—Shapinsha, 899 inhabitants; Weir, 62; Eagleshay, or Egilaa, 192; Rousa, 937; Enhallow, 24; Eday and Fara, 1016; Stronsa, Papa Stronsa, and Lingsholm, 1211; Sanda, 2004; North Ronaldshay, 526; Papa Westra, 371; Westra, 2088.

Coast-line, Surface, &c.—Some of the islands have rocky shores presenting abrupt precipices towards the west. In Hoy these precipices rise to the height of 1000 feet. Other islands rise from the shore in low rounded hills covered with heath, and with a considerable depth of peat-mould. Others are low and flat, with sandy shores. There are few trees on any of the islands. In the neighbourhood of the town of Kirkwall, and on Pomona generally, there has of late years been considerable planting. According to a rough estimate, the surface of the islands is 150,000 acres, of which less than one-third is cultivated and used as pasture; the remainder is waste or covered with water. The island of Sanda, which is flat and low, is the most fertile. Wart Hill, on the island of Hoy, has an elevation of 1556 feet, and is considered the highest land in the islands; Wideford Hill, on Pomona, also rises to a considerable elevation. The coasts of Pomona and the South Isles are very irregular in their outline, and contain several secure and spacious harbours. The harbours are not however much used except by fishing-boats. The principal stations for the herring-fishery are St. Margaret's Hope in South Ronaldshay, and Papa Sound in Stronsa. On the island of Hoy there is an excellent and spacious harbour called Long Hope. Stromness and Long Hope are most frequented by shipping. Small lochs are numerous in the islands. The Loch of Stennis in Pomona is by far the most important, being about 14 miles in circumference. The roads are good.

Climate, Soil, and Agriculture.—As the Orkneys lie open to the Atlantic, and are exposed to the west-south-western gales, which are the prevalent winds, the climate is rather wet than cold. Frost rarely lasts many days, and the harbours are open all the year round. The winter is disagreeable on account of the frequent rains and storms. The spring season also is usually wet and stormy. The summer is generally pleasant, the heat moderate, and the weather steady. The early part of the autumn is likewise agreeable, but in November the bad weather commences.

The soil of some of the islands is of inferior quality, but that of others is excellent. Agriculture is limited to the raising of oats and that kind of barley which in Scotland is called bere or big, and to the cultivation of potatoes, turnips, and a few other vegetables. Barley and bere are exported. Of late years improvements have taken place, the opening of a regular steam communication with Aberdeen and Edinburgh having given a stimulus to the rearing of cattle, for which the islands are peculiarly adapted. Cattle are numerous, but small: on several of the larger farms the Angus and short-horned breeds have been introduced with success.

Geology, &c.—The geological character of the islands is very simple; the whole group, with the exception of a small granitic district near Stromness, consisting of rocks belonging to the old red-sandstone formation. The prevailing rock is a species of sandstone flag, much charged with argillaceous matter. It occurs in distinct strata, usually slightly inclined, forming hills of small elevation inland, which however often present magnificent cliffs round the coasts. The colour varies from pale greenish to blackish gray. Occasionally it contains bitumen, and it is the repository of remarkable fossil fishes. Connected with the sandstone flag are beds of common sandstone of a yellowish or tile-red colour. These form the chief part of the mountains of Hoy, the highest point in Orkney, and also several headlands in Pomona and Eday. Dykes of basalt and greenstone traverse these rocks in Hoy and Pomona. The granite tract appears in the form of a chain of moderate hills, occupying a length of six miles, and a breadth of from half a mile to a mile, and ends at Stromness. It is everywhere in immediate contact with a coarse conglomerate, consisting of nodules of quartz and fragments of granite and sandstone imbedded in an arenaceous base.

Divisions, Towns, &c.—The Orkney and Shetland Islands form one county or stewardry, which returns one member to the Imperial Parliament. The Orkneys have a resident sheriff-substitute. The only towns requiring notice are Kirkwall and Stromness. *Kirkwall*, the chief town of the islands, and a royal and parliamentary burgh, is situated on a bay on the north coast of Pomona, in 59° 0' N. lat., 2° 57' W. long. It is governed by 2 bailies and 10 councillors, of whom one is provost. The population of the parliamentary burgh in 1851 was 3451. It unites with Cromarty, Dingwall, Dornoch, Tain, and Wick, in the return of one member to Parliament. The town consists chiefly of a long narrow street; it contains several good houses and shops, and is lighted with gas. Kirkwall is the chief place of trade in the island. On December 31st, 1853, there were registered as belonging to the port—22 vessels under 50 tons, aggregate burden 560 tons; and 21 above 50 tons, aggregate tonnage 1925. During 1853 there entered the port 187 sailing-vessels of 9813 tons, and 51 steam-vessels of 15,942

tons; and there cleared 213 sailing-vessels of 11,171 tons, and 51 steam-vessels of 16,026 tons. The cathedral of St. Magnus at Kirkwall is one of the most remarkable specimens of middle-age architecture in Scotland. The erection of the cathedral appears to have been commenced by Earl Hacon in 1138, but probably only a small portion was completed by him. The nave, northern side, and most of the lower part of the building, is Norman, or transition to the early English style. The upper part is chiefly early English. It is a cruciform structure, 226 feet long and 66 feet wide. The building is used as the parish church. Close to the cathedral are the ruins of the bishop's palace, and of the palace of Earl Patrick Stewart, the last feudal earl of Orkney, who was executed for high treason in the reign of James I. There are in the town a chapel of ease, a Free church, a spacious new chapel for the United Presbyterians, a chapel for Independents, and an Endowed Grammar school of great antiquity. *Stromness*, a burgh of barony and sea-port, situated towards the south-western extremity of Pomona, in 58° 58' N. lat., 9° 18' W. long., has also a good harbour. The population in 1851 was 2055. The town, which is irregularly built, contains Established, Free, and United Presbyterian places of worship; two schools, supported by subscription; a public library; and a museum of natural history. It has considerable trade. The port is subordinate to Kirkwall.

History, Antiquities, &c.—The Orkneys were early taken possession of by the Northmen, and remained subject to the kings of Norway and Denmark till 1468, but had their own earls, who governed them almost as independent sovereigns. The islands were the general rendezvous of the piratical fleets which so often devastated the coasts of England and France. In 1468 they were mortgaged to Scotland for 50,000 florins, the dowry of Queen Margaret of Denmark; the pledge was never redeemed, and from that time the islands have belonged to Scotland.

The inhabitants are partly of Scotch and partly of Norwegian descent. While the islands belonged to Denmark the Norwegian language was exclusively in use, but the Norse has been long extinct. A few relics of the Udal tenure, the universal tenure of land among the free nations of the north, may however still be found. In character, manners, and language, the inhabitants now differ little from the Scotch lowlanders.

Throughout the island are to be found numerous traces of the early and pre-historic races of Europe, the most interesting memorial of whom is perhaps what is called the 'Standing Stones of Stennis.' The dwarf-stone of Hoy is well known. Cromlechs, tumuli, and Pict-houses (as they are called) have been found in various localities. The remains of the more important ecclesiastical and feudal period have been already referred to, in addition to which may be mentioned Noltland Castle in the island of Westra, of which the massive gate-house and fragments of the walls are still standing.

Industry.—Some years ago the inhabitants of the islands derived considerable profit from the preparation of kelp. The manufacture is now almost extinct, and the consequence has been an extension of agriculture, and the rise of the herring- and cod-fisheries into a branch of industry of great importance. Upwards of 700 boats are now employed in the herring-fishery. The cod-fishery is prosecuted in the months of May and June, before the great shoals of herrings appear on the coast, and is also of great importance. The women find some occupation in straw-plaiting. A number of young men leave the country to enter the merchant navy. A few also go every year with the whale-ships to Davis's Straits.

Religious Worship and Education.—Since the commencement of the present century a great improvement has taken place in the character of the instruction given to the inhabitants of the Orkney Islands. The religious movements of the Scottish mainland have extended their influence to the islands, and the three great divisions of Presbyterians are fully represented. The Established Church has 21 congregations, the Free Church 14, and the United Presbyterians have 12; there are also some congregations of Independents. In the united county of Orkney and Shetland in 1851 there were 147 day schools with 6501 scholars, and 180 Sabbath schools with 6527 scholars.

ORLEANAIS, a former province of France, now forms the departments of LOIR-ET-CHER, LOIRET, and portions of those of EUVE-ET-LOIRE, and NIÈVRE. It was divided into Orleanais proper, capital Orléans; Gâtinais, of which Montargis was the chief town; Beauce, capital Chartres; Dunois, chief town Château-Dun; Vendômois and Blaisois, of which the respective capitals were Vendôme and Blois; and Sologne, of which the chief town was Romorantin.

ORLÉANS, a city in France, capital of the department of Loiret, is situated on the right bank of the Loire, 76 miles by railway S. by W. from Paris, 70 N.E. from Tours, in 47° 54' 9" N. lat., 1° 55' 48" E. long., at an elevation of 381 feet above the sea, and had 43,405 inhabitants in the commune at the census of 1851. This town occupies the site of the ancient *Aurelianis*, which according to D'Anville had the earlier name of Genabum, a town plundered and burnt by Julius Cæsar ('Bell. Gall.' vii. 3-11); but some recent antiquaries contend that *Gien* occupies the site of Genabum. It was besieged by Attila in 451, but relieved by the Romans commanded by Aëtius, who defeated Attila under its walls. Orléans subsequently passed into the hands of the Franks, and became the capital of a petty kingdom. The Northmen captured it in 865, and again in 865.

GEOG. DIV. VOL. IV.

On the accession of Hugues Capet, who had inherited the duchy of Orléans, the town became one of the most important places under the crown. It was besieged for seven months in 1428 by the English under the Duke of Bedford, but they were obliged to raise the siege with disgrace by Joan of Arc, and never after recovered their superiority. At this time the town gave the title of duke to a branch of the house of Valois, which afterwards came to the throne in the person of Louis XII. The town suffered much during the religious wars of the 16th century.

Orléans stands in a plain gently sloping down to the river: the circuit of the ramparts, which are now converted into a promenade, forms an arc of a circle about three miles in extent. The side of the town along the bank of the Loire is about a mile and a half, and the length of the principal street from the north entrance to the town to the bridge over the Loire is about three-quarters of a mile. Orléans is surrounded by numerous country-houses, and has large suburbs, of which that of Olivet is on the south side of the river. Some parts of the town are well laid out, with wide and clean streets and well-built houses. The line of street from the Paris road to the bridge is on the whole the finest, especially that part which lies between the bridge and the Place du Martroy, in which is erected a statue of Jeanne d'Arc. But in the older parts of the town the streets are ill laid out and ill paved; and the houses are built generally of wood. The bridge over the Loire is 1089 feet long and consists of 9 arches, of which the central one has 108 feet span. There is a handsome quay near the bridge; and between the bridge and the suburb of Olivet is a public walk. This suburb abounds with country-houses and with nursery-grounds.

The gothic cathedral of Sainte-Croix is one of the finest religious edifices in France. The present structure was commenced by Henri IV., and has been only lately finished. The architecture has excited much admiration, especially that of the portal entrance; the two towers of the front are of surpassing elegance and lightness. The church of St.-Agnan, the finest except the cathedral, is a beautiful gothic building, although now without nave or steeple. The church of St.-Pierre-le-Puellier, the oldest in the town, is remarkable only for its antiquity. Other remarkable structures in Orléans are—the church of St.-Euverte, now used as a storehouse, while the tower is turned into a shot-foundry; the chapel of St.-Jacques, now a salt-store; the town-house, which was long converted into a museum and picture-gallery, has been recently repaired; the house of Agnes Sorel in the Rue-du-Taboury; the court-house; and the house of François I. in the Rue-de-Recouvrance. The town has a public library of 26,000 volumes, a theatre, and a botanic garden. A new bronze statue of Jeanne d'Arc is about to be erected in front of the newly-repaired town-hall.

The chief manufactures of Orléans are—hosiery, refined sugar, vinegar, bleached-wax, blankets, and counterpanes. To these articles of manufacture must be added cotton- and woollen-yarn, fine woollen-cloths, flannels, hats, files, rasps, and other tools, glue, leather, tin-ware, and earthen-ware. There are numerous breweries and dye-houses. Trade is carried on in the above articles, and in wine, brandy, corn, flour, wool, hides, iron, salt, hoops, dye-stuffs, saffron, fire-wood, timber, oak-planks, coals, groceries, and spices. Its situation on the Loire, which is navigated by small steamers and communicates with the Seine by means of canals, and on the railway, to which the lines connecting Bourdeaux, Nantes, Lyon, and the south of France with Paris converge—renders Orléans the centre of a very considerable commerce and of a large transit trade.

Orléans gives title to a bishop, whose see is the department of Loiret. It is the seat of a High Court, which has jurisdiction over the departments of Indre-et-Loire, Loiret, and Loir-et-Cher. The University-Academy of Orléans has been recently suppressed by a law passed under the Empire, and the department of Loiret is now included within the limits of the University-Academy of Paris. The town also possesses tribunals of first instance and of commerce, a commercial court, an exchange, a college, a council of prud'hommes, a theological college, and gratuitous schools of design and architecture.

(*Dictionnaire de la France.*)

ORLEANS, NEW. [NEW ORLEANS.]

ORLEANSVILLE. [ALGÉRIE.]

ORLETON. [HEREFORDSHIRE.]

ORMSBY, GREAT. [NORFOLK.]

ORMSKIRK, Lancashire, a market-town and the seat of a Poor-Law Union, in the parish of Ormskirk, is situated in 53° 34' N. lat., 2° 52' W. long., distant 42 miles S. by W. from Lancaster, 219 miles N.W. by N. from London by road, and 212½ miles by the North-Western and East Lancashire railways. The population of the town of Ormskirk in 1851 was 5548. Ormskirk Poor-Law Union contains 21 parishes and townships, with an area of 58,736 acres, and a population in 1851 of 38,316. The town of Ormskirk is lighted with gas. The church is mostly modern, with a few portions of late perpendicular character: it has a large western tower at the end of the nave, and another tower and spire at the west end of the south aisle. There are chapels for Wesleyan Methodists, Independents, and Unitarians. Near the town is a large Roman Catholic chapel. The Free Grammar school, founded in 1614, has an income from endowment of about 1500*l.* a year, and had 27 scholars in 1852. There are also united charity schools, two literary societies, a dispensary, and a savings bank. Hand-loom silk.

Q

weaving, rope-making, and brewing are the chief occupations. The town-hall was erected in 1779. A market is held on Thursday; fairs are held on Whit-Monday and Tuesday, and on September 10th.

ORMUS, or more properly HORMUZ, an island at the entrance of the Persian Gulf, is about ten miles from the Persian coast, and about twelve miles in circumference. It is a mere barren rock, without vegetation and without soil. Its conical shape and the isolated position of the numerous small hills of which the island consists lead the spectator to attribute its origin to volcanic agency. The rugged hills which line the eastern shores of the island are covered to a considerable distance from their base with an incrustation of salt, which in some places is as transparent as ice. In other places the surface is covered with a thin layer of dusky-red coloured earth, which owes its colour to oxide of iron, with which the whole surface of the island is impregnated. As the island contains no fresh-water springs the inhabitants use the rain-water collected in tanks, which were constructed above 800 years ago. There is excellent anchorage on the north-eastern shore, opposite the town. The fortress is situated about 800 yards from the shore, on a projecting point of land, which is separated from the island by a moat. On the plain which stretches from it to the hills are the ruins of the once famous town of Hormuz. The Imam of Muskat has possession of the island. He derives a revenue from the salt, which is exported in large quantities.

Albuquerque took possession of Hormuz in 1507, and of the town which was then on it, with the view of preventing the Arabs from sending aid to the petty sovereigns on the coast of Malabar, with whom they carried on a lucrative commerce. The Portuguese made Ormuz the deposit of all kinds of Indian goods, and in a short time a populous and rich commercial town rose upon it. The buildings covered a space 3 miles in length along the sea-shore and 2 miles in width. The town contained 4000 houses and 40,000 inhabitants, and its commercial relations extended over all Persia and Mesopotamia to Bokhara and Samarkand in Turkistan. In 1622 Shah Abbas, assisted by the English, took Hormuz from the Portuguese, demolished the town, and transferred its commerce to GOMBRON.

ORNANS. [DOUBS.]

ORNE, a department in the north of France, is bounded N. by the department of Calvados, E. by those of Eure and Eure-et-Loir, S. by those of Sarthe and Mayenne, and W. by that of Manche. It lies between 48° 12' and 48° 58' N. lat., 1° 0' E. and 0° 47' W. long. Its greatest length from east to west is 84 miles; the average width is 28 miles. The area is 2855.6 square miles. The population in 1841 was 442,072; in 1851 it had fallen to 439,884, which gives 186.74 to the square mile, or 12.18 above the average per square mile for the whole of France.

The department is formed out of the old duchy of Alençon, the northern part of Perche, and a portion of the south of Normandie; and it is named from its chief river, the Orne. It is traversed from east to west by a range of wooded hills, which forms part of the watershed between the English Channel and the Loire. The highest points in this chain do not exceed 1868 feet. The larger portion of the department lies to the north of the range, from which numerous lateral chains spring off in a general north or north-western direction, inclosing between them fertile and well-watered valleys. A small portion of the department, drained by the Iton and the Rille [EURE], slopes towards the north-east. The other more important rivers to the north of the principal range are—the Touque, the Dive [CALVADOS], the Aure [EURE], and the Orne, which gives name to the department. The Orne rises near Sées, and runs through the department past Argentan in a north-west direction, till it enters Calvados, where it turns north-by-east, passing Caen; here it becomes navigable and enters the English Channel about ten miles below this town, after a course of about seventy miles. Its principal feeders are the Noireau, the Aize, and the Odon. That portion of the department which belongs to the basin of the Loire is drained by the MAYENNE and the SARTHE; this last-named river rises near Sées, and runs for some way along the southern boundary. There is a great number of ponds in the department and several mineral springs, of which that at *Bagnoles*, 10 miles from Domfront, is famous for the cure of skin-diseases and of rheumatism. The department is crossed by 8 imperial and 14 departmental roads, and by the railway now in course of construction from Le-Mans to Caen, which passes through Alençon, Sées, and Argentan, and is joined at Sées by a branch line from Chartres.

The climate is in general temperate but damp. The spring brings cold east winds, white frosts, and rain; the summer is dry and warm, but terminates with storms in September; in autumn the rains begin to fall about the middle of October, then succeed white frosts till the end of November; in the depth of winter there are continual fogs with much rain and snow. The chief grain crops are wheat, mixed corn, rye, and oats, of which in ordinary years the produce suffices only for about two-thirds of the consumption. No wine is produced; cider is the chief beverage. The number of apple- and pear-trees, which are planted along the roads, round the fields, or in quincunxes, amounts to several millions. The pasture-land of the department is of considerable breadth, and in general of good quality; great numbers of lean cattle, purchased in the neighbouring departments, are fattened for the Paris and Rouen markets; good butter and middling cheese are made. The plain of Alençon is famous for its saddle-horses of

the purest Norman breed; in the rest of the department a large number of cart-horses, also of the Norman breed, are reared. Poultry of all kinds, especially geese, are abundant.

The western side of the department is occupied by primitive rocks; the eastern side by chalk; and the valleys of the Sarthe and Orne by formations that intervene between the chalk and the new red-sandstone. Several iron-mines are worked; marble, granite, porphyry, building-stone, marl, kaolin, porcelain-clay, and quartz-crystals are found; these last, after being carefully cut, get the name of Alençon Diamonds. The number of smelting-furnaces and forges at the several iron-works amounts to 49.

Besides pig- and bar-iron the industrial products include sheet-iron and copper, wire of different kinds, pins and needles, linen, canvass, lace, thread, hair-cloth, cotton and woollen-yarn, glass, paper, beet-root sugar, pottery, and leather. There are several large bleach-works in the department. Other articles of commerce are—corn, clover-seed, cider, flax, thread, linen, wax, honey, horses, fat-cattle, pigs, poultry, goose-feathers, oak staves, timber, and firewood.

The department is divided into four arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Alençon . . .	6	108	72,298
2. Argentan . . .	11	248	106,854
3. Domfront . . .	8	70	138,657
4. Mortagne . . .	11	171	122,075
Total . . .	36	597	439,884

1. Of the first arrondissement and of the whole department the capital is ALENÇON. *Carrouges*, 16 miles N.W. from Alençon, has smelting furnaces and forges for manufacturing the iron-ore raised from the mines in the neighbourhood; a fine feudal castle, of the 14th century, still inhabited; and 2145 inhabitants. *Sées*, 13 miles N. by E. from Alençon, is a well built episcopal town on the Orne, with one of the finest gothic cathedrals in Lower Normandie, a handsome episcopal palace, a college, two ecclesiastical seminaries, and 4474 inhabitants.

2. In the second arrondissement, the chief town *Argentan*, situated on a hill above the Orne, 22 miles N. from Alençon, is a clean well-built town, surrounded by old ramparts which form a pleasant walk, and afford a fine view of the valley of the Orne. It has tribunals of first instance and of commerce, a college, and 5425 inhabitants in the commune; also linen factories, bleach-works, and tan-yards, besides some trade in corn, hides, cattle, poultry, and cheese. The old castle, now converted into a prison, the churches of St-Germain and St-Martin, are the most remarkable buildings. *Vimoutier*, 17 miles N.E. from Argentan, is the centre of an important linen manufacture, and has large bleach-works, tan-yards, a tribunal of commerce, and 4110 inhabitants.

3. In the third arrondissement the chief town *Domfront*, situated 80 miles W. by N. from Alençon, has a tribunal of first instance, a college, and 2773 inhabitants in the commune. The town, built on a steep rock above the Varennes, a feeder of the Mayenne, is ill-built, with narrow, crooked, and steep streets. The ancient church of Notre-Dame is the only important structure. In the neighbourhood there are iron-forges, glass-works, and paper-mills. *Athis*, 15 miles N. from Domfront, has 4000 inhabitants, who manufacture broadcloth, casimirs, and other woollen stuffs. *La-Ferté-Macé*, E. of Domfront, has manufactures of cotton, tape, twist, combs, tobacco-boxes, brandy, leather, and tiles. The population of the commune is 5197. *Flers*, N. of Domfront on the road to Caen, is the centre of a large linen manufacture, and has 6118 inhabitants in the commune. The old castle of Flers, which was burned during the Chouan war, has been lately restored. *Tinchebrai*, in the north-west of the department near the source of the Noireau, has a commercial court and 3783 inhabitants, who manufacture nails, hardware, ironmongery, cotton and woollen stuffs, paper and leather. Robert duke of Normandy was defeated and taken prisoner in a great battle before Tinchebrai, Sept. 27, 1105, by his brother Henry I. of England.

4. The fourth arrondissement is named from its chief town *Mortagne*, which is situated on the sides and summit of a high hill, 20 miles E. by N. from Alençon, and has a tribunal of first instance, a college, and 5012 inhabitants. Some of the streets are steep; but most of them are wide, and the houses well built. The high-road from Paris to Brest winds round the hill and up to its very summit, where it traverses the *Place-d'Armes*, the principal square of the town. The court-house, the large prison, the markets, and the fountains, which are fed with water raised from a great depth by a steam-engine, are the most note-worthy objects in the town. Here also linen is the staple manufacture; pottery and leather are also manufactured; and there is some trade in corn, hemp, sheep, pigs, horses, and cattle. *Bellême* is a well-built town, situated 11 miles S. from Mortagne, on a hill near the forest of Bellême, and has 3143 inhabitants. It was formerly one of the chief towns of Perche, and had strong fortifications, some of which remain. Calico, cotton yarn, linen, canvass, and paper, are the chief industrial products. *L'Aigle*, prettily situated on the slopes of two hills, 17 miles N. from Mortagne, is a well-built, clean, and

improving town, with a commercial court, a consultative chamber of manufactures, and 5505 inhabitants. The town is traversed by the Rille, and still preserves some remains of its inclosing walls and ditches. The castle, situated in the centre of the town, is a large brick building, more remarkable for the beautiful gardens and the magnificent lime-trees that surround it than for its architecture. The churches of St. Martin, St. Barthélemy, and St. Jean, and the town-hall are among the chief buildings of the town. The largest pin-factory in France is in this town, which has also important manufactures of nails, needles, card-wire, ribands, woollen-yarn, leather, and hardware. In the neighbourhood there are several copper, tin, and iron-foundries. Longni, E. of Mortagne, has tan-yards, iron-smelting furnaces and foundries, and 2946 inhabitants.

The department forms the see of the Bishop of Sées; is included in the jurisdiction of the High Court, and within the limit of the University-Academy of Caen; and belongs to the 2nd Military Division of which Rouen is head-quarters. It returns 3 members to the Legislative Assembly of the French empire.

ORONSA. [ARIZLISHIRE.]

ORONTES, or AZY, RIVER. [SYRIA.]

OROTAVA. [CANARIES.]

ORPIERRE. [ALPES, HAUTES.]

ORSCHA. [MOHILEV.]

ORSETT, Essex, the seat of a Poor-Law Union, in the parish of Orsett, is situated in 51° 30' N. lat., 0° 21' E. long., distant 20 miles S. by W. from Chelmsford, and 22 miles E. from London. The population of the parish of Orsett in 1851 was 1592. The living is a rectory in the archdeaconry of Essex and diocese of Rochester. Orsett Poor-Law Union contains 18 parishes and townships, with an area of 41,177 acres, and a population in 1851 of 10,030. Orsett is quite an agricultural village. The parish church, a commodious building in the transition style from early English to decorated, is handsomely fitted up. The Independents have a chapel. There are National schools, a Diocesan Commercial school, a literary and agricultural society, and a savings bank. Petty sessions are held monthly.

ORSOON, the name of two fortified towns on the Danube, one in the Military Frontier, the other nearly opposite, belonging to Turkey.

ORTHEZ, a town in the French department of Basses-Pyrénées, 25 miles N.W. from Pau, and 37 miles E. from Bayonne, is pleasantly situated on the right bank of the Gave-de-Pau, in 43° 29' 25" N. lat., 0° 48' 25" W. long., at an elevation of 892 feet above the level of the sea, and has a tribunal of first instance, a college, and 6924 inhabitants. There is a suburb on the left bank of the river, which communicates with the town by an ancient gothic bridge. On the only pier of this bridge is a tower. The streets of the town are well laid out, and the houses well built. There are, on a height commanding the town, some ruins of the ancient castle of Moncade, in which Gaston Phoebus, count of Foix, lived and died. This castle was also the prison of Blanche of Navarre who was poisoned by her younger sister after two years of captivity. It was also for a time the residence of the mother of Henri IV., Jeanne de Navarre, who founded a Calvinist college in Orthez, and rendered Calvinism the dominant religion, endowing it with the property of the Catholic Church. The town has manufactures of woollen stuffs, linen-yarn, leather, linseed oil, &c. There are also dyehouses, copper foundries, and saw-mills. The commerce in hides, hams, wool, goose feathers, flax, timber, slates, cattle, and marble is considerable. The French under Marshal Soult were defeated after an obstinate battle, by the allied army, commanded by the Duke of Wellington, near this town, Feb. 27, 1814.

ORTONA. [ABBUSO.]

ORVIE'TO, the chief town of the Delegazione of Orvieto, and the residence of a cardinal bishop, in the Papal States, is built on a steep hill, which rises above the river Paglia, an affluent of the Tiber, about 16 miles N.E. from Bolsena, and has 8000 inhabitants. It is chiefly remarkable for its handsome gothic cathedral, begun about the end of the 13th century, and finished towards the middle of the 14th century. This church was built to commemorate the miracle of the Bleeding Host mentioned in the article BOLSENA, and of which it contains memorials in the magnificent silver Reliquary in the chapel of the Santissimo Corporale. The facade, one of the finest in Italy, is ornamented with sculptures and mosaics. The interior contains a very large collection of the sculptures of the 16th century, and is enriched by many beautiful paintings and other works of art, including the History of Antichrist, the Last Judgment, Hell and Heaven of Luca Signorelli, which were studied, admired, and imitated by Michel Angelo and Raffella. The other remarkable buildings of Orvieto are the town-house and the Jesuits' college, and St. Patrick's well (Pozzo di San Patrizio), excavated in the tufa rock on which the town is built. The country around Orvieto is fertile, and produces a delicate white wine, which is in great repute at Rome. Orvieto is evidently of Etruscan origin; the city *Herbanum*, mentioned by Pliny, is said to have occupied the site, but nothing certain is known of its history. Etruscan remains exist here. The city has given title to a bishop since A.D. 509. It was called *Urbs Vetus* in the time of the Longobards. The province of Orvieto contains 300 square miles, with 26,450 inhabitants in 1850.

ORZINUOVI. [BRESCIA.]

OSACCA. [JAPAN.]

OSIMO. [ANCONA.]

OSNABRÜCK (generally written *Osnabury* in English) is a province of the kingdom of Hanover. It is divided into the following parts:—The principality of Osnabrück, 903½ square miles; the lower county of Lingen, 126½ square miles; the circles of Meppen and Emsbüren, 693 square miles; and the county of Bentheim, 399 square miles. The area of the whole is 2122 square miles, and the population according to the census of December 3rd, 1852, amounted to 261,965, consisting of 145,497 Catholics, 89,227 Lutherans, 26,519 Calvinists, 684 Jews, and 38 undefined Christians. The whole country is a part of the plain of northern Germany, and is generally poor and sandy. The chief produce is live stock, hemp, and flax; and the chief manufactures woollen stockings and linen.

Osnabrück was formerly a bishopric, being the first see that was founded in Saxony by Charlemagne. After the Reformation many of the inhabitants embraced the Lutheran faith, and it was decided by the treaty of Westphalia that it should be governed alternately by a Roman Catholic and a Protestant bishop, the latter to be always a prince of the house of Brunswick-Lüneburg. As the Catholic bishop was generally an old canon and the Protestants always chose a young prince, the country remained for a long time under the electoral house of Brunswick: the last bishop of that house was the late Duke of York. In the year 1802 the country was made over to Hanover as a hereditary temporal principality, in consideration of certain territorial cessions. It was afterwards annexed first to the kingdom of Westphalia and then to the French empire, and was recovered by its ancient sovereign on the fall of Napoleon.

Osnabrück, the capital, is situated in 52° 16' N. lat., 8° 1' E. long., in a valley on the river Hase. It is surrounded with a wall and ditch, and has five gates. Like most of the old German towns it is irregularly built. The most remarkable public buildings are—the palace, built in 1665, the cathedral, the Roman Catholic church of St. John, the Lutheran churches of St. Mary and St. Catherine, and the fine town-hall, in which the treaty of Westphalia was concluded at the same time as at Münster. The inhabitants, amounting to about 12,000, have manufactures of coarse woollens, leather, linen, and tobacco. A railway, in course of construction to connect Emden with the Cologne-Minden line, passes through Osnabrück.

OSSA, MOUNT. [THESSALY.]

OSSOLA. [NOVARA.]

OSSORY, Ireland, a bishop's see, in the archiepiscopal province of Dublin, comprises nearly the whole county of Kilkenny, a considerable part of Queen's County, and a small portion of King's County; and contains 69 benefices. The chapter consists of a dean, precentor, chancellor, treasurer, archdeacon, and seven prebendaries. The see, which derives its name from an ancient principality, was founded in the 5th century at Saigair, now Seikyrau, or St. Kyran parish, in King's County. In 1052 it was removed to Aghadoo in Queen's County, and near the close of the 12th century to Irishtown, part of the present city of Kilkenny. By the Church Temporalities Act the see was united to the dioceses of Leighlin and Ferns; and the income of the bishop was fixed at 4200*l.* The cathedral church and bishop's residence are in the city of KILKENNY.

OSTENDE, a fortified town and sea-port of Belgium, in the province of West Flanders, is situated in 51° 14' N. lat., 2° 55' E. long., 12 miles W. from Bruges, 88 miles by railway through Bruges, Ghent, and Malines W. by N. from Brussels, and contains about 15,000 inhabitants. The town is clean and well-built. It contains a citadel, 5 squares, 3 churches, a prison, an hospital, and a town-hall, which is a large and plain but handsome building. The town stands upon a plain, and is entered by four gates. Of late years it has been much frequented during the summer as a watering-place; the sea-bathing is good, and there are excellent baths. The ramparts form an agreeable promenade, but the finest public walk is the Digue, or break-water, built nearly parallel to the seaward rampart of the town. The water at Ostende is bad.

Ostende has great facilities for carrying on trade with the interior by means of canals and railways. The Ostende and Bruges Canal allows vessels of 300 tons to pass through it to Bruges. The Nieuport Canal terminates at Ostende; and by the canal from Bruges to Ghent, which is a continuation of the cutting from Ostende to Bruges, and which communicates with the Schelde, Ostende is connected with the heart of the kingdom of Belgium. The importance of the town has very considerably increased since the introduction of railways, by which it is connected not only with all the important towns of Belgium but also with those of Germany and France. It is also the principal landing place for travellers between England, Belgium, and Germany. There were 22,665 passengers to and from England in 1849; in 1850 the number was 26,322. Passenger and mail steamers ply regularly to Dover. The number of ships (not including steamers) that entered the harbour in 1849 was 464, and the departures numbered 425. The harbour is safe, but the entrance to it is rather intricate. The imports consist chiefly of colonial produce, wool, wine, and British manufactured goods: the exports are, agricultural produce, linens, leather, oak bark, tallow, and salt.

Ostende was a small village in the 9th century, but two centuries later the port was much frequented. Old Ostende was destroyed by the sea in 1384. In 1372 the present Ostende was merely a fishing-

place. It was inclosed with walls by Philip the Good in 1445, and fortified in 1583 by the prince of Orange. The Dutch surrendered the town to the Spaniards after a long siege in 1604. It was taken by the allies in 1706, and in 1715 it was ceded by Holland to the emperor of Germany. Louis XV. took it in 1745, and restored it in 1748. In 1794 it was taken by the French, and remained in their possession until 1814, having been unsuccessfully attacked by the English in 1798.

OSTER. [CZERNIGOF.]

OSTERODE. [GRUBENHAGEN.]

OSTERSUND. [SWEDEN.]

OSTIA, OSTIUM TIBERINUM, the name of the former port of Rome, situated at the southern mouth of the Tiber, is 16 miles from the capital. The ancient town of Ostia, which was situated below the fork of the river, spread in a semicircular form along a bend made by the left or southern branch, on a piece of ground slightly elevated above the surrounding sand and marshes. Ostia was founded by Ancus Martius, according to Strabo. Under the Roman empire it was a large town, but the site is now marked by mere shapeless masses of ruins. Ostia was destroyed by the Saracens in the 5th century, and has since then remained in a ruined state. The present town was founded by Pope Gregory IV., A.D. 830, at the distance of more than a mile from the ancient city. Under Pope Leo IV. it became famous for the defeat of the Saracens. In the 14th century it was occupied by Ladislaus, king of Naples. The fortifications were restored by Pope Martin V. The present castle was built by Cardinal della Rovere. The French, who had seized it, were defeated in 1494 by the Cardinal, afterwards Julius II., whose trophies are still in the cathedral. There are now about 100 inhabitants at Ostia in winter, and about 10 in summer. There is a small cathedral in good taste, a bishop's palace, and a few other habitable buildings. The castle of Ostia consists of massive semicircular towers, united by a curtain and surrounded by a ditch. The episcopal palace has been recently converted into a museum of antiquities by cardinal Pacca. Ostia has given title to a bishop since Apostolic times. The bishop of Ostia is always a cardinal, and he has the privilege of consecrating the Pope after his election. The see has been united to that of Velletri since 1150. Of the remains of ancient Ostia the most interesting are the ruins of an ancient temple and of a theatre; in the arena of the latter many early Christians suffered martyrdom. A great number of fine statues, busts, and sarcophagi were discovered among the ruins of the ancient city by excavations made within the century. The mouth of the Tiber is now three miles distant from the present town. (Gell, *Topography of Rome and its Vicinity*.)

OSWALDTWISTLE. [LANCASHIRE.]

OSWEGO. [CANADA; NEW YORK.]

OSWESTRY, Shropshire, a market-town, municipal borough, and the seat of a Poor-Law Union, in the parish of Oswestry, is situated in 52° 51' N. lat., 3° 3' W. long., distant 18 miles N.W. from Shrewsbury, 171 miles N.W. by W. from London by road, and 182 miles by the North-Western and Shrewsbury and Chester railways. The population in 1851 was 4817. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The living is a vicarage in the archdeaconry and diocese of St. Asaph. Oswestry Poor-Law Union, which is regulated by the provisions of a local act, contains 14 parishes and townships, with an area of 74,160 acres, and a population in 1851 of 22,775.

Oswestry is traditionally said to have received its name from Oswald, king of the Northumbrians, who was slain here in a battle with Penda, king of the Mercians, whence the place was called Oswald's Tree. In the vicinity of the town is a remarkably fine spring of water, which bears the name of Oswald's Well. The first charter was granted to the town in the reign of Henry II., by William, Earl of Arundel, the lord of the manor. The son of this nobleman having taken part with the barons against King John, the king in 1212 reduced the town to ashes. Edward I., in 1277, ordered it to be surrounded by a wall and ditch. Some portions of this wall are yet standing. The town is lighted with gas, and paved, and is increasing in extent, particularly on the English side. It contains a town-hall; a small jail, erected in 1825; a theatre, and a handsome new market-place. The church, erected in the early part of the 17th century, is a commodious structure, with a tower. The Wesleyan, Primitive, and Welsh Methodists, Baptists, Independents, and Welsh Independents have chapels. The Free Grammar school, which is of very ancient foundation, had 48 scholars in 1853. There are also National, British, and Infant schools; a savings bank, a dispensary, and a house of industry. Markets are held on Wednesday and Saturday, and fairs eight times in the year. In the vicinity are corn-mills, paper-mills, and coal-mines. Malting and brick-making are carried on. The trade of the town is facilitated by the Ellesmere Canal. Races take place annually, in the month of September.

OSYTH, ST. [ESSEX.]

OTAGO. [ZEALAND, NEW.]

OTAHUTE. [SOCIETY ISLANDS.]

OTAVALO. [ECUADOR.]

OTLEY, West Riding of Yorkshire, a market-town, in the parish of Otley, is finely situated on the right bank of the river Wharfe, in 53° 55' N. lat., 1° 42' W. long., distant 29 miles W. by S. from York, 205 miles N.N.W. from London by road. The population of the town of Otley in 1851 was 4522.

The principal establishments in the town are a worsted-mill, a paper-mill, and a flour-mill. The town is lighted with gas. The parish church, erected in 1507, has an open roof, and a painted east window. The north door has a plain Norman arch. There are chapels for Wesleyan, Primitive, and Reform Methodists, Independents, Plymouth Brethren, Mormons, and Roman Catholics; a Grammar school, with a small endowment; National and Infant schools; a mechanics institute; and a savings bank. Quarter sessions and a county court are held. The market on Friday is well supplied with corn, cattle, and agricultural produce; cattle-fairs are held every alternate week from Ladyday to Michaelmas. An agricultural show is held annually in spring.

OTRANTO, TERRA DL, a province of the kingdom of the Two Sicilies, occupies the whole Iapygian, or Messapian peninsula, which forms the south-eastern projection, or heel, of Italy. It is bounded N.W. by the provinces of Bari and Basilicata, and by the sea on every other side. Its greatest length is about 100 miles; its general breadth varies from 25 to about 35 miles, but south of 40° N. lat. the width diminishes rapidly as it approaches Capo di Leuca, the extremity of the peninsula. The area of the province is 2871 square miles; the population was estimated in 1851 at 409,000. The peninsula is traversed in its length by a ridge of low calcareous hills, which are an offset of the Apennines of Basilicata, and terminate in Cape Leuca. There are no rivers properly so called in this peninsula, but the springs and drainings of the hills on both sides form streams, most of which are absorbed by the soil or lose themselves in marshes before they reach the sea. Nearly the whole of the low tract of land along the sea-coast on both sides of the peninsula is unwholesome; but the interior being more elevated and dry is wholesome, and produces oil in abundance, wine, corn, and pasture for cattle. The oil is of the best quality; it is stored in large tanks excavated in the limestone rock at Gallipoli, from which port it is chiefly exported. The best tobacco grown in Italy is produced on the table-land above the Capo di Leuca. Cotton is cultivated with success. Figs, almonds, carobs, oranges, lemons, and other fruits are grown. Mules are bred in great numbers.

The population is distributed among four districts, Lecce, Taranto, Brindisi, and Gallipoli, which are subdivided into 180 communes. Brindisi, Otranto, and Taranto give titles to archbishops. The province is within the jurisdiction of the High Civil Court of Trani; in other respects its administrative and local governments resemble those of the other provinces of the kingdom as already explained under the head of NAPLES, Kingdom of.

The principal towns of the province of Otranto are—BRINDISI; LECCE; TARANTO; and Gallipoli. Gallipoli, a town of considerable commercial importance, is built on an insulated rock connected with the mainland by a stone-bridge of 12 arches, in about 40° 3' N. lat., 17° 57' E. long., on the eastern shore of the Gulf of Taranto. It contains, together with the suburb called Lizza, about 13,000 inhabitants, is a bishop's see, has a good roadstead and a harbour. Gallipoli is the most trading sea-port in this part of the kingdom. It has ample cisterns cut in the rock for containing the oil, which is the chief produce of the country. The oil is purchased from the growers in this and the neighbouring provinces, and stored here for export. Gallipoli exports oil, wool, wine, and other products of neighbouring provinces. Besides the oil-tanks and the bridge, the most noteworthy objects in the town are a fountain decorated with ancient bas-reliefs, and the castle built by Charles of Anjou. The palm grows luxuriantly about Gallipoli. Gallipoli is the ancient *Callipolis*. The tunny fishery employs many persons. Otranto, the ancient *Hydruntum*, once a flourishing town, has been long in a decaying state chiefly in consequence of malaria. The present population hardly exceeds 2000, and the surrounding country is marshy, unhealthy, and uncultivated. Otranto has an old cathedral, a castle, and a harbour which is not very safe. When Otranto was taken by the Turks in 1480 the city had a population of 20,000, of whom 12,000 were massacred; of the rest some were set free on paying a ransom, and the remainder sold as slaves. The Turks were driven out of the city and out of Italy the following year by the Duke of Calabria. In the cathedral (which was occupied by the Turks for a stable) are several antiquities, including some ancient mosaics. From Otranto on a clear day the opposite coast of Epirus and the lofty Acroceraunian Mountains may be seen.

Of the other towns the following may be mentioned:—*Alessano*, near Capo di Leuca, with about 7000 inhabitants. *Copertino*, on the road from Gallipoli to Lecce, population 4000, was famous formerly for its castle, built by Alfonso Castriot, a descendant of Scanderbeg. *Francavilla*, on the road from Taranto to Brindisi, and a short distance N.W. from Oria, has with its dependent villages a population of 13,500. The town was formerly the property of St. Charles Borromeo. The also flourishes in the vicinity. *Manduria*, a few miles S. by E. from Oria, on the road from Taranto to Lecce, is a handsome town of about 6000 inhabitants, many of whom are proprietors of estates

in the neighbourhood. About half a mile from the town is a well in the tertiary rock, which preserves a constant level, however much may be taken out of it. This well, which is locally called the Bath of Venus, is described by Pliny. Manduria retains its ancient name; of its massive ancient walls there are considerable remains. Archidamus, king of Sparta, who came to Italy to aid the Tarentines against the Leucanians, fell in battle near Manduria B.C. 388. *Martano*, midway between Lecce and Otranto, has a population of 3000. This town and the neighbouring village of Calimera are inhabited by descendants of Albanian colonies, who still retain the Greek language. *Mesagne*, a town of 7000 inhabitants, situated in a wide plain to the west of Brindisi, on the road to Taranto. Some think that this town occupies the site of the ancient *Messapia*. The plain between Mesagne and Brindisi is naturally fertile, but it is now entirely uncultivated. The hills east of Mesagne are covered with trees. *Nardo*, a few miles N.E. from Gallipoli, on the road to Lecce, is a well-built town, with a population of about 9000. The country about it is covered with olive plantations; the town itself has manufactures of cotton-stuffs and snuff. Nardo occupies the site of the ancient *Neritum*; it gives title to a bishop in conjunction with Gallipoli. The marshes between Nardo and the sea were formerly remarkable for their phosphorescent exhalations, which gave rise to many superstitious notions among the peasantry. *Oria*, midway between Brindisi and Taranto, is an episcopal city of 6000 inhabitants, built on the site of the ancient *Hyria*, mentioned by Herodotus (vii. 170). It stands on a steep hill, crowned with an old castle and surrounded by lime plantations, vineyards, gardens, and orchards. The city has a considerable trade in agricultural produce, honey, and wax. *Ostuni*, N.W. of Brindisi, and about four miles from the Adriatic, is a flourishing town with about 11,700 inhabitants, several handsome churches and large convents. *San Vito*, south of Ostuni: population, 4700. *Ugento*, an episcopal city of 2000 inhabitants, retains the name of the ancient *Ugentum*, and is situated a few miles N.W. from the Capo di Leuca, the ancient Iapygian promontory. Near Lecce was *Rudias*, the birthplace of the Roman poet Ennius.

Many of the 'masserie,' or farm-houses of the province, are built like forts, and occupy a considerable extent of ground, in which the country people, in the case of a landing being made by the Turkish corsairs, to which they were exposed for some centuries, could take refuge with their cattle and valuable effects. A wall, high and strongly built, forms a quadrangle, against one side of which the dwelling-house is built, containing two or three habitable rooms and sometimes a chapel; the granaries, stables, and outhouses are on the other side, and in the middle of the inclosure is a round or square tower two stories high, standing quite alone.

The peninsula of Otranto was anciently called by various names. Properly the south-eastern part of it was called Iapygia, the northern Messapia, and the southern, about Tarentum, the country of the Salentini. The whole was called *Calabria*, from the inhabitants, the Calabri, who were most probably a branch of the great Ocean stock. The Greeks formed settlements along the coasts in early times.

OTTAJANO. [NAPLES, Province of.]

OTTAWA. [CANADA; ILLINOIS.]

OTTERTON. [DEVONSHIRE.]

OTTERY ST. MARY, Devonshire, a market-town in the parish of Ottery, is pleasantly situated on the left bank of the river Otter, in 50° 45' N. lat., 3° 17' W. long., 11 miles E. by N. from Exeter, and 161 miles W.S.W. from London. In 1851 the population of the town was 2534. The town is under the management of a Local Board of Health. The living is a vicarage in the archdeaconry and diocese of Exeter.

The river Otter is here crossed by an elegant iron-bridge 80 feet in span, erected in the room of a stone-bridge which was washed away in 1849. The church, formerly collegiate, is a large cruciform edifice in the early English style (1336), with an aisle of perpendicular character, and two towers for transepts. It has recently been restored. There is a Lady chapel. In the church are several ancient monuments, and an altar-tomb with the effigy of an armed knight under a rich monumental arch. There are chapels for Wesleyan Methodists, Independents, and Plymouth Brethren; also National, British, and Infant schools. The King's school, founded in 1546, has an endowment of about 70*l.* a year, and had 30 scholars in 1850. Samuel Taylor Coleridge was a native of the town. The chief occupations are the making of Honiton lace and of silk, especially shoe-ribands and handkerchiefs. The market is on Thursday; fairs are held three times a year.

OTTOMAN EMPIRE. [TURKEY.]

OUDE, a kingdom of Hindustan, is bounded S. by Allahabad, N. by Nepal, E. by Bahar, and W. by Delhi. Its greatest length south-south-east to north-north-west is about 200 miles; its greatest breadth east by north to west by south is about 130 miles. The area is estimated at 23,738 square miles. The population is estimated at about 3,000,000.

Oude was formerly a soubah, or subordinate government, of the Mogul's dominions. By various treaties between successive viziers and the East India Company, Oude became one of those dependent states over which the British government have supreme political control. In 1819 the reigning prince renounced his nominal allegiance to the Mogul, and assumed the title of King. Oude forms a portion

of the plain of the Ganges. The general character of the country, and the capital city, Lucknow, are noticed under HINDUSTAN.

OUENARDE. [FLANDERS, EAST.]

OUGHTERARD, Galway, Ireland, a small market-town and the seat of a Poor-Law Union, is situated on both sides of the Feogh rivulet, in 53° 27' N. lat., 9° 18' W. long., 17 miles N.W. by N. from Galway, 161 miles W. from Dublin. The population in 1851 was 982. Oughterard Poor-Law Union comprises 14 electoral divisions, with an area of 172,745 acres, and a population in 1851 of 18,896. The town has a neat appearance, and contains a small parish church, a spacious Roman Catholic chapel, a National school, a court-house, an infantry barrack, a dispensary, Union workhouse, and bridewell. Oughterard is resorted to by invalids for its chalybeate spring. A lead-mine and a quarry of very fine green variegated limestones are in the neighbourhood. The Feogh above the town forms a series of small rapids called the Salmon Leaps, and below the town it passes through a natural tunnel in the limestone rock. Thursday is the market-day. Quarter and petty sessions are held in the town.

OUGEIN. [HINDUSTAN.]

OULAN ADASSI ISLAND. [BLACK SEA.]

OULCHY. [AIGNE.]

OUNDLE, Northamptonshire, a market-town and the seat of a Poor-Law Union, in the parish of Oundle, is situated on the left bank of the river Nen, in 52° 3' N. lat., 0° 28' W. long., distant 28 miles N.E. from Northampton, 78 miles N. by W. from London by road, and 97½ miles by the North-Western and Northampton and Peterborough railways. The population of the town in 1851 was 2689. The living is a vicarage in the archdeaconry of Northampton and diocese of Peterborough. Oundle Poor-Law Union contains 37 parishes and townships, with an area of 69,822 acres, and a population in 1851 of 15,655.

The town is nearly surrounded by the river Nen, which is here crossed by two bridges on opposite sides of the town: the 'North bridge,' over which the road to Peterborough passes, is a fine bridge of several arches; connected with it is a causeway, raised on arches over the adjoining flats. The town-hall and the new railway hotel are the chief buildings. The church, which is large and handsome, consists of a nave with side-aisles, chancel, large transepts, and a tower and spire 200 feet high. The building dates from the 13th to the 16th century. The Wesleyan Methodists, Independents, Baptists, and Roman Catholics have places of worship. Sir W. Laxton's Free Grammar school, founded in 1536, is under the charge of a head master and seven other teachers; it has an income from endowment of 156*l.* 12*s.* a year, and had 111 scholars in 1853. The Grocers' Company are the patrons. Connected with this school and in the lower part of the building is Laxton's hospital for seven poor men and a nurse. Latham's hospital and Blue-Coat school provides almshouses for 18 poor women, and clothing and education for 30 poor boys. There are National, Infant, and British schools, a parochial lending library, a young men's society, and a savings bank. The market-day is Thursday; fairs are held three times a year.

OUREM. [ESTREMADURA, Portuguese.]

OURIQUE. [ALEMTEJO.]

OUSE RIVER. [CAMBRIDGESHIRE; CANADA; YORKSHIRE.]

OUSEBURN, GREAT, West Riding of Yorkshire, a village and the seat of a Gilbert Poor-Law Incorporation, is situated near the head of the river Ouse, in 54° 3' N. lat., 1° 18' W. long., distant 13 miles N.N.W. from York, and 212 miles N.W. from London. The population of the parish of Great Ouseburn in 1851 was 629. The living is a vicarage in the archdeaconry of Richmond and diocese of Ripon. Great Ouseburn Poor-Law Incorporation contains 40 parishes, townships, and chapelries, with an area of 52,008 acres, and a population in 1851 of 12,187. The village contains the parish church, rebuilt, except the tower and part of the chancel, in 1823; an independent chapel; and a parish school. A small obelisk here marks the source of the Ouse.

OVADA. [AOQUIL.]

OVAR. [BEIRA.]

OVER. [CHESHIRE.]

OVERTON. [FLINTSHIRE; HAMPSHIRE.]

OVERYSSEL, a province of the kingdom of Holland, situated between 52° 6' and 53° 52' N. lat., 5° 40' and 7° 5' E. long., is bounded N. by Friesland and Drenthe, E. by Hanover and Westphalia, S. by Guelderland, and W. by Guelderland and the Zuyder-Zee. The area is 1282 square miles; the population at the census of December 31, 1853, amounted to 227,683. It is a low level country, containing a few hills, which the inhabitants call mountains. The soil is wet and marshy, especially in the eastern part, where are the extensive peat moors of Echter and Hardenberg. There are likewise several sandy heaths, but near the Yssel there is some rich land which yields rye, buckwheat, hemp, and fruits. The chief river is the Yssel, which runs along the frontier of Guelderland, and is 500 feet in breadth; it is joined at Deventer by the Schiepsbeek, and falls into the Zuyder-Zee below Kampen; other rivers are the Zwarte-Water, the Vechte, and the Linda. The Willemsvaart Canal unites the Yssel and the Zwarte-Water. The Yssel is navigated by steam-boats from Arnheim to Kampen, and other steamers ply thence across the Zuyder-Zee to Amsterdam. The province contains several small lakes. The climate

is moist, and rather unhealthy. The products are some corn, flax, rape-seed, pulse, potatoes, garden fruits, plums in great abundance, and some wood, especially oak and alder. There are great numbers of wild geese, fish, and bees. The inhabitants derive their chief subsistence by cattle breeding and by digging peat for exportation. The pastures are very rich, especially in the western parts of the province, and great numbers of oxen, sheep, and horses are bred. Considerable profit is derived from the breeding of bees and the fisheries. The manufactures are linen, woollens, cotton, paper, wicker-ware, and mats: there are iron-works at Deventer.

Towns.—*Zwolle*, the capital of the province, is a well-built town on the *Zwarte-Water*, between the *Yssel* and the *Vechta*. It is defended by a rampart, which is planted with avenues of trees, and by very strong outworks. It has three gates; leading to as many suburbs, eight churches, a house of correction, and a Latin school. The inhabitants number about 17,000, and carry on a considerable trade in grain, seeds, cattle, wool, skins, &c. Besides the ordinary handicrafts there are tanyards, sugar and salt refineries; and woollen, cotton, and linen factories. *DEVENTER*. *Almelo*, on the *Aa*, a feeder of the *Regge*, which is a tributary of the *Vechta*, has about 3500 inhabitants, who manufacture woollens and linen. *Kampen*, is a fortified seaport town near the mouth of the *Yssel*, with a population of about 9000, who manufacture woollen-cloth. It is a place of considerable trade; steam-boats ply regularly up the *Yssel* to *Arnhem* on the *Rhine*, and across the *Zuyder-Zee* to *Amsterdam*. *Hasselt*, on the *Zwarte-Water*, N. of *Zwolle*, is a fortified town, with about 2000 inhabitants. Among the other towns are the following:—*Enschede*, 3000 inhabitants; *Ommen*, 2000 inhabitants; *Raalte*, 5000 inhabitants in the commune; and *Steenwyck*, 3500 inhabitants.

OVIEDO, a city of Spain, capital of the ancient province of Asturias and modern province of Oviedo, is situated between the *Nalon* and its affluent the *Nora*, in 43° 22' N. lat., 5° 57' W. long., about 245 miles N.N.W. from *Madrid*, 65 miles N. by W. from *Leon*, and 20 miles S.S.W. from the small port of *Gijon* on the *Bay of Biscay*. It is the see of a bishop, and the residence of the provincial authorities, and contained in 1850 a population of 10,500.

The four principal streets of Oviedo branch from a large and handsome plaza near the centre of the city, and terminate in *alamedas*, or public walks, which extend respectively S. towards *Leon*, N. towards *Gijon*, E. towards *Santander*, and W. towards *Grado*. Several other regular streets connect these four main thoroughfares, and the whole of them are well-paved and kept clean. Many of the houses are old, but they are solidly built, and the architecture is in many parts picturesque. An aqueduct, well-constructed of freestone, and supported on 41 arches, brings an abundant supply of pure water, which is delivered from 11 public fountains. The cathedral is not large, but is a very beautiful specimen of gothic architecture. The main portion is of the 14th century, subsequent to the building of the cathedral of *Leon*, to which in plan and size it bears some resemblance, but the style of architecture is lighter and more pleasing. The western façade is striking, though one of the two towers is unfinished, and is terminated by a spire of later workmanship. The interior has been disfigured by modern alterations, especially the side-chapels. The chapel to the *Virgin*, now called *La Capilla del Re Casto* (*Alonso II.*, who died in 843), contains the remains of this king and of several other of the early princes and kings of Asturias and Oviedo. The churches of *San Tirso* and *San Juan* are ancient; also the two churches of *Santa Maria* and *San Miguel*, on the side of a hill called *La Cuesta de Naranco*, a short distance from the city, are very curious and interesting from their great antiquity and their peculiar style of architecture. The convent of *San Francisco* is now converted into a hospital, and the ex-college of *San Vicente* is used for government-offices. The convent of *San Pelayo* has also been converted to secular uses. The university is a handsome structure, is well endowed, and possesses a large and valuable library. The city also contains an episcopal palace, a theatre, a military hospital, public reading-rooms, and several schools. The manufactures consist of linens, woollens, hats, leather, and fire-arms. A magnificent road extends from *Leon* to *Oviedo*, and is continued to the small port of *Gijon*. The commerce however is very limited.

The origin of Oviedo is generally assigned to *Fruela I.*, grandson of *Pelayo*, who is supposed to have built it in A.D. 759, soon after his accession to the throne of Asturias. According to other authorities, Oviedo was a considerable town before the time of that sovereign, who is said only to have made it the capital of his new conquests from the Moors. During the early part of the middle ages Oviedo was known throughout Christendom as the City of the Bishops ('*Civitas Episcoporum*'), owing to the great number of dignitaries of the church who took refuge there. Oviedo was originally the seat of a bishop, but a council having been held there in 901, the bishopric was by the Pope elevated into an archbishopric. The dignity however was in the course of time transferred to the church of *Santiago*, and Oviedo became a bishopric as before.

(Ford, *Handbook of Spain*; Flores, *España Sagrada*; Madrid, 1754.)

OVIGLIO. [ALEXANDRIA.]

OWHYEE. [SANDWICH ISLANDS.]

OWSTON. [LINCOLNSHIRE.]

OXBOROUGH. [NORFOLK.]

OXFORD, the capital of Oxfordshire, an episcopal city, municipal and parliamentary borough, and university town, is situated near the junction of the *Cherwell* with the *Thames*, in 51° 45' N. lat., 1° 16' W. long., distant 54 miles W.N.W. from *London* by road, and 68 miles by the *Great Western railway*. The population of Oxford in 1851 was 27,973. The city is governed by 10 aldermen and 30 councillors, one of whom is mayor; but a co-ordinate jurisdiction over the night police, the markets, &c. is held by the university authorities. Oxford returns two members to the Imperial Parliament. The livings are in the archdeaconry and diocese of Oxford. For poor-law purposes the city is managed under the provisions of a local Act.

The origin of Oxford is unknown. In the Danish ravages Oxford was repeatedly injured or destroyed. *Edmund Ironside* resided at Oxford, where he died in the year 1016. *Canute*, his successor, held the great council of the nation here several times. On the invasion of England by *William the Conqueror*, the townsmen of Oxford refused to admit the Normans, and in the year 1067 the town was stormed by *William*, and the townsmen burdened with a great increase of taxation. A castle was built by *Robert de Oilli* on the site now partly occupied by the county jail and the house of correction. The foundation of *Oseney Abbey* by *Robert de Oilli*, nephew of the builder of the castle, and the erection of a new hall or palace by *Henry I.*, who was educated in Oxford, contributed to the prosperity of the town. In 1142 the empress *Maud* was besieged in Oxford castle by *Stephen*. After enduring a siege of nearly three months, and when the provisions in the castle had been exhausted, the empress, on the night of the 20th December, escaped with three attendants, and the castle surrendered next morning. The accommodation between *Stephen* and *Henry II.*, by which the civil war between these princes was terminated, took place at a council held at Oxford. In the reign of *Edward III.* and subsequently there occurred quarrels between the students and the citizens, as noticed under OXFORD UNIVERSITY.

The doctrines propagated by *Wickliffe* occasioned, in the reigns of *Richard II.* and *Henry IV.* and *V.*, much discussion at Oxford, giving rise to tumults which, with the civil war of the *Roses*, several years later, much depressed the place, and a dreadful pestilence soon after the accession of *Henry VII.* nearly depopulated the city and the colleges. In *Mary's* reign, *Bishops Ridley* and *Latimer*, and *Archbishop Cranmer* suffered martyrdom at Oxford, in front of *Balliol College*. Near the spot where the martyrs suffered a beautiful memorial cross, in the decorated gothic style, was erected in 1841, from the designs of *Scott* and *Moffatt*; it is called the *Martyrs' Memorial*. The structure is hexagonal, and consists of three stories, resting upon a platform reached by steps. The height is 73 feet. Statues by *Weales* of the three martyrs occupy the second story.

In the civil wars of *Charles I.*, after once or twice changing masters, Oxford became the head-quarters of the king, who collected here those members of parliament who adhered to him. The members of the University supported the royal cause with great zeal; but Oxford was at last obliged to surrender, after the battle of *Naseby*, to the Parliamentarians under *Fairfax*.

In the reign of *Charles II.* two parliaments were held at Oxford, in 1665 and 1681. In the reign of *James II.* the University firmly resisted the illegal proceedings of that prince, who paid Oxford a visit, and sternly rebuked and then expelled the contumacious members, whom however, from motives of fear, he afterwards restored.

The city lies on a point of land nearly insulated. On the E. it is bounded by the *Cherwell*, S. by the main channel of the *Thames*, here popularly called the *Ise*, and W. by the smaller channels of that river. A long bridge or succession of bridges over the arms of the *Thames*, and also over the *Oxford Canal*, is called the *Seven Bridges*. Oxford is irregularly laid out; the two principal lines of street are *Bridge-street*, *Fish-street*, the *Corn-market*, and *St. Giles's-street*, which form one line running from south to north, from the *Abingdon road* to the *Woodstock* and *Birmingham road*; and (*Magdalene*) *Bridge-street* and *High-street*, which run from the *London road* on the east into *Fish-street* and the *Corn-market* on the west, thus forming a junction with the line just described. *High-street*, which bends with a graceful curve, and is 3000 feet long, and in parts 85 feet broad, presents a splendid series of scholastic and ecclesiastical structures alternating with quaint old houses, and with shops of modern style. For picturesque effect this street is unrivalled in the kingdom. The town is nearly surrounded by meadows.

Oxford has much increased of late years; new streets, elegant houses, both in rows and detached, and a number of smaller tenements have been erected. The streets are well-paved and cleansed, and are lighted with gas. The public buildings, which are numerous, are mostly noticed under OXFORD UNIVERSITY.

The cathedral, which is the chapel of *Christ's College*, and noticed under that head, is mostly of Norman date, cruciform, with a tower and spire at the intersection of the nave and transepts. The length of the building is 154 feet; its breadth 102 feet. On the north of the choir are the *Dean's chapel* and the *Lady chapel*; on the south side are the cloisters of perpendicular character, the chapter-house of the early English period, and some other apartments. In the interior are many interesting monuments. The cathedral has been newly roofed, and otherwise repaired and restored. *St. Mary's*, the University

church, is a singularly interesting edifice: the tower and spire, and the chancel are of the decorated style, but the body of the church is perpendicular; the south porch, an incongruous addition with twisted pillars, was erected by Archbishop Laud. The spire is the finest feature of the exterior; it has elaborate pinnacles, with statues in niches, and bold crockets and finials. St. Martin's, or Carfax church, the tower of which, with its illuminated clock, fronts the High-street, is usually regarded as the city church, it being attended by the mayor and corporation. St. Peter's-in-the-East is the oldest church in the city. It has a crypt of early Norman date; the chancel is wholly and the nave partly Norman; the south aisle is of the decorated character. A few years back it was admirably restored. St. Mary Magdalene's church has some beautiful decorated features. When the Martyrs' Memorial, which stands close to it, was built, this church was carefully restored, and a new aisle, called the Martyrs' aisle, added. St. Giles's church is partly of early English date. St. Michael's church is ancient but of different dates. St. Aldate's church is partly of the decorated style. All Saints' church, erected from the designs of Dean Aldrich early in the 18th century, is a curious mixture of classic and gothic forms. At the time of the Census of 1851 there were 82 places of worship in Oxford, of which 19 belonged to the Established church, 4 to Methodists, 3 to Baptists, 2 to Independents, and 1 each to Quakers, Swedenborgians, Roman Catholics, and Jews. There were 81 day schools, of which 23 were public schools with 2322 scholars, and 58 were private schools with 1121 scholars. There are a book-club, a reading-room, a savings bank, a house of industry, a medical dispensary, and a pauper lunatic asylum for the city and borough.

Some remains of Oxford castle and of the ancient town wall, as well as of the works raised for the defence of the town in the civil war of Charles I., are still in existence. The town-hall erected in 1745, and subsequently improved, is a spacious stone building. There is a town-jail or bridewell. The county-hall was erected in 1840 at a cost of 15,000*l.* The other public buildings are the music-hall and the Radcliffe infirmary. The market-days are Wednesday and Saturday. Fairs are held three times in the year. The prosperity of the town depends to a great extent on the University. Considerable traffic is carried on by the river, by the Oxford Canal, which here communicates with it, and by railway. Oxford has railway communications with the south and west of England, and with Wales by the Great Western railway; and with the north and east of England, the midland counties, and Scotland by means of the North-Western railway and connected lines. Quarter-sessions for the city, weekly petty sessions, a mayor's court, and a county court are held.

The see of Oxford was founded by Henry VIII. in 1542; the seat of it was at first fixed in the abbey church of Osney, but removed in 1546 to Christ church in Oxford. The diocese includes the counties of Oxford, Berks, and Bucks, each of which constitutes an arch-deaconry. The chapter consists of the bishop, the three archdeacons, a dean, chancellor, and eight canons. The income of the bishop is 5000*l.*

OXFORD UNIVERSITY. The origin of the University of Oxford is unknown. It has been said by many of our elder writers that it was founded by Alfred the Great. This statement is now generally admitted to be fabulous, but it appears certain that Oxford was a place of study in the reign of Edward the Confessor, if not earlier.

The first places of education in Oxford appear to have been schools for the instruction of youth. These schools were either claustral, that is, appendages to convents and other religious houses; or secular, such as were kept by, or hired and rented of, the inhabitants of Oxford. When many of these secular scholars resided in one house, it got the name of Hall or Hostel (terms which are not yet out of use), and governors or principals were appointed to superintend the disciplines and the affairs of the house. It is difficult to discover any traces of a regular plan of education in Oxford before the foundation of the first college by Walter de Merton. The statutes of this founder for his college are well digested: and they have been adapted with little alteration to succeeding times in other colleges as well as his. In the reign of Stephen, Vacarius, a Lombard by birth, established a school of Roman law at Oxford. In the time of Henry III., we are told by Wood in his 'Annals' (vol. i. p. 206) that the number of students amounted to 30,000; and even when Merton college was founded, they are said to have amounted to 15,000. (Gul. Rishanger, in Chron. suo manuscript. Bibl. Cott., Claud., D. vi., quoted by Wood, ut supra, p. 266.) These numbers are evidently great exaggerations, but there is no doubt that the University was then frequented by a great number of students, and many foreigners resorted to it from Paris and other places.

The earliest charter of privileges to the University of Oxford as a corporate body is of the 28th Hen. III. (Pat. 28 Hen. III. m. 6, 'Libertates concessas Cancellario Universitatis Oxon.'). It was followed by numerous other charters, some of fresh privileges, and others of general confirmation of the privileges formerly granted. The regulation of the assise of bread and beer, and the supervision of weights and measures, were granted to the chancellor of the university by Pat. 32 Edw. III., m. 5.

The same jealousy of the authority of the University which existed in early times among the townsmen of Cambridge, prevailed at Oxford

also. The quarrels between the scholars and the townsmen often broke out into open violence, sometimes accompanied with bloodshed. Matthew Paris makes mention of these riots as early as 1240. On several occasions the scholars quitted the University for a time. At one period they retired to Northampton, at another to Stamford. The most serious riot on record was on the day of St. Scholastica the Virgin, February 10th, 1354-55, when many lives were lost. Grosteste, Bishop of Lincoln, in whose diocese the University then was, placed the townsmen under an interdict, from which he released them in 1357, upon condition that the commonalty of Oxford, every year after, should celebrate an anniversary on St. Scholastica's day, in St. Mary's church, for the souls of the clerks and others killed in the conflict; and that the mayor for the time being, the two bailiffs, and three score of the chiefest burghers, should personally appear on the said day in St. Mary's church at mass, and offer at the great altar a penny each. The mayor and commonalty at the same time gave a bond to pay a hundred marks yearly to the University, as a compensation for the great losses occasioned by the fray; but the bond was not to be enforced so long as the mayor and 62 burghers came yearly and performed the penance. The penance was mitigated in the reign of Elizabeth, and still more subsequently, but the citizens were not wholly absolved from it till 1825, when the University seal was affixed to an instrument which entirely released them from its observance.

This University has been long governed by statutes, or bye-laws, originated by the university authorities, and confirmed by the charters of the kings of England. Those at present in force were drawn up in 1629, and confirmed by a charter from King Charles I., in 1635. The corporation of the University is styled 'the chancellor, masters, and scholars of the University of Oxford.' The highest officer is the chancellor, who is elected by the members of convocation. At first the election was for one, two, or three years; but afterwards for life. The person chosen was a resident member of the University, and always an ecclesiastic until the time of Sir John Mason, in 1553, who was the first lay-chancellor. Since the time of Archbishop Sheldon, in 1667, it has only been conferred upon noblemen of distinction who have been members of the University. The vice-chancellor is elected for four years, by annual nomination. He is always a resident member of the University, and president of one of the colleges. The other principal officers are the seneschallus, or high steward; two proctors, whose duty is to inspect the conduct of the members of the University as to all matters of discipline and good order; four pro-proctors; a deputy steward; a public orator; an assessor; a registrar; librarians of the Bodleian and Radcliffe libraries; keepers and curators of the theatre, museums, galleries, &c.; and six commissioners of the markets.

The constitution of the University differs scarcely at all from that of CAMBRIDGE. There are 19 colleges and five halls at Oxford. As at Cambridge the colleges are corporate bodies; but at Oxford the halls are not incorporated, and consequently whatever estates or other property they possess are held in trust by the University; in all other respects they possess equal privileges. Previous to the Act 17 and 18 Vict. cap. 81, passed August 7th, 1854, every student at the University was obliged to have his name entered on the books of some college or hall, but by the 25th section of that Act the vice-chancellor is empowered to license Members of Convocation to open their residences, if within a mile and a half of Carfax, for the reception of students who shall be matriculated, and admitted to all the privileges of the university, without being entered as members of any college or hall. The Act also provides that after the first day of Michaelmas term 1854 no oath is to be taken or declaration made on matriculating, or on taking the degree of B.A. Each of the colleges and halls furnishes members both for the legislative and executive branch of university government. The whole business of the University is transacted in two distinct assemblies, termed 'Houses,' namely, the House of Congregation, and the House of Convocation, which are constituted much like the regent and non-regent houses at CAMBRIDGE. The chancellor, or vice-chancellor, or, in his absence, one of his four deputies, and the two proctors, or, in their absence, their respective deputies, preside in both houses, where their presence is necessary on all occasions. The business of the congregation includes the reception of statutes framed by the hebdomadal council, and their transmission, if approved, to the house of convocation. The power of convocation extends to all subjects which are connected with the affairs of the University. In the enacting of new or the explaining of old statutes, some restriction is imposed. If the statute to be explained be a royal, or, as it is commonly called, a Caroline statute*, the royal permission is first to be obtained. As in congregation, so also in convocation, the chancellor or vice-chancellor singly, and the two proctors jointly, are officially invested with an absolute negative upon all proceedings except in elections. In both houses, when the negative of the vice-chancellor, or of the proctors, is not interposed (an interposition almost as rare as the royal veto in parliament), every question is decided by the majority. For the better government of the University, there is an hebdomadal council, consisting under the provisions of the Act of 1854, of the chancellor, vice-chancellor, the provosts, six heads of

* The Caroline statutes transmitted by Charles I., and confirmed by convocation, are those which relate to the hebdomadal meeting, to the nomination of what are called collectors in Lent, to the election of proctors, and to the proctoratorial cycle.

colleges or halls, six professors of the university, and six members of convocation of not less than five years' standing. This council deliberates upon matters relating to the privileges and liberties of the University, and inquires into and consults respecting the due observance of statutes and customs. All the letters of the chancellor, in the case of dispensations, which are addressed to convocation, must be sanctioned by the hebdomadal meeting before they are recited in the house. By the Act of 1854 the various colleges and halls are empowered to revise and if deemed requisite to propose alterations in the statutes referring to headships, fellowships, and other college emoluments; in default of the colleges or halls attending to these matters within a specified time, the university commissioners are empowered to do so; any alterations proposed being submitted to the Queen in Council for approval. The University is empowered to propose such alterations as it may deem expedient in reference to any gift or endowment of more than fifty years' standing.

In 1603 King James I., by diploma dated March 12th, granted to the Universities of Oxford and Cambridge the privilege of choosing two representatives in parliament. The members are chosen by the vice-chancellor, doctors, and regent and non-regent masters in convocation.

The number of members on the books in January 1854 was 6259. There are four university terms in a year—Michaelmas term, which begins on the 10th of October, and ends on the 17th of December; Hilary term, which begins on the 14th of January, and ends the day before Palm Sunday; Easter term, which begins on the 10th day after Easter Sunday, and ends on the day before Whit Sunday; and Trinity term, which begins on the Wednesday after Whit Sunday, and ends the Saturday after the Act, which is always on the first Tuesday in July.

Before a candidate can proceed to the examination for Bachelor of Arts, he must have kept 16 terms, unless he be a member of the peerage, or the eldest son of a baronet or knight, and matriculated as such, in which case three years are sufficient. But in point of fact the terms are so reckoned that residence for 12 terms only is necessary for any candidate. The candidates have to make responsions, as it is termed, that is to undergo a previous examination publicly, by the masters of the schools. The final examinations for the degree of B.A. are held twice a year, beginning on the 2nd of November, and on the Friday which follows the second Sunday after Easter. After the candidates have been examined, the names of those who have honourably distinguished themselves are distributed in alphabetical order into four classes, under the two great divisions of 'Literæ Humaniores' and 'Disciplinæ Mathematicæ et Physicæ.' In 1850 an entire remodelling of the examination statutes took place, by which, in 1852, and henceforward, it became necessary for the candidates to undergo three public trials before proceeding to their B.A. degree, and the range of subjects is made to include law and modern history, and is otherwise considerably extended.

The public buildings belonging to the University are the schools with the Bodleian library, the theatre, the Ashmolean museum, the Clarendon, Radcliffe's library, Radcliffe's observatory, the University press, the University galleries, and Taylor institution. The Divinity school, with the room above forming part of the Bodleian, was completed about the year 1480; the rest of the schools, with the remainder of the Bodleian, early in the 17th century. The Bodleian Library was first laid open to the public on November 8th, 1602. It is a very fine apartment, and contains a noble collection of printed books and manuscripts. Attached to it is the picture gallery of the University. The theatre was built by Wren, for Gilbert Sheldon, archbishop of Canterbury and a chancellor of the University, in 1669, at an expense of 15,000*l.* The upper part of this building was used for the university press till 1713. The Ashmolean Museum was built at the charge of the University, in 1683, in order to contain the Tradescant collection of rarities presented to the University by Elias Ashmole. The Clarendon was completed in 1712, partly from the profits arising from the sale of Lord Chancellor Clarendon's 'History of the Rebellion,' the copyright of which was given to the University. The printing for the University was carried on in this building from 1713 to 1830, when it was removed to the newly-erected printing-house. The basement story of the Clarendon contains at present a police-room, and the remainder of the building is appropriated to offices for the despatch of university business, and lecture-rooms for the professor of experimental philosophy and the readers in mineralogy and geology. The munificent founder of Radcliffe's Library was John Radcliffe, M.D., who, by his will, dated 13th September, 1714, appropriated 40,000*l.* for the building and for the purchase of the site; 100*l.* per annum for the purchase of books, and 150*l.* per annum for the librarian. James Gibbs was the architect. The building was completed in 1747. It is appropriated to the reception of books in medicine and natural history. In the area of this library a few antique marbles are deposited, with a selection of casts from the best statues of antiquity. Here also is preserved the Corsi collection of specimens of the marbles employed in the ornamental architecture of both ancient and modern Rome. The Radcliffe Observatory was erected out of the funds bequeathed by Dr. Radcliffe, by the trustees of his will. It comprises a dwelling-house for the observer, apartments for observation and lectures, as well as rooms for an assistant-observer,

and it is amply supplied with astronomical instruments. Owing to the great increase of the printing business the present University Press was commenced in 1826. It is a very extensive quadrangular structure, containing, besides the printing-rooms, houses for the superintendents, an engine-house, strong-room for standing type, &c. The University Galleries and Taylor Institution form a magnificent range of buildings, erected from the designs of Mr. Cockerell, for the purpose of carrying into effect the will of Dr. Randolph, who left a sum of money to the University, "for erecting a building for the reception of the Pomfret statues," &c., and that of Sir R. Taylor, who bequeathed a sum for "establishing a foundation for teaching the modern languages," and erecting a proper edifice for the same. The building contains also the drawings of Michel Angelo and Raffaello, purchased for the University, the models and casts of Chantrey's statues, presented to the University by his widow, and pictures, engravings, and other works of art, presented at various times to the University. The botanic garden, containing about 5 acres, was originally the burial ground of the Jews in Oxford.

The professors of the University are, like those of Cambridge, paid from various sources; some from the university chest, others by the crown, or from estates left for that purpose. They are—the Regius professors of divinity, ecclesiastical history, pastoral theology, civil law, medicine, Hebrew, and Greek; the lady Margaret's professor of divinity; the Savilian professors of geometry and astronomy; Dr. White's professor of moral philosophy; the Camden professor of ancient history; Tomline's prælector in anatomy; a professor of music; two professors of Arabic, one of whom is called the Lord Almoner's reader; a botanical professor; a professor of poetry; a Regius professor of modern history; a professor of Anglo-Saxon; the Vinerian professor of common law; a clinical professor; the Aldrichian professors of anatomy, of the practice of medicine, and of chemistry; a professor of political economy; a professor of Sanscrit; Lee's lecturer in anatomy; Ireland's professor of the exegesis of Holy Scripture; and readers in experimental philosophy, in mineralogy, in geology, and in logic.

The following are the colleges and halls of this University; with the date of foundation and a few other particulars:—

University College, traditionally said to have been founded by Alfred the Great, was restored by William of Durham, who died in 1249. The present foundation consists of a master, 13 fellows, 17 scholars, together with some exhibitioners and a Bible clerk. The buildings occupy a conspicuous position in the High-street, with a frontage of 200 feet. Bishop Horne, Dr. Radcliffe, Sir William Jones, and lords Eldon and Stowell are among the eminent men educated at University College. The number of members on the books in 1854, was 277.

Balliol College was founded by John Balliol (father of John Balliol, king of Scotland) and Devorguilla his wife, between 1263 and 1268. The foundation consists of a master, 12 fellows, and 14 scholars, besides several exhibitioners. John Wickliffe was master of Balliol College; among the more eminent of its list of scholars are Bishop Tunstall, Lord-keeper Coventry, John Evelyn, and Bradley the astronomer. The number of members on the books in 1854 was 353.

Merton College, first founded at Maldon, in Surrey, in 1264, was removed to Oxford before 1274, by Walter de Merton, bishop of Rochester and Lord High Chancellor of England. The foundation consists of warden, 24 fellows, 14 post-masters, 4 scholars, 2 chaplains, and 2 clerks. The buildings consist of three courts; the older parts containing some of the most ancient and curious structures in Oxford. Among the more eminent members of this college are Duns Scotus, Bradwardine, Wickliffe, Bishop Jewel, Anthony à Wood, Dr. William Harvey, and Sir Richard Steele. The number of members on the books in 1854 was 185.

Ezter College was founded in 1314 by Walter de Stapledon, bishop of Exeter and Lord High Treasurer of England. The present foundation consists of a rector and 25 fellows, besides several scholars and exhibitioners. The new front of the college, rebuilt in 1835, which is the principal architectural feature, is 220 feet long. Among the more eminent scholars of Exeter College are Sir William Antony Ashley, Lord Shaftesbury, and John and Charles Wesley. The number of members on the books in 1854 was 487.

Oriel College was founded by Edward VI. in 1526 for a provost and 10 fellows; the present foundation consists of a provost, 18 fellows, and 24 scholars and exhibitioners. Sir Walter Raleigh, Frynne, Chief Justice Holt, Bishop Butler, and Joseph Warton are among the more eminent scholars of this college. The number of members in 1854 was 406.

Queen's College was founded in 1340 by Robert Eglesfield, confessor to Philippa, Queen of Edward III. (from whom it was called Queen's College), for a provost and 12 fellows; the fellows have been since increased to 16, and there are several scholars and exhibitioners. The buildings consist of two courts occupying an area of 300 feet long by 220 feet wide, and are among the most prominent ornaments of the High-street. Among the more eminent men educated at Queen's College are Cardinal Beaufort, Henry V., Bernard Gilpin, bishops Compton, Nicolson, Gibson, and Tanner, Archbishop Potter, Halley, Addison, Tickel, and Collins. The number of members in 1854 was 278.

New College was founded in 1386 by William of Wykeham, bishop

of Winchester and Lord High Chancellor of England, for a warden, 70 fellows and scholars, 10 chaplains, 3 clerks, and 16 choristers. The buildings of New College form the most complete example of a college erected by the ablest architect in the best age of English architecture. Some additions to the original buildings were made by Wren. Archbishops Chichele and Warham; bishops Beckington, Kenn, and Lowth, Nicholas Harpesfield, and Pitts the biographer are among the more eminent of the scholars of New College. The number of members in 1854 was 196.

Lincoln College was founded by Richard Fleming, bishop of Lincoln, in 1427, for a rector and 7 fellows. The present foundation consists of a rector, 12 fellows, 9 scholars, 12 exhibitioners, and a Bible clerk. Bishop Sanderson, and Sir William Davenant are among its eminent men. The number of members in 1854 was 212.

All Souls College was founded in 1437 by Henry Chichele, Archbishop of Canterbury, for a warden, 40 fellows, 2 chaplains, and 4 Bible clerks. The buildings are extensive and magnificent, consisting, besides the original quadrangle, of a second one erected after the designs of Hawksmoor, and admitted to be one of his most successful works. Linacre, Leland, Sir Anthony Shirley, Archbishop Sheldon, bishops Brian Duppa, Jeremy Taylor, and Reginald Heber, Dr. Sydenham, Sir Christopher Wren, Young, the author of *Night Thoughts*, and Sir William Blackstone were members of this college. The number of members in 1854 was 116.

Magdalene College was founded in 1456 by William of Waynesfeete, bishop of Winchester and Lord High Chancellor of England, for a president, 40 fellows, 30 scholars, called demies, a schoolmaster, an usher, 4 chaplains, a steward, and organist, 8 clerks, and 16 choristers. The buildings are among the most splendid in Oxford, and the gardens are without a rival. Cardinals Wolsey and Pole; bishops Warner, Hough, and Horne, Lily the grammarian, Foxe the martyrologist, Hampden, Heylin, Addison, Gibbon, and Chandler are among its more eminent members. The number of members in 1854 was 200.

Brasenose College was founded in 1509. The present foundation consists of a principal and 20 fellows. It numbers among its more eminent members Sir Henry Saville, Sir Henry Spelman, Lord Chancellor Egerton, Burton, the author of the *Anatomy of Melancholy*, Sir William Petty, Elias Ashmole, and Dr. Whitaker. The number of members in 1854 was 431.

Corpus Christi College was founded in 1516 by Richard Fox, bishop of Winchester and Lord Privy Seal, for a president, 20 fellows, 20 scholars, and 2 chaplains; there are besides 4 exhibitioners. The buildings exhibit some excellent examples of the perpendicular style. Among its more eminent scholars are Bishop Jewel, Nicholas Udell, Richard Hooker, Thomas Jackson, and Dr. Arnold. The number of members in 1854 was 145.

Christ Church College was originally founded by Cardinal Wolsey in 1526 for a dean, sub-dean, 100 canons, 10 public readers, 13 chaplains, an organist, 12 clerks, and 13 choristers. Upon the disgrace of the cardinal, Henry VIII. seized upon and suspended the foundation. In 1535 he re-established it upon a small scale, but "this was suppressed in 1545; and in the year following the episcopal see was removed from Oseney to this college, and the church of St. Frideswide was constituted a cathedral, by the name of the Cathedral Church of Christ, in Oxford, for the maintenance of a dean, 8 canons, 8 chaplains, a schoolmaster, an organist, 8 clerks, and 8 choristers; together with 100 students, to which number one more was added in 1664." (*University Calendar*.) The buildings of this college are by far the most extensive, and on the whole the grandest in Oxford. The front of the college is 400 feet long, the great quadrangle is 264 feet by 261 feet. The hall, the most magnificent in Oxford, and one of the finest in the kingdom, is 115 feet long, 40 feet wide, and 50 feet high, and contains a noble collection of portraits of the most famous scholars of Christ's College. In another room is a collection of paintings by the early Italian masters. The college church is, as above stated, the cathedral of Oxford. The grounds, which are very extensive, and stretch for some distance along the Thames, form one of the most popular promenades of both collegians and citizens. This college claims the honour of receiving as its guest the monarch who may visit the University. Among the more eminent of its scholars are Bishops Prideaux and Sanderson, and other divines; of statesmen, Sir Dudley Carleton, Godolphin, Lord Bolingbroke, Wyndham, Lord Mansfield, Canning, Sir Robert Peel; of philosophers, philanthropists, and scholars, John Locke, William Penn, Robert South, and Camden; of poets, Sir Philip Sydney, Ben Jonson, and Otway. The number of members on the books in 1854 was 777.

Trinity College was originally founded by Edward III., but having been suppressed at the Reformation, it was refounded by Sir Thomas Pope in 1554 for a president, 12 fellows, and 12 scholars; there are also 3 scholarships of subsequent endowment. Among its more eminent scholars are Sir James Harrington, author of *Oceana*, John Selden, Archbishop Sheldon, Chillingworth, Derham, author of *Physico-Theology*, the first Earl of Chatham, and Thomas Warton. The number of members on the books in 1854 was 290.

St. John's College was founded in 1555 by Sir Thomas White, alderman of London. It consists of a president, 50 fellows and scholars (all except 13 elected from Merchant Taylors' School), a chaplain, an organist, 6 singing men, 8 choristers, and 2 sextons. The buildings

GEOG. DIV. VOL. IV.

are spacious and handsome, and the grounds are celebrated as well on their own account as for the beautiful views obtained from them. Among the more eminent members of the college are archbishops Laud and Juxon, Shirley the dramatist, Bulstrode, Whitelocke, Sherrard the botanist, and Dean Tucker. In 1854 there were 329 members on the books.

Jesus College was founded in 1571 by Dr. Hugh Price. The present foundation consists of a principal, 19 fellows, and 18 scholars. The number of members in 1854 was 167.

Wadham College was founded in 1613 by Nicholas Wadham, and Dorothy his wife, for a warden, 15 fellows, 15 scholars, 2 chaplains, and 2 clerks; there are also several exhibitioners. The buildings, which cost the founder 10,816*l.*, form a very pleasing example of the later perpendicular style, and the grounds are very beautiful. Among the more eminent scholars of Wadham College are bishops Wilkins, Sprat, and Seth Ward, Sir C. Wren, Dr. Kennicot, and Harris, author of *Hermes*. The number of members on the books in 1854 was 305.

Pembroke College was founded in 1624, nominally by James I., but at the cost of Thomas Tesdale and Dr. Wightwick. The present foundation consists of a master, 20 fellows, and 16 scholars. The buildings have been recently restored, enlarged, and improved. Among the more eminent of the scholars are Sir Thomas Browne, Pym, Shensstone, Dr. Samuel Johnson, and Archbishop Newcome. The number of members on the books in 1854 was 218.

Worcester College was founded in 1714 by Sir Thomas Cooke, of Bentley in Worcestershire. The present foundation consists of a provost, 21 fellows, 16 scholars, and 3 exhibitioners. The number of members on the books in 1854 was 351.

St. Mary Hall was originally a dependency on Oriel College. The present foundation consists of a principal, vice-principal, and 3 scholars, but the number will hereafter be increased to six. The number of exhibitioners varies. The number of members on the books in 1854 was 119.

Magdalene Hall became an independent hall in 1602. The site of the present building, originally that of Hertford College, having lapsed to the crown, was obtained in 1816 by the president and fellows of Magdalene College, who erected a handsome building for the use of the principal and other members of Magdalene Hall, who removed there on its completion in 1822. The number of members in 1854 was 265.

New Inn Hall was restored for the purposes of academical instruction by the late principal, Dr. Cramer, afterwards Dean of Carlisle, who erected, at his own expense, a handsome building with suitable offices, for the reception of students. The number of members on the books in 1854 was 45.

St. Alban Hall, originally belonging to the nuns of Littlemore, passed some time after the dissolution to the warden and fellows of Merton College, who established it as an academical hall. The number of members on the books in 1854 was 10.

St. Edmund Hall was, by the Canons of Oseney, devoted to academical purposes in 1269. Some time after the dissolution of religious houses it passed to Queen's College. The number of members on the books in 1854 was 94.

OXFORDSHIRE, a midland county of England, is bounded N.E. by Northamptonshire, E. by Buckinghamshire, S. by Berkshire, W. by Gloucestershire, and N.W. by Warwickshire. It lies between 51° 28' and 52° 10' N. lat., 0° 50' and 1° 44' W. long. The county is very irregular in form. The longest straight line that can be drawn on the surface of the county measures 51 miles, and extends from the Warwickshire border near Upton House to the Thames at Lower Caversham. The area of the county is 739 square miles, or 472,887 statute acres. The population in 1841 was 163,127; in 1851 it was 170,363.

Surface and Geology.—The surface of Oxfordshire is for the most part level or gently undulating. A long range of hills runs from the left bank of the Evenlode, in the west of the county, northward to Chipping Norton, and thence eastward to the neighbourhood of Deddington. A low offset runs north-westward near Great Rollwright, and connects the range with a group of hills that occupies a considerable district on the north-west boundary, and forms part of the watershed between the Severn and the Thames. Broom Hill, one of the highest of these, and the most north-western point in the county, is 836 feet high. The most southern part of the county is occupied by the Chiltern Hills. The north-western slope of these hills is the steeper. Nettlebed Hill, near Nuffield, is 320 feet high; Nuffield Common has an elevation of 757 feet. The Chilterns were formerly occupied by a forest or thicket of beech-trees, which are the trees best adapted to the soil. A large part of the surface is now occupied as arable land or as sheep-walks. The only other hills worth mention in the county are those to the east of Oxford, between the Cherwell and the Thames. Shotover Hill, the highest of these, has an elevation of 599 feet.

The Chiltern Hills are composed of chalk; from their northern base the lower formations of the cretaceous group crop out. The upper green-sand is almost lost in the chalk marl which overlies and in the gault which underlies it: the gault has been sometimes designated Tetsworth clay, from the village of Tetsworth, near Thame. The upper division of the oolitic series, comprehending the Purbeck, Portland, and Kimmeridge beds, crops out from beneath the iron-sand.

D

To the east of Oxford the coral rag, one of the formations of the middle division of oolites, forms the elevated platform between the valleys of the Cherwell and the Thame. This formation extends across the Thames into Berkshire. The blue clay, or Oxford clay, which separates the coral rag from the lower oolites, occupies the middle part of the county. On the eastern side of the county the Portland beds of the upper series of oolites rest immediately on the Oxford clay.

The rest of the county, except the valley of the Cherwell above Banbury, is occupied by the lower division of the oolites. The forest marble, another formation of this division, has obtained its name from Whichwood Forest, near Burford, where it is found. It is a limestone susceptible of a tolerable polish, and occasionally used as a coarse marble. The calcareous slate of Stonesfield, near Woodstock, is remarkable for the singular variety of its organic remains, among which are the spoils of birds, land animals, *Amphibia*, sea-shells, and vegetables. The great oolite is quarried near Burford, and these quarries supplied the stone of which St. Paul's cathedral (London) is built. The lower division of the oolites forms the mass of a well-defined range of hills rising from the valley occupied by the Oxford clay. The greater part of the county north of Deddington and Chipping Norton is occupied by ferruginous sands and sandstone, denuded of the great oolite which usually caps them. The district occupied by these oolitic and arenaceous formations contains some of the highest hills in the county.

Hydrography and Communications.—Oxfordshire belongs almost entirely to the basin of the Thames. The Stour, an affluent of the Upper Avon, rises just within the north-western boundary at Drayton; and the Ouse, in the upper part of its course, skirts the north-eastern boundary, and receives the Ousel, one of its smaller tributaries, from that part of the county. The Thames first touches the county a little below Lechlade in Gloucestershire, where the navigation commences, and quits it a little below Henley. The length of its course along this county is about 70 miles. [THAMES.]

The *Windrush* rises in the Cotswold Hills, and after flowing through Gloucestershire enters Oxfordshire, passes Burford and Witney, and flows by several channels into the Thames. The *Evenlode* rises near Moreton-in-the-Marsh in Gloucestershire, and enters Oxfordshire about 9 miles from its source, having previously skirted the border for a short distance: its course through Oxfordshire is generally south-east and south. It falls into the Thames about a mile and a half east of Ensham. The Glyme, one of the tributaries of the Evenlode, after passing Woodstock flows through Blenheim Park, where it expands into a large sheet of water. The *Cherwell*, or *Charwell*, rises near the village of Charwellton, in Northamptonshire, and flows southward into the Thames at Oxford. It receives a number of small tributaries. The *Thame* rises at Stewkley, between Aylesbury and Fenny Stratford in Buckinghamshire, and flows south-west to the town of Thame, where it touches the border of Oxfordshire; for about 5 miles farther it skirts the border, and then entering the county flows through it about 10 miles into the Thames at Dorchester. It is navigable from Thame to Dorchester.

The Oxford Canal, the only one in the county, commences at Longford in Warwickshire, where it unites with the Coventry Canal. It enters Oxfordshire near the northern extremity of the county, some miles north of Banbury, and follows the valley of the Cherwell southward to Oxford, where it terminates in the Thames.

The county is well provided with common roads. The principal coach-roads are the following:—The road which enters the county at Henley-upon-Thames, and runs through Bensington to Oxford, and thence by Witney into Gloucestershire; the road which runs by Tetworth and Shotover to Oxford, and thence by Woodstock to Gloucestershire; the road to Birmingham, which runs through Bicester and Banbury.

The Great Western railway runs for about three miles along the left bank of the Thames in this county, passing through Goring and South Stoke; and from the Didcot station, which is in Berkshire, a line runs northward to Oxford and Banbury, whence it is continued by Leamington and Warwick to Birmingham. The city of Oxford is connected with the London and Birmingham line at Bletchley by the Buckinghamshire railway, which passes through Bicester and Winslow, where it is joined by the Buckingham and Brackley line, which runs north-west through these towns to Banbury. Oxford is also connected with Worcester and Wolverhampton by the Oxford, Worcester, and Wolverhampton railway.

Climate, Soil, Agriculture.—The climate of this county is, on the whole, colder than its situation in the central part of the island would lead one to expect; still the county may be reckoned amongst the most productive agricultural counties of England, and some of the land is of a quality which can scarcely be surpassed anywhere.

The soil may be divided into four distinct classes—the rich red loam, the stonebrash, the chalky and the irregular loams, and sands and gravels, which cannot be classed with any of the foregoing. The red land is partly in old grass, in which state it is very valuable, and partly cultivated as arable land. The stonebrash district, which extends from the borders of Gloucestershire across the country to the north of Oxford and Witney, is of inferior fertility to the red land; but it is easily worked, and, having a porous subsoil, it is not often

injured by rain. The soil is formed of decomposed chalk and sandstone. The chalk district, in the south-east of the county, is generally covered to a certain depth with a light calcareous loam. The low lands in the valleys through which the rivers flow are in many places covered with the finest herbage, and maintain much cattle. A part also is cultivated as arable land, and produces great crops of barley, clover, beans, wheat, and turnips. Besides these distinct soils, there are many of a mixed nature varying in texture and quality without any regularity. Where they rest on a porous subsoil, they are mostly fertile. Some few consist of poor sands or wet clays, which form the extremes, and are very unproductive until they are corrected and improved by marling or draining.

The farmers of Oxfordshire, as well as of most other parts of England, have very generally adopted the modern system of cultivation by rotation of crops, and new or improved implements of husbandry are generally in use. All the usual crops are raised.

The fattening of calves, by allowing them to suck the cows, is preferred by some farmers to making butter. On the butter-farms many pigs are fattened on the skimmed milk. The farm-horses in Oxfordshire are mostly good and active. The cows are of various breeds; Devonshire and Alderneys are common. The improved short-horns are the favourite breed both for the dairy and for calves. Sheep are an important object with the Oxfordshire farmer, and are in general well managed. Large hogs are prized; enormous boars are reared and fattened to be converted into brawn.

Divisions, Towns, &c.—Oxfordshire is divided into 14 hundreds, as follows:—Bampton, west; Banbury, north; Binfield, south-east; Bloxham, north; Bullingdon, central and east; Chadlington, north-west; Dorchester, central; Ewelme, south; Langtree, south; Lewknor, south-east; Piton, south-east; Ploughley, north-east; Thame, east; Wootton, central; and the city and liberties of Oxford.

Oxfordshire contains the city and university of OXFORD, the borough and market-towns of BANBURY and WOODSTOCK, and the market-towns of BAMPTON, BICESTER, BURFORD, CHIPPING NORTON, HENLEY-UPON-THAMES, THAME, WATLINGTON, and WITNEY, all of which will be found under their respective titles, except Watlington, which we notice here.

Watlington, population 1884 in 1851, about 15 miles S.E. from Oxford, has a small market which is held on Saturday, and two yearly fairs. The market-house is a substantial brick building. The church is ancient and of mixed styles. The Wesleyan Methodists and Independents have places of worship, and there are National schools. The making of pillow-lace employs a considerable number of females.

The following are some of the more important villages, with the populations of the respective parishes in 1851:—

Adderbury, population 2310, about 19 miles N. by W. from Oxford, is on the Sorbrook, a feeder of the Cherwell. The church, a good gothic edifice, with a lofty octangular spire, stands on an eminence. The chancel was built by William of Wykeham. The Wesleyan Methodists have a chapel, and there are an Endowed and a National school. *Bensington*, or *Benson*, population 1231, about 12 miles S.S.E. from Oxford, is on the left bank of the Thames, a little above Wallingford, Berkshire. It forms part of the parliamentary borough of Wallingford. Bensington, now a mere village, was a place of some importance in early times. The West Saxons built a castle here for the defence of their frontier; this castle was reduced by the Mercians under Offa in 776. The church, which is ancient, has an east window of decorated character. There are National schools, and an ancient hospital or almshouse. *Bloxham*, population 1577, about 21 miles N.N.W. from Oxford, is situated on a branch of the river Cherwell. The church is a handsome building, with an elegant tower and spire, 195 feet high; the west door has some curious carving in stone representing the Day of Judgment; near the east end of the church is a stone cross. There are chapels for Wesleyan Methodists and Baptists, a National and an Infant school. *Caversham*, population 1752, is pleasantly situated on the left bank of the Thames, about a mile N. from Reading. The church is ancient. There are a chapel for Dissenters and schools supported by subscription. *Chalgrove*, population 616, about 10 miles S.E. from Oxford, has a church of Norman character built of stone. In Chalgrove Field a monument has been erected to the memory of John Hampden, who was mortally wounded in a skirmish with the Royalists there. *Charlbury*, population 3179, about 15 miles N.W. from Oxford, a decayed market-town, has a parish church, partly Norman; chapels for Wesleyan Methodists and Quakers; an Endowed Grammar school; British and Infant schools; and a Girls school. Brewing, malting, and glove-making are carried on. Four yearly fairs are held. *Chinnor*, population 1257, about 18 miles E.S.E. from Oxford, at the foot of the Chiltern Hills, has a handsome church of Norman character, with a clerestory, and at the west end a square-roofed tower. The Independents have a chapel. Lace-making is carried on, and once a fortnight a feast or market for the sale of lace is held. Chairs, of the kind called Windsor chairs, are manufactured. *Cuddesden*, population 1542, about 8 miles E. by S. from Oxford, contains the bishop's palace, and a handsome building recently erected for the Diocesan Training school. Cuddesden Palace has been repaired and enlarged by the present bishop. A chapel in the decorated style has been added. The windows of the chapel are fitted with painted glass. The east window was presented by Prince Albert. *Deddington*, population 2178, is 17 miles N. by W. from Oxford. There are here the earth-

works of an ancient castle. At one time Deddington was a market and corporate town, and sent members to Parliament. Two annual fairs are held. The church is ancient. The Wesleyan Methodists and Independents have chapels, and there are National schools, a paper-mill, a flour-mill, and an extensive patent axletree manufactory. *Dorchester*, population 1061, about 9 miles S.S.E. from Oxford, at the junction of the Thames with the Thames, appears to have been the Dorocina of Richard of Cirencester. Foundations of an ancient town-wall have been dug up. In Dorchester and its neighbourhood many coins and other relics of antiquity have been found. The town was in the 7th century made the seat of a bishopric, which comprehended the two kingdoms of Mercia and Wessex. This bishopric was subsequently diminished by the formation of new sees, but was still the largest in England when the seat of it was removed to Lincoln in 1086. Of the castle not a vestige remains. In 1140 an abbey of Black Canons was founded here; some parts of the building yet remain. The church of Dorchester is a very large and curious edifice; the building is imperfect, and the plan of it irregular; at the west end is a low tower. The door at the western end of the northern aisle is Norman, but the greater part of the church is of later date. On the north side of the chancel is the celebrated Jesse window, of richly-painted glass; the stone frame-work represents the genealogy of the Saviour from Jesse, the father of king David. The Grammar school for six boys was founded in 1656. There are also National schools. A fair is held annually on Easter Tuesday. There is a modern bridge over the Thames at Dorchester built of Headington stone. *Ensham*, population 1941, is 6 miles N.W. from Oxford, near the left bank of the Thames. A richly-endowed abbey existed here at an early period. Besides the parish church there are chapels for Baptists and Primitive Methodists, and National, Free, and Infant schools. Rope-making, paper-making, malting, and brick-making are carried on. *Goring*, population 993, about 20 miles S.S.E. from Oxford, pleasantly situated on the left bank of the Thames, has a very ancient and curious church, a chapel for the Countess of Huntingdon's Connexion, and an Infant school. Numerous Roman coins, vases, and other antiquities have been found here. A station of the Great Western railway is at Goring. *Long Handborough*, population 1153, about 10 miles N.W. from Oxford, consists chiefly of one long street irregularly built. Many of the inhabitants are engaged in making gloves for the glove-makers of Woodstock. There is a chapel for Wesleyan Methodists. *Kiddington*, population 1494, about 5 miles N. from Oxford, has a commodious and handsome cruciform church, with a square tower surmounted with an elegant spire; a chapel for Wesleyan Methodists; a National school; and a Training school for female teachers. Malting is carried on. *Nettlebed*, population 754, about 18 miles S.E. from Oxford, a rural village, situated on a considerable eminence, has a handsome parish church, rebuilt in 1846; chapels for Wesleyan Methodists and Baptists; and a Free school for girls. A fair is held on the Monday previous to October 29th. A considerable amount of beech-timber is grown in the neighbouring woods. *Hook-Norton*, population 1496, is about 24 miles N.W. by N. from Oxford. The church, a commodious edifice, with a fine tower, was repaired a few years back. There are chapels for Wesleyan and Primitive Methodists, Baptists, and Quakers; and National and British schools. Near the village are the remains of an ancient encampment. *Whitchurch*, population 893, about 24 miles S.S.E. from Oxford, on the left bank of the Thames, occupies a picturesque situation on the declivity of a hill. The church is a fine building of Norman and early English dates. There are National schools. *Wroxton*, population 789, about 26 miles N. by W. from Oxford, has a parish church in which are some interesting monuments, particularly one of alabaster in memory of the first Earl of Downe and his lady. The Wesleyan Methodists and Independents have places of worship, and there are National schools. Near the church is Wroxton Abbey, a mansion built in 1618, on the site of an Augustinian priory founded in the 13th century.

Divisions for Ecclesiastical and Legal Purposes.—The county is in the diocese of Oxford, of which it forms an archdeaconry, and in the Oxford circuit. The assizes are held at Oxford, where the county jail and house of correction stands. Quarter sessions are held at Oxford and Banbury; county courts at Banbury, Bicester, Chipping Norton, Henley, Oxford, Thame, Witney, and Woodstock. Before the Reform Act Oxfordshire returned nine members to Parliament, namely, two for the county, two for Oxford city, two for Oxford University, two for the borough of Woodstock, and one for the borough of Banbury. Three members are now returned by the county, the place of election continuing as before at Oxford; two for the city of Oxford; two for the University; and one for Woodstock.

History and Antiquities.—The county was probably divided between the two Celtic nations, the Catyuechiani and the Dobuni; of whom the former held the eastern and the latter the western parts. The Dobuni were in subjection to the Catyuechiani, and upon the approach of the Romans, under the proprietor Aulus Plautius, readily submitted to him. In the Roman division of the island Oxfordshire was included in the province of Flavia Cesariensis.

The most remarkable monument of this or an earlier period is the singular group of Rollrich or Rowldrich stones, about three miles north-west from Chipping Norton. These stones form a ring of about 100 feet diameter, and appear to have been originally 60 in number;

there are now however only 24 that are more than one foot above the level of the soil, nor do any rise more than five feet above the ground, except one, precisely at the northern point, which exceeds seven feet. The ancient British or Roman roads which crossed this county were—Icknield-street; Akeman-street; and three roads of minor importance. At Aloxester are the remains of a square camp, or station, with a ditch and bank, the sides facing the four cardinal points. [BROESER.] Roman urns, coins, and other antiquities have been found at various places. There are traces of a Roman camp near Chadlington, in the neighbourhood of Chipping Norton; and of another near Kiddington, between Chipping Norton and Woodstock, which is in excellent preservation, though little noticed. Tessellated pavements and other Roman remains have been dug up at Steeple Aston, at Stonesfield, and some other places.

After the Romans withdrew from the island Oxfordshire was the scene of many conflicts, first between the Britons and the Saxons, and at a later period between the kings of Wessex and Mercia, of which latter kingdom it formed a part. Upon the division of the kingdom between Edmund Ironside and Canute (1016), Oxfordshire appears to have fallen to Canute; and about this time two great councils or assemblies of Danes and English were held at Oxford. At the time of the Conquest Oxfordshire was included in the earldom of Gurth, the brother of Harold. Of the Saxon and Danish period there are several memorials in the encampments and earth-works, which may be traced in different parts of the county. Of this description are the works at Dyke Hills near Dorchester; at Knollbury Banks near Chadlington, to the south of Chipping Norton; and at Mongewell, on the Thames, below Wallingford. There are several barrows in the county, chiefly on the north-western side.

In the reign of Richard II. Robert de Vere, earl of Oxford, was defeated at Radcot Bridge, near Bampton, by the insurgent nobles (1387). In the War of the Roses a great battle was fought near Banbury (1469), between the northern insurgents, under Robin of Redesdale, and the Yorkist, or royalist army, under Herbert, earl of Pembroke. The earl was defeated and taken, and next day beheaded by the rebels. Of the Anglo-Norman period there are several memorials in the ruins of castles and religious edifices, but none of them of great extent. Of Oxford and Banbury castles there are scarcely any traces: Dorchester Castle has entirely disappeared. Of Bampton Castle there are some remains. [BAMPTON.] Broughton Castle, near Banbury, is surrounded by a broad and deep moat, crossed by a bridge of two arches. An ancient tower forms the entrance to the court, and several other parts of the ancient edifice are standing, to which some additions of a later date have been made. There are castellated or other ancient mansions at Castleton, near Chipping-Norton; the High Lodge, near Woodstock; at Astall, or Asthall, near Witney; in Holton Park (the old mansion), between Stokenchurch and Oxford; and at Stanton Harcourt, near Bampton, where is a kitchen resembling the abbot's kitchen at Glastonbury. There are some fragments of Minster Lovel House, near Witney.

The chief ecclesiastical buildings are the churches of Oxford (the cathedral especially), Burford, Henley, Dorchester, and Witney. Ifley church is principally Norman, with an addition to the chancel of early English character, and some inserted windows of decorated and perpendicular date. The Norman portion is remarkably well executed: it has a groined chancel, three fine doorways, and a handsome west end. It has been recently restored. Of monastic remains there are few. Of Osney abbey, and of Godstow nunnery, near Oxford, the ruins are small: Godstow has some historical interest, from its being the scene of the early life of Rosamond, daughter of Lord Clifford, the 'Fair Rosamond' of Henry II., the place where she retired after Henry's marriage, and of her interment.

In the civil war of Charles I. this county was the scene of several severe contests. The taking of Oxford and its being made the headquarters of the king are noticed under OXFORD. Sir John Byron, a royalist, also took Banbury and Broughton castles, the former with a strong garrison. In 1643 a severe skirmish took place at Caversham Bridge between a body of the parliamentary army and a body of the king's troops, under Prince Rupert and General Ruthven; and about two months after occurred the skirmish of Chalgrove-Field, near Watlington, in which Hampden was mortally wounded. Several other contests took place in the county during the civil war.

Among the many extensive parks and splendid mansions in Oxfordshire are—Nuneham Park, the seat of G. V. Harcourt, Esq., on the left bank of the Thames, at a short distance east of Abingdon; Cudresden Palace, the residence of the bishops of Oxford, which has been rebuilt and enlarged by the present bishop, with the addition of a decorated gothic chapel, lighted through painted windows of great beauty; Ensham Hall, north-east of Witney, the seat of the Earl of Maclesfield; Bletchington Park, the seat of Lord Valentia; Ditohley Park, east of Charlbury, the residence of Lord Dillon; Cornbury Park, between Whichwood Forest and the Evenlode, which contains the mansion of Lord Churchill; Middleton Park, west of Bicester, the seat of the Earl of Jersey; Heythorp Park, east of Chipping Norton, a residence of the Earl of Shrewsbury; Aynho Park, east of Deddington, the seat of — Cartwright, Esq.; Wroxton Abbey, west of Banbury, the mansion of Colonel North; Upton House, the residence of Lord Villiers, situated in the extreme north-west of the county; and

Blenheim, the princely residence of the Duke of Marlborough. Blenheim is the most magnificent seat in the county. The estate was purchased by the nation, and presented to the great Duke of Marlborough. Vanbrugh was the architect of the mansion, which is a somewhat singular though a very picturesque and magnificent pile. In it is a noble collection of paintings, including a large number of works by Rubens. The park is a very extensive and beautiful one.

Statistics: Religious Worship and Education.—According to the Returns of the Census in 1851 it appears that there were then in the county 504 places of worship, of which 266 belonged to the Church of England, 116 to Methodists, 50 to Baptists, 43 to Independents, 13 to Quakers, and 8 to Roman Catholics. The total number of sittings provided was 110,666. The number of day schools was 591, of which 247 were public schools, with 16,674 scholars, and 344 were private schools, with 6924 scholars. Of evening schools for adults there were

18, with 383 pupils. Of Sunday schools there were 814, of which 221 were in connection with the Church of England, 45 with Methodists, 28 with Independents, and 16 with Baptists. The total number of scholars was 19,776. Of literary institutions there were 3 in the county, with 297 members, and 201½ volumes in the libraries belonging to them.

Savings Banks.—In 1853 the county possessed 7 savings banks, at Banbury, Bicester, Burford, Henley-on-Thames, Oxford, Thame, and Woodstock. The total amount owing to depositors on 20th Nov. 1853 was 349,677*l.* 4*s.* 11*d.*

PAAMUTO ISLANDS. [ARCHIPELAGO, *Dangerous.*]

PACIFIC OCEAN, THE, extends between America on the east, and Asia and Australia on the west. It received this name from Magalhaens, the first European who traversed it, and who, having experienced bad weather and heavy gales in the Strait of Magalhaens, sailed into the wide expanse of this ocean with a moderate south-east trade-wind, and enjoyed fair weather without interruption. He accordingly called it the Pacific. It is also called the South Sea, because vessels sailing from Europe can only enter it after a long southerly course. The name of South Sea has been limited in later times to the southern portion of the Pacific.

The Pacific is the greatest expanse of water on the globe, of which it covers nearly one-half of the surface. The area is roughly estimated at nearly 100,000,000 of square miles. Behring's Strait, its most northern boundary, lies between East Cape in Asia and Cape Prince of Wales near 66° N. lat., and is less than 40 miles wide. From this point southward the coasts of both continents, which inclose the Pacific, recede rapidly from one another; and at 54° 30' N. lat., between the western point of the peninsula of Alashka and Cape Krotzkoi Noes in Kamtchatka, they are upwards of 1200 miles apart. Near the northern tropic, Cape San Lucas in California is about 8500 miles from the coast of China east of Canton; and this may be considered as nearly the average width of the Pacific between the tropics. Near the southern tropics, Sand Cape in Australia is about 8200 miles from the northern coast of Chili. Towards the southern extremity the Pacific is divided from the Atlantic by a line drawn from Cape Horn to the antarctic circle, and from the Indian Ocean by another line drawn from South-West Cape in Tasmania (Van Diemen's Land) to the same circle.

The Pacific does not, like the Atlantic and Indian oceans, send off branches which penetrate deeply into the adjacent continents; but extensive peninsulas project from the continents which border on it on the Asiatic side, and these, together with some adjacent rows of islands stretching far into the sea, separate considerable portions of it from the main body of the ocean. Only two peninsulas project from the American continent. The peninsula of California divides the Gulf of California, and the peninsula of Alashka with the Aleutian Islands divides the Kamtchatka Sea from the Pacific. The peninsula of Kamtchatka, which projects from the continent of Asia, divides the Kamtchatka Sea from the Sea of Okhotsk, which latter is separated from the open expanse of the Pacific by the Kurile Islands. The western shores of the Sea of Okhotsk are partly formed by the island or peninsula of Tarakai (or Saghalien), which projects at a very acute angle from the continent of Asia; and the islands of Jeso and Nipon and the peninsula of Corea inclose the Japan Sea on the north, east, and south. The Yellow Sea, or Hoang-hai, which is farther south, is separated from the Pacific by a series of islands which extend from the most southern extremity of the island of Kiusiu to the northern extremity of Formosa. This remarkable formation continues still farther south, and the Chinese Sea, which extends from the island of Formosa on the northern tropic to the equator, must be considered as the last link in this chain of sea-basins. On the north the Chinese Sea is separated from the Pacific by a single row of islands, and farther south by a double and triple row. Thus we find that, though the continent of Asia forms the western boundary of the Pacific north of the equator, no part of it is immediately washed by that ocean, and its shores can only be reached by passing through one of these subordinate sea-basins.

This peculiarity of formation in the western parts of the Pacific appears to be mainly, if not exclusively, the effect of volcanic agency. The whole of the long series of peninsulas and islands which border the Pacific on the west, from the peninsula of Kamtchatka to the island of New Zealand, with the exception of Australia, contain active volcanoes or exhibit unequivocal traces of volcanic influence; so that in fact we may say that the western part of the Pacific is traversed by a volcanic chain which extends from the neighbourhood of the northern polar circle nearly to the southern tropic. Another series of volcanoes surrounds the Pacific on the east, but they are situated on

the continent of America. These volcanoes do not constitute a continuous chain; they rather occur in extensive groups at great distances from one another, but each group by itself may be considered as a chain, and the intermediate country shows evident traces of recent volcanic influence. These volcanoes are noticed generally under AMERICA, and more specifically under the countries in which they are situated. The chain of the Aleutian Islands, which contains more than 20 active volcanoes, connects as it were the American volcanoes with those of Asia. The most western volcano, situated on the island of Little Sitkin, is not much more than 600 miles from the series of volcanoes which line the eastern coast of Kamtchatka.

Though the Pacific covers nearly half of the surface of the globe, it receives the drainage of a comparatively small portion of the land. In South America the watershed between the rivers which run into the Pacific and the Atlantic is nowhere more than 100 miles from the shores of the Pacific; while for the greater part it is only about 50 or 60 miles, and in some places much less. Thus the Pacific receives hardly more than one twenty-fifth part of the drainage of South America. In the Mexican isthmus, as far west as the isthmus of Tehuantepec, the watershed continues at a short distance from the Pacific, never receding more than 40 miles, and frequently approaching it within less than 10 miles. West of the Isthmus of Tehuantepec it gradually recedes farther, and at 20° N. lat. it is more than 300 miles from the shores of the Pacific; but farther north it again approaches to a distance varying between 120 and 200 miles. The countries of the Mexican isthmus, which send their drainage to the Pacific, probably constitute not more than one-eighth of that division of America. In North America (north of 32° N. lat.) the watershed lies much more towards the interior of the continent, being between 35° and 45° N. lat., about 750 miles from the Pacific; but farther north it is only about 350 miles from it. The area of the countries of North America whose drainage runs to the Pacific probably does not exceed one-fifth of the whole surface. According to this rough estimate, the Pacific receives not quite one-tenth of the drainage of America.

In Asia the watershed between the rivers which fall into the Arctic Ocean on one side, and into the Pacific on the other, is likewise at no great distance from the latter, north of the mouth of the river Amur; but the basin of this river extends above 1200 miles into the interior of Asia, and it is followed on the south by the basins of the rivers Hoang-ho and Yantse-kiang, which reach somewhat farther inland. The basins of these three rivers, added to those of a few others of inconsiderable extent, may comprehend nearly one-seventh part of the area of Asia, and so much of the drainage of that continent enters the Pacific. In Australia the line which divides the waters which run into the Pacific from those which flow off in another direction is hardly anywhere 100 miles from the great ocean, except in the north-eastern district, where it is about 400 miles: it may be estimated that about one-ninth of the drainage of that continent is poured into that sea.

The eastern, northern, and southern portions of the Pacific Ocean are remarkably free from islands. In an extent of sea far exceeding the Atlantic in area, and bordering on the western shores of America, only a few isolated islands occur, and one considerable group, the Galapagos Islands. Between the coast of South America and Australia, south of 24° S. lat., only the large islands called New Zealand are situated; and in their vicinity there are a few small groups and islets: in the remainder of this vast extent of sea hardly four or five islands, or diminutive groups, are known to exist. But that portion of the sea lying between the two tropics, and extending from the western boundary of the Pacific eastward to 135° W. long., or over more than half the width of the ocean, is abundantly diversified with islands of various dimensions. To the north of the equator the islands and groups, though numerous, are much less so than to the south of the line. The islands of the Pacific are both low and elevated. The low islands are of very small extent, and are based on coral reefs, which encircle a small space of sea. This inclosed space resembles a lagoon, and these islands are often called Lagoon Islands. In close proximity to the coralline islands soundings have been made of great depth, clearly proving them to be the crests of lofty submarine

mountains, with sides of remarkable steepness. Captain Fitzroy found no bottom, within a mile and a half of Keeling Island, with a line of 7200 feet. The volcanic islands are of moderate extent, and generally rise to a great elevation in their centre. Besides the different groups which lie in a line along its western boundary, and which have been already mentioned, several groups of volcanic islands are dispersed in the ocean. The groups of this description north of the equator are the Bonin Sima, Ladrone, and Sandwich Islands. The Galapagos are traversed by the equator. South of the equator are the volcanic groups of the Marquesas, Society, Navigator, and Friendly Islands, and the solitary Easter Island. Some of these volcanic islands are encircled by coral-reefs, as the Society, Navigator, and Friendly Islands; others have not such a circle of reefs, as the Sandwich, Ladrone, Bonin Sima, Galapagos, New Georgian Archipelago, and New Hebrides. The islands which do not belong to the volcanic or lagoon islands are few in number: the largest of them is New Caledonia. A portion of the Pacific has a peculiar character. Flinders calls it the 'Corallian Sea,' and determines its extent by assigning Papua and Luistade as its northern boundary; whilst the north-eastern coast of Australia up to Sandy Point (21° 40' S. lat.) incloses it on the west, and on the south a line drawn from Sandy Point to the Island of Pines near the southern coast of New Caledonia. On the east it seems to terminate at some distance from the New Hebrides. It extends more than 1000 miles in length, and about 600 miles in width. The whole space is covered with innumerable coral-reefs and banks, which have only a few feet of water on them, and are very dangerous to the navigator. This is probably both the largest and the most extraordinary reef in any part of the world. It is divided from the continent of Australia by a space of sea free from islands, in general from 20 to 30 miles, and in some places from 50 to 70 miles wide. This arm of the sea has generally a depth of between 10 and 20 fathoms, but this depth increases towards the south to 40 and even 60 fathoms.

Our knowledge of the winds and currents of the Pacific is far from being so complete as that which we possess of the winds and currents of the Atlantic. Still enough has been ascertained to make us acquainted with the principal facts.

The north-east trade-wind seems to be more regular than in the Atlantic, and its northern boundary does not vary so much. From a careful comparison of the observations of the most judicious navigators made at different seasons, it appears that in summer this wind extends to 27° N. lat., in winter to 26° N. lat., and in spring only to 20° N. lat.; and that from these limits it does not recede more than three degrees. The southern boundary of the north-east trade-wind varies at different seasons between 1° and 11° N. lat.; the mean boundary is between 5° and 6° N. lat.

The south-eastern trade-wind extends in winter to 25½° S. lat., and in summer to 20½° S. lat. But according to numerous statements, it appears that this wind is by no means so regular along its southern border as in the Atlantic, and that it is frequently interrupted by winds from the west and south-west. The northern boundary of this wind also varies considerably at different seasons and under different circumstances: it may however be taken to extend generally in summer to about 2½° N. lat., and in winter to nearly 4° N. lat., while in autumn it reaches beyond 5½° N. lat. In spring these winds recede to one degree south of the equator. Captain B. Hall observes that towards their northern boundary these winds blow from the south, but farther south gradually draw more to the east, and at their southern limit are quite easterly.

In the Pacific the central line of the region of variable winds and calms is about six degrees north of the equator, but the boundaries vary greatly; it may however be said generally to range from 4° to 8° or 9° N. lat. In passing this region the navigator meets with calms interrupted by short squalls, and accompanied by a little rain.

The south-east trade-wind is only met with from 300 to 400 miles from the coasts of South America. In the intervening space the wind always blows in the direction of the Andes from the south, changing during the day a few points to the west, and in the night freshening off from the land. These winds are always very light, and sometimes interrupted by calms. North of Guayaquil the winds always blow from the south-south-east, and are steady. The north-east trade-wind is only met with at a distance of above 700 miles from the land. In the tract of sea lying between their eastern limit and the coast different winds prevail in the different seasons. From June to November, both included, the prevailing wind is from the north-west and west; it is very boisterous, and frequently comes in heavy gales and tornados or furious squalls, which are accompanied by deluges of rain and most dangerous thunderstorms; they are sometimes interrupted by calms. These winds set in earlier at the eastern parts of the isthmus than in the western. At Panama they are expected in March, and at San Blas in the middle of June. During this season the navigation along this coast is very dangerous; there are also few good harbours, and even most of them are abandoned by the inhabitants on account of their unhealthiness. In the opposite season, from December to May included, the prevalent winds between Panama and Cape Blanco de Nicoya are north-west and northerly, and they are pretty steady. From Cape Blanco de Nicoya to some distance east of Acapulco the winds blow from east and north-east, generally with moderate strength, but they are sometimes interrupted by hard gales from the north-east,

which are called Papayagos, and are experienced between Cape Blanco (9° 30' S. lat.) and Cape Santa Catherine. They last for several days, with a clear sky overhead and a dense red haze near the horizon. Other gales of a similar description from the north sometimes occur in this season east of Acapulco, opposite the isthmus of Tehuantepec, whence they are called Tehuantepec gales. West of Acapulco, and from 60 to 100 miles from the land, the winds are variable; but the prevailing winds blow between south-south-east and west-south-west. Nearer the coast, land and sea breezes are met with, blowing from the north-west during the day, and from north-east at night. They are experienced also east of Acapulco to a distance of about 100 miles.

The trade-winds also cease at a considerable distance from the eastern coasts of Asia, and in the tract of sea bordering on these coasts they are replaced by variable winds blowing generally from north-west, south-west, and south-east. Along the coasts of Australia the winds are very variable.

In the region south of the trade-winds the weather and the turn and succession of the winds are remarkably uniform. North-westerly winds prevail, bringing clouds and rain in abundance. South-westerly winds succeed them, and partially clear the sky with their fury; then the wind moderates, and blows from the south-east quarter, where, after a short interval of fine weather, it dies away. Light airs spring up from the north-east, freshening as they wear round to the north, but soon shifting to the usual quarter, north-west; and between that point and the south-west they shift back sometimes for weeks before they take another turn round. It never blows hard from east, rarely with any strength from north-east, but occasional gales may be expected in winter (between June and August) from south-east. Heavy tempests blow from west-north-west to south-west. In the region north of the trade-winds the winds usually blow from the south-west and west, and frequently in gales. When not strong they are accompanied with heavy fogs. In the subordinate basins along the coasts of Asia—the Yellow, Japanese, and Okhotsk seas—easterly winds are rather prevalent.

We turn now to the Currents of the Pacific. Near the southern polar circle a considerable portion of the surface of the ocean is in motion at first towards the north, or north-east, and forms a current of cold water known as the Antarctic Current, or Antarctic Drift Current. North of 60° S. lat. it turns more to the east, and sets towards the coast of South America, where about the parallel of Chiloe it divides into two branches, the southern of which runs off southward, and continues along the southern coasts of Tierra del Fuego to Cape Horn westward, round which it passes with an average rate of a mile an hour, and joins probably the South Atlantic Connecting Current. This is known as the Cape Horn Current. As the current sets rather from the land, it diminishes the dangers which attend the navigation along such a rocky coast. But the current is not wide, and from 20 to 30 miles from the land it is hardly perceptible. The northern branch of the Antarctic Current is known as the Peruvian or Humboldt's Current, and runs northward along the western coast of America as far north as Punta de Pariña, or Cape Blanco (near 5° S. lat.). The current extends about 100 miles from the coast, and is of moderate velocity, generally not exceeding a mile an hour. It is remarkable on account of the cold water which it carries from the south to the north; and it is doubtless to this current that Peru owes its comparatively cool climate. The difference of the temperature of the water within the current and that of the surface of the ocean without the current is considerable. At Callao the former indicates 62° Fahr., whilst in the same latitude, but about 300 miles from the coast, the temperature of the sea is between 77° and 80° Fahr. From the Punta de Pariña the current recedes from the coast, running off in a north-western direction to the islands of Galapagos, enlarging in width, but increasing in velocity to from 2 to 5 miles an hour. Though the current has now reached the equator, its temperature has not increased. Along the southern shores of Albemarle Island, one of the Galapagos, Captain Fitzroy found that the thermometer immersed in the sea only indicated 60°, while on the northern shores it stood at 80°. The low temperature of the water is believed to be the cause of no coral-reefs being found about the Galapagos, the coral insects being unable to sustain so great a degree of cold. From the Galapagos the current runs westward towards the centre of the ocean, and mingles imperceptibly, somewhere about 107° 30' W. long., with the southern portion of the great mass of inter-tropical waters, having a constant westward motion, and known as the Great Equatorial Current.

The Great Equatorial Drift Current flows on both sides of the line, forming a belt 3000 miles wide. But it is divided into a southern and a northern branch, which are separated by a counter current flowing in the opposite direction. The southern branch, or South Equatorial Current, for it would be more correct to view the two so-called branches as two distinct currents, has its southern limit about 26° S. lat. Its general flow is north of west, and it has its greatest velocity towards its western end. On its southern side among the Archipelagos its drift is considerably disturbed, in some places, as among the Feejee group and the Solomon Islands, it being diverted even eastward. A portion of the current, which off the New Hebrides sets off strongly to the north-west, is called Rossel's Drift by German geographers, but it scarcely appears needful to regard it as a distinct current. The

northern part of the South Equatorial Current seems to pass by New Guinea and into the Indian Ocean. The southern part striking against Australia by Moreton Bay, is diverted southward and forms what has been called the Australian Current. It sweeps round the south-eastern coast of Australia at the rate of one to two miles an hour, but at the southern extremity of the coast turns east to the island of New Zealand, which again turns it to the north. It thus appears to rotate between New Zealand and Australia, maintaining a high temperature, while the interspace, in which no distinct current is found, is the favourite 'middle ground' of the whalers of Australia and New Zealand. On the south of Van Diemen's Land is a warm drift current, which appears to be a connecting current between the Pacific and Indian Oceans, corresponding to the Southern connecting current of the Atlantic.

The northern branch of the Equatorial Current, or as it is more correctly called the Northern Equatorial Current, has its northern limit about 24° N. lat. At its eastern extremity it is comparatively weak, but, like the Southern Equatorial Current, strengthens as it proceeds west; its greatest velocity appears to be on its southern border. At its western extremity the Philippine Islands form an impenetrable obstacle, and it turns with considerable strength to the north. In this direction it sweeps along the Japan Islands at the rate of from two to four miles an hour, receiving the name of the Japanese Current. It thence proceeds past the Kurile Islands, where a portion of it seems to make its way into the sea of Okhotsk, and a somewhat larger portion passes into the Sea of Kamtschatka, and with considerable velocity through Behring's Strait; but the main body proceeds eastward to the north-west coast of North America, by which it is turned southward, and passes along the coasts of Washington, Oregon, and California, to about 30° N. lat., where it turns westward and rejoins the North Equatorial Current. The fact of the North Equatorial being a revolving and re-entering current was first established by Mr. Findlay in 1852, though indications of it had been long before made by scientific geographers and navigators of Europe and America. The still central space around which this Northern Equatorial current flows forms the great North Pacific whaling ground, corresponding to the smaller whaling ground between Australia and New Zealand, around which the Australian current revolves. A narrow current, called the Mexican Coast Current, runs southward along the coasts of Mexico and Central America from California, while as it approaches Panamá a counter-current runs northward closer in-shore; these appear to be currents connecting the Japanese and Peruvian currents, but there is a good deal of confusion and obscurity in relation to the currents about the Bay of Panamá. We must not overlook a current which is set down in the maps of Berghaus, &c., outside the Peruvian Current, about 25° N. lat., 80° W. long. It is called Mentor's Counter Drift Current, from the Prussian vessel by whose commander it was observed; but its existence does not appear to have been corroborated by subsequent navigators, and it may have been only a temporary drift caused by transient circumstances.

Another great current whose existence has only recently been established, is the Equatorial Counter Current, a great belt of water moving with considerable velocity in an easterly direction across the entire breadth of the Pacific, and occupying the region of the equatorial calms between 5° and 9° or 10° N. lat. This current traverses from east to west the middle of the broad space appropriated to the Great Equatorial Current, and, as already mentioned, divides it into a northern and a southern current, between which it flows in a direction opposite to both. Its velocity is greatest at its eastern end, towards which it has been found to be from two to three miles an hour.

Of the progress of the tidal-wave of the Pacific, our knowledge is but imperfect. According to Dr. Whewell its general direction is from east to west, but its heights are small. He traces it along the western coast of America from Acapulco southward along South America to Cape Horn; and again northward from Acapulco along the coast of North America, and thence westward by the Aleutian Archipelago to Kamtschatka.

The warmth equator, or line of greatest heat of the water of the Pacific, is by no means coincident with the terrestrial equator, being north of it east of 150° W. long., and south of it west of that meridian. On this line the minimum heat, 81° 7', occurs between the Galapagos and Sandwich Islands; and the maximum, 88° 5' at New Guinea. The current which sets northward through Behring's Strait prevents the ice of the Arctic Polar Sea from passing southward into the Kamtschatka Sea. On the opposite side the floating masses of ice of the Antarctic Polar Sea are frequently met with towards the American coast between 50° and 60° N. lat., 140° and 200° W. long., and even north of 50° N. lat. Farther west, in the sea south of Australia, it is supposed that ice never passes beyond 60° S. lat.

PA'DOVA, one of the Venetian provinces of Austrian Italy, is bounded N. by Treviso, E. by Venice, S. by Rovigo, and W. by Vicenza and Verona. The province consists almost entirely of a plain crossed by the rivers Brenta, Bacchiglione, Gorzone, and others, and sloping to the eastward towards the lagoons of Venice. The Adige forms the southern boundary of the province, and divides it from the province of Rovigo. The length of the province is about 40 miles from north to south, and its greatest breadth is about 30 miles, but in places it does not exceed 15 miles. The area is 831 square miles. The population is 312,765. The province of Padova is the most fertile and the most densely peopled of the Venetian provinces. It is divided into 12 districts, which contain 103 communes. A number of canals, some for navigation and others for irrigation, intersect the province, which produces wheat, Indian corn, pulse, oil, wine, flax, hemp, chestnuts, potatoes, fruits, and hay. The other products of the country are live stock, silk, wool, wax, and honey. The manufactories are few, and consist chiefly of tanneries, silk spinneries, woollen cloth, and hats.

The principal towns are the following:—PA'DOVA; *Este*, a town of about 8000 inhabitants, has given name to an illustrious sovereign family; *Montagnana*, with about 8000 inhabitants, has some tanneries and hat manufactories; *Abano*, with 3000 inhabitants, is noted for its mineral waters; *Battaglia* is also frequented for its mineral springs. Near Battaglia is the village of Arquà, where Petrarch died.

PA'DOVA (called by the English *Padua*), the chief city of the province of Padova in Austrian Italy, is situated in a fertile plain, in 45° 25' N. lat., 11° 55' E. long., 21 miles by railway W. by S. from Venice. The river Bacchiglione flows by its walls. Padova is fortified with walls, ditches, and bastions, and is above 6 miles in circumference; but it is thinly inhabited, the population not exceeding 50,000. Most of the streets, especially in the old part of the town, are narrow and lined with arcades; it has however some fine squares and handsome gates. The principal buildings are—the cathedral, begun in the 12th century, and having a fine baptistry; the episcopal palace; the churches of Sant' Antonio, Santa Giustina, Santa Croce, the church of the Eremitani, and many others, adorned with fine paintings and sculptures; the university, containing an anatomical theatre, a cabinet of natural history, an observatory, and a library of 70,000 volumes; several colleges; the palace del Capitano; the palace Giustiniani, the Caffè Pedrocchi, one of the most splendid coffee-houses and assembly-rooms in Europe; and the court-house or palace of justice (originally called the Palace of Reason), a vast structure, of which the great hall measures 300 feet long, 100 feet wide, and 100 feet high. The botanical garden and the Prato della Valle, or public promenade, are adorned with numerous statues. Among the antiquities none are prized more highly than the so-called monuments of Antenor (the fabled founder of the city) and Livy the historian.

Patavium, on the site of which Padova stands, was considered in Roman times one of the oldest towns of Italy. At the fall of the Roman empire, it was destroyed by Attila, and the inhabitants removed to the islands in the lagoons, where they founded Venice. Patavium was rebuilt by Narses, ravaged by the Longobards, and restored by Charlemagne. It afterwards governed itself for a long time as a free municipality with its consuls and podestats. In the 13th century Ezzelino da Romano usurped the sovereign power, but after his death the Paduans not only regained their freedom, but extended their authority over several adjacent provinces. Soon after the Carrara became lords of Padova, until 1406, when Venice took it by force and united it to its territory.

PADUCAH. [KENTUCKY.]

PÆSTUM, POSEIDO'NIA, an ancient town of Lucania, about 4 miles S.E. from the mouth of the Silarus, near the coast of the Gulf of Pæstum, now the Gulf of Salerno. The surrounding country, which is low and marshy, lies between the sea and an offset of Mount Alburnus, which divides it from the valley of the Calore, an affluent of the Silarus. The sulphureous springs which are in the neighbourhood form stagnant pools, and a stream, called Fiume Salso, which flows past the walls of Pæstum, by overflowing the low grounds adds to the unwholesomeness of the atmosphere. The remains of Pæstum are about 25 miles S.S.E. from the town of Salerno; they consist of the town walls, two fine doric temples, another building, and a small amphitheatre.

The origin of Pæstum is involved in obscurity. According to Solinus it was a colony of the Dorians; others say that it was first a

Phœnician settlement, and that it was afterwards colonised by the Dorians; while Strabo and others ascribe its foundation or enlargement to the Greeks of Sybaris, who gave it the name of Poseidonia. Coins have been found at Pæstum, in which the town is called *Phistuma*, and some bear the double epigraph 'Phistalis' and 'Poseidon.' Whoever were the founders, there is reason to believe that Pæstum existed as a town before it was colonised by the Sybarites.

The coins of Poseidonia show by their devices, which consist of anchors, oars, rudders, and other nautical implements, that the inhabitants were a seafaring people. Strabo says that the Lucanians took Poseidonia from the Sybarites, and the Romans afterwards took it from the Lucanians. At the end of the war against Pyrrhus, the Romans (who called it Pæstum, which seems to be the Latinised form of the ancient name) are stated to have sent a colony to Poseidonia. (Livy, 'Epit.,' xiv.) It assisted Rome in the great contest against Hannibal; and is numbered among the eighteen Latin colonies which did not forsake Rome in the time of danger. (Liv. xvii., 10.) It never became eminent however as a Roman colony. In the time of Strabo the city was declining and malaria was gradually creeping over its vineyards, fields, and gardens. The fall of the empire hastened the ruin of the city. Under the Lombards it became a dependency of the duchy of Benevento and subsequently an important town of the principality of Salerno. The Saracens destroyed the city in the 9th century and such of its citizens as escaped, accompanied by their bishop (for Pæstum was one of the first cities of southern Italy to embrace Christianity), fled to the hills, and there founded the town of Capaccio Vecchio. This town is still the residence of the bishop, who retains the title of bishop of Pæstum. The ruins of the deserted city were plundered by Robert Guiscard, who carried away its columns, bas-reliefs, and monuments to construct the cathedral of Salerno.

During the middle ages the remains of Pæstum lay unnoticed, though not unknown, as some people have gratuitously stated, for the temples are conspicuous objects from almost every part of the Gulf of Salerno, and there is nothing between them and the sea to obstruct the view. When Carlo Borbone, having conquered Naples towards the middle of the 18th century, became the resident sovereign, he revived the taste for the arts and antiquities. Count Felice Gazola of Piacenza, an officer in his service, admired the temples and other remains in that solitary region, and took drawings of them. Mazocchi, in 1754, in his work on the 'Heracleian Tables,' inserted a dissertation on Pæstum and its history. Winkelmann, who visited Pæstum in 1768, has made some remarks on the temples in his 'Anmerkungen über die Baukunst der Alten.' In 1767 appeared in London the first English description of Pæstum, 'The Ruins of Pæstum,' fol., with four plates, anonymous, which was followed by Major's work, which had the same title, in 1768. There are many subsequent works on the ruins of Pæstum, the most important of which is Father Antonio Paoli's 'Pæstanae Dissertationes,' Italian and Latin, fol., Rome, 1784, with sixty-three plates, including Gazola's drawings, coins, and a topographical map. The 'Magna Græcia' of Wilkins also contains descriptions and architectural drawings of the temples.

The remains of Pæstum are three temples, all in the Doric style; they agree in their general character with other Greek temples, consisting of a cella surrounded by external colonnades. The larger temple, called the Temple of Neptune, is 195 feet long and 79 feet wide. It is peripteral and hexastyle, there being six columns in front and twelve on each side, and upon these 36 columns rest an architrave and frieze. The cella, which is open to the sky, forms an inner court, with a range of seven doric columns on each side supporting an architrave, on which stands a second range of smaller columns of the same order. The columns of the outer peristyle are 6 feet 10 inches in diameter at the base, 28 feet 11 inches high including the capitals. The upper diameter, below the capital, is only 4 feet 9 inches. The smallest of the three temples, called the Temple of Vesta, and also the Temple of Ceres, is 107 feet long and 47 feet wide. It is also hexastyle peripteral, the peristyle being composed of six columns in front and eleven on each side. It differs in several respects from the larger temple. The second temple, in point of size, is usually called the Basilica. It has a peristyle of fifty columns, nine at each end and sixteen in the flanks, exclusive of the angles. It is the only known structure that has nine columns in each front. It was divided in its breadth by an internal range of columns, three of which remain.

Besides the ruins just noticed there remain also some traces of the aqueduct which supplied the city with water, and of the amphitheatre. The walls, built of large polyhedral masses of travertine, are still standing. They form an irregular pentagon, three miles in circuit, and in many places twelve feet high. Remains of eight towers and four gateways may be distinctly traced. The eastern gateway is almost perfect; its arch, nearly 50 feet high, is entire. Outside the northern or Salerno gateway are several ancient Greek tombs.

PAINSWICK. [GLOUCESTERSHIRE.]

PAISLEY, Renfrewshire, Scotland, a parliamentary burgh and market-town, situated on both banks of the White Cart, about 3 miles above the junction of that river with the Clyde, 8 miles W. by S. from Glasgow, in 55° 53' N. lat., 4° 26' W. long. The population was 47,952 in 1851. The town is governed by 4 bailies and 12 councillors, of whom one is provost. It returns one member to the Imperial Parliament.

In the time of Agricola, the Romans had a station here, but the town of Paisley owes its existence to the priory, founded in 1160, on the eastern bank of the Cart, by Walter, high-steward of Scotland. In 1219 Pope Honorius raised the priory into an abbacy. With the growth of this establishment there arose a small town on the opposite bank of the Cart, which James IV., in 1488, erected into a free burgh of barony. The town contains several good streets, and is lighted with gas. Of the public buildings the most interesting is the nave of the old abbey church, which is all that remains of the ancient monastery. It was repaired in the last century, and is now used as the parish church of the Abbey parish. Its style is partly of the middle of the 14th century. The Abbey of Paisley was the family burial-place of the High Stewards of Scotland before their accession to the throne. At the south side of the nave is a small chapel, which contains a tomb surmounted by the recumbent figure of a woman, said to represent Marjory, daughter of Robert the Bruce, wife of the founder of the abbey, and mother of Robert II. The great extent of the ancient abbey can be traced by the remains of its foundation. The other churches of the establishment are—the High church, the Middle church, St. George's, the Gaelic church, and three chapels of ease. The Free Church and United Presbyterian bodies each possess six places of worship. There are chapels for Episcopalian, Roman Catholic, and others. Between the old and Sneddon bridges, on the western bank of the river, is situated the county-hall, a stone building erected in 1818; it comprises a court-house, council-chamber, a debtor's prison, a bridewell, and a chapel.

The municipal corporation undertook the improvement of the navigation of the Cart, in the year 1787. The bed of the river was deepened, a short canal constructed, and the Cart is now navigable up to the town for vessels of 180 tons burden. The town is connected with Glasgow by the Glasgow, Paisley, and Ardrossan Canal. A short railway extends to a steam-boat pier on the bank of the Clyde, a little above the mouth of the Cart, and by the Glasgow and Paisley railway the town has direct communication with all parts of the kingdom.

In 1707 the principal articles made in the town were coarse linen and chequered cloths; the making of thread, the manufacture of silk gauze, of crape dresses, and of damask and embroidered shawls, were subsequently introduced. Many of the principal establishments of the town are now exclusively engaged in the various branches of the cotton manufacture, particularly muslins. The staple manufactures are now shawls of silk and cotton, plaids, scarfs, chenille and Canton crape shawls and handkerchiefs. There are several brass foundries, breweries, distilleries, a large soap-work, several bleach-fields, a large silk-throwing mill, &c.

Although Renfrew is the county town, Paisley has long been the seat of the sheriff's court. There is a weekly market on Thursday, and several fairs are held in the course of the year. Besides the parochial and burgh schools, there are—an academy, an infant school, and an endowed school. There are in the town a provident bank, established in 1815; a public dispensary; an infirmary; a mechanics institution; and several subscription libraries.

PALERMO, the metropolitan province of the island of Sicily, extends along the western part of the northern coast of Sicily, and is bounded E. by the province of Messina, W. by that of Trapani, and S. by the provinces of Girgenti and Calatanissetta. Its area is 1984 square miles, and the population in 1851 was 514,717. The province is divided into four districts, named from their chief towns, Palermo, Corleone, Termini, and Cefalù. It is the most populous of the seven administrative divisions of the island. The surface consists partly of naked hills and partly of fertile valleys, among which that called the Conca, or 'shell,' of Palermo, is one of the finest regions in the world. The general slope of the ground is to the north, from the mountain range, the Mount Nebrodes of the ancients, which crosses the island from east to west, to the sea-coast. Numerous short watercourses run in that direction; they are dry, or nearly so, in summer, but become impassable torrents in the rainy season. The principal are the river Termini, the Fiume Torto, and the Fiume Grande between Termini and Cefalù. The principal productions of the country are corn, oil oranges and lemons, manna, sumach, liquorice, almonds, pistachio nuts, and silk. The principal towns are the following:—

PALERMO. *Termini*, on the site of the ancient *Therma*, is a walled town of 15,000 inhabitants, with a harbour, a castle, and an old cathedral. The inhabitants are employed in the tunny, anchovy, and sardine fishery, and in the coast trade. The ruins of the ancient *Himera* are about 8 miles distant, at the mouth of the *Fiume Grande*. [*HIMERA*.] The hot mineral waters of *Termini* are much frequented, and supply the adjoining baths. *Cefalu*, a town of 8000 inhabitants, built on the sea-coast at the foot of a high cliff, with a handsome collegiate church. *Corleone*, an inland town, with 13,000 inhabitants, chiefly employed in agriculture. *Monreale*, 5 miles west of Palermo, with 13,000 inhabitants, and a splendid Benedictine abbey, founded in 1174, the church of which has become the cathedral of the archiepiscopal see of Palermo. It is rich in marble and paintings, and contains the tombs of the Norman kings William I. and II. *Carini*, near the site of the ancient *Hycara*, 9 miles west of Palermo, has 6000 inhabitants. *Piana dei Greci*, 15 miles south of Palermo, is an Epirote colony, with about 5000 inhabitants and a Greek church.

The small island of *Ustica*, situated about 40 miles from the coast north by west of Palermo, contains about 2000 inhabitants. It has a small port named *Santa Maria*, which is defended by batteries. The island produces good wine.

PALERMO (the ancient *Panormus*), the capital of the island of Sicily and the second city of the united kingdom of the Two Sicilies, is situated on a deep bay on the northern coast of Sicily, in 38° 8' N. lat., 13° 22' E. long., in a fine and fertile plain between two mountain ridges and the sea, and has about 180,000 inhabitants. The town is an oblong parallelogram, surrounded by walls furnished with bastions. It is rather more than four miles in circumference, the suburbs not included. A fine street, called *Il Cassaro*, a corruption of the Arabic word *Al-kaasr*, 'the palace,' runs through its length from the sea to the royal palace, which is at the inland extremity of the town, and is crossed at right angles towards its middle by another handsome street, called *Strada Maqueda*. The square before the royal palace is adorned with a bronze statue of Philip IV. of Spain. Another smaller square, in the centre of the town, between the palace of the senate and the university, is decorated with a curious fountain enriched with statues and figures of various animals, which spout the water into several basins. The houses of Palermo are built nearly in the same style as those of Naples, with flat roofs and terraces, and balconies with Venetian blinds. The royal palace is an old fortified building, with a fine hall, a spacious court, and a splendid chapel, built by King Roger in 1129, and enriched with mosaics. On the summit of the palace is the observatory, from which Father Piazzini discovered the planet *Ceres* in 1801. The cathedral, a magnificent gothic structure, built about the end of the 12th century, is adorned with marble columns and statues; it contains the mausolea of Roger, the Norman founder of the monarchy, and other exalted personages. The church 'del Gesu' is remarkable for its architecture and for the richness of its marble decorations, its paintings, and sculpture. Palermo has many other churches deserving of notice, all rich with marble, paintings, and mosaics. The church of the Capuchins is remarkable for its vaults, in which the bodies of the deceased monks and other persons are seen dried up standing in niches in various attitudes, and with their garments on, some being two or three hundred years old. The university, founded in 1447, has a library of 40,000 volumes, a museum of antiquities, with some fine statues and a fine collection of Græco-Sicilian medals. Besides the great hospital, Palermo has several other hospitals, a foundling hospital, a lunatic asylum, and other beneficent institutions. Some of the palaces of the nobility are remarkable for their architecture. The promenade along the sea-side, called *La Marina*, leads to the fine public gardens called *La Flora*, with a botanical garden. Palermo has two theatres, several barracks for soldiers, and a castle (*Castellamare*), which commands the roads. The harbour of Palermo is formed by a mole 1300 feet in length, terminating in a lighthouse and battery. An interior port is reserved for the marine.

Palermo is an archbishop's see, and the residence of the king's lieutenant-general over all Sicily. It has a supreme court of justice for the whole island, a court of appeal for the province, and a commercial tribunal. There are several monasteries and convents in the city. For public instruction, besides the university, there are at Palermo a college, a ladies college, and a nautical school. There is also a veterinary college.

The neighbourhood of Palermo contains many delightful villas and mansions of the nobility. To the west is the royal mansion and park of *Bocca di Falco*, beyond which is the handsome Benedictine convent of *San Martino*, situated on a hill. The church is adorned with paintings and marble, and the convent contains a good library, a museum of Sicilian antiquities, and a collection of medals. The *Monte Pellegrino*, Mount *Ereeta* of the ancients (a strong position of the Carthaginians during the first Punic war), is a broad rocky abrupt mass which rises north-west of Palermo, and forms a striking feature of the landscape. It is now famed among the natives for a grotto or cave, to which *Santa Rosalia*, a princess of the Norman blood royal, in the bloom of youth retired, in order to lead a contemplative and ascetic life. The cave is become a sanctuary, and every year on the 15th July there is a solemn procession to this place from Palermo, and the town is illuminated for several days. This is the most brilliant season

for seeing Palermo to advantage, as people flock to it from every part of the island.

Panormus was originally a Phœnician and afterwards a Greek colony. It became subject to the Carthaginians, until the first Punic war, when the consuls *Aulus Aquilius* and *C. Cornelius* besieged and took the town. It afterwards became a Roman colony.

The Arabian Emirs who ruled Sicily for several centuries made *Panormus* the capital of the island, and the Norman kings after them fixed their residence there. The Aragonese kings of Sicily resided at Palermo. When Sicily became united to the kingdom of Naples, Palermo lost its court, but retained the rank of capital of the kingdom of Sicily. The court of Naples however resided here from 1806 to 1814.

PALESTINE (**PALESTINA**) is the name commonly applied to the whole land anciently inhabited by the Israelites, including the country of the Philistines. It is derived from a Hebrew word signifying 'the land of the Philistines.' The country was originally called the Land of Canaan (*Exodus*, vi. 4). The Romans generally called it *Ju-deea*. It was adjacent on the south-west to the desert which lies east of the delta of Egypt, on the south and south-east to Arabia, on the east and north to Syria. Its frontier towns were *Dan* on the north and *Beersheba* on the south. On the west it is bounded by the Mediterranean Sea. Its southern boundary on the east was a stream which is called in Scripture the River of Egypt (probably the brook of *El-Arish*), from the mouth of which the southern boundary extended eastward through the Arabian Desert to a point about 25 geographical miles south of the Dead Sea. The northern boundary was formed by the mountains of Lebanon; the eastern by the river Jordan and its lakes. The country lay therefore between 30° 40' and 33° 36' N. lat., 33° 45' and 35° 30' E. long. Its length from north to south is about 180 geographical miles; its breadth increases gradually from the northern boundary, where it is not more than 20 miles, to the southern, where it is not less than 90 miles: the average breadth is about 50 miles. This description applies to the country originally intended in Scripture by the term 'the Land of Promise,' &c.; but the name of Palestine is used in history in a wider sense, embracing a considerable territory to the east of the Jordan, the addition of which increases its average breadth to about 65 miles. The southern limit of this eastern territory was the river *Arnon*, which falls into the DEAD SEA. The whole country contained about 11,000 square miles.

Mountains.—Palestine is a very mountainous country. A mountain range commences in Syria south of the *Orontes*, and stretches to the south as far as the sources of the Jordan, where it divides into two branches, which continue their course nearly parallel to each other, and inclose between them the valley of the Jordan and its lakes. These two ranges diverge from each other at the head of the Gulf of Akaba; the one running along the eastern coast of that gulf and terminating on the shore of the Red Sea; the other along the western coast of that gulf and terminating in the mountains of Sinai.

The mountains of Lebanon, which are a part of this mountain system, form the northern boundary of Palestine. They consist of two parallel ranges, inclosing a fertile valley of the average width of fifteen miles, which was the ancient *Coele-Syria* (*Hollow Syria*), and is now called 'El Bekka' (the valley). The western range inclines towards the sea, and terminates at the mouth of the *Leontes*, near Tyre; the eastern extends southward into Palestine, and divides into two branches, as above described. The name of Lebanon is applied in Scripture indifferently to either or both of these ranges: by the Syrian-Greeks the western was called *Libanus*, and the eastern *Anti-Libanus*. Lebanon is by far the highest part of the Syrian mountains. The summit of the western range is quite barren; but the lower slopes, especially on the western side, are inhabited and cultivated. Among the trees which grow upon them are the remains of the celebrated cedars of Lebanon. *Anti-Libanus* is in general not so high as the western ridge; but at the point where it divides into the two branches which inclose the basin of the Jordan, it rises above all the other summits of Lebanon, forming the *Jebel-es-Sheikh*, the *Hermon* of Scripture, whose summit is covered with snow for the greater part of the year. The eastern range is more barren, and has fewer inhabitants than the western. As this range passes into Palestine it diminishes in height, and becomes less rugged and more fit for tillage; but at the Dead Sea it consists of desolate rocks.

Almost all the mountains of Palestine may be regarded as belonging to the two principal ranges which include the basin of the Jordan. The most remarkable are the following:—*Mount Tabor*, the highest mountain in Lower Galilee, stands on the north-east of the plain of *Esdraelon*. It is entirely detached from the surrounding mountains, and is nearly of a hemispherical figure. On its summit is a plain of about half an hour in circuit, which is inclosed by an ancient wall. This mountain is said by an old tradition to have been the scene of our Saviour's Transfiguration. A range of fertile hills about five miles south-south-west of Tabor is generally considered to be the *Mount Hermon* mentioned in the *Psalms* (xlii. 6; lxxxix. 12): it is called the *Little Hermon*, to distinguish it from the great peak of the same name in *Anti-Libanus*. To the south and south-east of Tabor are the mountains of *Gilboa* of Scripture, a sterile range of hills about 1000 feet above the level of the sea: they bound the valley of the Jordan on the west for some miles. The range of *Carmel*, the termination of

which forms the only very prominent headland on the sea-coast of Palestine, lies almost due west of Mount Tabor. The promontory in which it terminates incloses the Bay of Acre on the south, whence the ridge runs inland to the south-east till it joins the principal range. It is only of moderate height, and is covered with forests and grass. To the south of the plain of Esdraelon lie the mountains of Samaria, which are beautifully wooded, chiefly with olive-trees, and covered with towns and villages. Of these mountains perhaps the highest are those of Ebal and Gerizim, which are separated from each other by a valley 200 or 300 paces broad. From these mountains were delivered the curses and the blessings of the Law. The Samaritans had their temple on Mount Gerizim, which they esteemed the holiest of mountains. Judæa, or the southern part of Palestine, is full of hills, which are divided by valleys and torrents, and are for the most part of moderate height. They are composed of a friable rock, particles of which are washed down by the torrents, and form terraces on the slopes of the mountains. In ancient times these terraces were planted with the olive, the fig-tree, and the vine. At present the rocks are for the most part barren and desolate. In the eastern part of Judæa, on the borders of the Jordan and the Dead Sea, is a wilderness of mountains, the most rugged and desolate in all Palestine. This mountainous country, which is the highest in Judæa, bears the name of Quarantania, from a tradition that this was the wilderness in which Christ fasted forty days and nights; the highest summit among these mountains is called the Mountain of Temptation, and is pointed out by tradition as that from which the devil showed our Saviour the kingdoms of the world. The most mountainous part of Judæa is the district round Jerusalem. [JERUSALEM.]

From the Jebel-es-Sheikh, already noticed, the mountains on the east side of the Jordan continue southward for about twenty-five miles under the name of Jebel-Heish, and terminating at a point about ten miles to the east of the Lake of Gennesareth. To the south of this mountain, for about twenty-four miles, is an open country, equally divided by the river Yarmak (ancient Hieromax), and containing the pasture-lands of Argob and Baahan. To the south of this district lies the land of Gilead, the mountains of which are the most considerable on this side the Jordan: they are for the most part well wooded, chiefly with the oak and wild pistachio. To the south of the river Jabbok (Zerka) the mountains are less elevated though broader. About six miles to the south of the river Jabbok is a ridge running east and west for about seven miles, the name of which (Jelaad) bears a trace of the ancient name of the country. As the principal chain approaches the latitude of the Dead Sea, it diminishes in breadth; and somewhat below the head of that sea it widens out again, and forms the mountains of Seir. [IDUMÆA.] Among the mountains at the head of the Dead Sea, and to the north of the river Arnon, was Nebo, from the summit of which Moses was permitted to see the promised land.

Geology and Mineralogy.—The mountains of Syria and Palestine are composed chiefly of a hard compact limestone, of a whitish or pale yellow colour, disposed in strata variously inclined, and affording a great number of caverns, to which frequent allusion is made in the Scriptures. The limestone rocks of which Lebanon is composed are of a whitish colour, from which circumstance the name of the mountain is supposed to be derived. The rock which lines the valley of the Jordan is of a texture much less compact than that of the mountains of Lebanon or of central Palestine; and it diminishes in compactness as we approach the Dead Sea. In the neighbourhood of Um-Keis, the ancient Gadara, to the south-east of the Lake of Gennesareth, there is a considerable quantity of black basaltic rock among the calcareous stone which prevails on the east of the Jordan between Yarmak and the Zerka. This black basaltic rock is also found in large quantities in the plain of the Haouran, farther to the east. In the mountains south of the Zerka the calcareous stone is interspersed with layers of sandstone of different colours, and large blocks of black basalt. The hills about Jerusalem are of a hard light-coloured limestone, which, as we approach the Dead Sea, is exchanged for white or grayish limestone of a looser texture, containing layers of a reddish micaceous stone. [DEAD SEA.] The black basaltic rock of the Haouran extends along the whole eastern border of the country. In the parts near the Jordan it is generally found in detached masses. Traces of basalt are also found on the west of the Lake of Gennesareth. Slate is found about the Dead Sea. In many places the limestone is covered by chalky rocks, containing corals, shells, and other marine exuvia. In the chalky beds about the summit of Carmel are found hollow stones lined with sparry matter, which resemble petrified olives and other fruit. This chalky formation appears very conspicuously in the White Cape (Ras-el-Abaid) below Tyre. There are indications of coal in various parts of Lebanon. Salt is obtained in abundance from the Dead Sea and the Mediterranean. The water of the Dead Sea is intensely salt. Fragments and beds of salt are found about its shores. [DEAD SEA.] Saltpetre is found in the district of the Haouran.

In modern times the mineral wealth of the country has been almost entirely neglected. Iron abounds in the Lebanon and Kersoun Mountains, and traces of it are found in other parts. Of copper there is no mention in modern times, though from the description of Moses (Deut. viii. 9) it seems to have been found in ancient times. Palestine possesses neither tin, lead, nor gold; but some traces of silver have

been found. There are celebrated mines of asphaltum in the neighbourhood of Hasbeya, near the sources of the Jordan.

The indications of volcanic action are chiefly confined to the basin of the Jordan and its lakes; and they are most frequent about the Lake of Tiberias and the Dead Sea. Hot springs, lava, and pumicestone are found about the Dead Sea. There are hot-springs at Tiberias, on the western side of the Lake of Tiberias, and at other places round the lake, which has itself a striking resemblance to the crater of a volcano. In the neighbourhood of the Dead Sea are still mines of asphaltum ('alime pits') of which the vale of Siddim was full in ancient times (Gen. xiv. 10), and other traces of the 'brimstone, salt, and burning,' by which the cities of the plain were overthrown. Palestine has been the scene of repeated earthquakes.

Valleys, Plains, and Deserts.—The chief valleys of Palestine are longitudinal, and run from north to south. The transverse valleys have a general east and west direction, being formed by the offsets of the principal mountain ranges. The chief plain country is the low land along the Mediterranean. The chief valleys are to the east of that range, and are the Bekka before mentioned, the basin of the river Jordan, and the great valley of Araba extending from the Dead Sea to the Ælanitic Gulf.

The flat country along the coast varies considerably in breadth, and is diversified by elevations which are offsets from the central mountains. The soil of this part of the country is very fertile, being composed of a rich brown mould. The climate along the coast is very warm. To the south of Cæsarea is the celebrated vale of Sharon, which is terminated in the neighbourhood of El-Arish by a sandy desert (the wilderness of Shur and Paran) which extends westward to Egypt, and eastward to the peninsula of Sinai.

The country between the mountains of Libanus and Anti-Libanus formed the Coele-Syria of the Greeks and Romans. Its length is about 90 miles, and its average breadth about 11 miles: it is the richest and most beautiful part of Syria.

The great valley of the Jordan extends about 175 miles from the sources of the river in the north, to the southern extremity of the Dead Sea. It is bounded on both sides by mountains, which on the east rise almost precipitously from the bed of the river till near the head of the Dead Sea, where the valley becomes wider: on the west there is a fertile vale between the river and the mountains, averaging about a half or three-quarters of a mile in breadth, except at the Lake of Gennesareth, where the mountains come close up to the shores. The valley of the Jordan is in fact a great longitudinal cleft, which traverses the country from north to south, and in its lowest part, the surface of the Dead Sea, is 1312 feet below the level of the Mediterranean. The valley is very warm, and singularly fertile. The name of the valley of the Jordan is usually restricted to the Ghor or the part between the Lake of Tiberias and the Dead Sea, which is about 65 miles long, and 5 or 6 miles wide in the northern half, but it grows much wider towards the Dead Sea, near which it spreads out into the plain of Jericho on the west and the plains of Moab on the east of the Jordan. The plain of Jericho is about 18 miles long by 7 or 8 miles broad, and is bounded on the west by an amphitheatre of mountains, which, by concentrating the sun's rays, cause a great degree of heat in the plain, which is further increased by the sandy nature of the soil, and by the low level of the plain. The plain immediately surrounding the Dead Sea consists on the eastern side for the most part of a sandy desert, with a few cultivated spots; on the western side the soil is rich, the heat great, and water abundant, but on the immediate borders of the lake it is a dreary waste. The great valley of Araba, which extends from the south of the Dead Sea to the head of the Ælanitic Gulf, is not within the limits of Palestine properly so called.

The valleys of Galilee are generally small, but beautifully wooded. The valley of Abilene lies beyond the hills which skirt the coast between Cape Nakhoora and Acre. South-east of this is the valley of Zebulon, between 3 and 4 miles long by 1 mile broad, which contains some of the finest pasturage in the whole country. To the east of this, and about the same length, is the vale of Sepphoris. The vale of Nazareth is a kind of hollow inclosed by mountains on every side, and abounds with fig-trees and gardens. Behind the hills which bound the north-western part of the Lake of Gennesareth is an extensive plain, forming a rich pasture-ground, which is much frequented by the Bedouins. It is called Dothan, from a village of that name.

On the borders of Galilee and Samaria lies the great plain of Esdraelon, called in Scripture the plain of Megiddo, and the valley of Jezreel. It is exceedingly fertile, and well adapted for growing corn. It has been the scene of some of the most remarkable battles recorded in the Jewish history, and of great battles in later times. Samaria is less mountainous than either Galilee or Judæa; it is beautifully wooded, and full of fertile plains. The valley of Jennin—through which lies the common route from Galilee to the city of Samaria—is about 13 miles long and 2 miles in its extreme width. About 4 miles south of Samaria is the vale of Shechem, between the mountains of Ebal and Gerizim, which is said to be watered by 365 springs. It opens out into a very fine plain which leads into the valley of Leban, after traversing which we enter into the kingdom of Judæa. This, in its present state, is the least fertile part of all Palestine, being full of rugged mountains, and deficient in water and soil. The stony

valley of Bethel lies about 8 miles to the north of Jerusalem. The valley of Jeremiah, in the north-east of Judæa, is long and sterile. It is connected by a narrow pass with the valley of Elah, which is pointed out by tradition as the scene of David's victory over Goliath. This is one of the pleasantest parts of Judæa. East of Jerusalem lies the valley of Jehoshaphat. [JERUSALEM.] To the south of Jerusalem on the road to Bethlehem lies the valley of Rephaim, which is upwards of 6 miles long. Near Hebron is the valley of Mamre, where was the sepulchre of Abraham. South of Jerusalem is the vale of Sorek, about 40 miles long, celebrated for its grapes and wine. Between the Dead Sea and the centre of Judæa lie the deserts of St. Saba and Engeddi.

On the east side of the Jordan lie the rich pasture-lands of Argob and Bashan, extending from Mount Hermon to the river Yarmak, a few miles south of the Lake of Gennesareth. South of this was the land of Gilead, the limits of which are not precisely defined, but it may be considered as lying between the rivers Yarmak and Jabbok. It is mountainous, and more so in the northern than in the southern part. Some portions of it are very fertile, and others are beautifully wooded. South of the Jabbok was the land of Moab, of which only a small part, that namely to the north of the Arnon, belonged to Palestine. This portion was occupied by the Amorites when the Israelites took possession of the country.

The south of Palestine is skirted by the great sandy desert which extends to Egypt and Sinal. It bears various names, of which that of the Desert of Paran seems to be used in the widest extent.

Lakes and Rivers.—There are no considerable rivers on the sea-coast of Palestine, the greater number of the streams being only mountain torrents which flow down from the hills that run parallel to the coast. The *Leontes* ('Litany') is not, strictly speaking, a river of Palestine. It rises at the base of the Lebanon Mountains in the neighbourhood of Baalbec, and flows in a south-westerly course to the Mediterranean, into which it falls a little to the north of Tyre. The most important river of Palestine is the *Jordan*, which rises nearly in the latitude of Tyre, and flows southward through the valley between the two great mountain ranges already noticed, and, after traversing the lakes of Semechonitis (Bahr-el-Huleh) and Gennesareth, falls into the Dead Sea. Its source, or what is generally considered to be its source, is a cave on the north-east side of the village of Panias, or Banias. The true source however seems to be a stream which rises in the hill of Tel-el-Kadi, about 3 miles north-east of Panias. After a course of about 15 miles, the river runs into the Bahr-el-Huleh, the waters of Marom of the Old Testament, and the Lake Semechonitis of Josephus. The size of this lake varies with the season of the year. Josephus makes it 7 miles long by half that breadth, which appears to be about the average size. The reeds which are used for writing grow on its margin. There are numerous water-fowl upon it, and it abounds in fish. The waters are muddy, and are said to be unwholesome.

After a course of 10 miles from the point where it quits this lake, the Jordan enters the Sea of Tiberias, Lake of Gennesareth, or Sea of Galilee of the New Testament. This lake is from 12 to 15 miles long, and from 6 to 9 miles wide. It is surrounded by mountains, and all travellers describe its scenery as exceedingly beautiful. The water is cool and clear, and contains a great quantity of excellent fish. Its margin is the resort of innumerable birds. The course of the Jordan is distinctly traced in a smooth current right through the middle of the lake.

The Jordan flows from the southern angle of this lake through a narrow valley, the level of which is lower than that of the large valley around it, which we have before spoken of as the valley of the Jordan (El Ghor). This lower valley is about three-quarters of a mile in breadth, and is covered with trees and luxuriant herbage. In the winter it is inundated by the river. In the summer the Jordan is fordable in many places. Its course when it leaves the lake is very rapid, but it diminishes in speed as it proceeds. At its junction with the Dead Sea it is 200 or 300 feet broad. The whole course of the river is about 150 miles, taking into account the windings of the stream.

The very remarkable lake which receives the waters of the Jordan occupies the site of the plain of Siddim, where stood Sodom and the other cities which God destroyed by fire in the time of Lot (Gen., xiv. 3; xix. 24, 25). The Dead Sea and its desolate shores are already fully noticed in the article DEAD SEA.

The following are the most important tributaries of the Jordan and its lakes. On the eastern side the Yarmak, or Maudhur, the Hieromas of the Romans, and the Jabbok (Zerka), both of which flow westward into the Jordan, the former entering it a little to the south of the Lake of Gennesareth, the latter at a point about half-way between that lake and the Dead Sea; and the Arnon (Modjeb), which flows into the Dead Sea, dividing Palestine from the land of Moab. On the western side, the Brook Daphne, which flows into the Lake Semechonitis; the Brook Capernaum which flows into the Lake of Gennesareth; the Brook Aenon, which rises in the mountains of Ephraim and flows into the Jordan between the Lake of Tiberias and the Dead Sea; and the Brook Kedron, which flows from the Mount of Olives into the Dead Sea.

The chief rivers which fall into the Mediterranean are the Belus,

which flows into the modern Bay of Acre a little to the south of Ptolemais; the Kishon, which flows from Mount Tabor through the plain of Jezreel, and falls into the same bay at the foot of Mount Carmel; the Chorseus and Kanah, which fall into the sea on the north and south of Cæsarea respectively; the Jarkon, which falls into the sea at Joppa; and the Eahool and Besor, which fall into the sea near Askelon and Gaza respectively. The extreme southern limit of the coast is formed by the River of Egypt, which is supposed to be the Brook El-Ariah.

Climate.—The climate of Palestine is temperate and the weather is not very variable. There are, properly speaking, only two seasons. The winter lasts from October to the beginning of April, and is distinguished principally by continual showers, which are called in Scripture the early and the latter rains. In summer, which lasts from June to September, there is a continuance of clear weather, with scarcely any rain; but very heavy dews fall in the night.

Political Divisions.—The political divisions of the country were very different at different periods of its history. The first notice we possess of the country is when Abraham came from Mesopotamia to dwell in it. It was then inhabited by the Canaanites, who were divided into the families of the Sidonians, Hittites, Jebusites, Amorites, Gargasites, Hivites, Arkites, Sinites, Arvadites, Zemarites, and Hamathites. Of these, the Sidonians inhabited the strip of coast about Sidon, between Lebanon and the Mediterranean, being a part of the district known in history under the name of Phœnicia; the Hittites dwelt about Hebron; the Jebusites about Jebus or Jerusalem; the Amorites in the mountains west of the Jordan; the Gargasites about the upper part of the river round Gergesa; the Hivites in the country to the north of Shechem; the Arkites around Aroa, and the Sinites near them; the Arvadites in the little island Aradus; the Zemarites and Hamathites about Simyra and Hamath. The Philistines inhabited the sea-coast in the south-west of the country. The land of Canaan having been conquered by the Israelites after their departure from Egypt, Joshua divided it by lot among the twelve tribes. Reuben, Gad, and half the tribe of Manasseh had their possessions on the east of the Jordan; the other tribes were located on its western side. Reuben was bounded on the south by the river Arnon, and on the north by the tribe of Gad, which inhabited part of the land of Gilead about the river Jabbok. On the north of Gad the half tribe of Manasseh extended to Mount Hermon and the sources of the Jordan. The whole of the southern part of the country, between the Dead Sea and the Mediterranean, was at first allotted to Judah; but this district being disproportionately large, the western part of it was given to Simeon and Dan. The small territory of Benjamin was bounded by Dan on the west, by Judah on the south, and by the Jordan on the east, and contained within its limits the city of Jerusalem. Ephraim possessed the country about Shechem, between the Mediterranean and the Jordan. To the north of Ephraim lay the second half of the tribe of Manasseh, also extending from the Mediterranean to the Jordan and on the coast as far north as Mount Carmel. Issachar had the valley of Jezreel, to the north and east of Manasseh. Zebulon lay next to the north, bounded by Asher on the west and by the Lake of Gennesareth on the east. The land of Naphthali lay about the sources of the Jordan, north of Zebulon and east of Asher, which last tribe possessed the sea-coast about Tyre and a part of the valley of Lebanon.

These tribes were united into one kingdom under Saul and David. By the conquests of David the territory of the Hebrews was extended to the Euphrates and the Atlantic Gulf. But these conquests are never included under the name of Palestine. By the revolt of Jeroboam, Palestine was divided into the two kingdoms of Judah and Israel, of which the former included the territories of the tribes of Judah, Benjamin, Dan, and Simeon, having for its northern boundary a line drawn from a point on the Jordan a little north of the Dead Sea, westward to the Mediterranean at Joppa; the latter included all the rest of Palestine to the north of this line.

The kingdom of Israel was overthrown, and the people carried captive by the Assyrians. The country, being thus depopulated, was next inhabited by the neighbouring heathen people and by colonies from other parts of the Assyrian empire, who, mixing with the scattered remains of the tribes of Ephraim and Manasseh which were left about Samaria, formed the people spoken of in the New Testament as the Samaritans, who were regarded by the Jews as an impure race, and between whom and the Jews there always existed a strong mutual hatred.

In the year B.C. 588, Nebuchadnezzar overthrew the kingdom of Judah and carried the greater number of its inhabitants into captivity. Many were however left in the land as subjects of the Babylonish empire. Upon the conquest of Babylon by Cyrus, Palestine fell under the dominion of the Persians, under whom it was divided for the purposes of government into small circles, each of which had its governor. By an edict of Cyrus, the Jews were permitted to return to Judæa and to rebuild Jerusalem and the Temple, but they still remained subject to Persia. When Alexander the Great invaded Asia, Palestine submitted to him without a struggle. After his death the possession of it was the subject of fierce contests between the Greek kings of Egypt and of Syria. Having been driven to revolt by the oppressions of the Syrian kings, the Jews, under the leading of the

Maccabees, recovered their independence, and restored the kingdom of Judah.

In the year B.C. 63 the country was conquered by Pompey, and it remained thenceforward in subjection to the Romans, by whom the part of it west of the Jordan was divided into the three provinces of Judæa, Samaria, and Galilæa. Judæa nearly coincided with the ancient kingdom of Judah; its northern boundary was at the parallel of Joppa. Samaria extended to the north as far as the plain of Esdraelon. Galilæa lay north of Samaria, reaching up to Lebanon, and having Phœnicia along its western border: it was divided into Upper and Lower Galilæa, the former containing the northern and the latter the southern half of the province. The former was also called Galilæa of the Gentiles, as it was inhabited by Syrians, Greeks, Phœnicians, and Egyptians, as well as Jews. On the east of the Jordan lay the province of Peræa, between the Arnon and the Hieromax; and to the north of this the districts of Batanæa, Trachonitis, Auranitis, and Gaulanitis, which commonly had one governor with Palestine. The whole country was considered by the Romans as a part of Syria, though it sometimes had a separate governor.

Under Constantine, Palestine was divided into Prima, Secunda, and Tertia. Palestina Prima included the country of the Philistines, Samaria, and the northern part of Judæa; its capital was Cæsarea. Palestina Secunda included Galilæa and part of the country east of the Jordan; its capital was Scythopolis. Palestina Tertia (also called Salutaris) contained the southern part of Judæa and the whole of Idumæa; its capital was Petra.

Towns and Villages.—In Upper Galilæa, near the sources of the Jordan, was Dan, more anciently called Laish, the most northern town of Palestine. In its immediate neighbourhood stood, in the time of the Romans, Cæsarea Philippi, or Panias. At the point where the Jordan enters the Lake of Gennesareth stood Bethsaida. This city was beautified by Philip the Tetrarch, who called it Julia. On the western side of the same lake were Capernaum, Chorazin, and Magdala. On the same side of the lake, but in Lower Galilæa, was Tiberias (*Tabariak*); to the west of which lay Cana (*Kana*); and farther to the west Sepphoris (*Saffurek*), the principal city of the district, which was enlarged by Herod, who called it Dio Cæsarea; south-east of Sepphoris was Nazareth (*Nasarak*); near the source of the Kishon was Nain. The city of Esdraelon, the ancient Jesreel, stood in the great plain of the same name; west of it was Shunem. In the south-east corner of Galilæa was Bethshean (*Bisna*), afterwards Scythopolis.

The most ancient city of Samaria was the Shechem, or Sichem, of the Old Testament, the Sychar of the New Testament, which stood in the valley between Mounts Ebal and Gerizim. The Romans erected close to it the city of Neapolis, which still retains the name of *Nablous*. Near to Shechem, on the south-east, was Jacob's Well. A few miles to the north of Shechem lay Samaria, which was built by Omri, who transferred the capital of the kingdom of Israel from Shechem to this city. It was rebuilt and beautified by Herod, who called it Sebaste in honour of Augustus, which name it still bears. In the time of the Romans the chief city of Samaria was CÆSARÏA (*Kaisariak*), on the sea-coast, which was built by Herod on the site of an insignificant place called Turris Stratonis. On the coast, north of Cæsarea, was Dora (*Tortura*), and near it En-dor; south of Cæsarea was Apollonias (*Om Khaled*), a Greek town. To the south-east of this was Antipatris, formerly called Capharsaba; and south of this was Saron, whence the Vale of Sharon obtained its name.

The chief city of Judæa was JERUSALEM, in the neighbourhood of which were the villages of Bethphage and Bethany, on the Mount of Olives, and Emmaus (afterwards called Nicopolis), farther to the north-west. Near Emmaus were Ajalon and Gibeon; and farther to the north Ephraim and Luz, or Bethel. To the east of Bethel, and in the north-eastern corner of Judæa, lay Jericho, which is sometimes called in Scripture the City of Palm-Trees. Between it and the Jordan was Gilgal; south of Jericho was Engeddi. Bethlehem, or Ephrath (*Bait-el-Lahm*), was about five miles to the south of Jerusalem. Farther south of Jerusalem lay Hebron (*El-Khalil*). Joppa (*Jaffa*) was the frontier town of Judæa and Samaria on the sea-coast; to the east of it lay Lydda, or Dioepolis (*Lud*). South-east of Joppa was Arimathea (*Ramla*), and near it Modin, the residence of Mattathias, the father of the Maccabees. On the east of the Jordan, in the district of Batanæa, &c., were—Canatha (*Kannaytra*); Hippos, on the Lake of Gennesareth; Gaulan, or Golan, one of the cities of refuge; and Gamala, on the same lake. In the north of Peræa, near the Lake of Gennesareth, was Gadara (*Om Keis*); and to the south-west of it Pella, built by the Macedonians; and farther south Gerasa, now *Jereesh*; and Jabesh-Gilead. Jereesh contains a large mass of noble ruins of the Roman period, consisting of fortifications, hot baths, and a naumachia, which is now converted into a corn-field. On the Jabbeek stood Ramoth-Gilead, one of the cities of refuge, and on a branch of the same river, Amathus (*Amata*). In the southern part of Peræa was Heshbon (*Esban*), the chief city of the Amorites; farther to the west Bethoran, which was beautified by Herod Antipas, who called it Livias; near it was the citadel of Machærus, where St. John the Baptist is said to have been beheaded.

PALESTRINA, the ancient *Præneste*, a town in the Campagna, 20 miles E. from Rome, built on the south-west slope of a high hill, which is an offshoot of the Apennine ridge that skirts the valley of the

Tiber on the east, and divides it from the high land of Abruzzo. It is naturally a strong position, and has been fortified from the oldest times. The ancient *Præneste* extended above the site of the present town, its citadel crowning the summit of the hill. There are remains of the ancient walls, built in the Cyclopean or polygonal style, of large irregular blocks of stone. A church, dedicated to St. Peter, has been raised on the site of the citadel. The modern town is half-way up the slope of the hill, on the site of the ancient Temple of Fortune, and about 700 feet above the sea. It is a bishop's see, and has about 5000 inhabitants, who manufacture coarse woollen cloth. The palace, belonging to the family of Barberini, contains the celebrated mosaic found among the ruins of the Temple of Fortuna. Many statues and other remains of antiquity have been found at Palestrina.

Præneste was a town of the Latins, and of older date than Rome. In the war of the Latins against Rome after the expulsion of Tarquinius, Præneste allied itself to Rome. (Livy, ii. 19.) More than a century later it sided with the Volsci against the Romans; but after the victory of Cincinnatus on the banks of the Allia, A.U.C. 375, it submitted to Rome by capitulation. (Livy, vi. 28, 29.) Thirty years later Præneste was included in the great Latin league against Rome, which was defeated by L. F. Camillus; the territory of the Prænestini was confiscated (Livy, viii. 12-14), and their town became subject to Rome like the rest of Latium. The younger Marius, being defeated by Sulla, took refuge in Præneste, where, after an unsuccessful attempt to escape, he ordered a slave to run him through the body. The town then surrendered, when Sulla ordered an indiscriminate slaughter of the inhabitants. Octavianus Cæsar sent a colony of veterans to Præneste. The Temple of Fortune was the great attraction of the place, and people repaired from all parts of Italy to consult the oracle. The temple was built on a magnificent scale, and richly adorned. Præneste was a favourite residence of the wealthy Romans during the summer heats.

In the middle ages Palestrina became the chief stronghold of the powerful baronial family of Colonna, who often disputed with the popes the possession of the Campagna and of Rome itself. Boniface VIII. took Palestrina and destroyed it, but after his death the Colonna recovered and fortified it again. Eugenius IV. in 1437 retook it from them. At last Urban VIII. gave it to his relatives the Barberii.

PALMELLA. [ESTREMADURA, Portuguese.]

PALMI. [CALABRIA.]

PALMYRA, TADMOR. Both these names are derived from the palm-trees which once grew in the neighbourhood of this ancient city. Palmyra is situated in an oasis of the Syrian desert, nearly half-way between the Orontes and the Euphrates, and about 140 miles E.N.E. from Damascus, in 34° 24' N. lat., 38° 20' E. long., according to Major Rennell. ('Comparative Geography of Western Asia.')

The circumstance of Palmyra being situated in an oasis sheltered by hills to the west and north-west, and supplied with wholesome water, and on a line leading from the coast of Syria to the regions of Mesopotamia, Persia, and India, must have pointed it out in very early times to the caravans as a convenient halting-place in the midst of the desert. The Phœnicians were probably early acquainted with it, and may have suggested to Solomon, with whom the king of Tyre was in alliance, the idea of establishing an emporium there. We read in the Second Book of Chronicles (viii. 4), that Solomon "built Tadmor in the wilderness, and all the store cities which he built in Hamath." Hamath was a town and territory extending along the banks of the Orontes, and bordering on the Syrian desert. After this we read no more of Tadmor in the Scriptures; but John of Antioch, probably from some tradition, says that it was destroyed by Nebuchadnezzar. The first notice which we have of it in Roman history is that M. Antony, being in Syria, marched to surprise it, expecting a rich booty, but the inhabitants disappointed him by transporting their goods beyond the Euphrates.

In the time of Pliny it was the intermediate emporium of the trade with the East, a city of merchants and factors, who traded with the Parthians on the one hand and the Romans on the other. The produce of India found its way to the Roman world through Palmyra. It afterwards became allied to the empire as a free state, and was greatly favoured by Hadrian and the Antonines, under whom it attained its greatest splendour.

Odenatus, a native of Palmyra, having rendered great services to the Roman empire in a war against the Persians, assumed, with the consent of Gallienus, the title of King of Palmyra, and Gallienus conferred upon him the command of all the forces in the East. Odenatus obtained several victories over the Persians, but being at last treacherously killed, his wife Zenobia, an aspiring woman, assumed the crown, and styling herself Queen of the East, asserted her sovereignty over Mesopotamia and Syria. Zenobia remained undisturbed for several years, during the latter part of the reign of Gallienus and the subsequent reign of Claudius. But after Aurelianus was proclaimed emperor, he resolved to put down Zenobia, who had extended her

conquests over Asia Minor, and after defeating her at Antioch and at Emesa, Palmyra surrendered to him, when he put to death her minister Longinus. An insurrection subsequently took place, when he returned to Palmyra, and carried on an indiscriminate slaughter of the inhabitants. This is averred by his own letter to Probus, whom he appointed governor of the place, and which has been preserved by Vopiscus. Zenobia appeared as a captive in the triumphal procession of Aurelian at Rome, after which she was allowed to reside at a country-house near Tibur, where she spent the remainder of her life. Syncellus says that she married a Roman senator, and had children by him. A Latin inscription at Palmyra, copied by Wood and Dawkins, shows that the place was garrisoned by the Romans under Diocletian, who built or restored several edifices. Justinian is mentioned by Procopius as having fortified Palmyra and placed a garrison in it. The Moslems took it under the kalifate of Abu Bekr, Mohammed's successor. (Ockley, 'History of the Saracens.') We hear no more of Palmyra after this till the 12th century, when Benjamin of Tudela visited it. He says it was encompassed by a wall, and that there were in it 4000 Jews. Among them Isaac, surnamed Græcus, and Nathan and Uziel, have the pre-eminence. (Purchas, ix., ch. 5.) The latest historical notice of Palmyra is its plunder in 1400 by the army of Tamerlane. It has been in a ruined and desolate state for centuries past, and the spot is inhabited by a small tribe of Beduin Arabs, who have built their hovels in the peristyle of the great temple.

The first appearance of Palmyra is very striking. Its innumerable columns and other ruins, extending nearly a mile and a half in length, and unobstructed by modern buildings, contrast by their snow-white appearance with the yellowish sand of the desert. But, examined separately, few of these remains can be called beautiful as works of art. The largest columns do not exceed 4 feet in diameter and 40 feet in height. There is a great sameness in the architecture, all the columns being Corinthian, with the exception of those which surround the Temple of the Sun, which are Ionic and fluted. (Irby and Mangley, 'Travels in Syria, &c. in 1817-18.') The most interesting remains of Palmyra are perhaps its sepulchres, which are outside of the walls of the ancient city, and are built in the shape of square towers, from three to five stories high, each forming a sepulchral chamber, with recesses divided into four or five compartments for the reception of the dead bodies. Some of the chambers are ornamented with sculptures and fluted Corinthian pilasters, and the walls are stuccoed white. The ceiling, on which the paint is still perfect, is ornamented like that of the peristyle of the Temple of the Sun at Baalbec, with the heads of various deities disposed in diamond-shaped divisions. Remains of mummies and mummy-cloths are found resembling those of Egypt. The lines of the streets and the foundations of the houses are distinguishable in some places. Small rows of columns denote the areas of the open courts of private houses, as at Pompeii. The inscriptions found at Palmyra are either Greek or Palmyrene, with the exception of one in Hebrew, and one or two in Latin. On the inscriptions of Palmyra see the work 'Inscriptiones Græcæ Palmyrenorum cum Annotationibus Edw. Bernardi et Thomæ Smithi,' Utrecht, 1698, and that of the orientalist Father Giorgi, 'De Inscriptionibus Palmyrenis quæ in Museo Capitolino adservantur Interpretandi Epistola,' Rome, 1782. Giorgi makes out a Palmyrene alphabet, which Barthélemy had attempted to do before him, but not successfully. The ancient commerce of Palmyra has been discussed by Heeren. Wood and Dawkins visited Palmyra about the middle of the last century, and published a description of its remains, with plates, folio, London, 1758. Since that time Volney, Cassas, Bankes, Irby, and other travellers have visited the same.

PALOS. [SEVILLA.]

PAMIERS. [ARIEGE.]

PAMPHY'LIA, a province of Asia Minor, formerly called Mopsopia according to Pliny ('Hist. Nat.,' v. 26), extended along the coast of the Mediterranean from Olbia to Ptolemais (a distance of 640 stadia according to Strabo, xiv., p. 667): it was bounded on the north by Pisidia, on the west by Lycia and the south-western part of Phrygia, and on the east by Cilicia. Pamphylia was separated from Pisidia by Mount Taurus, and was drained by numerous streams which flowed from the high land of Pisidia. The eastern part of the coast is described by Captain Beaufort as flat, sandy, and dreary, but this remark does not apply to the interior of the country, which, according to Mr. Fellows's account ('Excursion in Asia Minor,' p. 204), is very beautiful and picturesque. The western part of the coast is surrounded by lofty mountains, which rise from the sea and attain the greatest height in Mount Solyra on the eastern borders of Lycia. The western part of the country is composed, according to Mr. Fellows, "for thirty or forty miles, of a mass of incrustated or petrified vegetable matter, lying embosomed as it were in the side of the high range of marble mountains which must originally have formed the coast of this country. As the streams, and indeed large rivers, which flow from the mountains, enter the country formed of this porous mass, they almost totally disappear beneath it; a few little streams only are kept on the surface by artificial means, for the purpose of supplying aqueducts and mills, and being carried along the plain fall over the cliffs into the sea. The course of the rivers beneath these deposited plains is continued to their termination at a short distance out at sea, where the waters of

the rivers rise abundantly all along the coast, sometimes at the distance of a quarter of a mile from the shore."

The Pamphylians, according to Herodotus (vii. 91), were descendants of the people who followed the fortunes of Amphilocheus and Calchas after the destruction of Troy. They were subdued by Croesus (Herod., i. 28), and afterwards formed part of the Persian empire, and supplied Xerxes with thirty ships in his expedition against Greece (Herod., vii. 91). Under the Syrian kings it formed a separate province, including Pisidia; and the same appears to have been the case under the Roman empire, though it seems to have been sometimes united to the province of Galatia. (Tac., 'Hist.,' ii. 9.)

Though Pamphylia was of small extent, it contained several towns of considerable importance. Attalia, the modern Adalia, and Perge were visited by St. Paul (Acts, xiii. and xiv). Mr. Fellows, who visited Adalia in 1838, speaks of it as a small but clean town, built on a cliff which rises sixty or eighty feet above the sea, and informs us that it contains numerous fragments of ancient buildings, columns, inscriptions, and statues, which are generally built into the walls of the town with care and some taste. East of Attalia was Perge, in the neighbourhood of which was a celebrated temple of the Pergæan Artemis. Perge was situated between and upon the sides of two hills, with an extensive valley in front, and backed by the mountains of the Taurus. It contains several ancient ruins, of which the principal are—a large theatre, of the width of 330 feet, a stadium, or course for races, and two or three temples. At Side, beyond the Melas, there are some ruins, among them a large theatre, described both by Captain Beaufort and by Mr. Fellows. There were some other towns, of which the site even is in most cases doubtful.

PAMPLONA. [NAVARRA.]

PANAMÁ, THE ISTHMUS OF (*New Granada*), constitutes the most eastern and the narrowest portion of the long isthmus by which the two Americas are united. It extends, together with the province of Veragua, which is contiguous to it on the west, from 77° to 83° W. long., between 7° 20' and 10° N. lat. When measured along its curve the length from east to west is nearly 500 miles, but its width varies from 30 to 100 miles. Its area is nearly 30,000 square miles. The population was in 1853 estimated at about 140,000, of whom about 8000 were Americans, settlers, &c.; 14,000 descendants of Spanish colonists; and the remainder metis, mulattoes, negroes, and native Indians.

Surface, Soil, Climate, &c.—It was formerly assumed in geographical works that the Andes of South America extended through the Isthmus, but this is now ascertained not to be the fact. [ANDES.] West of 77° 30' W. long. no range of mountains, nor even an isolated elevation of moderate height occurs, and the whole isthmus throughout has a summit level comparatively little elevated above the sea, though the surface of the country is a good deal broken. The low country extends westward for more than a hundred miles to the western extremity of Mandingo, or San Blas Bay. The average width of this part of the isthmus does not exceed forty miles, and opposite San Blas it contracts to less than thirty miles. The shores on both oceans are rocky, and the whole region appears to consist of an immense mass of rock. The rocks however are covered by a thick layer of vegetable mould, and are clothed with lofty forest-trees. The shores of the Caribbean Sea are difficult of access for large vessels, being lined with numerous small rocky islands called 'keys.' Two rivers drain the isthmus. They are called respectively Chucunaque and Chepo, and rise near 78° 30' W. long. The *Chucunaque* runs east-south-east about eighty miles, and turning west by an abrupt bend falls into the Bay of San Miguel; the *Chepo*, or *Ballano*, runs west-north-west, and empties itself into the Gulf of Panamá, about twenty-four miles east of the town of Chepo, making a turn to the south. Both rivers are navigable for large river barges as far as the places where the great bend occurs. With all the advantages which this region possesses from its great fertility and the vicinity of two great oceans and navigable rivers, it is thinly inhabited, and chiefly by a tribe of Indians, the Mandingoes, or San Blas Indians, who resist all attempts to penetrate into the interior, though they receive in a friendly manner the vessels which visit the coast. The small town of Chepo, above the bend of the river of that name, is the most considerable settlement of the whites and negroes, but the inhabitants have little communication with their neighbours the Mandingoes. The country appears to be very unhealthy, owing to the swampiness of the soil and the consequent humidity of the atmosphere. This moisture of the air indeed maintains a most luxuriant vegetation, but the great quantity of vegetable matter, which is annually reproduced and decomposed, increases the miasma which exhales from a swampy soil under the influence of a vertical sun.

At the western extremity of Mandingo Bay some hills commence, which gradually attain the elevation of mountains, and extend in a continuous chain as far west as a line drawn across the isthmus from Navy Bay, or Port Limones, to the town of Panamá, a distance of about fifty miles. These hills advance close to the shores of the Caribbean Sea, where they surround the town of Puerto Vela, but they remain a few miles distant from the Pacific, and are separated from it by a level prairie destitute of trees. They occupy nearly the whole width of the isthmus, but are divided longitudinally into two ridges, between which lies the valley of the river Chagres. The southern ridge does not exceed 1000 or 1100 feet in height, but the

northern rises much higher. These hills are generally covered with thick and almost impenetrable forests. The valley of the Chagres is rather narrow, but the river itself is navigable to a considerable extent. [CHAGRES.] The climate in this portion of the isthmus differs considerably in the north and in the south. At Puerto Velo, on the northern coast, the rains are almost continuous, and generally descend in torrents, a circumstance which renders that place very unhealthy. At Panamá and in the valley of the Chagres the seasons are pretty regular. From December to March inclusive rain scarcely ever falls. From April to June showers occur at regular intervals. As the season advances the rain increases, and is incessant during July, August, September, and October. In November the nights are always rainy and cloudy, but during the days the sky begins to break. At Panamá the thermometer in the rainy season is 82° during the night and 87° during the day. In the dry season the temperature rises to 90° and even 93° in the day-time, and the days are very sultry; but the land-winds at night are cool, coming chiefly from the adjacent mountains.

West of the vicinity of Panamá to the Gulf of Parita the country exhibits different natural features. It is, properly speaking, a plain which rises from both oceans with a very gentle ascent towards the middle of the isthmus. In the northern part numerous isolated hills however, rising from 300 to 500 feet above their base, are dispersed over the surface of this plain. In the middle of the region merely a few isolated ridges of hills of inconsiderable height occur. The hills are generally covered with trees, but the plains and low grounds which surround them are savannahs, or prairies, destitute of trees, but covered with grass, which supplies pasture to numerous herds of cattle and horses. Though the vegetation of this region is generally much less vigorous than in the country farther east, there are several cultivated tracts and others which may be cultivated. The climate also is more healthy. The principal rivers of this region are the Trinidad and the Caymito, or Chorrera. The Trinidad enters the Chagres about twenty-four miles from its mouth, after a course of about sixty miles. It rises near the south coast, not far from the town of Chorrera, and is navigable in the greatest part of its course as far up as the town of Capua. The Caymito, or Chorrera, is formed by several petty streams which descend from the eastern declivity of the table-land of Veragua, and though its course is short, it is navigable to the town of Chorrera. There is a harbour at its mouth, but the anchorage is bad and exposed.

West of this region is the table-land (mesa) of Veragua. Its eastern ascent is formed by lofty mountains which rise abruptly, and frequently exhibit an almost perpendicular face of bare rock. The surface of the table-land itself is very uneven, and several summits on it rise to a great height. The Peak de Veragua is stated to attain nearly 9000 feet. In some places however there are plains of considerable extent. The general elevation of this table-land appears to be at least 3000 feet above the sea. It approaches the Caribbean Sea within a few miles, and is separated from it by a narrow and slightly hilly tract. But on the side of the Pacific the mountains approach close to the sea, and between the Gulf of Parita and the Bay of Montijo project in a wide and mountainous peninsula into the Pacific. This peninsula terminates in the capes called Punta Mala and Punta Mariata. Little is known of the interior, but it is more populous than the lower part of the isthmus, and is probably favourable to agriculture and to the health of the inhabitants. The rivers which descend from this table-land are interrupted by rapids and cataracts, and bring down great quantities of earthy matter, which they deposit at their mouths. All these rivers accordingly have a bar, with a very few feet of water on it, which renders them incapable of receiving vessels above 100 tons burden.

The most western portion of the Isthmus of Panamá begins at the western declivity of the table-land of Veragua, and extends to the boundary line of Costa Rica. The northern part is occupied by the Chiriqui Lagoon, a sheet of water above ninety miles in length from east to west, and on an average twenty miles wide. It is separated from the Caribbean Sea by a series of low, swampy, and wooded islands, between which there are three deep passages for vessels. The middle portion of the lagoon is occupied by low woody islands, but at each extremity a considerable space is free from islands, and affords excellent anchorage, as the lagoon is deep, and the swell of the Caribbean Sea is broken by the intervening islands. The country contiguous to the southern shores of the lagoon, for a distance of about twenty miles, is low and swampy, the soil being covered with a thick layer of alluvium produced by the annual inundations during the rainy season. At the back of this low tract, which is generally wooded, the country rises, and though it contains plains of some extent, it continues to rise gradually for forty or fifty miles from the lagoon, where it is bordered by a continuous ridge of high ground. This chain, which is called the Cabecaras Mountains, rises above 4000 feet above the sea, but it is of very inconsiderable width. The southern slope of this ridge is much more rapid, occupying only about ten miles in width, and terminating on the Pacific in tolerably level tracts, which however are many feet above the level of the sea. The whole country north of the Cabecaras Mountains is a continuous forest of lofty trees, but along the Pacific there are several woodless tracts. It is only in the last-mentioned district that the whites have formed a few establishments, the extensive country north of the Cabecaras Mountains being in possession of the native tribes, especially the

Valientes. This may be attributed to the climate, which on the coast of the Pacific resembles that of Panamá, being subject to regular changes of the seasons, and therefore healthy. But the low country about the Lagoon of Chiriqui is drenched with rain nearly all the year round: the more elevated tract however between it and the Cabecaras Mountains has more regular weather, and is considered tolerably healthy. The numerous rivers which run from the northern slope of the mountains into the Chiriqui Lagoon are impeded by many rapids and cataracts until they reach the low country, where their course is gentle, and where they may be navigated by large boats; but they have bars across their mouths, with little water on them.

The coast along the Caribbean Sea from the Bay of Candelaria to the Bay of Mandingo, does not present a single harbour for large vessels. It is lined by a continuous series of small keys, or rocky islands, lying from half a mile to a mile from the continent. The inner passage thus formed is full of coral rocks and reefs, but the water is so clear that they are easily seen and avoided in the day-time, and it affords a safe anchorage during the prevalence of the north-western winds (from December to April), as the swell of the sea is broken by the islands. The first harbour which occurs on this coast is that of Puerto Billo, or Velo, which is about 2 miles long, and on an average 1000 yards wide. It is of considerable depth, and, being surrounded by high hills and mountains, affords excellent and safe anchorage for vessels; but though it once was a place of great trade, it is now rarely visited, on account of its excessive unhealthiness. About 20 miles farther west is the Bay of Limones, or Puerto de Naos, now best known as NAVY BAY, which has an entrance 5 miles wide, free from danger, is several miles deep, and affords secure anchorage for 300 vessels. A few miles farther west is the deserted harbour of CHAGRES. Farther westward there is no harbour, except those afforded by the Chiriqui Lagoon.

The harbours on the shores of the Pacific are all within the Gulf of Panamá. The opening of this Gulf is between Punta Francisco Salano on the continent of South America and Punta Mala, where it is about 150 miles wide, which breadth it preserves for about 10 miles northward, when it begins to contract. In the northern and narrower portion of the gulf there is a group of islands, called Archipelago de las Perlas, on account of the pearls which were formerly procured in the adjacent sea in great abundance, and still are obtained to a considerable amount. The largest of these islands, called Isla del Rey, rises to a considerable elevation. Most of the rivers which fall into the gulf admit vessels of considerable burden. They have indeed bars across their mouths, on which there is rarely more than 2 feet of water at low tides, but as the tides here rise 18 feet, the bars may be passed at high-water, and inside of them the harbours are deep. The rivers most visited by vessels are the Pacora, about 18 miles east of the town of Panamá, and the Rio Grande, which enters the sea about 2 miles west of that town.

Great additional interest has been imparted to Panamá by the construction across the Isthmus of the railway connecting the coasts of the Atlantic and Pacific Oceans. The great commercial advantages likely to be afforded by a ship canal, which should connect the two oceans, and so shorten the voyage from the ports of Europe and the United States to the ports on the Pacific, China, &c., early directed attention to the narrow neck of land which connects North and South America. The Isthmus of Panamá was one of the first places which suggested itself, but the belief that it was traversed by the chain of the Andes, seemed to interpose an almost insuperable obstacle to such a work. Humboldt, as may be remembered, suggested the Gulf of Darien as the most likely place; while others looked rather to the west, and saw in the Lake of Nicaragua and the Rio de San Juan a line marked out as it were by nature for the purpose. In 1827 however, Bolivar, president of the republic of Columbia (of which Panamá then formed a department), directed Mr. Lloyd, an English engineer, to survey the country, not apparently for the purpose of forming a canal, but with a view of improving the communication across the Isthmus. His report showed how difficult the formation of a ship canal would be, but he pointed out how excellent a harbour was the unfrequented Bay of Limones, or Navy Bay, a few miles east of Chagres, and how readily a short canal might be cut through the low country from it to the navigable river Chagres. That river would then be ascended to its junction with the Trinidad River, and the latter to a place which appeared well adapted for the formation of wharfs and landing places, thence he proposed to form a railway to Panamá or Chorrera. Subsequent events destroyed all hope of any such scheme being carried out by the government, while however feasible it might appear, it hardly presented sufficient promise of success as a commercial enterprise to induce foreign capitalists to undertake its execution. But the remarkable discoveries of gold first in California and subsequently in Australia, again called attention to the subject, and the project of an Atlantic and Pacific Canal or railway was eagerly canvassed. Mr. Lloyd's survey was remembered and its general correctness verified; but as rapidity of transit was now the chief desideratum a company was formed in New York for constructing a railway quite across the Isthmus and nearly over the route which he had indicated; and American and English capital was freely embarked in the undertaking. A town named Aspinwall was founded in NAVY BAY, and this was made the starting point of the railway on

the Atlantic side: its Pacific terminus was fixed at Panamá. The works were commenced in 1850, but their progress was greatly impeded by the difficult character of the country through which much of the line passes, and the insecurity of life and property owing to the revolution in New Granada. [NEW GRANADA.] But the enterprise was conducted with energy and perseverance, and all difficulties were overcome. The first section was opened in 1850; a second portion in 1852; at the close of 1853 about 38 miles were in operation; and by the end of 1854 the whole was completed. The line was formally opened for traffic on the 28th of January, 1855. Its entire length is about 50 miles; the summit level is only 250 feet above the level of the sea; and the entire cost has been about 1,400,000.

Productions.—This isthmus is very rich in vegetable productions, especially in trees, useful as timber, dye-woods, or for cabinet-work, and domestic purposes. Some of them bear eatable fruits. It also produces all the fruits and esculent vegetables cultivated in other intertropical countries. The cultivated grains are rice and maize. The sugar-cane is grown, but not extensively. Coffee and cacao are cultivated for domestic consumption; and some cacao is exported. The caoutchouc-tree, milk-tree (Palo de Vaca), sarsaparilla, and vanilla plant grow in the woods. The *Styrax officinalis* is very abundant, and its gum sells very dear. Cattle, horses, and mules are reared in those districts where there are natural prairies or savannahs. The woods are inhabited by numerous wild animals: tiger-cats, which seldom exceed the size of a small Newfoundland dog; lions, bears, racoons; sajinos, or a species of wild boar, deer, conejos, which are somewhat like our rabbits, but larger; hosts of monkeys; wild turkeys, both black and coloured, and many other birds. The sea abounds with fish, especially sharks, which are eaten, alligators, and turtle. There are gold-mines in the mountains near Puerto Velo, but their produce is insignificant. Gold is also said to be found on the northern declivity of the table-land of Veragua, and in the country of the Valientes. Copper and iron are abundant, and tin and mercury are stated to occur.

The Isthmus formerly constituted one of the departments of the republic of New Granada, that of Istmo, but is now included within the department of Cauca. [NEW GRANADA.] The towns are principally of small size.

Panamá, the principal town, stands on a tongue of land which extends a considerable distance into the Gulf of Panamá, in 8° 57' N. lat., 79° 29' W. long.: the population is about 10,000. The principal streets extend across the peninsula. The houses are of stone, generally two or three stories high, substantially built, and the larger houses have courts, or patios. The public edifices are, a fine cathedral, four convents, a nunnery, and a college. As the sloping shores contiguous to the ground on which the town stands are dry at low-water to a considerable distance, the anchorage is 6 or 7 miles distant, where it is protected by a number of islands, the largest of which is called Perico, a name which is also applied to the harbour. These islands are high and well cultivated, and supplies of ordinary kinds, including excellent water, may be obtained from most of them. Panamá since becoming the port for the traffic with California has greatly increased in importance as a place of trade; its commercial intercourse previously was for the most part with the ports of South America and especially with Guayaquil.

Aspinwall and **Chagres** are noticed under NAVY BAY and CHAGRES.

On the isthmus, west of Panamá, there are several towns of some local importance. **Chorrera**, on the Caymito or Chorrera, at its outfall in the Gulf of Panamá, has 3000 inhabitants; **Natá**, on Parita Bay, has a population of 4000; and **Los Santos**, on the south-western side of the Gulf of Panamá, about 3500 inhabitants. Neither of these places has a harbour. In the province of Veragua, the capital, **Santiago de Veragua**, in the interior, has about 4000 inhabitants; the town of **La Mesa**, 4000; and **Santiago de Alange**, 2000.

Inhabitants.—A great portion of the isthmus, perhaps one-third, is still in the exclusive possession of the aborigines. These tribes occupy both extremities of the isthmus. Nearly the whole of the isthmus east of the Bay of Mandingo is inhabited by several small tribes, comprehended under the collective appellation of Mandingo or San Blas Indians. They are an active hardy race of people, very jealous of their independence, and hostile to the whites who have settled near them. They cultivate plantains, bananas, maize, and mandioc. They also rear many fowls. The adjacent sea and the rivers abound in fish and turtle, and the forests in eatable animals. The western portion of the isthmus, which surrounds the Chiriqui Lagoon, is inhabited by the Valientes, a collective name given by the Spaniards to different tribes inhabiting that part of the country. They are much taller than the Mandingo Indians, and seem to have made greater progress in civilisation. Their extensive plain-grounds, maize-fields, and mandioc-plantations exhibit a great deal of industry and care; and among other things they plant the cacao-tree, the produce of which is extensively used.

The countries inhabited by the Mandingo and Valientes Indians are annually visited by vessels from Jamaica and elsewhere, which export considerable quantities of tortoiseshell, sarsaparilla, and fustic, and also some cacao; they import manufactured cotton goods, outlass-blades, and a variety of toys and small articles. The port of Chagres was formerly visited by European and American vessels, but it is now

abandoned for Navy Bay. There is a considerable trade carried on there and at Panamá, and large quantities of the manufactured goods of Europe and America, with sugar, wine, &c., are imported; but the articles of export are of little comparative value. The transit trade is of great and growing importance, and will no doubt in a short time produce marked changes in the country.

PANARIA. [LIPARI ISLANDS.]

PANAY. [PHILIPPINE ISLANDS.]

PANEAS, or **BANIAS**, a village of Palestine, situated at the foot of the Jebel Heish, the Mount Hermon of Scripture, is supposed to be on or near the site of the Dan of the Jews. Its name was changed to *Cæsarea Philippi* by Philip the Tetrarch, son of Herod, in honour of the emperor Tiberius and himself. The village contains only about 150 houses, inhabited by Turks, Greeks, Druzes, and Arabs. It stands on a triangular-shaped piece of ground inclosed by the river of Banias and the Jordan, and backed by the mountains at the foot of which, to the north-east of the village, the river of Banias takes its rise in a spacious cavern beneath a precipitous rock. This precipice has several niches, in one of which the base of a statue still remains; and each of them had an inscription in Greek characters, which are now so nearly effaced as to be unintelligible. The cavern and Paneium, or sanctuary of Pan, within it, are described by Josephus ('Jewish War,' iii. 10-7), from whom it appears that the fountain or spring was considered as the source of the Jordan, and the outlet of the small lake Phiala. Around the spring are great quantities of large hewn stones, which probably belonged to the Temple of Augustus, built by Herod. Philip also added greatly to the town; indeed Josephus (ii. 9, 1) calls him the founder of Cæsarea in Banias.

Although these springs are by far the most copious they are not the most distant from the Dead Sea, and cannot be considered as the true source of the Jordan, which may be placed at about 4 miles N.E. of Banias, near the foot of a hill called Tel-el-Kadi. [PALESTINE.]

The river of Banias flows on the north side of the village, where there is a well-built bridge, and some remains of the ancient town; but the principal part of the old town appears to have stood on the opposite side of the river, where the ruins extend nearly a mile from the bridge. No walls remain, but great quantities of stone and architectural fragments are scattered about; there are also some granite columns entire. On the south side of the village are the ruins of a very strong turreted castle, surrounded by a ditch and wall; and about four miles to the eastward of the village, on an eminence, are the ruins of another castle, once evidently a strong fortress, and apparently coeval with that in the village. It is surrounded by a wall ten feet thick, and flanked with numerous round towers built with equal blocks of stone about two feet square, and has only one gate on the south side. This castle, which is called the Castle of Banias, contains the ruins of many private habitations; and at both western corners there is a succession of strongly-built low apartments like cells, dark, vaulted, and provided with loop-holes for musketry; there are also four wells in this castle full of water. Banias is about 23 miles E. by N. from Tyre.

(Burckhardt, *Travels in Syria*; Pococke, *Description of the East*; Seetzen, *Travels*; Mangles and Irby; Pliny, v. 15.)

PANGUTURAN. [SOOLOO ARCHIPELAGO.]

PANGBOURN. [BERKSHIRE.]

PANJAB. [HINDUSTAN.]

PANNAIR, RIVER. [HINDUSTAN.]

PANNO'NIA, the name of a province of the Roman empire, was bounded N. and E. by the Danube, S. by Illyricum and Mœsia, and W. by Noricum. It was separated from Mœsia by the Savus (Save), and from Illyricum by an imaginary line drawn a few miles south of the Save; but the boundaries between Noricum and Pannonia differed at various times. Pannonia would thus correspond to Sclavonia, parts of Hungary, Lower Austria, Styria, Croatia, and to those parts of Turkish Croatia, Bosnia, and Servia which immediately touch upon the Sava.

The Pannonians belonged to the Celtic, or perhaps the Germanic race. They were first attacked by Augustus, B.C. 35 (Dion Cass. xlix. 36, 37; Liv., 'Ep,' 181), and were subdued during his reign by Tiberius, and reduced to the form of a province. (Vell. Pat., ii. 110, et seq.) We learn from Tacitus ('Ann.,' i. 16), that at the death of Augustus there were several legions stationed in Pannonia, which was then regarded, and continued to be so till the end of the Roman empire, as one of the most important provinces of the empire, on account of its bordering on the powerful nations of the Quadi and Iazyges.

Under the early Roman emperors Pannonia only formed one province; it was afterwards divided, but at what time is uncertain, into two provinces—Pannonia Superior and Pannonia Inferior; the former comprising the western and the latter the eastern part of the original province. A new division of the provinces was made by the emperor Galerius, by whom Pannonia was divided into three provinces, which division appears to have continued till the downfall of the Roman empire.

The principal rivers of Pannonia were the Narabo or Arrabo (Raab), the Dravus (Drave), and Savus (Save), all of which flow into the Danube. The two most important ranges of mountains were the Pannonii Montes, a continuation of the Sarmatian range, which passed through the northern part of the province in a south-westerly direc-

tion, and joined Mount Cotius; and the Claudii Montes, which separated the valleys of the Save and the Drava.

Very little is known of the position of the different tribes which inhabited Pannonia. The powerful nation of the Boii dwelt in the north-western part of the province; and after their extermination by the Getae that part of the province was called Deserta Boiorum. (Pliny, iii. 27.)

Pannonia possessed several towns of importance, the inhabitants of which appear to have principally depended for their support upon the numerous legions which were quartered in different parts of the province. Following the course of the Danube, the first town we come to after leaving Noricum is Vindobona (Vienna), called Vianiomina by Pliny (iii. 27), who places it in Noricum. At the time of Ptolemaeus it was called Juliobona, and was the station of a legion. It is called by most later writers Vindobona; but in the 'Notitia Imperii' it is written Vindomana. The next town of importance below Vindobona on the Danube is Carnuntum, which, in the early part of the Roman empire, was the most important place in the north of Pannonia. The amber which was collected in the northern part of Europe was brought to this town, and thence conveyed to the different parts of the Roman empire. It was the head-quarters of the army of Marcus Antoninus in the war which he carried on with the Marcomanni. (Eutrop. viii. 6.) Its ruins are in the neighbourhood of Altenburg. Below Carnuntum on the Danube was Brigantium or Bragetium (Fusto), called by Ammianus Marcellinus (xxx. 6), Bregetio, the station of a Roman legion, where the emperor Valentinian died, while making preparations for a war against the Quadi. Following the course of the Danube, we next come to Aquincum or Acincum (Buda or Ofen), the principal town in the province of Valeria and the station of a legion. South of Acincum on the Danube, in the province of Savia, was Milatae or Milatia, afterwards called Bononia (Amm. Marc. xxi. 9; xxxi. 11); and below it were Acumincum or Aciminum (Peterwardein), and Taurunum (Semlin), the most easterly town in the province, near the confluence of the Save and the Danube.

The most important towns in the southern part of the province were Siscia (Sziasek), Cibale or Cibalis (Palaaha), and Sirmium (Schabacs), all on the Save. Siscia, which was upon the borders of Illyricum, was the most important town in Pannonia in the time of Augustus. Cibale or Cibalis was situated at a considerable distance below Siscia. It was memorable for the defeat of Licinianus by Constantine, and was the birthplace of the emperor Gratianus. (Amm. Marc. xxx. 24.) Sirmium, which was below Cibalis, was, under the later Roman emperors, the principal town of Pannonia.

On the Drave, near the confines of Noricum, was Petovio or Pstovio (Pettau), which is mentioned by Tacitus ('Hist.' iii. 1) as the winter-quarters of the 18th legion. Below Petovio, on the Save, were Jovia (Semevecs), and Mursia (Esseg), a colony founded by Hadrian. (Steph. Byz.) At Mursia the fleet of the Lower Danube was stationed, and near it Magnentius was defeated by Constantius. (Zonimus, i. 43.)

The only town of importance in the north-western part of the province was Sabaria (Steinamanger), a Roman colony founded by the emperor Claudius. (Pliny, iii. 27.)

PANORMUS. [PALERMO.]
PANTAI, RIVER. [BORNEO.]
PANTICOSA. [ARAGON.]
PAOLA. [CALABRIA.]

PAPAL STATES, called also *States of the Church*, is the name given to the dominions belonging to the See of Rome, of which the Pope is the monarch. This state occupies the central part of Italy stretching across the Peninsula in an oblique direction from the Mediterranean to the Adriatic. Its greatest length, from north to south, from the mouth of the Po at Goro to Monte Circeo, which is the most southern point, is about 260 miles. The breadth is very unequal. For a length of about 80 miles the southern part of the Papal States between the Neapolitan territory of Abruzzo and the Mediterranean has a width of only about 50 miles. For a few miles to the north of Rieti the width is greatest, extending from the Mediterranean to the Adriatic 130 miles; but in consequence of the projection of Tuscany eastward it grows rapidly narrower towards the north, so that in the latitude of Rimini the breadth is hardly 20 miles. Farther north the width is about 60 miles, from east to west, between the Adriatic to the frontier of Modena. The area of the States of the Church, exclusive of 484 square miles covered with water, roads, and buildings, is 15,881 square miles, and the population in 1850 numbered 3,006,771, besides about 10,000 Jews.

The northern provinces stretch from the Tuscan Apennines to the Po and the Adriatic, the ground sloping to the north and north-east, and merging into the wide plain of Lombardy. These provinces are the four legations of Bologna, Ferrara, Ravenna, and Forli, and have a population of about 950,000 inhabitants. This part of the country resembles the rest of north Italy in its climate and soil. In ancient times it was out of the limits of Italia proper, and formed part of Cisalpine Gaul; and even now the inhabitants rather resemble their Lombard neighbours than their fellow subjects, from whom they are divided by offsets of the Apennines, which approach close to the Adriatic coast in the neighbourhood of Rimini, where the Rubicon constituted the political boundary of Italy proper in the time of the Roman republic.

The eastern provinces extend from Rimini to the Tronto on the frontier of Naples, a length of 110 miles along the coast of the Adriatic. This division is bounded to the west and south by the central ridge of the Apennines, which separates it from the basin of the Tiber. This eastern division lies almost entirely on the eastern slope of the Apennines, the numerous offsets of which run in parallel ridges in a north-east direction from the central chain to the Adriatic coast, forming many transverse valleys watered by streams or torrents which have a short but rapid course. The distance from the central ridge or watershed to the Adriatic varies from 30 to 40 miles. The country is fertile and healthy, and is inhabited by an industrious and lively race of people. It is generally designated by the name of the *Marches*, but is divided into the provinces of Pesaro e Urbino, Ancona, Macerata, Camerino, Fermo, and Ascoli.

The southern division and the largest in extent, though not so densely peopled as the other two, is the most important, because it contains the metropolis, and includes the classical land of Latium and the other provinces which formed the early territory of ancient Rome. It extends south of the central ridge of the Apennines as far as the coast of the Mediterranean, being bounded on the west by Tuscany and by the kingdom of Naples on the east. This fine region comprises the ancient territories of Umbria, the Sabini, old Latium, and the western part of Etruria, and is now divided into the administrative provinces of Perugia, Spoleto, Rieti, Orvieto, Viterbo, Velletri, Frosinone, Civita Vecchia, and Rome. This extensive country is divided, with respect to its climate and productions, into two parts—the high lands and the valleys of the Apennines, including the valley of the upper Tiber, which are well cultivated and generally healthy; and the low lands of the Campagna and some other spots around the lakes of Perugia, Bolsena, and Bracciano, which are unwholesome and thinly inhabited. [CAMPAGNA DI ROMA.] There are few regions in Italy finer than the broad valley of Fuligno and Spoleto, the valley of Terni, the elevated plain of Rieti, and the rich territory around Perugia.

The area and population are distributed as follows over 20 provinces, 6 of which, called Legations, are governed by a Cardinal legate, and 14, called Delegations, are administered by dignitaries of lower degree:—

Legations.	Area in Square Miles.	Population in 1850.
Roma-e-Comarca	1,699	304,266
Bologna	1,292	367,340
Ferrara	1,053	229,862
Forli	683	203,007
Ravenna	674	175,338
Urbina-e-Pesaro	1,358	241,612
Velletri	629	59,356
Delegations.		
Ancona	424	172,393
Macerata	861	239,942
Camerino	311	88,055
Fermo	817	111,751
Ascoli	460	87,619
Perugia	1,447	222,926
Spoleto	1,130	123,765
Rieti	513	77,212
Viterbo	1,083	129,074
Orvieto	301	26,450
Frosinone	720	148,378
Civita Vecchia	373	20,365
Benevento	68	23,640
Total	15,381	3,006,771

The established religion is the Roman Catholic. The population includes about 10,000 regular clergy or monks, 8000 nuns, and about 32,000 secular clergy.

The central ridge of the Apennines runs through the States of the Church in a south-south-east direction, dividing the waters that flow into the Adriatic from those that join the Tiber. The road from Rome to Pesaro by Nocera crosses the Apennines between Gualdo and Cagli. Farther south-east there is a depression between Serravalle and Foligno through which passes the high road from Rome to Loreto and Ancona. South of this pass the Apennines form a lofty group extending to the eastward, and known by the name of Monte Sibilla, the *Mons Tetricus* of the ancients, which is 7200 feet high, and is the highest summit in the Papal States. The ridge then joins the mountains of Abruzzo in the kingdom of Naples east of Norcia. Two offsets detach themselves from the main ridge above the sources of the Nera, and run south, skirting the two banks of that river as far as its junction with the Tiber. The more eastern offset is intersected by the Velino, which makes its way through it by a fine waterfall not far from Terni. The whole fall of the Velino, from the level of the water above the cascade to its confluence with the Nera through a succession of rapids, is above 1000 feet. The country eastward of the Nera consists of high lands, which adjoin those of Abruzzo, and are a most interesting region, but seldom visited by travellers.

The southern division of the Papal State chiefly consists of the basin of the Tiber. This river rises at the foot of Monte delle Balze, in a

deep dell of the Tuscan Apennines, about 20 miles E.S.E. from the source of the Arno. The Savio, which flows by Cesena to the Adriatic, has its sources on the north side of the same mountain. The Tiber rises from two springs of limpid water in a wood of beech-trees, and, being swelled by mountain streams, flows in a south direction through a narrow valley between high mountains. The river passes by the towns of Pieve Santo Stefano and Borgo San Sepolcro, after which it receives the river Sovara, and soon after leaves the Tuscan territory and enters the province of Perugia. It then flows by Castello, and after a rapid course of about 50 miles from its sources it reaches the foot of the hill upon which stands the town of Perugia: it then flows through a fertile valley, receiving on its left bank the united waters of the Chiascio from the mountains of Gubbio, the Topino from Foligno, and the Maroggia, joined by the Clitumnus, from the valley of Spoleto; and lower down, on its right bank, the river Nestore, which comes from Città della Pieve on the borders of Tuscany. The river then enters a narrow gorge between two rocky ridges, on one of which stands the town of Todi, the ancient Tudertum or Tutere, a city of the Umbri and afterwards of the Etruscans, which is more than 1000 feet above the sea. The bottom of the river here falls about 2 feet in every 1000 feet, and the bed being confined and partly encumbered by stones and gravel brought down from the mountains, the waters rise in flood times as high as 24 feet, but the river is very shallow in the dry season. The navigation of the river, which from Perugia to Todi is carried on merely by rafts, becomes here totally interrupted. The Tiber, after receiving the Naia and other mountain streams, issues out of the gorge at the rapids called Passo del Forello, after which it enters a broad valley. It receives near Ovieto the river Paglia from the mountains of Tuscany, which is swollen by the waters of part of the Chiana. The river now assumes a more regular and less rapid course, flowing in a deep bed, and inclining to the south-west. It receives the Vezza from Montefiascone, and lower down the Nera, the largest of its affluents, near the town of Orta. The whole course of the Tiber, from its sources to the confluence of the Nera, is about 110 miles. From this point the regular navigation of the Tiber begins: boats of various sizes, some of which are 60 feet long and of 50 tons burden, carry to Rome wine, corn, charcoal, wood, and other produce of the upper country. In ascending the river they are towed up by buffaloes.

The Nera, the ancient Nar, a considerable river, rises in the high Apennines above Norcia, and increased by its affluents the Corno, Velino, Salto, and Turano, flows through a deep valley, passes the towns of Terni and Narni, and, after a course of about 70 miles, enters the Tiber near Orta.

After the confluence of the Nera, the Tiber flows through a valley between the Sabine Mountains on one side and offsets of Monte Cimino on the other: it receives on its right bank the united waters of the Treia and the Ricano, after which the valley becomes contracted between Mount Soracte on the west and the mountains of Poggio Mirteto on the east. After this contraction, it opens into the wide undulating plain of the Campagna. Three miles above Rome the Tiber receives the Anio, or Teverone, from the eastern Apennines, which has a course of above 60 miles. The course of the Tiber, from the confluence of the Nera to Rome, is about 70 miles, in which distance the width of its bed varies from 160 to 500 feet, the depth from 8 to 22 feet, and the fall is about one foot in every 3000 feet. Boats are three days in coming down from Orta to Rome, but in summer the navigation is often interrupted, owing to the shallowness of the water in several places. Within the walls of Rome the Tiber is about 300 feet wide and from 12 to 18 feet in depth. The river is never fordable in or near Rome. During heavy rains and floods the waters sometimes have risen more than 30 feet above the ordinary level, overflowing the lower parts of the city, and occasioning considerable mischief. The maritime navigation begins below Rome: the Tiber, after being confined by the quays and buildings of the town, spreads out to the width of 500 feet, until its bifurcation at Capo due Rami, a distance of 18 miles from Rome. Thence one branch of the river runs south-west into the sea below Ostia, a distance of about 5 miles, but is rendered useless for purposes of navigation by the accumulation of sand at the mouth. The other branch, which was widened by Trajan, and has been improved at various times by the popes, in order to keep open the communication between Rome and the sea, runs west for about four miles and enters the sea at Fiumicino, where the entrance is secured by two piers. In winter time vessels of from 130 to 190 tons, besides smaller ones, ascend the river to Rome; in summer there is often not more than 9 or 10 feet of water on the bar. Steam-tugs ply on the Tiber below Rome. The dreary sandy tract between the two arms of the river is called *Isola Sacra*, or Holy Island.

The basin of the Tiber below Rome is bounded on one side by the Alban Mount, and on the other by the offsets of Monte Cimino, which surround the basin of the Lake of Bracciano, the waters of which enter the sea by the river Arno. The Tiber, below Rome, receives only some small streams, the principal of which is the Galera, on its right bank. The basins of the lakes of Bracciano and Bolsena, which are separate from that of the Tiber, constitute, together with the basin of the river Fiora, near the Tuscan border, the greater part of the Patrimonio di San Pietro. In the opposite or south-east direction, the Alban Mount separates the basin of the Tiber from that of the

Promptine marshes; and farther north the mountains of Palestrina separate the basin of the Tiber from that of the Liris, of which the Sacco is an affluent. The total length of the river with its windings is about 200 miles. The Tiber is the largest and most important river of the peninsular part of Italy. Its waters from Perugia downwards to the sea are muddy and yellowish. The current as it enters the Mediterranean retains its colour to a considerable distance from the shore, and contrasts with the generally blue tinge of the sea-water, with which it does not mix for some miles.

The population of the States of the Church is Roman Catholic, with the exception of about 10,000 Jews, who live in the chief towns. The provinces, as before stated, are governed by a cardinal or other church dignitary, who is assisted by a council of laymen. There is also in every province a provincial council for local and financial affairs, which assembles for a fortnight once a year under the presidency of the delegate, or legata. For this purpose the communes appoint electors, who assemble at the head-town of their respective districts, and there choose the deputies to the council. One-third of the council is changed every two years. Every delegation or province is divided into districts, and every district into communes. Each commune consists of a town or large village, with the territory and hamlets belonging to it. At the head of each district is a governor (appointed by the Pope), who is also judge in the first instance, and is subordinate to the delegate in his administrative but not in his judicial capacity.

Every commune has a council, consisting of 48 members in the head towns, of 36 or 24 in the smaller towns, and of 18 in villages which do not contain more than 1000 inhabitants. The members of the council are taken in equal proportions from two classes, nobles and citizens or farmers. The councils deliberate upon the affairs of their respective communes, and make out, in August every year, an estimate in which are specified the probable expenditure of the following year and the means for meeting it, including any local taxes required. This estimate is forwarded to the governor of the province, who examines it, and then forwards it to Rome, where it is approved or modified. The estimate is then returned to the commune and published, upon which it becomes law, and no magistrate can depart from its provisions. The communal council appoints yearly, by a majority of votes, the local magistrates, all the officers and other servants of the commune, the secretary, the communal attorney, the receiver, the surgeon and apothecary (who for a fixed salary is obliged to attend the poor inhabitants gratis), the schoolmaster, the local police, &c. The councils are always presided over by the gonfaloniere or by the governor in the head town of a district. This system of municipal administration is more favourable to the liberties of the people than is commonly supposed. The communal councils are in fact more independent of the central authority than those of France. The common lands were sold by Pius VII. in order to supply the urgent wants and exactions of the French military. The ordinary revenue of the communes is now derived from taxes levied upon provisions coming to market, like the French octroi; and the extraordinary deficiency is made up by a capitation tax and a tax upon cattle. The expenditure consists of administrative, judicial, and police salaries, the repairs of the roads, public buildings, fountains, &c., the emoluments of the communal surgeon and apothecary, schoolmaster, and preacher who comes during Lent and Advent to deliver sermons adapted to those epochs. In the larger towns there are schoolmistresses, called *Maestre Pie*, paid by the commune for the elementary teaching of girls. There is however no general system of elementary instruction, and the proportion of illiterate people in the Papal States is much greater than in Lombardy.

The universities are those of Rome, Bologna, Perugia, Ferrara, and Macerata. There are also numerous colleges or gymnasia in Rome and the chief towns of provinces. Females of the higher classes are chiefly educated in convents.

With regard to the central government it is an elective monarchy. The Pope for the time being is the absolute sovereign of the state; he is assisted by a council of ministers and a council of state, over each of which the cardinal secretary of state presides. Laymen are appointed members of each of these councils. The governor of Rome is under the authority of the secretary of state, but is vested with great discretionary powers as to the police of the capital and its territory. The congregation or board called *Sacra Consulta*, consisting of cardinals and prelates, superintends the administration of the provinces, and is also a court of appeal for criminal matters. The territory of the state is divided into three military divisions, with an inspector at the head of each; the head-quarters are Rome, Ancona, and Bologna. The army consisted of 17,865 men in 1854, including 5144 police-gendarmes and 1778 custom-house guards. Many of the soldiers in the service of the Pope are Swiss.

The judicial department consists of a judge, called *Prator*, for civil matters in the head town of every province; two courts of appeal, one at Rome and the other at Bologna; and a supreme court, called *La Segnatura*, which sits at Rome. The ecclesiastical courts in each diocese judge of suits between clerical persons, and also between laymen who agree to bring their disputes before these courts. For criminal matters, there is a court in every province, presided over by the delegate; and two courts of appeal, one at Rome and the other at Bologna. The great evils of the system are frequency of

imprisonment on suspicion, and delay of trial. The penalties are imprisonment and hard labour either for life or for a term of years. Capital executions are resorted to only in very aggravated cases. Tribunals of commerce are established at Rome, Bologna, Ancona, and some other of the principal towns.

The revenue, according to the budget for 1854, amounted to 11,432,450 Roman crowns (worth 4s. 6d. each); the expenditure in the same year was estimated at 13,032,046 crowns. The interest of the debt, and other charges connected with it, amounted in 1851 to 4,800,000 crowns. The principal sources of the revenue are direct taxes, which amount to 2,800,000 crowns; customs duties; salt and tobacco monopolies, which bring in above 5,000,000 crowns; stamps and registry duty; post-office; and the lottery.

Agriculture, which is in a backward state, is the chief occupation of the population. A great extent of land is used for pasturage. The exports are—cattle, wool, cheese, lambskins, tallow, hemp, oil, some silk, vitriol, sulphur, pozzolana, potash, and cream of tartar. The salt-pans of Cervia and Comacchio, near the Adriatic coast, supply most of the salt for the consumption of the country. Vitriol is found near Viterbo; alum at La Tolla, near Civita-Vecchia; sulphur near Rimini; and coal near Pesaro, and at Sogliano, near Forlì. Wood and charcoal are the only fuel used.

The manufactures of the Papal State are of more importance than is generally supposed. One of the principal and oldest branches is that of woollen cloths, which are made in various towns of the state, and chiefly supply the internal consumption, especially of common or coarse cloth. The silk manufacture is carried on at Rome and Bologna. Tanneries are established chiefly at Ancona, Bologna, Pesaro, and Sinigaglia. Other industrial products are—paper, hats, soap, glass; and some cotton goods are manufactured at Rome. There are iron-smelting furnaces at Bracciano, Canino, and Conca, and iron-works in various other places. Plate-glass is made at Poggio Mirteto. Cables and ropes are made in the northern provinces, and exported to Greece and the Ionian Islands. Other manufactures are—wax-candles, catgut, liquorice, and refined sugar. The exports in 1852 were valued at 10,474,012 scudi, including the articles above named, and works of art and antiquity, sculptures, paintings, medals, mosaic, &c. The imports in the same year amounted to 10,218,426 scudi: they consist chiefly of tobacco, raisins and other dried fruit, colonial produce, salt fish, iron, lead, besides manufactures of fine cloth, silks, cottons, hardware, and articles of luxury from France and England.

The maritime trade is carried on chiefly by foreigners. This is the branch of industry most neglected by the natives of the Papal State. The navigation returns of the two ports of Civita-Vecchia and Ancona for 1852 give the total number of entries at 2311. Of these 1080, carrying 67,096 tons, were native vessels; and 1231, with 187,728 tons, were foreign, chiefly Austrian, Neapolitan, Tuscan, and Genoese. The departures in the same year were 2292, including 1082 native and 1210 foreign vessels. Even the coasting trade and the fishing along the greater part of the coast are carried on in great measure by foreign boats. The Neapolitans fish all along the Mediterranean coast, and the Venetians along that of the Adriatic. The Neapolitans supply Rome with fish, the consumption of which is very great in Lent.

The principal agricultural products are—wheat, barley, rye, and maize, which are produced in great quantity in the northern and eastern provinces; rice is cultivated in the low grounds; oil, wine, generally of ordinary quality, but some better sorts are made in the Marches, and on the hills of Albano, Orvieto, and Montefiascone; pulse and vegetables of every kind; fruit, including lemons and oranges, and chestnuts; hemp and flax, silk, tobacco, and timber and wood for fuel. There are forests of oak, cork-trees, elm, ash, and pine. The principal forests are on the sides of the Apennines, on the Mounts Cimino and Albano, on parts of the Monti Lepini, and along the sea-coast of the Mediterranean. The pine-forest near Ravenna, along the Adriatic shore, has been noticed by Byron in 'Childe Harold,' canto iv.

Horned cattle, including buffaloes, are numerous and remarkably fine, especially in the province of Perugia, the Campagna of Rome, and in the province of Ferrara. Very good cheese and butter are made. The sheep are reckoned at 2,000,000. Much cheese is made of ewes' as well as goats' milk. Pigs are reared in great numbers. Wild boars are numerous in the Pomptine Marshes. The horses are reckoned at about 500,000 in the whole state. The lakes and rivers abound with fish.

History.—After the fall of the western empire, and the re-conquest of Italy by Belisarius and Narses, Rome and the adjoining territory were administered by an officer called prefect, appointed by the Byzantine emperor, and subordinate to the exarch of Ravenna. Rome retained its municipal government, and the bishop of Rome, styled 'Præsul,' was elected by the joint votes of the clergy, the senate, and the people, but was not consecrated until the choice was confirmed by the Eastern emperor. The see of Rome enjoyed large revenues and benefices, the gifts of various emperors, besides the gifts and bequests of private persons. The people of Rome, forsaken as it were by the Eastern emperors, accustomed themselves to look upon their bishop as their chief defender and protector. The popes were the chief means of preserving Rome from being occupied by the Longobards. The Romans and the Italians in general refused to submit to the edict of

GEOR. DIV. VOL. IV.

Leo, the Isaurian, against images; and after the emperor was condemned by Pope Gregory II. in the council of Rome, A.D. 726, they refused to pay the usual tribute to the Eastern empire. (Paulus Diaconus, iv. 49.)

Rome now governed itself as an independent commonwealth, having its senate, its consuls and tribunes, and forming alliances with the dukes of Benevento and Spoleto, and with the Longobards. The pope was generally the mediator of these transactions. As the good understanding between the Longobards and the Romans was not however of long duration, the popes turned for protection towards the west, where the Frankish monarchy had attained great extent and importance. Gregory III., Zacharias, and Stephen III., wrote repeatedly to Charles Martel and his successor Pepin in the name "of the senate and the people of Rome," who, having renounced their allegiance to the Eastern emperor, wished to place themselves under the powerful protection of the kings of the Franks. And when Astolphus, king of the Longobards, devastated the territory of Rome, Pepin repaired to Italy with an army, and, having defeated Astolphus, obliged him not only to respect the duchy of Rome, but to give up the exarchate of Ravenna and the Pentapolis, not to the Eastern emperor, their former possessor, but "to the Holy Church of God and the Roman republic." The following list of the towns included in this grant is given by Anastasius:—Ravenna, Rimini, Pesaro, Fano, Cesena, Sinigaglia, Jesi, Forlimpopoli, Forlì, Montefeltro, Castel Sussubio, Acerragio, Monte di Lucaro, Corra, Castel San Mariano, Bobbio, Urbino, Cagli, Lucuolo, Gubbio, and Comacchio. Astolphus sent the keys of these towns to be deposited on the altar of St. Peter at Rome, but he did not give up the towns, and the possession of the Church and the Roman republic was merely nominal. The popes complained repeatedly of the non-fulfilment of the act of donation.

Charlemagne, urged by the entreaties of Adrian I., having come to Italy, defeated Desiderius, successor of Astolphus, and overthrew the kingdom of the Longobards. He assumed the title of Patrician of the Romans, and he confirmed his father's donation, and gave to the See of Rome the rents and fees of extensive domains in the exarchate and Pentapolis and other provinces, but retained himself the regal rights. The temporal power of the popes in those times was very little, being restrained on one side by the republican spirit of the people, and on the other by the imperial power, which regained the ascendancy whenever the emperor visited Rome. During the struggle between Pope Gregory VII. and the emperor Henry IV., an important addition was made to the temporal claims of the see of Rome by the donation of the Countess Matilda, who added to her paternal fiefs in the Modenes, Parmesan, and Mantuan territories, the rich succession of Godfrey, marquis of Tuscany, second husband of her mother Beatrix. She twice made donation of her territories, first to Gregory VII. and afterwards to Pascal II., which last is in her will dated 1102. Henry V., in 1116, the year after Matilda's decease, took possession of the whole of her property; but Matilda's donation continued long after to furnish to the see of Rome claims over a considerable part of northern and central Italy.

Innocent III. on his accession found the imperial power asserted over all Italy by Henry VI., in his double capacity of king of Lombardy and king of Sicily. The emperor had distributed the domains of Matilda as fiefs among his generals. But after the death of Henry in 1197, and of his wife Constance in the following year, their infant son Frederick was left to the guardianship of Innocent, who availed himself of the opportunity to assert the claims of his see founded upon the donations of Pepin and Charlemagne and of Matilda. He took possession of Spoleto and the Marches, and the towns of those provinces willingly opened their gates and swore allegiance to the see of Rome, their municipal franchises being guaranteed to them at the same time. These towns were Spoleto, Foligno, Nocera, Perugia, Gubbio, Todi, Rieti, Assisi, Città di Castello, Ancona, Fermo, Camerino, Sinigaglia, Osimo, Fano, Jesi, and Pesaro.

Rome and its duchy were still governed as a republic; but the people becoming tired of their senate abolished it, and substituted, after the example of other Italian cities, a foreign elective magistrate, whom they styled 'the Senator,' and to whom they gave the powers till then enjoyed by the senate. Innocent III. did not alter the form of the municipal institutions of Rome, but by the form of the oath which the senator took, that magistrate bound himself "to maintain the Pontiff in possession of his see and of the regal rights which should belong to St. Peter's Church, &c.; and lastly to provide for the safety of the cardinals and their household in every part of Rome and its jurisdiction."

Pope Nicholas III., after settling the disputes between Charles of Anjou and the emperor Rudolph of Hapsburg, urged the latter to define by a charter the dominions of the Holy See, and to separate them for ever from those dependent on the empire, and he sent to Rudolph copies of the donations of former emperors. Rudolph, by letters patent dated May, 1278, recognised the States of the Church as extending from Radicofani to Ceperano, near the Liris, on the frontiers of Naples, and as including the duchy of Spoleto, the march of Ancona, the exarchate of Ravenna, the county of Bertinoro, Bologna, and some other places. At the same time Rudolph released the people of all those places from their oath of allegiance to the empire giving up all rights over them which might still remain in the imperial

crown, and acknowledging the sovereignty of the same to belong to the see of Rome. This charter was confirmed by the electors and princes of the empire. (Raynaldus, 'Annales.') Several of the towns thus ceded, as Bologna, Perugia, Ancona, had long governed themselves as republics, and were possessed of considerable territories; while others constituted hereditary principalities, and the transfer of allegiance from the empire to the church made no alteration in their political condition.

The removal of the papal see from Rome to Avignon, at the beginning of the 14th century, where it remained for seventy years, tended greatly to weaken the loose bond between it and the provinces above-named. Accordingly we find during that period a number of petty princes and tyrants settled in central Italy often at war either among themselves or against the Visconti of Milan. The distant popes from Avignon sent legates with some mercenary troops to support the Guelph party, and to assert the authority of the papal see, but the towns and lords of Romagna stood their ground against them. At Rome, Rienzo put himself at the head of a popular movement, drove away the Colonna and other turbulent nobles, and proclaimed the republic, of which he was named tribune by popular acclamation. He re-established order, exterminated the robbers, and obliged the neighbouring barons to swear to maintain the new order of things. But Rienzo soon became intoxicated with vanity and pride, disgusted the people, offended the barons, and at last the pope sent a legate to supersede him. After seven months' power Cola di Rienzo was obliged to run away from Rome, at the beginning of 1348, and being arrested was taken prisoner to Avignon. Innocent VI., in 1353, sent Cardinal Gil Albornoz, a Spanish noble, who had distinguished himself in the wars of Spain against the Moors, at the head of an expedition which had for its object the reconquest of the States of the Church, and gave him Cola di Rienzo to assist him by his influence with the Romans. Albornoz defeated Ordelaifi of Forli, Malatesta of Rimini, Vico of Viterbo, and other petty princes, and restored the Romagna, the Marches, and the Campagna to the allegiance of the papal see. Cola di Rienzo, whom the cardinal had sent to Rome to second his views, was murdered there in a popular tumult in October 1354.

The popes returned to fix their court at Rome in 1371, and the government then assumed a more regular form, occasionally interrupted however by insurrections of the people of Rome. A great part of the territory, especially north of the Apennines, continued in the hands of petty princes or tyrants. Alexander VI., in the year 1500, sent his son, Cesare Borgia, who extirpated the tyrants of the Marche. Julius II., the successor of Alexander VI., put himself at the head of an army, conquered Romagna, Bologna, and Perugia, and from that time the Papal State acquired its present compact form. Ferrara was annexed to it in 1507, the duchy of Urbino in 1632, after the death of the last duke Della Rovere without issue, and in 1650 the duchy of Castro and Ronciglione.

In 1797 Bonaparte detached the four legations, Bologna, Ferrara, Ravenna, and Forli, and annexed them to the Cisalpine republic. In 1798 the French troops invaded Rome and drove away the pope. In 1801 the pope was restored to Rome and its territory, except the legations. In 1808 Napoleon detached the Marche, which he annexed to his kingdom of Italy, and in 1809 he took possession of Rome and the southern part of the Papal State and annexed it to the French empire. In 1814 the pope was restored to his dominions. Soon after his accession the present reigning Pope Pius IX., after a series of liberal concessions to his subjects, appointed a ministry, at the head of which was Count Rossi, and granted a constitutional parliament, consisting of 99 members popularly elected. The democratic party however were still unsatisfied. Count Rossi was assassinated at the very entrance of the Chamber of Deputies (Nov. 15, 1848); a democratic ministry was forced upon the pope, who however seized the earliest opportunity (Nov. 25) to escape from Rome to Gaeta, where he placed himself under the protection of the king of Naples. A provisional junta was instituted in Rome, and a constituent assembly called, which proclaimed a republican form of government, and declared the pope divested of all temporal power (Feb. 8, 1849). Against this the pope protested, and appealed to the great Catholic powers for intervention in his behalf. The National Assembly of the French Republic, Spain, and Naples sent troops in support of the rights of the Holy See; the French army under General Oudinot commenced to besiege the Eternal City on the 23rd of June. After considerable resistance the city surrendered unconditionally on the 3rd of July; the French took possession of the city, and soon after proclaimed the authority of the pope, who however did not return to Rome till April 12, 1850. Whilst the French were putting down the republican spirit in Rome the Austrians were similarly occupied in the Legations and Marche, and with equal success.

PAPASQUIARO. [MAXICO.]

PAPENBURG, a flourishing little town of 3620 inhabitants, in the Hanoverian province of Osnabrück, is situated near the edge of the Saterland Moor, about seven miles from the right bank of the Ems, with which it is connected by a canal. The town contains two Roman Catholic churches, three schools, and between 400 and 500 houses. The inhabitants gain their livelihood chiefly by building small craft and by trade. Besides saw-mills, sail-cloth, and rope-factories, there are brandy-distilleries and lime-kilns: the quantity of peat dug on

the moors is very great, and it forms an important article of export to the ports of the Baltic and the North Sea.

PAPHLAGONIA, a province of Asia Minor, was bounded N. by the Euxine, S. by the part of Phrygia afterwards called Galatia, E. by Pontus, and W. by Bithynia. It was separated from Bithynia by the Parthenius, and from Pontus by the Halya. (Herod. i. 6, 72.)

Paphlagonia is described by Xenophon ('Anab.,' v. 6, a. 6) as a country having very beautiful plains and very high mountains. It is traversed by two chains of mountains, running parallel to one another from west to east. The higher and more southerly of these chains, called Olgassys by Ptolemy, is a continuation of the great mountain chain which extends from the Hellespont to Armenia. Strabo (xii. p. 561, 562) however appears to give the name of Olgassys to the chain of mountains in the northern part of Paphlagonia, on which the Paphlagonians had built many temples. The country between these two chains of mountains is drained by the Amnias (Kara-Su), which flows into the Halya. There were several small streams which flowed from the mountains in the north of Paphlagonia into the Euxine, but the only river of importance besides the Amnias and Halya was the Parthenius, which is said by Xenophon to be impassable. (Xen., 'Anab.,' v. 6, a. 9.) In the neighbourhood of Pompeiopolis, in the central part of the province, was a mountain called Sandaracurgium, where, according to Strabo (xii. p. 562), sandaraca was obtained in mines which were worked by criminals, who died in great numbers in consequence of the unhealthiness of the labour. The sandaraca spoken of by Strabo was probably the same as sinopia, which was a kind of red ochre, obtained by the Greeks from Sinope, from which place it derived its name.

The Paphlagonians are said by Homer ('Il.,' ii. 851, 852) to have come to the assistance of the Trojans under the command of Pylæmenes from the country of the Heneti. They were subdued by Croesus (Herod., i. 28.) and afterwards formed part of the Persian empire. After the death of Alexander, Paphlagonia, together with Cappadocia, fell to the share of Eumenes. (Diod. Sic., xviii. 3.) It subsequently formed part of the kingdom of Pontus. Under the early Roman emperors it was united to the province of Galatia till the time of Constantine, who first erected it into a separate province.

The principal town of Paphlagonia was Sinope (Sinoub), a colony of the Milesians (Xen., 'Anab.,' vi. 1, a. 15), which was said to have been founded by Autolyous, a companion of Jason. It was built upon a rocky peninsula, and was for many centuries one of the most flourishing commercial towns in the Euxine. In the time of Strabo it was still a place of considerable importance. It was very strongly fortified, and possessed many handsome public buildings. The inhabitants were accustomed to catch off the coast great numbers of tunny-fish. Sinope maintained its independence till the 2nd century before the Christian era, when it was annexed to the kingdom of Pontus. Mithridates the Great, who was born there, made it the capital of his dominions, and adorned it with many public buildings. During the war which he carried on with the Romans it was taken by Lucullus. It was subsequently made a Roman colony. Diogenes the Cynic was born in this town. Sinope continued to be a considerable sea-port town till it was demolished by the Russian fleet under Admiral Nachimoff Nov. 30, 1853, on which occasion also the citadel was destroyed and the Turkish fleet in the roads burnt or sunk. The old walls of the town in part remain. The exports consist of timber, salt, oil, cordage, and fish.

PAPHOS. [BAFFO; CYPRUS.]

PAPUA, commonly called New Guinea, is an island of great extent, situated at the junction of the Indian and Pacific Oceans. It is separated by Torres Strait from the northern extremity of Australia; by the Strait of Gallowa from the small island of Sallawatty, which lies farther west; and by Dampier's Strait from New Britain, which is to the east of it. It extends from 10° S. lat. nearly to the equator. The most southern point, Cape Rodney, is in 10° 3' S. lat., and the most northern point, Cape Good Hope, in 0° 19' S. lat. From west to east it extends between 130° and 148° 30' E. long.; the most western point, Cape Salu, on Gallowa Strait, is in 130° 2' E. long., and the most eastern, Cape Rodney, in 148° 30' E. long. Its length from east-south-east to west-north-west, is nearly 1300 miles. Its width varies between 500 and 18 miles. The main body of the island, east of 135° E. long., constitutes a vast extent of continuous land, with a projecting peninsula at its eastern extremity, but between 135° and 133° E. long., a wide and open bay enters deeply into the land. This bay is nearly 200 miles wide at its entrance, in which some islands of considerable extent are situated, and penetrates about 200 miles southward into the body of the island. The southern extremity of this bay is separated from the Molucca Sea by an isthmus only about 18 miles wide. The island west of this isthmus consists of a projecting peninsula and deep inlets. According to a rough estimate, the surface of the island is about 260,000 square miles.

The surface and soil of this island are only known so far as they have been seen by navigators who have sailed along the coast. There are few places on which Europeans have landed, and in no place have they penetrated more than a few miles inland. The south-eastern peninsula, which terminates with Cape Rodney, is formed by a continuous chain of high hills, extending, according to Captain O. Stanley (in a paper read at the Geographical Society in February, 1851), for

300 miles, and of which some of the mountains attain a height of 10,000 feet, and one to as much as 12,800 feet. The declivities of the mountains are generally covered with wood, but these forests are free from underwood, which is rather a rare occurrence between the tropics. Small rivers are numerous, and there are probably some larger streams in the wider part of the island. In some places the surface is covered with good grass. Along the northern coast the sea is deep enough to be navigated by the largest vessels, and there are a few good harbours. On the south-eastern coast Captain Stanley found a ridge of shoal water at about 6 miles from the land, with strong currents in various directions. At a distance of from 10 to 20 miles from this coast there are numerous islands, which seem to lie in a row, and among which several are of volcanic origin. Dampier noticed three active volcanoes.

Along the southern shores, the country west of the isthmus is likewise mountainous, and the coast rather high and rocky, but it does not rise to any considerable elevation on the shores of MacCluer's Bay. The isthmus itself is formed by a chain of high hills. East of the isthmus, as far as Cape Buro (135° E. long., 4° S. lat.), the mountains advance close to the shore, and the sea can be navigated by large vessels. Cape Buro rises to a great height close to the sea; but east of this promontory the mountains recede farther inland. They are visible from the sea as far east as 138° E. long., but appear to be a great distance from the shore, which shows that they must attain a considerable elevation. Some navigators think that they have observed snow on them. No mountains appear east of 138° till we reach the peninsula in about 146°. The country between the sea and the mountains, and the whole country east of 138°, as far as it has been seen, is very low, and covered with extensive swamps, but generally occupied by lofty trees. This low coast cannot be approached, as it is lined by a broad belt of mud-banks. South of 8° S. lat., a wide and low promontory projects into the sea, between 138° 28' and 139° E. long. It is called *Valsche Caap* (Cape False), and up to 1835 was considered a part of Papua, but in that year a Dutch vessel discovered a strait between it and the mainland of Papua. Along the low shores are the mouths of some considerable rivers, but they are not accessible to vessels, on account of the extensive mud-banks at their mouths.

The natural productions of these islands are little known. The only animals are dogs, wild cats, and hogs, which are rather plentiful. Fish and turtle abound, and the inhabitants of the coast subsist chiefly on them. The ground appeared to Captain Stanley to be well cultivated, and the villages numerous. Lemons, limes, bamboo, and rattans seem to grow spontaneously. It is supposed that gold is found in the interior.

Papua is inhabited by two or perhaps three nations. The Papuas are rather stout, and not so short as the Australians. Their eyes are small and dark; the nose somewhat curved and projecting downwards; the lips thick, the mouth large, and the teeth exceedingly white; their hair is woolly; and their colour resembles that of the native Australian. The men wear a thin stuff, made of the fibres of the cocoa-nut-tree tied round their middle; and the women wear blue Surat cloth. The Haraforas live in huts, built between the branches of high trees, to which access can only be had by a ladder, which is drawn up during the night. They are said to be distinguished from the Papuas by a lighter colour, straight hair, and greater strength and activity of body. They are cannibals, and no person is permitted to marry until he can show the skull of a man whom he has killed. In this they resemble some tribes of Borneo and the Battas of Sumatra. They seem to have made some progress in agriculture, and they raise provisions, among which are plantains and kalavansas.

The Chinese and the inhabitants of the Ceram Laut and Goram Islands appear to carry on a very lucrative trade, the former on the northern and the latter on the southern coast. The Chinese import into Papua iron tools, especially chopping-knives and axes, blue and red cloths, China-beads, plates, basins of China, and other similar articles, and take in return, slaves, ambergris, trepang, tortoise-shell, small pearls, black loories, large red loories, birds of Paradise, and many kinds of birds which the Papuas have a peculiar way of drying. But the principal article of export is a bark called *masy bark*, which is taken to Japan, where the powder made of it is extensively used for rubbing the body. In Japan a pecul of this bark fetches thirty dollars. The harbour of Dory, near the western side of the Bay of Geelvink, is the most frequented by the Chinese.

The Portuguese discovered the western part of Papua soon after they had settled in the Moluccas, between 1512 and 1530. The Spaniard Seavedra visited it in 1528. Several other navigators discovered other parts of the coast. Our countryman Dampier discovered the strait which divides the island from New Britain, and sailed along the whole extent of its northern coast. In 1792 MacCluer surveyed the bay which bears his name; and in 1802 Flinders examined the country adjacent to Torres Strait, which was discovered by the Spaniard Torres in 1606. In modern times Koff, a Dutchman, has discovered and surveyed the south-western coast; and on his report respecting the advantageous trade which may be carried on with this island, the Dutch government founded a colony, and erected, in 1828, a small fortress on a spacious bay, called by the Dutch, Tritons Bay. The fortress, which is called Dubus, is situated in 3° 42' S. lat., 134° 15' E. long.

PARÁ, or with its full title, *Santa Maria de Belem do Gram Pará*,

is a town in Brazil, the capital of the province of Pará, in 1° 18' S. lat., 48° 22' W. long. It is built on the eastern banks of a wide river, formed by the confluence of the river Tocantins with the Tagipurú, or southern arm of the Amazonas, and called Rio do Pará. Opposite the town the river is about 7 miles wide, and this may be considered as its mean width to its mouth, a distance of more than 70 miles. On the south side of the town is the Rio Guamá, a considerable stream, which joins the Rio do Pará by a westerly course. The streets of Pará are wide and straight, and intersect one another at right angles. The houses are chiefly built of stone, but not high, consisting rarely of more than two floors and frequently of only one. The cathedral is large and has a fine appearance. The best edifice in the town is the College of the Jesuits, now the residence of the Bishop of Pará: a part of the building is occupied by the college, in which young persons study divinity. The church contiguous to the college has been converted into a hospital. The palace of the governor and the custom-house are also good buildings; and there are several churches and a theatre.

The commerce of Pará is considerable. The exports consist of sugar, rum, molasses, coffee, cacao, cotton, vanilla, copaiba, copal, dye-woods, India-rubber, indigo, arnotto, Brasil nuts, and various other articles, some of which are brought from the countries on both sides of the Amazonas, and frequently from a distance of 1000 miles and more. Pará sends articles of European manufacture by way of the Amazonas and Rio Tapayos to the western interior province of Matto Grosso, from which it receives gold in exchange.

The town was founded in 1615 by Francisco Caldeyra. In 1820 its population amounted to above 20,000; but in 1836 its prosperity was checked by an insurrection of the Indians of the province, who took possession of the town and kept it for about six months; the population is now estimated at 10,000, chiefly of European descent.

PARAGUAY, Republic of, South America, is situated nearly in the centre of that continent, between 20° and 27° 30' S. lat., 54° 30' and 59° W. long. It lies between the rivers Paraná and Paraguay; and is bounded E. and N. by Brazil; W. by the desert and unsettled country known as the Gran Chaco, claimed by the Argentine Confederation, but occupied by native Indian tribes; and S. by Corrientes. The area is about 75,000 square miles. The population is about 250,000.

Surface, Soil, Hydrography.—The northern part of the country is mountainous. From the Serra Selada, one of the mountain ranges which traverse the middle of Brazil from east to west, a branch called Sierra Amambahy detaches itself near 15° S. lat. and 55° W. long. This branch runs for some distance south-south-west, and then south, dividing the tributaries of the Paraná, which run east, from those of the Paraguay, which run west. It enters Paraguay near 20° S. lat., passes in a southern direction to the vicinity of 24° S. lat., where it turns eastward and terminates on the banks of the Rio Paraná, opposite the Salto Grande de Sette Quedas. [BRAZIL, vol. ii. col. 94.] Where it runs west and east this range is called Sierra Maracaju. That portion of Paraguay which lies on the east and north of this range is little known, being possessed by native tribes. It seems to have a very broken surface, exhibiting a succession of valleys and ranges of high hills, all covered with tall forest-trees. The rivers which descend from it are full of rapids and cataracts. The country west of the Sierra Amambahy is less mountainous, but has likewise a broken surface, and its rivers run with great velocity, though their course is less interrupted by rapids. It is also well wooded, and in general of great fertility, but few if any whites have settled in this part.

The remainder, or that part which is situated south of 24° S. lat., is one of the most fertile and most pleasant countries of South America. The greater part of the surface is a succession of hills and gently sloping eminences, and broad open valleys intersected here and there with lakes. The high lands which form the watershed between the affluents of the Paraná and those of the Paraguay, are throughout this southern and cultivated part of Paraguay much nearer to the Rio Paraná. The lower grounds and plains are in some tracts savannahs, and afford excellent pasture-ground; single palm-trees are dispersed over them. The hills and slopes however are wooded from the top to the bottom, and frequently with stately forest-trees. The vigorous vegetation shows the great fertility of the soil, which is still more evidently proved by the extent of cultivation. Though cultivation generally occurs only in detached patches and isolated tracts, no part of the interior of South America has a larger proportion of the soil under cultivation than the southern half of Paraguay. But there are some tracts less favourable for agriculture. Nearly thirty miles south of Assuncion begins a low tract of alluvial soil, which is covered with extensive marshes partly occupied by shallow pools of water. It is several miles wide, and extends along the Paraguay to its junction with the Paraná. Though in general destitute of trees, it is separated from the banks of the river by forests, which supply occupation to a small number of wood-cutters, the only inhabitants of this unhealthy tract. Near the place where the Paraguay joins the Paraná the country is more elevated, and its surface is overgrown with thorny acacias and underwood of every kind. But along the Paraná other tracts of marshy ground of a similar description extend as far as the island of Apipé, from which to the Salto de Sette Quedas the hills and elevated ground come close up to the banks of the river.

The rivers Paraná and Paraguay which inclose Paraguay on three

sides are described under ARGENTINE CONFEDERATION and BRAZIL. They differ greatly in their character as navigable rivers. The *Paraguay* is navigable in all its extent within this country, though its course is rather rapid at its northern extremity near the rocky barrier called Fecho dos Morros (21° 20' S. lat.). Vessels of 300 tons burden may ascend it as far as Assuncion, and smaller vessels several hundred miles within the boundary of Brazil. The *Paraná*, which runs along the eastern side of the country, is much less favourable to navigation. The great cataract, called Salto de Sette Quedas, near 24° S. lat., forms an insuperable impediment to navigation; and even lower down there occur several difficult passages, where the river descends in long rapids over rocky shoals. Vessels of 300 tons burden ascend to the island of Apipé, to take in timber. Some of the smaller rivers which join the Paraguay, are navigable to a short distance from their junction with it, but one of them, the Tibiquari, is navigable above a hundred miles. It drains the southern portion of the country, and falls into the Paraguay near 26° 30' S. lat.

Climate and Productions.—Paraguay enjoys the advantages of the intertropical rains. The rainy season occurs in the months when the sun is in the southern hemisphere. The rains are far less abundant than nearer the equator, but sufficient to bring the fertility of the soil into full action. Except in the marshy districts the climate is said to be very salubrious. At Assuncion the ordinary summer temperature is 85° Fahr., but it sometimes reaches 100°. In winter it falls to 45°; but the temperature depends greatly on the direction of the wind: north winds are hot; south or south-east, cold; westerly winds seldom occur, and never last more than two hours.

The natural productions of Paraguay include those of temperate and intertropical climates; and cultivation might embrace a wider range. But the long interruption of foreign intercourse and subsequent unsettled state of the country have prevented all chance of progress in agriculture, all the operations of which are still carried on in the rudest possible manner. The principal articles cultivated as food are maize, batatas, mandioc, yucca-root, and beans. The cultivation of the sugar-cane, tobacco, and cotton is rather extensive. Coffee and cacao grow luxuriantly; and the mulberry tree is indigenous. The principal fruit-trees are oranges and figs. The vegetables chiefly grown are onions, capsicums, and garlic. Water-melons and muskmelons are abundant and good.

Paraguay possesses great wealth in its forests, which contain numerous species of lofty timber-trees, and dye-woods for tanning and other purposes. Several of them produce gums and India-rubber, and others are used for cabinet-work. All the vessels that navigate the rivers Paraguay and Paraná are built of timber supplied by the forests of this country, and the ropes are made of the fibres of different native plants. The most remarkable of the trees is that which yields the famous herb called 'maté,' or Paraguay tea, which is in general use in all the southern countries of South America as a beverage. The country which separates the yerbales (or forests from which the leaf is procured) from the Paraguay is without cultivation, and covered with thorny trees intersected by marshy grounds.

As Paraguay does not contain such extensive prairies as those which occur in all the surrounding countries, the number of horses, mules, and cattle is not so great, but it is sufficient for the internal consumption. Most of the animals peculiar to South America are found in this country; and the monkeys commit great depredations on the fruit-trees and corn fields. Various kinds of birds, as parrots and paroquets, pheasants, toucans, humming-birds, and cockatoos, are numerous. The royal duck, or pato-real, is nearly as large as a goose, with a red and varied plumage. Wild bees are found in great numbers in the woods, and both honey and wax constitute articles of export. The large ants of this country have attracted the attention of naturalists on account of the extensive habitations which they build. The mineral productions are not known.

The manufactures are only of the comparatively few articles required for domestic consumption; and are carried on in the most primitive manner. The cotton for instance "is cleaned and spun by hand, and generally wove by itinerant manufacturers who carry about on horseback a portable loom, which they tie to a tree wherever it may be requisite to set it up for use."

The commerce of Paraguay might become of great importance were personal security established in the country, and the energy of the inhabitants directed to peaceful pursuits. The country is extremely fertile in itself, and capable of furnishing very varied agricultural products: the extensive forests supply immense quantities of valuable timber; and her rivers are the highways to a great portion of the mining regions of Bolivia and Brazil. Before its independence Paraguay exported goods to Buenos Ayres alone amounting in value to above \$50,000, consisting of 8,000,000 lbs. of maté, 1,000,000 lbs. of tobacco, besides cotton, sugar, molasses, spirits, &c. During the dictatorship of Francia in Paraguay the foreign trade, and even that carried on with the neighbouring provinces, was almost entirely destroyed; and not much progress has since been made towards its restoration, notwithstanding that treaties have been made with the Argentine Confederation, Brazil, and Bolivia, for the opening of the Rio de la Plata, the Paraná, and the Paraguay to each other's flags, and also permitting the free navigation of the rivers by foreign vessels. The chief exports at present are of maté, timber, sugar, cotton, tobacco, and hides.

Inhabitants.—In a few of the towns and their vicinity live a comparatively small number of whites; and a larger number of mestizos, or descendants of Spaniards and Indians, who differ little from them in appearance. Both these classes understand and commonly speak the language of the Guaranis. This tribe of aborigines forms the bulk of the population, and in manners and civilisation they approach nearer the whites who reside among them than any other of the aboriginal tribes of America. Some other tribes, as the Payaguas and Nalicunga, are dispersed among the Guaranis, but they consist of a small number of individuals.

Political Division and Towns.—The republic is divided into eight departments, called, after their capitals—Assuncion, Concepcion, Santiago, Villa-Rica, Curuguaty, Candelaria, San Fernando, and Santa Hermengilda.

Assuncion, the capital of the republic, population about 8000, is built near the left bank of the Paraguay River, in the form of an amphitheatre, and consists merely of one street of considerable length, with several connected lanes, and a great number of small houses, standing apart, and surrounded by groves of orange-trees. The cathedral is a building without any pretensions. The government-house is an extensive but tasteless edifice of only one floor. The best buildings of the town are a few convents. The inhabitants are mostly the descendants of Europeans and Indians, with a few negroes. *Cazapa*, in the interior, about 30 miles S.E. from Assuncion, population about 2000; and *Curuguaty*, about 40 miles N.E. from Assuncion, population about 3000, are said to be places of some trade. *Neembuco*, on the Paraguay, towards the southern extremity of the republic, population about 4000, is the chief trading town for foreign vessels. *Villa Reale de Concepcion*, also on the Paraguay, but considerably higher, population 4000, is the chief mart for the herb maté, the principal supply of which is obtained from the forests some distance east of the town. *Villa Rica*, in the interior, about 25 miles E.S.E. from Assuncion population about 3000, is the centre of the southern maté district.

History.—After the Spaniards had discovered the wide embouchure of the Rio de La Plata, they sailed upwards, and tried to establish a colony on the banks of the river. But two attempts of this kind failed. The settlements contained only a small number of settlers, who were soon destroyed by the warlike natives of the plains. In 1535, the Adelantado, Don Pedro de Mendoza, was sent with a considerable number of vessels to found a great colony. He sailed up the Paraná and Paraguay for nearly a thousand miles, until he came to Paraguay, where he founded the town of Assuncion. From this place the Spaniards by degrees spread over all the countries of South America south of 20° S. lat., and east of the Andes. In the 16th century the Jesuits were sent to those parts for the purpose of converting the natives to Christianity. Their success was not great until they obtained from the Spanish court a mandate (about 1690) forbidding all other Spaniards to enter their Missions without their permission. The Jesuits settled among the numerous tribe called the Guaranis, on both sides of the river Paraná, above the island of Apipé, and succeeded in bringing them to a certain degree of civilisation. When the Jesuits were expelled, in 1767, the Missions were inhabited by more than 100,000 civilised Indians, of whom perhaps less than half the number were in Paraguay. They afterwards dispersed through different parts of La Plata, but it seems that the majority settled in Paraguay, which after that time was entirely subjected to the viceroy of Buenos Ayres. In 1810, when an independent government was constituted in Buenos Ayres, Paraguay refused to acknowledge its authority, and defeated General Belgrano, who had been sent to bring Paraguay to obedience. The country soon after declared its independence. After some changes in the government, Doctor Gaspar Rodriguez de Francia, a lawyer, was in 1814 elected dictator. In 1817 he became dictator for life; and he ruled the country with an iron sway till his death in 1840. During his long and cruel despotism he adopted the policy of the Jesuits, absolutely prohibiting all intercourse with foreign countries, and placing the intercourse with the neighbouring provinces under the most irksome restrictions. No person who entered the country was permitted again to leave it without special permission from Francia himself. General Lopez, who has been dictator since 1844, has manifested a growing desire to open Paraguay to commercial intercourse, not only with the neighbouring provinces but also with foreign countries, and, as already mentioned, has entered into treaties by which the free navigation of the Paraguay, Paraná, and La Plata rivers is secured.

PARAMARIBO. [GUYANA, Dutch.]

PARAMATTA. [WALES, NEW SOUTH.]

PARANA. [BRAZIL; ENTRE RIOS; PARAGUAY.]

PARENZO. [ISTRIA.]

PARGA, a town in the province of Albania in European Turkey, on the coast of the Ionian Sea, opposite to the Isle of Paxo, from which it is 12 miles distant, in 39° 17' N. lat., 20° 18' E. long. This place is first mentioned in the 15th century, when, amidst the wreck of the Eastern empire, the inhabitants of Parga sought safety in the protection of Venice, retaining however their own municipal council, the

appointment of their magistrates, and several other privileges. This state of things lasted till the fall of Venice, in 1797, when, in the partition of the Venetian territories between France and Austria, France kept for herself the Ionian Islands and the Venetian settlements on the coast of Epirus. But after the invasion of Egypt by Bonaparte a Turco-Russian fleet and army attacked the Ionian Islands, and took them from the French, and at the same time Ali Pasha of Epirus attacked the French garrison of Prevesa, and massacred it with circumstances of great atrocity. He likewise invaded Butrinto and Vonitza, from which the French had withdrawn, as well as from Parga. Parga however was strong by nature, and the inhabitants, being summoned by Ali to submit, boldly refused, but admitted a Turkish bey to reside among them, according to the stipulations of a treaty between Turkey and Russia, to protect them against any encroachments from Ali. Parga remained in this state of nominal subjection to the Porte till 1806, when war broke out between Russia and the Porte; and the inhabitants fearing that Ali would renew his attempts to subjugate them, applied for protection to the Russian admiral on the station, who sent them a garrison.

By the treaty of Tilsit, in 1807, the Ionian Islands being given up to France, the Russian troops which were stationed in them withdrew, including the detachment at Parga, which was now garrisoned by the French. In 1814, the English, having already driven the French out of the Ionian Islands, with the exception of Corfu, and placed a garrison in the island of Paxo, which lies in sight of Parga, Ali Pasha sent a considerable force against Parga, which invaded its territory, took some villages, and murdered or carried away the inhabitants, but the Parguinoles sallied out of their town, repulsed the Turks, and killed the bey, who was a nephew of Ali. The French garrison remained within the citadel, and did not take part in the action. The Parguinoles, seeing that they could no longer rely on the protection of France, applied to the English at Paxo, in March, 1814. General Campbell, who commanded in the Ionian Islands, sent a detachment with two frigates; and the Parguinoles having surprised the citadel and hoisted the English flag, the detachment was landed, and took possession of the fortress on the 22nd of March, and the French garrison was sent to Corfu. After the general peace that followed the downfall of Napoleon I., an agreement was entered into at Constantinople between the English minister and the divan early in 1817, for the delivery of Parga to the Porte, under the condition that those inhabitants who might choose to emigrate should have an asylum in the Ionian Islands, and that their immoveable property should be valued and paid for by the Porte previous to their embarkation. This arrangement was formally announced to the Parguinoles by a proclamation dated May 28, 1817. The primates and other inhabitants, numbering altogether above 3000, declared that all would leave the place rather than trust themselves to the Turks.

The proceedings for the estimation and payment of the property were protracted for nearly two years through the cavils of the Turkish commissioner and the intrigues of Ali Pasha, who wished to obtain Parga without paying the money. At last, in May, 1819, the whole population of Parga embarked in English vessels, having received the valued amount of their property, 150,000*l.*, and were settled at Paxo and Corfu. The Turks then occupied Parga.

The town of Parga stands on a rock forming a small peninsula. It has two ports, one of them anciently called *ἄλιον λιμὴν* 'the port of sweet waters, now Port Veliki. The town is walled and has narrow streets. The citadel on the summit of the rock is almost impregnable. It is surrounded by a fertile territory, and the townsmen export oil, tobacco, fruit, and tolerably good wine.

PARIA, THE GULF OF, extends between the island of Trinidad and the continent of South America, and has received its name from the adjacent portion of the continent, which was once called Paria, a name afterwards superseded by that of Cumana. The gulf has nearly the form of a quadrangle, extends about 100 miles, from 61° 30' to 63° W. long., and is about 40 miles across. A hilly promontory, projecting from the continent of South America more than 70 miles, separates the gulf from the Caribbean Sea, and terminates on the east with Cape Punta de la Peña, which is also called Cape Paria. Opposite this cape, and about 20 miles from it, is the most north-western point of the island of Trinidad. This opening contains four straits formed by three rocky intervening islands. The most western of these straits, called Boca de Dragon (Dragon's Mouth), is the widest, being about six miles across to the rocky island called Chacachacares, and is that commonly used by large vessels. The Isla de Huevos (Isle of Eggs) forms the second strait, called Ship Channel, which is only two miles wide, and is used by vessels leaving the gulf. Between the Isla de Huevos and the Isla de Monos (Isle of Apes) is the Huevo Channel, which is somewhat wider than the preceding, and is more used by vessels entering the gulf. The Monos Channel, between the Isla de Monos and the north-western point of Trinidad, is the narrowest, and the current in it is the strongest. It is only navigated by small vessels. As the current runs through all these straits northward, the gulf can only be entered with a strong breeze. The tides also, which rise about six feet, run with great force. The southern entry of the gulf is between the rocky cape called Punta Iccacos, in the island of Trinidad, and the low alluvial shores lying on both sides of the two most western of the mouths of the Orinoco,

called Cano de Pedernales and Cano de Manamo Grande. From these low shores a shoal extends nearly across the strait, which is called the Serpent's Mouth. The narrow entry into the gulf can only be passed with a strong south-west wind. The gulf itself may be considered as one of the most extensive and best harbours on the globe. It offers nearly everywhere excellent anchorage, especially along the coasts of the island of Trinidad, in from 3 to 30 fathoms water, and the ground is everywhere free of rocks.

PARIME MOUNTAINS. [BRAZIL; ORINOCO RIVER; VENEZUELA.]

PARIS, the metropolis of France and capital of the department of Seine, is situated on the river Seine, and about 110 miles in a straight line E.S.E. from its mouth. The church of St. Geneviève, the pavement of which is 199 feet above the level of the sea, stands in 48° 50' 59" N. lat., 2° 20' 57" E. long. The Observatory of Paris in the southern part of the city stands in 48° 50' 13" N. lat., 2° 20' 22" E. of Greenwich. The population according to the census of 1851 was 996,067 within the old walls and barriers; but reckoning the inhabitants of the suburbs inclosed by the new fortifications, the population exceeds 1,250,000.

Paris is mentioned by Cæsar under the name of Lutetia, which was the chief town of the Parisii, a Celtic tribe, and stood on the largest of the islands formed here by the Seine. On this island, called Ile-de-la-Cité, the cathedral of Notre-Dame now stands. In B.C. 54, Cæsar convoked an assembly of the nations of Gaul at Lutetia. The town was burnt in the following year by the Gauls to prevent its falling into the hands of the Romans; but it subsequently came with the rest of Gaul into their power, and was included in the province of Lugdunensis Quarta, or Senonia. For the next four centuries Lutetia appears to have been of little importance. About A.D. 360 it took the name of the tribe to which it belonged, Parisii. It was the seat of a bishop from 245; in 272 St. Denys, its first bishop, suffered martyrdom with his companions in the persecution of Valerian on the hill of Montmartre, which is said to have derived its name from this event. Lutetia was the favourite residence of Julian while he governed the provinces of Gaul. Under the Romans the buildings connected with the town extended beyond the island to both banks of the river. Several traces of Roman altars, tombs, and aqueducts have been discovered at various times on the site of Paris.

Childeric I. drove the Romans from Paris in 466. His son Clovis, after his conversion to Christianity, made Paris his capital in 508, and was buried there in 511. Paris gave name to one of the kingdoms into which the dominions of the Franks were divided. After 567 it ceased to be the residence of the kings of the Franks. Several of the churches and other religious establishments of Paris were founded in the reigns of the Merovingian princes. A small basilica dedicated to St. Stephen is said to have occupied part of the site of Notre-Dame before the Frankish invasion. Under Clovis was built over the grave of St. Geneviève a church, dedicated to St. Peter and St. Paul, which was afterwards incorporated with the abbey of St. Geneviève. Childeric who died in 558 laid the foundation of Notre-Dame, and of the abbey of St. Germain-des-Près and St. Germain-l'Auxerrois. The Paris of Merovingian times covered the Ile-de-la-Cité, which was surrounded by a wall pierced by two gates that opened upon two bridges corresponding to the Grand-Pont and the Petit-Pont, which now cross the northern and the southern arms of the Seine respectively. To the east of the street that united the two bridges lay the cathedral, the baptistery, and an hospital for the poor, which long after became the Hôtel-Dieu. On the northern side of the island, partly on the site of the Marché-aux-Fleurs, was a building called the prison of Glauconius; and between the cathedral and the present Palais-de-Justice was the commercial part of the city.

Charlemagne did not reside in Paris, but he established there in 779, with the assistance of the clergy, a school in which reading, writing, calculation, and singing were taught. Under his successors Paris became the patrimony of hereditary counts. In 845 the Northmen pillaged the city, which the inhabitants had deserted; in 856-7 they pillaged it a second time, and burnt some churches; in 861 they pillaged it a third time, and burnt more churches, to which and to the clergy the Northmen before their conversion to Christianity had a great aversion. At this time they broke down the Grand-Pont to enable their barks to ascend higher up the river, whither they repaired to plunder the towns on the Upper Seine. After their retreat, the bridge was repaired by Charles le Chauve. In 885 the Northmen under Siegfried again attacked the place. The assailants, to the number of 38,000, made several attacks, in which they were foiled by the bravery of Count Eudes; the emperor Charles Le Gros came with succour to the beleaguered city, but instead of fighting, he concluded a disgraceful treaty with the Northmen. It was to recompense the bravery of Eudes, that on the death of the emperor in 888, he was elected to the throne of France in an assembly of the grandees of the kingdom. The Northmen again appeared before Paris, and were defeated by Eudes with fearful slaughter at the battle of Montfaucon.

Hugues Capet, son of Hugues the Great, grandson of Robert, brother of Count Eudes, and founder of the Capetian dynasty, having become King of France in 987, continued to reside at Paris, which thus again became the capital. Hugues and his successors resided in the building now called the Palais-de-Justice. In the reign of Louis VI. (1108-1137), it is probable that the fortresses or prisons of

Le-Grand-Châtelet and Le-Petit-Châtelet on the north and south banks of the river, at the extremities of the two bridges from La-Cité to the mainland, were built: they were demolished, Le-Petit-Châtelet in 1782, and Le-Grand-Châtelet in 1802. By the same king, the suburbs on the north and south banks were inclosed by walls, and thus incorporated with the insular part of the city. This was the second inclosing wall that girt the city of Paris which then consisted of three parts—the town north of the Seine, the city on the island, and the university on the southern bank. Under Philippe Auguste, a new wall 8 feet thick, strengthened by 500 towers and by a deep fosse, was built, comprehending a much larger inclosure than those of former times, both on the north and south bank, and some of the principal streets were paved; the foundation of the present cathedral of Notre-Dame was laid; several other churches also, and the hospital de-la-Trinité were built.

In the reign of Jean II. (1350-64), the town had again outgrown its limits, and many edifices had been erected without the walls. In apprehension of an attack from the English after the battle of Poitiers (1356), new walls were raised on the north side of the Seine, comprehending a yet larger inclosure than those of Philippe Auguste; and on the south side the old walls were repaired and the ditches deepened. The island of Notre-Dame, now Île-de-St.-Louis, immediately above the Île-de-la-Cité, was also fortified, and the passage of the Seine both above and below the city was obstructed by strong iron chains.

The treaty of Troyes (1420) and the events connected with it, gave Paris into the power of the English Henry VI., under whom it was governed by the Duke of Bedford, from 1421 to 1436. In 1429 it was attacked by the troops of Charles VII. of France under the command of Joan of Arc, but the assailants were repulsed. In 1436 it was taken by the French under the Count of Richemont, constable of France, and the Count Dunois, with the aid of the townspeople. The English garrison was surprised and put to the sword, except a few who retired to the fortress of the Bastille (one of the great fortified gates erected in the line of the last-mentioned wall at the extremity of the Rue-St.-Antoine), and surrendered upon terms.

During the troubled period of the dynasty of Valois, the edifices, public and private, of the city were gradually improving in character. The population of Paris in the latter half of the 15th century is supposed by Dulaure to have been about 150,000. The police of the place was wretched; the environs and suburbs, and occasionally Paris itself, were infested with wolves. In the reign of François I. the fortifications of Paris were repaired and strengthened. Under Charles IX. (1566), the circuit of the walls was partially enlarged, in order to comprehend the palace of the Tuileries, then in course of erection, by Catherine de' Medici, the queen-mother. The residence of the king was at that time at the Louvre, originally a fortress of ancient date, which had been made a royal residence, and enlarged and adorned by the care of successive sovereigns. It was at this time being gradually rebuilt. The rebuilding of the suburb of St.-Germain, on the south side of the river, which had been ruined in the wars of the 15th century, was commenced and some of its streets paved in the time of François I.; and in the reign of Henri III. a bridge was erected (near where the Pont-Royal now stands) to connect the quarter of the Louvre with this suburb. This appears to have been the only bridge across the undivided stream of the Seine. There were five other bridges which connected the island of La-Cité with the main: the Grand-Pont (now Pont-au-Change), the Petit-Pont, the Pont-des-Moulins, connecting La-Cité with the north bank of the river a little below the Pont-au-Change; Pont-Notre-Dame, in a line with the Petit-Pont over the north arm of the Seine; and the Pont-St.-Michel, opposite the Pont-au-Change over the southern arm. In the reign of Henri II. the erection of the Hôtel-de-Ville was commenced, but it was not finished till more than half a century afterwards. The population of Paris in the time of Henri III. is estimated to have been about 200,000. In August 1572 Paris witnessed the terrible massacre of St. Bartholomew, in which it is said that nearly 5000 persons were killed. In 1588 the Parisians who had embraced the party of the League, barricaded the streets with chains, with the paving-stones torn up for the occasion, and with casks of earth; and manning the barricades with musqueteers, defeated the troops which Henri III. had brought into the city. Henri quitted Paris next day, and the city came into the power of the League. This revolt is known in history as 'the day of the barricades.'

Upon the assassination of the Guises at Blois (December, 1588), the Parisians broke out into a fresh revolt. Henri III. advanced to besiege Paris, which was now under the command of the Duke of Mayenne; but his assassination at St.-Cloud (August 20th 1589) arrested his purpose. The siege was formed on the 31st of the following October, by his successor Henri IV. The suburb of St.-Germain was plundered; but the siege was raised soon afterwards, and the king retired with his army. In the following May (1590) the siege was renewed, the suburbs were all taken in one night, and the gates strictly blockaded. The effect of this long siege on a population so vast was truly dreadful. The most loathsome articles were consumed for food; numbers perished, and parts of the city were almost reduced to solitude. Henri, moved with compassion, allowed 3000 of the poorer classes to pass out of the place, and repeatedly admitted

supplies of provisions to enter. The approach of a Spanish force under the Duke of Parma obliged him to raise the siege (August 30th); and he did not obtain possession of his capital till March 1594.

In the reign of Henri IV. Paris received many improvements. The Pont-Neuf was completed, the hospital of St.-Louis built, several of the quays constructed, and the palace of the Tuileries finished. All the bridges, except the Pont-Neuf, were at this time lined with houses. In respect of cleanliness and security from robbery, little improvement seems to have taken place. In the reign of Louis XIII. several new bridges were erected; the churches of St.-Roch, of the Oratoire, of Val-de-Grace, and the façade of St.-Gervais constructed; the hospitals of the Incurables, the Salpêtrière, and the Foundlings; an aqueduct to convey water from Arcueil to the city, the Sorbonne, and the college of Clermont, afterwards Louis-le-Grand, were built. The palace of the Luxembourg was built by Maria de Medici; the Jardin-des-Plantes (botanical garden) was laid out; and the Palais Royal was built and the Académie Française founded by Cardinal Richelieu. New walls were erected on the north-west side of the city, inclosing a considerable space north of the Tuileries, and extending the circuit of the inclosure nearly to the line of the present boulevards. The island of St.-Louis was entirely covered with houses, surrounded with quays, and joined to the mainland by two bridges. The Pont-au-Change was rebuilt, and a wooden bridge thrown over the river where the Pont-Royal now stands.

The city suffered so much during the troubled minority of Louis XIV. that in 1653 it was estimated that there were in Paris 40,000 paupers. In the long reign of this king, the extent of Paris was again extended, and splendid gates and barriers built; the old ramparts were levelled, and replaced on the northern boulevards by magnificent promenades planted with trees; the quays were repaired; more than 80 new streets were opened, and most of the old ones were widened and rebuilt. Instead of dismal posterns and narrow wickets, the gates of St.-Antoine, St.-Bernard, St.-Denis, and St.-Martin rose in the form of triumphal arches. The city was ornamented with the Places Vendôme, des-Victoires, and du-Carrousel. Perrault raised the colonnade of the Louvre; the Hôtel-des-Invalides was erected as an asylum for the aged soldier; and the infirm were tended in the Salpêtrière, which was enlarged and called the General Hospital, with the Bicêtre for a dependency.

At the beginning of this reign the streets of Paris were always dirty, lighted at night only by lanterns hung out in front of the shops; many were unpaved, and impassable even in summer except in heavy boots. Opposite the Tuileries was a wretched wooden bridge called Pont-Barbier; in several quarters were seen the heavy chains which served for barricades in the times of the League and the Fronde; and so impure was the air, that bright copper vessels were coated with verdigris in a single night. During the night cut-purses roamed the streets with impunity, and assassinations were not uncommon where every body went armed. The administration of Colbert and Louvois checked these evils. The disorders of the capital were in part remedied by increased efficiency of police; pages and lackeys were disarmed; and lanterns, each containing a large candle, were suspended in the middle of the streets. Under Louis XIV. also was completed the building of the Tuileries, the gardens of which were laid out by Le Notre; the Champs-Élysées were planted with trees; and many fountains were erected as decorations of the city, and affording abundant supplies of water to the inhabitants. In the interest of science, the Observatory was founded, the College of Quatre-Nations built, and the Royal Library organised; St.-Sulpice was commenced, and Val-de-Grace completed; the Châtelet was built as a special court-house for the city of Paris; and the Pont-Royal was opened, connecting the quarter of the Tuileries with the Faubourg St.-Germain, on the left bank of the Seine. Great encouragement was given to manufacturing industry during this reign; manufactories of plate-glass and tapestry were established, the latter being the famous manufactory of the Gobelins, established on the little river Bièvre, which traverses the south-eastern angle of the city, between the Jardin-des-Plantes on the north and the great hospital and gardens of the Salpêtrière on the south, and enters the Seine on the left bank a little above the bridge of Austerlitz. The population of Paris, at the close of the reign of Louis XIV., was fast approaching half a million.

From the commencement of the reign of Louis XV. to the period of the Revolution, Paris received considerable accessions both to its extent and the number of its public buildings. The church of Sainte-Genève (the Pantheon of the revolutionary period), the church of St.-Philippe-du-Roule, near the Barrière-du-Roule, in the north-west of the town, and the façade of St.-Roch were erected; the Mint, the École Militaire (military school), and schools of law (droit) and surgery were built; the corn-market (halle) and several other market-places were formed; fountains and theatres erected; a line of boulevards formed on the south side of the river; the Petit-Pont, which united the Île-de-la-Cité with the south bank of the river, rebuilt; the Place Louis XV. laid out, with a statue of that king in the centre; the Hôtel-d'Armenonville was repaired and converted into the post-office; a city post was established; the names of the streets were written up and the houses numbered; reflecting lamps were used for lighting the streets; many sumptuous hotels were built; and the erection of the Pont Louis XVI. was commenced. Paris was also surrounded by a

wall, which still exists, comprehending a much larger area than any previous inclosure, and designed to prevent the introduction of commodities without the payment of the octrois, or local taxes. For this purpose 58 barriers, flanked by handsome guard-houses, were erected. The faubourgs du-Roule, St.-Honoré, St.-Lazare, Poissonnière, and Chaussée-d'Antin were covered with good houses. The Palais-de-Justice was repaired; the Palais-Royal was completed; the École-de-Médecine, the Collège-de-France, the theatres Français, Italien, Feydeau, de-l'Odéon, and de-la-Porte-St.-Martin, the Rotonde of the Temple, and several halles and fountains were built; and the Marchés-des-Innocents and other markets were opened.

The local history of Paris during the Revolution is the history of the Revolution itself. In 1789 (July 14) the Bastille (which had been greatly enlarged, fortified, and used as a state prison) was taken and demolished by the Parisians. In October of the same year the king was brought from Versailles to Paris by the Parisian mob. On the attempt of the king to quit France (21st June, 1791) some rioting took place, and in the early part of 1792 fresh commotions occurred. On the 20th June the Tuileries was attacked by the populace, and the lives of the royal family endangered; on the 10th August that palace was again attacked, and the king's Swiss guards who defended it were slaughtered; and on the 2nd of September the mob broke into the various prisons and massacred those confined in them. The king was deposed, and the Legislative Assembly gave place to the Convention, in which the more violent of the revolutionists gradually obtained the ascendancy.

The guillotine was erected in the Place Louis XV. (now Place-de-la-Concorde), between the gardens of the Tuileries and the Champs-Élysées, and the king himself was one of the earliest victims (21st January, 1793). In June the Girondist party in the Convention was overthrown; the faction of the Mountain became supreme, the reign of terror commenced, and blood flowed in torrents. Executions took place daily in the Place Louis XV.: Charlotte Corday, the assassin of Marat, queen Marie Antoinette, Brissot, Vergniaud, and others, the most illustrious members of the Girondist party in the Convention, Egalité, duke of Orléans, Danton and Camille Desmoulins, Mountaineers themselves, Madame Elizabeth, sister of Louis XVI., and numerous others perished. The victims at one time amounted to fifty or sixty a-day, and occasionally exceeded that number. The guillotine was shifted from the Place Louis XV. to the Place-de-la-Bastille, and from thence to the Place-du-Trône, at the eastern extremity of the city, in the Faubourg St.-Antoine, whence it was brought back to the Place Louis XV. for the execution of Robespierre and his associates (28th July, 1794), which put an end to 'the reign of terror.' The Convention, freed from the tyranny which Robespierre had established, restricted the power of the terrible committees, abolished the commune of Paris, and reduced the clubs to subordination. The Polytechnic school, the Institute, and the Bureau-des-Longitudes owe their establishment to the Convention. In 1795 the Parisian rabble rose repeatedly against the government, but were put down by the armed force of the forty-eight 'sections,' into which Paris had been divided. In October, 1795, this armed force itself rose against the Convention, but was completely defeated by the troops of the line at Paris, commanded nominally by Barras, but really by Bonaparte. The government of France now passed into the hands of the two legislative councils and the executive directory. Under Bonaparte, successively first consul and emperor (December 2, 1804), Paris enjoyed an increasing prosperity and almost uninterrupted quiet till the year 1814.

Notwithstanding the extreme warlike activity of his reign, which hung the churches of Paris with the flags of all the continental powers of Europe, Napoleon I. did not neglect the decoration of his capital. All the houses which as yet stood on the edge of the quays were swept away, and the prospect of the river opened entirely to view; the quays were extended; the bridge of Austerlitz spanned the Seine opposite the Jardin-des-Plantes; the Pont-de-la-Cité joined the Île-St.-Louis to the Île-de-la-Cité; the Pont-des-Arts connected the Louvre with the Institute; and the Pont-de-Jena, the most western bridge of Paris, which crosses the river opposite the École-Militaire and Champ-de-Mars, was erected. The Ourcq Canal was commenced to bring the water of that river to the plateau of la-Villette on the north side of the city, nearly 100 feet above the level of the Seine. Numerous elegant fountains sprung up; halles and markets were established; and five large abattoirs were built at the extremities of the town. The Louvre was filled with masterpieces of painting and sculpture, collected by no very scrupulous means from the galleries of conquered countries. The great column of the grand army was erected in the Place-Vendôme. The Luxembourg palace was restored, and its gardens embellished and united to the Observatory by a magnificent avenue. The Chamber of the Legislative Body was built between the Palais-Bourbon and the Pont Louis XVI. The Bourse, the Tribunal of Commerce, and the Madeleine were commenced; churches were repaired, and the Pantheon, again become the church of Sainte-Genève, was restored to religious uses.

Paris after a gallant defence capitulated on the 30th of March, 1814, to the allied forces under the command of Prince Schwarzenberg. On the 31st the allied sovereigns who accompanied the prince and their troops entered; Napoleon was dethroned and the Bourbons restored. Next year Napoleon returned (March 20th), to Paris from Elba, but

the defeat of Waterloo brought the allied English and Prussian armies, under Wellington and Blücher, before the city. On the 8th of July, Louis XVIII. re-entered Paris, and the Bourbons were again restored. A long interval of tranquillity followed, during which the Ourcq, St.-Denis, and St.-Martin canals were finished for the supply of the north side of the city; and the colleges of Henri IV. and St.-Louis were enlarged; and the lighting, cleansing, and paving of the town improved. Then followed the reign of Charles X. (1824-30), during which the church of St.-Vincent-de-Paul was commenced, some other churches were repaired or rebuilt, a statue of Louis XIII. was erected on the Place-Royale, that of Louis XIV. on the Place-des-Victoires, the Pont-de-la-Concorde adorned with statues of the illustrious warriors and statesmen of France, and the bridges of Arcole, de-l'Archêvêché, and d'Antin were built. In 1830 came the Revolution of the three days (27th, 28th, and 29th) of July, which overthrew the Bourbon dynasty, and established that of Orléans. In this memorable struggle above four thousand barricades were formed. Of the Parisians, 788 were killed and about 4500 wounded. The revolution of 1830 placed the crown of France on the head of Louis Philippe, duke of Orléans, whose father was guillotined during the reign of terror in 1793. During this reign, which lasted till 1848, several important works were completed. Among the most important of these are the church of La-Madeleine, the Palais-des-Beaux-Arts, the church of St.-Vincent-de-Paul, the Hôtel-de-Ville, and the triumphal arch de-l'Étoile, at the head of the long avenue of the Champs-Élysées outside the barrier of Neuilly. Several new bridges and quays were constructed; the asylum for deaf-mutes was rebuilt, and the approaches opened to the church of Sainte-Genève, which was converted to a temple in honour of the great men of France; the monument of July was finished, and the statue of Napoleon I. replaced upon the column of the Grand Army in the Place-Vendôme. The remains of the emperor Napoleon I. were brought from St. Helena to Paris by the Duke de Joinville, and deposited in the Invalides. The Place-de-la-Concorde (Louis Quinze) was decorated with fountains and an obelisk, brought from Luxor in Egypt. The Places Louvois and St.-Sulpice were embellished with beautiful fountains. The Barrière-du-Trône was completed and adorned with colossal statues of St. Louis and Philippe Auguste. Several railway termini were erected; the artesian well of Grenelle was bored; the normal school built; and last not least, the city of Paris and its suburbs were surrounded by vast fortifications, protected by fourteen detached forts, at a cost of not less than twenty millions sterling.

In 1848 the stiff-necked opposition of King Louis Philippe and his ministers to electoral reform led to the erection of barricades and a new revolution, in which the troops soon fraternised with the people. The king abdicated (February 24) in favour of his grandson, the Count de Paris, son of the Duke of Orléans, who was killed by a fall from his gig in 1842, outside the Barrière-de-Neuilly. The count was not accepted: the republican chiefs then taking the lead appointed a provisional government, and proclaimed a democratic republic. A Constituent Assembly was convoked, which framed a constitution in form of a republic with a president for chief magistrate. The Red Republican party, dissatisfied with the comparative moderation of the assembly, formed numerous clubs, in which the wildest principles of socialism were advocated, subversive alike of property and society. In furtherance of these objects, a vast assemblage of clubbists, led on by Barbès and others, forced their way into the National Assembly, and proposed "a tax upon the rich to carry on war for Poland." They then seized the Hôtel-de-Ville, and proclaimed a provisional government (May 15, 1848); but ultimately the national guard forced their way in, and arrested the leaders of the movement, who were lodged in the Castle of Vincennes. The loss of their leaders however did not discourage the socialists. On the 23rd of June barricades were again thrown up in the streets, and firing continued in most parts of Paris during the night. On the 24th the troops, under generals Cavaignac and Lamoricière, succeeded with great loss in driving the insurgents from the left bank of the Seine. On the 25th all the positions of the insurgents in the centre of the city were taken, and on the 26th the Faubourg du-Temple was swept with cannons and howitzers, and the whole city was in the evening in the hands of the government by which General Cavaignac had been appointed dictator. It was in this bloody insurrection that the noble archbishop of Paris (Denis Affre) lost his life, having been shot down by an unknown hand when, during a temporary cessation of the battle, he mounted a barricade in order to prevent the further effusion of blood, and to make peace between the combatants.

The constitution framed by the assembly was solemnly proclaimed in front of the Tuileries (November 11, 1848), and Prince Charles Louis Napoleon Bonaparte elected President of the Republic, who took the oath of office on the 21st of December following in the National Assembly, which still continued its sittings till the meeting of the Legislative Assembly, May 27th, 1849. Under the vigorous administration of the Prince both the mad attempts of the Red Republicans were suppressed and the intrigues of the Legitimists and Orléanists baffled. At last the President, in order to put an end to the disquieting hopes of parties, issued a decree, December 2, 1851, dissolving the Legislative Assembly, re-establishing universal suffrage (which had been very considerably narrowed by the assembly), proposing the election of a president for ten years, and a second chamber,

or senate, and declaring Paris in a state of siege. The leaders of the Orléanist and Republican parties, Thiers, Changarnier, Cavaignac, Lamoricière, and others, were arrested and thrown into the Castle of Vincennes, and Paris was occupied with troops. The result of the Prince's appeal to the people was the maintenance of his authority on the bases proposed in his decree of December 2 by 7,439,216 affirmative votes against 640,737 negative ones. In the course of September in the following year the councils-general of the French departments prayed for the stability of the Prince's power, and the majority of them for the re-establishment of the empire. The necessary preliminaries for the proposed change in the constitution were taken by the Senate in November 1852, and a 'plebiscite' resuscitating the imperial dignity in the person of Louis Napoleon obtained 7,864,189 affirmative votes against 253,145 negative ones from the electors of France on November 21 and 22. Accordingly Louis Napoleon was proclaimed Emperor from the Hôtel-de-Ville on December 2, 1852, and took the title of Napoleon III., thus asserting the claim of the Duke of Reichstadt, son of Napoleon I., to be Emperor of the French.

The part of the valley of the Seine in which Paris stands is screened by two chains of hills. On the right bank the series sweeps round nearly in a semicircle, forming the hill of Bercy in the south-east, the heights of Charonne, Ménilmontant, Belleville (the western part of which is called the hill of Chaumont), La-Villette, and Montmartre. The hill of Montmartre slopes down westward to the plateau of Monceau, where the ground again rises to the hill of Chaillot at the extreme west of the city. The highest points are the hills of Montmartre, Ménilmontant, and Chaumont, which rise from 262 to 295 feet above the valley. On the south side the heights that screen the valley are lower. Opposite Bercy the bank of the river is level, but the ground rises slowly to the plateau of Ivry and the hill of Cailles, beyond which runs the Bièvre. North of the Bièvre the ground rises sensibly, and forms the hill of Sainte-Geneviève, which is covered with buildings. This hill is joined towards the south-south-west to the plateau of Mont-Souris, to the west of which the surface slopes down to Petit-Montrouge, and again rises near the barriers of Mont-Parnasse and Maine; thence there is a slight declivity to Vaugirard, between which and the Seine is the wide plain of Grenelle. At a distance of two and a half to five miles from these heights there is another and higher series of hills, comprising the heights of Villejuif, Rungis, Hay, Bagneux, Meudon, St.-Cloud, and Mont-Valérien, the highest point around Paris, being a few feet higher than Montmartre. A large portion of the southern part of Paris is built over vast caverns formed by quarrying the rock. These old quarries have been converted into catacombs, in which are deposited the bones of the dead collected from the cemeteries that formerly existed within the bounds of the city. The great cemetery of Paris is that of Père-la-Chaise, to the east of the city, on the slope of the hill of Charonne. There are cemeteries also on the hill of Montmartre.

The Seine enters Paris at Bercy, on the south-east, and flows with a gentle curve convex towards the north, and leaves the city at Passy, on the extreme west, after a course of about five miles. Near the middle of the distance it forms two islands, the Île-St.-Louis and the Île-de-la-Cité, which are covered with buildings. The former Isle of Louvier, which was used as a dépôt for firewood, is now united to the quay. In all its length the river is lined with broad stone quays, backed by many fine buildings. The quays, which have been recently enlarged, repaired, and levelled, are fenced with parapets, and furnished with numerous wharfs and landing-places. Barges of large tonnage are towed up the river from Rouen and Havre with colonial and other produce for the supply of the capital; steamers also ply on the Seine. In 1854 a vessel, built at Bordeaux for the purpose, sailed from Rio Janeiro direct to Paris, and unloaded her cargo on the quays. The winding course of the river however, and the difficulties of the navigation (SEINE), prevent Paris from being a sea-port; the advantages of such a position are already conferred upon the city by the railways that connect it with all the principal sea-ports of France. The Seine is kept clear from all impurities; it flows between its beautiful quays in a stream so pure that, after traversing the whole length of Paris, one may see the bottom in a clear day. There are numerous baths and swimming schools upon it, and places resembling roofed boats with open sides, in which linen is washed and got up. The river is spanned by above twenty bridges, many of which have been repaired or partly rebuilt since the re-establishment of the empire. The most celebrated of the bridges of Paris is the Pont-Neuf, which crosses the Seine at the north side of the Île-de-la-Cité, and is embellished with a statue of Henri IV. A new bridge, to be called Alma, is now (March, 1855) being constructed between the Pont-des-Invalides and the Pont-de-Jena, which is to be connected by new avenues with the barracks of the École Militaire and with the triumphal arch de-l'Étoile. The bridges of Paris afford many noble views, and the quays form cheerful and healthy promenades.

Commencing on the left bank of the Seine, at the distance of a mile and a half south from the terminus of the Orléans railway, which is in the Boulevard de-l'Hôpital, on the south side of the Jardin-des-Plantes, the great bastioned wall that girds Paris runs westward across the plain on the south side of the city, and a little to the northward of Ivry, Arcueil, Grand Gentilly, Montrouge, Vanvres, and Issy, striking the Seine again opposite Le-Point-du-Jour; here starting from

the right bank of the river, it sweeps round sharply to north-north-east along the eastern side of the Bois-de-Boulogne, which it separates from the suburbs of Auteuil and Passy; having crossed the high road to Neuilly about three-quarters of a mile west of the triumphal arch De-l'Étoile, it runs north-east and east, inclosing the plateau of Monceau and the heights of Batignolles and Montmartre; in the angle between the St.-Denis and the Ourcq canals, which it spans respectively a little north and east of the suburb of La-Villette, the wall turns south along the eastern side of Belleville and Père-la-Chaise, and to the east and south of Bercy, between which and Charenton it again reaches the right bank of the Seine. At distances varying from one to three miles from the wall a series of detached forts are built, one of which, Fort-de-Charenton, stands in the angle between the Seine and the Marne, near the Veterinary School of Alfort; five between Ivry and Issy command all the approaches on the south; the castle of Vincennes, and four forts erected among the hills that intervene between the Marne and the Ourcq Canal, command the approaches from the east; to the north of St.-Denis are two strong forts, one of which spans the great north road, and the other commands the Seine opposite Île-St.-Denis; on the left bank of the Seine, which to the west of the city runs parallel with the bastioned wall, and at a distance of between one and two miles from it, a strong fort with bomb-proof casemates, and large barracks, are built on Mont-Valérien.

The outline of Paris, defined by the wall of 1787, approximates to an oval, having its longer diameter from west-north-west to east-south-east about 5½ miles, and its shorter diameter 3½ miles. The circuit of the wall is 15 miles. The included area is 8500 acres. The number of barriers, or entrances, through this wall is about 50. Most of these barriers have toll-houses attached to them, at which the local duties on goods entering the capital are levied. Round this wall, on the outer side, is a road planted with fine rows of trees, forming the outer boulevards. Most of the barriers are approached by wide roads lined with double rows of trees, forming magnificent approaches to the city.

The wall of 1787 incloses several portions which, as being without the walls demolished by Louis XIV., were designated 'faubourgs,' or suburbs, and which still retain that name. Of these suburbs and quarters the following are the principal:—On the west, Chaillot, adjacent to the Champs-Élysées; on the north-west, the Faubourg St.-Honoré and the Faubourg Du-Roule; on the north, the Chaussée-d'Antin (one of the handsomest and most regularly-built quarters in Paris), the Faubourg Montmartre, the Faubourg Poissonnière, the Faubourg St.-Denis, and the Faubourg St.-Martin; on the north-east, the Faubourg Du-Temple; on the east, the Faubourg St.-Antoine; all these are on the right or north bank of the Seine. On the opposite bank, in the south-east part of the city, is the Faubourg St.-Victor; on the south part are the Faubourgs St.-Marcel, St.-Jacques, and St.-Michel; and in the south-west are the Faubourg St.-Germain and the quarter of Gros-Caillou. The suburbs which surround Paris on the outside of the wall of 1787 are—Auteuil and Passy on the west; Batignolles, Montmartre, and La Villette, on the north; Belleville, Ménilmontant, Charonne, and Bercy, on the east; Montrouge, Vaugirard, and Grenelle, on the south. All these suburbs, with a wide belt of fields, gardens, and uninclosed land, are now girt by the bastioned wall; they are noticed under the article on the department of SEINE.

Before 1789 Paris was divided into three parts, named City, Town, and University; and subdivided into 20 quarters. In the year just mentioned an ordinance of Necker divided it into 60 districts, each of which furnished a battalion of national guards, and elected a deputy of the Tiers-État. For this arrangement the Constituent Assembly in 1790 substituted the division into 48 sections. A few years later the city was divided into 12 arrondissements, each administered by a mayor and corporation, and subdivided into 4 quarters. This arrangement still subsists. The general government of the city is vested in two prefects—the prefect of the department of Seine, and the prefect of police.

The central part of the town, which is by far the oldest, has narrow crooked streets, formed by lofty houses, chiefly built of stone. The outer parts of the town are more regularly laid out. The old streets are without foot-pavements and the kennel is in the middle of the street. The streets are lighted with gas. Great improvements have been made of late years; pavements have been laid with flag-stones for pedestrians; all modern streets are provided with foot pavements, which have also been extended to the older streets that are wide enough to admit of them. The boulevards are a line of streets forming a circuit of smaller extent than the city wall. They indicate, on the north of the river, the line of the ramparts and ditches demolished and filled up by Louis XIV.; on the south side they are of later date, and take a wider circuit than the ancient walls. They are planted throughout with alleys of trees. The northern boulevards are the gayest thoroughfares in Paris: they are flanked by fine ranges of houses and adorned with numerous fountains. Here are some of the principal hotels, coffee-houses, and restaurants of Paris. On the north side of these boulevards are the Porte-St.-Martin and the Porte-St.-Denis, two splendid triumphal arches, erected in honour of the victories of Louis XIV.

The largest of the old places, or squares, are the Place-de-la-Concorde, the Place-Vendôme, the Place-des-Victoires, and the Place-du-

Trône (both circular), and the Place-Royale. These places are adorned with columns, statues, fountains, or other decorations. In the Place-des-Victoires is a statue of Louis XIV. In the Place Louvois, opposite the great library, in the Rue-Richelieu, is a splendid fountain, erected on the spot where the Duc de Berry was assassinated in 1820. The Place-du-Carrousel, to the east of the Tuileries, hardly any longer exists, having become absorbed in the great square inclosed by the Palace of the Tuileries and the Louvre, as will be explained below. There are numerous fine public walks, as the gardens of the Tuileries, the gardens of the Luxembourg, the Palais-Royal, the Champs-Élysées, the Avenue-de-Neuilly, and the numerous avenues in the neighbourhood of the École Militaire and the Invalides, which are streets lined with alleys of trees, like the boulevards. The Champ-de-Mars is a very large inclosure, attached to the École Militaire, and used for reviews; the Esplanade-des-Invalides is a garden, or pleasure-ground, extending from the Hôtel-des-Invalides to the Seine. To the west of the city outside the great bastioned wall is the Bois-de-Boulogne, which is laid out in magnificent drives and embellished with fine sheets of water, fountains, and jets-d'eau.

The Place-de-la-Concorde, an octagonal space, lies at the intersection of two magnificent perspectives, one between the church de-la-Madeleine and the Chamber of Deputies, the other between the Tuileries gardens and palace on the east, and the triumphal arch de-l'Étoile on the west at the head of the Champs-Élysées. It is splendidly paved, lighted, and decorated; allegorical figures of the principal provincial towns of France surmount the eight pavilions of the octagon. In the centre stands the obelisk of Luxor, which occupies the site of the guillotine in the first revolution, under which Louis XVI., Marie Antoinette, Charlotte Corday, Robespierre himself, and many others, illustrious and ignoble, fell during that bloody convulsion. A little west of the Place-de-la-Concorde the Avenue-de-Marigny leads past the Elysée palace, the front of which is in the Rue-du-Faubourg-St.-Honoré.

There is perhaps no city in the world which has such a number of handsome public buildings as Paris. A few of the principal structures are here briefly mentioned, to describe all would require not an article but volumes. The cathedral of Notre-Dame, crowned by its two gigantic towers, is considered one of the boldest and most successful existing specimens of gothic architecture. It was commenced A.D. 1010 and not completed till 1260. The extreme length externally is 442 feet; breadth 162 feet; breadth of nave 42 feet, length to transept 186 feet, transept 155 feet, width of front 134 feet, and height of towers 235 feet. The plan is divided into a nave and four aisles, besides a range of chapels on each side between the external buttresses. The whole building has been recently cleaned and renovated. Notre-Dame stands in the most ancient part of Paris, in the Île-de-la-Cité. The archbishop's palace, which stood on the south side of the cathedral, was destroyed at the revolution of 1830. On the Isle are also the Hôtel-Dieu, one of the best regulated hospitals in the world, making up 1000 beds; the vast Palais-de-Justice, which with its beautiful Sainte-Chapelle (built in 1238), has been recently thoroughly restored; the Place-Dauphine, a triangular space, in which is a fountain surmounted by a bust of Desaix, the hero of Marengo; and the prefecture of police. In the Palais-de-Justice all the law courts are united except the tribunal of commerce. The Conciergerie, distinguished by its two lofty towers, on the Quai-de-l'Horloge, is also in the Île-de-la-Cité: in the western of these towers Marie Antoinette was imprisoned.

The former Pantheon, one of the finest buildings in Paris, has been again restored to ecclesiastical uses by the present emperor and to its old title of the church of Sainte-Geneviève. It is a beautiful edifice with good general proportions and much grace and elegance in the outline. The exterior presents a design marked by grandeur and simplicity. A single large order, whose columns are 60 feet high, forms a Corinthian hexastyle crowned by a pediment filled with sculpture; there are however 12 other columns, besides 4 attached ones. The entablature is continued along the whole building, of which it constitutes almost the sole decoration, there being no windows, as the interior is lighted by the dome, and by large semicircular windows above the internal colonnades, which are not visible externally. The lower part of the dome is encircled by a Corinthian peristyle of 32 columns 36 feet high, on an unbroken podium, or stylobate. The dome is entirely constructed of stone 67 feet in diameter and 190 feet above the ground. The interior is a Greek cross in plan, the length from east to west being 295 feet, that of the transept 262 feet, and the breadth uniform, namely 104 feet. Instead of pier-arches, the aisles are formed by insulated Corinthian columns 40 feet high, thereby producing an air of great richness and lightness. The total length of the church, including the portico, is 352 feet. In close proximity to the church of Sainte-Geneviève, are the École-de-Droit, the fine church of St.-Etienne-du-Mont, the polytechnic school, the college Henri IV., and the college Louis-le-Grand, separated by the Rue-St.-Jacques from the Sorbonne.

The façade of the church of the Invalides consists of two small orders, above which rises a composite order of forty columns, surmounted by a balustrade and attic, behind which swells a magnificent dome, crowned with a lantern and spire. The dome is raised on the centre of a Greek cross on an octagonal base. It is double; the inner

dome, constructed with masonry, is spherical; the outer, with stone and brick, is spheroidal. Its diameter is 80 feet, and its height above the ground 173 feet. The entire elevation to the top of the cross is 342 feet. The dome of the Invalides forms a magnificent feature in some of the perspectives of Paris. Under the dome the magnificent tomb of Napoleon I., the noblest work of Visconti, is erected. This tomb and the grand altar, by the same architect, are among the finest specimens of architecture in Paris. To the west of the Invalides is the École Militaire, now converted into barracks; in front of which is the Champ-de-Mars, a vast parallelogram, 950 yards long and 456 yards wide, surrounded by a fosse, masonry, and terraces. Races are held here annually, and the troops are reviewed in the Champ-de-Mars. The beautiful bridge of Jena crosses the Seine at the north-west end of the Champ-de-Mars, leading to the Avenue-de-Longchamps outside the barrier. On the southern side of the Avenue-de-Saxe, which leads from the Place-de-Fontenoy (opposite the southern entrance of the École Militaire) to the great avenue south of the Invalides, are the abattoir and artesian well of Grenelle.

The church de-la-Madeleine is in exterior form a Corinthian peripteral temple, upon a noble scale. On the pediment is a magnificent bas-relief containing nineteen figures, representing Christ granting pardon to Mary Magdalene, surrounded by emblematic figures. The dimensions are 328 feet by 138 feet, independently of the projection of the flights of steps at each end, which make the total length of the base or sub-structure 418 feet; the stylobate, on which the columns are raised, is about 13 feet high; the height of the columns 62 feet; that of the entablature nearly 14 feet, and the entire height from the ground to the apex of the pediment 116 feet. There are in all 52 columns; eight at each end, and twenty along each side, those at the angles being reckoned again. The door of the south or principal entrance is 32 feet high by 16 feet wide, and is of bronze, with ten panels sculptured in relief, with subjects illustrative of the Ten Commandments. The interior, which is a simple nave, with three chapels on each side and a high altar at the apex end, measures 259 feet by 52 feet, and consists of three compartments, covered by as many flat domes, through which the building is lighted, there being no side windows. It is adorned with a small Ionic order, which also extends round the apex. The whole of the interior is decorated with white marble and gold. The roof is entirely of iron and copper, and no timber has been used in the construction of any part of the building. The vault is covered with magnificent paintings.

The Louvre, which has long ceased to be a royal habitation, though one of the noblest palatial structures in Europe, is nearly a square, of 576 feet by 538 feet, inclosing a court 394 feet square. The celebrated east front, or colonnade, is in a style of simple grandeur almost unprecedented. The great painting gallery extends from the Louvre to the Tuileries, in a line of more than 1456 feet. The interior of the Louvre is splendidly decorated. The walls of the long gallery are lined throughout with paintings of the French, Flemish, German, and Italian schools. In other parts of the structure are splendid collections of Egyptian, Greek, Roman, and Assyrian antiquities; an unrivalled collection of paintings of the Spanish school; a museum, containing models of everything relating to the marine, arsenals, forts, forges, vessels, &c., and a vast collection of royal armour and various articles belonging to or used by sovereigns of France from Childeric to Louis Philippe. The Louvre now forms one building with the Tuileries, as will be noticed in the sequel when speaking of the improvements made in Paris by Napoleon III. Opposite the colonnade of the Louvre is the church of St.-Germain-l'Auxerrois, originally founded by Childeric about A.D. 580. A little farther along the quay is the Place-de-Châtelet, in which the great Châtelet, built in 856, stood till 1802. In the centre of it is a fountain surmounted by a column 52 feet in height, and crowned with a gilt statue of Victory. The shaft of the column is encircled with bands, on which are inscribed the principal victories of Napoleon I.

The Luxembourg Palace, now the Chamber of Peers, was erected by Mary de' Medici, and is a good specimen of the Florentine style, where three orders are introduced with rusticated columns and pilasters. It consists of a centre and two wings, which latter are connected by a screen of arcades, in continuation of the lower order, decorated in the centre with a lofty pavilion or vestibule, in three orders, and covered by a dome. One of the most splendid features of the interior is the grand staircase leading to the hall of the Peers, a magnificent apartment, 80 feet in diameter, lighted from the roof and decorated with Corinthian columns and frescoes. The gardens are beautifully laid out and planted. The grand avenue is of great length and leads to the Observatory. Marshal Ney was shot in this avenue Dec. 7, 1815: on Dec. 7, 1854, a colossal bronze statue of the Marshal was erected on the spot. Not far from the Observatory are the Foundling Hospital and Orphan Asylum, established by St. Vincent de Paul in 1638; the cemetery of Mont Parnasse; and in the Rue-St.-Jacques the hospital of Notre-Dame-de-Val-de-Grace and its beautiful church, founded by Louis XIV. in 1645. Opposite the north-east angle of the Palace-de-Luxembourg is the Odeon theatre, the only theatre on the south side of the river. The Luxembourg contains a vast deal of fine statuary and a painting gallery. The grounds, like the gardens of the Tuileries and other places of public resort in Paris, are embellished with statues.

To the north of the Luxembourg gardens is the church and semi-

nary of St-Sulpis. The church, built on the site of a former ecclesiastical edifice in 1646, is a superb building, 337 feet long, and flanked by two towers 210 feet high. Between the towers, mounted upon a stylobate, is a beautiful portico, composed of light Doric columns 40 feet high, above which is a gallery and Ionic colonnade, with columns 80 feet in height, the whole surmounted by a balustrade. In front of the church is a beautiful fountain by Visconti. The seminary is a large plain building, with accommodations for above 200 ecclesiastical students.

The Chamber of the Legislative Body of the French empire, formerly the Chamber of Deputies, and originally part of the Palais-Bourbon, is remarkable for its splendid façade towards the river and the Place-de-la-Concorde. The whole extent of this side of the building is 236 feet, 186 feet of which form an advancing central mass faced by a Corinthian portico of 12 columns, supporting a pediment covered with bas-reliefs and mounted on a stylobate of 28 steps 100 feet wide, and flanked by pedestals and statues. Notwithstanding that it is only a single intercolumn in depth, this portico makes an exceedingly majestic appearance. The legislative chamber, which is behind the portico, is a semicircle lighted from above, and surrounded by an Ionic colonnade.

Along the line of quays, between the Chamber of Deputies and the Mint, are many noble structures, among which may be mentioned the Palace of the Legion of Honour; the Palais-d'Orsay, one of the finest edifices in the capital, now occupied by the Council of State and dependent offices; the Palais-de-l'Institut, which contains the Mazarine library (120,000 volumes and 4500 manuscripts), and the library of the Institute; and the Palais-des-Beaux-Arts, on the roof of the amphitheatre of which is Paul de la Roche's beautiful picture representing the different Schools of Painting. The Institute, the principal of the learned societies of France, occupies the building of the former College des-Quatre-Nations.

The Hôtel-des-Monnaies, or mint, on the Quai-Conti, near the south end of the Pont-Neuf, is a noble structure of palatial aspect. It has two fronts of nearly the same extent, 376 feet, one towards the Quai, the other in the Rue-Guénégaud. The former is in three divisions, the centre one of which has an Ionic order of six columns above the basement, crowned by an attic, against which are statues over the columns and panels between them. There are two series of windows in the height of the order, and 27 on a floor. The whole is marked by great nobleness and simplicity, and is pure in taste.

The Hôtel-de-Ville, the splendid residence of the prefect of the Seine, the chief of the municipality of Paris, was commenced under François I., and completed in 1606; but it has received since then many additions and alterations, and the whole building has been recently restored. Its plan is a rectangle, with 25 windows in its length on the east and west façades, and 19 windows on the north and south façades. Four square pavilions, three stories high, flank the four angles, and two intermediate pavilions rise in the middle of the longest sides, besides the graceful bell-tower that springs up above the principal entrance. Between the pavilions the building is only two lights high, crowned by a lofty flat-roofed attic, in front of which are niches and pedestals with statues of illustrious magistrates, and on the south façade with allegorical figures representing Justice, Commerce, &c. The apartments of the Hôtel-de-Ville are furnished and decorated with unexampled splendour.

The Halle-aux-Blés, or corn-market, is a rotunda whose external diameter is 225 feet, containing within a circular arcade of 25 arches, leaving a clear central space 127 feet in diameter, which was originally an open court, but was afterwards covered in by a dome of iron and copper, with a skylight in the centre, similar to the opening in the dome of the Pantheon at Rome. The Halle-aux-Vins, or wine-market, to the north of the Jardin-des-Plantes, consists of seven large piles of building separating streets named after the most celebrated French wines. The granaries contain about 450,000 casks. Nearly opposite the Halle-aux-Vins, on the right bank of the Seine, are the vast buildings of the Arsenal, which contain a library, and some memorials of Sully and Henri IV.; and the great Reserve Granary, facing the Boulevard-Bourdon, which always contains four months' consumption of flour and grain for the capital, and is 2160 feet long by 64 feet in breadth. Behind the Halle-aux-Vins, opposite the north-west angle of the Jardin-des-Plantes, is the Hôpital-de-la-Pitié, which makes up 600 beds; and immediately west of the hospital is the prison of Sainte-Pélagie.

The Bourse is an insulated building standing in the centre of a large square. It is in form a parallelogram, measuring 164 feet by 234 feet, and is entirely surrounded by a Corinthian peristyle of 64 columns, of which there are 14 at each end, besides which there are two others, namely, behind the second one from each angle of the west front, the portico being there two intercolumns in depth. The columns are 40 feet high, and raised upon a solid stylobate 10 feet high; the extreme height from the ground to the top of the attic, or podium above the entablature, is rather more than 68 feet. The interior contains the tribunal of commerce, several offices, and a large central hall for the Exchange, 108 feet by 59 feet (exclusive of the arcades or galleries by which it is surrounded on both floors), and lighted by a central skylight in the vaulted roof.

Nearly on the line between the Bourse and the Tuileries, off the east

side of the Rue-Richelieu, is the Palais Royal, originally built in 1629 by Cardinal Richelieu, on the sites of the hotels of Rambouillet and Mercœur. At his death the cardinal left it to Louis XIII.; and here Louis XIV. and his mother resided during the troubles of the Fronde. After his accession to the throne, Louis XIV. presented the palace to his brother, the Duke of Orléans, in which branch of the Bourbon family it continued till recently. The palace was augmented in 1763, and in 1786 the galleries that surround the garden were built, with the exception of the Galerie-d'Orléans, completed in 1829 to connect the pavilions that inclose the second court. The father of King Louis Philippe converted the pavilions into an immense bazaar, parcelling them out into little shops. The garden forms a parallelogram, 700 feet long by 300 feet wide; in the centre is a beautiful fountain, rising from a large basin, on each side of which is a grass-plot bordered with flower-beds, and adorned with fine bronze and marble statues. The restaurants and coffee-houses of the Palais-Royal are very numerously attended; and the promenades here, in the evening, when the whole place is brilliantly lighted, are particularly attractive. The southern portion of the palace, facing the great square, is now the residence of Prince Jerome Bonaparte. It was sacked by the mob in February 1848, when the valuable battle-pieces of Horace Vernet were destroyed. Opposite the Palais-Royal stood the Château-d'Eau, the scene of a desperate struggle in the revolution of 1848. It has been demolished since. Near the north end of the palace is the Théâtre-Français; and at the corner of the Rue-Fontaine-Molière is a bronze statue of Molière, placed in a niche nearly opposite the house in which he died. A little farther on, in the Rue-Richelieu, is the Imperial Library, one of the largest in the world, open to all comers from 10 o'clock a.m. till 3 o'clock p.m.

The Column of the Grand Army, in the Place-Vendôme, is 231 feet high, comprising the pedestal. The column is built of cut stone, coated with bronze bas-reliefs representing the chief exploits of the Grand Army from its leaving the camp of Boulogne to the peace concluded after the battle of Austerlitz. In its general design it is a copy of that of Trajan; the bronze reliefs were executed by thirty different artists, under the direction of Denon. The pedestal is likewise highly enriched; the diameter of the column is 12 feet 10 inches. In 1814 the bronze statue of Napoleon I., in Roman costume, was taken down, and afterwards recast to form the horse of the equestrian statue of Henri IV.; but a second bronze figure of Napoleon I., in a characteristic dress and attitude, was put up July 23th 1833: it is 13 feet high.

The triumphal arch de-l'Étoile, begun by Napoleon I. in 1806 and completed in 1836, is, without exception, the most gigantic work of its kind either in ancient or modern times; the great arch being 47 feet 10 inches wide, 96 feet 6 inches high, and 73 feet in depth. This structure is perfectly isolated, and forms a mass whose plan is 147 feet by 78 feet, and its height 162 feet, the effect of which extraordinary dimensions is greatly enhanced by its simplicity of form and its solidity, the outline being unbroken by columns and projecting entablatures, and there being only a single opening on each side, namely the large arch in the direction of east and west, and the smaller one running transversely through the plan from north to south; the height of the latter is 60 feet, and the breadth 274 feet. There are no columns or pilasters, and the architectural forms are exceedingly simple, but at the same time prodigiously rich: the entablature is 23 feet deep, and the frieze is entirely covered with figures in relief, besides which the mouldings of the cornice are carved, as are likewise those of the archivolts and impost of the arch. If it were remarkable for nothing else, this monument would be eminently so on account of the display of sculpture, there being four colossal groups of sculpture, one on each side of the arch in the east and west fronts, the height of which, including their pedestals, is upwards of 56 feet, and that of the figures themselves about 20 feet. Corresponding with these, and above the cornice forming the impost to the large arch, are as many large bas-reliefs. The attic also has a great deal of sculptured ornament. The sculptures generally represent the achievements of Napoleon I. and his generals. Within the upper part and attic there is, besides some other rooms, a spacious hall, extending from end to end of the building.

The Colonne-de-Juillet, erected on the Place-de-la-Bastille, in commemoration of the revolution of 1830, is somewhat loftier than the column in the Place-Vendôme; the bronze exterior of the shaft consists of 20 cylindrical bands or rings, not attached by cramps, but fitted into each other by grooves. The capital is cast in one mass of bronze. On the top is a lantern surrounded by a gallery with a bronze balustrade, and the whole is surmounted by a bronze statue, 17 feet high, of Liberty, holding a torch in the right hand and a broken chain in the other. The height of the entire structure is 164 feet, and the weight of metal employed is 163,264 lbs. Near the Column of July is the well-built square of Des-Vosges, or Place-Royale, which occupies the site of the ancient Palais-des-Tournelles. Farther east, in the Faubourg St-Antoine, is the Barrière-du-Trône, which is ornamented with two plain but lofty columns, conspicuous objects from many parts of Paris. It was on this spot that seated on his throne Louis XIV. received the homage of the city on his triumphal entry, August 26, 1660.

The principal churches of Paris have been already mentioned. Most

of them are still more remarkable for the grand architectural effects and rich decorations of their interiors than for their external appearance. Besides those already named, are the churches of Notre-Dame-de-Lorette, at the end of the Rue-Lafitte, finished in 1823; the church of St.-Eustache, one of the largest and handsomest ecclesiastical structures in Paris, and celebrated for its musical services; St.-Germain-des-Près; St.-Roch; the gothic church of St.-Merri in the Rue-St.-Martin; Notre-Dame-des-Victoires; St.-Nicolas-des-Champs, in the Rue-St.-Martin; St.-François-d'Assise; and the church of St.-Vincent-de-Paul, one of the handsomest structures in Paris, built a little north of the prison of St.-Lazare on a height formerly occupied by a royal lodge.

Among the more modern structures of Paris, the termini of the different railways deserve notice for their neatness and elegance. The principal are those of the Strasbourg railway in the Rue-de-Strasbourg in the Faubourg-St.-Martin; the Great Northern in the Place-Roubaix; the Rouen and Havre terminus in the Rue-d'Amsterdam; the terminus of the Chartres railway in the Boulevard Mont-Parnasse; the Orléans terminus in the Boulevard-de-l'Hôpital; and the Lyon terminus in the new Boulevard Mazas.

The improvements effected in Paris since the accession of the present emperor Napoleon III., not four years ago, are of a most important character; and if the impulse thus given to architectural amelioration is continued for a few years longer, Paris will be in every respect, not only with regard to public buildings but also to street architecture, unrivalled among the great capitals of Europe. Anyone who knew Paris even ten years ago must remember the mass of unsightly buildings which fronted the magnificent triumphal entrance to the Tuileries on the Place-du-Carrousel and disfigured the approaches to the Louvre. All these are now swept away, and the Tuileries and the Louvre are united into one vast building, forming the greatest palace in the world. This magnificent structure, just completed from designs of the architect Visconti, stands entirely alone, being surrounded on every side by open spaces and magnificent perspectives. To the west are the well-known and beautiful gardens of the Tuileries; on the south the quays; on the north is the Rue-de-Rivoli, the grandest street in the world, which passes through a new square formed between the Tuileries and the Palais-Royal; and on the east is another large square planted with shrubs and trees, and connecting the quays with the Rue-de-Rivoli. The area inclosed by the palace buildings forms a square unrivalled for extent and magnificence and large enough for the encampment of an army. The wing facing the river has been completely restored, and the opposite new wing, which forms a large part of the Rue-de-Rivoli, is magnificently built. The whole interior of the Louvre has been restored and most gorgeously decorated, and all its treasures have been re-arranged.

From the Place-de-la-Concorde, which has been re-embellished, the Rue-de-Rivoli extends on a perfect level and in a straight line to the Hôtel-de-Ville, a length of more than a mile and a half, with a width of 24 yards. The houses on each side are all built of white stone, six or seven stories high, with ornamental balconies and sculptured work, but with such variations and differences of design as obviate the monotony of uniformity. To clear the ground for the erection of this noble street a great number of old houses and narrow streets, not without many historical associations, have been swept away. The houses too about the Hôtel-de-Ville have been pulled down, and this celebrated seat of municipal government now stands in the midst of a large square, one side of which is formed by an immense stone palace, used as a barrack for troops. A wide street, running along the quays parallel to the Rue-de-Rivoli, forms another line of connection between the palace and the Hôtel-de-Ville and the barracks.

From the square of the Hôtel-de-Ville another magnificent street, a mile long, planted on each side with trees, and lined with houses six stories high all built of white stone, runs northward, crossing the boulevards from the quays to the handsome terminus of the Strasbourg railway. This street, which is not yet completed, forms a most magnificent entrance to Paris.

A railway is nearly finished completely encircling Paris, in order to connect all the metropolitan lines of railway together, and to enable companies to carry both passengers and goods from one end of France to the other across the metropolis without changing carriage. In France railways have all the same gauge.

In the Champs-Élysées, on the left of the Great Avenue leading from the Place-de-la-Concorde to the triumphal arch de l'Étoile, a building intended for industrial exhibitions, public ceremonies, and imperial festivals is rapidly approaching completion. This noble hall is 900 feet long by 500 feet wide. The exterior walls, built of stone, consist of two stories of massive arched windows, rising one above the other and ornamented with sculptures emblematic of the principal cities of France. Through these windows (which are painted) and the arched roof, which is constructed of iron and ground glass, the building is lighted. In the centre of each long side of the building are noble projections to break the uniformity of the façades; the projection on the northern side contains the principal entrance under a noble arch flanked by two lofty towers. This building forms part of the Palais-de-l'Industrie for the Universal Exhibition of 1855: several wings and galleries, extensions of the plan, are connected with it.

A very beautiful gothic church, of cathedral dimensions, surmounted

by two lofty towers and lighted through windows of stained glass, is built in the Faubourg St.-Germain near the Legislative Chamber. The building of the Alma Bridge has been already mentioned. Among other improvements we may enumerate the restoration and decoration of Notre-Dame, the Palais-de-Justice and its Sainte-Chapelle, the churches of St.-Eustache, St.-Etienne-du-Mont, and St.-Roch. The dome of the Invalides has been rebuilt to make it more worthy of the Tomb of Napoleon I., the most wonderful monument of Paris. The quays have been completely finished and put in order, and several of the oldest stone bridges rebuilt. The great central markets have been constructed on a grand scale. The Boulevard Mazas, connecting the bridge of Austerlitz with the Place-du-Trône, and passing the terminus of the Lyon railway, has been completed, and a new boulevard is being cut from the Madeleine to the Park of Monceaux. Finally a free library, containing 200,000 volumes, has been opened near the church of Sainte-Geneviève in a stone building of great architectural merit, in the Italian style. The interior of this institution is remarkable for its elegant and judicious arrangements.

The population of Paris in 1791 was estimated to be above 610,000. The first regular census was taken in (we believe) 1806, and the population of the commune of Paris in the years named was officially given as follows:—In 1806, 580,609; 1826, 890,431; 1836, 909,126; 1846, 945,721; 1851, 996,067. At the census of 1851 the population of the arrondissement of Paris (a division of the department of Seine) was 1,053,262. But the population of Paris as bounded by the great modern fortifications considerably exceeds this last number.

The total number of births in Paris during the year 1851 was 32,324 (16,349 boys, 15,975 girls): of this number 10,635 were born out of marriage. The total number of deaths for the year was 27,585 (13,698 males, 13,887 females): the number of bodies exposed at the Morgue in the year was 335 (296 men, 39 women); the number of deaths from smallpox amounted to 364.

The following items of the consumption of Paris are taken from the official return for the year 1851:—

Beef, mutton, veal	135,230,992 lbs.	Oil	2,035,626 gallons.
Pork	24,447,748 "	Vinegar	407,484 "
Salt pork, hams, &c.	2,714,918 "	Sea-Fish, value	6,562,861 francs.
Suet	6,324,199 "	Oysters	1,870,926 "
Salt	11,926,633 "	River-Fish	717,094 "
Cheese	3,071,457 "	Fowls and Game	12,618,432 "
Grapes	6,993,441 "	Butter	12,028,712 "
Grease for machinery	3,079,863 "	Eggs	5,532,890 "
Wine	23,588,288 gals.	Charcoal	8,284,122 bushels.
Spirits	1,286,208 "	Coal	9,969,649 "
Beer	2,430,868 "	Firewood	763,684 cubic metres.

The students of various classes form a considerable part of the population of Paris, the total number reaching nearly to 18,000. There is also a very numerous manufacturing population, which has been lately estimated at 450,000; for in the variety and extent of its productions of industry, Paris may vie with most cities of the world. The carpets of the manufactory of La Savonnerie and the tapestry of the Gobelins are well known. The two establishments are now united at the Gobelins. Cashemire, silk, and woollen shawls; light woollens, cotton goods, hosiery, gloves, hats, embroidery, lace, and other articles of fashionable attire; steam-machinery, jewellery, gold and silver plate, and trinkets; pens, clocks and watches, glass, and bronzes; musical, mathematical, and philosophical instruments; paper-hangings, household furniture, carriages, saddlery, leather, glue, cutlery, fire-arms, liqueurs, and confectionary are manufactured. Dyeing, printing, engraving, and lithography; the manufacture of salts, acids, oxides, and other chemicals; the refining of sugar, tallow-melting, the distillation of spirits, brewing, and the manufacture of starch, are carried on with activity. The special exports of Paris according to official returns were valued at 94 millions of francs in 1837. In 1847 the value was 168,572,187 francs; in 1848, a year of great depression, the value of the exports was 157 millions. In 1851 the exports had risen to 219½ millions, and in 1852 to 221½ millions of francs (8,860,000L.), or nearly one-seventh of the value of the total exports of France. It must be borne in mind however that many articles manufactured in other towns of France are sent to Paris to be finished, and are included in the exports of the capital. The great manufacturers of Lyon, Rouen, and the other chief manufacturing towns of the provinces, have their agencies and their depôts at Paris. The Seine furnishes the principal means of water-carriage. The Ourcq Canal, which opens a communication with the country to the north-eastward, terminates in the basin of La-Villette, just outside the wall of Paris, on the north-east side of the city; and the canals of St.-Martin and St.-Denis open a communication between the Ourcq Canal and the Seine. The canal of St.-Martin enters the Seine in the very heart of Paris, opposite the inland Louvier; its termination toward the Seine is formed by the basin of the Arsenal. The canal of St.-Denis opens into the Seine at the town of St.-Denis, a short distance north of Paris. Paris also has abundant facilities for transport by means of railroads, which connect the capital with Lyon, Troyes, Orléans, Nantes, Bordeaux, Bayonne, Strasbourg, St.-Quentin, Lille, Dunkirk, Calais, Boulogne, Rouen, Havre, and Dieppe, besides short lines to Corbeil, Versailles, Chartres, and Le-Mans. The western railway now open to Le-Mans is part of a great trunk line in course of construction to Brest, which is to be connected by branches with a

north-western line to Cherbourg. Along all these lines electro-telegraphic wires are laid.

A vast number of barges and other craft arrive in Paris, besides trains of fire-wood or timber floated down the main stream, or its affluents the Marne and the Oise. Wood is the principal fuel consumed, but the consumption of coal is gaining ground, and begins to tell slightly by its grimy smoke on the formerly transparent atmosphere of Paris. The principal articles conveyed by the river in boats are wine and brandy; grain, pulse, and flour; butter, fish, and fruit; groceries, spices, salt, and oil; hay and straw; bricks, tiles, and stone; cottons, linens, and other woven goods; iron and other metals; earthenware and glass; soap, tobacco and snuff, soda, drugs, paper, &c. For the supply of provisions there are numerous markets, covered or open. The corn-market (Halle-aux-Blés) is between the Louvre and the Post-Office. The Reserve Granary, near the Arsenal, has been already mentioned. The meat-market, near the Halle-aux-Blés, a large space fitted up with wooden stalls, is supplied with water by six fountains. The poultry-market is on the south bank of the Seine, opposite La-Cité. It is a covered market, about 200 feet long and 150 feet wide, divided into three parts by rows of pillars and iron rails. The fish-market, near the meat-market, is a covered building, supported by a great number of columns. The Marché-des-Innocents, for fruit, vegetables, and flowers, is an open square in the same neighbourhood, surrounded by small shops for the market-people, and adorned in the centre by a handsome fountain. The Marché-St.-Germain, not far from the Luxembourg Palace, is an open square of about 300 feet long by 240 or 250 feet wide, with a covered arcade or piazza all round, and having a fountain in the centre. The old linen-market (Halle-au-Vieux-Linge), in which old clothes and secondhand articles of every sort are sold, is built on part of the site of the Temple, the tower of which was the prison of Louis XVI. and his family. The Halle-aux-Vins has been already noticed. The Marché-aux-Fleurs, or famous flower-market, in the Île-de-la-Cité between the Pont-aux-Changes and the Pont-Notre-Dame, is simply the wide space along the quay, which is planted with four rows of trees and watered by four fountains. There are five abattoirs, or general slaughter-houses, in the outskirts of the city, three on the north side of the Seine (Ménilmontant or Popincourt, Montmartre, and du-Roule), and two on the south side, Villejuif, outside the boulevard de l'Hôpital, and Grenelle. They are of great extent, and under excellent regulation.

The principal cemeteries of Paris are those of Père-la-Chaise, Montmartre, and Mont-Parnasse. They are all outside the octroi wall. Père-la-Chaise on the eastern side of Paris, the largest of these cemeteries, contains about 100 acres. It is beautifully laid out, planted with cypress-trees, and contains a vast number of handsome monuments, amongst others one erected over the ashes of Heloise and Abelard. The chapel is a neat building, surmounted by a white marble cross. In the cemetery of Mont-Parnasse, which is outside the city a little west of the Observatory, are the graves of many persons executed for political offences. The Guillotine, when it is wanted, is erected inside the Barrière d'Arcueil, to the south of the Observatory.

Paris is the centre of the imperial government, of the executive and legislative powers of the state, the seat of the supreme court of appeal for the whole empire (Cour-de-Cassation), and of an archbishop, whose suffragans are the bishops of Chartres, Meaux, Orléans, Blois, and Versailles. It has a university (Collège-de-France), five colleges, namely, those of Louis-le-Grand, Henri IV., Bourbon, Charlemagne, and St.-Louis; a polytechnic school, special schools of the fine arts, mines, &c., normal school, and a vast number of educational establishments of a high order. The University-Academy of Paris grants degrees to all students educated in colleges affiliated to it within the limits of the departments of Seine, Cher, Eure-et-Loir, Loir-et-Cher, Loiret, Marne, Oise, Seine-et-Marne, and Seine-et-Oise. There are also several theological schools, the most famous of which is that of the Sorbonne. The church of the Sorbonne is a handsome building; in the chapel of the college is a fine monument erected over the grave of Cardinal Richelieu. Printing was first introduced into France at the college of the Sorbonne in 1483. Paris is the headquarters of the First Military Division, which comprises the departments of Seine, Seine-et-Oise, Oise, Seine-et-Marne, Aube, Yonne, Loiret, and Eure-et-Loir.

Each arrondissement has a separate municipality, over which a mayor presides. There is also a justice of the peace to each of the 12 arrondissements, and a commissary of police to each of the 48 quarters. The council of the department of Seine over which the prefect presides, forms a municipal council for Paris. The municipal police has charge of the safety of the public, and the sanitary regulations of the city are confided to it. This force is about to be modelled after the police of London. The regulations for protection against fire and for the extinguishing of fires are excellent. There is an organised body of firemen (sa-peurs-pompiers), who are distributed in barracks or stations. The supply of water is generally by public fountains, and not commonly by pipes furnishing a supply to every house.

In Roman times the city of Lutetia was supplied with water by an aqueduct from Arcueil, as before stated. In the 6th century the monks of St.-Laurent and St.-Martin brought the waters of St.-Gervais to Paris, and their fountains of St.-Lazare and Maubude still remain. When Philippe Auguste founded the Halles he supplied them with

fountains. Henri IV. constructed the new aqueduct of Arcueil; Louis XIV. devoted large sums to the hydraulic service of Paris, and many of the fountains still existing were erected in his reign. More recently the supply has been largely increased by the completion of the Oureq-Canal, the boring of the Artesian well of Grenelle (which is 1786 feet deep, 1685 feet below the level of the sea, and gives 176 gallons per minute); the erection of the Pompe-à-Feu on the left bank of the Seine in 1848; and lastly the works at Chaillot, where large reservoirs are formed, into which steam-engines pump about 300 gallons from the Seine at each stroke. The supply from all these sources would give to each person 32 gallons a day, but owing to the small diameter of the pipes and the low level of the principal sources, the quantity furnished is far short of this. To remedy these defects larger pipes are now being laid down all through Paris, and the underground conduits are being made to communicate with each other, so that the surpluse at one point may make up the deficiency (if any) at another. The volume of water derived from the present sources is clearly sufficient if it could only be brought to all parts of the town. But unfortunately about four-fifths of Paris at present receive only a surface supply; and a high service supply could be furnished to only about one-fifth of the city, and this at vast additional cost. It is proposed therefore to leave the present arrangements for all public needs, such as street watering and cleansing, fountains, fire-plugs, and general ground service, and to bring by means of an aqueduct a new supply of water from a high level (the waters of the Somme and the Soude have been named) for the high service supply of the city.

Like the water supply the drainage of Paris is in an unsatisfactory state, and seems on the way of being thoroughly executed. In old times the city was drained by open sewers. The first covered sewer was made in 1374. In the 16th century the palace of Tournelles had to be abandoned in consequence of the malaria arising from the open drains around it. In the time of Louis XIV. the uncovered drains were four times as long as those that were covered. Napoleon I. began the subterranean canalisation of the city; but in 1854 there were only 102 miles of sewerage completed to 276 miles of public ways. In the interval however all the open sewers have been covered in, and some other important improvements have been effected. These are the establishment of arterial sewers parallel to the Seine; a grand sewer encircling the city into which several tributaries open; the purification of the Bièvre; and the commencement of the great sewer under the Rue-de-Rivoli (13 feet high and 8 feet wide), which will extend from Chaillot to the Faubourg St.-Antoine, and communicate with the sewer of the enceinte; and an arterial sewer on the left bank of the Seine, which when finished, will extend from the Bièvre to below Gros-Caillois. But even with all these aids the surface drainage of Paris is very imperfect, though two drains have been constructed outside the barriers to carry off the superficial waters from the streets. To remedy all the defects of the system it is proposed, in connection with the improved water supply above noticed, to form grand lines of sewerage under the principal streets furnished with rails for the passage of waggons and carts; out of these secondary lines, also furnished with rails to the less important streets, with smaller conduits to encircle each group of houses, and to communicate with each house by means of pipes.

It must not be supposed however that the streets of Paris are now as they used to be in a dirty state. Thanks to the regulations made since the re-establishment of the empire, not only the principal streets but the smaller thoroughfares are kept remarkably clean. Street-sweepers are appointed to every district of the metropolis. Between 8 o'clock in the morning and 9 o'clock in the evening no one is allowed to throw anything out upon the pavements; after the last mentioned hour all that is thrown out is collected and carted away before morning.

Paris possesses about 100 Catholic churches and chapels. There are few ecclesiastical communities for men, but several for women, the principal of which is the seminary of the congregation of the Sisters of Charity in the Rue-du-Bac. This establishment is of vast size, and has between 2000 and 3000 inmates, who here prepare themselves for the active discharge of their important duties—tending the sick in the hospitals, and instructing the children of the poor. There are two Calvinist and two Episcopal churches, one Lutheran church, a synagogue, and a Methodist meeting-house.

Besides the free library before mentioned there are several large and important libraries open to the public:—The Imperial library in the Rue-Richelieu near the Palais-Royal, with above 1,500,000 volumes, 80,000 manuscripts, 1,600,000 engravings, 100,000 medals and coins, and 300,000 maps; the library of the arsenal, with 180,000 volumes and 5000 manuscripts; the Mazarine library (120,000 volumes and 4500 manuscripts); the City library; that of the museum of Natural History at the Jardin-des-Plantes, and others.

The charitable institutions are numerous. There are 17 hospitals, most of them of great extent and admirably regulated. The most important of the non-military hospitals is the Hôtel-Dieu, in the island of La-Cité; of the military hospitals, the Hôtel-des-Invalides. The patients in nearly all the hospitals of Paris are tended by the admirable Sisters of Charity. There are also 13 asylums, including houses for the blind and for deaf-mutes. Each arrondissement has an office (Bureau-de-Charité) for relieving the destitute at their own

habitations. Two hospitals have been lately established by decree of the Emperor for receiving the workmen maimed or disabled at the great works in course of construction in the capital. There are a variety of other institutions for affording relief, and vast sums are distributed every year through the medium of the clergy, and the Brotherhood of St. Vincent de Paul, a lay society, for visiting the poor at their own houses.

Paris contains numerous places of amusement. There are several theatres, the most remarkable of which are the Académie-impériale-de-Musique, or French Opera House; the Italian Opera; the Opera-Comique; the Théâtre-Français; the Odeon; the Théâtre-Lyrique; the Gymnase; Du-Vaudeville; Des-Varietes, &c. The principal equestrian spectacles are the Cirque-Napoléon in the Boulevard-du-Temple; the Cirque in the Champs-Élysées, a spacious polygonal edifice built of stone and surmounted by a bronze horse; and the Hippodrome outside the barrier, opposite the south front of the triumphal arch de l'Étoile. The last has seats for 10,000 spectators. Public balls are common in summer and winter; and the gardens of the Tuileries and of the Palais-Royal, the Bois-de-Boulogne, and the Boulevards are much frequented by promenaders.

Among the prisons of Paris, besides Sainte-Pélagie before named, St. Lazare in the Rue-Faubourg-St. Denis, which was formerly the house of the congregation for foreign missions, established by St. Vincent of Paul, whose remains originally deposited in the chapel of St. Lazare, were translated from Notre-Dame to the chapel of the Lazarists in the Rue-de-Sèvres after 1830. Other prisons are La-Force, near the Place-Royale; La-Roquette in the Faubourg-St. Antoine; and the Abbaye in the Rue-Sainte-Marguerite, on the left bank of the Seine.

PARKGATE. [CHESHIRE.]

PARKHURST. [WIGHT, ISLE OF.]

PARKSTONE. [DORSETSHIRE.]

PARMA, Duchy of, a sovereign state in Northern Italy, which extends from the Apennines to the Po, and forms part of the great basin of that river. It is bounded N. by Austrian Italy, from which it is divided by the Po; E. by the duchy of Modena; W. by the Sardinian territory; and S. partly by the Riviera of Genoa, and partly by Tuscany. The length of the duchy from east to west is about 50 miles, and its breadth is from 40 to 45 miles; the area is 2391 square miles, and the population in 1852 amounted to 502,841. The state of Parma consists of five provinces:—1. Parma, between the Enza and the Taro, population 148,898; 2. Borgo San Donnino, between the Taro and the Riglio, population 142,540; 3. Piacenza, between the Riglio and the Bardoneggia, population 133,973; 4. Val di Taro, on the Apennines, population 50,952; and 5. Lunigiana Parmesana, also on the Apennines about Pontremoli, the chief town, population 31,478. In consequence of changes that followed the death of the ex-empress Maria Louisa, Parma obtained the territories of Pontremoli and Lunigiana, which formerly belonged to Tuscany and Modena. *Guastalla*, which was formerly united to Parma, now belongs to MODENA.

The mountain region, which constitutes about one-third of the whole country, is rugged, poor in produce, and bleak in winter; the forests of chestnut-trees, which clothe the sides of the mountains, supply the inhabitants with their chief article of food. Thousands of these highlanders quit their homes every year, many to seek employment in other and often distant countries, whilst others migrate with their flocks to pass the winter in the low lands. The lower hills and plains, which extend between the Apennines and the Po, and along the southern bank of that river, are very fertile, well cultivated, and populous; the lands have the advantage of a regular system of artificial irrigation. The pasture-lands are remarkably rich. The principal products are—corn, pulse, fruit, wine, silk, wool, remarkably fine cattle, and poultry. Good cheese is made, but no Parmesan. [LODI.] The mineral wealth of the country consists of iron, copper, salt, stones for lithography, marble, and alabaster. The manufactures consist of paper, gunpowder, woollen stuffs, glass, and delft ware.

The Ligurian Apennines enter the state of Parma from the west; the central ridge runs in an eastern direction, separating the waters of the Taro, which run into the Po, from those of the Magra, which flow into the Mediterranean, and detaching various offsets to the north-east towards the Po. Between these offsets flow numerous streams, all of which are affluents of the Po; and though nearly dry in seasons of drought, become impetuous torrents during rains. Among these streams are the Tidone and the Trebbia, a larger stream, which joins the Po above Piacenza. On the banks of the Trebbia river Hannibal defeated the consul Sempronius; and here also Suwarrow defeated the French under Macdonald, after three days' desperate fighting, in June, 1799. East of the Trebbia flows the Nura, which enters the Po below Piacenza. Farther east is the Taro, the largest river of the state of Parma, which rises in the Ligurian Apennines, and after flowing through a deep and long valley called by its name, enters the plain of Parma near Castel Guelfo, and joins the Po after a winding course of about 60 miles. A road leads from the Val di Taro to Pontremoli and Sarzana in the valley of the Magra, passing over

the Apennines of La Cisa at an elevation of about 3000 feet. The other rivers of the duchy are the Parma, which flows through the capital, and the Enza, which forms the boundary between Parma and Modena.

The principal towns are:—PARMA. PIACENZA. *Borgo San Donnino*, a bustling town in a fertile plain, with 3000 inhabitants, a bishop's see, a gymnasium, and a clerical seminary. *Borgo Taro*, the chief town of the province of Val di Taro, in the highlands of the Apennines, with about 1000 inhabitants, two elementary schools, and an old castle. *Pontremoli*, on the southern slope of the Apennines, is divided into an upper and a lower town; the former is defended by massive fortifications and an old castle. The lower town is well built, and has many good houses: the cathedral is the principal building. The population numbers about 8500. Some silks and linen are manufactured.

After the fall of Napoleon in 1814, the Congress of Vienna decided that the duchy of Parma and Piacenza should be the apanage of his wife, Maria Louisa of Austria, during her lifetime; that after her death the Duke of Lucca should be restored to his paternal states of Parma, which had been incorporated with the French empire; and that Lucca should be annexed to the grand duchy of Tuscany. On the death of the ex-empress, Maria Louisa, in 1847, the territorial changes intended by the Congress of Vienna were made, and certain districts were exchanged with Modena for others on the left bank of the Enza, so as to leave that river the boundary between these two states. During the war between Sardinia and Austria, in 1848-9, the Sardinians twice occupied the duchy of Parma. In consequence of the death by assassination in the public street of the late Duke of Parma, Charles III., in 1852, the state is now governed by his widow, the Duchess of Parma, a sister of the Duke of Bordeaux.

The revenue of the duchy amounts to about 9,500,000 lire, or francs; the expenditure is about the same. The military force maintained numbers 8597 men and officers.

PARMA, the capital of the duchy of Parma, situated in a fine plain about twelve miles south of the Po, is rather more than four miles in circumference, and is surrounded by walls and ditches: it is a bishop's see, and has about 40,000 inhabitants. The streets are wide and straight. Parma has a lyceum, with chairs of theology, medicine, and philosophy; a secondary or grammar school; two colleges for boarders, besides a military college; a school for the arts, and several elementary schools. The museum of Parma contains 20,000 medals, and many inscriptions, bronzes, and other remains of antiquity, dug up at Veieia, an ancient town situated at the foot of the Apennines, not far from the Nura.

Most of the churches of Parma are adorned with paintings by Correggio. The most remarkable buildings are—the ducal palace, which contains a library of 90,000 volumes and a gallery of good paintings; the cathedral; the Baptistery, which is built of marble, and adorned with numerous statues and frescoes; the churches of St. John the Evangelist; L'Annunziata; and La Madonna della Steccata, which contains the tombs of the dukes of Parma. In the convent of St. Paul is an apartment exquisitely painted by Correggio, and the Palazzo del Giardino is adorned with frescoes by Agostino Carracci and Cignani. The great Farnese theatre, one of the largest in Italy, has not been used for many years, and is now in a dilapidated state. A new theatre, of more moderate dimensions, was finished in 1829. Several palaces belonging to the nobility also deserve notice.

Parma has a Monte di Pietà, founded in 1488 by Father Benardino da Feltre, a philanthropist who invented this kind of institution for the accommodation and relief of the labouring classes. Among the other beneficent institutions of Parma are—an hospital for incurable patients, a school of mechanical trades, a house for the poor, another for the insane, and a school for midwives, all founded by the duchess, Maria Louisa. Foreign consuls reside at Parma.

Parma was once a town of the Etruscans, and afterwards of the Boii; it was made a Roman colony at the same time as Mutina (Modena) B.C. 183. (Livy, xxxix. 55.) Of the ancient town nothing remains except two military columns, which are in the little square near the church of La Steccata; a sarcophagus; and a cippus, with an inscription, in which Parma is styled 'Colonia Augusta.' These two last monuments stand in front of the cathedral.

PARNAHYBA. [BRAZIL.]

PARNASSOS (Παρνασσός), the name of a mountain-chain in Phocia, which extends in a north-easterly direction from the country of the Locri Ozolæ to Mount Eta, and in a south-westerly direction through the middle of Phocia till it joins Mount Helicon on the borders of Bœotia. The name was usually restricted to the lofty mountain upon which Delphi was situated. It is called at the present day Liakura. Parnassus is the highest mountain in central Greece. Strabo says (viii. 379) that it could be seen from the Acrocorinthus in Corinth, and also states (viii. 409) that it was of the same height as Mount Helicon; but in the latter point he was mistaken, according to Colonel Leake, who informs us ('Travels in Northern Greece,' vol. ii. p. 527), that Liakura is some hundreds of feet higher than Paleorona, which is the highest point of Helicon. Parnassus was covered the greatest part of the year with snow, whence the epithet of 'snowy,' so generally applied to it by the poets. (Soph., 'Œd. Tyr.' 473; Eurip., 'Phœn.' 214.) The mountain is sometimes called 'the two-headed,' from two lofty rocks below which Delphi was situated. Between these two rocks the celebrated Castalian fount flows from the upper part of the

mountain, which is clear, and forms an excellent beverage. Above this spring, at the distance of 60 stadia from Delphi, was the Corycian cave, sacred to Pan and the Corycian nymphs. When the Persians were marching against Delphi, a great part of the inhabitants took refuge in this cavern. (Herod., viii. 37.) It is described by a modern traveller (Raikes, in Walpole's 'Collection,' &c., vol. i. p. 312), as 330 feet long and nearly 200 feet wide. Above this cave, and near the summit of Parnassus, at the distance of 80 stadia from Delphi, (Paus., x. 32, s. 6), was the town of Tithorea or Neon, the ruins of which are near the modern village of Velitza. For an account of the towns in the neighbourhood of the Parnassus, see PHOCIS.

PARNDON. [ESSEX.]

PAROPAMISUS. [AFGHANISTAN.]

PAROS, one of the larger Cyclades, is situated west of Naxos, from which it is separated by a channel six miles wide. Paros is estimated to be about one-half the size of Naxos; it is about 36 miles in circumference. The surface is hilly; it produces corn, abundance of fruit, and has flocks of sheep and herds of swine, and plenty of partridges and other game. The population, according to Thiersch ('État de la Grèce'), is about 4000. The head town of Paros, called Parichia, is on the site of the ancient town, in the inner recess of a bay on the north-west coast of the island. The principal harbour is on the north-east coast, and is the finest in the archipelago. The mountain Marpesus, now called Capresso, near the centre of the island, abounds with white marble, which was often used by the ancient sculptors. There are four or five villages on the island, besides the capital, and several Greek monasteries scattered about.

Paros is said to have been colonised by the Cretans. It attained a great degree of prosperity by its maritime trade, and the chief town was wealthy and well fortified. When Darius invaded Greece, the inhabitants of Paros submitted to the Persians, and furnished sailors for the Persian fleet; in consequence of which, after the battle of Marathon, Miltiades went with an Athenian squadron to attack the island, but he failed in the attempt, and received the wound of which he shortly after died. When the Franks took possession of Constantinople, Paros, like most of the Cyclades, became subject to the Venetians. It formed for a time part of the dukedom of Naxos, but afterwards became a separate principality of the Venetian family of Veniero, under which it remained till Barbarossa took it in the 16th century. In the latter part of the 18th century the Russians took possession of Paros, and made it for a time the station of their fleet. It now belongs to the kingdom of Greece. The Greek inscription called the 'Parian Chronicle,' was found in this island. West of Paros, and separated from it by a narrow channel, is the smaller island called Antiparos. [ANTIPAROS.]

Coin of Paros. British Museum. Actual size.

PARSONSTOWN, or BIRR, King's County, Ireland, a market-town and the seat of a Poor-Law Union, is situated on the right bank of the Little Brosna, in 53° 5' N. lat., 7° 54' W. long., distant by road 22 miles S.W. from Tullamore, and 78 miles W.S.W. from Dublin. The population in 1851 was 5540, besides 1611 inmates of the workhouse. Parsonstown Poor-Law Union comprises 39 electoral divisions, with an area of 220,438 acres, and a population in 1841 of 67,860; in 1851 of 49,651.

This town early became the chief seat of the O'Carrolls. The Danes repeatedly attacked it. In 1620 it was bestowed on Lawrence Parsons, the ancestor of the present proprietor, the Earl of Rosse. The town extends on both sides of the Birr, which here joins the Brosna. The modern part of the town contains many handsome houses. The church, erected in 1815, is of pointed architecture, with a tower 100 feet high. The Roman Catholic chapel is a spacious building in the same style, with a spire 124 feet high. There is a second Roman Catholic chapel, in which the service is performed in English. The Independents, Wesleyan Methodists, Baptists, and Quakers have chapels. There are two National schools, and others partially endowed; a public library, a reading-room, a savings bank, and loan fund. A court-house, a fever hospital, dispensary, bridewell, and Union workhouse are in the town. Linen is manufactured. There is a weekly market for corn. Fairs are held four times a year. Quarter and petty sessions are held. A low Doric pillar, standing in the square in the modern part of the town, and supporting a statue of William, duke of Cumberland, was erected in 1747 to commemorate the victory of Culloden. Birr Castle, which has been rebuilt and improved by the present Earl of Rosse, is close to the town, and, with its towers and embattled walls, forms a striking ornament. The grounds contain a laboratory for the preparation of specula, and his lordship's celebrated telescope is set up on the lawn in front of the castle.

PARTHENIUS, the ancient name of the Chatl, a river of Anatolia, sometimes also called Barta from a town at its mouth, which seems to

retain the traces of the ancient name of the river. The river rises in Mount Olgassy, and flows in a north-westerly direction into the Euxine, separating Bithynia from Paphlagonia. The country through which it flows is very fertile and beautiful. Ovid and Ammianus Marcellinus (xxii. 8) speak of the Parthenius as a rapid stream; and Xenophon ('Anab.' v. 6, s. 9) says that it is impassable. It is mentioned in the Iliad (ii. 854).

PARTHIA originally comprised a small and mountainous country (Strabo, xi. p. 514) south-east of the Caspian Sea, between Hyrcania and Aria; but the name was sometimes applied to the countries included in the later Parthian empire. It is difficult to define the boundaries of Parthia proper, as they differed at various times. In the time of Strabo (xi. 514) Parthia extended on the west as far as Rhagæ and the Tapuri to the Caspian passes, and included the districts of Komisede (Kumis) and Choarene (Khuar). Pliny (vi. 29) says that it was bounded E. by the Arii, S. by the Carmanii and Ariani, W. by the Pratites Medi, and N. by the Hyrcani.

The chief town of Parthia, and the only one in the country of any importance, was Hecatompylon, which, according to Strabo (xi. 514), was 1260 stadia from the Caspian gates. The site of it is doubtful. Some writers identify it with the modern Damghan.

The Parthians were apparently of Scythian origin. According to Justin (xli. 1) their name signified in the Scythian language 'banished,' or 'exiles.' The Parthians were subject to the Persian monarchy, and in (Herod., iii. 93) the army of Xerxes they marched together with the Chorasmii, Sogdi, Gandarii, and Dadice (Herod., vii. 67); and in that of the last Darius they were united with the Hyrcani and Tapuri under one commander (Arrian, iii. 8). Under Alexander, Parthia and Hyrcania together formed a satrapy (iii. 22).

On the death of Alexander the Parthians espoused the side of Eumenes, and afterwards became subject successively to Antigonos and the Seleucids, till about B.C. 256, when they threw off the authority of the Syrian kings and were formed into an independent kingdom under the rule of Arsaces I., from whom the succeeding kings received the title of Arsacids. His reign was the beginning of the great Parthian empire, which was gradually increased at the expense of the Syrian kingdom in the west and the Bactrian in the east; and at length extended from the Euphrates to the Indus, and from the Oxus to the Persian Gulf.

The Parthian empire lasted from B.C. 256 to A.D. 226. Under Arsaces I., Mithridates I., and Phraates II. the dominions of Parthia were extended as far as the Euphrates and the Indus; after the defeat of Antiochus Sidetes of Syria in B.C. 190, the Parthians were constantly engaged in wars with the nomad tribes of central Asia, who, after the destruction of the Greek kingdom in Bactria, attempted to obtain possession of the western parts of Asia. Tigranes, king of Armenia, also obtained some successes over Mithridates II., but after his conquest by the Romans the Parthians again acquired the ascendancy. The invasion of Crassus during the reign of Orodes terminated in the death of the Roman general and the destruction of his army, B.C. 53, and the Parthians obtained a great increase of power. In the war between Cæsar and Pompey they took the side of Pompey; and after the death of Cæsar they sided with Brutus and Cassius. In B.C. 37 Orodes was murdered by his son Phraates IV., and from this time the history of Parthia is a succession of civil wars, with occasional interventions by the Romans, until A.D. 217, when Artaxerxes, who had served with great reputation in the army of Artabanus, the last king of Parthia, took advantage of the weakened state of the monarchy to found a new dynasty. He represented himself as a descendant of the ancient kings of Persia, and called upon the Persians to recover their independence. This call was readily responded to; a large Persian army was collected; the Parthians were defeated in three great battles, and Artaxerxes succeeded to all the dominions of the Parthian kings, and became the founder of the new Persian empire, which is usually known by that of the Sassanids.

PARTICK. [LANARKSHIRE.]

PARTNEY. [LINCOLNSHIRE.]

PAS-DE-CALAIS, a department in the north of France, is bounded E. and N.E. by the department of Nord, N.W. and W. by the Strait of Dover and the English Channel, and S. by the department of Somme. It extends between 50° 2' and 51° N. lat., 1° 35' and 3° 10' E. long.; from north-west to south-east it is 86 miles long, and its mean breadth is 33 miles. The area is 2550½ square miles. The population in 1846 was 685,021; in 1851 it amounted to 692,994; which gives 271.70 inhabitants to the square mile, being 97.12 above the average per square mile for all France. The department is formed out of the greater part of the former province of Artois, and portions of Lower Picardie. In ancient times the territory of Pas-de-Calais was inhabited by the Ambiani, the Morini, and the Atrebatæ. The southern district between the Anthie and the Canche formed part of the territory of the Ambiani, whose capital was *Samarobriua*, now Amiens. The Morini dwelt along the sea coast; and the Atrebatæ inland to the south of the preceding. *Nemetacum*, now Arras, was the capital of the Atrebatæ. *Taruenna*, now Théroutanne, was the chief town of the Morini; and *Gesoriacum*, afterwards called *Bononia*, now Boulogne, also belonged to them. Cæsar's Itius Portus is Witand, or Wissant, east of Cape Grinez, and the Itium Promontorium is Cape Grinez itself, which is now surmounted by a lighthouse.

The department takes its name from *Passage*, or *Pas-de-Calais*, by which the French sometimes designate the Strait of Dover. The surface consists of two inclined plains, which slope respectively towards the east and west, and lie on either side of a ridge of hills that crosses the department from south-east to north-west, terminating in the latter direction in the high cliffs of Cape Grinez, between Calais and Boulogne. These cliffs, which extend for some miles on each side of the cape, are composed of chalk, and bear a close resemblance to those of Dover. Farther west the cliffs are composed of masses of slaty clay. In some parts the coast is low, and defended from the sea by a natural barrier of sandy downs. The coast-line, reckoning all its indentations, has a length of about 80 miles, but it presents no good natural harbours, the inlets being incumbered with sand or the debris of the cliffs. Calais and Boulogne are good artificial high-water-harbours formed by piers. Besides the ridge of hills above mentioned, which sends out spurs that form the watersheds between rivers flowing through the valleys on either slope, there are some isolated high lands south of Boulogne, and also between the Authie on the southern boundary and the Canche. The principal rivers on the eastern slope are—the Scarpe, the Sensée, and the Lys, feeders of the Escaut; and the Aa, which forms the north-eastern boundary, and falls into the sea at Gravelines; most of these rivers are navigable, or are made so by canalisation. From the western slope flow the Lianne and the Canche into the Channel at Boulogne and Etaples respectively, and the Authie, which flows for some way in the department of Somme, and then north-west into the Channel, forming the boundary between Pas-de-Calais and Somme. By means of its rivers and several canals that connect the principal towns on the eastern slope with those of the department of Nord, Pas-de-Calais has an inland navigation of 124 miles. It is traversed by the Great Northern of France railway which passes through Arras, and from which branches run to Boulogne from Amiens, and to St-Omer and Calais from Lille. Along all these lines electro-telegraphic wires are laid down, and from Calais submarine electro-telegraphic cables cross the strait to Dover. Common highway accommodation is afforded by 13 imperial and 15 departmental roads.

The soil is in general fertile; farms are large; a very great breadth of land is occupied with the growth of wheat, but other cereal grains, pulse, oleaginous seeds, and cider fruits are also grown. The low valleys, though generally very fertile and abounding with excellent pastures, are in many places marshy, and in a few places covered with peat bogs. Except in the arrondissement of Béthune, and in the flat districts contiguous to the department of Nord, the fields are mostly uninclosed, and the country, save near hamlets or farmhouses, is bare of trees. A great deal of land is laid out in meadows and orchards. Other crops besides those already named are barley, beet-root for making sugar, hemp, flax, and hops. The number of horses chiefly for draught, of horned-cattle, sheep, and swine is very great; poultry is very abundant, good, and cheap; and fish is very plentiful, great numbers of boats being actively engaged in herring, cod, mackerel, and oyster fishing. The climate resembles that of the south-east of England, but is if possible more inconstant, the changes from heat to cold being sometimes marked by great rapidity; the west and north-west winds, charged with sea spray, are sometimes very annoying on the coast.

Iron- and coal-mines are worked, but not to any very great extent. The ore and coal used in the iron-works are mined on the spot. Other mineral productions are marble, quartz, rock-crystal, limestones, and pipe- and potters'-clay.

The industrial products of the department are common woollen cloth, linen, hosiery of all kinds, velveteen, lace, soap, fishing-nets, beet-root sugar, cotton and flaxen yarn, oil, salt, gin, grain and potato spirits, furniture and cabinet work, glass, earthenware, &c. Besides the numerous establishments for the manufacture of these articles, there are also 1578 wind- and water-mills, several bleach-works, 70 beetroot sugar factories, paper-mills, marble-sawing works, tan- and fulling-mills, and tan-yards. The coasting trade in corn, eggs, butter, seeds, oil, flax, hides, &c. is active. Steam-boats ply regularly from London, Dover, and Folkestone, to Calais and Boulogne.

The forests of this department are small, and chiefly confined to the arrondissements of St-Omer and Montreuil. Consequently coal is generally used for fuel, and has to be imported from Belgium and the department of Nord; for the quantity of coal raised does little more than suffice for the iron-works.

The department is divided into 6 arrondissements, which with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Arras	10	211	168,919
2. Béthune	8	142	135,943
3. St.-Omer	7	118	110,245
4. St.-Pol	6	193	81,800
5. Boulogne	6	100	117,615
6. Montreuil	6	139	78,472
Total	48	908	692,994

1. Of the first arrondissement and of the whole department, the chief town is ARRAS. *Bapaume*, situated near the source of the Sensée, 15 miles S. by E. from Arras, is a well-built fortified town, with 8210 inhabitants, who manufacture lawn, muslin, calico, thread, soap, and leather. The town has salt-refineries, and is supplied with excellent water from a fountain, which is fed by an artesian well. *Vitry*, on the Paris-Brussels railroad, 10 miles E. from Arras, on the Scarpe, is a village with 2308 inhabitants.

2. The second arrondissement takes its name from *Béthune*, a fortified town with a tribunal of first instance, a college, and 7158 inhabitants in the commune. The town, situated on a rock above the Brette, 18 miles N. by W. from Arras, is pretty well built, and possesses a large square, the centre of which is occupied by an old tower of odd construction. The town-hall, which stands on one side of this square, and the principal church, remarkable for the light elegance of its nave, are the only remarkable buildings. Béthune has a public library; manufactures of soap, oil, lawn, and woollen cloth; salt-refineries, beetroot-sugar factories, tan-yards, and a gin distillery. The trade of the town in its industrial products and in corn, wine, brandy, oleaginous seeds, cheese, pottery, &c., is much facilitated by the Lawe and Bassée canals, which here meet in a common basin. The first artesian wells were bored in Béthune and its neighbourhood.

3. The third arrondissement takes its name from its chief town St-Omer. [OMER, ST.] *Aire*, a tolerably well-built town with a college, and 9591 inhabitants, is situated 9 miles S. by E. from St-Omer, at the confluence of the Laquette with the Lys, and at the junction of the St-Omer and Bassée canals, by means of which it communicates with the Aa and the Deule. The town is surrounded with ramparts and deep ditches; it has barracks large enough to accommodate 6000 men; a town-house; several handsome fountains; and two fine churches. Hats, soap, oil, basket-work, grain spirits, glazed paving tiles, &c. are manufactured. *Ardes*, is a small fortified town with 2193 inhabitants, 17 miles by railway N.W. from St-Omer, and 7½ miles S. by E. from Calais. A regiment of cavalry lies in the town; the barracks, stables, and riding-house are the most noteworthy objects. *Le-Champ-du-Drap d'Or*, or the Field of the Cloth of Gold, the scene of the famous interviews between Henry VIII. and François I., lies between this town and Guines.

4. In the fourth arrondissement the chief town, *St.-Pol*, is situated 20 miles N.W. from Arras, at the intersection of seven high roads, and at the head of a vale watered by the Ternoise, a feeder of the Canche. This town was formerly the capital of the county of St.-Pol, and was fortified: of its defences, and of the castle of the counts of St.-Pol, there are still some remains. It is an irregularly-built place, and has a college and 3246 inhabitants in the commune.

5. Of the fifth arrondissement the chief town is BOULOGNE. The district which now forms the arrondissement of Boulogne comprises the former county of *Boulonnais*. The Boulonnais was governed from the 10th century by counts who were great vassals of the crown. The last count, Bertrand de la Tour d'Auvergne, was dispossessed by Philippe, duke of Burgogne, to whom the county was ceded by Charles VIII. Louis XI. took possession of it in 1477. The English held the northern part of it a long time; when the French regained this portion they called it Pays Reconquis. The other towns are:—CALAIS: *Guines*, which stands in a marshy country, 5 miles S. from Calais, and on the canal from St-Omer to Calais, has 4097 inhabitants, who trade in corn, linen, cattle, poultry, fire-wood, turf, and charcoal, and who manufacture tulle, pottery, leather, salt, &c.: *Marquise*, which is situated 8 miles N.E. from Boulogne, on the road to Calais, on the Slack, and has 2108 inhabitants: *St.-Pierre-les-Calais*, a large suburb of Calais, which is traversed by the railway to Lille, has 9000 inhabitants, engaged chiefly in the cotton manufactures, and in the manufacture of buttons, hats, beetroot-sugar, salt, and leather: and *Samer*, which is built on a hill 4 miles S.E. from Boulogne, on the high road to Montreuil, and has a population of 2195. Samer is famous for the remains of an abbey founded about the middle of the 7th century.

6. The sixth arrondissement is named from its chief town, *Montreuil-sur-Mer*, which is situated 25 miles by railway S. from Boulogne, on a high hill near the right bank, and about 4 miles from the mouth, of the Canche. It is tolerably well built with bricks, and strongly fortified. The town has a tribunal of first instance, a college, and 3720 inhabitants in the commune, who manufacture soap, salt, paper, beer, and leather. The tower of the citadel was the prison residence of Queen Bertha, the repudiated wife of Philippe I. Montreuil was ceded to the English by the treaty of Brétigny, but it soon shook off their yoke; in 1537 it was taken by Charles V.; the Spaniards took it a second time in 1544. The charter of the town dates from the year 1189. *Etaples*, a small sea-port town, is situated on the northern shore of the mouth of the Canche, which here forms a small bay, 18 miles by railway S. from Boulogne. Here a treaty of peace between Henry VII. and Charles VIII. was concluded in 1492. Etaples was formerly a place of much greater importance than now, when it numbers scarcely 2000 inhabitants, chiefly fishermen. *Fruges*, situated on a steep hill 18 miles E. from Montreuil, consists of several streets, which abut on a large square. It has 2952 inhabitants, who manufacture woollen cloth, hosiery, tobacco pipes, salt, and leather. *Hesdin*, one of the prettiest towns in the department, is beautifully situated in

the valley of the Canche, 15 miles S.E. from Montreuil, and has 3790 inhabitants. The town is well built with bricks; it is surrounded by ramparts and by ditches, which are always filled by the waters of the Canche. In the town-hall, a graceful structure, there is a small public library. The environs of this town are well cultivated and exceedingly pretty. Hesdin has manufactures of hosiery, oil, pottery, bricks, cotton-yarn, salt, and leather. The famous battle-field of Azincourt, or AGINCOURT, is near Hesdin, but in the arrondissement of St.-Pol.

The department forms the see of the Bishop of Arras, who is the sole suffragan of the Archbishop of Cambrai. It is included in the jurisdiction of the High Court and within the limits of the University-Academy of Douai; and belongs to the 3rd Military Division, of which Lille is head-quarters. It returns 5 members to the Legislative Body of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Official Papers.*)

PASAGES. [BASQUE PROVINCES.]

PASARGADÆ (sometimes written *Passargada*, and also, but only by Ptolemy and Solinus, *Pasargada*), an ancient town of Persia, which is said to have been built by Cyrus after his victory over Astyages the Mede, which he gained near this place. (Strabo, xv. 730; Curt., v. 6.) The kings of Persia, according to Plutarch ('Artax.'), were consecrated at Pasargadæ by the Magi; and here was the tomb of Cyrus, of which Strabo (xv. 730) and Arrian (vi. 80) have given a description, taken from the work of Aristobulus, who had visited the spot. The position of Pasargadæ has been a subject of much dispute. Many writers think that Pasargadæ and Persepolis are only different names for the same place, and that the latter word is the Greek translation of the former. There appears however little doubt that they are distinct places. But although we may have strong grounds for believing that Pasargadæ and Persepolis are different places, it is difficult to determine the site of the former. Lassen, who has examined the subject with great care and diligence ('Ersch. und Gruber's Encyclop.,' art. 'Pasargadæ'), thinks that we ought to look for Pasargadæ south-east of Persepolis, in the neighbourhood of Darabgherd, or Fasa.

PASO DEL NORTE. [MEXICO.]

PASSAGE. [CORK.]

PASSAMAQUODDY BAY. [NEW BRUNSWICK.]

PASSAU, the capital of the Bavarian circle of the Lower Danube, is situated at the point where the Danube receives the Ilz and the Inn, in 48° 36' N. lat., 13° 25' E. long., and has 10,820 inhabitants. It consists of the town itself, and of three suburbs. A handsome bridge, resting on seven piers of granite, crosses the Danube, which is 754 feet wide. On the right bank of the Inn, which is 800 feet wide, is the suburb called the Innstadt, connected with the town by a wooden bridge. On the other side of the Danube, and on the left bank of the Ilz, lies the Ilzstadt. The third suburb is called the Anger. In the angle between the right bank of the Ilz and the Danube there is a rock 400 feet high, upon which stands the fortress of Oberhaus, which is connected with the castle of Niederhaus, situated below. The other defences of the place consist chiefly of eight detached forts. The town of Passau itself is pretty well built: among the public buildings the most remarkable are—the palace, formerly the residence of the bishop; the lyceum; the cathedral; the church of St. Michael; a gymnasium; the ecclesiastical college; and the post-office, in which the treaty of Passau was signed in 1552. In the Domplatz, the handsomest square in the town, stands a colossal bronze statue of king Maximilian Joseph, erected in 1828. The charitable institutions of Passau possess a capital of 2,000,000 florins. There are a great tobacco and snuff manufactory, extensive breweries, tanneries, and paper-mills. Passau is the staple town of Bavaria for salt; there are great magazines, to which the salt is brought from the works at Hallein. Steamers ply on the Danube to Regensburg, Ratisbon, Linz, and Vienna. The bridge over the Rothfluss, near Passau, is considered a curiosity, being one arch of 200 feet span, the largest in Germany. Passau was formerly the capital of a bishopric, which was founded in the 7th century, but was secularised in 1803, and in 1809 wholly incorporated with Bavaria.

PASTO. [NEW GRANADA.]

PATAGONIA, a country in South America, comprehending the most southern portion of that continent, from the Cusu Leubu, or Rio Negro, to the Strait of Magalhaens, by which it is divided from TIERRA DEL FUEGO. It lies between 38° 50' and 53° 55' S. lat., 63° and 76° W. long. It is bounded E. by the Atlantic Ocean; N. by Buenos Ayres; N.W. by Chili; W. by the Pacific Ocean, and S. by the Strait of Magalhaens. The area is about 800,000 square miles; the population has been estimated at about 120,000.

Patagonia comprehends two very different regions—the mountain region and the plains. The mountain region occupies the countries extending along the shores of the Pacific and the western portion of the Strait of Magalhaens. The plains occupy the eastern part of the country, stretching out along the Atlantic and the eastern part of the Strait of Magalhaens.

The mountain region comprehends the southern portion of the ANDES. It is a remarkable and characteristic feature of the southern part of the mountain region of Patagonia that it is cut through by two long but comparatively narrow inlets, which extend to the plains east of the mountains, and there expand into large salt-water lakes.

The southern of these lakes, or inland seas, consists of two basins united by a narrow channel of moderate extent, and connected with the Strait of Magalhaens by a strait of larger dimensions, called Jerome Channel, which branches off from the Strait of Magalhaens near 53° 35' S. lat., 72° 30' W. long., and extends northward with a slight bend to the west to 53° 15', where it turns north-east, and gradually widens into Otway Water. It is upwards of thirty miles long, and generally two miles wide. Otway Water, the southern of these inland sea-basins, extends towards east-north-east for some fifty miles, and increases in width as it proceeds eastward, from hardly six miles to above twenty miles. Not far from the north-eastern extremity of Otway Water, a winding channel, about eight miles long, half a mile wide, and deep enough for the largest vessels, called Fitzroy Passage, runs north by west to another inland sea-basin, called Skyring Water, which is about eighty miles in length and from eight to fifteen miles wide. The northern inland sea is of comparatively small extent, but it sends out several branches, which advance to a considerable distance inland: it is described under ANCON SIN SALIDA. A deep and narrow inlet runs northward from the strait which unites this basin to the ocean, intersecting the country between the ocean and Last Hope Inlet for nearly thirty miles from the Ancon Sin Salida. It is called the Canal of the Mountains.

The more southern of the mountain districts, which is inclosed on three sides by the Strait of Magalhaens, and on the north by Otway Water, is called Brunswick Peninsula, and is connected with the main body of Patagonia only by the isthmus which extends from the eastern shores of Otway Water to the Strait of Magalhaens, opposite Elizabeth Island. This isthmus is from seven to ten miles wide, low, and partly occupied by lakes. Although the area of the peninsula probably exceeds 3000 square miles, it does not appear that a stream above the size of a mountain torrent finds its way to the strait itself. The whole drainage therefore must run off northward to Otway Water. South of the isthmus which divides Otway Water from the Strait of Magalhaens, a range called the Brecknock Hills rises to from 1000 to 1200 feet, and is only a few miles from the strait and parallel to it; but farther south it rises into mountains covered with perpetual snow. Where the mountains approach Cape Froward they sink under the line of perpetual congelation, but Mount Tarn is 2600 feet high, and the mountains at the back of the Cape are estimated at 2500 feet. The mountains continue close to the shore along Jerome Channel and round to where Otway Water opens to view; but the highest summit, Mount Cruz, near Port Gallant, is only 2290 feet high. The southern shores of this peninsula, though extremely rocky, are distinguished by luxuriant vegetation, and the trees attain a full growth, while farther west they are stunted. The climate, though colder than in Europe at an equal distance from the pole, is not subject to extreme cold. The greatest disadvantage is the moisture of the atmosphere and the frequent rain.

The tract of country, or rather peninsula, which is inclosed by Otway Water, Fitzroy Passage, Skyring Water, and the western portion of the Strait of Magalhaens, is called Ponsonby Land. The eastern part of it contains low wooded tracts of considerable extent along the shores of both waters, but the interior is occupied by hills, rising to about 1500 feet, with the exception of one summit, Mount Misery, which is near 72° W. long. and attains an elevation of about 3000 feet, but does not reach the snow-line. The western portion of Ponsonby Land is covered with rocky mountains. On Croker Peninsula and the adjacent district they do not appear to attain a great elevation. But on the shores of the Skyring Water, west of 72° 30' W. long., several of them rise above the snow-line and send down extensive glaciers on their slopes towards the sea. These high snow-capped mountains continue across the narrow isthmus which divides Skyring Water from Beaufort Bay, and attain their greatest elevation in Mount Burney, which is situated not far from the southern shores of the Ancon Sin Salida, and is 5800 feet high. Farther eastward the mountains decline in height, and are intersected by level tracts of some extent, until they disappear in the plains of eastern Patagonia, about 40 or 50 miles from the Pacific.

The Andes, that elevated chain which traverses South America in its whole length, begin on the south, on the very shores of the Ancon Sin Salida (52° 10' S. lat.). South of 47° S. lat. the higher peaks of the range are very lofty, but to the north of that parallel no peak of the Patagonian Andes rises above the line of perpetual snow. The country occupied by the Patagonian Andes is described under ANDES, vol. i. col. 348. From the Strait of Magalhaens to 41° 48' S. lat. the Andes constitute the very shores of the Pacific, and the watershed between the two oceans is so near the western coast, that the largest river which flows into the Pacific has its origin only 13 miles from the beach. This is the *Rio San Tadeo*, the mouth of which is a little south of the peninsula of Tres Montes (47° S. lat.). The shores along this extensive coast-line are rocky and high, with the exception of a few places of very moderate extent. But there is a difference between those which are north of the peninsula of Tres Montes and those which are south of it. The former run nearly in a straight line, both the projecting rocks and the recesses between them hardly anywhere exceeding one mile in extent. But south of the peninsula the inlets penetrate many miles into the mountain masses, and thus form huge promontories. The farther we advance to the south, the more the inlets

increase in depth, until we reach the Ancon Sin Salida and the Jerome Channel, which extend across the whole mountain region.

But the open sea of the Pacific does not wash this rocky coast. A series of high and rocky islands lie like a barrier in front of it, so that no part of the continent, except the peninsula of Tres Montes, is exposed to the ocean's swell. Some of these islands are of great extent; others are only separated from one another by narrow straits, which are not visible at some distance from the open ocean, and the islands accordingly appear to be a continuous high rocky shore. The most northern is the island of Chiloe [CHILI], between which and the continent is the Gulf of Ancud. Farther south is the Chonos Archipelago, which occupies the space between 44° and 46° S. lat., and consists of numerous islands, some of which are of considerable extent, and divided by narrow straits. Then follows the peninsula of Tres Montes, which is nearly isolated by a deep bay that enters the continent from the north, and extends about 30 miles southward. South of the peninsula is the Gulf of Peñas, which contains only scattered islands; but near 47° 30' S. lat. is the small group of the Guaianeco Islands, followed by Wellington Island or Islands, which extends from 47° 50' to 50° S. lat., and in some parts is 60 or 70 miles wide. The long strait which separates Wellington Island from the continent, and is called Mesier Channel, is on an average two miles wide towards each extremity; but in the middle and for a length of about forty miles it is hardly a mile wide, and in three particular places not more than 400 yards wide. A broad channel, called the Gulf of Trinidad, separates Wellington Island from the Archipelago of Madre de Dios; and this archipelago is separated from the continent and Hanover Island by Concepcion Strait. The strait south of Hanover Island, called Lord Nelson's Strait, separates it from the archipelago of Queen Adelaide, an assemblage of islands which run more than 80 miles north-west and south-east. MAGALHAENS STRAIT lies between this archipelago and South Desolation Island. These islands are, without exception, high and rugged, and have a rocky shore; but the mountains in none of them rise to the snow-line, except on South Desolation.

Although the difference in geographical position between the two extremes of this coast is 14 degrees, the difference in the temperature is much less than might be expected. On the island of Chiloe the mean temperature of the winter seems to be 40°, and that of the spring 50°, or something more. That of Port Famine, on the Strait of Magalhaens, is about 38° in winter and 50° in summer. It would therefore appear that the difference in the mean annual temperature between the two extremities of the mountain region of Patagonia does not exceed ten degrees of Fahrenheit, probably a smaller difference than in any other country of similar extent. This phenomenon is due to the great dampness of the atmosphere. As the prevailing winds blow from the west, they bring to the land the moisture which they collect in passing over the wide expanse of the Pacific; and this moisture being suddenly condensed when it comes in contact with the high mountains along the shores, descends in abundant and nearly continual rain. On the peninsula of Tres Montes only two or three weeks in November are without rain, and farther south there is hardly a day without either rain or snow and sleet, according to the seasons.

The constant dampness of the air, though not favourable to many European plants, especially to fruit-trees, maintains a vigorous vegetation. The forests, which cover the sides of the mountains for two-thirds of their height north of 45° S. lat., rival in luxuriance those of the tropical regions. Stately trees, with smooth and highly coloured barks, are covered with parasitical plants; large and elegant ferns are numerous, and arborescent grasses twine round the trees to the height of 80 or 40 feet. South of 45° S. lat. vegetation is less vigorous; but even at the most southern extremity, on the Strait of Magalhaens, the country and hills, from the height of 2000 feet above the sea to the very verge of high-water mark, are covered with trees, mostly evergreens, and some large enough to be used as timber, as the evergreen beech (*Fagus betuloides*), and two other species of beech. Capt. King saw large and woody-stemmed trees of *Fuchsia* and *Veronica*, in England considered as tender plants, in full flower within a very short distance of the base of a mountain covered two-thirds down with snow, and this with a temperature of 36°.

Where the mountains border on the eastern plains, a kind of deer, with short straight horns, is abundant. There are also pumas as far south as 53° S. lat., caviars, and nutrias; seals, otters, fur-seals, and sea-elephants. Fish is very plentiful, especially several smaller kinds, which live in the subaquatic forests formed by the gigantic seaweed (*Fucus giganteus* of Solander), which covers all the rocks near the open coast and in the numerous straits. Land birds are not numerous but water-fowl abound, among which is the black-necked swan (*Anser nigricollis*) and several kinds of geese and ducks. Shell-fish of several kinds occur in the recesses of the inlets, and they constitute the principal food of the inhabitants during a part of the year. On the Guaianeco Islands and the Chonos Archipelago the potato grows wild: they are small and quite tasteless.

The plains of Patagonia, which occupy the greater portion of the country, extend along the Atlantic Ocean. Though similar in aspect, these plains seem to differ in their natural capacities. Between 47° and 48° S. lat. the coast forms a wide promontory, projecting near

100 miles from the body of the mainland. On this promontory, at the back of Cape Blanco, are the high lands of Espinoza, which rise at least 4000 feet above the sea, and form an irregular range with several peaked summits. On this promontory and the contiguous coast, as far north as 45° S. lat. and southward to 49° S. lat., the rocks are porphyritic, but they seldom rise more than 300 or 400 feet above the sea-level, when they stretch westward in an undulating plain, which is covered with a light sandy soil, through which the rock protrudes in many places. This tract is dry and parched, and has no vegetation except a few tufts of grass and here and there a straggling bush of berberis, or of a dwarf woody shrub, which supplies good fire-wood.

South of 49° S. lat. to the northern shores of the Strait of Magalhaens, the cliffs are composed of soft marly clay, without any gravel or impression of organic remains. Between the high and low tide-mark, there is a smooth beach of green clay hardened by the action of the surf to the consistence of stone, which extends about a hundred yards into the sea, and is succeeded by a soft green mud, over which the water gradually deepens. The outer edge of the clay forms a ledge parallel to the coast, upon the whole length of which the sea breaks with violence. The cliffs rise rather abruptly to the height of 200 or 300 feet. They form the descent of an elevated plain, which extends several miles westward, and is then followed by an escarpment of from 100 to 150 feet elevation, which constitutes the slope of another and more elevated plain. Thus the country extends from east to west in wide plains, which rise one above the other like terraces. These plains are traversed by some broad and flat-bottomed depressions. The soil consists of well-rounded shingle mixed with a whitish earth. It is in most places without vegetation. Here and there are scattered tufts of brown wiry grass, and still more rarely some low thorny bushes. In the depressions the bushes are more abundant, and in some places they grow up to stunted trees. Fresh water is seldom found, but salinas, or salt-pools, are numerous. Marine shells are frequently scattered over the plains, but they abound most on the plains nearest to the sea.

The plains are traversed from west to east by the Santa Cruz River, which is supposed to rise in the Andes and traverse their base for a considerable distance from north to south: its mouth is near 50° S. lat. It was ascended by Captain Fitzroy to a distance of 140 miles from the sea in a straight line, and 245 miles by the course of the river. The river runs in a vast excavation below the level of the neighbouring plains. East of 70° W. long, this valley varies between one and five miles in width, and is bounded on both sides by steppe-like terraces. The valley is hardly more fertile than the plains which surround it, and no bushes grow in the upper part; even the wiry half-withered grass is scanty. West of 70° W. long, the valley contracts in some parts to a mile in width, and here the upper part of the adjacent plains is capped with a layer of lava from 120 to 320 feet thick. This part of the plain is 1400 feet above the valley, which is 400 feet above the sea. The lava seems to extend to the foot of the Andes, where the platform of the plains probably attains an elevation of 2000 or 3000 feet. The width of the lava seems to be about 100 miles. The layer of earth on which it rests does not differ from the materials of which the plains near the Atlantic are composed. Within the lava district, between 71° and 72° W. long, the valley is from 5 to 15 miles wide, and there is here a flat tract of apparently good land, exhibiting many swampy places covered with rich herbage; and higher up is a large plain, on which shrubs, small trees, and bushes are sparingly scattered; yet parts of this plain may be called fertile and woody by comparison with the tracts farther east. The Santa Cruz River is supposed to traverse in its upper course several lakes, among which is Viedma or Capar Lake, which lies between 48° and 49° S. lat., and is about 30 miles long and from 10 to 12 miles wide. At its mouth the Santa Cruz forms an estuary, in which the neap-tides rise 18 feet and the spring-tides from 38 to 42 feet. The extensive shoals which lie near the mouth of this river are ascribed to the meeting of the rapid stream with an extraordinary tide.

The country north of 45° S. lat. differs from the southern plains. The shores are fringed by rocky reefs, extending from two to three miles from high-water mark, which are dry at low tides, and in many places covered with seals. The beach is rather steep, and consists of shingle. Above it extends an undulating country, which at some distance rises into hills. Though the soil here also is gravelly and parched, and in most places exhibits a very scanty vegetation, the valleys and lower elevations are mostly covered with grass and shrubby plants. In several places there are tracts covered with good grass and stunted trees, especially at Camerones Bay and north of it. On the banks of the Chupat River and the western shores of New Bay (Bahia Nueva), there are extensive tracts covered with a fine dark soil, and producing abundance of fire-wood and excellent pasturage. Wild cattle abound, and are very numerous on the natural meadows which extend far inland on both sides of the Chupat River. The river Chupat is believed to rise in the Andes, but at the distance of 20 miles from its mouth it is only 100 yards wide and 6 feet deep at low-water, so that only vessels drawing 7 feet can enter its mouth at high-water. This river runs with a winding course through a wide and fertile valley, over which an immense quantity of drift timber is scattered, and large trees are found several hundred yards from its banks.

The climate of the plains differs greatly from that of the mountain region. Their sterility is partly to be ascribed to the nature of the soil, and partly to the want of rain. Westerly winds are prevalent during nine months of the year, and though they drench the western declivity of the Andes with rain, not a drop falls on the plains while they blow; and even during the three winter months (from June to August), little rain falls except on rare occasions, when it comes down heavily for three or four days in succession. Sea-winds sometimes bring small fine rain for a few hours, all through the year, but not enough for the support of vegetable productions. But it appears that rain is more abundant in the interior of the plains north of 45° S. lat. The Rio Negro covers the adjacent country with water to a great extent in autumn (May and June), when no snow on the Andes is dissolved. In summer the heat is scorching, but not sultry; and in winter, though the weather is sometimes very cold, especially during southerly winds, the air is always elastic and wholesome. Changes of wind are sudden, and cause rapid though not very great variations of temperature.

The plains differ from the mountain region both in vegetation and in animals. The natives have dogs and herds of horses, and there are wild cattle, as already mentioned, on the banks of the river Chupat. Guanacoos are very numerous, especially in the southern plains. Pumas are found everywhere, and wolves on the northern plains. There are several species of foxes, as well as caviars, armadillos, and tucu-tucu, a little animal like a rabbit. On the coast there are common seals, fur-seals, and sea-lions. Land-birds are not numerous, except emus, condors, and carrion-hawks. Teals, partridges, doves, snipes, and rails however are frequently met with, which pass southward or northward according to the season. The sea-birds consist of gulls, grebes, and periguina. On the coast fish are rather plentiful, the larger species resembling cod, ling, and salmon. Between Cape Blanco and Port Desire there are numerous salinas, or extensive hollows filled with salt, in which the solid mass is several feet thick, and consists of very white and good salt. Near Port San Julian there are salt lakes, in which the salt crystallises in great tubes.

Inhabitants.—The inhabitants of the mountain region are different from those of the plains. The natives of the plains are called Patagonians, or Horse-Indians, as they wander about in the interior on horseback, and do not live on the shores. The natives of the mountain region are called Canoe-Indians, because they live only on the sea-coast, and frequently remove from one inlet to another in canoes; they belong to the same race with the inhabitants of the western part of Tierra del Fuego.

The Patagonians were so called by Magalhaens when he saw them at Port San Julian in 1520. He described them as being of a gigantic stature, 7 feet in height, but the statement was disbelieved even in his own day, and Winter, who visited Patagonia a little later than Magalhaens, saw no natives of unusual stature. About the middle of the last century Captain Byron met with a number of Patagonians, of whom the men were not less than 6 feet, and some even exceeded 9 feet in height; the women were from 7½ feet to 8 feet. This account again was contradicted by Wallis and Bougainville. The fact however appears to be now established that though no men of the height said to have been seen by Magalhaens and Byron are to be met with at the present day, the Patagonians are really distinguished by their size. Captain Fitzroy observes that among 200 or 300 of these people scarcely half a dozen men are seen whose height is under 5 feet 9 or 10 inches, though none have recently been measured who much exceeded 6 feet; while the long mantle of skins which they wear adds so singularly to their apparent height, that it is difficult to believe, till they are measured, that they are not really much higher. Their head is rather broad, but not high, and except in a few instances, the forehead is small and low. Their hair, which hangs loosely, is black, coarse, and very dirty. Their brow is prominent, and the eyes rather small, black, and ever restless. Their faces are roundish, and the projection of the cheek-bones makes them look unusually wide. The nose is a little depressed, narrow between the eyes, but broad and fleshy between the nostrils, which are rather large. The mouth is large and coarsely formed, with thick lips. All the features are large except the eyes. They have little hair either on the face or the body, and they attempt to eradicate it. Their hands and feet are comparatively small. Their limbs are not so muscular as their height and apparent bulk would induce one to suppose; they are also rounder and smoother than those of white men. Their colour is a rich reddish-brown, between that of rusty-iron and clean-copper, rather darker than copper, yet not so dark as good old mahogany. The Patagonians wander about in the extensive plains south of the Rio Negro, and traverse that immense distance (800 miles) in a comparatively short time. Their principal subsistence is the flesh of mares, emus, caviars, and guanacoos, with two wild roots, one called tus, and the other chalis.

That tribe of Patagonians which principally visit the southern plains is called Te-huel-het, or Southern People. In the stony district between 45° and 49° S. lat. none of the tribes seem to make a long stay. North of 45° S. lat. there are said to be three other tribes: the Pe-huel-che, or Eastern People, who move about in the country along the coast; the Chulian Indians, who ramble over the districts adjacent to the Andes south of 42° S. lat.; and the Molu-che, or Warrior

Indians, who occupy the interior of the country south of the Rio Negro to about 42° S. lat.

The mountain region is inhabited by two tribes of the Fuegians; one occupying the country about Otway and Skyring Waters, and another which inhabits the western coast of Patagonia, between the Strait of Magalhaens and the promontory of Tres Montes. The Fuegians are rather short, varying in height from 4 feet 10 inches to 5 feet 6 inches, yet their bodies are as bulky as those of a man of 6 feet. Their limbs and joints are short in proportion to the trunk, which gives them a clumsy appearance. Passing so much time in low huts (wigwams), or cramped in small canoes, the shape and size of their legs are injured, and they move about in a stooping posture, with the knees much bent. Their colour is that of old mahogany, or rather between dark copper and bronze. The average height of the women is 4 feet and some inches. The most remarkable traits in their countenance are, an extremely small low forehead, a prominent brow, small black sunken eyes, wide cheek-bones, wide and open nostrils, a large mouth, and thick lips. The nose is always narrow between the eyes, and almost flat. Their hair is black, coarse, and lank. Their shoulders are square but high, and the chest and body very large. It is remarkable that, though living in a very cold climate, they have seldom any covering, for a scrap of hide, which is tied to the side or back of the body by a string round the waist, serves only as a pocket. The women have generally a seal skin wrapped about them and a diminutive apron. The tribes are dispersed among the islands in small families, on account of the scarcity of food. They live only on seals, birds, fish, and particularly shell-fish, and they are consequently always moving from one place to another. During the summer they prefer the coast, where they obtain a great quantity of eggs and young birds, besides seals, which come to shore to breed at that season. In winter they retire more to the interior waters in search of shell-fish, and the small but numerous and excellent fish which they catch among the sea-weed (*Fucus giganteus*).

(Fitzroy and King, *Surveying Voyages of the Adventure and Beagle*; Darwin, *Journal of Researches*; Parish, *Buenos Ayres and the Provinces of La Plata*.)

PATAY. [LOIRET.]

PATEAU. [SOOLOO ARCHIPELAGO.]

PATELEY BRIDGE, West Riding of Yorkshire, a market-town and the seat of a Poor-Law Union, in the parish of Ripon, is situated on the right bank of the river Nidd, in 54° 5' N. lat., 1° 45' W. long., distant 80 miles W.N.W. from York, and 224 miles N.N.W. from London. The population of the town of Pateley Bridge in 1851 was about 750. The living is a perpetual curacy in the archdeaconry of Richmond and diocese of Ripon. Pateley Bridge Poor-Law Union contains 14 parishes and townships, with an area of 74,276 acres, and a population in 1851 of 9324. In the neighbourhood of Pateley Bridge are several lead-mines, which afford some employment. The hat manufacture is carried on. There is a market weekly on Saturday. Cattle-fairs are held on October 10th, and on every alternate Saturday from that date till the third Saturday in May. Besides the church, there are three chapels for Dissenters, a mechanics institute, and a branch savings bank.

PATER, or PEMBROKE DOCK. [PEMBROKESHIRE.]

PATERNO. [CATANIA.]

PATERSON. [NEW JERSEY.]

PATHHEAD. [FIFESHIRE.]

PATMOS, a small island, one of the Sporades, near the southwestern coast of Asia Minor, and about 30 miles S. from Samos, now called Patino. Patmos is chiefly known as the place of exile of the apostle St. John, who here wrote his Revelations. The island is a rock about 15 miles in circumference, with only a few fertile spots; the coast is high, and forms many capes, with several good harbours. The only town is situated on a rocky eminence near the sea, with about 400 houses, which, with about 60 more at La Scala, or the 'landing-place,' are the only habitations in the island. In the highest part of the town is the monastery of St. John, built by Alexius Comnenus; a massive building flanked with towers. About half-way up the mountain, between La Scala and the town, is a natural grotto, the abode, according to the natives, of St. John, and they have built a small church over it. (Tournefort; Hilaire, *Voyage dans la Grèce*.)

PATNA. [ATREHIRE; HINDUSTAN.]

PATRÆ. [ACHÆA.]

PATRAS, the ancient *Patra*, a seaport town on the north coast of the Morea, capital of the nome of Achæa, is about 6 miles S.W. from the entrance of the Gulf of Lepanto. It stands partly on a plain and partly on a ridge about one mile long, of which the citadel crowns the summit, in 38° 14' 5" N. lat., 21° 44' E. long., on the site of the ancient acropolis. Mount Voidhia, one of the high summits of the Morea, rises above the ridge on which the town is built. The plain of Patras produces a great quantity of currants, which form the principal article of export. Previous to the Greek revolution, Patras was the most thriving town of the Morea, being the emporium of the trade of that peninsula, as well as of western Greece. It contained about 10,000 inhabitants, mostly Greeks, and had consuls of most European nations. The war of the Greek revolution greatly injured the town. The citadel, though repeatedly attacked, was never taken by the Greeks; it capitulated at last, in 1828, to the French auxiliary force. Since that

time Patras has somewhat recovered; and it is said to contain at present about 8000 inhabitants. The houses, many of which are surrounded by plantations of orange, fig, pomegranate, and other fruit-trees, are only one story high, on account of the frequency of earthquakes. Patras was one of the twelve cities of Achaëa, and is the only one that still exists as a town. (Leake, *Morea*.)

PATRINGTON, East Riding of Yorkshire, a market-town and the seat of a Poor-Law Union, in the parish of Patrington, is situated near the left bank of the estuary of the Humber, in 53° 40' N. lat., 0° 1' W. long., distant 14 miles E.S.E. from Hull, and 192 miles N. by E. from London. The population of the parish in 1851 was 1827. The living is a rectory in the archdeaconry of the East Riding and diocese of York. Patrington Poor-Law Union contains 27 parishes and townships, with an area of 88,872 acres, and a population in 1851 of 9407. The parish church is a beautiful cruciform structure, of the reign of Richard II.; it has a lofty spire, which is useful as a landmark to mariners. The Wesleyan and Primitive Methodists have places of worship, and there is a Free school. A creek which communicates with the Humber, brings vessels to Patrington Haven, a short distance from the town. The market is on Saturday, and there are fairs on March 28th, July 18th, and December 6th.

PATTI. [MESSINA, PROVINCE OF.]

PATUN. [HINDUSTAN.]

PATUXENT, RIVER. [MARYLAND.]

PATZCUARO. [MEXICO.]

PAU, the capital of the French department of Basses-Pyrénées, is situated on the right bank of the Gave-de-Pau, 468 miles S.W. from Paris, in 43° 17' 44" N. lat., 0° 22' 24" W. long., and has 15,171 inhabitants in the commune. The town is situated on a height, and is divided into two parts by a deep ravine crossed by a bridge; the principal part is on the south side of the ravine. There is a suburb, on the bank of the Gave-de-Pau, at the foot of the height on which the town stands. Pau is well laid out; the houses are well built, and coated with cement. The poorer houses in the suburbs are chiefly of pebbles laid in very hard mortar. The principal object of interest is the castle, the birthplace of Henri IV., on the west side of the town. This building is an irregular gothic structure, striking from its vastness and interesting from its historical associations. It is kept in repair by the government. The room in which Henri was born is still shown. The castle, which commands a beautiful and extensive prospect, and has a fine park attached to it, was for a part of the year 1848 the prison-residence of the Arab chief Abd-el-Kader. There are two handsome squares in Pau, called La-Comédie and La-Place Royale; the latter is planted with trees, and adorned with a fine pedestrian bronze statue of Henri IV. There is a good bridge over the Gave-de-Pau, leading from the lower town to the neighbouring town of Jurançon, celebrated for its wines. There are a court-house, a market-house, with a fountain in front of it, and several promenades. The town is the seat of a High Court, which has jurisdiction over the departments of Basses-Pyrénées, Hautes-Pyrénées, and Landes. It has tribunals of first instance and of commerce, a public library containing 18,000 volumes, and a college. The principal manufactures are carpets, linen, handkerchiefs, leather, and table-covers. Trade is carried on in hams, salted legs of geese, wines, chestnuts, cotton yarn, cotton goods, and coarse woollens. The English, who are pretty numerous at Pau, have a church and clergyman of their own, also an English banker and several English doctors. An English vice-consul resides in the town.

PAUILLAC. [GIRONDE.]

PAUL, ST. [ALPES, BASSES.]

PAULERSPURY. [NORTHAMPTONSHIRE.]

PAULIEN, ST. [LOIRE, HAUTE.]

PAULO, SAN. [BRAZIL.]

PAUMBEEN PASSAGE. [CEYLON; HINDUSTAN.]

PAUNTON. [LINCOLNSHIRE.]

PAVIA, a province in Austrian Italy, is bounded N. by the Milanese, E. by Lodi, W. by Sardinia, from which it is separated by the Ticino, and S. by Sardinia and Parma, being divided from both by the Po. It is one of the most fertile provinces in Lombardy, lying entirely in the fine plain of the Po. It produces corn, wine, fruit, hemp, and has good pasture land. The length from north-west to south-east is about 40 miles, the breadth about 10 miles. The area is 400 square miles, and the population in 1851 amounted to 171,622. The province is divided into eight districts, and 193 communes. Two navigable canals, the Naviglio-Grande and the Naviglio-di-Pavia cross the province, and supply water communication between Milan and the Lago-Maggiore, the Ticino and Po, and by the latter river with the Adriatic.

The capital is Pavia, a well-built walled city of about 28,000 inhabitants, situated on the left bank of the Ticino, a few miles above its junction with the Po, and 20 miles S. from Milan. A handsome covered bridge over the river connects Pavia with the suburbs of Borgo-Ticino, on the right bank. The cathedral, which is a modern structure, was rebuilt in the last century; it contains some good paintings. The oldest church in Pavia, and perhaps in Italy, is that of San-Michele, which it is asserted was built in the 6th century. Several old and curious baso-relievs adorn this church, as well as some frescoes of the age of Giotto. The vast church Del-Carmine,

which was built in the 14th century, contains some valuable paintings. That of Santa-Maria-Coronata was built by Bramante, and is also rich in paintings. The once handsome church of San-Pietro 'in Cielo d'Oro,' noticed by Dante ('Paradiso,' x.), was not long ago used as a military storehouse.

Pavia is chiefly known for its university, which was founded by Charlemagne and contains 13 colleges. It has faculties of law, medicine, and philosophy, attended by an aggregate of above 1000 students. Pavia has long been renowned for its medical and surgical instruction. A valuable library of 50,000 volumes, a museum of natural history, a cabinet of anatomy, and a botanical garden are annexed to the university. Three colleges, Caccia, Borromeo, and Ghislieri, the first two founded by the noble families of those names, and the third by Pope Pius V., support about 120 students gratuitously. The college Borromeo is a magnificent building. Pavia gives title to a bishop; it has a large hospital, a gymnasium, a theatre, a foundling hospital, and other benevolent institutions. The chief trade of the town is in silk, wine, rice, and Parmesan cheese.

Pavia occupies the site of the ancient *Ticinum*, which was a town of Cisalpine Gaul: little mention is made of it in Roman history. The Lombard kings resided in Pavia; their old castle still remains. Near Pavia Francis I. was defeated and taken prisoner by Charles V. in 1525. Five miles from Pavia, on the road to Milan, is the *Certosa*, a splendid Carthusian monastery, now suppressed. It was built by Gian Galeazzo Visconti, duke of Milan, whose monument is in the church: the church is rich in sculpture, marble, and fresco paintings.

PAWLENO-SELO. [NISCHNEI-NOVGOROD.]

PAX AUGUSTA. [BADAJOS.]

PAXO. [IONIAN ISLANDS.]

PAZ, LA, Bolivia, the seat of a bishopric, and the capital of the department of the same name, situated on the Rio Chuqueapo, at an elevation of 12,226 feet above the sea, near 16° 30' S. lat., 68° 10' W. long.; population about 20,000. It stands in a ravine probably more than 1000 feet below the table-land of the Lake of Titicaca [BOLIVIA], on some hills which are scattered over the ravine, on the northern side of which rises the elevated peak of Illimani. The streets of the town are very irregular, and some of them extremely steep. It contains many extensive dwelling-houses, built in the Spanish fashion; but the greater part of the houses are only mud-huts, and inhabited by Indians. La-Paz is the most commercial town in Bolivia, being the centre where European goods are brought from the coast of Peru, and exchanged for gold, bark, and other products of the interior.

PECKHAM. [SURREY.]

PEEBLES, the chief town of Peebles-shire, Scotland, a royal burgh and market-town, is situated in a valley on the left bank of the Tweed, in 55° 38' N. lat., 3° 6' W. long., 22 miles S. from Edinburgh by road. The population of the burgh in 1851 was 1982. The burgh is governed by two bailies and eleven councillors, one of whom is provost.

Peebles is a very ancient town. After the battle of Nevill-Cross (1346), in which David II. was taken prisoner by the English, the town of Peebles contributed so largely to his ransom that he, in 1367, created it a royal burgh. The old town having been burnt by the English in 1545, a new town was commenced, and surrounded by a wall, with gates, which were standing in 1707. St. Andrew's cathedral was formerly used as the parish church, but only a small portion of it is now standing. The river is crossed here by an excellent bridge of five arches. The houses and public buildings are substantial and well built. Besides the parish church there are a Free church, two chapels for United Presbyterians, an Episcopal and a Roman Catholic chapel, and a Grammar school. There are also in the town a town-hall and a jail, a scientific institute, and a savings bank. There is a weekly market. Eight fairs are held in the year.

PEEBLES-SHIRE, or TWEEDDALE, an inland county in the south of Scotland, bounded N. by Edinburghshire, E. by the counties of Selkirk and Edinburgh, S. by those of Selkirk and Dumfries, and W. by Lanarkshire, is situated between 55° 24' and 55° 50' N. lat., 2° 45' and 3° 33' W. long. Its greatest length from north to south is 30 miles, and the greatest width from east to west rather less than 22 miles. The area is 354 square miles, or 226,488 acres; the population in 1841 was 10,499; in 1851 it was 10,738.

Surface, Hydrography, and Communications.—The general elevation of Peebles-shire exceeds that of any other county in the south of Scotland. The most mountainous parts extend from the south-east to the south-western extremities of the county, including the sources of the Clyde, the Tweed, and the Annan. On the north-east a lofty ridge of mountains separates this county from Edinburghshire; and on the north-west it is separated from the same county by the Pentland Hills, among which the North Esk, the Leith Water, and the Lyne (a tributary of the Tweed), have their rise. The principal elevations are Culterfell, Cardon, and Dollariaw, the summit of each of which is more than 2400 feet above the sea-level; Hartfell (2635 feet) and Broadlaw (2741 feet). The hills and mountains in Tweedsmuir afford good pasturage for sheep and black cattle.

The Tweed rises just beyond the limits of the county, to the north of Erickstane, a hill in Dumfries-shire, near Moffat. After it reaches the town of Peebles, its course is nearly due east through the county,

which it quits a few miles below Innerleithen. The numerous rivulets which intersect the county are nearly all tributaries of the Tweed. The chief of these are—the Lyne, which itself has numerous small tributaries; the Peebles, or Eddlestone, which falls into the Tweed at the town of Peebles; the Leithen, in the east of the county; the Manor, and the Quair, which last falls into the Tweed, near the seat of the Earl of Traquair. All these streams contain salmon and trout. Eddlestone Loch is a small lake in the north-east part of the county, from which the South Esk takes its rise. It abounds with pike, perch, and eels, and is the resort of large flocks of wild fowl during summer.

The county is well intersected by roads, which are for the most part kept in good repair. The principal are those connecting Edinburgh and Moffat, and Lanark and Kelso. The former winds through the valley of the Tweed in a single line for about 15 miles, after which it separates into two branches, one passing through Broughton, the other through Eddlestone, which again meet upon the borders of Edinburghshire. The road from Lanark to Kelso is the means of communication with Glasgow, and crosses the county from north-west to east, passing through Peebles.

Geology, &c.—The prevailing rock is grauwacke, or as it is called here whinstone, of which there are some excellent quarries in the vicinity of Peebles, and from which the town has been chiefly built; but that which is found in other parts is, from its laminated structure, unsuitable for building; some of it serves as roofing-slata. White and red freestone are common in the north, and both coal and limestone have long been wrought at Carllops, in the parish of Linton.

Climate, Soil, and Agriculture.—The climate is keen, but less severe than that of Edinburgh. The mean annual temperature of Tweedsmuir, the most elevated parish in the county, was 45° in 1828; the mean height of the barometer at the town of Peebles, which is 535 feet above the sea-level, is 29.2 inches in summer, and 29 inches in winter; and the indications of a rain-gauge, kept at the same place, upon an average of seven years, give an annual fall of 26.75 inches. The fogs so often met with in the Lothians seldom extend into this county. In the lower parts of the county much attention has been paid to rotation of crops and the application of the new manures. Leases are generally granted for 19 years, but farms purely of the store kind are let for 14 years only. The arable farms vary in extent from 40 to 200 acres; the sheep farms from 600 to 4000 acres. Inclosures and planting are on the increase. Since the commencement of the present century the Cheviot breed of sheep has been introduced, and has increased rapidly. Other breeds have also been introduced from England with much advantage.

Divisions, Towns, &c.—PEEBLES is the county town. The county returns one member to the Imperial Parliament. The villages are few and not of much importance. Of these the following may be named; the populations are those of 1851:—*Drummelzier*, population of the parish 244, is situated on the right bank of the river Tweed, about 12 miles S.W. from Peebles. Of Drummelzier Castle, formerly the residence of the Tweedies of Drummelzier, some portions remain. *Eddlestone*, population of the parish 790, is on the coach-road between Edinburgh and Peebles. In the parish are traces of three ancient camps. In 1828 a stone coffin containing the ashes of human bones, also some brass weapons, were dug up from an ancient barrow. *Innerleithen*, population of the parish 1236, about 10 miles E. by S. from Peebles, is on the right bank of the Leithen Water, which falls into the Tweed near the village. Innerleithen is much frequented in summer on account of a medicinal spring. Besides the parish church there are places of worship for the Free Church and United Presbyterians. The Tweed is crossed by a wooden bridge which leads to Traquair House, the seat of the Earl of Traquair. The St. Ronan's Border Club holds an annual festival, at which games and gymnastic exercises are engaged in. *Linton*, or *West Linton*, population of the parish 1630, is situated on the left bank of the Lyne Water, about 18 miles N.N.W. from Peebles. Many of the inhabitants are weavers. Besides the parish church, there is a chapel for United Presbyterians. A sheep market is held on the last Tuesday of June; stock and hiring markets are held in April and September.

History, Antiquities, &c.—The only antiquities of the county are the ruins of castles or towers. One of these, the Castle of Need-path, on a rocky promontory in the Tweed near Peebles, now the property of the Duke of Buccleuch, made a stout resistance against the forces of Cromwell. Another, in the parish of Broughton, is called the Castle of Macbeth. The Earls of March were hereditary sheriffs of Tweeddale, which gives the title of Marquis to a branch of the house of Hay, Earls of Errol. In the churchyard of Drummelzier the famous Merlin, of the Hay family, is traditionally said to be buried.

Religious Worship and Education.—According to the Returns of the Census in 1851 there were then in Peebles-shire 31 places of worship, of which 13 belonged to the Established Church, 8 to the Free Church, 5 to the United Presbyterian Church, 2 to Episcopalians, and 1 to Independents. There were 28 day schools with 1526 scholars, 19 Sabbath schools with 879 scholars, and 3 evening schools for adults with 98 scholars.

PEEL. [MAN, ISLE OF.]

PEGLI. [GENOA.]

PEGU was a century ago a powerful empire in the peninsula with-

out the Ganges. The nation which established this empire is called Peguans by the Europeans, and Talam by the Birmans; but they call themselves Mosan. They inhabit the low country which extends on both sides of the river Irawaddy, from its mouth to the Galladyet Mountains (from 16° to 18° 30' N. lat.) and from the banks of the Saluen River to the mountains of Aracan. In 1757 the Birmese, under their emperor, Alompra, invaded the country, took the capital Pegu, which was razed to the ground, and annexed the whole as a province of their empire. [BIRMA.] In the war which broke out with the British in 1852 the province was wrested from them, and the towns of Pegu, Proma, and RANGOON were fortified. In 1854 an embassy was sent from Birma to the governor-general of India to treat for the restoration of Pegu, but the proposition was rejected.

PEGWELL BAY. [KENT.]

PEINE. [HILDESBREM.]

PEIPUS LAKE. [LIVONIA.]

PEKING, the capital of the Chinese empire, is situated near 40° N. lat., and between 116° and 117° E. long., in a level plain, which on the west of the town assumes an undulating surface, and at some distance from it rises into low hills. It is about 80 miles south from the nearest part of the Great Wall. The river Pei-ho, which falls into the Yellow Sea about 100 miles below Peking, runs at some distance on the west but is connected with the town by means of a canal, and serves as the medium of a large commerce. The city consists of two parts and of several suburbs. The most ancient part is the northern, called the town of the Tartars, or city of Nine Gates, a large portion of the centre of which is occupied by the palace and gardens of the emperor; the southern, or city of the Chinese, is the seat of commerce, of the larger part of the population, and is less strictly guarded than the other. The circumference of the united towns is estimated by Sir J. F. Davis ('Sketches of China') at 25 miles; the whole is surrounded by a wall 40 feet high, and surmounted by a parapet deeply crenated, but without regular embrasures; the merlons contain loopholes for archers. The thickness of the walls is about 20 feet at the base, and 12 across the terrepleine upon which the parapet is erected. The outside of the walls, though not perfectly perpendicular, is smooth, but the inside has a considerable bevel, the rows of bricks which form it being placed like steps, one above and behind the other, like the steps on the faces of the Great Pyramid of Egypt. In some parts there are slopes of earth, on which the cavalry can ascend the walls, on which several horsemen can ride abreast. The walls are flanked on the outside by square towers, at about 60 yards distance from each other, and projecting 40 or 50 feet from the curtain between them. Sixteen gates lead to the town. Over each gate is a watch-tower, nine stories high, and in each story are port-holes for cannon. The lowest story forms a large hall for the officers and soldiers on guard. Round the gate, on the outside, is a semicircular wall, inclosing a space about 360 feet long, which serves for a parade. In this semicircular wall there is a lateral gate, by which the troops can enter the parade without marching on the high road.

The roads leading to the city are paved with blocks of granite; the streets are not paved, but are constantly watered to keep down the dust. The principal streets vary from 140 to 200 feet in breadth, but they contain no large buildings; the houses are usually not higher than one story, and few have two stories. The streets are lined with a continuous series of shops, in which the goods are laid out with great order. The wooden columns in front of the shops are painted red, blue, and sometimes are gilt. In several places triumphal arches cross the streets. They are built of wood, and consist of three handsome gateways, of which the middle is the highest and largest, and over them are three roofs richly decorated. Public edifices and also the dwelling-houses of private persons occur only in the narrow streets and lanes. Where these lanes open into the wider streets there are generally gates, which are shut at night and opened only in case of need. The private dwellings do not embellish the town, as they are separated from it by walls or curtains, to prevent passengers from seeing the court into which the street-door opens. They are built of bricks, and have a roof of gray tiles.

Peking became the capital of China after the expulsion of the Mongols, and the accession of the dynasty of Ming. As the seat of government, it contains the great offices for the administration of the empire, which are situated, for the sake of convenience, near the southern gate of the imperial palace; the national college, and the imperial printing-office. The population has been very variously estimated, but it probably amounts to 2,000,000. Under the article CHINA a notice is given of the insurrection which broke out in 1851, and in 1854 had threatened the safety of Peking: in March 1855 the insurgents had not succeeded in capturing Peking, having turned their forces more against Canton, but they still retained possession of all the places previously taken by them, from which the imperialists had in vain endeavoured to expel them.

PELEW ISLANDS are a chain of small islands situated in the Pacific, between 8° and 9° N. lat., 130° and 136° E. long. They extend from south-south-west to north-north-east. The group is inclosed by a reef, which surrounds it in the form of a crescent almost entirely on the west and north, and even from the east it is difficult to approach the islands on account of the reefs. There is no reef on the south, but there are several shoals of coral-rocks. The group consists of about

twenty islands, the largest of which is that of Babeltoup, nearly sixty miles in circumference. There are no rivers in the islands, but the inhabitants are supplied with water from brooks and ponds. Cattle, goats, and hogs are abundant in the islands; wild fowl is numerous; fish are plentiful; turtles abound, as well as shell-fish, such as oysters, mussels, and others. The principal objects of cultivation are yams, bananas, and cocoa-nut trees, and most other vegetable productions of tropical growth. The inhabitants are of the Malay race. Their huts are made in a very simple way, but they show some ingenuity in the construction of their boats. Their cooking utensils are made of clay, and are burned in the same manner as our coarse pottery.

PELION, MOUNT. [THESSALY.]

PELLA. [MAEONIA.]

PELOPONNESUS, that is, 'the Island of Pelops,' the ancient name of the Morea, derived its name from Pelops, who is said by later Greek mythologists to have been of Phrygian origin. Thucydides (i. 9) simply observes that he came from Asia, and brought great wealth with him. He married Hippodameia, the daughter of Enomaus, king of Pisa in Elis, and succeeded to his kingdom. Agamemnon and Menelaus were descended from him.

The word Peloponnesus does not occur in Homer. The original name of the peninsula appears to have been Apia. In the time of Thucydides (i. 10) the Peloponnesus appears to have been divided into five parts, namely, Laconia, Messenia, Argolis, Achaia, and Arcadia; but in that case, as Pausanias has remarked (v. 1, § 1), Elis, which for many reasons ought to be made a separate division, must have been included in Achaia or Arcadia. Modern writers usually make six divisions—Achaia, Elis, Arcadia, Argolis, Laconia, and Messenia; to which Sicyonia, or Corinthia, is sometimes added.

The ancient history of the Peloponnesus forms parts of the history of GREECE. The physical geography of the country is given under MOREA, ACHAEA, ARCADIA, ARGOS, ELIS, LAONICIA, and MESSENIA.

PELTON. [DURHAM.]

PELUSIUM. [EGYPT.]

PELUSSIN. [LOIRE.]

PEMBREY. [CAERMARTHENSHIRE.]

PEMBRIDGE. [HEREFORDSHIRE.]

PEMBROKE, Pembrokeshire, South Wales, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on a navigable creek of Milford Haven, in 51° 40' N. lat., 40° 54' W. long., distant 264 miles W. by N. from London. The population of the borough in 1851 was 10,107. The borough is governed by 6 aldermen and 18 councillors, of whom one is mayor; and, in conjunction with Tenby, Wiston, and Milford, returns one member to the Imperial Parliament. The livings are in the archdeaconry and diocese of St. David's. Pembroke Poor-Law Union contains 29 parishes and townships, with an area of 69,804 acres, and a population in 1851 of 22,874.

Pembroke consists chiefly of one long irregularly-built street, gradually ascending westward to the castle, which stands on a bold rocky promontory about forty feet high. In the reign of Henry I. the fortress came into the possession of Gilbert Strongbow, earl of Pembroke. It sustained a protracted siege in 1648, when the Royalists under colonels Laugharne, Powell, and Poyer, held out against Cromwell till compelled by famine to surrender. The circular keep is 75 feet high, and 163 feet in circumference at the base; the walls are 14 feet thick. Under the keep is a spacious natural cavern called the Wogan. Henry VII. was born in Pembroke Castle. The important naval establishment Pater, or Pembroke dockyard, is described under PATER in the article PEMBROKESHIRE. In the town are—St. Michael's church, of Norman date; two other churches of the Establishment; chapels for Wesleyan and New Connexion Methodists, Independents, and Baptists; National schools; and a savings bank. The Free Grammar school has been closed for many years. Markets are held on Wednesday and Saturday, and fairs seven times in the year. A county court is held.

PEMBROKESHIRE, a maritime county, forming the extreme west of South Wales, is bounded E. by the counties of Caermarthen and Cardigan, on the other sides by the Irish and Bristol channels. It lies between 51° 36' and 52° 7' N. lat., 4° 30' and 5° 20' W. long. The length from Strumble Head on the north coast to St. Gowan's Head on the south, is 31 miles; the average width from east to west hardly exceeds 21 miles. The area is 628 square miles, or 401,691 acres. The population in 1841 was 88,044; in 1851 it was 94,140.

Surface, Coast, Rivers.—The surface is generally undulating. The county is surrounded on three sides by the sea, and intersected by the great estuary of Milford Haven; the course of the rivers is therefore short, and none of them is large. There is little timber except in sheltered situations. The Precelli Mountains, a range running from near Fishguard to the borders of Caermarthenshire, are about 10 miles in length; Cwm Cerwyn, the highest summit, is 1754 feet above the sea.

The river Teivy, which forms the northern boundary, runs into the sea between Cardigan Island and Cardigan Head; its mouth is impeded by a dangerous bar. Salmon abound in the Teivy. The fishermen ply their trade in light wicker boats or coracles, covered with skins or tarpaulin. Fishguard Bay, at the mouth of the Gwain, is about three miles across, with from 30 to 70 feet of water and good holding-ground

of sand and mud; it is open to the north-west. Off St. David's Head, 51° 54' N. lat., 5° 17' W. long., are seven rocky islets called the Bishop and his Clerks, and to the south-east of these Ramsey Isle. The coast here turns to the south, and shortly after forms St. Bride's Bay, about 8 miles broad and as many in depth; the projection of the mainland which forms the southern boundary of Bride's Bay, terminates southward in the peninsula of Dale, which shelters Milford Haven on the west. There are two lighthouses on St. Anne's Head at the north entrance of Milford Haven. This great estuary is about twenty miles in length; the mouth is about two miles wide, and it varies from that width to half a mile throughout. It contains numerous bays and creeks, completely land-locked, and forms one of the finest harbours in the world. Farther south are the Stack Rocks, high insulated cliffs which in spring and summer are the resort of innumerable sea-birds: a new tower has been recently erected on the Stack for the protection of Pembroke dockyard. On this part of the coast are the ancient chapel cell and holy well of St. Gowan, situated at the bottom of a terrific chasm in the rocks. The southern coast presents a wild and inhospitable appearance: the carboniferous limestone forms precipitous cliffs 150 feet high. Close to the Castle Hill at Tenby, on the west shore of Caermarthen Bay, is the small rocky island of St. Catherine's, on which are the ruins of a chapel. Ramsey island lies south of St. David's Head. It rises high out of the sea, is three miles long from north to south, about a mile broad, and terminates at each end in a precipitous hill. The island is the property of the Bishop of St. David's. Falcons and an immense number of sea-birds breed upon it; rabbits are plentiful. There is a solitary farm-house on the island. Caldy island, 2½ miles S. from Tenby, is above a mile long, and about half a mile broad, and the greater part of its surface is included in a well-cultivated farm. In the reign of Henry I., Robert de Tours founded a priory here, of which there are still some remains. Limestone is quarried; oysters, crabs, and lobsters abound round the island. Caldy lighthouse bears a stationary light, with two tiers of reflectors. St. Margaret's island, which has been separated from Caldy by the force of the sea, is perforated by vast caverns; it is reached over a ledge of rocks at low water of spring tides. Skomer island contains 700 acres. There is a farm-house upon it, and multitudes of rabbits. Skokham isle, separated from Skomer by Broad Sound, has an area of about 200 acres, and is used chiefly as a sheepwalk. Rabbits are numerous.

Pembrokeshire has no rivers of importance. The two rivers Cleddau, or Cleddy, are the principal: the eastern branch rises in the Precelli Mountains; the western, in the north-west part of the county, runs by Haverfordwest, whence it is navigable for small vessels, and, uniting with the East Cleddy about five miles below that town, falls into Milford Haven. The other rivers are—the Nevern, which empties itself into the Bay of Newport, the Gwain at Fishguard, and the Solva into St. Bride's Bay, where it forms a small port.

The principal common roads are—the coach-road from London to Pembroke; the road from Caermarthen to Haverfordwest, St. David's, Fishguard, and Newport to Cardigan; the road from Tenby to Pembroke, and from Tenby northward through Narberth. There is a railway from the coal-mines at Kingmoor to the sea at Saundersfoot. The South Wales railway runs from Caermarthen westward through this county to Haverfordwest.

Geology, Mineralogy, &c.—If a line be drawn through the centre of Pembrokeshire from east to west, we find the stratified rocks north of that line composed of slates, grit, and shales; to the south the older rocks are surmounted by the Silurian rocks, old red-sandstone, carboniferous limestone, and coal measures. The whole surface is greatly diversified by trap-rocks bursting forth in many places, and altering the structure of the sedimentary deposits. The carboniferous limestone dips below the millstone-grit, forming a girdle round it in the eastern district, but disappears in the west. The great coal-basin of South Wales runs across the county, gradually narrowing as it approaches St. Bride's Bay. The coal is anthracite; it is contained in beds of shale and sandstone, overlying millstone-grit and carboniferous limestone. The seams vary from three feet to a few inches in thickness. The southern part of the county presents a greater extent of carboniferous limestone to the view than is anywhere else laid open in Great Britain. There are numerous funnel-shaped cavities and fissures to which the sea has access. Of these the most remarkable is Bosherton Mere, near St. Gowan's Head. Another of these cavities, called the Devil's Punch Bowl, and situated in the same neighbourhood, presents a scene of the wildest confusion, the waves dashing and bellowing incessantly in the bottom and round the interior. Copper-ore has been found in small quantities in the neighbourhood of St. David's. Slate-quarries are opened in the Precelli Mountains and near St. David's. Coal is the only mineral besides slate which is worked in the county.

Climate, Soil, Agriculture.—The climate of the southern part of Pembrokeshire is mild but damp. The northern part of the county has a considerably lower temperature. On the southern part of the county the limestone and old red-sandstone formations afford soils of excellent quality; some districts near St. David's, and along the coast towards Fishguard, are well adapted for the growth of barley, but in the coal district and the slaty ridge of the Precelli Mountains the land is very inferior. The system of agriculture has been improved within the last few years. The breed of black cattle, called Castle-Martins,

are bought in droves for the supply of the London market. The horses are small but much esteemed. The farms vary in size from 30 acres to 800 and 1000 acres, the great proportion being from 100 to 200 acres. The chief crops are oats, barley, and potatoes. A good deal of butter is exported.

Divisions, Towns, &c.—Pembrokeshire is divided into seven hundreds, namely:—Narberth, south-east; Castle-Martin, south; Boos and Dew-island, west; Kemys and Kilgerran, north; and Dungleddy, central. Three members are returned to Parliament from Pembrokeshire: one for the county; one for Pembroke, Tenby, Milford, and Wiston; and one for Haverfordwest, St. David's, Fishguard, and Narberth. The county contains nine market-towns—HAVERFORDWEST, Fishguard, ST. DAVID'S, PEMBROKE, TENBY, MILFORD, NARBERTH, Newport, and Wiston. Those printed in small capitals are noticed under their respective titles; the others, with Pater, are given here.

Fishguard is a small sea-port, situated partly on a cliff near the mouth of the Gwain, 15 miles N. from Haverfordwest: population 1757 in 1851. The river is crossed by a bridge of five arches. Besides the parish church there are chapels for Independents, Baptists, and Calvinistic Methodists. The market is held on Thursday; fairs are held five times a year. A county court is held. Some flannel is manufactured. Hat-making and rope- and sail-making are carried on. Slate abounds in the neighbourhood. Numerous vessels are engaged in the fisheries and in the export of corn and butter. Fishguard is a parliamentary borough, contributory to the district of Haverfordwest.

Newport, a sea-port 7 miles E.N.E. from Fishguard, population of the parish 1716 in 1851, is situated at the mouth of the Nevern, which empties itself into the Bay of Newport. There are some remains of an ancient castle. Slates are quarried on the coast and shipped at Newport. There is good salmon-fishing in the Nevern. The market is on Friday: fairs are held on June 27th and October 16th.

Pater, or *Pembroke Dock*, is situated within a mile of Pembroke, in which borough it is included: population of the ecclesiastical district 6236 in 1851. The town is neatly built and lighted with gas. It has a large market-house. A considerable trade is carried on with Ireland and America. The royal dockyard was removed in 1814 from Milford to this place. The dockyard establishments cover 80 acres: they include an arsenal and 12 iron-roofed slips for ship-building; the whole is surrounded by a high wall and strongly fortified; large barracks, defended by bastions and a wide and deep ditch, have been recently completed. A new church was completed in 1848. There are a chapel of ease, chapels for Roman Catholics, Wesleyan Methodists, and Baptists, National and British schools, and a temperance hall. Markets are held on Tuesday and Friday.

Wiston, a contributory borough in the Pembroke district, is 10 miles N. by E. from Pembroke. It is a small place, with a population of 774; the chief buildings are the parish church and a ruined castle. A fair is held October 20th.

The following are some of the more important villages; the populations are those of 1851:—

Abercastle, a small place, situated on a creek 6 miles S.W. from Fishguard, has a well-sheltered harbour and some coasting trade. There are some large cromlechs and other primeval remains in this neighbourhood. *Broadhaven*, a pretty little watering-place on St. Bride's Bay, 6 miles W. by S. from Haverfordwest, is much frequented in summer. It is celebrated for the extent and hardness of its sands, and the purity of its water. *St. Dogmael's*, population of the parish 2689, a straggling fishing village on the left bank of the Teivy, is built round the remains of St. Dogmael's Priory, about two miles from Cardigan. The priory was founded by Martin de Tours; part of the north transept remains; the adjoining parish church was constructed with materials from this fine old building. Besides the church there are places of worship for Wesleyan Methodists (Welsh) and Baptists. *Kilgerran*, population of the parish 1266, a village consisting of a street half a mile in length, is situated on the left bank of the Teivy, about 4 miles S.E. from Cardigan. The chief occupation is salmon-fishing by means of coracles. Slates are extensively quarried. Large fairs for horses, cattle, &c., are held in August and November. Near the village is the majestic ruin of Kilgerran Castle, founded by Gilbert Strongbow in 1109. *Nevern*, 2 miles E. from Newport, on the right bank of the Nevern, population 1642, possesses a Norman church dedicated to St. Brynach. In the churchyard is an ancient decorated cross of great beauty. *Saundersfoot*, a thriving coal-port, is situated on Caermarthen Bay, 3 miles N. from Tenby. The harbour is protected by piers, and connected by tramways with extensive anthracite collieries. North of this place are Hean Castle, a modern residence, and Amroth Castle, a splendid modern mansion, on the site of an old feudal structure. *Solva*, or *Solfach*, is a small sea-port, 4 miles E. from St. David's. The Wesleyan Methodists, Independents, and Baptists have places of worship. There are a National school and a superior school called Solva Academy. A small market is held on Friday. *Stackpole*, is a pretty village, situated on the edge of Stackpole Park, 3 miles S. from Pembroke. In this park, one of the finest in Wales, stands the mansion of Earl Cawdor.

Pembrokeshire is in the diocese of St. David's and archdeaconry of Caermarthen. Assizes and quarter sessions are held at Haverfordwest; county courts at Fishguard, Haverfordwest, Narberth, and Pembroke.

History and Antiquities.—Giraldus Cambrensis informs us that Pembrokeshire was conquered in the reign of Henry I. by Arnulf de Montgomery, who built the first castle of Pembroke of stakes and turf. In the same reign a colony of Flemings settled in the peninsula west of Tenby, which is called the hundred of Castle-Martin, and in the neighbourhood of Haverfordwest; their descendants still retain much of their nationality, and the district is hence termed 'Little England beyond Wales.'

Pembrokeshire is rich in antiquities. Many primeval remains are found about St. David's Head, and in the west of the county generally; several Danish encampments may be seen near Linsey Head. The history of the see of St. David's, and a notice of the cathedral buildings, are given under DAVID'S, St. Pembroke Castle, the birthplace of Henry VII., is noticed under PEMBROKE. To the feudal structures already mentioned in this article we add the following:—Manorbear Castle, near Tenby, situated among hills overlooking a wild and broken coast terminated by St. Gowan's Head, was founded by a Norman knight named De Barri, ancestor of Giraldus de Barri, surnamed Cambrensis, who was born here in 1146. At Lamphey, near Pembroke, are the remains of an episcopal palace alienated to Henry VIII., and by him granted to Walter Devereux, afterwards Viscount Hereford. Carew Castle, on the road from Tenby to Pembroke, stands on a gentle elevation above a creek of Milford Haven. The state apartments, the chapel, and the great hall, 102 feet by 20 feet, are lighted through lofty mullioned windows, and are in good preservation; near the entrance is a room 80 feet by 30 feet. On the left of the road, in approaching the village of Carew, is a lofty ancient stone cross of remarkable beauty.

Statistics: Religious Worship and Education.—In the registration county (the population of which in 1851 was 84,472, being 9668 less than that of the county proper) there were 317 places of worship in 1851, of which 136 belonged to the Church of England, 62 to Methodists, 59 to Independents, and 50 to Baptists. The total number of sittings provided was 67,004. The number of day schools was 184, with 8079 scholars; of Sunday schools 179, with 14,846 scholars; and of evening schools for adults 2, with 31 scholars. A mechanics institute at Pembroke Dock had 276 members, with a library of 200 volumes; and a literary and scientific institute at Haverfordwest had 120 members, with a library of 40 volumes. In 1858 the county possessed 2 savings banks at Haverfordwest and Pembroke. The total amount owing to depositors on November 20th 1853 was 106,953*l.* 18*s.* 4*d.*

PENANG, PULO. [PRINCE OF WALES ISLAND.]

PENDENNIS. [FALMOUTH.]

PENDLEBURY. [LANCASHIRE.]

PENEUS. [THESSALY.]

PENISTONE, West Riding of Yorkshire, a market-town and the seat of a Poor-Law Union, in the parish of Penistone, is situated on the right bank of the river Don, in 53° 31' N. lat., 1° 38' W. long., distant 17 miles S.S.W. from Wakefield, 175 miles N.N.W. from London by road, and 176 miles by the Great Northern and Manchester, Sheffield and Lincolnshire railways. The population of the township of Penistone in 1851 was 802. The living is a vicarage in the archdeaconry of Craven and diocese of Ripon. Penistone Poor-Law Union contains 15 parishes and townships, with an area of 33,846 acres, and a population in 1851 of 13,214. Penistone church is a neat building, and there are places of worship for Wesleyan Methodists, Independents, and Quakers. The Grammar school, founded in 1604, is free for classics to all boys in the parish; it has an income from endowment of 100*l.* a year, and had 50 scholars in 1852. There is a Free school for girls. The market, which is chiefly for cattle, is held weekly on Thursday; there are five yearly fairs.

PENKRIDGE, Staffordshire, a village and the seat of a Poor-Law Union, in the parish of Penkridge, is situated on the right bank of the river Penk, in 52° 43' N. lat., 2° 6' W. long., distant 6 miles S. from Stafford, 131 miles N.W. from London by road, and 136 miles by the North-Western railway. The population of the township of Penkridge in 1851 was 2663. The living is a perpetual curacy in the archdeaconry of Stafford and diocese of Lichfield. Penkridge Poor-Law Union contains 21 parishes and townships, with an area of 68,369 acres, and a population in 1851 of 16,541. Penkridge chiefly consists of two streets leading down to the bridge over the Penk, before reaching which they unite: the lower part of the village is subject to frequent inundations. There are here the parish church, a chapel for Independents, and a National school. Three yearly fairs are held; one of them a large cattle-fair, and another a large horse-fair.

PENMAENMAWR. [CAERNARVONSHIRE.]

PENNAIR, RIVER. [HINDUSTAN.]

PENNSYLVANIA, one of the most populous and wealthy of the United States of North America, lies between 39° 43' and 42° N. lat., and 74° 40' and 80° 36' W. long. It is bounded E. by the state of New Jersey; N.E. and N. by that of New York; N.W. for 40 miles by Lake Erie; W. by the state of Ohio; S.W. by Virginia; S. by Maryland; and S.E. by Delaware. Its form is that of a parallelogram, with a length from east to west of 305 miles, and a width of 155 miles. The area is about 47,000 square miles. The population in 1850 was 2,311,786 (of whom 53,628 were free coloured persons), or 49.19 to the square mile. The inhabitants being all free, the federal representative population is the same as the entire population in 1850; this,

according to the present ratio of representation, entitles the state to send 25 representatives to Congress. To the Senate, like each of the other states, Pennsylvania sends 2 representatives.

Surface, Soil, Climate, Productions.—The Alleghany or Appalachian Mountains cover more than one-half of the surface of this state. The ridges of which the mountain system consists run in the general direction of the whole system, south-south-west and north-north-east; and along the southern boundary-line of the state their width hardly falls short of 100 miles. But north of 40° N. lat. the eastern ridges turn to the east-north-east, while the western ranges continue in a north-north-east course, and thus between 41° and 42° N. lat. the two outer ridges of the mountains are 200 miles apart. This mountain region occupies the middle and above half of the state, and to the south-east and north-west of it extend two hilly regions exhibiting different natural features.

1. *The South-Eastern Region* extends along the Delaware River as far north as 41° N. lat., and along the boundary of Maryland as far west as 78° W. long. Its north-western border is formed by the eastern ridge of the Blue Mountains. This region forms a portion of the Atlantic slope; the surface, while generally undulating or hilly, rising gradually from the south-east to the north-west, and near the foot of the Blue Mountains attaining an elevation of between 200 and 300 feet above the sea. About 15 miles from the Blue Mountains is the continuous ridge called the South Mountains, which rises to a considerable height near the southern boundary, but farther east exhibits frequent depressions. This ridge terminates on the banks of the Delaware at the mouth of the Lehigh River. Along the Delaware the soil is a sandy loam, not distinguished by fertility, but well cultivated on account of the ready market afforded by the navigable river and the city of Philadelphia. Farther inland the soil improves considerably in fertility. The climate of this region resembles that of England, except that the changes are more sudden and greater, and the summers hotter and the winters colder, than in England. The mean annual temperature varies between 54° and 50° according to the elevation of the country. Sudden changes of temperature, extending to 20 or 30 degrees, are not uncommon at any season. During the winter months there is a good deal of frost and snow. Rain is abundant all the year round. The mean annual fall is 38 inches. The greatest quantity falls in the summer months, from June to September. In this region are cultivated the grains of England, with maize and much buckwheat. Hemp, flax, tobacco, and esculent plants thrive very well. The orchards chiefly produce apples, peaches, and cherries; the other fruits are less cultivated. In some sheltered places there are extensive vineyards.

2. *The Mountain Region* south of 41° N. lat. consists of a succession of steep ridges and narrow valleys; but north of that line it extends in an elevated table-land, the greater portion of the surface being occupied by large tracts of level or hilly ground, while the mountain ridges are far distant from each other, and cover a comparatively small part of the surface.

Nearly in the middle of the mountain region runs the highest and widest of the ranges of the Alleghany Mountains. In the southern districts of Pennsylvania it forms the watershed between the rivers, which descend eastward to the Potomac and Susquehanna, and westward to the Ohio; but north of 41° N. lat., where it inclines to the north-east, the continuity is broken by the upper branches of the Susquehanna. The summit of this range is broad and nearly of equal elevation, being destitute of peaks. Its elevation above the sea, south of 41° N. lat., seems to vary between 2000 and 2600 feet, and it stands on a base from 800 to 1000 feet high and from 6 to 10 miles wide. East of this range there are five or six other ridges running parallel to each other. The most eastern, the Blue or Kittatinny Mountains, seems to be the highest, and in the Wind Gap, near Williamsburg, on the Delaware, attains the elevation of 1390 feet. The valleys inclosed by these several ridges rise in elevation as they approach the main Alleghany range; the most easterly being hardly more than 300 feet above the sea-level. Both the ridges and the valleys are comparatively narrow, occupying on an average only three miles in width. The declivities of the ridges are steep, and the valleys much depressed and deep. The mountain region west of the main range consists, south of 41° N. lat., of two broad valleys and two ranges, called the Laurel Hills and the Chestnut Ridge. The valleys are about 1000 feet above the sea-level, and the ranges rise some 700 or 800 feet above them. The soil of this region is in general poor and stony, though the valleys contain some alluvial tracts of great fertility, but of inconsiderable extent. The winters are very cold and of long duration; the snow covers the ground for several months. The springs are wet; and the summers, though hot, of comparatively short duration. Maize does not ripen in most parts, and is only planted to be consumed before it gets ripe; wheat is only cultivated in sheltered places. The most common grains are rye and oats. The vegetables generally raised are peas, parsnips, carrots, onions, shallots, potatoes, sweet potatoes, and cabbages. The uncultivated portion of this region, which comprehends the greater part, is chiefly covered with forests. On the higher parts of the ridges the mountains are covered with *Coniferæ*, as pitch, spruce, and white pines and cedars. In the valleys are oak and chestnut, and, where the soil is subject to inundations, sycamores. West of the Laurel Hills the forests are mainly composed of the broad-

leaved laurel, rhododendron, and *Magnolia acuminata*, mixed with chestnut-trees and some oaks.

The table-land of Pennsylvania, on the mountain region north of 41° N. lat., consists, as already observed, of wide broken plains with some ridges and some extensive swamps. The highest part of the table-land is contiguous to the boundary-line of New York, and rises to an elevation of about 1300 feet, with a few ridges which are a few hundred feet higher. Along the water-courses the table-land is depressed, sometimes above a hundred feet, and in these districts alone rye, oats, and some vegetables are cultivated. There are however extensive pastures on the higher parts. The climate is still more severe than it is between the ridges farther south, as the low ridges cannot shelter the plains against the prevailing north-west winds. The forests of the higher land are almost entirely composed of *Coniferæ*, but they do not contain many timber-trees, the stony soil being too poor for their growth. In the depressions and along the rivers are sugar-maple, black walnut, elm, and beach.

3. *The North-Western Region* constitutes the most eastern portion of the plain which slopes from the base of the Alleghany Mountains westward to the banks of the Mississippi. Near the foot of the mountains it is from 900 to 1000 feet above the sea, and where it approaches the boundary-line of Ohio it is still nearly 700 feet above it, in the valley of the Ohio, but much higher farther northward, where it preserves the elevation of from 900 to 1000 feet to the very boundary-line. The surface of this region is undulating, the ascents being gentle and the upper part of the eminences broad, with a rounded outline, except along the water-courses of the larger rivers, where the ascent is rather steep. The soil varies very much: in many places there are large tracts with a poor and stony soil; in others, especially along the rivers, there are fertile tracts. The climate does not materially differ from that of the south-eastern region, except that the winters are colder, and the quantity of rain which falls is not quite so great. In the southern districts cultivation has made considerable progress, and the country presents a pleasing variety of fields and forests. All the grains of the south-east region are raised in abundance, and the orchards produce great quantities of fruit, especially apples and cherries. The forests consist chiefly of oak and sugar-maple. The northern districts are almost entirely covered with forests, consisting of hemlock, spruce, and Weymouth pine, which attains a great size, intermixed with beech, birch, and sugar-maple.

Hydrography; Communications.—The most important river of Pennsylvania is the Delaware, which is navigable by large ships to Philadelphia, and by sloops to Trenton, 130 miles from its mouth. [DELAWARE.] The *Susquehanna* rises in two branches on the table-lands of Pennsylvania and New York, of which the eastern branch originates near 74° 40' W. long., and the western near 78° 40' W. long., and consequently more than 200 miles from each other. The eastern and principal branch has its source in Lake Otego, near the western declivity of the Tuscarora Mountains in New York, traverses the table-land of New York in a south-western and western direction, and after a course of about 140 miles enters Pennsylvania, and is soon afterwards joined by the Tioga River, which collects its waters on the table-land farther west, and flows about 80 miles. From the junction with the Tioga it flows about 130 miles south-east, and afterwards south-west, to its junction with the western branch. This western branch, which is exclusively a river of Pennsylvania, originates in the mountainous tract south of 41° N. lat., and after a northern and eastern course of about 140 miles, it turns southward about 25 miles and joins the eastern branch above Sunbury. After the union of the two branches, the Susquehanna runs southward for about 50 miles, traversing by narrow valleys five or six of the ridges, which here lie between the table-land and the south-eastern region. Before it reaches the lower country it receives on its right bank the largest of its affluents, the *Juniata*, which rises on the western declivity of the Alleghany Mountains, and runs in a circuitous course for about 160 miles, collecting in its way by far the greater part of the waters in the eastern part of the mountain region south of 41° N. lat. After having left the mountain region above Harrisburg, the Susquehanna is joined by the Swatara Creek, whose course hardly exceeds 50 miles, and by several other small streams. The course of the Susquehanna through the south-eastern region is about 170 miles; its entire course is somewhat under 450 miles. It is navigable by sloops for about 5 miles; but above that navigation is impracticable, owing to the rapidity of the current and the numerous rocky ledges which form numerous rapids. Its waters however have been rendered available by the construction of canals. Some of the affluents of the Susquehanna, as the Tioga, Juniata, and Swatara, are navigable for small boats, at least a considerable part of the year, when the rivers are full.

The western part of the state is drained by the two principal branches of the Ohio, the Alleghany and Monongahela rivers. [MISSISSIPPI RIVER, vol. iii. col. 821.] Both of these rivers are navigable for boats during several months of the year. The Ohio, also noticed under MISSISSIPPI RIVER, is formed by the junction of these two streams, and runs westward about 40 miles through Pennsylvania; it is joined from the north by the Big Beaver River, which is navigable for boats as far as the boundary-line between Pennsylvania and the Ohio.

Pennsylvania has a most extensive system of canals, by which the

great coal-fields of the state, and its commercial, manufacturing, and agricultural districts are provided with abundant facilities of internal water communication, and connected with Lake Erie on the one side, and Philadelphia, New York, and the Atlantic on the other. The main lines for the most part follow the great valleys of the interior. In all there are above 1100 miles of canal in the state.

The railways of Pennsylvania are of great extent and importance; and they are of a more costly character than those of any other state except New York. The longest lines are those carried quite across the state, from Philadelphia westward by Harrisburg to Pittsburg, and thence to Crestline in Ohio; and the unfinished series intended to run from Philadelphia north-westward by way of Sunbury to Lake Erie; while other main and junction lines of considerable length and importance connect all the leading towns of the state with each other, and with the towns on the lines of railway belonging to the neighbouring states. On the 1st of January 1855, there were in Pennsylvania 1992 miles of railway in operation, and 1400 miles in progress or projected. The number of railways was 69; but many of these are merely short mineral lines constructed for conveying the coal, &c., from the pits to the ordinary passenger lines.

Geology, Mineralogy, &c.—Igneous and metamorphic rocks occupy the south-eastern portion of the state. In the extreme south-east angle they are chiefly of granite, sienite, &c.; but north of these the prevalent rocks of this series are of gneiss, mica-schist, talcose slate, crystalline limestone, &c.; whilst veins of copper trap occur in several places. Bordering these on the west and north is a belt of Lower Silurian strata, which stretches across the state from Maryland to the Delaware above Trenton, and consists of thick beds of dark reddish-brown argillaceous sandstone, compact limestone, and over all slaty clays. West and north of this series and following its outline is a narrower belt of Upper Silurian strata, consisting chiefly of light gray limestones. Beyond these occur widely extended strata of Devonian rocks. These occupy the middle and north-eastern part of the state, attain a depth of some 14,000 feet, and consist of very fossiliferous sandstones, thick beds of marl and clay, and surmounting all strata of very deep red-sandstone, corresponding to the Old Red-Sandstone of Wales and Scotland. The whole of the western half of Pennsylvania belongs to the Carboniferous system—a portion of the great coal-field of the Alleghanias. The Lower Carboniferous strata are chiefly represented by red schist and siliceous conglomerate, and form a narrowish band west of the Devonian rocks, and between them and the Upper Carboniferous strata, or coal-measures, which occupy the entire remaining portion of the state, and recur in detached patches throughout the district assigned to the Devonian formation; it is indeed among these detached portions that the most productive coal-mines occur. The Upper Carboniferous strata consist chiefly of conglomerate as the base of the formation, and above carboniferous limestone, sandstone, and clay-slates, with veins of true coal, both bituminous and anthracite.

Rich as Pennsylvania is in minerals, by far the most important is coal. The anthracite coal is found in the greatest quantity between the Blue Ridge and the Susquehanna River, and chiefly in the Lehigh and Lackawanna valleys. The richest mines are near Mount Carbon or Pottsville, on the Schuylkill, and near Mauch Chunk on the Lehigh, where beds occur above 40 feet thick, and are worked in the open air, the overlying sandstone, 40 feet thick, having been removed bodily from the top of the hill. The quantity of coal extracted from the Schuylkill field in 1851 amounted to 2,178,584 tons. Other very productive beds of anthracite occur in the Wyoming valley and elsewhere. The bituminous coal-fields of Pennsylvania lie in the western parts of the state, where the coal is found in beds varying in thickness from an inch to six feet and upwards: and it is noteworthy that the coal becomes progressively bituminous as we advance westward in the state. The coal-lands of Pennsylvania are said to occupy above 15,000 square miles, or nearly one-third of the entire area of the state. The quantity of coal now annually obtained from the coal-mines or quarries of Pennsylvania averages nearly 8,000,000 tons, of which about 1,300,000 tons are bituminous.

Next in value to the coal is the iron-ore, which is abundant all over the state, but the more valuable kinds especially so in the bituminous coal districts of Pittsburg, where it has long been very extensively worked. Nearly half of the iron manufactured in the United States is said to be obtained from Pennsylvania. Copper-ore is worked in various places of good quality. Rich argentiferous lead-ore is also obtained. Some zinc is found. Salt-springs are common all over the region of the bituminous coal. Wherever the earth in this region has been penetrated to any considerable depth, salt water has been found, and there are salt-works on a large scale on the Conemaugh, an affluent of the Alleghany, and one or two other rivers. Saline and other medicinal springs in various places have of late been much resorted to by invalids during the summer season. Marble of beautiful variety and excellent texture, granite, and other excellent building stones are largely quarried. Slate and limestone abound in some places.

The climate, the principal agricultural productions, forest trees, &c., have been already noticed in describing the different sections of the state. The staple cereals are wheat, maize, and oats; but rye and buckwheat are also largely raised. Of other food crops potatoes are the principal. The culture of tobacco appears to be greatly on the

increase. Maple sugar is very extensively made. There are very large quantities of horses, cattle, and swine in the state, but their numbers decreased considerably between the censuses of 1840 and 1850. The waggon-horses of Pennsylvania are of extraordinary size and strength. The cattle are generally of a good breed. Sheep are kept in most parts, but the wool is not fine. The wild animals have much diminished. The elk has entirely disappeared, and the deer begins to be scarce. In the northern and less cultivated districts are still found the brown bear, the wolf, wild cat, &c.; also squirrels, rabbits, hares, and minxes. Among the birds, the wild turkey is the largest. Several kinds of fish are plentiful in the rivers, as salmon, trout, carp, shad, &c.

Manufactures, Commerce, &c.—Pennsylvania is one of the chief manufacturing states of the Union. Though the manufactures of cotton, woollen, and linen stuffs are less extensive than those of New York and Massachusetts, those of iron are by far the most extensive in the Union, amounting indeed in value to more than one-third of the whole. In almost every county there are iron-works, but the chief seats of the manufacture are Pittsburg in the north-west, Lancaster in the south-east, and Armstrong, Chester, Berks, Blair, Columbia, and Luzerne counties. Railway carriages and machinery, steam-engines for the navigation of the Ohio and Mississippi, sugar-mills and machinery, agricultural implements, tools, chain-cables, stoves, cutlery, &c., are made to a very great extent. Great quantities of common glass are made and sent to other states. The manufactures of paper are perhaps almost equal in value to those of glass. Leather-making is also a considerable branch of industry. The largest tan-yards are at Pittsburg, but they are numerous in the smaller towns in the north-west region. There are also manufactures of sail-cloth, ropes, hats, stockings, potash, tobacco, earthenware, china, candles, coaches, &c. The distilleries are on a large scale; but New York alone brews a larger quantity of ale.

Pennsylvania ranks fourth among the states of the Union in respect to foreign commerce. Philadelphia is the only sea-port in the state [PHILADELPHIA], and the only place through which foreign commerce is carried on. The exports during the year ending June 30, 1853, amounted to 6,527,996 dollars, of which 6,255,229 dollars were of domestic produce. The imports during the same period amounted to 18,834,410 dollars, of which 10,454,563 dollars were carried in American vessels and 8,379,847 dollars in foreign vessels. The entrances during 1850 were—352 American vessels of the aggregate burden of 100,009 tons, and 185 foreign vessels of the aggregate burden of 32,361 tons. The clearances during 1850 amounted to 479 vessels, of the aggregate burden of 111,618 tons. The total tonnage owned in the state in 1850 was 257,939 tons, of which by far the greater number were employed in the inland and coasting trade. During the year ending June 30, 1850, there were built in the state 191 vessels, of the aggregate burden of 31,539 tons; of these 56 were steamers, 102 sloops and canal boats, 28 schooners, 4 brigs, and only one a ship.

Divisions, Towns, &c.—Pennsylvania is divided into 63 counties, 21 in Eastern and 42 in Western Pennsylvania. Harrisburg is the political capital; but Philadelphia is the chief city and the commercial metropolis, and Pittsburg the principal seat of the iron manufactures of the state. PHILADELPHIA forms the subject of a separate article: some of the other more important towns are noticed below; the population is that of 1850:—

Harrisburg, the capital, occupies an elevated site on the left bank of the Susquehanna, in 40° 16' N. lat., 76° 50' W. long., 110 miles N. from Washington: population, 7834. The chief public buildings are the capital, or state house, a large and costly edifice of the Ionic order; the court-house, prison, several churches, schools, &c. Considerable manufactures are carried on. A handsome covered bridge nearly 3000 feet long crosses the Susquehanna here. Like almost every other town of any consequence in the state, Harrisburg has ample railway and canal facilities.

Pittsburg, the chief town of Western Pennsylvania, is a city and port of entry; it stands at the confluence of the Alleghany and Monongahela rivers, which uniting here form the Ohio: population, 46,601. The city is regularly laid out, well supplied with water, and lighted by gas; the wide streets are lined with well-built houses; and several handsome bridges cross both rivers. Among the principal buildings are the court-house, a large and costly Doric structure; a spacious Roman Catholic cathedral; about 80 churches, some of considerable architectural pretensions; the western university of Pennsylvania; several schools; a museum; market-houses; besides banks, hotels on a very sumptuous scale, railway stations, &c. The manufacturing establishments are very numerous, and of great magnitude; and Pittsburg boasts of being known as the Birmingham of America. The chief manufactures are of iron. There are very large rolling-mills, foundries of bar- and pig-iron, nails and other coarse goods, locks, latches, mills, tools, springs, gun-barrels, &c. The other leading manufacturing establishments are of glass, soda, potash, white-lead, &c.; with breweries, saw- and grist-mills, &c. A large wholesale and retail trade is also carried on. Great quantities of bituminous coal are obtained in the immediate vicinity of the city. Besides the commercial facilities afforded by the Ohio, which is navigable to Pittsburg by steamers of large size, the city is connected with Lake Erie and the Atlantic by canal and railway. *Alleghany City*, on the

opposite side of the Alleghany River, population 21,262, is really a suburb of Pittsburg, with which it is in almost every respect closely identified; and the same may be said of Birmingham (population 3732), and South Pittsburg (1883), on the opposite bank of the Monongahela. Alleghany City contains the western penitentiary of Pennsylvania; 30 churches; and has extensive manufactories of iron, hardware, cutlery, glass, cotton goods, &c.

Carbondale, on the left bank of Lackawanna Creek, 120 miles N.E. from Harrisburg, population 4945, is the centre of a busy coal-mining district, and contains some considerable iron-works. *Carlisle*, 22 miles W.S.W. from Harrisburg, population 4581, is a busy manufacturing town, and the seat of a United States barracks and cavalry school, and of Dickinson college. *Chambersburg*, on an affluent of the Potomac, 45 miles S.W. from Harrisburg, population 3335, is one of the busiest places in the centre of the southern part of the state, and contains some good buildings. *Columbia*, on the left bank of the Susquehanna, 25 miles S.E. from Harrisburg, population 4140, carries on an extensive river trade, and contains the county buildings, 13 churches, &c. The Susquehanna is here crossed by a bridge 5690 feet long. *Dannville*, at the confluence of the Mahoning Creek with the Susquehanna, population 3302, is also a place of considerable trade. *Easton*, at the junction of the Lehigh River with the Delaware, 95 miles E.N.E. from Harrisburg, population 7250, is one of the rising towns of Pennsylvania, being the centre of a great internal trade, and having been made the point of junction of several important lines of railway, and three canals. The town is regularly laid out with broad streets, and a spacious central square; and contains besides the county buildings, several churches and schools, Lafayette college, &c. Considerable manufactures are carried on, and there are extensive deposits of iron in the vicinity, but the principal trade at present perhaps is in flour, corn, meal, and whiskey. *Erie*, a port of entry on Presque Isle Bay, Lake Erie, 220 miles N.W. from Harrisburg: population, 5858. The harbour is a good and safe one, but the place has until the last few years made very slow progress owing to the thinness of the population of the surrounding country, and the want of good lines of communication. Since however it has been connected by the state railways with the leading towns of this and the neighbouring states and the Atlantic ports, it has rapidly advanced in trade and population, and has probably in 1855 nearly twice as many inhabitants as it possessed in 1850. *Germantown*; *Kensington* [PHILADELPHIA]. *Lancaster*, 35 miles S.E. from Harrisburg, population 12,369, is a well-built and flourishing town, the seat of extensive industrial establishments, and the centre of an important line of traffic between the interior and the sea-coast. It contains county court buildings, numerous churches and schools, Franklin college, banks, railway depôts, large hotels, printing offices, paper-mills, distilleries, cotton factories, iron-works, &c. *Mauch Chunk*, on the right bank of the Lehigh, 75 miles N.E. from Harrisburg, population 2567, is chiefly noteworthy as the capital of one of the principal anthracite mining districts. The village contains some good public buildings, banks, &c.; and some large iron-works. In the immediate vicinity is the celebrated Mauch Chunk coal mine, or quarry, which occupies the summit of a hill, and is reached by an inclined plane 700 feet long with a rise of 200 feet. *Moyamensing*. [PHILADELPHIA]. *Norristown*, on the left bank of the Schuylkill, 85 miles E.S.E. from Harrisburg, population 6024, possesses a great amount of water power, which is rendered available for several extensive factories. A handsome bridge spans the river, and a canal and railways afford ample facilities for the transit of goods, &c. *Northern Liberties*; *Oxford* [PHILADELPHIA]. *Phenixville*, on the left bank of the Schuylkill, 78 miles E.S.E. from Harrisburg, population 2670, is largely engaged in the manufacture of iron and iron-ware. *Pottsville*, on the right bank of the Schuylkill, 45 miles N.E. from Harrisburg, population 7515, is the capital of an important coal- and iron-mining district. There are extensive iron-works, machine and engine shops, breweries, &c.; and the place has abundant canal and railway facilities. *Reading*, on the left bank of the Schuylkill, 55 miles E. from Harrisburg, population 15,743, is a well-built town founded in 1748. Many of the public buildings are of a superior character, and there are very extensive iron-works, cotton factories, hat manufactories, potteries, breweries, grist and saw-mills, lumber yards, &c. *Southwark*; *Spring Garden* [PHILADELPHIA]. *Tamaqua*, on the Little Schuylkill, 58 miles N.E. from Harrisburg, population 3080, is another busy coal-mining village. *Washington*, on the Chartier Creek, 170 miles W. from Harrisburg, population 2682, is the seat of Washington College, and has considerable manufactures. *Westchester*, 70 miles E.S.E. from Harrisburg, population 3172, is a well-built town with several churches, schools, an atheneum, &c., and a place of considerable trade. *York*, on the Codorus Creek, 22 miles S. by E. from Harrisburg, population 6863, is regularly laid out, contains several handsome public buildings, and has extensive manufactures.

Government, History, &c.—The constitution of the State of Pennsylvania was framed in 1776 upon the base of that originally drawn up by William Penn. This was subsequently amended, and in 1838 entirely remodelled. The present amended constitution dates from 1850. By it the right of voting is vested in every free white citizen of the United States 21 years of age, who shall have resided in the state during one year. The legislature consists of a Senate of not less than one-fourth nor more than one-third the number of repre-

ROG. DIV. VOL. IV.

sentatives (now of 33 members), who are elected for three years; and a House of Representatives of not less than 60 nor more than 100 (at present 100) members, who are elected annually. The governor is elected for three years. The judges are also elected by the people; the judges of the supreme court for 15 years, of the other courts for 10 and 5 years. The public funded debt of the state on December 1st 1854 was 39,750,000 dollars. The total revenue of the state for the year ending December 1st 1854 was 6,666,000 dollars; the expenditure was 5,425,000 dollars. The state militia in 1852 was composed of 13,328 men, of whom 212 were commissioned officers. Since 1844 the sum of 200,000 dollars has been annually appropriated by the state for the support of schools. The whole number of schools in the state in 1853 was 9703 with 286,105 male, and 238,535 female scholars. There are 9 colleges, and 14 theological, medical, and law schools in the state. A large part of the population of Pennsylvania, especially in the middle and western districts, are Germans; they retain the use of their language, and a considerable number of newspapers in German are printed and circulated in the state.

The first settlements on the shores of Chesapeake Bay were made by the Swedes in 1627. The Dutch took possession of the Swedish colony in 1658, but were obliged to cede it to the English in 1664. Several dispersed settlements had been formed along both sides of Chesapeake Bay. The country was granted by Charles II. in 1681 to William Penn, who considered it just to buy from the original possessors, the Indians, what had been granted by the king of England. In 1682 he founded the town of Philadelphia, and published a 'Frame of Government,' which was confirmed by an assembly of the people at Chester, in December, 1682. The humane principles on which the constitution and laws of Penn were based, attracted numerous colonists to this country from most parts of Europe, especially from Germany. They all settled however in the south-east region, whilst the Indians remained in undisturbed possession of the north-west region. The French, advancing from Canada, got possession of this back country, and in 1752 built Fort Duquesne, the name of which was changed to Pittsburg after it was taken by the British. In 1774 the delegates of the colonies assembled in Philadelphia, declared against the right of the English parliament to tax the colonies, which may be considered as the declaration of war; and it was at Philadelphia that, in 1776, the representatives of the 13 states adopted and promulgated the 'Declaration of Independence.' The seat of the federal government was at Philadelphia till 1800, when it was removed to Washington.

PENNYCUIK. [EDINBURGSHIRE.]

PENOBSCOT, RIVER. [MAINE, U. S.]

PENRITH, Cumberland, a market-town and the seat of a Poor-Law Union, in the parish of Penrith, is situated in a fertile vale at the south extremity of Inglewood Forest, in 54° 40' N. lat., 2° 45' W. long., distant 17 miles S. by E. from Carlisle, 283 miles N.N.W. from London by road, and 282 miles by the North-Western and Lancaster and Carlisle railways. The town is under the management of a Local Board of Health. The population of the town of Penrith in 1851 was 6668. The living is a vicarage, with the curacy of Trinity annexed, in the archdeaconry and diocese of Carlisle. Penrith Poor-Law Union contains 39 parishes and townships, with an area of 181,236 acres, and a population in 1851 of 22,307.

Penrith is an ancient town, situated at the foot of a hill, and contains many well-built houses. The town is lighted with gas. The parish church is a spacious Grecian building, after the model of St. Andrew's, Holborn, London; it was rebuilt, except the tower, in 1720. In the churchyard is an ancient monument consisting of two pyramidal stones about 12 feet high. A new church in the style of the 13th century, consecrated in 1850, and chapels for Wesleyan Methodists, Independents, United Presbyterians, Quakers, and Roman Catholics are in the town. The Free Grammar school, founded in 1564 by Queen Elizabeth, had 21 scholars in 1852, of whom two were free scholars. There are also in Penrith, Free, National, British, Industrial, and Infant schools; a school supported by the Wesleyan Methodists; a mechanics institute and reading-room, and a savings bank. Tuesday is the market-day. Several cattle fairs are held in the course of the year. There is here a house of correction. A county court is held in the town. In olden times Penrith was several times pillaged, and twice burned by the Scots. The Beacon, which stands on a high mount about a mile from the town, commands a view of the country for more than 100 miles in circumference.

PENRYN, Cornwall, a market-town and municipal and parliamentary borough, in the parish of Gluvias, is situated in 50° 9' N. lat., 5° 6' W. long., distant 30 miles S.S.W. from Bodmin, and 266 miles W.S.W. from London. The population of the municipal borough of Penryn in 1851 was 3959; that of the parliamentary borough is included in the return for the united borough of Penryn and Falmouth. The borough is governed by 4 aldermen and 12 councillors, of whom one is mayor; and in conjunction with Falmouth returns two members to the Imperial Parliament. The living of Gluvias is a vicarage in the archdeaconry of Cornwall and diocese of Exeter.

Penryn was made a market-town in 1258, and was incorporated by

1

James I. in 1619. The town is built on a low hill, which projects eastward into one of the inlets of Falmouth harbour, dividing the inlet into two navigable branches. At the point between these branches is the public quay, from which the main street of the town rises. A considerable trade is carried on between Penryn and the populous mining district of Redruth. Granite is exported to a considerable amount. There are in Penryn an Episcopal chapel, places of worship for Wesleyan Methodists and Independents, and National schools. The market is held on Saturday, and five annual fairs for cattle are held.

PENSA is an extensive government of Russia in Asia. It is bounded N. by Nischnei-Novgorod, E. by Simbirsk, S. by Saratoff, and S.W. and W. by Tamboff. It lies between 53° and 54° N. lat., 42° 20' and 45° 20' E. long. The population in 1846 was 1,087,200, of whom nearly all are Russians of the Greek Church. The surface of the country is slightly undulating, and its general character is a plain. It is watered by numerous rivers, but most of them are small and not navigable. The most important rivers are the Soura and the Mokcha. The Soura, which rises in Saratoff, enters Pensa to the south of the chief town, traverses the eastern part of the government and enters Simbirsk. The Mokcha rises in the government itself, waters the north-east part of it, and after running northward turns to the west, and enters the government of Tamboff. The government of Pensa contains six small lakes. The climate is temperate and very agreeable in summer, but the winter is rather cold; the sky is clear and the air very healthy.

The soil is extremely fertile, and the produce includes corn, hemp, flax, potatoes, and fruit. The forests are of vast extent. There are still wild-deer and a great quantity of game, but the fur-bearing animals have disappeared. The chief occupations of the inhabitants are grazing and agriculture. Bees are reared in considerable numbers. The fisheries are of little importance. The mineral kingdom furnishes a little iron, vitriol, sulphur, and millstones.

There are few extensive manufactures. But the country people manufacture coarse linen and woollen-cloth, and all kinds of articles for their own use. There is a manufactory of blankets and carpets at the village of Jela. The distilling of brandy is carried on to a very great extent. The trade is chiefly carried on by land, especially with Nischnei-Novgorod. Annual fairs are held at Pensa, Nischnei-Lomoff, and Saransk. The exports are corn, flour, brandy, soap, wax, honey, potashes, wool, sail-cloth, carpets, blankets, wooden-ware, &c.

With respect to public instruction Pensa is under the university of Kasan, but the schools are few in number. The only printing-office belongs to the crown. There are in the government about 600 churches, of which 11 are cathedrals, 5 monks' convents, and 1 nunnery. The Tartar mosques are to the number of 70, of which about 40 are of the first class.

Pensa, the capital of the government, is built on an eminence at the conflux of the Pensa and the Soura, in 53° 7' N. lat., 44° 50' E. long., 465 miles from Moscow. It was founded in 1666, and is a flourishing town, with manufactures of leather and soap. There is a brisk trade in corn. Pensa is a bishop's see, and has a gymnasium, a seminary, two convents, to each of which two churches are attached; seven other churches and a cathedral. The houses are of wood. The population is about 11,000. At Nischnei-Lomoff (7000 inhabitants) a great annual fair is held from the 1st to the 16th of July; the chief articles sold are leather, furs, wax, drugs, and colonial produce. Saransk, at the conflux of the Saranga and the Insara, has nearly 9000 inhabitants, 9 churches, 2 cathedrals, and a convent of monks. It is a very thriving little town.

PENTRE VOELAS. [DENBIGHSHIRE.]

PENZANCE, Cornwall, a market and sea-port town, a municipal borough, and the seat of a Poor-Law Union, in the parish of Madron, is situated on the north-western shore of Mount's Bay, in 50° 7' N. lat., 5° 31' W. long., distant 53 miles S.W. from Bodmin, and 281 miles W.S.W. from London. The population of the borough in 1851 was 9214. It is governed by 6 aldermen and 18 councillors, of whom one is mayor. The living of Penzance is a perpetual curacy in the archdeaconry of Cornwall and diocese of Exeter. Penzance Poor-Law Union contains 19 parishes and townships, with an area of 65,022 acres, and a population in 1851 of 53,370.

Penzance is the most westerly town in England. It received a charter for a market and a fair in 1332, and was incorporated by James I. in 1616. The town is situated on the north-western shore of Mount's Bay, and has much increased of late years; it is lighted with gas. There are in Penzance a parochial chapel, rebuilt in 1836; a proprietary chapel, erected in 1843, in the early English style; places of worship for Wesleyan and Association Methodists, Independents, Baptists, Roman Catholics, and Jews; a Grammar school, which had 18 scholars in 1851; National schools, and a savings bank. Quarter and petty sessions and a county court are held. The town hall, recently built, is surmounted with a handsome cupola; its eastern front consists of a pediment supported by four noble columns. Penzance possesses

a good public library, a Society of Natural History and Antiquities, and a Horticultural Society. This town is also the seat of the Royal Geological Society of Cornwall, whose museum contains an admirable collection of minerals. The climate of Penzance is very mild but somewhat moist, and is in some repute for invalids. A large proportion of the tin produced in Cornwall is shipped at Penzance. The markets are held on Thursday and Saturday; and fairs on May 23th, Thursday after Trinity Sunday, and Thursday before Advent. Some woollen-yarn and coarse woollen-cloth are manufactured. The fishery at Penzance employs about 2000 persons and about 300 sail of large fishing-boats. The number of vessels belonging to the port on December 31st 1853 was—90 of 8190 tons aggregate burden. During 1853 there entered the port 777 sailing-vessels of 51,659 tons, and 29 steam-vessels of 11,462 tons; and there cleared 297 sailing-vessels of 20,797 tons aggregate burden.

PEORIA. [ILLINOIS.]

PERCY. [MANCHE.]

PERDU, MONT. [PYRÉNÉES.]

PERE-EN-RETZ, ST. [LOIRE INFÉRIEURE.]

PEREKOP. [CRIMEA.]

PERGAMOS, or PERGAMUM, the most important town in Mysia, first mentioned in Xenophon's 'Anabasis' (vii. 3, s. 8), was situated north of the river Calcus, on a small stream named Silenus. It was strongly fortified by nature and art, and was chosen by Lysimachus, when ruler of the north-west part of Asia Minor, as the most secure place in his dominions for depositing his treasures. Philetærus, to whom he entrusted his treasures, declared his independence about B.C. 288, and remained master of the town and a small part of the surrounding country till his death B.C. 263. He was succeeded by his nephew Eumenes, who increased his dominions, and even gained a victory near Sardis, over Antiochus son of Seleucus. He reigned for 22 years, and was succeeded, B.C. 241, by his cousin Attalus I., who assumed the title of King. Attalus was a successful general, and his prudence as well as his valour greatly extended the limits of his kingdom. He died at the age of 72, after a reign of 44 years, and was succeeded, B.C. 197, by his son Eumenes, who, like Attalus, was a firm friend of the Romans, and in consequence of his services in their wars against Antiochus and the kings of Macedonia, received from them all the territory conquered from Antiochus on this side of Mount Taurus. Eumenes embellished the city with many public buildings, and founded a library, which became only second in importance to that of Alexandria. The library remained at Pergamos till Antonius made a present of it to Cleopatra.

The history of the kings of Pergamos is given in an Appendix to Clinton's 'Fasti Hellenici' (iii. 400-410).

Pergamos was a considerable town, and possessed many public buildings, of which the most celebrated was a temple of Æsculapius, which possessed the right of asylum. (Tac., 'Ann.', iii. 63; App., 'Mith.', c. 60.) Pergamos was one of the seven churches to which St. John wrote in the book of the Revelation (i. 11; ii. 12). It continued to be the capital of the Roman province of Asia. The modern town, which is called Bergma, is still a place of considerable importance. Mr. Fellows, who visited it in 1838, says ('Excursion in Asia Minor,' p. 34), that "it is as busy and thriving as heavy taxation will allow, and has seven or eight khans." It contains many extensive ruins. Mr. Fellows informs us (p. 34) that the walls of the Turkish houses are full of the relics of marbles, with ornaments of the richest Grecian art.

PERGE. [PAMPHYLIA.]

PERIAPATAM. [COORG.]

PERIERS. [MANCHE.]

PÉRIGORD, a former province of France, included in the military government of Guienne, was bounded N. by Poitou and Llimousin, E. by Quercy, S. by Agenais, and W. by the Bordelais, Saintonge, and Angoumois. It is now included in the department of DORDOGNE; the capital was Périgueux.

PÉRIGUEUX. [DORDOGNE.]

PERM, an extensive government of Russia, is situated partly in Europe and partly in Asia, between 56° 30' and 61° 30' N. lat., 53° 20' and 64° 10' E. long. It is bounded N. by Wologda and Tobolsk, E. by Tobolsk, S. by Orenburg, and W. by Viatka. The area is about 128,500 square miles, or more than double the area of England and Wales. The population in 1846 was 1,637,700.

This government is mountainous, and is divided by the Ural Mountains, which traverse it from north to south, into two unequal parts, the smaller of which is in Asia. The loftiest summit of the Ural

chain, the Pavdinskoi-Kamen, is upwards of 6000 feet above the level of the sea, but the chain rises so gradually that travellers approaching it on the road from Perm to Ekaterinburg find themselves at the summit without perceiving that they were making an ascent. The mountainous parts are covered with forests, in some of which there are immense marshes. The southern parts of the government, on the European side, are fertile and well cultivated, but the other portions are more suitable to pasture than tillage. The course of the rivers is determined by the Ural chain. The principal river on the west side is the Kama, among the numerous affluents of which is the Tchousovaia, which flows from some lakes at the foot of the chain, and joins the Kama above the town of Perm. On the other side of the mountains, the Soqva, the Toura, and the Sceth flow eastward to join the Tobol. There are above 600 lakes, most of them east of the mountains. There are also sulphureous and other mineral springs. The climate is unequal, being very rigorous in the mountains and in the eastern part, but milder towards the south-west. It is however generally healthy. The government does not produce corn sufficient for the consumption of the inhabitants. Rye, barley, oats, potatoes, and flax are grown. The forests, of which a very large proportion belongs to the crown, consist of the pine, the larch, the birch, and the lime-tree; in the south-eastern part the oak, the ash, the birch, and the elm are found, and in the districts of Tcherdynne and Werkhoutourie, the cedar. Game and fur-bearing animals abound. The government of Perm owes its riches to its minerals, and the working of the mines employs the greater part of the inhabitants. They produce iron, copper, platinum, a little lead, gold, silver, salt, marble, jasper, agates, amethysts, loadstone, and some diamonds. The richest gold-mines are those of Beresoff. The mines of the Ural Mountains yield annually about 300 poods (one pood=36 lbs.) of gold, 200,000 poods of copper, and 5,500,000 poods of iron. The greater part of these products belongs to the government of Perm, which also produces about seven million poods of salt annually.

Of domestic animals there are horses, horned cattle, sheep, swine, and goats. The Baschkirs breed a great quantity of bees: formerly they had camels, but the race appears to be extinct. The Woguls, in the north, have a few reindeer.

Three-fourths of the inhabitants are Russians. The remainder are Permians, descended from the ancient inhabitants of the country between the Ural Mountains and the White Sea, and various Tartar races. Most of the inhabitants profess Christianity; there are a few Tartars and Baschkirs of both sexes, who are Mohammedans; and some Tchermisises and Woguls, who are still Pagans.

There are some manufactures of cloth, leather, soap, candles, &c. Trade is very brisk, partly in consequence of the facility for water-carriage on the Kama and its tributaries, and partly owing to the 39 annual fairs, 18 of which are held in the towns, the most considerable being that of Irbit. With respect to education, Perm is under the university of Kasan, but education is confined to a very small portion of the inhabitants.

Perm, the capital of the government, is a modern town, having been built in obedience to a ukase of Catharine II., issued in 1780. It is situated in 58° N. lat., 56° 30' E. long., at the conflux of the Iagouschika and the Kama. The streets are broad and regular, the houses almost all of wood, and the town is surrounded by a boulevard planted with trees. The population is about 10,000. Perm is a bishop's see. Ekaterinburg, with 11,000 inhabitants, is a place of much greater importance. [EKATERINBURG.] *Kumgar*, at the junction of the Iron and the Sylwa, a fortified town with 6000 inhabitants, has manufactures of leather and soap. Within a mile of the town, on the banks of the Sylwa, there are caverns in the rock, which appear to have been formerly inhabited by many thousand families. *Solismansk*, at the conflux of the Ufolka and the Kama, has 5000 inhabitants, five churches, and two convents. There are here extensive saltworks. Owing to the road to Siberia passing through this town, it has a considerable trade. There is a botanic garden, in which the principal plants of Russia and Siberia are cultivated. *Nischnei-Newiansk* has 12,000 inhabitants, who have considerable manufactures of lacquered or japanned ware. *Irbit*, or *Irbizk*, on the Neïwa, near its confluence with the Irbit, has 3500 inhabitants, and is celebrated for its annual fair, which is frequented by Bokharian, Persian, Armenian, Greek, &c., merchants. Irbit is a neat, regularly built, and rapidly improving town. [See RUSSIA, in SUPPLEMENT.]

(Schmidtlin, *La Russie et la Pologne*; Hörschelmann, *Handbuch*; Erman, *Reise nach Sibirien*; *Russian Official Journals*.)

PERNAMBUCO, a sea-port in Brazil, situated in 8° 8' S. lat., 34° 51' W. long. It is the collective name of two towns, Recife and Ollinda, nearly 3 miles distant from one another. It gives title to a bishop, and is the capital of the province of the same name. The Cidade do Recife consists of three different parts, united to each other by bridges, called Bairro do Recife, Bairro de São Antonio, and Bairro de Boa Vista. The Bairro do Recife is built on the south-eastern extremity of a low and sandy peninsula formed by the mouths of two small rivers, the Capibaribe on the south, and the Ibiribe on the north; being contiguous to the harbour, it is the seat of the commerce. The harbour is formed by a Recife, or chain of reefs, which runs parallel to the shore and about 20 yards from it, and resembles a large flat wall, elevated about 6 feet above low-water mark. This reef

is interrupted by a narrow break which forms the entrance to the port, north of the northern extremity of Recife, and inside the reef, vessels are completely sheltered by a shoal. The town is indifferently built, and the streets are narrow, but generally paved. The Rua das Cruzes, which is the only wide street, contains many substantial houses. The treasury and the governor's palace are situated in San Antonio. As the tide enters the river some distance above the places where the three towns are built, the water is not fit for drinking, but an aqueduct has been constructed, by which water is brought from the Rio Prata, a distance of about 5 miles. Recife has a college, an episcopal palace, and an hospital.

Ollinda is beautifully situated upon a cluster of eminences which are connected with the mountains farther west. It is rather well built, contains many convents, a cathedral, an episcopal palace, a botanical garden of trees and exotic plants, mostly brought from Asia; and a college. The population of Pernambuco as a whole probably amounts to 50,000. The exports of Pernambuco consist chiefly of cotton, sugar, rum, horns, hides, and dyewoods. The imports are cod, mostly from England, flour, wine, English cotton manufactures, and silks from France and China. The trade of the town has been increasing for several years.

The town of Pernambuco was taken by the Dutch in 1630, and remained in their possession to 1654. The Dutch did more for its public works in that short period than has been done ever since.

PERNAU. [LIVONIA.]

PERONNE. [SOMME.]

PERPIGNAN, capital formerly of Roussillon, now of the department of Pyrénées-Orientales, in the south of France, is situated at the junction of the Rasse with the Tet, 5 miles W. from the Mediterranean, 525 miles S. from Paris, in 42° 41' 55" N. lat., 2° 54' 18" E. long., 1194 feet above the level of the sea, and had 19,123 inhabitants in the commune at the census of 1851. Whilst Roussillon was in the hands of the kings of Aragon, Perpignan became in 1349 the seat of a university founded by king Pedro. In 1474 the town was taken, after a most vigorous resistance, by Louis XI. of France. Having been restored to Spain, it was again taken in 1642 by Louis XIII., and was included in the cession of Roussillon to the French. The town is built partly on the slope of a hill, and partly in the plain at its foot, on the right bank of the Tet, over which there are two bridges. A strong citadel commands the town on the south side. The defences of the town, consisting of ramparts flanked with bastions and protected by terraces from the besiegers' fire, of advanced redoubts, covered ways, &c., were all thoroughly repaired in 1823, and Perpignan is now one of the strongest places in France. There are barracks for 5000 men built by Louis XIV., and occupying one side of the parade. Perpignan is divided into the old and new towns. The streets, with few exceptions, are narrow and dark, and the houses ill built. The most remarkable buildings are—the cathedral, the churches of St-Jean-le-Vieux and La-Real, the town-house, the mint, the former churches of the Cordeliers, Carmelites, and Dominicans, the Carmelite convent, now the arsenal, &c. The town gives title to a bishop. It has tribunals of first instance and of commerce, a custom-house, a college, a clerical school, two hospitals, a theatre, a botanic garden, and a public library of 13,000 volumes kept in a part of the old university buildings. The manufactures are—broadcloth and woollen stuffs, playing cards, leather, brandy, soap, and corks. The chief articles of commerce are—red and liquor wines, brandy, oil, silk, wool, iron, and cork. Half-way between Perpignan and the sea is the hamlet of *Castell-Roussillon*, which stands on the left bank of the Tet, and occupies part of the site of the ancient *Ruscino*.

PERRANZABULOE. [CORNWALL.]

PERREUX. [LOIRE.]

PERROS-GUIREC. [CÔTES-DU-NORD.]

PERSEPOLIS is mentioned by Greek writers after the time of Alexander as the capital of Persia. The name however does not occur in Herodotus, Ctesias, Xenophon, or Nehemiah, who were well acquainted with the other principal cities of the Persian empire, and make frequent mention of Susa, Babylon, and Ecbatana. Their silence may be accounted for by the fact that Persepolis was not a place of residence for the Persian kings, though, from the account of Arrian and other writers, it was from the most ancient times regarded as the capital of the empire. The kings of Persia appear to have been buried here or at Pasargads. There was at Persepolis a magnificent palace, which at the time of Alexander was full of immense treasures, which had accumulated there from the time of Cyrus. (Diod. Sic., xvii. 71; Strabo, xv. p. 729.) The palace of the Persian kings and a part of the city were burnt by Alexander (Arrian, iii. 18; Curt., v. 7; Strabo, xv. p. 729; Diod. Sic., xvii. 70); but it still continued to be a place of considerable importance after his time. (Diod. Sic., xix. 22.) We read of an attempt by Antiochus Epiphanes to plunder it, which did not succeed. (2 Mac., ix. 1, 2.) Persepolis was situated in an extensive plain, near the union of the Araxes (*Bendmir*) and Cyrus (*Kur*). The situation appears to have been very healthy and favourable to longevity. The ruins of Persepolis, which are usually called by the inhabitants *Tehil-Minar*, that is, 'The Forty Pillars,' are described at great length in Sir R. K. Porter's 'Travels.'

PERSHORE, Worcestershire, a market-town, and the seat of a Poor-Law Union, is situated on the right bank of the river Avon, in 52° 7'

N. lat., 2° 4' W. long., distant 10 miles S.E. from Worcester, and 102 miles W.N.W. from London. The population of the town of Pershore in 1851 was 2717. The livings are in the archdeaconry and diocese of Worcester. Pershore Poor-Law Union contains 39 parishes and townships, with an area of 52,269 acres, and a population in 1851 of 13,553.

The town of Pershore is well built and well paved, and is lighted with gas. There are two churches—St. Andrew's, a small ancient structure; and the church of Holy Cross, which is a noble remnant of an abbey church. The lofty square tower and transept of Holy Cross are Norman; the chancel, which is now used as the church, is early English. The Baptists, Wesleyan Methodists, and Mormons have places of worship. There are National and Infant schools, and a mechanics institute. A county court is held. Tuesday is the market-day. The principal fair, at which many horses are sold, is held on the 26th of June.

PERSIA, or PERSIS, called in the Old Testament Paras, and by the Arabic and Persian writers Fars, or Farsistan, is used in two significations: first, it is applied to the country originally inhabited by the Persians; and, secondly, to the various countries in Asia included in the Persian empire founded by Cyrus, which extended from the Mediterranean to the Indus, and from the Black Sea and the Caspian to the Persian Gulf and the Indian Ocean.

Persis proper was bounded N. and N.W. by Media, from which it was separated by the mountain range known to the ancients under the name of Paracothras; S. by the Persian Gulf; E. by Carmania; and W. by Susiana, from which it was separated by rugged and inaccessible mountains. The country included within these limits is, according to Chardin's estimate, as large as France. The southern part of it near the sea-coast is a sandy plain, almost uninhabitable on account of the heat and the pestilential winds which blow from the desert of Carmania; but at some distance from the coast the ground rises, and the interior of the country towards the north is intersected by numerous mountain ranges. The soil upon these mountains is very dry and barren, and though there are some fertile valleys among them, they are generally fit only for the residence of nomadic shepherds. This part of Persia was the original seat of the conquerors of Asia, where they were inured to hardship and privation. In the inner part of the country however there are many well-watered and fertile plains, in the largest of which Persepolis is situated.

The Persians were divided into several tribes, of which the principal were the Pasargadae, Maraphii, and Maspai, and of these the Pasargadae were the noblest, to the chief clan of which, called the Achamenides, the royal family of Persia belonged. In addition to these tribes, Herodotus mentions the Panthialaei, Derousiaei, and Germanii, as agricultural tribes; and the Dai, Mardi, Dropici, and Sagartii, as nomadic tribes.

Herodotus says (vii. 61) that the Persians were originally called Artai, which word probably contains the same root as Arii, the original name of the Medes (Herod. vii. 62); and Arya ('excellent, honourable'), the word by which the followers of the Brahmanic religion are designated in Sanscrit. The same root occurs in Aria and Ariana, from the latter of which the modern Persian name Iran seems to be derived. [ARIANA.]

The only places of importance in Persis were PERSEPOLIS and PASARGADE, of which an account is given in separate articles. (Strabo, Ptolemy, Pliny, Herodotus.)

PERSIA, called IRAN by the natives, lies between 25° and 40° N. lat., 44° and 70° E. long., constituting an elevated table-land, surrounded by mountain ranges, which mark the edges of the table-land, and separate it either from the sea, or from the low countries which inclose it on the east, north, and west. On the south the table-land, or rather the ranges which inclose it, come close to the Persian Gulf and the Indian Sea. On the east of the table-land are the extensive plains which are watered by the river Sind, or Indus; and on the north the still more extensive plain which surrounds the Lake of Aral, and extends to the eastern shores of the Caspian Sea. These desert plains are known to the natives by the name of Turan. A narrow and very low tract of land separates Iran from the Caspian Sea; a more elevated and rather undulating plain divides it from the high range of Caucasus. Along the mountain chains which form its western border are the great plains drained by the Tigris and Euphrates. Thus the table-land of Iran is surrounded on all sides by lower countries, but it is connected with the mountain ranges of Eastern Asia and Asia Minor by two chains. The chain which unites it with the Himalaya and Kuen-Luen mountains, in Eastern Asia, lies between 33° and 37° N. lat., 68° and 74° E. long., and is known by the name of Hindu-Koosh. At the most north-western extremity of Iran is Mount Ararat. From this high pinnacle a mountain chain runs westward, and unites the table-land with the mountains of Asia Minor. This chain forms the Armenian Mountains.

The surface of the table-land of Iran, with the mountain ranges inclosing it, according to a very rough estimate, may occupy an area of between 1,000,000 and 1,200,000 square miles, or about one-twelfth of the surface of Asia. The table-land is generally level, interspersed with low and rocky ridges of comparatively small extent, which are like islands or oases in the sandy sea which surrounds them. The level tracts, which occupy an immense space, and lie contiguous to one another, are either covered with loose sand or sand impregnated

with salt, but both these kinds of sand are nearly destitute of vegetation. Along the interior base of the mountain ranges which extend along the edges of the table-land there are large tracts, the soil of which is generally fertile wherever there are means of irrigating the fields. However even in these tracts there are numerous ridges of rocks, which render cultivation always difficult, and frequently impossible.

This extensive country is at present divided into three independent states. The western half of it constitutes the present kingdom of Persia, or Iran; and the eastern is divided between Afghanistan and Beloochistan. Of the two last-mentioned countries an account is found under their respective heads.

The modern kingdom of Persia extends between 25° and 40° N. lat., and from 44° to 62° 30' E. long., and borders on the east on Afghanistan and Beloochistan. The plains along the northern boundary are inhabited by several tribes of nomadic Turkomans as far west as the shores of the Caspian Sea, which constitutes the boundary-line on the north as far as 49° E. long., and washes it as far north as 38° 40' N. lat., where the line begins which separates Persia from Russia. This line commences on the shores of the Caspian Sea, at the mouth of the Astarah River, and runs along its course to its junction with the Kala Kushi: it then follows the course of this river to its source in the Massila Mountains. This range (which extends to the west of north) constitutes, as far as 39° N. lat., the boundary-line, which, farther north, passes to the Bala-Rud River, and thence to the Aras River. The last-mentioned river separates Persia from Russia as far as the base of Mount Ararat, which is situated at the junction of the three empires of Russia, Turkey, and Persia. The western boundary-line of Persia passes over the mountains of Kurdistan, which inclose the table-land of Iran on the west. North of 35° N. lat. the greater part of these mountain ranges are subject to Turkey, the boundary-line between Turkey and Persia passing between the lakes of Van and Urmia, or Urumiyeh; but south of that parallel the whole of the mountain system is now included within the territories of Persia, which south of 33° N. lat. extend to the banks of the Tigris and Shat-el-Arab. According to a rough estimate the surface of Persia is 500,000 square miles, or considerably more than double the area of France. It includes the western half of the table-land of Iran, and also the low narrow tract which separates the table-land from the Caspian Sea, as well as a small portion of the low plain which lies to the west of the table-land on the banks of the Tigris. The population is variously estimated at from 8,000,000 to 15,000,000.

Surface and Soil.—The mountain range at the north-east corner of Persia is called the Mountains of Khorasan, which is a continuation of the Western Hindu-Koosh, the ancient Paropamisus, otherwise called the Ghor Mountains in the north of Afghanistan. The range is in some places 200 miles wide, and has peaks from 4000 to 5000 feet above the sea-level; it is crossed by numerous minor ridges; the valleys of which are drained by many rivers. Where the mountain ranges approach the Caspian Sea and turn to the west, between 55° and 56° E. long., they probably occupy less than 60 miles in width, and have few high summits; but westward of this point commences the portion called the Elburz Mountains, which have many lofty summits, of which Mount Demavend (a once active volcano) is 14,600 feet high; and several of the peaks are covered with snow during the greater part of the year. The tract of country which extends along the southern side of the Elburz Mountains, and between it and the desert in the interior of Iran, may vary between 20 and 30 miles in width. It is for the most part stony and sterile; but in the valleys watered by the rivers Shah-Rud and Sefid-Rud it is fertile. The Elburz Mountains do not descend with a steep declivity towards the north, but are skirted by a hilly tract varying from 20 to 30 miles in width, furrowed by many valleys, in which there is much fine timber, and which are cultivated to a considerable extent. The *Shah-Rud* is composed of two principal head streams, which flow through fertile longitudinal valleys between the mountains, and unite a little west of 50° E. long., whence the united stream runs west-north-west to the plain of Tarom, where near Menjil it meets the Sefid-Rud coming from the north-west. The *Sefid-Rud* carries down the waters that flow from the high undulating and in parts mountainous country to the east of the basin of Lake Urmia, and also a part of the drainage of the belt of highlands that skirt the Shahu or Zagros Mountains in Persian Kurdistan. From the Sehend Mountains to the south of the plain of Tabriz the watershed between the Lake of Urumiyeh and the Sefid-Rud runs south-south-east, the more southern part, between 36° and 37° N. lat., being called the Kibleh Mountains, which throw off several ranges of hills eastward and north-eastward. The highest of these secondary ranges are the Kafilan-Koh, which separates the Miana River from the Kizil-Uzen, the largest of the feeders of the Sefid-Rud. The *Kizil-Uzen* (the Turkish name for the Sefid-Rud, both meaning 'white river') rises on the eastern declivity of the Zagros, near the Naukhan Pass, and runs in a very winding and impetuous course towards the north-east to near 36° 20' N. lat., 48° E. long., where it sweeps round to the north-west near Mount Demirli, and then north, along the eastern base of the Kafilan-Koh. In this part of its course the Kizil-Uzen runs between deep precipitous banks, and, after receiving the Zenjan River (which flows north-west from the plain of Sultaniyeh), on its right bank it unites with the Miana River near the

town of Miana, about 37° 25' N. lat., 47° 40' E. long. The united stream, here called the Sefid-Rud, immediately sweeps round to the north-east, and then to the south-east, in which direction it flows for about 100 miles through the plain of Tarom, the upper part of which is very narrow, the high mountains, seamed by ravines and narrow valleys, reaching down on both sides nearly to the banks of the river, but wider at the lower extremity. The territory on the left bank of the river, along the southern declivity of the Massula Mountains, is also called the Pushti-Kuh. The plain of Tarom (which is only about 500 feet high above the Caspian) produces excellent cotton and abundance of fruits. At its eastern extremity the Sefid-Rud receives the Shah-Rud, and the river then flows through the Rudbar Pass, between the Elburz and the Massula Mountains, into the plain of Ghilan, and enters the Caspian Sea a little east of 50° E. long. and about 30 miles E. from the town of Resht. The Massula Mountains, which run north-north-west from the Rudbar Pass and nearly parallel to the Caspian, are from 6000 to 7000 feet high above the sea, and about 2000 feet above the table-land. To the west of it, along the right bank of the Sefid-Rud, at a distance of from 6 to 30 miles, is another higher range, one of the passes in which, called Ak-Geduk, is about 8000 feet above the level of the sea. This high range bounds the table-land of Media in the north. It is covered with snow for many months in the year.

The narrow tract of level ground which surrounds the southern extremity of the Caspian Sea, and goes under the name of the Plain of Ghilan and Mazandaran, extends from the mouth of the river Gourgan, which falls into the most south-eastern angle of the sea, to the mouth of the river Astarah. This tract considerably exceeds 300 miles in length; the width varies from 5 to 30 miles; the level is very little above that of the Caspian Sea. In climate and productions this region bears an extraordinary resemblance to intertropical countries. The swampy tracts along the shores of the Caspian Sea are overgrown with saline plants and canes. In the interior are extensive forests, mulberry plantations, rice-fields, vineyards, orchards, orange-ries, and sugar and cotton plantations.

The western portion of the plain of Ghilan separates the Caspian Sea from the table-land of Azerbijan, which constitutes the most northern portion of the great table-land of Iran, and lies between 36° and 40° N. lat., 44° and 49° E. long. The general elevation of this table-land is 4500 feet above the sea-level. The table-land is bounded on the west by the numerous ranges of the Kurdistan Mountains, and by the Massula Mountains on the east; it is also diversified with numerous cross ranges, one of which runs nearly eastward from the Sehend Mountains to the north of the great bend of the Sefid-Rud below Miana, along the edge of the basins of Lake Urumiyeh, the Sefid-Rud, and the Aras. To the north of this range the Aji flows westward from Mount Sevilan, a lofty summit 12,000 feet high, to the lake, crossing the plain of Tabris a little to the north of that city. Mount Sevilan, which is the culminating point of a more northerly range, is also the source of the Derahi, or Kara-Su, which flows past Ardebil and thence northward to join the Araxes.

The surface of the table-land is in parts hilly, but generally the hills do not rise into mountains; between 36° 30' and 37° 30' N. lat., several high ranges occur, as the mountains of Kibleh and the Kafilan-Koh, before mentioned, which perhaps rise to 2000 feet above their base. The levels between these ranges are not in general extensive enough to be called plains, though in some parts they are several miles wide. But farther north there are several extensive plains, among which that surrounding the Lake of Urumiyeh is by far the largest. Though in several places traversed by narrow and low ranges of hills, which terminate at a small distance from the shores of the lake, the plain extends in general from 20 to 30 miles from it, and at Tabris even 50 miles. From the hills and mountains which inclose the basin of the lake great numbers of perennial streams descend, and are much used for irrigation. The rice-fields are extensive, and produce rich crops. The meadows are also large, and horses, buffaloes, cows, and sheep are abundant on the pasture-grounds. Orchards, which are large and very numerous in this plain, yield abundance of peaches, nectarines, apricots, plums of all sorts, cherries, pears, apples, and grapes. There are also plantations of poplar and chinarr, but the mountains and hills are generally devoid of wood. In the other plains, which are much less in extent, and have not the advantage of abundant water, the cultivation is limited, and they are chiefly used as pasture-grounds by the nomadic tribes. The climate of this table-land is cold in winter, but very temperate in summer. During several of the winter months it is covered with snow, and the cold is sometimes very intense, except on the plain around Lake Urumiyeh. The royal family of Persia abandon the town of Teheran in summer, and retire to Sultaniyeh, in the southern districts of the table-land.

The mountains of Kurdistan occupy a broad belt of country along the western edge of the table-land of Iran. Mount Ararat may be considered as standing at the northern extremity of the mountains of Kurdistan. [ARARAT.] From its southern base mountains branch off to the south and south-west, which inclose the Lake of Van; and the mountain region then extends southward, with a width varying from 70 to 180 miles, till its termination in the mountains of Farsistan, about 30° N. lat. The northern portion of this extensive mountain region is nominally subject to the Turkish emperor; but the nomadic

tribes which inhabit it are nearly independent under their hereditary chiefs. The mountain system consists of several parallel ridges, between which are many narrow deep valleys, and a few plains fitted for pasturage. The declivities are wooded with oak, which, near the base of the mountains, grows to a large tree, but higher up is stunted.

The ridges, frequently four, five, or even six in number, run in the direction of the whole range, and are frequently united by transverse ridges. But there are also some valleys in the southern part of the system which run across the ranges, as is evident from the courses of the rivers; for nearly all those rivers which join the Tigris south of 30° N. lat., and traverse this mountain region, do not rise within the range, but to the east of it, on the plains of the table-land of Iran, such as the Great Zab, the Diyalah, and the Kerkhah. Several summits and ridges attain a great elevation, being for nine or ten months covered with snow; two summits of the Kurdistan Mountains rise above the snow-line: one on the most western ridge called Kebir-Koh, near 33° 15' N. lat., and the other in the ridge, called Koh-Mungasht, near 31° 25' N. lat.

That part of the great plain traversed by the Euphrates and Tigris, which belongs to Persia, lies between the mountains of Kurdistan, and the banks of the Tigris and Shat-el-Arab. It is about 100 miles long, and, on the average, 30 miles wide. The lower portion of it, which lies along the great river, and comprehends nearly one-half of the country, is swampy and uninhabited. About fifteen miles from the banks of the river, the country is considerably higher, but as the soil is composed partly of sand and partly of a hard clay, it cannot be cultivated, except along the banks of the rivers, and even there cultivation is very limited. The greater part of the country is a waste, which does not yield pasture, except for camels. This more elevated tract is called Chad, or Kaaban.

The country which lies east of the Kurdistan Mountains, and between them and the Kuweer, or Salt Desert, belongs to the table-land of Iran. Its general elevation above the sea in the southern districts exceeds 4000 feet, and rises in some parts to 6000 feet; but north of Ispahan it sinks down to 2500 feet, and in some places even lower. It is a plain traversed by numerous ridges of rocky hills, which generally run from west to east, and sink gradually into the desert farther east. Few of these hills are more than 1000 feet above their base, and generally not half so much. The valleys are open and wide, in some parts exceeding ten or fifteen miles in width; they are also very long. Here too, as in most places on the table-land of Iran, cultivation is limited for want of water. As the eastern ridge of the Kurdistan Mountains does not rise high enough to be covered with snow for many months, the rivers which descend from them are scarcely provided with water during a great part of the year; and the little that they furnish is absorbed in irrigation. The valleys are consequently, for the most part, uncultivated, except in the vicinity of the villages.

The mountain region of Farsistan and Kerman occupies the whole of Persia south of 30° N. lat., from the mouth of the river Tab to Cape Jask (from 50° to 58° E. long.), a distance of nearly 500 miles in length, and nearly 200 miles in average width. On the south it is washed by the Persian Gulf, and on the north it borders on the desert of Kerman. Along the shores of the gulf is a low and sandy tract, varying in width from 20 to 30 miles, the soil of which is impregnated with salt, and produces little else than dates. This district, which has a very warm climate, is called Dushtistan or Gurmair, that is, 'warm region.' At the back of this low tract the country rises in steep and bare rocks to the height of mountains, and constitutes an elevated region which extends more than 100 miles inland, where it stretches out in a plain traversed by low rocky ridges running east and west. About 50 miles from the sea, the lowest part of the mountainous tract is about 2500 feet above the sea-level, but where it approaches the plain it attains the height of 4000 feet. This mountainous region is called Sirhud (the cold country), in opposition to Gurmair. In its northern districts, where it is connected with the mountains of Kurdistan, the rocky ridges, which traverse the surface longitudinally from west to east, rise to 7000 or 8000 feet, and in these parts they are partially wooded. But south of 29° N. lat. they do not appear to attain so great an elevation, rising probably only from 1000 to 2000 feet above their base, which in many places cannot attain a great elevation above the sea, as the valleys inclosed by the ridges produce the date. The ridges, though generally of inconsiderable width, are numerous, and the valleys are narrow, except towards the north, where they are from 15 to 20 miles across. The mountains are barren and destitute of vegetation, but the valleys are rich in fruits, and even grain, where they can be irrigated. The plain which extends along the northern side of the mountain region, and which is from 60 to 100 miles in width, has a soil strongly impregnated with salt, and contains several smaller salt lakes, besides the great salt lake of Bakhtegan. It would form a portion of the Great Desert, if it were not divided from it by a series of oases, which stretch east and west through it, between 29° and 30° N. lat., and which are inclosed on the north and south by two low ridges of rocky hills. This narrow fertile tract, called the Nurmanshir, produces some grain, but it is particularly rich in several kinds of fruit, which attain great perfection.

The central desert of Persia, included between these several mountain ranges, extends from 40 to 350 miles in width from north to

south; and in length it extends through 9 degrees of longitude. The nature of this desert varies in different places. In some the surface is dry, and even produces a few of those plants which require a salt soil; in others we find a crackling crust of earth, covered only with a saline efflorescence. A considerable portion is marshy, and in certain spots sand predominates. In several parts of it rocks rise abruptly, though in general only to a moderate elevation. These rocks, usually short ridges, inclose small oases or fertile spots where water and herbage are found, and which are inhabited. The largest of these oases form a series across the desert between Herat and Ispahan, extending from the former westward to Tubbus, from Tubbus southward to Yazd, and thence westward to Ispahan. The towns of Tubbus and Yazd are situated in the most extensive of these oases. The smaller oases transversed by the road between these towns are 20 to 30 miles apart.

Rivers and Lakes.—The table-land of Iran, as well as the mountain regions which surround it on the north and south, is very sparingly watered. The southern mountain ranges are too bare and also too low to attract sufficient moisture to form perennial streams, except in a few places. The northern mountains give rise to a much greater number of watercourses; but as soon as they enter the plain, and sometimes before, the small volume of water which they bring down during the greater part of the year is absorbed in irrigation, and only a few of these streams reach the desert, where they are lost in the dry and thirsty soil. Only those parts of Persia which are included in the plains of Ghilan and Mazanderan, in the table-land of Azerbaijan, and in the mountains of Kurdistan, are well watered. The rivers of Ghilan and Mazanderan have a short course, but they are usually navigable for some miles from their mouth, where the woods on their banks do not form an impediment. The most considerable river in the table-land of Azerbaijan is the Sefid-Rud, or White River, the ancient Amardus before mentioned. The whole course of the Sefid-Rud may be about 350 miles. On the table-land the bed is generally many hundred feet, and sometimes a thousand feet, below the adjacent country. Thus it cannot be used for irrigation, and though the banks are less elevated in the plain above the pass of Rudbar, still the waters can nowhere be used to fertilise the country. In Ghilan the current is not rapid, but the river is not navigated, there being no place of any importance on its banks, which are very low and swampy. Two rivers, each running about 100 miles, fall into the lake of Urumiyeh: the Aji, already noticed, and the Jaghātu, or Jeghetu. This last mentioned river is formed by two head-streams, one of which flows north from the Naukhan Pass in the Zagros Mountains, and the other the Saruk, which rises in the angle between the Kibleh and the Kaflian mountains, and receives numerous feeders from the barren undulating downs that surround the Takhti-Soleiman, the site of the ancient Ecbatana. The Saruk flows near, not on, the boundary of Azerbaijan and Persian Kurdistan. Its course is generally south-west, in a narrow rocky valley between high banks, broken at intervals by huge ravines which intersect the country in all directions. From the point of confluence, which is a few miles west of the great ravine of Karafen, celebrated for its caves, the scenes of ancient Mithraic worship, the Jaghātu continues among the mountains for about twenty miles to Kiz-Kopri; the valley then expands, and at length opens out into the great plain of Mirjandab, on the south-east of Lake Urumiyeh. This plain is traversed a little farther west by the Tatau, which flows northward from the great western mountains through the districts of Sardasht and the Mikri Kurda, and enters the lake near its south-eastern point. In the plains about the lake the rivers named are extensively used to irrigate the valleys through which they flow, and also the plain itself. The rivers which drain the mountains of Kurdistan and its numerous valleys are not navigable within the mountains, as their course is frequently broken by rapids and cataracts; and where they enter the plain they are not navigated, the adjacent country being nearly uninhabited. Three of these rivers run between 200 and 400 miles: the Diyálah, which joins the Tigris below Baghdad; the Kerkhab, which falls into the Shat-el-Arab a few miles below Kornah; and the Karun, which passes Shuster, and after receiving the Dizful River (ancient Coprates) near Ahwaz, flows into the Shat-el-Arab by means of an artificial canal called Haffar, and also by a direct mouth into the sea. The Karun is the ancient Euleus. Below its junction with the Coprates, it was also called *Pasitigris*. The Karun is a deep river, easily navigable. Lieutenant Selby ascended it a few years ago in a steamer to Shuster. The Kerkhab is the ancient Choaspes: at the point of its nearest approach to the Dizful River are the ruins of the ancient city of Susa. These rivers are more fully noticed in the article on the *Pasallic* of BAGHDAD, where also the course of the Jerahi is traced.

As a great part of the soil of Persia is impregnated with salt, the few lakes which occur are salt also, except in Ghilan and Mazanderan, where there are several small lakes of fresh-water. The most considerable of the lakes of Persia is that of Urumiyeh, or Shabee (called *Spanta* by Strabo), which is about 90 miles long and from 20 to 30 miles wide. The greatest depth of the water is 4 fathoms, and the average depth about 2 fathoms; but the shores shelve so gradually that this depth is rarely attained within two miles of the land. The water is much saltier than that of the ocean. It contains no fish, but the smaller classes of zoophytes are found in considerable quantity.

The lake receives a great number of rivers, but it has no outlet. The mountain region of Farsistan contains the salt lake of BAKHREGAN.

Climate.—The climate of the low plain of Ghilan and Mazanderan, which forms part of the great depression occupied by the Caspian, sheltered by the Masaula and the Elburz mountains from the cold winds of the table-land, has a temperature resembling that of the tropics, with a dry and rainy season. During the latter a great part of the plain is inundated. The climate of Gurmair is distinguished by its great heat and dryness, and is therefore the country most suitable to the growth of date-trees, which only bear eatable fruit where these two circumstances concur. In the interior of the table-land the climate is very hot in summer but cold in winter. In winter a good deal of snow falls. The quantity of snow which falls on and near the mountain regions is much greater than that which falls in the centre of the table-land. Winter lasts on the table-land near Teheran till April, during which month cold north winds prevail. The transition from cold to heat about the end of April is very rapid.

Productions.—Agriculture is well understood and carefully attended to, as is evident from the means of irrigation employed, and especially from the subterraneous aqueducts. But extensive tracts, which were formerly under cultivation, are now a desert, or serve only as pasture-ground, owing to the predatory incursions of the neighbouring wandering tribes. In other tracts which are cultivable grain is not raised, but they are kept in their natural state as pasture-ground for the Iliyats, or wandering tribes who live within the boundaries of the empire.

Rice, wheat, and barley are the most usual crops, but there are also millet, maize, tel, or sesamum, dal (a species of vetch), and several kinds of beans and peas; cotton, indigo, sugar, tobacco, and madder are raised in many places, but especially in Mazanderan. The fruit-trees are managed with great care and skill, and fruit furnishes a considerable article of internal trade. These fruits comprise dates, apricots, peaches, nectarines, plums, apples, pears, quinces, figs, pomegranates, mulberries, currants, cherries, almonds, walnuts, and pistachio-nuts. The vine plantations are very extensive, though wine is made only in a few places by Christians. Melons are distinguished by their size and flavour. Common culinary vegetables are grown abundantly. One of the most remarkable vegetable productions of Persia is the plant from which assafetida is obtained. Opium poppies and saffron are extensively cultivated.

The domestic animals are camels, horses, asses, mules, black cattle, buffaloes, sheep, and goats. The Persian horses are noted for their beauty, strength, and speed. Asses are numerous, and some of them of superior size and description. Mules are used for the transport of goods more than any other animals; they are very strong, and usually carry about 3 cwt. The black cattle of the plain of Mazanderan are distinguished by size and beauty; they have the Indian hump. Sheep are very numerous in all the parts possessed by the nomadic tribes: they are principally of the fat-tailed kind.

Among the wild animals lions, leopards, cheetahs, tiger-cats, lynxes, bears, hyenas, wolves, jackals, foxes, antelopes, and several sorts of deer are found. The wild ass is found in many of the rocky recesses of the country, but particularly in the deserts of Khorasan and the extensive valleys of Farsistan and Irak Ajemi. Wild boars, porcupines, and hares are common. Among the most remarkable wild animals are the mountain sheep, and the mountain goat. Among birds, which are not numerous, except in a few places, are pheasants, bustards, partridges, desert-partridges, herons, wild ducks, and pelicans. Blackbirds, thrushes, and nightingales are frequently heard in the underwoods of Ghilan and Mazanderan, and in the thickets of roses which embellish every garden. Fish abounds only in the Persian Gulf and the Caspian Sea. Sturgeons and sterlets in great numbers ascend the small rivers which fall into the Caspian Sea, though not in such shoals as in the Volga. As the Persians themselves are not fond of fish, they have permitted the Russian fishermen to establish themselves near the mouths of these rivers, where they prepare caviar and isinglass, but the body of the fish is thrown away. Locusts frequently lay waste extensive tracts of country. Bees are common in many places, and much honey is collected. The silkworm furnishes the principal article of commerce in the plains of Ghilan and Mazanderan, but it is also reared in the country round the Lake Urumiyeh, and in several other places.

Iron, lead, copper, antimony, rock-salt, alum, bitumen, and naphtha are mentioned among the mineral productions of Persia.

Inhabitants.—The population of Persia consists of a great number of nations, who speak different languages; but all of them belong to the Caucasian race. It is said that one-fourth of the population consists of nomadic tribes. That portion of the population which has fixed abodes consists chiefly of Persians, Parsees, Armenians, Arabs. The Persians, who are distinguished for the politeness of their manners, constitute the bulk of the population, and are merchants, agriculturists, and manufacturers. The number of the Parsees is small; and they appear to be numerous only in the oases of Yazd. Their language differs considerably from that of the Persians; they adhere to the religion of Zoroaster, as it is contained in the Zend Avesta, and adore fire as the symbol of the divinity. They occupy themselves mostly with agriculture and the raising of fruits. The Armenians live in all the great towns, where they are merchants: they also cultivate the

ground, and are particularly numerous in the western districts of the table-land of Azerbaijan, where they exclusively occupy whole villages. Arabians form the bulk of the population in Dushtistan or Gurmair, where they gain their livelihood as fishermen, seamen, planters of date-trees, and merchants. In the western part of the country about Lake Urumiyeh and the valleys of the Zagros there are some Nestorian Christians, and also some Catholics.

The wandering tribes of Persia are comprehended under the general term *Iliyats*, and are found in every part of Persia; but many of them have become inhabitants of cities and villages. A considerable number of them live all the year round in tents, in the winter keeping to the plains, and in summer seeking the pasture of the mountains. As is the case with all nomads, their wealth consists in cattle. They breed camels and horses for sale, and their sheep yield milk, which is made into liquid butter, and sold throughout the country. In the summer they ascend to high mountains, where they find abundant pasture, and in the winter they keep to tracts which enjoy a warmer climate. They pay a tax to government, which is collected by their own chiefs; and are obliged to furnish a certain number of soldiers to serve on foot and on horseback, for which service however the individuals are paid. Some of these tribes have the almost exclusive possession of large tracts of country. The most numerous of the nomads of Persia are the Lurs, who inhabit that portion of the mountains of Kurdistan which lies south of 34° N. lat., and comprehends the province of Luristan, together with the mountainous part of Khuzistan. A small number of the Lurs and Bakhtiarijs have adopted a settled life, and their country contains towns and villages inhabited by persons who do not belong to these tribes. The language of the Lurs differs slightly from that of the Kurds. The mountains and plains to the west and south of Lake Urumiyeh are in possession chiefly of Kurdish clans, among whom many have adopted a settled or rather a half agricultural half nomadic life. The Kurds are also in possession of a large tract of the mountain region of Khorasan, on the northern border of the table-land of Iran. The character and habits of these people resemble the Kurds of Turkey and Armenia. [KURDISTAN; ARMENIA.]

To the south-east of the Kurds of Khorasan, between the towns of Mushed and Herat, there is a tribe of Arabs, which was transported to this country from Nejd by Shah Ismael, for the same purpose as the Kurds, namely, for the protection of the frontier. These Arabs retain their pastoral habits, and are almost all dwellers in the field. They are of the Sunni sect, and partly preserve their language, though they have changed their national costume.

Besides these tribes, which almost exclusively occupy large tracts of country, there are others mostly of Turkoman origin, which are dispersed over other parts, but constitute only a small portion of the population. Among them are the Lak, or Lek, who are dispersed throughout the country, but their principal seats are about Casvin, and in the provinces of Fars and Mazanderan; the Kajar, to which the present sovereign family belongs; the Afshars (from which tribe the famous Nadir Shah sprung), dispersed through Irak-Ajemi and Khorasan; the Shekagi and the Shah-seven, whose principal seats are in Azerbaijan. The two last mentioned tribes live mostly in tents: the others mostly live in towns. The Lek are by some said to be Kurds.

Political Divisions, Provinces, and Towns.—The provinces of Persia are twelve in number. Seven lie along the western boundary-line: Azerbaijan, Kurdistan, Luristan, and Khuzistan, along the border of the Turkish empire; and Farsistan, Laristan, and Kerman, along the shores of the Persian Gulf. The interior of Persia is occupied by the two large provinces of Irak-Ajemi and Khorasan; and along the shores of the Caspian Sea extend the provinces of Ghilan, Mazanderan, and Astrabad.

1. Azerbaijan, the ancient Atropaténé, is separated from Armenia by the Araxes on the north, by the Kizil-Uzen from the Irak-Ajemi; on the south and west it borders on Kurdistan and Turkey. The large salt lake of Urumiyeh is in this province. The differences of temperature are considerable; but the climate is healthy.

The most flourishing part of Azerbaijan is that along the northern and western border of the Lake of Urumiyeh, from Tabriz to the confines of Armenia. *Selmas* is now a town of about 2000 inhabitants, most of whom are Nestorian Christians. *DILMAN*. *Khoi* is described as one of the finest and best-built towns of Persia; its walls are in good repair, the streets are regular, shaded with avenues of trees, and the ceilings of many of the houses are tastefully painted. The town of *Urumiyeh* is situated on the south-west side of the lake to which it gives its name: its population is 12,000. *Maragha*, a town of about 15,000 inhabitants, is situated in a low valley; it is celebrated in Oriental geography for the observatory of the celebrated astronomer Nasir-Eddin, the ruins of which still exist.

The principal town of Azerbaijan is *Tabriz*, situated in 46° 8' N. lat., 38° 4' E. long. The number of its inhabitants, which was at one time much greater, is at present about 30,000. Its situation, near the confines of the Persian and Turkish dominions, sufficiently accounts for its present desolated condition, as the town has been subject to frequent conquests and devastations. It has, moreover, repeatedly and most severely suffered from earthquakes. *Tabriz*, *Khoi*, and several other towns in Azerbaijan were greatly injured by earthquakes in September 1854. *Miana* is situated in a long and winding valley

on the western side of the Kaslian-Koh. It was nearly ruined by the Russians in their last invasion of Persia, and is now a poor village. The ruins called *Kalah-Zohak*, are situated on a precipitous rock near the river Karangoo. *Ardibil* is situated at the eastern descent of the Sevelian Mountains. Towards the north of the town there is a fertile plain with excellent pastures.

2. Kurdistan comprehends the mountain region of the Kurdistan range, about the sources of the rivers Kizil-Uzen, Diyala, and Kerkhah; it is separated from the Paahalic of Baghdad by the eastern range of the Kurdistan mountains, called the Shahu Mountains, and farther south chiefly by the course of the river Shirwan, a branch of the Diyala. It is mainly separated from Luristan by the river Kerkhah. It is divided into two parts, Ardelan in the north-east, and Kermanshah in the south-west. The first part, comprehending the country surrounding the upper branches of the Sefid-Rud, which is about one-third of the province, consists of a succession of well-wooded mountains and narrow valleys, and has excellent pasture-grounds. It contains *Schmah*, the residence of a Kurdish chief, who lives in a palace built on a hill in the middle of the town: population, from 4000 to 5000 families, among which 200 are Jews, and a small number of Chaldean Catholics. Kermanshah also is principally mountainous, but there are fine wide open valleys along the rivers Shirwan and Kerkhah, and pretty extensive plains near the outer edges of the mountain region; both the valleys and plains are generally well cultivated. *Kermanshah*, the capital, a flourishing town, is situated in the southern extremity of a fine plain, through the centre of which runs the Kara-Su, an affluent of the Kerkhah. It contains about 12,000 houses, and has many public buildings. It carries on a considerable commerce, being on the great caravan-road which passes across the mountains from Baghdad to Hamadan, Ispahan, and Teheran. This road seems always to have been a great thoroughfare, and ruins of great antiquity occur along it. About six miles from Kermanshah, on the face of the mountains which inclose the plain on the north, are excavations and sculptures of great extent, called *Takt-i-Bostan*. Where this range of mountains terminates on the east, on the banks of the river Kerkhah, are the sculptures of *Basittoo*. About 30 miles farther east, also near the road, there are extensive ruins, among which those of a temple of Artemis are the best preserved. They occur near a village called *Kengawar*, which is about 30 miles W.S.W. from Hamadan. [EGBATANA.] South of Hamadan is Mount Elwend.

3. Luristan, which lies between the Kerkhah and the Dizful, an affluent of the Karun, is entirely occupied by mountains and narrow valleys, except some plains of moderate extent near the outer ridges of the mountain region. These plains alone are under cultivation, the remainder serving as pasture-grounds to the different tribes of Lurs who inhabit it. There is no town in this province except *Khorram-abad*, which stands in a fertile and tolerably extensive plain, 90 miles S. from Hamadan, on a feeder of the Kerkhah. It contains about 1000 houses, and is built on the south-western face of a steep rock, on which a strong fortress and palace are erected.

4. Khuzistan comprehends the southern part of the mountains of Kurdistan and that part of the plain of the Tigris which belongs to Persia. It is therefore naturally divided into two portions. The plain, which is in possession of some Arab tribes, contains good pasturage in the northern and western districts, and here the wandering Beduins pitch their tents. But the southern and eastern portion of it is a sandy desert, occasionally intersected by extensive morasses, and cultivated only in some places on the banks of the rivers, where rice, some wheat and barley, and dates are raised. In this part of the plain is the town of *Dorak*, or more properly *Felahi*, on the banks of two branches of the river *Jerahi*. It is a large place, the walls of which are two miles in circumference; but notwithstanding this, the houses are few, as the majority of the people live in the suburbs under the shade of the date-trees. This town is celebrated for its manufacture of Arabian cloaks, which are exported to all parts of Persia and Arabia.

The mountainous part of the country contains several plains and valleys of great extent, which are fertile, but only partially cultivated, among which the valley of *Ram Hormuz*, which is 40 miles long and from 6 to 8 miles wide, is distinguished by its soil and picturesque beauty. Between the higher ranges of the mountains and the level plain runs a hilly tract several miles wide, which contains a large portion of cultivable land, though at present only the borders of the rivers are under cultivation. This is however the most fertile portion of the province. The high mountain-ranges in the eastern districts of the province are in possession of Lurish tribes, which have almost entirely settled in villages, and cultivate the ground. Tobacco is extensively grown and exported. The present capital of the province is *Dizful*, on the river of the same name, a considerable place, with 20,000 inhabitants, and a fine bridge over the river. About 10 miles S.W. from this town are immense heaps of ruins, on both sides of the river *Kerkhah*, which mark the site of *Susa*. [SUSA.]

The second town of the province, and formerly the capital, is *Sawster*, which stands not far from the high mountain-ranges on the river *Karun*. The houses are good, being principally built of stone, but the streets are narrow and dirty. There is a considerable manufacture of woollen stuffs. The population amounts to 10,000. The town is supplied with water by extensive hydraulic works. The mountains east

of Shuster are traversed by roads leading to Irak Ajemi and Farsistan; and though they are now little frequented, the extensive ruins which exist in the valleys and plains along these lines of road show that large towns were once situated on them.

5. Farsistan, or Fars, the ancient Persia, comprehends nearly one-half of the Dushtistan, a low, hot, sandy strip which extends along the shores of the Persian Gulf, the northern portion of the mountain-region of Farsistan and Kerman, and the hilly plain which extends north-eastward to the lake of Bakhtegan and the Great Desert. The mountain-ranges, which in this part separate the table-land of Iran from the Persian Gulf, are hardly more than 30 or 40 miles wide, but exceedingly steep towards the sea. They consist of three or four rocky ridges, which can only be crossed by narrow roads over rugged mountain-passes. The most frequented road leads from the harbour of Bushire to the towns of Kazerun and Shiraz. The less mountainous portion of the table-land, which lies farther south, contains several salt lakes. Though there are many well-cultivated districts in this province, a great portion of it is nearly desert, especially towards the north. The southern part of the coast, east of Ras Berdistan, is occupied by Arabs, who acknowledge the authority of the Imam of Muscat; and in the northern districts there are some tribes of Kurds. In that part of the coast which is subject to the Imam are the town and harbour of *Congoon*, near Cape Berdistan. The town is stated to have 6000 inhabitants, and some trade is carried on with Bassora, Muscat, and the different towns on the Persian and Arabian coasts. Near it is an excellent roadstead, where a frigate may lie at anchor in safety. The principal commercial place is Bushire, or Aboushehr. [ABOUSHEHR.] The principal towns in the interior, from west to east, are Behaban, Kazerun, Shiraz, Firoze-Abad, and Darabgherd. *Behaban*, near the boundary-line of Khuzistan, is situated on a very mountainous tract, but in an extensive and highly-cultivated plain: it is about three miles in circumference, and contains nearly 10,000 inhabitants. *Kazerun*, in a valley 30 miles long and 7 or 8 miles wide, was once a considerable place, but has been depopulated by civil wars. It contains several thousand inhabitants, and has cotton manufactures. *Shiraz*, the capital of the province, and for some time the residence of the kings of Persia, stands in a fertile plain, surrounded by extensive gardens. It is six miles in circumference, but a great part of the area is covered with ruins. The houses are generally small, and the streets narrow and filthy. None of the edifices are remarkable for antiquity or beauty, except the great Bazar, or Bazar-i-Wukell, which is a magnificent arcade nearly half a mile long and 40 feet wide. It affords accommodation to several hundred shopkeepers. This town carries on a considerable trade with Yezd, Isphahan, and Bushire. Through Bushire it receives goods brought from India and Europe, which it exports to Yezd and Isphahan, receiving in return the manufactures of those two cities. The population is variously stated at 40,000 and 60,000. This place contains several manufactures of cotton, glass, iron, swords, and gunpowder. The wine, made by the Armenians who are settled in this town, is thought to be equal to any in Asia. Shiraz is also famous for its roses and the rose-oil which is obtained from them. Near the city are the tombs of the Persian poets Sadi and Hafiz. *Firoze-Abad*, a town situated in a fertile plain, contains about 4000 or 5000 inhabitants. Darabgherd is noticed in a separate article. [DARABGHERD.] North of Darabgherd is the pass of Urmijan, which leads to Robat in Kerman, and runs for two miles between perpendicular mountains.

In no part of Persia is the number of ruins so great as in Farsistan. The most remarkable are those of Persepolis [PERSEPOLIS], which are situated north-east of Shiraz, at a small place called Istekhar or Istakhr. The ruins of the ancient town of *Shapur* are situated north-west of Kazerun, where they cover an area six miles in circumference, amidst rocks and precipices, many of which are decorated with sculptures similar to those near Persepolis. A statue from 15 to 20 feet high, now mutilated, is found in an immense cavern at Shapur. At *Mourghab*, 49 miles N.N.E. from Istakhr, are other extensive ruins, resembling those of Persepolis, among which a building, called by the natives *Musjed-i-Madre Solyman*, is remarkable. It is considered by some persons to be the tomb of Cyrus the Great. [PASARGAD.] Near the great ruins of Persepolis are the *Nakah-i-Roostan* and the *Nakah-i-Rejib*, both of which are considered to be tombs of kings of the Sassanian dynasty. Very extensive ruins occur in the neighbourhood of Firoze-Abad. They occupy a large space in the plain, about 17 miles in length and half that distance in width. Other ruins of some extent occur in the neighbourhood of Darabgherd, and in several other places.

6. Laristan occupies the country between Cape Berdistan and the island of Kiahm, and consists of the Dushtistan and a hilly country. The low coast is in possession of the Arabs, who are subject to the Imam of Muscat. The hilly country, which is about 100 miles in width, is sterile along the low plain, but seems to contain a great number of fine valleys, which produce dates and other fruits, and also grain. There are several small harbours on the Persian Gulf. The capital, *Lar*, is at the foot of a range of hills, in an extensive plain, which is covered with palm-trees. It contains about 12,000 inhabitants, and is celebrated for the manufacture of swords, muskets, and cotton-cloth. The bazar is the noblest structure of that kind in Persia. It is built in the same manner as that of Shiraz but on a

much grander scale, the arches being more lofty, the breadth and length greater, and the work in every way superior. The houses are commodious. The only water used is from large cisterns, in which it is collected during the wet season. *Tarun*, E.N.E. of Lar, is as large and populous as Lar, but meanly built. It carries on a considerable commerce with Muscat, Gombroon, and Shiraz.

7. Kerman occupies the south-eastern part of Persia, extending along the Persian Gulf from Cape Jask to a place opposite the island of Kiahm, and thence northward to the borders of the desert, of which the adjacent southern part is considered as included in this province, and called the Desert of Kerman. The desert is sandy and impregnated with salt, and here and there intersected by short rocky ridges. The remainder of the province, which extends more than 200 miles from south to north, but less from west to east, is nearly unknown, except the tract along the shores of the gulf, and another tract in the interior, between 29° and 30° N. lat. That part of the coast east of 57° E. long, which lies along the narrow entrance of the gulf, is extremely mountainous, and the rocks come close up to the sea, where they form lofty cliffs. The short valleys in these mountains are well watered, afford pasturage all the year round, and contain fine plantations of date and other fruit-trees. Between *Sareek* and *Mináb*, or *Mináv*, the mountains retire from the shores, and form a plain which is very fertile, and termed by the natives the *Paradise of Persia*. It abounds in every kind of fruit. The mountains then run northward, retiring more than 50 miles from the sea, and then returning to it to the north of *Bunder Abas*, or *Gombroon*. The plain thus formed rather resembles the sandy tract called *Gurmais* than the country surrounding *Mináb*, being sterile and producing nothing except dates. That portion of the *Gurmais* which is within Kerman is subject to the Imam of Muscat, who however pays a certain annual sum to the king of Persia. That portion of the interior of Kerman which has been visited by European travellers comprehends the *Nurmanahir*, a district about 90 miles in length, and from 20 to 30 miles wide, in which are several small towns surrounded by large orchards and extensive cultivated grounds, and comparatively small sterile tracts. Two mountain ranges inclose this district on the south and north. The southern range is of considerable elevation, and covered with snow during the greater part of the year. Between the *Nurmanahir* and the town of Kerman is a desert, with a few oases of moderate extent; and about the town itself there is a large tract of very fertile country. West of the town, to the very boundary of Farsistan, there are numerous rocky ridges, with difficult passes, and several large villages, with a good deal of cultivation round them. The town of *Kerman*, which was destroyed in the civil wars of Persia in 1794, still contains a population of 20,000, of whom a small portion are *Guebres*: there are also Armenians, Jews, and Hindoos. The trade is still considerable, and it is celebrated for its manufacture of shawls, matchlocks, and carpets, which are chiefly exported to Khorasan and the northern provinces; and in return for which are received drugs, skins (from *Bokhara*), furs, silk, steel, and copper. These articles, as well as pistachio-nuts, carpets, rose-buds, and bullion, are sent to India, whence spices, cotton-manufactures, broadcloth, china and glass wares, hardware, indigo, tin, lead, and iron are received. The bazaar, which is extensive and well built, is abundantly supplied with articles of every description; and there are nine large caravanserais within the walls, and a number of inferior ones both within and without. In the country between Kerman and the harbour of Gombroon there is said to be a large place called *Sultanabad*. The Persians in December 1854 attacked Gombroon, which has been for several years in the possession of the Imam of Muscat. After shelling the town for two days and nights, they defeated the Arabs under the command of the Imam's son; but as far as we have yet learned they did not then succeed in taking the place. *Gombroon* is noticed separately. [GOMBROON.]

Opposite the town of Gombroon, and about 9 miles from it, is the island of *Kiahm*, the largest in the Persian Gulf. It is 60 miles long, but the widest part does not exceed 12 miles. It is separated from the mainland by a narrow channel, which is very intricate, but navigable for the largest ships. The inhabitants live by fishing and agriculture; and the island produces dates, wheat, and vegetables, with a few grapes, mangoes, and water-melons. There are two towns: *Kiahm*, at the southern extremity, with 2000 inhabitants; and *Laft*, on the northern side. At *Bassadore*, at the western extremity of the island, the East India Company formerly had an establishment. Not far from *Kiahm* is *Hormuz*. [ORMUZ.]

8. Khorasan, or Khorassan, extends over a large part of the Great Desert, and over nearly the whole of the mountainous region which lies north of it. In that portion of the desert which lies between *Herat* and *Yezd*, numerous oases occur; most of them are small, but some are of considerable extent, and contain large towns. Among these towns are *Gunahabad*, with 30,000 inhabitants; *Bushrewgab*, with 20,000 inhabitants; and *Tubbus*, with a still larger population. The wide valleys which lie between the desert and the declivities to the low sandy plains of Turan must possess a considerable degree of fertility, as there are several large towns here, and the villages are numerous and populous, in spite of the frequent incursions of the Turkomans and Kurds. *Herat*, which is the subject of a separate article, is generally considered to be the capital of Khorasan, although for many years it has been subject to an Afghan chief, who hardly acknowledges even a nominal allegiance to the Shah. [HERAT.] The

shortest road from Herat to Teheran runs along the northern border of the Great Desert, and on it there are two places of importance—Toorbut (20,000 inhabitants) and Toorshih; but this road is not much used. The most frequented road runs from Herat in a north-west direction to Mushed, and thence westward through Nishapoor and Sebsewar to Shahrood and Bostan. *Mushed*, or *Mashed*, occupies a larger space than Herat, but many of the houses are uninhabited and in ruins. The population amounts to 45,000, which however is often doubled by the number of pilgrims who visit the shrine of Imam Reza. A very wide avenue leads from the eastern to the western walls of the town, and is only interrupted by the sahn, or shrine, of Imam Reza. In the middle of it is a canal, and on both sides well-furnished shops. The mausoleum is a magnificent building of great extent, and kept in good condition. A silver gate, the gift of Shah Nadir, opens into the chief apartment, which rises into a noble dome and branches out into the form of a cross. Neither Jew nor Christian is permitted to enter this building. The city has many mosques, and 16 medresses, or colleges. There are also manufactures of steel wares, sword-blades, silks, velvets, polished turquoises and jewellery, and cups, plates, dishes, &c., made of talc. The town of *Nishapoor*, which was once a very large place, now contains only 8000 inhabitants. The famous turquoise-mines are about 40 miles from the town towards the north-west. *Sebsewar*, or *Subsewar*, contains about 4000 inhabitants; *Sharood*, 5000 inhabitants; and *Bostan*, 4000 inhabitants. In the neighbourhood of these towns cotton is grown to a great amount.

The wide and fertile valley which runs from Mushed north-west is in the possession of the Kurds, and contains some places of note. The largest is the town of *Kaboochan*, which contains from 15,000 to 20,000 inhabitants, and is the seat of the most powerful of the five chiefs of the Kurda. It has some commerce in wool, woollen-stuffs, tallow, butter, and sheep-skins. Some distance east of the town is the celebrated fortress of *Kelat-Nadiree* (the fortress of Nadir), which, according to the information obtained by Fraser from the natives, is in a valley from 50 to 60 miles long by 12 or 15 miles in breadth, surrounded by mountains so steep that a little assistance from art has rendered them quite impassable, the rocks being scarping into the form of a gigantic wall. A small river runs through this valley, and the only points of access occur where the stream leaves it, and even these are fortified by towers and walls, which are considered impregnable. The valley is well cultivated, and contains 2000 families in 20 or 30 villages.

9. Irak-Ajemi, the largest of the provinces of Persia, comprehends a considerable portion of the Great Desert and the countries which inclose its north-western extremity on the west and north, and which in their different parts display a great variety of natural features. South of Ispahan (32° 30' N. lat.) the mountains of Kurdistan terminate abruptly towards the table-land of Iran, and the country which lies between them and the desert, a space of more than 100 miles, consists of long and wide valleys running west and east, and terminating in the desert. Little water is found in them, except after the melting of the snow, and only a small part of them is cultivated, though the soil seems rather fertile. North of Ispahan, as far as 36° N. lat., the Kurdistan Mountains do not terminate abruptly; but between them and the plain there is a mountainous district, containing wide, fertile, and well-watered valleys. East of this district extends a plain about 40 or 50 miles wide, traversed by several broad and low ridges, and terminating on the border of the desert. It contains only a few cultivated tracts. That portion of Irak-Ajemi which lies north of 35° N. lat. belongs to the table-land of Azerbaijan. Its surface stretches out in a plain consisting of gradual ascents and descents, and furrowed by deep valleys in which the rivers flow. Though nearly the whole of this province is destitute of trees, it has excellent pasturage and many well-cultivated tracts. The surface is considerably higher than the plain farther east, and therefore the climate is not so hot in summer. The range of the Elburs Mountains, with its well-watered and fertile valleys, and its high summits, is included in Irak-Ajemi, as well as the hilly country which skirts its southern base, and which is generally well cultivated, being irrigated by the rivers that descend from the southern declivity of the Elburs Mountains.

That part of the desert which is included in Irak-Ajemi contains an oasis of considerable extent, in which the town of *Yezd* is situated. The oasis has a sandy soil, and is nearly inclosed by mountains. But though it is sparingly watered, it produces much silk and fruit. The wheat that is raised is only sufficient for forty days' consumption, and large quantities of grain are imported from Ispahan. On the north, east, and south, the Great Desert spreads out to a great extent; but on the west, a series of small oases connect that of *Yezd* with the more fertile districts east of Ispahan. The town of *Yezd* is very large, containing about 8000 houses and 50,000 inhabitants, among which 3000 or 4000 families are *Guebres*, or fire-worshippers. *Yezd* is remarkable as a commercial and manufacturing town. Its commercial importance arises from the caravan routes, which here cross one another. Two of these routes come from Herat and Mushed; two from the west, from Ispahan and Shiraz; and one from the south, from Kerman. Thus this town is the entrepôt of the commerce between India, Turkistan, and the western countries of Asia. A great variety of silk-stuffs are manufactured. Raw silk is imported

from Ghilan. Cotton is also manufactured to some extent, as well as carpets and felts; and much sugar-candy is made and exported. The summers are very hot, but the winters are cold. A good deal of snow falls, but it does not lie long on the ground.

Ispahan, or, more correctly, *Isfahan*, is still perhaps the most populous town in Persia. When it was the residence of Shah Abbas the Great its population was stated to be between 600,000 and 1,000,000. At present it is said to amount to between 100,000 and 200,000. It stands on the banks of the *Zeinde-Rud*, which during the heats of summer has little water, but in the spring months is equal to the Seine at Paris in winter. The mud walls are 24 miles in circuit. The streets are crooked, narrow and dirty, and unpaved, like those of most Persian towns. Ispahan contains a great number of magnificent palaces, large private buildings, spacious caravanserais, and handsome bazaars, most of which however are in a state of decay. On the southern side three nobly-constructed bridges cross the river; and near them, within the town, is a number of shady avenues of trees, which render that part of the city a very paradise, and lead to the great bazaar of Shah Abbas. This extensive building is vaulted above to exclude the heat, but it admits air and light: it is now nearly abandoned. In a still worse condition is the *Maidan-Shat*, or Great Square, which is 700 yards long and 200 yards wide, and inclosed by a double range of arched recesses. The other bazaars are still partly crowded, but most of the numerous caravanserais have been converted to other and meaner purposes. The most sumptuous of the palaces is the *Chehel-Sittoon*, with its hall of columns inlaid with mirrors so as to resemble pillars of glass. This building is situated in the centre of a garden, divided, according to the Persian fashion, into compartments by walks and canals bordered with poplars and stately chinars. There are also many other palaces, each with its own garden. Many of the mosques and medresses are in ruins; but a few of them are still in good preservation, especially the medress built by the mother of Shah Abbas, the gates of which are covered with wrought silver. Near the town is the suburb of *Julfa*, which is inhabited by Armenians, and contains a population of 12,500. The commerce of Ispahan is very great. The manufactures are various and numerous; in that of gold brocade it has attained unrivalled excellence.

The plain which extends from Ispahan to Teheran contains the towns of *Kashan* and *Koom*. *Kashan* is one of the most flourishing towns in Persia; it owes its prosperity to its manufactures of silk and cotton stuffs, brocades, carpets, and especially copper wares. It is as large as *Shiraz*, but better peopled. *Koom*, which lies farther north, a large place, but almost entirely in ruins, was formerly celebrated for its manufactures of silk. At present it is only noted as a place of pilgrimage. Among the shrines of this sacred place, that of *Fatima*, the sister of *Ali Reza*, the eighth Imam, is the most celebrated. Her tomb is in the centre of a lofty mosque, adorned with mosaic work in coloured tiles, and fitted up with rich carpets. The dome is covered with gilt tiles. In the mountainous country west of these towns are *Khonsar* and *Hamadan*. *Khonsar* is built in a long narrow valley, between steep and barren mountains, and is six miles in length, though not more than a quarter of a mile in width. It consists of isolated houses, surrounded by extensive orchards, and contains 2500 families. *Hamadan* is on or near the site of the ancient town of *Ecbatana*. [ECBATANA.] South of *Hamadan* is the snow-capped *Mount Elwund*, a lofty peak in the eastern range of mountains, which is connected with the *Zagros* by the *Hills of Sungur*. North of *Hamadan*, on the table-land of Azerbaijan, lies the town of *Zenjan*, a populous and thriving place, which derives its importance from being situated where the roads from *Hamadan* and *Teheran* to *Tabriz* meet. West of this town, near the boundary-line of the province of Azerbaijan, and rather within the last-mentioned country, are extensive ruins, called *Takht-i-Soleiman*, of the ancient *ECBATANA* of *Atropatene*. South-east of *Zenjan*, and at no great distance from it, is *Sultaniyeh*, a town quite in ruins, in which the reigning royal family has built a palace, to which they retire when the heat in *Teheran* becomes oppressive. On the road from *Zenjan* to *Teheran* is *Kasvin*, or *CASBIN*.

Teheran, or *Tehran*, the present capital of Persia and seat of government, is situated on a plain about eight miles from the base of the *Elburs* range, in a country without trees, and only covered with verdure during the spring. The town is about four miles in circumference, surrounded by a strong and high mud wall flanked by numerous towers and a dry ditch. The streets are narrow and crooked; the houses are built of sun-dried bricks, and are mean, with the exception of a few palaces. The only building of consequence is the citadel, which contains the palace of the sovereign and his officers. The population during the residence of the court is about 100,000; but when the king goes to *Sultaniyeh*, it is diminished by one-third of that number. In the neighbourhood are several royal country-houses, and the ruins of *Rai*, the Rhags of the ancients, and once the capital of the Parthian empire. About 70 miles E. from *Teheran*, on one of the mountains of the *Elburs* range, is the fortress of *Firuz-Koh*, which is of great importance, as it commands the most accessible of the mountain-passes which lead over the range to the plain of *Mazanderan*.

10. *Ghilan* comprehends the western portion of the low plain which surrounds the southern shores of the *Caspian Sea*. It is the lowest part of the plain, and more subject to inundations and continual rains than *Mazanderan*, which lies farther east. During the greater part of

the year it is properly a swamp, covered partly with forest-trees and partly with plantations of mulberries and rice-fields. There are no villages in this country, the peasants residing either in single dwellings or in small communities seldom exceeding eight houses. In some places there are bazaars, which, as well as the small clusters of huts, are situated in the midst of the forests or plantations of mulberry-trees. *Resht*, the capital of Ghilan, one of the most commercial places in Persia, is situated in the midst of a forest at some distance west of the mouth of the Sefid-Rud. The population is variously stated between 50,000 and 80,000. The houses are of a superior construction, and the streets generally well paved. Its commercial connections extend to Mushed and Herat, Teheran and Ispahan, and also to Badku, or Baku, and Astrakhan. There are several extensive manufactories of silk stuffs. The commerce with Astrakhan is carried on by means of the port of Enzillee, which is about 18 miles from Resht, and separated from it by a lagoon. Lahijan is a neat well-built town, on an island formed by the bifurcation of the river Sefid-Rud. It has a considerable commerce in silk with Resht and Ispahan. The population amounts to 15,000. The most northern portion of Ghilan is called Talish.

11. Mazanderan comprehends the largest and widest portion of the low plain along the shores of the Caspian Sea. Though the country along the sea is very low and marshy, it rises somewhat at a short distance from the shore, owing to which circumstance the inundations produced by the heavy rains are less extensive and of much shorter duration, especially as the rains themselves are less frequent and less heavy, than in Ghilan. The climate is accordingly much more healthy, and several plants are extensively raised which do not succeed in Ghilan, especially the sugar-cane and cotton; but it does not produce so much silk as that province. It is however very well cultivated, and populous. The most western town is *AMOL*. Farther east is *BALFRUSH*. *Saree*, the capital of the province, is a very ancient town. The walls, which are of mud, and strengthened with square brick towers, are about two miles in circuit. The streets are unpaved, and often impassable in bad weather. The town contains a population of 30,000 or 40,000, and has some commerce with Astrakhan by means of its harbour *Farah-Abad*, situated at the mouth of the river *Tejen*, which runs east of the town. At *Farah-Abad* the Russians have established a very extensive fishery, as great numbers of sturgeons enter the river: they send caviar and isinglass to Astrakhan. At this place are the ruins of a large palace built by *Shah Abbas the Great*.

A great artificial road was constructed by *Shah Abbas the Great*, through the provinces of Ghilan and Mazanderan. It begins at *Kiakar*, the western extremity of Ghilan, traverses the low plains, and ascends the declivity of the table-land of Iran by the pass which leads to *Bostan* in *Khorasan*, whence it is carried within a short distance of *Mushed*. In most parts it is still used, though it has been damaged in some places by torrents and inundations. It appears to have been 15 or 16 feet wide, and to have been constructed by filling a deep trench with gravel and stones, over which a regular causeway was very firmly built.

12. *Astrabad*, which comprehends the eastern portion of the low plain that skirts the Caspian, and comprises also the hilly country to the south, is the subject of a separate article. [ASTRABAD.]

Manufactures and Commerce.—The manufactures of Persia have been already named. In the manufacture of some articles the Persians are distinguished, as in several kinds of silk stuffs, especially brocades, and sword-blades, leather, carpets, felt of camel-hair, and jewellery. British cottons and silks obtain a ready sale owing to their cheapness. Persian goods are all woven by hand. The manufactures are chiefly in the large towns. The internal commerce of Persia is very considerable. It is entirely carried on by caravans. Great quantities of goods are brought by different caravan routes from India across Afghanistan, and distributed over the country. *Arthur Conolly* enumerates the articles conveyed to and from India by the northern caravan routes through *Mushed*, and indicates the countries from which they are brought; as from *Ispahan* and *Yezd*, fine velvet, silks, cotton-stuffs, felt, shoes, sugar, and sugar-candy; from *Cashan*, gold and silver, kimeob, cotton-socks, ink-stands, lamps of bronze, pots, and other utensils of copper; from *Shiraz*, dates, tobacco, lemons, lacquered-ware, ornaments made of ivory, and mats; from *Kerman*, shawls, sugar-candy, opium, henna, and indigo; from *Sind* and *Hind*, sugar, sugar-candy, spices, musk, amber, corals, precious stones, leather, kimeob, Indian and British muslins, and indigo; from *Cashmere* and *Bokhara*, shawls, saffron, paper; from *China* and *Russia*, by the way of *Bokhara*, lamb-skins (more than 120,000), stuffs made of camel-hair, tea, and Russian manufactures, as shagreen, broadcloth, satin, nankeen, china, glass, utensils of iron, copper, brass, cutlery, looking-glasses, needles, &c. Since the navigation on the Caspian Sea has increased, Russian goods are brought from *Resht* and *Balfrush*. From *Herat* are brought to *Mushed*, carpets, assafetida, lead, saffron, pistachio-nuts, mastic, manna, gummi, ispiruck (a yellow dye), and caraway-seeds. A well-frequented caravan-track leads from *Tabriz* through *Van* and *Erzurum* to *Trebizond*, and large quantities of textile goods are imported by the route from Europe. A branch of this route leads to *Tiflis* in Russian Georgia.

The foreign commerce of Persia however is less important than the internal trade. The principal foreign trade is with India through the port of *Bushire*, with *Russia* through *Balfrush*, and the ports on the Caspian (this trade is now carried on by steamers), with *Baghdad*,

Turkey, and *Bokhara* by caravans. The total exports are supposed to amount in value to no more than a million and a half sterling.

Government.—Persia is an absolute monarchy; the word of the king is law, and the life and property of the subject are in his hands. He delegates his power to the governors of provinces, reserving to himself the power of life and death, with which he entrusts only the governors of the royal blood, and such persons as are sent to govern distant provinces or such as are in a state of rebellion. The governors of the provinces are called *sardars*, and those of smaller districts *kulombega*. The tribes of the *Ilyats* however are not subject to these governors, but are under their own hereditary chiefs. The administration of the law is exercised by courts, of which there are two kinds, the *sherrah* courts and the *urf* courts. The former decide matters according to the *Koran*; the second, according to the customary laws of Persia. The supreme judge in the *sherrah* courts is the *Sheik-al-Islam*, who decides matters in the last instance. In every town there is a judge, and in the larger ones also a *cauzee*, who is aided by a council of *mollahs*. The *urf* is administered by the king himself, and his governors and delegates. The courts are held in public, and the monarch sits for a certain time each day in his hall of audience, to hear appeals, to receive petitions, and to decide such cases as come before him.

The army of Persia consists of about 40,000 men regularly disciplined, of which only about 20,000 are organised on European principles. But the king can in a few weeks collect an army of 100,000 men, the greatest part of which number is supplied by the tribes of the *Ilyats*, and consists of irregular cavalry.

(*Kinneir*; *Ouseley*; *Morier*; *Fraser*; *Conolly*, 'Journey to the North of India'; *Burnes*, 'Travels into Bokhara'; *Rich*, 'Narrative'; *Ritter*; 'London Geographical Journal,' vols. iii., vi., viii., ix., x., xiv.)

History.—At the earliest period of which any trace is preserved, Persia appears to have formed a province of the great Assyrian empire, on the disruption of which it fell under the power of the *Medes*, about B.C. 709. *Astyages*, king of the *Medes*, was dethroned B.C. 560 by *Cyrus*, who, according to *Herodotus*, was his grandson by his daughter *Mandane*, and who not only established the ascendancy of the Persians over the *Medes*, but by his victory over *Croesus*, king of *Lydia*, and by his conquest B.C. 538 of *Babylon* and its dependencies, extended his empire to the *Hellespont* and the *Syrian Sea*. This great prince perished (529) in an expedition against the *Scythians*, probably beyond the *Oxus*; and was succeeded by his son *Cambyses* (529-21), who subdued *Egypt*. On his death the kingdom was usurped by a *Magian*, who personated *Smerdis*, the brother of the deceased monarch: but this impostor was destroyed by the nobles, who raised to the throne one of their own body, *Darius Hystaspes* (*Gushtasp*). In his reign (521-485) the empire was divided into satrapies, and regular taxes introduced: *Babylon* revolted, and its walls were destroyed: and though a Persian expedition, under the command of *Darius* himself, against *Scythia* was a failure, the acknowledgement by *Macedonia* and *Thrace* of Persian supremacy extended the empire into Europe. The revolt of the *Asiatic Ionians* (501) and the aid given them by *Athens*, was the origin of the long wars of Greece and Persia. The defeat at *Marathon* (490) of a Persian force sent against *Athens*, showed the determination and military skill of the Greeks to be formidable. The famous expedition of *Xerxes*, the son and successor of *Darius* (485-64), conducted in person against Greece, *Herodotus* states to have consisted of above five millions of men, including an army of 1,700,000 infantry and 80,000 cavalry, and a fleet of 1200 ships. But this stupendous host, though it ravaged *Attica* and burnt *Athens*, sustained a signal naval defeat at *Salamis*; and the following year (479), after *Xerxes* had returned to Asia, the land and sea forces were discomfited in the two battles, fought on the same day, of *Platæa* in *Æscotia*, and *Mycale* on the coast of *Asia Minor*. The Persians were now driven from Europe; and *Xerxes*, who became more voluptuous and cruel after this disaster, was murdered by the captain of his guards (B.C. 464).

During the long reign of his son *Artaxerxes Longimanus* (probably the *Ahasuerus* of Scripture), the power of the empire greatly declined; *Egypt* was in continual revolt, and the *Asiatic Greek* cities were recognised as independent by the peace (449) which ended the Grecian war. The short reigns of *Xerxes II.* and *Sogdianus* occupy only a year (425): and the rule of *Darius II.*, surnamed *Nothus* (424-405), presents only revolts at home, and intrigues with Greece, where an alliance was formed with *Sparta* against *Athens* (411). *Egypt* threw off the yoke altogether in 414, and remained independent for 65 years. *Artaxerxes II.*, surnamed *Mnemon*, succeeded (405-359); and his younger brother *Cyrus*, attempting to dethrone him by the aid of an army of Greek mercenaries, was defeated and killed (401) at the battle of *Cunaxa*, in the plains of *Babylonia*, an engagement which was followed by the memorable *Retreat of the Ten Thousand*. In a war with *Sparta*, which commenced in 400, the integrity of the empire was threatened by the successes of *Ageilaus*, who, in three campaigns (398-94), advanced far into Asia: but by fomenting a coalition in the heart of Greece against *Sparta*, *Artaxerxes* was enabled in 387 to conclude the advantageous peace of *Antalcidas*, by which Persia recovered the *Ionian* cities and *Cyprus*, though the latter was not reduced till after 10 years' war. The accession of his son *Ochus*, or *Artaxerxes III.*, was followed by revolts in *Asia Minor*, *Syria*, and other provinces: but the former was betrayed by its leader *Orontes*,

and Syria was reduced (351) by Ochus in person, who destroyed Sidon, and advancing into Egypt, expelled the King Nectanebus, and reunited that country to the Persian empire (350). Ochus was poisoned by a eunuch named Bagoas, in B.C. 338. Bagoas now placed Arses, the only surviving son of Darius, on the throne, but murdered him two years afterwards, when the male line of the royal family being extinct, he invested Darius III, Codomannus (a great-grandson of Darius Nothus), with the vacant dignity. This prince commenced his reign (336-30) by ridding himself of the traitor Bagoas: but the invasion of his dominions by Alexander the Great, in 334, left him little opportunity for the exercise of sovereignty. By three great battles (Granicus, 334; Issus, 333; and Arbela, 331) the Persian empire was utterly overthrown; and the unfortunate Darius, flying from the arms of Alexander, was murdered (330) by his own servants, while the whole extent of his dominions from the Hellespont to the Indus fell under the sway of the Macedonian conqueror.

On the death of Alexander (323) and the dismemberment of his vast territories by his generals, Persia fell to the lot of the founder of the Syrian dynasty of the Seleucids, Seleucus Nicator (312-280), and remained in subjection during his reign and that of his son Antiochus Soter (280-61). But in the reign of Antiochus Theos (261-48), a germ of independence reappeared in the foundation of the Parthian kingdom in the country of Hyrcania (Mazanderan) by Arsaces, the first of the house of the Arsacids, of which 30 monarchs reigned in succession, each bearing the title of Arsaces, in addition to his individual name. One of these princes, Mithridates, or Pacorus I. (174-138), extended the Parthian power to the Euphrates and the Indus, and in 138 took prisoner Demetrius II. of Syria, who had invaded his territories. The sway of Orodes I. (54-37), who had dethroned and put to death his brother Mithridates III., was distinguished by the first war with Rome, and the defeat and slaughter of Crassus with his legions on the plain of Carrhæ (53). On invading Syria and Asia Minor however, the Parthians were repulsed by Ventidius (38); but this defeat was avenged by Phraates IV. (B.C. 37, to A.D. 4) on Mark Antony, who only escaped from Parthia (B.C. 36) with the loss of the greater part of his army. Some years later however Phraates opened diplomatic relations with Rome, and even sent his sons to be educated at the court of Augustus. The death of Phraates was followed by anarchy and dissension, and by wars with the Romans, at the close of one of which (A.D. 65), Tiridates, brother of Vologeses I., king of Parthia, accepted the Armenian kingdom as a fief of the Roman empire. Ctesiphon, the capital of the Parthian empire, was taken and sacked by the emperor Septimius Severus in 198; and these contests, though they occasioned no loss of territory, greatly weakened the declining monarchy. Artaxerxes, or Artashir, surnamed Babegan, a native of Fars, or Persia proper, overthrew the Parthian monarchy, and established the dynasty of the Sassanids.

The reign of Artaxerxes, or Artashir Babegan, after he attained undivided power (226-42), was occupied, excepting a short war with the Romans, in regulating his new dominions, and re-establishing in all its ancient splendour the Magian faith. His son Shahpoor, or Sapor I. (242-73), conquered Armenia, and by his victory, in 260, over the emperor Valerian (who was taken prisoner, with his army, and died in captivity), taught the Romans to respect and fear the arms of Persia. Syria, Cilicia, and Cappadocia were laid waste with ruthless severity; Antioch was taken and plundered, but the latter part of his reign was less fortunate: Odenathus, prince of Palmyra, and his celebrated wife Zenobia, defied his arms, and Aurelian re-established the Roman frontier in the East.

War with the Romans however continued, and Narses (294-301), vindicated for a time the renown of the Persian arms by a signal victory (296) over Galerius; but in the next campaign the Persian forces were surprised and destroyed by the Romans, and by the peace concluded in 297, Narses ceded Armenia and five provinces east of the Tigris. During the reign of Shahpoor or Sapor the Great the long war (327-63) was contested with the whole force of the two empires, and with varied success. In the battle of Singara (248) Shahpoor triumphed over the emperor Constantius; and the invasion of Persia by his successor Julian, which threatened the dismemberment of the kingdom, was frustrated by the death of that prince and the cowardice of his successor, who purchased a safe retreat by the peace of Dura (363), which restored Armenia and all the cessions made by Narses. The wisdom of Shahpoor in government was equal to his valour in war; and the kingdom continued in peace and prosperity throughout the reigns of the three next monarchs. The reign of Isdigertes (Yezdegerd) in 401-21 was disturbed by religious dissensions; the Magi murmured at the toleration and favour shown by the king to the Christians, and his friendship for the Greek emperor Arcadius; but the persecution of the Christians with which his son Bahram V. commenced his reign, led to a short and indecisive war with the Romans. The subsequent sway of this prince was glorious and popular; after repulsing with great loss an invasion of the Turks of Trans-Oxiana, he extended his realm to the frontiers of India; and his extraordinary personal prowess has preserved his memory to the present day in Persia as a favourite hero of romance. He perished accidentally in hunting. After a century of mingled prosperity, wars, and dissensions, the illustrious Khorsu Nusherwan (531-79), raised the Sassanian empire to its highest pinnacle of grandeur and prosperity.

He carried his arms to the Mediterranean, the Euxine, the Sutilj, and the Jaxartes. Trans-Oxiana, the Punjab, and great part of Arabia obeyed his mandates. Persia was divided into four great vicerealties, and the excellence of the internal administration, in which the king was aided by his celebrated minister Buzurg-Mihir, has earned for him the proud appellation of 'Just.' His son Hormuz (579-90), after losing all the conquests of his father, forfeited his throne and life in a popular revolt. Khorsu-Perwiz, son of Hormuz (590-628), attacked the Roman empire (602), and in 16 years restored the Persian empire to the limits under Xerxes, by the conquest of Syria, Asia Minor, and Egypt: but these successes were transient, and Khorsu, after having been in turn driven from his palaces by the victories of Heraclius, was murdered by his own son Shiruyeh, or Siroea. A period of confusion followed till the accession of Yezdegerd III., in the same year (632) in which Persia was attacked by the Arabs, then commencing the career of Mohammedan conquest. The fate of the kingdom, weakened by internal dissensions, was decided by the battles of Cadesia (636) and of Nehavend (641), the last of which, though the king survived in the condition of a fugitive 10 years longer, subverted at once the Sassanian power and the independence of the country.

The Persians imbibed the religion and literature of the Arabs; but the country for two centuries was only a province in the empire of the Kalifs. With the decay of the power of the kalifs the spirit of independence revived, and the re-establishment of the kingdom may be dated from the foundation of the Soffarian dynasty by Yakub Ibn Laïs, who about 868 threw off his allegiance to the kalif, and fixed at Shiraz the capital of a dominion including nearly all Persia. This dynasty lasted from 868 to 900; and was succeeded by the Tartar Samanides dynasty (900 to 936); and a native dynasty (936 to 1028). The Seljookian Turks, among whom were the distinguished kings Togrul-Beg and Alp-Arslan, ruled Persia from 1028 till 1194, when the Kharismians held the reins of power for a short time. The famous mogul Gengis Khan established a new dynasty, which ruled Persia till 1331, in which year the Tartars under Tamerlane conquered the country, and established a rule which lasted, with few interruptions, till 1502.

Ismael Shah, the founder of the Sefi, Soffee, or Soffavean dynasty, was remotely descended from the Kalif Ali, the cousin and son-in-law of Mohammed. He was a Turkoman, but he belonged to a different religious sect from the Turks usually so called, and hence partly the national hostility which has subsisted between the Sheah and Sooni, or Persian and Turkish Mohammedans. This dynasty lasted from 1502 till 1786; it included the distinguished name of Abbas the Great, under whom the Persian empire regained much of its former extent and splendour.

After totally expelling the Usbeks from Khorassan, in the first part of his reign, he turned his arms against the Turks, over whom he gained repeated victories from 1603 to 1618, in which year a peace was concluded, restoring to Persia all her former possessions. In order to promote manufactures, he invited Armenian artificers to settle at Julfa, and formed an alliance with the English, by whose aid he expelled the Portuguese from Ormuz; he removed the capital from Kazwin to Ispahan, and greatly improved the internal communications of the kingdom.

The Sefi dynasty was put an end to by Nadir Shah in 1736. This extraordinary man raised Persia, for a short time, to a higher degree of power than she had possessed since the rule of the Sassanian kings. He conquered Candahar and Afghanistan; and in invading India, in 1739, took Delhi, and carried off a booty estimated at 32,000,000*l.*, reducing the next year the Usbeks of Khiva and Bokhara, long the enemies of Persia. A second war with the Porte (1743-6) terminated favourably to Persia; but the barbarities and avarice of Nadir exasperated his subjects, and he was murdered in his tent, 1747. His death was the signal for a scene of anarchy and confusion; the Uzbek states threw off the yoke, and Afghanistan became an independent and powerful kingdom under Ahmed Dooranee, while the crown of Persia was contested by various competitors, and the kingdom torn by civil war, till a chief named Kereem Khan, of the Zend family, succeeded, in 1759, in possessing himself of supreme power, which he held till his death, in 1779, under the title of Wakeel, or administrator; he refused the insignia of royalty. But fresh troubles broke out at his death—six chiefs, between 1779 and 1789, ascended or claimed the throne, while Russia took Georgia under her protection in 1783. The candidates for royalty were at length reduced to Lutf Ali Khan Zend and Aga-Mohammed Khan Kajar; the former, a brave but cruel prince, bore the title of king from 1789 to 1795, when he was taken and put to death by his rival, who thus became sole monarch, and the founder of the Kajar or reigning dynasty. He fixed his capital at Teheran. His first act was to attack the revolted Georgians, whom he overthrew in the field, and subjected their capital Teflis to ruthless pillage and massacre; but his severity provoked his own attendants to assassinate him, and he was succeeded by his nephew, Shah Futah Ali (1797-1834). This reign was marked by two disastrous wars with Russia, the first of which (1804-13) ended in the cession of most of the Caspian provinces by the peace of Goolistan; the second (1826-8), in the cession of Erivan and the country to the Araxes, by the treaty of Turkmanchal. He however reconquered Khorassan from the Afghans and Usbeks, and broke the power of the chiefs of tribes by appointing his own numerous sons to nearly all the governments.

He was succeeded by Shah Mohammed, grandson of Futtah Ali by his son Abbas Mirza, who had been declared crown-prince, but died before his father. His reign was distinguished by an unsuccessful expedition in 1838 against Herat, the ruler of which however made his submission to the Shah in 1843.

PERSIAN GULF, a large closed sea, forming a kind of inlet of the Indian Ocean. The entrance from the Indian Ocean is by the Strait of Ormuz, which in the narrowest point, between Ras Koli (or Cape Koli), in Persia, and Ras Mussendom, in Arabia, is about 38 miles wide. The gulf extends between 24° and 30° N. lat., 48° and 58° 30' E. long. Its general form is that of a curve, the convex side of which is turned to the south-east. The greatest length in a straight line is about 550 miles; but measured along the curved line of the gulf, it is 600 miles. In width it varies between 40 and 200 miles. The area is about 70,000 square miles. The islands which are dispersed over this gulf are estimated at about 1400 square miles.

The navigation of this sea is dangerous and tedious, owing to the numerous shoals and reefs. These shoals and reefs are much more numerous on the southern or Arabian coast, which can hardly be approached in any part by large vessels without the greatest care, and it was accordingly for a long time the refuge of pirates. The most daring of these pirates were the Jawasimi, who were only compelled to keep the peace by two expeditions sent against them by the English from Bombay, in 1809 and in 1819. The navigation along the northern coast is comparatively free from danger. The places which are most resorted to by the shipping are the anchorage between the island of Ormuz and the town of Gombroon, the small bays of Mogoo and Bender Chetwar, the roadsteads of Busheer, and, north of that town, the bay of Jenabe and Ras Dilem.

The prevailing wind during the whole year blows from the north-west. It is only during the months of November, December, and January that southerly winds may certainly be expected, especially in the Strait of Ormuz, where gales from the south-west and south-south-west are sometimes experienced. The southerly winds blowing in winter are frequently accompanied with heavy rains, but the rains diminish towards the north, so that at Bassora, on the Shat-el-Arab, very little rain falls. These winds rarely last more than three or four days, and do not extend to the north-western part of the Gulf.

Before the entrance of the gulf, between Cape Jaak and Muscat, the currents are variable and uncertain, and usually subject to the wind (from the north-west); they set to the leeward. A current is frequently met with along the coast of Persia, which sets westward for several days together. Vessels therefore which sail to the west, keep close to the Persian shores, where, besides these currents, they are favoured by the land-breezes, which are not regular, but occur from time to time.

The most remarkable of the numerous islands which are dispersed along the shores of the gulf are—Ormuz [ORAMUS], Kishm, Kaés, Busheab, Bahrein [BAHREIN], and Karcj. *Kishm* is the largest island in the gulf, being 54 miles long and in the broadest part 20 miles wide. The greater part of the island is sterile, and in some places incrustated with a saline efflorescence, but there are also extensive tracts of fertile ground. The population exceeds 5000. *Kishm*, the capital, at the eastern extremity of the island, is a place greatly resorted to by native vessels. It has a bazaar well supplied with fruits and provisions. The population is 2000. *Laft*, on the northern coast, on the channel which divides the island from the continent, was once the resort of pirates, but is now nearly abandoned. Rice is cultivated, and date-trees are numerous. The island of *Kaés* or *Kenn* is small, but is well cultivated, and produces wheat and tobacco. It has a small town, and a harbour for native vessels. The island of *Busheab* contains about 40 square miles. It has a small town, and a harbour at the western end on the north side, where there is a good anchorage for vessels of large burden. The island of *Karcj*, or *Kharack*, contains about 26 square miles, and is surrounded by reefs except at its north-eastern extremity. It is elevated, and visible at a considerable distance. The date-groves are extensive, and there is abundance of good water. Vessels sailing to Bassora obtain pilots here, who conduct them through the dangerous shoals at the mouth of the Shat-el-Arab.

Fish abound along the shores of the gulf, and fish and dates constitute the principal articles of food of the population. Nearly the whole population of the Arabian shores of this sea get their means of subsistence by the pearl-fishery. The most extensive pearl-fisheries are those on the several banks not far from the island of Bahrein. About 1500 boats are employed in this fishery, and each contains ten persons, five divers and five 'syebors,' or pullers-up.

The shores of the gulf are low except near the Strait of Ormuz, where the mountains on both sides of Ras Mussendom rise to a considerable elevation, and come close up to the sea. This high coast extends within the gulf about 70 miles, and then the mountains on the Arabian shore recede to a great distance, leaving a wide plain which extends to the very mouth of the Shat-el-Arab. This plain is sandy, and produces only in a few places dates and a little corn. On all parts of the northern or Persian shore mountains are visible from the sea. In some places they retire to a distance of 80 miles from the coast, and at others they approach it within 3 miles. These mountains in general do not much exceed 3000 feet above the sea. The low plain which lies between the shores of the gulf and the mountains

is arid and sandy, and in many places swampy, but exceedingly hot. It produces very little grain, but dates in abundance, and is called by the natives Dushtistan, or Gurmair. Only one river of importance enters the Persian Gulf, namely, the Shat-el-Arab, which is formed by the confluence of the Tigris and Euphrates, and falls into the most northern recess of the sea by six or seven channels, of which however only the most western, called Cassia Boni, or Basra River, is navigable for vessels of considerable burden. The plain which here borders on the Persian Gulf extends northward on the banks of the rivers to the mountain ranges which surround the Black Sea on the south. The largest river next to the Shat-el-Arab is the Tab, which falls into the gulf not far from the most eastern mouth of that river.

It is remarkable that the shores of this gulf, in their whole extent, are inhabited by one nation, the Arabs. The Arabs are in possession of the whole country to the south of the gulf, which is also called Arabia; but on the northern shore they occupy only the Dushtistan, or low plain; the mountains at the back of it, as well as the table-land of Iran, which lies behind these mountains, being in possession of the Persians. The Imam of Muscat possesses authority over nearly the whole extent of the Dushtistan, at least as far west as Ras Berdistan; as an acknowledgment of superiority however the Imam pays to the king of Persia an annual rent. The earliest navigation of this gulf which is on record is the voyage of Nearchus.

(Kinneir, *Geographical Memoir of the Persian Empire*; Berghaus, *Geo. Hydrographisches Memoir vom Persischen Golf*; Wilson, *Memorandum respecting the Pearl Fisheries in the Persian Gulf*, in the *Lond. Geogr. Journal*, vol. iii.; Whitelock, *Descriptive Sketch of the Islands and Coast situated at the Entrance of the Persian Gulf*, in the *Lond. Geogr. Journal*, vol. viii.)

PERTE-DU-RHÔNE. [Aix.]

PERTH, the chief town of Perthshire, Scotland, and a royal and parliamentary burgh, is situated on the right bank of the Tay, 41 miles N. by W. from Edinburgh, in 56° 24' N. lat., 3° 25' W. long. The population of the municipal burgh in 1851 was 14,681; that of the parliamentary burgh was 23,835. The town is governed by a provost and 25 councillors, 4 of whom are bailies; and returns one member to the Imperial Parliament. Perth was a burgh in 1106, and down to the death of James I. (1437) was regarded as the capital of Scotland. It was the seat of a considerable trade, which the burghesses carried on in their own vessels with the Hanse towns, and many Flemings and Germans settled here. In the wars of Edward I., and in the contest between Bruce and Baliol, Perth several times changed hands. In 1437 James I. was assassinated in the Dominican monastery at Perth. After this event Edinburgh became the seat of government, though Perth continued to be nominally the capital till 1482.

In August 1600 Perth was the scene of the Gowrie conspiracy. In 1644 it was taken by Montrose, after his victory at Tippermuir. In 1651 it capitulated to Cromwell, after the defeat of the Royalists at Burntisland. Perth was occupied by Viscount Dundee in 1689, immediately before the battle of Killiecrankie. The Highlanders in 1715 and 1745 occupied the town.

The town is connected by a handsome bridge of 9 arches, 880 feet long, over the Tay, with Bridge-End of Kinnoull, which is included in the modern parliamentary burgh. The bridge of the Dundee and Perth railway crosses the river a little lower down. The streets are generally straight, convenient, lighted with gas, and paved. North and south of the town are two large public greens, called respectively the North Inch and the South Inch. The North Inch contains the race-course; the South Inch is surrounded by trees and villas. The principal public building is the church of St. John. The square tower is ancient; it has been surmounted at a later period with a pyramidal spire of wood. The body of the church is now divided into three places of worship, appropriated to three distinct parishes. There are three other churches of modern erection, in one of which the service is conducted in the Gaelic language. The Free Church has five chapels, including a Gaelic chapel; the United Presbyterians have three chapels; the Independents two chapels; and the Original Seceders one chapel. The choir, transepts, and other portions of a cathedral for the Scottish Episcopal Church have been recently erected. A handsome building containing the county-hall, courts of justice, and other apartments for county business, of Grecian architecture, faces the Tay; behind it is the city and county jail. The other public buildings are those of the academy, a neat theatre, a lunatic asylum, a range of barracks, and Marshall's monument (a building erected to commemorate the services of a late lord provost), containing the public library and the museum of the Perthshire Antiquarian Society. The general penitentiary at Perth is one of the largest buildings of the kind in Scotland. The manufactures of the town consist principally of coloured cottons, especially for umbrellas. There are flax-spinning mills, bleach-fields, dye-works, breweries, distilleries, iron-foundries, tanneries, rope-walks, and ship-building yards. The salmon-fishery in the Tay is valuable. The chief imports are—coal, lime, salt, and manure; timber, flax, bark, smalt, madder, &c. The exports are chiefly potatoes, sent to London; and corn, timber, and slates. The number of vessels registered as belonging to the port of Perth on December 31st 1853 was—54 sailing-vessels of 4573 tons burden, and 3 steam-vessels of 135 tons burden. During 1853 there entered 319 sailing-vessels of 21,689 tons, and cleared 302 sailing-vessels of 19,092 tons aggregate burden. Perth

Academy is an endowed institution, comprehending mathematical, scientific, and grammar schools, with classes for modern languages, English, writing, and drawing. The income (from the burgh funds) is 300*l.* a year. The number of scholars is about 550. There are six other endowed schools, a public library, an infirmary, a dispensary, and a savings bank.

PERTH. [CANADA; VAN DIEMEN'S LAND; WESTERN AUSTRALIA.]
PERTH AMBOY. [NEW JERSEY.]

PERTSHIRE, a central county in Scotland, bounded N. by the counties of Inverness and Aberdeen; E. by Forfarshire; S.E. by Fifeshire, the Frith of Tay, and Kinross-shire; S. by Clackmannan and Stirling shires; S.W. by Stirling and Dumfries shires; W. by Argyleshire; and N.W. by Inverness-shire. The form of the county is compact; but a small detached portion of it lies on the northern shore of the Frith of Forth, between the shires of Fife and Clackmannan, and another small detached part is surrounded by Stirlingshire; while a small detached portion of Forfarshire is included in the boundaries of Perthshire. It extends from east to west 70 miles, from north to south 66 miles; and its area is 2835 square miles, or 1,814,063 acres, of which about 50 square miles are covered with water. The county lies between 56° 2' and 56° 57' N. lat., 3° 2' and 4° 50' W. long. The population of the county in 1841 was 137,457; in 1851 it was 138,660. For parliamentary purposes part of the county is annexed to Clackmannan and Kinross. Perthshire returns one member to the Imperial Parliament.

Surface, Hydrography, and Communications.—The whole of the county, except in the immediate vicinity of Perth, is hilly, if not mountainous. The Ochill Hills traverse the south-eastern part between the Forth and the Tay. The Grampians form the northern and north-western boundary of the county, separating it from Aberdeen and Inverness-shires. Scarsoch (3390 feet), and Bruoch-Carruvan are in this part of the range. The western half of the county is overspread by the mountains of the Western Highlands, among which are Ben Venu, Ben Ledi (2863 feet), Ben Vorlich (3300 feet), Ben More (3900 feet), Ben Lawers (3948 feet), and Schihallien or Schihallion (3513 feet). Cairn Gower in the Ben y Gloe Mountains in Athol Forest, south of the Grampians, has an elevation of 3690 feet. The Sidlaw Hills are on the east side of the county near Forfarshire; Dunsinane Hill is 1084 feet above the level of the sea. Upon its oval and conical summit Macbeth is said to have erected his castle. Birnam Hill, near Dunkeld, is 1800 feet high.

These mountainous districts are intersected by long winding narrow vales, or 'glens,' through which the streams flow, or by 'straths,' or wider valleys. Strathallen, in the south, separates the Ochills from the Western Highlands; Strathearn extends across the centre of the county from west to east; Strath Tay, and lower down Strathmore (which extends through Forfarshire), form the valley of the Tay; and Strath Airdle is in the north-east of the county. In the north are Glen Shee and Glen Beg, Glen Fernal, Glen Tilt [ΑΤΗΟΛ], Glen Bruar, and Glen Erockkie. In the west are Glen Lyon, Glen Lochy, Glen Dochart, Glen Falloch, and Glen Artney.

This county is almost entirely comprehended in the basin of the Tay. A small portion on the south-west side is drained by the streams which flow into Loch Lomond; the district of Menteith in the south is included in the basin of the Forth.

The Tay rises in a small loch on the border of Argyleshire, and flows east and east-by-north 20 miles, through Loch Dochart into Loch Tay. In this part of its course it is known as the Dochart. Just before it enters Loch Tay it is joined by the Lochie, which rises a little to the north of Loch Dochart, and has a circuitous course of about 16 miles. Loch Tay is a long narrow lake embosomed in mountains, having Ben Lawers near its north-western shore; its length from south-west to north-east is about 14 miles; its average breadth is about one mile. The banks of the lake are steep and shelving, and the depth of water is supposed to be in some parts not less than 600 feet. It is fed by several mountain streams, and abounds with fish; its surface is at times agitated in a violent and uncommon manner. From the north-eastern or lower end of Loch Tay, the river Tay issues, and flows through Strath Tay. It receives several tributaries, and has a very winding course, extending in all to about 105 miles. Just above Perth, the Tay receives the Almond, and several miles below it the Earn, both on the right bank. The Tay is computed to send to the sea a greater volume of water than any other river of Great Britain. It is navigable to Perth for vessels of 100 tons. [DUNDEE.] There is a bar at the mouth, and the navigation is rather difficult, partly from the sand-banks in its channel, and partly from the strength of the tides.

The Tummel issues from the north-eastern end of Loch Lydoch, a large sheet of water on the border of Argyleshire, and flows eastward about six miles into Loch Rannoch, passing in its way through one or two smaller lochs. Loch Rannoch is a long narrow sheet of water, extending nine miles from west to east, and rarely if ever exceeding a mile in breadth. It abounds with trout of the largest size. Two streams, one flowing into the Tummel, between Lochs Lydoch and Rannoch, and the other into Loch Rannoch itself, serve to convey to the Tummel the superfluous waters of Loch Erich, another long narrow sheet of water, extending in length 14 miles from north to south by one mile in breadth, partly in Inverness-shire and partly in Perthshire. From the

eastern extremity of Loch Rannoch, the Tummel flows eastward 10 miles into Loch Tummel, and thence 12 miles farther east and south into the Tay. Its whole course is nearly 40 miles. Between Loch Tummel and the Tay it receives on its left bank the Garry, which has a course of about 30 miles, flows through Loch Garry, a narrow lake 3 miles long, and receives on its left bank the streams which water Glen Bruar and Glen Tilt, and on its right bank the Feachorie, which waters Glen Erockkie.

The Braan or Brand, 20 miles long, waters Strath Braan, and serves as an outlet to Lochs Freuchie, Kennard, Skiach, and some others, all small. The Isla, one of the most important feeders of the Tay, belongs chiefly to Forfarshire; only about 14 miles of its course are upon or within the border of Perthshire. Of its tributaries, the Shee or Erich, belonging to Perthshire, is nearly 30 miles long, and waters Glen Shee; it receives the Airdle, 20 miles long, which rises at the foot of Cairn Gower, in the Ben y Gloe Mountains, and waters Strath Airdle. The Almond rises not far from the south-east shore of Loch Tay, and flows about 24 miles east into the Tay.

The district of Menteith in the south belongs to the basin of the Forth, and is watered by the Teith, which rises just within Argyleshire, and flows 4 or 5 miles into Loch Katrine, a winding and picturesque sheet of water, 8 miles long from west-north-west to east-south-east, which has become celebrated as the scene of the 'Lady of the Lake.' From the south-east corner of Loch Katrine the Teith flows 9 miles through the Troaschs, and at the foot of Ben Venu it passes through the small lochs Achray and Venacher to Callander, where it is joined by a stream from Loch Voil and Loch Lubnaig, which lie north and north-east of Loch Katrine, and are each about 5 miles long. From Callander the Teith flows south-east 12 miles into the Forth above Stirling; its whole length is about 34 miles. The Allan, a small feeder of the Forth, waters Strathallen on the north-western and western side of the Ochills; the Devon, another small feeder, waters the valley on the south-eastern side of the same hills; and the Forth flows just within the southern boundary of the county. [FORTH; ARD, LOCH.] The Falloch is near the south-western border of the county. [DUMBARTONSHIRE.] There are several falls in the rivers of Perthshire. Those of the Bruar and the Tummel are very picturesque; as are also the falls and rapids of the Devon, called the De'il's Mill, the Rumbling Bridge, and the Cauldron Linn.

The road from Edinburgh by Queensferry and Dunfermline to Perth enters the county a few miles S. from Perth. Roads from Dundee, St. Andrews, and from Glasgow, by Stirling, converge at Perth. From Perth there is a road by Forfar, Brechin, and Stonehaven to Aberdeen; another road follows the valley of the Tay by Dunkeld, and afterwards the valleys of the Tummel and the Garry, through the Pass of Killiecrankie, to Fort Augustus, Inverness, and the Northern Highlands; while a third follows the valley of the Tay and the Dochart into Argyleshire. Three roads lead from Stirling into the Western Highlands through Menteith; one through Aberfoyle to the banks of Loch Lomond; another to Glengyle at the head of Loch Cateran; and another, branching from this, joins the road through the valley of the Tay into Argyleshire.

The town of Perth communicates with the south by the Scottish Central railway, which joins the Caledonian railway, and thence by the Lancaster and Carlisle and Midland lines to London. The portion between Perth and Dunblane, 28 miles, belongs to this county. By the Scottish Midland Junction railway and the Dundee and Perth line, both of which run through a portion of the south-eastern corner of the county, Perth has easy communication northward with Aberdeen and the intermediate towns, and eastward with Dundee and the other towns on the sea-coast.

Geology, &c.—The north-western and northern parts of the county belong to the great primitive district of the north of Scotland. Granite is found underlying the peat of the extensive waste of Rannoch Moor in the west portion of the county; but the predominant rock in this district is mica-slate, skirted by clay-slate and chlorite-slate, both of which pass insensibly into mica-slate. Schihallien, Ben Lawers, the hills round Loch Tay, and many of the mountains in the Grampian range, are composed of mica-slate, intermixed with hornblende-slate and quartz-rock, and in some parts with a small portion of crystalline limestone. Chlorite-slate, clay-slate, and others of similar character are found in the south-western part of the county. East of Loch Lubnaig, true mica-slate occurs and occupies the whole district, as far as Perth. A highly-elevated range of breccia may be traced in various places, separating the primitive district from the secondary district in the south-east of the county. The district to the south and east of the breccia is occupied by beds of sandstone. Basaltic rocks may be traced in a north-east direction. The Ochill Hills in the south-east consist chiefly of porphyry and amygdaloid; and the Hill of Kinnoul, near Perth, is an amygdaloid containing numerous nodules of agate and carnelian. Some portions of the county near the south-east are comprehended in the coal-field of Fifeshire.

Soil, Climate, Agriculture, &c.—Owing to its mountainous character a large portion of this county is ill adapted for cultivation. There are some extensive tracts of moor, bog, and moss. A large space is occupied either by natural woodlands or by plantations. The larch is generally planted in dry soils, and the spruce where there is moisture.

The most valuable tract of cultivated land in the county is the

'Carse of Gowrie,' the district watered by the Isla and its tributaries the Erich and the Airdle, and extending into Forfarshire. It is a low alluvial district, the finest, in an agricultural point of view, of any in Scotland. The lower part of Strathearn, or the vale of Earn, another low alluvial tract, is scarcely inferior to it. The vale of the Tay, above Perth, and the vales of the Forth and Teith, contain extensive tracts of low alluvium or of gravelly sandy loam. The size of the farms varies from 50 to 500 acres; and in the lower districts they are universally held on lease, commonly for 15 or 19 years; some of the small Highland occupiers are yearly tenants. The Carse of Gowrie, Strathearn, and the valleys of the Teith and the Forth yield good wheat and beans; but in the midland districts oats and barley are the principal grain crops. Turnip cultivation has been carried to a considerable extent. The chief article of agricultural produce is the potato, of which great quantities are yearly sent to London by railway. Considerable quantities of apples, pears, and other fruit are raised in the valleys and low grounds, particularly in the Carse of Gowrie.

There is no breed of cattle peculiar to the county. Ayrshire cows for the dairy have been introduced of late years into the lowlands. The West Highland breed is that commonly fed on the Highland pastures. The number of sheep has been vastly augmented, chiefly by the laying out of sheepwalks in the Highland tracts. The usual breeds are the black-faced Tweeddale and Cheviot. There are some Leicester and Southdowns.

Divisions, Towns, &c.—This county was formerly divided into the districts of Gowrie, Perth, Stormont, Strathearn, Menteith, Breadalbane, Balquhither, and Rannoch, each of which was in the jurisdiction of a distinct sheriff or steward. These divisions are now obsolete, though the names are still popularly applied to the districts. To these may be added the Highland district of ATHOL. The number of parishes in the county is 75, which form several presbyteries.

PERTH and CULROSS are royal burghs; AUCHTERARDER, and Dunblane were formerly royal burghs; Abernethy, ALYTH, CRIEFF, CUPAR ANGUS, and Dunkeld are burghs of barony. Those printed in small capitals are described under their respective titles. Of the others, as well as of the more important villages, we subjoin brief notices; the populations are those of 1851.

Abernethy, at the junction of the Earn with the Tay, is 7 miles S.E. from Perth: population of the burgh of barony 972. It was anciently the capital of the Picts, and the seat of a bishopric. Abernethy is chiefly remarkable for the possession of a round tower, which is built of hewn stone, and is 74 feet high, and 48 feet in circumference at the base, but diminishes towards the top. It serves as a belfry and clock tower to the church, which stands near, and is a modern building.

Dunblane, population 1816, anciently a seat of the Culdees, and subsequently a cathedral city, is situated about 6 miles N. from Stirling, on the left bank of the Allan. The town consists of a street of old-fashioned houses and a few lanes. The former cathedral, the choir of which (80 feet by 30 feet) is now used as the parish church, is a large gothic building, seated on an eminence. Every part, except the choir, is dilapidated. The nave is 130 feet by 53 feet. The choir was repaired, and the windows were renewed, in 1819 by the Earl of Kinnoull. The Free Church, United Presbyterians, Independents, and Episcopalians have places of worship. A modern steeple, 128 feet high, has been erected adjacent to the church. There is a public library, the foundation of which was a bequest of books by Leighton, archbishop of Glasgow, who held for a time the see of Dunblane.

Dunkeld, population of the town 1104, a burgh of barony and market-town, or city, as it is often termed, is situated on the left bank of the Tay, 15 miles N. from Perth, in a deep hollow under the brow of lofty wooded hills. The town attracts many visitors by the beauty of its situation and its convenience as the entrance upon the Highlands. There was an ancient monastery of Culdees here, and in 1127 it was made the seat of a bishopric. The cathedral, which was partly of Norman, partly of later architecture, is in ruins, except the choir, which serves as the parish church. The tower is 24 feet square at its base, and is 96 feet high. Episcopalians, Independents, and Free Church Presbyterians have chapels. The Macintosh library was founded by the Rev. Donald Macintosh, the last of the nonjuring clergy of the old Episcopal Church of Scotland. The Royal Grammar school of Dunkeld, founded by James VI. in 1567, has an average attendance of about 80 scholars. There is a girls school, founded in 1788 by Jane, Duchess of Athol. The market is held on Saturday: five fairs are held in the course of the year. A fine bridge of seven arches crosses the Tay; it was erected in 1809 by the Duke of Athol.

Auchtergaven, population of the parish 3232, chiefly employed in the cotton-works at Stanley. Quarries of freestone are in the vicinity. There is a small salmon-fishery. *Callander*, population of the parish 1716, on the Teith, at the junction of the stream from Loch Lubnaig, contains substantial freestone houses roofed with slate. The village is resorted to by tourists. *Comrie*, population of the parish 2463, situated on the north bank of the Earn, in the midst of picturesque scenery, is noteworthy for the shocks of earthquakes with which it has been visited of late years. *Downe*, population of the village 1459, on the banks of the Teith, 8 miles N. from Stirling, is remarkable for a handsome gothic church and tower, of modern erection; a fine old bridge over the Teith; and the ruins of Doune Castle, an ancient fortress of great strength and extent. There are extensive cotton-

works at Deanston, close to the village. *Barn, Bridge of*, a salubrious village in Dunbarney parish, frequented by invalids. The parish also contains the village of *Pitcaithly*, the mineral wells of which are much frequented. *Erris*, population of the parish 2796, is beautifully situated near the Frith of Tay. The church is a modern cruciform building in the Norman style, with a lofty square tower and pinnacles. Quarries are worked, and salmon and smelt fisheries carried on; but the linen-manufacture is the chief branch of industry. *Killis*, population of the parish 1608, stands at the junction of the river Dochart with the Lochy. Near the village are two islands in the stream, on one of which is the tomb of the Macnaba. Fingal's grave is pointed out in a field to the north of this village. *Killiecrankie*, in the parish of Moulin, is a pass on the great north road from Edinburgh by Perth to Inverness. Several handsome villas have been erected along both sides of the pass. At the northern end was fought the battle in which Grahame of Claverhouse, Viscount Dundee, lost his life, 17th July, 1689. The pass is famous for its picturesque scenery. *Kincairdine*, population 2697, is a burgh of barony and a thriving little port on the Forth, with a good quay and harbour. There are sail-lofts and rope-walks. Besides the chapel of ease, there are chapels for Free and United Presbyterians. *Longforgan*, population of the town 463, is a long straggling place, 18 miles from Perth on the road to Dundee. The chief occupation is the weaving of sheeting, sacking, and linens. Near the town are the ruins of an ancient Cistercian chapel, and the noble baronial seat of Castle Huntly. *Methven*, population of the parish 2454, a manufacturing village, 6 miles W. from Perth, has a commodious parish church, several schools, and a library. *Muthill*, population of the parish 2972, is a clean village, beautifully situated in Strathearn. There are at Muthill a parish church, an Episcopal chapel, a Free church, several schools, a library, and reading-rooms. *Soone*, population 1439, near the left bank of the Tay, about a mile north from Perth, is memorable for its palace, the ancient residence of the Scottish kings and the place of their coronation. It had also an abbey of the regular canons of St. Augustine. A modern house, the seat of the Earl of Mansfield, occupies the site of the palace. The village of Soone is neat and regularly built. *Stanley*, population of the town 1769, situated on the river Tay, about 8 miles N. from Perth, possesses extensive cotton-spinning mills.

History, Antiquities, &c.—Little that is certain can be advanced as to the early inhabitants of Perthshire. A Roman road crosses the eastern side of the county from the neighbourhood of Stirling to Orrea, near Perth, at or near which it probably divided into two branches, one directed towards the coast, the other crossing the Grampians (the Grampius Mons of the Roman historians and geographers) towards the shore of the Moray Frith. There were several Roman stations in Perthshire. Alaua was probably at Kier, just within the county, near Stirling. Lindum was at Ardoch, in Strathallan. Victoria was probably Dealgin Ross, in Strathearn, where are some remains of Roman works. Ad Hiernam may be fixed at Strageth, on the Earn, or Hierna, where are the remains of a Roman post. The Ad Tavum of Richard was probably in the neighbourhood of Perth. There are the remains of a Roman camp at Invergowrie. At Insuthill, on the Tay, above the junction of the Isla, are some remarkable Roman works. The remains of a Roman camp are at Fortingal, in Glen Lyon. The prætorium is still complete. There are the piers of a bridge over the Tay, close to the junction of the Almond, where the situation of Orrea may be fixed. This county was the scene of hostility in the sixth and seventh campaigns of Agricola (A.D. 83, 84). The attack made by the Caledonians on the camp of the ninth legion, in the sixth campaign, was probably at Dealgin Ross.

There are some remains of a large stone circle and of several ancient circular forts in the Highland parish of Fortingal. Remains of circles, cairns, standing-stones, and similar vestiges of the early inhabitants, are found in the parishes of Kirk-Michael, Blair Athol, Cargill, and other parts of the county.

At the downfall of the Roman empire, Perthshire was occupied by the Picts, who had Abernethy for their capital: it afterwards came into the hands of the Scots. In the latter part of the 10th century, the Danes arrived at the mouth of the Esk with a large fleet, and landing, marched to the Tay. They were entirely routed by the Scottish king, Kenneth III., at Luncarty, near Perth, probably in 990. Dunsinane Hill, in Collice parish, between Perth and Cupar Angus, was the stronghold of Macbeth, where he was defeated by the English allies of his competitor Malcolm (1054). The importance of Perth, and its rank as capital of the kingdom, made this shire the scene of many contests, some of which are mentioned under PERTH.

The chief ecclesiastical antiquities of the county are the remains of Dunblane and Dunkeld cathedrals. Among other ecclesiastical remains may be mentioned Inchaffray, in the parish of Fowlis, an ancient abbey now in ruins, founded in 1200 by an Earl of Strathearn and his countess. Remains of ancient castles are at Moulin, Doune, Kincairdine, Kinclaven, and Drummond castle near Muthill.

Statistics. Religious Worship and Education.—According to the Returns of the Census in 1851, it appears that there were then in the county 258 places of worship, of which 89 belonged to the Established Church, 71 to the Free Church, 41 to the United Presbyterian church, 15 to Episcopalians, 12 to Baptists, 11 to Independents, and 6 to Roman Catholics. The number of day schools was 307, of

which 221 were public schools, and 86 were private schools; the total number of scholars was 21,148. Of Sabbath schools there were 280, with 18,294 scholars, of which 76 schools were connected with the Free Church, 74 with the Established Church, and 37 with the United Presbyterian Church. Of evening schools for adults there were 19, with 464 scholars. There were 10 literary and scientific institutes, with 698 members, and about 9000 volumes in the libraries belonging to them.

Savings Bank.—In 1853 the county possessed one savings bank at Perth: the amount owing to depositors on the 20th of November 1853 was 184,759*l.* 17*s.* 1*d.*

PERU (Republic of), South America, is situated between 3° 30' and 21° 28' S. lat., 68° 20' and 81° 20' W. long. It is bounded S. and S.E. by the republic of Bolivia, E. by the empire of Brazil, N. by the republic of Ecuador, and W. by the Pacific Ocean. Its length from south to north, along the meridian of 70°, is about 1150 miles, but its width varies greatly. South of 17° S. lat., it hardly exceeds 30 miles, whilst near 10° S. lat. it is more than 650 miles wide. Its area is about 580,000 square miles; the population is about 1,375,000.

Coast-line, Surface, &c.—The coast-line is about 1500 miles in length. In an extent of 1200 miles this coast forms only three straight lines, which meet at obtuse angles, and are not interrupted by any large bays. The most southern line runs south and north, the central line runs nearly south-east and north-west, and the northern line runs north-north-west. The most northern and most projecting portion of the coast is broken by bays and headlands.

The southern coast-line, which runs south and north, extends from the mouth of the river Loa (21° 28' S. lat.), to the harbour of Arica (18° 28' S. lat.), a distance of 210 miles. The whole of this line consists of rocky cliffs, rarely low, and occasionally several hundred feet high. In a few spots a sandy beach lies between the cliffs and the sea. The projecting points seldom extend a mile from the mainland, and in no case more than two miles. The only harbour is that of Iquique, which is formed by a low island, the largest that occurs along this coast. Between it and the town is good anchorage in 11 fathoms. The harbour of Arica, which lies at the northern extremity of this coast-line, is also formed by a low island, on the northern side of which there is good anchorage. A mole runs out into the sea, which enables boats to lie quietly while loading or discharging.

From Arica (18° 28' S. lat.) to Point Carreta (14° 10'), a distance of more than 460 miles, the coast lies east-south-east and west-north-west. Where the cliffs come close to the sea, they rise from 50 to 300 feet above it, and the waves in some places break with great violence along the shore. The first harbour which occurs, after leaving Arica, is that of Islay, or Ilay, the port of Arequipa. Cove Mollendo formerly served for that purpose, but it has so changed that at present it only admits boats or very small coasting-vessels. Port Islay, formed by a few straggling islands which lie off Point Islay, affords good anchorage in 10 or 12 fathoms for about twenty sail. It is one of the most frequented ports on the Peruvian coast; but the landing is extremely difficult. Point Lomas, the port of Acari, lies farther west, and is an open roadstead, but has good anchorage in from 5 to 15 fathoms. Some distance farther west there are two good harbours, San Juan and San Nicolas. Farther west is the Bay of Independencia, which lies between Cape Quemada and Cape Carreta, is protected towards the sea by two islands (Santa Rosa and Santa Vieja), extends 15 miles from south-east to north-west, and is about 3½ miles broad. There is anchorage in all parts of this spacious bay, the bottom being quite regular in about 20 fathoms, but the country along here is sterile, and very thinly inhabited.

The coast from Cape Carreta (14° 10' S. lat.) to the roadstead of Lambayeque (6° 46' S. lat.), a distance of about 520 miles, runs north-north-west, and exhibits a much greater portion of low sandy beach than is found farther south. A high ground invariably appears at the back of the low shore. Towards the south-eastern extremity are some islands, and between 7° and 10° S. lat. some inlets, which are larger than commonly occur on this part of the coast, and good anchorage is found in them. The most southern of these harbours is the Bay of Pisico, which is between the mainland and a row of islands extending along the coast. The most southern of these islands, that of Gallan, is 2½ miles long, 1 mile wide, and of considerable elevation. North of it are the low rocky Ballista Islands, and north of them the Chinchas Islands. [CHINCHAS.] The sea about these islands is deep, and the Bay of Pisico may be entered safely by all the passages thus formed. Within the bay there is good anchorage in 12 fathoms. The Bay of Callao is between the coast and the island of San Lorenzo, which is 4½ miles long from south-east to north-west, and a mile wide; its highest part is 1050 feet above the sea-level. The bay, which is extensive and commodious, has good anchorage. Salinas Bay, on the north of Salinas Head, which extends 5 miles into the sea from south to north, is of large dimensions, and affords good anchorage. The Bay of Sapé, to the north of Cape Thomas, and the port of Guarmey, north of Point Legarto, are small, but afford good anchorage. Between 9° and 10° S. lat. there are four comparatively good harbours—Casma, Samanco, or Huambacho, Ferrol, and Santa. There is no harbour farther north. Opposite the towns of Truxillo and Lambayeque there are only open roadsteads with bad anchorage.

North of the roadstead of Lambayeque, and between it and the

Bay of Guayaquil, a huge promontory runs out into the sea. At its base, between Lambayeque and Point Malpelo (8° 30' S. lat.) it is 220 miles wide, and its coast-line exceeds 300 miles. Between Point Ahuja and Cape Blanco, the most projecting part of this promontory, the shores are rocky and steep, and rise to a considerable elevation; but near the roadstead of Lambayeque, and on the Gulf of Guayaquil, they are sandy and partially covered with brushwood. In this part there are two indentations, which form two tolerably deep but open bays. The southern is the Bay of Sechura, which is 6 miles deep, and at its entrance, between Cape Pisura and the Little Lobos Island of Payta, 12 miles wide. It is open to the swell of the sea, and is only navigated by the Indians in balsas. The Bay of Payta, which is farther north, is of smaller dimensions, but it is the best harbour on the coast of Peru, and is more visited by foreign vessels than any other harbour except Callao.

As the heavy surf occasioned by the swell of the Pacific renders landing with boats always dangerous, and often impracticable, 'balsas' are used along this coast, which carry two or three persons, and run through the surf and on the beach with ease and safety. These balsas, in Chili and the southern coast of Peru, are cane rafts supported by two inflated seal-skins made air-tight. Along the northern coast of Peru they are rafts formed of logs of the cabbage-palm secured together by lashings, with a platform raised about two feet, on which the goods are placed; and at Lambayeque, where the surf is very heavy, they consist of bundles of reeds fastened together and turned up at the bow.

As Peru comprehends the whole of the mountain masses of the Andes which lie between 15° and 5° S. lat., together with the countries on both declivities of the chain, it is naturally divided into three different regions. The country between the chain and the Pacific is called *Los Valles*, and that included between the higher ranges of the Andes, *Montañas*. The region east of the Andes may be conveniently called the *Eastern Plains*.

The country between the steep ascent of the Andes and the Pacific varies in width from 10 to 60 miles, and may be considered as the western base of the mountains. Its elevation above the level of the sea where it lies contiguous to the range, is on an average between 8000 and 10,000 feet. From this elevation it slopes towards the sea with a very irregular surface, which is furrowed by a number of deep depressions which are called *Los Valles*, or the *Vales*, and run from the Andes to the sea with a rapid slope. They are traversed by rivers, many of which are dry during nine months in the year, and only a few preserve a perennial stream. As it never rains in the lower portion of this region, vegetation and agriculture do not extend beyond the reach of irrigation. The narrow strips along the rivers are cultivated in proportion to the supply of water. Though the upper course of the rivers is extremely rapid, few of them enter the sea, but are either lost in shallow lagoons or filter through the sand which is invariably found near their mouth. The uplands which separate the valleys from one another are covered with a fine loose and yellow sand; and along them occur chains of sandy hillocks called *Medanos*, some of which are firm, but more loose and shifting. These uplands are complete deserts; neither beasts, birds, nor reptiles are ever seen on them, and they do not produce a single blade of vegetation. No stranger can travel from one vale to another without a guide, the sand being so loose that it is raised by the wind in clouds or columns from 50 to 100 feet in height, and thus all traces of a path are obliterated. On account of the great heat which is experienced in these uplands in the day-time, and the clouds of sand which the wind then raises, they are usually traversed by night, and the guides regulate their course by the stars, or the light breeze which always blows from the south. In the south the vales are very narrow, and occur at greater intervals, but farther north they are much wider and more numerous; and in the most northern district they are more extensive, and contain considerable portions of cultivated ground, but are at great distances apart. Between Lambayeque and Sechura the desert is 90 miles across.

Along the whole coast of Peru, south of Cape Blanco, a drop of rain scarcely ever falls. But for nearly five months, from June to November, the sky is covered with a kind of mist or fog, called the *garua*, which precipitates into a fine dew, which, though not heavy enough to penetrate the thinnest clothing, changes dust into mud, and fertilises the ground. In the morning it is so thick and close to the ground that objects at a moderate distance cannot be seen. About 10 or 11 o'clock the fog rises into the atmosphere, but does not break into clouds. While the *garua* covers the lower parts of the country, and produces their winter, the higher declivities of the Andes enjoy fine weather and have their summer. But in the month of January the rains on the mountains commence, and they last about three months. The rains occur however earlier in the year in the northern than in the southern districts: and hence it happens that the rivers in the northern parts of Peru are full at the end of January or the beginning of February, while in the southern parts this does not take place before the end of March.

The climate is not so hot as might be supposed. In summer the weather is delightfully fine, and the heat is moderated by the sea and land breezes. The sea-breeze generally commences about 10 o'clock; gradually increases till 1 or 2 o'clock in the afternoon; a steady breeze then prevails until sun-set, when it begins to die away; and soon after

the sun is down there is a calm. About 8 or 9 o'clock in the evening light winds come off the land, and continue until sun-rise, when it again becomes calm, until the sea-breeze sets in. The cold current which runs along this coast from south to north, and the temperature of which is on an average 8 degrees lower than the mean annual temperature of the adjacent coast, no doubt contributes to moderate the summer-heat. During the prevalence of the garua however the air is raw and damp. The mean annual temperature, according to Humboldt, is 72°, the maximum 82°, and the minimum 55°. In the day-time it varies between 72° and 77°, and in the night between 60° and 63°.

The prevailing winds along the coast blow from the south, varying between south-south-east and south-west. In the south they are seldom more than a fresh breeze, but farther north they are stronger and blow with greater rapidity; and near Cape Blanco they sometimes blow with great force. In winter light northerly winds are occasionally experienced. At some distance from the shores the prevailing winds blow from south and south-east, and with greatest strength in winter: no thunder-storms occur; lightning indeed is seen from a distance, but thunder is never heard. Earthquakes are very frequent, and sometimes destroy the towns and villages.

In the Valles, the soil is sandy; but becomes fertile when manured with guano, which is abundant on the rocky islands and cliffs (CHINCAS), and the use of which appears to have been well known here before the Spanish conquest. All the grains and fruits of southern Europe succeed, but many of the intertropical products do not. Maize is generally cultivated, and constitutes the principal food of the Indians and lower classes. Rice is extensively grown in some of the wider northern vales, and is exported. Wheat succeeds only in the more elevated part of the valleys, where barley also is grown. Potatoes and sweet potatoes are generally cultivated, also mandioc, yams, and bananas to a smaller extent. The sugar-cane plantations are numerous and extensive, and sugar is exported to all the American countries bordering on the Pacific. Vines grow in every valley, and good wine is made in several places, as at Pisco, Nasca, and Yca. The olive and the tomato are grown in the southern districts; the Aji, or Spanish pepper, is grown extensively all along the coast. There are few natural meadows; the want of them is supplied by the cultivation of lucern, which has spread over all the valleys.

The *Mountain Region*, or *Montaña*, runs parallel to the Pacific, and from 20 to 50 miles from the shores. It comprehends the central portion of the Andes, namely, the northern part of the Bolivian Andes and the whole of the Peruvian Andes. The Andes here consist of two very lofty chains, which with the country lying between them, known as the table-land of Cuzco, the valley of the Rio Jauja, the table-land of Pasco, and the valley of the Marañon, are described under ANDES, vol. i. col. 352-355.

The *Table-land of Cuzco* extends from the mountains of Vilcanota, its southern boundary, to about 12° 30' S. lat., or more than 150 miles from south to north, and about 100 miles from east to west. Its surface is very uneven, being traversed by several ridges of broad-backed hills rising with a tolerably steep ascent, and running from the south, where they are connected with the mountains of Vilcanota, towards the north-north-west, parallel to the great chains of the Andes, which inclose this region. The valleys between these ridges are usually several miles wide, but their surface is diversified by low eminences. The whole region declines towards the north. The town of Cuzco (13° 31' S. lat.) is 11,380 feet above the sea-level. In the most elevated districts south and west of Cuzco the only cultivated grain is the quinoa (*Chenopodium quinoa*). In the lower parts of the valleys north of 13° S. lat. the agricultural products consist of maize, sweet potatoes, yucas, and plantains. The sugar-cane succeeds very well, and is cultivated in some parts, but not extensively. The mountains which inclose these valleys are covered with thick forests, but trees are scarce in the more elevated districts, and in some of them are entirely wanting. Throughout this region a good deal of rain falls all the year round. In the valley of Paucartambo rain falls 300 days in the year.

The *Vale of the Rio Jauja* extends from the table-land of Pasco on the north, about 100 miles southward, between both ranges of the Andes, and in the widest part may be about 80 miles across. Its descent from the table-land is very rapid. At its southern extremity, near 12° 30' S. lat., it is probably less than 8000 feet above the sea-level. This valley is the most populous district of Peru, and contains several comparatively large towns. The northern districts produce abundance of wheat, maize, and the fruits of Europe; in the southern, yucas, plantains, and mandioc are cultivated, and the sugar-cane and tobacco are grown to a considerable extent: but here, as in every other part of Peru, agriculture is carried on in the rudest possible manner.

The *Table-land of Pasco* from south-west to north-east is about 60 miles wide, and in these parts it is inclosed by ranges which rise from 500 to 1000 feet above it. There is here an ascent from the Pacific near the high summit called La Viuda, about 11° 10' S. lat., 76° 30' W. long.; and a descent north of the Cerro Pasco, near 10° 30' S. lat., 75° 40' W. long. The mountain masses are broken towards the north-west and south-east by numerous river-courses, and do not constitute a determinate boundary, but sink imperceptibly lower. This is the highest of the table-lands inclosed within the Andes, the level parts being 14,000 feet above the sea-level, which renders the climate so cold

that this district would have remained uninhabited but for the rich mines of Pasco, which have attracted a numerous population. The mean annual temperature probably does not exceed 40° Fahr. Even in the midst of summer, from May to November, the nights are cold; and at sun-rise all the country is covered with hoar-frost, at which time the thermometer indicates 32°. During the morning the sky, which is serene in the night-time, is covered with fogs accompanied by a strong wind. This is followed by a fall of snow mixed with hail. In the afternoon storms are frequently experienced, accompanied by frightful thunder and hail, which sometimes cause great loss of property and life. In the winter, from November to March, the weather is much worse, as the snow-storms then last for weeks together. The table-land is an uncultivated plain divided into a considerable number of smaller plains by ridges of low hills rising a few hundred feet above their base. The surface of the level parts consists partly of bare rocks or sand. The sand is partly covered with peat, or by swamps intersected with grassy tracts, which serve as pasture-ground for the llamas, which are kept in considerable numbers for the purpose of carrying the ore from the mines to the smelting-places. A great number of lakes are dispersed over the plain. They are very deep, and are the sources of some of the largest tributaries of the Amazonas. In the northern part of the plain is the Lake of Llaurococha, the source of the Marañon. In the southern district is the Lake of Chinchaycocha, which is about 35 miles long, 7 miles wide, and 13,087 feet above the level of the sea. From it issues the principal branch of the Jauja, one of the greatest affluents of the Rio Ucoyal. Near the eastern edge of the table-land is the Lake of Quilnacocha, whence the Rio Huallaga, an affluent of the Amazonas, issues.

The *Vale of the Rio Marañon* extends from 10° to 5° S. lat. The southern part is merely a wide ravine, but about 8° S. lat., it gradually enlarges to a valley several miles wide, and more than 200 miles long. The southern part of this valley is probably not much more than 3000 feet above the sea-level and it lowers very gradually; at its northern extremity, at the Ponga of Rentama, it is only 1250 feet above the sea. This valley is by far the hottest portion of the mountain region, and the vegetation in the lower parts does not differ from that of other tropical countries. Wheat is only grown on the declivities of some adjacent mountains. Maize, mandioc, plantains, and yucas are most extensively grown for the consumption of the inhabitants, and the sugar-cane and tobacco for exportation.

On the west side of the Peruvian Andes, the region of the tropical productions does not ascend more than 2000 feet above the sea, but in the valleys of the mountain region it rises to between 4000 and 5000 feet, probably owing to the abundant rains which fall on the latter. The cultivated grains of this region are rice and maize, and the other products are plantains, bananas, mandioc, yams, amotes, and the sugar-cane. The principal fruits are grapes, anonas, pine-apples, papaws (carica), and cherimoyera. Above this region is that of the European cerealia, which towards the Pacific reaches to 10,000 feet, and in the valleys to upwards of 12,000 feet. The grains cultivated in this region are wheat, barley, and maize; potatoes and different kinds of pulse are also cultivated. The fruit-trees are those of Europe, among which the peach succeeds best. Above this region only quinoa and barley are cultivated; the latter for fodder. Potatoes succeed at a height exceeding 13,000 feet. There are no forest-trees on the western declivity of the Andes below 8000 or 9000 feet, but in the interior of the mountain region they increase in size and number in proportion as the country declines in height, and the lowest districts are covered with nearly impenetrable forests of lofty trees.

Several roads lead from the coast of the Pacific to the interior of the mountain region. [ANDES.] Six of these roads occur south of 15° 20' S. lat. The most southern is the Pass of Las Gualillas (17° 50' S. lat.), which is 14,830 feet high; the most northern mountain pass occurs near 5° S. lat., and leads over the Paramo of Guamani, where it attains the elevation of 10,950 feet above the sea-level. The lowest and most frequented of the southern passes is that of the Altos de los Huecos; it runs at the foot of the volcano of Arequipa, and where it passes the Andes (16° 21' S. lat.) it is only 13,573 feet high.

Of the eastern declivity of the Andes, the portion best known is the vale of the Rio Huallaga. This extensive valley lies east of the vale of the Marañon, being separated from it by the Eastern Andes. It extends from 10° 30' to 7° 30' S. lat., about 350 miles in length. The most southern part, as far north as 9° 30' S. lat., is narrow. In this part the descent is rapid. Huanuco is about 9000 feet above the sea-level, but at 9° 30' S. lat. the valley is probably not more than 4000 feet high. At this place it begins to widen, the Eastern Andes receding to the distance of 15 or 20 miles from the river. About 7° S. lat. a branch of the mountains comes close up to the river, and high hills approach also on the east close to its banks, forming near 6° 30' S. lat. the Pongo of Huallaga, at which the valley terminates on the north. The country north of the Pongo is level, and belongs to the alluvial plain of the Amazonas. The eastern boundary of the vale is formed by a range of lofty hills. The soil of the wider portion of the vale is chiefly alluvial, and as it combines great fertility with abundance of moisture and a great degree of heat, it is capable of maintaining a numerous population. There are at least 100 very rainy days in the year; rain falls at all seasons, but the most rainy season

is in October and November. During the rainy season the heat is frequently oppressive. The declivities of the mountains which inclose the vale are covered with thick forests of tall trees, which is also the case with the greatest part of the vale itself. Wheat and barley are grown in the southern and more elevated districts, whence they are sent to the table-land of Pasco. In the lower part maize, plantains, and bananas are cultivated. There are also plantations of sugar-cane, coffee, cacao, and coca, a herb much used by the Indian population, who chew it with a small quantity of lime. Fruit is here produced in greater perfection than in any other part of Peru, and there are several sorts of vegetables.

The Eastern Plains.—The country to the east of the range of hills which form the eastern boundary of the vale of the Huallaga, and extending from their base to the banks of the Rio Ucayali, is known under the name of the *Pampa del Sacramento*. But though the term 'pampa' is applied in South America to level plains destitute of trees, this country is covered with woods. The surface also is not a level, except along the banks of the Rio Ucayali. At some distance from this river the country is diversified by numerous eminences. This region extends from the banks of the Amazonas to the Rio Pachitea, more than 800 miles from north to south, with a breadth varying between 40 and 100 miles. North of 7° S. lat. it is a dead level, and forms part of the alluvial plain of the Amazonas. No European settlements have been established in this part of Peru. It does not suffer from oppressive heat, while in fertility and products it appears to be little inferior to the vale of Huallaga. It is still in possession of the native tribes, of whom a small number have embraced Christianity.

The country extending from the eastern banks of the Rio Ucayali to the Rio Yavari, which separates Peru from Brazil, is almost entirely unknown. In its general features it appears to resemble the Pampa del Sacramento. Some hills of considerable elevation rise on the plain between 74° and 75° W. long.; and north of 7° S. lat. they are called the Sencis Hills.

The Pampa del Sacramento extends southward to the banks of the Rio Pachitea. The country which extends south of this river, from the eastern chain of the Andes to the Rio Ucayali, is more broken; and the heights rise near the Andes into lofty mountains, but towards the Ucayali sink into hills. The country along the banks of the Ucayali is rather flat, and covered with forests.

Hydrography.—The rivers which descend from the western declivity of the Western Andes and fall into the Pacific are about 60 in number. They have a short course, and flow with great rapidity; are shallow, and have very little water during the greater part of the year; many of them indeed are quite dry for several months. They cannot consequently be navigated even by the smallest canoes, but the water is used to irrigate the adjacent flat tracts.

All the large rivers of Peru originate within the mountain region, and all the waters which collect in it are united in three large rivers, the Marañon, the Huallaga, and the Ucayali. These three rivers may be considered as the principal branches of the Rio Amazonas. The Marañon is noticed under AMAZONAS, of which river it is commonly regarded as the principal branch. It issues from the Lake of Llauricocha on the table-land of Pasco, and runs north-north-west about 150 miles in a narrow valley, and with great rapidity; it then flows in a wide valley with a much gentler current for more than 250 miles to the Pongo de Rentema, and is navigated by balsas and canoes. From the confluence of the Turumbusa the Marañon becomes the boundary line between Peru and Ecuador. From the Pongo de Rentema the river turns to the north-east, and then to the east; and after a course of 150 miles more it descends into the plains by the Pongo de Manseriche, a rapid about 7 miles in length. At the foot of the Pongo de Manseriche is the town of Borja (in Ecuador), from which place the river is navigable for vessels drawing not more than 7 feet. After its union with the Huallaga and Ucayali its depth is so much increased that it is navigable for the largest vessels.

The *Huallaga*, which joins the Marañon near 5° S. lat., 76° W. long., rises in the Lake of Quilucococha, which is also on the table-land of Pasco, south-east of the Lake of Llauricocha. It runs nearly 600 miles. The southern half of its course is north-north-west, and the northern half north-north-east. The upper part of its course is full of rapids, which may however be descended. These rapids cease at Juan del Rio, south of 9° S. lat.; and the river thence affords an easy navigation as far north as 8° S. lat., where several rapids again occur. North of 6° 40' S. lat. occur the last rapids, which render the river nearly unnavigable for about 30 miles. North of 6° 20' S. lat. the Huallaga flows through a level marshy plain to its junction with the Marañon, and is navigable for vessels of considerable size.

The *Ucayali* brings to the Amazonas the drainage of the mountain region situated between 11° and 15° S. lat. This large river is formed by the junction of the rivers Urubamba and Tambo, which takes place near 9° S. lat. The Urubamba is formed by the union of the rivers Paucartamba and Quilabamba, which drain the eastern portion of the table-land of Cuzco, and running north, meet near 11° 30' S. lat. The Rio Tambo is formed by the confluence of the rivers Apurimac and Mantaro. The Apurimac, which drains the western portion of the table-land of Cuzco, unites with the Mantaro, which drains the valley of the Jauja, and in its upper part is called Rio Jauja. Not

REG. DIV. VOL. IV.

far below the place where the Urubamba and Tambo by their union have formed the Ucayali, is a great rapid or cataract called *Vuelta del Diablo*. From this place downward the river runs above 500 miles, first north-north-west and afterwards north-north-east, and no impediment to its navigation by large vessels occurs in this part of its course. Among its chief tributaries is the Rio Pachitea, which rises on the eastern declivity of the mountains which inclose the upper vale of the Huallaga, near 10° S. lat., and runs first east and then north, falling into the Ucayali near 8° 30' S. lat. Nearly the whole of its course appears to be free from impediments to navigation; but its banks are inhabited by native tribes who are in a state of continual enmity with the whites.

Productions.—The trees and plants which are objects of cultivation have been already enumerated. The vast forests of the mountain region and the eastern country supply several articles for commerce and for domestic use, such as vanilla, sarsaparilla, copaiba, caoutchouc, and several kinds of resins and gum; also various barks and woods, used as dyes, such as Brazil-wood, log-wood, mahogany-bark, and arnotto; and the medicinal or Peruvian bark (*Cinchona*). The indigo plant grows spontaneously. There are various kinds of lofty trees, useful as timber or for cabinet-work, as mahogany and cedar.

Domestic animals are far from being abundant in Los Valles, on account of the want of pasture. There is a good supply of horses, and still better of mules, which are used for the transport of merchandise. On the elevated table-land of Pasco, and in other mining districts, llamas are kept for that purpose. A llama carries about 130 lbs., or half the load of a mule. Alpacas are bred for their wool. Cattle are abundant in the mountain region, where the declivities supply extensive pasture-grounds; and in the colder places sheep abound. The wool of the sheep, llama, and alpaca now forms an important article of export.

Nearly all the wild animals peculiar to South America are found in Peru, as the jaguar, the puma, the ounce, the tapir, the spectacled bear, several species of monkeys, sloths, armadillos, wild boars, ant-eaters, guanacos, and vicuñas. Von Tschudi found twenty-six species of *Mammalia* in the coast region. The condor inhabits the most elevated parts of the Andes. Falcons, hawks, and owls abound. Parrots, parroquets, and macaws are numerous in the woods on the mountains. Whales and seals abound along the coast. Fish are plentiful in the large rivers of the eastern region, where they constitute the principal food of the inhabitants, together with the manatee and turtles. The manatee occurs only in the Ucayali and the lower part of the Huallaga. The oil extracted from the eggs of the turtle is an article of export under the name of manteca. Alligators are numerous in these rivers, and they are often thirty feet long.

Peru is noted for its wealth in silver and gold. The number of mines which have been worked is above a thousand; many of them are exhausted or abandoned, but many of them are still worked; and some, as those of Pasco, are very rich. Of late years mining in Peru has received a great impetus from the introduction of foreign capital, and the annual produce of the mines has been largely increased. There are quicksilver-mines near Huancavelica. Copper, iron, lead, and brimstone are found in several places. Saltpetre is found in the country adjacent to the Pacific, south of Arequipa, and great quantities of it are exported by English vessels. Salt is collected on the coast north of Callao, at Point Salinas, and in Secura Bay, where there are salinas, or salt-ponds. Of late years a very important source of revenue has been the guano, which is obtained in vast quantities on the islands and rocky headlands of the coast. Of 235,111 tons of guano imported into England in 1854, no less than 221,747 tons came from Peru.

Inhabitants.—The population is composed of creoles, or descendants of Europeans, Peruvian Indians, negroes, and a mixed race. The greater part of the eastern region is in possession of independent tribes, and only those natives who inhabit the vale of the Huallaga have been converted and subjected to the government of the whites. The number of creoles is estimated at about 200,000, and that of the Peruvian Indians at more than 800,000; the remainder are a mixed race, the offspring of Europeans and Indian women, with about 40,000 free negroes and slaves.

The Peruvian Indians inhabit the Valles and the Montaña, to the exclusion of all other native tribes. They speak the Quichua language, which is generally called the language of the Incas, and which is used by all the natives of South America, from Quito near the equator, to Tucuman in La Plata, 27° S. lat. That the Peruvian Indians had attained a considerable degree of civilisation at the time of the arrival of the Spaniards is proved by the numerous ruins of extensive buildings; the remains of the great artificial road which leads through the Montaña from Quito to Cuzco, and thence southward over the valley of the Desaguadero; and more particularly by the fact that they irrigated the low tracts in the vales by making cuts to convey the water from the small rivers over the fields, and by the judicious manner in which the water was distributed. They have since acquired iron implements and domestic animals to assist them in their agricultural labour, but they have not been benefited in any other respect. These Indians apply themselves particularly to agriculture, and there are numerous villages, and even small towns, the whole population of which now consists of Peruvians. They also work in the mines, manufacture different kinds of woollen and cotton cloth, and show

L

much expertness in making articles in gold and silver, and in various other kinds of handicraft. They are also fishermen, and sail with their balsas along the coast from one small port to another to exchange their different productions.

The native tribes which inhabit the vale of the Huallaga River have been converted, and are nearly equal in civilisation to the Peruvians. The Shanamachos live on the eastern banks of the Huallaga, and on the western banks are the Cholones, Sharras, and Ibitas. They all seem to belong to one nation, as they speak one language called the Ibita, though most of them understand the Quichua. They cultivate the grains and roots which have been mentioned as the principal productions of this valley.

The independent native tribes inhabit the low and level country east of the mountain region. South of 12° S. lat., on the east of the Andes, are the Chunchos, a numerous and savage race, and the Tuyoneris. The Antes inhabit the country where the Paucartamba and Quilabamba unite, between 12° and 11° S. lat. North of 11° S. lat., and as far north as 9° S. lat., are four tribes—the Tampas, Palutuniques, Chuntaguirus, and Pirós. The country on both sides of the Pachitea River, as far north as 8° S. lat., is in possession of the numerous and warlike tribe of the Cashibos. North of them, between the Huallaga and Ucayali, are the Conibos, Setebos, and Shipobos; and still farther north two small tribes, the Maparis and Puinaus. Between the Ucayali and Yavari are the Amajuacas (between 9° and 8° S. lat.), the Remos (between 8° and 7° S. lat.), the Sencis and Capanaguas (7° and 6° S. lat.), and the numerous tribe of the Mayorunas, who occupy the country to the very banks of the Amazonas. The tribes inhabiting both banks of the Ucayali speak one language, the Pano, or dialects which differ very little from one another. The Conibos, Setebos, and Shipobos have been partially converted to Christianity; but the missionaries have made no impression on the other tribes, and no attempt at conversion has been made among some of them. Since Peru has obtained its independence the missions have been much neglected, and many of the converted Indians have returned to the woods, and are again lost to civilisation; but on the whole the Indians have made considerable progress during the last thirty years. The converted and several of the unconverted tribes are agriculturists. They use a few articles of European manufacture, as hatchets, knives, scissors, needles, buttons, and some glittering baubles, which they procure at Nauta on the Amazonas, or at Sarayacu on the Ucayali. The Chuntaguirus, who are the most remote from all the settlements of the whites, ascend the Ucayali and Urubamba to the confluence of the Paucartamba and Quilabamba, where they procure by barter such articles as they want, giving in exchange parrots and other birds, monkeys, cotton robes white and painted, feather ornaments, wax, balsams, &c.

Manufactures.—The Peruvian Indians consume a very small quantity of European manufactured articles. Their dress is composed of cotton or woollen stuffs made at home, or in several of the small towns in the vale of the Marañon and Jauja. These home-made stuffs also serve as the dress of the mixed race. Only the creoles dress in European stuffs. There are some manufactures of cordovan leather, and some tanneries and soap-houses. The iron utensils, such as hatchets, scissors, &c., made in Caxamarca, are highly valued. In the large towns many persons are occupied in making vessels, utensils, and ornaments of gold and silver.

Commerce.—The country is too mountainous to admit the making of carriage-roads in the interior. Mules are generally used by travellers and for the transport of merchandises. In the more elevated parts of the country llamas are employed for the latter purpose. The foreign commerce is considerable, especially that with the other countries of America bordering on the Pacific, and also with Europe. The most important article of export is the produce of the mines, especially silver. Sugar, which is sent to Mexico, New Granada, Ecuador, and Chili, and saltpetre, the quantity of which sent to different countries of Europe is very great, perhaps rank next in importance; but of late guano has been an article of very great traffic. Cotton, tobacco, maize, rice, salt, and spirits, are minor articles. Wheat, flour, wine, and fruits are imported from Chili, with which country there is an active commerce. Manufactured goods are received from Europe and from the United States of North America, and from Canton silk goods and nankeens. We have no particulars of the total value of the exports and imports of Peru. The value of the imports from England in 1853 was 1,246,730*l.*; that of the exports from Peru to England in the same year was 1,491,759*l.* The principal articles exported to England were—bark, cochineal, copper-ore, guano, nitre, and wool: of the latter there were 1,789,919 lbs. of sheeps' wool and 2,008,572 lbs. of alpaca and llama wool. Cotton and woollen goods, hardware, cutlery, iron, &c., are the principal articles which Peru imports from England.

Divisions, Towns, &c.—Peru is divided into eleven departments, Amazonas, Libertad, Anchas, Junin, Lima, Huanavelica, Ayauccho, Cuzco, Arequipa, Moquegua, and Puno, which are subdivided into 65 provinces. The capital of the republic is LIMA. The following are among the other more important towns: the population is a mere estimate:—*Acaes*, which is built in a fertile plain several miles from the sea, near the southern boundary of the department of Lima, is a considerable place, though little visited by travellers. The port, called Point Lomas, has good anchorage and tolerable landing.

AREQUIPA; ARICA; CALLAO. *Caxamarca* stands on the eastern declivity of the Western Andes, in a rich silver-mining district, 75 miles N.E. from Truxillo: population, 7000. It is nearly 9000 feet above the sea-level; contains some handsome churches, and the ruins of a palace of the Incas. Cotton and woollen-cloth are manufactured to a considerable extent, and also many articles of silver and iron; the artificers of Caxamarca being accounted the best workers in those metals in Peru. In the neighbourhood there are hot springs, called the Baths of the Incas. *Chachapoyas*, near the western declivity of the Eastern Andes, on the road which leads to the vale of the Rio Huallaga, 70 miles E.N.E. from Caxamarca, population 3000, is a place of much trade. A great deal of tobacco is raised in the neighbourhood. *Chuquito*, near the Lake Titicaca, has above 4000 inhabitants. **CUZCO.** *Huaccho*, a port and 'city' on the coast, 80 miles N. by W. from Lima, contains about 5000 inhabitants, chiefly Indians, who cultivate the rich farms in the vicinity, or work in the salinas: the women plait coarse straw-hats, mats, &c., which they carry to Lima for sale. *Huanuco*, the capital of the department of Ayauccho, population 20,000, is a large place, founded by Francisco Pizarro, in an elevated situation, on the road leading from Lima to Cuzco, and has a considerable trade. It has a fine cathedral, a university, and a seminary for clergymen. The rich creole families that live in this town have large sugar-plantations in the valley of the river Mantaro. The suburbs, which are inhabited by Indians, are large, and the houses better than in other Indian towns. *Huanaco*, in the upper vale of the Rio Huallaga, N.E. of Pasco, population 6000, owes its prosperity to the circumstance of its agricultural produce finding a ready sale at Pasco. In the neighbourhood there are ruins of considerable extent. *Huacavelica*, the capital of the department of the same name, population 6000, is built in a ravine between mountains whose summits rise to the height of 13,000 feet, and which contain several rich mines of gold, silver, and quicksilver. Nothing is cultivated in the neighbourhood. *Huari*, in the upper vale of the Marañon, is a mining town of 5000 inhabitants. *Islay*. [AREQUIPA.] *Lambayeque*, population 4000, is situated on the coast, 130 miles N.W. from Truxillo, in a district which produces abundance of rice, and has a considerable commerce, though the roadstead is bad. *Moyobamba*, near the eastern declivity of the Eastern Andes, has 4000 inhabitants, who make coarse cotton-cloth. *Pasco*, or *Cerro Pasco*, is built on the table-land of Pasco, 10° 48' S. lat., 76° 23' W. long., 13,673 feet above the sea-level. Pasco is the most elevated town in America, if not in the world, which is permanently inhabited. This town, whose population fluctuates, according to the produce of the mines, between 12,000 and 18,000, is irregularly built on very uneven ground. The site on which it stands abounds in silver-ore, and the mouths of the mines are frequently within small houses in the streets of the city. Only those mines are worked which contain rich ores. The houses are low, and some have small glazed windows; but the suburbs are merely a collection of mud huts. As the surrounding country is destitute of trees, it is fortunate that coal abounds in the neighbourhood. All kinds of provisions have to be brought from a distance; but the markets of Pasco are well supplied not only with the necessaries of life, but with many of the most costly luxuries. *Payta*, near the northern extremity of the coast of Peru, population 6000, is a commercial town with an excellent harbour. The town is built on the slope and at the foot of a hill. It is the port of the fine vale of the Rio Piura, which contains 75,000 inhabitants, and is a place of much business, being the port of communication with Europe by way of Panamá. It exports large quantities of cotton and grain. *Pisco*, built on a plain, about a mile from the shores of the Bay of Pisco, population 3000, has a considerable commerce, and exports sugar, wine, and a kind of spirit called Pisco, or Italia. South of Pisco are the towns of *Yca* and *Nasoa*, in which much wine is made and exported to other parts of Peru. These two towns are closely connected with Pisco in the wine trade. *Piura*, or *San Miguel de Piura*, the first town founded by the Spaniards in Peru, stands on the left bank of the Rio Piura, about 20 miles from Payta, population 8000, has considerable manufactures of soap and leather, and an extensive transit trade. It is the largest town in Northern Peru. *Puno*, on the western shore of the lake of Titicaca, in the valley of the Desaguadero, is the capital of the department of Puno: population, 8000. In the vicinity are numerous silver-mines, which were formerly remarkably productive. *Tacna*, in the valley of the Arica, about 30 miles from Arica, population 6000, is the depôt of European merchandises for the consumption of the department of Puno and the greater part of the republic of Bolivia. *Tarma*, in the vale of the Rio Jauja, has 5000 inhabitants, who manufacture considerable quantities of cotton and woollen stuffs. *Truxillo*, founded by Francisco Pizarro, and named after his birth-place, is situated in the middle of the extensive valley of Chimú, about 2 miles from the sea, 8° 7' S. lat., 79° 4' W. long.: population about 6000. The harbour, Huanacho, is an open roadstead. The streets of Truxillo are wide and regular, and it has a fine cathedral and a handsome town-hall. The principal articles of export are bullion, sugar, and rice. The valley of Chimú contains the ruins of a large Indian town.

History.—When the Spaniards first visited Peru, they found the country under a well-regulated government, and inhabited by a nation which had made great progress in the arts of civilisation. The people were decently dressed, and lodged in comfortable houses. Their fields

were well cultivated, and artificial cuts had been made to conduct the water of the small rivers to a considerable distance for the purposes of irrigation. They had extensive manufactures of earthenware and woollen and cotton cloth, and also tools made of copper. Even now the elegant forms of their utensils, made out of the hardest rock without the use of iron tools, excite admiration. The extensive ruins of palaces and buildings scattered over the country, and the remains of the great road which led from Quito to Cuzco, and thence southward over the table-land of the valley of the Desaguadero, show that the nation was far advanced in civilisation. This civilisation appears to have grown up in the nation itself, and not to have been derived from communication with other civilised people. The navigation of the Peruvians was limited to coasting from one small harbour to another in balsas. The difference in political institutions and in the usages of society between the Peruvians and Mexicans precludes the supposition of either of these two nations having received their civilisation from the other. Besides this, they were divided by savage tribes, which were sunk in the deepest barbarism. The Spaniards were surprised to find this state of things in Peru. When they had got possession of the country, they inquired into its history, and learned the following traditions:—

About three centuries before the arrival of the Spaniards, Manco Capac and Mama Ocollo appeared on the table-land of the Desaguadero. These two personages, male and female, of majestic stature, appeared clothed in garments, and declared that they were children of the sun, and sent by their parent to reclaim the human race from its misery. The savage tribes submitted to the instruction of these beings of a divine origin, who taught them the first arts of civilisation, agriculture, and the manufacture of clothing. Manco Capac organised a regular government, and formed his subjects into four different ranks or classes, which had some slight resemblance to the castes of the Hindoos. He also established many useful customs and laws, and founded the town of Cuzco, which soon became the capital of an extensive empire, called the empire of the Incas (or lords) of Peru. He and his successors, being considered as the offspring of the divinity, exercised absolute and uncontrolled authority. His successors gradually extended their authority over the whole of the mountain region between the equator and 25° S. lat. When the Spaniards first entered Peru, the 12th monarch from the founder of the state, named Huayna Capac was said to be seated on the throne. He had violated the ancient usage of the Incas, which forbade a monarch to marry a woman not a descendant of Manco Capac and Mama Ocollo. His wife was a daughter of the vanquished king of Quito, and the son whom she had borne him, named Atahualpa, was appointed his successor in that kingdom. The rest of his dominions he left to Huascar, his eldest son by a princess of the Inca race. This led to a civil war between the two princes, and when the contest was at its height, a Spanish force entered the country under Francisco Pizarro in 1531.

Pizarro had sailed in 1526 from Panamá to a country lying farther south, which, according to the information collected from the natives, abounded in precious metals. He sailed along the coast as far south as Cape Parina or Cape Aguja. Landing at Tumbes in the Bay of Guayaquil, the most northern point of the present republic of Peru, he was struck with the advanced state of civilisation of the inhabitants, and still more with the abundance of gold and silver vessels and utensils. From this time he resolved on the conquest of the country. In 1531 he returned with a small force which he had procured from Spain, marched along the coast, and in 1532 built the town of St. Michael de Piura, the oldest Spanish settlement in Peru. The distracted state of the country, caused by the civil war, enabled the Spaniards to take possession of it without a battle; and though the Peruvians afterwards tried to renew the contest, they were easily defeated and compelled to submit to a foreign yoke. Pizarro built the towns of Piura, Truxillo, Lima, Arequipa, and Huamanga: Cuzco was founded by Manco Capac.

The disorders which immediately followed the conquest nearly caused the loss of the country, a circumstance which determined the court of Spain to make Peru the chief seat of the Spanish dominions in South America. Lima was chosen for the capital, and it soon rose to such opulence that it was called the City of the Kings. The authority of Spain took deeper root in Peru than in any other of her South American Colonies. In 1780 the Peruvians took up arms against the Spaniards, under Tupac Amaro, an Inca, but failing to capture the town of La Paz after a long siege, they again submitted. When all the Spanish colonies began to rise against the mother country, after the year 1810, Peru remained quiet, and though some of the neighbouring provinces had already expelled the Spanish armies, and others were attempting to do the same, the Spaniards remained in undisturbed possession of Peru until 1820, when General San Martin, after having expelled the Spaniards from Chili, entered Peru at the head of a victorious army, and soon obtained possession of Lima. The independence of Peru was declared on the 28th of July, 1821, and San Martin was proclaimed protector of Peru. The Spanish viceroy Canterac, who had remained in possession of the Montaña, gradually recovered the Valles. San Martin, having lost his popularity, resigned his authority into the hands of the legislature on the 19th of August, 1822. On the 1st of September, Bolivar, the Columbian general, entered Lima, and continued the war with Canterac, but at first with doubtful

success. In February, 1824, Bolivar was made dictator; and in December of the same year the Spanish army, under Canterac, was entirely defeated by Sucre, on the plains of Ayacucho, by which battle the authority of Spain in Peru and South America was annihilated. In February, 1825, Bolivar had resigned the dictatorship, but he had previously contrived to separate the southern provinces from the northern, and to convert the former into a new republic, which adopted the name of Bolivia. Several different forms of government were tried within the six years following the declaration of independence. The constitution adopted by Bolivar in 1826 excited great discontent, and as Bolivar was soon afterwards obliged to go to Columbia, where an insurrection had broken out and a civil war was on the point of commencing, a complete revolution took place in Peru, in January, 1827. The Bolivian constitution, or government, was abolished, and a new federal constitution, avowedly founded on that of the United States of North America, was framed and adopted, and may be considered as still in force. The national congress, or supreme legislature, consists of two bodies, a senate and a house of representatives. The president, in whose hands the executive power is placed, is chosen for four years, and he cannot be re-elected. The departments have their own legislatures, and administer their own affairs, but the laws passed by these legislatures must be approved by the National Congress. The highest officers of the central government in the departments are the prefects and subprefects. These persons, as well as the judges, are elected by the congress from three candidates, who are proposed by the provincial governments. The Roman Catholic religion alone can be publicly exercised. But though this is still the nominal constitution, Peru has been ever since its adoption almost continually distracted by parties struggling for power, and by civil wars and revolutions produced by these continual struggles, while the government has really been in the hands of the chief of the successful party. The most recent intelligence received from Peru (March, 1855) confirms the announcement of the successful termination of a revolution which had been in progress for about a year, and by which the late president, or dictator, General Echinique, has been driven from power. During the latter portion of the late president's supremacy, the financial reputation of Peru had fallen into the lowest depth of discredit, but it has been announced that the new government will at once endeavour to regain the confidence of the national creditors. The public debt consists of an internal debt of a very large but unnamed sum, and a foreign debt which was stated in 1854 to amount to about 4,000,000*l.* The total revenue in 1850 was 2,139,000*l.*; the expenditure was set down at 1,857,000*l.* By the constitution no persons born in Peru, or brought into the country subsequent to the publication of the Charter of Independence, can be slaves, but this article of the charter has been frequently evaded, and its evasion has been formally sanctioned by the National Congress. The number of slaves in Peru has been estimated at about 30,000. General Castellan, the present ruler of Peru, in January, 1855, issued a decree by which all slaves are to be liberated, except such as took up arms in the cause of Echinique; at the same time he pledges the government to indemnify their owners within five years.

PERUGIA, a delegation or province in the Papal States, is bounded N. by the Apennines, W. by Tuscany, S. by the provinces of Spoleto and Viterbo, and E. by those of Macerata and Spoleto. Its length from the Apennines, which border the valley of the Tiber above Città di Castello, down to the confluence of the Paglia with the Tiber, is about 60 miles, and its breadth varies from 20 to 35 miles. The area is 1447 square miles. The population in 1852 amounted to 222,926. The province of Perugia is entirely in the basin of the Tiber. The Lake of Perugia (*Trasimenus*) lies near the borders of Tuscany; its circumference is about 30 miles, the greatest width is about eight miles; the depth is not more than 30 feet. It contains three small islands. The lake is inclosed by hills on the north, east, and south, but the western shore is more open, merging into the wide plain of Cortona. This lake is fed by no permanent river, but by numerous springs which rise from the bottom of the bed; it has no natural outlet, and in seasons of rain, when numerous streams run into it from the neighbouring hills, it used to overflow the banks, and sometimes the waters have entered the plain of Cortona, and mixing with those of the Chiana, have flowed into the Arno. In order to prevent the mischief occasioned by these floods, a tunnel was cut in the 15th century by Braccia da Montone, lord of Perugia, through a hill on the south-east bank opposite the southern island of Polrese. The water on issuing out of the tunnel flows into a canal, sets in motion several mills, and after a course of about two miles enters the river Caina, an affluent of the Nestore, which is a feeder of the Tiber. The mouth of the emissary is above the ordinary or summer level.

water flows into it only in the winter or after heavy rains. The emissary was repaired by order of Pope Clement VIII. in 1602-3.

The site of the battle between Hannibal and the Romans is supposed to be near Passignano on the north-east side of the lake, where the hills recede some way from the shore. The province of Perugia is chiefly hilly, being crossed by offsets from the Apennine chain, which stretch southward in a direction parallel to the course of the Tiber. South of the town of Perugia are some extensive plains, one of which lies eastward towards Foligno, and another along the right bank of the Tiber, towards Città della Pieve. The principal affluents of the Tiber in the province of Perugia are the Chiascio, the Nestore, the Naja, and the Paglia which receives the Chiana, the outlet of the Lake of Chiusi in Tuscany. [CHIANA, VAL DL.]

The province of Perugia is the most fertile of the provinces south of the Apennines. The principal productions are corn, wine, oil, silk, and grass, on which large herds of fine horned cattle are fed: nearly one-half of the consumption of butcher's meat by the city of Rome is supplied by cattle from Perugia. The Lake of Perugia abounds with fish, which forms a considerable article of export; and the shores are frequented by numerous aquatic birds. The climate is healthy, except in a few low spots on the banks of the lake and in the valley of the Chiana near Città della Pieve.

The principal towns of the province are—PERUGIA; ASSISI; NOCERA. *Foligno*, a pleasant well-built town on the Topino, on or near the site of the ancient Fulginium, is said to have risen to importance only about the 11th century, after the destruction of the neighbouring town of Forum Flaminii. It has a handsome cathedral, several other fine churches; manufactures of woollens and silks, extensive paper-mills, and 7300 inhabitants. *Todi*, the ancient *Tudertum*, a city first of the Umbri, next of the Etruscans, and afterwards a Roman colony, stands on a hill above the Tiber. It has a cathedral, and another handsome church built after the design of Bramante, with several remains of Etruscan and Roman antiquities, among which are the town walls and the ruins of a temple of Mars. The population is about 3000. *Città di Castello*, a well-built town, with 5000 inhabitants, in the valley of the Upper Tiber, near the borders of Tuscany, contains several fine churches (in which are some good paintings), and a palace of the former baronial family of Vitelli. *Città della Pieve*, a small town situated on an eminence above the Chiana, has about 2000 inhabitants. *Gualdo*, a walled town of 5000 inhabitants, near the site of the ancient Tadinum, is situated at the foot of the Apennines. Its neighbourhood was the scene of the defeat of the Goths under Totila by the Romans under Narses. *Spello*, a few miles north of Foligno, is on the site of the ancient Hispellum, of which there are still considerable remains of its walls, a Roman gate called *Porta Veneris*, a triumphal arch in honour of the emperor Macrinus, and an amphitheatre in the plain below the town. Spello has several churches, with good paintings, a college, and about 2400 inhabitants.

PERUGIA, the chief town of the province of Perugia, in the States of the Church, is built on a high hill which forms two summits, on the left bank of the Tiber, 82 miles N. from Rome, and has about 19,000 inhabitants, including the suburbs. It is surrounded by walls in the form of a polygon. The streets are wide, and the squares are lined by massive old buildings. It has also numerous churches with lofty domes, fine gates, and retains all the appearance of an important though now somewhat decayed city. Perugia is a bishop's see, and it has a long-established university, which is attended by between 300 and 400 students. In connection with the university are a library of 30,000 volumes with some valuable manuscripts, a botanical garden, a collection of minerals, and a cabinet of antiquities, rich in Etruscan inscriptions, bronzes, vases, and medals. The Academy of the Fine Arts has a collection of pictures by natives of Perugia and its territory; there are also several private galleries of paintings. Perugia has a school of music, two theatres, a dramatic academy, assembly-rooms, and a literary club. The circumference of the walls is above six miles, but much of the area within is not built upon. The citadel, from which there is a splendid view, was built by Pope Paul III. Perugia has manufactories of silks, woollens, and soap; brandy distilleries; and a considerable trade in the products of its fertile territory—corn, oil, wool, wine, and cattle. Large cattle-fairs are held in August and November.

Among the many churches of Perugia, said to be above a hundred, the most remarkable are—the *Duomo*, or cathedral, which is built in the gothic style and decorated with good paintings. A celebrated painting by Perugino, representing the Marriage of the Virgin, which adorned this church, was taken away, with many other master-pieces, at the first invasion of Bonaparte. The church of San Francesco formerly contained the Descent from the Cross, by Raffaele, now in the Borghese Gallery. The vast Benedictine convent of San Pietro is decorated with several paintings by Vasari. The church of San Domenico has a fine coloured-glass window in the choir; it contains also the finely-sculptured tomb of Pope Benedict XI., who died at Perugia in 1304. The town-house (Palazzo dei Priori), a vast gothic building, and the residence of the delegate and of the municipal authorities, contains the archives of Perugia. The old exchange is adorned with beautiful frescoes by Perugino. The square before the cathedral contains a fine fountain, with sculptures by Giovanni da Pisa. In the square Del Papa is the bronze statue of Julius III. seated in a chair,

cast by Vincenzo Danti of Perugia. The Place Grimana has a handsome gate, said to be of Etruscan construction, but called the Arch of Augustus. The church of San Angelo is built on the site and with the materials of an ancient temple. About a mile from the walls of the town there is an ancient Etruscan sepulchral structure, with an arched vault and an Etruscan inscription. Many objects of remote antiquity have been discovered in the immediate vicinity of the city, which are deposited in the Archaeological Museum.

Perusia was one of the principal cities of ancient Etruria, but it seems to have been built before the Etruscan dominion by a colony of Umbri from Saraina. (Servius, x. 201.) It acted a principal part in the wars of the Etruscans against Rome; its troops were defeated by the consul L. Fabius Maximus, and then Perusia, together with Arretium, sued for peace and paid tribute to Rome, B.C. 294. (Livy, x. 31, 37.) In the second Punic war Perusia was one of the allied towns that sent timber and provisions to Scipio to fit out his armament against Africa. During the second triumvirate, the consul Lucius Antonius shut himself up in the town of Perusia, where he sustained a long siege, and at last, through famine, was obliged to surrender to Octavianus, who gave up the town to plunder. Perusia was on that occasion nearly destroyed by fire. It was afterwards rebuilt under the name of Perusia Augusta. At the fall of the Western empire it was devastated by the Goths under Totila. It afterwards ruled itself for a time as a free municipality, had its factions of Guelphs and Ghibelines, its own tyrants, and at last submitted voluntarily to the rule of Braccio da Montone, one of the best chieftains of the middle ages. Pope Paul III. united it to the Papal State.

PÉRUEWELZ. [HAINAULT.]

PESARO-E-URBINO, a legation or province of the States of the Church, is bounded E. by the province of Ancona, N. by the Adriatic, W. by the province of Forli and Tuscany, and S. by the province of Perugia. The area is 1353 square miles: the population in 1850 was 241,612. The central ridge of the Apennines, which divides the province of Pesaro-e-Urbino from Tuscany, projects eastward towards the Adriatic in the neighbourhood of Urbino, and sends off several offsets, which run to the sea-coast, forming the natural boundary between Northern and Southern Italy. The mountain on which San Marino stands forms part of one of these offsets. [SAN MARINO.] Several streams run in a north-east direction from the Apennines to the sea. The Conca runs between the provinces of Forli and Pesaro, and enters the sea near La Cattolica. The Foglia (ancient Pisaurus) rises in the Apennines of Carpegna, on the Tuscan border, and enters the sea at the town of Pesaro. Farther south is the Metauro, the largest river in the province, which rises on the east side of the Apennines that bound the valley of the upper Tiber. It runs first due east, then north-east past Fossombrone, and enters the sea near Fano, after a course of 60 miles. The principal feeder of the Metauro is the Cantiano, which comes from the mountains of Gubbio, and joins it on the right bank between Fossombrone and Furlò. According to a tradition among the country-people, the spot at which Hasdrubal was defeated and killed is a plain above the confluence of the Cantiano. A tower on a hill, on the right bank of the Metauro, is called the Sepulchre of Hasdrubal. The Flaminian road from Fano crosses the Metauro above Fossombrone, and follows the course of the Cantiano, ascending the Apennines above the source of the latter river, and afterwards descending by Gualdo to Nocera. The Césano rises in the mountains of Avellana, passes Périgola, and enters the sea north-west of Sinigaglia. The Misa enters the sea at Sinigaglia.

The surface of the province is hilly; some parts of it are very fertile, but the mountains are generally barren. The lower hills are planted with vines and olive- and mulberry-trees. Good pasture is also abundant. Coal is found near Pesaro.

Towns.—URBINO. *Pesaro*, the ancient *Pisaurum*, a well-built town and a bishop's see, built upon a rocky and wooded hill above the mouth of the Foglia, has several fine churches with some good paintings; several palaces, one of which is the residence of the legate; a public library of 15,000 volumes, with a museum and a cabinet of models. Pesaro has a small harbour, several manufactories of silks, pottery and glass, and leather, and about 17,000 inhabitants. It is surrounded by a bastioned wall. In the 16th century it was the residence of the dukes della Rovere, great patrons of literature and the arts. The surrounding territory, which produces excellent figs, is covered with pleasant country-houses. Pesaro has a civil and criminal court, a commercial tribunal, a college, and a clerical seminary. It is the birthplace of Rossini. *Fano*, the ancient *Fanum Fortunæ*, is a sea-port town at the mouth of the Metauro, with about 10,000 inhabitants. It has a triumphal arch dedicated to Augustus, several churches with paintings by Guido and Guercino, a handsome theatre, some silk manufactories, and a public library. The town is surrounded by walls. The harbour is nearly useless, from the accumulation of sand; only vessels of very light draught enter it. *Sinigaglia*, the ancient *Sema Gallica*, is a bustling town with a small harbour, several churches and convents, and about 8000 inhabitants. It is chiefly remarkable on account of its great fair, which is held in the month of July, and is frequented by trades-people from all parts of Italy, and also from other countries, for the sale and purchase of colonial produce, and of British, French, and German manufactures. All articles enter the fair free, but pay duty on passing the gates into

the country. The fair of Sinigaglia has been held since 1200, and was made free by Pope Paul II. in 1464. *Fossombrone*, situated on a hill about a mile and a half from the ruins of *Forum Sempronii*, which are lower down the banks of the Metauro, is a bishop's see, has several churches and convents, a bridge over the Metauro, and about 6500 inhabitants. The silk manufactured by steam machinery at Fossombrone is considered the best in Italy. The town is also famous for its woollen manufactures. The Flaminian Way from Fano to Foligno through Fossombrone traverses an extremely beautiful country on the left bank of the Metauro. Crossing the Metauro, it then runs up the left bank of the Cantiano, traversing the scene of the great battle in which Hasdrubal was slain, B.C. 207. At the Pass of Furlo the road is carried for above half a mile on shelves and through a tunnel, out in the rocky precipices that overhang the Cantiano. *Gubbio*, the ancient *Iguvium*, a city of the Umbri, is situated on the southern slope of the Apennines, near the source of the Chiascio, an affluent of the Tiber. It has several churches and other buildings worthy of notice, and about 5000 inhabitants. Old Iguvium was in a lower situation than the present town; the amphitheatre is still in tolerable preservation. There is also an ancient tomb, with other remains of antiquity. Traces of the temple of Jupiter Apenninus, an old deity of the Umbri, are visible a few miles from Gubbio. In this neighbourhood also were found, about the middle of the 15th century, the seven bronze tablets written partly in Etruscan and partly in Latin characters, and known by the name of the Eugubine Tables, which are now in the museum of Gubbio. *Cagli*, the ancient *Callia*, a Roman colony, on the Flaminian road, has about 10,000 inhabitants, some remains of antiquity, and an important trade in leather and dressed skins. *Urbania*, a modern town, which derives its name from Pope Urban VIII., is situated on the banks of the Metauro; has a collegiate church, a manufactory of majolica, or delft ware, and about 4400 inhabitants. *Pérgola*, on the Césano, has 5600 inhabitants, and extensive carpet-factories.

PESCARA. [ABRUZZO.]

PESCIA. [FIRENZE.]

PESCINA. [ABRUZZO.]

PESCO COSTANZO. [ABRUZZO.]

PESHAWUR, formerly a frontier town of Afghanistan, is now included in the government of the Panjab, and occupied permanently by a body of British troops. The town is situated in a spacious and well-watered plain, in 34° N. lat., 71° 38' W. long., 12 miles E. from the Khyber Pass, and 40 miles W. from Attock. The town, which is about 5 miles in circumference, is defended by a fort, and contains a population of about 50,000. The streets are narrow, but are paved; the houses are generally constructed of brick. The public buildings include the mosques and a large caravanserai.

PESQUEIRA. [BEIRA.]

PESTH, the most populous city in Hungary, is situated in 47° 30' N. lat., 19° 4' E. long., on the left or east bank of the Danube, about 20 miles from the spot where the course of the river, till then nearly from west to east, makes a sudden bend to the south. On the other side of the Danube, which is here about 1500 feet broad, is the city of Ofen. [BUDA.] The two cities are connected by a bridge of boats, and by a fine suspension bridge, erected by Mr. Tierney Clark, an English engineer, and opened in January 1849. The city of Pesth is about 7 miles in circumference. It consists of five principal parts—1, the old town, which, though antiquated and irregularly built, contains some fine buildings; 2, the Leopoldstadt, or new town; 3, the Theresienstadt; 4, the Josephstadt; and 5, the Franzstadt—so named after the sovereigns in whose reigns they were built. Leopoldstadt is now joined to the old town, the walls which formerly surrounded the latter having been levelled to make room for new buildings. Leopoldstadt is built on a very regular plan. The other three parts or suburbs are separated from these two by a very broad street. The population of the city, including the garrison, is about 75,000, of whom about five-sixths are Roman Catholics. Among the 12 Roman Catholic churches, that of the university is distinguished by its fine steeple and excellent fresco paintings. The Greek church is one of the finest buildings in the city, but the Calvinist churches are very plain edifices. Of the other public buildings, the following deserve notice: the great barracks built by Charles VI.; the hospital of invalids, which serves as barracks for a regiment of artillery; the theatre, a very handsome edifice, capable of containing 3000 spectators; the national museum, and the university. The university was founded in 1635 at Tyrnau. In 1777 it was transferred by Maria Theresa to Ofen, and in 1784 by Joseph II. to Pesth. There are 45 professors and about 700 students. The university has a library of 60,000 volumes, a cabinet of natural history, and an anatomical and pathological collection. Connected with it are the botanic garden, the veterinary school, the university hospital, and the observatory at Ofen. [BUDA.] The national museum, which is independent of the university, was founded by Count Szecsenyi, who gave to it his fine library and a valuable collection of Hungarian coins and medals. The collection of coins and medals contains above 60,000 specimens, of which the Greek, Roman, and other antique silver medals amount to above 12,000. The gymnasium of the Piarists has 800 scholars; and the city normal school (likewise in the convent of the Piarists), above 400. The Magyar Academy is an institution of recent establishment.

The manufactures of Pesth are of silk, cotton, leather, jewellery, and musical instruments; that of tobacco is a government monopoly. Pesth has, next to Vienna, the greatest trade of any city on the Danube. It has four fairs, each of which lasts a fortnight. The principal articles sold are manufactures and colonial produce, and the natural products of the country, such as cattle, wine, wool, tobacco, and raw hides, honey, wax, &c. The environs of Pesth are not picturesque, the city being situated on a sandy plain, but there are some fine promenades, such as the Grove, a mile and a half from the city; the gardens of Baron Orczy; and the Palatine, or Margaret Island, in the Danube, which is laid out in walks and gardens with great taste. Pesth is connected by railway with Vienna.

Pesth has been frequently laid waste by war, and was for nearly 160 years in the possession of the Turks, who were not finally expelled till 1686. Civil war followed, and at the beginning of the 18th century Pesth was one of the most inconsiderable towns in the kingdom. Its improvement may be dated from the reign of Maria Theresa, and it has since been progressive and rapid. The winter of 1838 was disastrous to Pesth, above 1200 houses being destroyed by the overflowing of the Danube, but in rebuilding the houses considerable improvement was effected in the appearance of the town. The Hungarian insurrection of 1848 affected very materially the condition of Pesth and of its sister town, Buda. The principal incidents of the struggle, so far as the Hungarian capital is concerned, are noticed in the article BUDA.

PETERBOROUGH, Northamptonshire, a city, parliamentary borough, and the seat of a Poor-Law Union, is situated on the left bank of the river Nen, in 52° 35' N. lat., 15' W. long., distant 40 miles N.E. from Northampton, 81 miles N. by W. from London by road, and 76 miles by the Great Northern railway. The population of the parliamentary borough in 1851 was 8672. The borough returns two members to the Imperial Parliament. The living is a vicarage in the archdeaconry of Northampton and diocese of Peterborough. Peterborough Poor-Law Union contains 40 parishes and townships, with an area of 100,514 acres, and a population in 1851 of 28,957.

At this place a Benedictine abbey was founded by Peada, son of Penda, king of the Mercians, soon after the revival of Christianity among the Saxons. About 870 the abbey was destroyed by the Danes; it was restored in the reign of Edgar, about which time the name of Burgh, otherwise Gilden-burgh, from the wealth and splendour of the abbey, or Peter-burgh, from the saint to whom it was dedicated, was applied to the town. On two occasions the greater part of the village and the abbey were destroyed by fire. The monastic buildings were gradually restored and augmented; and at the dissolution of the religious houses under Henry VIII., Peterborough was one of the most magnificent abbeys then existing. Having been selected as the seat of one of the new bishoprics erected by Henry, the buildings were preserved entire. In the civil war of Charles I. great devastations were committed. The cathedral itself was much injured, and many of the other conventual buildings were utterly demolished and the materials sold.

The city is regularly laid out and well-paved and lighted. The corn exchange, a neat building in the Italian style, erected in 1848, contains a spacious market-room, lighted by a handsome lantern roof. The jail and house of correction for the liberty of Peterborough is in the Norman style. Besides the cathedral, there is a large parish church, a handsome stone building. There are also chapels for Wesleyan Methodists, Independents, Baptists, and Primitive Methodists. The Cathedral Grammar or Chapter school has an endowment of 100*l.* per annum for the education of 20 boys, who receive an annual payment of 5*l.* each, and are entitled to compete for three scholarships at St. John's College, Cambridge. The number of scholars in 1854 was 33. There are also another Endowed school, National and Infant schools, and a mechanics institute, with a library, a dispensary and infirmary, rebuilt in 1845, and a savings bank. There are workhouses for 52 poor persons.

The cathedral of Peterborough is a regular cruciform structure of Norman and early English character, remarkable for the solidity and massiveness of its construction. Its erection was commenced in 1117 by John de Sais, or Sees, a Norman, then abbot. It is probable that the choir was the part first erected. It has a semicircular eastern end: the aisles have subsequently been carried out square by an addition of perpendicular character. The building was carried on by degrees under successive abbots. The central tower is low, and forms a lantern. The fine western front of the cathedral is an addition to the nave; it consists of a lofty portico of three compartments, that in the centre being the narrowest; each compartment has an arch equal in height to the nave, supported by triangular piers faced with clustered shafts, and is surmounted by a lofty and richly ornamented pediment and a cross. At each extremity of the western front is a lofty turret, flanked at the angles by clustered shafts and pinnacles, and crowned with spires. The inner roof of the nave and of the great transepts is painted wood; the choir has a wooden groined roof of very inferior workmanship and appearance. The dimensions of the church are as follows:—Total length 476 feet 5 inches, breadth of the nave and aisles 78 feet, height of the ceiling of the church 73 feet, breadth of the church at the great transepts 203 feet, breadth of the transepts 69 feet, height of lantern 135 feet; length of the western front 156 feet, height of the turrets at the

extremities of the west front 156 feet, height of the central tower from the ground 150 feet. At the west end is a large court, the entry to which from the town is by a gateway of Norman architecture, with some later additions. On the south side of the court is a range of the ancient monastic buildings. On the greater part of the other sides the cathedral is surrounded by the ancient cemetery of the citizens. The entrance gate to this cemetery from the western court is by a gate of late perpendicular architecture, remarkably rich in ornament. The bishop's secretary's office, and registry for wills and diocesan documents, lately erected in the minster precincts, harmonises in style with the cathedral buildings.

The trade carried on at Peterborough is chiefly in corn, coal, timber, lime, bricks, and stone. There is a very extensive steam flour-mill. The Nen is navigable for boats. Markets are held on Wednesday and Saturday; and fairs are held on July 10th and October 2nd.

There is no corporation at Peterborough. The dean and chapter exercise a certain jurisdiction; their steward holds a court for trying all actions, personal or mixed, arising within the city. Peterborough has sent members to parliament from 1 Edward VI. (1647).

The bishopric of Peterborough comprehends the counties of Leicester, Northampton, and Rutland, and is divided into the arch-deaconries of Northampton and Leicester. It consists of 524 benefices, and includes the dean, 2 archdeacons, 4 canons, 14 honorary canons, 8 minor canons, and a chancellor. The income of the bishop is fixed at 4500*l*.

PETERBOROUGH. [CANADA.]

PETERHEAD, Aberdeenshire, Scotland, a parliamentary burgh and sea-port, in the parish of Peterhead, is situated in 57° 30' N. lat., 1° 46' W. long., about 32 miles N.N.E. from Aberdeen, on a peninsula running south-eastward into the North Sea. The two harbours, the New North Harbour and the South Harbour, are near the south-eastern extremity of the peninsula, in opposite sides of which they are formed; both harbours are furnished with quays and protected by piers. The population in 1851 was 7298. The town is governed by a provost and 11 councillors. It unites with Banff, Cullen, Elgin, Inverury, and Kintore in the return of one member to the Imperial Parliament. The streets of the town are generally paved with dressed granite and lighted with gas. The houses are built of granite, which is quarried near the town. The principal public building is the town-hall. The market-cross is a granite pillar of the Tuscan order. The parish church has a granite spire 118 feet high. There are chapels for Episcopalians, the Free Church, United Presbyterians, and Independents, a parochial school, the 'town school,' a reading society, with a large library; a scientific association, and a news-room. The chief exports are grain, meal, butter, pork, herrings, cod-fish, and eggs; the imports are lime, wool, timber, salt, flour, and general merchandise. The number of vessels registered as belonging to the port of Peterhead on December 31st 1853 was 48, of 9731 tons. During the year 1853 there entered the port 665 sailing-vessels, of 88,321 tons, and 24 steam-vessels, of 3888 tons burden; and there cleared 664 sailing-vessels, of 40,778 tons, and 24 steam-vessels, of 3888 tons burden. The herring fishery is usually productive. There is a salmon fishery in the river Ugie. The market is on Friday; two half-yearly fairs are held.

A few miles south from Peterhead, on the sea-coast, are situated the Bullers of Buchan, a nearly round basin, about 30 yards wide, formed in a hollow rock which projects into the sea. The waves enter the basin under a natural arch. It is open at the top, round which there is a narrow path about 30 yards from the water; when the sea is high in a storm the scene is exceedingly grand.

PETERSBURG, ST., a government of European Russia, extends from 57° 56' to 60° 35' N. lat., 21° 5' to 38° 52' E. long. It is formed of the ancient province of Ingermanland, or Ingria, a part of Carelia, and some circles formerly belonging to Novgorod. It is bounded N. by the Gulf of Finland, Finland, and Lake Ladoga; E. by Novgorod; S. by Pakow; and W. by Lake Peipus and Esthonia.

The country is for the most part level, and in the north-east part it is low, and full of swamps and morasses. In the south it is rather more elevated. The government contains many forests and some good arable land. More than half of the surface is covered by morasses, forests, and lakes. The principal lakes are the Ladoga, Peipus, and Pakow. The chief rivers are the Neva, the Luga, the Narova, and the Wolohow. The Neva issues from Lake Ladoga, near the fortress of Schlusselburg, from which point to its mouth the whole course, including the windings of the river, is 40 miles to the Bay of Cronstadt, which may be considered as the mouth of the river. The banks are rather elevated; the breadth varies from 600 to 1200 feet, and the water is remarkably pure, light, and limpid. Within the city of St. Petersburg it divides into several branches. The climate is cold, damp, and not favourable to agriculture. The summer is short, but in general fine and often very hot: thunder-storms are neither frequent nor violent. The area of the government is about 20,520 square miles. It is divided into nine circles. The population in 1846 was 648,700, exclusive of the capital. The crops raised are insufficient to supply the great population of the capital. There are in the vicinity of St. Petersburg fine gardens and parks; kitchen-gardens, which produce vegetables in abundance, and numerous hot-houses which supply the capital with pines, melons, pine-apples, asparagus, &c. Timber is the chief

source of wealth; the forests, though much injured by waste and bad management, being still of immense extent. The country-people rear great numbers of geese, ducks, and turkeys for the markets of St. Petersburg. Fish are tolerably abundant. The mineral kingdom affords granite, limestone, marl, brick-earth, potters'-clay, &c. The villagers manufacture wooden wares of various kinds. Trade and manufactures are almost wholly confined to the capital: there are however considerable manufactories of cloth, camlet, and blankets, as well as several glass-houses at *Jamburg* (2000 inhabitants), on the Luga, and of printed calico at *Schlusselburg*, on an island where the Neva issues from Lake Ladoga. *Narva*, the capital town of the circle of Narva, is situated in 59° 24' N. lat., 28° 12' E. long., and has a population of 5500, most of whom are of German descent. It stands chiefly on the left bank of the river Narowa, which comes from Lake Peipus and falls into the Gulf of Finland about 10 miles below the town. It is surrounded with a rampart, and in the suburb of Ivan-gorod, on the other side of the river, there are the remains of a large fortress. Narva is divided into the old and new town, which are separated by a rampart and by the river. The houses are well built of brick, and stuccoed white. There are 7 stone and 2 wooden Greek churches, and 2 stone Lutheran churches, an exchange, and a good German school. The port has a considerable export trade in balsa, planks, flax, hemp, corn, and furs. The fishery in the Baltic is very productive, and the lampreys and smoked salmon of Narva are celebrated. The barks which come down the Narowa from Lake Peipus are unloaded about a mile from the town, at the island of Kragholm, where there is a fall in the river about 12 feet perpendicular. Narva was built in the year 1213 by King Waldemar. On the 30th Nov., 1700, King Charles XII., with 8200 Swedes, totally defeated 60,000 Russians under Peter the Great and the Duke of Croy, and stormed their intrenched camp near the town. In 1704 however Peter the Great took it by storm, and it has ever since remained in the possession of Russia. *Gatschina*, situated on a beautiful lake formed by the Ischora, has 7000 inhabitants, a military orphan-house, a foundling hospital, and a palace, formerly a favourite residence of the late empress, the consort of Alexander I. *Tzarskocelo*, or the Emperor's Village, about 15 miles S. from St. Petersburg, has sprung up around the palace of that name, which was erected by the empress Elizabeth, and restored after a fire by Alexander I. [CRONSTADT; PETERSBURG, ST.]

PETERSBURG, ST., the capital of the Russian empire, is situated in 59° 58' N. lat., 30° 20' E. long., at the eastern extremity of the Gulf of Finland, and at the mouth of the river Neva, and had 478,487 inhabitants in 1848. St. Petersburg has at first sight a striking appearance: the breadth and cleanliness of the streets, the elegance of the buildings, the noble canals which traverse the city, and the regularity of the edifices on their banks, make altogether a most impressive spectacle. All is grand, extensive, large, and open; the streets seem to consist entirely of palaces; the edifices are lofty and elegant. The public structures, quays, piers, and ramparts, are composed of masses of solid granite. In 1703 Peter the Great chose this spot, then just taken from the Swedes, for the site of a fortified sea-port. In some respects the position was unfavourable as the site of a capital. It was a low marshy island, in summer covered with mud, and in winter a frozen pool. The adjacent country was covered with marshes and impenetrable forests, the haunts of bears and wolves. But it was important to have a strong position like this as a check upon the Swedes: besides, this was the only place through which an intercourse could be established with civilised Europe, an object which Peter had much at heart. When Peter the Great died in 1725 the city contained 75,000 inhabitants; in 1762, when Catherine II. ascended the throne, the population was 110,000; it is now about 500,000, of whom nearly two-thirds are males.

The Neva, on the banks and islands of which the city is built, runs first towards the north, and then turning to the west, sends out towards the north an arm called the Nevka, which again divides into two branches called the Great and the Little Nevka. The main river, after throwing out the Nevka, divides into two branches—the Little Neva, which runs north-west; and the Great Neva, which runs south-west. Thus the Gulf of Cronstadt receives the Neva by four great arms, which form several islands. On the island to which the name of St. Petersburg was first given Peter laid the foundations of a fortress. In the spring of 1703 he collected a number of Russian, Tartar, Cossack, Calmuck, Finnish, and other peasants, and workmen were sent for from all parts of the empire. At this period, in consequence of the state of war, soldiers were encamped on both sides of the Neva. The great difficulty was to find subsistence for so many persons. The surrounding country was desolated by a long war, and provisions were very scarce and dear. The workmen, exposed to cold and damp, perished from fatigue and want, and the foundation of St. Petersburg cost the lives of 100,000 men.

The city, in its present state, is of a circular form, but rather irregular. The circuit is nearly twenty miles, but the smaller portion of the area is covered with buildings. Fires frequently occur, in consequence of many houses being built of wood; but wooden houses are not allowed to be built now, except in the suburbs. The most considerable and the handsomest portion is the southern, on the left bank of the Neva, including the four Admiralty quarters; between this and

the northern or right bank of the Great Neva lie, from south to north, 1, Wassily-Ostrov; 2, St. Peter's Island, the Island of Petrovsky, and the Apothecaries' Island; 3, Kammenoi-Ostrov, Krestovskiy, and Yelagin, a group of islands covered with gardens, groves, avenues of trees, and country-houses, which in summer are the resort of the rich. The city is divided into 12 districts, and these again into quarters. Few cities have such long and broad streets as St. Petersburg. They are from 60 to 120 feet broad; and the Nevsky Perspective is 14,350 feet long, the Great Perspective 10,220 feet, and eight others 6000 feet. The stone pavement is in general bad, and requires to be laid down afresh every year; a pavement of hexagonal blocks of wood, covered with tar, has been found to be more durable and cheaper, and is used in many of the principal streets, which have broad flag-pavements for the foot-passengers. There are no wells, but the water of the Neva is held in high estimation by the inhabitants. A bridge of granite has been recently constructed across the Neva. There are two bridges of boats over the Neva, and three over its arms; one of them, near the citadel, is 2730 feet long. These bridges are removed whenever danger is apprehended from the ice, both at the beginning of the winter and in the spring. There are about 130 bridges over the canals, many of which are of granite; several of cast-iron, two of which are handsome suspension bridges; and many of wood. The Great or Southern Neva is here from 900 to 1200 feet wide, and its south or left bank, to the extent of 10,000 feet, exclusive of the Admiralty, which divides it into two parts, is furnished with a quay of granite; a work which for utility and magnificence will remain a lasting monument of the reign of Catherine II. The part of the quay to the east of the Admiralty is called the Imperial Quay, or the Quay of the Court; that on the west was, till the present war broke out, denominated the English Quay, being lined with a row of splendid mansions originally built or occupied by English merchants. The Quay of Wassily-Ostrov, on the opposite bank, which was completed in 1834, is still finer, but not so extensive. It is adorned with two colossal sphinxes brought from Egypt, which are placed in front of the Academy of Arts. Among other buildings here are the Custom House, the Academy of Sciences, and the Hotel-des-Mines. There are 140 Russian-Greek churches, 40 of other Christian communities, 2 Greek convents, a synagogue, and a mosque. Divine service is performed in 15 languages. Of the Greek churches the most remarkable are—1, the Isaac's church, a magnificent edifice built of marble; 2, the beautiful cathedral of the Mother of God of Casan; 3, the church of St. Nicholas; 4, the church of Alexander Nevsky, in the convent of the same name, containing the body of the saint in a silver sarcophagus; 5, the church of St. Peter and St. Paul, in the citadel, which contains the tombs of the imperial family. The number of magnificent palaces and public buildings is so great that we can do little more than barely enumerate the most remarkable:—1. The Imperial Winter Palace has been described as the most conspicuous by all travellers; it was entirely destroyed by fire in 1837, but was rebuilt in all its magnificence in the space of twelve months. Two of the apartments deserve especial notice—the Salle Blanche, or White Hall, a beautiful ball-room, the decorations of which are in pure white relieved with gilding; and St. George's Hall, which is fitted up with great magnificence, and is used for the reception of ambassadors and on other state occasions. By the great exertion of the imperial guard, the fire was prevented from extending to the Hermitage, built by Catherine, which contains a costly library, a valuable collection of paintings, and other treasures. The Hermitage communicates with the Winter Palace by covered galleries. 2. The Marble Palace, an elegant but gloomy-looking building. 3. The Taurida Palace, with its fine gardens; so called in honour of the conquest of the Crimea, the ancient Taurida. This palace was presented to Prince Potemkin by Catherine II., but subsequently became the property of the crown by purchase. 4. The Anitchkov Palace, the residence of the late emperor Nicholas while he was grand-duke. 5. The Old Michailov Palace, where the emperor Paul resided and died. 6. The New Michailov Palace was built between the years 1819 and 1825, and is one of the finest palaces in Europe. The number of what are called crown-buildings is very great. Among them are—1, the Admiralty, surrounded on three sides by the dockyards; 2, the splendid building belonging to the general staff; 3, in the very extensive Isaacs Square, the Senate House, the General Synod, the Palace of the War Department, the large and handsome riding-school of the guard; 4, the Alexander Theatre, in the Nevsky Perspective; 5, the fine palace of the Imperial Assignat Bank; 6, the New Arsenal; 7, the Gostinnoi-Dvor, or Merchants' Inn, a great bazaar, two stories high; 8, the Academy of the Fine Arts, &c. The Field of Mars, adorned with a statue of Suwaroff, is extensive enough to admit 40,000 or 50,000 men to be reviewed in it. The Field of Mars is bounded on two sides by the imperial gardens, on the third by the Winter Palace, and on the fourth by a row of massive buildings. The most recent of the public monuments is the Alexander Column, about 150 feet in height, erected in honour of Alexander I. There are also a celebrated equestrian statue of Peter the Great, and a granite obelisk, 82 feet high, in honour of Romanzov.

The Russian sovereigns have done much to promote science and learning; academies and schools have been founded and liberally endowed by them, and learned men invited from foreign countries. Among these establishments are—the university, founded in 1819; the academy of sciences, founded by Peter I., on the plan of Leibnitz;

the academy of fine arts; the pedagogical institution for training teachers in the higher departments of learning; the ecclesiastical seminary in the convent of St. Alexander Nevsky; the medico-chirurgical academy; four gymnasia; the Oriental institution; numerous institutions for the army and navy; the mining academy; the female schools of St. Catherine; the Smolnoi convent; and the founding hospitals. The collections of all kinds are very rich. In the splendid collection of minerals of the Mining Academy there is a lump of native gold weighing 80 lbs., and a lump of platinum of 10 lbs. The Imperial public library consists of above 400,000 volumes; that of the Academy of Sciences of 100,000 volumes; and almost every establishment has its own library. Hospitals and charitable institutions of all descriptions are numerous and well supported.

The ground on which St. Petersburg stands is low and swampy, and the surrounding country is a morass and forest, except where it has been ameliorated by industry and art. It is liable to be inundated by the Neva. In general the ice in the Neva does not break up before the 22nd of March, nor later than the 27th of April; the earliest time of the river's freezing is the 20th of October, and the latest the 1st of December. The few bright days are generally during the greatest heat or the severest cold. The spring is very short; a sudden transition brings summer at once, which all classes hasten to enjoy, in the adjacent villas, in hospitality and social amusements. In summer the nights are bright and generally warm. During the night, parties, frequently attended by music, promenade the streets in every direction; and the simple melody of the popular ballads floats on the air from the boats that glide on the canals and the smooth surface of the Neva. In autumn St. Petersburg is one of the most disagreeable spots on the face of the earth. In winter the cold, when it once sets in, is equal and constant, and it strengthens and braces the body. Travelling in sledges over the hard snow is convenient and agreeable, and the people defend themselves very efficiently against the cold. All commercial intercourse with foreign countries being suspended during the winter, the citizens indulge their national fondness for luxury and amusements. The great masked ball (as it is called) on New Year's Day brings together persons of all classes in the Winter Palace; tickets are very easily obtained, and above 30,000 are usually issued. Nobody however is masked, nor is there any dancing. The river being frozen over for several months, the populace are amused with swings, roundabouts, and the like; and by the ice-hills, which are inclined plains of considerable height, covered with blocks of ice. The ascent is by a flight of steps at the back. A low sledge with one person in it glides down the plane with such rapidity that it is carried by the impetus to the next ice-hill, when the driver takes his sledge on his back, ascends the steps, and descends on the other side. There are likewise great popular amusements during Lent in Isaac's-square. The bath establishments are much frequented.

In summer those persons who have the means go into the country. There are numerous country-houses in the islands, and on the road to Peterhof, Strelna, and Oranienbaum. Peterhof, on the Bay of Cronstadt, the road to which is a noble causeway bordered by fine gardens and country-seats, has a large garden and fine waterworks. A grand fête is generally celebrated here on the 13th of July in honour of the birthday of the empress Alexandra, when the gardens are splendidly illuminated and enlivened with bands of music, and sometimes as many as 250,000 persons are assembled. Oranienbaum, on the Gulf of Finland, is still more beautifully situated than Peterhof. Zarskoje-Selo is a very magnificent imperial country-seat, with an immense park and noble gardens. A large portion of this palace was burnt down in 1820. At a short distance is the Pulkowaberg, a fine observatory, erected by the emperor Nicholas. Pavlovsk, near the town of the same name, is an imperial country-seat, with a fine park laid out in the English style by Brown. At Gatschina, Tschesma, and Strelna, there are likewise country-seats belonging to the imperial family. [CRONSTADT.] In 1854 batteries and strong defensive works were erected on both sides of the Neva, in anticipation of an attack by the Anglo-French fleet upon Cronstadt and the capital.

St. Petersburg is not only the capital but the greatest manufacturing city of the empire. There are numerous manufactories of silk, cotton, woollen, leather, glass, gold and silver articles, watches, surgical instruments, paper, snuff and tobacco, sugar, &c. Some manufacturing establishments the government has considered it advisable to carry on upon its own account; such are the great manufactory of tapestry, a large manufactory of aqua-fortis, with an assay-office and a mint; a plate-glass manufactory, which produces mirrors 14 feet high and 7 feet wide; a porcelain manufactory; a great manufactory of cotton and linen, in which steam-engines are employed, at Alexandrovsk, near the city; a cannon-foundry, and powder-mills.

The commerce of St. Petersburg is very considerable. Ships of large burden cannot come up to St. Petersburg in consequence of a bar across the mouth of the Neva, which has not more than nine feet of water upon it. The gross imports into St. Petersburg in 1849 were valued at 71,546,996 silver rubles, or about 11,300,000 sterling; the exports amounted to 38,340,747 silver rubles, or about 6,000,000 sterling. The chief items in the exports were hemp, flax, tow, linseed, tallow, hides, various hempen and flaxen manufactures, timber, leather, bones, potash, bristles, iron, copper, furs, &c. The imports are chiefly colonial produce; tissues of cotton, flax, silk, and wool; dyestuffs, wine, spirits, &c. The harbour is at Cronstadt. [CRONSTADT.] When large

ships are built, the hull is usually constructed at St. Petersburg, and then towed down the river by steamers to be fitted up at Cronstadt. In the transit they are placed on large rafts called camels. A canal connects the river system of the Neva with that of the Volga, thus affording an unbroken water communication between the Baltic and the Caspian seas, a distance of upwards of 1400 miles. St. Petersburg is connected by railway with Moscow, a distance of 400 miles.

(Milner, *The Baltic, its Gates, Shores, and Cities*, London, 1854; Kohl; *Plan of St. Petersburg*, published by the Society for the Diffusion of Useful Knowledge.)

PETERSFIELD, Hampshire, a market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of Petersfield, is situated in 51° 1' N. lat., 0° 56' W. long., distant 18 miles E. by S. from Winchester, and 54 miles S.W. from London. The population of the parliamentary borough in 1851 was 5550. A mayor is chosen annually, but his only function is that of returning-officer at parliamentary elections. The borough returns one member to the Imperial Parliament. The living is a curacy, annexed to the rectory of Buriton, in the archdeaconry and diocese of Winchester. Petersfield Poor-Law Union contains 13 parishes and townships, with an area of 40,112 acres, and a population in 1851 of 7814.

Petersfield is a clean country town, well supplied with water, lighted with gas, and paved. Besides the parochial chapel, a building chiefly of the 12th century, with fine Norman arches, there are a chapel for Independents, Churcher's college or school, National, British, and Infant schools, a library and reading-room, and a savings bank. Near the chapel is an equestrian statue of William III. A county court is held. The market is on alternate Wednesdays. Fairs for cattle and sheep are held on July 10th and December 11th.

PETERWARDEIN, or **PETERVARA**, the principal and frontier fortress of Austrian Slavonia, is situated in 45° 15' N. lat., 19° 55' E. long., in the neighbourhood of some mountains and fruitful hills, on the right bank of the Danube. On a rock isolated on three sides stands the upper fortress and the hornwork; at the northern foot of the rock lies the lower fortress, which includes what is properly the town, and is partly on a gentle slope. It is a place of extraordinary strength both by nature and art. The lower fortress has very broad and deep moats, which may be filled with water from the Danube. One principal street, and two others parallel to it, with a pretty extensive parade, form the whole town. The principal buildings are the arsenal, the residence of the commandant, and the Catholic church. The population of the town not including the garrison is stated at 3860. The fortress is capable of containing a garrison of 10,000 men. Peterwardein is connected, by a bridge of boats over the Danube (here 700 feet wide, and from 50 to 60 feet deep), with the Hungarian town of Neusatz, on the opposite bank. [HUNGARY.]

PETHERTON. [SOMERSETSHIRE.]

PETROCA. [ACONCAGUA.]

PETRA, which lay nearly half way between the Dead Sea and the head of the Ælantic Gulf, was one of the most important towns in the north of Arabia, and the capital of the Nabathæi. It is in all probability the Sela of the Old Testament, which signifies, like the Greek word, a 'rock.' This town, which originally belonged to the Edomites, was taken by Amaziah, king of Judah, who changed its name into that of Joktheel (2 Kings, xiv. 7; compare Joseph., 'Antiq.' ix. 9, § 1); but it seems in later times to have belonged to the Moabites. (Isaiah xvi. 1.)

Petra is described by Strabo (xvi. p. 779) and Pliny ('Hist. Nat.' vi. 32) as situated on level ground about two miles in circumference, and surrounded by precipitous mountains, the principal one of which has been identified with Mount Hor of the Old Testament. The town itself was well watered, but the surrounding country, and especially the part towards Judæa, was a complete desert. It was 600 Roman miles from Gaza, and three or four days' journey from Jericho. In the time of Augustus, Petra was a large and important town, and its greatness appears to have been principally owing to its situation, which caused it to be a great halting-place for caravans. It maintained its independence against the attempts of the Greek kings of Syria (Diod. Sic. xix. 95-97), and was governed by a native prince in the time of Strabo. It was taken by Trajan (Dion Cass., lxxviii. 14); and it appears from coins that Hadrian called it after his own name.

The ruins of Petra still exist in the Wady Musa, two days' journey from the Dead Sea, and the same distance north-east of Akaba. Captains Irby and Mangles visited Petra in 1818, and gave a minute description of the ruins, and from them and from M. Laborde, who published an account in 1836, we take the following notice:—The principal entrance to the town was through a narrow valley formed by the passage of a small rivulet through the rocks, which in some places only leaves room for the passage of two horsemen abreast. This narrow valley extends for nearly two miles; and on each side of it there are numerous tombs cut out of the rocks, which, as you approach the city, become more frequent on both sides, till at length nothing is seen but a continued street of tombs. Nearly at the termination of this valley there are the ruins of a magnificent temple, entirely cut out of the rock, "the minutest embellishments of which, wherever the hand of man has not purposely effaced them, are so perfect that it may be doubted whether any work of the ancients, excepting perhaps some on the banks of the Nile, have come down to our time

so little injured by the lapse of age. There is in fact scarcely a building of forty years' standing in England so well preserved in the greater part of its architectural decorations."

After passing this temple, the valley conducts to the theatre, "and here the ruins of the city burst on the view in their full grandeur, shut in on their opposite sides by barren craggy precipices, from which numerous ravines and valleys, like those we had passed, branch out in all directions. The sides of the mountains, covered with an endless variety of excavated tombs and private dwellings, presented altogether the most singular scene we have ever beheld, and we must despair of giving the reader an idea of the singular effect of rocks tinted with the most extraordinary hues, whose summits present to us nature in her most savage and romantic form, while their bases are worked on in all the symmetry and regularity of art, with colonnade and pediments, and ranges of corridors adhering to the perpendicular surface."

PETROPAWLOVSKI. [AWATSKA BAY.]

PETROZAVODSK. [OLONETZ.]

PETTIGOE. [DONEGAL; FERMANAGH.]

PETWORTH, Sussex, a market-town, and the seat of a Poor-Law Union, in the parish of Petworth, is situated in 50° 59' N. lat., 0° 36' W. long., distant 14 miles N.N.E. from Chichester and 49 miles S.S.W. from London. The population of the town in 1851 was 2427. The living is a rectory in the archdeaconry and diocese of Chichester. Petworth Poor-Law Union contains 5 parishes, with an area of 39,329 acres, and a population in 1851 of 9629.

The town is clean and neat, and well lighted with gas. The church is a cruciform structure, chiefly in the perpendicular style. Some years back the building was repaired and altered, and a new spire added. The Independents and Calvinistic Methodists have small chapels. There are two Endowed schools, almshouses for 14 aged persons, founded in 1624; for 22 poor females, founded in 1746; and for 4 poor men. A savings bank and a literary institute are in the town. A county court is held here. The market-place and courthouse in the centre of the town is a neat building, erected at the cost of the late Earl of Egremont, the great benefactor of Petworth. The market is on Saturday; fairs are held on May 1st, September 4th, and November 20th.

The mansion of the Percys, who formerly possessed the manor, abuts upon the churchyard. In 1309 Henry de Percy had a licence and embattled his house at Petworth; the house was new-fronted by the Duke of Somerset, and greatly altered by the late Earl of Egremont. The galleries contain numerous portraits by Vandyke, and many other fine works, with choice specimens of ancient and modern sculpture, and the rooms are adorned with a singularly extensive and valuable series of carvings by Grinling Gibbons. The park, 12 miles in circumference, is remarkably picturesque and well wooded.

PEVENSEY. [SUSSEX.]

PEVERAGNO. [COMI.]

PEWSEY, Wiltshire, a village, and the seat of a Poor-Law Union, in the parish of Pewsey, is situated in 51° 20' N. lat., 1° 46' W. long., distant 12 miles E. by S. from Devizes, and 80 miles W. by S. from London. The population of the parish of Pewsey in 1851 was 1921. The living is a rectory in the archdeaconry of Wilts and diocese of Salisbury. Pewsey Poor-Law Union contains 23 parishes and townships, with an area of 65,650 acres, and a population in 1851 of 12,503.

PEYREHORADE. [LANDES.]

PEYRIAC-MINERVOIS. [AUDE.]

PEYRUIS. [ALPES, BASSES.]

PEZENAS. [HÉRAULT.]

PFORZHEIM, a town in the Baden circle of Middle Rhine, is situated in 48° 55' N. lat., 8° 48' E. long., at the entrance of the Black Forest, and on the navigable river Enz, near its junction with the Nagold and Wurm. It is surrounded with a wall and moat, and consists of the town and three suburbs. There are four churches and an ancient palace, the church of which contains a handsome monument to the late duke Charles Frederick. Among the public institutions are a convent for noble ladies, an hospital, an infirmary, an orphan-house, and an asylum for the deaf and dumb. The population of the town and suburbs is above 6500. The manufacture of trinkets employs above 1000 workmen. Watches, superfine cloth and kersey-mere, leather, hardware, and iron-wire are manufactured. There are also iron- and copper-foundries, dye-works, and extensive bleaching-grounds. Pforzheim has a very great trade in timber from the neighbouring forests of Hagenschies, which is floated down the Neckar and the Rhine to Holland. The trade in corn, oil, wine, and cattle is considerable.

PHAROS. [ALEXANDRIA.]

PHARSALIA. [THESSALY.]

PHASIS, the principal river of ancient Colchis, now called *Faz*, and sometimes *Rioni*, rises in the Caucasus nearly midway between the Kasbek and Elbruz, and flows in a westerly direction into the Black Sea. The river is composed of three principal head-streams, the Rioni proper (ancient Rion), or upper Phasis, the Quirilla, Kvirtla, or Ziroula, which joins the Rioni on the left bank below Kutais, and the Kakhenis-Kali, probably the ancient Glauous, which comes from the southern slope of the Elbruz and joins the Rioni several miles lower down on the right bank. The principal places on the Phasis

are Kutais on its upper course, and Poti, ancient Phasis at its mouth. Phasis was navigable in ancient times for large ships for 38 miles from the coast, and for smaller vessels as far as the fort of Sarapana (*Sarapan*), on the boundaries of Colchis and Iberia, from which place goods were conveyed by waggons in four days to the river Cyrus. (Strabo, xv. 498: Plin. 'Hist. Nat.,' vi. 4.) The Phasis was sometimes considered as the boundary between Asia and Europe (Herod., iv. 45), and was regarded in the time of Augustus as the northern boundary of the Roman dominions in that part of Asia. (Strabo, vi. 288.) From the junction of the Rion and Quirilla the river is navigable for boats at all seasons, has no obstructions, and is from 20 to 30 feet deep, with a current of about 2½ miles an hour. It flows through a level country, which is lower than the banks of the river. There is a bar at the mouth of the Phasis, with only 6 feet water, the only circumstance that prevents the river being entered by the largest vessels.

In ancient times there were 120 bridges over the Phasis (Strabo, xv. 500; Plin., 'Hist. Nat.,' vi. 4), and many towns upon it, of which the most important were *Æa*, the old capital of the *Æetes*, which is celebrated in the legends of the Argonautic expedition, and Phasis (*Poti*), situated at its mouth. The valley of the Phasis was in ancient times, as now, famous for great numbers of pheasants, which were first it is said (Mart. 'Ep.,' xiii.) brought into Greece by the Argonauts, and named Phasiani, from this river.

PHILADELPHIA. [LYDIA.]

PHILADELPHIA, a city and port of entry, and formerly the capital of the State of Pennsylvania, United States of North America, is situated between the Delaware and Schuylkill rivers, in 39° 57' N. lat. 75° 10' W. long., 136 miles N.E. from Washington. With the exception of New York, Philadelphia is the largest city in the United States. The population, which was only 69,403 in 1800, was 340,045 in 1850.

Philadelphia is about 120 miles from the Atlantic, following the course of the Delaware, and about 55 miles from it in a straight line. It lies immediately above the junction of the Schuylkill with the Delaware, and occupies the space, about 2 miles in width, between the two rivers, and a considerable space on the opposite side of the Schuylkill; it is about 5 miles in length, but the city proper is only 2 miles long and 1 mile wide. The streets which run north and south, parallel with the rivers, are called First-street, Second-street, and so on, except Broad-street and Schuylkill-street. These streets are crossed at right angles by others which run from east to west, and which are almost all named after trees, as Chestnut-street, Walnut-street, &c. The squares thus formed are subdivided by smaller streets and alleys. Most of the principal streets have rows of locust and other trees, which afford a pleasant shade in the summer. The houses are generally of brick, but many of them have the outer steps and also the window-sills of white marble. The city is lighted with gas and well paved. There are a few squares, which are very prettily laid out and planted.

Of the public buildings of Philadelphia, the old State House, now known as Independence Hall, is one of the most interesting, though one of the plainest. The Declaration of Independence was read from the steps in front of the building, on the 4th of July, 1776. The United States court, and the city and county courts are now held in it. The United States mint is a very large and handsome edifice of brick faced with marble, with an Ionic portico of six pillars, each 3 feet in diameter. The Custom-house, formerly the United States bank, is a large and splendid building, constructed entirely of white marble on the model of the Parthenon at Athens: the portico, at each end, consists of eight fluted Doric columns, 27 feet high and 4½ feet in diameter. The Merchants Exchange, in the basement of which are the post-office and various mercantile offices, is a spacious and handsome marble edifice with a semicircular portico; it is 114 feet long, 95 feet wide, and three stories high. Several of the banking-houses are among the leading architectural features of the city. The Bank of Pennsylvania, which is 125 feet long by 51 feet wide, is designed after the Temple of the Muses at Athens, with a portico of six Ionic columns at each end, and is constructed entirely, even to the dome and roof, of white marble. The Philadelphia Bank, and Girard Bank are also built of white marble, with commanding Corinthian porticos. One or two of the most recent banks are Italian palatial edifices.

The number of churches in the city and its suburbs is upwards of 170, including places of worship belonging to all the leading sects; but the only one which is remarkable in an architectural point of view is the recently-erected Roman Catholic cathedral, which is said to be a very magnificent pile. The other leading ecclesiastical buildings are the episcopal churches of St. Andrew's, in the Ionic, and St. Stephen's and St. Mark's in the Gothic style; St. Peter's Roman Catholic church; the First and Seventh Presbyterian churches; and the Baptist church in Sansom-street. Education is carefully provided for; the city and county of Philadelphia being constituted a school district, under duly qualified controllers and directors, whose duty it is to see that the system of uniform grades of free instruction—consisting of a high school, a normal school, grammar schools, secondary, and primary schools—is efficiently carried out. There were in 1853 in the district 286 schools, with 80 male and 760 female teachers, and 25,836 male and 24,249 female scholars. The buildings of the University of Phila-

GEOG. DIV. VOL. IV.

delphia are very spacious. The University has departments of law and medicine, as well as of arts. Philadelphia is generally regarded as the medical metropolis of the Union. Besides the University Medical School, which had 450 students at the last report, there are in the city—the Jefferson Medical College, with 514 students; that of Pennsylvania College, with 150 students; and the Philadelphia College of Medicine, with 75 students; besides several medical schools which do not grant degrees. The College of Physicians publishes its transactions quarterly. There are also theological and law schools. The literary and scientific institutions are numerous and important. The oldest scientific institution in the United States is the American Philosophical Society, founded in 1743, which reckons among its members distinguished literary men in all parts of the world, and the proceedings of which have a very high reputation. The library contains upwards of 20,000 volumes and an extensive collection of medals, maps, engravings, &c. The Philadelphia Library, commenced by Franklin in 1781, has a marble statue of Franklin placed over the front door. The library contains 60,000 volumes. The Historical Society of Pennsylvania has also a high reputation. The Academy of Natural Sciences possesses a library consisting of upwards of 18,000 volumes, and the finest collection of botanical, geological, and ornithological specimens in the Union. The Philadelphia Athenæum, established in 1814, has a library of about 12,000 volumes. The building is a very elegant Italian one. There are besides, the Franklin Institute, Mercantile, Apprentices, German Society, Friends, Law Association, and Philadelphia Hospital libraries. The Pennsylvania Academy of Fine Arts has fine galleries of paintings and statues by the best masters: an annual exhibition of the works of living artists is held here in May. There are also an Art Union, a Graphic Association, and an Artists' Fund Society. The Philadelphia Museum is a vast structure 238 feet long and 70 feet wide, and contains a very extensive collection of objects of interest; but it belongs rather to the places of amusement than of instruction. There are three theatres, and a musical hall capable of accommodating 2000 persons, in the city.

Philadelphia has a large number of benevolent asylums. One of the most remarkable is Girard College, an asylum for the gratuitous instruction and support of destitute orphans, founded by Stephen Girard, a Frenchman, who from an humble origin became a banker in Philadelphia, and left nearly the whole of his large property towards beautifying Philadelphia and New Orleans and establishing this college. He bequeathed two millions of dollars for the foundation of the college, nearly the whole of which has been spent in constructing the buildings and improving the grounds, which are about 40 acres in extent. The central building is in form of a Corinthian temple, 218 feet long, 160 feet wide, and 90 feet high. It has a colonnade of eleven columns on each side, and a portico at each end of eight columns, each 6 feet in diameter and 55 feet in height. The entire structure, including the roof, is of fine white marble. Besides this central building there are four others, each 125 feet long, 52 feet wide, and three stories high, faced with marble. In 1852 there were 305 orphans in the college. There are four other orphan asylums in the city—the Orphan Society of Philadelphia, St. John's (Roman Catholic) Male Orphan Asylum, St. Joseph's Female Orphan Asylum, and the Coloured Orphan's Asylum. The Pennsylvania Hospital was instituted in 1751, and has since relieved a vast number of patients. The buildings occupy an entire square, in the middle of which is a bronzed leaden statue of William Penn. A branch of this hospital for lunatics has been removed to a more open site at West Philadelphia, where the capacious buildings stand within inclosed grounds of above 40 acres. The Friends' Asylum, for the insane, is situated near Frankford. The House of Refuge, a school for the reformation of character, occupies a plot of ground 400 feet long by 230 feet broad, inclosed by a stone wall 20 feet high. The main building is 92 feet long by 30 feet deep. It receives all destitute males under 21 and all females under 19 years of age. During 1852 there were admitted 164 boys and 60 girls in the white, and 36 boys and 44 girls in the coloured department. The other hospitals are—the City Hospital, founded by the state in 1818; the State Deaf and Dumb Asylum, in a granite building 96½ feet long by 63 feet deep; the Institute for the Blind; Wills' Hospital for Diseases of the Eye, an excellent institution, founded by a gentleman named Wills; the City Almshouse and Infirmary; Christ Church Hospital, for indigent females; and St. Joseph's Hospital; besides four dispensaries, several widows' asylums, asylums or retreats for children, three Magdalene asylums, and various other charitable institutions. There are also numerous religious societies.

The sanitary condition of the city is regulated by a Board of Health of 18 members. The public markets are on a very extensive scale, well supplied with all kinds of provisions, and generally admired for their cleanliness.

The works for supplying Philadelphia with water are situated at Fair Mount, near the city, on the left bank of the Schuylkill. A dam 1248 feet long, thrown in a sloping direction across the Schuylkill keeps back the water, which is raised by eight powerful pumps lifting 1,250,000 gallons in 24 hours, into four vast reservoirs, the summit of a hill 100 feet above the level of the river and above the highest part of the city. The water is conveyed to the city in pipes. About a mile higher up the Schuylkill are of works on a smaller scale, for the supply of Spring Garden.

Northern Liberties. The fire-engine establishment consists of 70 companies, 35 being engine companies, 33 hose companies, which supply the fire-engines with water, and 2 hook and ladder companies. The firemen are all volunteers. The institution is kept up with an enthusiastic public spirit, and fires are extinguished with a promptitude which greatly surprises strangers. There is an association for the relief of disabled firemen.

The river Delaware, in front of the city, is about a mile wide, but the width is contracted by an island, which extends nearly the whole length of the city, and somewhat impedes the navigation. Both the Delaware and the Schuylkill are frozen over during the winter months, which renders Philadelphia, as a harbour, inferior to New York. A portion of the navy of the United States is stationed at the southern extremity of the city, and ships of the largest size are built. The Delaware is navigable for steam-boats and small vessels as high as Trenton. The Schuylkill Navigation Canal, and the Chesapeake and Delaware Canal greatly facilitate the commerce of the city; while eight lines of railway which terminate at Philadelphia afford rapid communication with every important place in the Union.

In respect to foreign commerce Philadelphia now ranks third among the cities of the United States: and it is the only city in Pennsylvania in which foreign commerce is carried on. [PENNSYLVANIA.] The exports to foreign countries in 1853 amounted to 6,527,996 dollars, the imports to 18,834,410 dollars. The exports chiefly consist of wheat, maize, flour, meat, wool, and manufactured iron. The shipping belonging to the Philadelphia district in 1851 amounted to 222,428 tons. The arrivals of ships from foreign countries in 1851 were 576; the clearances in 1850 were 479, of which 309 vessels of the aggregate burden of 81,276 tons were American, and 170 vessels of 30,342 tons burden were foreign. The coasting and internal trade is much greater than the foreign commerce. In 1851 the number of vessels arriving coastwise was 26,484. The home trade is chiefly in grain, flour, coals, cotton, and tobacco; but the coal trade is now the most important branch. In 1851, 8126 vessels engaged in this trade arrived at Port Richmond, the terminus of the Reading railway.

The manufactures of Philadelphia are very considerable. The capital invested in manufactures in 1850 was returned at 33,787,911 dollars; the number of hands employed was 59,099, of whom 15,803 were females. The principal establishments are warping-mills, sugar refineries, machine shops, rope-walks, marble-works, two shot-towers, and manufactories of cutlery, nails, leather, hardware, gold and silver goods, musical instruments, furniture, carriages, &c. There were in 1852 in Philadelphia 13 banks with capitals amounting in the aggregate to 10,650,000 dollars; 4 savings banks; 19 fire and marine, and 9 life insurance companies. In 1850 there were 64 periodicals published in Philadelphia, of which 11 were daily, and 38 weekly newspapers.

The federal government has very extensive naval and military establishments at Philadelphia. The United States arsenal near Frankford is an immense establishment for the manufacture and storing of military material: it includes one of the largest powder magazines in America. The United States arsenal at Moyamensing consists of four large warehouses forming a hollow square three stories high, and serving as a dépôt for military clothing, camp equipage, &c. The United States navy yard on the Delaware, Southwark district, covers an area of 12 acres, and includes large stacks of warehouses, workshops, moulding lofts, officers' residences, ship houses, and dry docks capable of raising the largest steam vessels and ships of the line, with hydraulic cylinders, railways, and other connected works. Connected with this is the United States naval asylum, which consists of three buildings, the principal one being of marble, three stories high, with a frontage 380 feet long, and affords accommodation for 140 pensioners; its grounds cover an area of 25 acres and are beautifully laid out.

The city of Philadelphia proper (like the city of London) forms but a portion of what is known by that name, always understood when the town is spoken of, and included in the official statement of the population. The city proper contains but 121,376 inhabitants, or little more than one-third of that given above; it has however its own municipal government consisting of mayor, select, and common council, &c. The other districts—Kensington, the Northern Liberties, Richmond, and Spring Garden on the north; Moyamensing, Passyunk, and Southwark on the south; with West Philadelphia, Oxford, Germantown, &c. on the west and north-west, are governed by boards of commissioners.

Philadelphia was founded by William Penn in 1682. On the 5th of September, 1774, the members of the first Congress assembled at Philadelphia, where they adopted the 'Declaration of Rights,' and subsequently the 'Declaration of Independence,' which was proclaimed at Philadelphia in April, 1776. The British forces obtained possession of the city on the 26th of September, 1777, and occupied it till the 18th of the following June. The city was the seat of the federal government till the year 1800, and the capital of Pennsylvania till 1799.

PHILBERT, ST. [LOIRE-INFÉRIEURE.]

PHILIP ISLAND. [NORFOLK ISLAND.]

PHILIPPEVILLE. [ALGÉRIE; NAMUR.]

PHILIPPI. [THESSALY.]

PHILIPPINES, THE, constitute the most northern group of the

islands that compose the extensive archipelago known under the name of the Indian Archipelago; and they lie between 5° and 20' N. lat., 119° and 127° E. long. The Strait of Balingtang, or Great Passage, separates them from the Batanes and Bashee Islands, which lie farther north. On the east extends the Pacific, and on the south the Celebes Sea, with the Sooloo Islands, only divided from Magindanao by the Strait of Basilan, which is frequently navigated by vessels sailing to China. The Mindoro Sea and the Chinese Sea wash the western shores of this group.

The Philippines consist of ten larger and a multitude of smaller islands. The larger islands have altogether an area of more than 120,000 square miles, according to the estimate of Berghaus, in which the surface of Magindanao is estimated at 36,140 square miles. The smaller islands comprehend, according to the same authority, 6230 square miles; several of the larger islands are to some extent subject to the Spaniards, who have also settlements on the northern and south-western coast of Magindanao. The total territory however in possession of the Spaniards amounts to only 53,271 square miles, including their settlements in Magindanao, upon which there was a total population in 1849 of 2,679,500 persons, under the government of the captain-general of the Philippines, while the entire population of the group is estimated at 5,000,000. The greater proportion of the population (about 3,500,000) are of the Malayan race, about 1,000,000 it is estimated of the Papuan negro race, and the remainder are Chinese, half-castes, and Europeans.

1. Luzon, which is by far the largest of these islands, has, according to Berghaus, an area of 57,405 square miles. The form of the island, which is extremely irregular, may be compared to a bent arm. Its length measured along the bend is more than 550 miles. The width varies between 10 and 136 miles. Where the bend occurs, which is near 14° N. lat., a deep bay enters the land from the north, and divides the island into two peninsulas. The isthmus which connects the two peninsulas is only from 10 to 12 miles wide, and nearly 50 miles long. The rocky coast of the island is indented by a great number of larger and smaller bays, among which the most extensive on the larger peninsula are the Bahia de Manila and the Golfo de Lingayen, both on the western side; and on the smaller peninsula the Bahia de San Miguel and the Seno de Albay on the northern coast, and the Seno de Ragay on the southern.

The island is extremely mountainous; the principal ranges are the Montes Caravallos, which extend from Cape Engaño in 18° N. lat., to Cape St. Ilfonso in 15° 5' N. lat., the more southern part being known as the Sierra Madre, and other ranges occupy other portions of the island. In the northern peninsula there are two extensive plains, one on the western side of the Caravallos range, called Llana del Dijun, watered through its whole length by the river Tajo, which runs from south to north, and falls into the sea west of Cape Engaño, at a town called Apari. The other lying at the south-western base of the Sierra Madre, and the western base of the Caravallos, is a level plain of great extent and fertility, called the Plain of Pampanga, extending from the innermost recess of the Gulf of Lingayen (16° N. lat.), on the north, to the Bahia de Manila (14° 45' N. lat.), on the south. It is about 90 miles in length, with an average width of about 30 miles, so that it covers a surface of 2700 square miles. The whole plain is very little elevated above the sea-level, full of lakes, and traversed by rivers, whose course is nearly imperceptible except in the rainy season. In the northern districts there is a large lake, the Laguna de Canarim, on the most elevated part of the plain; two rivers issue from it, one towards the north, which falls into the Gulf of Lingayen, and the other towards the south, which enters the Bahia de Manila. These rivers, of which the first is called Rio Grande, and the second Rio de Pampanga, are of great importance, as the produce of this rich and well cultivated tract, which is mostly covered with plantations of sugar, can be brought by water to Manila during the rainy months.

The Bahia de Manila is one of the finest basins in the world. It is nearly of a circular form, and measures from 20 to 25 miles in every direction. It is nearly free from shoals, and contains excellent anchorage. The tides in this bay are very irregular during the north-east monsoon, when the low tides run through the Boca Chica or northern entrance, with rather a strong current for 18 hours, whilst the high tides last only six. The rise is about three feet at full and change. A hilly country begins west of the bay and a mile or two from the shores, and extends eastward to the Laguna de Bahia. This lake is about 20 miles long, and on an average 10 miles wide, but it is divided into two nearly equal parts by a projecting tongue of land and an island situated opposite its termination. The surface of the water is about 36 or 40 feet above the sea-level of the bay. The water of the lake is carried off by five very narrow channels, which soon unite, and, being joined by a small river, constitute a wide and tolerably deep stream, called the Rio Pasig, which flows westward to the Bahia de Manila, and has its outlet between the two towns of which the capital consists. The country that surrounds the lake and extends on both sides of the Rio Pasig is very fertile and populous.

From the banks of the river and of the lake the country rises gradually to the south for 10 or 12 miles, when it is followed by a tract of land the surface of which is extremely uneven, and has a number of isolated mountain summits scattered over it, many of which

rise to a considerable height. This region is volcanic, and between the heights are many lakes, some of them of considerable size. The Laguna de Taal contains a volcanic island, from which an eruption issued in 1754, and which showed activity in 1825.

The peninsula of Camarines, or the south-eastern part of the island of Luzon, is not connected with the north-western part by a range of mountains. Towards the eastern extremity of the isthmus, which connects both parts, the mountains entirely disappear, and where the two bays called Seno de Lamon and Seno de Ragay approach nearest to one another, and are only about 15 miles apart, the intervening country is low, and constitutes a valley several miles wide, which runs across the island from one bay to the other. This peninsula is chiefly occupied by a mass of high mountains, which come close to the southern shores, and only in a few places leave a narrow strip of level ground. But the northern declivity of this range is not so steep, and terminates about 6 or 8 miles from the sea. On this tract, and at a short distance from the mountain range, there are ten volcanoes, of which that of Albay or Mahon is noted for the frequency of its eruptions. There is a considerable number of agricultural settlements on this volcanic tract, especially in the country surrounding the Bahía de San Miguel. This bay is about 25 miles long from north to south, with an average width of 12 miles.

2. *Mindoro*, which is separated from the island of Luzon by the Little Strait of Mindoro, and from the islands of Calamianes by the Great Strait of Mindoro, is 100 miles long, and rather more than 40 miles wide on an average. Its area, according to Berghaus, is 4115 miles. The mountains which occupy the interior rise to a very great elevation; but they descend in gentle slopes, and the sea-shore is skirted by low hills, which are covered with forests of lofty trees. There is only a small number of Malay families settled on some points of the coast.

3. *Panay* has the form of an isosceles triangle, the base of which is more than 100 miles long, and the other sides more than 80 miles. The area, according to Berghaus, is 4579 square miles. Along the western coast the country is of moderate elevation, well cultivated, and populous; villages are numerous. At some distance from the shore, a mountain ridge runs from Punta Potol, on the north, to Punta Nasog, or Naso, on the south, and appears to be very steep.

4. *Negros* is about 140 miles long, with an average width of about 25 miles. The surface, according to Berghaus, is 3827 square miles. It seems to be very mountainous, and contains a comparatively small number of agricultural settlements.

5. *Zebu*, or *Cebu*, extends in length from south to north rather more than 100 miles, but it is hardly more than 20 miles wide on an average. The area, according to Berghaus, is 2193 square miles. It is fertile and well populated.

6. *Bohol*, situated between Zebu on the west and Leyte on the east, is the smallest of the larger Philippines except Masbate. It extends in length from west to east about 45 miles, with an average width of 30 miles. Berghaus determines the area to be 1854 square miles.

7. *Leyte*, or *Leite*, extends from south to north about 120 miles, with an average width of 35 miles. According to Berghaus, the area is 4257 square miles.

8. *Samar*, or, as it is also called by the natives, *Ybabas*, is the largest of the Philippines which are subject to Spain, next to Luzon. It has the form of a triangle whose apex is turned to the south: the base measures about 60 miles, and the perpendicular length about 115 miles. The surface is 5547 square miles. A great part of this island, especially towards the north, is covered with high mountains, which are visible from a great distance at sea. The soil in general, though not distinguished by fertility, is far from being sterile.

9. *Maabate* is in the middle of that sea-basin which is called the Bisaya Sea: the islands surrounding this basin and those within it are comprehended under the general name of the Bisaya Islands. Maabate has a triangular form, whose apex is to the east. The base, or western coast, is nearly 40 miles long, and the perpendicular length about 55 miles. Berghaus makes the surface 1225 square miles. This island appears to be a mass of high rocks, and to contain very little cultivable ground. The population of the whole of the Bisayan Islands in 1849 was 803,000.

10. The island of *Magindanao*, or *Mindanao*, is the most southern of the Philippines, and the largest next to Luzon. Its form is extremely irregular. Berghaus makes the area 36,140 square miles. The coastline perhaps considerably exceeds 1000 miles. This island is hilly but not mountainous, except on the eastern coast, though there are some volcanoes, and in one part two deep bays, that of Illano on the south, and that of Siddum on the north, nearly separate the island. Numerous rivers water this large island. Large tracts are destitute of trees and covered with fine grass and finer savannahs than occur in any other island of the Indian Archipelago. The Spaniards have formed a great number of settlements on the eastern and western coast, where the inhabitants consist almost exclusively of Bisayes, or Malays of the Philippines. The large peninsula which extends between the Bay of Illano on the west and the Pacific on the east acknowledges the authority of the sultan of Magindanao, whose subjects are mostly Malays, and inhabit the country along the coast; but the interior is occupied by the Haraforas, who are treated by the Malays not as subjects, but as slaves.

The year is divided between the dry and rainy seasons, which depend on the monsoons. The rains commence in the beginning of May, and do not cease before the end of October or the beginning of November. They attain their maximum in the month of July. Between the beginning of November and the end of April showers sometimes occur. The northern part of Luzon is situated within the range of those terrific hurricanes which are called 'typhoon,' and which are rarely felt south of 14° N. lat. The mean temperature in summer is between 80° and 82° Fahr., and that of winter between 70° and 72°. Earthquakes occur frequently, and sometimes cause great damage.

The staple articles of produce are sugar, indigo, rum, tobacco, sapan-wood, rice, millet, maize, edible birds'-nests, and trepang. Tobacco, which grows very well in many places, and is of the first quality, is only exported in the form of cigars. Rice, for which there is always a ready market, and which constitutes the principal food of the bulk of the population, is the first object of cultivation nearly all over the island. Where the fields cannot be put under water the upland rice is cultivated. Coffee, cacao, ebony, sulphur, cotton, pearls, mother-of-pearl shells, tortoise-shells, and cordage are also exported. Cinnamon and cloves, with the cocoa-nut and banana, are among the products of these islands.

The buffalo is universally used in all field-labour, though in some parts people have begun to substitute the bullock for it. The buffalo here, as on all the islands of the Indian Archipelago, is of uncommon size and strength; the caymans, which are in the Laguna de Bay, and rather of a large kind, never attack a buffalo. Horses have also been introduced by the Spaniards; the breed is small but very hardy; they are only used for riding. Sheep are few but goats are more numerous. Pigs are plentiful, and domestic fowl are reared in immense numbers, especially ducks on the banks of the Laguna de Bay. Except the caymans, which are numerous in the Laguna de Bay, there are no rapacious animals. The Philippines are rather distinguished by the number than by the variety of wild-fowl. The sea abounds with fish, and the inhabitants, like all the tribes of the Malays, prefer fish to meat.

Manila, the capital and seat of the captain-general or governor of the island, is built on the eastern shores of the Bahía de Manila, at the mouth of the river Pasig, or the channel by which the Laguna de Bay discharges its water. It consists of two towns with extensive suburbs. The city, Manila, is built on the southern banks of the Pasig; it is fortified, and inclosed by high walls and a ditch which is connected with the river. The streets are straight, wide, and well paved. The houses are built of stone, and are substantial. There are several well-built churches and convents. The palace of the captain-general is not distinguished by its architecture, but the custom-house, or 'aduana,' is a large and fine building. In the great square is a statue of Charles IV. of Spain in bronze, given to the town by Ferdinand VII. in 1824; it is a fine work of art, and somewhat larger than life. On the land side is a large plain, on which the troops are exercised, and where the fashion of the place display themselves and their equipages in the evening. A well-built bridge leads from the city over the Pasig to a collection of suburbs, the whole of which form what is generally known as the trading part of Manila. The principal suburb is Bifondoc, and the population of the whole amounts to 150,000. In the fortified town, inhabited chiefly by Spanish officials and military, the streets are strait and formal, with granite footpaths, but macadamised carriage roads. In Bifondoc there is more variety; many of the houses are spacious, but from dread of earthquakes none of them are more than one story in height above the ground-floor, and in their construction the bamboo enters largely: the upper floor forms the residence of the family, and is surrounded by a gallery, which can be shut in or thrown open by means of large sliding shutters with panes of mother-of-pearl instead of glass, so as to admit the light while excluding the heat. Several canals communicating with the river intersect the town, upon which numerous pleasure-boats ply for the convenience of the inhabitants, and along the banks of the river are many villa-residences belonging to the principal merchants of the place. Manila contains a royal college for the instruction of youth, a university which was founded by Philip IV. in 1645, a nautical academy, an hospital for the poor, and various other religious and charitable establishments.

Cavite, which lies south of Manila, is a well-built fortress, situated at the extremity of a tongue of land about 2 miles long: it protects the Ensenada de la Estanzuela, the only harbour in the Bahía de Manila. The arsenal is in that fortress, and vessels are built there. The town of *San Roque* is near to Cavite.

The only manufactures of the Philippine Islands consist of a very fine species of grass-matting, of which hats, baskets, &c., are made, and of cigars and cheroots, which have a high reputation. For a long time the commerce of the colony was severely restricted by the Spanish government, and is yet carried on under many difficulties. The chief trade is with Great Britain; the imports consist chiefly of cotton, woollen, and silk manufactures, watches and clocks, jewellery and drugs; the exports are chiefly sugar, tobacco and cigars, indigo and hemp: the amount of each varies from half a million to three-quarters of a million sterling.

History.—The Philippines were discovered in 1521 by Fernando

Magalhaens, who was killed on one of the islands. In 1564 a small squadron under the orders of Lopez de Legaspi was sent from Mexico to form an establishment, which he effected in the following year on the island of Zebu, the inhabitants of which submitted to the Spaniards without any resistance. In 1571 Legaspi founded the town of Manila, and the Spaniards remained in undisturbed possession of the Philippines till 1762, when the English took the town of Manila. In 1764 the English restored Manila to the Spanish government. In 1851 the captain-general, in order to repress piracy, from which the coasting-trade had greatly suffered, undertook an expedition against the neighbouring islands of Sooloo, which was completely successful, and a settlement formed on the principal island.

PHILIPPINES, NEW, more frequently called the *Carolines*, are a number of islands situated in the Pacific, between 138° and 164° E. long., 5° and 13° N. lat. In this wide tract of ocean there are several groups of small islands inclosed by reefs, and others are isolated. The Spaniards, who obtained some knowledge of them from the natives who visited their settlement on the island of Guahan (Ladrones), claim the sovereignty of the New Philippines. They have however never made a settlement on any of them.

The islands, which lie either within the basins formed by the coral-reefs, or contiguous to the reefs themselves on their interior side, are all small, and produce hardly anything except cocoa-nuts and bread-fruit. All the isolated islands are high, and some rise to a great elevation. The cultivated fields contain plantains and arums; from the root of the latter the inhabitants make flour. They also cultivate the sugar-cane, and have several fruit-trees besides the cocoa and bread-fruit. The inhabitants belong to the Malay race; they are industrious agriculturists and fishermen, and they make excellent mats, and canoes of a large size, with which they undertake voyages of several hundred miles.

PHILIPSTOWN. [KING'S COUNTY.]

PHLEGRÆI CAMPI. [NAPLES, PROVINCE.]

PHOCÆA. [IONIA.]

PHOCIS was bounded S. by the Corinthian Gulf, W. by Doris and the Locri Ozolæ, N. by the Locri Epicnemidii and Opuntii, and E. by Boeotia. Strabo says (ix. p. 416) that Phocis was divided into two parts by the range of Parnassos, which extends in a south-easterly direction through Phocis till it joins Mount Helicon on the borders of Boeotia. Parnassos and the mountains which separate Phocis from Locris form the upper valley of the river Cephissus, on the banks of which there is some fertile country, though in many parts the mountains approach very near both banks of the river. The southern part of Phocis is almost entirely covered with the mountains which branch off to the south from the huge mass of Parnassos, though there are a few fertile plains between these mountains, of which the largest is the celebrated Crissean plain.

In the Persian invasion Xerxes ravaged the country at the instigation of the Thessalians. The Phocians had no political importance till after the battle of Leuctra; but shortly after that event the celebrated Phocian or Sacred war broke out, in which all the great states of Greece were more or less concerned. The real occasion of this war was the animosity between Thebes and Phocis, which had long prevailed under a show of peace. The Thebans used their influence in the Amphictyonic council to induce the Amphictyons to sentence the Phocians to pay a heavy fine to the god for an alleged violation of the sacred land in the Crissean plain; and, on their refusing to pay this fine, the council passed a decree that if the fine were not paid the Phocians should forfeit their territory to the gods, which decree was in all probability intended to reduce the Phocians to the condition of the Helots in Laconia, subject to the jurisdiction of the temple of Delphi. In these alarming circumstances the Phocians were induced by Philomelus, who appears to have held some high office in the Phocian state, and was a man of great talent and energy, to make the bold attempt at seizing the city and temple of Delphi. This attempt was successful; and the Phocians obtained in the treasures deposited in the temple ample means for carrying on the war. This war lasted for ten years. The Thebans, and almost all the northern states of Greece, were opposed to the Phocians; and though the Athenians and Spartans were willing, in consequence of their fear of the power of Thebes, to afford assistance to the Phocians, both were too weak at the time to render effectual aid. The Amphictyons called in the assistance of Philip of Macedon, who took possession of Delphi, and put an end to the war B.C. 346. The Phocian cities, with the exception of Absæ, were razed to the ground, and their inhabitants dispersed in villages not containing more than 50 inhabitants. Their two votes in the Amphictyonic council were taken away and given to Philip. (Paus., x. 3, sec. 1; Diod., xvi. 59; Æschin., 'De Fals. Legat.', p. 45.) Many of the towns however appear to have been rebuilt soon afterwards.

The principal towns of Phocis were DELPHI and Elateæ. Elateæ was situated on a small hill above the plain watered by the Cephissus. It was taken and burnt by the army of Xerxes; but was soon rebuilt, and became the most important town in Phocis. It commanded the chief road which led from the north of Greece to Boeotia and Attica. The ruins are at the modern Elephtha.

On the sea-coast the first town we come to after leaving the Locri Ozolæ is *Cirrhæ*, situated at the head of the Crissean Gulf (Bay of

Salona) and at the mouth of the Pleistus. Cirrhæ was the port of Delphi. The next town to Cirrhæ on the coast was *Anticyra*, celebrated for its preparation of hellebore, which grew in the mountains above the town. Next to Anticyra was *Mædon*, destroyed with the other Phocian towns after the termination of the Sacred war and never restored; and after it the small town of *Marathus*, beyond which was the Phrygian promontory with a station for ships.

In the modern kingdom of Greece the ancient name of the state has been restored in one of the nomes of Northern Greece, the nome of Phocis and Phthiotis, which had a population in 1853 of 80,693. [GREECE, Kingdom of.]

Coin of Phocis. British Museum. Actual size.

PHENICÆ (incorrectly called *Phœnicia*), even in its most flourishing state, was a very small country. It extended along the eastern coast of the Mediterranean, from the town of Aradus and the river Eleutherus, on the north, to Mount Carmel, or Dora, on the south. (Ptolem., v. 15; Pliny, 'Hist. Nat.', v. 13, 17; Joseph., 'Apion,' ii. 9.) It was bounded E. by the mountains Libanus and Antilibanus, from which numerous streams descended, which rendered the land exceedingly fertile. (Ammianus Marcell., xiv. 8.) This short line of coast was covered with numerous towns, which were more or less celebrated for their arts and manufactures. The most southerly town of importance was Acco, called by the Greeks Acca, subsequently Ptolemaia, and now St. Jean-d'Acre, which the Israelites did not conquer, though it was included in the division of the Holy Land made by Joshua. [ACRE.] North of Acco was TYRE, the principal of the Phœnician cities; and north of Tyre, SIDON. Between Tyre and Sidon was Sarepta (Sarphand), which is mentioned in the history of Elijah (1 Kings, xvi. 9) under the name of Zerephath. About 8½ miles N. from Sidon was Berytus, a very ancient town with a harbour. (Ptolem., v. 15; Strabo, xvi. 755; Joseph., 'Bell. Jud.', vii. 3, sec. 1; Ammian. Marcell., xiv. 8; Mela, i. 12.) The modern town of Bairuth, or Beirut, is still a place of some importance. [BEIRUT.] Twenty-four miles N. from Berytus was Byblus, situated on rising ground, not far from the sea. It was celebrated for the worship of Adonis. [BYBLUS.] North of Byblus was Botrus; and beyond it Tripolis, which originally consisted of three distinct towns, founded respectively by Tyre, Sidon, and Aradus. North of Tripolis was Orthosias (Plin., 'Hist. Nat.', v. 17; Strabo, xvi. 753; 1 Macc., xv. 37), and, still farther north, Aradus, a colony of Sidon, and the most important town in Phœnicia after Tyre and Sidon, situated in an island of the same name, which is called Arvad in the Old Testament. (Ez., xxvii. 8; Gen., x. 18.) This island was at the mouth of the Eleutherus, and 20 stadia from the mainland. It was only 7 stadia in circumference, but was crowded with houses. (Strabo, xvi. 753; Plin., v. 17; Mela, ii. 7.) Opposite to it on the mainland was the town of Antaradus.

The Phœnicians were a branch of the great Semitic or Aramean family of nations, and originally dwelt either on the Red Sea or the Persian Gulf. (Herod., i. 2; vii. 89; Strabo, i. 42.) It is uncertain at what time they emigrated to the coast of the Mediterranean; but it must have been at a very early period, since Sidon was a great city in the time of Joshua. (Josh., xix. 28.) The Phœnicians far surpassed all the other nations of antiquity in commercial enterprise. Their greatness as a commercial people was chiefly owing to their peculiar natural advantages. Their situation at the extremity of the Mediterranean enabled them to supply the western nations with the different commodities of the east, which were brought to Tyre by caravans from Arabia and Babylon; while their own country produced many of the most valuable articles of commerce in ancient times. Off the coast the purple fish was caught which produced the most celebrated dye known to the ancients; and the sand on the sea-shore was well adapted for the manufacture of glass. (Strabo, xi. 753; Plin., xxxvi. 65.) Mount Libanus supplied them with abundance of timber for ship-building, and the useful metals were obtained in the iron- and copper-mines near Sarepta. In the west they in all probability visited Britain; and on the north coast of Africa, in Spain, Sicily, and Malta, they planted numerous colonies, which they supplied with the produce of the east. Their settlements in Sicily and Africa became powerful states, and long opposed a formidable barrier to the Roman arms. By their alliance with the Jewish state in the time of Solomon, they were enabled to sail to Ophir in the south of Arabia, where they obtained the produce of India. (2 Chron., viii. 17, 18; 1 Kings, ix. 27, 28.)

PHRYGIA, a country of Asia Minor. The boundaries of Phrygia differed at various times. Before the establishment of the province of Galatia by the Gauls, who invaded Asia Minor, Phrygia extended as far as the river Halys.

Phrygia is a high table-land, supported on the south by Mount Taurus, and on the north by the high range of mountains which runs from west to east under the ancient names of Ida and Temnon in

Mysia, and Olympus in the neighbourhood of Brusa. The country in the southern and eastern parts is covered with salt marshes, rivers, and lakes, which have no visible outlet. Of these salt lakes, the most curious is the one called Tatta by Strabo (*Tus* or *Tuzla*), which is 45 miles in length, and supplies a vast tract of country with salt. [ANATOLIA, vol. i. col. 328.]

The Phrygians are said to have been a very ancient people. We know scarcely anything of the early history of Phrygia. There appears to have been a kingdom of considerable power in the northern part of Phrygia under the Midian or Gordian dynasty. The Phrygians were conquered by Croesus and added to the Lydian empire, and were subsequently subject to the Persians. On the division of Alexander's dominions, Phrygia first came into the hands of Antigonos, and afterwards formed part of the dominions of the Seleucids. After the defeat of Antiochus the Great, Phrygia was given to Eumenes, king of Pergamos, and on the death of Attalus, B.C. 133, it came by his bequest into the hands of the Romans, together with the other dominions of the kings of Pergamos. [PERGAMOS.]

In Northern Phrygia, the first town of importance on the west was Azani, near the source of the Rhyndacus, which flows into the Lake Apolloniatis. At this place are now extensive ruins, which have furnished materials for the erection of the modern village of Tjandere Hessar. South-east of Azani was Cotysium, or Cotysium (*Kutaya*), on the Thymbrius, which is still a considerable place. Ancyra is mentioned at the close of the article ANCYRA.

In the south-eastern part of Phrygia was Synnada, a place of considerable commerce and traffic, as it was situated on the road from Apameia Cibotus to Galatia, and also in the way, or nearly so, from Apameia to Iconium and Cilicia. At a short distance to the north of Synnada was Docimnia, which was celebrated for its marble quarries.

The most important cities in Phrygia were situated in the south-western part of the province. Of these cities Celense was the most ancient. Herodotus says (vii. 56) that it is situated at the source of the river Meander, and also of the Catarrhactes, a stream not less than the Meander. Xerxes, after his defeat in Greece, is said to have built here the citadel and a palace (Xen., 'Anab.' i. 2, § 9). The younger Cyrus appears to have frequently resided at Celense, where he had a palace and a great park full of wild beasts. Near Celense was Apameia Cibotus, which was founded by Antiochus Soter, who removed to the new city the greater part of the inhabitants of Celense, which became in consequence a place of small importance. Apameia soon became a place of great wealth, and in the time of Strabo was second only to Ephesus in Asia Minor in commercial importance. South-west of Apameia, and a little to the south of the river Lycus, was Colosse, which is mentioned by Herodotus (vii. 30) and Xenophon ('Anab.' i. 2, § 6) as a large and flourishing city. Strabo (xii. 576) and Pliny (v. 29) however speak of it as only a small place. At Colosse, there was formed a Christian church, chiefly, it appears, by the labours of Epaphras (Col., i. 7; iv. 12, 13), to which St. Paul, who does not appear to have ever visited Colosse himself (Col., ii. 1), wrote an epistle. Colosse was destroyed by an earthquake, together with Hierapolis and Laodicea, in the 9th year of the reign of Nero (Oros., vii. 7), but was built again, and became in the middle ages a place of considerable importance under the name of Chonæ. Chonæ is at present a small village, situated under a very high hill; the ruins of the ancient city may be traced for nearly a mile. (Arundell, 'Visit to the Seven Churches,' p. 94-98.)

West of Colosse, and a little to the south of the Lycus, was Laodicea, which was a large commercial town in the time of Cicero ('Ad Fam.' ii. 17; iii. 5) and Strabo (xii. p. 576). There was a Christian church at Laodicea in the time of the Apostles. Strabo says that Laodicea was celebrated for the sheep which fed in the plains around it, and that their wool was considered superior to that of Miletus. The ruins of Laodicea, which are considerable, are seen a little below Denizli.

Nearly opposite Laodicea, to the north of the Lycus, was Hierapolis, which was celebrated for its mineral springs. (Strabo, xiii. 629.) The ruins of Hierapolis, according to Chandler ('Travels in Asia Minor,' p. 290), are on the site called Pambouk-kalissi, and are about a mile in length. There are remains of a very large theatre and of other public buildings.

PIACENZA (*Placentia*), a town in the duchy of Parma, is situated about half a mile from the southern bank of the Po, and 2 miles east of the confluence of the Trebbia with that river, in a fine plain bounded on the south by well cultivated hills. The town is surrounded with old walls and ditches, and has a citadel, which, according to a stipulation of the Congress of Vienna of 1815, is garrisoned by Austrian troops. The streets are wide and straight, but many of them are grass-grown; on the whole the city has a deserted aspect and is much too large for its present population, which is about 30,000. The principal square (Piazza de' Cavalli) in front of the ducal palace is adorned with two equestrian bronze statues of dukes Ranuccio and Alessandro Farnese. Piacenza abounds in fine buildings, the principal of which are the ducal palace Palazzo Farnese, built by Margaret of Austria from designs of Vignola; the podesteria (Palazzo del Comune), or town-house, erected about 1281, in a style combining characteristics of the gothic and romanesque; the cathedral, a handsome gothic structure of the 12th century, with fresco paintings by Guercino and

Luigi Caracci; San Sisto, a handsome church, richly adorned; the fine church of San-Agostino; San-Francesco Grande, a noble building in the romanesque-gothic style, erected by the Franciscans in 1278; and the church of Santa Maria di Campagna, erected by Bramante, in the Roman-Doric style. All these churches are richly embellished with frescoes, paintings, and statuary. The town library contains 30,000 volumes; the new theatre, and the school of design and architecture, are also worthy of notice. Piacenza carries on a considerable trade in agricultural produce. The establishments for public instruction consist of a lyceum, with faculties of arts, law, and medicine; an episcopal seminary, the college Alberoni for boarders, a school of the fine arts, an institution for the education of young ladies, and several elementary schools. The charitable institutions comprise a large hospital, orphan asylums, &c. The industrial products are woollen-cloth, serge, fustian, hosiery, and hats.

Placentia is first mentioned as being a Roman colony, in the year 224 B.C. In the second Punic war it was besieged unsuccessfully by Hasdrubal; it was however taken and destroyed by a band of Ligurians and Gauls, headed by Hamilcar, a Carthaginian officer, after the defeat of Hasdrubal on the Metaurus. (Livy, xxxi. 10.) After the defeat of Hamilcar the colony of Placentia was restored. In modern history Piacenza is mentioned as one of the independent Lombard cities. It afterwards had its lords or tyrants of the families of Pallavicino, Scotti, and Landi. It next fell under the dominion of the Visconti of Milan. After the death of Filippo Maria Visconti, 1447, the citizens of Piacenza revolted against the Milanese, and placed themselves under the protection of Venice. But Francesco Sforza, being appointed commander of the Milanese, retook Piacenza, in December, 1447, when the town was given up to pillage. From that time Piacenza never recovered its former prosperity; it remained subject to the Sforza of Milan, was taken by the French under Louis XII., and retaken from the French by Pope Julius II., after which it remained subject to the popes, together with Parma, until 1645, when Pope Paul III. gave it to his son Pier Luigi Farnese. From that time it has formed part of the duchy of Parma.

PIANELLO. [ABRUZZO.]

PIAUHY. [BRAZIL.]

PIAZZA. [SICILY.]

PICARDIE, LA, a maritime province of France, constituting one of the military governments into which, before the Revolution, that kingdom was divided. It was bounded N.E. by Artois and French Flanders, E. by Champagne, S. by the Ile-de-France, S.W. by Normandie, and W. and N.W. by the English Channel. Its form was very irregular. The part south of the river Authie had its chief extension from west to east, about 145 miles from the mouth of the little river Bresle (which divided Picardie from Normandie) to the neighbourhood of Rocroy in Champagne; but the breadth of this portion from north to south was in no part greater than 60 miles, and generally was much less. A narrow strip of the province projected along the coast, about 50 miles northward from the Authie to Gravelines, but not having in any part a much greater extension inland from west to east than 20 miles.

Picardie was divided into Upper and Lower Picardie. Upper Picardie comprehended the districts of Amiénois, chief town Amiens; Santerre, chief town Péronne; Vermandois, chief town St.-Quentin; and Thiérache, chief town Guise. Lower Picardie comprehended the three districts of Calaisis, Boulonnais, and the county of Ponthieu, of which the capitals were respectively Calais, Boulogne, and Abbeville. The present department of SOMME, the arrondissements of St.-Quentin and Vervins in the department of AISNE, and the arrondissements of Boulogne and Montreuil in the department of PAS-DE-CALAIS, make up the province of Picardie. Its capital was AMIENS.

PICENUM. [ASCOLI.]

PICKERING, North Riding of Yorkshire, a market-town, and the seat of a Poor-Law Union in the parish of Pickering, is situated in 54° 15' N. lat., 0° 45' W. long., distant 26 miles N.N.E. from York, 226 miles N. by W. from London, and 243 miles by the Great Northern and North Midland railways. The population of the town in 1851 was 2511. The living is a vicarage with the perpetual curacy of Newton annexed, in the archdeaconry of Cleveland and diocese of York. Pickering Poor-Law Union contains 25 parishes and townships, with an area of 88,062 acres, and a population in 1851 of 9972. Pickering is a long and irregularly-built town; it is lighted with gas. The town contains an ancient and spacious church, with a lofty spire; places of worship for Wesleyan and Primitive Methodists, Independents, and Quakers; an Endowed Grammar school for 20 boys; a Free school for 20 boys; and a savings bank. The market is on Monday, and there are fairs held monthly, of which eight in the year are cattle fairs. Broom-making is extensively carried on, the adjoining moors supplying the material. The town formerly sent members to parliament. A county court is held in Pickering. On Pickering-moor are vestiges of two Roman encampments.

PICTON. [CANADA.]

PICTOU. [NOVA-SCOTIA.]

PIDDLETOWN. [DORSETSHIRE.]

PIDDLETRENTHIDE. [DORSETSHIRE.]

PIEDIMONTE. [LAVORO, TERRA DL.]

PIEDMONT, PIEMONTE, or PIE' DI MO'NTE, which means a country at the foot of mountains, is the old name of a district of North Italy which forms part of the Sardinian States. It has the title of a principality, and the eldest son of the king of Sardinia is styled Prince of Piedmont.

The name of Piedmont however was also and is still occasionally used as a general denomination for that part of the continental territories of the king of Sardinia which is situated on the Italian side of the Alps, and between the Alps and the Ligurian Apennines, as distinguished from the other great divisions of the monarchy, namely, the duchy of Savoy, the county of Nice, and the duchy of Genoa. In this larger sense Piedmont includes a fine and extensive tract of country 120 miles long from north to south, from the Pennine Alps to the Ligurian Apennines, and between 90 and 100 miles in breadth. It forms a distinct geographical region, having natural boundaries and a peculiar physical character. It comprises the western or highest part of the basin of the Po, from the sources of that river to where it emerges from the hills of Montferrato and enters the great plain of Lombardy, including its numerous and large affluents, the Tanaro, the Stura, the Bormida, the two Dora, &c. It is a country of hills and valleys, being occupied by numerous offsets of the Alps and of the Ligurian Apennines, except towards the eastern borders, where it merges into the plain of Lombardy, on the side of Vercelli and Mortara.

During the middle ages this fine country was parcelled out into several feudal principalities and lordships, under a nominal allegiance to the German emperors as kings of Italy, namely: 1, the principality of Piedmont proper; 2, the duchy of Aosta; 3, the duchy of Monferrato; 4, the marquisate of Saluzzo; 5, the county of Asti; 6, the marquisate of Ceva; 7, the lordship of Vercelli. In course of time the dukes of Savoy became possessed of all these districts, either by conquest or inheritance, the houses of the former lords having become gradually extinct.

The country of Piedmont, generally speaking, is one of the most fertile, healthy, and pleasant in Italy. It produces corn, rice, Indian corn, wine, fruits in abundance, timber-trees, excellent pasture for cattle, hemp, and silk. The system of irrigation has been long practised in Piedmont, and it is carried to considerable perfection wherever the slope of the ground and the vicinity of running water afford the opportunity.

The population of all Piedmont amounts to upwards of 3,000,000, being about two-thirds of that of the whole monarchy, the island of Sardinia included. [SARDINIAN STATES.]

PILKINGTON. [LANCASHIRE.]

PILLAU, a seaport in Eastern Prussia, with 8600 inhabitants, is situated at the extremity of a tongue of land between the Baltic and the eastern extremity of the Frisches-Haff. It is a place of considerable importance, for as the Haff is too shallow to allow large or heavily-laden ships to go up to Königsberg and Elbing, they are either lightened of part of their cargo, or remain at Pillau, and the goods are conveyed to those ports by lighters, which also bring back the return cargoes. Near to the town there is a lighthouse, and a fortress which defends the entrance of the Haff. Pillau derives great advantages from its fisheries, especially of sturgeons, from the roe of which caviare is prepared.

PILLIBERT. [BAREILLY.]
PILLNITZ. [PIRMA.]
PILLTOWN. [KILKENNY.]

PILSEN, a fortified town in Bohemia, is situated in the midst of fertile fields, in a beautiful and extensive valley, at the confluence of the Bradawka and the Beraunka, also called the Mies, in 49° 45' N. lat., 13° 23' E. long., 52 miles W. by S. from Prag, and has about 10,000 inhabitants. It is a well-built town, and the houses are mostly of stone. It has three suburbs. The most remarkable public buildings are the gothic church of St. Bartholomew (built in 1292), the gymnasium, the town-hall, and the house of the Teutonic knights. Besides the gymnasium, there are a military academy, a philosophical institution with six professors, and a lyceum. Pilsen has considerable manufactures of woollen cloth, morocco leather, ironmongery, articles made of horn, &c. There are four annual fairs, which are much frequented. The inhabitants carry on an extensive trade in Bohemian products, and in cattle, iron, potashes, feathers, wool, leather, cloth, &c.

PIRANO. [ISTRIA.]

PIRANA, a town in the circle of Meissen, in the kingdom of Saxony, situated on the left bank of the Elbe, 11 miles by railway S.E. from Dresden, and has about 6000 inhabitants. Most of the houses are built of stone from the celebrated quarries near the town. The principal public buildings are the town-hall, the cathedral, which is one of the finest specimens of Gothic architecture in the kingdom, the convent church, the church of St. Kunigunda, the orphan asylum, and a handsome schoolhouse. On a high rock near the town, called the Sonnenstein, there was formerly a strong fortress, which was dismantled by the Prussians in the Seven Years' War, and which is now used as a lunatic asylum. There are flourishing manufactures of cotton, linen, woollen cloths, stockings, hats, leather, ironmongery, starch, &c. Calico-printing is carried on. The inhabitants have a considerable trade also in the natural productions of the country, among which the Pirna sandstone holds an important place. Hops are extensively grown in the neighbourhood of Pirna. About four miles below Pirna, on the right bank of the Elbe, is the village of Pillnitz, adjacent to which is the extensive palace of Pillnitz, the summer residence of the kings of Saxony. In this palace a congress was held in 1791, at which a convention was agreed upon to oppose the French revolution, and to maintain the right of the Bourbons to the throne of France.

PISA, a province of Tuscany, is bounded N. by the province of Lucca, E. by that of Firenze, W. by the Mediterranean, and S. by the province of Siena. It comprises—1, the lower part of the basin of the Arno, with a small part of that of the Serchio; 2, a part of a hilly range, called Montenero, which bounds the basin of the Arno on the south, and runs close to the sea south-east of Livorno; 3, the basin of the Cecina, south of the hills just mentioned; and 4, a strip of land south of the mouths of the Cecina, and extending along the sea-coast, and between that and the hills for about 12 miles, as far as the Torre San Vincenzo. The area of the province is 1177 square miles, and the population in April 1854 amounted to 231,473. The city of Livorno (Leghorn) and territory about it amounting altogether to 38 square miles, and formerly included in the province of Pisa, has been recently formed into a separate government, to which the islands of Elba and Gorgona also are annexed. [LIVORNO; ELBA.] In the changes that occurred after the death of the ex-empress Maria Louisa in 1847, the outlying districts of Pontremoli and Fivizzano, formerly belonging to Tuscany and included in the province of Pisa, were ceded to Parma and Modena respectively; but the detached districts of Pietrasanta, Barga, and Seravezza, are still held by Tuscany in virtue of the Convention of Florence (Nov. 28, 1844). Barga lies in the valley of the Upper Serchio. [GARFAGNANA.] The district of Pietrasanta lies along the sea-coast between the territories of Lucca and of Massa and Carrara. It stretches from the sea to the foot of the Carrara Mountains, or Alpe Apuana, and is chiefly noted for its marble quarries at Seravezza, which are of the same description as those of Carrara.

The central and southern parts of the province are crossed by ramifications of the Apennines, and the northern part is the wide plain in which the city of Pisa stands. The principal rivers are the Arno and the Serchio, which traverse the plain of Pisa and here enter the sea. The other rivers are the Era, a feeder of the Lower Arno, and the Cecina, which rises in the range of high lands, between 1000 and 1500 feet high (which divides the Maremma, or maritime low lands, from the valley of the Ombrone in the province of Siena), and after a tortuous course of about 40 miles in a western direction, enters the sea by two mouths in the Gulf of Vad, 22 miles S.E. of Livorno. In the north-west of the province there are several marshy lakes: a narrow strip along the coast is unhealthy in summer and autumn, owing to malaria. The soil is very fertile in corn, wine, and fruits. The province is crossed by railways and electro-telegraphic wires connecting the city of Pisa with Lucca, Florence, and Leghorn. The chief towns, PISA and VOLTERRA, are noticed in separate articles.

PISA, capital of the province of Pisa in Tuscany, is situated in a plain watered by the Arno, 45 miles by railway W. from Florence, 10 miles N. from Leghorn, and about 4 miles from the sea-coast, in 43° 43' 11" N. lat., 10° 24' 7" E. long., and has about 22,000 inhabitants. The town is divided by the river into two nearly equal parts, connected by three bridges, one of which is of marble. The circumference of the walls is about six miles; the quays along the Arno and several other streets are wide, well paved, and lined with handsome buildings, but the town has an appearance of loneliness; it is too large for its population. The four most remarkable buildings of Pisa, the cathedral, baptistery, belfry, and Campo Santo, are grouped near one another in a vast open place at the western extremity of the town.

The duomo, or cathedral, begun in 1068 by the architect Buschetto and completed in 1118, is a splendid gothic structure, cased externally with marble of various colours, and ornamented with numerous reliefs, inscriptions, and columns of various sizes. The plan is a Latin cross. The interior of the church is lighted through small windows of painted glass; the nave is divided from the aisles by fine columns of granite; and the three bronze gates of the façade are ornamented with figures by Giovanni da Bologna, representing scenes

from the Passion of our Lord. Above the intersection of the nave and transepts rises a dome, which is one of the earliest constructions of the kind in Italy. The pulpit is enriched with valuable sculptures by Giovanni di Pisa; other statues and sculptures by the same master-hand, and by Giovanni da Bologna and other artists, are in various parts of the church. The paintings are by Andrea del Sarto, Razzi, Salvator Rosa, Roselli, and other masters. The pavement is of marble of various colours.

The Baptistery, erected between the years 1152 and 1160 by Diotisalvi, is of a singular design. The plan is circular, with a diameter of 116 feet; the walls are 8 feet thick; the building is raised on 3 steps, and surmounted with a dome in the shape of a pear. The external elevation is divided into 3 stories: in the basement the columns, 20 in number, are engaged, and have arches springing from column to column, with a bold cornice above; in the first story the columns are smaller, stand out in relief, and are placed closer together; and the order is surmounted with pinnacles and high pediments placed at equal distances: the terminations of these parts are crowned with statues. Above this is an attic story, decorated with other high pediments, pinnacles, and statues. The dome, which is covered with lead, is intersected by long lines of very prominent fretwork: all these lines meet in a little cornice near the top, and terminate in another dome, above which is a statue of St. John. The interior is much admired for its proportions: 8 granite columns, placed between 4 piers decorated with pilasters, are arranged round the basement story, which support a second order of piers arranged in a similar manner, on which the dome rests, which is famous for its echo. The interior is ornamented with numerous sculptures: the pulpit, by Nicola Pisano, is considered a masterpiece. In the middle of the Baptistery is a large octagonal basin of marble, raised on three steps. Within the basin there are four circular places hollowed out for water, and round the centre of the basin, which is occupied by a pedestal, is a place likewise hollowed out for the priest, who was thus enabled to turn from one basin to the other.

The Belfry, one of the most celebrated buildings of Pisa, is a round tower built externally of white marble. It is 150 feet high, divided into nine stories by rows of columns. It is generally named the Leaning Tower, from the circumstance that it deviates from the perpendicular line about fourteen feet. It was erected in the latter part of the 12th century by the architects William of Innsbruck and Bonanno of Pisa. From the summit there is a splendid view of the plain, the surrounding mountains, and the sea.

The Campo Santo, or cemetery, constructed in the 13th century by Giovanni di Pisa, is a parallelogram, 430 feet in length, 148 feet wide, with an arcade or cloister running all round the interior, the walls of which are covered with fresco paintings chiefly by Giotto, Orcagna, and Memmi. The paintings are for the most part greatly damaged, and some are entirely obliterated. A series of engravings of the paintings was published by Rosini in 1816. Several ancient sculptures and other remains of antiquity are deposited in the Campo Santo. Among the tombs is that of the Countess Beatrice, the mother of Matilda; of Algarotti, Pignotti, and of the celebrated surgeon and professor Vacca, which last is the work of Thorwaldsen.

Among the other remarkable buildings of Pisa are—the church of San Stefano, which was founded in 1561 by the grand-duke Cosmo; that of San Frediano, which is rich in paintings; San Nicola, with a handsome belfry, the work of Nicola Pisano; San Michele in Borgo contains the monument of Guido Grandi, a celebrated mathematician and contemporary of Newton; Santa Maria della Spina, a handsome church, with good paintings and sculptures; the palaces of Lanfranchi and Lanfreducci; the Torre della Fame (immortalised by Dante in his 'Inferno'), in which Ugolino and his children were starved to death, and now forms part of a structure called Palazzo dell'Orologio, on the Piazza de' Cavalieri; the university buildings, the library, observatory, and botanical garden; the great hospital; the Loggia, or old exchange.

The Certosa, or Carthusian convent and church, is in a pleasant situation, about two miles east of Pisa. The vast farm and forest of San Roisore, belonging to the grand-duke, three miles from Pisa, near the sea, is chiefly remarkable for the camels, about eighty in number, the original stock of which were brought to this spot in the time of the Crusades. The mineral baths, called Di San Giuliano, four miles from Pisa, at the foot of a mountain, have been restored on the remains of ancient Thermae, which were frequented in the middle ages by the countess Matilda. The present buildings are of the last century. In summer the air of Pisa and the neighbouring plain is not considered wholesome, though it is not so deleterious as it once was, owing to improvements in drainage and cultivation. During the winter the climate of Pisa is extremely mild, though rainy.

The origin of Pisa is unknown. It was on the border between Etruria and the country of the Ligurians, and was probably colonised by the Etruscans when they extended their dominion from the Arno to the Macra. It became subject to Rome about the middle of the 5th century of Rome, retaining, like most Etruscan towns, its municipal form of government. Livy (xl. 43) mentions that a Latin colony was sent to Pisa about B.C. 179. Nothing more is said concerning Pisa in Roman history. It had bishops at the beginning of the 4th century. Pisa passed successively under the dominion of the various

conquerors of Italy, the Goths, the Longobards, and the Carolingians. Under the last it governed itself as an independent community, with a nominal allegiance to the emperors and their great feudatories the counts or marquises of Tuscany. In A.D. 874 the Pisans defeated the Saracen pirates, who, after having plundered the Roman coast, landed at San Pietro in Grado, about three miles from Pisa. In 965 Otho I., on his return from Rome, stopped at Pisa, and granted various privileges to the town. About 1003 the Pisans sent their galleys to the coast of Syria against the Seljuk Turks, who had invaded the country, and who vexed the Christians of Palestine.

In the following year began the long struggle between the Pisans and Muscet, the Moorish king of Sardinia, which ended in the final conquest of that island by the united Pisans and Genoese, in the year 1022. At this period Pisa was a republic, having its annual consuls. About 1050 the Pisans subjected the island of Corsica, and in 1089 or 1091, Pope Urban II. made a grant to them of the whole island as a fief of the Apostolic See. In 1063 they sailed to Palermo, cut the Saracen fleet out of the harbour, and carried away a rich booty, part of which was employed in building their splendid cathedral. About the year 1070 began the wars between Genoa and Pisa, which continued, with various interruptions, for more than two centuries, and ended in the downfall of Pisa. In 1088, the two states having made peace, joined their fleets, and sailing to the coast of Barbary, took the town of Mahadiah, then the capital of a considerable Saracen state, and obliged the king to release all his Christian slaves.

It was in this period of their prosperity that the Pisans completed their splendid monuments of art, the cathedral, the belfry, baptistery, and Campo Santo. The Pisans sent a fleet of 120 sail to the first crusade, and their soldiers and sailors assisted at the taking of Nicæa, and afterwards at that of Antioch, as a reward for which they obtained a street of that city to establish a factory in. In 1099 the Pisans were at the taking of Jerusalem. In the following year they sailed into the sea of Marmora, and obliged the emperor Alexius to sign a treaty, by which he allowed them to establish a factory at Constantinople, with ample privileges. The Pisan fleet returned home in triumph, and their city was then entirely surrounded by walls.

In 1114 the Pisans sent a large armament, the largest that had ever sailed from their coast, to the conquest of the Balearic Islands, which were in possession of the Moors, and which had become a nest of Mohammedan pirates. The fleet consisted of 300 ships of various sizes, having on board 35,000 men and 900 horses. The archbishop of Pisa, Pietro Moriconi, himself commanded the expedition. In April, 1117, the Pisans, in conjunction with Raymundo IV., count of Barcelona, accomplished the conquest of the Balears. In the year 1137, the Pisan fleet went to the coast of Naples to aid the Pope and the emperor against the Normans, and took the town of Amalfi.

In the war between Frederic Barbarossa and the Lombard cities, Pisa sided with the emperor. In the following century the Pisans, as Ghibelines, took the part of Frederick II. against the Pope. In 1258, peace was made between Genoa and Pisa, through the mediation of Pope Alexander IV. In 1282 began the fourth war between Pisa and Genoa. In 1284 they suffered a disastrous defeat off the island of Meloria from the Genoese, commanded by Oberto Doria. In the action they lost 3000 men killed or drowned, and 13,000 were carried prisoners to Genoa, where they were confined in chains, and where most of them died. Hence a proverb became current throughout Italy—"Those who want to see Pisa must go to Genoa." In 1290, Conrad Doria attacked the Porto Pisano, destroyed its towers, and sunk ships filled with stones at the entrance. From that time Pisa completely lost its rank as a maritime power, after a glorious career of four centuries, and Venice and Genoa were left alone to dispute for the naval supremacy of the Mediterranean.

In the meantime Florence, at the head of the Guelphs of Tuscany, assailed Pisa by land, and in their distress the Pisans appeared as their captain-general, for 10 years, Ugolino Count Gherardesca, a Ghibeline feudal baron, who, in order to keep himself in power, favoured alternately Guelphs and Ghibelines, while he proscribed the more independent leaders of both parties. He was opposed by the archbishop Ruggiero degli Ubaldini, a staunch Ghibeline; and in 1288, being accused of betraying his country into the hands of the Guelphs of Florence and Lucca, an insurrection broke out against him, headed by the archbishop. Ugolino, being overpowered, was confined, with two of his sons and two of his grandsons, in a tower near the Arno, where the wretched prisoners were left to die of hunger. This catastrophe has furnished Dante with the subject of one of his most powerful descriptions.

The Pisans then appointed Guido da Montefeltro their captain-general. He recovered by force the strongholds which Ugolino had put into the hands of the Guelphs. Peace was made with Florence in 1293, and in 1299 with Genoa also. Pisa continued attached to the Ghibeline party, and at the death of the emperor Henry VII., in 1313, found herself exposed to the attack of all the Guelphs of Tuscany. The Pisans gave the chief command to Uguccione della Faggiuola, a captain of some renown, who took Lucca, in 1314, and afterwards defeated the Florentines in the battle of Montecatino. Pisa resumed its republican form of government in 1316, and in 1322 exiled 15 of the Ghibeline nobles, and made peace with the Guelphs. In the following year a general massacre of the Pisans took place in

Sardinia, and the insurgents offered the island to Alfonso, the son of James II., king of Aragon. Pisa made a last effort to preserve Sardinia, but was obliged to give it up to the Aragonese, in 1326. In 1328 Castruccio Castracani, the great Ghibeline leader, took Pisa by surprise, but his death soon after restored it to freedom. In 1341 the Pisans, who still retained much of their martial spirit, defeated the Florentines, took possession of Lucca, and kept it till 1369, when the emperor Charles IV. obliged them to restore Lucca to its independence.

Pisa was now distracted by internal feuds between the democratic party and the Ghibeline nobles, the result of which was that the city was sold by one of its tyrannical chiefs to Gian Galeazzo Visconti, in February, 1399. At the death of Gian Galeazzo, in 1403, his natural son Gabriello Maria had Pisa for his share, but not feeling himself secure, he placed himself under the protection of Charles VI. of France. Marshal Boucicault, the representative of Charles, sold the citadel and the other strongholds which he had in the territory of Pisa for 206,000 florins. Gabriello Maria demanded his share of the purchase money, but Marshal Boucicault rid himself of his importunities by having him beheaded as a traitor to the French king.

The Florentines had the citadel of Pisa, but not the town, and the citizens soon retook the citadel. They now asked peace of the Florentines, offering to repay them the money which they had paid to Boucicault. The Florentines however would hear of no proposal except the surrender of Pisa. They accordingly blockaded Pisa for about a year, and when the inhabitants were reduced to the greatest distress for want of provisions, Giovanni Gambacorta, whom they had recalled from exile to conciliate their enemies, secretly opened the gates to the Florentines for 50,000 florins on the night of the 8th November, 1406. Rather than submit to the yoke of Florence, the principal families of Pisa now emigrated to Sardinia and Sicily. Thus ended the career of Pisa as an independent state.

After 88 years of Florentine dominion, when Charles VIII. of France came to Italy, in 1494, the people of Pisa rose in arms, drove away the Florentines, and restored their republican government under the protection of France. In 1499, after the French had left Italy, the Florentines besieged Pisa, but were repulsed. In 1504 the Florentines resumed the siege, but they failed again. At last, in 1509, they formed a close blockade round the town, and Pisa was obliged to surrender through famine. A second emigration then took place, the wealthier families preferring exile to the loss of independence. Since that time Pisa has remained subject to Florence.

The university of Pisa has been the chief means of maintaining some life in the town. It is divided into three faculties, theology, law, and medicine; it is attended by about 400 students.

PISIDIA formed the northern and mountainous part of the Syrian and Roman provinces of Pamphylia. [PAMPHYLIA.] In their mountains, which formed a part of Mount Taurus, the Pisidians maintained their independence under the Persian empire. Neither the Syrian kings nor the Romans were able to subdue them, though the latter obtained possession of some of their towns. In the time of Strabo the Pisidians were governed by petty chiefs, and principally supported themselves by plundering their neighbours.

Mr. (now Sir Charles) Fellows, who visited the western part of Pisidia in 1838, says that the rocks are generally of marble, and some of common limestone with veins of marble running through them in all directions. The most singular features in this district are mountains of volcanic dust accumulated round marble rocks. This light sand or dust is tufa, the dust of the pumice-stone; the decomposed lime has in many parts mixed with this tufa and formed hills of Roman cement.

The chief towns of Pisidia were ANTIOCHEIA, Sagalassus, and Selge. South-west of Antiocheia was *Sagalassus*, or *Selgeus*, the ruins of which, according to Fellows, are very extensive, consisting of seven or eight temples; three other long buildings, ornamented with cornices and columns, and with rows of pedestals on each side; and a most beautiful and perfect theatre on the side of a higher hill than the rest of the ruins occupy. The town has no trace of walls, but its tombs are to be seen carved in the rocks for miles around, with much architectural ornament. These ruins are near the village of Allahsuun to the south of Isbarta. To the south rises a high insulated conical hill with the remains of the wall round its summit. On this hill stood the Acropolis of Sagalassus. (Hamilton, 'Researches in Asia Minor.')

South-east of Sagalassus was *Selge*, the most important town in Pisidia. When Alexander marched through Pisidia, the inhabitants of Selge sent ambassadors to him, and obtained favourable terms from him. (Arrian, i. 28.) The territory of Selge, though mountainous, was, according to Strabo, very fertile. It produced abundance of oil and wine, and afforded pasturage for great numbers of cattle. The forests supplied a great number of timber-trees, of which the styrax was reckoned the most valuable. Mr. Fellows visited the ruins of a large city, situated about 10 miles north-east of the village of Boojak, which are in all probability those of Selge. He rode (he says) for at least 3 miles through a part of the city, which was one pile of temples, theatres, and buildings, vying with each other in splendour.

PISINO. [ISTRIA]

PISTICCIO. [BASILICATA.]

PISTOIA, the ancient *Pistorium*, a town in the Tuscan province of

Firenze, is situated 21 miles by railway through Prato N.W. from the city of Florence, in a plain at the foot of the Apennines, and near the Stella, a tributary of the Ombrone, which is an affluent of the Arno. Pistoia lies on the high road leading from Florence to Modena over the Apennines. It is a well-built town of considerable size, but rather thinly inhabited; it contains about 12,000 inhabitants, and gives title to a bishop. Pistorium does not appear to have been a place of importance under the Romans, except that it was near one of the passes leading into Cisalpine Gaul. Sallust mentions the Pistorian territory in his account of the movements of Catiline and his insurgent followers. Pistoia was a place of importance under the Longobards, whose king Desiderius inclosed it with walls. It was afterwards an independent municipality, until it was subjugated by Florence, about 1150. In the bloody feuds of the numerous branches of a distinguished Pistoian family, named Cancellieri, in the latter part of the 13th century, the two factions of the Bianchi and the Neri originated, which spread also to Florence, and caused incalculable misery to both cities in this and the following century. The Florentine Neri blockaded Pistoia, and after terrible barbarities got it into their power by surrender, April 10, 1306, when they razed the walls to the ground. Pistoia never recovered from this blow. It has continued, with some short interruptions, to be subject to Florence ever since.

There are many remarkable buildings in Pistoia. The cathedral, which was built by the Countess Matilda, in the early part of the 12th century, and restored by Niccolo di Pisa, contains some good paintings, basso-relievos, and monuments. The other churches worthy of notice are San-Pietro-Maggiore, L'Annunziata, San-Filippo-Neri, Santa-Maria-dell'Umiltà, San-Giovanni-Battista, San-Domenico, and San-Giovanni-Rotondo. The palace dell'Commune, or degli Anziani, dates from the 13th century, and contains several monuments of the middle ages. The episcopal palace and the clerical seminary, both built in the 15th century by Bishop Ricci, are handsome buildings. La Sapienza (the public schools) has a good library. There is also at Pistoia an academy of sciences and belles-lettres. The private palaces of the families Bracciolini, Cancellieri, Rospigliosi, Tolomei, and Forteguerri, contain good paintings. The chief manufactures are woollen cloth, silk, leather, iron wares, and gun-barrels. The pistol is said to derive its name from this city. Pistoia was the birthplace of Pope Clement IX.

PITCAIRN'S ISLAND, a small settlement in the Pacific Ocean, situated in 25° 4' S. lat., 130° 8' W. long., is dependent on the British government, from the circumstance of its having been resorted to by some of the mutineers of the *Bounty* in 1790. The first settlers consisted of 9 English sailors, 6 Otaheitean men, and 13 Otaheitean women. The 6 Otaheiteans and 6 of the Englishmen were slain in quarrels. The population in October 1854 amounted to 200, all but 3 of whom were born on the island, and nearly all are descendants of the original settlers. The islanders speak both the Tahitian and English languages fluently.

Pitcairn's Island was so named on account of its having been first seen by a young gentleman of the name of Pitcairn on the 2nd July, 1767, as stated in Commander Carteret's narrative of his 'Voyage Round the World.' The island is about 4½ miles in circumference, about a mile and a half in its greatest length, and the highest point is 1008 feet above the sea. The coast is formed for the most part of rocky projections, off which lie scattered numerous fragments of rock rising like black pyramids amidst the surf, which on all sides rolls in upon the shore. Bounty Bay is the only accessible landing-place. The island has great variety of soil and aspect, is well wooded, and healthy. The thermometer ranges from 59° to 89° Fahr. Cocoa-nut, plantain, banana, bread-fruit, banyan, orange, and other trees flourish; potatoes, sweet potatoes, yams, water-melons, sugar-cane, tobacco, the tea-plant, and maize are cultivated; goats, hogs, and poultry are reared; and fish is abundant. About a dozen vessels, chiefly whalers, visit the island annually, and obtain provisions in exchange for clothing and other articles which the inhabitants stand in need of. Occasionally the island is visited by a British man-of-war. Rear-Admiral Moresby, the British Commander-in-Chief in the Pacific, visited and spent a few days on the island in August 1852, and the accounts given by him and by other visitors agree in ascribing to the islanders the highest character for virtue, good order, and intelligence. John Adams, the last survivor of the mutineers, died in 1829 in the 65th year of his age. This man at the time of the mutiny was 28 years of age; ten years later, he found himself the only man left of those who had come to the island; of the others only one had died a natural death; most of the men had been killed in quarrels fomented by the use of ardent spirits. The spirits were distilled from a root found on the island by one who himself committed suicide in a fit of delirium tremens. Adams became seriously impressed with a sense of his duty to the children of his companions, and devoted himself assiduously to the instruction and government of his little community. A Bible and prayer book saved from the *Bounty* were his only assistants; strict regulations were made against making intoxicating drinks, or landing them from ships; the little territory was divided first into 9, afterwards into 22 allotments, corresponding to the number of families; a chief magistrate and two councillors, elected annually, were appointed to direct the insular government; and an industrious, orderly, and virtuous community gradually sprang up. Four months before Adams' death an Englishman named Nobbs, who had been interested in the islanders-

by the accounts he had heard of them, arrived at Pitcairn, and was engaged by Adams as schoolmaster. After Adams' death, Mr. Nobbs continued to set as teacher and chaplain. In 1852, by the kindness of Admiral Moresby, he was enabled to visit England. After receiving ordination from the Bishop of London, and obtaining an interview with the Queen, he returned to Pitcairn. The Admiral's chaplain, who remained on the island in the absence of Mr. Nobbs, writes under date of September 5th 1852, as follows:—"The accounts of the virtue and piety of these people are by no means exaggerated: I have no doubt they are the most religious and virtuous community in the world; and during the months I have been here, I have seen nothing approaching a quarrel, but perfect peace and good-will among all."

(Murray, Rev. E., *Pitcairn*: London, 1853.)

PLATA, RIO DE LA, is the name applied to the wide estuary formed by the confluences of the rivers Paraná and Uruguay, in South America. Where the Rio de la Plata enters the sea, between Punta del Este and Cape San Antonio, its width is about 180 miles; and between Punta de las Pedras and the Barrancas de Santa Lucia above Monte Video, it is still 58 miles wide; but above these places the shores gradually approach nearer, and opposite Colonia they are only 20 miles apart; this width continues to the confluence of the two large rivers which fall into it. The Rio de la Plata is very shallow; at its mouth it is only 10 fathoms deep on an average, and this depth gradually decreases. Between Monte Video and Buenos Ayres the average depth is not more than 3 fathoms; but vessels drawing 16 feet of water can, except when the water is very low, ascend the Paraná as high as San Juan (80° 36' S. lat.), and those drawing 12 feet can go up to Corrientes (27° 30' S. lat.). The deep part of the Plata opposite Buenos Ayres, called the outer roads, is from 7 to 8 miles from that town; and between the outer and the inner roads there is a sand-bank. Smaller vessels anchor in the inner roads, at from one to two miles from the shore. The navigation of the Rio de la Plata is very difficult, owing to the dangerous shoals, the strong and irregular currents, and the sudden tempests to which it is subject. The strength and irregularity of the currents are easily accounted for, when it is considered that the larger of the two tributaries, the Paraná, rises within the tropics, and during the rainy season brings down an immense volume of water, and that the wide expanse of the estuary, being bounded either by low and level or very slightly elevated ground, is subject to be influenced by every strong wind which drives a great volume of water to the point of the compass opposite to that from which it blows. The 'pamperos,' or south-western gales, which frequently blow with inconceivable fury, cause very remarkable fluctuations in the depth of water. The extremely difficult and dangerous navigation of this estuary has obtained for it the designation of El Infierno de los Marineros; but Captain Fitzroy mentions as very redeeming qualities, that it affords anchoring-ground everywhere, and soundings where the indications are certain if the vessel is approaching danger. Little or no tide has been hitherto noticed in this wide expanse of water, but Captain Fitzroy thinks that "this anomaly may be more apparent than real; for where the depth of water is so fluctuating, and the currents are so variable, it is difficult to distinguish the precise effect of tides, except by a series of observations far longer than has yet been made." Mr. Darwin, when off the coast, noticed the slowness with which the waters of the Rio de la Plata mingled with those of the sea; the muddy and discoloured river-water, from its less specific gravity, floating for a great distance on the surface of the salt-water, and producing a very singular effect where the vessel crossed it. Other observers have found that the current occasioned by the discharge of the Plata preserves an easterly direction, and is still found to have a velocity of a mile an hour, and a breadth of more than 800 miles, at a distance of not less than 600 miles from the mouth of the river. (Sabine, 'Notes to Humboldt's Cosmos.') The vast body of water which issues from the Plata may be readily conceived when it is stated that the basin drained by the rivers which flow into it is estimated at 1,200,000 square miles.

Through the Rio de la Plata the commercial produce of about one-fourth of South America is brought to the market of the world. It is therefore a great advantage to the countries from which the estuary of the Plata receives its waters, that the rivers which flow into it offer less obstruction to navigation than is usual in large streams. The largest of these rivers, the Paraná, as already mentioned, is navigable

for vessels drawing 12 feet of water as far as Corrientes, a distance of 800 miles from its mouth. The Rio Paraguay, the largest affluent of the Paraná, may be navigated by large boats more than 1000 miles above its confluence with the Paraná. The Rio Vermejo, another affluent of the Paraguay, is navigable up to the confluence of its two principal branches, the Lavayen and Rio de Tarija, a distance of more than 400 miles. The Salado, which joins the Paraná in its lower course, is navigable to the town of Matara, 350 miles from the mouth of the river. The navigation of the Uruguay is obstructed by two cataracts, which occur about 180 miles above its mouth.

(Fitzroy and King, *Surveying Voyages of the Adventure and Beagle*; Parish, *Buenos Ayres and the Provinces of the Rio de la Plata*; Ignacio Nuñez, *Account of the United Provinces of the Rio de la Plata*; Mackinnon, *Steam Warfare on the Paraná*.)

PLATA, LA, States of. [ARGENTINE CONFEDERATION.]

PLATÆA, or PLATÆÆ, was a city of Bœotia under the ridge of Mount Cithæron, about 60 stadia, or rather more than 7 miles, S.W. from Thebes. The river Asopus ran between, at nearly an equal distance from each. Platæa, in order to escape being subjugated by Thebes, allied herself with Athens (B.C. 519). The Platæans were the allies of Athens at the battles of Marathon, Artemisium, and Platæa (B.C. 479), when the rest of the Bœotians joined the Persians, and also in the Peloponnesian War. One of the most remarkable events of the Peloponnesian War was the siege of Platæa by the Lacedæmonians. The inhabitants held out to the last extremity, and on their surrender were put to death by the Lacedæmonians to the number of 200, the rest having escaped by a sortie in the night. The Thebans (B.C. 427) afterwards razed the city to the ground. The citizens were restored (B.C. 386) after the peace of Antalcidas. The town was however again destroyed by the Thebans B.C. 374. The Platæans were again restored to their city sixty years after their last expulsion by the Thebans. (Clinton's 'Fast. Hell'.)

PLATTSBURG. [NEW YORK.]

PLAUBEN, one of the most considerable manufacturing towns in the kingdom of Saxony, is situated in a beautiful valley on the banks of the White Elster, 74 miles by railway S. from Leipzig, and the same distance S.W. from Dresden. It is in part well built, and has about 10,000 inhabitants. Among the public buildings there are two churches, a royal palace, a lyceum, a training school, two hospitals, and two orphan asylums. The industrial products are muslins and other cotton goods, hosiery, net-lace, bobbin-net, gauze, oil-cloth, buttons, and distilled spirits. Plauen is the chief town of the Saxon Voigtland.

PLOCK, the capital of the Russian government of Plock, is situated on the Vistula, about 50 miles N.W. from Warsaw. It has about 8000 inhabitants, of whom 3000 are Jews. Plock gives a title to a Roman Catholic bishop, who resides at Pultusk. There are in the town 11 churches, 5 convents, an episcopal palace, a Piarist gymnasium, a seminary of secular priests, an orphan house, a lunatic asylum, a literary society, &c. The inhabitants subsist partly by agriculture and partly by a brisk trade in corn with Danzig and other places. The government of Plock is noticed in the article POLAND.

PLŒUESCAT. [FINISTÈRE.]

PLŒVIGNER. [MORBIHAN.]

PLYMOUTH, Devonshire, a market-town, seaport, and municipal and parliamentary borough, is situated on the south coast, at the mouth of the river Plym, in 50° 22' N. lat., 4° 9' W. long., distant 42 miles S.W. from Exeter, 216 miles W.S.W. from London by road, and 246 miles by the Great Western, Bristol and Exeter, and South Devon railways. The population of the borough of Plymouth in 1851 was 52,221. The population of the municipal borough of Devonport, consisting of the parish of Stoke Damerel, was 38,180 in 1851; that of

Devonport parliamentary borough, which includes also the parish of East Stonehouse, was 50,159. Devonport and Stonehouse are contiguous to and usually regarded as forming one town with Plymouth. Plymouth is governed by 12 aldermen and 36 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The borough of Devonport also returns two members to Parliament. The livings are in the archdeaconry of Totnes and diocese of Exeter. For Poor-Law purposes, the two parishes of which the borough of Plymouth is composed, are governed under the provisions of a local act. Stoke Damerel is likewise under a local act, and East Stonehouse parish is governed by a board of guardians.

Plymouth was originally inhabited by fishermen. By the Saxons it was called Tameorworth; after the Conquest it was called Sutton (that is, South-Town); in the reign of Henry VI. it received the name of Plymouth. In the reign of Henry IV. the town was attacked and partly burnt, but the castle and the highest part of the town were not taken. In 1438, in the reign of Henry VI., Plymouth was incorporated by charter. The town was then walled in. In the civil war of Charles I. the town, which had embraced the parliamentary side, was besieged by the Royalists under Prince Maurice, and was soon after attacked by the king in his march into Cornwall, and subsequently blockaded by Sir Richard Grenville, but in each case without success.

The town of Plymouth is on the north side of Plymouth Sound, between the two great arms of that harbour, Catwater on the east, and Hamoaze on the west. The small inlet of Sutton Pool is close to the town on the east side, and Mill Bay, another inlet, not far from it on the west. The older streets are narrow and ill-built, and some of them steep. The town is well lighted with gas; the supply of water is under the direction of the corporation, and is still furnished by Sir F. Drake's channel, or 'leat,' from Dartmoor, which has a course of about 30 miles. The water is received in three large reservoirs, and distributed by iron-pipes.

St. Andrew's church is a spacious structure of ancient foundation, with a square embattled tower. Charles church was begun just before the civil war of Charles I., but was not completed until after the Restoration, when it was dedicated to King Charles the Martyr. It is a neat building, with a square tower and well-proportioned spire. There are two chapels of ease, besides six other Episcopal places of worship; chapels for Baptists, Independents, Presbyterians, Unitarians, Quakers, Wesleyan Methodists, and other Dissenters, and a Jews' synagogue—numbering in all 38 places of worship, containing 23,805 sittings. The Grammar school, founded by Queen Elizabeth in 1572, had 60 scholars in 1851. The New Grammar school, founded in 1822, had 70 scholars in 1854. The Western College, instituted in 1752, for the education of young men for the ministry amongst Protestant Dissenters, is in connection with the University of London. It had 21 students in 1854. There are National and British schools, Charity schools, a savings bank, and various benevolent institutions. The Royal hotel, with an assembly-room and a theatre adjacent to it, erected in 1811 by the corporation at a heavy expense, form a very extensive range of building. The custom-house, the royal baths, the new hospital, the Athenæum or building of the Plymouth Institution, the public library, the freemasons' hall, the Natural History Society's hall, and the mechanics institute, are worthy of notice. The guild-hall is an irregular structure, comprehended in which are, besides the town-hall, the central watch-house, and the town prison.

The harbour of Plymouth comprehends the Sound and its various arms. About 14 miles south stands the EDDYPTON LIONTHOUSE, built in 1759, on a reef of rocks stretching north and south 100 fathoms. The Sound is a considerable inlet of the English Channel, 3 miles wide at the entrance from Penlee Point on the west to the opposite headland on the east, and extending inland about 3 miles to the citadel and town of Plymouth. On the western side of the Sound is Cawsand Bay. The coast is generally rocky and abrupt, and the rocky island of St. Nicholas (sometimes called Drake's Island) rises out of the water not far from the north shore. The estuary of the Tamer forms the harbour for the ships of war, and is called Hamoaze; it opens into the north-west corner of the Sound. The estuary of the Plym, or Lara, forms another harbour, chiefly used for merchant vessels, and in time of war for transports, captured vessels, &c.: it is called Catwater, and is capable of containing 1000 sail of such vessels. Here is also an extensive wet- and dry-dock. Catwater opens into the north-east corner of the Sound, and has at its mouth the rocky promontory of Mount Batten, opposite Plymouth. It is not so deep as Hamoaze. Sutton Pool is a tide-harbour, also used by merchant vessels; and a pier in Mill Bay accommodates the largest class of steam-ships at all times of the tide. Extensive docks for vessels of large tonnage are being constructed at Mill Bay harbour. The harbour of Hamoaze is 4 miles long, and has a depth of water of 15 fathoms at ebb-tide; there are moorings for nearly 100 sail of the line. The dockyard is on Hamoaze. The harbour was long exposed to the heavy sea which rolled into the Sound with gales from the southward, and great damage was at various times done. To remedy this a breakwater, or dyke, formed of loose stones, was commenced in 1812. It runs across the middle of the Sound, having a total length of 1700 yards, namely, 1000 yards in the centre, which runs in a direction nearly from east to west, with a continuation of

350 yards at each end, turning more to the north, and forming a considerable angle with the direction of the centre. A lighthouse has been erected at the western end. The total cost of this noble work has been about 1,700,000*l.* Its efficiency as a protection to the harbour has been proved in many severe gales. The harbour and town are defended by the citadel of Plymouth, by the fortifications on the island of St. Nicholas, and by other works, of which some important parts are now in process of construction.

The number and tonnage of vessels registered as belonging to the port of Plymouth on December 31st 1853 were:—Sailing-vessels under 50 tons 250, tonnage 7394; above 50 tons 200, tonnage 36,759; steam-vessels 6, tonnage 371. During 1853 there entered the port in the coasting-trade, sailing-vessels 3197, tonnage 264,739; steam-vessels 466, tonnage 185,497; and there cleared 1848 sailing-vessels of 102,230 tons, and 455 steam-vessels of 156,121 tons aggregate burden. In the colonial trade there entered 218 sailing-vessels of 23,604 tons, and 33 steam-vessels of 3069 tons; and there cleared 266 sailing vessels of 25,362 tons, and 22 steam-vessels of 2046 tons. In the foreign trade there entered 248 British vessels of 17,345 tons, and 216 foreign vessels of 26,058 tons; and there cleared 150 British vessels of 10,569 tons, and 149 foreign vessels of 19,704 tons.

The trade of Plymouth is important. Considerable commerce is carried on with the West Indies, the Baltic, and the Mediterranean, and coastwise with London and other ports; and there is an active fishery, especially of whiting and hake. The imports are timber and West India produce; the exports, manganese to Scotland, wool to Hull, and lead to London and Bristol. There are an extensive sail-cloth manufactory, a sugar refinery, a glass-house, a very large soap factory, distilleries, and a starch factory. Granite, slate, limestone, and marble, are quarried in the neighbourhood. The limestone or marble of the Oreston quarries, on the shore of Catwater, opposite to Plymouth, was the material chiefly employed for the breakwater. Near these quarries is an iron bridge of five elliptical arches over Catwater, built at the expense of the Earl of Morley. A floating steam-bridge crosses the Hamoaze between Devonport and Torpoint at short intervals throughout the day, and conveys the mail-coaches, carriages, horses, and passengers. A railway from Sutton Pool, 24 miles long, connects Plymouth with Prince Town, on Dartmoor. There are markets on Monday, Thursday, and Saturday; and fairs in April and November. A county court is held in Plymouth. Races are annually held in a meadow near the town, and a regatta in the Sound. There are a hospital for merchant seamen, a public dispensary, an eye infirmary, and several other charities.

Devonport contains the government dockyards, and is familiarly called 'The Dock,' its name having been, till 1824, Plymouth Dock. It is now the most important of the maritime ports in Devonshire. The military and naval officers reside at Devonport. The town owes its importance to a naval arsenal established here in the reign of William III. It was first fortified in the reign of George II., but the fortifications have since been considerably enlarged and improved.

Devonport is bounded on the south and west by the mouth of the Tamar, and on the east by Stonehouse Creek. The streets are wide and regular, well paved, and lighted with gas; the footpaths are made of marble obtained in the neighbourhood. The Fore-street is approached from the east through a handsome gateway, with a fosse and a draw-bridge, and forms a thoroughfare to the dockyard. A wall 12 feet in height, called 'the king's interior boundary wall,' defends the town on the north-east and south sides; and the heavy batteries on Mount Wise protect the entrance from the sea. Without the wall is a line, or breast-work, with a fosse excavated in the solid rock from 12 to 20 feet deep. There are three gates in the line, the North-gate, the State-barrier, and the Stonehouse-gate. A chapel erected by government is in the dockyard. There are two chapels of ease at Devonport—St. Aubyn's, erected in 1771, and St. John's, erected in 1799. The inhabitants have access also to the dockyard chapel. There are places of worship for Baptists, Independents, Wesleyan Methodists, and Moravians. A classical school was established by subscription in 1821, and a public school for boys in 1808. There is a school for girls, where about 100 are educated and clothed. The Baptists and Methodists have each their respective schools. A public dispensary for this town and East Stonehouse was erected in 1815. There is a savings bank in the town, also one connected with the dockyard, and one entitled the Royal Naval Annuitant and Naval Savings Bank. The markets on Tuesdays, Thursdays, and Saturdays are well supplied with provisions of all kinds. There are in Devonport a small theatre, a subscription library, and a spacious and elegant assembly-room at the Royal hotel, where balls are held. Water is brought from Dartmoor in a circuitous line of about 30 miles, to a reservoir on the north side of the town, whence it is conveyed in pipes to the different houses. The town-hall is a spacious and handsome building, with a Doric portico. It contains a county meeting-room, 75 feet by 40 feet, a watch-house, temporary prison, &c. Near it is a fluted column of the Doric order, to commemorate the naming of the town in 1824. From the top of the column a splendid view of the harbour is obtained. The post-office, the mechanics institute, and the public library are fine buildings. To the south of the town are the houses of the port-admiral and the governor, the telegraph establishment, and the Grand Parade.

The Dockyard, one of the finest in the world, comprises an area of 71 acres. Within the yard are the basin, constructed in the reign of William III., and the dock, sufficiently capacious for the reception of a 74-gun ship, as well as six building-slips, and three other docks, one of which, the new north dock, is 280 feet by 85 feet, and 27 feet 8 inches deep. The building-slips are roofed over with sheet-iron, copper, or zinc. A new and very extensive basin or dock has been for several years in progress of construction. In the anchor-smithery Nasmyth's steam-hammer is employed in the forging of anchors. The 'rigging-house' is a handsome edifice 480 feet in length, and three stories high; it forms one side of a quadrangle, the whole of the buildings in which are entirely composed of stone and iron. The rope-houses are limestone buildings 1200 feet long, parallel to each other, and two stories high. Cables were formerly made here 100 fathoms in length, and measuring in circumference 25 inches. In the dockyard is a large chain-cable storehouse; but the annual consumption of hemp for the manufacture of ropes, cordage, cable, &c., is still very considerable. The immense roofs over the docks, being on the span of an arch without a buttress, are remarkable specimens of architectural skill, the area of one of them amounting to 1 acre 39 poles and 200 feet. At Keyham Point the construction of a great dock for the repair and fitting of war-steamer was commenced in 1844. The designs, which were prepared by Mr. Barry, embrace an extent of quay or wharfrage in the south basin amounting to 1570 feet, and in the north basin to 2240 feet. The area included is 72 acres.

Devonport was enfranchised by the Reform Act in 1832, and since that period has returned two members to the Imperial Parliament. The parliamentary borough includes, in addition to the town of Devonport, the whole of the parish of Stoke Damerel, and the township of Stonehouse. Petty sessions are held by the county magistrates weekly in the town-hall, for the dispatch of business connected with the town and parish.

Stonehouse, or East Stonehouse, is situated between Plymouth and Devonport, and almost reaches both, in consequence of the erection of new houses in all the towns. In Stonehouse are the Royal William Victualling-yard, the Royal Naval Hospital, the Royal Military Hospital, and the Marine barracks. The Royal William Victualling-yard is situated on Cremill Point, a rocky promontory connected with Stonehouse by a narrow isthmus. Over the entrance-gateway is a colossal statue of William IV. in Portland stone, upwards of 13 feet high. The interior of the victualling-yard consists of large quadrangular ranges of substantial buildings, separated by open courts, which have been hewn out of the solid rock. The area inclosed is about 15 acres, in part recovered from the sea by sea-walls and embankments, and the rest hewn from the solid rock. The machinery employed consists of a corn-mill (capable of grinding 1000 bushels of corn in ten hours), with 24 pairs of mill-stones, worked by two steam-engines; a bakery, worked by machinery, with 12 ovens; an oatmeal-mill; and two wheat-drying mills. There are in Stonehouse three churches of the Establishment; chapels for Independents, Baptists, and other Dissenters; National and Infant schools; and schools for boys and girls in the Marine barracks.

Connected with the towns of Plymouth, Devonport, and Stonehouse are the towns of Stoke Damerel and Morice Town; and several important villages are in the neighbourhood. The land and river scenery is exceedingly picturesque, and the sea-view is singularly interesting.

PLYMOUTH. [MASSACHUSETTS; MONTERRAT.]

PLYMPTON ST. MARY, Devonshire, the seat of a Poor-Law Union, is situated near the left bank of the river Plym, in 50° 23' N. lat., 4° 4' W. long., distant 4 miles N.E. from Plymouth, and 213 miles W.S.W. from London. The population of the parish in 1851 was 2815. The living is a perpetual curacy in the archdeaconry of Totnes and diocese of Exeter. Plympton St. Mary Poor-Law Union contains 19 parishes and townships, with an area of 75,569 acres, and a population in 1851 of 19,723. A priory was founded at Plympton St. Mary during the Heptarchy by one of the Saxon kings. The parish church, which stands within the cemetery of the priory, was originally built by William Warlewast, nephew of the Conqueror, and bishop of Exeter. The church is chiefly in the perpendicular style; some portions are of early English date. There are two National schools. Plympton St. Mary Union workhouse is a large building in the Elizabethan style.

PLYMPTON ST. MAURICE, PLYMPTON EARLE, or EARL'S PLYMPTON, Devonshire, a municipal borough and market-town, and one of the ancient stannary towns, adjoins Plympton St. Mary on the south-east. It is governed by a mayor, recorder, and eight aldermen. The living is a perpetual curacy in the archdeaconry of Totnes and diocese of Exeter. The population of the borough in 1851 was 1260. The parish church, a structure of the middle of the 15th century, is of perpendicular character; the chancel is decorated. A handsome painted window has lately been inserted at the eastern end. Hele's Grammar school, founded in 1659, has an endowment of 180*l.* a year, and had 18 scholars in 1851. Many of the inhabitants are engaged in mining. A cattle-market is held on the first Monday in each month; a market for butcher's meat is held every Friday. Plympton Castle, now in ruins, was built soon after the Conquest. Earl's Plympton was the birthplace of Sir Joshua Reynolds; his portrait, painted and pre-

sented by himself, adorned the guldhall till a few years back, when it was sold by the corporation.

PO, a river of Italy, called Padus and Eridanus by the Romans, rises from two springs in about 44° 40' N. lat., 7° E. long., on the eastern side of Monte Viso [ALPS], about 6000 feet above the sea. Flowing first east and then north-east through a deep valley called Val d'Oro, the Po receives on its left bank the Chisone and other streams from the valleys of Pignerol; and on its right bank the Vraita, the Maira, and the Grana, which, rising in the recesses of the Maritime Alps, flow in a north-east direction, and join the Po in succession above the town of Carignano, whence the river flows nearly due north to Turin through a broad valley bounded by the offsets of the Cottian Alps on the west, and the hills of Monferrato on the east. Passing Turin, where it is crossed by a handsome stone bridge, the Po receives on its left bank the Dora Riparia from the valley of Susa and Mont Cenis, and afterwards the Stura from the valley of Lanzo, a romantic district among the Alps north-west of Turin. The river now inclines to the north-east, receives the Orca from the north, and passing by the town of Chivasso, turns to the east, or east-by-south, in which general direction it continues to flow for the rest of its course to the sea, making however numerous windings. Below Chivasso the Po receives from the north the Dora Baltea, with all the drainage of the valley of Aosta; and about thirty miles farther the Sesia, a considerable stream, which rises in the glaciers of Monte Rosa, and which, after draining the Val-Sesia, an alpine valley, enters the plain of Verocelli, receives the Cervo and other streams, and after a course of about ninety miles enters the Po below the town of Casale. The Po here makes a bend to the south, but on reaching Valenza resumes its eastern course. In all its course from Carignano to Valenza, for a length of nearly eighty miles, the Po receives no affluents of any importance on its right bank, being skirted all along on that side by the hills of Monferrato, owing to which the river describes a kind of semicircle. But to the south of those hills, and between them and the Ligurian Apennines, flows the Tanaro, a large stream which rises near Ormea in the Maritime Alps, and, flowing northward, receives the Ellero, Pesio, and Gesso, and the Stura from Cuneo (Stura is the name of several rivers of Piedmont); and after passing by Cherasco and Alba it then turns to the east, receiving the drainage of the hills of Lower Monferrato on one side, and of the Ligurian Apennines on the other. The Tanaro flows by Asti, the principal town of Monferrato, receives the Belbo from the south, and farther on the Bormida, swelled by the Orba from the mountains of La Bocchetta; after which it flows through the plains of Alessandria and Marengo, and enters the Po about eight miles below Valenza, after a tortuous course of about 150 miles, in which it describes a segment of a circle nearly parallel to that described by the Po, being separated from the latter river by the hills of Lower Monferrato.

After receiving the Tanaro the Po continues its course in an easterly direction through the wide plain of Lombardy, receiving on its right or southern bank the Scrivia from Tortona and the Staffora from Voghera, and on its left or northern bank the Agogna and the Terdoppio from Novara. Between Voghera and Piacenza several offsets of the Ligurian Apennines approach close to the southern bank of the Po, whose only affluent of any importance from that quarter is the Trebbia, a mountain torrent which swells greatly in the rainy season, but is shallow in time of drought. The northern feeders of the Po east of the Tanaro are deep perennial rivers, being fed by the glaciers of the Alps; but the southern partake more of the nature of torrents, being chiefly supplied by the rains which fall in the Apennines.

The Ticino is one of the principal affluents of the Po. It issues out of several small lakes near the summit of the St. Gothard, flows through the canton of Ticino, and enters the Lake Maggiore, out of which it issues again at Sesto, whence it flows for sixty miles through the great plain, marking the boundary between the Austrian and Sardinian territories. It passes by Pavia, and enters the Po a few miles below that city. The Ticino is a very rapid river, but is navigable in the lower part of its course. East of the Ticino the Po receives the Lambro, swelled by the Olona, the river of Milan; and lower down the Adda, a deep and rapid stream, which is the outlet of the Lake of Como, and is swelled by the Brembo and the Serio from the mountains of Bergamo. [Adda.] East of the Adda runs the Oglio, a considerable river, which rises in Valcanonica on the borders of the Valtellina, forms the little lake Iseo, and, issuing out of it at Sernico, receives the Mella from Brescia, and the Chiese (which is the outlet of the Lake of Idro), and enters the Po above Borgoforte. The Oglio is navigable by large boats below Pontevico. Its whole course, from its source to its confluence, is about 140 miles. Proceeding to the eastward, the next great affluent of the Po is the Mincio, an important river, which is the outlet of the Lake of Garda, and with it forms a geographical division between the Milanese territory, or Lombardy proper, and the old Venetian territories. The Mincio, after issuing out of the lake at Peschiera, forms the lagoons in the middle of which lies Mantova. Below Mantova it is navigable for large boats down to its confluence with the Po near Governolo.

The Po below Piacenza receives on its southern bank the following rivers, or rather torrents, which rise in the Apennines:—The Nura, a small stream; the Taro, a larger river, which rises in the mountains of Pontremoli, and after a course of about sixty-five miles enters the Po above Casal Maggiore; the Parma and Lenza, two small streams in

the state of Parma; the Crostolo, a small stream which passes by Guastalla; the Secchia, a considerable river which crosses the duchy of Modena, and enters the Po a few miles below the confluence of the Mincio (the Secchia is navigable for large boats up to Pontebasso, near Modena); the Panaro, called Scoltenna in the upper part of its course, which rises at the foot of Mount Cimone near the frontiers of Tuscany, crosses the duchy of Modena and part of the papal province of Ferrara, and after a tortuous course of nearly 100 miles enters the Po below Bondeno. The Panaro is navigable for 30 miles above its confluence with the Po. The Panaro is the last affluent of the Po from the south; but on the north bank, below the confluence of the Mincio, various canals bring into the Po part of the waters of the Adige, and the drainage of the marshy country which lies between the two rivers. The Po in former times passed south of Ferrara, but after the flood of 1152 the main stream changed its bed, and it now passes about three miles north of Ferrara. About twenty miles lower down, near Papozzo, the river divides into two branches. The left, or northern one, which is the larger, is called Maestra, or Po Grande, and also Po delle Fornaci; it enters the sea by several mouths, the principal of which, called Maestra, is always navigable by merchant vessels. The length of its course from the point of bifurcation to the mouth is about twenty miles. The right, or southern branch, called Po d'Ariano, also divides into several mouths, the principal of which is called Po di Goro, and is likewise accessible to merchant vessels from the sea. The tide is only felt in a slight degree about seven or eight miles above the mouths, and it does not rise quite two feet. Small merchant vessels ascend the river as far as Lagoscura, near Ferrara. Higher up the navigation is carried on by boats of the burden of sixty tons as far as Cremona in all seasons, and higher up as far as Casale in Piedmont, except in times of great drought. Above Casale the Po is only navigable for small boats or rafts. The whole course of the river, including its windings, is reckoned at about 450 miles.

The width of the bed of the Po, from the confluence of the Ticino to its bifurcation, is from 1200 to 1800 feet. The depth of water varies from 12 to 36 feet. The periodical floods take place in the summer months, in consequence of the melting of the snows in the Alps, but extraordinary floods occur at other seasons also after great rains. From the confluence of the Ticino to its mouth, a distance of about 200 miles, the fall in the bed of the river is about 300 feet of perpendicular height. The Po is not fordable below Turin, and has no bridge across it below that city. It is embanked from below Piacenza to the sea, to protect the country from inundations. The Etruscans are said to have first applied themselves to embank the Po. Near Ferrara, and below that town down to the estuary of the Po, the ordinary level of the water in the river is higher than the country near its banks. The old bed of the Po, which runs south of the town of Ferrara, and which is still called Po di Ferrara, still receives some of the water of the great river by means of canals, but is chiefly filled by the water of the *Reno*, a rapid river which rises in the Tuscan Apennines, passes near Bologna, and after a course of above 70 miles joins the Po of Ferrara below that city. The Reno is navigable for boats in the lower part of its course, but only in the winter and spring. The Po of Ferrara divides into two branches: the left or northern is called Po di Volano, from the name of the place where it enters the sea; the right or southern branch, called Po di Primaro, receives several rivers, or rather torrents, from the Tuscan Apennines, namely the Savena, Idice, Silora, Santerno, and Senio. The Po di Primaro enters the sea at Primaro a few miles north of Ravenna. The Lamone, which passes by Faenza, enters the sea by a separate mouth between Primaro and Ravenna. In ancient times the Lamone communicated with the Po, and Ravenna itself stood on an island in the delta of that river. The delta of the Po may now be considered as terminating on the south at Primaro: it extends to the northward as far as the mouth of the Adige at Brondolo near Chioggia, distant from Primaro about 40 miles in a direct line from north to south.

The length of the basin of the Po, from the sources of the Dora Riparia at the foot of Mont Genève, which is its most western point, to the great estuary of the Po of Maestra, is 280 miles from west to east. The width of the basin is about 140 miles from the Ligurian and Tuscan Apennines to the Alps of Switzerland and of the Tyrol. The area, if we include in it the whole course of the Adige, is near 40,000 square miles, or about four-fifths of the area of England. The whole of Piedmont in its larger sense, Lombardy proper, Southern or Italian Tyrol, the western half of the Venetian territory, the Swiss canton of Ticino, some districts of the canton of the Grisons, the duchies of Parma and Piacenza, the papal legations of Bologna, Ferrara, and Ravenna, and that small part of Tuscany which extends along the northern slope of the Apennines and is called Romagna Gran-Ducale—all these countries belong to the basin of the Po.

By a treaty concluded between Austria, Parma, and Modena in July, 1850, the navigation of the Po and its tributaries from the confluence of the Ticino to the Adriatic was declared free. And it was proposed at the same time to carry on the navigation by a flotilla of Austrian steamers and steam tugs.

POCKLINGTON, East Riding of Yorkshire, a market-town and the seat of a Poor-Law Union in the parish of Pocklington, is situated in 53° 55' N. lat., 0° 47' W. long., distant 16 miles E. by S. from

York, 212 miles N. by W. from London by road, and 223 miles by the Great Northern and North Midland railways. The population of the town in 1851 was 2546. The living is a vicarage in the archdeaconry of the East Riding and diocese of York. Pocklington Poor-Law Union contains 47 parishes and townships, with an area of 107,636 acres, and a population in 1851 of 16,098. Pocklington is situated in a level country, about 2 miles from the western edge of the Wolds, and is connected with the river Derwent by the Pocklington Canal. The town is lighted with gas. The parish church is a plain structure, erected in the year 1252. There are places of worship for Independents, and Primitive and Wesleyan Methodists. The Free Grammar school, founded in the 6th year of Henry VIII, by John Dowman, LL.D., with which are connected five exhibitions at St. John's College, Cambridge, has a revenue of about 900*l.* a year, and had 40 scholars in 1854. There are National schools, a literary institute, a news-room, an Odd Fellows' hall, and a temperance hall. Petty sessions and a county court are held in the town. The market is on Saturday, and large sheep and cattle fairs are held on March 7th, May 6th, August 5th, and November 8th, and a statute fair on November 9th.

PODLACHIA. [POLAND.]

PODOLIA, or **KAMENETZ-PODOLSK**, a government of European Russia, formerly a part of Poland, extends from 47° 25' to 49° 45' N. lat., 26° 20' to 28° 50' E. long. It is bounded N. by Volhynia, N.E. by Kiew, E. and S.E. by Kherson, S. by Bessarabia, from which it is separated by the Dniester, and S. and S.W. by Austrian Galicia. The area is estimated at 16,375 square miles. Podolia is generally a table-land of no great elevation, and is traversed by a branch of the Carpathians, which enters it from Galicia; but the most elevated parts of this chain are scarcely 500 feet above the level of the sea, and their effect is chiefly to heighten the picturesque beauties of this fine province. The south-eastern parts, which formerly belonged to the Ukraine, are sandy, and form a kind of steppe. The province is well watered. The Dniester, which is the principal river, flows indeed only along the frontier towards Bessarabia, but most of the small rivers run into it. The second principal river is the Bug. There are numerous small meres in the western part of the province, but no large lakes.

The climate is mild and in general very healthy; there are scarcely any endemic disorders, except the Plica Polonica, which will probably remain endemic as long as the uncleanness of the Russiaks and Poles continues. The soil of Podolia is proverbially fruitful. In addition to all kinds of corn, hemp, flax, tobacco, and hops are cultivated. The peasants have generally gardens, in which they cultivate cabbages, onions, cucumbers, water-melons, and some fruit-trees. The grass is remarkably luxuriant, and the forests are extensive. In the fields and in the steppe between the Bug and the Dniester there are hares, wolves, foxes, a species of antelope, and bustards. Storks are numerous. Swarms of locusts come periodically from the Black Sea. The oxen of Podolia are remarkably large and fine, and great droves of them are annually sent even to the middle of Germany. The race of horses is much esteemed. The sheep are of a good breed, and their wool is tolerably fine. Swine are very numerous. The farmers breed great quantities of domestic poultry and of bees. The fisheries are productive. The mineral products are saltpetre, stone for building, lime, gypsum, and alabaster. Education is very limited. The schools are few in number. Most of the inhabitants are of the Greek religion. The population of the province in 1846 was 1,703,000.

The principal town is *Kamieniec*, the capital of the province, on the river Smotryza, at a short distance from its junction with the Dniester. It was formerly the most important fortress in Poland, but is now deprived of its fortifications; it consists of the upper town, of the lower, which is well built, and several suburbs. It has a very fine cathedral, a gymnasium, some manufactories and trade, and 16,000 inhabitants, half of whom are Jews. The other principal towns are the capitals of the circles (12 in all), but none of these are of great importance. Mohilew alone has 7000 inhabitants, a silk manufactory and some trade.

POISSY. [SEINE-ET-OISE.]

POITIERS, a town in France, capital of the department of Vienne, is situated on a rocky hill on the left bank of the Clain, a feeder of the Vienne, in 46° 34' 55" N. lat., 0° 20' 31" E. long., at an elevation of 387 feet above the sea, 211 miles by railway S.S.W. from Paris, through Orléans and Tours, and had 25,818 inhabitants in the commune in 1851. It is one of the oldest towns in France, and occupies the site of *Lemonum*, the chief town of the Pictones, which is mentioned by Julius Cæsar ('Bell. Gall.' iii. 11; vii. 75; viii. 26), and which afterwards took the name of Pictones, or Pictavi, whence the present names Poitiers for the town and Poitou for the province are said to be derived. Upon the downfall of the Roman empire, the town was pillaged by the Vandals, A.D. 410; it subsequently came into the hands of the Visigoths, from whom it was taken by the Franks. The neighbourhood of Poitiers has been the field of three of the greatest and most decisive battles ever fought in France—the defeat of the Visigoths under Alaric A.D. 507 by Clovis and his Franks at Vouillé,

a village a few miles west of the town; the defeat of the Saracens under Abd-el-Rahman, under the walls of Poitiers by the Franks, commanded by Charles Martel A.D. 732; and the victory of the Black Prince at the head of 8000 English and Gascon soldiers in 1356, over an army of 50,000 French troops under Jean II, who was taken in the action. By the marriage of Eleanor of Guienne to Henry Plantagenet, Poitiers came into the hands of the English kings, who held it till 1204, when it was wrested from them by Philippe Auguste. By the treaty of Bretigny in 1360 it was ceded to England, but it reverted to France in 1372, by the voluntary surrender of the townsmen to Charles V. For 14 years, while the English were masters of the greatest part of France, Charles VII. kept his court and parliament in Poitiers, and great additions were then made to the extent of the town. During the religious wars it was taken from the Huguenots by the Catholics, and was the scene of great cruelties; Admiral Coligny made an unsuccessful attempt to retake it in 1569.

Poitiers is inclosed by old turreted walls pierced by six gates, four of which open on bridges over the Clain. The space within the walls comprises large gardens and orchards, so that the extent of the place is much greater than the population would lead one to suppose. The streets are mostly narrow and steep; a few of them have been widened and modernised of late years; the leading thoroughfares are well paved and furnished with sidepaths for foot passengers. On the whole it is an irregular ill-built place, with houses mostly old, lumbering, and inconvenient, squares small and mean; yet its position on a hill-slope above the winding river, and its public buildings, remarkable for their antiquity, give Poitiers a picturesque and interesting appearance. The most remarkable structure is the cathedral of St. Pierre, which was commenced by the English Henry II., in 1152, but not finished till 1379. The western front, which is flanked by two low but graceful towers, presents three magnificent portals of great depth and richly decorated, the central one being surmounted by a handsome rose window. The interior, consisting of choir, nave, and aisles, is 323 feet long, 99 feet wide, and 96 feet high; in the choir are 70 stalls of carved woodwork, which date from the 13th century. The other remarkable churches are—the church of Sainte-Radegonde, with a crypt and nave, which date from the 12th century; the church of Montierneuf, which belonged to a Benedictine abbey and was finished in 1096; the church of Notre-Dame, a Byzantine structure, which, dating partly from the 9th, partly from the 11th century, is the admiration of archaeologists for its magnificent portal, and the delicacy and multiplicity of its sculptured ornaments; the church of St. Porchaire; what remains of the ancient basilica of St. Hilaire erected in the beginning of the 11th century; and near the cathedral the church of St. Jean, a venerable monument of the 5th century, which now serves for a museum of antiquities. In the centre of the town stands a large building called Le-Palais, formerly the residence of kings and of the hereditary counts of Poitou, but now used as a town-hall and chambers for the courts of justice. The house occupied by Diane de Poitiers still stands at the corner of the streets St. Paul and Du-Coq. Besides the collection of antiquities, Poitiers has a public library of 25,000 volumes, a cabinet of natural history, a botanical garden, and a departmental nursery. Of Roman structures there are still remaining some arches of an aqueduct to the south of the town, and within the walls the ruins of a vast amphitheatre, which is called les Arènes.

Poitiers gives title to a bishop, whose see is formed by the departments of Deux-Sèvres and Vienne; it is the seat of a High Court, which has jurisdiction over the departments of Charente-Inférieure, Deux-Sèvres, Vendée, and Vienne. It has a University-Academy, which embraces within its limits the departments just mentioned and those of Charente, Indre, Indre-et-Loire, and Haute-Vienne. Connected with the University-Academy, there are in the town a faculty of law, a secondary school of medicine, and a national college. The other institutions of the town are tribunals of first instance and of commerce, a consultative chamber of manufactures, a free architectural and drawing school, and several literary, scientific, artistic, and agricultural societies.

The chief manufactures are coarse woollen-cloth, blankets, hosiery, lace, playing-cards, vinegar, leather, and dressed skins. The trade in these articles and in seeds, wheat, wine, hemp, flax, wax, honey, hides, and dressed goose-skins, with the down on for furriers, is considerable.

(*Dictionnaire de la France; Annuaire pour l'An 1854.*)

POITOU, a province of France which now forms the departments of Vienne, Deux-Sèvres, and Vendée, was bounded N. by Anjou and Bretagne, E. by Touraine, Berri, and Marohe, S. by Saintonge and Aunis, and W. by the Océan. It was divided into Haut-Poitou and Bas-Poitou, which had Poitiers and Fontenay for their respective capitals. Poitou is the country of the Celtic Pictones. Under the Roman empire it formed part of Aquitania Secunda; it was invaded successively by the Vandals, the Visigoths, and the Franks; and was under the sway of the last, governed by its own counts, or dukes, until it fell into the hands of the English on the marriage of Henry Plantagenet to Eleanor of Guienne in 1152. Conquered by Philippe Auguste in 1294, it was ceded to the English by the treaty of Bretigny in 1360; and finally reunited to the crown of France in 1375 by Charles VII. The inhabitants of the province were called Poitevins.

POL-DE-LEON, ST. [FINISTÈRE.]

POL, ST. [PAS-DE-CALAIS.]

POLA. [ISTRIA.]

POLAND, a portion of the once powerful kingdom of the Jagellons, which now constitutes a vice-royalty and forms an integral part of the Russian empire. It consists chiefly of a large quadrangular territory, from the north-eastern angle of which a long narrow tract, forming part of the government of Augustovo, projects to the northward, the whole lying between 50° 4' and 55° 5' N. lat., 17° 30' and 24° 20' E. long. The narrow projection extends between 53° 20' to 55° N. lat., being about 120 miles in length, its breadth varying from 20 to 50 miles. The mean breadth of the quadrangular portion, from east to west, is above 200 miles, and its length from north to south about the same. The area of Poland, as we have defined it, is 49,091 square miles. The population in 1851 was stated to be 4,851,639, among whom were 563,970 Jews, 291 Mahometans, and 162 gipsies. The vice-royalty forms a vast solid projection, extending westward from the Bug to the frontier of Germany, and separating Austria from Prussian Poland. It is bounded N. by East and West Prussia; E. and N.E. by the Russian provinces of Wilna, Grodno, and Volhynia, S. by Galicia, which includes the suppressed republic of Cracow, and W. by Prussian Silesia and Posen. The Bug, the Narew, and the Niemen run along the eastern boundary, and the Vistula to its junction with the San along the south. From the junction the Vistula sweeps through the centre of the country, passing Warsaw and leaving the vice-royalty at its north-western extremity a little above the Prussian town of Thorn. The Proana, a feeder of the Warta, a tributary of the Oder, forms a large part of the western boundary.

Soil and Surface.—Though Poland is generally considered a perfect level, the surface exhibits considerable diversity, and some districts rise many hundred feet higher than others. The northern boundary of Poland runs over the southern declivity of that swell of high ground which must be considered as the southern limit of the plain of the Baltic, and which, beginning west of the western corner of that sea, and between it and the North Sea, extends eastward, at a varying distance from its shores, to the heights of Waldai and the source of the Wolga, into the centre of Russia. The most elevated parts of the surface of this tract (300 to 500 feet above the sea) are interspersed with numerous lakes, and some districts are literally dotted with them. Though the soil is sandy, the abundant moisture by which it is saturated for a great part of the year imparts to it a moderate degree of fertility, and it produces tolerable crops of rye, buckwheat, barley, and oats. The southern declivity of the swell is still more gentle. The river Bug in its western course is probably not more than 300 feet above the sea-level, so that in a distance of more than 50 miles the country hardly descends 150 feet. Hence the rivers in many parts have a sluggish course, not being able to carry off the great supply of water in spring-time, and a considerable portion of the adjacent lowlands is inundated at that period. Several large tracts along the Bug, Narew, and Bobr remain under water for the greatest part of the summer. A large portion of this region is covered with woods; the most common tree is pine.

The most southern districts of Poland, the greater part of the provinces of Cracow and Sandomir, and that portion of Lublin which lies between the rivers Vistula and Wieprz, are hilly, and rise in some places to a considerable elevation. The surface of the Vistula above Sandomir is about 600 feet above the sea-level. At no great distance from the banks of the river the country rises with a steep ascent until it has attained an elevation of more than 1000 feet, which may be considered the mean height of nearly the whole country between the Vistula and Pilica, with the exception of some tracts along the banks of the first-mentioned river. The country between the Vistula and Wieprz has a less elevation, though it is not less hilly. In the wide valleys of this hilly region the soil, though somewhat sandy, is of excellent quality, and yields good crops of excellent wheat.

The country which extends from the hilly region to the banks of the rivers Bug and Vistula, where they flow westward, and to the western boundary line of Poland, may be considered level, as the highest ground, which runs in a south-eastern and north-western direction, hardly rises more than from 200 to 300 feet above the low tracts along the rivers, and the slopes are long and very gentle. The more elevated parts of these higher grounds contain large tracts of sand, nearly without vegetation: in other places they are covered with heath, and here and there some swamps occur, but they are not of great extent. The slopes have a more fertile soil, but even there the crops of rye and oats are scanty. In the vicinity of the rivers fertile tracts are numerous, especially on the low lands along their banks; but in some places, and more especially along the banks of the Warta, these tracts are so low, that the soil is wet nearly all the year round, and they serve only as pasture-ground in the latter part of the summer and the beginning of the autumn. A large portion of this region also is covered with pine forests.

Climate.—The range of the temperature is above 100 degrees in the course of the year. The summers are generally very hot, the thermometer rising to above 90° under the influence of the south-eastern wind, which blows from the steppes of Southern Russia; but these winds are not frequent, and when succeeded by north-western winds, the thermometer in a few hours sinks 15 degrees. The winters are very cold, the thermometer generally descends to 10° below zero,

and sometimes to 15° and even 18°. The country is usually frozen and covered with snow for four or five months.

The most considerable rivers are the Niemen and Vistula [NIEMEN; VISTULA], which are navigable for large river barges as far as they drain Poland and flow along its boundary-line. The Vistula receives from the east the Wieprz and Bug, which latter river is joined several miles above its mouth by the Narew. The two last-mentioned rivers are navigable to a considerable distance; the Narew to the town of Lomza, and the Bug to Terespol, opposite the Russian town of Brzesko Litawski. From the west the Vistula receives the river Pilica, which is only navigable in the lower part of its course, and to no great distance from its mouth. The river Warta, an affluent of the Oder, which drains the most western part of the viceroyalty, begins to be navigable above Kolo, and the Bresna, an affluent of the Warta, above Kalisch. The last-mentioned river forms for the greater part of its course the boundary line between Poland and Prussia. Lakes are most numerous in the north-eastern district, but not of great extent. The largest lake, that of Goplo, which is about 10 miles long, lies on the north-western boundary-line. The larger and wider part of it belongs to Prussia.

Productions.—Though Poland is not distinguished by fertility, it produces more grain, flax, hemp, and tobacco than are required for its consumption, and it exports these articles to other countries. Wheat is abundant only in the hilly southern region; the principal species of grain which are cultivated in the other parts of the kingdom are rye, oats, and buckwheat; barley is also grown, but less extensively. Leguminous plants are much valued, and their cultivation attended to. Horses and cattle are of inferior size, but rather numerous; and cattle, as well as hides and tallow, are articles of export. Hogs also are numerous, and bacon to a considerable amount is exported. Sheep and goats are less abundant, though some parts of the country are well adapted for sheep-walks; the wool is coarse, and little of it is exported.

As a considerable part of the country is still covered with forests, timber constitutes an important article of export. The forests consist of oak, ash, lime-trees, and birch, but chiefly of pine and fir. In those parts where the lime-trees are numerous the forests swarm with wild bees, and the excellent honey which is obtained from them is sent to the neighbouring countries. Wild animals are numerous, especially wolves. Bears and lynxes have become rather rare, as well as the beaver, ermine, and elk; but deer, foxes, martens, polecats, badgers, and weasels are still very common.

Several metals and minerals are abundant in the hilly region. Among the metallic ores are those of silver, iron, copper, lead, and zinc. Rock-salt, marble, and coral are met with. The principal exports—corn, wool, oil, seeds, timber, and zinc—are sent down the Vistula and shipped at Danzig. A considerable portion also of the surplus produce of Poland is ordinarily absorbed by Austria. According to an official return for the year 1851, the exports through Prussia amounted to 4,015,871 silver rubles; to Austria, 1,373,537 silver rubles. The total value of the imports in 1851 was 9,403,792 silver rubles; they comprise wine, tobacco, spices, salt, metals, manufactured goods, colonial produce, &c. The custom-house receipts in 1852 were 1,423,549 rubles. Since January 1st 1851 the customs' line between Poland and Russia has been abolished, and along the whole of the western frontier a strict military cordon has been established, with stations at every half mile distance, and sentinels pacing between the stations night and day. The manufactures of Poland, which were very flourishing before the insurrection of 1830, comprise woollen-cloth, merinoes, flannel, hosiery, shawls, carpets, cotton tissues, and twist, chiefly at Lody and Lublin; some linen and plain silk, leather, paper, beet-root sugar, beer, distilled spirits (chiefly from potatoes), glass, &c. The most important branch of industry is the manufacture of metals, especially iron and zinc. Almost all the mines are in the southern part of the viceroyalty. Pit-coal is found in connection with the iron-ores, and it is used extensively in the iron blast-furnaces and in the zinc smelting-works. There are cast-iron foundries and establishments for the manufacture of machinery and agricultural implements at Warsaw, which is famous for its musical instruments, carpets, and carriages. Steam machinery is used in several of the factories, in the mines, and in some of the flour-mills. A railway runs from Warsaw to the Austrian line from Cracow to Vienna.

The great majority of the inhabitants are Catholics (they numbered 3,400,000 in 1838), who used to be governed by an archbishop (Warsaw) and seven other bishops. The Catholics, it is said, have been greatly persecuted in recent times. Of the eight sees only one, that of Lublin, is at present filled; all the others are managed by administrators. The Russo-Greek Christians, who numbered 100,000 in 1838, have an archbishop of Warsaw. There were also in that year about 150,000 Lutherans and about 10,000 Calvinists.

Divisions.—The kingdom of Poland is divided into eight provinces, which were formerly called waywodships.

1. *Cracow, or Krakow*, so called after the ancient capital of Poland, lies between 50° 8' and 51° N. lat., 19° and 21° 15' E. long. It is bounded N.W. by Kalisch, N. and E. by Sandomir, S. by Galicia, and W. by Prussian Silesia. Its area is 4057 square miles; the population is about 438,361. The Vistula separates it from Galicia; it is traversed by the Nida, a feeder of the Vistula, and has in it the sources of the

Pilica. It is traversed by a low range from the Carpathian Mountains. There are some tracts of excellent land, good pasturage, forests, and valuable minerals, especially iron. *Kielce*, the chief town, is situated in a picturesque country surrounded by high mountains. It has an episcopal palace, four churches, a convent of gray nuns, an ecclesiastical seminary, a lyceum, iron-works, and, in the neighbourhood, mines of iron, lead, copper, coal, and calamine. The population is about 5000, without the garrison. Among the other towns the principal are—*Pinczow*, on the Nida, which has 5000 inhabitants. Charles XII. of Sweden defeated the Poles and Saxons near this town in 1702. *Chencoty*, with a castle on a lofty hill, and lead- and silver-mines in the vicinity, has 2500 inhabitants. *Slawkow*, on the river Biala, and on the Warsaw railway, which traverses the west of the province, has 2000 inhabitants. *Zaski*, N. of Slawkow, has iron-mines and 2300 inhabitants. The province of Krakow is called *Kielce* by the Russians, from its present capital.

2. *Sandomir* is situated between 50° 25' and 51° 50' N. lat., 19° 50' and 23° E. long. It is bounded N.W. by Masovia, N.E. by Podlachia, E. by Lublin, S. by Galicia and Cracow, and W. by Kalisch. Its area is 5230 square miles; and the population 420,909. The Vistula divides it from Podlachia, Lublin, and Galicia; the Pilica, a feeder of the Vistula, from Masovia and Kalisch. The face of the country is undulating, and there are here and there some mountains and forests, with tracts of very rich fertile soil. *Radom*, the chief town, on the river Radomka, has a Piarist college, a gymnasium, and 8700 inhabitants. *Sandomir*, on the Vistula, in the south of the province, has above 3000 inhabitants. It is a walled town, with six gates and an ancient castle on a steep rock, which was razed by the Swedes in 1656. There are here a collegiate church, four convent churches, a synagogue, and a gymnasium. *Opoczno*, on the Drzewica, a feeder of the Pilica, has an ancient castle and 3500 inhabitants. *Opatow*, on the Opatowka (which enters the Vistula nearly opposite the mouth of the San), is situated in a fertile and pleasant country, has a cathedral and three other churches, a synagogue, and 2500 inhabitants. *Szawow* is a well-built walled town on the Czarna, with a suburb. It has above 3000 inhabitants, who have manufactures of cloth, woollens, and stockings.

3. *Kalisz*, the most westerly province, lies between 50° 40' and 52° 35' N. lat., 17° 40' and 20° E. long. It is bounded N. and W. by Posen, E. by Masovia and Sandomir, S. by Cracow, and S.W. by Silesia. The area is 6573 square miles; population, 6,6148. This province has mountains in the south and plains and forests in the north. The soil is in part sandy and swampy, but on the whole not unfruitful. The principal river is the Warta, a feeder of the Oder. *Kalisch*, the capital, one of the handsomest towns in Poland, is situated between two arms of the Prozna, in a marshy valley surrounded with hills. Most of the houses are built of stone, the streets broad and well paved, and some of them planted with trees. The population amounts to 15,000, of whom 2500 are Jews. There are five Roman Catholic churches, one Lutheran church, a cathedral, and six convents. Among the public institutions are several schools and three hospitals. Woollen-cloth and linen are manufactured here, and there are several tanneries. *Petrzkow*, 89 miles by railway S.W. from Warsaw, has seven Roman Catholic churches, a Lutheran church, a gymnasium, a handsome town-hall, and 4276 inhabitants. *Konin*, on the Warta, has a great manufactory of woollen-cloth and 3600 inhabitants. *Sieradz*, on the Warta, has 2650 inhabitants. *Wielun* has 3000 inhabitants, who manufacture some woollen-cloth. *Czenstochau*, 143 miles by railway S.W. from Warsaw, lies at the foot of the Klarenberg, on which there is a celebrated convent of St. Paul the Hermit, which was formerly fortified; population, including Old Czenstochau, 5000.

4. *Lublin*, the most south-eastern part of the viceroyalty, is composed of the circles of Lublin, Chelm, Josefow, and Zamoski, which formerly belonged to Galicia, and were ceded by Austria in 1810 to the then duchy of Warsaw. It lies between 50° 17' and 51° 48' N. lat., 21° 45' and 24° 7' E. long., comprising an area of 6455 square miles, with a population of 530,190. It is bounded N. by Podlachia, E. by Volhynia, S. by Galicia, and W. by Sandomir. The Vistula separates it from Sandomir, the Bug from Volhynia, and the Wieprz (which flows through it) for some distance from Podlachia. This province has extensive forests, and in some parts morasses, but likewise contains tracts of good arable land, and pasturage with a fine breed of cattle. There are no metals except bog-iron.

The principal towns in the circle of Lublin, besides the capital [LUBLIN] are the following: *Lubartow*, on the Wieprz, has a fine castle, three churches, a Capuchin convent, and 8200 inhabitants. *Krowo*, on the Kurowka, has a fine palace of Count Potocki, two churches, and 1920 inhabitants. In 1816 a mineral spring was discovered, the waters of which resemble those of Pyrmont: *Pulawy*, on the Vistula, in the north-west of the province, was once the residence of Prince Czartoryski, whose splendid palace, with its library of 60,000 volumes, many manuscripts, a collection of rare Polish antiquities, and countless treasures of art, was celebrated throughout Europe. The park was the finest in Poland. The Russians laid the whole waste in 1831, during the ill-fated Polish revolution. *Zamosz*, a very strong fortress on the Wieprz, was founded in 1588 by John Zamoycki, after his victory over the archduke Maximilian of Austria. The houses were built in the Italian style; and a high school with a considerable

library was founded in 1695. On the partition of Poland, it fell to the share of Austria. In 1820 the Russian government bought the town and environs from Count Stanislaus Zamoycki, who received for it above fifty estates belonging to the state. Hereupon the place was still more strongly fortified, and was deprived of its extensive suburbs. It has however still above 5000 inhabitants, with the fine palace of Count Zamoycki, an arsenal, four churches, the town-hall, two convents, and a theatre. *Hrubieszow*, situated on an island in the Hulsza, a small feeder of the Bug, has three churches, a convent, and 8900 inhabitants. *Krasniaw*, on the Wieprz and a lake, is a walled town; it has an old episcopal palace, several churches, and 2252 inhabitants, among whom are many Jews. *Chelm* has a castle on a high hill, several churches, a Piarist college, a gymnasium, and 2000 inhabitants.

5. *Plock* lies between 52° 15' and 53° 30' N. lat., 18° 45' and 22° 35' E. long. It is bounded S. by the Bug and the Vistula, E. by the Drawens; the Narew flows through it. In some parts there are tracts of the finest arable land and meadows, in others extensive forests and marshes. It is bounded N. and W. by Prussia, E. by Augustowo, and S. by Podlachia and Masovia. The area is 6411 square miles. The population is 547,455. *Plock* is the capital. [*PLOCK*] *Paltusk* on the Narew is a bishop's see, and has a palace, a cathedral, three churches, several suppressed monasteries, a synagogue, and a gymnasium. The population is 3760. *Wyszogrod* on the Vistula has 3500 inhabitants, of whom 1500 are Jews. *Modlis* at the confluence of the Bug and the Vistula has always been a strong fortress, but since the insurrection of 1830 a new fortress of the first rank has been erected.

6. *Masovia* is situated between 51° 30' and 52° 55' N. lat., 18° and 22° E. long. It is bounded N. by *Plock*, E. by Podlachia, S. by Sandomir, and W. by Kalisz and Posen. Its area is 7646 square miles. It lies on both sides of the Vistula, which flows through it, and has on the whole a rich fertile soil, which is well cultivated in the neighbourhood of the capital, and it also contains extensive forests. *Warsaw* the capital of the viceroyalty is within Masovia, but now forms a distinct government. *Losica* on the Bzura has 6700 inhabitants, an ancient castle, a cathedral, and three other churches, a gymnasium, four convents, and a seminary for schoolmasters. The inhabitants are partly employed in the manufacture of linen and in bleaching wax. There are two annual horse and cattle fairs, where a great deal of business is done. *Tomaszow*, a new manufacturing town at the confluence of the Wolborka and the Pilica, has important manufactures of woollens, cotton, and iron, a considerable trade, and 8000 inhabitants. *Alexandrowo*, a newly established manufacturing town, with manufactures of woollen cloths, has 3200 inhabitants. *Osokow* on the Bzura has also manufactures of woollen cloth, and the population is said to be near 8000. *Kuzno* is a flourishing town, with 4000 inhabitants.

7. *Podlachia*, situated between 51° 15' and 52° 40' N. lat., 21° 10' and 23° 40' E. long., is bounded N. by *Plock*, E. by Grodno, S. by Lublin, and W. by Sandomir and Masovia. Its area is 6469 square miles: population, 384,646. This province has the Bug running along the east and northern frontiers, on the west the Vistula, and on the south the Wieprz; on the south-east there are numerous small lakes, and in the interior extensive marshes and forests; but it is otherwise a good agricultural country, rich in corn, pulses, cattle, honey, and wax; but a considerable portion is still in a very uncultivated state. *Siedlec*, the capital, is a regularly built town, with a palace and a beautiful park, several churches, a gymnasium, and 4420 inhabitants. *Sokolow*, *Wingrow*, *Lukow*, and *Wlodawa* have each above 3000 inhabitants. *Kock* on the Wieprz has an elegant town-hall, a beautiful church, a palace with grounds in the English style, and 2000 inhabitants. *Biala* on the Ina has a fine palace and park, and 3386 inhabitants. *Miedzerzyca*, a well built town on the Ina, has 4340 inhabitants. A large portion of Podlachia was formed into the government of BIALYSTOK, and is now incorporated with GRODNO. The remaining portion here called Podlachia was sometimes called *Siedlec*, or *Siedles*, from its chief town, which was the scene of severe fighting in the insurrection of 1831.

8. *Augustowo* lies between 52° 40' and 55° 5' N. lat., 21° 25' and 24° 15' E. long. To the north and east lie the governments of Vilna and Grodno, from which it is separated chiefly by the Niemen, Bobr, and Narew; on the south is the government of *Plock*, and on the west Eastern Prussia. The length of this government is about 170 miles, and it is about 65 miles in its greatest breadth. Its area is 7237 square miles; and its population is 622,195. It abounds in small rivers, lakes, and morasses; some of the latter produce considerable quantities of wild hops, which form an article of export to Königsberg. It is likewise rich in forests, these which skirt the Niemen being full of linden-trees, whence the celebrated 'Linden honey.' The northern districts of Augustowo form an extensive plain, and the soil being fertile and well cultivated produces a fine description of wheat; excellent rye is also grown in the southern districts, which are watered by the Narew. *Augustowo*, the capital, is on marshy ground at the southern extremity of Lake Stabryna (out of which the Netta flows), and at a distance of 110 miles N.E. from Warsaw. It was founded by Sigismund Augustus, king of Poland, in the year 1560; it is fortified, contains two churches, an hospital, and about 3300 inhabitants, and has large fairs for horses and cattle, as well as a depôt for salt. *Swalky* has handsome

buildings, broad regular streets, and 3000 inhabitants. *Scymy*, situated on a lake, has 2700 inhabitants. *Lomsa*, on the Narew, in a woody country, has a Piarist college, a gymnasium, and 2300 inhabitants. *Szczuczyn* is a well-built town, with 3100 inhabitants. *Wilkowyzki*, in a very fruitful corn country, has 3000 inhabitants. *Nowomiesto*, at the conflux of the Schirwind and the Scheschuppe, surrounded by water on three sides, is on the Prussian frontier; it has much trade, and 3250 inhabitants. *Kalsary*, situated in a fruitful country, has 5500 inhabitants.

The old divisions have been retained under their old names in the preceding notice. But the Emperor of Russia, by a ukase, dated August 21, 1844, divided Poland into five governments, exclusive of the city of Warsaw, which are governed in the same manner as the other provinces of the empire, each having a military and a civil governor. The following table shows the area and population of the present divisions according to the official returns for the year 1851:—

Governments.	Old Provinces.	Area in Square Miles.	Population in 1851.
Warsaw . . .	Masovia . . .	14,219	1,544,790
Radom . . .	Kalisz . . .	9,299	939,344
Lublin . . .	Kielce, or Cracow . . .	11,934	1,038,883
Plock . . .	Sandomir . . .	6,411	548,413
Augustowo . . .	Podlachia . . .	7,237	626,594
Warsaw City . . .	Lublin . . .	—	164,115
Total	49,090	4,851,639

Of the geography of the historical monarchy of Poland this article does not treat. Out of that monarchy (besides the governments above named) the whole of West Russia is formed, comprising the governments of Wilna, Grodno, Minsk, Mohilev, Witabek, Volhynia, and Podolia: Austria obtained Galicia, with which the former republic of Cracow is now incorporated; and Prussia obtained West Prussia and the grand-duchy of Posen.

History.—The history of Poland previous to the introduction of Christianity is involved in darkness. Tradition says that the Polish part of the Slavonic race elected for their chief a peasant named Piast, who was endowed with great and noble qualities, and who fixed his residence at Gnesen in Posen. Christianity was introduced by his descendant the Duke Miecyslaw, A.D. 965, after his marriage with a Bohemian princess, an event which brought the Polish sovereign into connection with the German empire. His successor, Boleslav Chrobry, or the Brave (992-1025), received (1000) the royal crown from the emperor Otho III., who came to Poland on a pilgrimage to the shrine of St. Adelbert, and on that occasion declared him king of the Poles and protector of all the Slavonians. The emperor also recognised his independence of the empire. Boleslav not only considerably extended the frontiers of his kingdom, but strengthened it by wise regulations, and particularly by a skillful organisation of the military force. He transferred the government from Gnesen to Krakow. Under his son Miecyslaw II., and during the minority of Casimir I., Poland was a prey to all the horrors of anarchy. Casimir I., grandson of Boleslav, governed the country with great wisdom, and was succeeded (1058) by his son Boleslav II., surnamed the Dauntless, who was a skillful soldier and a man of chivalrous character. He restored two monarchs of Hungary, Bela and his son Geyza, as well as the Duke of Bohemia and Grand-Duke of Russia (Tsia-laf) to their respective thrones. Towards the end of his reign he became cruel and rapacious. He murdered Stanislaw Szczepanowski, bishop of Krakow, who had remonstrated against his excesses, and being in consequence excommunicated, his subjects refused to pay him allegiance. He was obliged to retire from the country, and died in exile.

The vacant throne of Poland was occupied (1089) by his brother Vladislav Herman, a weak monarch, whose reign was disturbed by foreign aggression and domestic war. Vladislav's son, Boleslav III., was a great monarch, whose reign was illustrious for many victories and for the conversion of the idolatrous Pomeranians. At his death in 1139 Boleslav divided the kingdom among his four sons, who were styled dukes; and the subdivision of the kingdom did not stop till the aristocratical government of territorial lords was substituted for the absolute sway of the kings. In the 13th century Poland was ravaged by the Tartars, and the petty princes of the country peopled their deserted towns with colonies from Germany. Vladislav II., crowned at Krakow in 1319, resumed the title of king; he was one of the greatest monarchs that ever governed Poland. He was educated in the school of adversity, having been twice driven from his throne into exile; and it was only on his last restoration that he succeeded in firmly establishing his authority. He exerted himself to settle the disturbed state of the country, to repel foreign aggression, and to curb the licence of the powerful vassals. His most formidable enemies were the Lithuanians and the Teutonic Knights, who having subdued the half-savage Prussians, became the most dangerous neighbours of Poland. Vladislav gained a great victory over them in the battle of Plowoc, in 1331. He was then 70 years of age; he died two years

afterwards. But the most memorable event of his reign is the first diet of Poland, which he assembled at Chenciny a few months before the battle of Plowoc.

The reign of his son, Casimir the Great, was devoted to the consolidation of the advantages gained by his father. He made great territorial concessions to Bohemia and the Teutonic order for the maintenance of peace, which was necessary to a kingdom that had so long laboured under the evils of war. His chief care was directed to the protection of agriculture; and the nobles, who were no longer permitted to oppress the peasants at their will, gave him the nickname of the Peasant King. The first code of laws was published in Poland by his orders at the assembly of Vislitz, in 1347. It was during his reign that the Russian principality of Halich (now Galicia) was united with Poland.

The ancient dynasty of Piast, which reigned in Poland from a date anterior to the introduction of Christianity, ended with Casimir's death, 1370. He was succeeded by his nephew Louis, king of Hungary. This monarch entirely neglected Poland, which he visited only twice during his reign. His youngest daughter, Hedvige, was proclaimed after his death Queen of Poland, in 1382, and was crowned at Cracow, being then only 15 years of age. The extraordinary beauty of this princess, which was united to the noblest qualities and the most exalted virtues, have rendered Hedvige's memory an object of national veneration. She married Jagellon, grand-duke of Lithuania, a pagan prince, who was baptised on that occasion, and converted to the Christian religion. This completely united Lithuania with Poland. Hedvige died in 1399, but Jagellon, who on his baptism had received the name of Vladislav, continued on the throne till his death, 1434. In his reign the power of the Teutonic knights was crushed in the battle of Gunwald by the united forces of Poland and Lithuania. The Hussites offered Jagellon the throne of Bohemia. He refused the offer; but permitted the princes of his house to assist the Hussites against the Roman Catholics. Jagellon was succeeded by his son, Vladislav III., a prince 11 years old. He was scarcely of age when the Hungarians, threatened by the fast-spreading power of the Ottomans, invited him to their throne. In prosecuting a hostile attack against the Turks, Vladislav perished at the battle of Varna, in the 21st year of his age. The throne of Poland remained vacant till 1445, when it was offered to Casimir, brother to Vladislav, and grand-duke of Lithuania. Casimir was reluctant to accept the crown of Poland; but when the states of Poland threatened to transfer their allegiance to a new sovereign he accepted their offers, and left Lithuania, for which he preserved to the end of his life a strong predilection. The most important event of his reign was the union with Poland of the Prussian provinces, which revolted from the Teutonic knights, and placed themselves under the crown of Poland. A war ensued (1454)—terminated in 1462 by the peace of Thorn, which gave to Poland a rich and fertile country with a large population. The acquisition of Danzig proved particularly advantageous to the commerce of Poland. Under Casimir's reign Poland was divided into electoral districts, each returning a representative in order to form a deliberative body distinct from the senate or nobles (whose representatives were styled 'nuncios'). A measure to become law had to pass these assemblies, and then be sanctioned by the king. Deputies from the towns were admitted to the senate or chamber of nuncios. Of the subsequent sovereigns of the Jagellon dynasty, one of the most illustrious was Sigismund, who was elected king after the death of his brother Alexander in 1506. Sigismund engaged in a severe and protracted contest with Russia, which was concluded by a treaty that left the frontier of the belligerent powers in the same state as it was before the war. In 1510, Bohdan, prince of Moldavia and Wallachia, invaded the southern provinces of Poland: he was however soon defeated, and compelled to conclude a treaty, by which he acknowledged himself the vassal of the kings of Poland. This acquisition became afterwards the origin of long and bloody wars with the Ottoman Porte, but an immediate collision with that power was avoided by the prudence of Sigismund.

Sigismund died in 1548, in the 82nd year of his age, with the character of a wise, just, and magnanimous prince, notwithstanding that in the latter years of his reign he had become unpopular, owing to the misconduct of his queen Bona, to whom he was dotingly attached. He was succeeded by his son Sigismund Augustus, who had been elected and crowned during his lifetime, and was then only ten years old. The most remarkable events of his reign are the acquisition of Livonia, which voluntarily submitted to Poland in order to save itself from the Muscovite yoke; and the legislative union between Poland and Lithuania, which was effected at the diet of Lublin, 1569. By this arrangement it was agreed that the deputies and senators of both nations should deliberate in common. The rights of the Polish nobles were extended to those of Lithuania, and the throne of both countries became equally elective; yet the laws, finances, and army remained distinct. This union continued until the final dissolution of Poland. Under the reign of Sigismund Augustus the doctrines of the Reformation acquired considerable influence in Poland.

The interregnum produced by the death of Sigismund Augustus (1572) was dangerous to the peace of the country, particularly as the election of the new king was embarrassed by religious differences. The diet of convocation however, which assembled in January 1573, enacted that all the religious sects which at that time divided Poland should

enjoy equal rights and privileges. The extraordinary address of the French ambassador Monluc, bishop of Valence, secured the election of Henry of Valois, brother of Charles IX. of France. Henry went to Poland; but a few months after his arrival, having learned the death of his brother Charles IX., by which he inherited the throne of France as Henry III., he secretly left Krakow (1574), and escaped from his new kingdom. The throne was declared vacant in 1575, and Stephen Batory was elected. He was a very remarkable person, who had risen by his great merit from a simple Hungarian noble to the dignity of sovereign prince of Transylvania. Batory defeated in repeated battles the Muscovites, retook many towns and districts of Lithuania which had been seized by them, and invaded their own country. His death took place in 1586, at the moment when he was making great preparations against Muscovy. His successor was Sigismund III. (Vasa), son of the king of Sweden, and nephew by his mother to Sigismund Augustus. Sigismund III., strongly attached to the Roman Catholic religion, lost his hereditary dominions, and created a general discontent in Poland by his complete subserviency to the Jesuits and the house of Austria, as well as by his tendency towards despotism. A civil war ensued; but the insurgents being defeated, the country was restored to peace. Soon after, Sigismund, taking advantage of the distracted state into which Russia fell after the murder of the pretender Demetrius, declared war against that country; and the Polish general Zolkiewski, having defeated the Muscovite army and an auxiliary Swedish force, entered Moscow; and concluded a treaty by which Vladislav, eldest son of Sigismund, was elected Czar of Moscow, 1610, on conditions which limited the absolute power that the monarchs of that country hitherto possessed. Sigismund delayed his confirmation of that treaty under various pretences, and in the meantime endeavoured to possess himself of some towns and provinces of Russia. The Muscovites, justly irritated by Sigismund's conduct, rose in arms, and a war ensued, during which the Polish general maintained himself for a long time against the Muscovites, but was finally obliged to retire. The refusal of the diet to grant the necessary supplies produced insubordination in the army, which was unpaid, and the Russians gained great advantages. Sigismund at last made an effort, and sent his son Vladislav to recover at the head of an army the throne which was lost through his father's incapacity, and already occupied by Michael Federovich Romanow, who was elected in 1613. Vladislav penetrated to the walls of the capital; and after an unsuccessful attempt to carry it by storm, occupied a strong position in its vicinity; but the insubordination of the army hastened the conclusion of a truce of fourteen years, by which the Czar Michael Federovich was recognised by Poland, which retained Smolensk, with other provinces. Among the principal events during the remainder of the reign was the war with the Turks (1620-1), who advanced to the Dniester 400,000 strong under the Sultan Osman, and were bravely held in check by 35,000 Poles and 40,000 Zaporogue Cossaks. Peace was concluded October 7, 1621, which restored the statu-quo of the two countries. In a war with Sweden, 1625, Poland lost Riga and other towns in Livonia.

Sigismund III. died in 1632, in the 66th year of his age. His son Vladislav IV. was elected without opposition. He was a virtuous and enlightened prince. Immediately after his coronation he marched against the Muscovites, who had invaded the Polish frontiers, and having defeated them, he entered the frontiers of Muscovy, where he occupied several towns. Peace was concluded in 1634, on terms advantageous to Poland. Poland enjoyed a long peace during the reign of Vladislav, who died in 1648, at the very moment when a most dangerous rebellion was breaking out among the Cossaks of the Ukraine. The rebellion raged for many years under John Casimir, the brother and successor of Vladislav, until Chmielnitaki, the chief of the Cossaks, in 1654, applied for aid to the czar of Muscovy, Alexius, who sent a numerous army to his assistance and another force to attack Lithuania. The situation of Poland was already very critical, but the imprudence of the king made it desperate. Charles Gustavus having ascended the throne of Sweden in consequence of Christina's abdication, John Casimir's ambassador at Stockholm made a protest against his accession to the throne of Sweden, of which his master was the legitimate heir. Charles Gustavus declared war against Poland, which he entered from Pomerania, and soon overran the whole country, seizing both Warsaw and Krakow. John Casimir had fled before the Swedes, and was now in Silesia, and the Poles, captivated with the vigour of Charles Gustavus, sent him a deputation to request him to convoke a diet for the purpose of electing him King of Poland. The reply of the Swede, "that he required no election, as he was already master of the country by conquest," wounded the pride of the nation, which rose en masse, and under the brave Stephen Czavniecki, expelled the Swedes, and restored John Casimir to the throne.

This war, which terminated by the peace of Oliva in 1660, was followed by hostilities against Muscovy, which lasted till 1667. By the peace of Andrashov in that year, Poland ceded Smolensk and a great part of the Ukraine to the Czar. John Casimir abdicated the throne in 1668, and retired to France, where he died in 1672. He was personally brave, and not without military talent. He had served with distinction in the Imperial armies during the Thirty Years' War. Besides the losses before enumerated, some important districts were

also ceded during his reign to the elector of Brandenburg, whose independence of Poland was further recognised by the treaty of Velau, in 1657. The country was depopulated by constant war and pestilence, and emigration to adjoining countries, which was caused by the horrors of war and by religious persecution. In the election of a successor to John Casimir, the minor nobility, jealous of the overgrown influence of the magnates, united to place upon the throne Michael Prince Wisniowietzki, a young man who had no pretensions to this dignity. It was during his reign that the heroic John Sobieski rose, displaying great military skill, and performing prodigies of valour, in the service of his country.

On the death of Michael in 1673, Sobieski was elected king of Poland in his stead, notwithstanding the competition of numerous candidates. Almost immediately after his election to the throne the Turks invaded Poland with a large force, and Sobieski was obliged to shut himself up with a few thousand men in Lemberg, which was speedily invested. Taking advantage of a snowstorm which blew right into the face of the Turks, the king issuing out of the town with his small devoted band and a simultaneous cry of 'Christ for ever!', completely routed the besiegers. A fresh Turkish army headed by the brave Pasha of Damascus advanced to the Dniester, where John Sobieski, with 10,000 men, entrenched himself between two villages, and sustained for 20 days the attacks of the enemy and a continued cannonade from a formidable artillery. At last (Oct. 14, 1676), the king left his entrenchments and drew up in order of battle against the Turks, who numbered between 200,000 and 300,000 men. The Turkish Pasha, notwithstanding the odds in his favour, knowing that a *levy en masse* of the whole of Poland was at hand, offered the king an honourable peace, which was accepted.

A few years of external peace followed, during which unfortunate Poland was harassed by the obstinate conduct of her untractable nobles, who by their veto dissolved every diet that attempted to reform or remedy the evils and grievances of the state. But soon the noble energies of John Sobieski were again called into action by the most terrible storm which had threatened Christendom since the days of Charles Martel. A most formidable Turkish army, commanded by the grand vizier Kara Mustapha, after sweeping over Hungary invaded Vienna, from which the emperor Leopold and his family had fled in July 1683. Without hesitation the Polish king, at the head of only 16,000 men, marched from Cracow to the Danube, where contingents from Lorraine and Germany joined him, raising his force to 70,000. On the morning of the 11th of September he reached the ridge of the Kalemberg which overlooks Vienna and gave him a view of the wide-spread tents of the infidels. Next day rushing down he attacked the Turks, and after a hard contest obliged them to take refuge in their fortified entrenchments, which seemed too strong to be forced. After a respite of a few hours these too were assaulted. The Polish lancers cleared the ditch right into the Turkish camp; the infantry poured in at their heels, and the Ottomans were driven in a confused mass to the vizier's tent, where a short stand was made, and all was lost; Kara Mustapha fled with all the Turks that were left alive, and John Sobieski remained master of the whole camp, artillery, and baggage. Christendom was thus saved from the heel of the Turk. All Europe rang with acclamations, while Sobieski pursued the Turks into Hungary, and although defeated once at Parang, he checked not his career till he had swept the infidels across the Danube. Returning to Poland, he spent the remainder of his life in vain endeavours to regenerate his country by reforming abuses and the vicious system engrafted upon its constitution, but in every attempt he made he was thwarted by the veto of the turbulent nobles. He died after a short illness on Corpus Christi, 1696, and with him the greatness of Poland may be said to have expired.

During the reigns of his successors Augustus II. of Saxony (1690-1733) and Augustus III. (1733-1763), the crown of Poland became subservient to the Russian court. This gave rise to two parties among the nobles. The majority headed by the Potockis and Radzivils, wished to maintain all the privileges of their order, and were strongly attached to the Saxon dynasty, which was favourable to their opinions. This Saxon or court party was opposed by the Czartoryskis, who, perceiving that a liberty which was destroying national independence was only an idle name, wished to establish a strong government as the only means of raising the country from its deplorable condition.

Prince Michael Czartoryski and his brother Augustus, who were descended from a collateral branch of the Jagellon dynasty, possessed at that time immense wealth and great influence. Both of them also possessed great abilities and activity. They undertook to change the republican constitution of Poland into a well-organised monarchy, which, they thought, was the best means of raising Poland from the humiliating position into which she had fallen through her feeble government. They encouraged science and literature, sought out and patronised men of superior talent, and such as by their writings exerted an influence on public opinion, by which means they powerfully contributed to the restoration of literature in Poland. Some of the patriotic plans of the Czartoryskis were carried into effect, some of them with the aid of the Russian power; but on the accession of Catherine II. to the throne of Russia, the Muscovite power was directed against the Czartoryski policy.

In order to save the country from foreign influence, a confederation was organised at Bar, a little town in Podolia, by the patriotic bishop

of Kamieniec, Adam Krasinski. Ill supported and without any regular troops, it struggled for several years against the forces of Russia, until it fell by exhaustion. The Turks, who had taken up arms in favour of Poland, after having represented in vain to the cabinets of Europe the danger of Russian predominance in Poland, were defeated, and the first partition of Poland, which was planned by Frederick II. of Prussia, took place in 1772. By this partition Poland lost of its territory above 83,000 square miles, which comprehended its best provinces, and were unequally divided between Russia, Prussia, and Austria. This great calamity roused the nation, which now strove to compensate its heavy loss by internal improvements. An excellent system of public education was introduced, and literature was encouraged; industry was re-animated, and every kind of improvement rapidly advanced. The chancellor, Andrew Zamoyaki, an enlightened and patriotic nobleman, prepared a new code, which removed many ancient abuses and partly emancipated the peasants. The code was rejected however by the diet of 1780. The diet which assembled in 1788, having declared itself permanent, continued till 1792, when, on the 2nd of May, it proclaimed a new constitution, which abolished the veto, made the throne hereditary in the Saxon family (which was to succeed after the demise of Poniatowski, the reigning king), and introduced some useful regulations. Russia, which had guaranteed the former state of things in Poland, excited a party composed of a few factious nobles, who, assisted by her troops, formed a confederation at Targovitsa, in order to overthrow the new constitution. The king soon became a party to this infamous confederation. The king of Prussia, who had encouraged the patriots to amend the constitution, then joined the Russians and invaded Poland. The consequence was a second partition of the Polish territory in 1793, by which Prussia took 22,500, Russia 83,000, and Poland retained 85,000 square miles. The remaining part of Poland was subjected to every kind of vexation from the confederates of Targovitsa, who, encouraged by the presence of Russian troops, persecuted the patriots in every possible manner, and the chief persons among them were obliged to seek refuge abroad. An extensive conspiracy was organised, and insurrections broke out in several parts of Poland. In 1794 Kosciuszko arrived at Cracow, and having assembled a number of peasants armed with scythes, he defeated a superior number of Russian troops. The inhabitants of Warsaw, which was occupied by a strong Russian army, rose against their oppressors, and expelled them after a bloody contest. Vilna did the same. Several individuals were convicted of high treason and executed, but the king was treated with respect. The Poles fought with the utmost bravery, but their courage and patriotism proved unavailing against the overwhelming numbers of Russia and Prussia. Kosciuszko was defeated, wounded, and taken prisoner at the battle of Maciejowica, and Praga, the suburb of Warsaw, was carried by storm by Suwaroff, and all the inhabitants were massacred. Warsaw capitulated, and the remainder of Poland was divided in 1795 among Russia, Prussia, and Austria.

The fate of the dismembered provinces differed according to the governments under which they fell. The Prussian part was well treated in some respects, but the advantages it enjoyed were more than counterbalanced by a decided tendency to establish Germanism on the ruin of everything that was national. The Austrian government was not more favourable to the nationality of its Polish subjects; it introduced some few improvements, such as roads, but it exhausted the Poles by heavy taxes and levies of soldiers in its long wars with France. The Russian part may be considered as having been in some respects the most favoured of all. The national language was preserved in all official transactions, and an excellent system of public education, which was carried on in the same language, was introduced by the university of Vilna under the superintendence of its curator Prince Adam Czartoryski, who, supported by the friendship of the emperor Alexander, whose minister he had become, preserved with his sanction the nationality of Poland in the Russian provinces, where the ancient laws relating to civil affairs were also retained.

The success of the French arms against Prussia in 1806 reanimated the hope of the Poles to see their country restored. As soon as the French entered the Polish territory, the inhabitants rose in their favour, and organising themselves into a military force with amazing rapidity, immediately joined the French in combating the enemy. Yet Napoleon, after his success against the Russians, stopped at the banks of the Niemen, and concluded at Tilait a peace with Russia. The Polish territory which had been taken by Prussia in 1793-6 was erected into a sovereign state under the name of the Duchy of Warsaw, with the exception of the province of Bialystok, which was given to Russia. A representative constitution was granted, the French code of laws introduced, and the sovereignty declared hereditary in the house of Saxony. In 1809 the Austrians invaded the duchy and occupied Warsaw, which the Polish forces were obliged to evacuate after an unequal contest; but having entered Austrian Poland, their numbers were rapidly swelled, so that their insignificant force soon became a considerable army, and compelled the Austrians to evacuate the duchy of Warsaw, and also a large part of the Polish territory which they held.

At the congress of Vienna in 1815, the affairs of Poland were arranged in the following manner:—A part of the duchy of Warsaw was given to Prussia under the title of the duchy of Posen. The salt-mines of Wieliczka and some districts were given to Austria.

Cracow with a territory of 490 square miles was erected into a republic; and the remainder was entitled the kingdom of Poland, and united to Russia under one sovereign. The new kingdom received a representative constitution, which guaranteed security of person and property, the liberty of the press, the responsibility of ministers, the independence of the judges; the use of the national language; and a national military force. The representative body was composed of two chambers, senators and deputies.

Such a liberal constitution granted to a kingdom with 4,000,000 of inhabitants, whose sovereign was monarch over more than 50,000,000 subjects, was a perfect anomaly. It could not be expected that such a constitution should be faithfully maintained; and it was not. The hopes raised by the emperor Alexander, that the Polish provinces incorporated with Russia should be united with the new kingdom, were soon dissipated, and discontent began to spread among all the Polish population. The country, it is true, began to make rapid progress in agriculture, and industry was greatly increased; but the acts of government evinced a systematic hostility to all that was national, particularly with respect to the system of public education. The free expression of opinion on the part of the students at the university of Vilna was forcibly repressed, and the utmost severity was exercised upon young men who had been imprudent enough to speak plainly what they felt strongly. Similar persecution of the students took place at Warsaw, and the system of instruction was continually rendered less efficacious by substituting absurd modes of teaching for sound methods, and by limiting the subjects of instruction. A severe censorship prevented not only the printing of every work of liberal principles, but even the introduction of similar works from abroad.

These causes produced their natural result. The French revolution of July 1830, which produced a general excitement all over Europe, was not without effect on public opinion in Poland: an insurrection was meditated, and the time was fixed for the spring of 1831. Information of this projected movement having reached the government, some of those who were implicated were arrested—a circumstance which hastened the development of the plot. The insurrection broke out on November 29th 1830, and was effected by the military school, composed of about 200 young men, who were joined by many students of the university and a few thousands of Polish troops stationed at Warsaw. The Russian troops, which had made some ineffectual attempts to put down the insurrection, took up a position near the town under the grand-duke Constantine, with whom two regiments of Polish guards remained. A provisional government was organised, which acted in the name of the emperor Nicholas as king of Poland, and the grand-duke Constantine remained in his position awaiting the arrival of the army which was summoned to Warsaw from different places. The army having assembled and declared for the insurrection, the grand-duke, as its commander, by an order of the day, transferred his authority to the national government, and was allowed to retire from the country with 8000 Russian troops and 24 guns. In January 1831 the Diet declared the throne vacant, and organised a national government under the presidency of Adam Czartoryski. A vigorous defence was resolved on. The nation however could hardly muster 60,000 men to oppose a Russian army of 130,000 men and 396 guns. In the campaign which followed the Poles fought with great bravery and gained several victories; but on more than one occasion, advantages they had secured over the Russians appear to have been thrown away from the inefficiency of their commanders. In a battle which took place at Ostrolenka, on May 26th 1831, the Polish army sustained an enormous loss, particularly of officers. After this Polish affairs assumed a melancholy appearance. The want of ammunition and of every kind of resources was severely felt. This was chiefly caused by the Prussian government, which did not permit the slightest assistance to the Poles to cross the frontier. The Russians, on the contrary, were allowed to have their magazines on the Prussian territory, and always found a friendly asylum whenever they were obliged to retreat there, while the Poles in such cases were invariably disarmed and retained prisoners.

The Russian commander-in-chief Diebitch died suddenly on June 9th, and was succeeded by Paskievitch, who had distinguished himself in Asia against the Persians and the Turks. Paskievitch resolved to cross the Vistula, and he accomplished his plan by marching near the Prussian frontier, where his magazines were in perfect safety, and where the bridges by which he effected his passage were prepared.

Meanwhile the national government resigned its authority, and General Krukowiecki was chosen president of the government. The town being in want of food, a considerable force was detached to collect provision in the provinces on the right bank of the Vistula, and only 30,000 men were left to defend Warsaw. Provisions were supplied, but the forces sent for them could not reach Warsaw in time, which, being attacked on September 6th by the Russians, was surrendered to them by Krukowiecki on the 8th. The army, followed by the members of the diet and many leading persons, retired towards the frontiers of Prussia, which they entered on October 8th; whilst another part of the army was compelled to retire on the Austrian territory.

The consequences of the failure of this insurrection were most deplorable to Poland. The emperor Nicholas exercised the utmost severity against the Poles. Many individuals who had taken a part in

the insurrection were condemned either to the mines of Siberia or sent to serve as soldiers in the Caucasus and other Asiatic provinces. The constitution was formally abrogated, and another form of government, called the Organic Statute, introduced. The universities of Vilna and Warsaw, as well as many minor schools, were abolished, and the public libraries and museums were carried away to St. Petersburg and other parts of Russia. Various other measures were taken to destroy the nationality of Poland, to abolish its language, and to overthrow its religion, all of which it is said have been persistently carried out up to the present time. After the surrender of Warsaw a great number of the patriots emigrated to foreign countries. In 1832 Poland was declared an integral part of the Russian empire. A feeble attempt at independence was made at Cracow in 1846, which led to the annexation of this last remnant of Polish nationality to Austria. [CRACOW; GALICIA.]

POLAR COUNTRIES AND SEAS. The countries and seas which lie between the northern coasts of America and the North Pole are noticed in the article NORTH-WEST PASSAGE; those which are situated on the other sides of the North Pole are described under their respective names. [GREENLAND; ICELAND; SPITZBERGEN; NOVA ZEMBLA; SIBERIA.] It only remains to notice certain conditions of the countries and seas which surround the North Pole, and then to give an account of the discoveries which have been made in the seas surrounding the South Pole.

The seas which surround the North and South Poles are named the Arctic Ocean or North Polar Sea, and the Antarctic Ocean or South Polar Sea. These two oceans are bounded by two imaginary circles which surround the globe at about 66° 30' N. lat. and 66° 30' S. lat. At the Poles themselves there is only one day of six months, during which the sun never sets, and one night of six months, when the sun never rises. In the spaces comprised between the Polar Circles and the Poles the quantities of continuous day and continuous night vary according to the distances from the Poles. Thus, at the north point of Nova Zembla, 75° N. lat., there is uninterrupted light from May 1st to August 12th, and uninterrupted darkness from November 8th to February 9th. At the Arctic Circle the greatest length of continuous light is 24 hours at the summer solstice, or Midsummer's-Day, whilst, at the same time, at the Antarctic Circle, the sun is 24 hours below the horizon; and the reverse at the opposite seasons of the year. The general coldness of the Polar Regions arises from the sun's rays striking the earth obliquely, as at the equator the heat is produced by the sun's rays falling upon the earth vertically.

The two great continents of the Northern Hemisphere terminate towards the North Pole near 70° N. lat., which parallel may therefore be considered as the general boundary-line of the North Polar Sea. The lands comprised within this polar basin, besides the northern shores of Europe, Asia, and America, include the northern parts of Greenland and Nova Zembla, the islands of Spitzbergen, the Liakheov Islands, and the great mass of islands which lie opposite to the northern coasts of British America. The North Polar Sea has only one entrance from the Pacific Ocean, by Behring's Strait, the narrowest part of which, between East Cape and Prince of Wales Cape, is only about 18 miles across. From the Atlantic Ocean, besides the great entrance by the Spitzbergen Seas, it is now known that there are entrances by Smith's Sound from Baffin's Bay, and by the Wellington Channel from Barrow's Strait.

A large portion of the Arctic Ocean is constantly filled with extensive fields and moving masses of thick and impenetrable ice. This portion seems to extend round the Pole at variable distances from the shores of Siberia, Russian America, and British America. In an easterly direction it extends from the north point of Nova Zembla to the western side of Melville Island. Here the navigation westward up Barrow's Strait ceases, the 'pack-ice,' as it is called, presenting an impassable barrier. On entering the Arctic Ocean from the Pacific through Behring's Strait, the most daring and skilful navigators have not been able to penetrate much farther in a northern direction than 70° N. lat. Captain Cook, in his last voyage, after passing through Behring's Strait, sailed as far westward as North Cape, 180° W. long.; but here the masses of ice prevented any farther advance. If the navigator, after passing through Behring's Strait, turns eastward, he finds, in summer, between the American shores and the pack-ice, a narrow passage much encumbered with broken ice, and may thus with some difficulty reach the most north-eastern point of the American continent; or, having reached Baring Island, may turn northward and try to accomplish the North-West Passage by following either of the tracks of Captain M'Clure.

The great entrance to the Arctic Ocean by the Spitzbergen Seas is not attended with much difficulty. Ships sail every year from the shores of the Atlantic Ocean to Archangel, and must necessarily pass round North Cape, 71° 10' N. lat.; other vessels proceed annually to fish for whales, which they never expect to take south of about 73° N. lat.; and others much smaller go every year from Hammerfest and other places to fish for walrus along the western shores of Spitzbergen. Barentz, the Dutch navigator, in 1594 and 1596, traced the western shores of Nova Zembla as far as North Cape, 75° N. lat.; and the Russian navigator Ziwoika, who in 1836 surveyed the island of Nova Zembla, found no difficulty in tracing the western coast to Cape Nassau, and even the eastern coast to 61° E. long.; but impenetrable masses of ice prevented his advance farther to the east.

The greater or less severity of cold in the Arctic Seas seems to depend more on circumstances of locality than on the degrees of latitude. Thus, on the European side of the Polar Basin, the navigation, as has been shown, is open as far as 80° N. lat.; on the Asiatic side it is generally closed by masses of ice; on the American side the cold is very severe, and the navigation everywhere difficult and in many parts dangerous. At North Cape, in Europe, 71° 10' N. lat., the mean temperature of the year is 32° Fahr.; at Bear Island (Cherry Island), between North Cape and Spitzbergen, 74° 30' N. lat., the mildness of the climate is extraordinary; but opposite the coasts of Siberia, farther to the east, the floating masses of ice render the navigation so dangerous that some portions of the coast-line have not been surveyed. This tract includes the most northern point of Siberia, Cape Severo (Severo Vostochinii Noss). In this part of the Polar Basin are the Liakhov Islands, the largest of which are named Kotelnof Fadiefkof, New Siberia, and Liakhov. They are situated between 73° and 76° N. lat. On these islands the snow does not entirely melt even in summer, and there is no vegetation whatever. Along these coasts of Siberia it has been ascertained that in winter the large body of the sea is free from ice at certain distances from the shore. North of New Siberia and Kotelnof the distance is less than 20 miles. Farther east it approaches nearer to the coast. Near 165° E. long. it is about 170 miles distant; but between 175° and 180° E. long., opposite Cape Yacan, it is only about 4 miles distant. At Ustyansk, in Siberia, near the mouth of the river Yana, 70° 55' N. lat., the mean temperature of the year is only 4° Fahr. At Winter Island, on the north-eastern coast of America, in 66° 11' N. lat., 83° 30' W. long., the mean annual temperature is not more than 7° Fahr., while on the south shore of Melville Island, about 74° N. lat., the mercury of the thermometer is frozen every winter during four or five months.

That there is a great sea comparatively unincumbered with ice in the vicinity of the North Pole, and perhaps flowing over it, seems to have been rendered probable by many facts and circumstances. Barentz, in 1594, remarked, "as soon as we made from the land [Nova Zembla] and put more into the sea, although it was much farther northward, presently we felt more warmth." Captain Parry, in his attempt to reach the North Pole in 1827, leaving his ship, the *Hecla*, moored in a bay on the north-east coast of Spitzbergen, proceeded with his party over the ice, dragging the boats and sledges which had been constructed for the purpose. On July 27th they reached 82° 45' N. lat., 19° 25' E. long., when, the season being far advanced, and finding that the ice over which they were travelling northward was itself drifting southward, they relinquished their attempt, and commenced their return-journey. On August 12th they reached Little Table Island, or rather a rock north of it, which Captain Parry named Ross's Islet, and which is the farthest land known in the northern hemisphere; it is in 80° 47' 30" N. lat., 20° 24' E. long. Captain Parry and his party were absent from the *Hecla* 61 days, the distance traversed being 654 miles. On July 15th, being then in 82° 17' N. lat., it rained incessantly for 21 hours. On July 16th the temperature was 37½° Fahr. in the shade. "In the evening it was so warm in the sun, though the temperature in the shade was only 35°, that the tar was running out of the seams of the boats." They found the ice everywhere broken, but most so when they were farthest north. After the middle of July no ice entered the bay where the *Hecla* was moored, and for some weeks afterwards not a piece was seen in the vicinity.

In further confirmation of there being a great sea in the vicinity of the North Pole, it may be stated that Sir Edward Belcher saw an extensive sea with little ice north of the Wellington Channel, as did also Captain Penny north-west of the Victoria Channel; that Captain Ingfield saw a great sea north-east of Whale Sound, near the head of Baffin's Bay, and also north of Smith's Sound, which seems to be an outlet into the Polar Basin from the head of Baffin's Bay.

The difference of temperature between the north-western shores of Europe and the north-eastern shores of America seems to be owing to two main causes—the Gulf-Stream, and the drifting of the ice-masses from the shores of Siberia. The Gulf-Stream is a great warm current many miles in width, which flows in a north-eastern direction from the Gulf of Mexico across the Atlantic, and passing by the British Islands and along the coast of Norway, penetrates the Polar Sea as far as the northern shores of Spitzbergen and Nova Zembla. Here in the spring it meets the powerful current caused by the breaking-up of the ice in the great rivers of Siberia. As this vast body of water and broken ice advances towards the shores of Nova Zembla and Spitzbergen the Gulf-Stream opposes its farther progress south and gives it a direction westward, so that it passes by East Greenland and Iceland, and reaches the shores of America and Newfoundland, where the masses of floating ice (sometimes miles in length and of great thickness) descend in the spring as low as 40° N. lat. On the coast of Norway, on the contrary, as far as 71° N. lat., not a piece of drift-ice is ever seen.

The countries which surround the north pole generally afford an abundant supply of animal food, consisting of the walrus, the polar bear, the moose-deer, the rein-deer, the wolf, the polar hare, and the seal. The number of aquatic birds is very large, and various kinds of fish are in great abundance.

We now proceed to give a sketch of the discoveries which have been made in the Antarctic Seas.

The southern hemisphere, as is now well known, contains a much

less proportion of land to sea than the northern hemisphere. But it was formerly supposed that the remote and then unknown parts of the southern hemisphere were occupied by an extensive continent, which surrounded the Antarctic Pole, and extended to a great distance from it. This imaginary continent, called Terra Australis Incognita, makes a conspicuous figure on all maps which are more than a century old. Little could be adduced in support of the supposed existence of this continent except some imaginary law of equipoise. In the middle of the last century however it was determined to solve the problem of the existence of this Terra Australis, and Cook undertook his second voyage (1772-1775) for the purpose. He found large masses of floating ice, and only in three places succeeded in penetrating beyond the Antarctic Polar Circle. In one place he attained 71° 10' S. lat., but he was generally unable to go much farther south than 60° S. lat. This was the case between 90° and 150° E. long., within which limits the most extensive and continuous line of coast has been since discovered. This line of coast however lies between 4° and 5° south of Cook's track. As Cook had found no land south of 60°, the Terra Australis disappeared from our maps, though he himself thought that there must be land in the vicinity of the pole, being convinced that ice can only be formed in the neighbourhood of land.

Thus the matter rested up to 1819, when the South Shetland Islands were seen by William Smith, on a voyage from Monte Video to Valparaiso. In 1821 Powell discovered Trinity Land south of the South Shetlands and the South Orkneys, between 60° 30' and 61° S. lat., 44° 30' and 46° 30' W. long. Palmer, an American, discovered a coast-line west of Trinity Land, which is called Palmer's Land; and the Russian navigator, Bellingshausen, discovered Alexander's Land, south-west of Palmer's Land. In 1823 Weddell tried to find land east of the meridian of the South Shetland Islands. He did not find land, but he succeeded in advancing as far as 74° 15' S. lat., where he found a sea clear of ice. In 1831 and 1832 Biscoe sailed round the icy masses which inclose the south pole, and added to former discoveries Enderby's Land and Graham's Land. The first lies at a great distance from the countries south of the Shetland Islands, between 49° and 51° E. long.; but Graham's Land is between Alexander's Land and Palmer's Land. Thus a nearly continuous coast-line has been discovered south and west of the South Shetland Islands, extending from 36° to 70° W. long., and comprehending from east to west Trinity Land, Palmer's Land, Graham's Land, and Alexander's Land. In 1837 the French government sent some vessels to these parts, under the command of Dumont D'Urville, who explored the coast which Powell named Trinity Land, and changed its name to that of Louis Philippe's Land. In the following year Balleny directed his course to those parts of the ocean which are south of New Zealand and Australia, and discovered some islands in 66° 44' S. lat., 163° 11' E. long., which he called Balleny Islands. He also discovered a projecting coast-line near 116° E. long., which was called Sabrina Land. But the largest tract of sea-coast was discovered in 1840. In 1839 the French government and that of the United States of North America sent out expeditions for the purpose of making discoveries in the Antarctic Seas. The French expedition consisted of two vessels, under the command of Dumont D'Urville, and the American of four vessels, commanded by Charles Wilkes. Both directed their course to the seas which the year before had been visited by Balleny. Wilkes found a coast-line in 154° 27' E. long., and in continuing his course westward for four weeks, he had either always a coast in sight, or unequivocal indications of land being at no great distance. He advanced as far as 97° 30' E. long., so that, including Sabrina Land, he discovered a coast-line extending over near 50 degrees of longitude. Dumont D'Urville reached the same coast in 140° 41' E. long., and pursued his course westward to 130° E. long. He called it Adélie Land. It is remarkable that the coast of this Antarctic Continent, if the appellation may be adopted, lies near the Antarctic Circle, either to the south or to the north of it, and this is also the case with Enderby's Land and Graham's Land, both of which are traversed by that line. Only the tract of coast south of the South Shetland Islands extends farther north, and approaches to 63° S. lat.

An expedition was fitted out in England in 1839 for the purpose of making an attempt to reach the south magnetic pole, and it was placed under the command of Captain James Clarke Ross. He directed his course several degrees east of Balleny Island, and on the 1st of January, 1841, passed the antarctic circle near 178° E. long. On the 11th of January he discovered land near 70° 41' S. lat., 172° 36' E. long., and soon found that it was a continuous coast, trending southward and rising in mountain peaks to the height of from 9000 to 12,000 feet, and covered with snow. On the 12th of January he effected a landing, and took possession of it in the name of the queen. He continued his course along the shores to 78° 4' S. lat., tracing a coast-line of above 600 miles in length. In 77° 32' S. lat., 167° E. long., he saw a mountain about 12,400 feet above the sea-level, which sent forth abundance of fire and smoke, to which he gave the name of Mount Erebus. East of this volcano he observed an extinct crater of somewhat less elevation, which he called Mount Terror. At 78° 4' S. lat. his progress to the south was prevented by a barrier which presented a perpendicular face of at least 150 feet, along which he sailed eastward until he attained 168° 37' W. long. In the voyage of the following year he reached 6 miles farther south,

and was stopped by the barrier in 78° 11' S. lat., 161° 27' W. long., the surface extending southward having the appearance of high mountains covered with snow. In 1843 Captain Ross, after adding to previous discoveries in Louis Philippe's Land, sailed eastward between 60° and 70° S. lat., and then southward, between the routes of Bellingshausen and Weddell, to 71° 30' S. lat., 14° 51' W. long., without any appearance of land.

The discoverers of these new countries have only in a very few cases been able to effect a landing, the coasts being skirted with a bank of either solid or broken ice, which generally extends from five to ten miles, and in some places to twenty miles, from the shore. The land is elevated, and even mountainous, at no great distance from the shores. Dumont D'Urville estimates the average elevation of the mountains in Adélie Land at about 1500 feet. They are covered with snow, even in February, and might easily be mistaken for icebergs, if some rocks did not rise from them, to the perpendicular sides of which the snow cannot adhere. Between the mountain ridges valleys are observed, but they are filled with snow and ice nearly to the summits of the mountains, and these icy masses, being converted into glaciers, protrude into the sea. In summer enormous pieces are broken off from them, and to this cause are owing the numerous icebergs which render the navigation along these coasts more difficult and dangerous than in the most northern latitudes which have been visited by our whalers. Some portions of the coasts are of volcanic origin, especially those which lie south of the South Shetland Islands. Bellingshausen found an active volcano near 69° S. lat., and there is another on Palmer's Land. A volcano occurs also on Balleny Islands, which continually emits smoke.

No traces of vegetation have been discovered on any part of the more southern coasts, nor any quadrupeds. The birds were albatrosses, penguins, eaglets, Cape pigeons, king-birds, and noddies. Whales have been observed in several places, especially humpbacked and fin-backed whales, as also several kinds of seals. On Cockburn Island, in Louis Philippe's Land, there were found nineteen species of plants, comprising mosses, algae, and lichens, seven of the species being peculiar to the island.

POLLENZA. [MALLORCA.]

POLPERRO. [CORNWALL.]

POLTA'VA, or PULTAVA, a government in European Russia, lying between 48° 48' and 51° 4' N. lat., 30° 25' and 36° E. long., is bounded N. by Tschernigov, E. by Kurak and Charkov, S. by Ekaterinoslav Kherson, and W. by Kiev. The area is about 18,973 square miles. The population in 1846 was 1,783,800.

The surface is one continuous plain, with the exception of some elevations along the elevated banks of the Dnieper and some other rivers. The soil consists of a thick layer of black mould on a basis of clay and sand; it is either arable land or rich meadows; the forests are few and inconsiderable. The heaths are covered with nutritious grass; those where furze and broom predominate are common only in the south-east part of the government. The principal river, towards which the whole country slopes, is the Dnieper, which forms the western boundary, and is everywhere navigable. Its chief tributaries are the Trubesch and the Sula, with the Udai coming from Tschernigov, the Psiol and the Worakla from the Ukraine, and the Orul, which forms for some distance the southern boundary. The Sula and Psiol are navigable in the spring, are free from rocks, and flow through a rich country. There is no considerable lake in this government. The climate is mild; in winter however, when the cold north winds sweep over the open plains, the cold is severe. The summer is very hot. Little rain falls in the summer.

Of all the provinces of Little Russia, Poltava is the most fertile and the best cultivated. The grains chiefly cultivated are rye, barley, and oats, then wheat, buckwheat, Egyptian barley, and millet. Peas, lentils, rapeseed, linseed, and tobacco are also cultivated. All kinds of vegetables known in Russia thrive; fruits abound; from cherries, plums, melons, and berries of various kinds, liqueurs are manufactured, and excellent preserves made. On the Dnieper the inhabitants use the reeds growing on its banks for thatch and for fuel; in the interior they burn cow-dung and straw.

The steppes are covered with rich pastures, and it is said that the climate is so favourable that the cattle remain in the open air all the year round. In these steppes the magnificent ox of the Ukraine attains its extraordinary size; horses are bred in great numbers; and the Russian sheep appear in large flocks. The breed of sheep has been greatly improved by the importation of Merinos. The breeding of swine is not much attended to; bees are common, and many farmers have above 100 hives. Common poultry is abundant; there are likewise blue Caspian or Chinese geese and Persian ducks. Hares and partridges are abundant. The Dnieper and other rivers abound in fish. The Dnieper furnishes the *Silurus Glanis*, of the bladders of which glue is made, and the dried skin is used as a substitute for window-glass. The country is periodically infested by immense swarms of locusts; gad-flies and a kind of musquito are very troublesome. Potters' clay, brick-clay, lime, chalk, and saltpetre are found

in the government. The inhabitants manufacture articles of various kinds for domestic use; it is only of their fine liqueurs and preserved fruits that there is a surplus for exportation. The distilleries of brandy are considerable. Large quantities of corn are exported to Odessa. The chief articles of export are corn, flour, groats, brandy, linseed oil, hemp, flax, tobacco, honey, wax, wool, tallow, butter, horses, oxen, preserved fruit, and liqueurs.

The most important trading towns are Poltava and Kremmentschuk. There are not more than seven or eight towns in this government, in addition to the capitals of the fifteen circles; but the number of villages is very large, and though, for want of timber, the buildings are mostly of clay, they are kept very clean, both within and without; and the villages, being surrounded with orchards and gardens, have a cheerful appearance.

Poltava, the capital of the government, is situated in 49° 30' N. lat., 34° 15' E. long., near the confluence of the rivers Poltawka and Worakla. The population in 1842 was 16,000. The town is built of wood, but the streets are wide and straight, and in the centre there is a good square surrounded with stone houses, and in the middle of it a handsome monument, of granite, in honour of Peter the Great. It is surrounded by a rampart. This town made a vigorous resistance to Charles XII., which led to the battle of Poltava, in which the Swedes were totally defeated, and Charles obliged to seek refuge in Turkey. A fine obelisk is erected on the field of battle, near which divine service is performed annually in commemoration of this victory. Poltava has 10 churches (including the cathedral), a convent, a gymnasium, and a school. The inhabitants have considerable distilleries and tanneries, and carry on an extensive trade in the produce of the country. The town is surrounded with vast cherry-orchards, from the fruit of which a very strong ardent spirit is distilled. There are four annual fairs. In the vicinity there are extensive saltpetre works.

Among the chief towns are the following:—*Mirgorod*, on the Khorol, which has about 7500 inhabitants, and great horse-fairs. *Lubny* and *Lokhwiza*, both on the Sula, have each a population of about 6000. *Pereaslavl*, at the confluence of the Alta and the Trubesch, has a great trade in cattle and corn, and 8000 inhabitants. *Kremmentschuk*, a well-built town, at the confluence of the Kaganlik and the Dnieper, has a considerable trade and a wool-fair, and 18,000 inhabitants. Its liqueurs and preserved fruits are very excellent, and there are manufactures of nitre, soap, and refined sugar. The Dnieper is here crossed by a bridge of boats. *Kobijaki*, on the Worakla, has a population of 7000. Part of the former fortified lines of the Ukraine traverses the south-east of the government of Poltava.

POLYNESIA (the name is formed from two Greek words, signifying 'many islands'), comprises those countless islands and groups of islands that lie in the Pacific Ocean, to the east of the Philippines, Moluccas, and Australia, and extend to within a few degrees of the western coast of America. The large islands and the groups of smaller islands comprehended under the name are merely enumerated here, as a particular notice of the more important is given under their separate heads. South of the equator are Papua, the Admiralty Islands, New Ireland, with New Hanover, New Britain, Louisiade, New Georgia Archipelago, Queen Charlotte Islands, New Hebrides, New Caledonia, Fiji Islands, Friendly Islands, Navigator's Islands, Society Islands, Marquesas Islands, Paamuto Islands, and the isolated Easter Islands; to which are to be added, south of the southern tropic, Pitcairn's Island, Norfolk Island, and the islands of New Zealand. North of the equator are the Pelew Islands, the New Philippines, the Ladrões, the Ralick, the Radack, and the Sandwich Islands. It will be seen that Polynesia thus comprises a part only of what is expressed by the more general term OCEANIA, before explained.

POMERANIA (*Pommern*), a province of Prussia, is situated between 52° and 54° N. lat., 12° 30' and 18° E. long. It is bounded N. by the Baltic, E. by West Prussia, S. by Brandenburg, and W. by Mecklenburg. It is a long tract of coast, extending 200 miles along the Baltic, and varying in breadth from 30 to 80 miles. The area is 12,153 square miles. The population in 1852 amounted to 1,253,904, of whom 1,232,376 were Protestants of various sects; 10,912 Catholics; 26 of the Greek Church; 156 Mennonites; and 10,434 Jews. The province is divided into the three governments of CÖSLIN, STETTIN, and STRALSUND.

Pomerania is one of the lowest and flattest countries in Germany; only a few hills of a moderate height break its continuous level. The coasts are defended by dykes. The soil consists of sand, mixed in some places with clay. The province is crossed in its broadest part by the Oder, which, flowing through a marshy tract, divides into many arms or channels, one of which, the great Regelitz, forms, towards its mouth, the Great Dammer Lake, and, together with the main stream, falls into the extensive inland water, the FRISCHES-HAFF. The two islands of Usedom and Wollin separate the Haff from the Baltic, with which it is connected by three outlets. The other rivers of Pomerania are the Uker, Peene, and Ilna. There are many small lakes; that of Madine, which is celebrated for its lampreys, is one of the largest.

The climate of Pomerania is cold, and the weather is changeable; storms on the coast are not uncommon. The natural productions of the country are—horses, horned cattle, sheep, goats, swine, small game, domestic poultry (especially geese), sea and river fish, and bees; corn, peas, and beans, potatoes, fruit, timber, flax, and tobacco; alum,

bog-iron, salt, turf, and amber. The Pomeranian forests are very extensive and productive. The chief manufactures are linen and woollen stuffs, iron, and glass-ware, leather, beer, and spirits. Ship-building is carried on in the coast towns. The principal branches of industry however are agriculture and cattle breeding. The salmon and sturgeon fisheries are productive. Smoked geese are largely exported. The trade of this province in corn is very important.

The inhabitants are by descent partly Slavonians and partly Germans. The Slavonian language is still spoken in the north-east of the province. The nobles are numerous, chiefly consisting of German families who have settled here since the 12th century. The vassalage of the peasants was abolished by Frederick William III.

Pomerania was formerly a considerable part of the ancient kingdom of the Wends, or Vandals. From the year 1062 it had its own dukes. The Christian religion was introduced in the 12th century. The line of the dukes became extinct on the death of Boleslaus XIII. in 1637. On the death of the last Duke of Pomerania, the electoral House of Brandenburg, conformably to a family compact, claimed the whole country; but Pomerania having been occupied by the Swedes during the Thirty Years' War, Prussia was obliged to be content, at the peace of Westphalia, with Further Pomerania (to the east of the Oder), leaving Sweden in possession of Hither Pomerania, with the island of Rügen. After the death of Charles XII., by the treaty of Stockholm in 1720, the southern part of Pomerania and the islands of Usedom and Wollin were ceded to Frederick William I., king of Prussia. Sweden ceded her part of Pomerania to Denmark as a compensation for Norway. About a seventh part of Pomerania, forming the western part of the country, was still held by the Swedes and was called Swedish Pomerania. At the general settlement of the continental states in 1814, and finally by a convention dated June 4, 1815, Denmark gave Swedish Pomerania to Prussia in exchange for the duchy of Lauenburg (which had been received from Hanover in exchange for East Friesland) and a large sum of money.

POMONA. [ORKNEY ISLANDS.]

POMPADOUR. [CORRÈZE.]

POMPEII, an ancient town of Campania, situated about 13 miles S.E. from Naples, in a plain at the foot of Vesuvius, through which runs the little river Sarno. The town appears to have been once close to the sea, and much resorted to as a bathing-place by the wealthy citizens of Rome. It is now nearly 2 miles from the sea in consequence of the physical changes which have taken place in the district. It stood on an eminence formed by a bed of lava, which seems to have been thrown up from the ground in this spot, and in several other places round the foot of Vesuvius, long before any of the eruptions recorded in history. Pompeii, as well as the neighbouring town of Herculanium, is said by Strabo (p. 247) to have been originally possessed by the Osci, and then by the Tyrseni and Pelasgi. It afterwards fell under the power of the Greek colonies of Cumæ and Parthenope, and lastly of the Samnites (about B.C. 440), who made themselves masters of this coast as far as the river Silarus. About 80 years later the inhabitants of Campania threw off the yoke of the Samnites, and placed themselves under the protection of Rome. In the second Punic war the Campanians joined Hannibal, but were severely punished for it by the Romans, who brought the country under subjection. In the Social War (B.C. 90) the Campanian towns revolted, and Pompeii, among them, joined the Marsian Confederacy. A fearful earthquake threw down a great part of Pompeii, A.D. 63. In the year A.D. 79, in the month of August, the first recorded eruption of Vesuvius took place, which is well known from the letter of Pliny the Younger, whose uncle lost his life on the occasion. In this eruption Pompeii was buried under showers of stones, cinders, and ashes, which in course of time became a bed of earth, and corn was sown and the vine was planted above the buried town, whose existence was forgotten until 1689, when the ruins protruding above the ground were first noticed. In 1755 the excavations began. They have been continued at intervals, and are still being carried on under the superintendence of the Neapolitan government. About a fourth part of the city along the western side of the walls has been excavated and cleared of the rubbish. This portion, which appears to have been the finest part of the town, contains about eighty houses and numerous small shops, two theatres, a basilica, nine temples, three forums, the amphitheatre, the baths, the prison, and other public buildings of less note. The city was anciently surrounded by walls, of which the greater portion has been traced, including six gates and twelve towers. The walls had a parapet on each side. The circuit of the walls is nearly 2 miles, and the area within measures about 161 acres. There were however suburbs, one of which, at the north-western or Herculanium gate, is partly excavated, and is called the street of tombs, from a number of handsome tombs which line the road leading to the town. The suburban villa, called the villa of Diomedes, is in this quarter. On entering the gate the visitor finds himself in a long tortuous street leading to the great forum. To the left of this street is the house called that of Sallust, which occupies a square of about 40 yards; and near it is the house of Pansa, which, with its court and garden, is about 100 yards long by 40 yards wide. Nearer to the forum are the baths, in very good preservation, which appear to have been finished a short time before the destruction of the town. Upon entering the forum the spectator finds himself in a

large oblong area, about 120 yards long and 40 yards wide, surrounded by columns, pedestals which once supported statues, the ruins of temples, triumphal arches, and other public buildings. Around the west, south, and east sides there runs a Grecian Doric colonnade, some of the columns of which are standing; they are 2 feet 3 inches in diameter, and 12 feet in height; the interval between them is 6 feet 10 inches. At the north end of the forum stand the ruins of a building, which has been called the temple of Jupiter, 120 feet long and 43 feet wide: when entire, it must have been 60 feet high. The columns are of the Corinthian order, and 3 feet 8 inches in diameter. On the west side of the forum is the temple of Venus, which stood in an open area surrounded by a wall and portico. Beyond it, to the south, is the basilica, or court of justice, the largest building in Pompeii, 220 feet long and 80 feet wide: the lateral walls remain, but the roof and upper gallery have fallen in. On the eastern side of the forum, towards its northern end, is the Pantheon, so called from 12 pedestals placed in a circle round an altar in the centre of an extensive area.

The other public buildings of Pompeii which have been excavated are the two theatres, the larger of which is capable of containing about 5000 persons; the temple of Hercules, which is the oldest building in the town, and the amphitheatre. The latter, which is at the eastern extremity of the town, separate from the other excavated parts, is 430 feet long and 335 feet broad, and is estimated to have been capable of accommodating 10,000 persons.

A description of these buildings is given in the work entitled 'Pompeii,' in the 'Library of Entertaining Knowledge,' and in the elaborate works of Masoia, Sir William Gell, and Donaldson. The numerous statues, medals, and other moveable antiquities found at Pompeii have been deposited in the Royal Museum of Naples, and are described in the work entitled 'Museo Borbonico,' published at Naples. An interesting view of the character of the architecture and antiquities of Pompeii is presented in the Pompeian Court in the Crystal Palace, Sydenham, and the descriptions and plans given in the 'Official Handbook' by Mr. G. Scharf, illustrate the subject in a very satisfactory manner.

POMPTINE or PONTINE MARSHES is the name of a low marshy plain in the Papal State, about 24 miles long from north-west to south-east, and varying from 8 to 10 miles in breadth. The plain is bounded E. by the Monti Lepini; W. by a range of downs from 30 to 60 feet high, which begin on the south at Mount Circeo, and thence run to the northwards parallel to and at the distance of from two to three miles from the coast, leaving a belt of land between them and the sea, which is partly covered by forests and partly occupied by lagoons. This belt has no water communication with the basin of the Pomptine Marshes. From Mount Circeo eastward to Terracina another ridge of downs of much smaller dimensions runs close to the sea-coast, and is cut through by the canal called Portatore di Badino, which is the great outlet of the waters of the Pomptine Marshes. On the north and north-west the Pomptine Marshes border on the dry plains of Cisterna and Sermoneta. The greatest depression is towards the south-east extremity, where an extent of about three or four square miles is below the level of the sea. The rivers which flow into this basin are the Toppia, Ninfa, Cavata, Ufente, Amazeno, and Pedicota.

There is every appearance that the basin of the Pomptine Marshes was once a gulf of the sea, which has been gradually filled up by alluvium from the mountains. Within the historical period it was a fertile district containing towns and a considerable population. It was occupied by the Volsci, one of whose towns, *Suessa-Pometia* (destroyed by Tarquinius Superbus), was situated in it, and is supposed to have given its name to the whole region. Both under the Republic and the Empire of Rome great works were undertaken for the draining of the Pomptine Marshes; and the Appian Road traversed part of them to Terracina. Something was done towards draining them by the popes, from Boniface VIII. to Pius VI., and by the French during their occupation of the Roman States. Since that time all that has been done for the Pomptine Marshes has been to maintain the drainage in the state in which Pius VI. left it, by keeping the canals clear and the dykes in repair. The greater part of the plain is covered with rich pastures, in which are numerous herds of buffaloes and other horned cattle, and other parts of it are sown with rice, wheat, and Indian corn, and afford rich crops. In the spring, before the great heat renders the atmosphere unwholesome, it has the appearance of a most delightful region. But, except the post stations along the high road, and some scattered huts here and there, there is no permanent population throughout the whole of the plain.

PONANY. [HINDUSTAN.]

PONCIN. [AIN.]

PONDICHERRY, a considerable town on the sea-coast of the Carnatic, in Hindustan, the principal seat of the French power in the East Indies, is situated in 11° 57' N. lat., 79° 54' E. long., 85 miles S. by W. from Madras.

The first commercial expedition of the French which succeeded in reaching the East Indies by sea was composed of two vessels fitted out from a port in Bretagne (A.D. 1601); but the vessels were wrecked on the Maldiv Islands before reaching their ultimate destination, and their commander returned ten years afterwards to France. In 1616, 1619, and 1633, attempts were made to form settlements in Java and Madagascar, but these attempts did not succeed. In 1664 Colbert

presented to Louis XIV. the plan of an India Company, which received the royal sanction. The new Company turned their attention to the establishment of factories in Hindustan, and fixed the principal one at Surat on the coast of Gujerat (180 or 140 miles north of Bombay), at that time one of the largest and most commercial cities of Hindustan. Leaving Surat they attempted to form an independent settlement at Trincomalee on the north side of Ceylon (1672). From this place they were very soon driven by the Dutch, and sailing to the coast of the Carnatic, they took by assault the Portuguese settlement of St. Thomé, or Malipoor, not far from Madras, from which they were again expelled (1674), and the wreck of this unfortunate expedition took refuge at Pondicherry, a little town on the same coast, which they had purchased two years before (1672) of the king of Visiapor, or Bejapoor. [BEJAPOR.] Pondicherry was taken by the Dutch (1693), but restored at the peace of Ryswick (1697), with the fortifications greatly improved. The town at this period owed much to the wisdom and probity of M. Martin, its subsequent governor. Its defences were subsequently further augmented, and Dumas, who was sent out as governor, obtained from the court of Delhi the permission to coin money, and the cession of the territory of Karikal in the district of Tanjore. In 1748 Pondicherry was attacked by the English with a considerable fleet and army under Admiral Boscawen and Major Lawrence; but the siege was raised after several days, and the English retreated.

In 1757 the war in the Carnatic was renewed: in 1758 the Count de Lally arrived at Pondicherry with strong reinforcements from France, and immediately attacked Fort St. David, about 16 miles south of that town, which he took by capitulation, and forced the English to abandon Devicottah, another of their posts. He next attacked the king of Tanjore, but unsuccessfully. Arcot and the black town of Madras were indeed taken, but Fort St. George (the fort of Madras) was relieved by an English fleet (1759), and Lally, with an exhausted commissariat and an empty pay-chest, retreated to Pondicherry. Subsequent hostilities were entirely to the disadvantage of the French. The English laid siege to Pondicherry, which surrendered early next year, and was subsequently demolished. The posts which the French retained in the Carnatic followed its example; and Lally returned to Europe to perish by an iniquitous sentence on the scaffold. At the peace of 1763 the French possessions in the Carnatic were restored. Subsequently Pondicherry was several times taken and retaken by French and English. In 1814 it was restored to France.

Pondicherry is built in a sandy plain not far from the shore, and consists of two parts, the white town and the black town. The white town is handsome; the streets are built with remarkable regularity, intersecting each other at right angles, and are of a uniform width. The houses are tolerably high, and have flat roofs; they are covered with stucco, white or yellow, and are adorned with fore courts or gardens. In the centre of the city is a spacious square planted with trees and laid out in walks, and open on the east side to the sea. The black town lies to the south of the white town, from which it is separated by a ditch or canal, with trees planted along the bank: it is laid out almost as regularly as the European quarter, but the houses are for the most part mere huts. The French are debarred by treaty from restoring the fortifications, or from maintaining any force beyond what is necessary for the purposes of police. The government-house is a handsome building; there are also a bazaar, two churches, and a residence for the Catholic bishop and his clergy. The grand pagoda in the black town is a building of vast size and grotesque architecture.

The population of the town and the district attached to it is about 80,000. There is no harbour, but a tolerable roadstead; a lighthouse was erected in 1836. Indigo, sugar-cane, millet, dye and aromatic woods, and mulberry-trees are cultivated in the neighbourhood. The exports consist of rice, drugs, sugar, indigo, and blue linens. The imports are lace, and articles of dress, furniture, jewellery, and books. There are two courts of justice, a mint, a college, schools for whites and for blacks, a botanic garden, a mont-de-piété, and several charitable institutions.

PONT-Y-POOL, Monmouthshire, a market-town and the seat of a Poor-Law Union, in the parish of Trevehan, stands on a bold cliff on

the right bank of the Afon Llwyd river, in 51° 42' N. lat., 8° 2' W. long., distant 19 miles S.W. by W. from Monmouth, 149 miles W. by N. from London by road, and 167 miles by the Great Western and South Wales railways. The population of the town of Pont-y-Pool in 1851 was 3708. The living of Trevehan is a perpetual curacy in the archdeaconry of Monmouth and diocese of Llandaff. Pont-y-Pool Poor-Law Union contains 22 parishes and townships, with an area of 51,429 acres, and a population in 1851 of 27,993.

Pont-y-Pool depends chiefly on the employment afforded by the coal and iron-mines in the vicinity, and the iron and tin manufactures. The town contains many well-built houses and shops. It is partially lighted with gas, and well supplied with water. The parish church of Trevehan, about a mile from Pont-y-Pool, is a very handsome structure in the early English style. In the parish are four churches, several school-rooms licensed for public worship, chapels for Wesleyan, Welsh, and Primitive Methodists, Independents, and Roman Catholics; National and Infant schools; a reading-room; and a savings bank. A county court is held. Markets are held on Wednesday and Saturday; fairs on April 2nd and 22nd, July 5th, and October 10th.

PONTEFRAC, West Riding of Yorkshire, a municipal and parliamentary borough and market-town, in the parish of Pontefract, is situated near the confluence of the rivers Aire and Calder, in 53° 42' N. lat., 1° 19' W. long., distant 24 miles S.S.W. from York, 177 miles N.N.W. from London by road, and 193 miles by the Great Northern railway. The population of the municipal borough of Pontefract in 1851 was 5106; that of the parliamentary borough was 11,515. The borough is governed by 4 aldermen and 12 councillors, of whom one is mayor, and returns two members to the Imperial Parliament. The living is a vicarage in the archdeaconry and diocese of York.

Pontefract is a town of considerable historical importance. It was called Kirkby in the time of the Saxons. After the Conquest, Ilbert de Lacy received a grant of the place, and built here a very strong castle. The vast possessions of De Lacy, who was a great favourite with William, passed about 1310 by marriage to Thomas, Earl of Lancaster, uncle to Edward II. When the Earl of Lancaster took part with the barons he was taken prisoner and brought to Pontefract Castle, where he was soon after beheaded. Pontefract Castle was subsequently the scene of Richard II.'s imprisonment and death, and of several other incidents of importance in English history. After the execution of Charles I., Pontefract Castle was dismantled by order of the parliament, and the valuable materials were sold. At the present day little even of its ruins remains: the area is now chiefly occupied by gardens and a quarry of filtering-stones.

Pontefract possesses several spacious streets, which are well-paved, cleansed, lighted with gas, and supplied with water. The parish church is small and plain. The more ancient church of All Saints, the original parish church, is cruciform, with a handsome tower in the middle. It is in the early English style, and has been partially restored and made available for public worship. The Roman Catholics, Independents, Wesleyan and Primitive Methodists, and Quakers have places of worship. The town has a subscription library, a mechanics library, a public news-room, a savings bank, and a dispensary. The Free Grammar school was established in the reign of Edward VI.; it has an interest in several exhibitions and scholarships at Oxford; its income from endowment is 50*l.* a year: the number of scholars in 1852 was 19. There are also National and British schools. The town-hall is a handsome building, erected on the site of the old moot-hall, at the joint expense of the county and the corporation; the borough and petty sessions are held in it. The spring quarter sessions are held in the court-house, a commodious modern building, erected at the expense of the West Riding. A county court is held. The market is on Saturday, and there are eight annual fairs for the sale of cattle. The town is chiefly celebrated for its extensive gardens, nurseries, and liquorice-grounds: the soil is rich and deep. Several coal mines, brick- and tile-works, potteries, flour-mills, iron- and brass-foundries, hat-manufactories, and breweries afford employment.

PONTOISE. [SEINE-ET-OISE.]

PONTREMOLI. [PARMA.]

PONTS-DE-CÉ. [MAINE-ET-LOIRE.]

PONTUS, a country of Asia Minor, derived its name from the expression 'on the Pontus Euxinus' (*ἡ Πόντος*), and was used rather as a political than a geographical division of the country. Under Mithridates the Great it included the whole of Paphlagonia and part of Bithynia; but the name is usually applied to the country between Colchis and the river Halys, bounded W. by Paphlagonia, S. by Cappadocia, and E. by Colchis. The boundary between Colchis and Pontus is differently given by different writers; Ptolemy places it as far as the Phasis, and Strabo at Trapezus. (Strabo, xii, p. 548.) The whole is now included and described under ANATOLIA.

Pontus was first erected into a separate kingdom by Ariobarzanes I., about the beginning of the 4th century before the Christian era. In the troubles which followed the death of Alexander the Great, Mithridates II., one of his lineal successors, was enabled to extend greatly his paternal dominions, whence he is frequently called the founder of the kingdom of Pontus. Under Mithridates VI. a fierce war was maintained for a considerable time with the Romans, which was ended B.C. 63 by the conquest of Pontus and the death of Mithridates. A son of Mithridates however, Pharnaces II., was suffered to hold, as an ally of the Romans, the kingdom of Bosphorus, while the remainder of the kingdom was annexed to the provinces of Bithynia and Galatia. In the civil war Pharnaces sided with Pompey, was defeated by Caesar, and murdered after his escape from the battle in B.C. 47. Pontus was subsequently reduced to the form of a province, and afterwards subjected to various divisions into districts. The history of the kings of Pontus is given in an Appendix to the third volume of Clinton's 'Fasti Hellenici.'

The chief towns on the coast of Pontus, proceeding from east to west, were Trapezus [TRAPESUND], a colony of the Greek colony Sinópe; Céræus (Kheræoun), afterwards called Pharnacia, from Pharnaces, who was one of the kings of Pontus. Pharnacia is said to be the place from which L. Lucullus brought the cherry to Europe; Cotýra, also a colony of Sinópe; Themiscyra, and Amisus (Samsoun), a Greek colony and a flourishing city when it was besieged by L. Lucullus. In the interior the chief towns were Amasia [AMASIEE], the birth-place of Strabo; and Comána, called Pontica, to distinguish it from a town of the same name in Cappadocia. Comana had a great temple dedicated to the goddess Ma, supposed to be an equivalent of the Roman Bellona, to which were attached several thousand slaves, most of whom were females: the office of high-priest of this temple was a place of honour and emolument. (Strabo, pp. 557-559, ed. Casaubon.) Zela and Necessarea were also considerable places; at Zela was an ancient temple to the goddess Anaitis, the chief-priest of which was also sovereign of the town.

PONTYPOOL. [PONT-Y-POOL.]

PONZA, an island in the Mediterranean Sea, off the coast of Naples, 20 miles S. by W. of Mount Circeo, and 35 miles S.W. of Gaeta. It is about 5 miles long, from 1 to 2 miles wide, and in shape like a crescent, the concave side of which faces the mainland of Italy. On the same side is the harbour, which is a natural basin with a narrow entrance, surrounded by high ground, and perfectly safe in all weathers. The island is one continuous rock, mostly barren, but affording some pasture for cattle. Round the harbour are ranged some buildings, consisting of a castle, which is used as a state prison by the government of Naples, some other buildings, houses, and huts occupied by persons attached to the garrison and by fishermen. The Roman name of the island was Pontia. About 4 miles west of Ponza is the smaller island of *Palmarola*, or *Palmoria*, and 2 miles north-east of Ponza is an uninhabited rock called *Zannona*. About 24 miles south-east of Ponza, and halfway between it and the island of Ischia, is the island of *Vandotene*, the ancient *Pandataria*, whither Julia, the daughter of Augustus, and afterwards Octavia, the wife of Nero, were banished. Vandotene is about 2 miles long, and is inhabited by sailors and fishermen. East of Vandotene, and separated from it by a narrow channel, is the smaller island of *Santo Stefano*. The whole group of these islands is of volcanic formation.

POOL, or WELSHPOOL, Montgomeryshire, a market-town, and municipal and parliamentary borough, in the parish of Pool, and conjointly with MONTGOMERY the seat of a Poor-Law Union, is situated in a hollow near the left bank of the river Severn, in 52° 39' N. lat., 3° 8' W. long., 10 miles N. from Montgomery, and 171 miles N.W. by W. from London. The population of the parliamentary borough of Welshpool in 1851 was 4484; of the municipal borough, 6564. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor, and is contributory to the Montgomery district of boroughs in returning one member to the Imperial Parliament. The living is a vicarage in the archdeaconry of Montgomery and diocese of St. Asaph.

Welshpool (so called to distinguish it from the town of Poole in Dorsetshire) derives its name from a pool or lake called Llyn Du, near which it is situated. Cadwgan, a powerful chieftain of the district of Powys, built a castle here in 1109, which was dismantled in 1223 by the Prince of North Wales. It was afterwards restored, and received its present name of Powys Castle.

The town is watered by two brooks, which flow into the Severn; it is partially paved and lighted with gas. It consists of two parts, Pool Town and Welsh Town. The town- and county-hall has a space beneath for a corn-market. The church, which is spacious, was rebuilt, with the exception of the chancel and the tower, in the latter half of the last century, and has been since enlarged. A new church of Anglo-Norman character, erected by subscription, is on high ground close to Powys Park. Independents, Baptists, and other Dissenters have places of worship, and there are National schools and a savings bank. Some flannel is manufactured. Monday is the weekly market-day for provisions; the market for Welsh flannels is held on alternate Mondays. Seven fairs are held in the course of the year. The assizes and a county court are held in Welshpool. The Severn is navigable for barges to within a mile of the town. The Montgomeryshire Canal passes on the eastern side.

Powys Castle, the seat of the Clive family, stands on a rocky elevation in a spacious and well-wooded park, on the south side of Welshpool town. It has of late years been to a considerable extent improved and its different parts made to harmonise. In a gallery, 117 feet long by 90 feet broad, is a collection of about 70 paintings by the first masters.

POOLE, Dorsetshire, a sea-port, a market-town, a municipal and parliamentary borough, a county in itself, and the seat of a Poor-Law Union, is situated on the south coast, in 50° 42' N. lat., 1° 59' W. long., distant 31 miles E. from Dorchester, 106 miles S.W. from London by road, and 123 miles by the South-Western railway. The population of the borough of Poole in 1851 was 9255. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor, and returns two members to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry of Dorset and diocese of Salisbury. Poole Poor-Law Union contains 8 parishes and townships, with an area of 27,023 acres, and a population in 1851 of 12,890.

Poole is supposed to have been a port in the time of the Romans, as traces of one of their roads appear between it and Winchester. Its earliest charter is of the time of Richard I. Edward III. made it a magazine for his wars in France. Elizabeth constituted the town a county in itself. During the civil war it was held for the Parliament. In the reign of Charles II. the fortifications were destroyed.

The town occupies a peninsula on the north side of Poole Harbour, which is noticed under DORSETSHIRE. The modern part of the town is well built. The streets are lighted with gas and paved, and the town is well supplied with water. It contains the parish church of St. James, which was rebuilt of Purbeck stone in 1812; a chapel of ease; places of worship for Independents, Baptists, Wesleyan and Primitive Methodists, Roman Catholics, Unitarians, and Quakers; a Free Grammar school; a British and a National school; a public library, erected in 1880 by the members for the borough; a savings bank; and two or three well-endowed almshouses. The other public buildings are the custom-house; the guildhall, which was built in the middle of the last century; the town-hall; the king's-hall, or wool-house, an edifice of some antiquity; the jail; and the Union work-house. The peninsula is lined with wide quays and extensive warehouses, close to which vessels of light burden lie afloat at low water. Ship-building is carried on, particularly the construction of sailing yachts. Sail-cloth, ropes, and twines are extensively manufactured. From a bank near the mouth of the harbour large quantities of oysters are taken to be fattened in the creeks of Essex and Kent. There is an important fishery of plaice and herrings. Corn is largely exported to London, and considerable quantities of Purbeck clay are shipped for use in the Staffordshire potteries. The number and tonnage of vessels registered as belonging to the port of Poole on December 31st 1853, were as follows:—Under 50 tons, 33 sailing vessels of 871 tons, and one steam-vessel of 22 tons; above 50 tons, 75 sailing vessels, of 13,429 tons. During 1853 there entered the port, in the coasting trade, 620 vessels of 48,388 tons, and there cleared 797, of 33,284 tons; in the colonial and foreign trade there entered 149 vessels of 15,418 tons, and cleared 123 vessels of 14,592 tons. Quarter-sessions and a county court are held in the town. Fairs, continuing eight days each, are held commencing May 1st and November 2nd. Monday and Thursday are the market-days. The neighbourhood of Poole is remarkable for earthworks, barrows, and other primeval or early antiquities.

PORTADOWN, County Armagh, Ireland, a market-town, is situated on the Upper Bann River, in 54° 26' N. lat., 6° 27' W. long., distant 10 miles N.E. by E. from Armagh, 84 miles N. by W. from Dublin by road, and 89 miles by the Dublin and Drogheda and Dublin

and Belfast Junction railways. The population in 1851 was 3091. The town is well-built and paved. It contains the parish church, a handsome building in the early English style; a Presbyterian and two Methodist chapels; schools endowed by the Duke of Manchester, proprietor of the town; a loan-fund; a lending-library; a commodious market-house; and a dispensary. The manufacture of linen, lawn, cambric, and sheeting, and the weaving of linen for the Belfast merchants, give some employment. Large sales of cattle, pork, and agricultural produce are made at the weekly market. The river is navigable for vessels of 60 tons' burden. A new bridge, erected at a cost of about 10,000*l.*, has much improved the appearance of the place. Petty sessions are held monthly. Fairs are held on Easter Monday, Whit-Monday, November 3rd, and on the third Saturday of every month. Saturday is the market-day.

PORTALEGRE. [ALEMTEJO.]

PORTARLINGTON, Ireland, a market-town and parliamentary borough, chiefly in Queen's and partly in King's County, is situated in 53° 9' N. lat., 7° 12' W. long., 9½ miles N.N.E. from Maryborough, and 41¼ miles S.S.W. from Dublin by the Great Southern and Western railway. The population in 1851 was 2728. The borough returns one member to the Imperial Parliament. The town took the name of its founder Lord Arlington, and was called a port because built at a landing-place on the river. A number of French and Flemish families settled in the place. The possessions were subsequently bestowed by William III. on the Earl of Galway, who introduced other refugee families, built a church, endowed two schools, and otherwise improved the town. The town and estate were afterwards purchased by the Dawson family, who received the title of Earl of Portarlington. The town consists mainly of a long street extending in a northerly direction from the canal to a square near the river, where it turns westward at a right angle, and is continued by a bridge over the Barrow to a considerable length in King's County. The streets are paved, and the place is well supplied with water. The principal buildings are the English church, a handsome structure, with a spire; the French church; the Roman Catholic chapel, a spacious building with a tower and spire 140 feet high; a chapel for Methodists; two National schools; two Free schools; the market-house; a dispensary; and some superior schools, at one of which the Duke of Wellington and his brother the Marquis of Wellesley received part of their education. The town possesses a savings bank. Soap and candles are manufactured. Fairs are held eight times a year. Wednesday and Saturday are the market-days. Ems Park, the seat of the Earl of Portarlington, is 3 miles S.E. from the town.

PORTSEA ISLAND, Hampshire, the peninsula on which are situated the towns of Portsmouth and Portsea, and which gives name to a Poor-Law Union. The island is described under PORTSMOUTH. Portsea Island Poor-Law Union contains the parishes of Portsmouth and Portsea, with an area of 7063 acres, and a population in 1851 of 72,096.

PORTSMOUTH, Hampshire, a municipal and parliamentary borough, sea-port and market-town, is situated on the west side of Portsea Island, in 50° 48' N. lat., 1° 6' W. long., distant 28 miles S.S.E. from Winchester, 70 miles S.S.W. from London by road, and 94 miles by the South-Western railway. The population of the borough, which includes the parishes of Portsmouth and Portsea, was 72,096 in 1851. The borough is governed by 14 aldermen and 42 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry and diocese of Winchester.

Portsea Island lies in an inlet of the British Channel, which extends about 4 miles inland, and stretches nearly 16 miles eastward from the town of Fareham in Hampshire to the village of Fishbourne, near Chichester in Sussex. On the west side of Portsea Island is Portsmouth harbour, and on the east side Langston harbour, bounded by Hayling Island, beyond which are Emsworth channel and Chichester harbour, separated by the small island of Thorney. The approach to Portsmouth harbour is defended by Monckton Fort on the west, and Southsea Castle, situated at the southern extremity of Portsea Island, on the east. Within these points, which are two miles apart, the

entrance narrows to about 220 yards at Portsmouth point, where there are also strong defences on each side. The harbour then widens into a basin about a mile long, and from half a mile to three-quarters of a mile broad, beyond which it expands till it attains a breadth of about three miles on the northern shore of the inlet. It contains three small low islands, Whale, Pewit, and Horsea islands; and about a mile and a half from the entrance the main channel divides into three branches, leading respectively to Fareham, Porchester, and the north end of Portsea Island. First-rate men of war can enter the harbour and lie at anchor inside at all times of the tide. From the approach to the harbour, on the west side, a sand-bank, called the Spit, extends three miles south-eastward. Beyond it, within a range of buoys, and under shelter of the Isle of Wight, is the admirable roadstead of Spithead, where 1000 ships of the line may ride without inconvenience. On the coast of the Isle of Wight, near its eastern extremity, is St. Helen's Bay, a place of rendezvous for the navy. These roadsteads, with Emsworth channel, and Langston and Portsmouth harbours, are within the jurisdiction of the port of Portsmouth, which extends from the town of Emsworth at the head of Emsworth channel on the east, to the opening of Southampton water on the west.

The town of Portsmouth is situated at the entrance of the harbour, on the south-west point of the island. It is inclosed by bastioned ramparts with batteries of heavy ordnance, and surrounded by a deep moat, with extensive outworks. The walls are entered by four handsome gates, with drawbridges. The ramparts, which are planted with rows of elms, form an agreeable promenade nearly a mile in length. Three or four streets of a better class extend from north-east to south-west, crossing the others at right angles. On the north side of Portsmouth, and divided from it by the mill-dam creek, is its principal suburb Portsea. The town of Portsea and its dockyard, the grand naval arsenal of England, occupy a space called Portsmouth Common, on which at the commencement of last century there was only a single hovel. The town, which is now much more extensive than Portsmouth, is similarly fortified, and the defences of both towns unite, so as to inclose them within one complete fortress. Portsea contains some handsome terraces and crescents, and a well-built open space called St. George's-square. Both towns are lighted with gas, well-paved, and supplied with water by pipes from the neighbourhood of Portsdown-hill. On the east-side of Portsea is a suburb called Landport, consisting of a belt of houses, some of which are handsome; south from Landport is Somerstown, and between Somerstown and the sea is Southsea, a fashionable watering-place, which spreads eastward from Portsmouth, with some good villas and well-built terraces and squares. On this part of the beach a fine esplanade has been formed, and embellished with statues of Nelson and Wellington. The suburb of Kington lies towards the centre of the island, and that of Mile End at some distance north from Portsea.

The borough of Portsmouth contains twelve churches and chapels of the establishment. The church of St. Thomas, Portsmouth, is a spacious cruciform structure, built in the early English style, but corrupted by successive additions. At the west end is a tower 120 feet high, surmounted by a cupola and lantern. St. Mary's, the parish church of Portsea, is an ancient structure in the suburb of Kington, surrounded by one of the largest burial-grounds in the kingdom. The garrison chapel, on the Grand Parade, is a part of the ancient hospital of Domus Dei, fitted up for its present purpose. St. Paul's, Southsea, and All Saints, Mile End, are in the perpendicular style. The Baptists have eleven places of worship, the Independents six, the Wesleyan Methodists six, the Bible Christians two, and the Primitive Methodists, Plymouth Brethren, Roman Catholics, Unitarians, Mormons, and Jews have one each. The public schools are, two Grammar schools, four National, four British, an Infant and a Bethel school. There is a philosophical society in Portsmouth, with a hall and a museum of considerable extent; Portsea has an atheneum and mechanics institute with a library of 1500 volumes; and the Watt institute at Landport has a library of 550 volumes.

The other principal buildings in Portsmouth are, the governor's house, on the Grand Parade, originally part of Domus Dei hospital, the residence of the lieutenant-governor; the town-hall, the new county court, the new market-house, the theatre, the custom-house, the United Service club-house, the Four House barracks, and the Marine barracks on the south-west margin of the town, the Cambridge barracks on the east, the Colewort barracks on the north, the new barracks at the end of High-street, the almshouses, the jail, and house of correction. In Portsea are St. Paul's academy, the Beneficial Society's hall, a general hospital, a savings bank, and on Mile End road the Union workhouse, a female penitentiary, and the Portsmouth and Farlington water-works. At Landport are the Tipner and Hilses barracks, and near Southsea Castle is the laboratory of the Royal Marine Artillery. About two miles north from Portsmouth, between the London road and the harbour, is an extensive cemetery.

The Naval Dockyard at Portsea, the largest in the kingdom, covers an area of nearly 120 acres. It is separated from the town by a wall 14 feet high, and along the harbour it has a wharf-wall of nearly three-quarters of a mile in length. It includes the residences of the port-admiral, the admiral-superintendent, and other officers, the guard-house and pay office, a school for naval architecture, and a

chapel. Besides extensive storehouses for hemp, cordage, canvass, sails, blocks, masts, rigging, and other requisites for naval architecture and outfit, it contains a rope-work and sail-lofts, a smithery, an iron-mill, a copper-sheathing foundry, an anchor forge, with Nasmyth's huge steam-hammer, and the remarkable block-machinery invented by the late Sir Mark Brunel. Forty-four block-making machines, impelled by a steam-engine, are arranged in three sets for blocks of different sizes. Receiving the rough timber, they cut it up, shape, and bore it, and continue the process till the block is complete. In the centre of the wharf-wall is the entrance to the great basin, which has an area of 2½ acres, and four dry docks attached, with an additional dry dock on each side, all capable of receiving the largest vessels. There is besides a double-dock for frigates. For the building of vessels there are six slips, two for ships of the first class. The Victoria steam-basin, lately formed at the north end of the dockyard, is 3000 feet in length. A range of engineers' shops, provided with every mechanical aid, occupies the western side of the basin. Close to the dockyard on the south is the Gun-wharf, with various ranges of building for ordnance stores. Guns of every calibre, with immense pyramids of shot adapted to them, occupy a spacious area of 14 acres. An ornamental building, called the Small Arms Armoury, contains upwards of 20,000 stand of arms for sea service. The Royal Victualling Yard at Weovil, and Haslar Hospital for sick and wounded seamen, are noticed under Gosport. The harbour is crossed every half-hour by a floating steam-bridge, which plies between Gosport and a suburb called the Point on the west side of Portsmouth. A small bay called the Camber, extending between the Point and the Gun-wharf, forms the harbour for merchant shipping. It is lined by an excellent quay, at which large vessels load and unload. The Victoria and Albert piers, two handsome erections, afford additional accommodation. An inland navigation proceeding by the channel at the north end of Portsea Island to the Portsmouth and Arundel Canal, and continued by the Arun and Wey Junction Canal and the river Wey to the Thames, connects Portsmouth with London. The South Western railway, which has its terminus at Gosport, and the Brighton and South Coast railway, which has its terminus at Portsea, connect Portsmouth by land with the metropolis. A short line running along the northern margin of the harbour unites the two railways. Steam-packets ply several times a day between Portsmouth and the Isle of Wight, and there is a regular communication by steamers with London, Southampton, Plymouth, Liverpool, Dublin, and Havre. The trade of Portsmouth depends on the dockyard and other public establishments. Great numbers of persons, especially females, are employed in Portsea and Landport, in the manufacture of articles of outfit for seamen. There are extensive market-gardens in the neighbourhood.

In the town and suburbs are several large breweries. The coasting trade of the port is extensive. Coals are largely imported. Cattle and sheep are brought from the Isle of Wight and the west of England. Large quantities of corn and provisions are brought from Ireland. Eggs are imported from France. Timber and wine are the chief articles of foreign trade. The ships registered as belonging to the port in 1853 were:—Under 50 tons, 170 sailing-vessels of 4221 tons, and 4 steam-vessels of 142 tons; above 50 tons, 74 sailing-vessels of 8335 tons, and 3 steam-vessels of 180 tons. During 1853 there entered the port, in the coasting trade 1553 sailing-vessels of 116,019 tons, and 38 steam-vessels of 12,235 tons; there cleared 866 sailing-vessels of 29,253 tons, and 75 steam-vessels of 15,781 tons. In the colonial trade there entered 37 sailing-vessels of 6902 tons, and cleared 19 vessels of 3001 tons. In the foreign trade there entered 74 British vessels of 4140 tons, and 85 foreign vessels of 8285 tons; and there cleared 27 British vessels of 1848 tons, and 76 foreign vessels of 6305 tons. A three days' fair is held on Portsdown Hill in the month of July. The market-days are Tuesday, Thursday, and Saturday.

Besides the fortifications of the towns of Portsmouth and Portsea, the island of Portsea has strong defences. Southsea Castle, built by Henry VIII., and greatly strengthened in 1850, is mounted with heavy cannon. Beyond the castle are two forts named Lumps and Eastney, and on the extreme point of the island, commanding the entrance to Langston harbour, is Fort Cumberland, a very strong defence, commenced in 1746, but only brought into an efficient state in 1820. It receives 3000 men, and mounts 100 heavy guns. The approach to Portsmouth on the land side is defended by a strong line of fortification on Portsdown Hill, a long ridge lying north of the island; by lines carried along the bank of the channel which separates the island from the mainland; and by other works at Hilsa, four miles from the town.

The excellence of the harbour seems to have attracted the notice of the Romans, who had a station at Porchester, on the northern shore, where there are still Roman remains. [HAMPSHIRE.] Portsmouth was a naval station in the reign of John. In the time of Richard II. it was burned by the French. Fortifications begun by Edward IV. were completed by Henry VIII., in whose reign Portsmouth was the principal station of the English navy. In the reigns of Charles II., William III., and George III., the defences were very much extended. They have been of late largely added to and considerably strengthened, and are believed to be impregnable. The moats, which are deep and wide, can be filled from the sea.

PORTSMOUTH, U.S. [NEW HAMPSHIRE; OHIO.]
GEOG. DIV. VOL. IV.

PORTSOY. [BANFFSHIRE.]

PORTUGAL, KINGDOM OF, is the most westerly kingdom of Europe. It forms part of the Spanish Peninsula, and is not divided from Spain by any well-defined natural boundaries. Most of the great rivers of Portugal—the Minho, the Douro, the Tejo (Tagus), and the Guadiana—have their sources in Spain, and belong to Portugal only in the lower part of their basins. The Mondego, the Zezere, and the Sado are the only considerable rivers which have their sources and their whole courses within the limits of Portugal. Portugal is bounded N. by the Spanish province of Galicia; E. by the Spanish provinces of Leon, Estremadura, and Sevilla; and S. and W. by the Atlantic Ocean. The greatest length from north to south is about 350 miles; the average width from west to east is about 100 miles. The area is 35,189 square miles. The population in 1851 was 3,487,025. The political divisions, with the area and population of each, are as follows:—

Provinces.	Districts.	Area in Square Miles.	Population in 1851.	
Alemtejo . . .	{ Portalegre . . .	2,382	86,175	
	{ Evora . . .	2,609	88,617	
	{ Beja . . .	4,991	123,107	
		9,982	297,899	
Algarve . . .	Faro . . .	2,140	143,851	
Beira {	Beira Alta . . .	Viseu . . .	1,291	302,070
	Beira Baixa {	Guarda . . .	2,128	206,738
		Castello Branco . . .	2,474	139,042
	Douro . . .	Porto . . .	1,087	869,583
		Aveiro . . .	1,458	247,103
Coimbra . . .		1,327	261,656	
		9,765	1,526,390	
Entre Douro e Minho	{ Viana . . .	954	184,359	
	{ Braga . . .	1,086	297,969	
		2,040	482,328	
Estremadura . . .	{ Leiria . . .	1,312	140,114	
	{ Santarem . . .	2,315	161,342	
	{ Lisbon . . .	3,615	423,705	
		7,242	725,161	
Tras os Montes . . .	{ Bragança . . .	2,374	126,617	
	{ Villa Real . . .	1,646	184,779	
		4,020	311,396	
Total . . .		35,189	3,487,025	

In addition to the above political divisions, each of the sub-provinces, or districts, is subdivided into comarcas (or judiciary divisions), cancelhos (or communal divisions), and parishes, all of which are enumerated under the names of the respective provinces. The total number of comarcas is 111; of cancelhos, 379; of parishes, 3774.

Colonial Possessions.—The separation of Brazil from its connection with the mother-country deprived Portugal of its most important colony. The dependencies which it still retains are as follows:—The AZORES: area, 1145 square miles; population (1851), 234,044. MADEIRA, with Porto Santo: area, 334 square miles; population (1851), 108,439. CAPE VERD ISLANDS: area, 1642 square miles; population (1851), 86,640. The islands of *Santo Thome* and *Do Principe*, in the Gulf of Guinea: area, 453 square miles; population (1851), 14,580. MACAO: area, 12 square miles; population (1851), 29,587. The other dependencies comprise establishments on the continent of Africa, namely, on the coasts of Guinea, Angola, Benguela, and Mozambique; in Hindustan, at Goa, Diu, and Damaun; on the islands of Timor, Solor, &c.

Coast.—The length of the coast-line of Portugal is about 500 miles, of which about 400 miles face the west, and 100 miles the south. The lofty precipice of Cape St. Vincent forms the south-western angle, and the coasts for some distance both to the east and north are rocky, high, and steep. Farther to the east the shores become low, and are bordered with small sandy islands, one of which forms Cape Santa Maria, the most southern point of Portugal. Cape St. Vincent is the chief termination of the Serra de Monchique, and as the coast extends northward other portions of that mountain range advance to the sea, and render the shores bold and rugged, though they are not high; they become low and level as they approach the great lagune of Setubal. This lagune is overlooked on the north-west by the Serra da Arrabida, which has an elevation of 1760 feet, and terminates at Cape Espichel, which is 660 feet high. The shores again sink down as they approach the south side of the estuary of the Tagus; but on the other side, north and west of Lisbon, the mountain ridges of Cintra, Mafra, Torres Vedras, and others, with their intervening valleys, fill

up the whole space between the Tagus and the sea, and have their chief termination at the Cabo da Roca, which is nearly 2000 feet high, and is the most western point of Portugal. The peninsula of Peniche is the northern termination of this mountain mass, and the coast thence to the mouth of the Mondego is generally rugged, though it is low; but on the north side of the Mondego the termination of the Serra de Alcoba at Cape Mondego has an elevation of 464 feet. Thence to the mouth of the Douro the shores are flat, sandy, and swampy. They afterwards become higher and rugged, but again sink down as they approach the mouth of the Minho. The whole coast of Portugal, with the exception of the estuary of the Tagus and a few other inlets, presents a rugged and dangerous shore. Nearly all the harbours have bars, which render most of them difficult of access even for boats, and with a breeze from the sea a terrible surf breaks along the whole line of coast, and forbids all approach. With a south wind, which generally prevails from August to the winter months, the whole of the line of coast is exceedingly dangerous.

Surface.—The surface of Portugal is for the most part mountainous. Numerous irregular offsets from the great Pyrenean chain enter the two northern provinces of *Tras os Montes* and *Entre Douro e Minho* from the Spanish provinces of *Asturias* and *Galicia*. One of these offsets extends into the province of *Beira*, and forming a continuous range takes a southern and western direction, and terminates at Cape Mondego: this is named the *Serra de Alcoba*. Another mountain range of much greater elevation and extent passes through the central provinces of *Beira* and *Estremadura* in a direction from north-northeast to south-south-west, and terminates near Lisbon at the *Cabo da Roca*. This range as it crosses *Beira* is named the *Serra de Estrella*; in *Estremadura* it has several local names, but the main ridge is called the *Serra do Junto*. As it approaches its termination it forms a series of ridges running east and west, which occupy the whole space between the Tagus and the sea for a distance of about 30 miles north of Lisbon. Another mountain range crosses the southern end of the kingdom from east to west, separating *Algarve* from *Alemtejo*. This range has the names of *Serra de Calderão* and *Serra de Monchique*. It is obviously the continuation of the *Sierra Morena* of Spain, interrupted only by the narrow valley of the *Guadiana*, and terminates abruptly in the great promontory of *Cape St. Vincent*.

There are only two plains of great extent in the whole of Portugal, the *Campo de Ourique* in *Alemtejo*, and another great plain, partly in *Alemtejo* and partly in *Estremadura*, extending south-west and west from the mountains of *Portalegre* to the eastern bank of the Tagus, along which it is continued northward as far as *Abrantes*. Another tract of flat land, but of less extent, in the province of *Beira*, stretches inland from the estuary of the river *Vouga*. The valleys are very numerous. One of the largest of these forms the river-basin of the *Mondego*, lying between the *Serra de Alcoba* and the *Serra de Estrella*. This valley is exceedingly beautiful and fertile. There are several other fine valleys of less extent, such as those of the *Lima* and *Cavado* in *Entre Douro e Minho*, the upper course of the *Vouga* in *Beira*, and the *Lis* in *Estremadura*.

Rivers.—The largest of the rivers of Portugal enter it from Spain. The *Douro* has a western course, and forms the boundary between the two northern provinces and the province of *Beira*. [*DOURO.*] The *Tagus* (*Tejo*) has a course in Portugal at first west, but afterwards south-south-west, and enters the sea below Lisbon. [*TAGUS.*] The *Guadiana* enters from Spain, near *Badajoz*, and has a southern course partly in Portugal and partly as a boundary-river between the two kingdoms. The *Mondego* is the largest of the rivers which belong entirely to Portugal. It has numerous affluents, and waters a wide and fertile valley. The *Zezeira*, a deep and rapid river, also entirely within Portugal, rises in the *Serra de Estrella*, flows along the base of its eastern side, and enters the Tagus below *Abrantes*. The *Sado*, or *Sadão*, is another large river, with a great number of tributaries, most of which rise on the northern flank of the *Serra de Monchique*, and traverse the great plain of *Ourique*; but others flow from the mountains south of *Evora*. The *Sado* enters the sea at *Setubal*. The smaller rivers of Portugal are numerous. The larger rivers, such as the *Tagus*, the *Douro*, and others, offer an important inland navigation, which might be extended by canals, of which however none have been formed. There are no lakes in the lower lands of Portugal, but there are a few small mountain-lakes. There are salt-marshes in the vicinity of *Setubal*, and also near *Aveiro*.

Geology.—Granite and other eruptive rocks constitute the base of the principal chains and groups of mountains in Portugal. Granite forms the axis of the great mountain range of the *Serra de Estrella* and *Serra do Junto*, and shows itself in the lofty peaks of the *Serras* of *Monchique* and *Calderão*. The town of *Oporto* stands on a mass of granite four or five miles wide, and this rock also forms the base of the neighbouring rocks, but farther to the east sienite takes the place of the granite. These crystalline rocks are very generally flanked and overlaid by clay-slates and micaceous schists, which form the upper strata of the greater part of the provinces of *Entre Douro e Minho* and *Tras os Montes*, cover both flanks of the granitic chain of the *Serra de Estrella*, and extend from the banks of the *Zezeira* to the frontier of Spain. Clay-slates cover the whole of the wine-districts of the Upper *Douro*, in which all the fine port-wines are produced upon the slates, the line of junction with the granite being the limit of the cultivation of the

finer qualities of wine. In the neighbourhood of *Valongo*, about twelve miles E. from *Oporto*, a dark-coloured hard roofing slate of the finest quality is extensively quarried for slabs and flags, but not for roofing, tiles being used for that purpose throughout the whole of Portugal. In the same locality are several beds of anthracite coal, which have been long wrought at three or four places, and are much used in the town of *Oporto*. Primitive limestone shows itself abundantly on the flanks and lower summits of the *Serras* of *Junto*, *Arrabida*, *Monchique*, and *Calderão*.

Climate, Soil, and Products.—The climate of Portugal is very warm, but no part of the country is subject to the dry and oppressive heats of central Spain. The mean temperature of the year at *Coimbra* is 62° Fahr., at *Lisbon* it is 61° 3' Fahr. The inequality of the surface and the extent of coast fronting the Atlantic Ocean occasion great diversities of climate. The more elevated districts are comparatively cool in winter, and snow falls heavily on the mountains of the two northern provinces. In the southern provinces the winters are very short, snow seldom falls, and the summers are very hot. Rain is abundant on the western coast, especially from October to April. The climate is very healthy in the more elevated districts, but is less so in the flat lowlands and the vicinity of the salt-marshes.

The soil is generally rich, but the husbandry is slovenly in the extreme. Wheat, barley, oats, maize, flax, and hemp, are cultivated in the more elevated tracts, and rice in the lowlands. Oranges, lemons, figs, and almonds, are produced in abundance in the central and southern provinces. The cultivation of the vine is the most important branch of industry, and the vineyards of the Upper *Douro* furnish the finest qualities of port-wine, which is so-called in consequence of being exported from *Oporto* ('o porto,' the port). The olive is cultivated, but the oil is not of the finest quality. The date-tree and the American aloe grow in the south. There are forests of oak in the northern provinces, of chestnuts in the central districts, and of cork-trees in the south. Cattle, sheep, goats, and hogs are in considerable numbers. Mules and asses are the chief beasts of burden. Fish abound in the rivers and on the coasts. Slates, marble, iron, and anthracite coal are obtained. Salt is made in large quantities by evaporation in the marshes on the coast.

Inhabitants.—The peasantry in the northern and mountainous regions are active and spirited; in the lower districts they are indolent and dejected, dirty in their persons and habitations, and ill-fed with coarse bread, dried fish, goat-milk-cheese, chestnuts, garlic, oil, and other cheap articles. The educated classes are polished in their manners, and courteous to strangers. The provincial nobility, called *fidalgo*s, are very numerous, but mostly poor.

Commerce and Manufactures.—The exports from Portugal during the year 1851 amounted to 1,974,000*l.*, of which 955,000*l.* were sent to Great Britain or British possessions. The imports into Portugal during the same year amounted to 3,298,000*l.*, of which 2,500,000*l.* came from Great Britain or British possessions. Of the imports 590,000*l.* were re-exported. The exports consist almost entirely of wine (which is the staple), fruits, and cork. The manufactures consist of coarse woollens, common cottons and linens, silks, jewellery, and a few other articles. Iron-work, wood-work, and earthenware are almost everywhere of the rudest kind.

Revenue, Army, and Navy.—The revenue for 1854 was somewhat less than 3,000,000*l.* The public debt amounted to 9,890,439*l.* The army of Portugal in 1854 numbered about 30,000 men, exclusive of about 9000 who protect the colonial possessions. The navy in the same year consisted of 1 ship of the line (80 guns), 1 frigate (50 guns), 6 corvettes of 18 guns each, 10 brigs mounting altogether 103 guns, 22 schooners and other small vessels mounting altogether 55 guns, and 7 steamers mounting altogether 32 guns.

Religion and Education.—The established religion is Roman Catholic, and the church is governed by the patriarch of Lisbon, the archbishops of *Braga*, *Evora*, and *Goa*, and 16 bishops. Though Catholicism is the religion of the state, and the constitution contains no clause allowing any other form of worship, other creeds are tolerated, and foreigners, not Roman Catholic, residing in the country, are not interfered with. The convents were suppressed by *Don Pedro* in 1834, and the revenues and buildings have been applied to secular purposes. The educational establishments are in a very low state, and the scientific and literary institutions, and even common libraries and printing offices, are almost exclusively confined to *Lisbon*, *Coimbra*, and *Oporto*.

Government.—The present government of Portugal is a constitutional monarchy established in 1836, and the parliament consists of a chamber of peers and a chamber of deputies. The present chamber of peers is composed of 3 archbishops, 6 bishops, 3 dukes, 8 marquises, 39 counts, 23 viscounts, 10 barons, and 26 untitled persons. The chamber of deputies is composed of 131 members elected by 36 districts of Portugal, 11 members elected by the inhabitants of the *Azores* and *Madeira*, and 14 sent from the other colonial possessions: total 156. The president is named annually by the crown.

History.—The Iberians and the Celts were the oldest inhabitants of the Peninsula. When the Carthaginians invaded it, their general *Hamilcar* overran and subdued the western provinces. The Romans, who succeeded the Carthaginians as masters of the Peninsula, governed by their praetors the province of *Lusitania*, the ancient limits of which

have been variously defined by different authors. Strabo (iii. p. 152) intimates that it extended from the Tagus to the Ocean on the north and on the west, and was bounded on the east by the Carpetani, Vettones, Vaccii, and Callaici. But when Augustus had divided the Peninsula into three provinces, Bœtica, Tarraconensis, and Lusitania, the last comprised the greater part of the modern kingdom of Portugal, besides a considerable portion of Leon and Spanish Estremadura. When Spain was inundated by the Visigoths, Portugal shared in the general devastation; and when, at the beginning of the 8th century, the torrent of Arabian conquest spread over the Peninsula, the territories and towns of Portugal were as easily subdued as the rest of the country. In the 9th century however the greater part of northern Portugal had been wrested from the Mohammedans, and had become subject to local governors dependent on the Counts of Galicia. The south still remained in the hands of the Mohammedans until towards the close of the 12th century, when Santarem, Lisbon, and Cintra were reduced by Alfonso Henriques, the first king of Portugal. About the year 1095 Alfonso VI., king of Castilla and Leon, conferred upon his son-in-law Henry of Besançon, who was descended in a direct line from the Duke of Burgundy, the government of the subdued territories from the Minho to the Tagus, with the title of Count. At the same time Henry, who took up his residence at Guimaraens, was permitted to hold in his own right whatever conquests he might make from the Moors beyond the Tagus. In this manner he reduced most of the Mohammedan governors of fortresses south and east of the Tagus to the condition of tributaries. On his death in 1112, his son Alfonso succeeded to the dignity of count, which the Castilian king had previously rendered hereditary in his family. The new count proved a more formidable enemy to the Mohammedans than even his father. In 1139, having resolved to reduce the Moorish fortresses west of the Guadiana, he assembled a powerful army at Coimbra, and advanced towards Badajoz, the governor of which place, having received considerable reinforcements from Africa, hastened to meet him. The armies met in the great plain of Ourique, in Alemtejo, where the Moors were defeated with great loss in 1139. After the victory Alfonso was proclaimed king by his soldiers, and his title was confirmed by the cortes and by the Pope.

Portugal continued to be governed by the kings of the House of Burgundy from 1139 till 1557. In 1147 Alfonso took Lisbon from the Moors, with the assistance of a fleet of crusaders under the command of William Longsword. The remainder of his reign was spent either in war with the Moors, or in defending his dominions against the kings of Castilla and Leon, who disputed his right to the title of king. He died at the close of the year 1185, and was succeeded by Sancho I., his eldest surviving son, whose reign was by no means so glorious. Though he took the town of Silves in Algarve, he lost Coimbra and other important fortresses, some of which he did not recover for a long time. Sancho died in 1211. His successor, Alfonso II., prosecuted the war against the Mohammedans with considerable success. His son Sancho II., who succeeded him in 1223, was animated by the same military ardour, and he took several places in Alemtejo and Algarve; but in consequence of disputes with his clergy, he was dethroned by a papal decree, after which he retired to Toledo, where he died early in 1248. Alfonso III., his brother, who succeeded him, completed the conquest of Algarve, which his predecessor had begun, and was thence called the Restorer. Alfonso died in 1279, and was succeeded by his son Dinis, who, like his father and most of his predecessors, was long at war with the church. Dinis was the first who turned to account the favourable position of the country for commerce, and who, by awaking the enterprise of his subjects, laid the foundation of the greatness of Portugal in the succeeding century. He was a generous patron of science, and in 1284 laid the foundation of a university in Lisbon, which he afterwards (1308) transferred to Coimbra.

Dinis was succeeded in 1325 by his son Alfonso IV., surnamed the Brave, whose reign was almost entirely spent in war with Alfonso of Castilla. Peace being at last concluded between them by the interference of the Pope, he joined his arms to those of his rival, and assisted him in humbling the power of the Mohammedans. His son Pedro I., who succeeded him in 1357, is chiefly known by his secret marriage with the celebrated Ines de Castro, and the tissue of crimes caused by that union. He was succeeded in 1367 by his son Fernando I., who, on the death of Pedro the Cruel of Castilla without male heirs, assumed the regal title and arms of that kingdom, as the grandson of the Princess Beatrix, daughter of Sancho the Brave of Castilla. His entire reign was spent in war with the bastard Enrique, who had usurped the throne of Castilla; but though he wasted his resources, he gained no advantages. With the death of this monarch, in 1383, the male line of the Burgundian princes became extinct in Portugal. His daughter Beatrix, who had married Juan I. of Castilla, was the true heir to the throne, but the Portuguese were so averse to a connection with Castilla, that on the marriage of the princess with the Castilian king, it had been expressly stipulated that in case of Fernando's death the government should be vested in a regency until Beatrix had a son capable of assuming the sovereignty. Accordingly Dom Joam, grand-master of the order of Avis, an illegitimate son of King Pedro I., was appointed regent, and two years afterwards was proclaimed king by the states assembled at Coimbra in 1385, to the

prejudice of Enrique, son of Beatrix, the lawful heir to the Portuguese throne. Joam I. maintained the possession of his usurped throne with great ability and courage. With this king begins the native line of Portuguese kings, as well as the foreign conquests and voyages of discovery which established the greatness of Portugal. Henry, surnamed the Navigator, one of the king's sons, first set on foot those enterprises of discovery and commerce which raised Portugal so much above contemporary states. The reign of Joam I. is justly considered one of the most glorious which Portugal ever had. He improved the administration of the kingdom, and introduced many salutary reforms into the courts of justice. He transferred the royal residence from Coimbra to Lisbon. At his death in 1433, Joam I. was succeeded by Duarte, who died of the plague at Tomar, and was succeeded by his eldest son Alfonso V.; but as he was only six years of age on his father's death, the regency devolved, according to his will, upon the queen-mother, a very able princess. Under the reign of this king the career of African conquest was ardently prosecuted. Alfonso died of the plague in 1481. He was a great patron of literature, and the first Portuguese king who collected a library. His reign was likewise signalised by the progress of maritime discovery; and the Azores, with the Madeiras, the Canaries, Cape Verd, and other islands west of the African continent, were either discovered or colonised through the persevering efforts of the Infante Dom Enrique. Joam II., who succeeded Alfonso V., was justly considered one of the ablest monarchs that ever sat on the throne of Portugal. In this reign the spirit of maritime discovery was carried to the highest pitch. In 1487 Bartholomew Diaz discovered and doubled the southern cape of Africa, which, from the good expectations which it encouraged, was called O Cabo de Boa Esperanza (Cape of Good Hope). Joam II. died universally regretted in 1495. He was succeeded by his cousin Manoel, who steadily pursued the career of maritime discovery. About the close of 1497 the passage to India by sea was effected by a squadron of five vessels, under the orders of Vasco de Gama, who returned to Lisbon in September 1499, after an absence of little more than two years. In this reign Brazil was discovered, and establishments were formed in that country and also on the west coast of Hindustan. During the reign of this king Lisbon became the most important commercial city of Europe; and Portugal, the most insignificant of the European states in extent of territory and population, grew into a powerful monarchy.

In the reign of Joam III., who succeeded his father Manoel in 1521, Indian discoveries and commerce were still further extended. But the introduction of the Inquisition, in 1536, which, as in Spain, was at first intended only against the Jews, greatly contributed to increase the misery caused by bad administration and a vicious course of policy pursued with regard to the colonies. The Jews were exterminated, or fled from Portugal: but although the object for which that tribunal was instituted no longer existed, it still continued a powerful political weapon in the hands of the absolute kings of Portugal. As injurious in its consequences as the Inquisition was the admission of the Jesuits into Portugal, under Joam, the first European monarch who permitted them to enter his dominions. The education of his grandson Sebastian, the heir-apparent to the throne, was likewise entrusted to the Jesuits, who inspired the young prince with that spirit of bigotry and that fanatical ambition which led to his death. Scarcely however had the young prince reached his fourteenth year—the period of his majority—when he began to turn all his thoughts towards the prosecution of the African war; and he sailed in 1574, in opposition to the remonstrances of his wiser counsellors. Four years afterwards, in August, 1578, the memorable battle was fought by which Portugal lost her king, and began rapidly to sink from her former prosperous condition.

After the short reign of Cardinal Enrique, Sebastian's uncle, who was proclaimed in 1578 and died in 1580, Philip II. of Spain, the most powerful candidate for the throne, obtained possession of it, and Portugal continued subject to the kings of Spain till the reign of the minister of Philip IV., when the Portuguese entered into a conspiracy, and on the 1st of December, 1640, Joam de Bragança, a descendant of the old royal family, was placed on the throne. The war with Spain, which was the result of this measure, and lasted during the reign of Joam, as well as that of his son Alfonso VI., was terminated in 1668, by a treaty of peace, and a cession on the part of Spain of all her claims on Portugal.

Joam IV., the first Portuguese king of the house of Bragança, died in 1656. He was succeeded by his son Alfonso VI. A treaty of peace was also concluded with Holland, by which Brazil, which had been seized by the Dutch, was restored to Portugal. Pedro II., who succeeded his brother Alfonso VI. in 1683, took part with the allies against Philip V. of Spain. From this time date the relations and alliance of England with Portugal. A commercial treaty with that kingdom had already been made, under the first sovereign of the house of Bragança. A new one was concluded in 1703 by the English ambassador Mr. Methuen, which secured to England the advantages of the newly discovered mines in Brazil. During the long reign of Joam V., which lasted from 1707 to 1750, some vigour was displayed in regard to the foreign relations, and several attempts were made for the promotion of the national welfare at home. Under his son and successor José I., who ascended the throne of Portugal in 1750, the

spirit of reform and improvement was still farther extended. In 1757 the Jesuits were deprived of the post of confessors to the royal family, and forbidden the court; two years afterwards they were banished from the kingdom and their estates were confiscated.

Maria Francisca Isabel, eldest daughter of José, succeeded him in 1777. During the reign of Maria, the power remained almost entirely in the hands of an ignorant nobility and of a still more ignorant and ambitious clergy. In 1789, on account of a serious indisposition of the queen, her eldest son, Joam Maria José, Prince of Brazil (the title of the prince royal until 1816), was declared regent, and soon after, her malady having terminated in mental alienation, the prince was declared regent with full regal powers. Portugal for some years preserved a mere shadow of independence by the greatest sacrifices, till at last General Junot entered that country, and the house of Bragança was declared by Napoleon Bonaparte to have forfeited the throne, owing to the refusal of Joam VI. to seize the British merchandise in his dominions. The regent now put himself entirely under the protection of the English, and in November, 1807, embarked for Brazil. Junot entered the capital on the next day, and Portugal was in every respect treated as a conquered country. This led to the Peninsular War, in which the Portuguese now took an active part. On the death of Maria Isabella in 1810, Joam VI. was called to the throne of Portugal, which he occupied conjointly with that of Brazil, where he continued to reside. In August, 1820, the cry for liberty which was raised in Spain, was responded to in Portugal, and a revolution commenced, in which the army and the citizens acted in concert. On the 15th of September, 1820, all the troops and the citizens of Lisbon unaniously proclaimed the constitution, and the cessation of the absolute government which had hitherto prevailed in Portugal. A provisional government was immediately established, which acted in union with the junta at Oporto. In the meantime Count Palmella, the head of the regency, was dispatched to Rio Janeiro with an account of what had passed, and a petition that the king Joam VI. or the prince royal Dom Pedro would return to Lisbon. The revolution was unattended either by violence or bloodshed. The Cortes having assembled in 1821, under the presidency of the archbishop of Braga, various laws were passed, among which freedom of person and property, the liberty of the press, legal equality and the abolition of privileges, the admission of citizens to all offices, and the sovereignty of the people, were passed almost unanimously.

After some disturbances in Brazil, Joam VI. sailed for Portugal, where he was not allowed to land until he had given his consent to several acts of the Cortes, which imposed restrictions on his power, and had sworn to observe the new constitution. The ambassadors of Russia and Austria left the court; Brazil separated itself from Portugal; and the country was disturbed by various attempts in favour of the old system of government. In the meanwhile the constitution was completed by the legislative assembly, and publicly sworn to by the king on the 1st of October, 1822, but the Infante Dom Miguel, assisted by the Count of Amarante and other noblemen, resolved to overthrow it. After many disturbances and insurrectionary movements Dom Miguel obtained possession of supreme power, the ambassadors of the foreign states were not allowed to enter the presence of the king, and he was closely watched; but Joam succeeded in escaping on board an English man-of-war at anchor in the Tagus, where, having sent for the diplomatic body, he deprived his son of command, and summoned him to his presence. Dom Miguel obeyed, confessed that he had been deceived and misguided, and received the royal pardon, with permission to travel. On the 14th of May the king returned ashore, and early in June proclaimed a sort of amnesty for the adherents of the Cortes of 1820. In 1825, after many difficulties and protracted negotiations, the independence of Brazil was finally acknowledged by Joam VI., who merely retained the imperial title.

Early in March, 1826, Joam VI. died, after having named the Infanta Isabel regent. She administered the kingdom in the name of Dom Pedro, the emperor of Brazil, as king of Portugal. On the 23rd of April, Pedro IV. granted the latter kingdom a constitution, which established two chambers, and in other respects resembled the French charter. On the 2nd of May however he abdicated the Portuguese throne in favour of Dona Maria da Gloria (he remaining king during her minority) on condition of her marrying her uncle Dom Miguel. But a party secretly favoured by Spain aimed at the overthrow of the constitution granted by Dom Pedro. Dom Miguel having caused the Cortes to assemble in June, 1828, was declared by that body sovereign of Portugal, chiefly on the grounds that Dom Pedro had forfeited all right to the crown, as well as to the appointment of a successor, by becoming a Brazilian citizen, and not residing in Portugal. On the 4th of July, 1826, Dom Miguel assumed the royal title.

On the 24th of February, 1832, the naval forces of Dom Pedro arrived off Terceira, of which island they took possession in the name of Dona Maria, as lawful queen of Portugal. Three months after (June, 1832), an expedition 10,000 strong sailed from St. Michael's in the Azores, and on the 10th of July landed near Oporto, which city they took without opposition. The Miguelite forces laid siege to Oporto, but were defeated in several engagements by the troops of Dom Pedro, who were chiefly Englishmen. After a siege of several months, an expedition was fitted out by means of a loan raised in England, and Dom Pedro, encouraged by the recent victory won by

Admiral Napier over the naval forces of Dom Miguel, sailed with part of his forces for Lisbon, of which he took possession with comparatively little trouble. He then established a permanent government, and shortly after sent to England for the young queen, who was received by the Portuguese nation with every demonstration of joy.

In the meantime the army of Dom Pedro prosecuted its successful struggle. On the 26th of May, 1834, after the surrender of Santarem and other places, Dom Miguel was obliged to capitulate and sign the convention of Evora. He was permitted to leave Portugal, and to embark for Genoa. This event ended the struggle, and the young queen was firmly seated on the throne of Portugal, the regency being conferred upon her father. One of the first acts of his administration was the suppression of the monastic establishments; another was the partial abolition of paper money, and the formation of a metallic currency. On the 15th of August Dom Pedro was confirmed in the regency by the Cortes, but in the following month the declining state of his health having induced him to resign his office, the Cortes in consequence declared the young queen of age. She then assumed the full exercise of royal authority. Dom Pedro died on the 22nd of September, 1834. Soon after (January, 1835), Dona Maria married Duke Augustus of Leuchtenberg, who died shortly after (March, 1835), and in April, 1836, she married Prince Ferdinand of Saxe Coburg-Gotha. Dona Maria died November 15, 1853, and was succeeded by her eldest son Dom Pedro V., who was born September 16, 1837. The king-consort is regent of the kingdom during the minority of his son.

Language.—The language of Portugal, like those of other kingdoms in the Peninsula, originated in a mixture of the Latin, Teutonic, and Arabic. Some writers have called it a dialect of the Castilian; but, besides the striking difference in its structure and pronunciation, there can be no doubt that the Portuguese was formed earlier than the Castilian. It might more properly be called a dialect of the Galician, to which it had at first great affinity, and which it still much resembles. The separation of Portugal from Spain, their wars, and the little commercial intercourse which existed between them during the middle ages, combined in course of time to make the Portuguese a different language. When Henry of Burgundy fixed his court at Guimaraens, the French knights who came with him introduced a considerable number of French words into the language of the country. The great efforts too of the Portuguese poets and prose writers in the 15th and 16th centuries to improve their native language by resisting the introduction of Castilian words, and anathematizing all those who adopted the Spanish language in their writings may be mentioned as one of the means which mainly contributed to render the tongues of Spain and Portugal still more dissimilar. The Spanish, like the Portuguese, has many words borrowed from the Arabic. Their wars with the Moors of Africa and the Mohammedans of India in the 15th century introduced into it many others from the languages spoken in those countries. The pronunciation is difficult for a foreigner, more particularly the nasal sounds, in which it abounds. The gutturals are neither so strong nor so common as in the Spanish, and many consonants have been omitted, so that it is softer than the Spanish, but not so harmonious.

PORTUGALETE. [BASQUE PROVINCES.]

PORTUMNA, Galway, Ireland, a market-town and the seat of a Poor-Law Union, is situated at the head of Lough Derg, in 53° 6' N. lat., 8° 12' W. long., 41 miles E.S.E. from Galway, and 94 miles W.S.W. from Dublin. The population in 1851 was 1542, besides 147 in the Union workhouse. Portumna Poor-Law Union comprises 15 electoral divisions, with an area of 77,046 acres, and a population in 1841 of 30,714; in 1851 of 19,731. The town has been much improved by the increased trade of the Shannon. It contains the parish church, a handsome structure in the perpendicular style; a large Roman Catholic chapel; a dispensary; Union workhouse; and bride-well. The Shannon is here crossed by a causeway and wooden bridge 820 feet in length. Quarter and petty sessions are held in the town. Saturday is the market-day; fairs are held six times a year. Portumna Castle, a fine baronial mansion, the seat of the Marquis of Clanricarde, was destroyed by fire in 1826.

POSEN (*Poznanie*), a government of Prussia, was formerly a part of the kingdom of Poland. On the first partition of Poland in 1772, the part of Posen to the north of the Netze, and on the second partition in 1793, the remaining part, fell to the share of Prussia; this, together with the part of the kingdom south of the Vistula, as far as Warsaw, acquired by Prussia on the third partition, received the name of South Prussia. In 1807 all South Prussia was taken from Prussia by Napoleon I., to form part of the duchy of Warsaw. In 1815 the congress of Vienna restored the original province of Posen to Prussia by the name of the grand-duchy of Posen. During the insurrectionary troubles in Prussia in 1848 this government was violently agitated. The Poles were in open insurrection against Prussia in the months of April and May of 1848. The principal action took place at Xion, in the province of Posen, and Exin, in the province of Bromberg, in both of which the Poles suffered very severely. At last the leaders were arrested and the insurgents dispersed. On the 3rd of April of that year, the districts chiefly inhabited by Germans demanded incorporation with the territory of the German confederation; the question was referred by Prussia to

the German Diet, which admitted the districts to form a part of Germany, and their admission was recognised and confirmed by a decree of the German National Assembly, sitting at Frankfurt, on the 27th of July of the same year. A bill incorporating the whole of the duchy of Posen with Germany passed the Berlin chambers in 1850; but after the insurrectionary wave subsided in Germany we believe the territory of Posen was restored to its former condition. The government of Posen lies between 51° 10' and 53° 32' N. lat., 15° 7' and 18° 38' E. long. It is bounded N. by the province of Prussia, E. by Poland, S. by Silesia, and W. by Brandenburg. The area is 11,352 square miles, divided into the two provinces of Bromberg and Posen. The population in 1852 numbered 1,381,745; of whom 869,433 were Catholics; 437,861 Protestants of various sects; 30 of the Greek Church; and 74,331 Jews. The Catholics are in spiritual matters subject to the archbishop of Gnesen and Posen; the Protestants are guided by a superintendent-general assisted by the council of the government. The great bulk of the population are Poles, and Polish is the general language of the country. There are however many inhabitants of German descent, who inhabit the towns on the frontiers of Silesia and Brandenburg.

The surface is level, except the banks of the Wartha in the circle of Obernik, which are rather more elevated, and there is here and there a hill on the frontiers of Silesia. The soil is partly marsh, which is very fertile, and partly sandy, but even here the sand is so mixed with more solid elements, especially loam, that the soil may be considered as tolerably good. The most fertile parts are the country on both sides of the Wartha, and the Netzbruch, a low tract on the river Netze, about 90 miles in length, and not above 3 miles in breadth, which, having been completely secured by dikes, is now converted into fine corn-land and meadows, with farmhouses and villages. The Wartha or Warta, which traverses the province in its whole breadth, and the Netze, are navigable. The Netze is connected by the Bromberg Canal (20 miles in length) with the Brahe, which has been made navigable, and falls into the Vistula, which only touches the frontier for a short distance below Thorn, and opens a communication with the Baltic. There are several lakes, the largest of which is that of Gopplo. The air is pure and healthy.

The chief products are corn, pulse, culinary vegetables, flax, and hemp; tobacco, hops, fruit, and timber; the common domestic animals, game, poultry (especially geese), fish, and bees. There are limestone, freestone, saltpetre, and bog-iron. The exports consist chiefly of corn, especially wheat, a large quantity of wool, timber, cattle, tallow, hides, wax, honey, hogs' bristles, and feathers. Broad-cloth of good quality is manufactured in most of the towns. The railway that connects Berlin with Stettin, Danzig, and Königsberg traverses the government of Posen, and passes through the town of Bromberg. A branch line from the Woldenberg station runs up to Posen.

The government of Posen occupies the southern part of the province, and has an area of 6807 square miles, with a population of 900,430 in 1846. *Posen* (in Polish *Poznan*), the capital of the province and of the government, situated in 52° 24' N. lat., 16° 52' E. long., in a sandy tract on the left bank of the Wartha, is a strongly-fortified town, with a population of 40,209. The town, which has three suburbs and four gates, is pretty regularly built. The chief public buildings are—the castle, situated on an eminence; twenty-four Roman Catholic churches, the most remarkable of which are the cathedral and the church of St. Stanislas, the latter being a masterpiece of Italian architecture; two Protestant churches, a Greek chapel, a synagogue, the archiepiscopal palace, the theatre, the chief-guard-house, the town-hall, &c. Posen is the residence of the Catholic archbishop of Posen and Gnesen, and of the governor of the province. It has two gymnasiums, one called Frederick Wilhelm, for Protestants, which has 19 teachers and 350 pupils, the other, the Mary gymnasium with 22 teachers and 640 pupils. The manufactures consist of chintzes, calico, tobacco, leather, woollen cloth, ticking, sealing-wax, and carriages. There are likewise breweries, distilleries, several printing-offices and lithographic presses. The city has some trade, and three annual fairs. Posen is 160 miles E. from Berlin in a straight line, but 206 miles by railway through Stettin. *Lissa*, 38 miles S. from Posen, has 9000 inhabitants. This town has a palace, a handsome market-place, a Protestant gymnasium, five churches, a synagogue, and extensive manufactures of woollen-cloth, linen, snuff, chicory, and carriages. *Rawitsch*, situated in a marshy spot near the frontiers of Silesia, has 8500 inhabitants. It is pretty well built, has a gymnasium, a town-hall, and manufactures of woollen-cloth, linen, leather, tobacco, and earthenware. *Meseritz*, situated in a beautiful and fertile country on the river Odra, 56 miles W. from Posen, has 4500 inhabitants. The manufacture of woollen-cloth is very considerable. *Krotoszin*, close to the Silesian frontier, has 7000 inhabitants, who manufacture woollen-cloths, linen, tobacco, and chicory. There are also tanneries, dye-houses, and distilleries. *Fraustadt*, in Polish *Wschowa*, situated on the frontiers of Silesia, consists of an old and new town; it has four churches, a gymnasium, an orphan asylum, and 6257 inhabitants, who manufacture woollen and linen cloths, beer, and spirits, and carry on a considerable trade in corn, cattle, wool, &c. *Kempen*, also on the Silesian frontier, has 6154 inhabitants, who carry on some traffic in horses with Silesia, and manufacture cloth, linen, tobacco, and

soap. *Ostrowo*, 70 miles S.S.E. from Posen, has several Lutheran and Catholic churches, woollen manufactures, a Catholic gymnasium, and about 5000 inhabitants.

The north of the government forms the province of Bromberg, which has an area of 4545 square miles, with a population of 463,969 in 1846. The chief town *Bromberg*, in Polish *Bydgoszcz*, is situated on a hill above the Brahe, about 5 miles W. from the Vistula, 67 miles in a straight line, 166 miles by railway through Woldenberg, N.N.E. from Posen, and has about 10,000 inhabitants. The canal which completes the navigation between the Oder and the Vistula enters the Brahe at this place. The town is well built; it has a Lutheran gymnasium, a training school, manufactures of chicory, tobacco, linen and woollen cloth, sugar, &c.; and a briak trade in corn, cattle, &c. *Gnesen*, an old town, with 7000 inhabitants, 44 miles S.S.W. from Bromberg; it gives title in conjunction with Posen to a Catholic archbishop, who was primate of Poland. Besides the cathedral, there are seven Roman Catholic churches, and a seminary for the clergy. The inhabitants manufacture woollen cloth and linen, and there are breweries and distilleries. Gnesen is one of the oldest towns in Poland. It was the earliest capital of that country. [POLAND.] *Inowratzlaw*, also called *Jung-Breslau*, an ill-built town, in a fertile plain, 24 miles S. by E. from Bromberg, has 5600 inhabitants, who have distilleries, breweries, and saltpetre works. There are five Roman Catholic churches, a Franciscan convent, and a synagogue. *Schtulanke*, is a well-built town, 62 miles W. from Bromberg, with 4000 inhabitants, who manufacture woollen cloths.

POSILIPPO. [NAPLES, Province and City of.]

POTENZA. [BASILICATA.]

POTIDÆA. [MACEDONIA.]

POTOMAC. [MARYLAND; VIRGINIA.]

POTOSI, a town in South America, in the republic of Bolivia and in the department of Potosi, is built on the south-western declivity of the Cerro de Potosi, in 19° 36' S. lat., 65° 20' W. long., at an elevation of 13,265 feet above the level of the sea. The population, which a hundred years ago it is said amounted to 100,000, does not now exceed 30,000, about half of whom are Peruvian Indians. It is built on an uneven site, and the streets are consequently irregular, but they are tolerably wide and clean. The houses are generally low, not more than one story high, timber being scarce and dear; most of them however are substantial. On one side of the principal square stands the government-house, a long low range of buildings, including the courts of justice, the jail, and the guard-house. Opposite to it is the cathedral, an immense granite edifice. The mint also is very large, but far from being a fine building. The great square contains a monument erected in honour of Bolivar. There are several other churches besides the cathedral. A college is established in the Bethlehem convent. The town is supplied with water from reservoirs formed at some eight or ten miles distance by making dams across the heads of several ravines in the Cerro de Potosi; from these the waters are conducted to the houses and fountains of the town in conduits, and to the mining establishments in streams to turn the machinery used in washing and purifying the silver-ore from the celebrated mines of Potosi. [BOLIVIA.] The town is well supplied with meat, fruits, and vegetables, though the surrounding country is barren and exhibits few signs of vegetation. The climate of Potosi presents the changes of the four seasons of the year every day. It is a healthy place, but the extreme rarity of the air, in consequence of the great elevation above the sea-level (13,000 feet) produces a difficulty of respiration, to which even the natives and animals are at times subject.

The Cerro de Potosi rises to the elevation of 15,981 feet above the sea. It is of a reddish-brown colour, and has the shape of a perfect cone, but is not volcanic, as has been supposed. It does not produce a blade of grass; the whole mountain seems to consist of silver-ore of different degrees of richness. It was discovered that this mountain contained silver-ore by an Indian, in 1545, who being in pursuit of a llama upon the steep declivity, in order to save himself from falling caught hold of a shrub, which being torn from the soil exposed a mass of solid silver at the roots. From that time to the present day the mines have been worked. The produce of these mines from 1556 to 1800 amounted to the enormous sum of 823,950,508 Spanish dollars, or 185,388,864*l*.

POTOSI, U.S. [MISSOURI, State of.]

POTOSI, SAN LOUIS DE. [MEXICO.]

POTSDAM, the capital of the circle of Potsdam, in the government of Brandenburg, in Prussia, is situated on an island in the Havel, at the point where that river is joined by the Nuthe, 16 miles by railway S.W. from Berlin, and has about 40,000 inhabitants. It is, next to Berlin, the handsomest and best built town in Prussia, a distinction for which it is indebted to being the occasional residence of the court. The streets are regular and broad, and there are some good squares. The town is surrounded by ramparts and has nine gates, of which the Brandenburg gate is a handsome triumphal arch copied from the arch of Trajan at Rome. Of the seven bridges over the Havel and the canal, the finest is the Teltow Bridge, which is 600 feet long and 30 feet wide; it consists of eight iron arches resting on massive stone pillars. Of the numerous buildings the most worthy of notice is the Royal Palace,

which is an oblong parallelogram, three stories high, adorned with colonnades of the Corinthian order. The main entrance is towards the old market-place, a handsome square, in the middle of which there is an obelisk of red and white marble 75 feet high adorned with busts. The palace has extensive gardens along the river. The town-hall was built in 1754, on the model of that of Amsterdam. Among the other buildings the most notable are the theatre; the poor-house and infirmary; the military orphan asylum; the garrison church, which contains the tombs of Frederick William I. and Frederick II.; the church of the Holy Ghost, with a fine steeple 280 feet high; the French Protestant church, built on the plan of the Pantheon at Rome; the barracks; and a large building, 660 feet in length and 75 feet in breadth, for exercising the troops in bad weather. The gymnasium (which has 18 teachers), the seminary, and the military school are the chief educational establishments. The principal manufactures are silk, cotton, linen, woollens, leather, muskets and small arms, sugar, hats, hosiery, musical instruments, and carriages.

In the vicinity of Potsdam are the Pfaueninsel (Peacocks' Island), in the Havel, 2000 paces long and 500 paces broad, prettily laid out, and containing many foreign animals; the palace of Sanssouci, the favourite residence of Frederick II., which stands amidst beautiful gardens on the slope of an eminence and commands a fine prospect; the Marble Palace; and the New Palace, a magnificent building founded by Frederick II., and situated in a fine park.

The circle of Potsdam and the chief towns in it are noticed under BRANDENBURG.

POTTERS PURY, Northamptonshire, a village and the seat of a Poor-Law Union, in the parish of Potterspury, is situated in 52° 5' N. lat., 0° 53' W. long., distant 10 miles S. from Northampton, and 56 miles N.W. from London. The population of the parish in 1851 was 1734. The living is a vicarage in the archdeaconry of Northampton and diocese of Peterborough. Potterspury Poor-Law Union contains 15 parishes and townships, with an area of 22,401 acres, and a population in 1851 of 10,651. The parish church is in the decorated style, with a very handsome tower; there are also a chapel for Independents, and a Free school. The lace manufacture gives employment to some of the population.

POTTON, Bedfordshire, a market-town in the parish of Potton, is situated in 52° 8' N. lat., 0° 13' W. long., distant about 12 miles E. from Bedford, and 50 miles N. by W. from London by road. The population of the parish in 1851 was 1922. The living is a vicarage in the archdeaconry of Bedford and diocese of Ely. The town of Potton was almost entirely destroyed by a conflagration in 1783, so that the houses are now nearly all modern. A good corn-market is held on Saturday; fairs are held four times in the year. Besides the parish church there are chapels for Independents and Baptists, and a National school.

PRAGUE, properly PRAGA, the capital of Bohemia, is situated in 50° 5' 19" N. lat., 14° 25' E. long., 250 miles N.N.W. from Vienna by railway through Brünn, but only 158 miles in a straight line. The town is built on the banks of the Moldau, in a valley and on the slopes of the hills that inclose it. In size and beauty Prague is the third city in Germany, and produces a very striking effect when viewed at a distance, by its commanding situation, the lofty steeples of its numerous churches, and its fine palaces and public buildings. The city consists of four quarters—the Old Town, which is gloomy and closely built, with very high old-fashioned houses, and which includes the Jewish quarter; the New Town, which surrounds the Old Town, and has finer and broader streets, spacious squares, lower houses, and a healthy site; the Kleinseite, which stands in a semicircular valley on the left bank of the Moldau, between two hills called the Laurenzberg and the Schlossberg; this quarter is smaller than the old town, but contains many gardens, fine palaces, and lofty houses; and the Hradschin, which is built on the Schlossberg, is the smallest but the finest part of the city, and contains a great number of magnificent palaces. The town of Wissehrad, which joins the new town, and the village of Smichow, on the left bank of the Moldau, are reckoned as parts of Prague; there is likewise a new suburb called the Karolinenthal. The city is surrounded with fortifications, and has eight gates. Additional fortifications were erected on the Hradschin in 1850, so that its guns commanded every point in the city. The Old Town and the Kleinseite are connected by a chain bridge recently erected, and by an ancient stone bridge of 16 arches. This last, which was commenced by Charles IV. in 1358, is 619 yards long, 35 feet broad, and 42 feet high; it is adorned with 29 statues and groups of saints, and has an ancient tower at each end. There are in the city 46 Catholic and 2 Protestant churches, 9 synagogues, 15 monasteries,

and 68 palaces. The metropolitan church of St. Veit, in the Hradschin quarter, which was commenced in the 10th century, but not completed till 1500, has a steeple 314 feet high, from the top of which there is a magnificent view of the city. This cathedral, in which are the sepulchres of several emperors and kings, of Bohemian princes, and remarkable men, has twelve richly-adorned chapels, and contains paintings of the 14th century, besides numerous antiquities and relics. The greatest ornament of the cathedral is the monument of St. John Nepomuk, the patron saint of Bohemia. Another remarkable old church is the Theinkirche, which dates from the 9th century, and contains the tomb of the astronomer Tycho Brahe. Many of the more modern churches, which are chiefly in the Italian style, are worthy of attention. Among the palaces, the Imperial Palace in the Hradschin is the most remarkable building in the whole city, both for its immense extent and its fine and commanding situation. King Charles X. of France and his family resided for some years in this palace after their expulsion from France. This palace was greatly injured by fire in the winter of 1854-5. Other remarkable public buildings are, in the Old Town, the Collegium Clementinum, built by the Jesuits, in which Joseph II. placed the archiepiscopal seminary, which has about 400 pupils; the theatre; the mint; and several palaces, among which is one which belonged to the famous Wallenstein: in the New Town, the senate-house, the custom-house, and the military hospital: in the Kleinseite, the arsenal and the government-house: and in the Hradschin, the archbishop's palace.

The Carolinum of Prague, the oldest university in Germany, was founded in 1348 by Charles IV., on the model of that of Paris, with faculties of Catholic theology, law, medicine, and philosophy; it had 63 professors and teachers and above 2400 students in 1850. Connected with the university are a veterinary school, a school for midwifery, five clinical institutions, zoological and anatomical collections, a botanic garden, a chemical laboratory, and an observatory. Prague has three gymnasia—one in the Kleinseite, with 17 professors and 570 pupils; one in the New Town (Neustädtisches), with 18 professors and 562 pupils; and one in the Old Town (Altstädtisches), with 20 professors and 850 pupils. There are also several other schools, a Polytechnic Institution, an Academy of the Fine Arts, a Musical Conservatory, an Academy of Sciences, and a Bohemian National Museum, founded by Count Kolowrat, with important collections and libraries. The university library, which consists of 130,000 volumes and 4000 rare manuscripts of classical and Slavonian literature, is kept in the Collegium Clementinum; there are besides, eight public libraries and several private ones. The Imperial Cabinet of Natural History has been greatly increased of late years. The hospitals and charitable institutions for the reception and relief of the poor are numerous and admirably conducted. There are asylums for the blind, for deaf-mutes, and for lunatics.

The manufactures consist of cotton tissues, hosiery, silk, leather, hats, gloves, earthenware, jewellery, and plated goods, mathematical and musical instruments, glass, buttons, snuff and tobacco, paper and paper-hangings. There are also breweries, saltpetre-works, and many other industrial establishments. Prag has a very flourishing commerce: the transit trade facilitated by the Moldau, which is navigable, and by railways which connect the city with Vienna, Berlin, Dresden, and the principal towns of Germany, is considerable; there are three great annual fairs.

Prag is an ancient city, but the time of its foundation is uncertain. It has suffered frequently and severely by the calamities of war, especially in the religious troubles of the 15th century. In 1620, in the contest between the elector palatine and the emperor for the crown of Bohemia, a battle was fought on the White Hill, two miles from the city, in which the Imperial troops were victorious, and the elector Frederick V., son-in-law of James I. of England, lost the crown. In 1741 Prag was taken by the French, who were blockaded in it by the Austrians and after a vigorous defence were compelled by famine to evacuate the city. In 1744, the Prussian Frederick II., got possession of the city with an army of 100,000 men, but in ten weeks afterwards was obliged to evacuate it with the loss of 2000 prisoners, 132 cannons, and 12 mortars, which fell into the hands of the Austrians. In 1757 Frederick again besieged Prag, but the victory of the Austrians at Collin obliged him to retire. On the 29th of May, 1848, the Czechs, or native Bohemian party, revolted against Austria, and appointed a provisional government. From the 12th to the 17th of June there was desperate fighting between the Czechs and Germans; on the latter day the military under Prince Windischgrätz retired to the Hradschin, from which they commenced to bombard the rest of the town. On the 19th the insurrection was quelled and the ringleaders in custody. The population of Prag is 143,000, of whom 12,000 are Jews, and the great majority of the rest Catholics.

PRERAU. [MORAVIA.]

PRESBURG, a town in Hungary, is situated on the north bank of the Danube, 33 miles in a straight line, 41 miles by railway E. from

Vienna, in 48° 8' N. lat., 17° 10' 45" E. long., and has 38,000 inhabitants. It is built on a hill of moderate height, commanding a fine view over an extensive plain watered by the Danube, which is here crossed by a bridge of boats 365 paces in length. The town is said to have existed in the time of the Romans. In 1446, Ofen having fallen into the hands of the Turks, Presburg was declared the capital of Hungary, and the diets were long held here. In 1784, Joseph II. decided that the vicerey and palatine, with the high officers of government, should reside at Ofen, as a more central situation. The emperor is however still crowned in Presburg as king of Hungary. The trade of the city is considerable in consequence of its vicinity to Vienna (with which it is connected by railroad), and of the navigation of the Danube by steamers. The town is handsomely built. The principal buildings are—the cathedral, in which the kings of Hungary are crowned; the county-hall, the ancient senate-house, the archiepiscopal palace, and the theatre. Among the public institutions are several academies, a royal model school, an hospital, and a public library of 50,000 volumes. On a hill outside the city, 439 feet above the level of the Danube, are the remains of the royal palace, which was burnt down in 1811, and has not been restored. It was in this palace that the Hungarians uttered the famous outburst of loyalty towards their 'King, Maria Theresa. The manufactures comprise woollens, silks, tobacco, snuff, oil, rosoglio, and leather. The transit trade in corn, linen, and Hungarian wines is important. A treaty was signed at Presburg in 1805, after the battle of Austerlitz, by which Venice was ceded to France, and the Tyrol to Bavaria. The defences of the town were greatly strengthened in 1850.

PRESCOT, Lancashire, a market-town and the seat of a Poor-Law Union, in the parish of Prescott, is situated in 53° 25' N. lat., 2° 48' W. long., distant 8 miles E. from Liverpool, and 198 miles N.W. from London. The population of the town of Prescott in 1851 was 7393. The living is a vicarage in the archdeaconry of Liverpool and diocese of Chester. Prescott Poor-Law Union contains 20 parishes and townships, with an area of 56,859 acres, and a population in 1851 of 56,074.

The town is lighted with gas, and paved. The chief business of the town is the manufacture of watch-movements. Small files are manufactured to a considerable extent. Coarse earthenware, sugar moulds, &c. are manufactured. The market-days are Tuesday and Saturday; fairs are held in June and November, and fortnightly cattle-fairs in the spring months. The parish church has a lofty tower, surmounted with a spire 156 feet high. The Wesleyan Methodists, Independents, and Baptists have places of worship, and there are a Grammar school, founded in 1782, which had 90 scholars in 1852; a school for girls, an infant school, a news-room, and a savings bank. A county court is held in the town.

PRESCOTT. [CANADA.]

PRESSIGNY-LE-GRAND. [INDRE-ET-LOIRE.]

PRESTEIGNE, Radnorshire, the county town, a market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of Presteigne, is situated in 52° 14' N. lat., 2° 59' W. long., distant 151 miles W.N.W. from London. The population of the borough of Presteigne was 1617 in 1851. The living is a rectory in the archdeaconry and diocese of Hereford. The borough is contributory to Radnor in returning a member to the Imperial Parliament. Presteigne Poor-Law Union contains 16 townships, with an area of 25,534 acres, and a population in 1851 of 3493.

Presteigne stands at the extreme eastern verge of the county, in a fertile valley watered by the river Lug. The church is a spacious edifice, partly of decorated and partly of perpendicular style; it has a square tower at the west end. Wesleyan and Primitive Methodists, and Baptists have chapels. The Free Grammar school, which has an income from endowment of 180*l.* a year, had 50 scholars in 1852. The assizes, quarter sessions, and a county court are held in Presteigne. The shire hall and county jail are modern buildings. The market-day is Saturday. Three fairs are held in the course of the year.

PRESTON, Lancashire, a market and manufacturing town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Preston, is situated on the right bank and near the head of the estuary of the river Ribble, where it receives the Darwen and the Lostock, in 53° 46' N. lat., 2° 42' W. long., distant 22 miles S. by W. from Lancaster, 217 miles N.W. by N. from London by road, and 210 miles by the North-Western railway. The population of the borough in 1851 was 69,542. The borough is governed by 12 aldermen and 36 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The living is a vicarage in the archdeaconry of Lancaster and diocese of Manchester. Preston Poor-Law Union contains 23 townships, with an area of 68,035 acres, and a population in 1851 of 95,754.

Preston is a place of high antiquity, and is supposed to have been named Priest's town from its religious houses, of which vestiges still appear. Its origin is traced to the decay of Ribchester, the Roman station Rigodunum, 11 miles up the river. The town was held by Tostig, brother of Harold II., and became a borough by prescription. It received 13 royal charters, from the time of Henry II. to that of Charles II. The place was partly destroyed by Robert Bruce in 1322. In the parliamentary war it declared for the king, and was besieged and taken by General Fairfax. In 1715 the Jacobite insurgents, under

Foster, entered the town, and erected barricades for its defence, but after a brave resistance were forced to surrender.

The town is built on an eminence rising 120 feet from the Ribble. It occupies an area about a mile and a half square. There are some good terraces and squares, and the houses are in general well built. The town is lighted with gas, and for the most part well-paved and supplied with water. The river is crossed by Walton bridge, on the London road, a structure of three arches, erected in 1782; and about a mile and a half below it, Penwortham bridge, on the Liverpool road, consisting of five arches, and about a century old. A viaduct of the North Union railway has five arches, and rises 68 feet above the stream.

Preston contains 10 Established places of worship. The parish church, originally dedicated to St. Wilfred, was rebuilt in 1770, and dedicated to St. John. St. George's church is a brick building, erected in 1723. The church of the Holy Trinity was built in 1814. St. Peter's, erected in 1824, and St. Paul's in 1825, both in the modern gothic style, were built by grants from the parliamentary commissioners. The Roman Catholics have four chapels, one of which is a very elegant building; the Wesleyan Methodists three; the Baptists three; the Independents two; the Primitive, Episcopalian-Primitive, and Association Methodists, Lady Huntingdon's Connexion, Unitarians, Quakers, Swedenborgians, and Mormons one each. The Free Grammar school, founded in 1663, of which the mayor and corporation are patrons, has an income from endowment of about 150*l.* a year, and had about 130 scholars in 1852. There are eleven National and five Infant schools, a Blue-Coat school, and a school for the deaf and dumb. The Institution for the Diffusion of Useful Knowledge has one of the finest structures in the town, with a library of 5000 volumes, and an excellent museum. There are a literary and philosophical institution, an agricultural society, and three public libraries, the Palatine, Dr. Shepherd's, and the Law library, which are accessible to all classes of readers. The other principal buildings are—the guildhall, a handsome brick building in the centre of the town; a fine court-house, erected in 1826; assembly rooms; a neat theatre; the custom-house, corn-exchange, cloth-hall, and market-house; the dispensary and house of recovery; public baths and wash-houses, built by the corporation, and opened in 1851; an extensive range of barracks, at Fulwood, about a mile from the town; the union work-house; the borough prison; and a large county penitentiary. There are nine almshouses in the place, a savings bank, and several benefit and provident societies.

Preston is now one of the great seats of the cotton manufacture in England. The manufacture of linen, which was formerly the staple trade of the place, is still of considerable extent. There are several flax-mills. Hand-loom weavers are numerous. There are several iron and brass-foundries and machine factories. Malting and brewing, tanning, and rope-making are carried on. The borough has an ancient fishery on the Ribble, which abounds with salmon, smelt, plaice, and eels. The river is navigable at spring-tides to within a quarter of a mile of the lower bridge for vessels drawing 12 feet of water. Preston is a free port, and there are bonding warehouses on the quay. Coal is brought in by the navigation of the Douglas River, which joins the Ribble eight miles below the town. The number and tonnage of vessels registered at the port of Preston on December 31st 1853 were as follows:—Under 50 tons, 79 sailing-vessels of 3007 tons, and 5 steam-vessels of 145 tons; above 50 tons, 42 sailing-vessels of 3929 tons, and 4 steam-vessels of 768 tons. During 1853 the entries at the port were:—Inwards, sailing-vessels 510, tonnage 29,066; steam-vessels 72, tonnage 9270; outwards, sailing-vessels 595, tonnage 31,247; steam-vessels 8, tonnage 870. By the Lancaster Canal, Preston communicates northward with Lancaster and Kendal, and southward with Chorley, where the Leeds and Liverpool Canal connects the town with the great canal system of the manufacturing districts. By railways Preston has communication with all parts of the kingdom. Annual, general, and quarter sessions, a county court, and a court of chancery for Lancashire (alternately with Liverpool) are held in the town. Races are held annually in the Holme, on the left bank of the river. A horse-fair, called Great Saturday, is held during the week ending the first Sunday after Epiphany; a fair of three days begins March 27th, one of eight days May 26th, and one of five days November 7th. A festival called a Guild Merchant is held by the corporation every twentieth year for a week at the end of August or beginning of September. The markets are held in a spacious and well-paved square in the centre of the town. The Saturday market, which is the largest, is principally for corn; those of Wednesday and Friday are for butter, vegetables, and fish.

PRESTON, GREAT, West Riding of Yorkshire, a village, and the seat of a Gilbert's Poor-Law Incorporation, in the parish of Kippax, is situated in 53° 46' N. lat., 1° 23' W. long., distant 8 miles E.S.E. from Leeds, and 184 miles N.N.W. from London. The population of the joint township of Great and Little Preston in 1851 was 464. Great Preston Poor-Law Incorporation comprises 43 parishes and townships, with an area of 69,626 acres, and a population in 1851 of 22,316.

PRESTON PANS. [HADDINGTONSHIRE.]

PRESTWICH, Lancashire, a village, and the seat of a Poor-Law Union, in the parish of Prestwich-cum-Oldham, is situated in 53° 39'

N. lat., 2° 17' W. long., distant 4 miles N. by W. from Manchester, and 187 miles N.W. by N. from London. The population of the township of Prestwich in 1851 was 4096. The living is a rectory in the archdeaconry and diocese of Manchester. Prestwich Poor-Law Union contains 11 townships, with an area of 11,088 acres, and a population in 1851 of 41,043. The parish church is ancient. The Wesleyan Methodists have a chapel, and there is a National school. The population, as in all the district around Manchester, is chiefly employed in calico printing, gingham making, and other branches of the cotton manufacture.

PREUILLY. [INDRE-ET-LOIRE.]

PREVESA, a fortified town in European Turkey, is situated on the north side of the entrance of the Gulf of Arta, in 38° 57' N. lat., 20° 49' E. long., about 3 miles distant from the ruins of the ancient Nijopolis founded by Augustus Cæsar in commemoration of his naval victory of Actium. The Venetians obtained possession of it in 1684. It came with the Ionian Islands into the hands of the French by virtue of the treaty of Campo Formio in 1798. War having broken out between France and the Porte, a force of 5000 Albanians, headed by the son of Ali Pasha, of Jannina, took and plundered Prevesa, the population of which is said at this time to have amounted to 10,000 or 12,000. Ali made Prevesa his chief naval station, fortified the town with new works, and adorned it by building here a very handsome seraglio, which is situated at the entrance of the bay. Some new and handsome houses were built by the Turks and Albanians who settled here, but Prevesa has never recovered its prosperity under the Turkish yoke. The population is now estimated at about 4000.

Prevesa exports wheat and maize, timber, oil, tobacco, cotton, wool, and capotes, or Albanian cloaks, to the Ionian Islands, to Malta, and to Italy. The imports are coffee, sugar, common cloth, velvet, iron goods, fire-arms, &c.

PREZ-EN-PAILL. [MAYENNE.]

PRINCE EDWARD ISLAND, a British colony, is situated on the south side of the Gulf of St. Lawrence, between 45° 53' and 47° 7' N. lat., 62° and 64° 27' W. long. Its length from east to west is about 140 miles, and it varies in width from 10 to 30 miles. The area is 2134 square miles. The population in 1848 was 62,678; in 1852 it was about 90,000.

Prince Edward Island is separated from Nova Scotia and New Brunswick by Northumberland Strait, which varies in width from 9 to 30 miles. The island is almost entirely surrounded with red cliffs, varying from 20 to 100 feet in height. The coast is so intersected by bays and creeks that no part of the island is at a greater distance than eight miles from the ebbing and flowing of the tide. Hillsborough Bay enters the island from the south with a wide opening, but afterwards becomes so narrow that it appears like a river, and is called Hillsborough River. The tide ascends nearly to its extremity, which is only about a mile distant from Savage Harbour on the northern coast. Farther west are Halifax Bay and Richmond Bay, the former intersecting the island from the south, and the latter from the north, till there remains between them only an isthmus about a mile and a half wide.

The surface of the island consists of gentle ascents and descents. A series of heights intersect the island about the middle, running from north to south. Streams and springs of fresh water are abundant. The spring and autumn are both of short duration. In the beginning of June summer bursts forth, and continues till the end of September, when the evenings get cool, and the autumn commences. During January and February the weather is generally steady, with the thermometer occasionally from 10° to 20° below zero of Fahrenheit; but the air is dry and clear. In summer the heat is tempered by the sea-breezes.

The soil is generally fertile, and consists for the most part of a thin layer of decayed vegetable substances surmounting a light loam a foot or more in depth; below, a stiff clay resting on sandstone predominates. The island was formerly covered with large forest-trees, especially pine, the timber of which has been so largely exported to England that little more now remains than is required for ship-building, house-building, and other local purposes.

The soil and climate of this island are particularly suited for agriculture. All kinds of grain and vegetables cultivated in England grow well; and well-cultivated farms produce wheat, barley, oats, green crops, and grasses in abundance and of excellent quality. The horses are small, but strong and hardy. The breed of cattle has been improved by the introduction of Durham and Ayrshire bulls, and that of sheep by the introduction of Leicester and Southdown stock from England. Swine are plentiful. The fur-bearing animals have become scarce. Seals are found in the bays and along the coasts in summer and autumn, and vast numbers sometimes come down on the ice when it breaks up in the Polar Seas. As a fishing station the island is one of the best in the Gulf of St. Lawrence; and the harbours on the north side are most conveniently situated for carrying on this pursuit. Cod and mackerel are abundant in their respective seasons. The inhabitants however do not prosecute fishing as a branch of commerce, only taking what is required for their own consumption; while from 200 to 300 fishing-vessels from the United States are engaged during the summer in fishing round the shores of the island.

Prince Edward Island is divided into three counties; Queen's County includes the central part of the island, King's County the eastern part, and Prince's County the western part. The settlements are dispersed all over the island, except the western end, which is still to a great extent overgrown with forest. *Charlotte Town*, the capital and seat of government, is situated in Queen's County, at the junction of the Hillsborough River with the York River, on an angular piece of ground which rises gradually to the north-west. These two rivers, together with the Elliot River, form the Inner Harbour, which is a well-sheltered basin about three miles wide, whence the united streams discharge their waters by a single channel about half a mile wide into Hillsborough Bay, which is called the Outer Harbour, and is capacious and safe for vessels of any burden. The town is regularly built, with broad streets intersecting each other at right angles. The public buildings consist of the Colonial Building, a handsome stone edifice, containing accommodation for the legislature, public officers, and supreme courts of law and chancery; the old court-house; an asylum for lunatics and indigent persons; an Episcopalian church, Roman Catholic church, Scotch church, Methodist chapel, and Baptist chapel. There is an academy established by the colonial legislature, and endowed with 200*l.* a year, and also a National school, partly supported by the colonial government. The population of the town is nearly 5000. *George Town*, the capital of King's County, is situated on the eastern coast, on a point of land in the Bay of Three Rivers, or Cardigan Bay, which is formed by the junction of the rivers Cardigan, Montague, and Brudenell. The town is regularly built, and contains about 700 inhabitants. The harbour is excellent, and is very conveniently situated either for fishing or trading. *Prince Town*, at the entrance of Richmond Bay, has been regularly laid down as the capital of Prince's County, but has very few inhabitants; but the village of *St. Eleanor's*, at the head of Richmond Bay, is a thriving place, and contains the county jail, the court-house, and an Episcopalian church.

The population of the island is composed of mixed races, about three-fourths of the whole number being natives of the island, chiefly descendants of the French Acadians, who remained after the colony was ceded to the British in 1763; of settlers from the Highlands of Scotland, who were introduced by the proprietors of townships subsequently to 1770; and of American loyalists, to whom lands were granted at the close of the revolutionary war. There are also about 300 Indians remaining on the island of the once numerous Micmac tribe. The remaining fourth of the population are immigrants from England, Scotland, and Ireland. Of the entire population nearly one-half are Roman Catholics, about one-third are Presbyterians, and about one-ninth are Episcopalian. Free schools have been established throughout the island, and a visitor appointed; there are also district schools with a visitor for each county.

The commerce of the island consists in the exchange of its agricultural produce, timber and deals, and a small quantity of dried and pickled fish, for British and American manufactures and other articles of consumption. The manufactures of the island are of small amount, consisting of linen and flannel for domestic use, coarse woollen cloth, and leather.

The civil establishment consists of a lieutenant-governor, whose salary is paid by the British government, a chief-justice, an attorney-general, an assistant-judge, and a master of the rolls, and other officers whose salaries are paid by the colonial government. The revenue of the island in 1852 was 20,856*l.*; the expenditure was 14,857*l.* By means of the sub-marine telegraph Prince Edward Island has communication with the neighbouring provinces and with the United States.

PRINCE OF WALES ISLAND, or PULO PENANG, is the seat of government of the British possessions in the Strait of Malacca. These possessions consist of Prince of Wales Island, Province Wellesley and the provinces of MALACCA and SINGAPORE. The two latter are noticed under separate heads. These possessions, under the title of the *Eastern Straits' Settlements*, were in 1851 by an order of the Court of the East India Directors, formed into a separate government.

Prince of Wales Island lies between 5° 18' and 5° 30' N. lat., 100° and 100° 9' E. long., and extends from south to north about 16 miles, with an average breadth of 8 miles, which gives a surface of nearly 130 square miles. This island consists of a mass of rocks, and of two tracts of alluvial soil, which extend on the eastern and western sides of the rocks. The western plain is mostly a swamp, and nearly uninhabited; but the eastern, which on an average is two miles wide, and opposite George Town more than four miles, is well cultivated and populous. The highest portion of the mountains occupies the middle of the island, where Mount Elveira, or Mount Macalister, rises to the elevation of about 2500 feet. The hills which lie between this highest range and the eastern plain rise to the height of 600 to 800 feet. The mountains are covered with lofty trees, except their summits, which are naked for about 200 or 300 feet from the highest point downwards.

Province Wellesley lies opposite Prince of Wales Island, on the Malay Peninsula, and is separated from the island by a strait, which at its southern extremity is nearly 10 miles wide, but grows narrower farther northward; opposite Fort Cornwallis it is hardly two miles wide. Province Wellesley extends from 5° 10' to 5° 35' N. lat., and lies between 100° 11' and 100° 18' E. long. It extends along the coast

about 80 miles, and from 6 to 10 miles inland. On the east it borders on the kingdom of Keddah, or Queda, which is dependant on Siam. The northern boundary-line is formed by the river Muda, which separates it from Keddah, and on the south it is separated by the river Kream from the state of Perak. The area is estimated at 160 square miles. The mountain ranges in this part do not approach so near the sea as to enter the province, except near the river Juru ($5^{\circ} 20' N. lat.$), where one of their offsets terminates in the Moratajam, a hill 1800 feet high, the western slope of which lies within the British territory. The coast-line exhibits a narrow sandy belt of low land in the northern districts, and in the southern a broad mud flat covered with mangrove-trees and flooded at high-water. Behind the sandy belt and mangroves there are extensive alluvial tracts under rice cultivation, alternating with gentle swells of light soil running parallel to the coast. About four or five miles from the coast are dry alluvial plains which stretch south and north. The soil of the alluvial plains and rice-grounds is superior in fertility to lands of the same classes on Prince of Wales Island.

There are no permanent streams in the Island, but several rivers traverse Province Wellesley from east to west, rising in the elevated mountains in the state of Keddah. All these rivers have bars at their mouths, generally with seven to nine feet of water on them, and they are navigable for moderate-sized vessels nearly the whole length of their course within the province. Between the rivers Muda and Pry is the mouth of a creek called Qualla Tulloh, which forms a good harbour for boats; and near it is an extensive village of the same name.

The dry and wet seasons in these countries are not so distinctly marked as in other parts of the East Indies. What is properly called the rainy season occurs from September to November, but showers, frequently heavy, fall in all the other months. The heat is not oppressive, and is greatest in June and July. The highest temperature in George Town is 90° Fahr., and the lowest $70\frac{1}{2}^{\circ}$. The northern half of Province Wellesley has the more healthy climate, as it enjoys the advantages of a regular change of sea and land breezes. The rainy season is considered the spring, and January, February, and March the autumn; in the former period the rice is sown, and in the latter it is harvested.

Prince of Wales Island derives its importance partly from the cultivation of spices. Pepper has long been the object of an extensive cultivation, but of late it has been to a considerable extent replaced by clove and nutmeg trees. The mace and cloves grown in the island are considered the finest in the world. The sugar-cane is partially cultivated on Prince of Wales Island, and extensively in Province Wellesley, especially in the central and southern districts; the cultivation in both places is in the hands of the Chinese settlers. Tobacco, coffee, and cotton are only raised for consumption. A considerable quantity of betel is exported to the neighbouring state of Keddah. The areca raised on the east coast of Sumatra is brought to this island, and thence exported to other parts of Asia. Rice and Indian corn are the only kinds of grain cultivated. The plantains and bananas are, next to rice, the principal objects of agriculture, and in times of scarcity supply in some measure the place of grain. A great variety of fruit-trees are cultivated; and many different kinds of trees are met with in the forests of the country which are applicable to building and other domestic uses. Besides the native vegetables, which are numerous, the Chinese cultivate cabbages, celery, and lettuce. There are many varieties of sweet potato, one of which is much esteemed. Yams, both red and white, and French beans, are extensively grown.

Buffaloes and cattle are numerous. The cattle are reared for the dairy, cattle for slaughter being chiefly imported from Keddah and Patani. The black buffalo is most prized, both for draught and slaughter. Goats and sheep do not abound, but a great number of hogs are reared by the Chinese. Poultry are reared in large numbers in Province Wellesley. The elephant, rhinoceros, and tiger are found in that province. The elephants are sometimes exported to Madras, and used in the neighbouring states to carry the tin from the mines to the coast. They are also killed by the Malays for the sake of the ivory. The rhinoceros is killed for its horn and hide. There are two species of wild ox, and abundance of wild hogs and deer. Birds are found in great variety, and of great beauty. Fish is abundant, and the fishing-stakes afford nearly exclusive employment to numbers of Chinese and Malays. A species of sea-turtle abounds in some places, and another smaller kind in the rivers: the eggs of both species are eagerly sought after.

When the English in 1786 took possession of Pulo Penang (the original name of Prince of Wales Island), they found only a few Malay families, mostly fishermen; but natives from the neighbouring countries, as well as Chinese and natives from Hindustan, soon flocked to it, and the population in 1835 consisted of ten different nations, amounting altogether to 40,207.

When the British acquired the coast-line called Province Wellesley, it was very thinly inhabited; and though the population gradually increased, it did not exceed 5000 in 1821. But in this year the Raja of Ligor invaded the neighbouring state of Keddah, and took possession of it for the king of Siam. Upon this a great part of the Malay population abandoned Keddah, put themselves under the protection of the British, and settled in Province Wellesley. In 1835 the population amounted to 46,880, chiefly Malays and Chinese.

GEOG. DIV. VOL. IV.

George Town is built on the eastern side of Prince of Wales Island, where it projects into the strait, and contains a population of 20,000, mostly Chinese. It is the seat of the Governor of the British Possessions on the Strait of Malacca, and carries on a considerable commerce. The harbour, which lies on the south-east of the town, is well sheltered. It is visited by most of the vessels sailing from Hindustan to China, and likewise by vessels from China, Arabia, and Siam. There are sometimes 300 vessels in the harbour. The establishment of the free port of Singapore took away some of the commerce of George Town. The articles brought to the port include pepper, benzoin, camphor, gold-dust, areca-nuts, rice, ratans, sago, brimstone, tin, arrack, sugar, oil, tobacco, birds'-nests, trepang, and ivory. It exports to the eastern coast of Sumatra and the Malay countries north of Malacca various kinds of piece-goods from England, Bengal, and Comandul; cotton, opium, iron, steel; European coarse blue, red, and green cloth, and coarse cutlery. James Town is a small but thriving place, about a mile from the sea, on the eastern plain of Prince of Wales Island, in a very fertile district. There are no towns in Province Wellesley; but in the northern more fertile and better cultivated districts, the higher parts of the low ridges are in some places covered by continuous rows of houses for several miles. The most extensive of these villages is Pinaga.

Before 1786 the island and province belonged to the small kingdom of Keddah. In the war between the English and French, which terminated in 1783, the want of a good harbour in the southern part of the Gulf of Bengal was much felt by the British. The island of Penang was found fit for that purpose, and it was accordingly purchased by the East India Company from the then proprietor, an Englishman, Captain Francis Light, who had received it from the king of Keddah as a marriage-portion with his daughter. Captain Light was appointed first governor, and the sovereignty first of the island and afterwards of the coast, was ceded by the king of Keddah in consideration of an annual payment. The British flag was hoisted on the 7th of July, 1786. The country, which at the time of its cession, contained only 1500 inhabitants, including a very few Chinese, was then termed Point Wellesley; but this not being a very correct designation for a line of coast, was subsequently changed to Province Wellesley. The estimated revenue of the government of Prince of Wales Island for 1851-52 was about 19,500*l.*; the estimated charge was about 40,000*l.*

PRINCE-TOWN. [DEVONSHIRE; PRINCE EDWARD ISLAND.]

PRINCE WILLIAM'S SOUND is a wide bay on the north-west coast of North America, extending, with several branches, between 60° and $61^{\circ} N. lat.$, 146° and $148^{\circ} 30' W. long.$ It is called by the Russians Tshongathkaia. It opens to the south, and the entrance contains two large islands, of which the eastern is called Rose Island, and the western Montague Island. In both islands there are good harbours, and the largest vessels may enter the bay on both sides of Montague Island. Rose Island contains Port Etches, where the Russians have a factory, and a wooden fort, called Fort Constantine. The islands are rocky and mountainous. The country abounds in pine-trees, alder, and hazel-trees. Wild berries are plentiful. Sea-otters and foxes are frequently met with, and other fur-bearing animals are abundant in the forests. The natives, who are few in number, and called Oogaliakhmutes, live mostly on the produce of their fishing.

PRINCE'S RISBOROUGH, Buckinghamshire, a market-town, in the parish of Prince's Risborough, is situated near the Oxfordshire border, in $51^{\circ} 43' N. lat.$, $0^{\circ} 50' W. long.$, distant 8 miles S. from Aylesbury, and 37 miles N.W. by W. from London. The population of the parish in 1851 was 2317. The living is a perpetual curacy in the archdeaconry of Buckingham and diocese of Oxford. According to the local tradition, Edward the Black Prince had a house in the place, from which circumstance the town had its name. Besides the parish church, an ancient edifice, which has been recently repaired and considerably enlarged, there are chapels for Baptists and Wesleyan Methodists; and National, British, and Infant schools. The market-house, rebuilt in 1824, is a small brick edifice. The market is on Thursday, and fairs are held on May 6th and October 21st. Petty sessions are held in the town monthly.

PRINCIPATO CITRA, a continental province of the kingdom of the Two Sicilies, is bounded N. by the province of Principato Ultra, W. by the Gulf of Salerno and the province of Naples, S. by the Gulf of Policastro, and E. by the province of Basilicata. It lies west of the central ridge of the Apennines, and between that and the coast of the Mediterranean, except a small portion which spreads along the eastern slope of the Apennines, about the sources of the river Agri. The length of the province is about 80 miles from north-west to south-east, and its average breadth is about 80 miles. The area is 2261 square miles; the population in 1851 amounted to 553,809. The central and larger part of the province consists of the basin of the Sele and its affluents. The Sele (Silarus) rises in the central Apennines near Conza, and flows in a southern direction to its junction with the Tanagro, or Rio Negro, a larger stream, which flows from the south-east through the beautiful and fertile Val-di-Diano; the united stream then runs south-west to the sea, which it reaches a few miles north of the ruins of Pastum. The Tanagro is joined, before its confluence with the Sele, by the Rio Bianco, which descends from the Apennines of Muro in Basilicata. At the mouth of the Sele was

the ancient Portus Alburnus, near which the Argonauts erected a famous temple to Juno. The plain of Paestum southward from the Sele, is marshy and unhealthy; it is overrun with buffaloes, wild horses, pigs, and sheep. In this plain Crassus defeated the rebel army of Spartacus, and in the 15th century the Duke of Anjou defeated the Aragonese. Between the Calore and the Sele is the royal chase and forest of Persano, 35 miles in circumference, and backed by the range of the Monte Alburno. The plain north of the Sele to the Tusciano is also unhealthy. Above this plain, to the eastward, is the pretty town of *Eboli* (near the ruins of the ancient *Eburi*), with 5000 inhabitants.

The valley of the Tanagro is bounded on the west by a detached ridge called Monte-Alburno, which runs about 20 miles from north-west to south-east. West of the Alburno is the valley of the Pietra or Calore, which enters the Sele a few miles above its mouth. The valley of the Calore is bounded to the south-west by another ridge, which rises east of Paestum, and on which stands the town of Capaccio, with 2000 inhabitants. [PAESTUM.] South of this ridge is a fine region of hills and valleys sloping towards the coast, and extending to the south as far as the Gulf of Policastro. This tract of country, which was known to the ancients by the name of 'Paestanæ Valles,' is now called 'Il Cilento;' the small river Alento flows through it. The region of the Cilento is favourable to the growth of all sorts of fruit, and it contains good pasture: the inhabitants are noted for their industry. They have numerous coasting vessels, in which they trade with Salerno and Naples. A good road leads from Salerno to *Il Vallo*, which is the principal town of the district: population 7500. The town of *Policastro* was formerly of some importance, but being sacked and half destroyed by the Turks in the 16th century, it has never recovered, and is now an insignificant place of only about 700 inhabitants. *Sopri*, which is farther east in the innermost recess of the Gulf of Policastro, is a place of some trade, and has a natural harbour. It is said to mark the Scydros of Herodotus. About two miles above the mouth of the Alento on a lofty hill (Castellamare della Bruca) is the supposed site of the ancient *Velia* or *Elea*, founded by the Phœacians, B.C. 540, and famous for the Eleatic school of philosophy established here by Zeno. Farther down the coast is the Punta di Palinuro, a promontory named from Palinurus, the pilot of the Trojan fleet. The little rivers Molpa and Mingardo enter the sea on the eastern side of the promontory. The Alento is the ancient Heles. The hill of Monte della Stella, which stands between the Alento and Il Vallo, is covered with ruins supposed to mark the site of *Petilia*, the ancient capital of Lucania.

The southern coast of the peninsula of Sorrento, as far as Cape Campanella, belongs also to the province of Principato Citra. The Gulf of Salerno extends nearly in a semicircle from Cape Campanella to Point Licosa, a promontory opposite the island of Licosa, the ancient Leucosia. The towns of Vietri (3000 inhabitants), La-Scala, AMALFI, and SALERNO, the capital, are in this district, which is remarkably populous and healthy. The inhabitants are mostly engaged in the coasting trade and the fisheries.

A long offset of the central Apennines, called Monte San Angelo, runs in a westward direction, dividing the province from Principato Ultra, and then running along the whole length of the peninsula of Sorrento. This ridge forms a natural boundary between the plain of Campania and the basin of the Sele. The province however includes also a district north of this ridge, extending to the banks of the Sarno.

Among other towns of the province, besides those already mentioned, are the following:—*La-Cava*, a town of 5000 inhabitants, and a bishop's see, delightfully situated in a valley of the Apennines, on the high road from Naples to Salerno. The population is chiefly employed in manufacturing linen, silk and cotton stuffs, and pottery. The neighbouring Benedictine monastery of La-Trinità, founded in 1025, is famous for its vast collection of historical, judicial, and religious manuscripts, amounting to about 40,000 parchment rolls, and above 60,000 paper manuscripts. The library is still more famous for its rare manuscripts and early printed books; among the former is the manuscript Latin Vulgate, written on vellum, between the 5th and the 7th century. The abbey church contains tombs of Sibilla (queen of Roger II., king of Naples and Sicily), and of several antipopes. A fine grotto beneath the abbey has originated the name of the town. The railway along the coast from Naples penetrates into the province as far as NOCERA, a short distance north-west of La-Cava. Near Nocera is *Pagani*, a village situated on a hill of tufa; its church of San Michele is of some note, as containing the remains of St. Alfonso de Liguori. The district between La-Cava and Nocera is studded with hamlets, churches, villas, and ruined castles, embosomed among trees or surrounded by vineyards and cornfields. The great Calabrian road after passing through Salerno and Eboli, runs east to the lower part of the Negro, near Auletta, whence it runs up the whole length of the Val di Diano, along the right bank of the Negro. This beautiful and fertile valley, 20 miles long and 8 miles broad, is situated between the main ridge of the Apennines and the Monte-Alburno, which is scored by deep ravines and clothed with extensive forests of oak and beech. In the Val di Diano are *La-Polla* (population 7000), situated on a hill, at the base of which the Negro disappears and runs underground for two miles, emerging again at Pertosa; *La-Sala*, a thriving town of 8200 inhabitants; *Diano* (population 7000), which

is the Lucanian *Tegianum*, and gives name to the valley; and *Padula* (population 9000), near which are the remains of the monastery of San Lorenzo, ruined by the French. *Sarno*, a considerable town in the plain of Campania, near the river of the same name, 5 miles N. from Nocera, has several convents and churches, and about 10,000 inhabitants. Between the Sarno and the Monte San Angelo, Narzes defeated the Goths under Teias, A.D. 533.

PRINCIPATO ULTRA, a province in the kingdom of the Two Sicilies, is bounded N. by the provinces of Sannio and Capitanata, from which it is divided by the central ridge of the Apennines; E. by Capitanata; S. by Basilicata and Principato Citra; and W. by Terra di Lavoro. The province of Principato Ultra lies almost entirely in the Apennines, and between the western lower ridge of these mountains, including Monte Taburno, Tifata, and Monteforte, which divides the basin of the river Calore, an affluent of the Volturno, from the plains of Campania, and the central ridge, which forms the watershed between the streams that flow into the Mediterranean and into the Adriatic. The Calore and its affluents the Tamaro and Sabato are the principal rivers of the province. A small part of Principato Ultra however extends along the eastern slope of the central ridge, where the river Ofanto (Aufidius) has its source in the neighbourhood of Conza and Nusca. The area of the province is 1407 square miles. The population in 1851 amounted to 383,414. The province is divided into 3 districts and 132 communes.

The temperature is considerably lower than that of Campania; in some of the valleys however the summer heats are occasionally very great. Some places in the valley of the Calore are subject to the malaria in consequence of stagnant waters. The country produces corn, fruits in abundance, silk, some wine, and has excellent pasturage for cattle. There are iron-foundries and paper-mills at Atripaldi, on the Sabato, near Avellino. Some woollen manufactures are carried on in the principal towns. There are beds of lignite near Montefusco. Benevento and its territory, although geographically included within the boundaries of Principato Ultra, is a dependency of the Holy See. [BENEVENTO.] The principal towns of the province are—AVELLINO; ARIANO; Montesarchio, a walled town with 6000 inhabitants; Montefusco, an episcopal town, with a population of 3000; and Sant' Angelo dei Lombardi, population about 6000.

The province of Principato Ultra occupies the country of the ancient Hirpini, one of the nations of the Samnite confederation. The celebrated pass called Furculæ Caudinæ, where the Samnites compelled the Roman army to pass under the yoke; and the lakes of Amsanctus, still called Amsanto and Le-Mofete, and still emitting destructive gases as in the days of Virgil, are in this province. The lakes are about four miles from the village of Frigento.

PRITTLEWELL. [ESSEX.]

PRIVAS. [ARDRECH.]

PROVIDA, the ancient *Prochyta*, is an island at the north-west entrance of the Bay of Naples, situated between the island of Ischia and Cape Misenum. It is about eight miles in circumference, generally level, with some gently-rising grounds, and is fertile and well cultivated. The vineyards produce good common wine. The population exceeds 10,000; many of them are engaged in the tunny and coral fisheries. The island contains several villages, a small fort, and a royal country-seat.

PROME. [BURMA.]

PROPONTIS. [MARMARA, SEA OF.]

PROSNTZ. [MORAVIA.]

PROVENCE, an old province of France, including a portion of the territory of the Roman *Provincia*, from which the name is derived, was bounded E. by Italy, N. by Dauphiné, N.W. by the Comtat-Venaissin and the Comtat-d'Avignon, W. by Languedoc, and S. by the Mediterranean. It now forms the departments of BOUCHES-DU-RHÔNE, VAR, Basses-Alpes [ALPES-BASSES], and part of VAUCLUSE. It was divided into Upper and Lower Provence, which had Digne and Aix for their respective capitals. In Roman times the country was inhabited by various tribes, and formed part of Gallia Narbonensis. About A.D. 416 the Romans were dispossessed by the Visigoths and Burgundians, but recovered a portion along the coast from the former in 450. The next invaders were the Franks, who in 534, under the sons of Clovis, by conquest or cession became masters of the whole territory, which was included also in the empire of Charlemagne. Under Charlemagne's descendants Provence formed part of the kingdom of Arles; it then passed to hereditary counts descended from the counts of Barcelona. Raimond Bérenger V., the last count of Provence, left four daughters, with the youngest of whom, Béatrix, in 1245, the county of Provence passed to Charles of France, count of Anjou. The Angevine family held it till 1481, when Charles, count of Anjou, and king of Sicily, made it over to Louis XI. and his successors; and in 1487 it was re-united to the crown by Charles VIII. A sketch of the Provençal language is given in the article FRANCE, vol. ii., col. 1036.

PROVIDENCE. [RHODE ISLAND.]

PROVIDENCE, NEW. [BAHAMAS.]

PROVIDENCE, OLD, is an island in the Caribbean Sea, about 125 miles from the Mosquito Coast, and between 13° 19' and 13° 32' N. lat., 81° 20' and 81° 28' W. long. This island is nearly 4½ miles long, and 2¼ miles in its greatest breadth. The centre of the island

rises to 1190 feet above the level of the sea, so that it can be seen at a distance of from 33 to 86 miles. Separated from its northern end by a cut or channel of from 40 to 60 yards wide, is the island of Santa Catalina, 1800 yards long by 1300 yards in its greatest breadth, forming the northern boundary of a harbour in Old Providence which affords secure anchorage in 2 to 3½ fathoms. The soil is very productive, and affords rich crops with very little cultivation. The island belongs to the state of New Granada, and the population amounts to only a few hundred persons.

PROVINCS. [SEINE-ET-MARNE.]

PRUSSIA, a kingdom in the north of Europe, consists of two great divisions, which are unconnected with one another. The western and smaller portion, comprising Rhenish Prussia and Westphalia, is situated on both sides of the lower Rhine between 49° and 52° 15' N. lat., 6° and 9° 30' E. long. It is bounded S. by the French department of Moselle, W. by Belgium and Holland, N. by Holland and Hanover, and E. by Hanover, Lippe, Waldeck, Electoral Hesse, Nassau, Hesse-Darmstadt, and the Bavarian Palatinata. The eastern and larger portion of the kingdom extends from 49° 50' to 55° 50' N. lat., 9° 50' to 22° 50' E. long. On the north-west of it lies Mecklenburg; on the west Hanover, Brunswick, and the electorate of Hesse. Along the southern boundary are the duchies of Saxe, the kingdom of Saxony, and several portions of the Austrian monarchy, and along the east is Russia. The area and population of Prussia and its provinces are given in the following table:—

Provinces.	Area in Square Miles.	Population in 1852.	Number of population to the square mile.
East Prussia . . .	14,946	1,531,273	102,453
West Prussia . . .	9,981	1,073,476	107,552
Posen . . .	11,353	1,331,745	121,707
Pomerania . . .	12,153	1,253,904	103,176
Silesia . . .	15,695	3,173,171	202,177
Brandenburg . . .	15,534	2,205,040	141,949
Prussian Saxony . . .	9,747	1,828,732	187,620
Westphalia . . .	7,786	1,504,251	193,199
Rhenish Prussia (Rhein-Provinz, and Hohenzollern)	10,759	2,972,130	276,246
Total . . .	107,954	16,923,721	156,797

The provinces, the 25 governments into which they are divided, and all the chief towns of Prussia are noticed in this work for the most part in separate articles.

Surface and Soil.—Rhenish Prussia is divided into two portions by the Rhine, and each of these divisions consists of an elevated table-land and a low plain. The table-land on the west bank of the Rhine is connected on its south-eastern border with the Hardt Mountains, as the northern extremity of the Vosges is called. The Hardt Mountains attain a general elevation, varying between 1100 and 1600 feet; their highest summit however is above 2000 feet. From this mountain region the table-land extends northward to the parallel of the towns of Bonn and Aix-la-Chapelle. Along the right bank of the Moselle is the highest part of the table-land, which appears in the shape of a range elevated on a very high base. Part of this range is called the Hochwald, and another part the Soonwald: its mean elevation is more than 2000 feet above the sea-level, while the highest summit, called the Walderbeenkopf, attains nearly 2690 feet. The larger part of the table-land lies to the north of the Moselle, and is called the Eifel, and in its northern districts the Hohe Veen. The mean elevation of this part is about 1600 feet, and it may be called a plain; neither the eminences nor the depressions are great. A few hills rise from 500 to 700 feet above it. [EIFEL.] The level country which extends from the northern border of the Eifel between the Rhine and the Maas, is nearly flat. Its fertility is considerable, and it produces rich crops of all kinds of grain.

Opposite the table-land of the Eifel, on the right bank of the Rhine, is a similar table-land, which extends southward through Nassau, where it rises along the banks of the Main and Rhine to a more elevated ridge known under the name of *Taunus* which, like the Hochwald and Soonwald, attains a mean elevation of 2000 feet; and its highest summit, the Feldberg, is 2850 feet. From the Taunus the table-land extends northward, and terminates on the northern bank of the river Ruhr, an affluent of the Rhine. It extends about 40 miles farther north than the table-land west of the Rhine, and, between the Lahn and Sieg rivers, is called *Westerwald*; and, between the Sieg and Ruhr, *Sauerland*. The mean elevation of this district does not differ from that of the Eifel, being also about 1600 feet above the sea-level. But the surface is more uneven, especially that of the *Westerwald*, which contains several high summits, among which the *Salzburgerkopf* is 2172 feet high. Lava, trachyte, and basalt are also frequently met with in the *Westerwald*, but not north of the Sieg river. The soil of the whole region is poor; and it is unsuited for the production of any grain except oats, which supply the inhabitants with bread. The population is considerable, especially on the *Sauerland*, which is, without exception, the most manufacturing district in Germany, a

circumstance owing to the abundance of iron and coals which this part of the table-land contains. Agriculture is also in an advanced state in parts of the region, especially in the valleys of the Ruhr, the Senne, and the Lippe, where it is stimulated by the presence of a large mining and manufacturing population. [ARNSBERG.]

The Rhine separates the two table-lands just mentioned, and runs in a narrow valley which is noted for its picturesque beauties. It begins to run between the mountains at Bingen, where its surface is a little more than 200 feet above the sea-level. It leaves the mountain region at Bonn, where it is not more than 120 feet above the sea. Between Bonn and Düsseldorf, a distance of nearly 50 miles, the fall is only 26 feet.

That portion of Rhenish Prussia which lies to the north of the *Sauerland*, and extends to the northern limits of this part of Prussia, has a soil which varies greatly in fertility. The western portion of it, from the Rhine to the banks of the Ems, is nearly a desert: the cultivable ground, which only occurs in isolated places, is but a small portion of the whole. On the east of the Ems the soil is much better, especially as we approach the hilly country, which extends along the western side of the river Weser, where wheat is raised; some good tracts occur also along the northern declivity of the *Sauerland*, but they are not extensive.

The Eastern and larger portion of Prussia is a part of the great plain of Eastern Europe, which extends from the Strait of Dover to the foot of the Uralian Mountains. Mountains occur only along the southern boundary. On the boundary of Prussia and Bohemia are the Sudetic Mountains, whose northern portion is called *Riesengebirge*, or *Giant Mountains*. There are mountains also on the line which separates Prussia from Saxony. Where the south-western angle of Prussia is intersected by the duchies of Saxe and the territories of the prince of Reuss, and partly also by Hanover, it comprehends parts of the *Thüringerwald* and of the *Harz* mountains.

The *Sudetic Mountains* are not connected with the *Carpathian Mountains*. At the north-western extremity of the last-mentioned range there is a nearly level plain, between 45 and 50 miles wide, on which the *Oder* rises. This plain is only 600 or 700 feet above the sea-level; and it descends on the north along the course of the river *Oder* with a gentle slope, but rapidly towards the south. On the north-western edge of this plain the southern extremity of the *Sudetic Mountains* commences with the mountain plain of *Glatz*, which is surrounded by elevated ranges. It rises with a steep ascent, and extends in a north-western direction for about 70 miles, when it again descends with a similar slope. Its interior, the mountain plain of *Glatz*, is between 1200 and 1300 feet above the sea; but the ranges which surround it rise to 3500 and 4300 feet. The highest summit, which lies at the south-eastern corner of the mountain mass, is called the *Altvater*, and is 4281 feet above the sea. The whole region occupies a width of about 27 miles, and is called the *Mountains of Glatz*. Between the northern extremity of this range and the *Giant Mountains* is a tract, the surface of which is chiefly occupied by high hills; but its mean level above the sea does not exceed 1500 feet. It is followed in the same north-western direction by the *Giant Mountains*. [BOHEMIA.]

The *Thüringerwald*, which is at the south-western extremity of this part of Prussia, is a mountain-range nearly 50 miles long, but only from 8 to 12 miles wide. The mean elevation may be 2000 feet above the sea, and the highest summit, the *Great Beerberg*, is 3258 feet. A very small part of this range lies within the boundary of Prussia. The *Harz* is about 50 miles distant from the *Thüringerwald* on the north. The greater part of the country which lies between the *Thüringerwald* and the *Harz* belongs to Prussia; its general level may be about 900 feet above the sea, but some hills rise several hundred feet higher. The soil of the valleys, most of which are wide, is generally of excellent quality.

The great plain is not a dead level; the surface is diversified by several moderate elevations. Two of these traverse this portion of Prussia from east to west in its whole extent. The northern elevation runs generally parallel to the Baltic, and the southern in its eastern portion parallel to the *Sudetic Mountains*. The northern elevation is a portion of that high ground which extends eastward from the mouth of the *Elbe*, at a varying distance from the Baltic, to the sources of the *Volga*, through a space of more than 1000 miles. It is remarkable for the number of lakes dispersed over its broad surface and on the upper part of its slopes, and for the quantity of erratic blocks of granite which are imbedded in it. In the east of Prussia it occurs near 54° N. lat. The mean height of this part of the elevated ground may be about 450 feet above the sea-level; the lakes are more numerous than in any other part of it, and some are of considerable extent. The lake of *Spiriding* occupies an area of more than twenty square miles, and is nearly 400 feet above the sea-level; the lake of *Mauer* is nearly as large, and about 410 feet above the sea. The larger lakes taken together occupy a surface of 812 square miles, and the smaller lakes are very numerous. The soil is sterile, chiefly consisting of loose sand, covered in many places with heath, and in others with stunted pines. The portion of cultivable land is very small; that which supplies indifferent pasture for cattle and sheep is not much larger.

From this elevation the country slopes to the shores of the Baltic with an undulating surface, which is seldom varied by a hill. The

soil improves to the northward; along the Frisches Haff and the banks of the Pregel and the Niemen there are extensive tracts of great fertility. The most productive parts occur along the banks of the Niemen and Vistula, where the low river-bottoms are of great extent, and are protected against inundations by embankments. The embankments were erected along the Vistula, more than 600 years ago, by the Teutonic knights: they are above 150 miles long. The country which is thus secured from inundations is by far the most fertile tract in Prussia.

The elevation is interrupted by the wide valley of the Vistula, and on the west side of the river it does not rise opposite to the termination of the eastern portion, but much farther to the north. It begins about 25 miles south-west of Danzig, with a rather steep ascent, and attains its greatest elevation in the Thurmberg near Schönberg, which is nearly 1070 feet above the sea, and the highest hill between the Harz and the Ural mountains. From this place it extends in a south-western direction towards Behrendt, and thence to Märkiach Friedland, which is on the boundary-line between Prussia proper and Pomerania. So far it resembles in all its features a mountain system of a diminutive size. It continues with a less elevation and more extended slopes along the boundary-line between the provinces of Pomerania and Brandenburg, and terminates in abrupt hills not far from the banks of the Oder opposite Schwedt and Oderberg. The soil of this elevation is much better in this part than it is farther east, but it is only of very moderate fertility. To the south-east of the higher portion of the elevation extends the greatest waste in the Prussian monarchy, called the Tuchler Heide (Heath of Tuchel), which is 50 miles in length and from 20 to 25 miles in width. The soil is sandy, and, with the exception of shrubs and stunted pines, it produces scarcely anything that is useful to man. The spots of cultivable ground are few and of small extent. Towards the south, where it approaches the river Netze, an affluent of the Warta, the soil improves, and it is still better between the two last-mentioned rivers, but even here the fertility is not great. Between the Warta, where that river runs north, and the Vistula, there is a large tract of country which yields abundant crops of wheat and other grain. The tract which extends along the lower course of the Warta to the Oder, is much less fertile. On the northern side of the elevation the country is of moderate fertility, but it improves towards the shores of the Baltic. A few miles from the sea there is a tract several miles wide, which may be called fertile, but the shores consist of sand-hills which extend 2 or 3 miles inland, and occupy the whole coast from the eastern mouth of the Oder to the fertile delta of the Vistula near Danzig.

The Western portion of the elevation begins on the west of the Oder, between Schwedt and Oderberg, and runs west-north-west until it enters the duchy of Mecklenburg, through which it extends to Holstein and the banks of the Elbe. Its mean height is here probably less than 300 feet above the sea-level, and the surface is rather uneven, several hills rising from 100 to 200 feet above it. The soil of that part which is within Prussia is of moderate fertility; but along its northern declivity, and as far as the shores of the Baltic, including the island of Rügen, it consists of very good land, which yields large crops of grain.

The Southern elevation of the Prussian plain is connected at its eastern extremity with the highlands of Sandomir in Poland. It runs in a west-north-west direction along the eastern boundary of Silesia, where it rises to about 1000 feet above the sea-level north of the town of Breslau. In this part it is called the Heights of Trebnitz. The elevation is interrupted by the valley of the Oder between Leubus and Great Glogau, and farther on by the Bober, Neisse, and Spree; but it appears south of Berlin, where it is called the Fleming, and is 400 feet above the sea, or 300 feet above the site of the Prussian capital. It terminates not far from the banks of the Elbe, between Magdeburg and Burg; but a continuation of it appears on the western side of the Elbe, and after leaving the Prussian dominions it continues between the Elbe and the Weser to the vicinity of the North Sea between the mouths of these two rivers. In these parts it is very wide and comprehends the Heath of Lüneburg, which belongs to the kingdom of Hanover.

The country which lies between the two elevations, west of the meridian of 19°, is not distinguished by fertility, except in some of the river bottoms. Berlin lies in a sandy desert, which contains only small isolated tracts of fertile ground; and this sterile country, in some parts overgrown with fine forests, extends northward to the boundary of Mecklenburg, and southward to the Fleming. To the east and west of this waste, on both sides of the Oder, and towards the banks of the Elbe, the country is much better, but still not very fertile.

The country to the south of the southern elevation is more favoured by nature than the other parts of the Prussian monarchy. Completely sterile tracts are rare, and of small extent, with the exception of one which forms the southern district of Silesia, and is contiguous to the boundary-line of the Austrian dominions and of Poland. The remainder of Silesia is fertile, especially the plain, which extends on the left bank of the Oder from Oppeln to Liegnitz. The same observation applies to the provinces of Saxony, as far as it lies south of the southern elevation; the country about the town of Magdeburg is noted for its fertility, and is considered the granary of Berlin.

Climate.—The difference of temperature in the provinces is considerable. The following approximations are given by Berghaus:—

Divisions.	Mean Annual Temperature.	Mean of Summer.	Mean of Winter.
Western Prussia . .	49½ Fahr.	63°	35°
Central Prussia . .	48° "	64°	33°
Eastern Prussia . .	45° "	61°	26°

Berghaus observes, that the mean annual quantity of rain in the western division amounts to 20 inches, and only to 15 inches in the eastern division, but it is nearly impossible to determine this point, as the latter division annually experiences very heavy falls of snow, which it is nearly impossible to estimate, on account of the drift-storms, which accumulate the snow in some places to a great depth, whilst other places, which are exposed to their whole force, are quite bare. The prevailing winds in Prussia, as all over the west of Europe, blow from the west, and frequently with great force.

Rivers.—In Rhenish Prussia is the Rhine, which traverses this division of the monarchy from south to north, and is navigable for large vessels and steamers as far as it flows through the Prussian dominions. Its course above Bonn is rapid, and in some places eddies occur, but they are not dangerous. Several rivers join the Rhine from the east and west. From the east it receives the Sieg, on which timber is floated, and which is also navigable for 4 or 5 miles from its mouth; the Wipper, farther north, which is only navigable for a short distance from its mouth; and the Ruhr and the Lippe, both of which are navigable for 30 or 40 miles from their junction with the Rhine. On the left the Moselle falls into the Rhine at Cologne, and is navigable in the whole of its course through the Prussian dominions, an extent of more than 150 miles. Steamers ply on this river between Cologne and Trèves, and even up to Metz; the stream is rapid, and the up-navigation tedious.

In the eastern parts of Prussia four large navigable rivers, the ELBE, ODER, VISTULA, and the NIEMEN traverse the elevations which run through them from east to west. Between the two elevations however the affluents of these rivers run east and west, and as many of them are navigable for barges, they facilitate the intercourse between the countries on their banks. The navigable affluents of the Elbe from the west are the Saale, which begins to be navigable where it enters Prussia, the Unstrut, and the Elster; and from the east the Havel, which is joined by the Spree: the course of the Havel is nearly 250 miles, measured along the windings, and it is navigable for about two-thirds of that distance. The navigable affluents of the Oder from the east are the Klodnitz, in southern Silesia; the Bartsch, which is navigable from Militch downwards; the Warta, which is navigable before it leaves Poland and enters Prussia, with its navigable tributary the Netze; and from the west the Bober, the Neisse, and the Finow. The lake into which the Oder discharges its waters before it enters the Baltic, receives the two navigable rivers, the Ucker and the Peene; by the latter sea-vessels of moderate size can ascend to the town of Demmin. The Vistula receives from the west the Braha, which becomes navigable at the town of Bromberg. Between the Oder and the Vistula is the Persante, which runs more than 100 miles, and is navigable more than 20 miles from its mouth in the Baltic. The Elbing River rises in the lake of Drausen, and though its course is not long, it is navigable, and of great importance to the town of Elbing: it falls into the Frisches Haff. Farther east the same lake receives the Passarge, which is navigable for small sea-vessels to the town of Braunsberg, four miles from its mouth. The Pregel, which also falls into the Frisches Haff, is navigable as far as Insterburg for large river vessels, and to the town of Königsberg for vessels of 300 tons burden. The Deime, which is united with the Pregel by a canal, runs to the Kurisches Haff, and is navigable for large river boats. The Niemen or Memel is navigable in the whole of its course through Prussia; it receives from the north the Yura, which about 10 miles from its mouth is navigable for small river boats; and from the south the Scheschuppe, which is navigable about 25 miles upwards. The last river which requires mention is the Dange, which comes from Russia, and enters the Kurisches Haff at its most northern extremity, where it forms a part of the harbour of the town of Memel. Vessels of more than 500 tons burden can enter the river and unload in the middle of the town.

Productions.—Of domestic animals the numbers stated a few years ago were—horses, 1,500,000; horned-cattle (bulls, cows, oxen, and calves), 4,003,912; sheep, 16,844,018, namely, 4,119,950 merinos, 7,846,752 of an improved breed, and 4,877,316 common sheep; swine, 2,000,000, bred in Pomerania, Saxony, the provinces of the Rhine, and above all in Westphalia, the hams of which country have long been celebrated. Goats are bred only in the mountainous parts of Silesia, Saxony, and Westphalia. There are likewise asses and mules. Of wild four-footed animals there are stags, fallow-deer, wild boars, hares and rabbits, wolves, foxes, bears rarely, lynxes, beavers, badgers, pole-cats, otters, weasels, and martens; the ermine is very rare. Domestic poultry of all kinds abounds; and of wild-fowl, besides pheasants and partridges, there are such immense numbers of wild geese as frequently to do great injury to the farmers. Smoked geese

are an important article of exportation from Pomerania. Of birds of prey, there are the eagle, the sparrow-hawk, the kite, and some others. Fish of various kinds are extremely abundant, as well in the numerous rivers as in the Baltic. In all the provinces where there are heaths, buckwheat, and lime-trees, great quantities of bees are bred.

Agriculture is carried on with great care in most of the provinces. Wheat, rye, oats, and barley are raised both for home consumption and exportation; there are likewise peas, beans, vetches, millet, maize, rapeseed, and linseed. Potatoes are cultivated in all the provinces. Flax, hemp, hops, tobacco, chicory, beet-root, and garden vegetables of all kinds are raised. Fruit is grown extensively in Pomerania, Saxony, and Rhenish Prussia: the chief, indeed almost the only wine-growing province is Rhenish Prussia. The principal forests are in Prussia proper and Silesia; but some provinces, for instance part of Saxony, have not sufficient. The mineral products are salt from salt springs, of excellent quality and in great abundance, amber, and coals in large quantities; alum, vitriol, saltpetre, alabaster, basalt, granite, porphyry, marble, slate, freestone, chalk, lime, porcelain-clay, pipe-clay, &c. The metallic products are silver, copper, lead, iron, zinc, cobalt, arsenic, and calamine. The precious stones are the onyx, agate, jasper, and carnelian.

Manufactures.—The principal manufactures are:—linen in all the provinces, but chiefly in Silesia; woollen cloths and cotton goods, especially in the province of the Rhine, at Elberfeld, Barmen, Crefeld, &c.; silk, leather, iron- and copper-ware, cutlery, articles of gold and silver, chicory, paper, china, glass, earthenware, snuff and tobacco, beet-root sugar, gunpowder, &c.; breweries and spirit distilleries are very numerous. Cotton factories with steam machinery have risen in considerable numbers in recent years in Rhenish Prussia, Westphalia, and Silesia.

Commerce.—The commerce of Prussia is facilitated by the Baltic, which including the windings of its coast extends along the north of Prussia for more than 850 miles; by the great navigable rivers before mentioned, and their navigable tributary streams; by numerous canals; and by the system of railroads which traverses the country in all directions. The commerce of Prussia extends to almost all the states of Europe, to America, and China; but its chief commerce is with Austria and the other states of Germany, with England, Russia, Sweden, Denmark, and the Netherlands. The principal articles of export are the chief natural and industrial products already enumerated. The principal articles imported are:—raw and refined sugar, coffee, tea, spices, cotton, silk, tobacco, hops, tin, saltpetre, dye-stuff, wine, glass, and various manufactures, chiefly printed calicoes, silks, and fine hardware. In 1831 the celebrated German commercial league commenced, under the auspices of Prussia, and has been since gradually joined by almost all the German states except Austria. The object of this league (or, as it is called in German, *Zollverein*, 'customs union') is to establish an entire freedom of trade among the German states, and to subject foreign trade to such restrictions only as the protection of national manufactures or the financial circumstances of the state may render necessary. The chief harbours of Prussia are:—Memel, Pillau, Danzig, Kammin, Schweinmünde, Peenemünde, Greifswald, Stralsund, and Barth. The foreign trade of Prussia out of the Baltic is greatly hampered by the Sound dues. Danzig and Memel export large quantities of Russian corn and other heavy produce. The most considerable commercial towns are:—Berlin, Königsberg, Danzig, Breslau, Stettin, Magdeburg, Cologne, Elberfeld, Barmen, and Aix-la-Chapelle. The great fairs are those of Breslau, Frankfurt-on-the-Oder, and Magdeburg.

The transit trade of Prussia with Russia including Poland and central and southern Germany is of great importance, and is greatly facilitated by internal navigation and by railroads. From Berlin a railway 488 miles in length, including its branches from Kreuz to Posen and from Dirschau to Danzig, runs north-eastward through Stettin and Bromberg to Königsberg. Another line runs south-eastward through Frankfurt-an-der-Oder to Breslau (220 miles), and is continued southward through Brieg and Oppeln to meet the Vienna-Cracow railway, which is also joined by the Russian line to Warsaw: this south-eastern line is met at Kohlfurt by the Saxo-Silesian line to Dresden; and from Breslau and Brieg respectively there are branches to Schweidnitz and Neisse. Southward from Berlin runs the Berlin-Köthen line, connecting the capital with Halle, and by means of the Thuringian, Saxon, and other railways, with Frankfurt-am-Main, Leipzig, Dresden, and Munich. Westward from the capital through Potsdam and Magdeburg a line runs to Brunswick, Hanover, and Bremen near the mouth of the Weser; and north-westward a line runs to Hamburg, thus connecting Berlin with the ports on the Elbe. The western part of the Prussian states is traversed by the Cologne-Minden line, which runs from Deutz opposite Cologne on the right bank of the Rhine through Düsseldorf, Hamm, and Minden to Hanover; from Cologne it is continued westward through Aix-la-Chapelle, between which and Verviers it joins the Belgian railway system. There are numerous short branches from these western lines, as from Cologne to Bonn; Aix-la-Chapelle to Maastricht and Krefeld; Düsseldorf through Elberfeld to Dortmund, a station on the Cologne-Minden line; Hamm to Münster; and the Westphalia line from Hamm to Paderborn, Warburg, and Cassel. The railway from Paris to Mayence traverses the extreme southern angle of Rhenish Prussia,

passing through Saarbrück and Neunkirchen. Along all the lines mentioned electro-telegraphic wires are laid.

Religion.—There is, properly speaking, no state religion. That of the royal family and of the majority of the people is Calvinism; but Christians of all denominations are equally admissible to all public employments. In 1817, the three hundredth anniversary of the Reformation, the Calvinists, Lutherans, and other Protestant sects in Prussia, and in some other parts of Germany, united themselves into one religious body, under the name of Evangelical Christians. These amounted in Prussia in 1852 to 10,359,994; the Roman Catholics to 6,392,293; the Mennonites to about 14,780; Greeks to 1485; and Jews to 226,863. The Protestants are governed in spiritual matters by a general consistory (Ober Kirchenrath), and by a consistory for each of the provinces. The Catholics are under the archbishops of Breslau, Cologne, and Gnesen and Posen, and the bishops of Culm, Ermeland, Münster, Paderborn, and Trèves.

Education.—For the education of the people, there are in all the towns elementary, Sunday, and infant schools, schools for mechanics, &c. Parents are compelled by law to send their children to school. In 1850 there were 24,201 elementary schools, with 80,865 teachers and 2,452,062 pupils in the kingdom. For the higher branches of education, there were in the same year 117 gymnasia, with 1664 professors and 29,474 scholars. There are universities at Berlin, Bonn, Breslau, Greifswald, Halle, Münster, and Königsberg, to the support of which the government applies large sums. Literary and learned societies are very numerous.

Revenue.—According to the budget of 1854 the total revenue was estimated at 107,990,069 thalers (about 16,198,500*l.*). The expenditure for the same year was estimated at an equal sum. The debt amounted to about 82,670,674*l.* sterling, bearing interest at 4 per cent.

Army.—All subjects of the Prussian monarchy are bound to military service, which they perform successively in the standing army, the landwehr (militia) of the first and second ban, and in the landsturm (which answers to the French 'levée-en-masse'). All men able to bear arms from 20 to 25 years of age belong to the standing army; they serve three years, and are then discharged for two years, during which they are liable to be called out as the reserve. All those who have served in the standing army belong to the landwehr of the first ban, from the age of 28 to 32, both inclusive. In the time of war this ban is on the same footing as the standing army, and equally liable to serve both at home and abroad. It is called out every year to exercise, in one year for a fortnight, in the next for a month, and is equipped and clothed while it serves. The second ban, which is called out only in time of war, and is then chiefly employed in reinforcing the garrisons, includes all men capable of bearing arms till the age of 39. All older men fit for service belong to the landsturm. The standing army consists of a corps of guards and eight army-corps. In the field each army-corps consists of 25 battalions (25,000 men), 32 squadrons of cavalry (4800), and 11 batteries with 88 guns. The total force of the army on a war footing, and including the landwehr of the first ban, numbers 410,000 men; the landwehr of the second ban numbers 115,000 men; giving a total available force of 525,000 men.

Prussia has lately aspired to become a maritime power, and now maintains a small fleet of sailing and steam vessels. The sailing vessels consist of 1 frigate, 48 guns; 1 corvette, 12 guns; 1 schooner, 8 guns; one transport ship with 6 guns; 36 gunboats with 2 guns apiece; and 6 yawls carrying 1 gun each. The steam fleet consists of 2 corvettes, 10 and 12 guns; and 2 dispatch boats carrying 8 guns apiece. Two frigates (40 guns each), 1 corvette (20 guns), and 1 schooner (8 guns) were on the stocks in 1854. For the purpose of forming a naval arsenal and station for the fleet Prussia has recently purchased the bay of Jahde from OLDENBURG. The commercial navy of Prussia consisted of 973 ships carrying 131,046 lasts (of 4000 lbs. each); and 379 coasting vessels of an aggregate burden of 6005 lasts in 1853. The total number of vessels that entered Prussian harbours in 1851 amounted to 6893, of which 1205 were Prussian; 3954 had cargoes amounting to 310,189 lasts, and 2939 were in ballast. The total number of departures in the same year amounted to 6799, of which 1197 were Prussian; 5884 carried freights measuring 476,949 lasts, and 916 left in ballast. The principal foreign trade is carried on with Great Britain, Denmark, the Hanse towns, Norway, Holland, Sweden, Hanover and Oldenburg, Russia, Mecklenburg, Belgium, and France.

The *Constitution* was until lately an unlimited monarchy, hereditary in the male and female line. Prussia had formerly a representative body called the Estates, which however, as the power of the crown increased, soon fell into disuse. In July 1823 a law was promulgated by Frederick William III. for the institution of provincial estates, which were thenceforward convoked in all the provinces; but no steps were taken towards the institution of a general national representation. On the accession of the present king, Frederick William IV., in 1840, provincial and district assemblies were established in all parts of the monarchy. Subsequently (February 3rd, 1847), the king granted a kind of representative constitution to his subjects, according to which there was a diet consisting of two chambers—one of the Nobles, who sat separately, except on financial votes, when they sat with the other orders; the other called

the United Diet, consisting of the provincial diets conjoined into one legislative body, which was to be convened at least once in every four years. The king bound himself to contract no new loan and to impose no new tax (except in certain cases) without the consent of the diet. The United Diet was excluded from legislating on all subjects of foreign policy, frontier dues, and war taxes; its positive rights were limited to questions of internal taxation. Finally, the right of petition with respect to internal affairs was conceded.

On this foundation, small and slender though it was, an ample share of liberty might in time have been secured by a patient practical people; but circumstances were unfavourable. The French revolution of February 1848 established a republic in France, and the king, dreading the spread of this contagious example, tried to pre-occupy the minds of his subjects with fears of French invasion, and with a desire to secure an impracticable object, the unity of Germany—both in some measure subjects of foreign policy, and excluded by the new constitution from the legislative functions of the diet. The revolutionary wave however which had originated in France reached Berlin in less than a month. On the night of March 18 barricades were thrown up in the streets, and many bloody encounters took place between the people and the royal troops, which on the next morning withdrew from the capital. The king then, bending to the storm, granted all sorts of liberal *measures*—abolition of the censorship and perfect freedom of the press; a political amnesty; a truly constitutional form of government for Prussia, with an electoral law for regulating the election of a National Assembly to discuss a new constitution; independence of judges; right of public meeting; exercise of political rights without reference to religious belief; the submission of all new laws to the deliberation of the representatives, &c. The National Assembly met on May 22nd: it discussed and passed several laws forming the bases of a new constitution; but frequently its debates were boisterous and intemperate, and its discussions were criticised or continued in clubs and even in the streets, where members who opposed the popular demands were frequently ill treated. The menacing attitude of the populace became more aggravating after the opening of the Democratic Congress in Berlin (October 26). The National Assembly was kept almost in a state of siege, and it was said that its resolutions were influenced by the democratic mobs that thronged about its place of meeting. On October 31 the Assembly adopted an article declaring all Prussians equal before the law, denying any difference or privilege of rank or any special nobility, and forbidding the use of titles of nobility or other qualifications in public documents; and voted to urge the government to take prompt and energetic steps to secure the liberty of the people in the German portion of the Austrian states. On its rising the Assembly found that the populace had nailed up the outer doors of the Hall of Session. To deliver the capital from a state of long-continued ferment and commotion, and to get rid of the National Assembly, which was every day becoming more impracticable and more democratic, on the accession of Count Brandenburg to the ministry, the Assembly was prorogued (November 8) and ordered to transfer its sitting to Brandenburg. The president (Unruh) refused to close the session; the National Guard of Berlin was ordered to keep the members who persisted to meet from reaching the hall of the Assembly; but instead of obeying the government the National Guard took the Assembly under its protection, and enabled it to continue its deliberations. The National Guard was then disarmed, the city declared in a state of siege, and occupied by the royal troops under General Wrangel, who closed all the clubs, prohibited all meetings in the streets and the sale of all political papers without the authority of the police. A portion of the Assembly met (November 16) in a coffee-house, passed a resolution to withhold payment of the taxes, and was then dispersed by the troops.

On November 27 (to which date it was prorogued by royal ordinance) the National Assembly met in Brandenburg, and continued its sittings for a few days, during which it exhibited undignified helplessness by its squabbles and dissensions. On December 5 the king issued a proclamation dissolving the Assembly, and containing the heads of the present constitution of Prussia. This state paper guarantees the freedom of the press, subject to prosecution for offences by existing laws; freedom of meeting in inclosed places, and also in public on 24 hours' notice and permission of the police; a responsible ministry; two chambers, the upper consisting of 180 members elected by the wealthier inhabitants of the state, who are themselves chosen by the general body of the electors—the lower of 350 members, elected by universal suffrage—the members of either house requiring no other qualifications than being of a certain age and proof of naturalisation; complete liberty for all religions; abolition of aristocratic privileges; and the adoption of the principle of the British Habeas Corpus Act. It is true that some of these principles have been modified, narrowed, or violated (as in the case of the press, and in the composition of the upper house, of which the king nominates the majority if not all the members for life) since the subsidence of the revolutionary period of 1848-9, but the leading features of constitutional liberty on the basis of representation are there.

Prussia, as a member of the German Confederation, is the second in rank; its contingent to the army in 1815 was 79,484 men, including infantry, cavalry, and artillery and train with 100 pieces of cannon;

but in recent times Prussia has placed her whole army at the service of the Confederation. It contributes 301,083 florins per annum to the expenses of the Diet; and in the full council has, like the other kings, four votes.

Historical Sketch.—The name of Prussia is derived from the Borusses, a Slavonic people, who inhabited the territory that now forms the provinces of East and West Prussia. These people were subjugated and converted to Christianity in the 13th century by the Teutonic knights. In the 15th century West Prussia became subject to Poland, and the Teutonic knights, who still held East Prussia with Königsberg for their capital, became vassals of Poland. Albert of Brandenburg, a descendant of Frederick von Hohenzollern, burgrave of Nürnberg and 35th grand master of the order, renounced his vows, became a Protestant, and erected East Prussia into a hereditary duchy, which he left with the march of Brandenburg to his descendants. The estates of the electors of Brandenburg increased by slow degrees till 1648, when the elector Frederick Wilhelm obtained by the treaty of Westphalia the bishoprics of Halberstadt and Minden. In 1653 he delivered Prussia from the suzerainty of Poland, and in 1680 he added to his possessions the archdiocese of Magdeburg. His son the elector Frederick III. obtained the title of King (Frederick I.) from the emperor in 1701, and made several acquisitions of territory, the most important of which was the principality of Neuchâtel. He also took an active part in the Thirty Years' War. His successor, Wilhelm I., who mounted the throne in 1713, wrested a large part of Pomerania from Sweden, and obtained at the peace of Utrecht a part of Guelderland and the duchy of Limburg. Frederick II. (the Great), who reigned from 1740 to 1786, made Prussia famous by his military genius and his successes against Austria, Saxony, and Sweden. Soon after his accession he wrested Silesia from Austria; in 1744 he overran Saxony. In the Seven Years' War he took a leading part, and fought fourteen battles, of which he gained nine. At the close of the Seven Years' War, in 1763, he applied himself to the improvement of his kingdom, which he did not fail to enlarge on the first partition of Poland, by seizing for his share the greater part of West Prussia. His successor, Wilhelm II., joined the first coalition against the French republic, from which he gathered little glory; but added to his states considerable territories on the second and third partitions of Poland (1793 and 1795). His son, Frederick Wilhelm III., who ascended the throne November 16, 1797, joined the coalition against France November 8, 1805, upon certain conditions. After the battle of Austerlitz peace was concluded between Austria and France. A few days before, on December 15, 1805, the Prussian ambassador, Count Haugwitz, concluded a preliminary convention between Prussia and France, by which Prussia ceded Anspach to Bavaria and Cleves and Neuchâtel to France, which made over the electorate of Hanover to Prussia, and Prussia in fact took possession of that country. This led to a declaration of war by England against Prussia. Various negotiations followed, which ended in a war between Prussia and France. The battle of Jena (October 14, 1806) decided the fate of the Prussian army. The most important fortresses between the Weser and the Elbe surrendered in rapid succession, and Napoleon I. entered Berlin on October 27th. Frederick William retired to Memel, collected a new army, and, together with his ally the Emperor of Russia, marched to oppose the advance of the enemy in East Prussia. The battles of Eylau and Friedland led to the peace of Tilsit (July 9, 1807), by which the king lost his dominions between the Rhine and the Elbe, and the greater part of Prussian Poland, which went to form part of the grand-duchy of Warsaw. The king did not return to his capital till the end of 1809. On February 24, 1812, he concluded an offensive alliance with France, and when war broke out between Russia and France, in June 1812, he sent 30,000 men to join the 10th French corps under Marshal Macdonald, which was employed in the siege of Riga. On the rapid retreat of the French from Russia the Prussian corps was likewise obliged to retire, but General York, who commanded it, concluded a convention with the Russian general Diebitzsch, by which the Prussian corps was declared neutral and separated from the French army. The campaign of 1813, the advance of the allies to Paris, the capture of that city in March 1814, the deposition of Napoleon I., his removal to the island of Elba, and the restoration of the Bourbons, followed in rapid succession. The return of Napoleon from Elba in 1815 led to a new alliance between Prussia, Austria, Russia, and England, who declared war against him. The battle of Waterloo led to the general peace of Europe, when the Congress of Vienna restored to Prussia her lost territories, with the exception of a part of Poland, in lieu of which she obtained a part of Saxony and the territories on the lower Rhine, distinguished above as Rhenish Prussia. During the reign of the present king, Frederick William IV., the most important events that have occurred in Prussia are the constitutional reforms above noticed; the suppression of the insurrection of the Poles of Posen in 1848; delivering Baden from insurgent bands of democratic socialists in 1849 [BADEN]; and the open assistance given to the Schleswig-Holsteiners in insurrection against their sovereign the King of Denmark. [HOLSTEIN.]

PRUSSIA, properly so called, formerly designated by the name of the Kingdom of Prussia, and afterwards divided into the two provinces of East and West Prussia, is situated between 52° 54' and 55° 53' N. lat., 16° 42' and 22° 45' E. long. It is bounded N. by the Baltic,

E. by Russia, S. by Poland and the province of Posen, and W. by Brandenburg and Pomerania. The area and population of East and West Prussia are given in the statistical table in the preceding article. Of the area 800 square miles are covered with waters. The climate is temperate in summer, very cold in winter, very changeable on the coast, and generally rather damp. The face of the country is level, broken here and there by low ranges of hills. The forests which cover the sandy plains are estimated at 2,000,000 of acres. The principal rivers are the Vistula, the Pregel, and the Memel, or Niemen. There are several hundreds of small lakes, namely, 300 in East and 150 in West Prussia; but no large ones, unless we reckon as such the two Haffs, which communicate with the sea only by canals, and have fresh water. [KURISCHES HAFF; FRISCHES HAFF.] The two largest are the Mauer Lake, 40 square miles, and the Spindling Lake, 70 square miles in extent. With regard to the natural productions, the province produces corn, pulse, flax of excellent quality, hemp, tobacco, hops, madder, potatoes, and timber. There are good breeds of the usual domestic animals, abundance both of fresh-water and sea fish, and bees. The mineral kingdom is very poor; iron however in various forms is abundant, and amber is more plentiful in this province than in any other part of the world. It is thrown up chiefly on the Baltic coast between Memel and the western extremity of the Gulf of Danzig. Its collection was formerly under the direction of persons appointed by the government, and the cause of much annoyance to the coast population who could not enjoy an aquatic excursion without subjecting themselves to a strict search on their return; and they could put to sea from certain places only. The collection of the amber has been farmed by the government since, we believe, 1809. The manufactures of the province are confined to the towns, of which the principal are Danzig, Memel, Elbing, and Königsberg. From Danzig and Memel large quantities of Russian produce, corn, tallow, hides, flax, hemp, timber, &c. are shipped. The province of East Prussia is divided into two governments, Königsberg and Gumbinnen; and West Prussia also into two governments, Danzig and Marienwerder. Under the heads DANZIG, GUMBINNEN, KÖNIGSBERG, and MARIENWERDER, further particulars are given respecting the provinces in question, including notices of the less important towns. The chief towns, DANZIG, ELBING, and KÖNIGSBERG are noticed separately.

PRUTH, RIVER. [AUSTRIA; Bessarabia.]

PRZEMYSL. [GALICIA, Austrian.]

PSKOW, a government of Russia, situated between 56° and 58° N. lat., 27° 20' and 32° 5' E. long., is bounded N. by lake Pskow, and the government of St. Petersburg, E. by Novgorod and Twer, S. by Smolensk, and W. by Witepsk and Livonia. The area is 17,126 square miles. The population in 1846 was 775,800.

The surface is level, and in some places slightly undulating: there are no mountains, though the whole country is rather elevated. The soil is partly clayey, partly sandy, and in many parts covered with a tolerably thick layer of mould. The only large lake is Lake Pskow, which is noticed under LIVONIA. The Polista, Podso, Khwat, and Woiskoe lakes are much smaller. There are also numerous meres and many marshes, principally in the south-east part of the government. There is no large river in the province. The Düna rises in it, but soon turns into Witepsk; the Loweth, or Lovat, which also rises in it, runs into Novgorod, is joined by the Polista and the Pola, and has below Velikie-Luki several rocks and whirlpools, which are called cataracts. Most of the rivers, though not deep enough for large vessels, are navigable by flat river boats called struses, and facilitate communication with St. Petersburg, Narva, and Riga.

The climate is cold. Agriculture is the chief occupation of the inhabitants. The soil is in general tolerably fertile, but requires careful cultivation and manure; it produces however not only sufficient for the consumption of the inhabitants, but also a surplus for exportation. The chief products are rye, barley, oats, and buckwheat; pulse, peas, beans, and lentils. Culinary vegetables, such as cabbages, turnips, onions, garlic, and cucumbers are cultivated. On the estates of the nobility small orchards are here and there to be seen. Flax and hemp, both of excellent quality, are staple productions. The extensive forests furnish abundance of timber, chiefly pines, fir, birches, and alders. The breeding of cattle is merely subservient to agriculture. Swine are kept in great numbers, but only few goats and little poultry. Beasts of prey and fur-bearing animals abound, such as bears, wolves, lynxes, foxes, martens, squirrels, and badgers. The lakes and rivers produce abundance of fish. The only mineral products are bog-iron, limestone, sandstone, and clay. There are salt-springs near the Szelon.

The inhabitants excel in dressing skins and manufacturing leather; but, unlike the Russians in general, they have not a turn for mechanics, and do not willingly apply to any kind of handicraft. The country-women hardly spin wool and flax sufficient to manufacture linen, stockings, &c. for their own use. Some struses and barks are built, there are many saw-mills, and a few spirit distilleries and glass-furnaces. Rye, oats, barley, squared timber, masts, spars, planks, hemp, flax, hempseed and linseed, wool, hides, and a few other articles are sent to Perna, St. Petersburg, and Narva, whence the inhabitants import colonial products and other necessary articles.

The great majority of the inhabitants are Russians of the Greek church. There are also many Germans in the towns.

Pskow, the capital of the government, is in 57° 40' N. lat., 28° 10' E. long., on the left bank of the Wellikaja, nearly 5 miles from its mouth in Lake Pskow. It is said to have been founded in the 10th century by the grand-duchess Olga. The interior of the city has some resemblance to that of Moscow. In the centre of the town is the Kremlin (on the steep left bank of the river), which was erected by Prince Dowmont, who reigned from 1266 to 1299. The citadel is surrounded by a wall. The middle town, extending in the form of a semicircle about the citadel, is also surrounded with a wall; a third very high and strong wall, 5 miles in extent, defends the great town, which envelops the middle town. There is a large suburb. Pskow has sustained several memorable sieges, among others, in 1614, when it was attacked without success by Gustavus Adolphus, king of Sweden. Pskow has declined from its ancient power and greatness, but is still a large town; it has one cathedral, richly adorned with gilding and carved-work, about 60 other Greek churches, a Lutheran church, three monasteries, an ecclesiastical seminary, a gymnasium, a district and other schools, an orphan asylum, and a handsome building for the government offices. It is the see of the Greek archbishop, and the residence of the military governor. The present population is 12,000, who manufacture Russia leather, linen, sail-cloth, and glass.

Toropes, an ancient town, with about 12,000 inhabitants, is extremely well situated for carrying on an extensive trade; it communicates with Riga by means of the river Toropa, on which it is situated, and which joins the Düna. There are thirteen churches and two convents in the town. Most of the houses are of wood. *Wellikaja-Luki*, on the Lovat, a tributary of Lake Ilmen, has about 4000 inhabitants.

PUERTO REAL. [SEVILLA.]

PUERTO RICO, or PORTO RICO, an island of the West Indies, belonging to Spain, is the smallest of the Greater Antilles [ANTILLES], and the most western of the LEEWARD ISLANDS. It lies between 17° 55' and 18° 30' N. lat., 65° 39' and 67° 11' W. long.; and is bounded N. by the Atlantic, W. by the Mona Passage about 75 miles wide, which separates it from San Domingo, S. by the Caribbean Sea, and E. by the Virgin Islands. The island is in the form of a parallelogram, 100 miles long and 40 miles broad, and it contains about 3800 square miles. The population in 1849 was 288,000.

A range of mountains of considerable height runs through the centre of the island; the highest summit is that of Languillo in the north-east, which is 3678 feet above the level of the sea. Towards the south and east the mountains descend with rather a steep slope to the sea. On the north and west the descent is much less rapid, and there is a plain from five to ten miles wide between the sea and the base of the mountains. From the central chain many inferior ridges run north and south, containing between them valleys of great fertility. The valleys on the north side produce the best pasturage; those of the south grow most sugar. The coast abounds with harbours: those on the north coast are generally unsafe during the prevalence of the northerly winds, in consequence of the heavy surf which then rolls in upon the shore. The same cause creates bars at the mouths of the rivers on the north coast. The port of San Juan is however perfectly sheltered by the narrow island on which the town and fortress stand. Aguadilla is an open roadstead at the north-west extremity of the island and much exposed, but from its position and the abundant supply of provisions and water which it affords, it is much visited. It was here that Columbus effected his first landing on Puerto Rico. The ports of Guanica and Hovas, on the south coast are very large, afford excellent anchorage, and are easily defended. In the port of Guanica vessels drawing 21 feet of water may enter with perfect safety, and anchor close to the shore.

Few countries are so well watered by rivers as Puerto Rico. Seventeen rivers rising in the central chain run into the sea on the north coast. Of these Manati, Loisa, Trabajo, and Arecibo are deep and broad; and though there are bars at their mouths, small vessels with cargoes can safely cross them at high water. Some of the rivers on the north-west, unable from the accumulation of sand at their mouths to discharge rapidly the great quantity of water which they bring down from the mountains, have formed a series of lagoons along the coast, some of which are 8 or 10 miles long. These lagoons have been connected by artificial canals, and form a very convenient means of communication along this part of the coast. Nine rivers fall into the sea on the east coast, sixteen on the south, and three on the west. These rivers are well stocked with fish. During the last thirty years many good roads have been constructed and bridges built. The principal roads are from San Juan to Aguadilla and Mayaguez, from Ponce to Guayama, and from Faxardo to the capital. The greater number of bridges are of wood, but several are of stone.

The climate of Puerto Rico seems to be more favourable to Europeans than that of most of the other islands of the West India. The maximum height of the thermometer is stated to be 92° Fahr. in the

month of August, and the minimum 80° in December, taken at noon. There are two rainy seasons: the first commences in May and lasts about twenty days. The second is in September, when the rain pours down in such torrents, that in a few hours from the commencement of the rain the rivers have overflowed, and the low lands are completely inundated. August is the hottest month, and the most sickly for Europeans. The heat is then suffocating, the sea-breeze has died away into a calm, only occasionally broken by a faint breeze, and the night brings no relief, for there is no land-wind. In October the weather becomes much cooler. In November the north and north-east winds set in, and blow till January, during which months the weather is occasionally cool.

The soil of Puerto Rico is of the richest and most varied description: there is the deep rich soil required for the cultivation of the sugar-cane, the cool mountain valley for the coffee plantation, the most luxuriant pasture, the moist spot favourable for the cocoa-nut and the irrigated rice fields. The pasture-lands are principally on the north and east coasts; the cane-fields on the south and west. About one-fifteenth of the land is under cultivation, and upwards of 400,000 cwts. of sugar are annually produced; also very large quantities of coffee, maize, tobacco, rice, and some cotton. The proportion of sugar obtained from an acre is much greater than in either of the other West India islands. A large number of head of horned cattle are reared for exportation as well as for home consumption.

The island possesses no indigenous quadrupeds, scarcely any birds except a few species of water-fowl and some parrots, and no monkeys. The cane-fields are infested by rats of a large size, which at times commit great ravages.

There are no manufactures in Puerto Rico beyond those of the ruder articles of daily use. Nor have mining operations engaged much attention, though gold, iron, copper, lead, and coal are said to have been met with.

The commerce of Puerto Rico is very considerable, the exports having an average annual value of upwards of 5,000,000 dollars, the imports about 4,500,000 dollars. The principal exports are of sugar, molasses, and rum; coffee; cattle, and hides; cotton; tobacco, and cigars; timber and dye-wood; and indigo. The larger part of the commerce is carried on with Spain and the United States; but England, France, Denmark, and Germany share in it to a considerable extent. A heavy ad valorem duty is imposed on the importation of foreign goods; the consequence of which is an extensive contraband trade with St. Thomas's and other islands. The trade with America consists in salt-fish, grain, flour, butter, and lumber; with France, in linens, cambrics, ornaments, toys, and jewellery; with England, cotton goods, hardware, and earthenware: England takes a great quantity of cattle for the supply of her colonies; with Spain, olives, brandies, wines, dried fruits, anchovies, &c.; with the German States, in glass, sword-blades, linens, hams, &c.

Puerto Rico was discovered by Columbus in 1493. The natives submitted quietly to the Spaniards for some time, but at length rose and slaughtered many of them. On this the Spaniards exterminated the greater part of the natives, and the remainder have become so intermixed with the conquerors, that there is no mark of distinction between the races. The present inhabitants are composed of whites, who are somewhat more than half; and free mulattoes, who are somewhat more than one-fourth of the entire population; the remainder are negroes, about two-thirds of whom are slaves. It is remarkable that in Puerto Rico white and black persons work together in the fields at the same labour without any feeling of degradation on the part of the former; and there is said to be none of the antipathy manifested here between the races which is so common in the United States and elsewhere.

The government of Puerto Rico is administered by a captain-general, who has the supreme military command, but his civil authority is in some degree controlled by an officer who is called his legal adviser. A court of royal audience is invested with the superintendence of all other authorities, and is consulted by the governor on all important occasions. Two courts of cabildo superintend the police and municipal affairs. In each of the seven towns and villages which form the head of a department, a magistrate resides called the *alcalde mayor*. In the smaller towns there are inferior magistrates, who are annually appointed by the captain-general. The ecclesiastical tribunal is composed of the bishop and provisor. A naval tribunal is presided over by the commandant of the marine; and a consulado is established for the decision of all mercantile disputes.

The island contains 58 towns and villages. *San Juan de Puerto Rico*, the capital, is situated on the north side of the island, in 18° 29' N. lat., 66° 10' W. long.; population about 20,000. *San Juan* is built on a narrow island about 2 miles in length, which is connected at one end with the mainland by a bridge. The town is placed on the slope of a hill, and has regularly-built streets, which cross each other at right angles. It is inclosed by strong fortifications, and on the summit of the hill is a fortress called *Moro castle*. The harbour lies between the town and the mainland. *San Juan* is the seat of government. The chief public buildings are the cathedral, a theatre, a military hospital for 350 patients, another for females, a jail, a house of correction, a handsome town-house, an arsenal, a custom-house, four churches and two chapels. The town has been thrice unsuccessfully attacked by

British forces: in 1594 under Sir Francis Drake; in 1791 under Sir Ralph Abercromby; and in 1799 under Sir Henry Harvey; and once successfully in 1597 under the Earl of Cumberland.

The more important of the smaller towns in Puerto Rico are *Maya-gues* and *Aguadilla* on the west coast, *Ponce* on the south coast, *Humacao* on the east coast, and *Pepino* and *Cayey* in the interior. The rest are very small, consisting generally of a large square with a church and a few straggling houses.

PUGHMAN MOUNTAINS. [AFGHANISTAN.]

PU'GLIA, the ancient *Apulia*, is the general name given to a large division of the kingdom of Naples, which, lying between the Apennines and the Adriatic Sea, comprises the provinces of *Capitanata*, *Terra di Bari*, and *Terra d'Otranto*. It is naturally divided into two regions, namely, the great plain of *Capitanata*, called *Puglia Piana*, or 'Flat Apulia,' and the hilly region of *Bari* and *Otranto*, called *Puglia Pietrosa*, or 'Stony Apulia.' These regions are noticed under *CAPITANATA*, *BARI (TERRA DI)*, and *OTRANTO (TERRA DI)*. The whole of *Puglia* is one of the most productive countries of the kingdom; its chief wealth consists in corn, oil, wool, and cattle. [APULIA.]

PURNEAH, the capital of *Purneah* district, in the province and presidency of *Bengal*, is situated in 25° 50' N. lat., 87° 34' E. long., about 230 miles N.W. from *Calcutta*. The population of the city and suburbs is estimated at 40,000. *Indigo* is raised to a considerable extent in the district.

PUTEOLL [NAPLES, Province of.]

PUTNEY. [SURREY.]

PUTWL. [KURSK.]

PUY, LE. [LOIRE, HAUTE.]

PUY-DE-DÔME, a department in France, lies between 45° 18' and 46° 16' N. lat., 2° 27' and 3° 57' E. long.; and is bounded N. by the department of *Allier*, E. by that of *Loire*, S. by those of *Haute-Loire* and *Cantal*, and W. by those of *Creuse* and *Corrèze*. Its greatest length from north-west to south-east is 85 miles, and the average width is about 50 miles. The area is 307285 square miles; the population in 1841 was 591,458; in 1851 it amounted to 596,897; which gives 194.248 to the square mile, being 19.664 above the average per square mile for the whole of France. The department is formed out of *Lower Auvergne*, part of *Bourbonnais*, and a small portion of *Fores*; and is named from a lofty peak in the *Dômes* Mountains.

The surface presents an extensive undulating basin inclining generally towards the north, drained by the *Allier*, and shut in on the east and west by two chains of volcanic mountains resting on a granitic base. This basin, which is distinguished by the name of *La-Limagne*, consists of the valley of the *Allier*, into which a great number of other valleys open on either side, each watered by a stream that descends from the neighbouring mountains, and separated from the adjacent one by gently-sloping hills. The *Limagne* has a soil which consists of decomposed volcanic matter mixed with alluvial deposits; it is exceedingly fertile and well cultivated; the hill sides are covered with vineyards and orchards; the rows of walnut-trees that bound the fields, and the chestnut plantations, with their masses of foliage, add richness and variety to the landscape, which presents at every turn some new beauty. The chief products of this basin are wheat, hemp, wine, oil, and fruits; there is some fine pasture-land, and a great breadth of rich meadow, especially near *Riom*, which is flooded every year and yields three crops of hay.

The mountains of *Fores*, which bound the *Limagne* on the east, are an offshoot of the *Cévennes*; they form the watershed between the *Allier* and the *Loire*, and are covered with pine forests interspersed here and there with some hungry pastures, and a few cultivated patches that yield only oats and rye.

The western boundary of the *Limagne* is formed by that portion of the *Auvergne* Mountains which runs northward out of the department of *Cantal*, and forms part of the watershed between the *Garonne* and the *Loire*, including the two remarkable volcanic groups of the *Monts-Dômes* and the *Monts-Dores*. The common base of these mountain groups is 1968 feet above the mean level of the *Limagne*. The *Monts-Dores*, or *Monts-D'Or* (as the name is commonly but incorrectly written), are in the south of the department, and consist of a great number of high peaks, the loftiest among which, called *De-Sancy*, has an elevation of 6196 feet above the level of the sea. The peak *De-Sancy*, although it has no crater, is covered on all sides with bare rocks, lava streams, and other volcanic products—a circumstance

which favours the opinion that this elevated mass once had near it a still more elevated crater, whence the materials that form it were thrown out. Indeed but few of the peaks of the Monts-Dores have craters, yet they are all of unquestionably volcanic origin. This mountain mass is visible from Montauban, in the department of Tarn, a distance of 127 miles; and the view from the accessible summits is said to be of a most extensive range, reaching even to the Alps. On the north-western flank of the Monts-Dores rise the two streams that give origin to the Dordogne, which river drains the south-western angle of the department: the slopes of the Monts-Dores are rich in pasture and medicinal plants. The *Monts-Dômes* group lies more to the northward, a few miles west of the city of Clermont-Ferrand. It is famous for its picturesque beauty, and presents above 40 conical peaks with extinct craters, locally called 'Puy,' lava-streams that seem but just arrested in their course, basaltic columns in every variety of position, and frightful ravines, the sides of which give evidence of the agency that reared these stupendous masses. Far above all the other peaks rises the majestic cone of the Puy-de-Dôme, which gives name to the department, and forms an object of grand and striking beauty, being covered with brilliant verdure in all its vast dimensions, from base to summit, except in a few places where some rude protuberances and hideous chasms display the volcanic origin of the mountain. Although its summit is 4805 feet above the sea-level it is easily accessible, and presents in clear weather a view perhaps unequalled for extent and variety. Standing on its lofty summit the spectator beholds countless numbers of cattle and sheep feeding all round the grassy slopes of the Puy; a little further a vast number of conical peaks yawning with craters, some of which contain water; further south and west, the Auvergne ranges, extending into the departments of Corrèze and Cantal, and inclosing between them the valley of the upper Dordogne; away to eastward and northward the whole basin of the Limagne with its towns, villages, and hills, its fields of every hue, its vineyards, isolated homesteads, rivers, and highways, all spread out before him as in a map or picture. The Puy-de-Dôme is connected with the history of the barometer, Pascal's test of the Torricellian theory having been satisfied by carrying the instrument to the top of this mountain. The basement and lower slopes of all these mountains abound in excellent pasture, and in medicinal and aromatic plants. Hot and cold mineral springs exist at several points, the most famous being the hot springs of Mont-Dore-les-Bains, near the source of the Dordogne. The mountains above described present the finest ancient volcanic mountain scenery in Europe.

The climate of the department is not uniform. In the Limagne the summer is very hot, and the winter of short duration; the thermometer reaches 86° Fahr. in the shade in summer, and sometimes as low as 5° in winter. On the mountain slopes, above the region of vines, where only oats and hardy grains are grown, the winter and spring are cold; the high mountains, which are adapted solely for summer pasture, have a long winter, the intense cold lasting from December to the end of February. The western range of mountains is subject to terrible hurricanes. The prevailing winds are the south-west and the north-west.

The principal rivers are the ALLIER and its feeders, the Dore and the Sioule, which drain the eastern and north-western districts respectively; the DORDOGNE; and the Ance, a small feeder of the Loire which flows south, draining a small strip on the extreme south-east of the department. Highway accommodation is afforded by seven national and departmental roads. In the west of the department there are several small lakes, and also many beautiful waterfalls.

The corn products of the department exceed the consumption; chestnuts, hemp, apples, pears, apricots, and other fruits, are grown in great abundance. About 12,892,000 gallons of wine are made annually, of which a third part goes to the home consumption. The principal forests are in the arrondissements of Thiers and Ambert; they contain pine, oak, and beech, and afford a considerable quantity of timber and firewood, which are floated to the Allier, and thence conveyed northward along the latter river. Horses are small. Cows are very numerous, a good deal of cheese and butter is made; and many cattle are fattened. There are immense numbers of sheep, but of inferior breed. Among the wild animals are boars, roebucks, wolves, foxes, hares, eagles, vultures, &c.

A lead-mine near Pont-Gibaud and one of antimony near Rochefort are worked. The country is rich in minerals. Iron, zinc, copper, alum, and manganese, are found. Coal-mines are worked in the north-west of the department near Montaut; and also at several points on the left bank of the Allier, by which river the coals are forwarded to Paris and Orleans. Almost all the towns of the department are built of volcanic substances; and for building purposes there are numerous quarries of lava, trachytic rock, basalt, pumice, besides granite, limestone, and bitumen. The lava quarries of Volvic, near Riom, are especially to be noted.

The manufactures of the department, which are unimportant, are noticed under the several towns. The commerce is composed of the various agricultural products before named, confectionary, hides, paper, hampseed, nut-oil, deal planks, cattle, wool, coal, &c. Above 460 fairs and markets are held chiefly for the sale of stock and farm produce.

The department contains 1,966,624 acres. Of this area 905,276

GEOG. DIV. VOL. IV.

acres are under plough culture; 222,726 acres are meadow and grass land; 72,088 acres are under vines; 208,486 acres are covered with woods and forests; 474,756 acres consist of heath and mountain pasture; 14,646 acres are laid out in orchards, nurseries, and gardens; 15,756 acres are occupied with rivers, waters, irrigating rills, &c.; and 54,246 acres with roads, streets, and buildings.

The department is divided into 5 arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Clermont-Ferrand	14	108	174,126
2. Ambert	6	53	90,048
3. Issoire	9	116	100,671
4. Riom	13	128	158,035
5. Thiers	6	39	78,017
Total	50	443	596,897

1. The first arrondissement takes its name from its chief town CLERMONT-FERRAND already described, which is also the capital of the whole department. *Billom*, formerly the capital of the Limagne, is situated on a high hill, 18 miles E.S.E. from Clermont, and has a tribunal of commerce, a college, a clerical seminary, and 3993 inhabitants, who manufacture linen, pottery, bricks, tiles, and lime; and trade largely in hemp, wool, corn, cattle, timber, &c. *Pont-du-Château*, 9 miles E. from Clermont, and on the left bank of the Allier, which is here crossed by a basaltic bridge of 8 arches, is built on the slope and crown of a hill, and has 3562 inhabitants. It takes its name from the bridge and a castle near the river. A large portion of the articles exported from the department are sent down the Allier from this place, consisting of wine, hemp, ivory-black, coal, apples, wood, corn, hay, mill-stones, asphalt, &c. *Vic-sur-Allier*, the birthplace of Le Sage, 12 miles S.E. from Clermont, has 3185 inhabitants, and is celebrated for the mineral springs near it.

2. The second arrondissement takes its name from *Ambert*, which is situated at the foot of a ridge of hills in the fertile valley of the Dore, a feeder of the Allier, 35 miles S.E. from Clermont, in 45° 33' 4" N. lat., 3° 44' 35" E. long., 1742 feet above the level of the sea, and has tribunals of first instance and of commerce, a college, and 8044 inhabitants in the commune. The houses of the town are in general well built; but the streets are narrow and crooked. The granite church of St.-Jean, surmounted by its lofty spire, is the most remarkable structure. Woollen cloth, blankets, laces, garters, serge, linen, pins, tape, woollen yarn, and a large quantity of printing and engraving paper are manufactured. *St.-Amand-Roches-Savine*, 6 miles from Ambert, has silver-lead mines, and 2294 inhabitants. *St.-Anthème*, a large village 8 miles E. from Ambert, has a population of 3425. *Arianc*, 10 miles S. from Ambert, prettily situated on the slope of a hill above the Dore, has a mineral spring, and a population of 4390, who manufacture blond lace, linen, and small wares.

3. In the third arrondissement the chief town, *Issoire* (the ancient *Isiodorum*), is situated near the confluence of the Couze and the Allier, in 45° 32' 37" N. lat., 3° 15' 13" E. long., 1309 feet above the sea, 20 miles S.S.E. from Clermont, and has tribunals of first instance and of commerce, a college, and 5785 inhabitants in the commune. It is in general a well-built, clean, and regularly laid out town, all the principal streets abutting on a great central square in which markets are held. The parish church, which has a curiously-decorated exterior, and has been numbered among the historical monuments of France, is the principal structure. Copper ware and nut-oil are the chief industrial products. The mineral springs of *Liens*, and the numerous volcanic rocks in the neighbourhood of the town, deserve mention. *Ardes*, 12 miles S.W. from Issoire, in a country bristling with volcanic rocks, stands on the Grande-Couze, and has about 2000 inhabitants. *Besse*, 16 miles W. from Issoire, built on an enormous mass of black basalt, of which substance the houses are constructed, stands on the Couze, and has 2096 inhabitants. In this town is a curious circular structure, which some think to be a temple of the sun, others an ancient baptistry. Two miles N.W. from Besse is the Lake Pavin, which occupies the crater of an extinct volcano, on a high mountain-peak of the Mont-Dores. *St.-Germain-Lembron*, 6 miles S. from Issoire, has a population of 2135. *Saux-Manges*, 5 miles E. from Issoire, is a small place of 2049 inhabitants, who manufacture camlet, scythes, saw-blades, reaping-hooks, and leather.

4. Of the fourth arrondissement, the chief town, *Riom*, is built on a hill above the Ambone, a feeder of the Allier, in 45° 53' 39" N. lat., 3° 6' 54" E. long., 1173 feet above the level of the sea, 9 miles N. from Clermont, and has 10,269 inhabitants in the commune. The town is the seat of a High Court for the departments of Allier, Cantal, Haute-Loire, and Puy-de-Dôme; it has tribunals of first instance and of commerce, and a college. The streets are wide; the houses are constructed with lava, and have an ancient look; the courts of justice, the hospitals, and the residence of the prefect, are built in a good style. The whole town is surrounded by shady walks, one of which is adorned with a column in honour of Desaix, the hero of Marengo. The chapel built by Jean de Berry, first duke of Auvergne, in 1352, for the service of the ducal palace (now the court-house), still remains

entire, and contains magnificent windows of the best period of glass-painting. The other structures worthy of note are the cathedral, the corn-market, and the reservoir, which is fed by an aqueduct. Linen, leather, and brandy are the chief manufactures; these articles, together with wine, corn, hemp, fruits, nut-oil, and preserves, form the items of a considerable commerce. *Aigue-Perse*, the birthplace of the chancellor De l'Hopital and the poet Delille, is a well-built little town, situated in a fertile wheat district, 9 miles N.E. from Riom, and has 3053 inhabitants. Near it there is a mineral-spring gushing out from the foot of a hill called *Butte-de-Montpensier*, the summit of which commands a magnificent view, and is covered with the ruins of an ancient castle, demolished in 1637, by order of Cardinal Richelieu. The other towns are small: among them is *Randans*, 15 miles N.E. from Riom, population 2149. Madame Adélaïde, sister of King Louis Philippe, who was owner of the fine estate and splendid mansion that formerly belonged to the Polignacs near Randans, was a great benefactress to this town. The mansion commands fine views over a level country, with the mountains of Forez, the Puy-de-Dôme, and the Mont-Dores in the distance.

5. The fifth *arrondissement* takes its name from *Thiers*, which stands on the crown and slope of a high hill, above the *Durolle* (a feeder of the Dore), 24 miles E.N.E. from Clermont, in 45° 51' 15" N. lat., 3° 33' 5" E. long., 1312 feet above the level of the sea; and has tribunals of first instance and of commerce, a consultative chamber of manufactures, a council of prud'hommes, a college, and 9984 inhabitants. The town is very irregularly built, though some of the houses are good; and the streets are narrow, steep, and crooked. The summit of the hill presents a splendid view of the whole of the fertile district of Limagne and of the majestic mountains of Auvergne. The vicinity abounds in wild and picturesque sites, in juxtaposition with vine-clad hills and rich meadows. On the hill slopes, and among the rocks along the left bank of the *Durolle*, are numerous small habitations, all resounding with the noise of the hammer or the file. The *Durolle*, which runs through a narrow gorge called *Trou-d'Enfer*, close to the town, forms several small cascades, and drives the machinery of numerous iron-forges and paper-mills. The church of St. Jean is the most remarkable building in this town. The leading manufactures are cutlery, hardware, and paper; broadcloth, sewing thread, ribbons, playing-cards, chessmen, and leather are also made. *Courrière*, 8 miles E. from Thiers, on the left bank of the Dore, has a population of 3592, and manufactures of woollens, small wares, and pottery. *Loux*, situated in a fertile plain, 8 miles W. by S. from Thiers, is a pretty well-built town, with 8601 inhabitants, who manufacture pottery and leather. *Maringues*, situated 12 miles W. by N. from Thiers, near the confluence of the *Morge* with the *Allier*, is a well-built town, with numerous tan-yards for the manufacture of shoe- and glove-leather: population, 4109. *St. Remy*, 8 miles N.E. from Thiers, has 4081 inhabitants, who manufacture superior cutlery.

The department forms the see of the bishop of Clermont; is included in the jurisdiction of the High Court of Riom, and within the limits of the University-Academy of Clermont-Ferrand; and belongs to the 20th Military Division, of which Clermont-Ferrand is headquarters. It returns five members to the Legislative Chamber of the French empire. [AUVERGNE; CLERMONT-FERRAND.]

PUY-LEVEQUE. [LOT.]

PUY-LAURENS. [TARN.]

PWLLHELLI, Caernarvonshire, a market-town, sea-port, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parishes of Denio and Llannor, is situated on the shore of Cardigan Bay, in 52° 54' N. lat., 4° 24' W. long., distant 21 miles S. by W. from Caernarvon, and 284 miles N.W. by W. from London. The population of the borough of Pwllheli in 1851 was 2709. The borough is governed by four aldermen and 12 councillors, of whom one is mayor, and is contributory to Caernarvon in returning one member to the Imperial Parliament. Pwllheli Poor-Law Union contains 32 parishes and townships, with an area of 92,889 acres, and a population in 1851 of 21,896.

Pwllheli consists of one long well-built street. In the town are a parochial chapel, chapels for Independents and Baptists, National and Infant schools, and a savings bank. A county court is held. The harbour has at its entrance a round rock, called *Careg yr Imbill*, about a mile from the town, to which it is joined by a range of sand-hills; vessels of about 60 tons find accommodation in the harbour. Ship-building employs some of the population. Wednesday and Saturday are the market-days. Six fairs are held in the year. Lobsters, oysters, crabs, and mussels are abundant, and salmon of good quality are taken. The sands on the beach are well adapted for bathing.

PYDNA. [MACEDONIA.]

PYRAMUS, RIVER. [ANATOLIA.]

PYRENEES (the *Pyrenæi Montes* of Julius Cæsar and the *Pyrenæ* of Strabo and Lucan), a range of mountains extending from the Mediterranean Sea to the Bay of Biscay, and constituting a natural barrier between France and Spain. The etymology of the name is uncertain. An offset which runs in a northerly direction between the Aude and the Lers, and forms in this part the watershed between the Bay of Biscay and the Mediterranean, is usually said to connect

the Pyrenees with the Cévennes Mountains; on the west, the prolongation of the Pyrenees forms the mountains of Guipuzcoa, Biscay, Asturias, and Galicia, which terminate in the capes Ortegal and Finisterre, and the other headlands of the northwest of Spain. The present article however is a notice of that part only of the system to which the name of Pyrenees is usually applied.

The area occupied by these mountains is comprehended between 42° 10' and 43° 20' N. lat., 3° 20' E. and 2° 0' W. long. The length of the chain from Cape Creux, near the town of Rosas, in Catalonia, on the coast of the Mediterranean, to the 'port' of Passages in Guipuzcoa, is about 370 miles in a straight line from east-by-south to west-by-north. The breadth varies from about 20 miles near the eastern extremity, to about 60 miles near the centre, and to 40 miles near the western extremity of the chain. The Pyrenees pass along the border of the following departments of France, enumerated in order from east to west:—*Pyrénées-Orientales*; *Ariège*; *Haute-Garonne*; *Hautes-Pyrénées*; and *Basses-Pyrénées*. In Spain the Pyrenees pass through Catalonia, the valleys of Andorre and Arran, Aragon, and Navarre.

The range of the Pyrenees may be regarded as consisting of two parts, both having the same general direction, but not forming one continuous line: the point of dislocation is near the head of the Garonne; thence to the Mediterranean the principal ridge is more advanced toward the north than between the head of the Garonne and the Bay of Biscay. The point at which the two parts of the chain approach each other is occupied by a group of mountains which unite them to one another. The southern slope of the Pyrenees is steeper than the northern: the ascents on the Spanish side are invariably more rugged and difficult. The French valleys generally ascend toward the main ridge by a succession of steps and terraces. As in most other great mountain systems the loftiest summits are not found in the line of direction of the main ridge, but at short distances from it, in some of the numerous spurs thrown out on both sides of it. Lateral branches inclosing valleys are thrown off at points where the main ridge rises into lofty summits; while the heads of the valleys are marked by depressions, which constitute the natural passes between one side and the other of the mountains. Towards the eastern extremity of the Pyrenees these depressions are called 'cols,' as in the Alps: in the central and western parts they are more commonly designated 'ports.' The principal branches thrown off on the northern side are the *Corbières Mountains*, which cover a considerable portion of the department of Aude, on the right bank of the river Aude; the ridge already alluded to as forming part of the watershed between the Mediterranean and the Atlantic, and by a certain latitude of expression said to connect the Cévennes with the Pyrenees; and the range that separates the basins of the Adour and the Garonne.

At their eastern extremity in Cape Cerbère the Pyrenees are about 1470 feet high above the sea; they rise rapidly as they proceed westward, reaching 1920 feet near Bellegarde; after a slight depression here, which forms the Pass of Pertus, they swell to the lofty mass of Costabona, whence springs to northward the spur crowned by the Canigou, 9135 feet high. The principal ridge attains the height of several thousand feet not far from Mont-Louis, and instead of the hitherto rounded summit terminating in plateaus covered with forests or pastures, it begins to assume bolder and more imposing forms; a crest bristling with peaked summits and scarped rocks, frowning chasms, and precipices become the leading features. Sinking to 5113 feet to form the pass of La-Perche, it soon rises to 6394 feet, and increases to 7673 feet near the valley of Vic-Dessos; here again there is a swell to above 9000 feet, which sends out northward the spur that contains Montolm, whose summit is 10,513 feet high. From this part to the source of the Garonne in the Val-d'Arran the height of the chain is almost uniformly about 7673 feet. After bending round the Val-d'Arran, another massive swell takes place in the main ridge, whence projects to the southward the gigantic spur containing the *Maladetta*, which reaches the height of 10,563 feet, and is one of several peaks that are gathered nearly in a semicircle round the Peak of Néhou, or Malahite, the loftiest summit in the Pyrenees, which has an elevation of 11,168 feet above the sea. Between the *Maladetta* and the Val d'Ossau, the principal chain reaches its greatest height, the crest maintaining an elevation of 8320 feet, while the spurs thrown out north and south contain several very lofty peaks, among which are—the *Punta-de-Lardana*, 11,000 feet; the *Tours-de-Marboré*, the highest of which has an elevation of 10,660 feet; *Mont-Perdu*, 10,991 feet; the *Vignemale*, 10,817 feet; the *Pic-du-Midi*, 9486 feet. In this part also are numerous lakes, glaciers, cascades, and inclosed between the lateral ranges, transverse valleys of great length abounding in magnificent scenery. West of the Val d'Ossau the summit of the main ridge, as well as of the branches, again assumes the generally rounded form, and in many places is covered with pastures; here and there however are still seen peaks exceeding 7500 feet in height. The range at its western, as at its eastern extremity, is crossed by several practicable passes, called 'ports,' or 'cols,' the most important of which are noticed in the account of the French departments named above. The Pyrenees, as considered in this article, terminate near Fuenterrabia, in the masses which inclose the valley of the *Bidasoa*, while the main ridge continues its western course under various names across the north of Spain.

All the great valleys of the Pyrenees are transverse. The val-

head is usually at a 'col' or a 'port,' and the valley extends for many miles towards the north or south, bounded by lateral branches of the mountains. The longest valleys, as that of the Garonne, and the valley of Lavedan, which is watered by the Gave-de-Pau, are near the centre of the great range. Many of the valleys present a succession of basins, or circular hollows, locally called 'oules,' through which the stream which waters the valley winds slowly, assuming a character in keeping with the scenery of these secluded spots. These basins are usually elevated one above the other, and they communicate by narrow and deep ravines, or by a slope or descent more or less steep. In the upper part of the valleys, where these basins are more frequent and more perfect in their form, they often contain lakes or tarns. Tarns are numerous on the French side of the mountains; on the Spanish side they are rare. Some of them are in very elevated sites from 6000 to nearly 8000 feet above the sea. The most elevated lake seems to be that of the Pic-du-Midi. Some of them, as the Lake of Oo, are frozen for the greater part of the year. At the head of some of the valleys is found an 'oule,' 'olla,' or hollow, surrounded by walls of almost perpendicular rock, and forming a cirque or amphitheatre. The most famous of these circular vale-heads is the Cirque of Gavarnie, celebrated for its romantic scenery. [PYRÉNÉES, HAUTES.]

The line of perpetual congelation in the Pyrenees, according to Malte-Brun, occurs at the height of 9269 feet on the northern slopes, and 8311 feet on the southern. The climate in the neighbourhood of the Pyrenees varies considerably. It is warmer at the extremities, because of the inferior height of the mountains and the proximity of the sea; this is especially the case at the eastern extremity, where the olive grows luxuriantly. The winters are short, and in the lower valleys snow rarely lies more than a day or two. In the upper valleys the climate is more rigorous. The lower slopes are in many parts covered with forests of oak and beech; the pine, the fir, the box, the rhododendron, the Alpine rose, the dwarf willow, and a variety of other trees and shrubs grow higher up the sides. The summers are very warm, and vegetation in all the valleys is very luxuriant. Thunder-storms are frequent.

Many rivers rise in the Pyrenees. Those on the southern side, except a few near the eastern extremity, flow into the Ebro. The waters of the northern slope, with the exception of the Bidasoa, which flows directly into the ocean, are carried into the Bay of Biscay by the Adour, the Ariège, and the Garonne; or into the Mediterranean by the Aude, the Tech, the Tet, and the Gly. There are numerous mineral springs in the neighbourhood of the Pyrenees. Those of Bagnères-de-Bigorre, Bagnères-de-Luchon, Barrèges, St-Sauveur, in the valley of Lavedan; Cauterets; Eaux-Bonnes, in the valley of Ossau; Eaux-Chaudes, in an adjacent valley; Ax, in the valley of the Ariège; Alet, in that of the Aude; and some others, are of considerable note.

In the higher Pyrenees small glaciers are of frequent occurrence; they are found adjacent to the loftiest peaks. Avalanches also occur, as in the Alps. The glaciers of the Pyrenees are found on the slopes of the loftier mountains, not occupying deep gorges or valleys, as in the Alps; neither are they as in the latter mountains contiguous, but separated frequently by considerable intervals. They are frequently traversed by deep fractures or chasms. Glaciers are found only between the valleys of Arran and Ossau, and for the most part on the northern slope of the mountains.

The recesses of the Pyrenees are the haunts of the isard, a variety of the chamois, of smaller size and brighter colour. The bear and the wolf are also found. The slopes of the mountains afford pasturage in summer to numerous flocks, which are driven thither from the plains or lower slopes where they pass the winter. Medicinal plants abound. The mountaineers are a fine intelligent race of men. An unhappy and despised race of men, commonly but falsely said to be disfigured by goltre, are found in the western Pyrenees, where they are called Cagots. They were formerly held in the utmost abhorrence and kept in a state of the greatest degradation: in the churches they had a distinct place which they reached, not by the same entrance as other Christians, but by a side-door made purposely for them. The condition of the Cagots has been ameliorated by advancing civilisation, and they are now nearly absorbed by intermarriage with the mass of the population. Goltre and cretinism are not unfrequent in the Pyrenean valleys, but they have never been confined to the Cagots alone. The prevailing opinion is that the Cagots are descended from a tribe of Saracens.

Although hot-springs exist in most of the valleys of the Pyrenees yet there is no appearance of volcanic action in the structure of the mountains, the mass of which is composed of primitive, transition, and secondary formations. The primitive rocks, which form the least part of the mass, comprise granite and gneiss; these rocks in the eastern part of the Pyrenees are found on the north slope considerably below the crest of the chain, but towards the west they form the crest itself and part of the southern slope. Towards the middle of the range micaceous schist is found and primitive limestone extends between the Garonne and the Ariège. Sienite, porphyry, serpentine, and trap are occasionally met with among the varieties of the primitive formations. The transition rocks, which form the larger part of these mountains, are clay-slate and grauwacke-slate, which extend in two

beds from one end of the chain to the other, resting in a very inclined position upon the primitive formations. Bands of red-sandstone and alpine limestone occur along the chain chiefly on the southern slope, and also nearly uninterruptedly on the northern slope, but not in such great masses. Ophite is found, not in strata, but in isolated masses, generally at the entrance of the valleys. The Pyrenees are rich in iron-ore; copper also, lead, and silver exist in the mountains that flank the valley of Baigorri; some gold is washed down by the Salat, the Ariège, and the Garonne. Fine statuary and beautiful coloured marble are quarried.

The most important, because most practicable, passes of the Pyrenees are, proceeding from east to west, the Col-de-Pertus commanded by the fortress of Bellegarde, through which runs the road from Perpignan to Barcelona, practicable at all seasons, and for vehicles of every kind; the Col-de-la-Perche, commanded by the fortress of Mont-Louis, communicating between French and Spanish Cerdagne: the Port-de-Salo, through which runs the road from Toulouse and St-Girons to Lerida; the Port-de-Viella, by which communication is kept up between the valley of Arran and the rest of Spain: the Port-de-Canfranc, through which runs the road from Oléron by the valley of Aspe to Jaca: the Port of Orisson and the Port of Roncevaux, or Roncesvalles, through which runs the road from St-Jean-Pied-de-Port to Monreal: and the Port-de-Maya, communicating between Bayonne and Pampeluna. The main road from Paris, Bordeaux, and Bayonne to Madrid crosses the Bidasoa near the sea, at the western extremity of the chain. It was by the Pass of Pertus that the armies of Hannibal and Julius Cæsar crossed the Pyrenees. Charlemagne advanced into Spain, A. D. 778, by the pass of Roncesvalles, where his rear-guard suffered great loss from the hardy mountaineers. Among the slain was the renowned Roland, whose name still lives in the traditions of the country, besides being given to the famous Brèche-de-Roland, the highest pass of the Pyrenees (about 9000 feet), which he is said to have formed by a blow of his sword. There are above 50 passes in the Pyrenees, but except those mentioned (not including the Brèche-de-Roland) few are traversed unless it be by smugglers or adventurous tourists.

PYRÉNÉES, BASSES, a department in the south-west of France, lies between 42° 47' and 43° 35' N. lat., 0° 2' E. and 1° 45' W. long., and is bounded N. by the departments of Landes and Gers, E. by that of Hautes-Pyrénées, S. by the Pyrenees and Spain, and W. by the Bay of Biscay. Its greatest length from east to west is 88 miles; the breadth varies from 13 to 55 miles. The area is 2943·3 square miles. The population in 1841 was 451,683; in 1851 it amounted to 446,997, which gives 151·869 to the square mile, being 22·715 below the average per square mile for the whole of France.

The department is formed out of the old principality of BERN, Basse-Navarre, the Basque districts of Soule and Labour [BASQUES, PAYS DES], and a portion of Chalosse. It takes its name from its position on the slopes and at the foot of the Western Pyrenees, which send out numerous offshoots to the north-west, dividing the surface of the department into a great number of valleys, each watered by a clear rapid stream that ultimately falls into the ADOUR on the northern boundary. From the Basque word for running water these mountain rivers are called 'gaves.' The principal of them are the Gave-de-Pau, which drains the north-east, and the Gave-d'Oloron (formed by the gaves that drain the valleys of Aspe and Ossau), which runs through the central districts. More to westward are the Bidouze and the Nive (this enters the Adour at Bayonne), the Nivelle, which rises in Spain and enters the Gulf of Gasconne at St-Jean-de-Luz, and the Bidasoa, which marks the boundary between France and Spain for a short distance before its entrance into the Bay of Biscay below Fuenterrabia. Timber and other articles are floated down all these rivers almost from their sources; such of them as fall directly into the sea have a tide navigation a few miles from their mouths.

The lower valleys of the department, the principal of which are those of Baigorri, Soule, Aspe, and Ossau, are fertile. The vale-heads in many instances have the form of an amphitheatre (locally called 'oule' from the Spanish 'olla,' pot), inclosed by high mountains, and connected with the valleys by narrow gorges; some of them also present beautiful cascades. The high valleys and lower slopes of the Pyrenees afford excellent pasture, on which great numbers of cattle, swine, sheep, mules, and light Navarrese horses are fed. The hill-sides are in general covered with vineyards, which yield very good wine, and with plantations of fruit and chestnut-trees. The annual produce of wine is about 7,150,000 gallons, the best kinds being those of Jurançon and Gan. The high mountains are to a great extent covered with forests of pine, fir, and oak, which afford good ship timber. Along the Adour there is some marsh land, and in the north-west, and near the sea, there are some naked barren wastes. Of wheat the produce is not enough for the consumption; other crops are rye, barley, oats, millet, chestnuts, and maize, which last forms the principal article of food of the peasantry. The growing of flax and hemp, the trade in hams chiefly carried on in Pau and Bayonne, and the traffic in mules and cattle with Spain, are the most important sources of wealth to the agriculturist.

The Pyrenees consist of primitive rocks (especially granite mingled with gneiss), which occupy however but a small space in this department. The transition rocks (grauwacke, grauwacke-slate, clay-slate, and transition limestone) form the principal component of the

mountains, skirting the nucleus of primitive rocks by which they are supported. The secondary formations, especially the new red-sandstone, and the Alpine limestone which overlies it, form the predominant rocks; the former is observed in the higher part of the mountains, where it usually exceeds the transition rocks in elevation; the latter appears in the lower slopes and at the base of the mountains, extending northward in several parts to the banks of the Adour and the Gave-de-Pau. The immediate vicinity of these rivers, and the north-eastern part of the department, which extends across the Gave-de-Pau, are occupied by the tertiary formations. Masses of secondary trap rocks are found in the lower part of the valleys watered by feeders of the Nive; the Gave-d'Oloron, and the Gave-de-Pau. The formations of the cretaceous group are found on the flanks of the Pyrenees, but considerably altered in their mineralogical character by their vicinity to the granite.

The mineral wealth of the department comprises silver, copper, iron, lead, coal, salt, cobalt, and sulphur; slate, marble of all colours, granite, alabaster, rotten-stone, and marl. Of the numerous mineral springs the most famous are those of Eaux-Bonnes and Eaux-Chaudes, in the upper part of the Val-d'Ossau. Game abounds in the highlands, and includes roebucks, bears, chamois, ortolans, &c.

The height of the Pyrenees, and the snow that lies on them several months in the year, the proximity of the ocean, and the great number of springs, streams, marshes, and rivers, which, presenting a considerable surface, absorb a large quantity of heat, modify the temperature of the department very considerably, and render it much less genial and more cold than one would expect from the latitude. From the end of February to the end of April the south wind blows regularly, changing winter into spring; west winds succeed for the next two months; and during the summer and autumn the north and north-west winds prevail. In some valleys men and women, the latter especially, are very subject to goitre, the diseased gland in some exceeding the size of the head.

The manufactures include linen, calico, coloured handkerchiefs, flannel, drugget, hosiery, Bearnese caps, carpets, chocolate, liqueur and common brandy, paper, leather, pottery, and iron. Ships are built on the Adour and on the coast. The commerce is composed of the various products already named, and of wine, liquorice, rosin, prepared skins, wool, hides, deal planks, colonial produce, salt, &c. Highway accommodation is afforded by 5 national and 20 departmental roads: two of the former lead across the Pyrenees from Bayonne to Spain, one through St. Jean-Pied-de-Port by the 'ports' or passes of Orisson and Roncevaux; the other to Pamplona by the pass of Maya. A railway, opened in 1854 from Bordeaux to Bayonne, gives the department rapid means of intercourse with Paris, and connects it with the general railway system of France.

The department was comprised in the Roman Novempopulana. It is inhabited chiefly by two distinct races, the Bearnese and the Basques, who differ from each other in character and language. There are also several of that once degraded race, the Cagots, who it is believed are descended from the Saracens.

The surface measures 1,888,713 acres. Of this area, 386,049 acres are under tillage; 163,723 acres are natural pasture; 57,269 acres are laid out in vineyards; 323,183 acres are covered with woods and forests; 15,385 acres are occupied with orchards, nurseries, and gardens; 841,997 acres consist of unproductive mountain and barren moor; 37,106 acres are covered with streets, roads, and buildings; and 24,820 acres with rivers, waters, and lakes.

The department is divided into five arrondissements, which, with their sub-divisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Pau	11	185	126,578
2. Oloron	8	80	75,476
3. Orthes	7	135	82,579
4. Bayonne	8	52	88,185
5. Mauléon	6	109	74,180
Total	40	561	446,997

1. Of the first arrondissement, and of the whole department, the capital is PAU. *Lescar*, 3 miles N.W. from Pau, is built on the slope of a hill on the right bank of the Gave-de-Pau, and has a population of 2096; before the revolution of 1789 it was the residence of a bishop, and had a college of Barnabites. The church of *Lescar* is reckoned among the historical monuments of France. *Morlaas*, once the capital of Béarn, and the residence of its viscounts, is situated 5 miles N.E. from Pau, and has 1886 inhabitants. For several centuries there was a mint in this town, at which the livres morlaises were coined. Horse-races were established here by Gaston IV. *Nay*, situated on the Gave-de-Pau at the extremity of a fertile plain 10 miles S. by E. from Pau, is a well-built town with 3227 inhabitants, who manufacture woollen-cloths, drugget, blankets, calico, hosiery, caps, and leather. *Pontac*, 15 miles S.E. from Pau, on the Lousse, a feeder of the Gave-de-Pau, has a population of 2123.

2. In the second arrondissement the chief town *Oloron*, or *Oloron*, situated on the summit and slope of a hill at the confluence of the

Aspe and the *Ossau*, which here unite to form the Gave-d'Oloron, is an ancient town, with 6272 inhabitants in the commune. The town, which occupies the site of the ancient *Nuro*, or *Blorensium Civitas*, has a tribunal of first instance, manufactures of cloth, woollen caps, hosiery, woollen-yarn, horn and boxwood combs, leather, and paper. There is a good trade with Navarre and Aragon in wool, sheep-skins, hams, and cattle. A high bridge over the *Aspe*, under which there are several mills, joins the town to *Sainte-Marie-d'Oloron*, a well-built little town of 3629 inhabitants. In this town, there is a street called *Rue-des-Cagots* from its having been the residence of that unfortunate race; in the ancient parish church there is still to be seen the separate door and holy water basin of the Cagots. *Arudy*, prettily situated in a fertile territory watered by the *Ossau*, is 10 miles S. from Oloron, and has about 2000 inhabitants, several of whom are Cagots. The church of *Arudy*, like that of *Sainte-Marie*, gives evidence of the loathing with which this race was formerly looked upon. *Arudy* is a place of considerable trade in wool, cattle, sheep, corn and agricultural produce, as the shepherds and graziers on the slopes of the Pyrenees dispose of their stock and buy provisions in the town. *Laruns*, a small place of 1814 inhabitants, 8 miles S. from Arudy, is a dépôt for the mast and ship-timber from the Pyrenees for the French marine. It has also iron-forges. Not far from this town is the valley, village, and baths of *Eaux-Chaudes*, and a little further south is the *Pic-du-Midi-de-Pau*, a granite mountain, the summit of which is 9700 feet high, being the highest point within the department. *Lasseube*, a large village with a population of 3040, stands on the *Buze*, 8 miles N.E. from Oloron. *Monein*, a well-built town, consisting of several good streets abutting on a central square, is situated 8 miles N. from Oloron, on the left bank of the *Baise*, in a country productive of excellent wine, and has 5373 inhabitants. There are iron, copper, and lead-mines in the neighbourhood. The chief trade is in wine and ship-timber.

3. The third arrondissement takes its name from its chief town *Orthes*. *Salies*, 8 miles W. from Orthes, takes its name from its abundant salt-springs; it stands on a small feeder of the Gave-d'Oloron, and has a considerable trade in salt and hams. The population of *Salies* is 7852.

4. In the fourth arrondissement the chief town is *BAYONNE*. *Le-Bastide-de-Clairence*, 14 miles E. from Bayonne, has 2097 inhabitants, who manufacture hosiery, caps, and leather. There are copper- and iron-mines near it. *Bidache*, 19 miles E. from Bayonne, on the *Bidouze*, which is here navigable, is a pretty town with 2869 inhabitants. *Happarrea*, 11 miles S.E. from Bayonne, situated in a fertile and well cultivated country, has 5870 inhabitants in the commune, and a great number of tanneries for shoe and white leather, and a large trade in cattle. *St. Jean-de-Lus*, a small sea-port at the mouth and on the right bank of the *Nivelle*, over which a bridge leads to the suburb of *Sibourre*, has a population of 3208. The town is pretty well built, and is defended by two forts, near one of which there is a lighthouse. *Ustaritz*, 7 miles S. from Bayonne, is a collection of hamlets on the left bank of the *Nive*, and has a population of 2348. Before the revolution of 1789 it was the seat of a court of justice for the Basque territory of Labour. The administrative council of Labour called 'bilcar,' and consisting of the heads of families, met in a rocky wood near *Ustaritz* for the decision of questions affecting all the communes of the territory. Except the president and secretary, who sat on stones by a large block which served for a table, the members of the bilcar stood leaning on their blackthorn sticks, or against the old oaks that grew in a circle round the place. The privilege of managing their own affairs was taken away from this people by the revolution of 1789.

5. The fifth arrondissement takes its name from *Mauléon*, a small town, with a college and 1167 inhabitants, situated on the Gave-de-Gaison, which divides it into two parts—one built on a hill surmounted by an ancient castle, and the other in a level plain. *Mauléon* was the capital of the Basque district of Soule. The tribunal of first instance is at *St. Palais*, a little walled town with 1619 inhabitants, situated in a fertile country, on the left bank of the *Bidouze*. *St. Etienne-de-Baigorry*, situated in a valley of the same name, has a population of about 3300. The valley commences on the frontier of Spain, from which it extends about 11 miles in a northern direction, with a breadth of about 8 miles. It is traversed by a small stream, the *Hourepeteca*, which falls into the *Nive*, a tributary of the *Adour*. There are rich copper- and iron-mines in the valley, and large copper- and iron-works for smelting and refining the ores. *St. Jean-Pied-de-Port*, a small fortified town, with a population of 2332, is situated on the *Nive*, 18 miles W. by S. from *Mauléon*; it takes the latter part of its name from its position at the foot of the port or pass across the Pyrenees into Spain. The town is of some importance in a military point of view; the citadel stands on a hill, and commands three passes by which France may here be entered from Spain. Not far from this town, is *Roncevaux*, or *Roncevalles*, famous for the defeat of Charlemagne in 778, and for the death of Roland: in the Augustinian abbey of *Roncevalles*, as the place is properly called, the monks display some memorials of the illustrious paladin, whose memory is still glorious in the neighbourhood.

The department forms the see of the Bishop of Bayonne; it is included in the jurisdiction of the High Court of Pau, and within the limits of the University-Academy of Bordeaux; and belongs to

the 13th Military Division, of which Bayonne is head-quarters. It returns three members to the Legislative Chamber of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Annuaire du Commerce; Official Papers.*)

PYRÉNÉES, HAUTES, a department in the south of France, lies between 42° 39' and 43° 34' N. lat., 0° 30' E. and 0° 20' W. long., and is bounded N. by the department of Gers, E. by Haute-Garonne, S. by Spain, and W. by Basses-Pyrénées. Its greatest length is about 70 miles, and its greatest breadth about 45 miles. The area is 1748·4 square miles; the population in 1841 was 244,196; in 1851 it amounted to 250,934, which gives 143·522 to the square mile, being 31·062 below the average per square mile for all France.

The department is formed out of the districts of BIGORRE and Quatre-Vallées, and a portion of Nébouzan. The *Quatre-Vallées*, or Four Valleys of Aure, Barousse, Magnac, and Veste formed part of the county of Armagnac, a subdivision of Gasconne. Castelnau-de-Magnac was the chief place of the Quatre-Vallées, which now form the south-east of the department of Hautes-Pyrénées and the south-west of Haute-Garonne.

The department takes its name from the Pyrenees, which attain their greatest height on the southern boundary, where Monte-Maladetta, Mont-Perdu, and the highest peak of the Vignemale group, reach respectively 10,863, 10,991, and 10,817 feet above the sea-level. Stretching northward from this great mountain barrier, the department presents a surface diversified by plains, hills, forests, valleys, gorges, high mountains, torrents, and waterfalls. Two lateral offsets of the Pyrenees extend northward and terminate in the two ranges of hills that inclose between them the fine plain of Bigorre. Between this plain and the main range of the Pyrenees occur a great number of picturesque valleys, where the scenery comprises within little compass the quiet well-sheltered village, the snow-clad mountain, with rocky precipitous sides, or with slopes shaded by dark forests, and the whole echoing with the noise of waterfalls, or animated by the cheerful babble of the furiously-running 'gave.' Among the most noted of these valleys is that of Caunteretz, celebrated for its hot springs. In most instances, the valleys, which in their higher parts contract at intervals to mere gorges wide enough to afford a passage for the troubled waters of the gave, terminate in vale-heads that take the form of an amphitheatre. Of these vale-heads that called the *Cirque-de-Gavarnie* must be specified. The road or path to this vale-head from the village of Gèdres passes some savage mountain scenery, and among a chaos of massive blocks of stone, many of them large enough to afford singly sufficient material for building a cathedral. On reaching the vale-head one sees a vast semicircle of precipitous rocks, about 1640 feet high, broken into three stages or steps, on one of which a glacier rests, forming part of the ice-field of the Mont-Perdu group. From a lake among the glaciers on this lofty mountain, the Gave-de-Gavarnie, the head-water of the Gave-de-Pau leaps down the savage side of the Cirque 328 feet at a single bound, and striking against one of the steps or ledges above mentioned is dashed into spray, which, struck by the rays of the sun, forms an infinite number of rainbows, some of a completely circular form. The broken waters from this point form several cascades (these again divide into a greater number on striking the next ledge), and at length, uniting at the bottom, after a total fall of above 1600 feet, roar in a torrent stream through a hollow vault worn out under the rock strewn floor of the Cirque of Gavarnie. Excursions are made over rocks, snow, and glaciers, from Gavarnie to the Tours-du-Marboré, and to the pass called *Brèche-de-Roland*, a colossal gap in the mountain-wall 330 feet wide, and nearly 9000 feet above the sea, which Roland, of the famous sword, is fabled to have made for his followers, and which is now frequented only by smugglers and adventurous tourists. There are many more practicable passes however than the *Brèche-de-Roland*, at a height of 6000 to 7000 feet, but all of them are subject to tremendous hurricanes, and such is the danger in threading them, that it is a received axiom that among these stormy heights "the son must not wait for the father, nor the father for the son."

The *Pic-du-Midi-de-Bigorre*, which stands in front of the main mass of the Pyrenees, at the south of the plain of Bigorre, rises to the height of 9436 feet above the sea-level. It is ascended not without difficulty by the valley of Barèges and the gorge of Grip. In clear weather the view from its summit is truly magnificent: to the southward the Pyrenean range extends in a vast crescent mass, surmounted at different distances by tremendous peaked or rounded heights, whose slopes are covered with snow heaps or with ice-fields that contrast strongly with the sombre hue of the dark brown rocks near them. To the northward, all inequalities of surface seem annihilated, and a vast plain spreads itself out before the eye, comprising the departments of Basses-Pyrénées, Gers, and Haute-Garonne.

The hilly region which extends over a great portion of the department north of the *Pic-du-Midi-de-Bigorre*, is furrowed by numerous streams flowing through lateral valleys of great beauty, and emptying themselves into the Adour or the Garonne. The fine plain of Bigorre, in the centre of which stands the town of Tarbes, inclines gradually towards the north. The ranges that inclose it on the east and west are covered with woods throughout their entire length; the Adour and its feeders drain it; good high roads, diverging from Tarbes, and

several other branch roads, traverse its surface, which is strewn with towns, villages, and hamlets in all directions.

The principal rivers are the ADOUR, which runs through the department from south to north: the GARONNE and its feeder the Neste, which drain the south-eastern districts; the Gave-de-Pau, which flows through the beautiful valleys of Caunteretz and Argelès in the south-west, on its way to join the Adour; the GERS and the Baise, feeders of the Garonne; and the Larros, a tributary of the Adour, which drain the north-east of the department. The Alaric Canal serves for the irrigation of the plain on the right bank of the Adour; it is about 30 miles in length, and turns above 60 mills. It commences below Bagnères, passes a little east of Tarbes, through Rabastens, and enters the Adour below Maubourguet. This canal was opened in A.D. 507.

The climate is in general good and healthy, the temperature in the plains of Bigorre is mild; but, as may be expected from the nature of the surface of the department, different temperatures may be obtained by varying the elevation. All the atmospheric phenomena succeed each other in the highlands with remarkable rapidity and inconstancy. The prevailing wind blows from the south-west, and it is attended very frequently with violent rains. The spring is mild, but sometimes late frosts are destructive to the young vegetation; summer is dry and windy; the autumn is invariably fine and clear; the winter foggy.

The common corn products of the department are insufficient for the consumption; buck-wheat, maize, potatoes, figs, mulberries, &c., are also grown. About 6,000,000 gallons of good white and red wines are made annually. Horned cattle and sheep are very numerous; good butter and cheese are made; mules, asses, and horses are reared, and also pigs and large numbers of poultry, especially geese, the legs of which are salted for export. Bees are carefully tended, and honey and wax are abundant.

The loftiest parts of the Pyrenees in this department are composed of granitic rocks, which are also found in the upper part of the valley of Lavedan, between Gèdre and Gavarnie, in the valley of Héas, in the upper part of the valley of Aure, near the village of Plan, and in detached portions in one or two other places. The *Pic-du-Midi-de-Bigorre*, and the surrounding district between Arreau in the valley of the Neste, and Caunteretz, are occupied by mica-slate. The great mass of the Pyrenees however is composed of transition rocks, namely, clay-slate and grauwacke, in the neighbourhood of the primitive formations, and limestone toward the foot of the chain and the plains at its base. The red-sandstone, or red-marl formation, is found in one or two places, chiefly on the east side of the department. A narrow district extending eastward from Bagnères-de-Bigorre to Haute-Garonne, is occupied by Alpine limestone. The north of the department is occupied by the tertiary formations. Iron, copper, zinc, lead, manganese, nickel, and cobalt, are found, but no mines are worked; marble of different colours, building-stone, slate, granite, amianth, kaolin, marl, fullers'-earth, and potters'-clay are raised. Mineral and hot-springs abound.

The commerce of the department is limited to cattle, corn, mules and horses for Spain, timber, oak-staves, hoops, the agricultural products before named, some linen, cotton- and woollen-stuffs, outlery, nails, hides, &c. About 80 fairs are held.

The department contains 1,118,983 acres. Of the whole area about 236,000 acres are under the plough; 110,000 acres consist of grass-land; 33,000 acres are planted with vines; 256,000 acres are covered with woods and forests; 430,000 acres consist of heath, moor, or mountain pasture; and about 20,000 acres are occupied as orchards, gardens, nurseries, &c.

The department is divided into three arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Tarbes . . .	11	197	112,963
2. Argelès . . .	5	102	42,558
3. Bagnères . . .	10	202	95,413
Total . . .	26	501	250,934

1. Of the first arrondissement, and of the whole department, the chief town is *Tarbes*, which is prettily situated on the left bank of the Adour, in 43° 13' 58" N. lat., 0° 4' 41" E. long., 1022 feet above the level of the sea, at a distance of 24 miles E. by S. from Pau, and has 12,663 inhabitants in the commune. The streets are wide, regular, and clean, the waters of the Adour being distributed by canals through all parts of the town; the houses are low, built of marble, boulders, and bricks, and covered in with slates. There are three handsome squares, and outside the town a beautiful walk called the *Prado*. Of the old ramparts there is no longer a trace; but the ancient castle of the counts of Bigorre still stands, and is now used as a prison. The other remarkable buildings are the prefect's residence, formerly the bishop's palace; the hospital; the theological and communal colleges; the Ursuline barracks, once a convent; the normal school; the baths; the bridge over the Adour; and the theatre. There are also a handsome cathedral and two churches in the town, which has manufactures of paper and leather, and a good trade in wine, iron, hides, cattle, agricultural produce, &c. The view of the Pyrenees from this place

is much admired. Edward the Black Prince kept his court in Tarbes-*Maubourquet*, N. of Tarbes, on the Adour, has a remarkable church, built by the Templars, and 2202 inhabitants. *Ossun*, S.W. of Tarbes, has a population of 8016. On a hill near it there is an ancient Roman camp, which, local tradition says, was laid out by Caesar's lieutenant, Crassus. *Vic-en-Bigorre*, a small town surrounded by larger suburbs, is situated 12 miles N. from Tarbes, and has a college, brandy distilleries, tan-yards, and 4644 inhabitants. It was formerly defended by a strong castle, built in 1151, and of which there are still some remains. The places that give name to the other cantons are mere villages.

2. The second arrondissement takes its name from *Argelès*, or *Argeles*, a small town with a college and 1589 inhabitants, situated at the northern entrance of the beautiful valley of Lavedan, on the left bank of the Gave-d'Azan, a feeder of the Gave-de-Pau, 18 miles S.S.W. from Tarbes. *St.-Pé*, situated in a country rich in copper- and lead-mines, on the right bank of the Gave-de-Pau, 7 miles N.W. from Argelès, has a population of 2972, who manufacture nails and box-wood combs, and export roofing-lates. *Lourdes*, 5 miles E. from St.-Pé, stands on the Gave-de-Pau, and is built at the meeting of five high roads round a rock, surmounted by an old castle of the counts of Bigorre, and on the slopes of a ravine which is traversed by a torrent. The houses are pretty well built, but from the nature of the ground the streets are irregular. The town has a tribunal of first instance, and 4146 inhabitants. It is a very ancient place; remains of ancient towers, said to be of Roman construction, are seen here. By the treaty of Bretigny, this town, with the rest of Bigorre, was ceded to the English as part of the ransom of the French king, John. The history of Lourdes forms an admirable story in Froissart. A few miles S. from Argelès, at the small village of Pierrefitte, the road diverges into two branches, which lead, through narrow gorges separated by a mountain mass above 7000 feet in height, to the famous hot springs of *Cauterets* and *St.-Sauveur*. Cauterets is about 7 miles from Pierrefitte. The road which leads to it is cut with great engineering skill, and presents some of the finest mountain scenery in this part of the Pyrenees. The baths are very numerous frequented in July and August. About 6 miles from Cauterets is the famous *Pont-d'Espagne*, a bridge consisting of a number of pine-trees thrown across a narrow chasm in the rocks, into which two mountain streams leap and unite, while the sides of the ravine are covered with dark pine-forests, diversified here and there by granite cliffs that shoot up into spires and pinnacles. Not far from the Pont-d'Espagne are the *Lac-de-Gaube*, the largest tarn among the Pyrenees, and near it the *Vignemale*, one of the highest mountains in France. [PYRÉNÉES.] The road to the baths of St.-Sauveur passes through *Luz*, 9 miles S.E. from Pierrefitte, the narrow gorge presenting scenery similar to that already noticed. Luz is a clean village, situated at the foot of the Pic-de-Bergoms, a high mountain of easy approach, commanding a magnificent view, and on a crystal stream that flows with great rapidity through the ravine in which the town stands. The population of Luz is 2640. The church, which was built by the Templars, is a remarkable structure, a good deal resembling a fortress. Half a mile S.W. from Luz are the hot baths of St.-Sauveur, and about 2 miles N.E. are the still more famous baths of *Barèges*. Barèges is inhabited only during the summer and autumn, at which time it is visited by about 1800 invalids. The springs are the highest in the Pyrenees; the winters consequently are long and cold, so that no population remains, except a few people who take care of the houses in the village.

3. The third arrondissement is named from its chief town, *Bagnères-de-Bigorre* (the *Aquensis Vicus* of the Romans), 461 miles S.S.W. from Paris. It stands in 43° 3' N. lat., 0° 8' E. long., on the left bank of the Adour, and has a resident population of 8335 in the commune. The town is celebrated for its medicinal baths, which are much frequented from May to the end of October, during which time the population is increased to about 15,000. The town stands at the foot of a limestone hill, from the sides of which the medicinal waters flow which supply the public and private baths. There are about 70 baths, which vary in temperature from 90° to 135° Fahr. The waters of all the baths differ only in temperature; they are clear and without any peculiar taste, aperient, and tonic. Bagnères is perhaps the neatest and best-built town in the south of France: the streets are wide, well laid out, well paved, and watered by streams from the Adour. The environs are very beautiful and extremely fertile: there are delightful walks in the valley of Campan and along the banks of the Adour. The town contains a library and reading-rooms, and an establishment with accommodations for dancing, reading, bathing, gaming, theatrical performances, &c. There are also a college and an hospital for the poor. Some manufactures of woollen-stuffs of good quality, serges, crapes, and other fabrics are carried on here; paper is also manufactured. Quarries of fine marble are worked near the town. *Campan* is a well-built town, situated on the Adour, about 4 miles S.S.E. from Bagnères, in a very rich and fertile valley, and has a population of 4058, who manufacture woollen-cloth and paper, and export marble from the quarries in the neighbourhood. There is a large grotto near the town filled with beautiful crystallisations. The valley of Campan is at the source of the Adour, and comprehends in reality two valleys, one of them watered by the Adour, and the other by its

feeder, the *Trasports*. The delightful scenery of the valley of Campan forms one of the attractions of the neighbouring watering-place, Bagnères-de-Bigorre, the most frequented of this part of France. The mineral riches of the valley constitute however its chief claim to notice. It is celebrated for its fine-grained marble of different colours, some of purple and white with veins of green, and some of deep red veined with green and white. The marble quarries of Campan have been long worked by the government for the embellishment of the royal residences of France. The valley of Campan is one of the most fertile in the department; and the flocks, orchards, and gardens, which its inhabitants generally possess, enable them to live in comfort. The Pic-du-Midi-de-Bigorre, which overlooks the valley, rises to the height of 9544 feet.

The department forms the see of the Bishop of Tarbes; is included in the jurisdiction of the High Court of Pau, and within the limits of the University-Academy of Toulouse; and belongs to the 13th Military Division, of which Bayonne is head-quarter. It returns two members to the Legislative Chamber of the French empire.

(*Dictionnaire de la France; Annaire pour l'An 1853; Annaire du Commerce; Official Papers.*)

PYRÉNÉES-ORIENTALES, a department in the south of France, lies between 42° 20' and 42° 55' N. lat., 1° 44' and 3° 10' E. long. From east to west its greatest length is 75 miles; from north to south, 85 miles. The area is 1591.4 square miles. The population in 1841 was 173,592; in 1851 it was 181,955, which gives 114,336 to the square mile, being 60,248 below the average per square mile for all France.

The department is formed out of the former district of Rousillon and portions of Cerdagne and Languedoc, and named from its position at the eastern extremity of the Pyrenees. It is bounded S. by the main ridge of the Pyrenees, except at one or two points, where it encroaches on their southern slopes; W. by the Val-d'Andorre and Ariège, from which last it is separated by an offshoot of the Pyrenees on the left bank of the Aube; N.W. and N. by the department of Aube, from which the Corbières Mountains on the right bank of the Aube divide it; and E. by the Mediterranean and the southern part of the shore-lake of Leucate. A plain of considerable width, and in general of great fertility, extends along the coast, which, reckoning all its indentations, measures about 45 miles. The interior is traversed by two ranges of mountains, one of which springs from Mont-Caiguon, the highest point in the department (9185 feet), and, curving from south to east, divides the basin of the Tech from that of the Tet; the other range runs from west to east, between the Tet and the Gly, into which last the Verdoules runs from the south-eastern slopes of the Corbières. All these mountains are furrowed by numerous valleys and by streams that enter the principal rivers already named, which fall into the Mediterranean. A small portion in the west of the department is drained by the Aube, which flows out of the Pyrénées-Orientales by the defile between the Roc-Blanc and the Corbières Mountains. On the southern slope of the Pyrenees, and not far from the sources of the Tech and the Aube, the Segre, a Spanish river, takes its rise. None of these rivers are navigable, but the waters of most of them are turned to good account for fertilising the land by means of an excellent and extensive system of irrigation, whereby, in the plain of Perpignan, the valleys of the Tet, the Tech, and the Gly, not less than 70,000 acres of land, are rendered exceedingly productive. Two canals, namely, those of Millas and Perpignan, date respectively from the years 1163 and 1172: the latter is nearly 20 miles long, with a mean breadth of 10 feet and a total fall of 800 feet.

The soil in the plains of the arrondissement of Perpignan consists of a layer of vegetable earth about a foot deep, resting on sand or gravel. By careful husbandry and by an extensive system of irrigation it is made to produce fine crops of wheat, rye, black and white oats, maize, millet, barley, broad and haricot beans, flax, hemp, fruits, &c. The olive and the vine are extensively cultivated. The arrondissement of Ceret, drained by the Tech, is with little exception a cold mountainous country, cut up by narrow arid valleys; placed above the region of the vine, it produces only rye, oats, maize, chestnuts, and pulse. The arrondissement of Prades, also very mountainous, is diversified by several ranges of vine-clad hills, and by valleys inferior neither in soil nor cultivation to the plain of Perpignan, which it also resembles in its products. The corn produce of the department exceeds the consumption. Of wine about 7,000,000 gallons are made annually. The red wines of Rousillon are in general of excellent quality, agreeable taste, strong body, and well adapted for transport; they are used for giving colour and body to the lighter growths of Cahors and Auvergne. The wines of Collioure and Port-Vendres have the highest repute; they become of a golden hue with age; in this state they take the name of Rancio de Rousillon. The sweet wines of Rivesaltes hold the first rank among the dessert wines of France.

The mountains of the department are in many parts clothed with fine forests of oak, beech, pine, and fir, and abound with aromatic and medicinal plants. The cork tree grows naturally, and is also an object of careful cultivation. There is but little grass land, but the breadth of heath, moor, and mountain pasture is very considerable. Good farm- and saddle-horses, a great number of mules for the Spanish markets, few horned-cattle, but a large number of sheep

common and Thibet goats, are bred. Bees and silkworms are carefully tended; honey and bees'-wax are important exports. Poultry, game, and fish are abundant.

The Pyrenees in this department are composed almost entirely of granitic rocks, as also is that part of the Corbières which lies nearest to the Pyrenees. Not only the peaks, but the intervening valleys are in great part occupied by these formations. The mountains which bound the valley of the Aude on the western side, and occupy the extremity of the department towards the west, are composed of mica-slate, which is not found anywhere else in this department. The transition rocks are found near the base of the granitic mountains, except where their continuity is interrupted by the tertiary or alluvial beds. In the valley of the Tech above Céret, and extending northward across the extremity of that short spur of the Pyrenees to which Le Canigou belongs, these transition rocks consist of clay-slate and transition limestone. About Villefranche, in the valley of the Tet, is found a mass of compact gray limestone, inclosing beds of gray marble veined with red and green. The localities occupied by these two masses of transition rocks are isolated in the district of the granitic formations. The valley of the Gly from Estagel upwards, and that part of the Corbières which lies at the head of the valley, are formed of transition rocks (chiefly compact gray limestone) which skirt the granitic district on the north, and extend into the department of Aude. The valleys watered by the tributaries of the Sègre are, in this department, occupied by the transition rocks. A small portion of the department to the north of Estagel is occupied by the Alpine and Jura limestone, which formations extend northward into the department of Aude, where they overspread a large district. All the eastern side of the department, comprehending the sea-coast, the plain which extends for some miles inland from the coast, and the valleys of the Gly, the Tet, and the Tech, are occupied by tertiary formations. A great number of iron-mines are worked, and the ore is smelted, and converted into malleable iron at 175 forges and furnaces, by means of charcoal prepared on the spot. Copper, lead, bismuth, and alum are found. A coal-mine is worked near Estavar; marble, alabaster, granite, and steatite are quarried. There is a great number of hot and mineral springs, the most frequented of which are those of *Amélie-les-Bains*, formerly called *Arles-les-Bains*.

Besides wine and iron, the industrial products include coarse woollen cloths, leather, corks, knit stockings and caps, brandy, whip-handles, common pottery, tiles, and bricks. The fisheries on the coast are actively plied, and large quantities of sardines and anchovies are preserved. The coasting trade in the leading articles named, and in wool, oil, honey, &c. is active. About 80 fairs are held in the year.

High roads lead from Narbonne and Carcassone to Perpignan, whence southward there are three others—one leading to Port Vendres; another to Spain, by the port or col of Pertus, commanded by the fortress of Bellegarde; and a third which crosses by the port of La-Perche to Puycerda in Spain, where it is joined by the road from Toulouse, up the valley of the Ariège through the port of Puymorens. Another road through Céret enters Spain near Prats-de-Mollo.

The climate is good: the heats of summer in the plains are moderated by sea-breezes; in winter the cold is not intense; snow rests only on the mountains of the Canigou and about Mont-Louis; if it falls elsewhere, it disappears in three days at most. The south-west and north-west are the prevailing winds.

The language of the inhabitants is a mixture of the langue d'oc [FRANCE], the Catalanian, and the Castilian.

The department contains 1,018,526 acres. Of the whole area 228,714 acres are under cultivation; 28,907 acres are grass-land; 94,995 acres are vineyards; 141,658 acres are covered with woods and forests; 465,580 acres consist of barren heath and moor; 22,512 acres are occupied with orchards, gardens, nurseries, and various culture; and 28,354 acres are covered with rivers, canals, lakes, and marshes.

The department is divided into three arrondissemens, which, with their subdivisions and population, are as follows:—

Arrondissemens.	Cantons.	Communes.	Population in 1851.
1. Perpignan	7	85	87,759
2. Céret	4	50	42,125
3. Prades	6	113	52,051
Total	17	248	181,935

1. Of the first arrondissement, and of the whole department, the chief town is PERPIGNAN. *Elne*, the ancient *Illiberis*, under the walls of which Hannibal encamped on his way to Italy, formerly the seat of a bishop, and one of the strongest towns in Roussillon, stands on the slope and at the foot of a hill near the left bank of the Tech, 8 miles S.E. from Perpignan, and has 2268 inhabitants. The emperor Constantius was murdered in this town, and his tomb existed till about eighty years ago in the church cloisters. *Elne* presents a wide ruin: its decay was caused by the continual sieges it stood from the French and Spaniards. The church, which was opened December 10, 1058, and consists of a nave, choir, and aisles, the whole surmounted by a lofty roof supported on square stone pillars, is a very remarkable

structure. *Millas*, 10 miles W. from Perpignan, on the right bank of the Tet, has a population of 2095, who trade in corn, brandy, beans, and cattle. *St.-Paul-de-Fenouilles*, a small place on the left bank of the Gly, or Agly, and near its confluence with the Boulsons, is built on a height surrounded by arid hills which are crowned with the ruins of many an ancient castle, 23 miles N.W. from Perpignan, and has 2000 inhabitants. *Rivesaltes*, prettily situated on the Agly, in a fertile plain environed by vine-clad slopes that yield muscatel wine of superior quality, has 3446 inhabitants, who trade in wine, brandy, flour, wool, &c. The town is 5 miles N. from Perpignan, and still has remains of the turreted walls erected for its defence by the kings of Aragon. *Thuir*, a walled town 8 miles S.W. from Perpignan, situated on a small stream, has potteries, tanyards, paper-mills, silk-throwing factories, and 2490 inhabitants. The Spaniards seized this town on June 6, 1793, and held it till September 25 of the same year, when the French drove them out of it.

2. In the second arrondissement the chief town, *Céret*, is situated at the foot of the Pyrenees, 17 miles S.S.W. from Perpignan, and has a tribunal of first instance, a college, and 3575 inhabitants. The town, which is surrounded by high tower-flanked walls, stands near the right bank of the Tech, which is passed by a very high bridge of a single arch. It is ill built, with narrow badly-paved streets. Corks, leather, and copper-ware are the chief industrial products. *Argelès-sur-Mer*, 16 miles E. from Céret, and about 2 miles from the Mediterranean, has a population of 2136. South of Argelès is the small village of *Ecluse*, and near this the strong fortress of *Bellegarde*, built on a high hill, and commanding the cols of Pertus and Punissas, by which communication is kept up between France and Spain. *Arles-sur-Tech*, situated W. of Céret on the left bank of the Tech, is a well-frequented market-town with 2384 inhabitants, who manufacture oak-staves, hoops, leather, and iron, and trade in wine and corn. Near Arles are the hot springs and baths of *Amélie-les-Bains*. *Collioure*, an ill-built town with a small harbour and 3476 inhabitants, is situated on a hill above the sea, 22 miles E. from Céret. The harbour, which admits small craft only, is defended by several forts. Cork-cutting and tunny and sardine fishing are the chief employment of the inhabitants, who also trade in wine, salt-fish, &c. Near Collioure is *Port-Vendres*, the ancient *Portus Veneris*, a small fortified town with a tolerably good natural harbour, a lighthouse, and 1805 inhabitants, who trade in corn, wine, and brandy. *Prats-de-Mollo*, an irregularly-built fortified town of 3710 inhabitants, is situated 20 miles S.W. from Céret, on the left bank of the Tech, in a wild country surrounded by savage mountains. It is built on the slope of a hill which is surmounted by the principal church. The defences are old, and consist of a wall strengthened by gothic round towers and several bastions. Broadcloth, swan-skin, woollen hosiery, and whip-handles, are the chief industrial products. Near this town are the sulphurous hot springs of *Prats*.

3. Of the third arrondissement the chief town, *Prades*, is situated 25 miles S. by W. from Perpignan on the right bank of the Tet, and has a tribunal of first instance, a college, an ecclesiastical school, and 3192 inhabitants. The town stands in a vast plain surrounded by high hills, at the foot and on the slopes of which are several villages; it has a handsome church and a well-built hospital. Woollen cloth, brown paper, and leather are manufactured; and there is considerable commerce in corn, excellent fruits, wine, flax, hemp, hides, fine wool, and cattle. *Mont-Louis*, a small regularly-built fortified town, was erected under Louis XIV., on a rugged rock, commanding the bridge over the Tet on the road into Spain by the Col-de-la-Perche. The situation is bleak and cold in the extreme. The town consists of eight straight streets of symmetrically-built houses; there are two squares, and good barracks; the whole is defended by parapets, bastions, glacis, &c. and by a citadel. The population is only 1084. Lichen abounds in the neighbourhood: the savage wildness, the waterfalls, and the frightful chasms of the gorge through which the Tet hurries in its noisy course near this place, deserve to be mentioned. *Olette*, 10 miles from Prades, situated in a gorge on the left bank of the Tet, where that river is joined by two torrents, has 1209 inhabitants. *Vings*, 5 miles E.N.E. from Prades, is situated in a fertile plain near the right bank of the Tet, and is a spot abounding with springs of the purest water. It retains still some remains of its old fortifications, consisting of walls and towers. The town, which is ill built, has two pretty suburbs, a college, and 2040 inhabitants, who trade in hides, corn, fruits, flax, hemp, and cattle.

The department forms the see of the Bishop of Perpignan; it is comprised in the jurisdiction of the High Court and within the limits of the University-Academy of Montpellier; and belongs to the 11th Military Division, of which Perpignan is head-quarter. It returns one member to the Legislative Assembly of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Annuaire du Commerce; Official Papers.*)

PYRMONT, a county belonging to the Prince of Waldeck, about 32 square miles in extent, with 6623 inhabitants (in 1852), whose chief occupations are agriculture and the breeding of cattle, lies between Lippe-Deimold, Prussia, and Hanover. It yields the prince a revenue of about 8500*l.*, of which the mineral springs alone produce nearly 2000*l.* *Pyrmont*, the capital, is a well-built town, of about 2900 inhabitants, at the northern extremity of a romantic valley on the Emmer, a feeder of the Weser. The principal street, shaded on both sides by

lofty lime-trees, leads to a great avenue and to the celebrated chalybeate springs, of which there are four. The great bathing-house, which contains 140 apartments tastefully fitted up, and handsome spacious baths, is the most important structure in the place. There is likewise

a salt-spring at which other baths have been fitted up. A few hundred paces from the great avenue stands the palace of Fyrmont, the residence of the Prince of Waldeck. Above 300,000 bottles of the water from the principal chalybeate spring are exported annually.

QUADRA ISLAND. [VANCOUVER ISLAND.]

QUAINTON. [BUCKINGHAMSHIRE.]

QUATHLAMBA MOUNTAINS, or **DRACHENBERG MOUNTAINS.** [NATAL.]

QUATRE BRAS. [PRABANT, SOUTH.]

QUATRE VALLÉES. [PYRÉNÉES, HAUTES.]

QUEBEC, the capital city of Canada East, is situated on the river St. Lawrence, about 400 miles from its mouth, in 46° 49' N. lat., 71° 12' W. long. The population in 1851 was 42,052. Quebec is alternately with Toronto the seat of government and of the legislature for the province of Canada.

Quebec stands on a promontory formed by the confluence of the river St. Charles with the St. Lawrence, at the north-eastern extremity of an elevated but narrow table-land, which for about 8 miles forms the left bank of the St. Lawrence. Cape Diamond presents a nearly precipitous face to the St. Lawrence; the descent to the St. Charles is more gradual. The height of the platform of the citadel of Quebec, which stands on Cape Diamond, is 333 feet 3 inches above the St. Lawrence. The distance across the ridge between the two rivers is rather more than a mile. The St. Lawrence abreast of the town is only 1314 yards wide; below the point, the basin formed by the junction of the two rivers is above a mile and a half in width, and the tide rises 25 feet. Quebec is situated at that part of the river where the St. Lawrence suddenly contracts in breadth, and is said to take its name from the Indian word 'kebec,' which signifies narrow.

Quebec is divided into the Upper Town and Lower Town, and the suburbs of St. Roche, St. John, and St. Lewis. The Lower Town, which is the seat of commerce, is built round the base of the promontory. The custom-house and exchange reading-room are in the Lower Town. There are two modes of ascent to the Upper Town, one by a narrow and steep winding street, the other by a flight of steps. The Upper Town has a northerly aspect, and is well ventilated; some of the streets are rather narrow, but they are generally well paved. All public buildings and many private houses are roofed with tin-plates, which produce a very striking effect. The citadel, which crowns the summit of Cape Diamond, is strongly fortified, and covers about 40 acres of ground. Surrounding the Upper Town is a wall mounted with heavy ordnance, and pierced by five gates strongly defended. The citadel contains a very extensive armoury. The parliament house, governor's residence, post-office, and other edifices appropriated to government departments, are among the public buildings. Quebec is the seat of a Protestant bishop and a Roman Catholic bishop. The Protestant cathedral is a plain modern edifice with a spire. The Roman Catholic cathedral is a large building with a heavy dome and spire. The Established Church of Scotland and the Free Scotch Church have each a place of worship; and there are several other churches and chapels belonging to the various religious bodies. In the market-place is a barrack, a spacious building, formerly the Jesuits' college. There are several large conventual establishments. Among the chief public institutions are, the French college, the Royal Grammar school, the Royal Institution, the Literary society, the Historical society, the Medical school, the mechanics' institute, the city library, and several benevolent associations. A monument in honour of Wolfe and Montcalm stands on the plains of Abraham, a short way west from the citadel.

The harbour of Quebec admits ships of the line to the lower part of the basin; merchant ships lie close to the wharfs at the head of the basin, and in the St. Lawrence abreast of the city. On the banks of the St. Lawrence, above the city, are extensive timber basins. Quebec is the great entrepôt for the trade of Canada with Great Britain, the United States, the West Indies, and elsewhere. The total number of ships, inwards, during the year 1852 was 1231, of 505,024 tons aggregate burden; outwards, 1228 of 518,580 tons.

Quebec contains distilleries, breweries, and soap, candle, and tobacco manufactories; but the most important branch of industry is ship-building. The ships built at Quebec during the year 1852 were 65, of 41,505 tons; and in 1851 they were 42, of 27,856 tons. Steamers ply daily in summer between Quebec and Montreal, and between Quebec and places down the river. The city is connected by electric telegraph with Montreal, Canada West, the United States, St. John's in New Brunswick, and Halifax in Nova Scotia.

Quebec was founded by the French in 1608. It 1759 it was taken by assault by the British troops under General Wolfe. The French garrison was commanded by the Marquis de Montcalm. Both Wolfe and Montcalm were slain in the action. Quebec was ceded to Great Britain by the treaty of Paris in 1763. A large part of the town outside the fortifications was destroyed by fire in 1845.

QUEDLINBURG. [MAGDEBURG.]

QUEEN CHARLOTTE'S ISLAND and SOUND. [VANCOUVER ISLAND.]

QUEEN CHARLOTTE'S ISLANDS, also called the **ARCHIPELAGO OF SANTA CRUZ,** are a group of islands in the Pacific, north of the New Hebrides, between 10° and 12° S. lat., 165° and 168° E. long. They were discovered in 1595 by Mandana. The archipelago consists of five or six islands of moderate extent, and a great number of smaller ones. Some of them are surrounded by extensive coral-reefs. The largest is the island of Santa Cruz, called by the natives Nitandi, which is above 20 miles long from east to west, and about half a mile wide. On the north-western shore of it is Travenion Lagoon, a fine round harbour, though small. The other islands are Guerta, Tubus, Lord Howe, Mallicolo, and Volcano: the last has an active volcano. The larger islands and some of the smaller are elevated, and apparently of volcanic origin, but most of the latter are low. They are well wooded, and very populous. They produce the coconut, the bread-fruit, and all the products of the Friendly Islands and New Hebrides. The inhabitants belong to the race of the Austral negroes; they have large canoes, and go almost entirely naked. It was on the island of Mallicolo, called by the French Wanicoro, that La Perouse was wrecked and lost with his crew.

QUEEN CHARLOTTE'S TOWN. [PRINCE EDWARD ISLAND.]

QUEENBOROUGH. [KENT, *Sheppey, Isle of.*]

QUEEN'S COUNTY, province of Leinster, Ireland, is bounded N. by King's County; E. by the county of Kildare, a detached portion of King's County, and the county of Carlow; S. by the county of Kilkenny; and W. by Tipperary and King's County. It lies between 52° 45' and 53° 13' N. lat., 6° 54' and 7° 47' W. long. Its greatest length from east to west is 37 miles, and from north to south 33 miles. The area is 664 square miles, or 424,854 acres, of which 342,422 acres are arable, 69,289 acres uncultivated, 11,630 acres in plantations, 1117 acres in towns, and 396 acres under water. The population in 1841 was 153,930; in 1851 it was 111,623.

Surface, Hydrography, and Communications.—The county is for the most part comprehended in the basin of the Barrow, but a small portion on the north and a yet smaller portion on the west side slope towards the Shannon. The Slieve Bloom Mountains occupy the north-western part of the county, and for some miles separate it from King's County. These mountains are traversed on the border of the county by a narrow defile, the Gap of Glendine, which forms the only communication in this part with King's County. The Dysart Hills occupy the south-eastern part of the county, and separate the valley of the Barrow from that of its tributary the Nore. The rest of the county is flat, or varied only by gentle undulations. Bogs are numerous in the central portions of the county, between the Slieve Bloom and the Dysart Hills.

The principal rivers are the Barrow and the Nore. The Barrow rises in the Slieve Bloom Mountains, and has a winding course to the border of the county, a little above Portarlinton; it continues its course eastward along the boundary, except just about the towns of Monasteravan and Athy in Kildare, till it quits the county a little below the town of Carlow. The Barrow is navigable for barges from Athy, about 40 miles from its source. The Nore rises in the adjacent county of Tipperary, enters Queen's County on the south-western side, not far from Borris-in-Ossory, and flows first north-eastward, then eastward to Castletown. Below Castletown it turns on the south-east and flows to the border of the county, which, before finally quitting, it separates for a short distance from Kilkenny county. The Lower or Little Brosna, or Brusna, which joins the Shannon below Banagher, rises within the western boundary of the county; and the Clodagh, whose waters fall into the Brosna, which joins the Shannon above Banagher, rises within the northern boundary. The only lake is Lough Annagh, on the northern border of the county; it does not exceed a mile in length.

A branch of the Grand Canal from Monasteravan enters the county at its north-eastern corner, and there divides into two branches, one of which runs westward about 12 miles to Mountmellick; the other, known as the Athy Canal, runs 12 miles southward, entering Kildare county near Athy, just below which town it joins the Barrow.

The Great Southern and Western railway crosses the county from north-east to south-west, connecting it with Dublin on the one side and with Limerick and Cork on the other. The road from Dublin to Limerick passes through Ballybrittas, Maryborough, Mountrath, and Borris-in-Ossory. The road from Dublin, by Athy and Cashel, to Cork passes through Stradbally and Abbeyleix. A road from Dublin to Birr passes through Portarlinton and Mountmellick. Other roads are numerous, and those to the market-towns are generally well laid out, and in good condition.

Geology, Mineralogy, &c.—The greater part of Queen's County is included in the limestone district which overspreads a large part of Ireland. The Slieve Bloom Mountains are composed chiefly of sandstone, with thin beds of limestone and coal. Mica-slate occurs on the summits and higher acclivities. A portion of the Dysart Hills is formed by the coal-measures. An esker or gravel ridge, called the Ridge of Maryborough, extends about eight miles northward from that town, continuing with intermissions to King's County. Potters' clay is found, and is employed in making tiles, garden-pots, and other coarse earthenware. Sandstone of a soft texture, suited for hearthstones and chimney-pieces, is quarried; as are also slates, and, in a few places, marble.

Climate, Soil, and Produce.—The general surface being high and open, the climate is generally dry and free from fogs. It is decidedly salubrious, notwithstanding the exhalations from extensive tracts of bog. The soil is generally fertile. There are some large tracts of bog, resting on clay or gravel, which are capable of being converted into fine productive land. On the east side of the Slieve Bloom Mountains, a yellow clay lying on gritty gravel, and on the west side a strong red clay good for oats and potatoes, are very much interspersed with wet spongy ground, and broken by protruding rocks. There is good limestone for manure in every part of the county. Dairies are numerous. There is a small manufacture of woollen fabrics, and some families are employed in the weaving of linen and cotton. A factory for extracting sugar from beetroot has been formed at Mountmellick. In 1853 the number of acres under crop was 151,656, of which 18,874 acres grew wheat, 85,397 acres oats, 11,222 acres barley, bere, rye, peas, and beans; 19,619 acres potatoes, 14,606 acres turnips, 2259 acres mangel-wurzel, carrots, parsnips, vetches, and other green crops; 14 acres flax, 49,665 acres meadow and clover. In 1841, including an equivalent of 2331 acres for detached trees, there were 13,961 acres growing oak, ash, elm, beech, fir, mixed timber, and fruit. In 1852 on 11,294 holdings, there were 11,923 horses, 5347 mules and asses, 56,624 cattle, 75,745 sheep, 28,292 pigs, 5794 goats, and 191,643 head of poultry. The value of the live stock here enumerated was estimated at 598,845*l.*

Divisions and Towns.—Queen's County lies chiefly in the diocese of Leighlin and Ossory, with small portions in the dioceses of Kildare, Killaloe, and Dublin. It contains 53 parishes, and is divided into 11 baronies—Ballyadams, Clandonagh, Clarmallagh, Cullenagh, Maryborough East and West, Portnahinch, Slievemarigue, Stradbally, Tinneshinoh, and Upperwoods. The principal towns are MARYBOROUGH, MOUNTMELICK, and part of PORTARLINGTON, which, with ABBEYLEIX, are noticed under their respective titles. The following towns and villages we notice here, with the population of each in 1851:—

Ballinakill, population 1109, a market and post-town, 13 miles S.S.E. from Maryborough, contains a handsome parish church, with a tower and spire; a large Roman Catholic chapel; two National schools; a market-house, and a district dispensary. Fairs are held every month, and on the Thursday after Whit-Sunday. Tuesday is the market-day. The castle is now in ruins. Ballinakill was incorporated by James I., and returned two members to the Irish Parliament.

Borris-in-Ossory, population 804, a market- and post-town, situated near the right bank of the river Nore, 16 miles S.S.W. from Maryborough, consists of a single street, and contains a neat court-house, which is used as a chapel of ease; a Roman Catholic chapel; a National school; a bridewell; and a dispensary. Quarter and petty sessions are held in the place. Fairs are held seven times a year. Borris was anciently defended by a castle, which is now in ruins.

Durrow, population 1085, a small market-town, 16 miles S. from Maryborough, is watered by the Erkin, a feeder of the Nore, and is agreeably environed by the demesne of Castle-Durrow, a seat of Lord Ashbrooke. It consists of a few regular streets, opening into a square; the houses are generally well built, and roofed with slate. It contains a church, a Roman Catholic chapel, a dispensary, and an infantry barrack. Petty sessions are held monthly, and fairs nine times a year.

Graigu, population 1527, a suburb of the town of CARLOW, with which it is connected by a fine bridge of five arches over the Barrow. It consists principally of one street, extending nearly half a mile along the right bank of the river, and contains a parish church, a Roman Catholic chapel, a public school, built by voluntary contributions; a National school, two tan-yards, and a flour-mill. Fairs are held four times a year.

Mountrath, population 2101, a market- and post-town, 8 miles W.S.W. from Maryborough, contains a neat parish church, a Roman Catholic chapel, a Methodist and a Quakers meeting-house, a monastery of the order of St. Patrick, with a classical school attached; a nunnery, dedicated to St. Bridget, with schools attached; and two National schools. There are also a new court-house, a neat market-house, a dispensary, and fever hospital. Cotton and woollen fabrics are manufactured. Mountrath possesses an oil-mill, malt-house, and a brewery. There is a large weekly market. Fairs are held seven times a year. Petty sessions are held weekly.

Rathdowney, population 1192, is situated on a feeder of the Nore, 19 miles S.W. from Maryborough. The town contains the parish church, a Roman Catholic chapel, a Methodist meeting-house, two National schools, a constabulary barrack, and a dispensary. Petty sessions are held monthly. Fairs are held seven times a year.

AGRO. DIV. VOL. IV.

Stradbally, population 1326, a town 7 miles E. from Maryborough, pleasantly situated on the Straid, a feeder of the Barrow. The principal street is spacious, and contains some well-built houses, a handsome parish church, a large Roman Catholic chapel, a National school, a neat court-house with a small bridewell attached, a dispensary, and a savings bank. Quarter and petty sessions are held, and fairs six times a year. Saturday is the market-day.

The following are the chief villages:—*Ballyroan*, population 430, a post-village, 7 miles S. from Maryborough, contains a neat parish church, a spacious Roman Catholic chapel, a National school, and a classical and English school. *Castletown*, population 339, a village on the river Nore, 9 miles S.S.W. from Maryborough by the Great Southern and Western railway. It is well built and has a clean and neat appearance. It contains a Roman Catholic chapel. On the precipitous bank of the river are the ruins of the castle from which the village derives its name. *Clonaslee*, population 428, is situated on the Clodagh Rivulet, which is here crossed by a good bridge, 16 miles N.W. from Maryborough. It contains a district church, a Roman Catholic chapel, two National schools, a school on Erasmus Smith's foundation, and a dispensary. Near the village are the ruins of Castle Cuffa.

Queen's County returns three members to the Imperial Parliament, two for the county and one for the borough of Portarlinton. The county jail is at Maryborough, where the assizes are held. The county infirmary is at Maryborough, as also the district lunatic asylum, to which the county is entitled to send 50 patients. There are fever hospitals at Mountrath, Mountmellick, Abbeyleix, and Maryborough; and dispensaries in 21 places. Savings banks are established at Abbeyleix, Portarlinton, and Stradbally; and loan funds at Abbeyleix, Aghaboe, Crettyard, Durrow, Mountrath, Portarlinton, and Timahoe. In September 1852 there were 82 National schools in operation, attended by 3935 male and 4407 female children.

History and Antiquities.—The county was anciently comprehended in the districts of Leix and Ossory. The King of Ossory, after the invasion, made peace with the English, and managed to retain his independence. In the reign of Edward II., O'More, an Irish chieftain, to whom Mortimer had intrusted the administration of his domain, the ancient district of Leix, became so powerful as to hold it for himself, and the district was the seat of almost incessant war between the O'Mores and the English. In Edward VI.'s reign the O'Mores were defeated by Sir Edward Bellingham, the lord deputy, who re-annexed their territories to the English pale. A new rebellion in the reign of Mary was quelled with a severity which threatened to extirpate the inhabitants; and two shires were formed, one being named after the queen, and the other after her consort, Philip of Spain. In the latter part of the reign of Elizabeth the O'Mores were again in rebellion, and the county was invaded by the lord deputy, the Earl of Essex (1599), who broke the power of the rebellious clan: their ruin was completed by Lord Mountjoy, the successor of Essex. In 1641 Roger More, head of the now reduced sept of the O'Mores, was the mainspring of the rebellion. Several castles fell into the hands of the insurgents. In 1646 the insurgent force from Ulster, under Owen Roe O'Neale, occupied Maryborough and several other strongholds; but the Parliamentarians maintained a strong garrison in the castle of Borris-in-Ossory, by a party of which, in 1647, the neighbouring fort of Ballaghmore was taken. In 1649 Maryborough and some other places were taken from the insurgents under Owen Roe O'Neale, by the Royalists under Ormond, and shortly afterwards they were taken from the Royalists by the Parliamentarians under colonels Hewson and Reynolda. In the war of the revolution some fighting took place in the county, in which the Jacobites were defeated by William's army.

Danish raths and other ancient tumuli occur in the parishes of Lea, Killeshin, and Aghaboe, and other parts of the county. At Timahoe there is a round tower, nearly perfect; and at Killeshin and Rosnallis are the remains of two others. The principal ecclesiastical remains are the ruins of an abbey at Aghaboe, of a priory at Aghmacart, and of a monastery at Rathaspeck. Of numerous feudal antiquities, the most remarkable are the remains of the castles of the Fitzpatricks at Castletown and Borris-in-Ossory, of Lea Castle near Portarlinton, and those of a castle of Earl Strongbow, on the rock of Dunamase, a few miles east from Maryborough.

QUEENSFERRY. [LIMLITHGOWSHIRE.]

QUEENSTOWN, or COVE OF CORK, County Cork, Ireland, a sea-port town, is situated on the south side of Great Island, in Cork Harbour, in 51° 51' N. lat., 8° 18' W. long., distant by road 14 miles E.S.E. from Cork, and 167 miles S.W. by S. from Dublin. The population in 1851 was 11,423. Previous to the French war Cove was a small village consisting of fishermen's cabins; it then rose into importance by becoming an admiral's station. It was the port of embarkation for troops going on foreign service, and a place of rendezvous for merchant vessels about to sail under convoy. It now depends on the number of invalids who resort to it, especially in summer, when it is much frequented as a favourite bathing-place. The name was changed from Cove to Queenstown on the occasion of her Majesty's visit to Cork in 1850. The town, which occupies a steep acclivity overlooking the harbour, consists of several streets rising one above another in lines parallel to the beach. It contains a

handsome parish church, erected in 1812; a Roman Catholic chapel, which serves as the cathedral of the diocese of Cloyne and Ross; a Wesleyan Methodist chapel; National schools; a club-room; a literary society; a public library; and reading-rooms. It has also a market-house, a fever hospital, dispensary, and bridewell. The pier, erected in 1805, forms a fine promenade, commanding a view of the magnificent harbour. The harbour of Cove is 3 miles long by 2 miles broad, with an entrance 2 miles long and 1 mile wide. It contains Spike Island, on which are artillery barracks and a dépôt for convicts; the small island of Hawbowlin, with the ordnance dépôt, and near it Rocky Island, with two powder-magazines cut out of the rock. Steamers ply daily in summer between Queenstown and Cork. The Royal Yacht Club of Cork holds its annual regatta in the harbour. Petty sessions are held weekly. A market is held on Saturday.

QUENTIN, ST. [AISNE.]

QUERCY, LE, a district in France, which formed part of Guienne, was bounded N. by Limousin, E. by Auvergne and Rouergue, S. by Languedoc, and W. by Agenais and Perigord. It was divided into Upper Quercy, which comprehended the chief town Cahors, Gourdon, Figeac, and other places; and Lower Quercy, in which were Montauban, Moissac, and other towns.

Le Quercy took its name from the Caduroi, a Celtic tribe, who inhabited it. It belonged successively to the Visigoths and the Franks. It was erected into a county by Charlemagne; subsequently it was held by the counts of Toulouse and by the English, from whom it was taken by Charles V. It is now included in the departments of Lot and of Tarn-et-Garonne.

QUILOA (pronounced Keel-wa) is a town built on an island of the same name on the east coast of Africa, in 8° 41' S. lat., 39° 47' E. long. This island is about six miles long from north to south, and the strait between it and the main forms a secure harbour capable of receiving the largest vessels. Quiloa was a large town when the Portuguese first visited these countries, and the king held the sovereignty of Sofala, Mozambique, and the intervening ports. In 1505 it was taken by Francisco de Almeida, after a desperate resistance on the part of the inhabitants, which induced him to burn the town. At a later period the Portuguese erected a fort, but the bad climate soon obliged them to abandon it. Quiloa is now subject to the Imam of Muscat, under whom the town seems to have recovered a certain degree of prosperity, and to have been rebuilt. Mr. M'Gregor, in his 'Com-

mercial Statistics,' says that the town is represented to be large and well built; the houses are of stone, two or three stories high, and have terraced roofs; the streets are narrow. The trade of Quiloa is of little importance. It is carried on by the Arabs of Muscat, who import piece goods, sugar, arrack, spices, &c., and receive in return slaves and elephants' teeth. (M'Gregor, 'Commercial Statistics.') Part of the walls of the city still remain in a tolerably perfect state. The fort, which still exists, and is garrisoned by the Arabs, is a substantial building of stone, and is capable of containing a numerous garrison. The harbour, one of the finest on the coast, consists of a wide basin, from which several arms run a considerable distance inland.

QUITO, the capital of the republic of Ecuador, South America, is situated in 13° 27' S. lat., 78° 48' W. long., at an elevation of 9534 feet above the level of the sea: population, about 40,000.

A small portion of the city is built on level ground, and the remainder on the declivity of a hill. The plain contains the great square, on opposite sides of which are the cathedral and the episcopal palace, and on the other two sides the palace of the government and the town-hall. Four wide and straight but short streets branch off from the angles of the square. The remainder of the town is very irregular, being built on the lower declivities, which are furrowed by numerous ravines, some of which are of considerable depth. The smaller streets are unpaved, and after rain, which is very frequent, are almost impassable. The greater part of the houses are built of sun-dried bricks; and in order that they may suffer less from the frequent earthquakes, they are only one story high. The roofs are flat, and are covered with the leaves of the maguey (*Agave Americana*). The great elevation of Quito, and its position near the equator, render the climate very mild all the year round; much like our finest spring weather. The mean annual temperature is 59°; the maximum 79°, the minimum 45° Fahr. The surrounding country wants trees, but the scenery is very grand, as eleven snow-capped summits are visible from the town. Quito is the seat of the legislature and general government of the republic, as well as of the provincial government of the department of Ecuador. It has a university and two colleges for the instruction of the clergy; a large establishment for the maintenance of orphans and poor people; and several convents, that of the Franciscans being a large and very fine edifice. There are some manufactures of cotton, coarse woollens, flannels, silk, and leather; silver and gold are worked rather extensively, and a large quantity of confectionary is made. The town exports a considerable amount of grain and other agricultural produce to central America.

RADCLIFFE. [LANCASHIRE; NOTTINGHAMSHIRE.]

RADFORD, Nottinghamshire, a suburb of Nottingham, and the seat of a Poor-Law Union, in the parish of Radford. The population of the parish of Radford in 1851 was 12,687. The living is a vicarage in the archdeaconry of Nottingham and diocese of Lincoln. Radford Poor-Law Union contains four parishes, with an area of 7110 acres, and a population in 1851 of 26,776. The village is noticed under NOTTINGHAMSHIRE.

RADICK and RALICK are two parallel chains or groups of coral islands, situated in the Pacific between 5° 30' and 12° N. lat., 167° and 173° E. long. The chains extend nearly due north and south, and are not much more than 100 miles from one another. Radick, which is the eastern, consists of groups of small islands, inclosed and connected with one another by coral reefs rising several feet above the sea-level. The sea which separates the single groups is of great depth. The chain of the Ralick Islands is of the same character. The islands are of small extent, low, but well wooded. The inhabitants seem to belong to the Malay race, and have made some progress in civilisation, having commodiously-built houses, and boats more than 30 feet long, the sails of which are made of finely braided mats, and managed with considerable art. Both groups, with the Pescaderes and Marshall's Islands, are sometimes included in one group as the Mulgrave Islands.

RADICOFANI. [SIENA, Province of.]

RADIPOLE. [DORSETSHIRE.]

RADNOR, NEW, Radnorshire, a market-town and a municipal and parliamentary borough, is situated on the Somergill, at the southern base of Radnor Forest, in 52° 12' N. lat., 3° 8' W. long.,

distant 8 miles W.S.W. from Presteigne, and 159 miles W.N.W. from London. The population of the borough of New Radnor in 1851 was 2345. The borough, in conjunction with Presteigne, Knighton, Rhayader, Knucklas, and Cefnlllys, returns one member to the Imperial Parliament. The living is a rectory in the archdeaconry and diocese of Hereford. New Radnor was formerly the capital of the county. On a lofty eminence to the north-east of the town stood the strong castle of the Mortimers, destroyed by Owen Glyndwr in 1401; on which occasion also he burned the town. The town was formerly surrounded by walls pierced with four gates. The market has been long discontinued, but several yearly fairs are held in *Old Radnor*, now a small village, called also Pen-y-Craig, or 'the summit of a rock.' *Old Radnor* stands on an elevated situation, about two miles S.E. from New Radnor. It was burned in 1216 by King John, in revenge for an insurrection of Llewellyn, Prince of North Wales, and his son-in-law Reginald de Breos.

RADNORSHIRE, a county of South Wales, lying between 52° 2' and 52° 33' N. lat., 2° 57' and 3° 45' W. long., is bounded N. by Montgomeryshire, E. by Shropshire and Herefordshire, S. by Brecknockshire, and W. by Brecknockshire and Cardiganshire. Its greatest length from east to west is 33 miles, from north to south 30 miles. The area is 425 square miles, or 272,128 statute acres. The population in 1841 was 25,458; in 1851 it was 24,716.

Surface, Hydrography, &c.—Radnorshire is a mountainous county. The mountains form massive groups of hills, rarely forming a continuous chain. The highest and most connected range, that of Radnor Forest, runs nearly east and west from the Herefordshire border to the Ithon, and attains its greatest height, 2163 feet, between New Radnor and Llanvihangel Rhydithon. This wild tract is supposed to have been formerly covered with wood, although it now produces nothing but moss and heath. It is the property of the crown. The hills in the

west and north of the county are also of considerable height. The southern end of Rhydd Hywel, on the right of the road leading from Rhayader to Llanidloes, is 1750 feet high; Bryn Maen, in the parish of Llanvihangel Nantmelan, 1700 feet high; Camlo Hill, near Abbey Cwm Hir, east of Rhayader, 1650 feet high; and Craig-y-Foel, near Nant-Gwylt and the romantic valley of the Elan, is 1650 feet. The south-eastern part of the county is generally level.

The *Wye* enters Radnorshire on the north-west, between Llangerrig and Rhayader, at a distance of about 18 miles from its source on Plynlimmon. From two miles below Rhayader to the town of Hay it forms the boundary between Radnorshire and Brecknockshire. Below Hay the *Wye* separates Radnorshire from Herefordshire, and continues to run in the same direction till it enters Herefordshire below Clifford Castle. The *Elan* enters the *Wye* on the right bank a short distance below the town of Rhayader. The scenery of the Elan is extremely romantic.

The *Ithon* rises in the Kerry Hills on the northern side of the county, and drains the central portion of the county; before its junction with the *Wye*, seven miles above the town of Builth, it becomes a stream of considerable size, having a course of 30 miles. The *Lug* rises in the hilly country, seven miles W. from Knighton, and runs east-by-south to the town of Presteigne, two miles below which it enters Herefordshire, and traversing the most fertile parts of that county, falls into the *Wye* four miles below Hereford. The *Teme* rises on the southern slope of the Kerry Hills, and after running about four miles it turns south-east along the Shropshire border to Knighton, whence it runs eastward and still along the border to its entrance into Herefordshire, a short distance north of Brompton Park. The *Teme* is a feeder of the Severn.

Of the smaller rivers of the county the more important are the Somergill, the Edw, the Bach-wy, the Claer-wen, the Clywedog, the Aran, and the Dernel. The scenery on the Edw and Bach-wy, near their respective junctions with the *Wye*, is very beautiful. The *Wye* and *Ithon* abound with salmon. The fish of the other streams are principally trout and grayling.

The lakes are four in number and of small extent:—Llanbychllyn, a mile and a half round, between Llanbadarn-y-garreg and Llandewi-fach; Llyn Gwyn, about two miles west of Rhayader; Llynallyn, about a mile round, close to the turnpike-road leading from New Radnor to Builth; and Llyn-Hindwell, near Old Radnor.

The principal roads are the mail-road to Aberystwith, which traverses the centre of the county through New Radnor and Rhayader; the road from New Radnor to Presteigne and Knighton; the road from Rhayader to Builth; and the road from Builth to Newtown in Montgomeryshire, which runs nearly north and south up the valley of the *Ithon*.

Geology, Mineralogy, &c.—The principal portion of the county is composed of the strata forming the Silurian system; but on the west and north-west side of the county, the upper beds of the older rocks, composing the Cambrian system, make their appearance. These rocks comprise perhaps one-fourth of the whole county, having in their extreme western and north-western limits a slaty character, which towards the interior or east is gradually changed to quartzose grit. The river *Ithon* forms with tolerable exactness the line of junction of the Cambrian with the Silurian rocks; the Silurian however crosses to the west of the *Ithon* as that river approaches the *Wye*. The upper Silurian rocks compose (with the exception of the trap rocks of Llandegly, &c., and the strata interlaced with them) the whole of the middle portion of the county. The strata vary in direction from north-east and south-west to north-west and south-east. Radnor Forest is included in this district, and is chiefly composed of the upper Ludlow rock. The summit is a gritty sandstone.

On the eastern side of the county, at Old Radnor, and in the neighbourhood of Presteigne, the strata are more varied and interesting. The trap rocks at Old Radnor have brought to light the rocks both of the upper and lower Silurian system. "There is not," says Sir R. I. Murchison, "perhaps in Great Britain a finer mass of altered and crystalline limestone than that exhibited at Nash Scar, the principal cliff of which rises to the height of 200 or 300 feet above the adjoining valley of Knill and Presteigne." This limestone is well developed at Old Radnor, where also traces of the lower Silurian rocks may be observed. The old red-sandstone occupies a considerable portion of the south-eastern part of the county. The chief mass of trap rocks in Radnorshire is situated near the centre of the county, having a direction from north-west to south-east, and extending from Llandegly and Llanbadarnfawr, to the neighbourhood of Builth. Parallel to the main ridge, on the eastern side, are a number of smaller elongated mounds of trap running in the same direction, and besides these there are numerous stratified traps, alternating with beds of marine deposit. The mass of Old Radnor Hill is a dark greenstone, but there is a peculiar conglomerate thrown off on the western flanks, having a base of gray and green felspar, inclosing pebbles of quartz. Minute veins of copper-ore and crystals of copper and iron pyrites occur in the altered bedded rocks, as well as nests and coatings of anthracite. There are various proofs that the volcanic rocks penetrated the limestone subsequently to its consolidation.

The medicinal springs of Llandrindod, Llandegly, and Blaen Edw all issue from the altered strata in junction with the trap rocks of the

district, and, like the mineral springs in Brecknockshire, are supposed to owe their origin to the decomposition of iron pyrites and other mineral ingredients. There are three springs at Llandrindod, namely—saline, chalybeate, and sulphur. The Llandegly and Blaen Edw waters are sulphurous. Llandrindod lies on the Builth and Newtown road, about seven miles from the former town, and is much frequented in the summer months.

Soil and Agriculture.—A great portion of the county consists of common bog and moor land, and is therefore comparatively useless for agricultural purposes. It is supposed that only about one-fourth of the inclosed land is under the plough. Inclosures are gradually being made, as well as considerable plantations of larch and fir. The waste lands are still of great value as sheepwalks. Notwithstanding the thin population, the quantity of wheat grown in the county is considerably less than the consumption. The best wheat is grown on the eastern and south-eastern districts. Barley, oats, and potatoes are grown in considerable quantities on nearly all the farms. Flax is grown in small patches for home use.

The main dependence of the Radnorshire farmer is on the stock reared on the pasture and common land; the latter support large quantities of sheep, and in the most sheltered parts cattle of all sorts. The cows are principally of the Herefordshire breed. Numbers of Welsh ponies are also reared on the commons. Salt-butter for winter use is an article of export. Some cider is made in the districts adjoining Herefordshire.

Divisions, Towns, &c.—Radnorshire is divided into six hundreds, exclusive of the borough of Radnor, and contains 53 parishes and 3 market-towns. The hundreds are Colwyn, south and central; Kevenleece, central; Knighton, north-east; Paincastle, south; Radnor, east and central; and Rhayader, west and north. PRESTEIGNE, the county town, KNIGHTON, RADNOR, and RHAYADER, the only market-towns, are noticed in separate articles. The only villages of any importance are given here, with the population of the respective parishes in 1851.

Boughrood, population 314, is pleasantly situated among woods, near the left bank of the *Wye*, at the southern extremity of the county, 22 miles S.S.W. from Presteigne. The neighbouring country is hilly. Besides the parish church there is a Primitive Methodist meeting-house. Some remains of Boughrood Castle are still left. *Cefnllys*, or *Kevenleece*, population 386, about 9 miles S.E. from Rhayader, situated on a bend of the *Ithon*, is a contributory borough to New Radnor: the population of the borough in 1851 was 45. *Olyro*, population 883, on the left bank of the *Wye*, near the junction of the counties of Radnor, Brecknock, and Hereford. There was formerly a monastery at this place; also a castle, of which there are still some remains. The chancel of the church was rebuilt in 1823. The Wesleyan Methodists have a chapel, and there are National schools. *Disserth*, population 564, on the left bank of the *Wye*, has a commodious old church with a lofty turreted tower. *Glisbury*, population 1375, about 20 miles S.S.W. from Presteigne, is on the left bank of the *Wye*, over which there is a high wooden bridge, built in 1800. The church has a tower at the west end. There are National schools and some small charities. Woolstapling is carried on. Westward of the village, standing in an extensive park, is Maeslough Castle, the seat of the De Winton family. *St. Harmon*, population 853, on the *Wye*, 4 miles N. by E. from Rhayader, has a neat church, rebuilt in 1823, and chapels for Wesleyan and Calvinistic Methodists and Baptists. *Knucklas*, population of the borough 251 in 1851, is situated near the right bank of the river *Teme*, 13 miles N. by E. from New Radnor, to which borough it is contributory in returning a member to the Imperial Parliament. *Norton*, population 294, about 3 miles N. by W. from Presteigne, is sometimes called by the inhabitants a borough. The church is ancient. A school is supported by Lady Brydges. There are remains of an ancient castle.

Divisions for Ecclesiastical and Legal Purposes.—The eastern side of Radnorshire is in the diocese of Hereford, and the western in that of St. David's. The county is in the South Wales circuit. The assizes are held at Presteigne; county courts at Presteigne and Rhayader. One member of parliament is returned for the county, and one for New Radnor and its contributory boroughs. By the Poor-Law Commissioners the county is divided into three unions, Knighton, Presteigne, and Rhayader. These unions comprise 46 parishes and townships, with an area of 228,558 acres, and a population in 1851 of 19,769.

History, Antiquities, &c.—Radnorshire originally formed part of the territory inhabited by the Silures, and, after its subjugation and ultimate abandonment by the Romans, was included in one of the petty principalities into which Wales was divided. In the reign of Henry VIII. Radnor was formed into a county.

There is a Roman station at Cwm, on the right bank of the river *Ithon*, about two miles north-west from Llandrindod. The camp is square, and covers an area of about four acres. Radnorshire being a border county, the remains of British encampments are numerous. Offa's Dyke, the boundary formed by Offa between his kingdom of Mercia and the territories of the Welsh princes, enters Radnorshire on the north at Knighton; running south the dyke enters Herefordshire at Berva Bank, a steep hill on the right of the turnpike-road between Presteigne and New Radnor. There were several castles in

this county, but their remains are very imperfect. One tower of Aber Edw Castle remains. It is situated close to the romantic village of Aber Edw, near the junction of the Edw with the Wye, about three miles below the town of Builth. This castle belonged to Llewellyn ap Griffyth, and was that prince's last retreat. He was here killed. The dell of the Edw has ever since been called Cwm Llewellyn, or Llewellyn's Dingle.

The only monastic establishment in Radnorshire seems to have been that of Abbey Cwm Hir. It is romantically situated in a narrow valley surrounded by high hills, 5 miles east by north from Rhayader. It was founded about 1143. The only remains of the edifice are part of the exterior walls and the foundation of the pillars which supported the arches. Some of the columns and arches of the abbey were removed to Llanidloes, and are now in the church of that place. The ancient font and screen at Newtown were also taken from Abbey Cwm Hir.

Statistics: Religious Worship and Instruction.—According to the Returns of the Census of 1851, it appears that in the Registration County of Radnor, including a population of 31,425, there were then 139 places of worship, of which 59 belonged to the Church of England, 50 to three bodies of Methodists, 17 to Baptists, and 11 to Independents. The total number of sittings provided was 22,802. The number of day-schools was 83, of which 34 were public schools, with 1731 scholars, and 49 were private schools, with 699 scholars. Of Sunday schools there were 51, with 2519 scholars. There was an evening school for adults, with 9 scholars.

RADOM. [POLAND.]

RADWINTER. [ESSEX.]

RAGGED ISLAND. [BAHAMAS.]

RAGUSA, or RAU'GIA (Rhaussa, in Latin; Dubrounik, in Slavonian), an episcopal and sea-port town of Austria, in the crown-land of Dalmatia, is situated on the eastern coast of a peninsula in the Adriatic, formed by the Gulf of Breno on the east and the Gulf of Santa Croce, or Ombla, on the west. The town stands about 40 miles W. by N. from Cattaro, in 42° 38' N. lat., 18° 8' E. long., and is built partly at the foot and partly on the steep declivity of two hills: it is fortified with walls and ditches, and has a castle on the east, at the entrance of the harbour, and another at the western end of the town. The streets are paved, but very narrow, except two: the houses, which are built of freestone, are generally large and commodious. The principal buildings are—the cathedral, which is a good structure; the palace of the government, which is extensive, and has some fine halls and galleries; the custom-house, the guard-house, and barracks. The town has a lyceum and several other institutions, a theatre, and a quarantine station. The town is well supplied with spring-water. Outside of the walls are numerous gardens and country-houses, with plantations of orange and other fruit-trees, and handsome fountains. From Ragusa along the western coast as far as the Creek of Ombla, a distance of about three miles, there is an almost continuous suburb. The surrounding country produces abundance of fruit and very good wine: the malmsey of Ragusa has a great reputation, and forms an article of export. The climate of Ragusa is temperate and healthy, and instances of great longevity are not uncommon. The population of Ragusa, which is said to have once amounted to 30,000 inhabitants, is now only about 6000. Its maritime trade, which during the period of its independence was very flourishing, was almost annihilated after the French occupation in 1806; but it has somewhat revived since the peace. Ship-building, manufactures of soap, rosoglio and other liqueurs, and tobacco are the chief branches of industry. The harbour, which lies immediately south of the town, admits only small vessels; but two miles west of Ragusa is the fine harbour of Gravosa, which admits ships of the line, and has docks for ship-building, and fine country-houses and gardens. Timber is carried thither from the opposite coast of Monte Gargano in Italy. A few miles east of Ragusa is Ragusa Vecchia, on or near the site of the ancient Epidaurus in Illyria, a Roman colony, which was destroyed by the Slavonians in the 6th century.

Ragusium, or Rausium, seems to owe its origin to the inhabitants of Epidaurus who escaped from the sack of the city by the Slavonians. In the 7th century the population was increased by emigrants from other towns of Dalmatia and Albania, and the town was then enlarged and fortified. The people organised a republican form of government, consisting of a general council, from which the senate, or executive, was elected, with an officer at their head, who was first styled Count, and afterwards Rector. Till the 10th century they lived under the protection of the Slavonian princes of Narenta. The Narentines were defeated at sea by Pietro Orseolo, doge of Venice; after which the Ragusans now applied themselves strenuously to agriculture, as well as to maritime trade: they built vessels, and became so powerful by sea, that in no very long time afterwards a Ragusan squadron joined the Imperial fleet and defeated the Saracens, who had attacked Ragusa and several other towns on the Dalmatian coast. The annals of Ragusa for several centuries after this event exhibit a succession of wars and treaties between the republic and the Slavonian powers of Croatia, Servia, Bosnia, and Bulgaria, as well as with the emperors of Constantinople and the Norman kings of Sicily, throughout which the small community of Ragusa preserved its independence and extended its maritime trade.

From about the year 1260 till 1368 Ragusa had Venetian rectors,

who held office for two years each, and were taken from among the first patrician families of Venice. Ragusa however still continued to govern itself as an independent state, and to be administered according to its own laws. In this interval it greatly extended its trade, obtained considerable accessions of territory, and built the strong fortress of Stagno to defend the isthmus of the peninsula of Sabioncello. About 1368, war having broken out between Venice and the king of Hungary, who had attacked Ragusa and several other towns on the Dalmatian coast, the Hungarians advanced as far as Maestre, and Venice was obliged to sue for peace, one of the conditions of which was that Ragusa should be restored to independence, and should choose its own rectors. It was also determined that the rector should be renewed every six months. In gratitude for this the Ragusans agreed to pay a tribute of 500 ducats yearly to the king of Hungary, and to hoist his flag on their ramparts by the side of that of the republic. In the war between Genoa and Venice (1378-80) the Ragusans sided with Genoa, and some of their galleys were at the battle of Chioggia. After the defeat of the Genoese, Venice sent a squadron against Ragusa, which applied to the king of Bosnia for assistance, by whose means they repulsed the Venetians, after which peace was made between Venice and Ragusa. About the year 1397 the Ottomans, under Sultan Bayazid, having defeated Sigismund of Hungary at the great battle of Nicopolis, overran part of Bosnia, and spread alarm as far as Ragusa. About 1414 the Ragusans purchased peace with the Ottomans by paying an annual tribute of 500 ducats, which was afterwards gradually raised as the Turks drew nearer to Ragusa. In 1433 the Ragusans introduced the manufacture of woollens from Florence, which became their principal branch of internal industry. They also constructed an aqueduct to carry the spring-water from the valley of Giuncheto to their town, at an expense of 12,000 ducats.

In 1440 George Despotos of Servia, being defeated by Amurath II., took refuge at Ragusa with his family and treasures, and was there protected against the threats of Amurath. About 1450 the Ragusans purchased from several Bosnian lords the district of Ragusa Vecchia and Canale, which constituted the eastern part of their territory, and distributed the land among the citizens. But in 1463-64 Mahomet II. conquered Bosnia also, and the Turks became immediate neighbours of Ragusa, and have been ever since. About 1471 they ravaged the district of Canale, but Ragusa obtained a respite by raising the tribute to 8000 ducats. From this time the Ragusans paid a yearly tribute to the Porte, which afforded them its powerful protection. During the long wars of the 16th century, between Sultan Solyman and his son Selim on one side, and Venice and Spain and other Christian powers on the other, the Ragusans found it a most arduous task to preserve their neutrality, as the fleets of the belligerents came repeatedly off their coasts, and landed and plundered the territory without scruple.

During the 17th and 18th centuries, after a better understanding had been established between the Porte and the Christian powers, Ragusa continued to enjoy her independence and neutral security, paying the accustomed tribute to the Sultan, who however did not interfere in her internal concerns, and no Turkish soldier was allowed to step within its boundaries. The Sultan's protection was of importance to Ragusa, by securing its flag from the attacks of the Barbary pirates. In this respect the Ragusan merchant ships had the advantage over those of most states in the Mediterranean, and they acted as carriers in that sea between the Levant and the ports of western Europe, and realised considerable profits, especially in times of war. Ragusan mercantile houses were established in many of the sea-port towns of the Mediterranean. The republic maintained a small fleet of galleys and other armed vessels for the protection of its coasts and its trade. In 1667 Ragusa was afflicted by a dreadful earthquake, which ruined the greater part of the town.

Ragusa had remained an independent state for more than a thousand years. Coeval with Venice, it fell soon after that republic. In 1806 France and Russia were quarrelling about the possession of the important district of Cattaro, which was ceded to France by the treaty of Presburg between Austria and France. The Russians however from Corfu had been beforehand, and had taken possession of Cattaro. The French troops from Dalmatia could not reach Cattaro without crossing the neutral territory of Ragusa. The soldiers of Napoleon, unable to occupy Cattaro, took military possession of Ragusa in May, 1806. The French occupation of Ragusa led the Montenegrins to overrun its territory. They besieged the French within the town. The unfortunate Ragusans, placed between the regular French troops within and the savage Montenegrins without, saw their country-houses and villages devastated, but the town was saved from the Montenegrins. The result was, that Napoleon by a stroke of the pen in 1808 abolished the republican government, and incorporated Ragusa with the province of Dalmatia, and he made Marmont titular duke of Ragusa and governor of the province. On the fall of Napoleon in 1814, when the Austrians again occupied Dalmatia, they found Ragusa included in that province, and they kept it.

RAINHAM. [ESSEX.]

RAJAMUNDY. [CIRCARS, NORTHERN.]

RAJASTHAN. [HINDUSTAN.]

RAJMAHAL, a town of Hindustan, in the presidency and province of Bengal, on the right bank of the Ganges, in 25° 2' N. lat., 87° 53'

E. long. It was formerly a large city, and at one time the capital of the province of Bengal, but is now little more than a long street of mud huts, some tombs and dilapidated mosques, and the ruins of a vast palace, which was built by the Sultan Sujah, brother of the emperor Aurengzebe, and completed in 1630. In the following year however a fire destroyed the greater part of the town, and a considerable portion of the palace; and not long afterwards a branch of the Ganges changed its course, and carried away nearly all the houses which remained. Rajmahal has ever since continued in a state of decay. The town contains several market-places, and has a considerable trade with the inhabitants of the mountainous district of the Rajmahal Hills. The population of the town is estimated at nearly 30,000.

RAJMAHAL HILLS, a group of mountains which derive their name from the town of Rajmahal, near which the southern part of them commences: they extend about sixty miles northward along the west bank of the Ganges. They form a detached mass, bounded on all sides by a level country, and rise from the flat surface of Bengal as if out of the sea. They are well wooded, and there is much thick jungle, so that they abound in wild animals of all kinds, from the jackal to the tiger, and from the deer to the elephant and rhinoceros.

The Rajmahal Hills, and indeed all the hilly country between Rajmahal and Burdwan, are inhabited by the Puharrees (or mountaineers), who appear to be an aboriginal race, differing from the inhabitants of the plain in features, language, manners, and religion. They are distinguishable from the Hindoos by their long narrow eyes, broadish faces, and flattish turned-up noses; in stature they are rather short, but strong and active. They live chiefly by the chase, in which they use bows and arrows, few of them having fire-arms, and they shoot the larger animals with poisoned arrows. In addition to hides and game they dispose of wax and honey, in which their hills abound, and they cultivate millet in considerable quantity.

A considerable improvement both in manners and morals took place among these mountain tribes about seventy years ago, chiefly resulting from the equitable administration of Mr. Cleveland, judge of Boglipoore, who died in 1784 in the 29th year of his age, and whose memory is held in grateful remembrance both by the lowland Zemindars and the mountain Puharrees. [BOGLIPOORE.]

RAMBLA. [CORDOVA.]
RAMBOUILLET. [SEINE-ET-OISE.]
RAMERUPT. [AUBE.]
RAMESERUM. [HINDUSTAN.]

RAMILLIES, or RAMELIES, a small village in Belgium, in the province of South Brabant, 13 miles N. from Namur, and 26 miles S.E. from Brussels, celebrated for the victory obtained in its vicinity May 23, 1706, by the allied army under the Duke of Marlborough over the French and Bavarians commanded by Marshal Villeroi and the Elector of Bavaria.

RAMPOOR. [BUSSAHER.]
RAMREE. [ARACAN.]
RAMSBOTTOM. [LANGASHIRE.]
RAMSBURY. [WILTSHIRE.]

RAMSEY, Huntingdonshire, a market-town in the parish of Ramsey, is situated on a feeder of the river Neve, in 52° 28' N. lat., 0° 6' W. long., distant 12 miles N.N.E. from Huntingdon, and 69 miles N. from London. The population of the town of Ramsey in 1851 was 2641. The living is a perpetual curacy in the archdeaconry of Huntingdon and diocese of Ely.

In the reign of Edgar, in the year 969, Ailwine, duke or earl of the East Angles, founded a Benedictine abbey on an island or dry spot in the marshes called Ram's 'ey,' or island; hence the name of the town. The abbey attained great wealth and repute, and had among its abbots and monks many able and learned men. A school was maintained here almost from the foundation of the abbey, and the library was celebrated for its collection of Hebrew books. The abbey of Ramsey were mitred.

Ramsey consists chiefly of one long street running east and west, and another street running northward along the Bury Brook. The church consists of a nave with clerestory, aisles, and chancel, with an embattled tower at the west end. Some of the piers and arches of the church are in the transition from the Norman to the early English style. The only remains of the abbey are the ruined gateway, a rich specimen of decorated English architecture, and a statue of Earl Ailwine, the founder, supposed to be one of the most ancient pieces of English sculpture extant. The Baptists have a chapel, and there are National and Infant schools. Wednesday is the market-day; a fair is held on July 22nd.

RAMSEY. [MAN, ISLE OF.]
RAMSEY ISLAND. [PEMBROKESHIRE.]

RAMSGATE, Kent, a market-town, sea-port, and watering-place in the parish of Ramsgate, is situated at the south-east corner of the Isle of Thanet, in 51° 21' N. lat., 1° 24' E. long., distant 17 miles E.N.E.

from Canterbury, 73 miles E. by S. from London by road, and 97 miles by the South Eastern railway. The town is governed by commissioners under a local act. The population of the town of Ramsgate in 1851 was 11,838. The living is a vicarage in the archdeaconry and diocese of Canterbury.

The ville, as it is legally termed, of Ramgate, is a member of the Cinque-Port of Sandwich. Ramgate was anciently a poor fishing town, consisting of a few meanly-built houses, with a small wooden pier. After the revolution of 1688 some of the inhabitants embarked in the Russian trade, by which they acquired wealth, and this led to the improvement of the town. Ramgate was one of the places earliest frequented by the inhabitants of the metropolis for sea-bathing, though for some time eclipsed by the superior attractions of Margate. Early in the present century a stone lighthouse was erected on the head of the west pier; a small battery is fixed at the head of the east pier. The east pier is one of the longest in the kingdom, extending nearly 3000 feet; the western pier extends about half that length: they are built of Portland and Purbeck stone and Cornish granite. The harbour includes an area of 48 acres, and furnishes a convenient shelter for vessels obliged by heavy gales to run from the Downs. A dry dock and a patent slip afford facilities for repairing vessels.

The old part of Ramsgate is situated in one of those natural depressions (called in the Isle of Thanet 'gates,' or 'stairs') in the chalk which open upon the sea. The newer part, which consists of well-built houses arranged in streets, terraces, and crescents, is well paved and lighted with gas. The chief public buildings are the town-hall and the custom-house. There are an assembly-room, several bathing-rooms, and numerous boarding- and lodging-houses for the accommodation of visitors during the summer. The places of worship are—the parish church, erected in 1827, a spacious and handsome gothic structure, with a tower 137 feet high; a chapel of ease; a district church; two chapels for Baptists; and one each for Wesleyan and Primitive Methodists, Independents, Roman Catholics, and Jews. There are several National, British, and Infant schools; a Church Union, with a library; a savings bank; a dispensary; and an hospital especially for seamen, but to which the neighbouring poor are under certain regulations admitted.

Ramsgate has a considerable coasting-trade; coal is largely imported, and ship-building and rope-making are carried on. Wednesday and Saturday are the market-days. A county court is held in the town. There is a considerable fishery. The number and tonnage of vessels registered as belonging to the port of Ramsgate on December 31st, 1853, were—under 50 tons 95, tonnage 2564; above 50 tons 37, tonnage 3485; with 1 steam-vessel of 10 tons. The custom-house entries at the port during 1853 present the following results:—Inwards, 619 vessels, tonnage 47,035; outwards, 252 vessels, tonnage 15,486.

RANDALSTOWN. [ARMAGH.]
RANDAZZO. [MESSINA, Province.]
RANDERS. [AARHUS.]
RANELAGH. [DUBLIN, County.]

RANGOON, formerly the most commercial port of the Birman empire, is situated in 16° 47' N. lat., 96° 18' E. long., on the left bank of the most eastern branch of the river Irrawaddy, about twenty-six miles from the sea. About two miles below the town the river divides into two arms, of which the eastern, running nearly due east, is called Syrian River; and the western, running nearly due south, Rangoon River. Both of these branches are navigable, but the Rangoon River is generally preferred. The town and suburbs extend about a mile along the bank of the river, but the houses are very unequally scattered over this area. The streets are narrow, but clean and well paved. The houses are raised on posts; the smaller supported by bamboos, and the larger by strong timbers. There are a few brick houses chiefly belonging to Europeans, and since its occupation by the British the town has been fortified. Two narrow roads paved with brick lead from the southern face of the stockade to the great pagoda, Shewi Dagong; and along the sides are built a number of Sidis, or monuments, in honour of Buddha. In form they may be compared to a speaking-trumpet standing on its base. The lower part is generally a polygon, and the shaft or upper part is round, the apex being ornamented with an iron net in form of an umbrella, called a 'ti.' The Shewi Dagong is in the same style as the rest, but richly gilt all over. It is said to be about 273 feet high, and is surrounded by an inclosure in which is an immense bell of very rude fabric.

Rangoon was built by Alompra, after the destruction of Pegu and Syrian in 1755, and the choice of the site shows the sagacity of the conqueror. It was well adapted for ship-building, as the tide rises from 18 to 24 feet. Timber can be procured from the teak-forests at Sarwa, not far from Rangoon, and floated down the whole way to the port; consequently many vessels of considerable burden have been built here. Besides its advantageous situation for commerce, the elevated ground on which it is built secures it from being inundated by the tropical rains to which all the lowlands of the delta of the Irrawaddy are subject. The climate is temperate, agreeable, and salubrious. The place at first rose slowly, but by 1826 its commerce was very large, and Crawford estimated the population at near 9000. On January 2, 1852, at the commencement of the war in the Birma, Rangoon was attacked by a British naval force, and the passage of the river forced; on April 14 of the same year it was stormed by the

British forces under General Godwin, and captured. It has ever since (with the rest of Pegu, of which it is the commercial capital) remained in possession of the British; but in February 1853 it suffered from a fire which destroyed a great part of the town. By the latest estimate the town and suburbs are computed to contain a population of nearly 20,000.

(Crawford, *Journal of an Embassy to the Court of Ava.*)

RAPALLO. [GENOA.]

RAPHOE, County Donegal, Ireland, a post- and market-town, and the seat of a diocese, is situated in 54° 53' N. lat., 7° 36' W. long., 6 miles W.N.W. from Lifford, and 186½ miles N.N.W. from Dublin by road. The population in 1851 was 1492. The town, which is finely situated in a fertile and cultivated district, is well built. It contains the parish church, which is the cathedral church of the diocese, a plain cruciform building with a square tower; a Presbyterian meeting-house; a Free school founded in the reign of Charles II., which has an income from endowment of about 350*l.* a year, and had 35 scholars in 1854; a school for clothing, teaching, and apprenticing 20 poor boys; a National school; a widows' house for four clergymen's widows; a public library; a neat market-house; and a dispensary. Near the town are the deanery and the late episcopal palace, a spacious and handsome building. Considerable quantities of produce are sold at the weekly market. Fairs are held four times a year. Petty sessions are held monthly.

The see of Raphoe is in the archiepiscopal province of Armagh. It comprehends above two-thirds of the county of Donegal, and contains 34 benefices. The dignitaries are a dean, archdeacon, and four prebendaries. The bishopric is said to have been founded in the 9th century by St. Eunan, but there are no distinct traces of its existence till the 12th century. By the Act 3 & 4 Will. IV. the see of Raphoe has been united with that of Derry. The cathedral church and bishop's palace of the united dioceses are in the city of Londonderry. The income of the bishop is 8000*l.* a year.

RAPPERTSWYL. [GALL, ST.]

RASSEIN, LAKE. [BULGARIA.]

RASSOVA, a small town in Bulgaria, situated on the right bank of the Lower Danube, at the point where the river makes its great bend to the northward, about 30 miles E.N.E. from Silistria. It is of importance from its position at the western end of the line of earthworks called Trajan's Wall, which extends across the isthmus of the Dobrudscha from near Rassova to Kustenje, on the Black Sea. Rassova is slightly fortified; it was occupied for a short time by the Russians in their invasion of Bulgaria in 1854.

RASTADT, a fortified town, with 6000 inhabitants, in the grand-duchy of Baden, is situated on the river Murg, near the right bank of the Rhine, at a distance by railway of 14 miles S. from Karlsruhe, and 26 miles N. by E. from Strasburg. It is regularly built. Among the public structures is a fine palace, built on the model of that of Versailles, and till 1771 the residence of the margrave of Baden. There are three churches, two chapels, a lyceum, and a training-school for Catholic school-masters. Starch, snuff, tobacco, chicory, papier-mâché articles, fire-arms, mathematical and philosophical instruments, and carriages are manufactured. Rastadt has been the scene of important negotiations. On March 6, 1714, Prince Eugene and Marshal Villars signed a treaty of peace in this town, which put an end to the war of the Spanish succession. On the 9th of December, 1797, a congress was assembled at Rastadt to negotiate a peace between France and the German empire. Roberjeot and Bonnier, the French ambassadors at this congress, which was dissolved by the emperor April 7, 1799, were murdered on their way home, at about 500 paces outside the town: no satisfactory evidence was ever obtained respecting the authors of the crime. During the late rebellion in Baden, the republican insurgents having suffered various defeats from the auxiliary Prussian troops, shut themselves up in Rastadt, which, after about a month's siege by the Prussians, surrendered unconditionally July 23, 1849.

RATBY. [LEICESTERSHIRE.]

RATHANGAN. [KILDARE.]

RATHCORMACK. [CORK.]

RATHDOWN, a Poor-Law Union in Ireland, extends over the barony of Rathdown in the county of Wicklow, and part of the baronies of Rathdown, Dublin, and Uppercross in the county of Dublin. It comprises 11 electoral divisions, with an area of 61,514 acres, and a population in 1851 of 48,140. The Union workhouse, erected in 1841 at a cost of 6000*l.*, and capable of receiving 1280 paupers, is a handsome building, finely situated on a rising ground overlooking the Dublin road, about 3 miles N. from the town of Bray. It contains a National school. Rathdown Castle, church, and village stood in a deep ravine on the coast of Wicklow, about 15 miles S.S.E. from Dublin. Of the castle there are some interesting remains; the church is quite gone; two or three mud cabins alone mark the site of the village.

RATHDRUM, County Wicklow, Ireland, a market-town and the seat of a Poor-Law Union, is situated on the right bank of the Avonmore River, and on the Dublin and Wexford road, in 52° 56' N. lat., 6° 14' W. long., 10 miles S.W. by W. from Wicklow, and 38 miles S. from Dublin. The population in 1851 was 947. Rathdrum Poor-Law Union comprises 30 electoral divisions, with an area of

227,540 acres, and a population in 1851 of 47,932. The town, the name of which signifies 'the hill fort,' occupies the sides and summit of a commanding eminence, on which was anciently the residence of the chieftain of the district. The houses are generally well built, and the place has a neat appearance. The parish church was erected in 1795. There are a Roman Catholic chapel, a Wesleyan Methodist meeting-house, a Royal Chartered school with an endowment of 153*l.* a year, and a National school. There are also a dispensary and Union workhouse. The flannel-hall, or market-house, which forms a spacious square on the summit of the hill, was built in 1793 by Earl Fitzwilliam, proprietor of the town. Petty sessions are held in the place. There are eleven yearly fairs.

RATHENAU. [BRANDENBURG.]

RATHFRILAND. [DOWNSHIRE.]

RATHKEALE, County Limerick, Ireland, a market-town and the seat of a Poor-Law Union, is situated on the river Deel, in 52° 32' N. lat., 8° 53' W. long., distant by road 17 miles S.W. by W. from Limerick, 186 miles S.W. by W. from Dublin. The population in 1851 was 3029. Rathkeale Poor-Law Union comprises 18 electoral divisions, with an area of 79,932 acres, and a population in 1851 of 28,587. The town contains the parish church, a Roman Catholic chapel, a Wesleyan Methodist meeting-house, and three National schools, the court-house, fever hospital, dispensary, Union workhouse, bridewell, and barrack. Quarter and petty sessions are held in the place. Thursday is the market-day. There are 12 yearly fairs. In the town are the remains of an ancient Augustinian priory. The town derived considerable advantage from the introduction of some Palatine families, a part of a colony of German Protestants that settled in the neighbourhood about the commencement of the 18th century.

RATHMELTON. [DONEGAL.]

RATHMINES. [DUBLIN, County of.]

RATHMULLEN. [DONEGAL.]

RATIBOR. [OPPELN.]

RATISBON (*Regensburg*), the capital of the Upper Palatinate, in Bavaria, is one of the most ancient towns in Germany, having been built by the Romans, by whom it was called *Reginum*, *Castra Regia*, and subsequently *Augusta Tiberii*. In the 2nd century it was already a place of trade. The Romans threw up a line of fortifications between Ratisbon and Cologne. Before the time of Charlemagne, and long subsequently, it was the chief town in Bavaria, and governed by counts of its own under the immediate protection of the German emperors. From 1663 to the dissolution of the German empire in 1806, it was the seat of the Imperial Diet.

Ratisbon is situated in 49° N. lat., 12° 22' E. long., in an extensive and fertile valley, on the right bank of the Danube, opposite to its confluence with the Regen. The Danube here forms two small islands, called Oberwörth and Niederwörth, which are connected with each other and with the banks of the Danube by a remarkable stone bridge, 1100 feet in length and 23 feet wide, which was built in the years 1135 to 1140, and connects Ratisbon with its suburb *Stadt-am-Hof*, on the left bank. The town is surrounded with ramparts, pierced with six gates; but the ditches have been filled up. Most of the houses are built of stone; they are very old-fashioned, and their great height adds to the gloominess of the streets, which are narrow and crooked, but clean and well paved. The most remarkable buildings are the ancient rath-house, in which the German Diet held its sittings; the gothic cathedral, one of the finest in Germany, within the large precincts of which are two older cathedrals, one now called the Baptistery and dating from the 10th century, the other in the form of a basilica and dating from Roman times; the Scotch Benedictine church of St. James, founded in 1165; the vast abbey of St. Emmeran, which now forms the palace of the Prince of Thurn-und-Taxis; and the churches of the ancient abbeys of Niedermünster and Obermünster. There are in all one cathedral and 27 other churches and chapels. Besides the library in the town-house, there are some other considerable libraries and collections of works of art; also a botanical garden, a Catholic gymnasium, an ecclesiastical seminary, a school for the blind, and a school of design. There are extensive bleach-grounds and breweries, and manufactories of leather, tobacco, wax-candles, soap, cutlery, earthenware, porcelain, fire-arms, and carriages. The inhabitants carry on a considerable trade in salt, timber, corn, and their own manufactures, and transact extensive business on commission. The population is about 22,000, exclusive of the military. Steamers ply regularly to Ulm and Vienna. In an alley near the city is a monument, erected in 1817, in honour of Kepler, who died here in November 1630, and was buried in St. Peter's churchyard. On a rock above the Danube, six miles below Ratisbon, stands the *Walhalla*, a marble temple of the Doric order, erected on the plan of the Parthenon of Athens, by the ex-king Ludwig of Bavaria, in honour of the great men of Germany. There were severe engagements between the French and Austrians near Ratisbon in 1809. Electro-telegraphic wires connect Ratisbon with Munich and Vienna.

RATOATH. [MEATH.]

RATZEBURG. [MECKLENBURG.]

RAUCHEWACKE. [LAUENBURG.]

RAUMO. [FINLAND.]

RAUNDS. [NORTHAMPTONSHIRE.]

RAVENGLASS. [CUMBERLAND.]

RAVENNA, a province of the Papal State, is bounded N. by the province of Ferrara, W. by that of Bologna and by Tuscany, S. by the province of Forlì, and E. by the Adriatic. The area is about 674 square miles, and the population in 1850 was 175,338. The eastern part of the province, which lies near the Adriatic, is low and marshy; but the western or inland part, which stretches to the foot of the Tuscan Apennines, in the neighbourhood of Imola and Faenza, is healthy, well cultivated, and thickly inhabited. The chief products of the country are corn, wine, silk, hemp, and cattle. A considerable quantity of sea-salt is derived from the Lagoon of Cervia. The principal towns of the province are RAVENNA and FAENZA. *Imola* is an episcopal city of 10,000 inhabitants on the Santerno, which is crossed by a handsome bridge. It has a fine cathedral, a college, and a manufactory of cream-of-tartar. Popes Pius VII. and Pius IX. were bishops of Imola before their election to the Holy See. *Cervia*, a small town, in an unhealthy situation near the sea-coast, has about 1200 inhabitants. *Castel Bolognese*, a bustling town, in a fertile district, has about 4000 inhabitants.

The province of Ravenna is crossed by numerous streams, which rise in the Tuscan Apennines, and flow in a north-east direction to the Adriatic. The principal are—the Santerno, which flows by Imola; the Senio; the Lamone, which flows near Faenza; the Montone, which enters the sea below Ravenna; and the Ronco, which joins the Montone above its mouth. A road leads from Faenza across the Apennines into the valley of the Sieve, north of Florence.

RAVENNA, situated in 44° 26' N. lat., 12° 12' E. long., is an ancient city of Italy, once a sea-port, but now 9 miles from the sea, which has receded all along this coast, owing to the accumulation of sand thrown up by the waves, and of the alluvial earth brought down by the rivers. Between Ravenna and the sea is the *Pineta*, or Forest of Pines, which extends about 15 miles in length along the sea-coast, and which has been noticed by Dante, Boccaccio, Dryden, and Byron. Ravenna is an archbishop's see, and the residence of the legate of the province. It has a college, and civil, criminal, and commercial courts. The population is about 18,000. The cathedral, built in the 4th century, but since that time almost completely rebuilt, retains several sculptures and other remains of its early age: the baptistery, detached from the church, is still in its original state. The church of Santa Vitale was built by an exarch in the time of Justinian, in imitation of the Holy Sepulchre at Jerusalem. It has some handsome pillars of granite, and a large mosaic, in good preservation, representing the emperor Justinian with his courtiers, and his empress Theodora attended by her ladies. The church of St. John the Baptist was built by Placidia, daughter of Theodosius, as well as that of St. John the Evangelist, with its altar, which is faced with porphyry and other valuable marbles. The mausoleum of Theodoric, which is outside of the town, has a monolithic dome, nearly 100 feet in circumference, which has been transformed into a church, called Santa Maria Rotonda. There are some remains of the splendid palace of Theodoric, which was inhabited by his successors the Exarchs. A fragment of a wall, with two or three pillars, and a semicircular recess above, are all that remain of the palace. A porphyry bath, which was found near the mausoleum, has been let into the wall of the palace. The church of St. Apollinaris in Classe, so called because it was built on the site of the old port, is a magnificent structure, raised also by Theodoric, with 24 large columns, each of a single piece of marble, which were brought from Constantinople; and a fine mosaic, representing a view of Ravenna in the 6th century, with numerous figures of saints. The great altar is made of porphyry, verde antico, and oriental alabaster; and the pulpit, which is of marble, is of curious workmanship. Ravenna, next to Rome, is the city of Italy which abounds most with valuable and rare ancient marbles. The church of St. Apollinaris contains the tombs of many of the old archbishops of Ravenna, and a series of their portraits.

The public library of Ravenna contains 40,000 volumes and 700 manuscripts. There is also a cabinet of ancient medals and inscriptions, and a gallery of paintings. The mausoleum of Dante, who died at Ravenna, was raised in the 15th century, by Bernardo Bembo, a Venetian podestà, and father of Cardinal Bembo: it has been repaired several times.

The ancient town of *Classis*, the port of Ravenna, which stood 2 or 3 miles S. from the city, was destroyed in the year 728 by Luitprand, king of the Longobards. It is now a marsh, 6 miles distant from the sea.

Ravenna is said to have been originally a town of the Umbri. It is not particularly noticed in Roman history till the time of the empire, when the port of Ravenna became one of the two great stations for the Roman fleet, Misenum being the other. After the fall of the empire Theodoric made Ravenna the capital of his kingdom, and he greatly embellished the town. When Narses, the general of Justinian, having overthrown the kingdom of the Goths, A.D. 553, was appointed by the emperor exarch or governor-general of Italy, he fixed his residence at Ravenna, which continued under his successors to be the centre of the imperial administration in Italy, till Astolphus, king of the Longobards, took Ravenna in 752. In 755 Pepin, having defeated Astolphus, obliged him to give up Ravenna and the district called the *Pentapolis* to the see of Rome.

RAWITSOH. [POEM.]

RAWTONSTALL. [LANCASHIRE.]

RAYLEIGH. [ESSEX.]

RÉ, ISLE OF. [CHARENTE-INFÉRIEURE.]

READING, Berkshire, the county town, a municipal and parliamentary borough and market-town, and the seat of a Poor-Law Union, is pleasantly situated on the banks of the river Kennet, just above its junction with the Thames, in 51° 27' N. lat., 0° 58' W. long., distant 39 miles W. by S. from London by road, and 36 miles by the Great Western railway. The population of the town of Reading in 1851 was 21,456. The borough is governed by 6 aldermen and 18 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The sanitary arrangements of the town are under the management of a Local Board of Health. The livings are in the archdeaconry of Berks and diocese of Oxford. Reading Poor-Law Union contains three parishes, with an area of 4699 acres, and a population in 1851 of 22,175.

Reading is first noticed in history in 871, when it was occupied by the Danes, who quitted the town towards the close of that year. In 1006 it was burnt by the Danes, who destroyed an abbey of nuns, on the site of which an abbey for Benedictine monks was erected in 1121 by Henry I., who was buried here. In the following reigns the kings frequently resided at Reading, where a grand tournament was held by Edward III., and four parliaments were held by Henry VI. and Edward IV. On the dissolution of the abbey, the buildings were appropriated as a royal palace. In the civil war of Charles I. the town was occupied successively by both parties, and suffered severely from being so long a garrison town.

The town is very irregularly laid out. Much improvement has however taken place in its general appearance of late years. The chief business part of the town stands on the point of land at the junction of the Kennet with the Thames. The town is well paved, lighted with gas, and tolerably supplied with water. The houses are in general substantial, and built of brick; but there are some old ones of lath and plaster, with high gables. As the river Kennet has a divided channel, there are several bridges in and near the town. St. Lawrence's church has some portions of the original structure of Norman character; it consists of a nave and north aisle, and a chancel. There is a fine tower at the west end, of perpendicular character, and of chequered flint-work; it has a peal of ten bells. St. Mary's church consists of a nave, south aisle, a small north aisle, and a chancel; it was rebuilt about 1551, chiefly from the materials of the abbey church, then pulled down; it has a tower similar to that of St. Lawrence. There are two district churches and a chapel of ease. The Baptists and Independents have each three chapels, the Primitive Methodists two, and the Wesleyan Methodists, Quakers, and Roman Catholics one each. The Roman Catholic chapel, erected in 1840, is a neat structure in the Norman style. It is built chiefly of flints from the abbey ruins. The Free Grammar school, founded in 1486, has an income from endowment of about 50*l.* a year, and had 26 scholars in 1854. Attached to the school are two fellowships at St. John's college, Oxford; and two recently-founded scholarships. There are National, British, and Infant schools; a Blue-Coat school, with an income of about 850*l.* a year, in which 40 boys are maintained and educated; a Green-Coat school for 21 girls; a Charity school of industry; and six sets of almshouses. The town-hall is a commodious modern building, the under part of which is appropriated to the use of the grammar school. A building, termed 'the Oracle,' was erected early in the 17th century by Mr. John Kendrick, a great benefactor to the town, for the employment of the poor; the principal gateway, which is the most striking portion of the building, is of mingled gothic and Grecian architecture. The Public Hall is a fine structure, containing apartments for the Literary Society and mechanics institute. A new assize-hall has lately been completed. The new county jail and house of correction, erected on the plan of the Pentonville model prison, stands on the site of the abbey. Among other buildings requiring notice are, the borough buildings, public baths, a new and spacious hospital, and a large union workhouse. A medical dispensary is supported by voluntary contributions. There is a savings bank.

The trade of the town is considerable. Coarse linen is now woven to a small extent. Silk for umbrellas and parasols is manufactured; silk ribands and galloons are woven, and some floor-cloth and sail-cloth is made. There are iron-foundries, breweries, and yards for building and repairing barges. Trade is carried on in corn, seeds, timber, bark, hops, wool, and cheese. There are flourishing biscuit-making establishments. Fish sauce, sometimes called Reading sauce, is extensively made. Large quantities of flour and of agricultural produce are sent by railway and by barges to London. The markets are held on Wednesday and Saturday. Fairs are held on February 2nd, May 1st, July 25th, and September 21st. The Kennet is navigable to Reading for vessels of about 120 tons burden. The Kennet and Avon Canal affords a water communication with most of the chief ports of the kingdom. The Great Western railway crosses the Kennet between the town and the river Thames. By the Reading, Guildford, and Reigate railway, the Great Western, South-Western, and South-Eastern main lines are connected; by the Basingstoke branch of the Great Western from Reading, another communication is obtained with the South-Western line; there is likewise a branch of the Great Western railway from Reading to Hungerford. The assizes, quarter

sessions, and a county court are held in the town. Of the abbey buildings there are some ruins, especially the gateway and part of the great hall; there are also some interesting remains of the abbey mill. Of the buildings of a convent of Grayfriars, the west window and part of the church remain. Races take place at Reading in August.

RECVLVER. [KENT.]

RED RIVER. [MISSISSIPPI, River.]

RED SEA, an inlet of the Indian Ocean, which extends from the strait of Bab-el-Mandeb, in 12° 40' N. lat., in a north by west direction, to 30° N. lat. It lies between 32° 20' and 43° 30' E. long., and is little short of 1400 miles long. From the strait of Bab-el-Mandeb, which is only 16 miles wide, the Red Sea gradually increases in breadth; at the distance of 160 miles from the strait it is 180 miles across; this breadth may be considered as the average width from Ras Essah or the island of Camaran to Jiddah, a distance of nearly 500 miles. Off Jiddah it is not much more than 120 miles wide; and this width continues to Ras Mohammed, south of 28° N. lat., where the sea divides into two arms; this interval considerably exceeds 500 miles in length. Of the two arms, into which the Red Sea branches off at Ras Mohammed, the eastern is called Bahr-el-Akaba, and the western Bahr-el-Suez, or Kolsun. Between these two gulfs is the mountain region of Mount Sinai, or Jibbel Musa (Mount of Moses). The Bahr-el-Akaba branches off in a north-eastern direction, and extends more than 100 miles, with an average width of less than 15 miles. Near its entrance is the island of *Tiran*, which is 800 feet above the level of the sea, and between it and the continent are two straits, of which only the western, called the strait of *Tiran*, is navigable for large vessels. The entrance of the Bahr-el-Suez is called the strait of Jubal, or Jublah, and is about 15 miles across. The gulf itself runs in a north by west direction to its extremity at the town of Suez, a distance exceeding 180 miles; its average width is 20 miles. The surface of the Red Sea is about 180,000 square miles.

The Red Sea is of great depth. The shallowest part is the Gulf of Suez, which in the middle, towards the Strait of Jublah, is from 40 to 50 fathoms deep; farther north its depth decreases to 30 fathoms; and approaching the harbour of Suez, it shoals to 20 fathoms, and by degrees to 8 fathoms, which is the depth of the harbour itself. The Gulf of Akaba varies in its middle part between 100 and 200 fathoms. The main body of the sea is still deeper, and in most parts a bottom cannot be found at the depth of 100 fathoms; in some places it is 230 fathoms deep. Towards the southern extremity, south of 16° N. lat., it grows much shallower, the depth in general not exceeding 40 or 50 fathoms.

The sea generally shoals near the shores; but the navigation is rendered difficult by islands, banks, and the prevailing winds. Small rocky islands are tolerably numerous, especially along the eastern shores, but as they usually contain small harbours they would be rather advantageous were it not for the adjacent reefs. The islands are generally isolated, except between 15° and 17° N. lat., where the group of the Farsan Islands occurs along the eastern shore, and on the western that of the Dhalak Islands, each of which consists of a larger island and a great number of smaller islands, between which there are numerous reefs. South of these groups there are some islands dispersed in the middle of the sea, as Jibbel Teer, the Zebayer Islands (Jezayer es Seba, or the Seven Islands), and others. Two of these islands are volcanic, and on Jibbel Teer there is an active volcano, 900 feet above the sea.

The Red Sea is the most northern portion of the ocean in which coral reefs occur, and they are more numerous than in any other part of the sea of equal extent. They almost always extend in a tolerably straight line, parallel to the coast; the interior is filled up, so that they never contain a lagoon, as is almost invariably the case with those in the Pacific. These coral-reefs are frequently united with the adjacent continents, and render the shores almost inaccessible, as the water near them is very deep, and the reefs themselves have only from 3 to 6 feet water, which gradually shoals on approaching the beach, so that even boats are stopped at the distance of a quarter of a mile from the dry land. The reefs which are unconnected with the shores are still more numerous, and frequently several miles from them. Their edges towards the open sea are very steep, and the sea itself is of great depth. But the edge which is opposite the mainland has usually a gradual and gentle slope, and affords good anchorage to vessels. The sea between this inner edge and the mainland is generally not very deep, and the small vessels of the country navigate these straits in preference to the open sea, as the water is less agitated by the winds, and they are always in the neighbourhood of some place which offers anchorage in case a gale should rise. The winds, which commonly are very strong in the open sea, can hardly be said to extend to these straits, so that small vessels can take advantage of the sea and land breezes, which set in at certain hours of the day during the greatest part of the year. These advantages however are lost by the necessity of putting into some harbour during the night.

The Red Sea occupies the lowest portion of a deep valley which

lies between the elevated table-land of Arabia on the east, and the high lands of Abyssinia, Nubia, and Egypt on the west. The outer edge of these table-lands is generally from 10 to 80 miles from the shores, and has the appearance of a continuous mountain range, varying in height between 3000 and 6000 feet. These mountains approach much nearer to the shores north of 24° N. lat. than south of that parallel. The space between them and the shores is partly occupied by hills, which skirt the edges of the table-land, and partly by a low and level tract along the sea, which is generally sandy, but sometimes swampy. This tract, as well as the hills between it and the mountains, is far from being sterile, and it has also the advantage of rains in November, December, and January; but it is nearly uncultivated, as the inhabitants, who consist of several tribes of Beduin Arabs, are averse to industry, and make no other use of these tracts than as pasture-grounds when the grass on the table-land is dried up.

During the warm season, from May to October, northern breezes prevail, and for the rest of the year southerly winds blow with great constancy. During the continuance of the northerly winds there is a current out of this sea into the Gulf of Aden, and the depth of water on the reefs is diminished two feet. During the season of southerly winds the current sets into the Red Sea from the Indian Ocean, and then the depth of water in the northern part of the Red Sea is considerably increased. Lieutenant Maury, in his 'Directions to accompany the Wind and Current Charts,' argues (without taking the action of the winds into account) that the waters of the Red Sea ought to be lower at the isthmus of Suez than at the Strait of Bab-el-Mandeb; and infers, with great probability, an under or outer current from the Red Sea as there is from the Mediterranean through the Strait of Gibraltar. The Red Sea lies in a rainless and riverless tract or nearly so; the loss by evaporation in the course of its great length is very considerable, making the surface of the sea an inclined plane; the loss by evaporation, together with the diminution of the temperature (between Bab-el-Mandeb and Suez), renders the water colder and saltier and therefore heavier at the isthmus; the lighter water at the strait of Bab-el-Mandeb cannot balance the heavier water at the isthmus, and therefore this must run out as an under current. According to a French survey made across the Isthmus of Suez in 1853, the surface of the Red Sea was one metre (3 feet 3 inches) higher than the surface of the Mediterranean.

The principal harbours on the Arabian shores are Mokha, Hodeidah, and Jiddah; and on the African, Suez, Cosseir or Cosaire, Suakin, and Massowah. There is a pretty active communication kept up between these places, especially by the numerous pilgrims who visit Mecca and Medina from the eastern countries of Africa. Grain and slaves constitute the chief exports from Africa to Arabia. As Arabia does not produce sufficient supplies for the pilgrims who visit Mecca, and annually amount to above 120,000, the transport of grain from Cosire to Jiddah employs a considerable number of vessels of 50 to 200 tons burden. The grain is brought from Upper Egypt by camels to Cosira.

As the countries along the shores of the Red Sea do not produce many articles of export, they are not much visited by foreign vessels. The few which navigate this sea go to Mokha and Jiddah. They come from the Persian Gulf, Hindustan, and the Indian Archipelago, with wheat, tobacco, dates, carpets, rice, sugar, and Dacca muslins: also coarse and fine blue cloths, cambric, and indigo; with teak-timber, palm-oil, cocoa-nuts, spices, and young females, who are sold to the Turks. The returns for the foreign goods imported into Jiddah are generally cash, which is brought by the pilgrims, to whom nearly all the goods are sold; but coffee, gum, myrrh, and frankincense are exported from Mokha. The Red Sea is now regularly navigated by British steamers, which convey passengers and the Indian mail over this sea and across the Indian Ocean between Suez and Bombay.

The first mention of the Red Sea occurs in the Bible, on the occasion of the Israelites passing through it. In the time of Solomon the advantages of its navigation were well understood; for after the conquest of Idumæa by David, and the acquisition of the country near the Bahr-el-Akaba, Solomon established at Elath and Ezion Geber, on the shores of that gulf, a colony of Phœnician navigators. It is probable that before the time of Alexander the Great some connection existed between the Red Sea and India. Subsequently to the death of Alexander the policy of the kings of Egypt favoured the navigation and commerce of the Red Sea, and it became soon the principal channel of commerce between Europe and India. In the 1st century of the Christian era this trade was so considerable, that, according to Strabo, 120 vessels annually departed from Myos Hormos to India. In the 9th century the Arabs extended their navigation from the Red Sea through the Indian Ocean to Canton in China. Soon after that time the Venetians established factories in Alexandria; and the goods of India passed by the Red Sea to that town, and thence to Europe, during the period between the 12th and 15th centuries, until the discovery of the route round the Cape of Good Hope directed the whole commerce of India into a different channel.

The name Red Sea is a translation of the Latin Rubrum Mare, and the Greek term (*Ἐρυθρὰ θάλασσα*) used by Strabo. Herodotus calls the Red Sea the Arabian Gulf, and also includes it in the general term of Erythraean Sea, which comprises the Indian Ocean and the Persian Gulf. In the Hebrew Scriptures it is always called Yam

Suph, or 'Weedy Sea,' from the vast quantities of marine weeds that grow in it. The Arabs still give it the name of Bahr Souf, which has the same meaning. The name Red given to this sea has not been explained; it is probably a translation of Edom, the land of Edom having extended to the Gulf of Akaba, where were its two ports Elath and Ezion Geber.

REDBOURN. [HERTFORDSHIRE; LINCOLNSHIRE.]

REDDITCH. [WORCESTERSHIRE.]

REDON. [ILLE-ET-VILAINE.]

REDRUTH, Cornwall, a market-town, and the seat of a Poor-Law Union, in the parish of Redruth, is situated in 50° 18' N. lat., 5° 13' W. long., distant 27 miles S.W. from Bodmin, and 261 miles W.S.W. from London. The population of the town of Redruth in 1851 was 7095. The living is a rectory in the archdeaconry of Cornwall and diocese of Exeter. Redruth Poor-Law Union contains eight parishes, with an area of 40,805 acres, and a population in 1851 of 53,628. Redruth did not possess any importance till the working of its valuable mines of copper and tin gave it wealth and population. The town stands on the brow of a hill, and consists chiefly of one long street. The church, dedicated to St. Uny, is about half a mile S.W. of the town; it was rebuilt in 1768, except the tower, which is a handsome gothic structure. A chapel of ease was consecrated in 1833. There are chapels for Baptists, and Primitive, Wesleyan, and Association Methodists; National schools; and a literary institution. The town possesses a town-hall and county court-house; a commodious market-house; shambles, a small theatre, and a savings bank. Near the entrance to the market-place is a clock-tower with an illuminated clock. There are several iron-foundries in operation. There are weekly sales of copper-ore. Markets are held on Tuesday and Friday; fairs, chiefly for cattle, are held on Easter Tuesday, May 1st, August 3rd, and October 1st. Several mineral railways connect Redruth and the adjacent mines with ports of shipment on both sides; the West Cornwall railway gives Redruth direct communication with Truro, Hayle, and Penzance.

REEPHAM. [NORFOLK.]

REETH, North-Riding of Yorkshire, a market-town, and the seat of a Poor-Law Union, in the parish of Grinton, is picturesquely situated on the left bank of the river Swale, in 54° 24' N. lat., 1° 56' W. long., distant 58 miles N.W. from York, and 242 miles N.N.W. from London. The population of the township of Reeth in 1851 was 1344. Reeth Poor-Law Union contains seven parishes and townships, with an area of 70,267 acres, and a population in 1851 of 6820. The town is irregularly built. It contains chapels for Wesleyan Methodists and Independents, an Endowed school, and a school supported by the Wesleyan Methodists. Some of the inhabitants find employment in knitting stockings. Friday is the market-day; six fairs are held in the year. In the vicinity are some lead-mines. Near the town are the remains of intrenchments which appear to be of Roman origin.

REGENSBURG. [RATIBON.]

REGGIO. [CALABRIA; MODENA, DUCHY; RHEGIUM.]

REICHENBACH. [SILESIA.]

REICHENBERG, a large and flourishing town in the north of Bohemia, on the river Neisse, 52 miles N.N.E. from Prague: population about 15,000. The principal buildings are—three churches, two palaces, a theatre, and a large and handsome school-house. There are four great manufactories of woollen-cloth, with fulling-mills and dye-houses. There are also manufactories of stockings, hats, linen, and calico. The annual value of the goods manufactured here is above half a million sterling. The trade of the town is very considerable, it being the staple place for all woollen, linen, and cotton manufactures of this part of Bohemia.

REICHENHALL, a town in Upper Bavaria, is situated in a romantic country on the left bank of the Saale, at an elevation of 1323 feet above the level of the sea. Though it has only about 3000 inhabitants, it is a place of great importance, as being the central point of the four great salt-works of Bavaria. The most ancient documents relative to the salt-springs at Reichenhall are of the 8th century. As the great consumption of wood for so many years made fuel too scarce to boil all the brine on the spot, pipes were laid down in 1618 from Reichenhall to Traunstein, over an elevation of 828 feet perpendicular height, and extending 8 leagues in length. A similar conduit 14 leagues in length, to Rosenheim on the Inn, where there is abundance of wood, was made in 1809; and in 1817 the salt-springs of Reichenhall, Traunstein, and Rosenheim were connected by conduits and pipes with the salt-mines of BERCHTESGADEN. The quantity of salt produced annually is 16,000 tons.

REIGATE, Surrey, a market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of Reigate, is pleasantly situated in 51° 14' N. lat., 0° 11' W. long., distant 22 miles E. from Guildford, 21 miles S. by W. from London by road, and 23 miles by the London and South-Eastern railway. The population of the borough of Reigate in 1851 was 4927. The borough returns one member to the Imperial Parliament. The living is a vicarage in the archdeaconry of Surrey and diocese of Winchester. Reigate Poor-Law Union contains 16 parishes, with an area of 51,276 acres, and a population in 1851 of 14,329. This place was a royal demesne at the Conquest, and was afterwards granted to the Earl of Warrenne and Surrey. There was a castle here, which was taken from Earl

GEOG. DIV. VOL. IV.

Warrenne by Louis of France and the insurgent barons in 1216. Under the site of the castle court is a spacious cavern, called the Baron's Cave, from a tradition that it was a meeting-place of the barons when consulting on the measures for obtaining Magna Charta. The town contains many new houses, and is lighted with gas. The church is of different dates from the 12th to the 17th century, but is chiefly of perpendicular character; it has a lofty embattled tower of later date. In a vault under the chancel is buried Lord Howard of Effingham, afterwards Earl of Nottingham, who commanded the English fleet against the Spanish Armada. The Quakers and Independents have places of worship. The Free Grammar school, founded in 1675, has an income from endowment of 45*l.* a year; it had 31 scholars in 1854, of whom 7 were free. There are also National and Infant schools, a literary institute, and a savings bank. At Red-Hill, near Reigate, is the Agricultural school of the Philanthropic Society for the Reformation of Juvenile Offenders, which is under the direction of a chaplain-superintendent. There is a market on Tuesday for corn and provisions. Fairs are held on Whit-Tuesday, September 14th, and December 9th. Sessions for the county and a county court are held in Reigate.

REIKJAVIK. [ICELAND.]

REILLANNE. [ALPES, BASSES.]

REIMS, or RHEIMS, a city in the department of Marne in France, is situated on the right or north bank of the Vêle, a feeder of the Aisne, 80 miles in a straight line and 107 miles by railway through Epernay E. by N. from Paris, in 49° 15' 15" N. lat., 4° 2' 12" E. long., at an elevation of 232 feet above the level of the sea, and had 43,643 inhabitants in the commune at the census of 1851, exclusive of the floating population. It is mentioned under the name of Durocortorum by Julius Cæsar ('Bell. Gall.' vi. 44), in whose time it was the capital of the Remi. It stood at the convergence of several military roads. At a later period it took the name of the people to whom it belonged, whose name it retains with little alteration. In the time of the empire Durocortorum was the most important place in the provinces of Belgica Secunda, and was distinguished by its literary character. Christianity was introduced into Reims about A.D. 360, from which date it gave title to a bishop.

In 494 this city, then in the hands of the Franks, by whom it had been occupied after the defeat of Syagrius at Tolbiac, was the scene of the baptism of Clovis and the chief lords of his court by St. Remi, who was then bishop of Reims. Reims was made an archbishop's see in 744. In 1179 it was signalised by the consecration of Philippe Auguste: all the succeeding kings of France down to Charles X. inclusive were also consecrated here, with the exception of Henri IV., Napoleon I., and Louis XVIII. On the revolution of 1830 the ceremony was abolished. In the middle ages several councils were held here. Reims was also the capital of a county, afterwards of a duchy. In 1359 it was unsuccessfully besieged for seven months by the English under Edward III. It was taken in 1421 by the English, who however were driven from it by Joan of Arc. In 1814 it was taken, March 12, by a corps of Russians, but retaken next day by Napoleon I.

The town is situated in a vast basin surrounded by chalk-hills, on which good wines are produced. The site of the town is an oblong, extending from north-west to south-east. The ancient walls which surround it are between two and three miles in extent; they are strengthened with towers, and being planted with trees form in summer a very agreeable public walk. They inclose within their circumference many large gardens and several spaces entirely unoccupied. The entrance into the town is by six gates. A Roman triumphal arch, covered with bas-reliefs and adorned with eight fluted Corinthian columns, is built into the circuit of the walls.

The town is well built; the streets are wide, neatly laid out, and well paved, but present a dull appearance from the absence of bustle and the grass which grows plentifully in them. The houses are for the most part built of chalk, or of boards covered with slate; some of them still present their gables to the street; in others the upper stories project, and being supported on wooden columns form on the ground-floor a covered walk or gallery. The squares are generally small and of irregular shape, except La-Place-Royale, a regular square, surrounded by good houses and public buildings of mingled Doric and Italian architecture, and having in its centre a well-executed statue of Louis XV. The streets are adorned with fountains supplied with water from the Vêle by the water-works erected at his own cost by the Abbé Godinot, one of the canons of the cathedral. There is a pleasant public walk planted with trees on the west side of the town.

The most striking public building is the cathedral of Notre-Dame, one of the finest gothic edifices in Europe. It was commenced in 1210 on the site of a more ancient church, and was opened in 1241. The length of the nave and choir is about 466 feet; the breadth 99 feet; the length of the transept is 160 feet; the height is 144 feet. The west front, which is flanked by two square towers 267 feet high, is pierced by three magnificent arched portals, adorned with a vast number of statues, bas-reliefs, and other ornaments of exquisite workmanship. Over the principal doorway is a fine circular window of stained glass. The shafts of the flying buttresses surmounted with statues, the rose-windows over the side doorways, and the Angel

Tower (a remarkably light bell-tower rising 59 feet above the roof of the church at the eastern end, surmounted by a ball and by the statue of an angel from 7 to 8 feet high), are all worthy of attention. The interior of the church is also very striking from the vast extent of the nave, the splendid stained-glass windows; the pavement of the choir, inlaid with marble of various colours; the ancient baptismal fonts; the organ, reputed to be one of the best in France; and the painting of Christ Washing his Disciples' Feet, one of the finest works of Poussin; and the ancient Roman tomb of Jovinus, a citizen of Reims, who, in A.D. 366, attained to the honour of the consulship, and died in 406. This monument was removed in 1800 from the ruins of the ancient church of St.-Nicaise to the nave of the cathedral.

The church of St.-Remy, the most ancient in the town, is almost as large as the cathedral, but not so lofty; the principal front is of simple architecture, surmounted by two lofty spires. The interior is remarkable chiefly for the tomb of St. Remy, an elaborate piece of workmanship, erected in 1803, partly from the remains of the more ancient one destroyed in 1793. The church of St.-Nicaise, demolished during the revolutionary period, was by many considered the finest church in the town; it was superior in elegance to the cathedral, though inferior to it in the richness of its ornaments. There are three other churches, a town-hall, and other buildings. The town-hall, finished in 1825, presents a centre and two wings, adorned with Doric, Ionic, and Corinthian columns. Over the central building, the architecture of which is superior to that of the wings, rises a tower, having a clock, an equestrian statue of Louis XIII., and four pedestrian statues. The public library, which contains 25,000 volumes and above 1000 manuscripts, is deposited in the town-hall.

The manufactures of Reims are extensive: they include woollen-cloths, kerseymeres, light stuffs for summer coats and trowsers, swanskins, camlets, merinos, cashmere shawls, flannels, blankets, carpets, hosiery, bolting-cloth, cordage, candles, soft soap, and leather. The woollen manufactures of Reims were fostered by Colbert, who was a native of the city. The machinery of the woollen factories is driven partly by steam and partly by water power. Wax and wool bleaching, dyeing, wool-combing, brewing, and the making of machinery are carried on. The spiced bread and biscuits of the town are in great repute. The chief trade is in the above-named articles of manufacture, corn, flour, Champagne wines, brandy, spices, colonial produce, wool, cotton-yarn, flax, hemp, and raw hides. There are four yearly fairs. A branch railway 14 miles in length connects Reims with the Paris-Strasbourg line, which it joins a little east of Épernay.

Reims is the seat of an archbishop, whose province comprises the bishoprics of Soissons, Châlons, Beauvais, and Amiens, besides the arch-see, which extends over the department of Ardennes and the arrondissement of Reims in the department of Marne. It has an assize court, tribunals of first instance and of commerce, a chamber of commerce, several government offices, a college, a botanic garden, a theatre, baths, a savings bank, a loan-office, and other institutions. There are two seminaries for the priesthood, several nunneries, and four hospitals, the principal of which, the Hôtel-Dieu, occupies the buildings formerly belonging to the Benedictine abbey of St.-Remy.

REMBANG. [JAVA.]

REMIEMENT. [VOSGES.]

REMO, SAN. [NICÈ.]

REMY, ST. [BOUCHES-DU-RHÔNE.]

RENAIX. [FLANDERS, EAST.]

RENDESHAM. [SUFFOLK.]

RENDSBURG, a town of Denmark, in the duchy of Holstein, is situated in 54° 18' N. lat., 9° 40' E. long., partly on a heath, partly on an island in the Eyder at its junction with the Kiel Canal. It consists of three parts, the Altstadt, or Old Town, built on the above-mentioned island, the Neustadt, or New Town, on the Holstein bank of the river, and the Kron-werk, or Crown-work, on the Schleswig side. The town is well and regularly built, and has about 10,000 inhabitants, including the garrison. There are two churches, an arsenal, a hospital, a house of correction, a gymnasium, a military academy, a board of trade, and a custom-house. It is the residence of a Lutheran superintendent-general. The manufactures comprise stockings, pottery, tobacco, and vinegar; there is a brisk trade in timber. Rendsburg is connected by railway with Altona and Kiel, from which it is 39 miles and 26 miles distant respectively. A branch line runs up to Rendsburg from the Neumünster station on the Kiel-Altona railroad, and is in course of continuation to Husum, Tönning, and Flensburg in Schleswig. Rendsburg rose up round a castle erected on the island in the 13th century. The fortifications, which inclosed the Altstadt, the Neustadt, and the Kron-werk, were all constructed about 1671, when the stone with the inscription 'Eidora Romani terminus imperii' was placed over the Holstein gate. The stone was removed in 1806, but restored subsequently. Rendsburg was taken by the Imperialists in 1627, by the Swedes in 1643, and by the Prussians and insurgent Holsteiners in 1848. The fortifications were dismantled in 1852.

RENFREW. [RENFREWSHIRE.]

RENFREWSHIRE, a county in the west of Scotland, is bounded N. by the Clyde, by which it is separated from Dumbartonshire; N.E. and E. by Lanarkshire; S. and S.W. by Ayrshire; and W. by the

Frith of Clyde. A small portion lies on the right bank of the Clyde. The form of the county is an irregular oblong, having its greatest length from south-east to north-west, 32 miles; and its greatest breadth from the Kilbirnie Loch to Erskine on the Clyde, 13 miles. It lies between 55° 40' and 55° 58' N. lat., 4° 14' and 4° 54' W. long. Its area is 234 square miles, or 150,000 acres. The population of the county in 1841 was 155,072; in 1851 it was 161,091. The county returns one member to the Imperial Parliament.

Surface, Hydrography, and Communications.—The western part of the county, and the southern border which joins Ayrshire, are hilly; the eastern and northern part along the Clyde is flat. The hills on the border of Ayrshire are the loftiest. They attain their elevation in a gradually rising range which traverses the county, commencing on its northern and eastern boundary, a little way south of Glasgow, and running south of Paisley to the Loch of Kilbirnie; the valley of this lake and of Lochwinnoch separating this range from the western and hilly part of the county. The hills on the north border of Ayrshire and in the western part of the county attain an elevation varying from 1200 to 1400 feet; the Neilston Pad, in the centre of the range, is about 900 feet above the sea-level; the Ferenese and Eaglesham hills, farther east, are generally less elevated.

The whole county is included in the basin of the Clyde, the estuary of which washes a large portion of the border; but the tributaries which drain it are all small, and, with the exception of the Cart, useless for navigation. [PAISLEY.] A stream which bears, in different parts of its course, the names of Rotten Burn, Shaws Burn, and Kipp Water, drains the western part, and joins the estuary of the Clyde at the little village of Innerkip, on the west coast of the county. In one part of its course it expands into two lochs, which are used as reservoirs for the supply of Greenock with water. The central and eastern parts of the county are drained by the Gryfe, the Black Cart, and the White Cart, or the Cart, which passing through Paisley, joins the united stream of the Black Cart and the Gryfe just above its fall into the Clyde below Renfrew.

The only canal in the county is that between Glasgow and Johnstone. [PAISLEY.] The Kilmarnock and Ayr railway enters the county from Glasgow, and runs in a westerly direction by Paisley and Johnstone, and enters Ayrshire near Beith. A short branch connects Paisley with Renfrew. The Glasgow, Paisley, and Greenock railway traverses the county in a north-westerly direction. Turnpike-roads from Glasgow to Greenock run, one near the banks of the Clyde through Renfrew, another more inland through Paisley. Roads from Glasgow by Paisley run through the valley of Kilbirnie to Ayrshire. More direct roads cross the eastern side of the county.

Geology, Mineralogy, &c.—The eastern part of the county is included in the great coal district of the west of Scotland. The chief coal-works are at Quarrelton, near Johnstone, and at Hurllet and Househill, near Paisley; the mines here are very productive. In the coal-works at Hurllet a bed of shale over the coal has, by combination with sulphuric acid, been converted into alum-slate; and an alum-work on a very extensive scale is carried on. Limestone, sandstone, ironstone, granite, and secondary trap-rocks are found in considerable abundance. The hills in the west are mostly porphyry, capped with greenstone, which intersects the porphyry in innumerable dykes. Alluvial and diluvial beds are observed along the banks of the Clyde. Good freestone for building is quarried; limestone is also wrought for burning. The coal and ironstone mines give employment to many persons.

Climate, Soil, and Agriculture.—The hilly parts of the county on the west and south are chiefly devoted to pasture. Scarcely more than half the surface of the county is under cultivation, and this part is on the north and north-east, and in the centre, where the soil is most fertile. The best modes of cultivation are generally adopted. Owing to the demand for meat, vegetables, milk, butter, &c., by the large populations of Greenock, Paisley, and Glasgow, a large part of the cultivated land is meadow-land or garden-ground. Dairy farming is very extensively practised. Farms vary in size from 50 to 300 acres. The buildings are generally good.

Divisions, Towns, &c.—There are 16 parishes in the county, reckoning Paisley and Greenock each as one; and portions of three others, Beith, Dunlop, and Govan, which are partly in Lanarkshire or Ayrshire. There are six towns—Renfrew, GREENOCK, PAISLEY, Port Glasgow, BARRHEAD, and Pollockshaws.

Renfrew, a royal burgh, and the county town, though not so large as some of the villages in the county, lies on the left bank of the Clyde, about 6 miles W.N.W. from Glasgow: population of the royal burgh 2722 in 1851; of the parliamentary burgh, 2977. The Stuart family had their earliest known patrimonial inheritance in this parish. Renfrew became a royal burgh by grant from Robert III. in 1396. The town is governed by a provost, two bailies, and nine councillors; and unites with Dumbarton, Kilmarnock, Port Glasgow, and Rutherglen, in returning a member to the Imperial Parliament. A canal about half a mile long affords a communication from the town to the river Clyde. The church is a cruciform structure. There are a Free church, town-house, small jail, and an endowed burgh school. Muslin-weaving employs about 500 persons, half in weaving, the rest (either women or children) in winding or drawing. Many females are employed in clipping, tambouring, and flowering. There is a bleach-field. Several

collieries are in the parish; and on the left bank of the Clyde are a ship-building yard, and a work for the manufacture of iron knees for ships, boilers, &c. A weekly market is held on Saturday.

Port Glasgow, population 6986 in 1851, a parliamentary burgh and sea-port, is situated on the left bank of the Clyde, about 14 miles W.N.W. from Glasgow, and 4 miles E.S.E. from Greenock. The town is governed by a provost, two bailies, and six councillors; and unites with Dumbarton, Kilmarnock, Renfrew, and Rutherglen in the return of a member to the Imperial Parliament. The magistrates of Dumbarton refused to make that place a sea-port for the city of Glasgow; in consequence of which the magistrates of Glasgow in 1668 bought a piece of ground, and obtained a grant from the crown constituting Port Glasgow, the then intended harbour, a free port. Port Glasgow increased in importance for some years, until the rise of Greenock and the improvements on the river Clyde destroyed its prosperity. The town is well built and clean, is lighted with gas, and possesses a handsome parish church, a Free church, a chapel of ease, and a chapel for United Presbyterians. The harbour is almost entirely devoted to vessels trading between the Clyde and North America. The vessels belonging to the port on December 31st 1853 were—54 sailing-vessels of 6269 tons, and 13 steam-vessels of 2195 tons aggregate burden. During 1853 there entered the port 127 vessels of 44,281 tons, and cleared 48 vessels of 33,384 tons aggregate burden. There are a large canvass and rope manufactory, several large sugar-refineries, and an iron ship-building establishment. The town possesses two reading-rooms, a town library, two parochial schools, and an endowed school. Adjoining the town is Newark Castle, built in the 17th century, now half ruinous.

Pollockshaws, population 6086, on the White Cart Water, 3 miles S.W. from Glasgow, was erected in 1814 into a burgh of barony; it is governed by a provost, a bailie, and six councillors. There is a station of the Glasgow and Barrhead railway at Pollockshaws. The town, which consists of one long winding street, with some small branch streets, has been somewhat improved, and new houses have been built of late years. It has an old town-house with a tower and clock. There are the parish church, a chapel of ease, two Free churches, chapels for United Presbyterians, Original Seceders, and Roman Catholics, with several schools and benefit societies. The town depends on the cotton manufacture; spinning, weaving, bleaching, and printing are actively carried on. Coal and stone are procured in various parts of the parish.

The following places we notice here, with the population of each in 1851:—

Busby, a thriving village on the White Cart Water, is partly in LANARSHIRE, under which county it has been noticed. *Eaglesham*, population of the parish 2524, a burgh of regality, 9 miles S. from Glasgow, is a neat village, lighted with gas, and consisting of two rows of houses 200 yards apart; the intermediate space, through which a rivulet flows, is partly planted with trees, and partly occupied by a large cotton-mill and a public green. Many of the inhabitants are employed in the cotton-mill, and there are a number of handloom weavers. Besides the parish church there are a United Presbyterian and a Reformed Presbyterian church. *Elderslie* is a small village, between Paisley and Johnstone, inhabited chiefly by handloom weavers. It is interesting chiefly from its having been for centuries in the Wallace family. In it is a tree known as 'Wallace's Oak,' from a tradition that Sir William Wallace was concealed in it for some time. *Gowrock*, a small burgh of barony on the Frith of Clyde, 3 miles below Greenock, population of Innerkip parish 3018. Its inhabitants are chiefly fishermen. The town is much resorted to as a bathing-place. It has a chapel of ease and a United Presbyterian church. *Johnstone*, 3 miles W. from Paisley, population 5872, owes its existence to the cotton manufacture. It contains a chapel of ease, a Free church, and two chapels for United Presbyterians; a library, a news-room, and a mechanics institute. Several cotton-mills, brass-foundries, iron-foundries, machine-manufactories, and a gas-work are in the town and its vicinity. *Kilbarchan*, population 2467, about 2 miles W. from Johnstone, is inhabited chiefly by weavers. It contains the parish church and a chapel for United Presbyterians. There are two other thriving villages in Kilbarochan parish, called the *Bridge of Weir* and *Linwood*. *Langside*, a small village about 3 miles S. from Glasgow, is chiefly remarkable as having been the scene of the battle of Langside, from which Queen Mary after her defeat fled to England. *Lochwinnoch*, population 2271, on the western bank of Castle Semple Loch, is a large village. Cotton-spinning is the chief branch of industry, but muslin-weaving and the manufacture of Angola shawls and other fabrics are carried on. There are a large parish church, a Free church, and a chapel for United Presbyterians; parochial and other schools; and a library. *Mearns*, population of the parish 3704, a small village, 7 miles S. by W. from Glasgow, on the old Kilmarnock road, contains the small parish church and a well-attended parish school. About a mile N.W. from Mearns Kirk is the larger village of *Newtown Mearns*, on the new Glasgow and Kilmarnock road; it is a burgh of barony, and had a population of 800 in 1851. It consists of one winding street, with a new and neat United Presbyterian church. In the neighbourhood are a print-field and bleach-field. *Newtown Mearns* has the right to hold a weekly market and two annual fairs, but the market has long been discontinued. *Neilston*, population 2076, a village 9 miles S.W. from Glasgow,

possesses several cotton-mills, print-fields, and bleach-fields; freestone and whinstone are quarried, and coal is wrought in the parish. The church of Neilston contains some remains of ancient gothic architecture. *Thornliebank*, a village 4 miles S.S.W. from Glasgow, extends along the highway in detached lines of houses, some of which are new and well built. It is lighted with gas, and has a United Presbyterian place of worship, a large school, an extensive cotton-mill, a bleach-field and print-field, and a small iron-foundry.

History, Antiquities, &c.—The civil history of the county is that of Paisley and Renfrew, the only two places of any importance in the early period of national history. The rise of Paisley as a manufacturing town, and of Greenock as a sea-port, comprises the modern history of the shire. The church of Renfrew contains some curious monuments, and about eight miles west by north from Renfrew is Barochan Cross, a stone monument of mediæval times. There are a few ruinous towers of the feudal period, as Barr and Elliston castles, near Lochwinnoch; and Polnoon, near Eaglesham.

Statistics; Religious Worship and Education.—According to the Returns of the Census of 1851 there were then 133 places of worship in the county, of which 36 belonged to the Established Church, 30 to the Free Church, 21 to the United Presbyterian Church, 7 to Independents, 7 to Baptists, 7 to Roman Catholics, 6 to Methodists, and 4 to Mormons. The total number of sittings for 128 places of worship was 82,514. Of Sabbath schools there were 216, of which 62 were connected with the Free Church, 52 with the Established Church, 43 with the United Presbyterian Church, and 10 with the Roman Catholic Church. The total number of scholars was 20,830. Of day schools there were 208, of which 105 were public with 10,355 scholars, and 103 were private with 5948 scholars. There were 37 evening schools for adults with 1330 scholars. There were 25 literary and scientific institutes in the county, with 3788 members, and 39,433 volumes in the libraries belonging to them. In 1853 the county possessed one savings bank at Paisley. The amount owing to depositors on November 20th 1853 was 59,602*l.* 10*s.* 4*d.*

RENNES, a city in France, capital of the department of Ille-et-Vilaine, stands in 48° 6' 55" N. lat., 1° 40' 17" W. long., 190 miles in a straight line W. by S. from Paris, on the Ille-et-Rance Canal, at the confluence of the Ille and the Vilaine, 176 feet above the level of the sea, and had 33,066 inhabitants in the commune at the census of 1851. The town occupies the site of the ancient *Condate*, the chief city of the Celtic Redones, whose name it subsequently took, and still bears with slight alteration.

Rennes has an agreeable appearance, especially the part rebuilt since the fire of 1720, which destroyed the quarter on the right bank of the Vilaine. This part is distinguished by wide, regular, and straight streets, handsome squares, and good buildings. The town is surrounded by an ancient wall and towers. The upper or new town, and the lower town, which stands on the left bank of the Vilaine, are united by three bridges. The lower town has narrow and crooked streets, with houses mostly built of wood, curiously carved and highly picturesque. The suburbs, which are large, resemble the lower town in character. Rennes is noted for its fine public walks, the principal of which are—Le-Thabor, formed out of the gardens of the old Benedictine Abbey; the Mail, which is formed by a long jetty that runs between two canals to the junction of the Ille and the Vilaine, and the Champs-de-Mars, a space of 125 acres, inclosed by raised and shady walks.

The most remarkable of the public buildings are—the cathedral, a large heavy gothic structure; the church of St. Pierre, of which the two towers of the principal front form a conspicuous object in a distant view of the town; and the churches of Toussaint, and St. Sauveur. The town-house is an elegant modern structure in which are the mayor's offices, a public assembly-room, the public library, lecture-rooms, and schools of design and architecture. Among the other public structures are the court-house, which is appropriated to the administration of justice and to the study of the law, and is decorated with paintings; the episcopal palace; the abbey of St. Georges, now occupied as a barrack; the Kergus barracks, and the arsenal.

The manufactures comprehend linen, linen and cotton yarn, sail-cloth, flannels, hosiery, lace, cordage, nets, hats, gloves, starch, glue, earthenware, porcelain, candles, and liqueurs. There are tan-yards and wax-bleaching-works. A pretty considerable trade is carried on in these articles, and in the honey, wax, poultry, and butter of the surrounding district. The Vilaine is navigated by barges up to the town. [ILLE-ET-VILAINE.] The Ille-et-Rance Canal communicates with St. Malo. A railway in course of construction from Paris to Brest, and already completed as far as Le-Mans, passes through Rennes, from which city there will be branches to St. Malo and Redon.

Rennes gives title to a bishop. It is the seat of a High Court, which has jurisdiction over the departments of Ille-et-Vilaine, Côtes-du-Nord, Finistère, Morbihan, and Loire-Inférieure; and of a University-Academy whose limits extend over the departments just named, and those of Maine-et-Loire and Mayenne. Rennes is the head-quarters of the 16th Military Division. The other institutions of the town comprise tribunals of first instance and of commerce, a college, a school of law, a secondary school of medicine, an ecclesiastical college, a museum, four hospitals, a botanic garden, public

baths, a public library of above 30,000 volumes and some valuable manuscripts; a museum with collections of paintings, natural history, antiquities, &c.; a departmental prison, and a theatre.

RÉUNION. [BOURBON.]

REUS. [CATALUÑA.]

REUSS is a principality in the interior of Germany, consisting of a part of the ancient Voigtland, which was governed by the ancestors of the princes and counts of Reuss. It is situated between 50° 20' and 51° N. lat., and between 11° 40' and 12° 20' E. long. It is divided by the circle of Neustadt, which belongs to Saxe-Weimar, into two portions, of which the southern is much the largest; the lordships of Greitz, Burg, Schleitz, and Lobenstein, with the bailiwick of Saalburg, form the southern portion, bounded N. and E. by Saxony and Saxe-Weimar, S. by Bavaria, and W. by Saxe-Coburg and Schwarzburg Rudolstadt. The principality of Gera, which is the northern part, is bounded N. by Prussia, S. by Saxony, and E. and W. by the different parts of Altenburg. The area and the population in 1853 may be thus stated:—Reuss-Greitz, area 130 square miles, population 35,159; Reuss-Schleitz, area 460 square miles, population 79,824; total area 590 square miles; population 114,983.

The country is mountainous, being traversed by the Erzgebirge and the Thüringerwald, here called the Frankenwald, in which the Sieglitzberg is 2300 feet, and the Culm 2260 feet in height. There are many extensive well-cultivated valleys, of which the two great valleys watered by the Saale and the Elster are the most fruitful. There are fine forests of pine and other timber, and rich pastures. The natural productions are corn, garden vegetables, fruit, hops, flax, and timber; horned-cattle, sheep, game, and fish. The minerals are iron, copper, lead, alum, gypsum, vitriol, and salt. The inhabitants are industrious, and have manufactures of woollen, calico, stockings, hats, earthenware, china, tobacco, alum, and vitriol, besides breweries and iron-works. Cattle and timber are exported.

The capital, Gera, is noticed in a separate article. [GERA.] *Eberdorf*, which lies N. from Lobenstein, has a population of about 1200. *Greitz*, situated on the river Elster, is the residence of the sovereign prince, and contains about 7000 inhabitants. Besides the palace there are here a park, a gymnasium, a seminary for the education of schoolmasters, and another for the clergy. Woollen cloth, calico, and paper are manufactured. *Lobenstein*, on the Lemnitz, a feeder of the Saale, contains about 3000 inhabitants, and has a palace and a public library. In the vicinity are extensive iron-works. *Schleitz*, on the left bank of the Wiesenthal, a feeder of the Saale, has a population of about 5000. The town is neat, and contains a palace and a gymnasium. Broad-cloth, cotton, and leather are manufactured, and there are breweries in the town. *Zeulenroda*, W. from Greitz, has a handsome church, manufactures of hosiery, woollen cloths, and beer. The population is about 4500.

The family of the princes and counts of Reuss may be traced back as sovereign princes to the 11th century. This family now consists of two principal lines, the elder and the younger, and some collateral lines. The elder line, that of Reuss-Greitz, possesses the lordships of Greitz and Burg, and part of the district of Reichenfels. The possessions of the younger line, that of Reuss-Schleitz, are considerably more extensive than those of the elder, but this line being subdivided, the revenue and territory are also divided, though only the prince of Reuss-Schleitz is considered as sovereign. All the subjects of both lines are Lutherans, except a few Moravians and Jews. The government is monarchical, with estates on the ancient German model. In 1813 both lines joined the German Confederation; Reuss, conjointly with five other small states, has one vote (the 16th) in the diet of the Confederation; in the full council each line has one vote. The elder furnishes a contingent of 223 men, the younger of 523 men, to the army of the Confederation.

REUTLINGEN, the chief town of the circle of Schwarzwald, in Würtemberg, is situated in 48° 29' N. lat., 9° 12' E. long., 20 miles S. from Stuttgart, at the foot of Mount Achalm, on the river Echatz, in a beautiful and fertile country. The population is about 11,000. The town is surrounded with moats, lofty walls, and towers, and has four principal gates. Without the walls there are three small suburbs. The Marienkirche, or St. Mary's church, built in the Gothic style entirely of freestone, was founded in 1273, and finished in 1343. The steeple, which is very handsome, is 325 feet high. The town-house is a considerable edifice, and there is a large building called the Chancery, formerly a Franciscan convent, but now converted into government offices.

Reutlingen possesses considerable manufactures of woollen cloths,

cotton, leather, hats, outlery, &c. In the neighbouring country are raised some fruit and corn, in which, as well as in their own manufactures, the inhabitants carry on a considerable trade.

REVEL, the capital of the Russian government of Esthonia, is situated in 59° 26' 22" N. lat., 24° 39' 38" E. long., on the Gulf of Finland. It is very strongly fortified, and in 1824 the harbour, which is one of the best in the Gulf of Finland, was made capable of receiving the Russian Baltic fleet. It has narrow irregular streets, and dark old-fashioned houses. The best part of the city is the part called the Dom, which is in fact a distinct portion, being surrounded with walls and towers in the old style, and further defended by a strong castle. It is on an eminence called the Domberg, on the west side of the city, commanding an extensive view of the sea. Most of the houses of the nobility are in this part. There are likewise two extensive suburbs. The principal public buildings are the cathedral, which has a very lofty and handsome steeple, the arsenal, the town-house, the admiralty, a gymnasium founded by Gustavus Adolphus in 1631, and the naval and military hospital. The manufactures are cotton goods, hats, stockings, leather, powder, starch, pins, needles, earthenware, looking-glasses, &c. There is also a cannon and bell foundry.

The trade of Revel formerly of considerable importance has, it is said, greatly declined of late years. Since the outbreak of war between Russia and the western European powers its foreign trade has been annihilated. The exports usually shipped at Revel are corn, hemp, flax, timber, spirits, tallow, &c.; the imports are composed of colonial produce, fruits, wine, salt, tobacco, manufactured goods, cheese, herrings, &c. The town was founded about 1218 by Valdemar II. of Denmark. It soon became an important member of the Hanseatic League, and had an extensive commerce with Novgorod. The Swedes took Revel in 1561, when its trade began to languish. In 1710 it came into the hands of Peter the Great, who confirmed most of its commercial and municipal privileges. The population of Revel is about 20,000.

REVEL. [GARONNE, HAUTE.]

RHÆ'TIA appears properly to have comprehended the whole country between the north of Italy and the Danube, and consequently to have included Vindelicia. In the time of Augustus however these two countries formed two separate provinces (Vell. Pater., ii. 39; Aurel. Vict., 'Epit.' c. i.; comp. Suet., 'Aug.' 21), of which Rhetia was bounded W. by the Helvetii, E. by Noricum, S. by Gallia Cisalpina, and N. by Vindelicia, from which it was separated by the Brigantinus Lacus (Boden See, or Lake of Konstanz) and the river Cenus (Inn). It included the greater part of the Tyrol and the eastern cantons of Switzerland.

The Rhetia are said to have been a Tuscan people, who were expelled from Italy by the Gauls, and who settled in the country afterwards called Rhetia, under a leader named Rhetus. (Plin., iii. 24; Justin, xx. 5; Liv., v. 33.) They were a brave and enterprising race, and for a long time committed constant robberies in Gaul and the north of Italy. Augustus at length sent Drusus against them (B.C. 15), who subdued the southern part of the country, and delivered Italy from their depredations; but as they still continued to trouble the province of Gaul, Tiberius also was sent against them, who attacked them near the Boden See, and reduced the whole country.

The great chain of the Alps passes almost through the centre of this province, and was called the Alpes Rheticae. [ALPS, Rhetian.]

The Rhetii were divided, according to Pliny (iii. 24), into many states or tribes. The only town of any importance in Rhetia was Tridentum (Trent) on the Athesis (Adige), the capital of the Tridentini.

RHAGÆ. [PERSIA.]

RHAYADER, or RHAYADERGWY, Radnorshire, a market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of Rhayader, is picturesquely situated on the banks of the river Wye, in 52° 19' N. lat., 3° 31' W. long., distant 27 miles W. by N. from Presteigne, and 181 miles W.N.W. from London. The population of the borough of Rhayader in 1851 was 1007. The borough is contributory to the Radnor boroughs in returning one member to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry of Brecon and diocese of St. David's. Rhayader Poor-Law Union contains 10 parishes, with an area of 105,532 acres, and a population in 1851 of 6796.

Rhayader derived anciently its chief importance from its castle, erected about 1173, of which the only vestige remaining is the fosse, which was excavated out of the solid rock. A bridge of one arch crosses the Wye at this place. A plain town-hall stands in the centre of the town. The parish church, a spacious edifice, was rebuilt in 1733. The Wesleyan and Calvinistic Methodists, Independents, and Baptists have places of worship, and there are National and Free schools. The flannel manufacture is carried on. The market-day is Wednesday; five fairs are held in the year. A county court is held.

RHEGIUM, now Reggio, one of the oldest Greek towns in Italy, is situated on the Fretum Siculum, or Strait of Messina, and about 8 miles S.E. from the town of Messina. It received a colony of the Chalcidians, who were joined by a party of Messenian emigrants who left their country during the first quarrel between Messene and Sparta. Both the town and the name probably existed previous to the establishment of the Chalcidian colony, as Diodorus and other ancient writers place its foundation in the Heroic times. After the

taking of Ithome, and the end of the first Messenian war, a fresh colony of Messenians, led by Alcidas, settled at Rhegium about B.C. 723, and after the capture of Eira, a third party of Messenian emigrants, led by two sons of Aristomenes, joined their countrymen at Rhegium, which became a very populous and flourishing city, and extended its dominion over the neighbouring towns and districts. The government appears to have been a kind of open aristocracy, which, according to some accounts, was vested in one thousand of the citizens.

About B.C. 494, Anaxilaus, a citizen of Rhegium, of a Messenian family, usurped the supreme power. He took the town of Zancle on the opposite side of the strait, and colonised it with his Messenian countrymen, who gave it the name of Messana. Anaxilaus married a daughter of Therillus, tyrant of Himera, who, being afterwards defeated by Theron of Agrigentum, took refuge at Carthage. Anaxilaus and Therillus invited the Carthaginians to the first invasion of Sicily (B.C. 480), which was defeated by Gelon of Syracuse. Anaxilaus died shortly after, and his sons were subsequently driven away from both Messana and Rhegium. Rhegium joined the Athenians in their first expedition against Syracuse, but in the second Athenian expedition against Syracuse it remained neutral. Afterwards a long struggle began between Rhegium and Dionysius the elder, tyrant of Syracuse, which terminated with the ruin of Rhegium. Dionysius besieged the city B.C. 388 with a large force. The Rhegians made a brave resistance, but they were compelled to surrender through famine (B.C. 387). Many of the inhabitants were found dead; fifteen thousand of the remainder were sent to Syracuse as slaves; some of the wealthiest ransomed themselves. Python, their commander, was put to a cruel death with all his family by Dionysius, who razed the walls of Rhegium, and obliged the neighbouring towns of Magna Græcia to pay allegiance to him. Under his successor, Dionysius the Younger, Rhegium recovered its independence, and gradually some part of its former prosperity.

While Pyrrhus was waging war in South Italy and Sicily, Rhegium applied to Rome for assistance. The Romans sent a body of 4000 men, raised in the Latin colonies in Campania. These auxiliaries, finding themselves far from Rome, rose against the inhabitants, killed most of the men, took possession of their houses and property, and appropriated their wives and daughters to themselves. After the final retirement of Pyrrhus from Italy, the Romans severely punished the traitors, and the surviving citizens were restored to their houses and property, and to their municipal independence under the protection of Rome. The Aquilian road terminated at Rhegium. The town has often suffered from earthquakes. It retained the Greek language, manners, and customs to a late period of the empire.

After the fall of the Western empire, Rhegium remained subject to the Eastern emperors, and its archbishop was metropolitan of Bruttii. In A.D. 509 it was taken by Totila; in 918 by the Saracens; in 1005 by the Pisans; and in 1160 by Robert Guiscard, since which time it has always been a part of the kingdom of the Two Sicilies.

In the 16th century Reggio was sacked three times by the Turks, in 1543 by Barbarossa, again in 1558, and lastly in 1593. The great earthquake of Calabria, in 1783, completely ruined the town of Reggio; not a single building remained entire. Reggio has been since rebuilt on a regular plan; it spreads along the declivity of a hill down to the sea. A wide street, called La Marina, runs along the sea-shore, and another street, parallel to it, runs through the centre of the town, and is intersected at right angles by various streets. The view of the opposite coast of Messina and its verdant hills, backed by the huge mass of Ætna, is truly magnificent. The Apennines near Reggio are rugged and bare, but the plain around it is extremely fertile, and the ground is very valuable, most of it being laid out in orange and lemon plantations. Reggio is a great nursery of orange and lemon plants for all parts of the kingdom. The date-palm flourishes and produces fruit. The climate is temperate, and the atmosphere remarkably pure.

Coin of Rhegium. British Museum. Actual size. Silver.

Reggio is the capital of the province of Calabria Ultra (II). [CALABRIA.] It is fortified, well supplied with water, and situated in one of the most delightful spots in Europe. The population amounts to about 10,000. The most note-worthy buildings are the cathedral, several convents, the college, the hospital, the foundling asylum, and the theatre. The manufactures comprise silks, gloves, hosiery, cedrat and other essential oils. Articles, such as gloves, stockings, &c., are manufactured from the silky byssus of the *Pinna marina*. The export trade in wine, oil, citron, olives, and dried fruits is considerable. An annual fair is held in the town from the 1st to the 15th of Sept.

The ancient port of Reggio no longer exists. The small craft of modern Reggio anchor a little to the north of the town.

RHEIMS. [REIMS.]

RHEIN PROVINZ ('Province of the Rhine'), the most western province of Prussia, lies between 49° 10' and 51° 55' N. lat., 5° 55' and 8° E. long. It is situated on both sides of the Rhine, and comprises the grand-duchy of the Lower Rhine, and the duchies of Juliers, Cleves, and Berg. It contains the five governments of Cologne, Düsseldorf, Coblenz, Treves, and Aachen (Aix-la-Chapelle). Except the circle of Wetzlar, which is encompassed by Nassau, Hesse-Darmstadt, and Hesse-Cassel, it is bounded N. by Westphalia, E. by Nassau and Hesse-Darmstadt, S. by France, Bavaria, Saxe-Coburg, Hesse-Homburg, and W. by Luxemburg, Belgium, and the Netherlands. The area and the population of the five governments of the province in 1847 were as follows:—

Governments.	Area in Square Miles.	Population in 1847.
Cologne	1,532	484,593
Düsseldorf	2,080	887,614
Coblenz	2,320	499,557
Treves	2,775	488,699
Aachen	1,601	402,617
Total	10,308	2,768,090

In the return for 1852 the area and population of the province, with the addition of Hohen-Zollern, are given at 10,759 square miles, and 2,972,130 souls, of whom 2,247,396 were Catholics; 691,777 Protestants; 31,656 Jews; 1290 Mennonites; and 11 Greeks.

The northern part of the province is generally level, the eastern and southern parts mountainous and hilly. The Hundsrücken, which extends between the Moselle, the Rhine, and the Nahe, forms the west side of the valley of the Rhine and the east side of the valley of the Moselle, and is connected on the south with the Vosges. Its highest point within the province is in the Soonwald, which is 2015 feet above the level of the sea. The Eifel, which is a wild and partly very sterile region, is a continuation of the Ardennes, and extends between Luxemburg, the Moselle, and the Rhine. In the eastern part there are numerous extinct volcanoes. The Westerwald is a rude chain, which likewise shows many traces of volcanic action. The most interesting part of it is that called the Siebengebirge near Bonn; some parts of this chain are from 1200 to 1400 feet above the level of the sea.

The principal rivers are the Rhine, the Moselle, and the Lippe, which are navigable; the many smaller streams, most of which fall into the Rhine, are either not navigable or navigated by very small vessels. The climate is temperate; the air on the right bank of the Rhine is pure and healthy; on the left side damp fogs are more frequent, especially in the north-west part, where there are many marshes; on the mountains it is cold. The natural productions of this province are equally numerous and valuable. The higher parts of the mountains are crowned with noble forests, and the declivities are covered with vineyards. The minerals are silver, iron, copper, lead, calamine, marble, slate, freestone, millstones, basalt, porphyry, alum, manganese, sulphur, coals, and salt. Where the country slopes to the Rhine there are productive corn-fields and rich pastures; between the mountains there are fertile valleys, where flax, hemp, hops, and tobacco are grown, and fruit and garden produce of every kind are cultivated in great abundance. Game is plentiful, and all the domestic animals are bred in sufficient number.

But the great source of the prosperity of the province is the Rhine, which, from its junction with the Nahe to the village of Hochheim on its right bank, forms the natural boundary between the duchy of Nassau and the government of Coblenz; it then traverses the governments of Cologne and Düsseldorf, and leaves the Prussian territory at Schenkenschanz, opposite the Dutch village of Lobith, having passed through this province as one undivided stream for 180 miles. On the banks are many vestiges of Roman works and ruins of castles of the middle ages. The small rivers and streams are applied to turn mills and to work manufacturing machinery of every kind; for this, says Has-sell, is the most industrial province not only of the Prussian Monarchy but of all Germany. The duchy of Berg has been termed an England in miniature, and the comparison is more appropriate now than when it was first made. Cotton-factories with steam-machinery have been established in the most important towns of the province. Steam-boats ply on the Rhine and its navigable feeders, and railroads connect its chief towns with each other and with the great industrial and trading centres of Belgium, North Germany, and France. [PRUSSIA.] The manufactures comprise woollen, silk, and cotton textures of all descriptions; steam-engines and steam-machinery; plain and damask linen; yarn of all descriptions; lace, buttons, ribands, chemical products, sugar, tobacco, musical instruments, hardware, agricultural and mechanical tools, needles, pins, &c. Under the heads AIX-LA-CHAPELLE, COBLENZ, COLOGNE, DÜSSELDORF, TRÈVES, BERG, CLEVES, JÜLICH, BARMEN, DÜREN, EIFEL, ELBERFELD, EUPEN, CREFELD, &c., the surface of the country, its chief towns, and industrial products are noticed.

Gueldres, which has been referred to this article, is a small manufacturing town on the Neers, 26 miles N.W. from Düsseldorf, and has about 4000 inhabitants. It was formerly the residence of the dukes of Gueldres, and gave name to the Dutch province of Guelderland, from which it was detached with a small territory in 1713, and ceded to Prussia by the treaty of Utrecht. It was formerly fortified, but its defences were dismantled in 1764 by the French, to whom it had surrendered in 1757.

RHEIN, CIRCLES OF. [BADEN; BAVARIA.]

RHEIN-HESSEN. [HESSE-DARMSTADT.]

RHEINECK. [GALL, ST.]

RHEINGAU. [NASSAU.]

RHENEIA. [DILES.]

RHÉTIERS. [ILLE-ET-VILAINE.]

RHIN, BAS (Lower Rhine), a department of France on the eastern frontier, named from the river Rhine, on the left bank of which it lies, is bounded N. by the department of Moselle and Rhenish-Bavaria; E. by Baden, from which it is separated by the Rhine; S. by the department of Haut-Rhin; and W. by the departments of Vosges and Meurthe. The greatest length is from south-south-east to north-north-west, 68 miles; the greatest breadth is in the northern part, 60 miles; but its ordinary breadth does not exceed 30 miles. The area is 1756·9 square miles. The population in 1841 was 560,113; in 1851 it amounted to 587,434, giving 334·358 to the square mile, being 159·774 above the average per square mile for the whole of France.

Surface; Geological Character; Hydrography.—The western side of the department is occupied by the rugged wooded highlands, which form the eastern face of the Vosges Mountains. The projection at the north-western side of the department crosses the ridge in one part so as to include both the ridge itself and the western face down to the valley of the Sarre. The mountain sides are diversified with precipitous rocks, and picturesque valleys watered by small streams, which flow ultimately into the Rhine, except a few which join the Sarre. The mountains are composed of sandstones, limestones, and marls. Upon the limestone rest variegated marls, which are occasionally interstratified with gypsum. By convulsions subsequent to the deposition of the sandstone, a portion of that formation has been thrown up into bold craggy mountains, while the later formations rest upon the lower portions, several hundred feet below, at the foot of the escarpment. From the eastern foot of the Vosges a rich tract, forming part of the valley of the Rhine, extends to the bank of that river. This part is occupied by the tertiary formations. The immediate banks of the river are in many places marshy.

A small quantity of coal is procured. Iron-ore is abundant; about 30 mines are worked; and there are 27 forges and furnaces for the manufacture of the metal. Other mineral products are lead, asphalt, antimony, manganese, gypsum, slates, potters'-clay, building-stone, &c.

The department belongs entirely to the basin of the Rhine. The greater part is included in the valley watered by that river, and the remaining part, which extends across the Vosges, is drained by the Sarre, which falls into the Moselle, and so ultimately into the Rhine. The Rhine skirts the eastern boundary of the department; it is as broad as the Thames at London, and studded with a great number of small wooded islands. The Rhine yields abundance of trout, perch, salmon, carp, sturgeons, and eels. Some particles of gold are brought down by the current.

The principal feeder of the Rhine is the Ill, which rises in the department of Haut-Rhin and flows northward, nearly parallel to the Rhine and a few miles west of it, so that it receives the mountain streams that flow down the eastern slopes of the Vosges, and thus becomes a considerable river. Nearly forty miles of its course are in this department, and through the whole of that distance it is navigable. It receives the Liepvrelle, the Scheer, the Andlau, the Eger, the Bruche, into which flows the Mossig, all from the Vosges; passes Schelestadt, Benfeld, Erstein, and Strasbourg; and joins the Rhine a few miles below the last-named place. It is used for the conveyance of the timber of the Vosges and the other productions of the country. One or two arms of this river branch off from it above Strasbourg, and communicate with the Rhine.

The Zorn, which receives the Zintzel; the Moder, which receives another Zintzel; the Surbach, which receives the Eberbach; the Seltzbach; and the Lauter, all flow from the eastern face of the Vosges into the Rhine. The Surbach and the Lauter rise in the Bavarian territory, and the Lauter has its course on the frontier of France and Bavaria, which it separates from each other. The Moder and the Lauter, the longest of these streams, have each a course of about 45 miles; the Moder alone is navigable, and that for only 2 miles. The others are used for floating timber down from the mountains. The course of the Sarre within the department may be estimated at about 20 miles, for nearly 10 miles of which it is navigable.

There are two navigable canals. The most important is the great canal for joining the Rhône and the Rhine, formerly called Canal-de-Monsieur. This canal enters the department on the south side from the adjacent department of Haut-Rhin, and, running northward along the valley of the Rhine, opens into the Ill just above Strasbourg. The canal of the Bruche commences near the junction of the Mossig and the Bruche, and follows the valley of the latter river till its junction with the Ill just above Strasbourg.

Climate.—The department has long and cold winters; the spring is short, the heat of summer succeeding very rapidly to the cold of winter. The vicinity of the Vosges Mountains, on which snow remains till June or July, renders the summer liable to sudden transitions to cold. The autumns are uniformly long and very fine. The climate is generally healthy, but cretinism and goitre are very prevalent in parts: in 1852 there were 125 cretins and 873 gottrous persons, not idiots, in the department, spread among the population of 38 communes. The causes of these diseases are unknown; they prevail to a less extent than formerly, owing it is said to the drainage of the marshes and the extended cultivation of the soil.

Soil, Agriculture, &c.—The soil of the mountains is rocky, and in great degree barren; that of the immediate bank of the Rhine is marshy; but the flat which occupies the intervening space is rich and highly cultivated. About 450,000 acres are under the plough. The produce in corn is more than enough for the consumption. The chief crops are wheat, spelt, rye, mixed corn, and maize. Potatoes are grown in large quantities. In oats the produce is small. Tobacco has been cultivated for two centuries in this department; about 25,000 acres of the best land are under tobacco culture. Madder is successfully cultivated. The oleaginous seeds grown are the poppy and the rape. Excellent hemp and hops are grown. Cabbages are very extensively cultivated, and a great quantity of 'choucroule,' or sauerkraut, is exported to Germany. Other products are—onions, beans, gentian, plums, and cherries of which kirschwasser is made. About 11,000,000 gallons of wine are made annually from about 82,000 acres of vineyards. There is a good breadth of meadow land. Horses, cows, and pigs are very numerous. Geese are reared in great numbers; their livers are used in making the famous Strasbourg pie. The number of sheep is comparatively small. Both oxen and horses are employed in agriculture. The orchards and gardens cover about 15,000 acres. The woodlands are very extensive, amounting to nearly 300,000 acres. A considerable part of the timber is formed into small rafts, and floated down the Rhine to Mainz, where they are united so as to constitute enormous rafts from 250 to 300 yards long, and 25 to 30 yards broad, conducted each by 300 or 400 men. A part of the timber is sawn into deals and planks in Holland. The abundance of timber supplies not only sufficient fuel for domestic purposes, but also furnishes some for manufactures. It is not however sufficient for the demand, and a considerable quantity of coal is imported to make up the deficiency of wood.

The internal navigation of the department, including the Rhine (which is navigable all along the eastern frontier), amounts to about 200 miles in length. The department is traversed by 7 imperial and 32 departmental roads, and by the Paris-Strasbourg and Strasbourg-Basel railways.

The manufactures of the department are very important, comprising woollen-cloths of all descriptions, calicoes, linen, hats, playing-cards, room-paper, soap, oil, chemical products, ironmongery, hardware, mechanical and edge tools, fire-arms, gloves, surgical instruments, paper, &c. There are numerous breweries, tan-yards, paper-mills, madder-mills, and iron-works.

Divisions, Towns, &c.—The department is divided into four arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Strasbourg . . .	12	161	244,172
2. Saverne . . .	7	165	109,879
3. Schélestadt . . .	8	114	139,678
4. Weissembourg . . .	6	104	93,705
Total . . .	33	544	587,434

1. Of the first arrondissement and of the whole department the chief town is STRASBOURG. *Bischwiller*, a manufacturing town of 5700 inhabitants, is situated on the Moder, 13 miles N. from Strasbourg. Its fortifications were dismantled in 1706. *Brumath*, is supposed to occupy the site of Brocomagus, a town of the Tribocci: population of the commune 3760. Brumath is 11 miles from Strasbourg by the railway to Paris. *Molsheim*, is in a wine growing district at the eastern foot of the Vosges. It is a tolerably well-built town situated on the Bruche W. by S. from Strasbourg, and has about 3380 inhabitants, who manufacture tools, cutlery and other hardwares, and paper. *Mutzig*, in a valley near the foot of the Vosges, is a walled town with 3500 inhabitants. *Wasselonne*, W. of Strasbourg on the Mossig, has manufactures of woollen-yarn, woollen-hose, paper, and leather; bleach-grounds for linen, and 4300 inhabitants. *Haguenau*, a pretty fortified town on the Moder, was founded by the emperor Frederick Barbarossa, and was one of the imperial cities of Alsace; its privileges were abolished after the conquest of Alsace by Louis XIV. In 1675 and 1705 it was besieged by the imperialists: in the second siege they were successful, but the town was retaken by the French soon after. In 1793 the imperialists and Prussians were defeated near the town by the French. Haguenau is surrounded by old walls, strengthened by towers and a ditch. It has manufactures of cotton-yarn and calico; and of woollen-cloth, cordage, soap, pitch, tiles, pottery, and earthenware. There are several oil-mills, gypsum-mills,

madder-mills (a great quantity of madder is grown round the town), tan-yards, and breweries. There are four yearly fairs for cattle and general merchandise. The town has five churches and a synagogue; a college, and a military hospital: population 10,500.

2. In the second arrondissement the chief town is *Saverne*, which was a post of some importance in the time of the Romans, who called it *Tabernæ*. The town stands on the *Zorn*, at the eastern foot of a steep and high mountain, 27 miles N.W. from *Strasbourg*, and has 5733 inhabitants. The chief building is the former palace of the bishops of *Strasbourg*, who used to spend their summers here. The townsmen manufacture hardwares, hosiery, and leather; and there are some breweries. *Saverne* has a subordinate court of justice, a college, and an hospital. *Bouxwiller*, is a busy little place, with 3600 inhabitants, who are engaged in manufacturing fustians, linens, hats, chemical products, &c.; there are also drying-houses for madder; bleach-grounds, and breweries. *Saar-Union*, N.W. of *Saverne*, is divided by the *Sarre* into two parts: *Bourquenom*, on the right bank, and *Sarrewerden*, on the left. The population amounts to 4300, who manufacture woollen-cloth, cotton goods, linen, hosiery, beer, tiles, and bricks.

3. In the third arrondissement, the chief town, *Schélestadt*, is situated 28 miles S. by railway from *Strasbourg*, on the left bank of the *Ill*, and has 8367 inhabitants in the commune. It is regularly fortified, and entered by three gates, of which the one leading to *Strasbourg* opens upon a fine avenue of poplars. The town has several good churches and public buildings. Its chief industrial products are pottery, tobacco, vinegar, starch, beer, leather, flour, &c. *Barr*, 9 miles N. from *Schélestadt*, is a well-built town of about 4500 inhabitants, situated among vineyards at the foot of the *Kirchberg*. There are cotton factories, and oil- and tan-mills driven by water-power. *Benfeld*, a station on the railway to *Basle*, 10 miles N. from *Schélestadt*, is situated on the *Ill*, and has about 2700 inhabitants. Tobacco is extensively manufactured about this town. At *Ersheim*, a town of 3500 inhabitants, 14 miles by railway N. from *Schélestadt*, cotton hosiery, snuff, cordage, tiles, leather, and pottery are manufactured; and there are dye-houses and bleach-grounds for linen. *Markolsheim*, S.E. of *Schélestadt*, near the left bank of the *Rhine*, has manufactures of linen, breweries, potteries, tile- and brick-yards, and above 2300 inhabitants. Trade is carried on in hemp and tobacco. At *Ober-Nai*, or *Ober-Ehnheim*, a small ill-built walled-town of about 5000 inhabitants, there are copper-works, cotton factories, and distilleries. At *Rosheim*, situated on the *Magel* in a valley among the *Vosges Mountains*, woollen and cotton stuffs are manufactured: population, 3500.

4. In the fourth arrondissement the chief town, *Weissembourg*, or *Wissembourg*, is a fortress of considerable strength, and is connected with the 'lines' of *Weissembourg*, works constructed along the bank of the *Lauter* to cover this part of France. It has 5110 inhabitants in the commune, and is the seat of a college and a tribunal of first instance. The chief industrial products are hosiery, straw hats, earthenware, pottery, soap, beer, bricks, and leather. *Lauterbourg*, 12 miles E. from *Weissembourg*, and the most eastern town in France, is also fortified. It stands on the *Lauter* near its mouth in the *Rhine*, and has about 2500 inhabitants, two churches, two hospitals, ropewalks, breweries, and potash factories. At *Soultz-sous-Forêts*, between *Weissembourg* and *Haguenau*, there are iron- and coal-mines, beds of asphalt, and salt-springs: population about 2000. *Niederbronn*, a small town of about 3000 inhabitants, 16 miles S.W. from *Weissembourg*, are iron-works, tanyards, breweries, and paper-mills; also some mineral springs, the waters of which are drunk and also used for baths.

The department together with that of *Haut-Rhin* forms the see of the Bishop of *Strasbourg*. Protestants of the Lutheran and Calvinist sects form a large ratio of the population. The Calvinists have consistorial churches at *Strasbourg* and *Bishwiller*, and 12 meeting-houses in other towns of the department. The Lutherans have 21 local consistories. The Jews have a consistorial synagogue at *Strasbourg*, presided over by a grand Rabbi; and 18 communal rabbis. The Catholics have 42 parish churches and 274 chapels of ease in the department, a diocesan seminary and theological school at *Strasbourg*, where also is a great Protestant seminary, and a Lutheran industrial school and gymnasium. The University-Academy of *Strasbourg* embraces within its limits the departments of *Bas-Rhin* and *Haut-Rhin*. The department of *Bas-Rhin* is included in the jurisdiction of the High Court of *Colmar*, and belongs to the 6th Military Division, of which *Strasbourg* is head-quarters. It returns four members to the Legislative Chamber of the French empire.

RHIN, HAUT, a department in the east of France, bounded N. by *Bas-Rhin*, E. by the *Rhine* and the grand duchy of *Baden*, S. by *Switzerland* and the department of *Doubs*; and W. by the departments of *Haute-Saône* and *Vosges*. Its greatest length is 64 miles; its breadth is about 36 miles. The area of the department is 1585·8 square miles. The population in 1841 was 464,775; in 1851 it amounted to 494,147, which gives 311·607 inhabitants to a square mile, or 137·023 above the average per square mile for the whole of France.

This department, like that of *Bas-Rhin*, is included between the crests of the *Vosges* on the west and the bank of the *Rhine* on the

east; its western side is consequently mountainous, while in the east it subsides into the valley of the *Rhine*. Some of the mountains, called from their rounded forms 'ballons,' are lofty. *Le Ballon d'Alsace*, at the junction of the three departments of *Haut-Rhin*, *Haute-Saône*, and *Vosges*, has an elevation of 4121 feet; and *Le Ballon de Guebwiller*, or *Soultz*, the highest point of the *Vosges Mountains*, about six or seven miles west of the town of *Guebwiller*, has an elevation of 4701 feet. The southern portions of the department are covered by the ramifications of the *Jura*. The highest summits of the *Vosges* are composed of granitic or other primitive rocks; in the neighbourhood of *Giromagny*, south of the primitive district, are the sandstones, limestones, and other formations of the carboniferous system. On the lower slopes of the *Vosges* are the variegated marls, limestones, and sandstone; and resting upon these, the oolitic formations, which also compose the mass of the *Jura*. The eastern side of the department, from the foot of the *Vosges* to the *Rhine*, is occupied by the tertiary formations. Among the mineral products are copper and lead; iron-mines are numerous; mines of antimony and coal, and beds of asphalt are worked. Granite, porphyry, marble, rock crystal, good freestone, potters' clay, and gypsum are procured; and there are several mineral springs, of which those of *Soultzmatt*, about ten miles south-south-west of *Colmar*, are the most important.

The department belongs chiefly to the basin of the *Rhine*, which river has a considerable breadth, an average depth of ten to twelve feet, and is studded with numerous islands. The various streams which flow from the *Vosges* are received by the *Ill*. [*RHIN, BAS.*] The navigation of the *Ill* commences at the junction of the *Lauch*, close to *Colmar*; but it is used for floating timber above that point. The *Lauch* and the *Fecht*, which join the *Ill*, are also used for floating timber. The *Largue*, which rises in the *Jura*, has been made a feeder of the canal from the *Rhône* to the *Rhine*. The south-west of the department belongs to the basin of the *Rhône*, and is drained by the *Halle*, the *St-Nicholas*, and the *Savourens*, which fall into the *Doubs*. None of these rivers is navigable.

The canal from the *Rhône* to the *Rhine* enters the department near the junction of the little rivers *Halle* and *St-Nicholas*, and runs north-east along the valley of the *St-Nicholas* to the summit level near *Dannemarie*; thence it runs partly along the valley of the *Ill* to the basin near *Mulhausen*, whence a branch proceeds to join the *Rhine* at *Huningue* near *Basel*, while the main branch runs northward between the *Ill* and the *Rhine* into the department of *Bas-Rhin*. The inland navigation of the department, including the *Rhine*, the *Ill*, and the canal, extends to 131 miles.

The department is crossed by 7 imperial and 15 departmental roads, and by the *Strasbourg-Basel* railway through *Colmar* and *Mulhausen*; from *Mulhausen* a branch line, 13 miles in length, runs north-west to the manufacturing town of *Thann*.

The soil of the department is stony and barren along the bank of the *Rhine* and in the *Vosges*; the central part is fertile; and among the mountains also there are some valleys of great fertility. The district formerly called the *Suntgas*, of which *Belfort* was the capital, is also considerably fertile. There is much forest-land between the *Ill* and the *Rhine*. The climate resembles that of *Bas-Rhin*, but is rather colder, and the winters are a little longer.

Cultivation is carried on with great care. Wheat, barley, oats, and other crops mentioned in the preceding article, are grown in this department in quantity sufficient for the demand, though this was formerly not the case. The meadows, which are very rich, amount to 130,000 acres, and the heaths and open pastures to above 70,000 acres. The number of horses and horned cattle is very considerable; the number of sheep is comparatively small. The vineyards cover about 28,000 acres; the growth of wine is about 12,760,000 gallons annually. The orchards, which cover nearly 15,000 acres, are very productive, especially in cherries, from which excellent *kirschwasser* is made. Pulse, hemp, flax, tobacco, and madder are grown. The woodlands comprehend 336,000 acres. The abundant supply of wood furnishes fuel for the various manufactures of the department. It is floated down the streams which flow into the *Ill* or the *Doubs*.

The department of *Haut-Rhin* is one of the principal seats of the cotton manufactures in France. All kinds of calicoes and printed goods, cotton-yarn, shawls, hosiery, &c., are manufactured. Other important industrial products are fine woollens, linens, woollen-yarn, thread, canvases, ironmongery, clock and watch movements, room-paper, soap, leather, pottery, hats, chemical products, refined sugar, spirits, glass, bar-iron, &c.

The department is divided into three arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Colmar . . .	13	142	211,682
2. Altkirch . . .	6	160	149,874
3. Belfort . . .	9	191	132,591
Total . . .	28	493	494,147

1. Of the first arrondissement, and of the whole department the

chief town is COLMAR. *Ensisheim*, 15 miles by railway from Colmar, on the right bank of the Ill, was formerly the capital of Upper Alsace. It is slightly fortified, and has a central prison for eight departments and 3800 inhabitants. *Guebwiller*, situated on the Lauch, 15 miles S.W. from Colmar, contains a handsome church, erected in the middle of the last century: the townsmen spin cotton-yarn, weave stockings, gloves, caps, handkerchiefs, calicoes, cotton-prints, printed-shawls, and woollen-cloths, and manufacture nails, currycombs, potash, and refined sugar. *Kouffach*, 8 miles S. from Colmar by railway, is a walled town with 3400 inhabitants, who are engaged in spinning cotton-yarn and weaving cottons. Near the town is the castle of Isemburg, where some of the Frankish kings of the Merovingian race resided. *Neuf-Brisach* is a small well-built fortified town between the Ill and the Rhine, 9 miles E. by S. from Colmar, and has about 2500 inhabitants. It was built by Louis XIV. to serve as a check to the fortress of Alt-Brisach, on the Baden side of the Rhine, and was fortified by Vauban on the most improved principles. The streets are straight, and the houses low but regularly built. *Soultz*, a well-built walled town with 3400 inhabitants, south of Colmar on the Lauch, has manufactures of silk ribbon, woollens, paper, and leather. *Münster*, a small town with 3400 inhabitants, 12 miles S.W. from Colmar, owes its origin to a Benedictine abbey, founded here in the 7th century. It was anciently fortified, and suffered much in the Thirty Years' War. The townsmen are engaged in the manufacture of cottons, muslins, and paper. Cotton and woollen goods are manufactured at *Wintzenheim*, a small town west of Colmar with 3500 inhabitants. *Kaiserberg*, on the Weiss, 6 miles N.W. from Colmar, founded by the emperor Frederick II., who surrounded it with walls, was formerly a free imperial city. The town is well built, and has above 3000 inhabitants, who manufacture cotton goods, linen, canvass, and leather. At *Ribeauville*, a town of 7500 inhabitants, 8 miles N. from Colmar by railway, cotton handkerchiefs and other cotton goods are manufactured: near the town are the ruins of the castle of Ribeaupierre. *Sainte-Marie-aux-Mines* is, next to Colmar, the most important place in the arrondissement. It is near one of the passes of the Vosges, 18 miles N.W. from Colmar, in an agreeable situation. The *Liepvrette* divides it into two parts. It derives its name from the copper and lead mines formerly worked in the neighbourhood, but the working of these has been gradually given up. The chief occupation of the townsmen is the manufacture of cotton and woollen-yarn, of linens, woollens, and cottons, including handkerchiefs and printed calicoes, and of leather and paper. There are also tan-yards, bleaching-grounds, dye-houses, and fulling- and paper-mills. The town has a chamber of manufactures, a council of prud'hommes, and about 12,000 inhabitants in the commune.

2. In the second arrondissement the chief town is *Altkirch*, a small town 36 miles S. from Colmar, with a communal college, a tribunal of first instance, and 3500 inhabitants. *Altkirch* was built early in the 13th century by one of the counts of Ferette. There are some ancient towers yet standing. The townsmen manufacture leather, and there is a monthly fair for cattle. The only other place worth notice in the arrondissement is the important manufacturing town of *Mulhausen*, which forms the subject of a separate article. [MULHAUSEN.]

3. In the third arrondissement the chief town is *Belfort*, or *Belfort*, which is situated in the south of the department, on the left bank of the Savoureuse, a feeder of the Doubs, and has a commercial court, a tribunal of first instance, a college, and 7400 inhabitants. The town is fortified and well built. Outside the three gates are three important suburbs. The chief industrial products of Belfort are watch- and clock-works, leather, tin ware, hats, wax-candles, beer, ironmongery, and iron wire. *Cernay*, a station on the railway from Mulhausen to Thann, is situated on the Thur, and has a manufacturing population of 3500. At *Givomagny*, a small town of 2300 inhabitants on the Savoureuse, cotton stuffs, hosiery, and tiles are manufactured, and a monthly fair is held for corn and cattle. *Massevaux*, prettily situated on the Doller, 10 miles N.E. from Belfort, has manufactures of cotton-yarn and cotton goods, copper-works and iron-furnaces, and a population of 3300. *Thann*, a well-built busy manufacturing town of about 6000 inhabitants, situated on the Thur, 13 miles by railway distant from Mulhausen, has a fine old gothic church dedicated to St. Théobald, remarkable for its spire, 328 feet high, which is an imitation of that of Strasbourg. The ruins of the castle of Enguelbert, on a hill above the town, are also deserving of notice. Cotton-yarn and cotton goods, including printed calicoes, are manufactured; also machinery, starch, gunpowder, pig- and bar-iron, salt, and chemical productions.

The department is included, with that of Bas-Rhin, in the diocese of Strasbourg; it is in the jurisdiction of the High Court of Colmar, and within the limits of the University-Academy of Strasbourg. The Calvinists form a considerable element in the population of the department. The Catholics have 32 parish churches and 320 chapels of ease. The Calvinists have a consistorial church at Mulhausen, and 7 meeting-houses in other towns of the department. The Jews have a synagogue and grand rabbi at Colmar, and 18 communal rabbis spread over the department. There are colleges in Altkirch, Belfort, Colmar, Mulhausen, and Thann. The department is included in the 6th Military Division, the head-quarters of which are at Strasbourg.

It sends three members to the Legislative Chamber of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Annuaire du Commerce; Official Papers.*)

RHINE (ancient Rhenus), a large and important river in Europe, rises in the Alps of Switzerland, in several parts of its course separates that country from Germany, afterwards divides Germany from France, traverses the territories of several princes belonging to the German Confederation, and lastly drains the plains of Holland, where it reaches the sea by several arms. That portion of the river which lies within or along the boundary-line of Switzerland is called the Upper Rhine; from Basel to Cologne, it is denominated the Middle Rhine; and the remainder of the course, to its several mouths, the Lower Rhine.

Upper Rhine.—The river originates in three branches in that elevated chain of the Alps which runs eastward from the mountain-road of St.-Gothard through the Grisons. The most eastern of these three branches, the Vorder-Rhein (Fore-Rhine), is considered the principal. It rises in two small lakes, situated on the eastern declivity of Mount Badus, belonging to the St.-Gothard group, about 7500 feet above the sea-level. It runs in a ravine like a torrent, and about 12 miles from its source, at Dissentis, where it is met by the second branch, the Mittel (Middle) Rhein, it is hardly more than 3600 feet above the sea. It continues its course for about 40 miles more in an east by north direction, to Reichenau and Coire. At Reichenau the waters are increased by the third branch, called the Hinter (Hinder) Rhein, and at Coire it is nearly 250 feet wide, its waters having been increased by numerous small tributaries. From Coire downwards it is navigated by small flat river-boats, and it begins to run through a valley from one to two miles wide, in a nearly northern direction towards the Boden See, or Lake of Constanz. This valley is nearly 50 miles long. About 20 miles north from Coire two mountains come close up to the banks of the river, so as not to leave even space for a road. The eastern is called the Fischerberg, and the western the Schollberg. Their declivities along the river are extremely steep, and there is reason to suppose that the two mountains at some remote time formed one mass, and that the course of the river was different from what it is at present. In fact a low tract of alluvial ground extends south of the Schollberg westward to the small town of Sargans in St.-Gallen, and thence to the Lake of Wallenstadt. Between this lake and that of Zürich there is also a broad tract of level alluvial ground, in which the Linth Canal has been made. As the ground between the present course of the Rhine and the Lake of Wallenstadt is little more than 20 feet above the level of the river, it is supposed that the Rhine formerly took its course through this low ground, and passing through the lakes of Wallenstadt and Zürich, followed the course of the Limmat, which joins the Aar a little below the mouth of the Reuss. When the Rhine is unusually swollen there is some danger of its returning to this its supposed ancient bed. In 1817 and 1821 the danger was only averted by the great efforts of the inhabitants of the adjacent places. North of the narrow passage between the Schollberg and Fischerberg the valley is much wider, and here the river constitutes the boundary-line between Austria and Switzerland. Where the river enters the Boden-See it runs through a swampy tract of small extent. The river issues from the lake at Constanz, which is 1344 feet above the sea-level, and flowing in a western direction for a few miles, enters the Unter-See (Lower Lake), which is about 30 feet lower than the Boden-See. In this tract, and as far as Schaffhausen, the Rhine is navigable for large boats, but below the last-mentioned place its waters rush over a rock, which is between 65 and 70 feet high, and this waterfall is called the cataract of Schaffhausen or Laufen. The last name is derived from that of a castle which is contiguous to the waterfall. At Schaffhausen the surface of the Rhine is 1260 feet above the sea-level. Below this cataract the course of the river is very tortuous, between mountains and high hills, but its general direction is toward the west. Nearly 50 miles below Schaffhausen the navigation is again interrupted by a cataract, at the town of Laufenburg, where the bed is narrowed by projecting rocks to about 50 feet. At this point goods must be unshipped, and the barges descend the river by means of ropes. The last and least impediment to navigation in the Upper Rhine occurs near Rheinfelden, about 10 miles below Laufenburg, where a rapid of some length occurs, which does not stop the navigation, but is fatal to many boats which navigate this part of the river. It is called the Höllebacken (Hook of Hell). Below this rapid the river is only 850 feet above the sea; and at Basel only 800 feet.

Numerous tributaries join the Rhine in its upper course above Basel, but none of them is navigable or otherwise important, with the exception of the Aar, which with its feeders the Reuss and the Limmat, brings into the Rhine the drainage of the greater part of Switzerland. [AARGAU.]

Middle Rhine.—At Basel, where this division of the river begins, it has entirely left the mountain region of the Alps and Jura Mountains, and at the same time it changes its western into a north-north-eastern and northern course. It flows in a valley from 40 to 50 miles wide, extending between the Black Forest (Schwarzwald) and the mountains connected with it on the east, on the one side, and the Vosges and their northern prolongation the Hardt Mountains on the west, from

Basel to Mainz, a distance of nearly 200 miles. At Mainz the surface of the river is only 274 feet above the sea. Between Basel and Strasbourg, a distance of only about 80 miles, the fall of the river is not less than 847 feet, or 4½ feet per mile. Accordingly the current is very rapid, and in addition to this the wide bed of the river contains numerous sand-banks and small islands, which are subject to sudden and frequent changes in their form and position, so that navigation in this part of the Rhine is dangerous and therefore limited. Between Kehl opposite Strasbourg, and Germersheim, which places are about 50 miles distant from one another, the islands increase in size, and are less subject to change. Few islands occur north of Germersheim, and the river flows slowly, making large bends. The largest kind of barges used between Strasbourg and Mainz are of 100 tons burden, but in ascending they must be drawn up, which is chiefly done by horses.

Between Mainz and Bonn the Rhine runs between two mountain regions in a narrow valley. This valley, which contains some of the most picturesque scenery on the continent of Europe, is in some parts so narrow, that there is hardly level space enough for a road between the mountains and the banks of the river. The hills along the banks of the stream contain extensive vineyards, the produce of which is known all over Europe under the name of Rhenish wines. At Bingen a ledge of rocks crosses the river, and though the Prussian government has somewhat lessened the danger by blasting some of the rocks, neither barges nor steam-boats can pass by night or in foggy weather. Near Bacharach, farther down, there is a group of rocks, and opposite St. Goar another ledge. At Cologne the river is only 110 feet above the sea-level. The ascent by barges is very tedious.

Numerous tributaries join the Rhine in its middle course. Those which flow into it from the west have a short course, and are not navigable, with the exception of the *Moselle*, which rises on the western slopes of the Vosges, and runs first north-west, and then north, but the greater part of its course is to the north-east. After a course of 320 miles, it joins the Rhine at Coblenz. [MOSELLE.] The lower part of its course lies in a deep valley of moderate width, inclosed by hills and mountains, the slopes of which are covered with extensive vineyards, which produce the Moselle wine.

The number of navigable rivers which join the Rhine in its middle course from the right is much greater. The most southern is the *Neckar*, which rises near 48° N. lat., in the mountainous tracts by which the range called the *Raube Alp* is connected with the Black Forest, and after a course of about 170 miles falls into the Rhine at Mannheim. [NECKAR-KREIS.]

The most important of the affluents of the Middle Rhine is the *Main* or *Mayn*, which falls into it opposite Mainz. Its sources are in the *Fichtelgebirge*, not far from the boundary of Bohemia, where it originates in two branches, of which the northern is called the *White* and the southern the *Red Main*. The two branches unite about two miles and a half below *Kulmbach*, and begin to change their western course into a southern. Not far from *Bamberg* the river is joined by its only navigable affluent, the *Rednitz*: it then flows west by north to *Schweinfurt*, whence it again runs south to *Markbreit*, and from that place to the north-north-west to *Gemünden*. From *Gemünden* it again flows southward, and making a wide sweep, encircles the mountain region of the *Spessart*. At *Hanau* it turns westward, and passing near *Frankfort* in that direction, joins the Rhine. Though its sources are only about 150 miles from its mouth, the whole course exceeds 360 miles, owing to the numerous large bends. River barges ascend above the mouth of the *Rednitz*, more than 250 miles from its mouth; and from *Kitzingen* downwards, it is navigated by vessels of 100 tons burden. The whole course lies through a hilly but rather fertile and well-cultivated country. As no high hills intervene between the *Main* and the *Danube*, a canal, originally projected by *Charlemagne*, was cut by the ex-king *Ludwig* of *Bavaria* from *Forchheim* along the banks of the *Rednitz* and those of the *Altmühl*, a feeder of the *Danube*. This canal establishes a water communication between the *North Sea* and the *Black Sea*.

Farther north the Rhine is joined by the *Lahn*, which falls into it a little above the mouth of the *Moselle* at *Niederlahnstein*: it flows about 140 miles, and is navigable for moderate-sized river boats to *Diez*, about 20 miles from its mouth. It traverses a very hilly country. The river *Sieg*, which falls into the Rhine below *Bonn*, flows about 70 miles, and is navigable to *Siegburg*, which is about eight miles from its mouth. [ARNSBERG.]

Lower Rhine.—From *Cologne* to its mouths, a distance of about 300 miles, the course of the Rhine is through a low level country, though the western declivity of the hills of the *Sauerland* are near its eastern bank, between *Cologne* and *Düsseldorf*. The current is extremely gentle, as the whole fall does not amount to much more than four inches per mile, the surface at *Cologne* being, as already observed, only 110 feet above the sea-level. From this town downwards the Rhine is navigated by sea-going ships, many of which are built in the ship-yards of *Cologne*. [COLOGNE.]

About 200 miles from its mouth, and soon after it has entered *Holland*, the Rhine begins to divide into several arms; but before this division, the waters are increased by three navigable rivers, on the left bank by the *Erft*, which has a course of about 60 miles, and on the right bank by the *Ruhr*, whose course is above 100 miles,

about one-half of which has been made navigable for barges by the construction of several locks, and the *Lippe*, which is somewhat more than 100 miles long, and is navigated from *Lippstadt* by small river-boats, and from *Lünen* by large ones.

Near the village of *Pannerden*, which is within the territories of *Holland*, the Rhine divides into two arms, of which the southern is called the *Waal*, and the northern preserves the name of *Rhine*. Nearly two-thirds of the volume of water run into the *Waal*, which is more than 210 yards wide, while the *Rhine* is only 114 yards wide. The *Waal* runs westward, and the *Rhine* north-north-west. The *Rhine* divides again about 12 miles lower down, above *Arnhem*, into the *Yssel*, which runs to the north, and the *Rhine*, which turns off to the west. The *Yssel* was originally a canal, cut by *Drusus*, to unite the *Rhine* with the river which is now called *Oude* (Old) *Yssel*. It falls into the *Zuider-Zee*. The *Rhine* running westward divides for the third time about 80 miles lower down, at *Wyck*. The southern arm is called the *Leck*, and the northern goes by the name of *Kromme-Rhyn* (Crooked *Rhine*): the *Leck* is the larger river. The *Crooked Rhine* runs north-west to *Utrecht*, where it divides for the fourth and last time. The arm which runs northward is called the *Veicht*, and falls into the *Zuider-Zee*; the other, whose name is changed into that of *Oude-Ryn* (Old *Rhine*), continues westward through the marshes of *Holland*, where the waters are used for feeding numerous small canals. It passes through *Leyden*, and formerly did not reach the sea, being prevented by some sandy dunes which line the shores of this part of *Holland*; but in 1807 a canal was made through them, and the river now discharges a small quantity of water into the sea at *Katwyck*, north-west of *Leyden*. [HOLLAND.]

The *Leck*, or middle branch of the *Rhine*, was originally also a canal, made by the *Roman* general *Corbulo*; and it existed as such to A.D. 839, when the bed was greatly enlarged by an inundation, and thus it became the principal river, and the true *Rhine* was reduced to insignificance. It runs from *Wyck* by *Duurstede* westward for about 50 miles, and enters an arm of the *Meuse* that runs along the north shore of the island of *Ysselmonde*. [MEUSE.] The *Waal* runs about 80 miles from *Pannerden* to *Gorkum*, where it flows into the *Maas*. A branch of the *Meuse*, called the *West Kil*, leaves the main stream a few miles below its junction with the *Waal*. After flowing through the *Bies-Bosch* [HOLLAND] it runs west, and takes the name of *Hollands-Diep*, which divides into two, the arms that inclose the island of *Over-Flackee*. [MEUSE.] The whole country between the arms of the *Rhine* is intersected by numerous canals, most of which serve for the purpose of internal navigation, though only for small boats. The whole course of the *Rhine* amounts to about 870 miles, of which about 570 miles, from *Basel* to its mouths, are navigable.

The delta of the *Rhine* is bounded on the east by the *Yssel*, on the south by the *Waal* and the *Maas*, and on the other sides by the *North Sea* and the *Zuider-Zee*: it comprehends the whole of the three Dutch provinces of *North* and *South Holland* and *Utrecht*, and nearly two-thirds of *Guelderland*. The whole extent of the low country near the mouths of the *Rhine* is nearly 5000 square miles. All this country would occasionally be covered with the inundations of the river, or by the sea, if it were not protected by embankments. The river embankments begin at *Wesel*, in the Prussian province of *Düsseldorf*, and extend on both sides of the different arms of the *Rhine* to the sea. These embankments are generally from 25 to 80 feet above the lowest level of the river. In the basin of the *Rhine* the winter usually lasts from six weeks to two months, during which time the river is covered with ice, and the snow accumulates in the adjacent countries. If the snow has fallen in greater quantities than usual, and is suddenly dissolved by warm rains, the river in a short time swells to an extraordinary height, and lays the contiguous lowlands under water. No part of these lowlands is more subject to such inundations than the *Betuwe*, or that tract which extends between the *Rhine* and *Leck* on the north and the *Waal* on the south. When such inundations take place they are always attended with great loss of property, and sometimes of life. The basin of the *Rhine* is estimated at about 80,000 square miles, of which about 13,000 miles are assigned to the upper, 40,000 miles to the middle, and 27,000 miles to the lower basin of the *Rhine*.

Ancient writers differ respecting the number of mouths by which the *Rhine* falls into the ocean. *Cæsar* says that there are several, but *Virgil* ('Æn.' viii. 727), *Aianius* (*Strab.* iv. p. 193), and *Tacitus* ('Ann.' ii. 6) speak only of two; of which, according to *Tacitus*, the western is called *Vahalis* till its union with the *Mosa*, when it takes the name of the latter river, while the eastern, which forms the boundary between *Gaul* and *Germany*, preserves the name of *Rhine*. *Pliny* ('Hist. Nat.' iv. 29), *Ptolemaeus* (ii. 9), and other writers say that the *Rhine* falls into the sea by three mouths, of which the eastern, according to *Pliny*, was called *Flevum*, and the western, formed by the union with the *Mosa*, *Helium*; while the middle one, which was only a stream of moderate size, retained the name of *Rhine*. The channel called *Flevum* is supposed to have been formed by the canal which *Drusus* dug to connect the *Rhine* with the *Isala* (*Yssel*), and by means of which he and *Germanicus* sailed to the ocean. (*Suet.* 'Claud.' c. i.; *Tac.* 'Ann.' ii. 8.) The *Isala*, increased by the waters of the *Rhine*, flowed northward into a great lake called *Flevo*, on issuing

from which it became a river again, and fell into the ocean after forming an island of the same name. (Mela, iii. 2.) In course of time the sea made great inroads upon the land round the mouth of this river, till at length it submerged that part of the country, and became united with the lake Flevo, thus forming the modern Zuider-Zee.

Though the basin of the Rhine extends from 46° 30' to 52° N. lat., nearly the whole of it has the same climate. The distance between the upper and lower basin, amounting to about five degrees, is compensated by the greater elevation of the upper basin. Thus the plains of Switzerland, which are about 1400 feet high, resemble in climate the low countries which lie between 51° and 52° N. lat. The countries in the middle basin, being less elevated in proportion, enjoy a somewhat milder climate than the plains of Switzerland and the lowlands near the mouth of the Rhine.

The Rhine is connected by canals with the Saône and Rhône, the Schelde, the Meuse, and the Danube. A very important trade in colonial produce, manufactured goods, timber, coal, iron, corn, wine, and agricultural products, is carried on by the Rhine and its chief navigable feeders, the Moselle, the Mayn, the Ruhr, and the Neckar. The annual traffic on the Rhine and its tributaries amounts to 5,250,000 tons, of which 3,500,000 tons belong to the Rhine exclusively, and about 1,000,000 tons to the Ruhr. The free navigation of the river was guaranteed by the stipulations of the treaty of Vienna, but every one of the seven states—Switzerland, France, Baden, Bavaria, Prussia, Hesse-Darmstadt, and Holland—through which it passes, or which it touches, from the point where it becomes navigable to the North Sea, demand toll on goods and vessels passing their respective territories. The duties it is true have been considerably reduced from time to time, especially by Holland, but still they are very onerous. To give some idea of the vexations and stoppages caused by the system of Rhine tolls, it is only necessary to state that in 1854 a vessel of about 130 tons paid on the Rhine, between Emmerich and Mayence, in recognition dues and duties, no less than 82*l.* 4*s.* sterling, or above 12*s.* 7*d.* a ton. The commerce and navigation of the Moselle, the Mayn, the Ruhr, and the Neckar, are restricted in a similar way. The Rhine is navigated by steam-boats belonging to several companies, and by many steam-tugs and colliers, which ply with coals between the Ruhr and the principal towns on the Rhine.

A railway runs down the right bank of the Rhine from Basel through Freiburg, Karlsruhe, and Darmstadt to Frankfurt-am-Mayn and Wiesbaden. The line is to be continued from Frankfurt to Cologne. At Frankfurt this trunk line is joined by the Cassel railway, which is connected by the Thuringian and Westphalian lines with central and northern Germany, and by the Würzburg line with the Bavarian railways. At Bruchsal, a little north of Karlsruhe, it is joined by a branch line with the Würtemberg railway system. A French railway runs down the left bank of the Rhine from Basel to Strasbourg, whence a line runs to Paris. Farther down a line, in connection with the Paris-Strasbourg line, skirts the left bank of the Rhine from Spire to Mayence. In the Prussian territories a railway joins Bonn to Cologne, whence a short line running west connects the Rhine with the Belgian railways. From Deutz, opposite Cologne, a railway runs along the right bank of the river to Duisburg, whence it turns eastward, connecting the Rhine with the Hanoverian and Prussian lines.

The Rhine is crossed by pontoon bridges, or bridges of boats, only at Cologne, Mayence, Mannheim, and a few other places; and the railways that skirt its banks have as yet no point of junction. An iron bridge is about to be constructed over the river from the Frankenplatz in Cologne to the wharf near the railway terminus at Deutz. It will rest on three massive piers and two abutments, leaving four openings for the passage of the water each 313 feet in span. There is to be no opening in the arches, their height above the water being sufficient to admit vessels to pass. The bridge is to be divided longitudinally into two equal divisions, one for the passage of trains and the other for general traffic and use. The height of the bridge is to be greater than the level of the railroads on either side of the river, in order not to impede the navigation; but at each end a moveable platform will be constructed, with powerful machinery for raising and lowering it with a whole train to the levels of the two railroads respectively, so that there will be no necessity to unload or change carriages.

RHIO is a Dutch settlement, on the island of Bintang, which lies opposite Cape Romania, one of the promontories with which the Malay peninsula terminates on the south. The island of Bintang is a little larger than that of Singapore, and contains about 300 square miles, with a population of about 13,000. The Dutch first established themselves here in 1785, and in 1818, after Java, Malacca, and the other Dutch colonies had been restored, the Dutch government took possession of the town of Rhio in order to secure the Malacca trade; but the foundation of the town of Singapore and the rapid growth of that British colony has frustrated their design: yet Rhio is a thriving place. A large quantity of gum and terra japonica is exported. The town and fortress of Rhio is situated on the south-west coast of the island, at the entrance of a wide inlet, called the bay of Tanjung Pinang. The harbour is good and safe, but its entrance is rendered difficult and dangerous by a number of small rocky islands. Rhio is in 50° N. lat., 104° 28' E. long.

RHODE ISLAND, one of the United States of North America, lies

between 41° 18' and 42° 2' N. lat., 71° 6' and 71° 58' W. long., except Block Island, which lies between 41° 6' and 41° 15' N. lat. The state is bounded E. and N. by Massachusetts; W. by Connecticut; and S. by the Atlantic Ocean. The area is about 1200 square miles. The population in 1850 was 147,545 (of whom 8670 were free coloured persons), or 122.95 to the square mile. Rhode Island is the smallest state in the Union, but with the exception of Massachusetts the most densely peopled. The inhabitants being all free, the federal representative population is the same as the entire population in 1850; this according to the present ratio of representation entitles the state to send two representatives to Congress. To the Senate, like each of the other states, Rhode Island sends two representatives.

Surface, Hydrography, Communications.—The largest part of the state lies to the west and north-west of Narragansett Bay, and comprehends about 900 square miles; a small portion lies to the east of Narragansett Bay; and the rest is composed of the islands of Rhode Island, Canonicut Island, Prudence Island, Patience Island, Hope Island, Hog Island, and Dyer's Island in Narragansett Bay; and Block Island in the Atlantic. Rhode Island, which gives its name to the state, is the largest of the islands which belong to it. The central part of it is in 41° 32' N. lat., 71° 15' W. long. Its length is about 15 miles from north to south, with an average width of about 3½ miles. This island is the most fertile part of the state; the soil is suitable either for tillage or grazing, and is well cultivated; and the climate is so temperate and healthy, that the island is a place of resort for the inhabitants of the southern and central states in the summer months, and for invalids at all seasons. Near to Rhode Island is Canonicut Island, which is seven miles long and one mile broad, and has some beautiful scenery. Prudence Island higher up the bay, and partly between Rhode and Canonicut Islands, is a little less than the latter. The only other island requiring specific mention is Block Island, which lies about 12 miles S.W. from Point Judith on the mainland; it is about 8 miles long, and from 2 to 4 miles broad; and is chiefly inhabited by fishermen: the population of Block Island in 1850 was 1262.

Narragansett Bay, which intersects a large portion of the state, is about 30 miles long from Point Judith, on the south, to Bullock's Point, and about 10 miles wide. The entrance extends from Point Judith on the west to Point Seaconet on the east. The bay forms a safe road during the north-west storms, is navigable in all seasons, contains several excellent harbours, and has many points suitable for defence, which have been strongly fortified. Newport Harbour in the channel between Rhode and Canonicut Islands, is one of the finest in America.

The surface of the continental part of Rhode Island is generally hilly and broken, but the hills nowhere attain a greater elevation than about 300 feet above the level of the sea. Along Narragansett Bay, and on the islands, the surface is level or slightly undulating.

The rivers of this state are not more than 50 or 60 miles long, and have but an inconsiderable quantity of water. They are therefore of little value for navigation, but having generally a considerable fall, they afford a large amount of mechanical power, and work numerous mills. The *Pawcatuck*, which in the lower part of its course forms the boundary between this state and Connecticut, is navigable for about six miles. The *Pawtucket*, the principal river in the state, rises in Massachusetts, where it is called the Blackstone River; traverses the north-eastern part of Rhode Island; and falls into Providence River about a mile below Providence city. At Pawtucket village, four miles from its mouth, there are falls of about 50 feet, below which the river is known as the Seekonk: it is navigable up to the falls. The *Providence*, formed by the union of the Wanasquatucket and the Mohausick, opens into the north-western arm of Narragansett Bay: it is navigable for vessels of 900 tons burden up to Providence city. The *Pawtucket* falls into the Providence about three miles below Providence city.

The Blackstone Canal, uniting Providence with Worcester in Massachusetts, is the only canal which in part belongs to this state: about 16 miles of it is in Rhode Island, the chief part, 47 miles, being in Massachusetts. Only one railway, the Providence and Stonington, 50 miles long, is exclusively a Rhode Island line, but portions of lines belonging to other states lie within the boundaries of this state.

Geology, Soil, Climate.—That portion of the state which lies west of Narragansett Bay is occupied almost exclusively by eruptive and metamorphic rocks. The part east of the bay belongs to the Carboniferous system. The state is not rich in minerals. Iron-ore is found in various places, but it is not much worked. Coal is found, but it is an anthracite of secondary quality, and it is likewise little worked. Some copper-ore is said to have been found. Serpentine is abundant. Limestone is obtained in great quantities in the north-eastern part of the state; also marble of good quality. Freestone is extensively quarried.

The soil is generally thin. On the mainland it is mostly a gravelly loam, which with careful culture is tolerably fertile: on the islands it is slaty, but productive. The climate is temperate but changeable. On the whole it is said very much to resemble that of England, and it is generally very healthy. In places, as at Newport, which is a favourite resort of invalids, it is milder in the winter and cooler in the summer than in any other part of New England.

Productions, Manufactures, Commerce.—Grain is grown in consider-

able quantities, but the soil is for the most part better fitted for pasturage than for the plough. The cereals chiefly cultivated are maize and oats; a good deal of rye and barley is also grown; wheat and buckwheat are little cultivated. Potatoes and other vegetables are grown very largely, and of excellent quality. A considerable quantity of fruit is also grown. In the low districts extensive pine lands occur, and there are large quantities of oak, chestnut, and walnut trees, but there are no extensive forests.

Cattle and sheep are raised in great numbers on the islands and on the coasts of Narragansett Bay. Horses are numerous, and there are a great many swine. Butter and cheese are largely made; and a good deal of wool is sent to market. The rivers, Narragansett Bay, and the coasts supply plenty of fish.

The manufactures of the state are extensive. Providence is the centre of both the manufacturing and commercial industry. The cotton is the principal manufacture. In 1850 there were in the state 158 cotton factories employing 4959 males and 5916 females. The woollen manufacture employed 1758 persons; the iron about 1100 persons. There are also numerous tanneries, breweries, distilleries, paper-mills and flour-mills, manufactories of machinery, hardware, cutlery, saddlery, hats, glass, jewellery, &c.

The direct foreign commerce of Rhode Island is now very small, little more, in fact, than one-tenth of what it was fifty years back:—in 1805 the exports of the state amounted to 2,572,049 dollars, while in 1853 they were only 810,485 dollars. The imports in 1853 amounted to 366,116 dollars, of which goods to the value of 261,719 dollars were carried in American vessels. The foreign trade of Rhode Island is now chiefly carried on through the ports of Massachusetts and New York. Providence has the greatest number of vessels entering and clearing at Rhode Island ports, and Bristol and Newport together about equal Providence. The total amount of shipping owned in the state in 1850 was 40,489 tons, a large proportion of which was engaged in the cod, mackerel, and whale fisheries, and in the coasting trade. In 1853 there were 11 vessels, of the aggregate burden of 3170 tons, built in the state, of which 6 were ships and 5 schooners.

Divisions, Towns, &c.—Rhode Island is divided into five counties, the respective capitals of which, Providence, Newport, Bristol, East Greenwich, and South Kingston, are also the political capitals of the state; the meetings of the general assembly being held at each periodically. Of these, with some of the other more important towns, we give a brief notice: the population is that of 1850:—

Providence, a city, the principal capital, and considerably the largest town in the state, is situated at the head of the navigation of Providence River, 35 miles from the sea, and 394 miles N.E. from Washington; in 41° 49' N. lat., 71° 24' W. long.: population 41,513. The town is built on both sides of the river, and the two parts are connected by bridges. The harbour is safe and convenient, but somewhat difficult of approach. Vessels of 900 tons burden can lie alongside the wharfs. Most of the houses are of wood, but many are of granite and brick, and in the more modern parts of the city many of the houses are both costly and handsome. The chief public buildings are—the state house, of brick; the state prison; the arcade, which is a magnificent doric building 226 feet long, 80 feet deep, and 72 feet high, the body of stone, and the two fronts and the columns of granite; the two halls of Brown university, of brick; the athenaeum; the museum; What-Cheer building; the Dexter asylum, for the poor of Providence; Butler hospital for the insane; the Friends' boarding-school; the first Congregational, St. John's, St. Peter's, Grace, and some other of the churches are handsome buildings. Brown University, originally founded at Warren in 1764, but removed to Providence in 1770, is chiefly under the direction of the Baptists. It has 11 instructors, 252 students, and a library of 32,000 volumes. There are several public schools, and three or four libraries belonging to literary institutions. Providence is a place of great manufacturing industry. There are large cotton- and woollen-factories, worked both by steam and by water-power; extensive bleaching establishments, dye-houses, iron-foundries, machine-shops, brass-foundries, establishments for working in tin, sheet-iron, copper, brass, &c.; marble-works, grist- and saw-mills, glass-houses, carriage manufactories, numerous jewellers' and goldsmiths' shops; besides boot, hat, soap, and several smaller manufactories. But the commercial is greater than the manufacturing importance of the place. The foreign trade, like that of the state generally, has declined, but the coasting trade is extensive; and the whale, cod, and mackerel fisheries afford considerable employment. The transit and retail trades are also very extensive. The city possesses great railway facilities, and constant communication by steam-vessels is maintained with Boston and New York. There are 26 banks in the city. Providence was founded by Roger Williams in 1637.

Newport, the town next in importance to Providence, is situated at the south end of the island of Rhode Island, in 41° 29' N. lat., 71° 18' W. long., 30 miles S. from Providence: population 9563. The situation is very beautiful; the town is built in the form of an irregular semicircle around the harbour, which is one of the finest in the United States. It contains a state-house, custom-house, market-house, 12 churches, several schools, an athenaeum, and other public buildings. There are large cotton and woollen factories. The commerce of the place is less than formerly. Many of the inhabitants are engaged in the coasting trade and the whale and cod fisheries. The harbour,

which can accommodate vessels of the largest size, is defended by two strong forts. The beauty of the situation and the salubrity of the climate have rendered Newport a fashionable bathing-place, and extensive hotels, &c., afford ample accommodation for visitors.

Bristol, on the east side of Narragansett Bay, 20 miles S. by E. from Providence, population 4616, contains a state-house, churches, schools, &c.; has a good harbour, and is much engaged in the coasting trade and fisheries.

East Greenwich, on the western branch of Narragansett Bay, 15 miles S. by W. from Providence, population 2358, has some cotton and woollen-factories, and many of the inhabitants are engaged in the coasting trade and fisheries.

South Kingston, on the west side of Narragansett Bay, 38 miles S. by W. from Providence, population 3807, who are chiefly engaged in the woollen manufacture, in the coasting trade or in the fisheries.

Burrillville, on a branch of the Blackstone river, 20 miles W.N.W. from Providence, population 3538, has extensive water-power, which is applied to the working of several large factories. *Coventry*, on a branch of the Pawtuxet, 14 miles S.W. from Providence, population 3620, is another busy manufacturing town. *Pawtucket*, on both sides of the Pawtucket River, 4 miles N. from Providence, population about 7000, is next to Providence the chief seat of the cotton manufacture of the state. The village contains 12 cotton-factories and 8 banks; also 7 churches. *Scituate*, on the Pawtuxet River, 12 miles W.S.W. from Providence, population 4582, has several cotton-mills; in the neighbourhood are extensive freestone quarries. *Tiverton*, on the east side of Narragansett Bay, 20 miles S.E. from Providence, population 4699, has numerous factories chiefly of cotton goods, and a considerable coasting trade.

Government, History, &c.—The constitution of 1663, under which Rhode Island was governed for nearly two centuries, was in 1844 superseded by a new one. By this the right of voting is vested in every male citizen of the United States (not being a Narragansett Indian) who has resided for 12 months in the state, and for 6 months in the town or city for which he claims to vote, he owning real estate in such town or city worth 184 dollars above all incumbrances, or a clear yearly value of 7 dollars; and every such elector is capable of holding any office for which he is qualified to vote. The legislative body, styled the General Assembly, consists of a Senate of one member for each of the 31 towns [townships] or cities; and a House of Representatives of 72 members. The senators and representatives, as well as the governor of the state, are elected annually. The state has no (admitted) public debt. The total revenue of the state for the year ending April 30, 1854, exclusive of the balance from the previous year, was 136,150 dollars; the total expenditure for the same period was 116,348 dollars. The state militia is composed of 15,969 men, of whom 111 were commissioned officers. For educational purposes the state has a permanent school fund, the interest of which, with that of the deposit fund, and the proceeds of the militia commutation tax in each town, are applied to the support of public schools. The number of school districts is 379; the number of scholars in 1853 was 25,905, of whom 14,086 were males and 11,819 females. The only college in the state is that at Providence, already noticed. A state normal school was established by the legislature in 1854.

The first white settler on Rhode Island was the celebrated Roger Williams, who, in consequence of the severity of the laws against the non-conformists, fled from England to North America, where he arrived on the 5th of February 1631. Williams soon began to preach at Boston, and afterwards at Salem (where he became pastor of a church), in favour of unlimited religious toleration, extended not merely to every sect of Christians, but to Jews, Mohammedans, heathens, and infidels. This extent of toleration was not approved of by the New England churches, and Williams, after some years of controversy and persecution, during which he was more than once obliged to withdraw for awhile from Salem, was eventually banished from the colony. Having refused to submit to the orders of the general court, and there being evident danger of the infection of his opinions spreading very widely, it was resolved to send him to England in a ship then ready to sail. A pinnace was sent to bring him to Boston to embark, but he had fled. It was the depth of winter (January, 1636). "For fourteen weeks he was sorely tossed in a bitter season, not knowing what bread or bed did mean." He wandered towards Narragansett Bay, and was welcomed by the Indians, whose language he had learned. In June 1636, with five companions, he founded his little settlement at the mouth of the Seekonk River. He named the place Providence, as an acknowledgment "of God's merciful providence to me in my distress. I desired," he said, "it might be for a shelter for persons distressed for conscience." On the 24th of March, 1638, the chiefs of the Narragansetts, to whom the territory belonged, made over to him a large domain. This was the foundation of the state of Rhode Island, which was then called Providence Plantations.

A sect of violent Antinomian Calvinists had sprung up in Massachusetts, who became offensive to the government, and its leaders were sentenced to banishment: they were welcomed by Roger Williams, and through his influence and that of Sir Henry Vane, who was then residing in Massachusetts, they obtained from the Narragansetts the island of Rhode Island; and the colony of Rhode Island was thus founded.

The people of Providence Plantations and Rhode Island, excluded from the Colonial Union, had no chance of maintaining a separate existence without the powerful protection of the mother country; and in 1643 Roger Williams was chosen to conduct a mission to England for the purpose of obtaining a charter. The affairs of the American colonies were at this time under the control of the Earl of Warwick as governor-in-chief, assisted by a council of five peers and twelve commoners. Sir Henry Vane was one of these commoners; and chiefly through his influence a charter was granted, dated March 14, 1644, by which the two colonies were incorporated under the title of *Rhode Island and Providence Plantations*. A new charter was granted by the ministers of Charles II. in 1663, which continued to be the constitution of Rhode Island till 1844.

The colony of Rhode Island took part with the other colonies of North America in the resistance to the attempts of the English government to impose the Stamp Act of 1765, and the subsequent measures which led to the declaration of independence. But to the federal constitution she offered a strenuous resistance: Rhode Island was in fact the last of the original colonies to give in her adherence to that measure, having delayed her signature to it till May 1790.

The only subsequent event in the general history of the state was the effort made by a section of the citizens in 1840 to subvert by force the constitution of 1663, in order to adopt one of a more democratic form. In 1841 the suffrage party, as it called itself, rose in arms under one Thomas N. Dorr, whom they had elected as governor and general. A regular 'suffrage government' was organised at Providence, while the constitutional or legal government was carried on at Newport. A convention called by the general assembly framed a new constitution, which was accepted by a majority of the people; but in consequence of the disturbed state of the country it could not be organised. In 1842 Dorr failed in an attempt to seize the state arsenal, and subsequently his forces were defeated at Chepachet and himself captured. The general assembly now appointed another convention for the framing of a constitution which should be acceptable to all parties, and after some little delay the suffrage party gave in their acquiescence. A new constitution was accordingly drawn up and adopted, and peace was restored. Dorr remained in prison for some years, but was eventually released.

RHODES, an island off the coast of Caria in Asia Minor, opposite to Cape Volpe, between the gulfs of Syme and Macri. The harbour of the city of Rhodes is in 36° 28' N. lat., 28° 12' E. long.

Rhodes was inhabited in very early times, and had acquired considerable eminence several centuries before the Christian era. Previous to the first Olympiad B.C. 776, the Rhodians had already manifested a disposition for maritime and commercial enterprise, which subsequently more fully developed itself. They founded the colonies of Rhodé in Ibesia, Gela in Sicily [GELA], Parthenope among the Osci in Italy; and nearer home, Corydalla and Phaselis in Lycia, and Soli in Cilicia. About B.C. 660, the ancient kingly form of government which prevailed in the island, as in other Dorian states, was abolished, and magistrates, called Prytanes, probably substituted. In B.C. 408, the city of Rhodes was founded, by collecting into one spot the inhabitants of Lindus, Ialysus, and Camirus; and from this time the history of the city is identical with the history of the island. In B.C. 357 Rhodes reverted for a short time to the dominion of Athens, against which state it soon after formed a league with Cos, Chios, and Byzantium. It submitted, like the rest of Greece, to Alexander; but having taken a very decided stand, and courageously struggled through the conflicts which took place after Alexander's death, Rhodes became the mistress of the Mediterranean.

The celebrated Colossus of Rhodes was made about B.C. 300. It was begun by Chares, a pupil of Lysippus, and completed by Laches. It was formed of brass; the height is said to have been 70 cubits; the thumb was so large that few men could span it; 12 years were employed in making it. The notion that its legs rested one on each side of the harbour at Rhodes does not seem to be supported by any good authority, and modern travellers do not agree as to its site. After it had stood for 56 years, it was thrown down by an earthquake, by which the buildings of the city suffered very much. Such was the commercial importance of Rhodes, that on this occasion the great princes of the day vied with each other in the munificence of their presents to repair its losses, and came forward with ready zeal to serve a city whose fleets protected the seas against pirates and extended mercantile communication. The Rhodians (B.C. 219), assisted by Prusias, king of Bithynia, compelled the Byzantines to remit the duty which they had been in the habit of exacting from corn ships that passed through the Bosphorus, and shortly afterwards they protected Sinope against Mithridates IV., king of Pontus.

Rhodes joined Attalus, king of Pergamus, in his war against Philip III., king of Macedon. The Romans entered into an alliance with the two powers against Philip. After the defeat of Philip at Cynosephale, B.C. 197, the Rhodians joined Rome in a war with Antiochus, in which their navy was of great service. In gratitude to their new allies, the Romans gave them portions of Caria and Lycia.

From this time the prosperity of the city began to decline. Her recently-acquired continental possessions resisted her sway, and in their struggles appealing from time to time to the Roman senate, gave that body an opportunity of practising their usual policy of interference. In the Mithridatic war the Rhodians gave important aid to the Romans by sea, and were in consequence attacked by the king of Pontus with a great armament, which they defeated. In requital for their fidelity, Sulla at the close of the war confirmed their liberty. Vespasian incorporated this island in a *Provincia Insularum*, of which it was probably the seat of government. Here the ancient history of Rhodes ceases.

The code of laws enacted by the Rhodians in regard to their navy, and adopted afterwards by other maritime states (Dig., 14, tit. 2, 'De Lege Rhodia'), the powers vested in the several branches of their executive administration, their sumptuary statutes, and regulations to protect their poor, all claim especial attention from the student of ancient history. In their most flourishing age, their city, like Alexandria at the same period, was the place of resort of learned men from all countries, and a very similar style of literature sprung up in both places. The spirit of research and critical inquiry was awakened, and great progress was made in mathematics and other sciences.

Besides the celebrated Colossus, 3000 other statues adorned the city, and of these 100, according to Pliny, were on such a scale that the presence of any one of them would have been sufficient to ennoble any other spot. The architecture of Rhodes was of a stately and imposing character; the ground on which it stood sloped gradually to the sea, like the interior of an ancient theatre. The plan designed by the same architect who built the Piræus at Athens, was perfectly symmetrical, as much, Aristides remarks in his 'Rhodian Oration,' as if it had been one house. The streets were wide and of unbroken length, and the fortifications, strengthened at intervals with lofty towers, did not appear, as in other cities, detached from the buildings which they inclosed, but by their boldness and decision of outline heightened the unity and connection of the groups of architecture within. The temples were full of the finest paintings, the works of Protogenes, Zeuxis, and other artists of the school of Rhodes. The celebrated picture of Ialysus, by Protogenes, which was afterwards brought to Rome, was the object of universal admiration. The coins of Rhodes are numerous and of good workmanship.

In the reign of Heraclius (A.D. 616), Rhodes is mentioned among the conquests of Chosroes, king of Persia, but it reverted to the dominion of the Greek emperors shortly afterwards. In the kalifate of Othman, 651, it was taken by Moawiyah, one of his generals, and the fragments of the Colossus, which had been lying on the ground ever since its fall, were collected by the Saracens, and sold to a Jewish merchant of Edessa. It afterwards came again under the sway of the Greek emperors. In the year 1310 Fulke de Villaret, grand-master of the Knights of St. John, made himself master of the island, which became from that time the place of residence of the order, till their final expulsion in the 16th century. Five years after their settlement they sustained a formidable siege from Othman, the Turkish sultan, and, notwithstanding the unprepared state of their fortifications, succeeded in repulsing him, and a few years afterwards his son Orkan. From this period they continued to resist the constantly increasing power of the Turks, for about 200 years, adding to the advantages of a position naturally very strong the most skilfully designed fortifications that could be devised in the 14th and 15th centuries, and making the numerical superiority of the infidels of little avail, by their better organisation in the field, more efficient weapons and armour, and incredible valour. In 1344, in the grand-mastership of Heloon de Villeneuve, they attacked and took Smyrna, which they maintained as an outpost. About 50 years later the order engaged in a league to check the increasing power of Bajazet, and sustained a severe loss at the fatal battle of Nicopolis. In 1401 Tamerlane deprived them of Smyrna. In 1480 Mahomet II. laid siege to Rhodes, and, notwithstanding the immense force of artillery employed against it, could not take the place. The last and most memorable siege of Rhodes was June, 1522, by the Turks, conducted by their sultan Solymán II. The princes of Christendom, thinking probably that it was hopeless to attempt the defence of so distant an outpost, abandoned Rhodes to its fate, and its gallant inhabitants held out till they were nearly buried in the ruins of their fortifications. Their grand-master, Villiers de Lisle Adam, entered into a capitulation in December the same year, and evacuated Rhodes on honourable terms, retiring with his knights to the island of Malta. The island of Rhodes has ever since remained a province of the Turkish empire.

The greatest length of Rhodes, from north to south, is about 36 miles, and its breadth 18 miles. The air is mild and healthy, and fragrant from the number of orange and citron groves and of aromatic herbs. The soil is fertile, producing grapes, figs, and corn. The population has been variously estimated at from 20,000 to 40,000. The inhabitants are governed by a bey, who holds his office for life. The bey farms the revenues and pays an annual sum of half a million of piastres every year to the Porte, besides fitting out a frigate every two or three years. Ship-building is the chief employment of the Rhodians.

Homér mentions three cities of Rhodes—Lindus, Camirus, and Ialysus. These were the three most ancient Doric cities in the

island which flourished long before the foundation of Rhodes. Previous to this event which took place in B.C. 408, *Lindus*, like the other cities, was a small independent state; a great part of its population was removed to the new city, and the town lost its political but not its religious importance. It continued famous for its two ancient sanctuaries, one of Athena, said to have been built by Danaus or his daughters on their flight from Egypt; the other of Hercules, the worship in which was conducted in vituperative language. *Lindus* contained several of the paintings of Parrhasius. It was the birth-place of Cleobulus, one of the seven sages of Greece, whose song of the swallow (which the Lindian boys used to sing in spring), has been preserved by Athenæus. The site is still marked by a town called *Lindos*, a neat little place on the east side of the island. The remains at *Lindos* include many beautiful decorated tombs, a theatre at the foot of the acropolis, and ruins of two Greek temples, one of which is supposed to have been the sanctuary of Athena, above mentioned. Hamilton however ('Asia Minor,' vol. ii. p. 55), says that the building taken for a temple of Minerva was a tomb with a Doric façade excavated in the rock. The harbour of *Lindos* is frequented by small craft; the vicinity of the town produces wine and figs, but little else.

Camirus was also a coast town, and situated on white cliffs, which consist of white scagliola limestone. Hamilton thinks that the site is marked by ancient Hellenic and Cyclopean walls at a place still called *Camiro*, between Rhodes and *Lindos*. There are some more modern ruins on the spot erected by the knights of Rhodes, probably from the materials of ancient structures. No other ancient remains of *Camirus* have been discovered.

Ialysus was situated less than a mile S.W. of the city of Rhodes. It was a mere village in the time of Strabo; the city having decayed in consequence of the rise of Rhodes. The site is now marked by the village of *Ialiso*, about which a few ancient remains exist.

Of the town of Rhodes on the east side and at the northern extremity of the island, there are no remains earlier than the time of the knights, but all their works are interesting specimens of the military architecture of the middle ages. On entering Rhodes from the sea, two harbours, separated by a narrow quay, present themselves; the larger, to the north, is called *Mandraici*, and the smaller is named the *Port*; the narrow quay which separates them forms a curve, having on its extremity next the sea a round tower, and farther inland a square one of great strength and crowned with turrets of observation at the four corners. Attached to it is a curtain, which connects it with the fortification of the town within. From the other side of the smaller port a narrow quay juts out, on which is another round tower. The Turks have suffered the entrance to *Mandraici* to be so much obstructed as to impede the navigation. The buildings of the town exhibit a curious mixture of the European and Saracenic styles.

RHODEZ, properly **RODEZ**, a city of France, capital of the department of Aveyron, 312 miles S. from Paris, is situated in 44° 21' 5" N. lat., 2° 34' 48" E. long., at an elevation of 2073 feet above the level of the sea, and had 8267 inhabitants in the commune at the census of 1851. The town stands on a considerable eminence on the northern bank of the Aveyron, and nearly 500 feet above the bed of the river. It is surrounded by ancient walls, which have been converted into a terraced walk or garden. The streets, from the rapid slope of the hill on which the town is built, are steep; they are also narrow, and lined with ill-built wooden houses with projecting upper stories, which are however being gradually displaced by others of better architecture. There are four 'places,' or squares, two of them of tolerably regular form. The cathedral is built in the gothic style, and dates from the earlier part of the 15th century. The size of the nave, the boldness of the vaulted roof, the beauty of the stained-glass windows, and the height of the bell-tower (to which some writers assign an elevation of above 265 English feet) render it a striking edifice. The office of the prefect is a modern building; the other chief public buildings are the Jesuits' college and the seminary for the priesthood. The inhabitants manufacture woollen-yarn, woollen-frieze, serges, and other woollen stuffs, hats, wax and other candles, and playing-cards. There are tan-yards and dye-houses. The trade of the place is in manufactured articles, in the wool grown in the neighbourhood, and in cheese. There are four yearly fairs. Silk-worms are reared, and mules for the Spanish market are bred round the town. *Rodez* gives title to a bishop, whose diocese comprehends the department. It has several government offices, an exchange, a chamber of manufactures, an agricultural society, an hospital, cabinets of natural history and of natural philosophy, a public library of 15,000 volumes, a deaf and dumb school, a theatre, and public baths. *Rodez* occupies the site of the ancient *Segodunum*, chief town of the *Ruteni*, a Celtic tribe, whose name was afterwards given to it.

RHÔNE, one of the principal rivers of France, takes its rise in Switzerland, in a glacier near the Furka Pass, not far from the St.-Gothard and the source of the Rhine. It runs with a rapid course in a south-west direction through the canton of Valais, in which it receives many small tributaries. After its junction with one of these, named the *Drane*, at *Martigny*, it turns sharply to the north-west, and throws its turbid waters into the Lake of Geneva. Emerging from the south-western extremity of the lake is a clear blue stream,

which however is soon defiled by the muddy current of the *Arve*; it flows south-west through a savage rocky gorge of the Jura, marking out the boundary between France and Savoy. In the contracted portion of its course the Rhône, below *Fort-del-Eoluse*, disappears totally for above 100 yards under a ledge of the rocks, and forms the cascade called *Perte-du-Rhône*. [AIN.] At the south-eastern angle of the department of Ain the Rhône, leaving the frontier, enters the territory of France, and flows with a winding course, but in a general western direction, to the city of Lyon, where it is joined by the *Saône*. From Lyon to the Mediterranean it runs nearly due south, its course still rapid, and its bed obstructed with numerous shifting sand-banks and gravelly islands. In France, besides the *Saône*, it receives the *Ain*, the *Ardèche*, and the *Gard* on the right bank; and the *Isère*, the *Drome*, and the *Durance* on the left bank. Below Lyon it passes several considerable towns—*Vienna*, *Valence*, *Avignon*, *Beaucaire*, *Tarascon*, and *Arles*. After its junction with the *Saône* the Rhône is a noble stream: the scenery along its banks is generally beautiful, in parts striking, and grand. The river, which is of great importance in a commercial point of view, is navigated by numerous steamers from Lyon downwards; owing to the rapidity of the stream the up-navigation is rather tedious, and vessels plying on it must keep a constant look-out, on account of the frequent changes in the bed of the river from the shifting of the sands. Steamers ply on the river above Lyon as far as *Seyssel*, but not regularly. By means of the *Saône*, which is navigated by steamers to *Châlon*, and by canals, the navigation of the Rhône is connected with the *Garonne*, the *Seine*, the *Loire*, and the *Rhine*. At *Arles* the Rhône divides into branches, which inclose the deltoid island of *Camargue*. The eastern arm, called the *Grand-Rhône*, enters the Gulf of Lyon below the *Tour-St.-Louis*, where it has commenced the formation of a new delta. The western arm, called the *Petit-Rhône*, has its mouth a little west of the village of *Saintes-Marie*. [BOUCHES-DU-RHÔNE.] These arms are of little use to navigation; vessels making for the Rhône from the Mediterranean reach the main river by the shore-lake of *Berre* and the *Martigues Canal* from the east, and by the *Beaucaire Canal* from the west. The whole length of the Rhône is about 530 miles, 350 of which are in France. It falls 1000 feet between the Lake of Geneva and the sea. On its banks below Lyon are grown some of the finest wines of France. The *Paris-Marseille railway* runs along its left bank from Lyon to *Arles*.

RHÔNE, a department of France, the smallest except the metropolitan department of *Seine*, is bounded N. by *Saône-et-Loire*, E. by that of *Ain*, S.E. by that of *Isère*, and S. and W. by that of *Loire*. Its greatest length from north to south is about 60 miles; its greatest breadth is 28 miles. Its area is 1077.4 square miles. The population in 1841 was 500,831; in 1851 it amounted to 574,745, giving 533,455 inhabitants to a square mile, or 358,871 above the average per square mile for the whole of France. In density of population the department of Rhône ranks second among the departments of France, being surpassed only by the metropolitan department of *Seine*.

The western side of the department is mountainous; the *Lyonnais*, *Beaujolais*, and *Charolais* heights, which form the prolongation northward of the *Cévennes*, extend through it on this side from south to north. From a point in the north of the department near the town of *Beaujeu* these heights send off two offsets, one (the *Mâconnais* heights) to the north-north-east, which are separated from the principal range by the valley of the *Grône*, a feeder of the *Saône*; and another to the south-south-east, which are separated from the principal range by the valley of the *Azergue*, another feeder of the *Saône*. In the south of the department another offset branches off from the main range, from which it is separated by the valley of the *Brevanne*, and extends north-east to the banks of the *Saône*, north of Lyon; its extremity is known as *Mont-d'Or*, a name which is sometimes given to the whole branch. The extremity of another branch, running to the north-east and separated from the main range by the valley of the *Gier*, just extends into the south of the department. Some of the peaks are of considerable height; the mountain of *Tarare* is, on the north side, about 2600 feet, in the centre nearly 3000 feet, and on the south nearly 4500 feet high. The *Mâconnais* heights have in some places an elevation of above 3000 feet. The principal pass over these mountains is that of *Tarare*, where the road from Paris by *Moulines* to Lyon crosses the ridge. Southward of this are the passes through which run the roads from Lyon to *Feurs* and to *St.-Etienne*; northward of it the only pass in the department is that through which runs the road from *Beaujeu* to *Charlieu*. The road from Lyon along the western bank of the Rhône runs in several places through a narrow pass between the lower slopes of the mountains and the river.

The principal mass of the mountains is composed of granitic or other primary rocks. In the valley of the *Gier* are found the lower secondary formations, while the valley of the Rhône is occupied in the north by secondary and in the south by tertiary formations. The mineral wealth of the department comprises copper-ores and coal. The copper-mines are at *St.-Bel* near *Arbresle* on the *Brevanne*, and at *Chesny* on the *Azergue*. Coal-mines are worked. Rock-crystal, porphyry, granite, fine marble of various colours, sandstone, gypsum, potters'- and fullers'-earth, manganese, and excellent freestone, are found. Some particles of gold are brought down by the Rhône.

There are chalybeate waters at Charbonnières near Lyon, and at Neuville-sur-Saône.

The department is included in the basin of the Rhône, only a small part of the western side being in that of the Loire. The Saône touches the eastern boundary of the department about ten miles below Mâcon; this river and the Rhône form the eastern boundary to Condrieu, adjacent to the southern extremity of the department, except just in the neighbourhood of Lyon, where the department extends across so as to comprehend a portion of the eastern bank of both rivers. The affluents of the Saône are—the Grône, of which only the source and the upper part of the course are in this department; the Ardière; and the Azergue. The Azergue receives the united streams of the Brevanne, or Brevanne, and its feeder the Tardine. The feeders of the Rhône are the Izeron, the Garon, and the Gier, of which last only the lower part belongs to the department. Of the feeders of the Loire, the Sornin, the Trambouze, the Loise, and the Coize have their sources in this department. Of these rivers only the Saône and the Rhône are navigable.

The only canal is that of Givors, which extends along the valley of the Gier from Rive-de-Gier to Givors. The total length of water communication in this canal, the Saône, and the Rhône, amounts to about 80 miles. The department is traversed by 6 imperial roads; by the railway from Paris to Marseille, which passes through Mâcon and Lyon; and by the railway from Lyon to St. Etienne, which is extended down the valley of the Loire to Roanne. From Roanne a new line is authorised to be constructed to Lyon through Tarare.

The climate is healthy, but the temperature varies with the elevation of the surface. The surface may be estimated in round numbers at 690,000 acres, of which about 353,000 acres are under the plough. The banks of the Saône are remarkably fertile, and much wheat is grown there. The grain harvest is abundant, but insufficient to supply the wants of the inhabitants. Pulse, colza, madder, millet, saffron, flax, and hemp are also cultivated. The meadows comprehend 90,000 acres; the heaths and open pastures about 30,000. Neither horses nor oxen are numerous; the number of cows is considerable, approaching 50,000. Sheep are numerous; asses are both numerous and good; and on Mont-d'Or a number of goats are fed, from whose milk good cheese is made. The vineyards occupy above 75,000 acres, yielding annually about 17,000,000 gallons of wine. Some of the finest wines in France are produced here, especially the Côte-Rôtie, Romanèche, Sainte-Foy, and Condrieu. The fruits both of northern and southern France are grown, except the orange and the olive; chestnuts abound, and are sent to Paris and sold under the name of Marrons de Lyon. The mountains are for the most part covered with wood; Mont-Pilat in particular is covered with fine firs; the woodlands occupy about 85,000 acres. Pike, eel, barbel, excellent trout and perch, and other fish are taken in the streams; and the shad, the lamprey, and the sturgeon ascend the Rhône. The eel-pouts of the Saône are excellent.

The industrial products of the department are of great variety and importance. No other spot in Europe is so famous for its silk fabrics as Lyon, which is the centre of the manufacture of the finest satins, taffetas, lutestrings, velvets, lace, brocades, silk-hats, shawls, gauze, ribands, hosiery, &c. Other industrial products are—muslins, handkerchiefs, calicoes, cotton-twist, gold-lace, straw-hats, steam-machinery and mill-work, liqueurs, chemical products, &c. &c. There are also numerous dye-houses, paper-mills, type-foundries, glass-works, potteries, breweries, bleach-works, printing-offices, gypsum-mills, and hydraulic saw-mills. The general commerce in raw and manufactured produce, wine, coal, iron, planks, timber, and provisions of all kinds, is very important.

The department is divided into two arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Lyon	16	128	410,139
2. Villefranche	9	128	164,608
Total	25	256	574,745

1. Of the first arrondissement, and of the whole department, the chief town is Lyon, which forms the subject of a separate article. [LYON.] *Arbresle*, a small place of about 2000 inhabitants on the Brevanne and Tardine, has silk-factories, sico-works, and potteries. *St. Genis-Laval*, 5 miles S. from Lyon, is a handsome little town of about 2500 inhabitants, with a square planted with trees. The townsmen manufacture paper-hangings, paper-stainers' colours, printers' ink, writing ink, buttons, carpets, banners, and paintings for churches. Considerable trade is carried on in wine and cattle. The environs of the town are laid out in gardens and country-houses of the merchants of Lyon. *Givors*, standing at the junction of the Givors Canal with the Rhône, 18 miles by railway from Lyon, is a busy well-built town, with about 8000 inhabitants, situated in a fertile and pleasant district. It has glass-factories and silk dye-works, and a large trade in coal and coke. At *Condrieu*, a town on the right bank of the Rhône, in the south of the department, with a population of about 3500, are manu-

factures of silk and leather; and the inhabitants carry on trade in corn, and the much-esteemed white wines of the neighbourhood. A considerable number are boatmen on the Rhône, and many boats are built here. *Oullins*, a town of about 4000 inhabitants, is situated on the right bank of the Rhône, 4 miles S. from Lyon. In the parish church is a monument to Jacquard, the inventor of the loom that goes by his name.

2. In the second arrondissement the chief town, *Villefranche*, 18 miles by railway N. from Lyon, is situated in 45° 59' 21" N. lat., 4° 48' 19" E. long., 599 feet above the level of the sea, and has 7769 inhabitants in the commune. It was founded near the end of the 11th century by Humbert, Sire de Beaujeu. The town consists of one very wide and handsome street, extending for above a mile along the road from Paris to Lyon, and of some smaller streets branching from it. The houses are well built. The inhabitants manufacture cotton- and linen-yarn, cotton goods, and leather. There is a considerable weekly market for cattle (chiefly for the supply of Lyon), hemp, flax, cotton-yarn, and cotton- and hempen-cloth. Considerable trade is carried on in hides and wine. *Villefranche* has tribunals of first instance and of commerce, a college and hospitals. *Anse*, a small town of about 2000 inhabitants, near the mouth of the Azergue in the Saône, is agreeably situated in one of the richest plains in France, at the foot of a hill covered with vineyards. *Belleville-sur-Saône*, north of Villefranche, has a manufacture of muslins and other cottons, and 2500 inhabitants, who trade in wine. The *Belleville* station is 27 miles N. from Lyon. *Tarare*, a well-built, busy, manufacturing town of about 10,000 inhabitants, situated in a narrow valley at the foot of Mont Tarare, has a commercial chamber and a council of prud'hommes. It is the centre of a manufacture of muslin, embroidery, silks, cotton-prints, merinoes, leather, and earthenware. The neighbouring mountain contains lead-ore, but the mines have been given up; marble is quarried. The town has at times suffered considerably from the swelling of the little river Tardine, on which it stands. *Beaujeu*, the ancient capital of Beaujolais, is a neat town, at the foot of a mountain crowned with the ruins of the old castle of the Sires de Beaujeu. There are cooperages, paper-mills, and tan-yards. A considerable trade is carried on in grain, wines, and iron, and in the cottons and linens manufactured in the district around. It has six yearly fairs. At *Thizy*, a small place of 2000 inhabitants, 20 miles N.W. from Villefranche, linens and cottons are manufactured; and at *Cours*, a large village of 3000 inhabitants, near Thizy, a mixed fabric of cotton and flax is woven. There are twelve fairs at Thizy, which is the mart for the surrounding country.

The department constitutes, with the adjacent department of Loire, the diocese of the archbishop of Lyon-et-Vienne: it is in the jurisdiction of the High Court and within the limits of the University-Academy of Lyon. It belongs to the 8th Military Division, the headquarters of which are at Lyon. It sends four members to the Legislative Chamber of the French empire. The Calvinists have a consistorial church at Lyon and two meeting-houses at Lyon and Tarare. For purposes of higher education there are a lyceum, or college, an academy of sciences, medical and theological schools, a diocesan seminary, and a preparatory ecclesiastical college in Lyon, and a college and normal school in Villefranche.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Annuaire du Commerce; Official Papers.*)

RHUDDLAN. [FLINTSHIRE.]

RHYL. [FLINTSHIRE.]

RHYNDACUS, RIVER. [ANATOLIA.]

RIASAN, or RIASAN (sometimes written *Risan*), is an extensive government town of European Russia, which derives its name from the very ancient town of Riasan, which indeed has long since fallen into ruins, but the name has been transferred to the town of Peralawl. It is situated between 53° and 55° 40' N. lat., 38° 18' and 41° 30' E. long., and is bounded N. by Vladimir, E.S.E. by Tambow, S.W. by Tula, and N.W. by Moskwa. The area is about 16,200 square miles. The population in 1846 was 1,365,900. It is divided into 12 circles. The country is traversed by many small hills and eminences, and the banks of the rivers are high. The surface is diversified with little forests and groups of trees. It is only on the banks of the Don, the Osetr, and the Prona that the elevations are rocky; the other eminences consist of beds of stone, clay, marl, and lime, and are by no means unfruitful. The soil in general is a pretty thick layer of fine black mould. The principal rivers are the Oka, which flows from the government of Moscow, and the Don, which issues from Lake Iwanowskoe, on the frontier, both of which rivers receive smaller streams. In this government, which joins the Bakowa, a tributary of the Prona, is the greater part of the canal which, by uniting the Bakowa with the Lernoï, effects a communication between the Volga and the Don by the Oka and the Woronesh. The intermediate rivers are however only navigable by boats in spring when the water is high. In autumn, winter, and spring the weather is variable, and in summer hot. The climate is healthy.

The soil is on the whole very fertile, especially in the southern part. Rye, wheat, oats, barley, millet, flax, and hemp are cultivated. Corn is raised in sufficient quantities to allow exportation. Horticulture is general; every peasant has his kitchen-garden, where all kinds of Russian culinary vegetables are grown. Most of the peasants grow

hops, which are an article of exportation. Apples and cherries are the fruits chiefly cultivated. The farmers let their pasture-land, which is of considerable extent, to the cattle-dealers of the Ukraine. Few swine are kept, and no domestic poultry except the common barn-door fowl. Bees are very generally kept. Fish abound in the rivers, and great quantities are exported. The minerals are iron-stone, clay, marl, lime, a little freestone, gypsum, vitriol, and sulphur.

The manufactures are few, and chiefly in the towns. The country-people spin thread and worsted yarn, and manufacture coarse linen and woollen cloths, leather, wooden agricultural and domestic implements and utensils, and bast shoes. There are numerous spirit distilleries. Almost all the exports go to Moscow, from which are received in return such commodities as are required, except salt, which is obtained from the banks of the Volga.

The inhabitants are all Russians, except a small number of Mordwines, who live in a few villages; and between 4000 and 5000 Tartars, who live partly in the town of Kasimow, and partly in some villages. The archbishop of Riassan and Saraisk is at the head of the Greek clergy. The Mohammedan Tartars have their imams, mosques, and teachers.

Riassan, the capital of the government (formerly called *Pereslaw Riassanski*), in 54° 58' N. lat., 39° 20' E. long., is situated on the river Trubesch (a branch of the Oka) at its junction with the Lebeda. It is a well-built town with a fortress. It is the residence of the military governor of Riassan and Tambow, of the civil governor and the government authorities, the see of the archbishop, and has a seminary for priests, a gymnasium, the cathedral, and about 20 other churches, a public library, college, a school of drawing and architecture, an hospital, and manufactories of woollen cloth, linen, sailcloth, leather, glass, iron-ware, and needles. The houses and streets are spacious, and present a cheerful appearance, particularly in the centre of the town where is a public garden. The population is upwards of 10,000.

Saraisk on the Osetr has 5000 inhabitants, a citadel, several churches, and a great trade in cattle. There are numerous wide and straight streets, but the public buildings are in a dilapidated condition, and the town appears almost deserted. *Kasimow*, on the Oka and the Babenka, has about 7000 inhabitants, of whom 500 are Mohammedan Tartars, who carry on a great trade in furs. It was a place of considerable importance under the Tartar rule, but is now of little consequence. It contains an ancient mosque, near which is the tomb of Shah Ali.

RICCARTON. [AYRSHIRE.]

RICHBOROUGH. [KENT.]

RICHELIEU. [INDRE-ET-LOIRE.]

RICHMOND, Surrey, a town, and the seat of a Poor-Law Union, in the parish of Richmond, is situated on the right bank of the river Thames, in 51° 27' N. lat., 0° 18' W. long., distant 21 miles N.E. from Guildford, 12 miles W.S.W. from London by road, and 10 miles by the Windsor branch of the London and South-Western railway. The population of the village of Richmond in 1851 was 9065. The living is a vicarage in the archdeaconry of Surrey and diocese of Winchester. Richmond Poor-Law Union contains five parishes, with an area of 4339 acres, and a population in 1851 of 15,900.

The original name of the village was *Schens* or *Scheen*, afterwards altered to *Sheen*. Henry I. had a palace here. Chaucer the poet was clerk or surveyor of the works to the palace of Sheen in the reign of Richard II. In 1499, while Henry VII. was residing in it, the palace was destroyed by an accidental fire. Henry caused it to be rebuilt, and called it Richmond, from his own earldom. Henry died in his new palace in 1509. It was in Richmond palace that Elizabeth died in 1603. The palace was in part demolished by order of the parliament during the period of the commonwealth. The remainder was pulled down in the next century with the exception of some of the offices, which are still standing. The site is now occupied by private houses. The park, which was attached to the palace, is now known as the Old Park: it lies on the north-west and north sides of the village; and extends along the Thames to Kew Gardens, with which it was united by George III. The park now known as Richmond Park is to the south-east of the village. It was inclosed by Charles I., in whose time it was called 'the New Park:' it is about eight miles round, inclosed by a brick wall, and comprehends 2253 acres. The scenery of Richmond park is eminently picturesque. A Carthusian priory, which was established here at an early period, was restored after the general suppression by Queen Mary I., but existed at Richmond only a year.

Richmond is delightfully situated on the side and summit of an eminence on the banks of the Thames, over which there is a handsome stone bridge of five arches, erected in 1777 at a cost of 26,000*l.* Along the brow of the hill is a terrace, commanding a prospect of exceeding richness and beauty; and along the banks of the river are some delightful villas and grounds. Richmond is a favourite place of

resort in summer for the inhabitants of London, with which there is at that season communication several times a day by steam-boats. The town is well paved, and is lighted with gas. The parish church is a plain brick building of modern erection, except the tower, which is of flint and stone, and of perpendicular character. In the church or churchyard are monuments to the poet Thomson, Kean the tragedian, Gilbert Wakefield, Dr. John Moore, and other persons of celebrity. St. John's district church was erected in 1831. There are chapels for Independents, Baptists, Wesleyan Methodists, and Roman Catholics; a Commercial school; several National schools; an Industrial school for girls; two Infant schools; and a Roman Catholic school. On Richmond Hill is the Wesleyan Methodist Theological Institution for the education of young men for the ministry. The building is a very handsome one, 248 feet long by 65 feet deep, with projecting wings; it is in the Tudor collegiate style. There are a literary and scientific institution, a young men's mutual instruction society, a dispensary, and a savings bank. There are market-gardens and nursery-grounds in the vicinity.

RICHMOND, North Riding of Yorkshire, the capital of the extensive baronial liberty of Richmondshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Richmond, is situated in 54° 25' N. lat., 1° 44' W. long., distant 44 miles N.W. from York, 233 miles N.N.W. from London by road, and 240 miles by the Great Northern and York and Newcastle railways. The population of the parliamentary borough of Richmond in 1851 was 4969; that of the municipal borough 4106. It is governed by 4 aldermen and 12 councillors, of whom one is mayor; and returns 2 members to the Imperial Parliament. The living is a rectory in the archdeaconry of Richmond and diocese of Ripon. Richmond Poor-Law Union contains 41 parishes and townships, with an area of 78,589 acres, and a population in 1851 of 13,846.

Alan Rufus, son of Hoel, count of Bretagne, a kinsman of William the Conqueror, who accompanied him in his expedition to England, obtained from William the title of Earl of Richmond, and the estates of the Saxon Earl Edwin, embracing nearly 200 manors and townships, and a jurisdiction over all Richmondshire, about a third of the North Riding. These possessions fell to the crown on Henry, earl of Richmond, becoming king of England by the title of Henry VII. Charles II. bestowed the title of Duke of Richmond on his son Charles Lennox, in whose descendants the dignity continues. The castle is situated on an almost perpendicular rock on the left bank of the Swale, about 100 feet above the bed of the river. The walks around the castle present a succession of varied and romantic scenery. Of the castle, the bold Norman keep is still almost entire; the walls are nearly 100 feet high and 11 feet thick. A small monastery, called the Gray Friary, was founded at Richmond in 1258; of the building only a steeple remains.

Richmond is said to have been a place of good trade for three centuries after the Conquest, but it subsequently declined. The town is lighted with gas, and is well supplied with water. The town-hall is a convenient building; in it the quarter-sessions are held both for the town and the North Riding. It contains a spacious assembly-room. The railway station and bridge over the Swale are handsome structures. The parish church is a gothic building, with portions of Norman character, and consists of a nave, chancel, and aisles, with a tower at the west end. Holy Trinity chapel stands in the market-place. The Wesleyan Methodists, Independents, and Roman Catholics have places of worship. Richmond Free Grammar school was incorporated by Queen Elizabeth. A new school-house has been erected by public subscription in memory of the Rev. Canon Tate, the late head-master. The school has an income from endowment of 270*l.* a year, with six scholarships at Oxford, Cambridge, and Durham, and had 60 scholars in 1854. There are also the Corporation school, in which 50 boys are taught; National and Infant schools; a school supported by Roman Catholics; a scientific society, with a library of 4400 volumes; a mechanics institute, with about 700 volumes in its library; a news-room; a savings bank; and various charities. The market is held on Saturday, and fairs are held five times in the year. A cattle-fair is held on the moor. Iron and bras founding, rope-making, and tanning are carried on. There are several corn-mills. The only manufactory is an extensive paper-mill. Many wealthy families reside in the town, and the country for several miles round is studded with the parks and mansions of landed proprietors. Races are held in the first week of September on the high moor about a mile from the town.

RICHMOND. [CANADA, WEST; VIRGINIA, U.S.]

RICKMANSWORTH, or **RICKMERSWORTH**, Hertfordshire, a market-town, in the parish of Rickmansworth, is situated on the right bank of the river Chess or Cheham, in 51° 38' N. lat., 0° 27' W. long., distant 23 miles S.W. from Hertford, and 18 miles N.W. from London. The population of the parish in 1851 was 4851. The living is a vicarage in the archdeaconry of St. Albans and diocese of Rochester.

The town is irregularly laid out. The parish church, a spacious and handsome edifice, has been recently rebuilt, except the tower. A fine painted window in this church was formerly in the church of St. John in Rouen. There are chapels for Wesleyan Methodists and Baptists, and National and British schools. Flour-mills and mills for the cotton, silk, and paper manufactures are in the neighbourhood.

There is an extensive brewery. Straw-plaiting and horse-hair weaving are carried on. The market-day is Saturday. Fairs are held in July, September, and November. The Grand Junction Canal passes close to the town.

RIDEAU LAKE and CANAL. [CANADA.]

RIDGWELL. [ESSEX.]

RIESENGBIRGE. [GERMANY.]

RIEUPEROUX. [AVEYRON.]

RIE'TI, the ancient *Reate*, once one of the principal towns of the Sabini, and now the chief town of a province of the Papal States, stands on the Velino, 42 miles N.N.E. from Rome, about 1000 feet above the sea, in an elevated plain, which is part of the western highlands of the Apennines, a large tract that projects out of the central chain of the Abruzzo. The elevated region in question formed the country of the ancient Sabini. Before the French occupation of Italy it formed the province of Sabina, which is now called Rieti, from its chief town. This tract begins at the ridge east of Antrodoco, which forms the boundary between the table-land of Aquila, 2500 feet above the sea, the waters of which run by the Pescara to the Adriatic, and the basin of the Velino, or of Rieti, the waters of which run into the Tiber. This mountain region belongs partly to the Papal and partly to the Neapolitan territories. Its length is about 70 miles from north to south, and from the sources of the Nera at the foot of Mount Tetricus, above Norcia, to the sources of the Anio, above Subiaco. Its greatest breadth, from the defile east of Antrodoco, on the road from Aquila to Rieti, to the fall of the Velino near Terni, is about 30 miles. The Nera forms the northern boundary of this mass of highlands, and drains the northern part of them by means of the river Corno, which joins the Upper Nera near Cerreto. The Velino and its affluents drain the central and largest part of the region. The Anio drains the southern part as far as the ridge which divides its basin from that of the Sacco. The Anio falls by a cascade at Tivoli into the lowlands of the Campagna, and thence flows into the Tiber. The two waterfalls of the Velino and Anio are the only outlets by which the waters of the highlands of Sabina find their way westward to the Tiber.

A succession of mountain ridges form the western boundary of the highlands of Sabina on the side of the Tiber, extending from the Anio at Tivoli to the Nera above Terni. The southern part of this range near the Anio is known by the ancient name of Lucretilis, now Monte Genaro; and the northern part, which extends to the Nera, by the name of Mount Canterius, which is seen from the valley of the Tiber towering to the eastward above the towns of Magliano, Calvi, Otricoli, and Narni. The eastern boundary of the region of the Sabini is formed by the lofty ridge of the central Apennines, consisting of the groups of Monte Sibilla, 7200 feet; Mount Terminillo, north-east of Rieti, 7000 feet; and Mount Velino, 8180 feet. Between these two ridges lies the basin of the Velino, the lower part of which forms the plain of Rieti. The *Velino* has its source in the central Apennines, about 15 miles north of Antrodoco, at the foot of Mount Cenatra, not far from the sources of the Tronto, which flows on the opposite or eastern slope to the Adriatic. It flows first southward through a narrow and deep glen until it reaches Antrodoco, where it turns to the west, passing by Civita Ducale and Rieti. Before it reaches the latter town it receives the Salto, or Imele, from the south. The Salto rises near Tagliacozzo, not far from the Lake Fucino, and flows north-west through a secluded but interesting valley called Ciolano, belonging to the Neapolitan territory. This valley abounds in remains of cyclopean constructions, which are supposed to belong to the towns of the aborigines mentioned by Dionysius (i. 14) as destroyed long before his time. The district of Ciolano has acquired a certain historical interest on account of the tragical end of the Cenci, a Roman baronial family of the middle ages, the head of which, Francesco Cenci, was murdered in the castle of Petrella, at the instigation of his wife and daughter, who were put to death after a long trial.

The Velino, after its confluence with the Salto, passes through Rieti, dividing the city from the suburb, and then turning to the north-west receives the Turano also from the south. The *Turano*, the ancient *Telonius*, rises in the Neapolitan territory, in the mountains which border the basin of the Fucino to the westward; it runs in a north-west direction nearly parallel to the Salto, passes by Carsoli on the Via Tiburtina, and after flowing along the eastern base of Mount Lucretilis, enters the plain of Rieti, where it joins the Velino after a course of about 40 miles, the greater part of which lies in the Papal States. It was on the banks of the *Telonius* that the consul P. Rutillius and 8000 men were defeated and killed during the Marsian or Social war.

The plain of Rieti is one of the most delightful spots in Italy. It is covered with plantations of mulberry-trees, vines twining round elms and maple-trees, fields of wheat, Indian corn, beans, flax, hemp, wood, and vegetables of every kind. It is traversed by two clear streams, which unite their waters about three miles below the town of Rieti, whose churches, steeples, and other massive buildings make a fine contrast with the brilliant verdure of the surrounding country. Farther down the river, between the right bank and the base of the Apennines, is a succession of marshes and lakes, the largest of which, called *Piè di Luco*, is about 10 miles in circumference; the banks are very bold and picturesque, but are considered unwholesome. The waters of the lake have an outlet into the Velino. Near this place

the two ridges that bound the plain of Rieti approach near each other, leaving only a narrow gorge through which the Velino flows on a rocky bed with a rapid declivity until it reaches the edge of the terrace, where it falls into the valley of the Nera amidst clouds of mist. The whole perpendicular height from the edge of the rock to the level of the Nera below is about 469 feet. The fall however is broken into two parts, the first of which is perpendicular, after which the water forms a succession of cascades or rapids, until it meets the Nera. A pavilion called 'la Specola,' erected by Pius VI. on a projecting shelf of rock which overhangs the precipice, commands a fine view of the fall and of the valley of the Nera. The cascade, called Della Marmora, has been considered as the finest in Europe, the mass of water being superior to all the Alpine cascades, and the height far superior to the fall of the Rhine at Schaffhausen. A rainbow is often seen hovering on the mist produced by the spray.

The name of Marmora has been given to the mountain from which the river falls, on account of the abundant incrustations, resembling marble, produced by the deposit of the waters of the Velino.

The valley of the Velino is said to have been in very remote times occupied by the Umbri, before that people descended from the highlands of the Apennines into the valley of the Upper Tiber, which has ever since retained the name of Umbria. [ETRURIA.] After the migration of the Umbri, another race of mountaineers from the central parts of the Apennines about Amiternum, near the sources of the Aternus or Pescara, became possessed of the valley of the Velinus; they were known by the name of Sabini, and they spread from thence into the country between the Nera, the Anio, and the Tiber, which they occupied almost as far as the gates of Rome. The Sabini were a remarkable people; their manners were simple, and their habits austere; they had a reputation for good faith and domestic virtue. They were religious, and even superstitious, and their country was famed for omens and prodigies.

The plain of Rieti was almost entirely covered with water, when the consul M. Curius Dentatus, B.C. 240, made a cut through the rock, deepening and widening the outlet for the waters of the Velino, and drained thereby the fields of Reate. In modern times the bed of the Velino above the fall has repeatedly become obstructed by calcareous deposits, and the river has again overflowed the plain; to remedy which Pope Paul III. made a new cut, and Clement VIII. afterwards restored the old one made by Curius.

Reate is said to have derived its name from Rhea, or Cybele, the ancient patroness of the place. Like the rest of the Sabini, Reate was an early and constant ally of Rome, and is mentioned by Livy as having, together with Amiternum, furnished soldiers for Scipio's expedition to Africa. Cicero, in various places, extols the fidelity of the Sabini, and particularly of the people of Reate. In modern times the people of Rieti were among the first to pay voluntary allegiance to the see of Rome as their temporary sovereign. Rieti was often an asylum for the popes in the middle ages, when driven away from Rome by faction or foreign invasion. In 1831 the people of Rieti showed their devotedness to the papal see by repulsing the insurgents from Bologna and the Romagna who were advancing towards Rome.

Rieti is built partly on the slope and partly at the foot of a hill; it is a bishop's see; it has a college and a clerical seminary; it has also manufactures of coarse woollens, silks, glass, and leather. The population amounts to about 10,000, among whom are many wealthy landed proprietors. The town-house, or governor's palace, is a massive building in the highest part of the town, and enjoys a splendid view of the surrounding country. The cathedral was built in the 12th century, but has been repeatedly repaired. There are several churches and convents, which, as well as the episcopal palace, are worthy of notice.

The province of Rieti was formerly united to that of Spoleto, the two forming a province called Spoleto-e-Rieti. It contains 513 square miles, with a population of 77,212 in 1850.

RIEZ. [ALPES, BASSES.]

RIGA (in the language of Livonia, *Rīga*; in that of Esthonia, *Riõlin*), the capital of the government of Livonia, is situated in 56° 55' N. lat., 24° 6' E. long., on the right bank of the Düna, about 5 miles above its entrance into the Gulf of Riga. The width of the river and the distance of the town from the sea make the port very spacious and secure, and the merchantmen come up to the quays. In summer a bridge of pontoons, loosely attached to piles, and rising and falling with the tide, is laid across the river; this bridge is a pleasant and fashionable promenade in the summer time. The central boats are moveable, to allow the passage of vessels. The town is surrounded with ramparts and bastions, and is otherwise strongly fortified, the fortifications having been materially strengthened and added to in 1854 and 1855, and defences were erected at the mouth of the river. Besides the town itself there are one suburb within the palisades, and two more distant suburbs on the left bank of the Düna. There are three gates towards the country and four towards the Düna. The streets are narrow and crooked, and the town dark and gloomy. Before the palace is a spacious parade, in which the merchants erected in 1817 a granite column 23 feet high, surmounted by a bronze statue representing the goddess of Victory, 9 feet high, in memory of the repulse of a French force by the citizens of Riga in 1812. Of the Lutheran churches, the most remarkable are the large and lofty

cathedral, attached to which is a quadrangle surrounded with cloisters, and which contains the museum and the public library of 18,000 volumes; and St. Peter's church, which has a fine tower commanding an extensive prospect. There are also several Greek, Calvinist, Livonian, and Roman Catholic churches. The other public buildings are—an imperial palace, with an observatory; the residence of the civil governor; an ancient palace, partly used as the residence of the military governor, and partly serving for barracks; the exchange, erected in 1812; the assembly-house of the estates of Livonia; the arsenal; the hospital of St. George; the Catherinenhof, a bomb-proof warehouse 445 feet in length; and a theatre. There are numerous literary and useful institutions, as the gymnasium, the Economical Society, the Society for the Study of the History and Literature of the Baltic Provinces, the cathedral school, and the commercial bank. The population is about 60,000, of whom about one-half are Protestants, chiefly Germans and their descendants, and the remainder are mostly Livonians.

The town of Riga was founded about the year 1200, by Albert, the third bishop of Livonia, Christianity having been introduced in the middle of the 12th century, by Meinhard, a monk of Bremen, who was ordained by the Pope as first bishop of Livonia. The founder granted it several privileges and a considerable extent of territory. The city, which was at that time a colony of Germans, soon became rich and powerful, and in the 13th century joined the Hanseatic League, and its commerce was the source of such great wealth that the power of the city and the pride and luxury of the inhabitants became proverbial. At the beginning of the 16th century it belonged to the Teutonic knights, who were obliged to submit to Poland in 1561. In 1621 it was besieged and taken by Gustavus Adolphus. In 1710, after a vigorous defence, it was taken by Peter the Great, when half the town was in ruins, many hundreds of the inhabitants had perished by the enemy's fire, and 20,000 had been carried off by the plague during the siege. In the siege of 1812, the suburbs were burnt, and also 200 houses in the town itself, and 1500 inhabitants perished. The suburbs have been rebuilt, and are much handsomer than before. The town has suffered several times by fires and inundations. Riga is next to St. Petersburg the greatest emporium of foreign commerce in the empire. The exports consist of fish and of the great staple articles of Russian produce, corn, timber, flax, hemp, hemp-seed, flax-seed, tallow, Russia leather, and sail-cloth. During 1849 the quantity of flax exported from Riga amounted to 44,700 tons. The number of ships which arrived at the port in 1849 was 1749; the number which left was 1677. Riga has several sugar-refining houses, and considerable manufactures of woollen and cotton fabrics, tobacco, starch, looking-glasses, and iron-ware. The construction of a railway from Riga to Dunaburg has been recently authorised by the government. [LIVONIA.]

RIGNAC. [AVEYRON.]

RIMINI. [FORLÌ.]

RINGWOOD, Hampshire, a market-town, and the seat of a Poor-Law Union, in the parish of Ringwood, is situated on the left bank of the river Avon, in 50° 50' N. lat., 1° 47' W. long., distant 27 miles S.W. from Winchester, 92 miles S.W. by W. from London by road, and 104 miles by the London and South-Western railway. The population of Ringwood parish in 1851 was 3928. The living is a vicarage in the archdeaconry and diocese of Winchester. Ringwood Poor-Law Union contains five parishes and townships, with an area of 16,425 acres, and a population in 1851 of 5465. The town is lighted with gas. The manufacture of thread and woollen gloves employs some of the inhabitants. The chancel and transepts of the parish church appear to have been erected about 1230; the nave and the tower are more recent. There are chapels for Wesleyan Methodists, Independents, and Unitarians, and National schools. There is an excellent corn-market, held every Wednesday. Fairs for horses and cattle are held on July 10th and December 11th.

RINTELN. [HESSE-CASSEL.]

RIO GRANDE DEL NORTE. [BRAZIL.]

RIO JANEIRO. [JANEIRO.]

RIO NEGRO. [NEW GRANADA.]

RIOBAMBA. [ECUADOR.]

RIOJA, LA, one of the provinces of the Argentine Confederation, comprehends the country between the Gran Salina and the Andes, and extends from north to south from 28° to 31° S. lat. It is bounded S. by the provinces of San Juan and San Louis, E. by Cordova, N.E. and N. by Catamarca, and W. by the republic of Chili. The area is about 5850 square miles. The population is variously estimated at from 18,000 to 25,000.

The country is described generally under ARGENTINE CONFEDERATION. It consists of a narrow strip of cultivable land along the eastern base of the Sierra de Velasco, the two valleys of Famatina and Guandacol, and a pastoral tract extending round the southern extremity of the Sierra de Velasco. Only the northern districts of the country east of the Sierra Famatina are fit for agriculture. The province is by its position almost cut off from intercourse with the more civilised parts of the Confederation. The roads leading to La Rioja are mere circuitous paths, hardly passable by mules, and the country is altogether in the most backward condition. The province is divided into four departments—Arauco, Famatina, Guandacol, and the Llaños. Arauco

GEOG. DIV. VOL. IV.

lies east of the Sierra de Velasco, and produces wheat, maize, and cotton; but its principal wealth is its vineyards. From 7000 to 10,000 barrels, of 16 gallons each, of a strong sweet wine, and 100 barrels of brandy, are annually made, nearly the whole of which is exported to Cordova and the neighbouring provinces. The capital, La Rioja, is also that of the whole province. Famatina lies to the west of Arauco, between the Sierra de Velasco and the Sierra Famatina. It contains rich orchards in its northern districts, and makes and exports about 6000 barrels of wine annually. This department takes its name from the Sierra Famatina, celebrated for its mineral wealth. The silver-mines of Famatina are very rich, but the remoteness and inclemency of their situation—they being above the line of vegetation, and only accessible by difficult mountain-paths—have hitherto prevented them from being worked except on a small scale. The capital, Chilceto, is a place of no importance. Goitre prevails to a fearful extent in the valley of Famatina. Guandacol lies between the Sierra Famatina and the Andes, and produces very rich crops of wheat. It is thinly inhabited, and chiefly by aborigines, who hunt the vicuña in the adjacent mountains. The wool of the vicuña is the only article of export. Guandacol, the capital, and Vinchina are the only towns. The Llaños consist chiefly of a desert plain, containing a great number of grassy oases, on which there are numerous cattle-farms. About 20,000 head of cattle are annually reared. Like the other provinces of the Argentine Confederation, La Rioja is a federal state, owning a qualified dependence upon the central government. The state government is nominally vested in a governor and a municipal junta of five members.

La Rioja, the capital of the state, is situated at the foot of the Sierra de Velasco, in 29° 12' N. lat., 59° 50' W. long. It contains some substantial houses, a few public buildings, the only school in the province, and about 3000 inhabitants.

RIOM. [PUY-DE-DÔME.]

RIONERO. [BASILICATA.]

RIONI, RIVER. [PHASIS.]

RIPABTANSONE. [FERMO.]

RIPLEY. [DERBYSHIRE; YORKSHIRE.]

RIPOLL. [CATALUÑA.]

RIPON, West Riding of Yorkshire, a market town, municipal and parliamentary borough, and the seat of a bishopric, in the parish of Ripon, is situated on the right bank of the river Ure, in 54° 8' N. lat., 1° 32' W. long., distant 23 miles N.W. from York, 212 miles N.N.W. from London by road, and 215 miles by the Great Northern and Leeds Northern railways. The population of the borough in 1851 was 6080. The borough is governed by 4 aldermen and 12 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The livings are perpetual curacies in the archdeaconry of Richmond and diocese of Ripon.

When Eata, abbot of Melrose, founded a monastery here in 661, there were only 30 houses in the town. A few years after, Aldfrid, king of Northumbria, gave the monastery to Wilfred, archbishop of York. The town was made a borough in 886 by Alfred the Great. The town suffered reverses in the wars against the Northumbrian Danes, in the devastations of the Normans, and in the invasion of Robert Bruce. Henry IV. fixed his residence here when he was driven from London by the plague.

The collegiate church of Ripon, commonly called the minster, now the cathedral, is dedicated to St. Peter and St. Wilfred; it is parochial as well as collegiate. Many parts of it are very fine, especially the west front, which is a bold and good example of the early English style. The first stone of the present building was laid in 1331, but the choir was probably not finished till 1494. It is considered to be one of the best-proportioned churches in the kingdom. Its length from east to west is 266 feet 5 inches, the transept is 132 feet long, the nave and aisles are 87 feet broad, and the choir and aisles 66 feet 8 inches broad. It has two uniform towers at the west end, each 110 feet high, besides the great tower, called St. Wilfred's tower. The breadth of the west front is 43 feet, or, including the two towers, 102 feet. Under the chapter-house is a crypt, believed to be of Saxon date; it contains an immense collection of human remains in good preservation, piled in regular order round the walls. Trinity church was built and endowed in 1826, at a cost of 13,000*l.*, by its first incumbent, the Rev. Edward Kilvington. It is a cruciform structure, in the early English style. The Wesleyan and Primitive Methodists and Independents have places of worship. The Free Grammar school, founded in 1553 by Philip and Mary, has an income from endowment of nearly 600*l.* a year; the number of scholars in 1854 was 55. There are National and Infant schools, a Blue-Coat school, and a Wesleyan Training school. St. Mary Magdalene's hospital, founded by Archbishop Thurstan in 1144, is divided into six dwellings for poor widows, who receive a small annual stipend. In the hospital of St. Anne eight poor women are similarly maintained. The public rooms, erected in 1834, comprise a dispensary, a mechanics institute, a subscription library, and a news-room.

Ripon was once celebrated for its manufacture of spurs, which were in such high repute, that 'as true steel as Ripon rowels' became a proverbial expression to denote honesty and courage; it was also once noted for its woollen manufactures. Saddle-trees are now largely manufactured in Ripon. Tanning, malting, and iron and brass

founding are carried on. There are several flour-mills and varnish manufactories. There is a manufactory of steam-engines, water-wheels, and engine-boilers. The market-place is a spacious square, surrounded chiefly by shops and good houses; in the centre stands an obelisk 90 feet high, which is surmounted by the arms of Ripon, a bugle-horn and a spur-rowel. On the south side of the market-place is the town-hall, built in 1801. The streets are well paved, and lighted with gas. There is a good supply of water. A county court is held. The market is on Thursday. Six fairs are held annually, chiefly for leather, cattle, and cloth. Near the town the river Ure is crossed by a handsome bridge of 17 arches. The Ure navigation was brought up to the town by means of a short canal in 1787.

The diocese of Ripon was formed in 1838 from the dioceses of York and Chester. It is in the province of York, and extends over a great part of the West Riding, and over the liberty of Richmondshire in the North Riding. It is divided into the archdeaconries of Richmond and Craven. The chapter consists of the dean, the two archdeacons, six canons, a chancellor, and two minor canons. The income of the bishop is fixed at £5000. annually.

RISBOROUGH. [PRINCE'S RISBOROUGH.]

RISBRIDGE, a hundred in the county of Suffolk, which gives name to a Poor-Law Union. Risbridge Union contains 26 parishes, of which five are in the county of Essex, the remaining 21 being almost all in Risbridge hundred, Suffolk. The area of the union is 53,572 acres; the population in 1851 was 18,117.

RISING-SUN. [INDIANA.]

RIVE-DE-GIER. [LOIRE.]

RIVES. [ISÈRE.]

RIVESALTES. [PYRÉNÉES-ORIENTALES.]

RIVOLI, a town in Piedmont, situated about 10 miles W. from Turin. A wide and straight avenue, lined with fine elm-trees, leads from Rivoli to the capital, through a rich plain irrigated by canals. Rivoli has 5000 inhabitants, and a royal palace situated upon a height.

There is another Rivoli which is in the Austrian province of Verona, on the right bank of the Adige, and is celebrated for the victory gained by the French over the Austrians January 17, 1797. General Massena obtained afterwards, under the empire, the title of Duke of Rivoli.

ROANNE. [LOIRE.]

ROBERTSTOWN. [KILDARE.]

ROCHDALE, Lancashire, a market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of Rochdale, is situated on both sides of the river Roch, in 53° 38' N. lat., 2° 10' W. long., distant 48 miles S.E. from Lancaster, 198 miles N.W. by N. from London by road, and 200 miles by the North-Western and Lancashire and Yorkshire railways. The population of the borough in 1851 was 29,195. The affairs of the town are managed by Improvement Commissioners. The borough returns one member to the Imperial Parliament. The living is a vicarage in the archdeaconry and diocese of Manchester. Rochdale Poor-Law Union contains six townships, with an area of 40,340 acres, and a population in 1851 of 72,515.

Rochdale is called Reodham in the Domesday Survey. In the time of Edward III. some Flemings introduced the woollen manufacture into the parish; and two centuries afterwards, in the reign of Elizabeth, it was still famous for its woollens. In 1610 there were five fulling-mills established on the Spodden, or Spotland brook, in this parish.

The town has been considerably improved of late years. The houses are chiefly of brick; some of the best are built of freestone quarried in the neighbourhood; they are commonly covered with stone instead of slates. The streets are well paved, and lighted with gas; and the town is supplied with water from four reservoirs. The old stone bridge of three arches over the Roch has been widened and improved; about a quarter of a mile below it is another stone bridge of one arch, and just above it an iron bridge for foot passengers. The parish church, which occupies an elevated site, was built in the 12th century. It is partly of late Norman and partly of the perpendicular style. St. Mary's church, a plain brick building, was built in 1740 as a chapel of ease to the parish church. St. James's church was built in 1814. The Wesleyan and Association Methodists, Baptists, Independents, the Countess of Huntingdon's Connexion, Primitive Methodists, Quakers, Roman Catholics, and Unitarians, have places of worship. The Grammar school, founded in 1565, had 9 scholars in 1854, of whom 1 was free. There are National, British, Infant, and Charity schools, and a school supported by the Society of Odd Fellows. A literary institute connected with the Established Church, an Athenaeum, a people's institute with libraries and reading-rooms attached, a temperance-hall, and a dispensary are in the town. The town-hall, a neat building, is also used as a news-room. There is a commodious jail, called the New Bailey. A county court is held in the town.

The manufactures of Rochdale are in a prosperous condition, and are rapidly increasing in importance: they comprehend woollen goods, as baize, flannels, coatings, and friezes; and strong calicoes and other cotton goods; but the woollen fabrics form the staple. Coal is dug, and slates, flagstones, and freestone are abundantly quarried in the parish. There are several hat-manufactories, cotton-spinning mills, iron and brass foundries, and machine factories. There are two markets: on Monday for manufactured goods, wool, oil, dye-stuffs,

and grain; and on Saturday for provisions. Fairs are held for cattle, horses, and pedlery on May 14th, on Whit-Tuesday, and on November 7th. The Rochdale Canal, which unites the Duke of Bridgewater's Canal at Manchester with the Calder and Ribble navigation near Halifax, passes at a short distance south-east from the town.

ROCHE-BERNARD. [MORBIHAN.]

ROCHEFORT. [CHARENTE-INFÉRIEURE.]

ROCHEFOUCAULT. [CHARENTE.]

ROCHELLE. [CHARENTE-INFÉRIEURE.]

ROCHESTER, Kent, an episcopal city, a municipal and a parliamentary borough, is situated on the right bank of the river Medway, immediately adjacent to the parliamentary borough of CHATHAM, with which it forms one continuous town, in 51° 23' N. lat., 0° 30' E. long., distant 8 miles N. from Maidstone, 29 miles E.S.E. from London by road, and 31 miles by the North Kent branch of the London and South-Eastern railway. The population of the city in 1851 was 14,938. The borough is governed by 6 aldermen and 18 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry and diocese of Rochester.

Rochester probably existed antecedently to the Roman invasion. By the Romans it was called Durobriva. During the independence of the Saxon kingdom of Kent it was of importance both as the seat of a bishopric (established about 604) and as a place of strength, situated at the passage of the Medway. It was destroyed by Ethelred, king of Mercia, in 676, and by the Danes in the time of Ethelwulf, in 839; it was besieged again by the Danes in 885, but relieved by Alfred, who drove the invaders to their ships. At various periods from the 10th to the 18th century Rochester city and its castle, which had been built or repaired by the Conqueror, were the objects of hostile attack and siege. Three times in the 12th century the city was nearly destroyed by fire. In the rising of the commons under Wat Tyler, the castle was assailed. Edward IV. was the last king who paid any attention to the repair of the castle. James II. embarked at Rochester when he fled to France after his abdication, in 1688.

The town consists of several streets irregularly laid out; the principal street leads from the bridge at the west end of the town into Chatham on the east side. On the left bank of the Medway is Strood, which is united with Rochester by the bridge. Rochester, Chatham, and Strood thus form in effect one town: they are commonly spoken of in the locality as 'the three towns.' The streets are lighted with gas and paved, and the houses are of respectable appearance. The environs are extremely pleasant, and in the outskirts of the town are some handsome villas, and rows of neat modern houses, built on the higher ground which rises from the low margin of the river.

The cathedral is situated on the south side of the High-street within the ancient Priory gate. It consists of a nave with side aisles, a choir (the floor of which is raised 10 steps above the floor of the nave), a principal transept, at the junction of the nave and choir, and a smaller transept at the east end of the choir. At the intersection of the principal transept is a central tower, erected in 1825; at the western end of the church there appear to have been originally four low towers, two on each side the doorway and two at the extremities; of these only two now remain, which are different in style. On the north side of the choir, between the two transepts, but nearer to the principal one, is a low square tower, now in ruins, called Gundulph's tower. The dimensions of the building are as follows:—Length of the nave 150 feet; breadth with side aisles 66 feet; length of the choir 156 feet; making the total length of the church 306 feet; length of the principal transept 122 feet; of the smaller transept 90 feet; area of Gundulph's tower, inside, 24 feet square; walls of Gundulph's tower 6 feet thick. Extent of the west front of the cathedral 81 feet. The chapter-house is in ruins; a mean building, erected in the place of it, serves for chapter-house and library. The nave is part of the structure of Bishop Gundulph, who rebuilt the cathedral, near the close of the 11th century, on the site of the previous structure, said to have been founded in 604, when the diocese was constituted. The west front is a good specimen of enriched Norman architecture; but the great west window is an insertion of perpendicular character, as are most of the other windows of the nave. The nave has Norman piers and arches, except in the part nearest the choir, where the arches are early English. The roof of the nave is now flat, but there are indications that it was intended at first to be vaulted. Most of the eastern part of the church is of plain early English architecture. The roof of the choir and of both transepts is vaulted and groined. The pillars of the choir are of Petworth marble. The crypt is very spacious, extending under the buildings of the choir; its character is early English, scarcely differing, in one part, from Norman. There are several chapels, in one of which the bishop holds his consistory court. The interior of the cathedral was about the year 1842 repaired and in many places restored by the dean and chapter at an expense of about 14,000*l.*

There are two parish churches in Rochester, St. Margaret's, which was rebuilt in 1824, and St. Nicholas', erected in 1624. The Wesleyan Methodists, Independents, Quakers, and Jews have places of worship. The Cathedral Grammar school, founded in 1542, has an income of 598*l.* 6*s.* 8*d.* a year. It has four exhibitions at Oxford or Cambridge, and two restricted to University College, Oxford. The number of scholars in 1854 was 62, including 20 free scholars; each of the free

scholars receives 16*l.* 13*s.* 4*d.* a year from the endowment. Sir Joseph Williamson's Free Mathematical school, founded in 1703, is free to the sons of freemen of Rochester. It has an income from endowment of about 600*l.* a year, and had 47 scholars in 1854. There are National and British schools, a dispensary, and a savings bank. Watts' Charity for Poor Travellers provides entertainment and a night's lodging for wayfarers. This charity has an endowment of about 3000*l.* a year, which is applied in part for the benefit of the local poor.

The bridge at Rochester in the time of Henry I. appears to have been of wood, with 10 arches or spaces between the piers, and a total length of about 431 feet. A stone bridge of 11 arches, 560 feet long, with a stone parapet and balustrades, was completed in the reign of Richard II. Near this bridge, but a little lower down the river, is a new bridge, chiefly of iron, constructed by Messrs. Fox and Henderson, from designs by Sir William Cubitt. There are three lofty arches; the centre arch, 50 feet in span, opens at the crown to allow large vessels to pass without lowering masts. The approaches to the bridge rest on a series of brick arches. The castle is on the bank of the Medway, just above the old bridge. The outer walls inclosed a quadrangular area nearly 300 feet square, and are, with their towers, now in ruins. The keep, a massive square building, is yet standing, with a tower at each angle rising 12 feet above the rest of the building; three of these towers are square, that at the south-eastern angle is round. On the north side is another tower, through which was the entrance; it joins the keep, and rises about two-thirds of its height. The walls of the castle are of great thickness, built of Kentish ragstone, and cemented with a grouting or mortar, equal to the stone itself in hardness. The architecture is Norman, except perhaps the round tower at the south-eastern angle.

The other public buildings are, a commodious town-hall, with a market-house beneath, and a small jail adjacent; a clock-house, built by Sir Cloudesley Shovel on the site of a former town-hall; a neat theatre; and the bridge chamber or record-room, opposite the east end of the bridge. There are some remains of the city walls; and part of the fortifications of Chatham are within the city.

Frindsbury, which forms part of the borough of Rochester, consists chiefly of one long street. The church is on an eminence commanding a very fine prospect. The Wesleyan Methodists have a chapel, and there are National schools. Upnor Castle, erected by Queen Elizabeth, on the Medway, is in Frindsbury parish: it consists of an oblong central building, with a round tower at each end, and is surrounded by a moat; it has been occasionally used as a powder magazine.

There are no manufactures in Rochester. The chief source of its prosperity is the trade supplied by the government establishments at Chatham and Strood. Trading vessels come up to the bridge, where they discharge their cargoes, chiefly coals, which are conveyed up the river in small craft. The oyster-fishery is carried on with great activity under the direction of the corporation. Considerable quantities of oysters are sent to London or exported to Holland; shrimps also are sent to London. The number of vessels registered as belonging to the port of Rochester on December 31st, 1853, was, under 50 tons, sailing-vessels, 324, tonnage 10,091; steamers 4, tonnage 154; above 50 tons, sailing-vessels 62, tonnage 7745; and one steam-vessel of 62 tons. During 1853 there entered the port, 2453 vessels of 204,791 tons; and there cleared 974 vessels of 38,137 tons. During the year 41 steam-vessels entered, of 2945 tons. There are two weekly markets, one on Tuesday for corn, and one on Friday for provisions; and there is a monthly cattle-market. Fairs are held on May 30th and December 10th. Quarter sessions and a county court are held in Rochester. The city has returned members to parliament since the reign of Edward I.

The diocese of Rochester includes the city and deanery of Rochester, the county of Essex except 10 parishes, and the whole of Hertfordshire. The number of benefices is 562. The diocese is in the province of Canterbury, and is divided into the archdeaconries of Rochester, Essex, Colchester, and St. Albans. The chapter consists of the dean, the four archdeacons, five canons, a chancellor, and five minor canons. The income of the bishop is fixed at 5000*l.*

ROCKCORRY. [MONAGHAN.]

ROCKFORD. [ILLINOIS.]

ROCKINGHAM. [NORTHAMPTONSHIRE.]

ROCKY MOUNTAINS is a term usually applied to an extensive mountain system in North America, corresponding in a measure to that of the Andes in South America. Believing that this term has too general a signification to be with propriety applied to a particular system, some geographers have proposed to call the North American range the *Chippewyan Mountains*, but this designation has not come into common use. Though farther inland than the Andes, the Rocky Mountains are like them much nearer to the Pacific than to the Atlantic Ocean. It was formerly supposed that these mountains were only a continuation of the Andes, the two mountain regions being connected by a chain which traversed the Mexican Isthmus. But it is now known that two depressions intervene between the Andes and the

Rocky Mountains on the Isthmus of Panama and on that of Nicaragua. [ANDES.]

This mountain system, which is noticed generally under AMERICA, vol. i. col. 284, may be divided into three parts—the Southern, Central, and Northern Rocky Mountains. The Southern extends from 19° to 40° N. lat.; the Central from 40° to 49° N. lat.; and the Northern from 49° to 70° N. lat. The whole length is about 5000 miles.

The *Southern Mountains*, about 22° N. lat., divide into several ranges, which are described under MEXICO. The most easterly ranges belong to TEXAS. That part of the Southern Mountains which extends from 34° to 42° N. lat., has a breadth of from 50 to 100 miles. The mountains rise abruptly from the plains to the east of them, towering into peaks of great height, which are visible at the distance of more than 100 miles east of their base. They consist of ridges, knobs, and peaks variously disposed, among which there are many wide and fertile valleys. The more elevated parts of the mountains are covered with perpetual snow, which gives them a luminous, and at a great distance even a brilliant appearance, whence they have derived the name of the 'Shining Mountains;' and some of the loftiest summits are more than 11,000 feet above the sea-level. This part of the range is described under NEW MEXICO. Here occurs, near 36° N. lat., the most frequented pass over the Southern Rocky Mountains, being that of the great overland route from Missouri to Santa Fé in New Mexico and the country westward. Some distance south of this, near the boundary of Mexico and the United States, is another much-frequented pass, that of the Paso del Norte.

The *Central* portion of the Rocky Mountains, extending from 40° to 49° N. lat., appears to consist in its southern part of two, but farther north of three or four, distinct ranges. These ranges are loftier and more difficult of transit than any other part of the system. The only really practicable pass is that known as the Great South Pass, near 42° N. lat., over which flows the great stream of emigration to Utah and California. The mountains of the central range are however of very unequal elevation; they present rather the appearance of extensive groups than regular ranges, and are here and there overtopped by high peaks, among which some rise more than 13,000 feet above the level of the sea. Fremont's Peak, north of the Great South Pass, is 13,570 feet high. [NORTH-WEST TERRITORY; WASHINGTON TERRITORY.] The higher parts of the ranges consist of granite, and are bleak and bare, being nearly destitute of vegetation, but many of the inferior ridges are scantily clothed with scrub pines, oaks, cedar, and furs. In some places these mountains have traces of volcanic action. On the eastern side of this region originate the numerous rivers by whose confluence the Missouri is formed, besides its first great confluent the Yellow Stone River, which receives the waters of the Big Horn River, and the Nebraska or Platte River. The great velocity with which the Missouri flows through all its course, and the numerous falls on its upper branches, together with the severity of the climate, favour the supposition that the base of this hilly region is at least 5000 feet above the sea-level. On the western side of this part of the Rocky Mountain system originate most of the upper tributaries of the Oregon or Columbia River.

The *Northern* section of the Rocky Mountains extends from 49° N. lat. to the Arctic Ocean west of the mouth of the river Mackenzie, a distance of about 2000 miles, and is described generally under AMERICA and HUDSON'S BAY TERRITORIES. The direction of the Rocky Mountains here is nearly due north-west. The southern portion, between 49° and 55° N. lat., seems to be the highest part of the whole range. Most of the summits are covered with snow all the year round. Mount Hooper is 15,690 feet and Mount Brown nearly 16,000 feet high; these two summits are between 52° and 53° N. lat. On their eastern declivities rise the northern fork of the Saskatchewan and the river Athabasca, and from the western descend the rivers that form the northern fork of the Oregon River. There are two passes over this portion of the Rocky Mountains: the more southern is near 52° 30' N. lat.; the northern occurs near 53° 30' N. lat., between the Red Deer River, a branch of the Athabasca, and the northern branch of the Columbia River; but these passes are only practicable from the end of June to the middle of September, when they are crossed by the agents of the Hudson's Bay Company, who bring the furs collected in the countries west of the Rocky Mountains to their establishments on the east of that range.

Farther north, between 56° and 57° N. lat., the Peace River breaks through the eastern range of the mountains, its upper course being in a valley between the two principal ranges, which appear to be here of nearly equal height: both of them contain summits which are always covered with snow; their height above the sea-level however seems to fall short of 5000 feet. The western range, which is about 200 miles from the Pacific, constitutes the watershed between the rivers which run east to the Atlantic and west to the Pacific. North of 57° N. lat. the mountains appear rather to sink lower than to rise. As far north as 62° N. lat. they seem to occupy a much greater width, and consist of three or more nearly parallel ranges, and the watershed between the rivers which fall respectively into the Atlantic and Pacific is advanced much more to the west. The Turnagain River, which after having left the mountain region assumes the name of the Southern Branch of the Mackenzie, rises on this watershed, and breaks through two ranges of mountains before it reaches the great plain east of the Rocky

Mountains. Between the ranges which fill up this immense tract of country there are low tracts, which however are partly covered with water. It is said that about one-sixth of the entire surface of this region consists of extensive lakes.

Between 62° and 69° N. lat., the eastern ranges of the Rocky Mountains approach the valley of the Mackenzie River. Dr. Richardson says that they appear to consist of short conical peaks, scarcely rising 2000 feet above the river. Lateral ridges project from their sides, which stretch south-south-west and north-north-east, being nearly at right angles to the general course of the great range, to which they belong. Their bases are from one to two miles wide, and their eastern slopes present a succession of precipices, with shelving acclivities beneath them, formed of débris, and exhibit on their faces regular lines of stratification. The valleys which separate these ridges and open upon the river, are narrow, with level bottoms, but very steep sides well clothed with trees. One of these ridges presents towards the river a very precipitous descent, 1200 feet high, which extends for at least 15 miles. A large portion of this mountain region is drained by the Peel River, which breaks through the eastern ridge near 67° 40' N. lat.; at its junction with the Mackenzie River the Peel is of considerable size, and brings down a great volume of water.

The most northern portion of the Rocky Mountain system to its termination on the shores of the Arctic Ocean consists of several parallel ridges. Between the embouchure of the most western arm of the Mackenzie River (137° W. long.) and 146° W. long., four distinct ridges are seen from 12 to 25 miles from the shore. At their northern extremity they are separated by valleys about 20 or 30 miles wide. The summits of the two eastern chains, called Richardson Chain and Buckland Chain, are lower, being free from snow in summer, but the two western, called British Chain and Romanzow Chain, are always covered with snow. Romanzow Chain occupies the greatest width, and presents to the Arctic Ocean a front exceeding 60 miles in extent. These chains consist of slate-rocks; their summits are rounded and naked, but the narrow valleys between them are covered with grass. No bushes nor even shrubs appear on their declivities. At a great distance farther west, between 151° and 152°, the northern extremity of another chain, called the Pelly Mountains, is seen from the shores of the Arctic Ocean. It is most probable that the mountain-chain which is observed to skirt the shores of the Pacific, at no great distance from the sea, and in numerous places to advance with its offsets close to the water's edge, forms a part of the Rocky Mountain system and is connected with it. But on this point we are without information, the interior of the countries along this coast not having been explored by Europeans.

ROMA, COMARCA DI, a province of the Papal state, in which the city of Rome is situated, and which is under the same administrative authorities as the metropolis itself. It consists of the Agro Romano, or territory immediately around Rome, and of the districts of Tivoli, Albano, and Subiaco. The province extends on both banks of the Tiber, including Bracciano, Monte Rosi, and Monte Sant' Oreste (the ancient Soracte) on the west or right bank of the river, and it extends as far as Magliano on the eastern or left bank, including Palombara, Tivoli, Vicovaro, and the whole valley of the Anio, with Palestrina, Frascati, Albano, Genzano, and Porto d'Anzo and Nettuno on the sea-coast. It is bounded N. by the provinces of Viterbo and Rieti, E. by the kingdom of Naples, S. by the province of Frosinone and the Mediterranean, and W. by the province of Viterbo. The area is 1699 square miles: the population including the city of Rome in 1850 amounted to 304,266. The chief products are corn, cattle, oil, wine, and fruits.

The surface of the province is diversified in its eastern and northern parts by ramifications of the Roman and Tuscan sub-Apennines respectively; both districts abound in picturesque scenery. The eastern region is drained by the *Teverone* (ancient *Anio*) which rises in Monte Tarino near the Neapolitan frontier, and passes Subiaco in a north-west direction. A few miles lower down it turns south-west passing Tivoli, where it makes the renowned cascades, and enters the Tiber on the left bank about two miles north of Rome. The northern and central parts of the province are drained by the Tiber, or *Tevere*. [PAPAL STATES.] Some smaller streams run directly into the sea, the principal of which is the *Arrone*, the outlet of Lake Bracciano. There are several lakes, the largest of which, namely those of Albano, Bracciano, and Nemi, occupy ancient craters. There are many smaller lakes and some large marshes on the sea coast. Besides the two hilly

districts already named the province presents an extensive plain diversified only by the gentle undulations of the Campagna, many parts of which are infested by malaria. The highest points in the Roman sub-Apennines are Monte Guadagnolo, to the south-east of Tivoli, and Monte Genaro (4185 feet above the sea). The latter is supposed to be the *Mons Lucretilis* of Horace. The Monte San Oreste (ancient Soracte), in the north of the province, is a mass of limestone projecting up from the tufa of the Campagna to the height of 2000 feet above the sea. It is in parts beautifully wooded. On its summit is the monastery of St. Sylvester, which was founded by Carloman, son of Charles Martel, on the site of a church built here by St. Sylvester before his elevation to the Holy See, in commemoration of the conversion of Constantine the Great. Gusts of wind still issue from the fissures on the east side of the mountain as described by Pliny. Mount Soracte fills up the fork between the Tiber and its feeder the Treia, which is formed by the junction of two streams that flow in ravines and unite their waters between the mountain and the town of Civita Castellana. They are the Rio Ricano, which is the outlet of the Lake Vico and the most northern of the two; its course is nearly due east: and the Rio Maggiore which also flows east past Sutri and Nepi in the neighbouring province of Viterbo.

In the valley of the Teverone are the following towns:—*Subiaco*, the ancient *Sublaqueum* (population 5836), built in a most picturesque situation on a hill on the right bank of the river. It is supposed to occupy the site, or part of the site, of Nero's villa, remains of which still exist. Subiaco has a fine church dedicated to St. Andrew, a papal chateau, and several convents, the most famous of which are those of Santa Scholastica and St. Benedict, both founded in the 5th century. The Teverone forms some cascades below the town. TIVOLI (ancient *Tibur*), celebrated for the cascades of the Anio and for its antiquity, is described in a separate article. A short distance west of Tivoli is the Lake of *Solfatara*, the ancient *Aqua Albulæ*, whose sulphureous waters are carried by a canal into the Teverone. The waters are of a milky colour and always have a strong smell of sulphur. Their petrifying qualities are continually contracting the area of the lake, which in the time of Father Kircher was a mile in circuit but is now only about 500 feet in diameter. There are other smaller lakes of the same character near the Solfatara. North of Tivoli is *Vicovaro* (the ancient *Varia*), now a village of about 1000 inhabitants. Between Vicovaro and Monte Genaro is *Licenza* (the ancient *Digentia*), situated on the bright limpid stream immortalised by Horace, of whose villa there remain some scanty memorials. To the west of Licenza, near the Tiber is *Palombara*, a small town of 2700 inhabitants.

Among the hills of the ancient Hernici round the source of the Sacco are—PALESTRINA, described in a separate article. *Paliano*, situated on an isolated rocky hill fortified with towers and bastions, and approached only by means of a drawbridge: population, 3700. *Cavi*, picturesquely situated on a rock of tufa above a torrent-feeder of the Sacco, over which a fine bridge of seven arches is thrown: population, 2000. *Genzano*, built on a steep hill 4 miles E. from Cavi, is famous for its chapel of the Madonna, on whose feast the peasantry of all this part of the province assemble in the town: population 2500; on the summit of the hill is a baronial castle of the Colonna, separated from the town by a drawbridge. *Olevano*, a mediæval town situated in the midst of the most romantic scenery, a few miles north of Genzano, has about 3000 inhabitants. *Zagarolo*, a small town of 3600 inhabitants, situated on a long ridge that projects into the plain about 6 miles W. from Palestrina, has some handsome churches and a baronial castle, which formerly belonged to the Colonna. *Castiglione*, a small place west of Zagarolo, stands on the site of the citadel of ancient *Gabii*, of which there are still some remains. The Lake of *Gabii*, which occupied an ancient crater, and is not mentioned till the 5th century, has been recently drained by Prince Borghese. Near the junction of the Osa with the Teverone, a little north of Castiglione, stood *Collatia*, the scene of the death of Lucretia, the wife of Collatinus.

About 12 miles E. from Rome, situated on one of the lower eminences of the Alban Hills, is *Frascati*, surrounded by magnificent villas. [FRASCATI.] North-east of Frascati is the ruined village of *Colonna*, which gave title to the historical family of the Colonna, and occupies the site of the ancient *Laticum*. South of Frascati, on an isolated hill at the base of Monte Cavi, the ancient *Mons Albanus*, is *Marino*, which occupies the site of the ancient *Castrimanium*, and has about 5100 inhabitants; it is a well-built town with some interesting churches, which are adorned with fine pictures. Between the hill on which Marino stands and the ridge of Alba Longa is a deep wooded glen, called Parco di Colonna, in which the ancient Latins held their general assemblies. The stream called by Livy, *Aqua Ferentina*, still traverses it, and may be traced to its source at the base of a mass of tufa. Near Marino also is *Grotta Ferrata*, a small village celebrated for its Basilian monastery; the chapel of which is decorated with magnificent frescoes by Domenichino. The region of the Alban Hills, the Alban Lake, the town of Albano, &c. are noticed under ALBA LONGA. Separated by a deep ravine from Albano is *L'Ariceia*, a small place of 1400 inhabitants, which occupies the site of the citadel of the ancient *Ariceia*, ruins of which are spread about the neighbourhood. The region of the Alban Hills abounds in evidences of ancient volcanic action; the hill slopes are in many parts covered with vineyards. From L'Ariceia is

seen beyond the broad crater of Vallerioccia the hill of Monte Giove, famous as the site of *Corioli*; and on another hill to the south-east the village of *Civita Lavinia*, the site of the ancient *Lanuvium*. East of L'Ariccia is the village of *Nemi* and the beautiful lake of the same name, the ancient *Lacus Nemorensis*, which occupies an extinct crater, and is 5 miles in circumference. Near the south shore of the lake is *Gensano*, a town of 4700 inhabitants, celebrated for its flower-mosaics on the octave of the feast of Corpus Christi. The Appian Way between L'Ariccia and Gensano is carried across the crater of Vallerioccia by a magnificent causeway.

The Campagna to the south-east of *Ostia*, which forms the subject of a separate article [OSTIA], is covered near the sea with pine plantations and with the great Laurentine forest, which skirts the Mediterranean for above 50 miles, with a breadth of about 3 miles from the coast, and abounds with buffaloes, wild boars, and wolves. This region, once dotted with cities, is now all but deserted on account of the malaria. Two miles from *Ostia* is *Castel Fusano*, a castellated mansion of the Chigi family, built on the site of Pliny's Laurentine Villa. Farther south, among gigantic groves of stone-pine, ilex, laurel, and wild olive, is *Torre di Paterno*, a solitary brick-tower, built about half a mile from the sea, among the ruins of an imperial villa. About a mile inland from *Torre di Paterno* is the site of *Laurentum*. The ancient Laurentine Way still leads from this region to Rome, but the polygonal blocks with which it is paved have in places been displaced by the roots of the trees which have encroached upon it, and rendered it impassable for carriages. *Pratica*, a small hamlet on a strip of table-land, separated from the plain by deep glens, except at one point, marks the site of the ancient *Lavinium*. The Borghese family have a large mansion here, the tower of which commands a fine prospect of the coast, the plain of the Campagna, the Alban Hills, the Ciminian Wood, and the domes and palaces of Rome. *Pratica* is 18 miles south-south-east from Rome. A few miles south-east of *Pratica* is the small hamlet and castle of *Ardea*, which marks the site of the ancient *Ardea*, the city of *Turnus*. A great castellated mansion of the Cesarini occupies the site of the citadel. At the extreme south point of the coast are the towns of *Porto d'Anzo*, on the site of the ancient *ANTURUM*, which is noticed in a separate article: and *Netuno*, about a mile south of the preceding, which is the largest town now on the coast of Latium, although the population hardly exceeds 1000. The whole coast hereabouts is covered with ruins of Roman villas. The town contains remains of a temple of Neptune, and also an old fortress, now tenanted by the coast-guard. All this part of the coast belongs to the princely house of Borghese. The malaria and swarms of mosquitos render it uninhabitable in the summer and autumn.

On the right bank of the north arm of the Tiber, which is called the *Fiumicino*, are the extensive remains of the *Portus Trajanus*, now *Porto*, which was founded by *Claudius* and enlarged by *Trajan*, so as to be the naval arsenal of Rome. The docks formed by *Trajan* are a mile and a half in circuit, and there are still remains of large magazines; and numerous slips for ship-building purposes. *Porto* was a place of importance under the empire. It gave title to a bishop from the 3rd century. It was taken by the Saracens in the 9th century and soon after abandoned. At the mouth of the *Fiumicino* is the marine village of *Fiumicino*, in which is a lofty square tower surmounted by a beacon to point out the entrance to the river. The current of the Tiber through the *Fiumicino* is deep and rapid, and the navigation except by steam tedious. Steamers ply to Rome, and steam-tugs tow vessels of 200 to 300 tons up to the *Ripa Grande*. The southern arm of the Tiber, which passes *Ostia* on the site of *OSTIUM*, the port of ancient Rome, is called *Bocca di Fumara*. The delta between the two arms (if it be a delta) is called *Isola Sacra*, or *Holy Island*, probably from its being included in the gift of *Constantine* to the *Holy See*, or it may be from the church and tomb of *St. Hippolitus*, bishop of *Porto*; the tower of the church is still standing. The *Fiumicino*, it is asserted by some, originated in a cut made by *Trajan* to his new harbour.

Northward from the Tiber at a short distance is a large shore-lake or marsh called *Maccarese*, a little north of which the *Arrone*, the outlet of *Lake Bracciano*, enters the sea. The *Polidoro* is another small stream that falls into the Mediterranean on this coast. A little way north of the mouth of the *Polidoro* is *Monterone*, on the road between Rome and *Civita Vecchia*, where there are tumuli containing Etruscan tombs. But the most interesting place in this region is *Cerveteri*, a village of about 800 inhabitants, situated on a strip of table-land with perpendicular sides 50 feet high on all sides except the west, which is cut through artificially. This is the site of the ancient *Cære*, the *Agylla* of *Herodotus*, and the city of *Mezentius*. The village occupies the ground on which the citadel of *Cære* stood. The four gates of the town may still be traced and the roads leading to them. The necropolis of *Cære* is a hill separated from the town by a small stream; a great number of Etruscan tombs have been explored in this hill. Many of them are said to be above 3000 years old. The articles found in them are preserved in the antiquarian collections of Rome. Farther inland on the *Arrone* is *Galera*, which represents the ancient *Galeria*. It has been long deserted in consequence of a malaria, and is now in ruins. The lake of *Bracciano*, which is about 18 miles N.W. from Rome, is nearly circular in form, and 22 miles round. It is surrounded by hills on all sides except the

south, where it borders on the wide unhealthy Campagna. On the south-west shore is the town of *Bracciano*, which has a large paper factory, a splendid baronial castle built by the *Orsini* (the finest feudal castle in Italy), and about 2000 inhabitants. The castle of *Bracciano* now belongs to the *Torlonia* family. The Lake of *Bracciano* is the ancient *Lacus Sabatinus*. Its shores seem to have once formed the crater of a volcano, being formed chiefly of lava and scoria. Between the lake and *Baccano* are three other craters and two small lakes. The village of *Baccano* is situated within the lip of a crater on the high road from *Viterbo* to Rome. A little south of *Baccano* the traveller gets his first view of Rome. The stream that rises in the crater of *Baccano* has by some been considered to be the *Cremera* which flowed past *Veii*. The site of the citadel of *Veii* is marked by the tower and hamlet of *Isola Farnese*, which lies a little east of the road between *Baccano* and *La Storta*, the first post-station out of Rome. The walls and gates of *Veii* may still be traced. Several valuable relics of antiquity have been found in the tombs of *Veii*. A Roman municipium was built in imperial times on the site of *Veii*. It was about two miles in circuit, and far within the limits of the old Etruscan city. The hamlet of *Isola* is gone to decay in consequence of malaria.

ROME, ROMA, the capital of the States of the Church, and formerly of the whole Western world, is situated in the Campagna, on the banks of the Tiber, 15 miles from the sea-coast, in 41° 54' N. lat., 12° 28' E. long., and had a population of 175,838 in 1852. The site of Rome consists partly of several strips of low land on both banks of the Tiber, the ordinary level of the river being there about 35 feet above that of the sea, and partly of the table-land of the Campagna, which rises on both sides from 150 to 200 feet above the river. The projections of this table-land which advance towards the river have been called hills; and hence the name of the Seven Hills. After the enlargement of the city walls by *Aurelian*, these hills or projections were considerably more than seven. On the right bank of the river, the Vatican and the Janiculum, which are within the modern city, are a continuation of the ridge of *Monte Mario*, which is outside of the walls to the north, and is 450 feet above the sea, and of *Monte Verde* to the south. On the left or eastern bank, the table-land of the Campagna extends, within the walls of Rome, in a semicircular shape, forming several projections to the west towards the river. The low grounds between these projections and the river constitute the *Campus Martius*, on which the greater part of the modern city is built. Beginning from the north, the first projection of high lands within the city is the *Monte Pincio* (the ancient *Collis Hortulorum*); farther east, and partly separated from it by a depression or ravine, is the *Quirinal*, and still farther south-east the *Esquiline*. In a kind of recess between the *Quirinal* and the *Esquiline* is a smaller projection, the *Mons Viminalis*, which is hardly distinguishable from the other two. It rises above and north of the church of *San Lorenzo Panisperna*. The *Quirinal*, *Viminal*, and *Esquiline* are joined on the east, within the walls of Rome, by an extensive plateau, which is about 150 feet above the ordinary level of the Tiber, and which slopes gently towards the country outside of the walls of Rome. The highest points of the *Esquiline* and the *Quirinal* are nearly 200 feet above the Tiber. South of the *Esquiline*, and separated from it by a depression or valley, is *Mount Cælius*, which is divided on the south from the *Aventine* by the valley of the *Aqua Crabra* or *Marrana*. Within the space that is inclosed between the table-land and the Tiber, and in the middle of the ancient city, there are three small insulated hills, the *Palatine*, the *Aventine proper*, and the *Capitol*, of which the *Aventine* is the most southern and the *Capitol* the most northern. The *Capitol* rises between the south-west extremity of the *Quirinal* and the left bank of the Tiber, and nearly fills up the intermediate space. The ancient city of Rome, before the time of *Aurelian*, lay south and east of the *Capitol*, and along the *Palatine*, *Aventine*, *Cælian*, *Esquiline*, and *Quirinal* hills: the main bulk of modern Rome lies north of the *Capitol*.

The Tiber, on approaching Rome from the north, makes a sweep to the east towards the base of *Monte Pincio*, receding from *Monte Mario* and the *Vatican* hill on its right bank; but on reaching *Ripetta* within the city, the river makes a bend to the westward, and flows along the north-eastern base of the *Janiculum*, after which it turns again to the east as far as the base of the *Capitol*. It then turns again to the south-west, sweeping past the base of the *Aventine*, and along the southern extremity of the *Janiculum*. It then assumes a course south by east. The level space between the *Vatican Mount*, the north end of the *Janiculum*, and the right bank of the river, is the *Vatican field*, which is about a mile long from east to west. It contains the *Borgo*, or suburb of Rome, inclosed by the pope, and *St. Peter's church*, the *Vatican palace*, and their appurtenances. The space between the long ridge of the *Janiculum* and the right bank of the Tiber constitutes the district of *Trastevere*, which is another suburb of Rome. The space on the left bank running north and south, and between the great westward bend of the river and the eastern hills, is the site of the modern city of Rome, properly speaking which extends also along the slope of the *Pincian*, *Quirinal*, part of the *Esquiline*, and the *Capitol*, forming a kind of triangle, of which, the apex is to the north, at the *Porta del Popolo*, and the base extends from *Santa Maria Maggiore* on the east, to the *Tiberine Island* on the

west, a distance of about a mile and a quarter, whilst from the Porta del Popolo to the foot of the Palatine opposite Ponte Rotto, the farthest southern point of modern Rome, the distance is rather more than a mile and a half. All to the south and east of these limits, forming about two-thirds of the area within the walls, consists of ruins, gardens, and fields, with some churches, convents, and other scattered habitations.

The present line of walls of Rome proper on the left bank of the river is generally understood to be that traced by Aurelian, restored by Honorius, and afterwards by Belisarius, and since repeatedly renewed by several popes. It describes an irregular polygon, of which the longest diameter is three miles in length from north-west to south-east, from the Porta del Popolo to the Porta San Sebastiano on the Appian road. The whole circuit of the present walls, including those of Trastevere and of the Borgo or Vatican, is between 14 and 15 miles. The wall is made of brick mixed with stones and rubbish, and has been often repaired. It varies in height, but in most places does not exceed 15 feet. It has no ditch, but is flanked by towers and bastions, which were repaired by Pope Benedict XIV. Rome has 16 gates, some of which however are walled up. Beginning from the north is:—1. Porta del Popolo, on the Flaminian way, or high northern road, which divides at a short distance from Rome, one branch leading to Florence and the other to Ancona. 2. Farther east, the next gate is Porta Pinciana. 3. Porta Salaria, on the road to Rieti. 4. Porta Pia, on the north-east, formerly Nomentana, the road from which joins the Via Salaria. 5. Porta San Lorenzo, facing the east, and leading to Tivoli. 6. Porta Maggiore, leading to Palestrina: this is the handsomest of the gates of Rome, being originally part of the aqueduct of Claudius restored by Vespasian and Titus, which is attested by the triple inscription over it. It consists of a fine arch which crosses the high road, built of Travertine or Tiburtine stone. 7. Porta San Giovanni, which looks to the south-east on the modern road to Albano and Naples. 8. Porta Latina, the road from which joins the Naples road. 9. Porta San Sebastiano, on the ancient Via Appia. 10. Porto San Paola, on the road to Ostia. Crossing the Tiber, we find—11. Porta Portese, which leads to Fiumicino, the present port of Rome. 12. Porta San Pancrazio, on the summit of the Janiculum, which is nearly 300 feet above the Tiber. Outside of this gate is the Villa Pamfilii, with its shady walks, its waterworks, and beautiful groves of lofty umbrella pines. 13. Porta Cavalleggieri, south-west of St. Peter's; it leads towards Civita Vecchia. 14. Porta Fabbrica, on the same side, is now walled up. 15. Port' Angelica, on the opposite or northern side of St. Peter's, on the road leading to Monte-Mario. 16. Porta Castello, which opened from the Castle of San Angelo northward into the country, and is now walled up. Besides these, there are two internal gates, one called Santo Spirito, leading from the Borgo to the Lungara, and the other Porta Settimiana, leading from the Lungara to Trastevere. These districts, Borgo and Lungara, have been consecutively annexed to the modern city.

The course of the Tiber within Rome, including its windings, is about three miles; the banks are not built up with quays or walks, but in most places the river is bordered by the backs of houses generally of an inferior sort; in other places there is a slip of sand or gravelly ground between the houses and the river, which is frequently overflowed. There are only two places where there is a sort of quay or landing-place; one in the northern part of the town, on the left bank, above the bridge of San Angelo, called Ripetta, where the boats from the inland provinces on the upper Tiber land wine, charcoal, and provisions; and the other at the southern extremity of the town, on the right bank near Porta Portese, called Ripa Grande, where sea-vessels land their cargoes, and where there is a line of warehouses and a custom-house. There are three bridges across the Tiber within Rome; the northernmost is Ponte Sant' Angelo, the Pons Ælius, built by Hadrian, and restored by several popes, and lastly by Clement IX., by whose order Bernini constructed the present balustrade and the statues with which it is decorated. It is about 300 feet long, but the width of the bed of the river is not more than 200 feet. The Ponte Sisto, formerly Pons Janiculensis, built originally by Marcus Aurelius, and rebuilt by Sixtus IV., is about 300 feet long, the bed of the river being 230 feet wide. About half a mile lower down is the island of San Bartolomeo, the ancient Insula Tiberina. This island is of an oblong shape, something like a ship, being about 1000 feet long, and 800 feet wide in the middle of its length. It is joined to the mainland by two bridges; one to the left bank called Ponte San Bartolomeo; and the other to the right bank, called Ponte Quattro Capi, from a head of Janus Quadrifrons which once decorated it. The two arms of the river together form a bed of about 200 feet in width. There are also within Rome the remains of three ancient bridges; the Triumphalis, called also Vaticanus, just below Sant' Angelo, of which the piers have fallen into the bed of the river and occasion a rapid; the Pons Palatinus, now called Ponte Rotto, of which three arches remain on the Trastevere side; and lastly, the Pons Sublicius, at the foot of the Aventine, the first bridge built by the Romans, of which there are very few vestiges.

Rome is divided into 14 districts, called Rioni, which however do not correspond in their boundaries to the Regiones of the ancient city. The modern Rioni are of very unequal extent, their boundaries being determined with reference to the population included within them.

Thus the inhabited part of the city contains 11 Rioni, namely—1. Campo Marzo, near Porta del Popolo; 2. Colonna; and 3. Trevi, along the slope of the Pincian and Quirinal; 4. Sant' Eustachio; and 5. Pigna, in the middle of the lower town; 6. Ponte; 7. Parione; and 8. Regola, near the left bank of the Tiber; 9. Sant' Angelo in Pescheria, between the Capitol and the Tiber; and 10. Trastevere, and 11. Borgo, on the right bank of the river. The whole of the ancient or southern city is comprised within three extensive Rioni, namely—12. Monti, on the north-east; 13. Campitelli, south-east; and 14. Ripa, south-west.

The modern city of Rome may be conveniently divided, for the sake of topographical description, into three great divisions:—1. The lower part of the town between the eastern hills, the Tiber, and the Capitol. 2. The upper town, which extends along the eastern hills. 3. The part of the town which is on the right bank of the Tiber.

I. The Lower Town, which occupies the site of the ancient Campus Martius and Campus Tiberinus, is the seat of all the bustle and trade. It is crossed in its central part from north by west to south by east by the street Del Corso, which is about a mile in length from the Piazza del Popolo, or great northern entrance of Rome, a handsome open place with an obelisk in the middle, to the Venetian palace, near the foot of the Capitol. Two other streets branch out from the Piazza del Popolo on the right and left of the Corso, and at an acute angle with it. One leads south-east to the fine open place called Piazza di Spagna, the great resort of foreigners, at the foot of the Pincian Mount, after crossing which it continues in the same direction to the College of Propaganda at the foot of the Quirinal. The other street, called Ripetta, runs in a south direction, parallel to the bank of the Tiber, and then following the bend of the river leads, under a different name, to the bridge of Sant' Angelo.

About the middle of the Corso is a square, called Piazza Colonna, from the column of Antoninus which stands in the middle of it. It was raised by the senate in honour of the emperor Marcus Aurelius Antoninus, and in memory of his victory over the Marcomanni and other German tribes. After the extinction of the western empire this column and its pedestal suffered greatly from fire, from lightning, and from wanton injury. Pope Sixtus V. repaired it at the expense of 10,000 scudi, and placed the inscription which is now seen on the pedestal, the original one having been probably defaced. He also raised on the summit of the pillar a bronze statue of St. Paul; that of Marcus Aurelius, which formerly stood there, had been removed—it is not known when or by whom. The shaft of the pillar is 13 feet 1 inch in diameter at the bottom, and one foot less at the top; its height, including the pedestal and capital, is 136 feet, of which 13 feet are under ground; and the statue on the top and its pedestal are 27½ feet more, making the whole height 163½ feet. The capital is Doric. The shaft is made of 28 blocks of white marble placed one above the other; a spiral staircase of 190 steps is cut through the interior of the marble and leads to the gallery on the top, which is surrounded by a balustrade. The exterior of the shaft is covered with bassi-relievi placed in a spiral line around, which represent the victories of Marcus Aurelius. The column is still one of the most striking monuments of ancient Rome and one of the principal ornaments of the modern city.

Immediately to the west of the Piazza Colonna is an irregular square, which crowns a slight eminence called Monte Citorio, or Citorio, a small hill which rises in the middle of the Campus Martius. It contains a fine building, called Curia Innocenziana, in which the courts of justice sit: a handsome obelisk stands in front of it. Returning to the Corso, and following it southward, we meet with a street on the left, which leads to the Fontani di Trevi, the handsomest fountain in Rome, and then we come to another street, leading to the ascent of the Quirinal, or Monte Cavallo. Farther up the Corso, on the right, is a wide street called Stada del Gesù, which leads to the splendid Jesuit church and convent of that name, whence, turning to the left, is a street that leads to the foot of the Capitol. The whole of this part of the city, in the neighbourhood of the Corso, consists chiefly of regular and substantial buildings. The most remarkable are—1. Palazzo Borghese, near Ripetta, one of the largest and finest in Rome: it contains a choice collection of paintings by Titian, Domenichino, Albano, Annibale Caracci, Caravaggio, Parmigiano and other great masters. 2. Farther north the old mausoleum of Augustus has been transformed into an amphitheatre, called Corra, for bull-fights, fireworks, and other popular diversions. 3. Palazzo Ruspoli, on the Corso, in a good style of architecture by Ammanato, has a much-admired staircase, constructed by Martino Longhi, consisting of 115 steps, each of a single block of white marble. The extensive ground-floor of the palace has been converted into a coffee-house, which is the largest in Rome, and consists of various rooms, where several clubs of lawyers, merchants, and other persons assemble, that of the contributors to the 'Giornale Arcadico,' the literary review of Rome, among the rest. The artists' club is held at the Caffé del Greco, in the Piazza di Spagna; that of the antiquarians at the caffè of Fontana di Trevi; the club of professors and other men of letters meets at the Caffé di Monte Citorio. 4. Palazzo Ghigi, which forms the north side of the Piazza Colonna, contains some choice paintings, and a fine library rich in curious manuscripts. 5. Palazzo Piombino, on the opposite or south side of the square. 6. Palazzo Sciarra Colonna, on the Corso, has a rich collection of paintings and a handsome

Doric marble gate. 7. Palazzo Doria, a vast building, designed by Borromino, also contains a gallery of choice paintings. 8. Palazzo Torlonia, formerly Odescalchi, or Bracciano, on the Piazza Santi Apostoli, has a splendid marble gallery and some good modern paintings. 9. On the opposite side, next to the church of Santi Apostoli, is the Palazzo Colonna, with a handsome court and gardens behind, which extend up the slope of the Quirinal, and a gallery of paintings with some splendid portraits by Titian, Veronese, and Giorgione. 10. The huge Palazzo di Venezia, so called because it once belonged to that proud republic, is now occupied by the Austrian ambassador: it looks like an old castle, with its massive walls and battlements. 11. Opposite the church Del Gesù is the Palazzo Altieri. All these palaces are in the immediate neighbourhood of the Corso. The principal churches in the same district are—1. Santa Maria del Popolo, which, like most churches at Rome, contains some good paintings, several remarkable sepulchral monuments, and also a handsome chapel belonging to the Ghigi family. 2. San Carlo al Corso. 3. San Lorenzo in Lucina, raised on the ruins of an ancient temple. 4. San Ignazio, which is rich in ornaments, adjoins the Roman College. 5. The handsome church Del Gesù contains some good paintings; the splendid chapel of St. Ignatius, enriched with lapis lazuli, silver, and gold; and the mausoleum of Bellarmine, by Bernini. 6. Santi Apostoli, with the fine mausoleum of Pope Ganganelli, the work of Canova, and a cenotaph by the same illustrious artist to the memory of his friend the engraver Volpato. In the adjoining cloisters is the tomb of Cardinal Bessarion. 7. San Marcello contains the sepulchral monument of Cardinal Consalvi. 8. Santa Maria in Vialata, &c.

West of the Corso, and between it and the Tiber, is a dense mass of irregular streets, a busy part of the town, containing market-places, shops, and inferior dwellings, with here and there a fine building. Towards the centre of this district is the fine oval space called Piazza Navona (the ancient Circus Agonalis), one of the largest in Rome, with its fountains, by Bernini, its three churches, and the modern palace Braschi at one extremity of it. The university called La Sapienza is in the neighbourhood. Between it and the Corso is the church of Santa Maria Rotonda, the ancient Pantheon, which is above 18 centuries old, and one of the best preserved monuments of antiquity. It consists of a rotunda with a noble Corinthian octastyle portico erected by Agrippa, the son-in-law of Augustus. It is by far the largest circular structure of ancient times, the external diameter being 188 feet, and the height to the summit of the upper cornice 102 feet, exclusive of the flat dome, which makes the entire height about 148 feet. The portico (103 feet wide) is octastyle, yet there are in all sixteen columns, namely, two at the returns, exclusive of those at the angles, and two others behind the third column from each end, dividing the portico internally into three avenues, the centre one of which is considerably the widest, and contains the great doorway within a very deep recess, while each of the others has a large semi-circular tribune or recess. But although, independently of the recessed parts, the portico is only three intercolumns in depth, its flanks present the order continued in pilasters, making two additional closed inter-columns, and the projection there from the main structure about 70 feet; which circumstance produces an extraordinary air of majesty. The columns are 47 feet high, with bases and capitals of white marble, and granite shafts, each formed out of a single piece. The interior diameter of the rotunda is 142 feet, the thickness of the wall being 23 feet through the piers, between the exhedra, or recesses, which, including that containing the entrance, are eight in number. The dome has five rows of coffer (now stripped of their decorations) and a circular opening in the centre, 26 feet in diameter, which not only lights the interior perfectly, but in the most charming and almost magical manner. As an interior, Grecian architecture has nothing whatever that even approaches it.

On one side of the church of Santa Maria Rotonda is the Palazzo Giustiniani, and on the other side of it is the large church and Dominican convent of Santa Maria sopra Minerva. Nearer to the river are—1, the Palazzo della Cancelleria, by Bramante. 2, the Palazzo Farnese, the best-built in Rome, with a square before it, ornamented by two handsome fountains; some of the apartments are painted by Caracci, Zuocari, Vasari, and others. Next to the Piazza Farnese is another square, called Campo di Fiora. 3, the Palazzo Spada, with a collection of ancient sculptures, among others the supposed statue of Pompey, and some very fine basso-relievos, found at Santa Agnese without the walls. 4, the handsome church of Santa Maria in Vallicella, belonging to the brothers of San Filippo Neri, or Congregation of the Oratory, a most gentlemanly, unassuming, and useful body of clergymen. The library contains many valuable manuscripts, historical and ecclesiastical. 5, the church Santa Maria dell'Anima has some good paintings, and the monuments of Pope Adrian VI. and of Lucas Holstenius, a Protestant converted to Catholicism, who died librarian of the Vatican. Near the left bank of the Tiber, and parallel to it, runs a handsome regular street, called Strada Giulia, about three-quarters of a mile long, from Ponte Sisto to Ponte San Angelo. This district, though well built, is dull, when compared with the Corso and the adjoining streets.

South of Ponte Sisto, along the left bank of the Tiber, and extending round the western base of the Capitol to the foot of the Palatine, is the lowest, meanest, and dirtiest part of modern Rome. It is partly

occupied by the Jews, who are cooped up to the number of 4000 in several narrow filthy alleys, in rows of tall old houses, near the river-side, between Ponte Sisto and Ponte San Bartolomeo. Their district, called Ghetto, is separated by a wall from the rest of the town. They have their rabbis and a synagogue, a sort of municipal council, their schools, support their own poor, and follow their customary occupation of buying and selling. Facing the Ghetto is the island of San Bartolomeo, with the church of that name, and an hospital, kept by the congregation of the Ben Fratelli, whose motto is, 'Fate bene, Fratelli' ('Brethren, do good' to your fellow-men), and who devote themselves to tend the sick poor gratuitously. Proceeding farther south, along the left bank of the river, is a succession of narrow streets extending to the foot of the Palatine, with some of the most ancient churches in Rome, especially Santa Maria in Cosmedin, built in the 3rd century of our era, on the ruins of a temple dedicated to Pudicitia Plebeia. (Livy, x. 23.) The church of Santa Maria in Cosmedin is adorned with two rows of fine ancient columns. It is also called Bocca della Verità, from a large stone mask with a large mouth which is seen in the portico of the church, and the use of which is unknown. In the same neighbourhood are the churches of San Giorgio in Velabro, Santa Anastasia, Santa Maria Egiziaca, and of San Teodoro, said to be on the site of the temple of Romulus, on the Palatine, at the southern extremity of the inhabited part of modern Rome, on the left bank of the Tiber. Beyond it, the Aventine, Palatine, and Cælian hills stretch to the south and south-east. They are occupied with fields and gardens, and contain several churches, convents, and scattered ruins. The most remarkable churches are—Santa Sabina and San Alessio, on the Aventine; and Santa Bonaventura and its adjoining convent and garden, on the Palatine. The Cælian, an extensive hill, has some interesting churches:—1. San Gregorio, a fine building on the west slope of the hill, which has splendid frescoes by Domenichino and Guido, representing the Martyrdom of St. Andrew; a painting of St. Gregory by Annibale Caracci; and a statue of the same pope. 2. San Stefano Rotondo is an ancient circular building, transformed into a church in the 5th century. 3. San Giovanni e Paolo, belonging to the Order of Barnabites, in a fine situation, commanding a view of the Palatine and Aventine, is much resorted to by persons religiously inclined, who retire thither for a time, and board in the convent, where they employ themselves in pious exercises and in quiet meditation, which the solitude of the spot and the view of the majestic ruins before them are well calculated to assist. A solitary palm-tree rises in the garden of the convent; there is another in the garden of Santa Bonaventura on the Palatine. The Villa Mattei occupies a considerable space on the Cælian Hill. A large group of buildings connected with the Basilica of San Giovanni occupies the eastern end of the Cælian. The Colosseum, triumphal arches, and other ancient remains, are noticed hereafter. Between the Lateran and the Colosseum is the remarkable ancient church of San Clemente.

South of the Aventine, and between it, the Tiber, and the walls, is a large space of low ground laid out in fields, part of which are common, and go by the name of 'Prati del Popolo Romano.' An artificial hill, called Mount Testaccio, rises on one side of them; it is formed of a quantity of broken earthenware (testæ) and other rubbish which has been thrown and has accumulated here from ancient times, and over which a green turf has formed. The modern Romans have excavated cellars in the side of the hill, where they keep their wine cool, and the place is resorted to on holidays by the populace of Rome. On the other side, by the gate of San Paolo, is the Protestant burying-ground, and near it is the pyramid of Caius Cestius.

II. The upper town, or eastern part of modern Rome, stretches up the slope of the Pincian and Quirinal hills, and occupies also part of the plateau which unites all the eastern hills of Rome. This part is not so densely built as the lower town: it consists in great measure of palaces and villas, of churches, convents, and other large buildings, with spacious courts and gardens, and is intersected by two fine long streets, which cross each other at right angles on the summit of the Quirinal, forming there a small circus, with a fountain at each bifurcation, from which the place is called Le Quattro Fontane.

On the terrace or plateau of the Pincian Mount, in this part of Rome, there is a fine promenade or public walk. Next to it is the villa Medici, now the academy of French pensionary artists; the church of La Trinità de' Monti; and the esplanade with the obelisk in front of it, from which there is a splendid view of modern Rome. From this esplanade a good street, called Via Sistina, leads in a south-east direction to the Piazza Barberini, which lies in the depression between the Pincian and the Quirinal. The Palazzo Barberini, one of the largest in Rome, is at the east end of the Piazza. It contains a good collection of paintings, among others the celebrated portrait of La Cenci, by Guido, who had seen her on the scaffold at her execution. The library of the Barberini palace has about 50,000 printed volumes, and many valuable manuscripts. At the north end of the Piazza Barberini is the church and convent of the Capuchins, with its garden, which is kept in excellent condition, like all the gardens of the convents of that order. Adjoining is the vast and splendid patrician villa Flaminio, which has beautiful walks; in the apartments of the principal casino is a valuable collection of ancient sculptures, and also the fresco of Aurora by Guercino.

South of the Piazza Barberini rises the Quirinal Mount, which bears

on its summit the extensive pontifical palace and gardens. At Rome it is commonly called Monte Cavallo, from the two colossal statues of Castor and Pollux, with their horses, which stand in the square before the palace. On the east side of the square is the Palazzo della Consulta, and next to it the Palazzo Rospigliosi, which occupies an extensive area. In a detached gallery or summer-house of the latter is the celebrated Aurora of Guido, which is considered the masterpiece of that great painter. A fine street, about a mile in length, leads from the square of the pontifical palace along the plateau of the Quirinal to Porta Pia, passing near the *Thermae* of Diocletian. It is crossed at the Quattro Fontane by another street, leading from the Piazza Barberini to the church of Santa Maria Maggiore, whence several streets lead to Porta Maggiore, Porta San Lorenzo, and Porta San Giovanni. The magnificent church of Santa Maria Maggiore on the Esquiline Hill, which here joins the Quirinal, is the eastern extremity of modern Rome. Beyond it, north, east, and south, the whole expanse of the Esquiline is occupied by gardens, villas, and fields, with some solitary churches. The more interesting of these churches are—1, San Pietro in Vincoli, built first by Eudoxia, wife of Valentinian III., and rebuilt by Pope Adrian I.; it contains the mausoleum of Julius II., with the statue of Moses by Michel Angelo; 2, the handsome church of San Martino ai Monti, which, with its ancient oratory and vaults, its modern embellishments and the frescoes by Poussin, is worthy of notice.

Between the west slope of the Esquiline and the south slope of the Quirinal are several streets, which extend to the Campo Vaccino. Farther north, at the foot of the Quirinal, and in the gap between it and the Capitoline Mount, is the piazza which contains Trajan's column.

The Capitoline Mount, celebrated in the history of ancient Rome, is called by corruption Campidoglio. It rises on the eastern skirts of the inhabited part of modern Rome, which it divides from the Forum and the other forsaken districts of the ancient city. The Capitoline Mount is of an oval shape, and about one mile in circumference at its base; it is divided from the Quirinal to the north-east by a narrow valley, in which the Forum of Trajan once was, and the Pillar of Trajan still is; it has to the east the Forum of Augustus and the Via Sacra, which divides it from the Esquiline Hill; to the south-east the valley of the Forum Romanum, which divides it from the Palatine Hill; to the south the Forum Boarium, which divides it from the Aventine Hill; and the Tiber to the south-west. It has two summits, one to the north towards the Quirinal, on which the church and Franciscan convent of Ara Coeli now stand; and another to the south towards the Tiber, on which are the Caffarelli palace and gardens. At the south end was the Tarpeian rock, down which state-criminals were hurled. The height of this side of the hill is very much reduced, the ground at the foot of it having been considerably raised by ruins and rubbish, and the rock itself having been sloped down, and houses built against it. The height of the Capitol, taken at the pavement of the church of Ara Coeli, which is the highest summit, is 155 feet above the sea, 135 feet above the Tiber taken at its medium height, and about 90 feet above the present surface of the Forum, which however is in several places 20 feet higher than its ancient level. This hill is said to have been called Saturnius in the ante-Roman times. When the first Romans built their town on the Palatine, they built their *arx*, or citadel, upon the hill afterwards called the Capitoline. In their first war with the Sabines the latter took possession of this stronghold by the treachery of a woman called Tarpeia, the daughter of the Roman commander. Hence the hill took the name of Tarpeius. After the peace Tatius and his Sabines settled on the Tarpeian Mount, and Romulus remained on the Palatine. Tarquinius the Elder began to build a temple to Jupiter on the Tarpeian Mount, the summit of which he levelled for the purpose. The building was afterwards continued by Tarquinius Superbus. In digging some part of the foundations it is said the workmen found a human head quite fresh, which was interpreted to signify that the spot would be the head and centre of the Roman power. (Livy, i. 55.) The temple was accordingly dedicated to Jupiter Capitolinus, from *caput*, 'a head.' The temple stood on the northern summit of the hill where the church of Ara Coeli now stands. It was burnt in the civil war of Marius, but Sulla rebuilt it with much greater splendour and of the most costly materials. It is said to have been 200 feet long and 185 feet wide; it had a peristyle with three rows of marble columns in front, and two rows of pillars divided the interior into three aisles, at the farthest end of which were three cells dedicated to Jupiter, Juno, and Minerva. The vault of the temple and the external roof were covered with plates of gold. This temple was the principal sanctuary of Rome, to which the victorious generals and emperors went in triumphal procession to sacrifice to the gods. Many other temples and public buildings were raised successively on the Capitoline Hill. The temple of Concord stood on the slope towards the Forum. In the intermontium or little valley between the two summits (Clivi) stood the asylum or place of refuge, between two plantations of oak-trees.

The principal buildings of the modern Capitol consist of three palaces, the work of Michel Angelo, forming three sides of a square, in the middle of which stands the equestrian statue of Marcus Aurelius. The open side faces the north-west towards the modern city. The palace facing it is that of the senator of Rome; to the left of it is the palace de' Conservatori, which is filled with collections

of pictures, statues, and objects of vertu, among which is the famous bronze wolf of the Capitol mentioned by Cicero in his third 'Catalinarian Oration;' and to the right the Capitoline Museum, one of the finest collections of statues and sculptures in Italy. Among the treasures of this museum are the celebrated Dying Gladiator, and the Antinous and the Faun from Hadrian's villa. The three palaces and the square between occupy the intermontium, the two summits being occupied by the church of Ara Coeli and the palace and gardens of Caffarelli. Two ways lead down by the senatorial palace into the Campo Vaccino, or ancient Forum, one of which passes the site of the Mamertine prison.

III. The third great division of modern Rome lies on the right bank of the Tiber, and consists of two distinct parts: Il Borgo, or Vatican, and Trastevere, properly so called, which are divided from one another by an inner wall. The Borgo, or Città Leonina, extends from the bridge of St. Angelo to the Piazza of St. Peter's. The Vatican Mount was outside the walls of ancient Rome, and originally within the territory of Etruria. In the plain between the hill and the Tiber Caligula constructed a circus for chariot-races, which was the scene of the martyrdom of many of the early Christians. Nero fixed an obelisk in the middle of it, the same which now stands before St. Peter's. This circus, being afterwards used by Nero, was called by his name. Nero had also gardens in the same neighbourhood. The circus was destroyed under Constantine, who built on its site a church or basilica, dedicated to St. Peter, who, according to tradition, was buried on that spot. This church was consecrated by Pope Sylvester I., and enriched by Constantine with splendid ornaments and ample revenues.

Pope Leo IV., about A.D. 850, walled round part of the Vatican Hill and the plain beneath, to protect the church of St. Peter against the incursions of the Saracens, and he gave the uninclosed grounds to a number of Corsican families, which, having been driven from their country by the Saracens, had taken refuge at Rome. It then became a suburb of Rome, and was called Leonina Civitas. In 1146 Eugenius III. began building a palace near the church of St. Peter for the Papal residence, which grew by degrees, under successive popes, into an immense mass of buildings, known by the general name of the Vatican. The Lateran palace had been formerly the residence of the popes. Gregory XI., on his return from Avignon, fixed his permanent residence in the Vatican on account of the protection of the neighbouring castle of St. Angelo. The palace of the Vatican continued to be the residence of the popes until about the middle of the 16th century, when Paul III. built the palace on the Quirinal Mount, which, on account of its healthier and purer air, has since been preferred to the Vatican, which is however occasionally used as a winter residence, as well as on the occasion of grand ceremonies being performed in St. Peter's, when the Pope removes to the Vatican to be near at hand.

The old church of St. Peter was a large structure, more than 300 feet in length: it lay lower than the present church, which has been raised above it, and which is much larger. Part of the ancient church is become a subterraneous vault under the pavement of the modern building: it contains chapels and altars, with old monuments, sculptures, and mosaics, and the public have access to it on certain days only.

Pope Julius II. commissioned the architect Bramante to make a plan of a new church. The plan of Bramante was a Latin cross, surmounted by a vast and lofty dome. Julius II. himself laid the first stone on the 18th of April, 1506. Bramante raised the enormous pillars which support the cupola. After the death of Julius and Bramante, Leo X. entrusted the work first to Giulio di San Gallo and to Raphael d'Urbino, who was an architect as well as a painter; and afterwards to Peruzzi, who altered Bramante's plan into that of a Greek cross, but effected little towards its execution. After Peruzzi's death, Pope Paul III. sent for Michel Angelo, who carried forward the works with his characteristic energy, raised the drum of the cupola, covered over the body of the church, and cased the inside with stone. After the death of Michel Angelo, his pupil Barozzi, or Vignola, continued the building, and cased the exterior with travertine. He died in 1573, and little more was done till 1585, when Sixtus V. resolved that the dome should be finished, and commissioned Domenico Fontana and Giacomo della Porta, who, after making the necessary plans and arrangements, began the work in July, 1588. It was carried on night and day; 600 workmen were employed on it; and in May 1590 the last stone, after being solemnly blessed by the Pope, was fixed in its place at the sound of a discharge of cannon from the castle of St. Angelo. By the following November the crowning of the dome was completed. Paul V. (Borghese) being elected Pope in 1605, appointed Carlo Maderno to be architect of St. Peter's, who lengthened the nave of the church so as to give it the shape of a Latin cross. He then built the portico, which was finished in six years, and was open to the public in 1612. Two years later the whole structure was completed. Sixtus V. and his architect Fontana had already raised the obelisk before the church. Paul V., and after him Innocent, constructed the two magnificent fountains by the sides of it; and Alexander VII. began in 1661 the two semicircular colonnades which inclose the Piazza, or open area, in front of the church. Bernini was the architect of this last work, which was finished in 1667. Lastly, Pius VI. built the fine Sacristia and Chapter-house which adjoin the church.

Such a building as St. Peter's, carried on under many different architects for a period of more than a century, must have faults and incongruities. The portico in front, the approach to which is formed by the beautiful colonnades of Bernini, which conceal the buildings on each side of the piazza, is mostly objected to, as spoiling the view of the church itself. But St. Peter's as a whole may be safely said to be the most magnificent structure raised by man. Its interior well corresponds with its external appearance: the proportions are so well kept, that the eye, at first, is not struck with the vastness of the edifice until some of the parts are examined separately. For a description of the structure itself, and its gorgeous ornaments in marble, bronze, stucco, and gold, its altars, chapels, paintings, mosaics, sculptures, and numerous sepulchral monuments, we must refer the reader to guide books, and to professional works on the subject: here we can only state the dimensions of this vast structure. The total length of the interior within the walls is 602 feet; length of transept 445 feet; the nave increases from 77 feet at the entrance to 89 feet, and is 150 feet high; the aisles are 21 feet wide and 47 feet in height. The height of the baldachino, or canopy over the high altar (which is immediately under the dome), to the top of the cross is 93 feet. The four great pillars on which the dome rests are 232 feet in circumference. The diameter of the cupola is 193 feet. The base of the lantern of the dome is 400 feet, and the top of the cross 430 feet above the pavement. The high altar stands immediately over the grave of St. Peter.

The assemblage of buildings called by the name of the Vatican, and which extends in an oblong irregular mass north of St. Peter's as far as the town walls, consists mainly of—1, the Papal palace; 2, the court and garden of Belvedere; 3, the library; 4, the museum. The Papal palace contains, among other remarkable objects, the Sistine and Pauline chapels, painted by Michel Angelo: the Sistine chapel contains the painting of the Last Judgment; the four 'stanzes,' or apartments, painted by Raffaele; and the 'logge,' or open galleries, painted by Raffaele's pupils under his direction. The principal staircase, made by Bernini, is a splendid work of art. The Vatican is said to contain altogether eight great staircases, more than twenty courts, twelve great halls, and several thousand apartments large and small. A corridor, about a thousand feet long, joins the Papal palace to the building called Belvedere, which serves as a museum. About half-way up this corridor is the entrance to the Vatican library, which was built by the architect Fontana under Sixtus V. Pope Nicholas V. was the founder of the Vatican library, which has been increased by many popes. It now contains about 100,000 printed volumes and 24,000 manuscripts, of which 5000 are in Greek, 16,000 in Latin, and 3000 in the oriental languages.

The museum, or collection of works of art, mostly of ancient sculpture, was begun by Clement XIII. and Clement XIV., and greatly increased by Pius VI. Pius VII. began a new collection, to which has been given the name of Museo Chiaramonti. The two together, which are distributed along the court, garden, and palace of Belvedere, constitute the richest museum in Europe. Another and more extensive garden belonging to the Pope is annexed to the Vatican palace, and extends along the brow of the hill.

The other remarkable building in the Borgo is the great charitable establishment of Santo Spirito, the largest in Rome, situated close to the right bank of the Tiber. It comprises an hospital for the sick, which in the summer months contains from 1000 to 1200 patients at a time, a founding hospital, and a lunatic asylum.

The castle of Sant'Angelo (of which the massive circular tower was built by Hadrian for his mausoleum, and the fortifications around it, consisting of ramparts, ditches, and bastions mounted with cannon, were begun by Pope Boniface IX. and continued by successive popes) is the citadel of Rome, but it is not capable of a regular defence. It serves as a state prison and also as a house of correction.

The district called Trastevere lies south of the Borgo and between the Janiculum and the Tiber, and communicates with the Borgo by the handsome gate of Santo Spirito. The Janiculum is a long straight ridge about a mile and a half long from north to south, and it rises nearly 300 feet above the level of the river. In the northern half of its length it rises almost immediately from the bank of the Tiber, leaving however sufficient level ground for a street, which from its length is called La Lungara. This street contains some fine buildings, the Palazzo Salviati, the Palazzo Corsini, one of the handsomest in Rome, once the residence of Christina of Sweden, with a gallery of paintings, a library, and delightful gardens, which extend up the slope of the Janiculum, and from which there is a splendid view of Rome; and lastly, La Farnesina, a house and gardens built by the wealthy banker Ghigi in the time of Leo X., with some fine frescoes by Raphael. On the slope of the Janiculum is the Villa Lante, the casino of which was painted by Giulio Romano. The church and convent of San Onofrio, likewise on the Janiculum, above La Lungara, is worthy of notice, as having been the last asylum of Tasso, where he died and was buried.

Towards the southern end of the Lungara the hill recedes farther from the banks of the river, which here makes a bend to the east, and it is within this bend that the great bulk of the district called Trastevere is situated. Some of the streets run up the Janiculum to the gate of San Pancrazio, but the higher part of the hill is chiefly unbuild,

GEOG. DIV. VOL. IV.

though it is inclosed within the walls. The villa Spada is in this part, near the gate, outside of which is the villa Pamfilii, a favourite promenade of the youth of Rome, with shady walks, water-works, and clusters of lofty umbrella pines. Among the most remarkable buildings of Trastevere is the church of San Pietro in Montorio, which covers the spot on which St. Peter was crucified, and contains some fine paintings. Above San Pietro in Montorio, in a commanding situation, is the fountain of L'Acqua Paola, the largest in Rome, which appears at a distance like a triple triumphal arch with streams of water rushing through: it was constructed by Paul V. with the marble taken from a temple of Minerva. Lower down, at the foot of the hill, is the collegiate church of Santa Maria in Trastevere, a vast and handsome structure, with granite and porphyry columns, rich marbles, some good paintings, and an old mosaic of the 12th century. Near to it is the fine Benedictine convent of San Calisto, in the library of which is a splendid illuminated Latin Bible of the 9th century. A long street leads from San Calisto to the church and convent of San Francesco a Ripa, once inhabited by St. Francis of Assisi. The church is ornamented with paintings, sculptures, and rich marbles, and has a chapel with vaults belonging to the Pallavicini family. Not far from San Francesco is the large building of San Michele a Ripa, near the Tiber, facing the Aventine Hill, which rises on the opposite bank. San Michele is one of the most useful and best conducted charitable establishments of Rome, and is inhabited by above 700 persons. It consists of a workhouse, or house of industry for poor boys and girls, of a school of the fine arts for those boys who have a taste for them, of an asylum for the old and infirm of both sexes, and of a house of correction for juvenile offenders. Along one side of this vast building is the handsome quay and landing-place of Ripa Grande, where vessels which ascend the Tiber from the sea land their goods, and annexed to which are warehouses. Below it is the Porta Portese, or gate leading to Fiumicino, which is the southern extremity of Rome on the right bank of the Tiber.

There are above 360 churches in Rome, most of which are worthy of notice, either for their antiquity, architecture, or their decorations. A few of the most interesting have been mentioned. The churches constitute one of the principal attractions of modern Rome. One of the most remarkable, the church of St. John in Laterano, remains to be noticed.

The Basilica Lateranensis, with a palace and other buildings annexed to it, is situated at the south-eastern extremity of Rome, near the walls of Aurelian and Honorius, in the older and now desolate part of the city. This group of buildings is called 'in Laterano,' from being built on the estate once belonging to Plautius Lateranus, who was put to death by order of Nero (Tacitus, 'Ann.,' xv. 60). It appears that the later emperors had a palace on the spot, and that Constantine had a church or chapel annexed to the palace. This was the beginning of the splendid church of St. John in Laterano. Constantine, or some of his successors, gave up the palace to the bishops of Rome, and the Lateran, till the beginning of the 14th century, was the residence of the popes, who enlarged the adjoining church at different times, and made it their episcopal or patriarchal church, which it continues to be. The pope, in his quality of bishop of Rome, goes to take solemn possession of it after his election, and he officiates there on certain great festivals, for which reason it is styled the head church in the world, 'Ecclesiarum Urbis et Orbis Mater et Caput.'

Many councils have been held in the palace of the Lateran, five of which are styled Ecumenic, or universal. The palace fell to ruin during the long residence of the popes at Avignon in the 14th century, and a fire broke out in 1308, which consumed the greater part of it as well as the church. The church was restored, but the palace was abandoned, and Gregory XI., when he transferred his residence to Rome in 1377, fixed his residence in the Vatican palace, which then came to be considered as the residence of the pontiffs till the 17th century, when they went to reside on the Quirinal. Sixtus V. however in 1586 ordered a new palace to be built next to the Lateran church, which was not finished until more than a century after his death, and is that which now exists. It is used at present as an asylum for the poor; and there is also a large hospital on the other side of the square. The whole vast mass of buildings called by the name of Lateran has been much changed from what it was when the popes resided here. The interior of the Basilica, or church, in its present state, was completed in the 17th century by Clement VIII. and Innocent X., and the splendid front was raised by Clement XII. The church has a nave with double aisles, and is enriched with pillars of rare marble, statues, paintings, gildings, and bronzes. The middle gate, which is of bronze, and of masterly workmanship, was taken from the Æmilian Basilica in the Forum. The statue of Constantine, under the portico, was found in the Thermæ of that emperor on the Quirinal Mount. The ceiling of the nave, which is carved and gilt, is one of the richest in Europe. The bronze mausoleum of Martin V. is erected in the nave. Among the side chapels that belonging to the Corsini family is one of the richest in Rome; the pillars, walls, and pavement are of valuable stones, and the mausoleum of Clement XII. consists of a beautiful urn of porphyry, which lay under the portico of the Pantheon. The altar of the Blessed Sacrament is adorned with four fluted columns of gilt bronze. The cloisters, which date from the 13th century, have some curious

monuments of the middle ages. In every respect the church of the Lateran is one of the most interesting in a city abounding with magnificent churches. The obelisk of Syene granite which stands in the square at the back of the church is the highest in Rome, and perhaps in the world. The whole height of the obelisk, pedestal and ornaments included, is about 150 feet. The Baptistery of Constantine, which adjoins the church, is rich in marble pillars and paintings, and it contains the oldest baptismal font in Rome. The church of St. John in Laterano is collegiate: its chapter of canons and prebendaries, instituted by Boniface VIII. in 1300, has at its head a Cardinal Archbishop.

Under the fine portico on the north side of the building, constructed by Pope Sixtus V. from designs by Fontana, is the celebrated Scala Santa, or 'Holy Staircase,' which is said to contain a number of steps from the house of Pilate, which Jesus Christ ascended, and which are held in great veneration. Pious people ascend them on their knees, and to prevent the steps from being worn out, they have been covered with boards.

East of the Lateran, and in the eastern angle of the city, stands the Basilica of Santa Croce in Gerusalemme, which was built near the Amphitheatrum Castrense by the empress Helena. It derives its name from the circumstance that a portion of the true cross is deposited in it, and that earth brought from Jerusalem was mixed with the foundations. This basilica was consecrated by St. Sylvester, and has been often repaired. Underneath the church is the chapel of St. Helena, which is decorated with mosaics. The consecration of the Golden Rose, sent by the Pope annually to one of the great Catholic sovereigns, takes place in the Basilica of Santa Croce.

The great basilicas, namely St. Peter's, St. John, Lateran, Santa Maria Maggiore, and Santa Croce in Gerusalemme, are within the walls. Outside the walls are three other basilicas of great antiquity and historical interest. 1. The Basilica of San Paolo Fuori le Mura (or St. Paul without the walls), about 4 miles from the city on the road to Ostia, was founded by Constantine the Great above the tomb of the apostle. It was rebuilt by the emperor Theodosius on the original plan, which was carefully preserved in all the subsequent repairs and restorations. This church, formerly unrivalled for its magnificence and for its collection of Christian antiquities, after divine worship had been performed in it for about 1500 years, was destroyed by fire in 1824. It has been since rebuilt, and was consecrated by Pope Pius IX. in 1854. The site of this church is exposed to malaria in the summer months. This basilica was under the protection of the kings of England before the Reformation. 2. The Basilica of San Lorenzo is a mile outside the walls on the road to Tivoli. It was founded by the empress Placidia, and entirely rebuilt by Pope Pelagius II. in A.D. 578. The portico, of six Ionic columns, four of which are twisted, is supposed to date from the 8th century. Among the vast collection of Christian antiquities in this church, which is built over the tomb of St. Lawrence, are two marble amboines, or pulpits, relics of the earliest ages of Christianity. From one of the chapels in this church there is a descent to the catacombs of Santa Cyriaca. 3. About two miles out of the city, on the Appian way, is the Basilica of San Sebastiano, which was founded about the time of Constantine, but the present structure was erected in 1611 by Cardinal Borghese. The sanctuary is famous for its relics. Under the altar of one of the chapels is the tomb of St. Sebastian. There is an entrance from this basilica to the celebrated catacombs of St. Callistus, in which the Christians of Pagan Rome met for divine worship and for concealment, and in which they buried the remains of martyrs to the faith.

The palaces of the nobility form another class of interesting objects. They are generally buildings of princely magnitude and imposing style, containing vast courts and long ranges of spacious apartments, and Rome can boast of a greater number of these than any other capital in the world. In point however of interior comfort, neatness, or splendour, most of them are sadly deficient. The walls are of Travertino, or Tiburtine stone, the pillars and staircases are frequently of marble and other costly materials. The ground-floor is either let as shops or used for coach-houses, stables, kitchens, or other menial offices, and the windows are guarded with a strong iron-grating, without glass behind it, which gives to the lower part of the building the appearance of a prison. Several of the Roman palaces are partly let to lodgers, and the owners occupy only one floor, or part of a floor; the building being too large for any single family to live in, except such as a baronial family of the feudal times with its numerous dependents. The higher and wealthier Roman nobles however, the Borghese, Colonna, Doria, Rospigliosi, and others, still retain something of that feudal state, although they have lost their feudal jurisdiction.

The villas of the Roman nobility are more pleasant than their palaces, and resemble much the country-houses of the wealthy Romans of old. Several of the villas are within the walls of Rome, such as Medici, Piombino, Mattei, and Corsini; others are outside of the walls, such as the Villa Pamfili, on the Janiculum; Villa Patrizi, outside of Porta Pia; and the Villa Madama, upon Monte Mario. The Villa Albani, although plundered by the French in 1798, has recovered so much of its treasures as to be reckoned the third museum of antiquities in Rome, and next to the Vatican and the Capitol. Cardinal Alessandro Albani, who created this noble villa and its still nobler

museum towards the middle of the 18th century, made it the business of his life; he was a man of taste and an enthusiast for antiquity and the fine arts. Among the finest sculptures are—the rilievo of Antinous, the Thetis found in the villa of Antoninus Pius at Lanuvium, the Minerva, the Jupiter, the Apollo Sauroctonos, Diogenes in his tub, the two Caryatides representing Grecian basket-bearers, the bassi-relievi of the triumph of M. Aurelius and others. The contents of the museum Albani are illustrated in the works of Winckelmann.

The Villa Borghese, on the Pincian Mount, outside of the walls, is well known for its gardens, its laurel and myrtle groves, its fine sheet of water, its temple, and hippodrome. The fine museum of ancient sculptures was sold to Napoleon I., and is now in the Louvre; but it has been partly replaced by new acquisitions.

The numerous handsome fountains form another peculiar ornament of modern Rome as works of art, independent of their utility. Rome is better supplied with good water than most continental towns, and was much more abundantly supplied in ancient times. Of the ancient aqueducts three still continue to carry water into the town, having been repaired by the popes. The first is that of the Acqua Vergine, the best in quality, which comes from near the ancient Collatia, 14 miles north of Rome: it supplies a great part of the lower town, and feeds 13 public fountains, of which those of Trevi, of La Baraccia in Piazza di Spagna, of Piazza Navona, and Farnese, are the principal. The second is the Acqua Felice, the ancient Aqua Marcia and Claudia, restored by Pope Sixtus V.: it comes from the east, and supplies the upper or eastern part of the town, and feeds 27 public fountains, of which that of Moses, near Porta Pia, that of Triton in the Piazza Barberini, and that of Monte Cavallo, are the principal. The third aqueduct, called Acqua Paola, the ancient Aletina, enters Rome by the Janiculum, and supplies both the Trastevere and the Vatican, feeding the Fontana Paolina and the splendid fountains before St. Peter's: passing the Ponte Sisto by conduits, it supplies the adjoining fountain and the neighbouring district of Strada Giulia.

The obelisks which adorn most of the squares of Rome are another peculiar feature of this city. There are no less than 12 Egyptian obelisks, most of them covered with hieroglyphics, erected in different parts of Rome. When the Romans became masters of Egypt they removed many of these monuments to their own capital, among others that of the Lateran, which is the largest now known, its shaft being 105 feet (although it has been reduced, a portion at the lower part having been cut off in consequence of being fractured), and two of its sides 9 feet 8½ inches, the other two 9 feet. This obelisk was first conveyed from Heliopolis to Alexandria by Constantine, and by that emperor's son, Constantius, brought from the latter city to Rome, where it was erected in the Circus Maximus. The shaft of the Lateran obelisk weighs about 445 tons in round numbers. Augustus also had previously brought two from Heliopolis. That which was originally placed in the Vatican Circus by Caligula, and now stands in the piazza of St. Peter's, is next in size to that of the Lateran, though supposed to have been somewhat abridged of its original dimensions. The entire height, including the pedestal and the ornament at top, is about 132 feet; the shaft itself is 83 feet, and 8 feet 10 inches square at its base, and 5 feet 11 inches at the other end.

The streets of Rome are generally narrow, like those of most old cities, but many of them are straight and regular, and the great number of open spaces, such as squares, gardens, large courts, &c., render the town generally airy. The pavement of the streets is made of selci, or small cubes of basaltic stone, not very agreeable to pedestrians, especially as there are no footpaths except along the Corso. The streets are lighted at night with gas. Rome possesses a great advantage over many continental towns, in being provided with a regular system of sewers, partly ancient and partly modern.

The lower town is subject to occasional inundations from the Tiber, which sometimes rises, in seasons of extraordinary rains, from 25 feet to 30 feet above its ordinary level, whilst a considerable part of the town is hardly 20 feet above the level.

The climate of Rome in ancient times was considered healthy when compared with the surrounding country. The dense population of the ancient city, its elevated position, the plentiful supply of wholesome water, the convenience of an admirable system of sewers, and other circumstances contributed to maintain a tolerable state of salubrity within the walls. Cicero remarks the good choice of those who built Rome in the most favourable spot in the midst of a generally unhealthy region. ('De Repub,' ii. 6.) Horace however ('Epist,' l. 7), complains of the fevers which prevailed in the month of August. The improvements made by Augustus, and the reconstruction of the town after the great fire in Nero's time, seem to have had a good effect on the salubrity of the city, and Frontinus (i. 18) observes that the increased supply of water by means of additional aqueducts had contributed to render the atmosphere purer than it was in the old times. After the fall of the empire, and the ravages committed by the barbarians, we read of the abandonment of Porto, Ostia, Ardea, and other neighbouring towns in consequence of the malaria. At the same time a gradual removal was taking place within the walls; the population, which was much diminished, was leaving the southern part of the city for the northern, the hills for the plain of the Campus Martius.

As the southern hills, the Cælian, Aventine, Palatine, and Esquiline

became abandoned, they became also unhealthy, for populousness and salubrity go together in the whole Maremma region. But still the unhealthiness of the city was, and is, much less in degree than that of the country without the walls, and especially of the lowlands towards the sea-coast. There are families and whole religious communities that live all the year round on the desolate hills of old Rome without any remarkable inconvenience, though no one would venture to spend the summer months, at least from choice, outside of the walls between Rome and the sea. The miasmata which produce the malaria, emanate from the volcanic soil of the Campagna, acted upon by the rays of a burning sun; they seem to be of a dense heavy nature, seldom rising very high above the ground unless wafted by the winds. Walls appear to stop their advance, fire dispels them, and house foundations and pavements prevent their emanation.

It seems now proved that whenever the population has decreased within Rome, from political and other causes, the air has become less wholesome, and that the thinly-inhabited districts are, independently of their situation, unwholesome in summer, when compared with the more populous parts of the town. Thus the neighbourhood of the Corso and the lower town in general, and even the low filthy quarter of the Jews, are salubrious, whilst the eastern part of the fine street of Porta Pia, the neighbourhood of Santa Maria Maggiore, and that of the Lateran are considered unhealthy in summer, although they are on comparatively high ground. The parts of the Quirinal and the Pincian which are built upon are the most desirable situations in modern Rome for fresh air and health. On the other side of the river the thinly-built district of La Lungara and the Vatican are considered unhealthy in summer, whilst the densely-peopled part of Trastevere is less complained of. The fact is, that wherever the population gets thin and miserable, the malaria will gain ground; it will take possession of houses and gardens from which the warmth of the blazing hearth, and the cheering breath of human life, and the cares of domestic industry have disappeared.

The temperature of Rome is generally mild and genial. Frosts occur in January; but the thermometer seldom descends lower than 26° Fahr., and the mid-day sun generally produces a thaw. The tramontana, or north wind, sometimes however blows cold and piercing for days together. Snow falls at times, but it seldom remains on the ground for more than a day. Orange-trees thrive in the open air; but lemon-trees require covering during the winter months. Rains are frequent and heavy in November and December, but fogs are rare. In the summer months the heat is at times oppressive, especially when the scirocco, or south wind, blows. The hour which follows sunset is considered the most unwholesome in summer, and people avoid exposure to the open air. The sky of Rome has been admired by most travellers for its soft transparent light, its ultramarine blue tinge, and the splendid colours of the sunset, which Claude has so well rendered.

Antiquities: Baths.—The Baths of Titus were constructed near the Flavian Amphitheatre about A.D. 80, on the site of the gardens of the golden house of Nero, between the Colosseum and the Esquiline. The ruins stand now in a vineyard. The Baths of Trajan, partly on the same site, and adjoining those of Titus, were commenced by Domitian and finished by Trajan: they extended towards the church of San Pietro in Vincoli, which they almost touched. (In the church of San Pietro in Vincoli is Michel Angelo's celebrated statue of Moses.) The Baths of Trajan resemble very much those of Diocletian in plan: they occupy an area of about 1100 feet by 800 feet. One of the great hemicycles near the northern angle still remains. On the shorter sides, near the eastern and southern angles, are the remains of two hemicycles with niches for statues. The long side opposite the Colosseum contains in the centre the remains of a great semicircular theatre. There are few (and those few are unintelligible) remains of the internal part of the building. Part of the golden house of Nero remains under the Baths of Trajan. In the passages and chambers of this house there are still some elegant arabesque decorations, the colours of which in many parts are still very vivid.

The Baths of Constantine were, according to Victor, in the region of the Quirinal. They were erected about A.D. 326, and were repaired in the middle of the 5th century. In 1519 some of the ruins were still in existence, but they disappeared about 1527. Palladio restored the plan, and in the reign of Clement XII. an excavation was made on their site, when a magnificent portico, with an ornamented ceiling, and walls painted with historical subjects, were discovered.

The Baths of Diocletian, situated on the Viminal, were erected by Diocletian about A.D. 302. They were of vast dimensions. The extensive and capacious ruins were adapted to the purposes of a monastery, and Michel Angelo transformed the ancient tepidarium, the caldarium, and a part of the frigidarium into a church with its dependencies. The church is called Santa Maria degli Angeli. The rest of the ruins consist of large brick masses with arches of enormous span: some of these masses still support parts of the vaulted ceiling. On a part of the site of the baths Michel Angelo constructed a spacious and elegant cloister.

The Baths of Agrippa were inclosed within the space circumscribed by the square of the Pantheon, the street of the Theatre della Valle, the street of the Stimmate, and that of Gesù. They occupied a space about 500 feet from east to west and 700 feet from north to

south. The Pantheon has been sometimes considered a part of these baths.

The Baths of Nero were situated on the ground which stretches from east to west between the square of the Pantheon and the square Della Madama. Eusebius fixes the date of their construction at A.D. 65. One hemicycle alone of these baths exists in the inn of the Piazza Rondanini.

The Baths of Caracalla, commenced about A.D. 212, and continued by Elagabalus and Alexander Severus, are situated on a prolongation of the Aventine, not far from the gate of San Sebastian. They are perhaps the most extensive ruins in Rome; but being stripped of their marbles, columns, stuccoes, and paintings, they consist only of vast and lofty walls, corbels, and niches of brick and tile, and for the ordinary spectator possess in this dilapidated state little interest. The ruins stand in three separate vineyards.

Temples.—The ruins of the temple erected by Maxentius to the memory of his son Romulus, are vulgarly called the Stables of the Circus of Caracalla. They are situated in a large inclosure forming part of the villa of Maxentius on the Appian Way, and about a mile from the gate of San Sebastian. The lower part or basement is purely sepulchral, with niches for the sepulchral urns. The ceiling is vaulted, and supported by a huge central pier.

The Temple of Vesta, situated in the Forum Boarium near the Tiber, was constructed in the time of the Antonines. It is of a pure Greek style. Twenty Corinthian columns, of which nineteen remain, surrounded the circular cella, which was formed of masonry in the Greek taste. These columns are of Parian marble, and fluted; they are raised on a series of steps, most of which have been destroyed or removed. The ancient entablature and roof are wanting, and the latter is supplied by an ugly tile covering.

The Temple of Ceres and Proserpine, rebuilt by Tiberius, and now forming part of the church of Santa Maria in Cosmedin, is situated almost opposite the circular temple of Vesta. A part of the cella constructed with large masses of travertine, and eight columns of the peristyle, remain partly walled up in the church. The fluted white marble columns are in a good style, and of the composite order.

The Temple of Fortuna Virilis, originally built by Servius Tullius on the banks of the Tiber, was burnt and rebuilt in the time of the republic. It is of an oblong figure, constructed of travertine stone and tufa, and stuccoed with a fine and hard marble stucco. The hexastyle portico of the Ionic order has been walled up between the columns, and an engaged intercolumniation is continued on the walls of the cella. The temple is placed on a high moulded basement, and was ascended by a flight of steps. The columns support an entablature, the cornice is bold, and the frieze is decorated with festoons supported by infantine figures, and intermixed with skulls of oxen and candelabra.

The Temple of Fortune is situated in the Forum Romanum, on the Clivus Capitolinus. On the entablature is the following inscription:—

SENATUS POPVLVSQVE ROMANVS
INCENDIO CONSUMPTVM RESTITVIT.

The Temple of Jupiter Tonans, situated also on the Clivus Capitolinus, was built by Augustus, and is supposed to have been restored by Septimius Severus and Caracalla. The portico was hexastyle, of the Corinthian order, and of white Luna marble. The columns are deeply fluted. Upon the frieze are carved instruments of sacrifice, and the decorations which remain indicate that the building was highly ornamented.

Of the Temple of Concord which stood near the temple of Jupiter Tonans, there remain only the ruins of the cella, which was originally covered with giallo antico and pavonazzetto. The pavement was formed of slabs of the same material, and numerous fragments discovered in the late excavations prove that it was profusely enriched with ornamental carvings and statues, and that it was also destroyed by fire.

The Temple of Antoninus Pius is in the Forum of Antoninus, now the Piazza della Pietra, and at a short distance from the Column of M. Aurelius Antoninus. Eleven large Corinthian columns, which are much injured, remain on the north side, and support a white marble architrave; the rest of the entablature, being much ruined, was restored with stucco. The columns have been walled together, and form the front of the present Custom-house, in the court of which there are several fragments of vaulting adorned with sunk panels.

The Temple of Antoninus and Faustina was erected by the senate to the emperor and his wife in the Forum Romanum. The two sides of the cella, once clothed with marble, remain, as well as the magnificent marble entablature over them. The hexastyle portico, with the return columns of the Corinthian order, each of one single piece of Carystian or Cipollino marble, still supports a considerable part of the entablature. In the frieze are griffins, candelabra, and other ornaments, in a fine style of art. On the ruins of the cella has been erected the church of San Lorenzo in Miranda.

The Temple of Romulus and Remus is a circular temple in the Forum Romanum, near the temple of Antoninus and Faustina. In the year 527, this building was used as a vestibule to the church of Santi Cosmo and Damiano, erected by Felix IV. Urban VIII. applied the present Etruscan bronze door, found at Perugia, and placed the

two antique porphyry columns, with their entablatures, in their present situations.

The Temple of Peace, called also the Basilica of Constantine, was built by Maxentius, and after his death dedicated by Constantine. This edifice, which consisted of three naves, has the northern-most till in good preservation, and divided into three great arches, embracing the whole length of the nave. The centre arch, at a later period, was altered into the form of a tribune. The vaultings of all three are decorated with enormous sunk panels and stuccoed ornaments, and the walls with niches. The southernmost nave was similar, but without a tribune. All except the indications of the piers have disappeared, as well as the great central nave, at the extremity of which was the principal tribune, of which there are only a few fragments of the vaulted ceiling on the ground. Winding brick staircases led up to the roof; one is still almost entire. The building was 300 feet long and 220 feet wide. The principal façade faced the Colosseum, and part of an external arcade remains in this direction. The pavement was of giallo antico, pavonazetto, and cipollino. At a later period this building was converted into a Christian church, at which time an entrance was formed towards the Palatine, on the Via Sacra.

The Temple of Minerva Medica was a circular domed temple of brick, erected probably about the time of Diocletian. The circumference has nine niches for statues, seven of which have been found among the ruins at different times. Only a part of its bare walls and a small portion of the dome, with the buttresses to secure it against a lateral thrust, now remain.

The Temple of Nerva, situated in the forum of Nerva, was consecrated by Trajan to the memory of Nerva; it was one of the most sumptuous edifices in Rome. Only three columns and a pilaster, partly buried in the ground, on the south side, now remain.

The Temple of the Sun, on the terrace of the Colonna gardens on the Quirinal Hill, is said to have been erected by Elagabalus. It was of gigantic dimensions, and highly enriched, if we may judge from the two great masses that are left—a part of an architrave and frieze, and the angle of the pediment. Many fragments of sculpture dug up in the gardens have been fixed in walls at the back of these two masses. The site was eminently calculated for a colossal temple, as the entire height of the building would have been visible from most parts of Rome.

The Temple of Janus no longer exists, but its site is supposed to have been the junction of the four great forums, in the immediate vicinity of the Mamertine prison, the arch of Septimius Severus, and the Basilica Pauli.

A temple for a long time called the Temple of Jupiter Stator, and afterwards the Temple of Minerva Chalcidica, is situated in the Forum Romanum, next to the site of a temple of Castor and Pollux. The ruin consists of three marble Corinthian fluted columns on an isolated basement of travertine; the columns support a part of the highly enriched entablature, which is in tolerable preservation. The proportions and execution of this fragment are the very finest, and, since the restoration of true architecture, it has served as the great model of the Corinthian order. Of the temple of Jupiter Capitolinus, originally built by the Tarquins, burnt a.c. 83, and rebuilt by Sulla, there remain only some vast substructions in the gardens of the Caffarelli Palace. A temple was built to Æsculapius on the island of the Tiber, the site of which is occupied by the convent and church of San Bartolomeo.

Gates.—Many of the gates of ancient Rome still remain, most of them having been rebuilt by Honorius or Belisarius. We mention the following:—Porta San Lorenzo, built by Honorius, A. D. 402, and called Tiburtina from its leading to Tivoli; it also opened out on the Via Collatina. This gate is attached to the monument at the junction of the three aqueducts, the Aqua Marcia, Tepula, and Julia, which bears an inscription alluding to the repairs made by Caracalla. The aqueduct called Marcia is commemorated by a coin of the Marcii, which possibly may represent the original monument.

The Porta Maggiore, situated at the spot called the 'Spes Vetus.' Here are the ancient gates of the Via Labicana and Via Prænestina, formed by the monument of the Claudian aqueduct. The magnificence of these gateways was owing, in a great measure perhaps, to the circumstance of the Claudian aqueduct passing over them. The three great inscriptions on the attic above the gateways show, first, that Tiberius Claudius, the emperor, brought to Rome the Claudian waters composed of the Cærulean and Curtian streams, and also the Aniene Nova. The second indicates the restoration by Vespasian; and the third, that by Titus. This magnificent façade consists of two great archways, and three piers, each decorated with two rusticated columns of the Corinthian order, placed on a rustic basement, and supporting an entablature and pediment. Above these is the lofty attic in which are the two water-channels. This attic is surmounted with a cornice. Severe in character, this structure is one of the best preserved, and one of the most imposing architectural masses in Rome. From this gate may be seen the four aqueducts, Julia, Tepula, Marcia, and Aniene Vetus.

The Porta San Paolo, substituted by Honorius for the ancient gates of Servius called Trigemina, Minucia, Navalis, and Lavernalis. Being built on the Via Ostiensis, it was called also Ostiensis. The present gate was rebuilt by Belisarius, who constructed it on a new level, the

ancient being 26 palms lower. The internal gate is older than the time of Belisarius, and is formed with a double arch.

The Porta del Popolo, the Flaminian Gate, the chief entrance into Rome, was built by Honorius on a site a little higher up than the present gate, towards the Pincian hill, on a slight elevation; it was removed between the 6th and 8th centuries to its present situation. The name of Porta del Popolo was given to it in the 15th century. Aided by Vignola, Pius IV. decorated the external front, after the design of Michel Angelo. The internal decoration of this gateway is by Bernini.

The Porta Latina, flanked by round brick towers, is built up in the walls near the modern gate of San Sebastiano, in the south-eastern angle of the city. On a spot near it St. John is said to have suffered martyrdom in A. D. 96. Inside the walls, between the Porta Latina and the Porta San Sebastiano, is the tomb of Scipio.

The Porta San Sebastiano, the ancient Porta Appia, presents two fine semicircular towers of brickwork resting on substructions of solid marble. Inside of it is the arch of Drusus.

The Porta San Pancrazio, on the Janiculum, is probably the ancient Porta Janiculensis. Outside the walls between this gate and St. Peter's are the grounds of the Villa Pamfili. It was here the French commenced their operations against Rome in the siege of 1849.

Tombs and Monuments.—Among the ancient tombs not the least remarkable is the sepulchre of Eurysaces the Baker, which is situated at the junction in Bivis of the Via Labicana and the Via Prænestina, close to the monument of the Claudian aqueduct. The tomb of C. Publicius Bibulus stood originally without the walls of Servius Tullius; it stands now at the extremity of the Corso, and consists of two stories, one of which is buried in the soil. This monument appears to have been erected prior to the Augustan age. The tomb of the Claudii, a mass of shapeless rubble, stands on the Via Marforio almost opposite the tomb of Bibulus.

The Pyramid of Caius Cestius, constructed in the reign of Augustus, for the ashes of Caius Cestius, and situated near the Porta San Paolo, is a pyramidal mass of masonry covered with slabs of white marble, and is erected on a basement of travertine. In the centre is a small vaulted sepulchral chamber, decorated with arabesques, of which some brilliantly coloured portions remain. At the angles are two Doric fluted columns of white marble placed on pedestals, and on one of two bases which have been discovered, was a bronze foot, which, from an inscription on the base, appears to have belonged to a statue of Caius Cestius.

The Tomb of Scipio is situated on a cross-road connecting the Via Appia and the Via Latina. The chambers are irregularly excavated in the tufa rock, and appear to have been turned into a tomb, having been originally formed for the purpose of procuring building materials. The ancient entrance consists of a rude arch upon peperino imposta, and appears to have been partly covered with stucco and painted. Over the arch is a stout moulding, upon which there was anciently a second story. Several slabs of marble with inscriptions are attached to the sides of the passages and chambers cut in the tufa. An elegant sarcophagus of peperino with a bust of the same material were found in one of these chambers, and have been placed in the Vatican.

The Tomb of Cæcilia Metella, constructed on an eminence on the side of the Appian way, a little beyond the Circus of Romulus, and dedicated to the memory of Cæcilia Metella, daughter of Quintus Metellus, and wife of Crassus, is round in form, and placed on a square basement constructed with magnificent blocks of travertine. It is surmounted with a beautiful decorated frieze and an elegant cornice, from which most probably rose a dome or a conical-formed roof, now destroyed. In its place there is a battlemented wall, built A. D. 1300, which indicates its change from a sepulchre to a fortress. In the time of Paul III. a sarcophagus was found here, which was placed in the cortile of the Farnese palace in Rome.

The Mausoleum of Augustus, constructed by Augustus, between the Via Flaminia and the banks of the Tiber, was destroyed in 1167 in a popular tumult, and became a shapeless ruin. The building was of circular form, 220 Roman feet in diameter, and was probably domed. Round the inner circumference were thirteen sepulchral chambers and an ample chamber in the centre. In the latter part of the last century the remains of this edifice were turned into an amphitheatre for bull-fights and fireworks. Two obelisks without hieroglyphics, which formerly stood at the entrance of the Mausoleum, now adorn the piazza of Santa Maria Maggiore and the Quirinal.

The Mausoleum of Hadrian, now called Castle of San Angelo, erected by Hadrian on the right bank of the Tiber, within the gardens of Domitia. This building consists of a circular tower whose present diameter is 188 feet, placed on a quadrilateral basement, each side of which is 253 feet. It was once highly decorated, but no vestiges of the decorative part remain. Procopius, who described it in the 6th century, before it was injured, says it was built of Parian marble, and adorned with statues, both of men and horses, of the same material. ('Goth.' lib. i.) Between the time of the rebuilding of the walls of Rome by Honorius and the Gothic war, it appears to have been already turned into a fortress, but without injury to the decorations. During the wars with the Goths, the Romans, being shut up in the building, were reduced to the necessity of throwing down the statues on their besiegers. In the 10th century it was fortified, and it has been since

extended and strengthened by the popes. The ancient doorway is situated immediately in front of the bridge; a spiral-way led to the sepulchral chambers at the summit of the building; part of the white mosaic floor with which the way was paved is still remaining.

Bridges.—The Pons Ælius, now Ponte San Angelo, crosses the Tiber immediately opposite the Mausoleum of Hadrian. It was constructed by Hadrian as an entrance to his mausoleum and the gardens of Domitia, in which he also built his circus. The whole of this bridge is ancient except the parapets, some trifling restorations of masonry, and a small arch on the side of the Castle of San Angelo. It consists of three large and two small arches, with buttresses attached to the piers and starlings projecting beyond them. It is decorated with modern statues.

The Pons Milvius, now Ponte Molle, on the Flaminian Way, rather more than a mile from the city. The construction of this bridge is attributed to Æmilius Scæurus, about B.C. 100. A part only of the bridge is ancient. Nicholas V. restored it in the middle of the 15th century, up to which period the extremities consisted of wooden drawbridges.

The Pons Sublicius, or Sublician Bridge, first erected by Ancus Marcius of wood, was destroyed by an inundation in the time of Augustus, and rebuilt of stone by M. Æmilius Lepidus, the censor, from whom it took the name of Æmilian. It was restored by Antoninus Pius, and in little more than six centuries after was destroyed by a great inundation of the Tiber during the reign of Pope Adrian I. The basements of the piers are visible when the water is low. From a coin of the Æmilii it appears to have consisted of three arches, and was adorned with an equestrian statue of the censor.

The Pons Fabricius, built by Fabricius, the Curator Viarum, A.U.C. 690, connects the city with the Isola Tiburtina, and is the best preserved of the ancient Roman bridges. Pons Gratianus is a continuation of the Pons Fabricius, connecting the Isola Tiburtina with Trastevere. It was constructed about A.D. 367.

The Pons Janiculensis, now Ponte Sisto, connecting Trastevere with the city above the Fabrician Bridge, appears to have been restored by one of the emperors. It was reconstructed in 1774.

The Pons Palatinus, or Senatorius, now called Ponte Rotto, was below the Fabrician and Gratian bridges, and above the Sublician; only three arches of it remain on the Trastevere side. It was first built by P. Cornelius Scipio Africanus, and was repaired by Augustus. It was a very handsome bridge, and had a roof supported by marble columns. Being carried off by a great flood, it was rebuilt by Pope Pius III., and again by Gregory XIII. in 1575; after which it broke down, and has not been repaired since.

The Pons Triumphalis, called also Pons Vaticanus, was constructed in a bend of the river near the Vatican. It is conjectured to have been built by Caligula or Nero as a means of easy access to their gardens on the Vatican. It appears to have been ruined about the 5th century: some remains of the rubble piers of this bridge may be seen when the water is low.

Theatres.—Of the Theatre of Pompey, built by and named after Pompey the Great, there are some ruins under the Palazzo Pio, near the Campo di Fiore.

The Theatre of Marcellus, built by Augustus, and dedicated to Marcellus, son of Octavia, his sister, in honour of whom he named the portico attached to this theatre. This was the second solid theatre constructed in Rome, and consisted of three orders, the upper of which is entirely lost. The remains of this building are in the Piazza Montanara, and a small part near the entrance to the Palazzo Orsini. The style of the architecture was the Palladian model of the Roman Doric and Ionic orders.

The Flavian Amphitheatre, or Colosseum, well characterised by Byron in its present state as

“A noble wreck in ruinous perfection,”

was commenced by Vespasian, in the last year of his life, on the site of the great pond formed by Nero within the extent of his Domus Aurea. The following brief description will give an idea of the exterior of this building when perfect:—Its form is that of an ellipse, the axes of which are 620 feet and 513 feet long respectively. The arena is 287 feet long and 180 feet broad. The difference between the external and internal diameters (166 feet 6 inches at each end) is occupied by four corridors and two blocks of radiating substructions—in, or between, which are the staircases and ways from the outer corridors to the inner, and to the arena, together with the concentric or encircling walls which gird the structure, separate the corridors, and inclose the arena. Two of the surrounding corridors lie together, or adjoin each other, on the outer side; and in this particular the Colosseum exceeds every other structure of the kind, all the rest having but one only; it thus acquires a second gallery, in which also it is singular. The space covered by this edifice is little short of six acres.

The outer encircling wall is pierced with 80 openings, leaving of course an equal number of piers; every opening is arched, and in or against every pier is a column projecting about half its diameter, and supporting an entablature which runs in an unbroken line all round the structure. With the exception of the four central openings, which lie on the diameters of the ellipse, and are each nearly two feet wider than the rest, all the openings are very nearly the same, their width being 14 feet 6 inches. An exactly similar series of arches, diminished

only in proportion to the smaller extent of the ellipse, separates the second corridor from the first; and another, bearing the same relation to the second series that the second does to the first, or outer, bounds the second corridor.

The external elevation of the Colosseum (which alone can be noticed, as a detailed description of the building is given in another part of the ‘English Cyclopædia’) is composed of three stories of attached or engaged columns with their usual accessories, and a pilastered ordinance, forming a species of attic, which is pierced with windows—one in every other interspace. The lowest ordinance of columns rests on the upper step of the substructions, or on the ground-floor of the structure; it is of what is termed the Doric style. The intervening arches are semicircular; they spring from moulded imposte, and have moulded archivolts on their outer faces. The second ordinance is in the Roman Ionic style, having voluted capitals to the columns; and the third is in the Corinthian or foliated style: these rest upon continued, but recessed, stylobata; their entablatures are unbroken throughout, and the arches in the intercolumniations in both correspond exactly—except in minor details—with those of the lowest or Doric ordinance. The pilasters have foliated capitals also, and are called composite; they rest on deep plinths under which there is a continued and recessed dado superimposing the Corinthian entablature; this dado is pierced with holes or small windows alternating with those of the ordinance above, to give light to the corridor behind the lower and under the upper gallery on the inside. The crowning entablature, which runs its cornice round in one unbroken line, is made bold and effective by deep modillion blocks or consoles occupying the whole depth of the frieze.

The Amphitheatre Castrensium, a small brick amphitheatre, erected probably in the first century of the Christian era. It originally stood without the walls of Servius Tullius, but during the reign of Honorius it was employed to form part of the new inclosure, and the arches were filled up. On the inside the form of a semi-ellipse on its greatest axis is all that can be discerned; but externally the engaged Corinthian columns of the lower order, with their brick capitals, are well preserved; of the upper order there only remain a pilaster and part of an arch.

Arches.—The Arch of Titus, which stands near the ruins of the Temple of Venus and Rome, was erected by Domitian in honour of Titus and his conquest of Jerusalem. It is of Pentelic marble, and of an elegant design, but with only one arch. On the sides of the piers under the arch, which is highly decorated, are two very fine bas-reliefs, illustrating the victory of Titus over the Jews. In one of them is represented the golden table, the trumpets and horns of silver, and the golden candlestick with its branches. The triumph of Titus is represented also on the frieze on the outside of the arch.

The Arch of Septimius Severus, erected A.D. 205 by the senate and Roman people, in honour of Septimius Severus and his sons Caracalla and Geta, for their victories over the Parthians and other oriental nations. This arch is also of Pentelic marble, with archways and transverse archways through the piers of the centre arch. Each front is decorated with four fluted columns, and a series of bas-reliefs. Above the attic was a marble group representing the emperor and his two sons, in a chariot drawn by six horses. The whole of the mouldings and the vaulting are highly enriched with carved ornaments.

The Arch of Constantine, erected in commemoration of his great victory over Maxentius, stands near the Meta Sudana, and fronting the Colosseum. It is formed with three archways, adorned with four beautiful columns of giallo antico on each side, and enriched with many fine bas-reliefs and statues. Above the attic was a triumphal quadriga. The roadway passes under the arch.

The Arch of Dolabella. This single arch of travertine was constructed A.D. 10, by the consuls Publius Cornelius Dolabella and Caius Junius Silanus. It stands near the church of San Giovanni and Paolo, and is thought to have been the entrance to the Campus Martialis, where the Equiria, or equestrian games in honour of Mars, were celebrated, when the Campus Martius was inundated by the Tiber.

The Arch of Gallienus, upon the site of the Esquiline gate, dedicated to Gallienus and Salonina, by Marcus Aurelius Victor. The gate is formed of a single arch, adorned with four pilasters, and flanked with two buttresses, a part of one of which remains on the side towards the church of Santa Maria Maggiore. The structure is formed of large blocks of travertine.

The Arch of Drusus, erected across the Appian Way, close to the gate of St. Sebastian, by the senate, to Claudius Nero Drusus, father of the emperor Claudius. It consists of one arch only, adorned on each side with two marble columns of the Composite order; above the entablature are the remains of a pediment, and there was also an attic. Caracalla used the arch as part of the line of his aqueduct for his Thermæ.

The Arch of Janus Quadrifrons, situated in the Velabrum, is square, 105 palms on each face, with a large arch in each front, forming an open vaulted space. In each of the piers supporting the arch are twelve niches in two rows, between which were small columns as a decoration forming a double order. The construction is formed of large blocks of white marble. The upper part is ruined. The building was held by the Frangipani as a fortress.

The Arch of Septimius Severus, situated also in the Velabrum, and close

to the Arch of Janus, is a small structure highly enriched, and consists of a single opening, square in form, and supported on broad pilasters filled with ornament. The inscription shows it to have been erected by the bankers and dealers of the Forum Boarium in honour of Septimius Severus, Julia Domna his wife, and Caracalla.

Columns.—The Column of M. Aurelius Antoninus, in the Piazza Colonna, has been already noticed.

The Column of Antoninus Pius was discovered on the Monte Citorio, in the house of the Mission, in 1709. It was of a single piece of red granite, and had a white marble pedestal, now in the Vatican gardens. The granite shaft, which was 68 Roman palms long, was used to restore the obelisks erected by Pius VI.

The Column of Trajan, formed of 34 pieces of white marble, was erected by Trajan, as a decoration to his great forum, at the west base of the Quirinal. The height represents the height of the Quirinal cut away and removed for the level site of the forum. This column, admirable both for its proportion and for the design and execution of the bas-reliefs and ornaments, which are in the best taste, was the receptacle for the ashes of Trajan. A series of bas-reliefs are round the shaft, in a spiral, forming a pictorial history of the achievements of the emperor. It is in a high state of preservation. A statue of St. Peter is placed on the pedestal at its summit, and it is ascended by a spiral staircase.

The Column of Phocas, erected in the Forum Romanum by the exarch Smaragdus to the emperor Phocas A.D. 608, is a fluted Corinthian column. On the top of the capital there was a gilt statue of the emperor. The pedestal is placed on a flight of steps of bad construction.

Forums.—The forums of Trajan, Nerva, and Augustus were situated between the Quirinal and the Capitoline. The Forum Romanum lay between the Capitoline and the Palatine; and between the west base of the latter and the Tiber was the Forum Boarium, along the north of which ran the Cloaca Maxima; and to the south, between the Palatine on the east and the Aventine on the west, was the Circus Maximus. Between the Forum of Augustus and the Forum Romanum the Via Sacra led down from the Capitol in the direction of the Colosseum, to the east of which was the street called Suburra, between the Esquiline and the Cælian hills. Northward from the Forum of Trajan was the Forum Suarium and the Forum of Antoninus, which lay between the Flaminian Way and the Quirinal. West of the Flaminian Way, and between it and the Tiber, was the Campus Martius and the Flaminian Circus. It has been before stated, that the modern city covers this part of the ancient site, and the position and extent of most of these forums are now all but unknown. The Forum of Nerva is marked by an irregular line of wall, remarkable for its height and massive masonry of travertine, set without cement. It is highly probable that the wall is much more ancient than the date of the formation of the forum. Through this wall there is an ancient archway with the masonry cut diagonally. Of the Forum of Trajan only the celebrated Column of Trajan and part of the Basilica Ulpia can be seen; the rest of the site is buried under the adjacent streets and houses. The columns of the basilica are of gray granite, and have been replaced in their respective situations. The site of the steps and pedestals at their entrance may be distinguished, and numerous fragments of marble capitals, entablatures, and ornaments are ranged round the area.

Miscellaneous.—The Mamertine and Tullian Prison, situated near the Capitol, and close to the Roman Forum, was built prior to the reign of Servius Tullius, and enlarged by him. Part of the front, 45 feet long and 18 feet high, is constructed with large blocks of tufa without cement; a part is also buried in the earth. The prison was divided into two floors, and the round hole through which criminals were dropped into the lower prison still exists. There is a tradition that St. Peter was confined in this prison by order of Nero. It underwent some repairs A.D. 23; but there is no doubt that the building is of a much more ancient time. The masonry resembles that of the Treasury of Atreus at Mycæne and the tombs of Tarquinii, and it was probably the work of ancient Etruscan workmen. The prison is now covered by the church of San Giuseppe, and is far below the level of the surrounding soil.

The Cloaca Maxima, constructed by Tarquinius Priscus about B.C. 600, is perhaps the most memorable work of ancient Rome. It was built to drain the marshes between the Palatine and Capitoline hills. The masonry is of the same massive and durable character as that of the Mamertine Prison. It is a tunnel or arched sewer, 14 feet wide and 14 feet high, constructed of vast blocks of volcanic stone put together without cement. Two parts of this great sewer only are visible, one near the arch of Janus Quadrifrons, opposite the church of San Giorgio in Velabro, and the other on the Tiber near the temple of Vesta, a little below the Ponte Rotto.

The Prætorian Camp was built by Sejanus, in the reign of Tiberius, without the walls of Servius, to the north-east of Rome, and dismantled by Constantine the Great. Three sides of the walled inclosure of a rectangular figure were joined by Honorius to his new walls, and form a large rectangular recess on the plan of Rome. The site of the camp is now a vineyard.

The Meta Sudans was a fountain placed at the point of junction of four ancient regions, and within a short distance of the Colosseum. It

was reconstructed by Domitian in the form of a cone, in the centre of a circular basin 80 Roman feet in diameter. The water came out in a jet from the top of the cone. The gladiators of the amphitheatre washed themselves at this fountain, which was repaired a few years ago.

The Portico of Octavia, built by Augustus, near the theatre of Marcellus, as a place of refuge for the spectators in the theatre from a storm. The portico, which had been burnt, was restored by the emperors Septimius Severus and Caracalla. The ruin consists of one of the principal entrances only, which had two fronts each, adorned with four Corinthian fluted columns of white marble and two pilasters, supporting an entablature and pediment. Several columns of Cipolino and Carystian marble are walled into the houses of the fish-market (Pescheria), in which the ruin is situated. A part of the portico is now used as a church.

The Palace of the Cæsars, commenced by Augustus Cæsar, on the site of the house of Hortensius, the orator, and of Catilina. Augustus added to the original dwelling of Hortensius a temple dedicated to Apollo, with a portico of Numidian columns, and also a library. This palace was extended by Tiberius towards the Velabrum to the extremity of the Palatine Hill. This part, in contradistinction to the Domus Augustana, was called Domus Tiberiana. It was increased towards the forum by Caligula, and united to the Capitol by a bridge, which was afterwards destroyed by Claudius. The Palatine not being sufficient for Nero, he extended the palace of the Cæsars over the whole of the plain between it, the Cælius, and the Esquiline, and a part even of the Esquiline itself, thus uniting the palace with the gardens of Mæcenas. This extensive palace having been destroyed by the great fire of Rome in the reign of Nero, it was rebuilt by him in a sumptuous style, and called the Domus Aurea, or Golden House. After having suffered many changes and mutilations during the reigns of successive emperors, it was much injured at the sacking of Rome by the Vandals. Yet Heraclius inhabited it in the 7th century, and in the time of Pope Constantine, in the beginning of the 8th century, the greater part of it was standing. Extensive remains of the substructions and some of the corridors still exist, especially towards the Circus Maximus. The ruins of the palace of the Cæsars stood in what is now called the Orti Farnesiani, and here may be recognised the position of a part of the palace of Augustus, of that of Tiberius, of Caligula, and of Nero. The most extensive parts of the ruins are the foundations and basements which sustained the external porticoes, and the basements of the other parts of the palace, which from time to time was enlarged. On the higher part of the hill may be seen considerable remains of the famous Palatine Library, built by Augustus, and the magnificent Temple of Apollo connected with it, and built after the victory of Actium. Towards the Circus Maximus are the foundations of the theatre built by Caligula, in the palace which he joined to the front of the house of Augustus. Near the Temple of Apollo, but below it, there are two small chambers, called the Baths of Livia, which are very well preserved, and the painting and gilding are in good taste.

The Curia Hostilia, on the southern side of the forum. Three walls only of this building remain; they were originally covered with marble, and the façade was probably decorated with columns.

The Milliarium Aureum, or Golden Milestone, from which distances were measured, stood near the temple of Saturn and close to the arch of Septimius Severus, in the Forum Romanum. It is a circular pillar on a circular basement lined with marble, and was erected by Augustus.

The Circus Maximus, situated in the valley at the south side of the Palatine Hill, was founded by Tarquinius Priscus, and restored and enlarged by Julius Cæsar. Augustus erected the obelisk of the spina. It was burnt in the great fire of Rome under Nero. Vespasian restored and perhaps enlarged it. Trajan embellished it, and under Constantine the Great it was again repaired and beautified, and his son Constantius erected the second obelisk. Of this vast edifice the general form only is distinguishable in the vineyard in which it now stands.

The Circus of Romulus, commonly called the Circus of Caracalla, is adjoining to the Temple of Romulus, and is of the same style of brick construction. This circus was consecrated by Maxentius, A.D. 311, according to the inscription upon it.

General Topography.—The part of Rome built by Romulus about B.C. 752 occupied the Palatine Hill on the eastern side of the Tiber. This town, built in a square form, was intersected by two main streets, one running from north to south, the other from east to west. This square town existed till a very late period, and was surrounded by a wall pierced by three gates. The Pomerium, that is, the precincts within which auguria could be taken, ran, according to Gellius (xiii. 14, 2), round the foot of the hill; but was afterwards extended. Towards the Capitoline and the Aventine respectively the town was surrounded by swamps and ponds. Between the Palatine and Cælian the valley was not so deep, and it contained a long tract of elevated ground called the Velia, on which side the town, being easy of access, required fortifications.

As early as the time of Romulus, Etruscan settlements existed on the Cælian Hill, and extended over Mons Cispinus and Oppius, which are parts of the Esquiline. They were compelled by the Romans to

abandon their seats on the hills, and to descend into the plains between the Cælian and the Esquiline, whence the Vicus Tuscanus in that district derived its name.

The three hills north of the Palatine, that is, the Quirinal, Viminal, and Capitoline, were occupied by the Sabines, and the last of these hills was their citadel. When the Latin and Sabine towns became united, the valleys between the hills must have been drained, and the cloaca by which this was effected belong to the earliest architectural remains of Rome. The valley between the Palatine and Capitoline was set apart as the place of meeting for the two nations (Comitium and Forum Romanum), and the boundary between the territories of the two towns was probably marked by the Via Sacra, which came down from the top of the Velia, ran between the Quirinal and the Palatine, and then making a bend proceeded between the latter hill and the Capitoline, as far as the temple of Vesta, whence it turned right across the Comitium towards the gate of the Palatine.

The Seven Hills inhabited by these three different nations were united into one town, and surrounded by a wall by king Servius Tullius. The new fortification consisted in some places of a wall, probably with towers at certain intervals; in other places the steep sides of the hills rendered artificial fortifications unnecessary, for instance on the western side of the Capitoline. The north-eastern part from the Colline to the Esquiline gate, seven-eighths of a mile in length, was fortified by a wall, or rather mound. From the border of a moat 100 feet broad and 30 feet deep, was raised a wall 50 feet wide and above 60 feet high, faced towards the moat with flagstones, and flanked with towers. Traces of this gigantic work are still visible. The walls of Servius were above six miles in circuit and had above 20 gates, the sites of almost all of which are determined. They included considerable tracts of land which were not occupied by buildings, but were either pasture-grounds or covered with wood or thickets, such as great parts of the Esquiline and Viminal. It was however principally the inner space near the wall itself which was not occupied by buildings until a very late period.

Many great buildings were erected at Rome during the kingly period. The great temple of Jupiter was on the Capitol. The prison of Tullius, called Carcer Tullianus, or Mamertinus, was at the eastern foot of the Capitoline. The Circus Maximus was between the Palatine and the Aventine. The Forum Romanum was between the Palatine and Capitoline. The Cloaca Maxima carried the waters of the Velabrum and the Forum Romanum into the Tiber, and is still a stupendous work. Of the wall of Servius Tullius few traces remain; but it existed in the 8th century of Rome.

About 120 years after the establishment of the republic, when the city was taken by the Gauls, the whole was consumed by fire, with the exception of the Capitol, a few houses on the Palatine, and some of the works above enumerated, the magnitude of which saved them from destruction. The hasty mode in which the city was rebuilt explains the fact that down to the time of Nero the streets of Rome were narrow, irregular, and crooked, and, in point of beauty and regularity, Rome was far inferior to most of the other great towns in Italy. Down to the 5th century of the city, private houses were generally covered with shingles, and there continued to be a number of groves within the walls of the city. But towards the end of the period, which is comprised between the Gallic conflagration and the end of the second Punic war, Rome began to be embellished with temples, which however, both as to material and architecture, were far inferior to the temples of Greece. High roads and aqueducts also began to be built. The streets of the city itself were not paved, though we have no reason to suppose that they were neglected. At a somewhat later period we find public places, streets, and walks under the porticoes, commonly paved with large square blocks of tufo or of travertine. In the year B.C. 176, the censors ordered the streets of the city to be paved with blocks of basalt, which were laid on a stratum of gravel, such as is still visible in a part of the Via Appia. At the time of the war with Hannibal, the district near the river, between the Capitoline and Aventine, was almost entirely covered with buildings.

The private houses had from the earliest times been very simple in structure; but after the conquest of Greece, and more especially of Asia, individuals began to build their dwellings in a magnificent style, and the taste for splendid mansions and palaces increased so rapidly, that a house like that of Crassus, which at first was universally admired for its splendour and magnificence, in the course of a few years was lost among superior buildings. Public edifices however still remained the chief objects of the pride of the Romans. Theatres were erected in several parts of Rome during the last century of the republic. During the civil wars between Marius and Sulla the number of houses had increased to such a degree, that the walls of Servius Tullius in several parts lay within the city itself.

Of all the splendid buildings which were raised during the latter part of the republic scarcely any traces exist, and Augustus might well say that he had changed Rome from a city of bricks into one of marble; for the roads, aqueducts, and public buildings of every description, temples, arcades, and theatres, which were raised during his long and peaceful reign were almost innumerable. The whole plain between the Quirinal and the river became a new town, which in splendour and magnificence far surpassed the city of the hills: this

new town was one mass of temples, arcades, theatres, and public places of amusement, not interrupted by any private habitations. Aqueducts for the purpose of supplying the city with water had been built as early as the year B.C. 813, and the first (Aqua Claudia) was begun by Appius Claudius. It ran almost entirely underground, and conveyed the water from a distance of about eight miles in the direction of the Porta Capena into the city. Other aqueducts were constructed, but it was not until the imperial period that this kind of architecture reached perfection, and most of the remains which are still extant belong to the period of the empire. They were mostly built upon arches which had an easy inclination, so that the water ran gently from its source towards the city. Each of the 14 Augustan regions, according to a survey taken in the reign of Vespasian, contained 19, or, according to a later account, 22 vici, with as many sacella in places where two streets crossed each other. Each vicus seems on an average to have contained about 230 dwelling-houses, so that every region contained rather more than 4500. About one twenty-fifth part of this number of houses were 'domus,' that is, habitations of the rich (palazzi), with a portico in front and an extensive inner court (atrium). The remainder consisted of 'insulae,' that is, habitations for citizens of the middle and lower classes: they had no portico in front, but mostly an open space which served as a shop or workshop. In the interior they may have had a court, but of smaller extent than the atrium of a domus. The number of these insulae was about 44,000. All Roman houses were very high. Augustus fixed 70 feet and Trajan 60 feet as the height, above which none were allowed to be built; and the upper story was generally of wood. It was a law of the Twelve Tables, which also occurs in the Roman legislation of later times, that no two houses, whether domus or insulae, should be built closely together but that an open space of five feet should be left between them.

Tiberius, besides completing many of the buildings of his predecessor, began the Prætorian camp on the north-east side of the city, in the Campus Viminalis, and surrounded it with high walls. The wealthy Romans at this time had their palaces principally in the eastern districts, from the Porta Collina to the Porta Cælimontana; they did not however form streets, but lay in gardens within the fields between the high roads which issued from the city; and hence they are generally called Horti, as Horti Mæcenatis, &c. All that had been done for the embellishment of the city previous to the reign of Nero was eclipsed by the magnificent buildings of this emperor; but the greater part of these works, together with those of former days, perished in the conflagration which took place in his reign. In his restorations the face of the city assumed a totally different aspect. On the ruins of the temples and the imperial palace on the Palatine rose the so-called Golden House of Nero, which occupied a space equal to a large town. The greatest care was taken to make the new streets wide and straight, and that the buildings should not exceed a reasonable height. In order to render possible the execution of the regular plan the several quarters of the city were measured, and the heaps of ruins were removed and conveyed in ships to Ostia, to fill up the marshes in its vicinity. All the new buildings were massive, and constructed of the fire-proof peperino, without the old wooden upper story. The width of the new streets rendered it necessary to extend the city beyond its former limits. Some time afterwards, in the reign of Vespasian, a measurement of the circumference of Rome was taken, according to which it amounted to 13½ Roman miles. The subsequent emperors continued to increase and embellish the city; but under Commodus a great part was again consumed by a fire which destroyed all the buildings on the Palatine. Septimius Severus exerted himself to restore the parts which had been burnt, and to ornament the city, and some of his buildings are still extant. But the grandeur and magnificence of the thermæ of Caracalla, south of the Porta Capena, surpassed all the works of his predecessors. Almost all the great buildings, or their remains, which still exist at Rome, belong to the period between Nero and Constantine.

The most extensive work of this latter period is the immense wall, with its numerous towers, with which Aurelian surrounded the city. The work, which was completed in the reign of Probus (A.D. 276), does not however enable us to form a correct estimate of the real extent of the city, as the objects of the fortification may have rendered it necessary to inclose parts which were not covered with buildings. The Janiculum, which seems to have been fortified from the earliest times of the republic, was now for the first time included within the city walls, together with the Regio Transtiberina. The whole circumference of these new fortifications was about 21 miles. In the time of Honorius some parts of this wall which were decayed were restored. Though the present walls do not much exceed the height of 15 or 20 feet on the inside, owing to the accumulation of rubbish, they are in many places as much as 50 feet high on the outside.

After the time of Constantine, when the emperors and the Roman nobles had adopted the Christian religion, the decay and destruction of the ancient edifices commenced. The building of numerous churches was the immediate cause of this destruction. Neither the court nor private individuals possessed sufficient wealth to raise buildings equal in form or material to those of their ancestors, and as heathen temples could not always be converted into Christian churches, they were generally pulled down, and the materials used for other purposes. During the 5th century of our era great calamities were

inflicted upon Rome by the ravages of the northern barbarians. The buildings destroyed at the capture of the city by Alaric were near the Porta Salaria, where the enemy entered. There are in this part still some remains of the house of Sallust which was destroyed on that occasion. A harder fate befell the city in 456, when it was taken by the Vandals, who sacked it for fourteen days; but the buildings seem to have suffered little, the precious metals being the main object of the cupidity of these barbarians, as well as of the followers of Alaric. Theodoric and his immediate successors not only took the greatest care to preserve what remained, but even exerted themselves to restore the public buildings which had suffered or were beginning to decay. The population however rapidly decreased during the 5th century, and became impoverished, so that towards the end of the century the suburbs around Rome seem to have no longer existed, with the exception of that which had arisen between the northern extremity of the Janiculum and the Vatican. Rome was thus confined to the walls of Aurelian and their restoration by Honorius, and even within its precincts extensive districts were uninhabited. The most remarkable buildings of former days indeed still existed, but after the reign of Theodosius they were entirely neglected; and thus one after another they fell into decay and ruin.

Historical Sketch.—The history of Rome is not a fit appendage to a short topographical article: no more can be done here than merely enumerate a few of the chief dates and occurrences. Rome, founded by Romulus on the Palatine Hill, B.C. 753 or 752, was governed by kings in the interval between the year just mentioned and B.C. 510. The seven kings were—Romulus, B.C. 753-714; Numa Pompilius, 716-673; Tullus Hostilius, 673-641; Ancus Marcius, 641-616; L. Tarquinius Priscus, 616-578; Servius Tullius, 578-534; Tarquinius Superbus, 534-510. During the regal government, the history of which rests mainly on the authority of popular traditions, the foundations of the most valuable institutions of Rome were laid—the senate, military organisation, assemblies of the burghers (who had the power to accept or reject the laws passed by the senate), a respect for law, and a system of colonisation were established. At the close of the kingly period Rome was mistress of nearly all the tribes of Latium and of a part of the Sabine territory. In the territory of the Volsci, the first two Roman colonies, Signia and Circeii, were founded, though Ostia, founded by Ancus Marcius, is also sometimes called a Roman colony. On the Etruscan side of the Tiber, Rome was in possession of the Janiculum, which was probably fortified. From the first treaty of Rome with Carthage, which was concluded in the first year of the Republic in B.C. 509, we must conclude that the Romans had already formed important mercantile connections with foreign nations. (Polyb., iii. 22.)

The abolition of the kingly power and the establishment of the republic did not produce any other material change in the constitution of Rome. The plebeians derived scarcely any benefit from it, but the patricians extended their power, inasmuch as they appointed, in the place of a king, two magistrates, originally called Prætors and afterwards Consuls, who were proposed by the senate and appointed in the *comitia centuriata*. Patricians only were eligible to this and the other great offices of the state. With the exception of the office of high-priest (*pontifex maximus*), which was transferred to the *rex sacrificulus*, the consuls possessed all the rights and privileges as well as most of the insignia of the former kings; but their office was only annual, and upon its expiration they might be called to account for their conduct. On the termination of their office, they returned indeed to a private station, but as members of the senate they still retained some influence in the administration of the republic.

The principal event after the banishment of the Tarquins was the war with the Etruscans under Porsena, in which the Romans suffered very severely. The war with the revolted Latin cities followed (B.C. 500-496), and ended with the battle of the Lake Regillus, when the Romans again became masters of Latium. The contests between the patricians and the plebeians, who had never been allowed to exercise the rights conferred upon them by the constitution of Servius Tullius, broke out at the commencement of the Latin war, when they refused to take up arms. The struggle was afterwards embittered by disputes about the public lands taken from the conquered people which the patricians held in their exclusive possession. At last B.C. 493, the plebeians, exasperated by the oppression under which they lived, seceded from Rome, and took up a fortified and threatening position on the Mons Sacer. The senate in great alarm granted their demands: two, or according to others, five plebeian tribunes (*tribuni plebei*) were created to protect their order, and two other plebeian magistrates, called *ædiles*. The most important concession however was that which the plebeians shortly afterwards obtained, the right of summoning before their own *comitia* (*comitia tributa*) any one who violated the rights of their order, and in the year B.C. 471 the tribune Publilius Volero succeeded in procuring for the plebeians the right to elect their own magistrates without any interference on the part of the patricians, to deliberate and make laws in their own *comitia* (*plebiscita*), which indeed were not binding as *leges*, but still must have had a considerable influence, being the declared will of the commonalty. In B.C. 451-2 the laws of the Twelve Tables, the basis of Roman law, were promulgated. The *connubium*, or right of intermarriage with the patricians, was obtained by the plebeians in B.C. 445

through the tribune Canuleius, who also made an attempt to divide the consulship between the two estates. But the plebeians were not admitted to the consulship till B.C. 366, and between this time and B.C. 300, all the other great civil and religious offices were open to them.

During the long struggle between the patricians and the plebeians the arms of Rome were kept in constant activity by the wars with Fidense, which was destroyed in B.C. 426, and with the Æquians, who were defeated in B.C. 418 at the foot of Mount Algidus. The war with Veii lasted for several years, and in B.C. 396 this wealthy city was taken by M. Furius Camillus. The Gauls, in B.C. 390, completely defeated a Roman army on the small river Allia. They then advanced upon Rome, took and burned the city, and laid siege to the Capitol, but were induced, by an inroad of the Veneti into their own territory, to return home. Though the city was soon rebuilt, its weakness encouraged the Æquians, Volscians, and Etruscans to renew their hostilities; but they were conquered by Camillus. The Hernicans and Latins also endeavoured to shake off their alliance with Rome. The former, after a series of campaigns and reverses, were completely subdued in B.C. 306; while the Latins, induced by the repeated incursions of the Gauls, soon renewed their alliance with Rome.

The treaty with Carthage was renewed in B.C. 348, probably on account of the Greek pirates, who about this time infested the coasts of Latium. (Livy, vii. 27.) The great power which the Romans had gradually acquired and shown in the various contests with their immediate neighbours, now began to be displayed in the war against the Samnites, which lasted from 343 to 341 B.C., and ended in a treaty with Rome, whose power now began to raise apprehension throughout Italy. The Latins were the first who showed this feeling; a war with the Latins was the consequence, and a continuation of that against Samnium. The Romans were successful against both, and in B.C. 338 all Latium was subdued.

In the second Samnite war, which lasted from 326 to 315 B.C., a Roman army marched into Campania, Palessopolis fell in B.C. 326 by treason, and Neapolis opened its gates to the enemy. Apulia submitted to Rome in B.C. 318. The Etruscans, Umbrians, and Gauls now rose successively against Rome, and the Marsians, Pelignians, Æquians, and Hernicans made common cause with them. But the Romans subdued them all. The Samnites in the meanwhile entered into an alliance with the Etruscans, Umbrians, and Gauls, against Rome, and thus commenced their third war, which lasted from B.C. 295 to 290, when they were compelled by M. Curius Dentatus to make peace. All Latium, Etruria, Campania, Samnium, a great part of Apulia, and several other Italian nations now submitted to the overwhelming power of Rome.

The war with Pyrrhus and the Tarentines lasted from 281 to 275 B.C., and three years afterwards Tarentum surrendered to the Romans, and Rhegium also soon fell into their hands. The war with Tarentum made the Romans masters of the whole of the southern peninsula; and all Italy, from the Sicilian Straits to the river Maera in the north of Etruria, now recognised the supremacy of Rome in B.C. 265. Colonies, chiefly Latin, that is, colonies which had inferior rights to the Roman colonies, were established in various parts to ensure the submission of the conquered nations, and the Italian states and towns either received new constitutions or retained their old ones, modified according to the circumstances under which they had submitted to Rome. Some towns however, such as Capua, seem to have remained almost independent states.

The first Punic war lasted from 264 till 241 B.C. At its termination Rome had gained possession of Sicily and the adjacent islands; and Sicily became the first Roman province. In B.C. 238 the Romans took possession of Sardinia, and soon after Corsica was subdued. Between 233 and 222 B.C. the Cisalpine Gauls were subdued, Mediolanum taken, and colonies planted in Cremona and Placentia. A year after this event Istria was added to the Roman republic, and by B.C. 219, the Romans were masters of the whole coast of Illyricum.

The second Punic war, which was caused by the siege and capture of Saguntum by Hannibal, lasted from 218 till 202 B.C. This period is marked by the march of Hannibal across the Pyrenees into Gaul, his passage of the Alps, and his victories on the Ticinus, the Trebia, and the Lake Trasimene, the complete overthrow of the Romans at Cannæ (after which fortune forsook the great African leader, who was henceforth held in check by Fabius Maximus and Marcellus), the destruction of Hasdrubal's army on the Metaurus in B.C. 207, the invasion of Africa by Scipio, and the defeat of Hannibal at Zama, which closed the war (B.C. 202). To gain peace Carthage submitted to give up her fleet; to pay 10,000 talents, to retain only her possessions in Africa; to make no war without the consent of Rome; and to restore to Masinissa all his hereditary possessions.

Philip III., king of Macedonia, after the battle of Cannæ, had concluded a treaty with Hannibal. This led to the first Macedonian war, which lasted from B.C. 214 till 205, and was carried on with little vigour. A second war with Macedonia lasted from B.C. 200 till 197, and was terminated by the battle of Cynoscephalæ, gained by Quintus Flaminius, by which the power of Macedonia was broken, and Philip became a vassal of Rome. Soon after followed the war with Antiochus (B.C. 192), which was carried on in Greece and in Asia; the battle of Magnesia decided the victory, and the power of Syria was broken.

Perseus, the successor of Philip III. in Macedonia, who had inherited

his father's hatred of the Romans, declared war against them in B.C. 171. This war was at first very unfortunate for the Romans, but in B.C. 168 L. Æmilius Paulus decided the fate of Macedonia in the battle of Pydna.

The third Punic war lasted from B.C. 149 to 146, when the Romans razed Carthage to the ground (B.C. 146), and her territory became a Roman province under the name of Africa. Macedonia was next reduced to the form of a province; and the same fate befel Greece after the fall of Corinth in B.C. 146. The discontented Spaniards, headed by Viriathus, carried on war with the Romans for many years with varying success, from B.C. 148 till 140. After the death of Viriathus in the latter year the Romans penetrated as far as the western coast, but the natives nevertheless did not submit. Numantia, which offered the most determined resistance, was totally destroyed in B.C. 133. Spain then became apparently quiet, and Roman commissioners arranged the affairs of the country. Attalus, the last king of Pergamus, left, in B.C. 133, his kingdom as an inheritance to Rome; the disputes arising out of this gift led to the reduction of Asia into the form of a province (B.C. 129). How completely the old distinction between patricians and plebeians had disappeared during these incessant wars, may be inferred from the fact, that in B.C. 172 both the consuls, and in B.C. 131 both the censors, were plebeians. Ever since the wars of Hannibal, the number of plebeian senators had exceeded that of the patricians. The citizens were either exorbitantly rich or in absolute poverty. The illustrious families had almost monopolised the lucrative offices of the republic, and the small landowners, on account of the constant wars, had been compelled to neglect their fields, and in numerous cases had sold them to the nobles. Such reduced persons wandered about homeless, with their wives and children, and lived in extreme poverty. (Plut. 'Tib. Gracchus,' c. 9.) The only remedy was to provide this multitude of destitute citizens with lands, and to raise them to the station of an independent middle class. This was undertaken by the two brothers, Tiberius and Caius Gracchus, who proposed to relieve the people by an equitable distribution of the public lands and by the leading out of colonies. The aristocratic party gained the victory over the Gracchi, but it was gained by crime and bloodshed. Several regulations of the agrarian law were abolished, the nobles still extended their possessions by purchasing the smaller portions of the poor, and expelled the impoverished peasantry. The large estates of the nobles were cultivated by an enormous number of foreign slaves, whom the long wars of the Romans had brought into Italy. (Appian, 'Civil,' i. 27.)

Jugurtha, the usurper of the kingdom of Numidia, in B.C. 106 was brought to Rome in triumph, and C. Marius, the conqueror of Jugurtha, annihilated (B.C. 102) the whole body of the Teutones near Aquæ Sextis, and in the following year the Cimbri in the Campi Raudii. These barbarians had been hovering over the northern frontiers of Italy since B.C. 113, and had defeated several Roman armies sent against them.

The demand of the Italians to be admitted to the Roman franchise led (B.C. 91) to the bloody and destructive Social or Marsian war. The Italians, seeing that there was no hope of gaining their object, intended nothing less than to destroy Rome, to establish a new Italian republic with a senate of 500 members and two consuls, and to make Corfinium under the name of Italica its centre and capital. The Latins and Umbrians remained faithful to Rome, and obtained, together with some other places in Etruria, the Roman franchise by a Lex Julia. In the first campaign the Romans were unsuccessful, but Cn. Pompeius Strabo defeated the Italian allies at Asculum, which he took and destroyed (B.C. 89). The Italians gradually submitted, and received the franchise, and thus the great mass of the inhabitants of the peninsula became Roman citizens. The province of Gallia Transpadana received in the same year by the Lex Pompeia the Jus Latii, that is, those political rights which the Latins had possessed previous to receiving the full franchise; but did not obtain the Roman franchise till Julius Cæsar became dictator.

The war against Mithridates and the civil war between Marius and Sulla followed. The first Mithridatic war lasted from B.C. 87 to B.C. 84. After its conclusion Sulla returned to Italy, forced his way to Rome, and was made perpetual dictator (B.C. 82). In B.C. 83 the second Mithridatic war broke out, in which the Romans were defeated, and in B.C. 81 they concluded a peace. In B.C. 74 Mithridates commenced the third war against the Romans, which led to the complete subjugation of all Asia Minor, Syria, and Phœnicia. Other Roman generals in the meantime advanced into Mœsia as far as the Danube, and on the northern coast of the Euxine as far as the river Don and the Palus Mœotis, or Sea of Azof. In B.C. 63 Rome was saved by the watchful care of Cicero from the destruction with which the conspiracy of Catiline threatened it. Between B.C. 58 and B.C. 50 Cæsar completed the conquest of Gaul; and in B.C. 56, by the treaty of Luoca, the Roman world was divided among Cæsar, Crassus, and Pompey (first triumvirate); and when Pompey, as sole consul (B.C. 52), placed himself at the head of the republic, the civil war between him and Cæsar broke out which was decided in B.C. 48 by the battle of Pharsalus. Cæsar, who had now become dictator, defeated the remains of the Pompeian party, and then endeavoured to restore order in Italy; but he was assassinated in B.C. 44. His opponents, whose republican spirit had survived the republic, were unable to restore it; and in the

GEOG. DIV. VOL. IV.

following year a second triumvirate was formed by Octavianus, Antony, and Lepidus, whose object was the total destruction of the republican party. This object they pursued by proscriptions and a series of despotic and cruel measures, until they began to quarrel with one another. Their quarrels led to a new civil war, which ended in the battle of Actium, and placed Octavianus (Augustus) at the head of the Roman world. Thus ended the Roman republic.

The Roman republic at the time of its dissolution comprehended the following countries, which were for the most part administered as Roman provinces:—Italy and all the islands by which it was surrounded; all Gaul as far as the Rhine; nearly all Spain, Illyrium, Pannonia, Dalmatia, Greece with all the islands of the Ægean, Thrace, Mœsia (the Danube here formed the boundary): in Asia all the countries between the Caspian Sea, the Parthian empire, the Persian and Arabian gulfs, the Mediterranean and the Caucasus, that is, Colchia, Iberia, Armenia, Syria, Palestine, Phœnicia, nearly the whole of Asia Minor, the whole of the northern coast of Africa, Mauritania, Numidia, the territory of Carthage, Cyrenaica, and Egypt. In some of these countries however the power of Rome was not firmly established until the imperial period.

The imperial period comprises the interval from the accession of Augustus to the deposition of Romulus Augustulus, that is, from B.C. 30 to A.D. 476.

Augustus gradually concentrated in his own person all the great offices of the republic, though the officers themselves, mere shadows of former days, still continued to be appointed. He thus in effect acquired the sovereign power, being free from all responsibility. He had the right to raise armies, to impose taxes, to decide on peace and war; he had the command of all the legions, and the power of life and death over all Roman citizens, both within and without the city. The senate, after the removal of those whom Augustus had reason to fear, was filled up with individuals who were his mere creatures. Tiberius indeed restored to the senate part of its former power, but the more the influence of the soldiers increased the more that of the senate declined, which body, as a compensation for this loss, was made a high court of justice, which took cognizance of offences against the state or the person of the emperor. No provision was made for a regular succession; the first five emperors all belonged to the Julian and Claudian families. The succession depended upon the will of the actual emperor, who appointed his successor either by adoption or by giving him one of the titles, Cæsar and Princeps Juventutis; or by making him his colleague in the quality of tribune or proconsul. In cases where no person was designated the senate exercised the right of election. But this privilege was soon assumed by the soldiers, who proclaimed the emperors, and the sanction of the senate became a mere form. The numerous body-guards of the emperors (prætorians), who in their stronghold (prætorian camp) formed as it were a new Capitol, in effect possessed the sovereign power; and on some occasions they sold the empire to the best bidder. The numerous legions in the provinces too soon became acquainted with this secret of despotism, and availed themselves of it.

The Roman empire, notwithstanding its vast extent at the end of the republic, still continued to increase. Vindelicia, Rhætia, Noricum, Pannonia, and Mœsia were completely subdued, and made parts of the empire. The Danube was made the boundary in these parts, to secure the empire against the incursions of the barbarians. The subjugation of Spain was completed by the submission of the warlike Cantabrians. In Germany conquests were also made, but more with a view to secure Gaul than to acquire any new possessions in that country; and the Rhine may be considered as the frontier on that side of the empire. In the reign of Trajan the empire attained its greatest extent; Dacia, Assyria, Mesopotamia, Armenia, and Arabia were made Roman provinces; but some of these conquests were soon given up, and the Danube and the Euphrates became the boundaries of the empire. Britain and the southern part of Scotland had been made a province in the reign of Nero. But the internal weakness, resulting from the imperfect union of so many countries and nations, rendered it impossible to repel the incursions of the barbarians by whom the empire was harassed from about the close of the 4th century. During this period one country was lost after another, and Italy itself was invaded by the Huns under Attila (A.D. 452). In the year A.D. 476 Odoacer, an officer of the imperial guards and a Goth by birth, dethroned the last emperor Romulus Augustulus, and was saluted by his army King of Rome. The Roman senate implored his protection, and Zeno, the emperor of the East, raised him to the rank of a Roman patrician. Thus ended the Roman empire in the west.

Long before this event the necessity of dividing the unwieldy mass of the empire had been felt, and since the time of Diocletian a division had been made for the purpose of facilitating the administration. Constantinople, founded by Constantine A.D. 323, had become the capital of the eastern part of the empire; but it was not until after the death of the elder Theodosius (A.D. 395) that the division into the Eastern and Western empires became permanent: the two parts however were intended to form one whole. The line of demarcation between the two empires was the Danube, from a little above Pesth down to where it receives the Drave, then the small river Drinus (Drino), and a line drawn past the town of Scutari towards the great Syrtia, near the coast of Cyrenaica. All the countries east of this line

belonged to the Eastern empire, and those west of it to the Western empire. The capitals, Rome and Constantinople, had each its senate, with equal privileges; but the bond of union between the two empires was weakened by the course of events, and they soon began to feel jealous of each other. The emperors of the East contrived to avert the invasions of the barbarians, and to turn their attention to the West, which, being also more exposed to such invasions, was destined to fall first; the Eastern empire, which had the advantage of a more favourable position for its capital, and had also greater means and better armies, prolonged its existence for many centuries. And even after it had lost all its provinces, and was confined to a very narrow space, it nevertheless maintained itself in this wretched condition until the year 1453, when Constantinople was taken by the Turks under Mohammed II.

The following is a chronological list of the emperors of Rome:—

		A.D.			A.D.	A.D.
Augustus	B.C. 30—14	Maximianus	235—238	
Tiberius	A.D. 14—37	Gordianus	238—243	
Caligula	38—41	Philippus	243—249	
Claudius	41—54	Decius	249—251	
Nero	54—68	Trebonianus Gallus	251—253	
Galba, Otho, Vitellius	68—70	Valerianus & Gallienus	253—260	
Vespasian	70—79	Gallienus & Odenathus	261—268	
Titus	79—81	M. Aurelius	268—270	
Domitian	81—96	Aurelianus	270—275	
Nerva	96—98	Tacitus	275—276	
Trajan	98—117	Annius Florianus	276	
Hadrian	117—138	Aurelius Probus	276—282	
Antoninus Pius	138—161	Carus	282—284	
Marcus Antoninus	161—180	Diocletian & Maximianus	284—305	
Commodus	180—192	Constantius	305—306	
Pertinax	193	Constantine	306—337	
Julianus	193	Constantius	337—361	
Septimius Severus	193—211	Julianus	361—363	
Caracalla	211—217	Flav. Jovianus	363—364	
Macrinus		Valentinianus	364—378	
Elagabalus	218—222	Theodosius	378—395	
Alexander Severus	222—235				

Western Empire.

	A.D.	A.D.
Honorius	395—423
Joannes	424—425
Valentinianus	425—455
Maximus	455
Avitus	455—456
Majorianus	457—461
Libius Severus	461—465
Procopius Anthemius	467—472
Glycerius	473—474
Nepos	474—475
Romulus Augustulus	475—476

Eastern Empire.

	A.D.	A.D.
Arcadius	395—408
Theodosius II.	408—450
Pulcheria & Marcianus	450—457
Leo I.	457—474
Leo the Younger	474
Zeno	474—491
Anastasius I.	491—518
Justinus I.	518—527
Justinian I.	527—565

Odoacer, who as before stated deposed Romulus Augustulus A.D. 476, fixed his residence at Ravenna, and professed to govern Italy in the name of Zeno, emperor of the East. In A.D. 490, Odoacer after being repeatedly defeated by Theodoric, chief of the Ostrogoths, shut himself up in Ravenna, in which he was besieged for more than two years, during which all the rest of Italy submitted to Theodoric. At last Odoacer surrendered through famine, in February, 493. Theodoric made his entrance into Ravenna, and was received by the archbishop at the head of his clergy. At first he treated Odoacer with kindness, but he afterwards caused him to be put to death.

Theodoric obtained the investiture of the kingdom of Italy from the emperor Anastasius, fixed his residence at Ravenna, and founded the gothic dynasty in Italy, which lasted till 552, when Totila was defeated and slain at the battle of Tagina, in Umbria, by the imperial forces of Justinian commanded by Narses. During the wars of Justinian against Totila for the recovery of Italy, Rome was frequently besieged and occupied successively by Belisarius, Totila, and Narses. Narses soon after defeated Teias (one of the Gothic generals who had been elected king at Pavia) near Nucera in Campania; and from this time Rome and Italy were governed by Exarchs, who resided at Ravenna. Under the wise administration of Narses, Rome recovered from the long calamities that it had suffered during the Gothic war. It escaped the devastating incursion of a large party of Franks and Alamanni, who overran Italy to its southern extremity, but were defeated with great slaughter by Narses on the banks of the Volturnus, after which Narses returned in triumph to Rome with an immense booty. Narses after being deposed from his government at the instigation of the Romans, came at their invitation to reside in the city, and died quietly at Rome in 568, being then above 90 years of age.

The Exarch, having fixed their residence at Ravenna, made a considerable change in the administration of Italy. The annual consulship, which had been perpetuated from the time of the ancient republic, fell into disuse after the year 541. During the Gothic war, Basilius was the last consul appointed. But the distribution and the names of the provinces had remained the same as under Constantine,

and they were administered by consules and præsides. Longinus however abolished these magistrates, and instead of them sent an officer called Dux to each town or district, who was changed every year. Rome was not in this respect more privileged than the rest; it had its duke, or patrician, as he is sometimes called, who was sent from Ravenna. Hence the name of Duchy of Rome. Rome however retained its internal municipal administration and laws, and the clergy and bishop of Rome began to exercise a greater influence in temporal matters than they had done under the Gothic kings. [PAPAL STATES.]

The Longobards occupied a great part of Italy, but they never took Rome, although they threatened and besieged it several times during the two centuries that their power lasted. This remarkable fact may be partly explained by the circumstance of Rome being doubly protected by the presence of her bishop, who was highly venerated in all the west, and by the temporal jurisdiction exercised over it by the Greek emperor. The Longobards never formed a compact kingdom; they did not possess all Italy, as the Goths had; the eastern emperors retained a considerable part of the country, and their power, though distant, was still considered formidable.

A rupture between Luitprand and the Romans, brought on by the demand of the former for the surrender of a fugitive, and the devastation by the Longobards of part of the Roman duchy, induced Pope Gregory to send for support to Charles Martel, about the year 740, with presents and the keys of the sepulchre of St. Peter, and with an offer of transferring the allegiance of the duchy of Rome from the emperor to him, provided Charles would protect Rome against the Longobards. This was the beginning of the connection of the popes with the kings of France. On the death of Gregory, his successor, Zacharias, adopted a different course of policy, and, instead of applying for assistance from beyond the Alps, sent an embassy to King Luitprand, to beg of him to let the duchy of Rome have peace. Subsequently, Pope Zacharias had an interview with Luitprand at Orta, when the king received him with great honours, released all the prisoners made in the preceding war, and restored several towns and domains belonging to the duchy of Rome which he had occupied, but he gave them in writing as a donation to St. Peter. Pope Stephen succeeded Zacharias (753); after some useless remonstrances with Astolphus, the Longobard king, who demanded the submission of the duchy of Rome, the Pope then went to France, where he crowned Pepin, the son of Charles Martel, king; and at the same time pleaded his cause so well with Pepin against the Longobards that Pepin entered Italy with a large army. Astolphus shut himself up in Pavia. After a short siege a treaty was concluded, by which Astolphus promised to leave Rome in peace, and to restore the towns of the duchy which he had seized. Astolphus however broke his promise, and in the year 755 he besieged Rome and devastated its territory. Pepin, at the request of the Pope, again crossed the Alps. Astolphus retired to Pavia, and soon after concluded a new treaty, by which he engaged to pay a large sum of money, and not only to restore all that belonged to the duchy of Rome, but also Ravenna and the Exarchate to the see of St. Peter. The act of donation of the Exarchate, the Pentapolis, and the town of Commachio was made by Pepin. [PAPAL STATES.] In the following year, 757, Astolphus died, and Desiderius, duke of Istria, was proclaimed king of the Longobards. Desiderius refused to observe the stipulations of Astolphus, and retained several towns of the Exarchate. A fresh quarrel broke out between Desiderius and Pope Adrian I., who had applied for assistance to Charlemagne. Charlemagne passed the Alps and besieged Desiderius in Pavia. Desiderius surrendered in 774, and the kingdom of Italy passed under the dominion of the Franks.

Charlemagne, having assumed the iron crown of Lombardy, confirmed Pepin's donation to the Pope, who acknowledged him as patrician of Rome and his temporal superior. In the year 800 the sovereignty of Charlemagne over Rome was confirmed by Pope Leo III., who crowned him at Rome emperor of the West, with the title of Carolus I., Cæsar Augustus, a title which was acknowledged by Nicephorus, emperor of the East, who defined the limits between the two empires. Rome was nominally under the Carolingian dynasty till 883.

In the year 887 Charles the Fat was solemnly deposed, and in him ended the imperial dynasty of the Carolingians. A long period of confusion followed, during which there were many claimants for the throne of Italy. Otho of Saxony, king of the Germans, married Adelaide, widow of Lotharius, the late so-called king of Italy, at Pavia, and in the following year returned to Germany. He allowed Berengarius, who had succeeded Lotharius, to retain the crown of Italy as his vassal, after swearing fidelity to Otho in the presence of the court and army. Friuli and the March of Treviso were excepted, which Otho kept under his immediate dominion. Otho himself handed to Berengarius a sceptre of gold, in token of investiture. From this transaction arose the claims of the kings of Germany upon the kingdom of Italy. Otho soon after deposed Berengarius, and was himself elected king of Italy, and crowned in the church of St. Ambrose, at Milan, with the ancient crown and other insignia of the Longobard kings. He was immediately after crowned as emperor by Pope John XII. He swore to respect the authority of the Roman see, and not to encroach upon its temporal rights and possessions. He was acknowledged emperor, and his son as king of the Romans;

but the Pope remained lord of the Roman duchy as a great imperial feudatory, as in the time of the Carolingians. Rome, with the rest of Italy, paid nominal obedience to the emperors of Germany till 1278. Cardinal Orsini, being elected pope in 1277 by the name of Nicholas III., applied to Rudolph of Hapsburg, king of Germany, to define by a charter the States of the Church, and separate them for ever from those dependent on the empire. Rudolph defined by letters patent, dated May 1278, the States of the Church as extending from Radicofani to Ceprano on the frontiers of Naples, and from the Mediterranean to the Adriatic, including the former duchy of Spoleto, the March of Ancona, and the Romagna. He released the people of all those places from their oath of allegiance to the empire, giving up all rights over them which might still be settled in the imperial crown, and acknowledging the sovereignty of the same to belong to the see of Rome. This important document, which is found in Raynaldus ('Annales'), was confirmed by the electors and princes of the empire. Thus ended the former imperial authority over Rome and its territory; and the city and States of the Church have been since under the temporal government of the popes. [PAPAL STATES.]

ROMAGNA, ROMANDIO'LA, a name which was given in the middle ages to a tract of country north of the Apennines, extending along the coast of the Adriatic, from the river Foglia near Pesaro, which was the northern boundary of Picenum, or the March of Ancona, to the Scotenna, or Panaro, which flows half way between Bologna and Modena. This extent of territory corresponds to that of the modern Papal legations, Bologna, Ravenna, Ferrara, and Forli. The Po was its boundary on the north, and the Apennines of Tuscany on the south and west. Ravenna was the chief town. Pepin and Charlemagne bestowed this part of Italy on the Holy See, but the popes could not for a long time after enforce their political supremacy over it. Alexander VI. commissioned his son Cesare Borgia to conquer the country, which he effected, and Julius II. annexed it to the Papal states. Although the country has been long divided into administrative divisions styled legations, the general name Romagna continues in use, being applied more especially to the eastern part of the country, near the Adriatic, between Rimini and Ravenna, the inhabitants of which are called at Rome to this day 'Romagnoli.'

ROME. [ROMA.]

ROME, U. S. [NEW YORK.]

ROME-DE-TARN. [AVEYRON.]

ROMFORD, Essex, a market-town and the seat of a Poor-Law Union, in the parish of Romford, is situated chiefly on the left bank of the Bourne brook, called also the river Rom, in 51° 34' N. lat., 0° 11' E. long., distant 17 miles S.W. by S. from Chelmsford, 13 miles E.N.E. from London by road or by the Eastern Counties railway. The population of the town in 1851 was 3791. The living is a vicarage in the archdeaconry of Essex and diocese of Rochester. The parish is under the management of a local Board of Health. Romford Poor-Law Union contains 10 parishes, with an area of 48,244 acres, and a population in 1851 of 24,607.

Romford is a place of considerable antiquity. The site of the Roman station Duroilitum, on the ancient road from London to Colchester, appears to have been at or near the present town. Being the centre of an important agricultural district, Romford markets and fairs are largely attended. On Monday there is a market for calves, on Tuesday one for hogs, and on Wednesday an important market for corn and cattle. In spring and summer great numbers of young calves are brought to market from Suffolk and the dairy districts of Essex. The annual fair, which is chiefly for horses, is held on Midsummer-day and the two following days. The church is a handsome new building in the decorated style, with a square tower. The Independents, Wesleyan Methodists, and Baptists have chapels, and there are National and Infant schools; schools connected with the Wesleyan Methodist and Baptist chapels; a literary and scientific institution, with a library and reading-room, and a savings bank. There is a large manufactory of agricultural implements. A county court and quarter sessions are held in the town.

ROMNEY MARSH, a liberty in the lathe of Shepway and county of Kent, which gives name to a Poor-Law Union. The union contains 19 parishes, with an area of 46,785 acres, and a population in 1851 of 5437. The tract of country called Romney Marsh is noticed under KENT.

ROMNEY, NEW. [KENT.]

ROMORANTIN. [LOIRE-ST-CHEZ.]

ROMSEY, Hampshire, a market-town, municipal borough, and the seat of a Poor-Law Union, in the parish of Romsey Infra, is situated in 50° 59' N. lat., 1° 30' W. long., distant 10 miles S.W. from Winchester, 73 miles S.W. from London by road, and 81 miles by the London and South Western railway. The population of the town of Romsey in 1851 was 2030. The borough is governed by four aldermen and 12 councillors, of whom one is mayor. The living is a vicarage in the archdeaconry and diocese of Winchester. Romsey Poor-Law Union contains 12 parishes, with an area of 27,373 acres, and a population in 1851 of 10,802.

Romsey stands on the left bank of the river Anton or Test, over which is a bridge. The town at one time possessed some extensy

manufactures, but since the application of steam to machinery, these manufactures have been removed to districts where coal is abundant. One flax-spinning mill and a paper-mill are in operation, worked by water-power. The town is lighted with gas. The parish church is a spacious cruciform structure. The exterior is chiefly of Norman architecture; the central portion of the interior, the transepts, and the sides of the chancel are also Norman; the west end of the church is early English. The church formerly belonged to an abbey of Benedictine nuns, founded in the reign of Edward the Elder. The Wesleyan and Primitive Methodists, Independents, Baptists, and Sandemanians have places of worship. There are National, British, and Infant schools; an endowed school for 18 boys; an industrial school for girls, maintained by Viscount Palmerston; a literary and scientific institution; a reading society, and a mutual improvement society for young men. There are in the town a town-hall; an audit-house, supported on piers, with an open space below for the persons attending the market; a small borough jail; and some almshouses. The market is held on Thursday; fairs are held on Easter Monday, August 26th, and November 8th.

ROSCOMMON, an inland county in the province of Connaught, Ireland, is bounded N. by the counties of Sligo and Leitrim; E. by Leitrim, Longford, and Westmeath; S. by King's County and Galway; and W. by Galway and Mayo. It lies between 53° 17' and 54° 8' N. lat., 7° 50' and 8° 47' W. long. Its greatest length from north to south is 60 miles, from east to west 40 miles. The area is 949 square miles, or 607,691 acres; of which 440,522 acres are arable, 130,299 acres uncultivated, 6732 acres in plantations, 768 acres in towns, and 29,370 acres under water. The population in 1831 was 249,613; in 1841 it was 253,591; in 1851 it was 173,417.

Surface, Hydrography, and Communications.—The county has an irregular outline. Near the centre it suddenly contracts southward to less than half its greatest breadth, extending in a narrow strip between the rivers Suck and Shannon. Northward the area gradually diminishes till it terminates in a breadth of three miles. The surface slopes towards the Shannon, and lies within the great plain of Ireland. It consists for the most part of bold undulations. In the southern division a series of elevated ridges, separated by alluvial flats, divide into two ranges, the one skirting the shore of Lough Ree, the other the left bank of the Suck. At a distance of from two to four miles from the Shannon, the surface rises into the Slieve Bawn range, which reaches at its southern extremity an elevation of 857 feet. Towards the opposite verge of the county the surface is generally level. The only considerable elevation in this district is Slieve Aalwyn, which rises between Castlereagh and Ballinlough to a height of 497 feet. The highest part of the county is in the north, where the Curlew Hills on the Sligo border near Boyle have an altitude of 868 feet; and the Braulieve Mountains, 1817 feet high, and Slieve Curkagh, 1098 feet high, extend from Sligo and Leitrim into the district west from Lough Allen.

The principal rivers are the Shannon and the Suck, which form about two-thirds of the whole boundary line of the county. The Shannon, five miles from its source in the county of Leitrim, enters Lough Allen, about the middle of which is the northern limit of Roscommon. From Lough Allen it flows along the eastern boundary with a winding course and several expansions, forming the chief lakes of Roscommon, to the southern extremity of the county, where it receives its chief tributary the Suck. The course of the Shannon along the border of Roscommon is about 75 miles in length, with a fall of less than 40 feet, or about six inches to a mile. It is navigable throughout, except in a few places where rapids and shoals are passed by canals. [SHANNON.] The Arigna and the Boyle are tributaries of the Shannon. The Suck rises within the border of Mayo county, flows eastward to the town of Castlereagh, where it bends to the south, and then runs south-eastward to the western boundary, which it follows, with an interval of about five miles, till it unites with the Shannon. Its course in all is about 60 miles long. It is navigable for flat-bottomed barges to Ballinaloe, about 10 miles from the Shannon.

The principal lakes are the several expansions of the Shannon. Lough Allen, the lower half of which borders the county, lies north and south about eight miles long by three or four miles broad, and about 160 feet above sea-level. Its shores are well-wooded and rise gently towards the fine mountain scenery in the back-ground. Between Lough Allen and Lough Ree, are Loughs Corry, Tap, Boderig or Bodarg, Sconnall, and Forbes. These are of various sizes, and some of them very irregular in outline. Lough Ree, next to Lough Derg, the largest of all the expansions of the Shannon, reaches within two

miles of the town of Athlone, extending 16 miles from north to south, with an extreme breadth of 7 miles. The depth of water is from 20 to 30 feet, sinking in some places to 120 feet. The shores nowhere rise higher than 250 feet above the surface of the water, and being shallow and stony are unfavourable for landing. Numerous shoals render the navigation difficult. There is not much wood along its banks, and not a village is visible from the water, but the lake is studded with islands, which in many places render the scenery picturesque. Numerous pleasure-boats are kept on the lake. In the north Lough Skean and Meelagh, and in the line of the Boyle River Lough Gara, which is five miles in length and breadth, Lough Key or Rockingham Lough, and Lough Oakport, all communicate with the Shannon, and are remarkable for their beautiful and picturesque scenery. There are a number of smaller lakes in the county. In many parts of the limestone tracts are temporary lakes, called turloughs, which are filled with water in winter, but are usually dry in summer, being drained off by fissures in the rock as the vegetable matter that stopped them decays with the progress of the season. They yield excellent crops where the bottom is grassy, and early enough left dry.

The Dublin road to Galway crosses the county between Athlone and Ballinasloe. The road from Dublin to Sligo sends one branch northward, which passes from Drumsna to Jamestown, and then from Carrick north-eastward by Boyle; and another through the centre of the county by Tarmonbarry to Strokestown, and thence by Elphin to join the former at Boyle. From Strokestown the Dublin road runs westward through Tusk and Frenchpark to Ballina. Roads run from all parts of the county to the various ports on the Shannon. The Shannon navigation extends along the eastern boundary, penetrates to the interior by the Boyle branch to the vicinity of that town, and by a branch to Strokestown, and touches the county at Ballinasloe by a continuation of the Grand Canal, thus connecting it in all directions with the traffic down the river to Limerick, and along the Grand and Royal canals to Dublin. The Midland Great Western railway from Dublin to Galway passes between Athlone and Ballinasloe.

Geology, Mineralogy, &c.—The county in its geological structure forms a continuation of the central limestone district of Ireland. The upper limestone appears to some extent in beds of a gray colour, abounding with fossils. The argillaceous limestone or calp occupies a great proportion of the county, and is in many places blended with Lydian stone. The lower beds are generally of the black crystalline limestone. In several districts sandstone protrudes through the limestone. It is quarried near Frenchpark in thin layers, which are used as a substitute for roofing-slate. West from Castlereagh, an area of some miles is occupied by yellow sandstone. Old red-sandstone forms the greater part of the Slieve-Bawn range and of the Curlew Mountains; from the latter it extends across the county in a belt of some breadth along the valley of the Boyle River. The Brulieve and Slieve-Curkagh groups belong to the coal measures, and form part of the great coal district extending over the highlands divided by Lough Allen. These two groups consist of shales and sandstones supported by the limestone, with three beds of coal resting on beds of millstone grit, from which good ironstone is obtained. The coal answers well for smelting iron, and was used at the Arigna iron-works within the county. Only small quantities of the coal, which is slightly bituminous, are now raised for domestic use. Good bricks are made from the fire-clay of the coal-field. Pipe-clay is found in the county, also potters'-clay, from which coarse earthenware is manufactured. Limestone suitable for building is quarried.

Climate, Soil, and Produce.—The climate is comparatively cold and moist, and the crops are late in coming to maturity. The limestone districts, except the intervals of bog and marsh, are covered with fertile soils, which consist in some places of a rich deep loam. The central portions consist chiefly of natural pastures, which are the richest in Connaught, extending, under the name of the Boyle Plains, over the undulating country bounded by Boyle, Castlereagh, Roscommon, and Strokestown. The heights between the Suck and the Shannon have a light soil too shallow in many places for the plough, but clothed with excellent pasture for sheep. Some portions of the red bog along the rivers have been reclaimed; the mountain bogs are wet and spongy, but interspersed with dry heathy moors. The employments of the county are mainly agricultural, and grazing is most generally and successfully attended to. The tillage farms are for the most part small, and the modes of culture defective. The larger farms are more skilfully managed, and better methods are coming into use. The grazing farms are generally larger, and in a much better condition. The sheep are much superior to those reared in the neighbouring counties. The favourite breed is a cross between the Leicester and the old large Connaught breed. The long-horned Leicester is the most common breed of black cattle reared for the market. There are few large dairy-farms, but a considerable quantity of butter is made in all parts of the county.

The linen manufacture, which was carried on to some extent, has declined. Coarse woollen stuffs are made by the wives and daughters of the farmers. There are small manufactures of brick, earthenware, and tobacco-pipes.

In 1853 there were 138,565 acres under crop, of which 1338 acres grew wheat; 61,951 acres, oats; 730 acres, barley, bere, rye, peas, and beans; 36,124 acres, potatoes; 4900 acres, turnips; 2638 acres, mangel-

wurzel, carrots, and other green crops; 535 acres, flax; 30,299 acres, meadow and clover. In 1841 there were in plantation 8093 acres growing oak, ash, elm, fir, beech, mixed timber, and fruit. In 1852 on 19,610 holdings, there were 8992 horses, 5558 mules and asses, 84,880 head of cattle, 110,117 sheep, 22,388 pigs, 12,291 goats, and 260,767 head of poultry. The total value of the live stock here enumerated was estimated at 794,167*l*.

Divisions and Towns.—The county is mainly in the diocese of Elphin, with small portions in the dioceses of Ardagh, Tuam, and Clonfert, and contains 58 parishes. It is divided into 9 baronies—Athlone, Ballintober (north and south), Ballymoe, Boyle, Castlereagh, Frenchpark, Moycarn, and Roscommon. The principal towns are—ROSCOMMON, BOYLE, part of BALLINASLOE, part of ATHLONE, CASTLEREA, ELPHIN, and STROKESTOWN, which are noticed under their respective titles. The following are some of the smaller towns and more important villages, with the population of each in 1851:—

Frenchpark is a small market-town, situated on the Strokestown and Ballina road, about 21 miles N.N.W. from Roscommon. It consists of two straggling streets intersecting each other, and contains a few substantial houses. It has a Roman Catholic chapel, a court-house, a new market-house, and a school, partially endowed. A manor court is held in the town. Fairs are held on May 21st, July 12th, and September 21st. Thursday is the market-day.

Keadue, population 206, a post-town, in the barony of Boyle, is situated on the road from Leitrim to Sligo, 35 miles N. from Roscommon. It contains a Roman Catholic chapel, a court-house, a new market-house, a dispensary, one or two endowed schools, and the ruins of the ancient parish church, in the burial-ground of which Carolan, the last of the Irish bards, who died in 1738, was interred. There is a weekly market, and fairs are held eight times a year.

Athleague, population 331, a village 5 miles S. by W. from Roscommon, on the river Suck, where it is divided into several channels, crossed obliquely by a chain of low bridges, with a connecting causeway. The place consists of a long street running from the end of the causeway along the right bank of the river, with another rising at right angles to it up the elevated bank. There are a few neat houses in the outskirts, but the village has not many buildings better than cabins. It contains a decayed parish church, a Roman Catholic chapel, a dispensary, a constabulary barrack, and some large flour-mills and malt-houses, which have gone out of use. Fairs are held on July 11th and September 24th. **Knockcroghery**, population 232, is pleasantly situated on a rising ground, 5 miles S.E. from Roscommon by the Athlone road, and consists of a single street of well-kept cabins, with a few better buildings. It contains the parish church, which has school-houses connected with it. A number of the inhabitants are employed in the manufacture of tobacco-pipes, for which there are eight kilns in the village. Fairs are held on May 26th, August 21st, and October 25th, the last being a great sheep fair. **Loughglynn**, population 265, is situated on the south shore of Lough Glynn, and on the Castlereagh and Foxford road, 22 miles N.W. from Roscommon. It contains some good houses, a Roman Catholic chapel, and a dispensary. Fairs are held four times a year. **Mount Talbot**, a neat village on the Suck River, 7 miles S.S.W. from Roscommon, has a parish church and a Roman Catholic chapel. The river is here crossed by a bridge of 12 arches. Talbot House, the seat of the Talbot family, is a fine old castellated mansion adjacent to the village. Fairs are held four times a year. **Rusky**, or **Roosky**, population 246, a village situated on the Shannon, and on the Dublin and Sligo road, 22 miles N.E. by N. from Roscommon, is partly on the Leitrim side, but chiefly on the Roscommon side of the river, which is crossed by a bridge of 9 arches. A rapid in the river is here passed by a canal a quarter of a mile in length. Petty sessions are held monthly. **Tusk**, population returned with that of the parish, was formerly an incorporated town returning two members to the Irish Parliament, but now consists of a few cottages, a school-house, and a constabulary barrack. It contains the ruins of a castle built by O'Connor Roe in 1406, and the church walls, two pointed arches, and other remains of an abbey supposed to have been founded in the same century.

The county returns two members to the Imperial Parliament. The county jail is at Roscommon, where the assizes are held. Quarter sessions are held at Roscommon, Athlone, Boyle, Castlereagh, and Strokestown. Petty sessions are held in 19 places. The county infirmary is at Roscommon. The district lunatic asylum for Connaught, to which the county is entitled to send 40 patients, is at Ballinasloe. There are dispensaries in 16 places. A savings bank is established at Boyle. In September 1852 there were 102 National schools in the county, attended by 6229 male and 5883 female children.

History and Antiquities.—The Auteri, a people mentioned by Ptolemy, first appear in history as the possessors of this part of Ireland. At a later period it was occupied by various septa, of which the principal were the two branches of the O'Conors—the O'Conors Roe or Ruadh (red), and the O'Conors Don or Dhunne (brown), the Madermots, the O'Dalys, and the O'Kellys.

Seven years after the Anglo-Norman invasion the county was attacked by Miles de Cogan, one of the English adventurers, who was joined by Murrough, son of Roderic, king of Ireland, at the head of a body of malcontents. The natives, by driving away their cattle and

laying waste the country, exposed De Cogan and his army to great danger from famine, and compelled them to retreat. In 1204 the county was ravaged by William de Burgo Fitz-Aldelm, lord of Limerick; in 1216 the castle of Athlone was erected to command the ford of the Shannon; and in 1268 that of Roscommon was built to secure the quietness of the county. In 1315 Richard de Burgo, earl of Ulster, and Phelim O'Connor, prince of Connaught, advanced from Roscommon to repel the invasion of the Scotch under Edward Bruce; but O'Connor entered into a secret treaty with Bruce, and retired to defend his own territory against the usurpation of his kinsman Roderic, whom with the aid of the English he defeated and slew. Having then avowed his alliance with the Scotch, he was attacked and completely defeated at Athenry in Galway by the English under William de Burgo, the earl's brother, and Sir John Bellingham. This victory broke the power of the O'Conors. Meanwhile the inheritance of the De Burgos was conveyed by marriage to Lionel, duke of Clarence, son of Edward III., whose descendants came to the throne in the person of Edward IV. In the reign of Elizabeth, Connaught was divided into counties, and the county of Roscommon into baronies. The O'Conors remained loyal during the troubles of Elizabeth's reign, but in the rebellion of 1641 the O'Connor Don took part with the Ulster insurgents after they had made themselves masters of the county. At the close of the war his estates, with those of other chiefs, were confiscated and divided among English and Scotch adventurers. At the restoration however he recovered the greater part of his property, and his descendants are among the few native Irish families who retain their lands.

The most numerous antiquities of the county are the raths, or hill-forts, of which nearly 500 have been reckoned. They are found upon natural eminences, and are formed generally of earth and hurdles, but sometimes of wooden walls, resting on a foundation of earth, and inclose the dwelling-place of the chieftain and his family. They are regarded with reverence, and left in most cases undisturbed by the plough. At Oran, between Roscommon and Castlereagh, there is a portion of a round tower 12 feet high, built of limestone in regular courses, with finely-cut and close-fitting stones. Near Lough Glynn are the ruins of a fort of unknown antiquity. The massive walls and polygonal towers of Ballintubber Castle, the ancient stronghold of the O'Connor Don, are in tolerable preservation. Other feudal remains are, those of Roscommon Castle, the keep of Athlone Castle, the ruins of a small castle on Castle Island in Lough Key, and those of Coothe Hall, a fortified mansion of the middle ages, between Lough Key and the Shannon. The principal ecclesiastical antiquities are the ruins of Boyle, Roscommon, Tulak, and Clonshanville abbey. There are numerous remains of old churches, inclosed within cemeteries still in use.

ROSCOMMON, Ireland, the chief town of county Roscommon, and the seat of a Poor-Law Union, is situated near the centre of the county, on the road from Lanesborough to Tuam, in 53° 38' N. lat., 8° 8' W. long., 96 miles W. by N. from Dublin by road. The population of the town in 1851 was 3364, besides 1259 inmates of the Union workhouse. Roscommon Poor-Law Union comprises 18 electoral divisions, with an area of 114,056 acres, and a population in 1851 of 34,046. An abbey was founded here for the order of Preaching Friars, about 1257, by O'Connor, king or prince of Connaught; and a few years after a strong castle was built by Sir Robert de Ufford, one of the early English adventurers. Of both the abbey and the castle there are considerable remains; the castle is on the north side of the town, and the abbey church on the south side. The interior of the church is still used as a burial-ground. Roscommon sent members to the Irish Parliament, but was disfranchised at the Union. In the centre of the town is the old jail, a building situated on the summit of the eminence on which the town stands, but now disused as a prison. The parish church has been lately enlarged. The old court-house has been converted into a Roman Catholic chapel. There are two national schools. In the town are a new court-house, a new jail, and the county infirmary. Coarse pottery-ware is manufactured, and friezes, coarse flannel, and woollen stuffs are woven. On Saturday is held a market, at which large quantities of grain are sold, to be shipped on the canal at Lanesborough. The assizes for the county, quarter and petty sessions, and a monthly manor court, are held in the town. Fairs are held four times a year.

ROSCREA, county of Tipperary, Ireland, a market-town and the seat of a Poor-Law Union, is situated on a feeder of the Lower Brosna River, and on the Dublin and Limerick road, in 52° 57' N. lat., 7° 48' W. long., distant by road 19 miles E. by N. from Nenagh, 94 miles S.W. by W. from Dublin. The population in 1851 was 3496, besides 641 inmates of the workhouse. Roscrea Poor-Law Union comprises 23 electoral divisions, with an area of 118,488 acres, and a population in 1851 of 33,442. The town is of great antiquity, having arisen around a monastery which was founded in 620. In the reign of John a castle was erected in the place as a defence against the Irish. Several of the streets are wide and contain some good houses. The town contains the parish church, erected in 1812; places of worship for Wesleyan and Primitive Methodists, Quakers, and Roman Catholics; a National school, and others partly endowed; and a savings bank. It has also a court-house and a market-house, a fever hospital, dispensary, Union workhouse, bridewell, and infantry barracks.

Ormond Castle now forms a military store-house. An ancient round tower, 80 feet high, and having a projecting roof, stands in the town. The entrance to the churchyard is the gable and porch of the abbey of St. Cronan, with a full-length figure of the saint. The steeple of a Franciscan priory, founded in 1499, forms the belfry of the Roman Catholic chapel. The town has a small manufacture of coarse woollen cloths. There is a considerable sale of agricultural produce at the weekly markets. Quarter and petty sessions are held. Fairs are held seven times a year.

ROSEAU. [DOMINICA.]

ROSEHEARTY, Aberdeenshire, Scotland, a fishing village and a burgh of barony, in Pitaligo parish, is situated on the Moray Frith, 4 miles W. from Fraserburgh, and 46 miles N. from Aberdeen by road. The population of the burgh in 1851 was 844. It consists of several small streets, mostly running parallel with the beach. The parish church is a short distance inland, with a handsome school-house adjacent. In the village are a Free church, a United Presbyterian church, and a female school. The harbour affords convenient shelter to fishing-boats, and admits vessels of 70 tons burden. The inhabitants are chiefly engaged in fishing. From July to September there is an active herring fishery, employing from 40 to 50 boats and several sloop. In spring a number of boats go to the island of Tyree for the cod and ling fishery, and return by Glasgow, exchanging their fish for coals. Fish are cured in the village for the Glasgow, Edinburgh, and London markets. Boat-building is carried on. Fairs are held on the first Tuesday of May, July, and October.

ROSENAU. [HUNGARY.]

ROSETTA, or EL RASCHID, a town and port of Lower Egypt, is situated in 31° 25' N. lat., 30° 28' E. long., on the left or west bank of one of the principal branches of the Nile, and about four miles from its mouth. The country around Rosetta is a complete garden. The town contains several large mosques; the streets, which are exceedingly narrow, not more than two yards wide, lie parallel to each other in a line with the river, and are irregularly intersected by others which are shorter. Between the houses and the Nile there is a wide space, which is the promenade of Rosetta. The houses, which are built of a dingy red brick, are two or three stories high; the bazaars are narrow, dirty, and dark. Rosetta formerly carried on a considerable trade both with Europe and the Levant, and at one time its population amounted to 25,000 persons, but the opening of the Mahmoudieh Canal, connecting Alexandria with the Nile, has deprived the town of nearly the whole of this traffic, though it still has many thriving manufactories for sailcloth, leather, and iron, with which it supplies the dockyards at Alexandria. The population now does not exceed 4000. In 1798 the French took Rosetta, and in 1807 it was besieged by the English. Here was found the 'Rosetta Stone,' now in the British Museum.

ROSHAN. [BADAKSHAN.]

ROSHEIM. [RHIN, BAS.]

ROSLIN. [EDINBURGHSHIRE.]

ROSOY. [AISNE.]

ROSS, Herefordshire, a market-town, and the seat of a Poor-Law Union, in the parish of Ross, is beautifully situated on the left bank of the river Wye, in 51° 54' N. lat., 2° 33' W. long., distant 14 miles S.S.E. from Hereford, and 120 miles W.S.W. from London. The population of the town of Ross in 1851 was 2674. The living is a rectory in the archdeaconry and diocese of Hereford. Ross Poor-Law Union contains 30 parishes and townships, with an area of 55,568 acres, and a population in 1851 of 15,502.

The town of Ross has a neat and interesting appearance; it is lighted with gas, and paved. The town-hall, a building of some antiquity and interest, is in the centre of the town. The parish church is believed to be of the date of 1816. The church is chiefly noted for its fine spire, alluded to by Pope in connection with John Kyrle, 'the Man of Ross.' The spire has been several times struck by lightning. From the floor of Kyrle's pew in the church three elm-trees spring up. In the church is a monument with an inscription to the memory of John Kyrle. The Wesleyan Methodists, Baptists, Independents, and Quakers have places of worship. There are National and British schools, a Blue-Coat school, a mechanics institution, a savings bank, and a dispensary. The market-day is Thursday. Fairs are held six times in the year. A county court is held in the town. A railway intended to connect Gloucester with Hereford through Ross, has been partly constructed. Ross is much resorted to by tourists.

ROSS, or ROSSCARBERRY, county Cork, Ireland, a market-town, and the seat of a diocese, is situated on a rocky eminence at the head of Ross Bay, in 51° 35' N. lat., 8° 59' W. long., distant by road 39 miles S.W. from Cork, and 197 miles S.W. from Dublin. The population in 1851 was 1044. The cathedral is an old building several times altered. A modern tower, with a stone spire 50 feet high, rises from the west end. There are a Roman Catholic chapel, a court-house, a market-house, some corn-stores, a dispensary, and a bridewell. Many of the inhabitants are employed in weaving. A market is held on Wednesday. Fairs are held on September 19th and December 19th. Some remarkable excavations, containing regular apartments, have been at different times laid open in the neighbourhood of the church.

Of the see of Ross nothing certain is known till after the invasion.

In the reign of Elizabeth it was united to the see of Cork. It now forms part of the united dioceses of Cork, Cloyne, and Ross. The chapter consists of a dean, archdeacon, precentor, chancellor, and treasurer, with five prebendaries. The diocese contains 23 benefices. The cathedral church and bishop's residence are in Cork city.

ROSS and CROMARTY SHIRES, two counties in the north of Scotland, so intimately connected politically and geographically, that it is necessary to treat of them together. Ross comprehends a large area on the mainland, and includes the island of Lewis. [HEBRIDES.] Cromarty is composed of a number of detached portions, either interspersed among the inland parts of Ross or lying along its border. Ross is bounded N. by Sutherland, E. by the North Sea, S. and S.E. by Inverness-shire, and W. by the Western Ocean; it lies between 57° 8' and 58° N. lat., 3° 55' and 4° 52' W. long. The two counties include several small islands, the Summer Islands, Martin, Eilan-Clearach, Longa, the Croulin Islands, &c., off the western coast. Lewis is to the north-west of the mainland part of the county: the distance to its nearest point across the Minch is about 25 miles. Lewis is 39 miles long from north to south, from the northern promontory, called the Butt of the Lewis, to the border of Harris; and 31 miles broad from east to west: its coast-line is very irregular. The islands of Bernera and Scarpa lie close to Lewis on the western side. The Shiant Isles are a group of small islands or rocks between Lewis and the Main, but much nearer Lewis. The southern portion of Lewis, called Harris, belongs to Inverness-shire. The area of the united counties is 3151 square miles, or 2,016,375 statute acres. The two counties unite in returning one member to Parliament. They form one sheriffdom. The population of the united counties in 1841 was 78,685; in 1851 it was 82,707.

Surface, Coast-Line, and Islands.—A general description of the district, of which Ross and Cromarty form a part, is given under GREAT BRITAIN: 'Scotland, north and west of Glenmore.' It is sufficient here to notice that, except the two peninsulas formed by the three friths Dornoch, Cromarty, and Moray, and the parts immediately adjacent to them, it consists of mountains irregularly grouped, with deep intervening glens or ravines. Ben Wyvis is 3720 feet above the level of the sea; Kea Cloch, near Little Loch Broom, 3600 feet; Ben Derag, one of the Ben More Hills, near the head of Loch Broom, 3551 feet; Ben Lair, near Loch Maree, 3000 feet; Ben Attow, on the border of Ross-shire and Inverness-shire, is said to be nearly 4000 feet. Dornoch Frith is about 10 miles across at its entrance between Tarbet Ness and Brora. Moray Frith has been already described. [MORAY FRITH.]

The principal inlets on the western or Atlantic coast are, Loch Enard, at the north-west extremity of the two counties; Loch Broom, Little Loch Broom, Loch Greinord, Loch Ewe, Loch Gaisloch, Loch Torridon, Loch Carron, with Loch Kishorn, which is a branch of it; and Loch Alah, with its branches, Loch Ling and Loch Duich. Loch Broom and Loch Carron extend about 15 miles inland, but are both narrow. Loch Greinord is about 4 miles across at the mouth.

The principal inlets on the coast of Lewis are, Loch Bernera, Loch Roig, and Loch Resort on the west side; Loch Tua, Loch Luerboest, Loch Shell, and Loch Seaforth on the east side. Lochs Bernera and Roig are branches of one inlet, 9 miles across at the entrance, and extending 9 miles inland: in the middle of it is the island of Bernera (5 miles long from east to west, and 3 miles wide), and a number of smaller islands. The headlands of Lewis are, the Butt of Lewis; Tiompan Head, at the extremity of the peninsula which forms the east side of Loch Tua; and Gallan Head, at the south side of Loch Roig. Lewis is mountainous; the peaks form a range extending north and south, with lateral branches. The Barvas Hills, near the centre of the island, are 780 feet high; and Suaneval, on the western side, between Loch Roig and Loch Resort, 2700 feet.

Hydrography and Communications.—There are no large rivers. The Oikel rises at the foot of Ben Mohr in Sutherlandshire, and flows 26 miles along the border of the county till it unites with a stream from Loch Shin in Sutherlandshire. It then expands into a narrow lake five miles long, called the Kyle, which opens into Dornoch Frith. The Repath Water and Carron Water are one stream 24 miles long, which joins the Kyle at its lower end. Loch Monar, five miles long by one mile broad, is drained by a stream which belongs to Inverness-shire. Loch Glass, five miles long, and many other lakes, most of them very small, are drained by streams flowing into the friths of the eastern coast. Loch Maree, the largest fresh-water lake in the counties, extending 12 miles in length, and 2 miles or 2½ miles across in the broadest part, is drained by the Ewe, which flows into Loch Ewe. Lewis abounds in lakes; but they are all small, except Loch Langavat, which extends in length nearly 10 miles from north to south, between Loch Seaforth and Loch Resort.

The two counties have very few roads. The greater part of them, including those of chief importance, are on the east side, and lead to different places farther north. One leads near the coast from Inverness, by Fortrose, Cromarty, and Tain, to Dornoch, Wick, and Thurso, the communication being made in several places by ferries over the lochs and friths. Another road from Inverness to Wick and Thurso runs more inland, passing round the heads of Loch Beaulie and the Frith of Cromarty, and through the town of Dingwall, which is at the head of Cromarty Frith: it crosses into Sutherlandshire by Bonar

Bridge, which is thrown over the Kyle at the head of Dornoch Frith. There are several roads communicating between these two. A road from Dingwall leads across the county through Strathbrann to Loch Carron, a distance of 49 miles, sending off various branches. The road from Inverness to the Isle of Skye, with a branch to Loch Alah and Loch Carron, runs through Rhiabuaie and Glen Shiel, in the southern parts of the county of Ross; and that from Dornoch and the east coast to Loch Assynt just passes through the northern part of the same county.

Soil and Agriculture.—The arable land of the two counties is almost entirely confined to the eastern part, comprehending the two peninsulas—the Black Isle, between Loch Beaulie and Cromarty Frith; and Easter Ross, between the Cromarty and Dornoch friths, together with the comparatively low and level tract immediately adjacent to these. The central and western parts are rugged and mountainous, interspersed with lakes and narrow glens that afford pasture for sheep and black cattle. Within the last half century great improvements have been made in the system of agriculture. Besides the grain consumed in the counties, a large quantity is annually exported to London, Leith, Liverpool, &c.; and a large portion is used in the manufacture of whisky, there being several extensive distilleries.

The soil in Black Isle is various, and much of it poor. The cultivated portion consists chiefly of clayey loam, good black mould, and sandy loam. In Easter Ross there is a considerable extent of clayey loam and light sandy soil. Around Dingwall the soil is clayey. Turnips are grown equal in quality to those of more southern counties. The crops are clean, and for the most part rich. The houses of the principal farmers are commodious, and the cottages of the peasantry are in general good.

Cheviot sheep, and the best breeds of cattle from the West Highlands and from Ayrshire, have been introduced. Considerable attention has also been paid to the breed of horses. The native breed of cattle is hardy and compact, adapted to the climate.

The western side of the county, where it has not been thrown into large sheep-farms, is occupied by a poor class of tenants. They have some arable land, in which potatoes, barley, and oats are raised; but the country generally is an open waste. The houses of the peasantry are very poor; some are built of turf, others with stone, with or without mortar, and have a roof of turf with heather or fern above it. They have no chimneys; the fire of peat or turf being kindled against the wall, or on a stone in the centre of the room, the smoke escapes as it can, by roof, door, or windows, which last have wooden shutters. Along the coast the peasantry are much engaged in the herring fishery.

There are stone-quarries in some parts of the two counties, but their products are comparatively unimportant. Limestone is wrought, but there is no coal. The herring-fishery is carried on along the eastern shore, and the salmon-fishery in the rivers and estuaries of the coast.

Divisions, Towns, &c.—The two counties are divided into 33 parishes, two of which extend into the adjacent counties. The parishes are within the ecclesiastical jurisdiction of the synod of Ross. There are four royal burghs, namely, CROMARTY, FORTROSE, DINGWALL, and TAIN; and one burgh of barony, STORNOWAY, in Lewis.

Dingwall, a royal burgh and market-town, and the county town of the united counties, lies at the south-western extremity of Cromarty Frith, 23 miles N.W. from Inverness by a circuitous road, and 166 miles N.W. from Edinburgh. The population of the burgh in 1851 was 1990. The town is governed by a provost and 14 councillors, two of whom are bailies, and unites with Cromarty, Dornoch, Kirkwall, Tain, and Wick in the return of one member to Parliament. Dingwall was made a royal burgh by Alexander II. in 1227. Some traces remain of the ancient castle of the earls of Ross. The church is a commodious building; near it is a pyramidal obelisk 57 feet high and 6 feet square at the base, erected on a large artificial mound by a former earl of Cromarty to mark out the burial-place of himself and his family. The town-house, a curious old building with a spire, is near the centre of the town; and there are besides, a Free church, an Episcopal chapel, and a small jail. A short canal from the frith enables vessels to come quite up to the town.

Tain, a royal burgh and market-town, lies on the southern shore of Dornoch Frith, 47 miles N. from Inverness by the road. The population of the burgh in 1851 was 2049. The burgh is governed by a provost and 14 councillors, two of whom are bailies; and unites with Cromarty, Dornoch, Dingwall, Kirkwall, and Wick in the return of one member to Parliament. Tain had its earliest charter from James VI. It was early celebrated for a chapel of St. Duthac, bishop of Ross, which had right of sanctuary. The town is irregularly built, but the streets have been improved of late years, and new and handsome houses erected. There are a large parish church, a Free church, and a chapel for United Presbyterians; a handsome academy, erected by subscription in 1813; a parochial and a burgh school; a reading- and news-room; a good town-house; and a prison. The ruins of St. Duthac's chapel, east of the town, are of granite, and are remarkable for the strength and simplicity of their architecture. A church, also dedicated to St. Duthac, and now deserted, stands in the centre of the town. The ruins of an old prison tower with five spires are in the town. There are an iron-foundry, a carding-mill, and a dye-work. Salmon-fishing is carried on in the frith.

Stornoway, a burgh of barony and sea-port, and the only town in Lewis, is situated at the head of a bay on the east side of the island, in 58° 13' N. lat., 6° 20' W. long. The population of the town in 1841 was 1354; in 1851 it was 2391. Stornoway was founded by James I. for the purpose of introducing civilisation into the Highlands. The houses are good, with slate roofs. There are a custom-house, a court-house, a jail, a branch bank, and an assembly-room. In addition to the Established church, there are a Free church and an Episcopal chapel. The town is lighted with gas. The principal employment of the inhabitants is fishing. Agriculture has considerably improved of late years. The harbour is good and well sheltered, and is capable of containing 300 vessels of any tonnage. Those belonging to the port are 56 in number, with a tonnage of 2608. During 1853 there entered the port 119 sailing-vessels, tonnage 5463, and 88 steam-vessels, tonnage 15,864; and there cleared 60 sailing-vessels, tonnage 2508, and 89 steam-vessels, tonnage 16,063. Attached to the harbour is a patent slip. There are several schools and a circulating library. On an eminence overlooking the town is a splendid mansion, in the castellated style, lately erected by Sir J. Matheson, the proprietor of the island.

Invergordon, population about 1100, about 14 miles N. by E. from Dingwall, is a small sea-port, from which cattle are sent to London. Considerable quantities of grain are also shipped at the port. The steam-vessels plying between Inverness and Leith and Inverness and London call regularly at Invergordon. Boat-building is carried on. *Nigg*, population of the parish 1457 in 1851, on the north side of the entrance to Cromarty Frith, opposite Cromarty town, possesses a parish church, a Free church, and a chapel for United Presbyterians, in all of which service is conducted regularly or occasionally in Gaelic. Many of the population are engaged in fishing. Two ancient monumental stones are at Nigg and at Shandwick, in the parish. *Strathpeffer*, a village which has recently arisen in connection with a mineral spa in the valley of Strathpeffer, a short distance W. from Dingwall. Visitors resort to the place from May to October for the purpose of drinking the mineral-waters. Near the spa is a fine ancient mansion, formerly the seat of the earls of Cromarty.

History, Antiquities, &c.—In Kincardine and Fearn parishes are several circles and standing stones; and on the eastern shore of Loch Roig, in Lewis, are the almost perfect remains of a circle of rough stones. There are cairns in different places on the summits of hills. In several parts of the counties are duns, or dounes (or Picts' houses, as they are termed); and also stone coffins, vitrified ruins, and stone obelisks. The earliest separate history of Ross shows it to have been an earldom, which was united with the lordship of the isles by the marriage of a lord of the isles with the daughter of the earl. In 1476 the earldom of Ross, the lands of Knapdale and Kintyre, and the shrievalty of Inverness and Nairn, were annexed to the crown, in return for which the Earl of Ross was created a peer of Parliament. During this period Ross gave title to a bishopric, erected by David I., king of Scotland; the cathedral was at FORTROSS.

There are several remains of the feudal period in Ross-shire. Lochlin Castle, on an eminence 6 miles E. from Tain, consists of two square towers 60 feet high, with large turrets raised upon the towers. Craighouse Castle, on the southern shore of Cromarty Frith, is an ancient tower of five stories. The castles of Killcoy and Redcastle are on the shore of Loch Beaulu. Some ruins of Cadbole Castle are on the east coast, between Cromarty and Moray friths, and of Donan Castle, on the shore of Loch Alsh, on the west coast. There are also some ecclesiastical ruins. Lochlin (or Fearn) Abbey is near Lochlin Castle, east of Tain; and there are the ruins of a number of ancient chapels in Lewis, especially of St. Mulvay's chapel, in the north part of the island.

Religious Worship and Education.—According to the Returns of the Census in 1851, there were then in the two counties 88 places of worship, of which 43 belonged to the Free Church, 35 to the Established Church, 5 to the Episcopal Church, 2 to United Presbyterians, and one each to Independents, Baptists, and Roman Catholics. The number of sittings provided in 75 of these places of worship was 44,644. Of day-schools there were 167, of which 143 were public schools, with 9379 scholars, and 19 were private schools, with 600 scholars. There were 70 Sabbath schools, with 5243 scholars; and one evening school, with 22 scholars. The Tain and Easter Ross Mechanics Institution had 173 members in 1851, and 633 volumes in its library.

Savings Banks.—In 1851 the county possessed two savings banks, at Dingwall and Tain. The amount owing to depositors on November 20th 1853 was 6323l. 9s. 1d.

ROSSANO. [CALABRIA.]

ROSSTREVOR. [DOWNSHIRE.]
ROSTOCK. [MECKLENBURG.]
ROSTOV. [KATELINORLAV.]
ROSTOW. [YAROSLAV.]

ROTHBURY, Northumberland, a market-town and the seat of a Poor-Law Union, in the parish of Rothbury, is situated in 55° 18' N. lat., 1° 54' W. long., distant 32 miles N.N.W. from Newcastle, and 804 miles N.N.W. from London. The population of the township of Rothbury in 1851 was 895. The living is a rectory in the archdea-

conry of Lindisfarne and diocese of Durham. Rothbury Poor-Law Union contains 71 townships, with an area of 159,168 acres, and a population in 1851 of 7,431.

Rothbury occupies a pleasant retired spot in a valley on the left bank of the Coquet, and consists chiefly of three wide and airy streets, which contain many well-built houses. The parish church is a fine old cruciform structure. The Free Grammar school and the Free school for girls were endowed by Dr. Thomlinson, formerly rector of the parish; the number of scholars at the grammar-school in 1854 was 62. In the market-place is a cross. The market on Friday has almost fallen into desuetude. Fairs for horses, cattle, and sheep are held on the Friday in Easter-week, Whit-Monday, October 2nd, and November 1st. A county court is held. On the summit of a hill on the right bank of the Coquet, is Whitton tower, one of the ancient borderers' strongholds, now converted into the rectory, and surrounded with plantations. In summer Rothbury is resorted to by invalids.

ROTHENBURG. [HESSE-CASSEL.]

ROTHER, RIVER. [SUSSEX; YORKSHIRE.]

ROTHERHAM, West-Riding of Yorkshire, a market-town and the seat of a Poor-Law Union, in the parish of Rotherham, is situated on elevated ground on the right bank of the river Don, in 53° 26' N. lat., 1° 20' W. long., distant 48 miles S. by W. from York, 159 miles N.N.W. from London by road, and 172 miles by the North-Western and Midland railways. The population of the town of Rotherham in 1851 was 6325. The living is a vicarage in the archdeaconry and diocese of York. The government of the town is chiefly in the hands of 12 feoffees. Rotherham Poor-Law Union contains 27 parishes and townships, with an area of 50,591 acres, and a population in 1851 of 33,082.

Rotherham is a place of some antiquity. The station 'Ad Fines,' on the great road from Little Chester to Castleford, is fixed by the best authorities at Temple Brough about a mile from the town. Rotherham probably originated early in the Saxon period. The church at Rotherham was then the only ecclesiastical edifice in an extensive district. A weekly market and an annual fair were held here before the Conquest; the Saxon lord of the manor had his corn-mill; and these were sufficient, with its ecclesiastical superiority, to render Rotherham a place of some importance. In 1307 Edward I. granted the town another market and a second fair. The parish church, a very handsome edifice in the early English style, with a highly-enriched central tower and spire, was built in the reign of Edward IV. There are chapels in the town for Wesleyan and Primitive Methodists, Independents, Baptists, Roman Catholics, and Unitarians. The Grammar school, which has a small endowment, had 40 scholars in 1853. The Feoffee's school, built in 1776, for 28 boys and 20 girls, has an endowment of about 100l. a year. There are also National schools. A college for the training of young men for the ministry in the Independent connexion, had 13 students in 1854. The town possesses a dispensary, a subscription library, a news-room, a literary and mechanics institution, and a savings bank. Archbishop Rotherham, a native of the town, in 1482 founded a college for a provost, three fellows, and six scholars. It was suppressed in the reign of Edward VI.; some remains of it still exist and are used as an inn. The bridge-chapel on the Don has been long used as the town jail. The town is lighted with gas, well paved, and has a good supply of water. Rotherham is united with Masborough on the left bank of the Don by a handsome stone bridge of five pointed arches. The court-house, in which the Midsummer quarter sessions are held, was built by the county in 1827. A county court is held.

Extensive beds of coal, of a quality suitable for manufacturing processes, exist in nearly every part of the parish, and iron-ore is also abundant. In 1746 the Messrs. Walker established a work for the manufacture of cast-iron goods of all kinds; and at the large establishments which originated in their enterprise, great part of the cannon used in the navy during the American and French wars was cast. Masborough is now the more strictly manufacturing part of the town, of which it may be said to form a part. There is an extensive brass-foundry. Glass, earthenware, starch, soap, naphtha, and pyroligneous acid, are largely manufactured. Malting is carried on, and there are two breweries. Vessels of 50 tons burden are occasionally built in yards adjoining the river Don. There is a flax-mill. The markets for corn and cattle are held on Monday: on every alternate Monday the cattle-market is one of the largest in the north of England. On Friday a market is held in a covered stone building in the market-place for butter, poultry, and eggs. Fairs for horses and cattle are held on Whit-Monday and December 1st; and a statute fair in November. The Don is connected with the Trent by the Stainforth and Keadby Canal.

ROTHERHITHE. [SURREY.]

ROTHERSAY, Scotland, a royal burgh in the island of Bute, and the chief town of Bute County, 52 miles W. from Glasgow, in 55° 51' N. lat., 5° 2' W. long. The population of Rothersay was 7014 in 1851. The town is governed by a provost and 17 councillors, three of whom are bailies.

Rothersay owes its origin to a castle erected about 1098, by Magnus, king of Norway. Robert III. made Rothersay a royal burgh, and James VI., in 1585, further augmented its municipal privileges. It was repeatedly taken and plundered by the English, the Norwegians,

and the lords of the isles. It was occupied by the Duke of Argyle in 1685.

The town stands on the east side of the island, at the bottom of a small bay. It has been much enlarged along the shore on each side of the bay by the addition of villas and lodging-houses for visitors, who resort here in summer for bathing. The ruins of Rothesay Castle stand in the middle of the town. The town-hall and county buildings, and the prisons for the county, are adjacent to the castle. There are two churches of the Establishment, three Free churches, and chapels for United Presbyterians, Reformed Presbyterians, and Episcopalians. The town is lighted with gas and possesses baths and wash-houses. Close to the parish church are the ruins of the ancient church of St. Mary, once the cathedral of the bishopric of the isles; the walls of the choir, and one or two ancient monuments, are standing.

There are a cotton spinning-mill and three power-loom factories, boat-building yards, and several cooperages in the town. The herring fishery is carried on. The harbour is used chiefly by the steamers which ply between Glasgow and Loch Fyne. There are a Parochial school, a Charity school, and several Congregational schools; a savings bank; a public library; and two reading-rooms. *Port Bannatyne*, a village in the parish, about 2 miles N. from Rothesay, has several small vessels engaged in the herring fishery. It is frequented in the summer by bathers.

ROTHLEY. [LEICESTERSHIRE.]

ROTHWELL. [NORTHAMPTONSHIRE.]

ROTONDA. [BASILICATA.]

ROTTERDAM, the capital of the Dutch province of South Holland, and now perhaps the most commercial town in the Netherlands, is situated in 51° 55' N. lat., 4° 29' E. long., on the right bank of the Maas, about twenty miles from the mouth of that river, and has about 90,000 inhabitants, of whom about 4000 are Jews, 25,000 Roman Catholics, and the remainder Protestants of different sects. It is in the form of a triangle, the base of which, about a mile and a half in length, extends along the Maas. It derives its name from the little river Rotte, which runs through the middle of the city, and falls into the Maas. The town is surrounded by a moat, and has six gates towards the land and four towards the river. The part called the Binnenstad ('inner town') has many narrow streets, and is separated by the High-street (Hoogstraat) which is built along the dyke that embanks the river, from the outer town (Buitenstad), which contains fine houses, and is intersected by numerous canals by which the largest merchantmen can come up and unload at the very doors of the warehouses. Along the Maas are many fine quays, the handsomest of which, called the Boortjes, consists of a long row of stately houses facing the river, with a broad and deep canal in the rear, parallel to the river. Rotterdam is connected by canal with Helvoetals, and by electro-telegraphic wires and railways with the Hague, Amsterdam, and Antwerp. The cathedral of St. Lawrence contains the tombs of De Witte, and several other admirals. This church, the statue erected to Erasmus (a native of the town) in the market-place, and the dock-yards are the chief objects of attraction in the town. There are also many churches and chapels of the Dutch and Scotch Calvinists, French Protestants, Baptists, and Roman Catholics, a synagogue, &c. British residents are numerous at Rotterdam, and for their accommodation there are three chapels—one for members of the Church of England, one for members of the Church of Scotland, and one for Independents. The Exchange is larger and handsomer than that of Amsterdam. The other principal buildings are the new town-house, the Admiralty, the Academy, the Dutch theatre, the magazines of the East India Company, and some manufactories. The commerce of Rotterdam extends to all parts of the world, and embraces almost every kind of produce and manufacture. Steamers ply regularly to Düsseldorf, Antwerp, London, Hull, &c. The imports and exports consist of similar items to those of Amsterdam. The annual value of the imports has been roughly estimated at 10 millions sterling, the exports at about 7 millions. Rotterdam contains many valuable collections of works of art, an academy of sciences, a public library, a central prison, many schools, and charitable institutions.

ROTTERDAM, NEW, one of the islands which constitute the group of the Friendly or Tonga Islands, is situated in 20° 15' S. lat., 174° 48' W. long. It was discovered by Tasman (1643), and named New Rotterdam, but it is now better known by the native name *Annamooka*, or *Namooka*. The island is about twelve miles in circumference, and in the middle there is a lagoon which is a mile and a half across. The island is low, and surrounded by a sea with regular soundings. [FRIENDLY ISLANDS.]

ROTTL. [SUNDA ISLANDS.]

ROUBAIX. [NORD.]

ROUEN, a large seaport-town in France, capital of the department of Seine-Inférieure, is situated on the right bank of the Seine, 85 miles by railway N.W. from Paris, in 49° 26' 29" N. lat., 1° 5' 40" E. long., 71 feet above the level of the sea, and had 91,512 inhabitants in the commune at the census of 1851. Rouen occupies the site of the ancient *Rotomagus*, capital of the Celtic *Veliocasses*. Under the empire it was the chief town of *Lugdunensis Secunda*. It was taken and plundered by the northmen in A.D. 841 or 842, and it became their capital by virtue of the treaty between Rollo and Charles the Simple. It continued to be the residence of the dukes of Normandy

till William the Conqueror made the conquest of England. [NORMANDIE.] After the murder of Prince Arthur at the instigation of John in 1204, the city was taken after a siege by Philippe Auguste, king of France, and annexed with the rest of the duchy to the crown of France.

From this time Rouen was subject to the kings of France till 1418-19, when it was besieged by the English under Henry V. The town was resolutely defended by a small garrison of 4000 men, under their gallant commander Alain Blanchard. As the town militia mustered 15,000 men, the population of Rouen at the time may be estimated at not less than 50,000 or 60,000. Famine at last compelled the garrison to surrender, and Henry V. tarnished the fame of his victory by the execution of the gallant Blanchard. For thirty years after this Rouen remained in the hands of the English, who here in 1431 burnt the heroic Joan of Arc in the square since called from her, the *Place-de-la-Pucelle*: the spot is marked by a fountain surmounted by a statue of the Maid of Orléans. In 1449 the city was recovered by the French, under Charles VII. In 1562 the Huguenot party succeeded in seizing the town, almost without resistance, and committed great excesses. On October the 26th of the same year it was taken, after a siege, by the Duke of Guise, who gave it up to pillage for eight days. The massacre of St. Bartholomew extended to this town, but the humanity of the governor somewhat checked the excesses. In 1593 the city was taken by Henri IV. after a siege of eight months.

The city stands on the right or north bank of the Seine. Its form approximates to an oval, defined by the boulevards, which form a line of street adorned with trees, and occupying the site of the ancient walls, except on the side of the river, where the city is bounded by a line of quays. Separated from the city by the boulevards are the faubourgs—Cauchoise on the west, Bouvreuil on the north-west, Beauvoisine on the north, St-Hilaire on the north-east, Martainville on the east, and Eauplet on the south-east. South of the city, from which it is separated by the Seine, is St-Sever, the most important of the suburbs. Opposite the central part of the city the river was formerly crossed by a floating bridge supported by 19 barges. Just below this may be seen, at low-water, the ruins of a stone bridge, erected in the 12th century by the empress Matilda, daughter of Henry I. of England, and carried away by a flood in 1564. Opposite to the upper and lower parts of the city and suburbs are two long islands—the upper called *Ile-de-la-Croix*, or *Ile-de-la-Mouque*; the lower, the *Ile-du-Petit-Gay*. Between these islands is the harbour for seaborne vessels. At the western or lower end of the *Ile-de-la-Croix* the river is crossed by a stone bridge, divided into two parts by the point of the island. On the point of the island between the two parts of the bridge is a circular area adorned with a column. A suspension-bridge also crosses this part of the river, connecting the city with the suburb of St-Sever. Above the stone bridge, on the east side of *Le-Croix* islet, lie the large river craft and small steamers that ply to Paris. Two small rivers, the Robec and the Aubette, traverse the eastern part of the suburbs and city by artificial channels, and flow into the Seine near the stone bridge. On the east side of the city, between the Seine and the Aubette, rises Mount St-Catherine, a bold eminence 380 feet high. On the left bank of the Seine, along which it extends for about a mile from the south end of the stone bridge, is the principal public walk, *Le-Grand-Cours*, planted with four rows of fine elms.

Rouen being an old town is in general badly built. The houses for the most part are built of lath-and-plaster, the timbers uncovered and painted red or black, the plaster frequently coated with small gray slates. Many of these old houses however are highly picturesque and distinguished for their rich carvings and old quaint gothic ornaments. In general they are very tall and very narrow, which adds to the singularity of their appearance; but mixed with these are other houses of white brick or stone, and really handsome. The frequent rains, by cleansing the streets, render the town less unhealthy than it would be; and beneficial changes introduced of late years have contributed to the same result. The broad quays, with the river covered with craft of all sizes, from the light skiff to vessels of 300 tons burden in front, and a line of warehouses behind, form at once the busiest and most agreeable part of the town. On the western side of the city and suburbs are some handsome straight streets lined with good stone-houses. The squares and other open spaces are numerous, but for the most part very irregularly laid out; the *Champ-de-Mars*, adjacent to the eastern boulevards, and the *Place-du-Boulingrin*, used for the cattle and horse market, adjacent to the northern boulevards, are of more regular form. The *Place St-Ouen*, or *Place-de-l'Hôtel-de-Ville*, is large, and planted with trees.

The cathedral, the most remarkable building in Rouen, is a noble gothic edifice, cruciform, with two towers at the extremities of the west front, and a lofty tower and spire over the intersection of the nave and transepts. The interior, which is lighted by 180 magnificent painted glass-windows, has a total length of 434 feet, and a width of 104 feet; the height of the nave is 90 feet, that of the aisles 45 feet; the transept, each end of which is lighted by a magnificent rose window, is 175 feet long; at its intersection with the nave four massive pillars support the lantern tower, on which rests a beautiful pyramidal cast-iron spire, the summit of which is 433 feet above the

pavement. The west front, which opens upon a spacious close, is about 170 feet wide; the towers by which it is flanked are of dissimilar architecture, though of nearly equal height (245 feet). The summit of the west front is crowned by a range of open screens, with the lightest and most elegant tracery. There are three deep doorways in the front; the central, which is the largest, projects like a porch before the others, and is surmounted by a pyramidal canopy of open stone-work, partly concealing the great rose-window behind. The northern tower of the western front, called the tower of St-Romain, is one of the oldest portions of the church. The southern tower is of a very rich pointed architecture, and was built in 1599 by Cardinal D'Amboise. The interior of the cathedral contains 25 chapels, including the Lady-Chapel at the end of the choir, and many interesting monuments, including those of Rollo and his son, William Longue Epée. The monuments of Henry the younger, son of Henry II.; of his brother Richard Cœur-de-Lion (whose heart was buried here); of Charles V. of France; of John, duke of Bedford, and others were destroyed by the Huguenots. The heart of Cœur-de-Lion was discovered in 1838, and is now deposited in the sacristy. The library was plundered during the Revolution; the staircase of the room which contained it is remarkable for its delicacy and beauty. The extensive palace of the archbishop, adjoining the cathedral, contains some good paintings.

The abbey church of St. Ouen, the noblest gothic edifice in Rouen, was rebuilt in the 14th century. It is a cruciform building, with a central tower and two western towers, which jut out diagonally from the angles of the western front, and were intended to be connected by a porch of three arches, extending along the lower story of the western front: the towers were for a long time raised only to about fifty feet. The lightness and purity of the architecture; the flying buttresses, with crocketed pinnacles and unusually lofty shafts; the beautiful south porch; the large rose or circular windows; the balustrade of varied quatrefoils round both the body of the church and the aisles; the painted windows, the whole of which have been preserved; and the rich central tower, 296 feet high, and terminated by an octagonal crown of fleurs-de-lis, entitle this church to the highest admiration. Its dimensions are little inferior to those of the cathedral itself. This splendid church was completely restored at the expense of the nation in 1852. There are in all 14 Catholic churches, several of Roman architecture. Under the choir of the church of St-Gervais there is a crypt which is said to be 16 centuries old; this church, situated in the Cauchoise suburb, belonged to the abbey of St-Gervais, in which William the Conqueror died.

The Palais-de-Justice, or court-house, a gothic structure built in the 15th century for the Parliament of Rouen, forms three sides of a quadrangle, of which the fourth side consists of an embattled wall and a gateway of elaborate architecture. In the Place-de-la-Pucelle is an hôtel ornamented with bas-reliefs, representing the interview of Henry VIII and François I. in the Field of the Cloth of Gold. There are a town-hall, formerly part of the abbey of St-Ouen, a clock-tower, some remains of the ancient castle, and a few fragments of the town-wall. In apartments in the town-hall are kept the public library of about 40,000 volumes, and a collection of paintings. The Martainville barracks, in the square of the Champ-de-Mars, has an imposing front; the Hôtel-Dieu, or great hospital, is spacious and airy; and the Halles, or covered markets, are considered to be among the finest in France. They surround on three sides one of the public squares, and form several conveniently-arranged and extensive apartments. The Mercury Hall, or Halle-des-Rouenneries, is 295 feet long by 55 feet wide; the corn-market is still larger. These halls occupy the site of the old castle, the scene of Prince Arthur's murder. A considerable number of handsome fountains are distributed through the streets and squares of the city. Among other structures of the town may be mentioned the archiepiscopal palace, near the cathedral; the custom-house and consular buildings, on the quays; and the theatre, barracks, and Bicêtre prison. Among the more recent buildings, the railway terminus, on the left bank of the river, by which trains from Paris reach Rouen, and the terminus on the right bank, from which the railways to Havre and Dieppe diverge, deserve special mention. Opposite the custom-house a statue of Boieldieu (who was a native of the town) was erected a short time ago.

Rouen ranks next to Lyon among the manufacturing towns of France; it is the principal seat of the cotton manufacture. The spinning-machines are driven by water or by steam power. Hand-weaving is also actively carried on. One large class of the productions of the town is known by the name of 'Rouenneries,' which comprehend chiefly checked and striped cottons for women's dresses. Nankeens are manufactured to a great extent. Kerseymeres also are manufactured. Dyeing cottons and woollens, calico-printing, and bleaching by chemical processes are carried on to a considerable extent. To the above manufactures may be added dimities, muslins, lace, bed-ticking, woollen hosiery, silk and cotton-velvet, shawls, handkerchiefs, fabrics of mingled silk and cotton, ropes, blankets, flannel, hats, combs, preserved meats, liquors, soap, chemical products, paper, haberdashery, steam-machinery and mill-work, shot, sheet lead, cotton- and woollen-yarn, &c. There are also numerous sugar-refineries, bleach-works, tan-yards, ship-yards, breweries, saw-mills, copper- and iron-foundries, &c.

GEOG. DIV. VOL. IV.

The western part of the city is the mercantile part; the centre is chiefly occupied by retail traders; and the eastern part is inhabited by the manufacturing population. The Faubourg-St-Sever is also occupied by persons engaged in manufactures. In the northern part of the town, and in the Faubourg-Cauchoise, on the western side, the gentry and persons not engaged in business chiefly reside. Ship-building is carried on along the bank of the Seine. Above 100 vessels, including steamers, belong to the port. The industrial products of Rouen are shipped to all parts of the world; and its commerce is said to be largely on the increase. The entries into the harbour for sea-borne vessels in 1848 numbered 1695, and in 1849, 1972; the total arrivals and departures in 1852 numbered 6215 vessels, carrying an aggregate burden of 541,855 tons, and 37,724 men.

The river (which opposite Rouen is 1000 feet wide and 36 feet deep) forms a commodious port, divided by the stone bridge into two parts, the upper devoted to the large boats which convey goods to Paris and other places higher up the river, the lower part to sea-borne vessels. The direct distance of Rouen from the sea is about 45 miles, but the length of the navigation is almost twice that distance. The influence of the tide is sensibly felt at Rouen, and vessels of 250 or 300 tons can get up to the town. The ready communication of Rouen with the capital and with other towns, by the navigation of the Seine and by railroads, has made it a place of considerable trade, independently of its manufacturing population. The articles of trade are wine, brandy, cider, corn, fruits, grocery, raw products used in the manufactures of the town, dye-stuffs, drugs, timber, iron, slates, pitch, tar, &c.

Rouen, besides being the capital of the department, is the seat of an archbishop, of a High Court of justice for the department of Eure and Seine-Inférieure, of tribunals of first instance and of commerce, of a council of prud'hommes, and of the head-quarters of the 2nd Military Division. The archbishop's diocese comprehends the department of Seine-Inférieure; his suffragans are the bishops of Bayeux, Evreux, Sées, and Coutances. The city also has a mint, a custom-house, two seminaries for the priesthood, a school of medicine, a college, museums of natural history and natural philosophy, schools of painting, sculpture, architecture, and navigation, a botanical garden, and an academy of science and art. Among the other institutions are four hospitals, including one for the insane and one for foundlings, a bank, a savings bank, public baths, and two theatres. Corneille was born in Rouen in 1606.

ROUERQUE. [AVEYRON.]

ROUFFACH. [RHEN, HAUT.]

ROUGÉ. [LOIRE-INFÉRIEURE.]

ROUJAN. [HÉRAULT.]

ROULERS. [FLANDRES, West.]

ROUMELIA. [RUM-ILL.]

ROUNDSTONE. [GALWAY.]

ROUSSILLON, an old province of France, coinciding with the present department of PYRÉNÉES-ORIENTALES. It obtained its name from the town called by the Romans Ruscino, the site of which is marked by an ancient tower now called Castell or Tour de Roussillon, near Perpignan. After the decline of the Roman sway in Gaul the country came successively into the hands of the Visigoths, the Saracens, and the Franks, and was for a long time governed by independent counts of its own. In 1173 the last of these counts bequeathed Roussillon to the kings of Aragon, who held it till the 17th century, when the French took possession of it. By the treaty of the Pyrenees in 1659, Roussillon was finally ceded to France.

ROVATO. [BRESCIA.]

ROVIGNO. [ISTRIA.]

ROVIGO, a province of Austrian Italy formerly included in the territory of the Republic of Venice, is bounded N. by the province of Padua, from which it is divided by the Adige, E. by that of Venice, W. by the provinces of Verona and Mantova, and S. by the papal province of Ferrara, from which it is separated by the Po. The length of the province of Rovigo is 35 miles from east to west, and its greatest breadth is about 15 miles. The area is 428 square miles, and the population in 1851 was estimated at 153,788. The surface is flat, and crossed by various canals, which communicate with the Po and the Adige. The chief products are corn, rice, hay, hemp, pulse, and flax.

The principal towns are the following:—*Rovigo*, the capital of the province, a bustling modern town, with about 7000 inhabitants, a collegiate church, a government house, a cathedral, and a chapel dedicated to the Blessed Virgin, in which are some good paintings. The Bishop of Adria resides in Rovigo. [ADRIA.] *Badia*, a small town, with a manufactory of fine pottery, and about 4000 inhabitants. *Lendinara*, 9 miles W. from Rovigo, on the Adigetto, has about 5000 inhabitants.

ROXBURGHSHIRE, Scotland, an inland county, situated on the south-eastern border, is bounded N. by Berwickshire, E. and S.E. by Northumberland, S. by Cumberland, S.W. by Dumfriesshire, W. by Selkirkshire, and N.W. by Edinburghshire. It lies between 55° 5' and 55° 40' N. lat., 2° 18' and 3° 10' W. long. Its form is very irregular: its greatest length from north-north-east to south-south-west is about 40 miles; its greatest breadth at right angles to the length is 28 miles. Its area is 720 square miles, or 460,938 acres, of which about one

half is under the plough, and the remainder is hill pasture, moor, or meadow. The population in 1841 was 46,025; in 1851 it was 51,642. The county returns one member to the Imperial Parliament.

Surface, Hydrography, and Communications.—The whole surface of the county is undulating and diversified, but in the northern and central parts the hills are of less elevation than along the English and Dumfriesshire borders. A range of lofty hills extends along the border of Northumberland, to which the general designation of Cheviot Hills is sometimes given. The Carter Fell (2020 feet), the Peel Fell, and Lauriston Crag form part of this range. From the head of the Jed Water the range of hills turns westward and runs through the county into Dumfriesshire, separating the basin of the Tweed from Liddesdale and Eskdale. From each side of the range, hills irregularly grouped overspread a wild pastoral district drained by the upper waters of the Teviot on the one side and the Liddel on the other. In the separating range are Windburgh Hill (2000 feet) and Wisp Hill (1830 feet). In Liddesdale (the country drained by the Liddel) are Peel Fell, the Lauriston Hills, and Mildenwood Hill (2000 feet). In the northern part of the county are the Eildon Hills (1864 feet); and on the banks of the Teviot, near the centre of the county, are Ruber's Law (1419 feet) and Dunian (1120 feet) on the south side, and the Minto Crags (721 feet) and Minto Kame on the north.

The county belongs almost entirely to the basin of the Tweed, which first touches the border of the county at the junction of the Ettrick Water; that part of its course which belongs to Roxburghshire may be estimated at 30 miles. It is valuable for its salmon fishings. The principal affluent of the Tweed is the Teviot, which flows through the county in nearly its whole extent, giving to the greater portion of it the name of Teviotdale. It drains nearly the whole county, receiving the Slitrig, the Rule, the Jed, and the Kail from the Northumbrian border, and the Borthwick water and river Ale from Selkirkshire. The Ettrick, the Gala, the Leader, the Eden, and other small affluents of the Tweed have part of their course in this county. Liddesdale is drained by the Liddel and its tributary the Hermitage. It receives the other streams of Liddesdale, and joins the Esk, which falls into the Solway Frith. The whole course of the Teviot is beautiful; it flows along the bottom of a spacious open valley, the sides of which often rise to a considerable height, and its banks are adorned with numerous mansions. Above Hawick the valley is narrower, and becomes pastoral rather than agricultural. None of the streams are navigable, except for ferry-boats.
