South of the boundary-line of the London clay the plastic clay crops out, and occupies a long narrow district extending across the county from the Kentish to the Hampshire border, bounded on the south by a line drawn near Addington, Banstead, Horsley, and Guildford, and thence to the Hampshire border. The breadth of the plastic clay district on the Kentish border is four or five miles, but it becomes narrower towards the west, and on the Hampshire border is probably not more than half a mile in breadth. The hills near Addington and Croydon, Banstead Downs (576 feet), and Epsom, Ashstead, and Leatherhead Commons are on the plastic clay, which here covers the chalk with a thin bed; the chalk is quarried beneath it on Banstead Downs. Beds of fine clay of the plastic clay formation are wrought near Ewell, and red clay near Guildford. South of the plastic clay the chalk range of the North Downs rises. These downs extend from Kent across the county into Hampshire, interrupted only by the depressions through which the rivers Mole and Wey pass, and by a depression near Farnham. The southern escarpment may be traced running just to the north of Titsey, Godstone, Gatton, Reigate, Dorking, Wotton, and Farnham. Guildford is in the line of the downs in the depression through which the Wey passes. The breadth of the chalk district is greater on the eastern side of the county, and the downs there attain their greatest elevation. Botley Hill (880 feet), above Titsey, is the highest point. The breadth of the chalk district here is about four miles. Box Hill, near Dorking, overlooks the depression through which the Mole passes, and is, from the picturesque scenery which it presents, a favourite place of resort for the inhabitants of the metropolis. Between Dorking and Guildford the range of the Downs gradually narrows; and between Guildford and Farnham it forms a remarkable narrow unbroken ridge, above six miles long and about half a mile broad, called the 'Hog's Back.' The downs rise again beyond Farnham, just on the border of Hampshire, into which they extend. The thickness of the chalk formation at Denbigh, north-west of Dorking, is 440 feet. The chalk is dug in different places, and is burnt for lime.

From beneath the south escarpment of the North Downs the chalk-marl and greensand formations crop out. They occupy the valley which extends at the foot of that escarpment all through the county, and east of Reigate is called Holmesdale; but as the formations extend southward from the chalk they rise into hills, among which are Leith Hill (993 feet, the highest point in the county, and indeed in this part of England), Holmbury and Coneyhurst Hills, and Hind Head Common, on the Hampshire border, 923 feet high. This range of hills presents a bold escarpment towards the valley on the south, and is broken by two considerable depressions, one near Reigate, by which the Mole passes through, and another between Hurtwood Common and Hascombe, through which a feeder of the Wey passes; and by some minor interruptions. Beds of chert occur in the chalk-marl near Reigate, and fire-stone is dug in the same formation at Merstham. The high grounds of these formations are almost entirely waste. On Hind Head Common occurs that remarkable hollow, the 'Devil's Punch-bowl,' round which the Portsmouth road winds for nearly a mile. The rest of the county, comprehending the whole of the southern border, except a very small part west of Haslemere, is occupied by the Weald clay and iron-sand formations. The latter only just appears at the south-eastern corner of the county. The Weald clay occupies the broad valley at the foot of the greensand

hills, and in some places forms the lower part of the south side of the hills.

Hydrography and Communications.—The county is included in the basin of the Thames, except three very small portions; two south of the greensand hills, which are drained by streams flowing into the Arun, and a third in the south-east corner of the county, which belongs to the basin of the Medway. The Thames, which forms the northern boundary, is navigable throughout for small craft, and up to London Bridge for sea-borne vessels. Those of its tributaries which belong to Surrey are the Bourn Brook, the Wey, the Mole, the Hog's Mill River, the stream which joins the Thames above Putney, and the Wandla. The *Bourn Brook* rises near Bagshot, and flows by Chobham and Addlestone into the Thames below Chertsey, sending off one branch into the Wey; it receives a stream from Virginia Water in Windsor Great Park: its whole length is about 14 miles.

The *Wey* rises near Alton in Hampshire, and flows north-east about 9 miles to the border of Surrey, which it enters not far from Farnham. Thence it flows by Farnham to Tilford, where it receives, on the right bank, a considerable stream from Woolmer Forest in Hampshire, and runs eastward to Godalming, where it becomes navigable. From Godalming it flows by Guildford and Woking into the Thames at Weybridge. The Wey has several tributaries in the county. The whole length of the Wey is about 41 miles, for about 18 miles of which it is navigable. The *Mole* rises in the northern part of the county of Sussex. It enters Surrey at Charlwood, passes Horley, Kennerley Bridge, Dorking, Leatherhead, and Cobham, and flows into the Thames at East Molesey, opposite Hampton Court. Its whole course is about 42 miles. It is not navigable in any part. The *Hog's Mill River* rises in a copious spring in the village of Ewell, and flows north-west 7 miles into the Thames at Kingston. It is not navigable, but turns several mills. The stream which joins the Thames near Putney rises at the foot of Banstead Downs near Cheam, and flows northward by Richmond Park, and Barnes, where it turns east and joins the Thames half a mile above Putney Bridge; its length is almost 10 miles: it is not navigable. The *Wandla* rises near Croydon, flows by Carshalton, Mitcham, and Wandsworth, into the Thames: its course is only 11 miles, and it is not navigable, but it works numerous mills.

The canals are the Grand Surrey Canal, the Wey and Arun Canal, and the Basingstoke Canal. The Grand Surrey Canal is cut from the Thames at Rotherhithe, about a mile and a half to the neighbourhood of Deptford, in Kent, and then turning west is carried two miles and a half farther to Camberwell. There is an extensive basin in the part of the canal near the Thames. The Wey and Arun Canal, sometimes called the Surrey and Sussex Canal, commences in the river Wey near Shalford, between Guildford and Godalming, and runs south by east (11 miles) into Sussex, where it joins the Arun navigation near Billingshurst. The Basingstoke Canal commences in the river Wey, about 3 miles above its junction with the Thames, and runs south-west nearly 12 miles to Frimley, near the border of the county; it then turns south and runs above three miles to near Aldershot, where it enters Hampshire.

The principal roads in the county are those which lead from the metropolis to the south-east, south, and south-west. The Dover road, as far as New Cross, near Deptford, is in this county. The Brighton road runs south from Southwark through Brixton, Croydon, and Merstham. Here it divides, one branch running through Reigate, the other running over Red Hill and through Horley. The two branches reunite near Horley, and run across Lowfield Heath to Cawley in Sussex. The most frequented Portsmouth road leaves the metropolis at Hyde Park Corner, and enters the county over Putney Bridge, but formerly the more frequented road was through Newington and Wandsworth. The two roads unite beyond Putney, and run south-west by Kingston, Guildford, and Mousehill. The Winchester and Southampton road branches from this to the right at Guildford, and runs west along the Hog's Back to Farnham. The Salisbury and Exeter road enters the county across the Thames at Staines, and runs just within the north-western border and parallel to it through Egham and Bagshot. There are numerous branch and cross roads.

The Greenwich railway, now leased to the South-Eastern Railway Company, runs south-east from London Bridge to Corbet's Lane, near New Cross, where it quits the county. The North Kent line also leaves the county at New Cross. The Brighton and South Coast railway runs parallel to the Greenwich line nearly to Corbet's Lane, where it turns south, and with the exception of the short distance from near Forest Hill to Penge, which is in Kent, it continues in a generally southward direction through this county, which it quits at Oakhead, a few miles north from Horsham. The Croydon and Epsom line is a branch of the Brighton and South Coast line, which it quits at Croydon, and runs south-west to Ewell and Epsom. The Crystal Palace railway runs between the London Bridge terminus and the grounds of the Crystal Palace at Penge. The South-Eastern railway is carried over the same rails as the Brighton line as far as Redhill, Reigate, where it turns eastward, and quits the county a few miles west of Godstone. The Dorking and Guildford branch quits the main line at Reigate, and runs westward past Dorking to Guildford, where it joins the Guildford and Reading railway. The main line of the London and South-Western railway runs from the Waterloo

Bridge terminus, past Kingston, below which a branch runs off to Hampton Court, and Weybridge, where there is a short branch to Chertsey, and quits the county near Farnborough. At Woking Heath, a branch runs off southward to Guildford and Godalming. On the Guildford and Reading branch, a short line branches south-west to Alton, quitting this county near Farnham. The Windsor branch quits the main-line near Battersea, and runs westward to Richmond, where it quits the county; the Brentford loop-line quits this branch at Barnes Common. A line to connect the West End of London with the Crystal Palace is in progress.

Climate, Soil, and Agriculture.—The climate of this county is favourable for corn and grass. Along the Thames and the other rivers of the county the air is soft and mild: where the ground rises into barren gravelly hills, or lies on the range of chalk which divides the county in a direction from north-east to south-west, from Croydon to Farnham, it is keener, and the winds are more boisterous. Generally along the sandy hills the climate is remarkably salubrious. The soil varies greatly in different districts. The richest is that which lies along the banks of the rivers, consisting chiefly of a deep alluvial loam. On this soil, in the neighbourhood of London, are some of those extremely productive and highly-cultivated market-gardens, which supply the metropolis with fruit and vegetables. The immense quantity of manure which is annually laid on the land so occupied, and the deep trenching and digging which are repeated at short intervals, have converted the whole surface, to the depth of three feet or more, into a rich black vegetable mould. On this soil are raised the best and earliest culinary vegetables, which so rapidly succeed each other that five or six different crops are sometimes gathered from the same ground in one year. There is another naturally rich black soil, which appears in small detached portions along the foot of the chalk hills, and produces fine crops of wheat. The next in fertility is a hazel loam, with a considerable portion of calcareous earth in its composition, which is found on the northern side of the hills about Cobham, Woking, and Horshill: the well-known hop-grounds in the neighbourhood of Farnham are mostly on a similar soil. The most extensive tract is that of the Weald clay, which is a soil with a smaller mixture of siliceous sand than most clays. This Weald extends into Sussex and Kent, and occupies most of the southern parts of the county. This soil can only be rendered productive by very complete draining, and by correcting the tenacity by chalk or gravel, where they can be found at hand, which however is seldom the case. The Weald is generally low and flat; where it rises into hills the soil is more fertile. In the northern portion of the county extending towards Hampshire is a large tract of sandy loam of various qualities, some of which remains in the state of heath and common. There are some sandy loams of a better quality between the barren soil known by the name of Bagshot sand and the chalk hills, as about Esher, Dorking, and Reigate: about Godalming it becomes of a very good quality, resting upon a sandstone. The poorer sands rest chiefly upon a yellow ferruginous gravel. The tops of the chalk hills are either covered with a short pasture, as downs, or where the soil is deeper over the chalk, it is mostly under the plough. Generally the most improved systems of husbandry, and the best implements, have been introduced; and the local peculiarities of cultivation are fast disappearing.

Surrey is a favourite county for the residence of men of fortune. It possesses many beautiful sites, and the views from some of the hills are very extensive, such as Richmond Hill, St. Ann's, Cooper's Hill, and Leith Hill. The villas within a short distance from London are very numerous, but few of them have more than a small quantity of pasture-land and pleasure-ground attached to them.

The Wealds of Surrey were, till within a comparatively modern date, one continued forest, and have been gradually cleared and cultivated. The management of underwood is well understood and attended to. In the heaths and poor sands furze is often abundant, and is sold for heating bakers' ovens, and for the use of brick-makers and lime-burners.

There is no peculiar breed of cattle in Surrey. There is not much good grazing-land, and the beasts that are fattened or kept for milch-cows are of all the breeds which are usually met with. Short-horn Alderney cows, and crosses between them, are very common in the pastures adjoining gentlemen's seats. Beasts of all breeds are fattened on the wash obtained from the distilleries near London. There was once a peculiar breed of heath sheep, which had a small fleece of fine wool, and very delicate flesh when fattened. The meat was well known by the name of Bagshot mutton. There is only a small remnant of this breed left. The farmers are partial to the South Down sheep. Several farmers about Ewell, Esher, and Walton, and towards Guildford, rear house-lambs of the Dorsetshire breed for the London market. The pigs are principally of the Berkshire breed.

Divisions, Towns, &c.—Surrey is divided into 14 hundreds, as follows:—Blackheath, south; Brixton, north-east; Coptorne, central; Effingham, central; Elmbridge, north; Farnham, south-west; Godalming, south-west; Godley, north-west; Kingston, north; Reigate, south; Tandridge, south-east; Wallington, east; Woking, west and central; Wotton, south.

The metropolitan boroughs of Southwark and Lambeth are included in Brixton hundred, and Guildford in Woking hundred.

Surrey comprehends the parliamentary boroughs of Southwark, Lambeth, Guildford, and Reigate; the now disfranchised boroughs of Haslemere, Blechingley, and Gatton; the market-towns of Chertsey, Croydon, Dorking, Epsom, Farnham, Godalming, and Kingston; the suburban villages of Rotherhithe, Bermondsey, Newington, Walworth, Camberwell, Peckham, Dulwich, Norwood, Brixton, Kennington, Clapham, Wandsworth, Putney, Battersea, Tooting, and Streatham; and the remoter, but extensive villages of Mortlake, Barnes, Kew, Richmond, Wimbledon, Merton, Mitcham, Ewell, Carshalton, Beddington, Leatherhead, Walton-on-Thames, Esher, and Egham. Southwark, Lambeth, and some other of the places which form part of London, are spoken of in our account of the metropolis; the places printed in small capitals are described under their respective titles; the remainder, with the other villages of importance, we notice here, with their respective populations in 1851:—

Gatton is 2 miles N.E. from Reigate. Some Roman antiquities have been found here. Gatton first sent members to parliament in 29 Henry VI., and returned two members down to the time of its disfranchisement by the Reform Act. The parish now contains only 37 houses and 172 inhabitants. Gatton House is a handsome residence in an extensive and beautiful park. Until the disfranchisement of the borough, the proprietor of Gatton House chose the members. Upper Gatton House is a noble building standing in a spacious park. Some quarries of stone are worked.

Haslemere, population of the parish 955, is 12 miles S. from Guildford, on the road to Chichester. A charter granted by Queen Elizabeth in the 38th year of her reign speaks of the antiquity and populousness of the town, but refers to its existing impoverishment from the extinction of its fair and market. The town occupies an elevated site, and is very clean; the streets are irregularly laid out, and only partially paved. The parochial chapel, on the north side of the town, is an ancient structure with a small square tower at the west end. The Independents have a meeting-house; there are a National school and a literary institution. The market on Tuesday is of little importance: cattle fairs are held on May 18th and September 26th. The principal trade is in wood-turning; there are three extensive paper-mills. Haslemere sent members to parliament until the disfranchisement of the borough by the Reform Act.

Ash, population 472, is on the border next Hampshire, about 7 miles N.E. from Farnham. About 2 miles W. from Ash, at Aldershot, in Hampshire, an encampment has been formed in the present year (1855) by the government, for the purpose of training the soldiers to the habits of camp life, and instructing them in the best modes of mitigating the hardships of a campaign. *Bagshot*, 9 miles S.W. from Egham, population of the parish of Windlesham, 1794, is on the Hampshire border. Bagshot Heath is now inclosed. The church was erected at the end of the 17th century. There is a National school. Bagshot Lodge is a royal hunting seat. In the vicinity are extensive nursery-grounds. *Barnes*, 7 miles W.S.W. from London by the South-Western railway, population 1879, is a suburban village on the right bank of the Thames, contains several good residences. Besides the parish church, which is ancient, but much altered, there are a chapel of ease at Castelnau, and a National school. It was in a room attached to the house of Jacob Tonson at Barnes that the celebrated Kit-Cat club held its meetings. Cowley the poet resided at Barnes Elms. *Battersea*, population of the parish 10,560, is a suburban village on the Thames nearly opposite Chelsea, with which it is connected by a wooden bridge. The parish church is a plain brick building erected in 1777: in it is a monument by Roubiliac to Bolingbroke, who was born and died at Battersea. There are in Battersea a preparatory training establishment of the National Society, which had 100 students in residence in July 1854. Much of the ground in Battersea is occupied as market-gardens. A new park is now being formed in Battersea Fields; and a suspension-bridge to connect it with the north side of the Thames is being constructed. *Beddington*, 2 miles W. from Croydon, population 522, has a very handsome church, partly of the decorated and partly of the perpendicular style of architecture, which has been recently restored. There is a National school. Beddington House is a noble Elizabethan mansion, partly rebuilt in 1709. The Wandle here turns some snuff- and flour-mills. *Bermondsey*, population of the entire parish 48,128, is a suburb of London and the seat of a Poor-Law Union. [LONDON.] It lies on the Thames, between Southwark and Rotherhithe. The old church is a building of little architectural pretension; there are three new churches, chapels for Independents, Wesleyan Methodists, Baptists, and Roman Catholics; National, British, Infant, and Roman Catholic schools, and a Roman Catholic convent. Near the waterside are wharfs, and the various trades connected with shipping are carried on. In the parish are numerous extensive tan-yards. *Brixton*, population 14,610, is a hamlet of Lambeth parish, and contains many genteel residences. There are a district church, St. Matthew's, at the foot of Brixton Hill; two other Episcopal places of worship, chapels for Independents and other Dissenters, and National, British, and Infant schools. On Brixton Hill is a handsome building for the St. Ann's Society schools. *Camberwell*, population 64,667, is an extensive parish, extending from the boundaries of Rotherhithe and Bermondsey on the north to Croydon on the south. It is the seat of a Poor-Law

Union. [LONDON.] The village of Camberwell consists of four principal thoroughfares meeting in an open green, and leading respectively to London by Walworth, to Deptford by Peckham, to Kennington and to Norwood by Denmark and Herne hills. These thoroughfares are lined with good houses; many new houses have been erected within the last few years. The parish church is a spacious and very handsome edifice in the decorated style, erected from the designs of Brandon and Wyatt in place of the old church, which was destroyed by fire in 1841. There are also St. George's church; Emmanuel church; Camden church; St. Paul's, Herne Hill, a small but graceful and well-finished church in the decorated style; a handsome new gothic chapel at Camberwell Green for Independents; several other places of worship for Dissenters; National, British, and Infant schools; a proprietary grammar school; and a literary and scientific institute. *Carshalton* is on the edge of Banstead Downs, 8 miles W. from Croydon, population 2411. The river Wandle flows through the village, expanding in the centre of it into a wide and ornamental sheet of water. Several corn, oil, snuff, drug, flock, and paper-mills are worked by the Wandle. There are also some print-works; brewing, leather-dressing, and coach-making are carried on. The church is ancient, but has been much altered. There are parish schools. A government preparatory school for officers of the Royal Artillery and Engineers was established here in 1848. *Cheam*, 2 miles E. from Epsom, population 1187, is on the line of the Epsom railway, and contains some good residences. The church was rebuilt in 1639; there are National schools. At Cheam was Nonsuch, the costly palace of Henry VIII.: only a few fragments of it remain. *Chobham*, 7 miles S.W. from Chertsey, population 2069, is pleasantly situated on the Bourn Brook, a feeder of the Wey. The church is an ancient edifice; a chapel of ease was erected in 1842 at the west end. The Baptists have two places of worship. At Chobham Park are the remains of an old mansion. In 1854 an experimental encampment was held on Chobham Common. *Clapham*, population 16,290, lies S.W. of Stockwell, on the road from London to Epsom. Clapham Common, an open space of about 200 acres, partly in this parish and partly in Battersea, is planted with trees, so as to present the appearance of a park, and is surrounded by handsome houses. At one corner of the common is the parish church, a plain brick building. There are also the district churches of St. Paul's, erected in 1814 on the site of the old parish church; St. James's, a gothic structure erected in 1829 in Clapham Park; and St. John's, a Grecian building erected in 1842 in the Clapham road. A very handsome Roman Catholic church, in the decorated style, has been lately erected in connection with a Redemptorist convent. There are also a handsome new Independent chapel, in the decorated style, with a lofty spire, and several other Dissenting places of worship; a Grammar school; Parochial, National, British, and Infant schools; a literary institute; a savings bank; and the British Orphan Asylum. *Cobham*, population 1691, is pleasantly situated on the right bank of the Mole, 6 miles W. by S. from Leatherhead. The church is ancient, chiefly of the decorated style. On the Mole are extensive mills for carding woollen rags. *Dulwich*, population 1632, lies in a hollow about 2 miles S. from the village of Camberwell, and contains a number of genteel residences. The most important building is the College of God's Gift, which was repaired and much improved in appearance a few years ago, under the superintendence of Sir C. Barry. The college was founded and endowed, and the building erected, by Edward Alleyn in 1614-19. It consists of a master and warden, who must be of the same name as the founder, four fellows, six poor brethren, six poor sisters; and of 12 poor boys, who are to be educated and maintained from the age of 6 to 12 years and then apprenticed. Behind the college is a picture-gallery, containing some fine paintings, chiefly by the old masters. It is open to the public without charge, by tickets, every day except Friday and Sunday. In the hamlet are a chapel of ease and a Wesleyan Methodist chapel. *Egham*, population 4482, is near the north-western boundary of the county, on the bank of the Thames. It is united to Staines by a handsome granite bridge. The village consists of a long street, which is lighted with gas and paved. The parish church is a modern brick building; there is a new district church at Virginia water. There are places of worship for Wesleyan Methodists and Independents; National schools; Strode's charity school; and a literary institution. Virginia water, Englefield Green, Cooper's Hill, and Runnymede, where Magna Charta was signed by King John, are in the parish. A fair is held on Englefield Green; Egham races are held annually on Runnymede. *Esher*, 4 miles S.W. from Kingston, population 1441, is pleasantly situated near the right bank of the Mole. At Esher is Claremont, the residence of the Princess Charlotte and the place where she died: it is now held in trust for Leopold, king of the Belgians, and is at present the residence of the widow and sons of Louis Philippe, the late king of the French. The mansion was erected by the celebrated Lord Clive. There is a new church at Esher, towards the erection of which the King of the Belgians subscribed 1000*l.* The Quakers have a meeting-house; and there is a National school. *Ewell*, 1½ mile N.E. from Epsom, population 2186, was once a market-town. A new church, in the early English style, was erected in 1848: the tower of the old church is left standing. There are National and Infant schools. Gunpowder-mills, potteries, and brick-works give some employment. *Frimley*, population of the

hamlet 1792, is on the Hampshire border, about 14 miles N.W. from Guildford. Besides the chapel there is a district church, erected in 1850, at *York Town*, a village on the Berkshire border, not far from the military college at Sandhurst. There are National schools. *Ham*, population with Hatch 1324, lies near the Thames, 2 miles N. from Kingston. Besides the church, which is a neat modern building, there are an Independent chapel, National and Infant schools, and a Cholera Orphan Asylum, established in 1849. *Ham House*, the property of the Earl of Dysart, is a large and handsome mansion facing the Thames, erected in the reign of James I. *Horley*, population 1415, is situated 5 miles S. from Reigate. The church is of the early English period; there are a Baptist chapel and National schools. *East Horsley*, population 247, and *West Horsley*, 719, are adjoining villages, pleasantly situated about midway between Guildford and Leatherhead. *East Horsley* church is a small one of Norman date; *West Horsley* church is also ancient; in it was interred the head of Sir Walter Raleigh, and the body of Carew Raleigh, the son of Sir Walter. There are Free schools at *East Horsley* and National schools at *West Horsley*. *Kennington*, population 43,109, adjoins Brixton on the north. It comprehends a tolerably extensive public park, recently formed, at the extremity of which is St. Mark's district church, erected a few years ago. There are three proprietary episcopal chapels besides St. Mark's church and *South Kennington* church; also some Dissenting chapels, a Roman Catholic convent, National and Infant schools, and a savings bank. The Licensed Victuallers' schools, for the maintenance and education of 200 children, are at *Kennington*; the building is very spacious and handsome. South of *Kennington*, on the Clapham road, is *Stockwell*, where are a district church and a chapel of ease. *Kew*, 6 miles W. from Hyde Park Corner, population 1009, is on the Thames opposite Brentford. The church, which stands on the centre of the green, was built in 1714, and enlarged in 1837. There is a Free school for girls. At *Kew* are the extensive public Botanic Gardens, at present the finest in the country; they are open daily to the public free of charge. *Leatherhead*, population 2041, on the right bank of the Mole, 4 miles S.W. from Epsom, was once a market-town. Besides the church, an ancient cruciform edifice, there are an Independent chapel and National schools. Brewing, malting, and tanning are carried on. The Mole is here crossed by a bridge of 14 arches. *Lingfield*, 6 miles S. by E. from Godstone, population 2141, is in an agricultural district. The church contains some interesting monuments. The Baptists have two places of worship. *Mertsham* is on the Brighton railway, 3 miles N.E. from Reigate, population 843. The church contains some curious monuments: there are National and Subscription schools. *Stone* is quarried to some extent. *Merton*, population 1870, on the river Wandle, 9 miles S.S.W. from London, is noticeable on account of its abbey, which possesses some historical interest. *Merton Abbey* was for regular canons of St. Augustine, and was a wealthy institution. Part of the outer walls, and the east window of the abbey-chapel, are still standing. *Merton* church is an ancient edifice, partly of Norman date. There is a chapel for Independents. Several manufacturing establishments are in the neighbourhood. *Mitcham*, 2 miles N. from Dorking, population 766, stands in a vale watered by the Mole, and long celebrated for its beauty. The church, of the early English style, has been recently enlarged. There are National schools. *Norbury Hall* is a fine mansion, standing in an extensive and picturesque park. *Mitcham*, population 4641, is about a mile S. from Tooting. Besides the church, which was erected in 1821, there are chapels for Wesleyan Methodists and Independents; National and Infant schools, and an establishment for the infant poor of St. George's-in-the-East. On the Wandle are numerous mills, calico- and silk-printing works, and shawl-printing works; and on the common and elsewhere are gelatine-, varnish-, and japan-works, felt-works, gas-works, and a blacking, vinegar, and lucifer-match manufactory. Brewing and malting are carried on. *Mortlake*, population 3110, consists of a street stretching along the Thames, 2 miles E. from Richmond. Besides the parish church, which was rebuilt in 1725, there are an Independent chapel, National and Infant schools, a savings bank, and almshouses erected by the Boot- and Shoe-Makers' Benevolent Institution. *New Cross* [GREENWICH]. *Norwood*, population 3977, is about a mile S. from Dulwich. St. Luke's district church is of Grecian architecture; All Saints' district church, on Beaulieu Hill, is a neat gothic edifice. At *Norwood* is a large public cemetery, with episcopal and dissenting chapels for performing the burial service. The Wesleyan Methodists, Independents, and Baptists have places of worship; there are National and British schools; a district school for the pauper children of Lambeth parish, and a very spacious and costly structure for the pauper children of the city of London; also several almshouses, a Roman Catholic convent, and a female school. The *Beulah Spa* is a public pleasure-ground prettily laid out, in which is a mineral spring. *Peckham*, population 19,444, is a large suburban village, in the parish of Camberwell. It contains numerous good residences, especially around the extensive common called *Peckham Rye*. Besides the district churches there are chapels for Wesleyan Methodists, Independents, Baptists, and Quakers; National, British, Birkbeck, and Infant schools; a savings bank; and the Licensed Victuallers' Asylum, which affords 103 separate dwellings for the pensioners; and at *Newhead* is an extensive cemetery, with an Episcopalian and a Dissenting chapel. *Page*, population 1160, is a hamlet of Battersea parish, lying

between *Norwood* and *Sydenham* (Kent), about 5 miles distant from the main part of the parish. The church is a handsome new building of the decorated style. There are National schools; the Surrey School of Industry; the almshouses of the Watermen's Company, a spacious and commodious pile containing 41 houses; and King William's Asylum, for 12 decayed widows of commanders in the merchant service, a handsome range of houses erected at the expense of the late Queen Adelaide. *Penge Park*, or *Penge Place*, is the spot on which the Crystal Palace is erected. The grounds of the palace have been laid out with great care under the direction of Sir Joseph Paxton. Several fine fountains are in operation, and the principal fountain is now (August 1855) nearly ready. About 50,000 persons visit the Crystal Palace weekly. *Putney*, population 5280, is on the Thames opposite to Fulham, with which it is connected by a wooden bridge. The church was partly rebuilt in 1836. There are Wesleyan and Independent chapels; National and Infant schools, and an Endowed school for watermen's children; also some almshouses. *Putney Heath* is a fine open area united with Wimbledon Common. *Red Hill* [REIGATE]. *Rotherhithe*, population 17,805, is a suburb of London containing many extensive trading establishments chiefly connected with the ship-building business. There are also iron-works, corn-mills, and extensive granaries and warehouses for goods. The Surrey Canal docks and warehouses are at *Rotherhithe*. The Thames Tunnel has its south entrance near *Rotherhithe* church. Besides the parish church there are four district churches or episcopal chapels; several places of worship for Dissenters; National, British, and Infant schools; and some Free schools. *Streatham*, population, including Upper Tooting, 6901, lies S. from Brixton. The principal street extends along the Brighton road, and in it and by the common are many handsome villas. The church was partly rebuilt in 1830; there is a district church. The Independents and Wesleyan Methodists have chapels, and there are National and Infant schools. *Sutton*, population 1387, is on the Dorking road, 5 miles W.S.W. from Croydon. The church is a plain building; there are National schools. In the vicinity are several good residences. *Tooting* lies S.W. from Clapham; it comprehends Upper and Lower Tooting. Upper Tooting is a hamlet of Streatham; Lower Tooting, or Tooting Graveney, is a separate parish, population 2122. The principal street of Upper Tooting lies along the Horsham road; Lower Tooting is partly to the left of the road. The parish church of Lower Tooting was rebuilt in 1833: there is a chapel of ease on Balham Hill, Upper Tooting; and there are some Dissenting places of worship, two National schools, and an Infant school. Extensive nursery-grounds are in the vicinity. *Walton-on-Thames*, population 2881, is on the right bank of the Thames, 5½ miles W. from Kingston. Near *Walton* is *Oatlands*, the residence of the late Duke of York; and at the foot of *Walton* bridge is an elegant Italian villa with a lofty campanile, erected from the designs of Barry. The church contains some curious monuments; there are also a chapel of ease, an Independent chapel, and National schools. A fair is held in Easter week. *Wandsworth*, population 9611, is on both sides of the river Wandle at its junction with the Thames, about 7 miles from the General Post-Office. *Wandsworth* is called in 'Domesday' *Wandesorde* and *Wendlesorde*. The main street is along the old Portsmouth road. There are manufactures of matting, bolting-cloths, wire-blinds, candles, lucifer-matches, and hats; a distillery, breweries, dye-houses, oil, corn-, and paper-mills, an iron-foundry, coal-wharfs, and calico print-works. *Wandsworth* has been divided into two parishes: the old parish church, All Saints, is a plain modern building; St. Ann's, the new church, is a Grecian edifice erected a few years back; there is a chapel of ease at *Summer's Town*. The Independents, Baptists, Quakers, and Roman Catholics have places of worship; there are National, British, and Infant schools; a school of industry, and a savings bank. The *Freemasons' Orphan* schools, a quaint red-brick edifice erected in 1852, is on *Wandsworth* Common. A county court and a police court are held in *Wandsworth*. On the common is the County Bridewell, a very extensive and costly structure; and at *Garrett* is the County Lunatic Asylum, a noble building, providing ample accommodation for 800 patients. A fair is held in *Whitson* week. *Weybridge*, population 1225, adjoins *Walton* on the south-west, at the confluence of the *Wey* with the *Thames*. The church, a very handsome edifice of the decorated style, was erected in 1846; in it are some interesting monuments removed from the old church. The Roman Catholics have a chapel, in which Louis Philippe, late king of the French, was buried. There is a National school. *Wimbledon*, population 2693, is 3 miles W. from *Wandsworth*. *Wimbledon* Park extends northward to the Portsmouth road, and comprehends an area of 1200 acres: part of it is occupied by handsome new villas. West of the park is *Wimbledon* Common, nearly as extensive, on which is an ancient circular entrenchment. *Wimbledon* church is a modern building. There are chapels for Independents and Wesleyan Methodists, and National and Infant schools. *Woking*, population 2837, on the left bank of the *Wey*, about 6 miles N. from *Guildford*, possesses an ancient church; it has also National schools. Paper-making, printing, brewing, and malting are carried on. A fair is held on *Whit-Tuesday*. *Sutton* House is a fine old mansion of the Tudor period. A portion of *Woking* Heath is occupied by an extensive metropolitan cemetery.

Divisions for Ecclesiastical, Legal, and Parliamentary Purposes.—The county is wholly in the diocese of Winchester, in which it consti-

tutes the archdeaconry of Surrey. By the Poor-Law Commissioners the county is divided into 21 Unions—Ash (a Gilbert's Incorporation), Bermondsey, Camberwell, Chertsey, Croydon, Dorking, Epsom, Farnham, St. George the Martyr, Goldstone, Guildford, Hambledon, Kingston, Lambeth, Newington (under a local act), St. Olave's, Reigate, Richmond, Rotherhithe, St. Saviour's, and Wandsworth and Clapham. These unions include 154 parishes and townships, with an area of 471,466 acres, and a population in 1851 of 679,003.

The county is in the Home Circuit, except that for criminal offences the parts of the county within 10 miles of St. Paul's cathedral are in the district of the Central Criminal Court. The spring assizes for the county are constantly held at Kingston; the summer assizes alternately at Guildford and Croydon. The Epiphany quarter sessions for the county are held at the sessions-house, Newington; the spring sessions at Reigate; the Midsummer sessions at Guildford; and the Michaelmas sessions at Kingston. County courts are held at Chertsey, Croydon, Dorking, Epsom, Farnham, Godalming, Guildford, Kingston, Lambeth, Reigate, and Southwark. There are county prisons at Newington (Horsemonger-lane), Kingston, Croydon, and on Wandsworth Common. There are, besides these, in the borough of Southwark, the Queen's Bench and the Borough Compter. At Garret, near Wandsworth, is the County Lunatic Asylum, a very extensive and handsome edifice.

Before the Reform Act 14 members were returned to the House of Commons from the county of Surrey—two for the county itself, and two each for the boroughs of Southwark, Guildford, Haslemere, Gatton, Blechingley, and Reigate. By the Reform Act, Haslemere, Gatton, and Blechingley were altogether disfranchised, and Reigate was reduced to one member; but the county was formed into two divisions, each returning two members, and the borough of Lambeth was created, which returns two members, so that the present number of members sent from Surrey is 11—two for each division of the county, two each for Southwark, Guildford, and Lambeth, and one for Reigate.

History and Antiquities.—At the earliest historical period this county seems to have been, for the most part, included in the territory of the Regni, a nation probably of the Belgic stock, who occupied also the adjacent county of Sussex. In his second expedition, Cæsar advanced westward from Cantium, or Kent, through this county to the Thames, which he crossed probably at a ford at Coway Stakes, near Walton-on-Thames, though some fix his passage at or near Kingston. Several ancient entrenchments are still existing in the county: on Bagshot Heath, about four miles beyond Egham, there is a very large one, in form approaching a parallelogram; on St. George's Hill, between Weybridge and Cobham, is another of irregular form, following the shape of the hill on which it stands; on Wimbledon Common is a third, of circular form; near Farnham, partly in this county and partly in Hampshire, is another, popularly called Cæsar's Camp, of irregular form, following the brow of the hill on which it stands.

Surrey was included in the Roman province of Britannia Prima. No Antonine station is ascertained to have been in it; though Londinium (London) and Pontes (Staines) were close on the border, in Middlesex; and Noviomagus, the capital of the Regni, was probably at Holmwood Hill, close on the eastern border, in Kent. It is probable that several Roman roads crossed this county: the most remarkable and best known is that which ran from Londinium. It appears to have run over Mickleham Downs to Dorking, and thence by Oakley, beyond which it is known as Stone-street Causeway, into Sussex. The Roman road from Londinium to Calleva and Sorbiodunum (Silchester and Old Sarum) crossed the north-western border beyond Staines. Traces of Roman buildings have been found in various places, as at Albury near Guildford, at Guildford, where some Roman bricks have been incorporated in the castle walls, at or near Kingston, and on Walton Heath, Walton-on-the-Hill, north-east of Dorking.

Surrey was probably, in the earlier period of the Heptarchy, a part of the kingdom of Wessex—not, as is commonly supposed, of Sussex. Wibbandune, where the battle which decided the war between Ethelbert of Kent and Cealwin of Wessex was fought, is generally supposed to have been Wimbledon in Surrey. In the later period of the Heptarchy the county appears to have constituted a detached principality governed by a sub-regulus or dependent king. In the middle part of the 7th century it was governed by Frithewald as sub-king, under the supremacy of Wulfhere of Mercia, who also conquered the Isle of Wight, and obtained the supremacy over Sussex. From this time Surrey appears to have depended on Wessex or Mercia, as the power of one or the other preponderated. The inhabitants submitted willingly to Egbert in 828. On the death of Egbert, in 837, his son Ethelwulf succeeded him as king of Wessex, and Athelstan, son of Ethelwulf, as sub-king of Kent. In the war of Ethelred, or Ethered I., with the Danes, the king and his brother Alfred were defeated at Mere-tune, probably Merton in Surrey, in 871, and Ethelred received a wound, of which he died soon after. In the struggle of Alfred with the Danish chieftain Hasting, the Danes were beaten by the king's army at Farnham in 894. Some of the Anglo-Saxon kings were consecrated at Kingston. In 1042 the Anglo-Danish king Hardicanute died through excessive drinking at Lambeth. A little before this time Alfred, son of Ethelred II., was seized at Guildford, his eyes put out, and his followers massacred.

In 1215 the Great Charter and the Charter of the Forests (Magnæ Charta and Charta de Foresta) were signed by John at Runnymede, a narrow slip of flat meadow-land on the bank of the Thames near Egham, on the border of this county: the Egham races are now run upon it. By Henry III., nearly the whole county was disafforested. Attempts, at a later period, to bring parts of the county into Windsor Forest proved unsuccessful.

In the civil war of John, Guildford and Farnham castles were taken by Louis of France and the insurgent barons. In the civil war of Henry III., a body of royal troops, retiring from Tonbridge to Bristol after the battle of Lewes (1264), took Blechingley Castle, and routed a body of Londoners at Croydon. In the rebellion of Sir Thomas Wyatt (1554), he took possession of Southwark, and, marching to Kingston, forced a passage over the Thames into Middlesex, though the bridge at Kingston had been broken down. In the civil war of Charles I. the county was devoted to the Parliamentary cause. After the battle of Edge Hill, and the advance of the Royalists towards London, part of the Earl of Essex's army was posted at Kingston (1642). Farnham Castle, which was held by the Royalists, was taken not long after by the Parliamentarians.

Surrey had at different periods before the Reformation about 80 religious houses of all kinds. Of these the most eminent were the abbey of Bermondsey (Clunian), Chertsey (Benedictine), Merton (for regular canons of St. Augustine), and Waverley (Cistercian); and the priories of St. Mary Overy, Southwark, and Newark, in the parish of Send, near Guildford, for regular canons of St. Augustine, and Shene, now Richmond, for Carthusians. The remains of Merton Abbey have been noticed. Of Bermondsey and Chertsey abbeyes, and of Shene Priory, scarcely a fragment is left. The priory church of St. Mary Overy, at the foot of London Bridge, now forms the parish church of the same name. The remains of Waverley Abbey, near Farnham, overgrown with ivy, extend in detached fragments over a surface of three or four acres; they comprehend some remains of the church, refectory, dormitory, and cloisters. There are some remains of the church of Newark Priory. Many of the parish churches in the county are of great antiquity. The early English style, which was in use in the reigns of Richard I., John, Henry III., and Edward I., is prevalent.

Statistics: Religious Worship and Education.—According to the Returns of the Census of 1851, it appears that there were then in the county 546 places of worship, of which 262 belonged to the Church of England, 84 to Independents, 73 to six sections of Methodists, 68 to Baptists, 14 to Roman Catholics, 11 to Quakers, and 4 to Mormons. The total number of sittings provided was 222,840. Of Sunday schools there were 363, of which 206 belonged to the Church of England, 61 to Independents, 60 to Methodists, and 25 to Baptists. The total number of Sunday scholars was 44,422. There were 1792 Day schools, of which 406 were public schools, with 54,219 scholars, and 1386 were private schools, with 30,994 scholars. Of evening schools for adults there were 49, with 1245 scholars. The number of literary and scientific institutions in the county was 25, with 3661 members and about 17,000 volumes in their libraries.

Savings Banks.—In 1853 the county possessed 20 savings banks, at Camberwell, Carshalton, Chertsey, Clapham, Croydon, Dorking, Epsom, Ewell, Farnham, Godalming, Guildford, Kennington, Kingston, Lambeth, Lambeth St. John, Reigate, Richmond, Rotherhithe, Southwark, and Wandsworth. The amount owing to depositors on November 20th 1853 was 904,992*l.* 17*s.* 8*d.*

SURY-LE-COMTAT. [LOIRE.]

SUSA. [SUSA.]

SUSA, the capital of the country called Susiana and Susis by the Greek geographers. Susiana comprised part of a mountain region between Babylonia and Persia, and it extended also to the coast of the Persian Gulf, east of the mouth of the Tigris. The *Choaspes*, now *Kerkhah*, flowed through Susiana from the mountains of the Uxii. [BAGHDAD.] Between Susiana and Persia there was a mountain tract, the passes of which were infested by robbers. The coast of Susiana was marshy, as it still is. Besides the Choaspes, there were the rivers *Coprates*, the *Bulans*, and the *Paritigris*, now the *Karwa*, which flowed from the mountains of the Uxii. The *Euleus* and the *Paritigris* are both represented by the modern Karun, which was called *Kulsus* above the junction of the Choaspes, *Paritigris* below that point. [BAGHDAD, PAHALIC; PERSIA.]

In proceeding from Diarful to Sus, and at the distance of 10 miles from Diarful, the great mound of Sus is seen. From the summit of the great mound Diarful is distinctly visible, bearing north 88° east. The Kerkhah River is one mile and a half west of the great mound of Sus. The *Abi-shapur*, a feeder of the Karun, rises about 10 miles north of Sus, and flows in a deep narrow channel past the so-called tomb of Daniel, and past the western face of the great mound. It is navigable from Sus to its junction with the Karun, and as its bed is deep and narrow, and nearly on a level with the surface of the plain, it is peculiarly suited for some kinds of navigation. The great mound is described by Major Rawlinson in vol. ix. of the 'London Geographical Journal,' as forming "the north-western extremity of a large irregular platform of mounds, which appear to have constituted the fort of the city, while the great tumulus represents the site of the inner citadel." The height of the lower platform is between 80 and

90 feet, and that of the great mound 165 feet. The platform itself is square, and measures about two miles and a half. The mound is 1100 yards round the base, and 850 yards round the summit. The slope is very steep. Major Rawlinson saw on the mound a slab with a cuneiform inscription of thirty-three lines, three Babylonian sepulchral urns imbedded in the soil, and in another place there was exposed to view, a few feet below the surface, a flooring of brickwork; "the summit of the mound was thickly strewn with broken pottery, glazed tiles, and kiln-dried bricks. Beyond the elevated platform extend the ruins of the city, probably six or seven miles in circumference: they present the same appearance of irregular mounds, covered with bricks and broken pottery, and here and there the fragment of a shaft is seen projecting through the soil."

SUSA, a province of Piedmont, is bounded N. and W. by the Alps, which separate it from Savoy and France, S. by the province of Pine-rola, and E. by that of Torino. The area is 539 square miles, and the population in 1848 was 81,834. A great part of the province of Susa lies on the slope of the great Alpine ridge, which here forms the groups of Mont Cenis and Mont Genève, the highest summits of which are more than 11,000 feet above the sea. The *Dora Ripuaria*, which crosses the province from east to west, rises on Mont Genève above the village of Cesanna, descends by Oulx and Exilles into the fine valley of Susa, passes by the town of Susa, and at Avigliana enters the plain of Turin, and joins the Po north of Turin, after a course of between sixty and seventy miles. The valley of Susa is fertile, and produces corn, wine, flax, hemp, and mulberries. The highlands produce abundance of chestnuts, and afford good summer pasture. The great road from Turin to Savoy and France over Mont Cenis ascends the valley of Susa as far as the town of Susa, and then turning off to the northward, climbs the side of the mountain till it reaches the elevated plain with the small lake of Mont Cenis, famous for its trout, where is the boundary between Piedmont and Savoy. From the town of Susa, following the ascent of the valley to the westward, is the village of Chiomonte or Chaumont, known for its wines, which are equal to those of Burgundy. Higher up is the village of Exilles, with its old fortress built on a rock above the Dora; and still higher is the village of Oulx, from which a carriage-road leads over Mont Genève to Briançon in Dauphiné. Below Susa is the village of Bussolino, on the high road to Turin, in the neighbourhood of which is a quarry of green marble. Lower down is the town of Avigliana, on the Susa-Turin railway, with 3000 inhabitants, in a very fruitful country, with two small lakes well stocked with fish. The province of Susa is included in the administrative division of Torino.

Susa, the capital of the province, which is connected with Turin by railway, occupies the site of the ancient Segusium or Segnaio, is a bishop's see, and has about 3300 inhabitants. North of the town is a triumphal arch of white marble raised in honour of Augustus, which is still in pretty good preservation. The fortress of La Brunetta, cut in the rock by Charles Emmanuel III. commanded the roads of Mont-Cenis and Mont-Genève. It was destroyed by the French in 1796. The town is old and ill-built. Several of the streets are lined with low arcades. It has a royal college, a provincial court, and some manufactures of leather, gloves, and thread.

SUSIANA. [SUSA.]

SUSQUEHANNA. [PENNSYLVANIA.]

SUSSEX is a maritime county in England, due south of Greenwich, the meridian of which passes very nearly through the centre of the county. It is bounded N.E. by Kent, W. by Hampshire, N. by Surrey, and S. and S.E. by the British Channel. It lies between 50° 43' and 51° 9' N. lat., 0° 49' E. and 0° 58' W. long. The extreme length, from Lady-Holt Park due east to the Kent Ditch, is 76 miles; the greatest breadth, from Beachy Head to Tunbridge Wells, 27 miles; and the average breadth a little less than 20 miles. The area is 1461 square miles, or 934,851 acres. The population in 1841 was 300,075; in 1851 it was 336,844.

Surface; Coast; Rivers.—The principal feature in the surface of Sussex is occasioned by the intervention of the high ridges of chalk hills generally known as the Downs. These hills rise from the marsh of Pevensey to the bold promontory of Beachy Head; they then trend westward as far as Shoreham, occupying a surface of about 26 miles in length, and about 6 miles in breadth, containing about 100,000 acres. This tract is denominated the South Downs. From Shoreham the Downs gradually recede from the coast and traverse the western part of the county, entering Hampshire between West Harting and Stanstead near Petersfield. Their extreme length in Sussex is 53 miles, their greatest breadth 7 miles, and mean breadth 4½ miles. The average height is about 500 feet above the level of the sea; but Ditchelling Beacon is 853 feet, Fittle Beacon 820 feet, Chanctonbury Ring 814 feet, and Beachy Head 564 feet above that level. The Downs have a rich covering of a short and delicate turf containing large portions of *Thymum serpyllum*, and occasional patches of the common furze, the *Ulex Europæus*, in patches of 30 or 40 acres. The district is in general without trees. The surface of the Downs is gracefully undulating; the northern escarpment is precipitous, whilst the southern declines gently, and westward of Brighton gradually blends with the low land of the coast.

The maritime district lies between the Downs and the sea, and extends from Brighton westward to Emsworth, a distance of 36

miles. At first it is narrowed to a point, but gradually extends to the breadth of a mile between Brighton and Shoreham; towards Arundel it widens to three miles; and finally, as it approaches Hampshire, it becomes in many places seven miles wide. This district is of remarkable fertility. Here, in Saxon times, many salt-pans for procuring salt from sea-water by evaporation existed.

The centre of the county is occupied by a woodland tract, denominated the Weald (Saxon, 'weald,' a forest); it extends from the Downs, to which it runs parallel, to the Surrey hills. The Weald was once an immense forest, inhabited only by hogs and deer, but has been gradually cleared and brought into cultivation. This district within the county now contains about 425,000 acres.

The Forest Ridge is that portion of the county which, gradually uniting with the Weald, forms the north-eastern division. It stretches from Fairlight Down on the south by Crowborough to St. Leonard's Forest, and thence westward, terminating in an angle formed by the sand-hills of Petworth on one side, and by Blackdown and Leith hills in Surrey on the other. In this district are two great forests, St. Leonard's Forest, containing 10,000 acres, and Ashdown Forest, containing about 18,000 acres. Pine, fir, beech, and birch all grow well, and portions of the two forests have been planted with success. The whole ridge is broken into hill and dale, and is very elevated. Crowborough Beacon, the highest and most central eminence, is 804 feet above the level of the sea. The marsh-land extends across the eastern division of the county from Eastbourne into Kent, with the exception of five miles taken up by the Forest Ridge of Fairlight and the Hastings hills. Marshy tracts also exist on the borders of all the rivers.

The coast at the extreme east of the county is formed of the low marsh-land, which is a continuation of the low land of Romney Marsh. At Pett the Forest Ridge breaks in for five miles, including Fairlight, Hastings, and Bexhill. The low marsh-land of Pevensey, forming Pevensey Bay, extends from Bexhill to the Downs, a short distance to the east of the well-known and bold promontory of Beachy Head. The high chalk cliffs of the Downs extend thence as far as Brighton, a distance of 19 or 20 miles coastwise, when the lowland of the maritime district intervenes and forms the coast line into Hampshire. Pevensey Bay and Seaford Bay form good roadsteads for vessels with north or east-winds, and Seaford Bay is much frequented by vessels for water. A lighthouse of the first class was erected in 1828 on the summit of the second cliff to the westward of Beachy Head, 235 feet above the level of the sea. The lowest part of the coast from Seaford to the Kentish boundary is protected by single round towers, called Martello towers. They commence near Hythe in Kent, and are continued, except where the coast is easy of defence, to Seaford, where the last tower is numbered 74. They are built on the beach, at intervals of about a quarter of a mile between each. The period of their erection was the time of the threatened invasion of England by Napoleon I. At the same time a portion of this low district, from Cliffe End, near Pett, in Sussex, to Shorecliffe, in Kent, a distance of 23 miles, was protected by a canal called the Royal Military Canal.

The principal rivers are the Ouse, the Rother, the Adur, the Arun, the Cuckmere, and the Lavant. The Ouse begins at Rylands, a few miles north of the village of Lindfield, at the junction of two streams, whence it flows near Lindfield, and, pursuing a tortuous course to the south-east, half encircles Sheffield park; then proceeding more directly south, the stream runs by Isfield, Barcombe, and Hamesey to the Lewes levels, which it enters to the north of the town. After separating the suburb of Cliffe from the town of Lewes, it proceeds through the levels, divides the South Downs, and discharges itself into the British Channel at Newhaven Harbour. The river is navigable for large barges as far as Lindfield. The Rother rises near Argus Hill, in the parish of Rotherfield, close under the Forest Ridge. Thence it runs to Mayfield, Etchingham, and Bodiham. It touches Kent at Wigsell, in the parish of Salehurst, and separates the two counties. It afterwards forms for some distance the boundary, and proceeding to Newenden and Witterham, receives in its course several small streams from the Weald of Kent, the arms of which, together with the Rother itself, inclose the river island of Oxney. After passing this island, it quits the border, and turns suddenly southward across the eastern extremity of the county, sending off a branch at Iden called the Kent Ditch, which parts the two counties, and empties itself into the sea in the parish of Broomhill, a mile and a half eastward of old Rye Harbour. Proceeding from this branch, the Rother flows to the south-east part of the town of Rye. Below the town of Rye the Rother receives the waters of the Brede, which rises in Ashburnham Wood. The united stream expands into an estuary, forms the harbour of Rye, and empties itself into the sea at the bight of the bay formed by Fairlight Head on the west and Dungeness on the east. The Rother is navigable as far as the point where it first touches the borders of Kent. The Adur has three sources, the streams from which unite near Ashurst. From Ashurst the river flows in a due southern direction, between Beeding and Bramber to Shoreham Harbour and the sea. [SHOREHAM.] The river is navigable for small craft from Moak Bridge in the parish of Shermanbury, to the mouth; and it is celebrated for its mullet, pike, and eels. The Arun rises in St. Leonard's Forest, and flows due south, receiving at Stopham the waters of a small river called the Western Rother. From Stopham the Arun runs

in a circuitous course, passes Hardham and Amberley, in which part the stream is celebrated for trout, through the marshes forming the rich vale of Arundel, and flowing through Arundel town enters the sea at Littlehampton. The channel is led in a southerly direction into the sea between two piers composed of piles with an extension of dicker-work. The larger vessels which enter usually remain near the river's mouth at Littlehampton, but a vessel of 13 feet draught can proceed to Arundel bridge, a distance of six miles. The lower part of the river is famous for its mullet. A canal, called the Arun and Wey Junction Canal, connecting the Arun with the Wey, completes an inland communication by water with London. The Arundel and Portsmouth Canal also enters the Arun at Ford, connecting it with Chichester Harbour; and a canal following the course of the Rother has made a navigable water-communication from Stopham bridge to Midhurst, with a branch to Haslingbourne, within half a mile of Petworth. The *Cuckmere* rises in the Forest Ridge near Heathfield Park, runs through Warbleton to Hellingley, Arlington, and Littleington, and empties itself into the sea at the opening in the South Downs, to the westward of Beachy Head, about 2 miles S.E. from Seaford. The channel is very narrow and crooked, but at high water it is navigable for small barges to Longbridge, about a mile above Alfriston. The *Lavant* has its source in Charlton Forest, and runs through Singleton, Binderton, and the Lavants, and, after circling the city of Chichester on all sides except the north, falls into the harbour of Chichester, and enters the sea at the extreme south-west corner of the county. The estuary at the mouth of the river is famous for its lobsters; and the rocks next Selsey Bill are celebrated for cockles. There are also two smaller rivers which discharge themselves into the sea, the Ashbourne at Pevensey, and the Asten near the spot where William the Conqueror landed. The Asten runs through the battle-field of Hastings. The *Medway* rises in the northern part of the county. It flows in an easterly direction through Forest-row, Hartfield, and Withyham. It reaches the county of Kent between Groombridge and Ashurst, forming the boundary between the two counties for about a mile, and then turns at Ashurst directly into Kent, at a spot about four miles from Tonbridge.

The road from London to Hastings enters the county at Frant, near Tonbridge, and runs through Robertsbridge and Battle; the road from London to Brighton enters the county in the parish of Ifield, and runs thence through Cuckfield; the road from London to Portsmouth traverses a small portion of the western division of the county near Petersfield; and the road from Dover to Portsmouth, which runs parallel with the sea-shore, enters Sussex near Rye, and proceeds to Winchelsea, Hastings, Brighton, Arundel, and Chichester, quitting the county for Hampshire near Havant. There are also many branch and cross roads.

The London Brighton and South Coast railway enters the county at Three Bridges, and proceeds across it in a generally southward direction to Brighton (20½ miles). The coast-line of this company runs at a little distance from the coast from the western extremity of the county almost to the eastern, from a few miles beyond Chichester on the west to Hastings on the east. From the Three Bridges station of the main line a short branch runs south-west to Horsham. From the Cuckfield station a branch runs south-east to Lewes, where it unites with the coast line. A short distance east from Lewes a branch is carried south to Newhaven Harbour. Several miles farther east a branch runs off north to Hailsham, and another south to Eastbourne. The Hastings branch of the South-Eastern railway enters the county at Tonbridge Wells, and runs south-east past Battle to Hastings. From Hastings a branch, connected with the Coast line of the Brighton and South Coast railway, runs north-east at a short distance from the coast to Rye, where it enters Kent.

Climate.—The climate of the southern part of the county, near the sea-coast, is mild, and not subject to many variations of temperature. The mean temperature of the year is 51·10° Fahr., or more than one degree above the mean temperature of London. Large towns have consequently sprung up, to which invalids and others repair for health and relaxation. The mean temperature of the three winter months at Hastings is 43°, whilst the mean temperature of winter in the adjoining southern counties is generally only 40·35°. The higher or northern part of the county, particularly the Forest Ridge, is of considerably lower temperature. In the Weald the climate is cold and damp.

Geology.—The greater portion of the southern part of the county is occupied by the chalk formation, which constitutes its most striking geological feature. The general dip or inclination of this, as indeed of all the strata in the county, is to the south-east, with occasional exceptions. The face of the chalk is marked with fissures or wells, and scooped into deep hollows, furrows, and basins, which are more or less filled with tertiary sand and gravel. In many places quarries have been opened and kilns erected for converting the chalk into lime for the use of the agriculturists, who annually consume large quantities. The Sussex chalk varies in colour from pure white to a bluish-gray; the harder varieties were in great request among the Normans for building. The walls of several old castles and religious houses were built with chalk faced with Caen stone or flints. The chalk is regularly stratified. The upper division contains horizontal layers of siliceous nodules with intersecting veins of tabular flint. Sulphuret

GEOL. DIV. VOL. IV.

of iron is found in irregular masses and in octahedral crystals. Chalk-marl constitutes the foundation of the chalk-hills; its outcrop connects the detached parts of the range, and composes a fertile tract of arable land, on which are some of the best farms in the county. Below the marl is a bed of fire-stone, which is obscurely traced in the eastern part of the county, but to the west forms a terrace of considerable breadth. The gault, the lowest division of the chalk formation, generally constitutes a valley within the central edge of the chalk, and may be traced with little interruption from Eastbourne westward along the whole county into Hampshire, forming a stiff soil, but very rich.

Next to the chalk, the most important formation is the Wealden. It joins the gault, and extends through the centre of the county. It is a series of clays and sands with subordinate beds of limestone-grit and shale; it forms an anticlinal axis of considerable elevation, the direction of which is nearly from east to west. This district is an irregular triangle, the base extending from near Pevensey to Seabrook in Kent, and the apex being situated near Harting Comb in the western part of Sussex. The Wealden clay is a tenacious clay of various shades of blue and brown, containing subordinate beds of limestone and sand with layers of septaria of argillaceous ironstone. This formation is celebrated chiefly for the Iguanodons, Hylosaurians, and other gigantic reptiles which have been found within it. The Sussex marble occurs in layers in different parts of the district. It is a limestone of bluish-gray mottled with green and ochraceous-yellow, and is composed of the remains of fresh-water univalves formed by a calcareous cement into a beautiful compact marble which bears a high polish. The central group of the Wealden is formed of alternating sands, sandstone, and shale, which have been denominated the Hastings beds. These beds form a line of irregular cliffs 30 or 40 miles in length, from 4 to 9 miles in width, and from 20 to upwards of 600 feet in height. Below this are the Tilgate beds, the lowest stratum of which contains large concretionary or lenticular masses of a compact calciferous grit or sandstone in three or four layers, each varying in thickness from two to three inches, which was formerly extensively quarried and used for paving and roofing. These beds extend from the western extremity of the Hastings sands at Loxwood to Hastings, and are separated from the next subdivision by blue clay and shale. This subdivision, called the Worth Sands, consists of a series of arenaceous strata, some of which form a fine soft building-stone extensively used. The last division of the Wealden is composed of the Ashburnham beds, which occur beneath the Worthstone; they are composed of alternations of sand, friable sandstone, shale, and clay; for the most part they are highly ferruginous, and inclose rich argillaceous iron-ore and large masses of lignite. It was in the Wealden strata, when wood was abundant and charcoal was employed in smelting iron, that the chief iron-works of Sussex were situated, the iron-ore being extracted from the ironstone of the argillaceous beds.

The plastic clay is the foundation of the flat maritime district south of the Downs, which extends from near Worthing to Bracklesham Bay, and thence into Hampshire, forming part of the Isle of Wight basin; and is seen elsewhere in insulated patches. The London clay, which in some localities includes beds of gray limestone and sandstone, is also found; the clay constitutes the flat maritime district of the south-west part of the county, and the limestone composes groups of rocks on the coast. The valleys of all the rivers, and the large levels of Lewes, Pevensey, and Brede, the soil of which is extremely fertile, being formed of alluvial deposits, furnish rich marsh pastures almost equal to Romney Marsh.

Agriculture.—The rich marsh-lands, of which there are about 30,000 acres in the county, make an excellent pasture-ground, on which many oxen and sheep are reared and fattened for market. There are also about 50,000 acres of down-land, which are left in down, and produce excellent pasture for the small sheep known as South Down sheep. After the hay is cut and carried in the marsh-land the pastures are usually occupied by cattle and sheep. Stall-feeding is also much and successfully practised in Sussex. The arable land on the Downs consists of thin light layers of earth, not exceeding eight inches in depth, intermixed with flint pebbles, and is very favourable for the growth of barley. In some of the hollows the soil is deeper and more loamy, and so dry as to allow of its being ploughed quite flat without any ridges or water-furrows. Along the slopes of some of the hills the soil is of a tough tenacious nature, being a mixture of chalk washed down from the hills by the rains and stiff clay, and is very difficult to cultivate. In the spring it is extremely heavy, and retains moisture for a long time; but when dried it becomes very hard. The rich arable land in the county is about 120,000 acres. Hops are cultivated to a considerable extent in the eastern part of the county: they have been introduced from Kent, and have gradually extended themselves westward. There are still many extensive woods in Sussex, amounting altogether to about 150,000 acres. The county is noted for its breed of oxen and of sheep. The Sussex ox bears a strong resemblance to the Devon, between which and the Hereford it holds an intermediate place, possessing the activity of the first and the strength of the second, with the propensity to fatten and the fine-grained flesh of both. The South Down sheep are among the best for all hill countries where the grass is short; and their kindly

properties have caused them to penetrate into almost all parts of the country. The number of these sheep on the Downs has been estimated at 300,000 in summer and 250,000 in winter. On the richer and wet land in West Sussex a heavier sort of sheep, a cross between the Somerset and the Down, is much more used than the pure Down. The breed of horses is not famous.

Divisions, Towns, &c.—Sussex has been for centuries divided into six Rapes, a term peculiar to the county, the derivation of which is not satisfactorily settled. Each rape contains several hundreds and other smaller divisions. The county has also been for many years subdivided for all civil purposes into two divisions, the Eastern and the Western; the Eastern comprising the rapes of Lewes, Pevensey, and Hastings; and the Western the rapes of Chichester, Arundel, and Bramber. The rapes are as follows:—

I. Lewes rape occupies the centre of the county, and includes the hundreds of Barcombe, Buttinghill, Dean, Fishergate, Holmstrow, Lewes borough, Poynings, Preston, Street, Swanborough, Whalesbone, and Younsmere.

II. Pevensey rape extends from the borders of Surrey and Kent on the north to the sea, and contains the hundreds of Alcieton, Bishopstone, Daneshill-Horsted, Dill, Eastbourne, East Grinstead borough, Flexborough, Hartfield, Lindfield-Burleigh-Arches, Longbridge, Loxfield Camden, Loxfield, Dorset, Lowey of Pevensey, Ringner, Rotherfield, Rushmonden, Shiplake, Totnoor, and Willingdon.

III. Hastings rape forms the eastern portion of the county; it includes the following hundreds:—Baldalow, Battle, Bexhill, Foxearle, Goldspur, Gostrow, Guestling, borough and cinque-port of Hastings, Hawkesborough, Henhurst, Netherfield, Ninfield, cinque-port of Rye, Showswell, Staple, and the town and parish of Winchelsea.

IV. Chichester rape is situated at the western side of the county, and consists of the hundreds of Aldwick, Bosham, Box and Stockbridge, city of Chichester, Dumpford, Easebourne, Manhood, borough of Midhurst, and Westbourne and Singleton.

V. Arundel rape forms the centre of the western division of the county, and includes the following hundreds:—Arundel borough, Avisford, Bury, Poling, Rotherbridge, and West Easewrith.

VI. Bramber rape is situated between the rapes of Arundel and Lewes. The hundreds are as follows:—Brightford, Burbeach, East Easewrith, Fishergate, Horsham borough, New Shoreham borough, Patching, Singlecross, Steyning, Tarring, Tipnoak, West Grinstead, and Windham and Ewhurst.

The parts of the county which have their particular liberties exempt from the jurisdiction of the county magistrates are—the city of Chichester, and the liberty of the cinque-ports, which is partly in this county and partly in Kent.

In the county of Sussex there is only one city, CHICHESTER; one cinque-port, HASTINGS; two ancient towns added to the cinque-ports, RYE and Winchelsea; two members of the cinque-ports, Pevensey and Seaford; the parliamentary boroughs of ARUNDEL, BEIGTON, HORSHAM, LEWES, MIDHURST, SHOREHAM, or New Shoreham; the ancient boroughs of Bramber, EAST GRINSTEAD, and STEYNING; the market-towns of BATTLE, CUCKFIELD, HAILSHAM, and PETWORTH, and the towns of BOGNOR, EASTBOURNE, MAYFIELD, NEWHAVEN, and WORTHING. Of the places printed in small capitals an account is given under their respective titles; the others are noticed here.

Winchelsea, population 778 in 1851, is near the eastern extremity of the county, about 2 miles S.W. from Rye. Old Winchelsea, before the reign of Henry III., was washed by the waters of the Channel on the south and east, and by the Rother on the north. It was of some importance in Saxon times, and was added to the cinque-ports before the reign of John. Early in the 13th century the old town began to suffer much from the influx of the sea. More than 300 houses were destroyed by the overflow of the sea in the year 1250. The sea continued its ravages; the site of the present town was purchased, and the "inhabitants of Old Winchelsea took to it by little and little and builded it." The new town was walled in, and in six or seven years it was "metely well finished." In 1287 the old town was entirely overwhelmed by the sea. The new town continued to increase and flourish. It soon became the place of import for French wines, for which massive crypts were built. In the time of Henry VI. Winchelsea was one of the principal ports of embarkation for the continent. The new town was pillaged and partially burnt by the French in 1360, and received much more serious injury from the Spaniards twenty years afterwards. The town was subsequently repaired. Henry VIII. raised for its defence the castle of Camber, the ruins of which are still standing. The sea began once more to desert the new town; the inlet and harbour became choked up with sand and beach, and although Queen Elizabeth, who visited it in one of her progresses in 1578, manifested her sense of its importance by calling it Little London, the trade was soon entirely lost, and Winchelsea fell into decay. It is now little more than a village; the houses round two sides of the principal square and one small square with a few houses alone remain. Winchelsea is a corporation by prescription. The corporation consists of a mayor and jurats, of whom there ought to be 12. This town returned two members to parliament from 42nd Edward III. till 1832; it has since been added to the electoral district of Rye. Three of the four ancient gateways are still standing, namely, the Landgate on the north-east, the Strandgate on the south, and Newgate to the south-

west, but in a very ruinous condition. Of the three churches, St. Giles, St. Leonard, and St. Thomas the Apostle, a portion of the last alone exists. It was a large cruciform structure, but the nave has long since disappeared; the north and south transepts are in ruins, and the chancel with two aisles is the only part used for public worship. In the church are three altar-monuments, of the time of Edward I., of secular warriors in mail armour, with their legs crossed. Besides the churches Winchelsea had a convent of Gray Friars, of whose edifice the choir with beautiful arches and fine gothic windows yet stands.

Pevensey, 5 miles S.W. from Hailsham, population 412 in 1851, which gave its name to the rape, and was once formidable for its castle and useful for its harbour, is now an insignificant village. In the reign of Edward the Confessor the port was ravaged by Earl Godwin and his son Harold in 1043, when many ships were taken. In the Bay of Pevensey, William the Conqueror landed with his army from Normandy prior to the decisive battle of Hastings. Pevensey is supposed to be the site of the ancient British city of Anderida. Many interesting vestiges of ancient fortifications have been laid open. The castle, though a mere ruin, is in several respects of much interest. The outer walls, which are the most ancient part of the fortifications, inclose a space of 7 acres, and are from 20 to 25 feet high. The moat on the south side is still wide and deep; on the other sides it has been filled up. Within the walls is another and much more modern fortification, approaching a pentagonal form, with five nearly circular towers, moated on the north and west. The walls are 9 feet thick, and the towers were two and three stories in height. The castle withstood the attacks of William Rufus's army for six days, protecting Odo, bishop of Bayeux, who ultimately yielded only for want of provisions; and it afterwards successfully resisted a siege conducted in person by King Stephen. It was again in 1265 fruitlessly assailed by Simon Montford, son of the renowned Earl of Leicester. When Sir John Pelham was in Yorkshire in 1339 assisting Henry, duke of Lancaster, to gain the crown, Pevensey Castle was bravely and successfully defended by Lady Jane Pelham, when attacked by large bodies of the yeomen of Kent, Surrey, and Sussex, who favoured the deposed king Richard. Pevensey is a member of the cinque-port of Hastings. It is a corporation by prescription. The inhabitants had formerly an hospital dedicated to St. John.

Seaford, population 997 in 1851, a small sea-port town, and a member attached to Hastings, one of the cinque-ports, is situated on the coast, between two ridges of the South Downs, 11 miles S.E. from Lewes. Till the great storm of 1570 it was the port where the river Ouse emptied itself into the sea. The Ouse now reaches the sea at NEWHAVEN. Seaford was a Roman station. In one of the marauding visitations from the French, once so common on the southern coast, the town was burned, and several religious edifices, with the original chancel of the church, were destroyed. The town was incorporated in the 35th Henry VIII., and still has its bailiff and jurats. There is a town-hall with a jail beneath; and quarter and petty sessions are held. The borough returned two members to parliament till disfranchised by the Reform Act.

Bramber, population 130, stands on the right bank of the Adur, about 4 miles N. by W. from New Shoreham. It was formerly a borough town of some importance. Though decayed it returned two members to parliament till 1795, when the franchise was extended to the entire rape of Bramber. The two members for Shoreham are now elected by the qualified voters of the rape of Bramber. The place is now a poor village. The church, an interesting Norman structure, has been recently repaired.

Hurst, or *Hurstpierpoint*, population of the parish 2119 in 1851, is a small market-town, 8 miles N. by W. from Brighton. The church is a handsome gothic building of recent erection. There are a Wesleyan Methodist and a Baptist chapel, and National schools. A short distance from the town is St. John's Middle Grammar school, which is in connection with Nicholas College at SHOREHAM, and had 147 scholars in 1854. The market is held on Tuesday, and a fair on May 1st.

Littlehampton, population of the town 2436, a seaport town and watering-place, 7 miles W. from Worthing, is a convenient port for a considerable district, and has a good trade. The place is much resorted to in summer for sea-bathing. The church was rebuilt in 1827. There are National schools. A market is held on Thursday.

Mayfield, population of the parish 3055 in 1851, is situated on high ground, 8 miles S. from Tonbridge Wells. The town was formerly remarkable for a palace of the archbishops of Canterbury, with whom Mayfield was a favourite residence. Provincial synods were held here in 1332 and 1362. Of the ancient palace the walls and three noble arches in the hall, and some portions of the chambers, are still standing. The church is a large building of the perpendicular style, with a lofty spire. The Wesleyan Methodists and Baptists have places of worship; and there is a National school. A market for corn is held on Monday; fairs for cattle and sheep are held on May 30th and November 18th.

The following are the principal villages: the populations are those of the respective parishes in 1851:—

Ashburnham, population 865, about 3 miles W. from Battle, has an old gothic church, in the vestry of which are preserved some relics of

Charles I. Ashburnham House, the seat of the Earl of Ashburnham, is a large modern edifice, containing a good collection of paintings, and standing in a fine park. *Bezhill*, population 2148, is on the coast, 6 miles W. from Hastings. The village is resorted to in summer as a quiet secluded watering-place. The church is partly of Norman date; the chancel is early English; and the windows of the nave are of perpendicular date. There is a National school. *Billinghurst*, population 1458, is 13 miles N. from Arundel. Some malting is carried on. *Boxgrove*, population 755, is a pleasantly-situated village 4 miles N.E. from Chichester. The church is a portion of the priory of Boxgrove, founded in the reign of Henry I. Goodwood, the magnificent seat of the Duke of Richmond, is chiefly in Boxgrove parish. The mansion, a very spacious and stately edifice, contains some fine pictures: the park is well-wooded and very picturesque. *Burwash*, population 2227, is 20 miles E.N.E. from Lewes. The church is partly in the early English style. There are chapels for Wesleyan Methodists and Independents, and National schools. Petty sessions are held here. *Buxted*, population 1694, is on the river Ouse, 12 miles N. by E. from Lewes. Besides the church, which is small but very ancient, there are a Dissenting chapel and National schools. A cattle-fair is held on July 31st. *Buxted Place*, the seat of the Earl of Liverpool, is a fine mansion, standing in a well-wooded park. *CHAILEY*, 7 miles N. by W. from Lewes, on the London road, the seat of a Poor-Law Union, is noticed in a separate article. *Findon*, population 559, is pleasantly situated 4 miles N. by W. from Worthing, and has in its vicinity several excellent residences. The church is Norman. There is a National school. A fair for lambs is held on July 12th, and one for sheep on September 14th. On Cisbury Hill are traces of a considerable encampment. *Fletching*, 10 miles N. from Lewes, population 2007. The church is a large ancient edifice. There are a chapel for Baptists, and a National school. *Sheffield Place*, the seat of Earl Sheffield, is a fine modern mansion, standing in a beautiful park. *Framfield*, 9 miles N.E. from Lewes, population 1385, has a fine old church and a National school. The archbishops of Canterbury formerly had a seat here. *Frant*, population of the parish, part of which is in Kent, 2447. The village is 2 miles S. from Tonbridge Wells, of which it is a sort of suburb. The church stands on a commanding site. There are National schools. On Saxonbury Hill are traces of an ancient encampment. *Heathfield*, 14 miles N.E. from Lewes, population 2208, has, besides the church, an independent chapel and a National school. In Heathfield park is a monument erected in honour of General Elliot, Lord Heathfield, the brave defender of Gibraltar. *Hellingly*, population 1761, is about 12 miles E. from Lewes. The village is united with that of *Horse Bridge*, also in Hellingly parish. Besides the church, there are places of worship for Wesleyan Methodists, Independents, and Baptists, and a National school. Fairs for cattle are held on May 9th and September 29th. *Henfield*, population 1664, is a good-sized village 5 miles N.E. from Steyning. The church is ancient. There are National schools. *Hurstmonceux*, 5 miles E. from Hailsham: population, 1292. The church, which is partly of the early English period, contains some interesting monuments. The Baptists have a chapel, and there are National schools. *Hurstmonceux Castle* is noticed at the end of the article. *Keymer*, population 1006, about 8 miles N. from Brighton, has an old church and National schools. There are brick- and tile-works, and potteries at St. John's Common. *Lindfield*, population 1814, is on the right bank of the Ouse, 3 miles E.N.E. from Cuckfield. It has a fine old church, and a school of industry founded by the late W. Allen. There are fairs for sheep on April 1st and May 12th, and for lambs on August 5th. *Maresfield*, 2 miles N. from Uckfield, population 1805, has an old church, a district chapel at Nutley, and a National school. There are very extensive nurseries and market-gardens. *Ore*, 2 miles N. by W. from Hastings, population 1745, has an old church and a National school. The village is a favourite resort of visitors to Hastings, on account of its picturesque scenery. *Pulborough*, population 1325, is on the left bank of the Arun, 8 miles N. from Arundel. The church, which stands on an eminence, is of early English date, and contains some interesting monuments. There is a Dissenting chapel. A customary market for corn is held on Friday; a fair is held on Easter Tuesday. *Ringmer*, 8 miles N.E. from Lewes, population 1374, has, besides the church, an independent chapel and a National school. In the parish is an artillery barrack. *Selsey*, population 984, situated on the head-land known as Selsey Bill, 9 miles S. from Chichester, is said to have once stood much farther inland, the shore having been much encroached upon by the sea. In Saxon times it was the seat of a bishopric, removed to Chichester about 1075: it is now a mere village. The church, which is ancient, is a portion of a larger edifice. Prawns and lobsters are extensively taken: they are chiefly sent to the London market. *Storrington*, 9 miles N.E. from Arundel: population, 1038. The church contains some monuments by Westmacott. There are National schools. A customary corn-market is held every alternate Tuesday; fairs for cattle and pedlery are held on May 13th and November 11th. *Parham House* stands in a richly-wooded park. *Wadhurst*, 6 miles S.E. from Tonbridge Wells, population 2302. The church is partly in the early English style, and contains some interesting monuments. There are Independent and Baptist chapels, and National schools. *Withyam*, 6 miles S.W. from Tonbridge Wells: population, 1692. The church was

rebuilt in the 17th century, but has a mortuary chapel of decorated character, repaired in 1844, in which are some old monuments of the Sackville family, and some by Flaxman and Chantrey. The Wesleyan Methodists and Baptists have places of worship, and there are National schools. *Worth*, 8 miles S. from Cuckfield, on the Brighton road, population 2475. The church is one of the few ecclesiastical edifices which retain portions of Anglo-Saxon architecture. The Wesleyan Methodists have a place of worship.

Sussex constitutes the diocese of Chichester. It is divided into the archdeaconries of Chichester and Lewes. By the Poor-Law Commissioners the county is divided into 25 Poor-Law Unions:—Arundel, Battle, Brighton, Chailey, Chichester City, Cuckfield, Eastbourne, East Grinstead, Hailsham, Hastings, Horsham, Lewes, Midhurst, Newhaven, Petworth, East Preston, Rye, Steyning, Sutton, Thakeham, Ticehurst, Uckfield, Westbourne, West Fife, and Weathampnett. These Unions comprise 321 parishes and townships, with an area of 946,299 acres, and a population in 1851 of 339,117. Sussex is in the Home circuit. The assizes are held at Lewes, where there is a house of correction: the county jail is at Horsham. Quarter sessions are held—for East Sussex at Lewes; for West Sussex, the Epiphany and Easter sessions at Petworth, the Trinity at Horsham, and the Michaelmas at Chichester. County courts are held at Arundel, Brighton, Chichester, Cuckfield, East Grinstead, Hastings, Horsham, Lewes, Midhurst, Petworth, and Worthing. East and West Sussex return two members each to Parliament; two members each are returned by the city of Chichester, the Cinque Port of Hastings and the boroughs of Brighton, New Shoreham, and Lewes; and one member each for the ancient town of Rye and the boroughs of Arundel, Horsham, and Midhurst. The total number now returned from the whole county is 18. Before the Reform Act it was 23.

History and Antiquities.—This county, like the adjoining county of Kent, comprehends that part of England which, from its proximity to the Continent, first attained notice; but its name is derived from the kingdom erected by Ella, after his successful expedition in 477, when he assumed the title of king of the South Saxons, and gave the title of South-sex to the district.

In the time of Cæsar the Belgæ were numerous in Sussex, and held the district with ample defences and fortifications. They had a regular chain of communications along the hills, from one end of the county to the other. The principal posts were at the extremity of some point nearly surrounded by water, and often defended on the land side by a vallum and trench. The towns of Arundel, Bramber, Lewes, and Seaford, were thus conveniently placed. They had stations also at Storrington, at Sullington, at Ditchling, at Lewes, at Cisbury above Worthing, and on almost all parts on or near the slopes of the Downs; in such places remains of ancient earthworks have been traced. A branch of the Ermine Street entered Sussex at Pulborough near Horsham, running to Chichester on the west, and another branch went through the eastern part of the county. Three large Roman stations were at Regnum, now Chichester; Mutuantonis, most probably Lewes; and Anderida. There were several smaller and intermediate stations. Ad-decimium is believed to have been at Bignor, where were discovered, in 1811, the foundations of a large villa, with several tessellated pavements, the crypto-porticus, or inclosed gallery for walking, a sudatory, and a bath. Earthworks, both British and Roman, occur in many places along the main lines of road. Anderida probably occupied the site of the modern Pevensey. In 477, Ella, a chieftain of repute among the old Saxons, landed at a place called Mercadesburne, supposed to be Chichester, and defeated the enfeebled Britons. In 485, the British kings and rulers, uniting their forces, collected a formidable army, which met the Saxons at a place named Mercadesburne. The victory was doubtful; and the Britons maintained themselves in Anderida, a fortress of considerable importance, till 491, when, having been reinforced from Germany, Ella defeated the Britons, and raised the fortress. He then proclaimed himself king of the South Saxons. For nearly two centuries from the abdication of Ceadwalla in 688 Sussex was under the rule of military despots, called 'eorls,' appointed by the kings of Wessex. In subsequent times Sussex was commonly the appanage of the eldest son or heir-apparent of the King of Wessex. In the latter half of the 9th century the Danes or Northmen made frequent predatory excursions into Sussex, as well as Kent. In 893 a Danish fleet of 330 sail assembled at Boulogne, and directed its course to the British shore. Two hundred and fifty vessels entered the Rother, up which river they towed their ships four miles. A vessel, supposed to be one of these Danish ships, was discovered in the year 1822 imbedded in 10 feet of mud and sand in a field at Northiam, a short distance from the present navigable river. In the beginning of the 10th century a body of the Danes who had settled in East Anglia and Northumberland fitted out a fleet, and after being repulsed in Devonshire, landed at Chichester, but were driven back to their ships with considerable loss. King Alfred made his residence in Sussex, and built several castles for the protection of the coast. When the Northmen renewed their ravages under Ethelred II., 980-991, Sussex was ravaged in the retreat from London of Colans, king of Norway, and Sweyn, king of Denmark; and again in 1009 and 1013, when Sweyn assumed the government.

In the time of Edward the Confessor, Sussex with Kent was included

in the earldom of the famous Godwin, who exercised within his earldom vice-regal power. On the assumption of the throne by Harold, Sussex became the scene of the memorable contest which gave the English crown to the Norman invader. On the 28th of September, 1066, the Normans landed near the mouth of the little river Asten. The decisive battle of Hastings was fought on the 14th of October following, on a heath then called Epiton or Hetheland, but which thenceforth assumed the name of Battle. In the troubles of the period of Henry III., on the 14th of May, 1264, was fought the battle of Lewes, between the assembled barons, headed by Simon de Montfort, earl of Leicester, and the king's troops, commanded by the king himself, assisted by his son Edward and his brother Richard. Jack Cade, whose insurrection in the reign of Henry VI. caused some trouble, extended his march into Sussex, and is reported to have been killed at Cade Street in Heathfield, where a stone monument has been raised to mark the spot. In the subsequent reigns till Henry VIII., the Sussex coast suffered from the incursions of the French. During the civil wars the castles of Amberley, Arundel, and Bodiham, and the city of Chichester, were taken by the parliamentary forces.

Of ancient castellated edifices not already described, the most remarkable are Amberley, Bodiham, and Herstmonceux, and the castellated mansions of Eridge, Knepp, and Scotney. The castle of Amberley is situated about four miles from Arundel. The bishops of Chichester had a residence here from the early Roman times, but the present castle was built by Bishop Rede, who was consecrated in 1369, and obtained a licence, in 1 Richard II., to fortify his castle. The ground-plan is nearly a parallelogram. The present dwelling-house consists of the state apartments, built in the upper court by Bishop Sherburn at the commencement of the 16th century: in one still called the queen's room there are some curious paintings, the side panels exhibiting a series of 10 female figures, and the ceiling having the portraits of six warriors carved in wood. The castle was dismantled in 1643, by the parliamentary forces. Bodiham Castle, built in 1386, by Sir Edward Dalyngrudge, is four miles from Robertsbridge, on the river Rother. The site forms a parallelogram or nearly a square, with four round towers at the angles and three square ones between them; the great gateway is flanked by two square towers, and the entrance is defended by a machicolation and portcullis. The interior was fitted up for a baronial residence. In the time of Charles I., the castle was dismantled by Waller. The castle of Herstmonceux was built in 1423 by Sir Roger Fiennes, treasurer of Henry VI.'s household. It stands on the borders of Pevensey Level, a few miles north of Pevensey Castle. It is one of the oldest brick buildings in England, built after the reintroduction of that material. The building is nearly a square, 214 feet from east to west, and 206 feet from north to south. It has an octagon tower at each corner, and another in the centre of the east and west sides. The Rev. Robert Hare, in 1777, sold the ancient tapestry and furniture, pulled down the roof, and wholly dismantled the castle, leaving the walls alone standing. Eridge Castle stands upon a bold eminence in the parish of Frant, on the borders of Kent. The castle has received extensive alterations. Knepp Castle, in the parish of Shipley near Horsham, is a castellated building in the gothic style, erected about the commencement of the present century by Sir Charles Burrell: of the old castle, at a distance of half a mile, only a single wall is standing. Scotney Castle is on the Kent Ditch, in the parish of Lamberhurst: the stream which divides the two counties runs through the centre of the castle. It was built about the time of Stephen. Of monastic remains the principal are, the mitred abbey of Battle [BATTLE], the abbey of Bayham and Robertsbridge, and the priory of St. Pancras at Lewes. The Knights Templars had a preceptory at Sedlescombe.

In 1851 the number of places of worship in the county was 617, of which 350 belonged to the Established Church. The total number of sittings provided was 160,988. Of day schools there were 1178, with 46,169 scholars; of Sunday schools, 363, with 29,570 scholars.

In 1853 the county possessed 14 savings banks, at Arundel, Battle, Brighton, Chichester, Cuckfield, East Grinstead, Hastings, Horsham, Lewes, Midhurst, Petworth, Rye, Uckfield, and Worthing. The amount owing to depositors on November 20th 1853 was 580,998*l.* 4*s.* 8*d.*

SUTHERLANDSHIRE, an extensive county in the north of Scotland, stretches from the Dornoch Frith and German Ocean, along which it has a sea-coast of about 24 miles, across the island to the Atlantic Ocean and the North Sea; having along the Atlantic from Inverkirkaig Bay to Cape Wrath a sea-coast of 62 miles, and along the North Sea from Cape Wrath eastward a sea-coast of 66 miles (in both cases excluding the bays and indentations from the calculation). The county lies between 57° 48' and 58° 38' N. lat., 3° 40' and 5° 20' W. long. Its area is 1886 square miles, or 1,207,188 statute acres. Its length varies from 42 to 60 miles, and its breadth from 42 to 54 miles. The population was 25,793 in 1851. The county returns one member to the Imperial Parliament.

Several small islands along the west and north coasts belong to the county: four of them are inhabited; the three largest are Oldany, Calva, and Handa. Handa is remarkable for the altitude and wild grandeur of its cliffs. Along the north coast, the lofty peaks of the Stack and Skerries islands, belonging to this county, are conspicuous

in clear weather at a distance of some miles from the coast. Island Hoan, the Rabbit Islands, Island Roan, and Holy Island, are near to the coast, and form, in some instances, natural breakwaters.

Surface, Coast-Line, Hydrography, and Communications.—Sutherland is a mountainous and pastoral district. The interior of the county consists of a succession of mountains, ranges of hills, and extensive moors, separated by straths and mountain glens, diverging from the principal valleys, which open towards the coasts. Among these mountain ranges, one of great altitude, which contains several of the highest mountains in Great Britain, separates the west and north coasts of the county from its southern shore and valleys, and runs in a line nearly parallel with the shores of the Atlantic and North Sea. Ben More of Assynt attains an elevation of 3231 feet. Ben Hoo (2859 feet), and Ben Spinnue (2565 feet), mark the prolongation of this range to the North Sea. The coast near this point trends almost due east from Cape Wrath, the north-west point of Scotland, a cliff 600 feet high, on which is a lighthouse with a revolving light. The same range stretches to near the Caithness boundary. In keeping with the bold character of this range are the magnitude of many lakes at the base of the mountains, the depth and abruptness of the openings and passes, the expansion of widely-spread mountain sides and considerable moors and bogs, and the variety of romantic valleys and rugged glens and hollows. Assynt and Edderachillis, on the west coast, are remarkable for the ruggedness and inequalities of the surface. Along the north coast the same description of country continues, in a more modified form. The sea-coasts present headlands, promontories, and numerous cliffs of the boldest description. In the central districts of the county are several extensive valleys, with numerous low hills clothed with rich pasturage, and comprising valuable tracts of arable land. With the exception of the Ord of Caithness, the sea-coast along the shore of the German Ocean is flat and sandy.

The county is abundantly watered by the Oykill, the Fleet, and their tributary streams; all of which have their source within the county. The salmon-fishings are valuable. Except the Frith of Dornoch and the short estuary of the Fleet, none of the rivers are navigable. The western district of Sutherland is remarkable for a great number of fresh-water lakes. Loch Shin forms the largest of a chain of lakes, which extends almost continuously from near the head of the Dornoch Frith on the east coast to Loch Laxford, a salt-water loch of the Atlantic on the west coast. Loch Assynt, which is surrounded by some of the highest and most picturesque mountains of the county, is the largest lake along the west coast; Loch Hope and Loch Eribol, and the Kyles of Tongue and Durness, are conspicuous on the north coast. At Scullomie, in the Kyle of Tongue, is a harbour, in which coasters may find refuge: it is always accessible. Since 1811 the whole circuit of Sutherlandshire has been provided with excellent and well-kept roads and numerous bridges, embankments, and mounds necessary to connect them.

Geology.—The rocks of the interior of the county and a considerable portion of the west coast are gneiss. Detached districts, chiefly in the parish of Rogart and on the confines of Caithness, exhibit great masses of granite, and the high hills of Loth are composed of porphyritic granite of different colours. Sienite and large rocks of granular marble abound on the north shore of Loch Shin. The parish of Assynt also contains extensive masses of white marble, and many of the high hills in that district are of quartz. Limestone is the prevailing rock in Durness, except the headland of the Parph, which terminates in Cape Wrath, and in which quartz, red-sandstone, and conglomerate prevail. Along the east coast the high hills of Golspie are of old conglomerate; the low parts of the east coast between Golspie and Helmsdale are of oolite sandstone, sandstone-flag, limestone, and coal. Veins of quartz, of calcareous spar, of tremolite, and of a rude kind of porphyry, occasionally occur.

Climate, Soil, Agriculture, &c.—Sutherland has a variable climate, but along the sheltered east coast it is mild and salubrious. The high parts of the interior and the west coast are subject to continued and heavy falls of rain. The arable land of Sutherland lies principally on the east coast; and there the most improved system of husbandry is acted upon. The Dunrobin breed of Highland cattle belong to this county. Cheviot sheep are the most important stock and the staple produce of the Sutherland high grounds. On the arable farms the grain raised is limited to barley, oats, and occasionally wheat and rye. Turnips are extensively raised, and chiefly consumed on the field by sheep during the winter season; potatoes form the chief article of food for the great bulk of the population. In most of the valleys, natural woods of birch, alder, and occasionally oak, adorn the steep sides and water edges. Several parts of the county have been celebrated for centuries as deer forests; and red-deer are still found in considerable numbers. Roe deer are common in the woods; and game of all kinds, being protected, is everywhere abundant.

Divisions, Towns, &c.—The county is divided into 13 parishes, 10 of which belong to the Duke of Sutherland, who has also considerable properties in the remaining three. The only town is *Dornoch*, a royal and parliamentary burgh and market-town, in the parish of Dornoch, about 200 miles N. by W. from Edinburgh. Dornoch was made a royal burgh by charter of Charles I. in 1628. The population was 599 in 1851. The town is governed by a provost and 13 councillors, of whom 4 are bailies, and unites with Cromarty, Dingwall, Kirkwall,

Tain, and Wick in returning a member to Parliament. It was anciently the seat of the bishops of Caithness, part of whose palace is now used for county purposes. The old cathedral of the diocese was at Dornoch. It was rebuilt in its present form, as the parish church, at the sole expense of the late Duchess-countess of Sutherland. This cathedral contains the remains of the Sutherland family from the 13th century. There is in the town a Free church. Fishing is carried on to a small extent. Six fairs are held in the course of the year.

The villages are mostly small. The following only need to be noticed; the populations are those of the parishes in 1851:—*Bonar*, population of the parish of Creech 2714, at the head of the estuary of the Oykill, about 12 miles W. from Dornoch; vessels of 60 tons burden find accommodation; meal, coals, and lime are imported, and timber, wool, corn, and salmon are exported. Bonar bridge is a fine iron structure of one arch, 150 feet in span, erected in 1818. Extensive cattle markets are held in July, August, and September. *Brora*, population of Clyne parish 1933, at the mouth of the Brora water, about 14 miles N.W. by N. from Dornoch, has a harbour, with a pier. A small coasting trade is carried on. There is a school of industry for females. A market is held in October for cattle, horses, &c. *Golspie*, population 1529, about 10 miles N. by E. from Dornoch, contains some good dwellings and shops; it is inhabited chiefly by agricultural labourers and fishermen. Golspie parish is united with Dornoch parish by a mound 2985 feet long, and a bridge constructed in 1816 across Loch Fleet. The inlet of Little Ferry, outside the mound, forms an excellent harbour. The parish church is situated near the village. There is a school for females, supported in part by the Society for Propagating Christian Knowledge in the Highlands. An annual fair is held in October for cattle and pedlery; and another of less importance in May. Dunrobin Castle, the seat of the Duke of Sutherland, is about two miles east-north-east from Golspie: it is surrounded with extensive and well-wooded grounds. *Helmsdale*, population of Loth parish 640, at the mouth of Helmsdale Water, about 24 miles N.E. from Dornoch, is the seat of a considerable herring fishery. There is a productive salmon-fishery in Helmsdale Water. The bridge is a handsome structure of two arches, each 70 feet span, erected in 1811. There is a Free church. Helmsdale Castle, an old square building, was formerly a hunting-seat of the Sutherland family. *Port Gower*, also in Loth parish, about 22 miles N.E. from Dornoch, is occupied by fishermen and small holders of land.

Antiquities.—The Northmen made early settlements along the coasts of Caithness. Upright stones, tumuli, and similar remains mark the period of their abode here. The foundations, and ruins of old towers and strongholds, are the chief vestiges of feudal times.

Industry.—The county has no manufactures; but the fisheries are prosecuted with vigour and success. Cod, ling, and herrings are taken in large numbers. Vast numbers of lobsters are sent to the London market.

Religious Worship and Education.—According to the Returns of the Census for 1851 there were 37 places of worship in the county, of which 16 belonged to the Established Church, and 21 to the Free Church. In 29 of these places of worship the total number of sittings provided was 11,616. Of day schools there were 78, of which 73 public schools had 4156 scholars, and 5 private schools had 69 scholars. Of Sabbath schools there were 26, with 1361 scholars. One literary institution, the Tongue Subscription Library, had 56 members, with 1304 volumes in the library.

SUTLEJ. [HINDUSTAN.]

SUTTERTON. [LINCOLNSHIRE.]

SUTTON. [CAMBRIDGESHIRE; NOTTINGHAMSHIRE.]

SUTTON, Sussex, a village and the seat of a Gilbert's Poor-Law Incorporation, in the parish of Sutton, is situated in 50° 56' N. lat., 0° 36' W. long., distant 5 miles S. by E. from Petworth, and 54 miles S.W. by S. from London. The population of the parish in 1851 was 389. The living is a rectory in the archdeaconry and diocese of Chichester. Sutton Poor-Law Incorporation comprises 16 parishes and townships, with an area of 26,189 acres, and a population in 1851 of 7052.

SUTTON COLDFIELD. [WARWICKSHIRE.]

SUTTON COURTNEY. [BERKSHIRE.]

SUTTON ST. MARY. [LINCOLNSHIRE.]

SUTTON VALENCE. [KENT.]

SUWALKY. [POLAND.]

SVEABORG, or SWEABORG. [HELSINGFORS.]

SVENDBORG. [DENMARK.]

SWAFFHAM, Norfolk, a market-town and the seat of a Poor-Law Union, in the parish of Swaffham, is situated in 52° 39' N. lat., 0° 43' E. long., distant 27 miles W. by N. from Norwich, 98 miles N.N.E. from London by road, and 113½ miles by the Eastern Counties and East Anglian railways. The population of the town in 1851 was 3858. The living is a vicarage in the archdeaconry of Norfolk and diocese of Norwich. Swaffham Poor-Law Union contains 33 parishes and townships, with an area of 81,200 acres, and a population in 1851 of 14,320. The town of Swaffham stands on the summit of a hill. The houses are generally well built, and the streets are lighted with gas. Swaffham contains an assembly-room, a theatre, and a house of correction. In the centre of the town is a spacious market-place. The parish church is a very fine cruciform structure; at the west end

is an embattled tower with pinnacles at the corners. There are chapels for Wesleyan Methodists, Baptists, and other Dissenters; also National and Infant schools, and a savings bank. Saturday is the market-day; there are three annual fairs. A considerable quantity of butter is brought to market. Quarter sessions and a county court are held in the town.

SWALWELL. [DURHAM, County of.]

SWAN RIVER. [WESTERN AUSTRALIA.]

SWANAGE. [DORSETSHIRE.]

SWANSCOMBE. [KENT.]

SWANSEA, Glamorganshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Swansea, is situated on the right bank of the river Tawe, at its entrance into Swansea Bay, in 51° 37' N. lat., 3° 56' W. long., distant 43 miles W.N.W. from Cardiff, 206 miles W. by N. from London by road, and 216 miles by the Great Western and South Wales railway. The population of the borough of Swansea in 1851 was 31,461. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor; and, in conjunction with Neath, Loughor, Aberavon, and Kenfig, returns one member to the Imperial Parliament. Swansea Poor-Law Union contains 27 parishes and townships, with an area of 103,769 acres, and a population in 1851 of 46,907.

The Welsh name of Swansea is Aber-Tawe, from its position at the mouth of the river Tawe. The harbour may be described in general terms as a square basin, of the dimensions of nearly half a mile each way. It has received considerable improvements of late years. On the western pier there are a lighthouse and watchhouse. Communication between the two banks of the river is maintained by a ferry. On the north-east and north-west the bay is backed by lofty hills, and the beach consists of an extensive level of firm sand. Swansea is the port of a rich mineral district. The principal branches of industry are the smelting of copper-ore and the export of coal. Copper-ore is brought from Cornwall, Devonshire, parts of Wales, Ireland, Australia, and elsewhere. There are 17 smelting-works in the Swansea district, of which number eight are close to the town. Besides the works for smelting copper, there are iron-foundries, zinc-works, tin-plate works, yards for building and repairing ships, roperies, tanneries, breweries, and two potteries. The South Wales railway and the Vale of Neath and Taff Valley railways afford great facilities to the staple manufactures of Swansea. Several canals and tramroads communicate with the inland parts of the county. A canal about 17 miles in length runs along the valley of the Tawe into Brecknockshire; another connects the Neath River and Canal with Swansea Harbour; and a third communicates with collieries on the north-east of the town. On the western side of the harbour is a tramway, 7¼ miles long, which passes along the coast to Oystermouth and the Mumbles, the western head-land of the bay. At the Mumbles is a lighthouse. The trade of the town has increased very rapidly during the present century. Swansea is now a thriving place; the town is well paved and lighted with gas. The number and tonnage of vessels registered as belonging to the port of Swansea on the 31st of December 1854, were—Sailing-vessels, under 50 tons, 65, tonnage 1946; above 50 tons, 103, tonnage 14,799; steam-vessels, under 50 tons, 6, tonnage 141; above 50 tons, 4, tonnage 332. During 1854 the returns of vessels entered and cleared at the port were as follows:—Coasting trade, inwards, sailing-vessels, 3647, tonnage 246,260; steam-vessels, 301, tonnage 48,175; outwards, sailing-vessels, 6771, tonnage 428,866; steam-vessels, 261, tonnage 51,957. Colonial and foreign trade, inwards, sailing-vessels, 724, tonnage 93,677; steam-vessels, 2, tonnage 694; outwards, sailing-vessels, 887, tonnage 120,106; steam-vessels, 4, tonnage 1339. The corporation claims to be a corporation by prescription. The market-days are Wednesday and Saturday; fairs are held in May, July, August, and October. A county court is held in the town.

St. Mary's church is 72 feet by 54 feet, and has a lofty square tower. St. John's is a small edifice; it was formerly a chapel belonging to the Knights of Jerusalem. There is another church of recent erection. The Wesleyan Methodists have chapels, one of which, erected in 1846, is said to be the finest chapel in Wales belonging to that body. The Roman Catholics have a new gothic chapel, opened in 1847. The Unitarians have a chapel in the Tudor style, also opened in 1847. There are besides, places of worship for Welsh Baptists, Independents, Calvinistic Methodists, Quakers, and Jews. National and Infant schools for 800 children were opened in 1848. The Free Grammar school, founded in 1682, for which a handsome new school-house has just been erected, had 72 scholars in 1854. Swansea possesses a Normal college, supported on the voluntary principle, an asylum for the deaf and dumb, a literary and scientific society, a society for the acquirement of useful knowledge, a mechanics institute, a savings bank, and a dispensary. The principal public buildings are the town-hall, erected in 1827, the South Wales Royal Philocephical institution, the infirmary, the theatre, the house of correction, the assembly-rooms, and the spacious and handsome new guildhall and assize-courts. A market-place was opened in 1830, the cost of the construction being about 20,000*l.*; a new fish-market was opened in 1847. The only remains of the ancient castle are a massive square tower; the town-prison and the Union workhouse occupy a part of the site of the old castle.

SWEDEN, a country in Europe, which occupies the eastern and

larger portion of the Scandinavian peninsula, and is situated between 56° 20' and 69° N. lat., 11° and 24° E. long. About one-sixth of the country lies within the Polar Circle. On the east, to 66° N. lat., Sweden is bounded by the Baltic and the Gulf of Bothnia, at the head of which it is contiguous to Russia, the boundary running up the Tornea Elf, the Muonio, and the Kõngsämä, a feeder of the Muonio, to its source in the small Lake of Koltejaur, which is on the boundary of Norway. On the west Sweden is bounded by Norway, the boundary following for the most part the watershed of the mountain ranges between the two countries, the Bullaren Lake, the strait called Swinesund, the Kattagat, and the Skagerack. On the south, the Oresund, or Sound, separates Sweden from the Danish island of Zealand, and the western part of the Baltic from Germany.

The length of this country from south to north is somewhat more than 900 miles; its width, between 58° and 68° N. lat., varies from 150 to 200 miles, but south of 58° and north of 68° it is not so wide. Its area is 3868 Swedish square miles, equal to 169,380 English square miles. The population at the end of 1850 amounted to 3,482,541. The only foreign possession of Sweden is St. Bartholomew's Island, in the West Indies. [BARTHOLOMEW'S, ST.]

Coast.—The coast of Sweden is somewhat more than 1400 miles, exclusive of the deep inlets. The coast along the Skagerack, Kattagat, and Sound is near 300 miles: the remainder is washed by the Baltic. Along the Botten Viken, or the most northern part of the Gulf of Bothnia, the coast is low, and consists of sandy alluvial matter brought down by the numerous rivers which fall into this part of the Baltic. The islands which line this coast in all its extent are of the same character. The coast begins to rise as it approaches the Quarken, or strait which connects the Botten Viken with the Botten Hafvet, or Sea of Bothnia, and the islands which lie across the strait are rocky. South of the Quarken, as far as the town of Gefle (near 60° 40' N. lat.), the coast presents an alternation of low and moderately elevated shores. The islands which line this tract of coast are less numerous than farther north, but larger, and they resemble the neighbouring coast, many of them being low and sandy, while others are undulating, and contain low rocky hills. The semicircular projection of the Swedish coast between Gefle on the north (60° 40' N. lat.), and Bräviken Bay near Norrköping on the south (58° 35' N. lat.), has a rocky shore, indented by numerous inlets, which are generally small, with the exception of that which unites Lake Mälär with the sea. In consequence of these inlets, this coast consists of a succession of small peninsulas. Though extremely rocky, the coast in general is of moderate elevation: in a few places it may rise to 100 feet. The islands, which are very numerous along the whole coast, but especially to the south of the Alands Haf (the Sea of Aland), all consist of rocks, but the greater part of them are only a few feet above the sea. These rocky islands and islets are called 'akars,' and many of them are surrounded by sand-banks. South of the small bay of Bräviken, as far as the parallel of the northern extremity of the island of Oland (57° 22' N. lat.), the coast is partly rocky and somewhat elevated, and partly low and sandy. It is likewise intersected by many inlets, all of which run from east-south-east to west-north-west, so as to give to this part of the coast nearly the appearance of a saw. The rocky islands and cliffs which line it are still more numerous than farther north, and render the access to it very difficult. The coast of the Strait of Calmar (which divides the island of Oland from Sweden), is low, and runs in a less broken line. The islands in this strait are comparatively few; and south of Calmar they disappear almost entirely. The Strait of Calmar terminates on the south with Cape Tornhamnsudde or Torrumudde, a low rocky point east of Carlsrona, at which the coast, which up to this point extended nearly due north and south, suddenly turns to the west. This is the most broken rocky and elevated part of the coast of Sweden, and it extends to a few miles west of Carlsahamn. Nearly the whole of this coast consists of rocks, sometimes rising 50 feet high with a steep ascent: but between the projecting masses, and especially at the mouths of the small rivers, it sinks nearly to the level of the sea; and such places generally form good harbours and anchorages, being protected from the wind and sea by the numerous islands which line the coast. The largest of these islands are at a short distance from Cape Torrumudde, and form the harbour of Carlsrona. The rocky elevated coast terminates at the peninsula of Sölvetaborg; the shores of the peninsula of Scania, which forms the most southern part of Sweden, being low, sandy, and free from islands and rocks, but in a few places lined with sand-banks. Cape Kullen, which forms the northern entrance of the Sound on the east, is of moderate elevation, but north of it the coast sinks down nearly to the level of the sea, and continues so to Warberg, up to which place no islands or rocks occur. The coast rises a little north of Warberg, and the rocky islands reappear and increase in number as we proceed northward: it also gradually rises higher, though the elevation never exceeds 30 feet. The coast is very rocky, and intersected by several large inlets, especially north of Göteborg, where the arms of the sea run up to Uddevalla, and separate from the mainland two large islands, Työrn and Orust, which are rather hilly. The other islands are only rocky cliffs of small extent and moderate elevation; and as we approach the boundary of Norway several of them consist of sand and other alluvial matter.

Surface.—In that part of Sweden which lies north of 62° N. lat.,

the country rises continually from the Gulf of Bothnia to the boundary of Norway. South of that parallel the slopes extend in a different direction. Between 62° and 59° N. lat. the country slopes to the south, and attains its lowest level at the place where the three great lakes of Wener, Hjelmar, and Mälär nearly intersect the country; south of these lakes the country rises again, and from 58° to 57° 10' N. lat. it constitutes an elevated table-land bounded by slopes. This table-land is connected with the mountain region north of 62° N. lat. by a low narrow ridge, which runs nearly due north of it between 14° and 15° E. long. as far north as 60° N. lat., and afterwards declines to the north-west. This ridge constitutes the watershed between 58° and 62° N. lat.

The most elevated part of Sweden lies along the boundary-line of Norway, and is called the Kiölen Mountains, which range extends as far south as 64° N. lat. The mountainous country continues farther south to 61° N. lat., but this southern portion is a part of what is called Norska Fiellen. Both these ranges are noticed under NORSKA FIJELLEN.

1. The *Northern* part of the mountain region of Sweden, or that which extends from the banks of the rivers Muonio and Tornea to 64° N. lat., has a great uniformity of surface. The western districts, being occupied by the most elevated portion of the Kiölen range, contains very high mountains, and a considerable tract surrounding Mount Sulitelma is always covered with snow. The lowest parts of the highest portion of the range are probably 4000 feet above the sea-level. From these parts the country slopes towards the Gulf of Bothnia; but the descent is not regular, being more rapid near the range, and more gentle towards the sea. The whole distance between the crest of the range and the gulf is rather more than 200 miles. About 40 miles from the crest the whole region has descended to about 2000 feet. In this highest region all the mountains rise above the level on which trees grow; in the valleys some diminutive firs and pines are found, but the greater part of these valleys are filled with lakes or swamps. Below this mountain region extends the elevated region, in which the country descends from the general level of 2000 feet to that of 800 feet above the sea-level. The width of this tract is about 60 miles. Numerous branches of the Kiölen Mountains traverse this tract, and their summits are generally above the line of vegetation, being 3000 feet high; between them the valleys are several miles wide in many places, but nearly all of them are occupied by alpine lakes. These lakes are frequently of great extent, 30 or 40 miles long, and from 3 to 5 miles wide. One of them, the Horn Afvan, from which the Skelleftea Elf issues, occupies the whole width of this tract, and is more than 60 miles long, and in some places 10 miles wide. The inhabitants of this region live chiefly on the produce of their cattle, and on the fish caught in the lakes, among which are several kinds of salmon. The forests are useless, except for the local supply of firewood. The rivers do not admit either of navigation or the floating of wood. Nearer the sea is the lower region, the general level of which sinks from 800 to 300 feet. It is wider than the elevated region, measuring from east to west about 70 miles. The ridges which traverse the whole breadth of the elevated region extend to this region, and may even be said to cross it; but they sink into hills, being, with few exceptions, hardly more than 500 feet above the general level. They are generally wooded to their summits. These hills are not usually steep, and there are small level tracts between them which are dry; but only a small surface is cultivated, owing to the severity of the climate and the poverty of the soil. Potatoes and cabbages, with a little barley and rye, are grown. The inhabitants live mainly on the produce of their cattle. The lakes in this tract are few, and most of them hardly larger than ponds. The fir and pine cover the greater part of the country, and pitch and tar are made from them. The regions just described constitute the Läns of Pitea and Umea, which contain an area of above 62,000 square miles. Of this the lakes and swamps occupy about one-tenth; the cultivated tracts do not exceed 66 square miles; the meadows occupy about 390 square miles, and all the remainder is either covered with forests or a useless waste.

2. The *Central* portion of the mountain region, or that which lies between 64° and 62° N. lat., though in some respects it resembles the northern portion, is distinguished by some peculiar features. The average width of Sweden in this part does not exceed 170 miles. The highest part of this region, situated within the Kiölen Mountains, varies from 20 to 30 miles in breadth. Only a few summits are always covered with snow, among which the most elevated is the Sylfellen, which is 5860 feet above the sea-level. The rivers which originate in this region run only in ravines, and the whole tract is entirely uninhabited, and only visited in summer by a few Laplanders, who find pasture for their reindeer on the mountains. The country adjacent to this mountainous tract forms a kind of table-land, extending about 80 miles in every direction. In the lowest part of this table-land there is the Great Lake, or *Storsjön*, whose surface is 978 feet above the sea-level; it is 40 miles long from north to south, and in some parts 12 miles wide. The river which issues from the north-east side of the lake is the principal feeder of the Indals Elf. This table-land forms a basin, being inclosed by higher land. From the Kiölen range, west of the basin, a branch advances into the basin for a few miles, and then terminates abruptly with the high summit of Mount Areskatan

(4716 feet). The surface of the table-land, which may be called the table-land of Jemtland, is about 1000 feet above the sea. It is very much broken, and interspersed with steep rocks and swamps. Besides the Great Lake there are ten or twelve others, each of them from 10 to 15 miles long, and more than a mile wide. Agriculture is carried on to some extent; barley, rye, and oats are grown. Several kinds of vegetables, especially potatoes and peas, grow very well. The soil however is stony, and far from being fertile; and towards the end of August the crops are sometimes destroyed by frost. The pastures being extensive, cattle, sheep, and goats are rather numerous: there is also a due proportion of horses and hogs. South of the table-land of Jemtland are the upper valleys of the river Ljungan and Ljusnan: that of the latter is called the valley of Herjedalen. These two valleys are of considerable width, and though interspersed with hills, they contain level tracts which are cultivated. These valleys are higher, that of Herjedalen being from 1200 to 1800 feet above the sea.

From the high ground which forms the eastern border of the table-land of Jemtland, the country descends in a regular slope towards the sea. Rivers cross it in narrow valleys considerably below the general level, in which they frequently expand in long narrow lakes, and usually form rapids and cataracts. In this tract the valleys alone can be cultivated; but the higher grounds contain good pasture and support cattle of various kinds. The remainder of the region, extending about 40 miles east and west, and reaching to the shore of the Gulf of Bothnia, is almost entirely occupied with isolated hills or short ranges; they have generally steep declivities, and some of them rise nearly 1000 feet above the sea. Between them are valleys or level grounds of small extent, the lowest parts being occupied by a river, or by a small lake, on the banks of which there are meadows alternating with woods. The slopes of the hills, and generally their summits also, are clothed with trees. Barley is extensively cultivated. Potatoes and peas are grown to some extent. The number of domestic animals, black cattle and sheep, is great, and that of goats considerable, but horses and hogs are few in number. A considerable quantity of timber is exported.

3. The Southern part of the mountain region lies south of 62° N. lat. That part of this region which may properly be called mountainous, is not extensive. It forms an appendage of the Norraka Fiellen. From Mount Sylfellen eastward run three ridges inclosing the upper valleys of the rivers Ljungan and Ljusnan, and towards the south those which divide the Oster- and Westet-Dal, and the latter from the Klar, while the most western ridge separates the Klar from the Glommen. The ridge which separates the valley of the Westet-Dal from that of the Klar, preserves a considerable elevation south of 61° N. lat., running south-south-east until it has passed 60° N. lat., when it turns to the south. Near the mountain region its general elevation is more than 1500 feet above the sea; but south of 60° 30' N. lat. it is hardly more than 1000 feet. It sinks still lower south of that line, where, running from north to south, it forms the watershed between the rivers that fall into Lake Wener on the west, and those running to Lake Mälär to the east; and farther south separates the basins of the lakes Wener and Wetter. In these parts it is called the *Tifveden* range, and it attains only a height of from 500 to 700 feet above the sea-level, and from 300 to 400 feet above its base. It seldom exceeds 3 or 4 miles in width.

The country to the east of this ridge and of the mountain system of Mount Sylfellen, resembles in its great features the countries which lie farther north. The higher tract, whose general level is more than 800 feet above the sea, stretches from the mountains to the western extremity of Lake Siljan, a distance of about 40 miles. North of that lake it extends much farther to the east, and here it occupies from west to east about 80 miles, leaving between it and the sea a space not quite 40 miles wide. The surface is less broken than that of the regions farther north, consisting chiefly of long and gentle swells, the summits of which form levels of considerable extent. A few hills are dispersed over these summits, but their sides are not steep, and they do not rise more than 300 or 400 feet above their base. These hills are numerous in the vicinity of the mountains, especially on the west of Lake Siljan, but they become rarer in the country farther east. Agriculture is limited to a few valleys of moderate extent, and to the low grounds surrounding the lakes, where rye, barley, and especially oats, are cultivated, and some vegetables are grown. Cattle, sheep, and goats are reared. Nearly the whole tract is covered with forests, the produce of which finds a ready sale in the adjacent Region of the Mines.

Lake Siljan, which is situated near the southern border of this tract, is 25 miles long, 6 miles wide, and 555 feet above the sea-level. On the west and south it is surrounded by low hills, alternating with level plains. On the north and east the hills are much higher, but the declivities are usually gentle, and inclose narrow fertile valleys. In the district surrounding this beautiful lake agriculture is conducted on a larger scale than in the country to the east and north of it.

The eastern portion of this region, extending from the Gulf of Bothnia about 40 miles inland, is an inclined plane, which gradually rises from the sea to an elevation of 800 feet. The surface is interspersed with numerous hills of moderate elevation and with lakes. A plain of considerable width extends along the shores from 61° 40' N. lat. to the mouth of the Dal (60° 40'); this is the most northern

part of Sweden in which wheat is grown. Barley and potatoes are most extensively cultivated; rye, oats, and peas are also grown. Sheep and cattle are very numerous.

4. South of the region just described extends the *Region of the Mines*. It occupies the whole breadth of Sweden, from Norway to the Gulf of Bothnia, between Lake Siljan and Söderhamn on the north, and Lake Wener (59° N. lat.) on the south. The Tifveden ridge crosses it nearly in the middle at an elevation of about 1000 feet above the sea. West of the range the country slopes towards the south, and terminates on the banks of Lake Wener. Two-thirds of this slope are less than 300 feet above the sea. The country lying east of the Tifveden ridge slopes to the south in the southern and to the east in the northern districts. Its elevation above the sea is never less than 300 feet, except on the level plain along the Gulf of Bothnia from Söderhamn to the mouth of the Dal. West of the great southern bend of the Dal is a tract of considerable extent, which rises from 800 to 1000 feet above the sea. The surface of this region is exceedingly uneven, and it is covered with a succession of low unconnected hills, the slopes of which are very gentle, and generally covered with wood. The low grounds between the hills are generally occupied by countless lakes and marshes. In the country west of the Tifveden ridge the lakes lie from north to south. The largest among them are Legen, Lelanf, Glafs, Wermelen, Mellan, and Ofre, each of which is above 20 miles long, but they seldom exceed two miles in width. The lakes to the east of the Tifveden ridge have a more irregular form, and are not so large. South of the Dal are the lakes Wesman, Barken, and Amänningen, and north of it Runn and Siljan. Though the soil of this region consists chiefly of gravel and sand with a mixture of clay, nearly every spot that is of any value (there are not many such) is carefully cultivated for the supply of the miners; the greatest number and the richest of the iron-mines of Sweden being situated within this region. Oats, rye, some barley and wheat are the chief crops. Potatoes and peas are grown. In a few places there are good pastures; and cattle, sheep, horses, and hogs are numerous in the southern districts.

5. To the south-east of the Region of the Mines is the *Central Agricultural Region*, which comprehends the greatest extent of low country in Sweden. No part of this tract exceeds 300 feet above the sea-level. Its southern boundary is a higher tract, which is connected with the Tifveden ridge, north-west of the northern extremity of Lake Wetter, and extending from the ridge eastward, terminates on the north shores of the bay of Bräviken, on the coast of the Baltic. That portion of the region which is north of Lake Mälär is nearly a level plain. The country south of the lakes Mälär and Hielmar is more undulating, and in some places it is broken and interspersed with rocks. In these districts there are numerous lakes, which are not common in the country north of the lakes. The surface consists of sandy clay, which gives to the country a greater degree of fertility than is usual in Sweden. Above 900 square miles or more than one-seventh of the surface of this region is employed to produce food for man. Rye is the principal object of cultivation. Next to rye are barley and wheat; very little oats are grown, but potatoes and peas are largely cultivated. Cattle and sheep, horses and hogs, are numerous.

6. South of the central agricultural region is the *Plain of Linköping*, which is separated from the central region by a more elevated tract, which surrounds the northern extremity of the Lake Wetter, and extends eastward to the Bay of Bräviken, where it contracts to a narrow ridge called Kolmoren, which runs along the northern shore of the bay to its termination in the Baltic. The elevation of this tract is about 200 feet above the countries north and south of it. The greater portion of it is covered with woods of pine, fir, and birch.

The plain of Linköping, one of the most fertile tracts in Sweden, measures from the shores of the Baltic to the banks of Lake Wetter, above 60 miles. West of the town of Linköping, which is situated nearly in the centre of the plain, its average width is 30 miles, of which one-third is north of the Göta Canal and two-thirds south of it. The surface is generally level. From the Baltic the country rises gradually towards the west, so that Lake Roxen, which is nearly in the middle of the plain, is 106 feet above the sea-level, and on the banks of Lake Wetter the country is about 300 feet high. South of the efflux of the river Mottala there rises, on the shores of the lake, Mount Omberg (845 feet above the sea), and from this hill a ridge of elevated ground runs southward close to the borders of the lake, separating it from the plain. The soil of the plain is a mixture of clay and sand, and in some places of loam. In no other part of Sweden is wheat so extensively cultivated as in this plain, but rye and barley are grown to a still larger amount. Peas and potatoes are also much grown, and there is much meadow-ground. Domestic animals are numerous, with the exception of goats. There are however some extensive tracts partially covered with woods which supply fuel, and partly consisting of open pasture-ground.

7. To the south of the plain of Linköping rises the *Table-land of Småland*. This extensive region, with its declivities, occupies nearly the whole of the country south of 58° N. lat., leaving only comparatively narrow tracts of lower grounds along the sea, which bounds it on the east, south, and west. At the south-western extremity of it

region is the extensive level of Scania. The eastern border of the table-land itself is a little west of 16° E. long., and the southern border is a short distance south of 56° 30' N. lat. The western border runs parallel to the shores of the Cattogat, at the distance of about 15 miles. Along the outer borders the elevation of the table-land is between 300 and 400 feet above the sea-level. The most elevated portion of the table-land (which surrounds the southern side of Lake Wetter) is traversed by a ridge of higher ground, which may be considered as a continuation of the *Tyfveden* ridge. This last-mentioned ridge, which is between 500 and 600 feet high where it separates the basins of the lakes Wener and Wetter, continues southward along the western banks of Lake Wetter, preserving nearly the same elevation, but interrupted in some places by short depressions; but as it approaches the southern extremity of the lake it rises higher, and where it meets the table-land it has an elevation of more than 900 feet. Nearly 10 miles south of the lake there rises on this ridge a high hill, called *Tabery*, whose summit is 1100 feet above the surface, and has attracted the attention of geologists, as about three-fourths of it consists of pure ironstone. From this summit the ridge runs westward, and near the centre of the higher portion of the region it again rises to more than 1100 feet above the sea, and divides into two branches, of which one runs west and the other south-west: both of them terminate on the margin of this region. The general elevation of this ridge may be about 1000 feet above the sea, and less than 200 feet above the general level of the country. This is the highest ground in Sweden south of 60° 30' N. lat. The surface of the table-land varies greatly. There are many tracts of considerable extent, which are level plains: other districts have a broken surface. On the higher part of the table-land there are only a few lakes, but in its western district, and still more in its southern, they are very numerous. This unsheltered table-land suffers much from gales, and its climate is severe. What soil there is in this region is extremely infertile, being composed of disintegrated gneiss, on which rock the table-land rests. Tracts many miles in length and width are covered with sand, on which nothing grows but common heath, and some spots are quite destitute of vegetation. Where the soil is mixed with a little vegetable mould, the country is covered with stunted birch woods. The best tracts are those which surround the lakes. The principal grain raised on the higher part of the table-land is oats, and on the lower part barley. Some wheat and rye are grown in patches here and there. Potatoes are much cultivated on the higher part. The cattle, sheep, and hogs are rather of small size, and the wool of the sheep is very coarse. The grass-lands are bad. Out of the whole surface of this region, about 14,000 square miles, an aggregate of little more than 30 square miles produces corn and vegetables: about 130 square miles more consist of meadows and inclosed pastures.

8. *The Maritime Region of Småland*, or the eastern declivity of the table-land of that name, extends opposite the island of Oland, from south to north, but it advances northward within 5 or 6 miles of the Göta Canal. Its length rather exceeds 140 miles; the width varies from 15 to 25 miles. The southern districts, or about one-third, are slightly undulating, with extensive intervening flats. The soil is sandy. The greater part is covered with fir and birch woods, but there are few timber-trees. The northern districts present a succession of hills, valleys, and small plains. The hills are generally steep, and inclose narrow valleys, the lower parts of which are filled with lakes. The soil is rather better than in the southern district, and a comparatively larger portion of the surface is under the plough. Most of the valleys and hill slopes, though unfit for cultivation, produce abundance of grass. But the forests constitute the wealth of this tract: they contain pine, fir, birch, beech, and oak, and a considerable number are large trees. Timber, tar, and pitch are exported. Rye, potatoes, and barley are grown, and also a little oats and wheat. Domestic animals, with the exception of goats, are abundant. The meadows and pasture-grounds cover about 420 square miles: the area of the part under cultivation does not exceed 90 square miles.

9. *The Maritime Region of Blekinge* extends over the southern coast of Sweden from about 14° 30' to 16° E. long., somewhat more than 50 miles in length; its width may be estimated at 15 miles. The surface is the most broken portion of the Swedish coast. The rocky masses of the table-land of Småland, divided into small ridges by numerous watercourses, which run in deep and narrow valleys, advance within a short distance from the shore, where they terminate in hills from 200 to 300 feet high. The rivers are extremely rapid, and form many small and beautiful cataracts. The level grounds are much less extensive in this region than in any other part of Sweden, but they possess a considerable degree of fertility. Wheat is much grown, but the cultivation of rye is ten times more extensive. Barley and potatoes are also much cultivated. The meadows in the valleys, though not extensive, and the hill sides, yield abundance of grass. The hills in parts are covered with woods of stunted birch and fir—in parts they are utterly barren. The rearing of cattle and hogs constitutes one of the principal objects of domestic economy, and much cheese is made.

10. *The Plain of Scania* occupies all the peninsula which constitutes the most southern portion of Sweden, between the Sound on the

west and the Baltic on the south and east. A straight line drawn from the innermost recess of the Skelder Vick, a large and open bay of the Cattogat, on the west, to the peninsula of Sölvetaburg on the east, may be considered as marking its northern boundary. It extends from south to north about 55 miles; the width varies between 50 and 60 miles, being greater towards the north than along the southern coast. It is traversed in its length by a low broad swell of high ground, which begins at Cape Kullen, a moderately elevated headland at the northern opening of the Sound. From this point it extends in a south-east direction to the lakes called Ringsjön, where it enlarges to a great width, inclosing these lakes, and covering a space of considerable extent with numerous hills, most of which are covered with wood. From the banks of these lakes it declines a little more to the south, running towards the south-eastern portion of the plain, where it terminates about 12 miles from the sea in low hills. The tract of country between the termination of this swell and the south-eastern shores of Scania is a level, with numerous depressions, which are occupied by marshes and swamps. That portion of the region which is situated to the south-west of the swell contains a large level plain, which extends along the shores of the Sound, varying in width from 6 to 10 miles. The soil of this tract is of first-rate quality, consisting of a strong rich loam, which yields good crops of wheat. The country between this plain and the swell above mentioned is interspersed with small isolated hills. The soil of this tract is inferior to that of the plain. Rye and barley are extensively grown. The hills are covered with wood or with indifferent pastures. That portion of the plain which lies north-east of the swell contains also a considerable level round the town of Christianstad, which has a fertile soil, yielding wheat and rye; but it is not equal to that of the plain along the shores of the Sound. The remainder of the country resembles the hilly district west of the swell in surface, soil, and productions.

11. *The Maritime Region of Halland*, which extends along the eastern shores of the Cattogat, is the western declivity of the table-land of Småland. It extends from the Skelder Vik northward to the mouth of the Göta, about 112 miles, with a width of about 15 miles. The level portion of this region is separated from the plain of Scania by a tract of high land (400 to 500 feet above the sea and about 8 miles wide), which projects from the south-western corner of the table-land of Småland, and, running westward, terminates in the peninsula of Halland's Ås, between Skelder Vik on the south and the Bay of Laholm on the north, close to the sea. The soil of this high tract is sandy, partly covered with heath, partly wooded, and in some places swampy. Beech is abundant, and there are many large trees. To the north of it lies the most level portion of the region, which extends to the vicinity of Warberg. In these parts the table-land of Småland descends with a continuous declivity, which is only broken by the water-courses, nearly to the sea-level, leaving between its base and the shores a tract of undulating ground about 8 miles wide. The soil, though inferior, yields barley, rye, and potatoes. The slopes of the hills at the back of the undulating plain make good sheep-walks. The northern districts of this region, from Warberg to the mouth of the Göta Elf, have a much more broken surface. Rocky hills of moderate elevation extend from the table-land nearly to the sea, and between them are wide valleys sloping to the south-west, and partly filled with long lakes. Most of the hills are covered with stunted trees or with grass. Large numbers of sheep and cattle are kept, and also many horses, as the pasture-grounds are extensive. Only a small portion of this tract is under cultivation, and it produces chiefly rye and barley.

12. *The Southern Basin of Lake Wener* extends over the wide isthmus which separates the two lakes of Wener and Wetter, between 58° and 59° N. lat. On the west it borders on the Göta. The basin of Lake Wener is very limited on the east and west. On the east the *Tyfveden* ridge, running parallel to its eastern shore, is only about 8 or 9 miles distant. On the west the stony masses of the Rocky Region advance still nearer to the border of the lake. Towards the south the basin of the lake extends about 60 miles; to the north 120 miles, this part being included in the Region of the Mines. The southern basin of Lake Wener is more than 80 miles in length from south-west to north-east; the width decreases from 70 miles in the south to about 10 miles under 59° N. lat. The greater part of this region is an inclined plane, which descends northward towards the lake, with a gentle declivity, and on the east and south is surrounded by higher land. At its most northern boundary the *Tyfveden* ridge enters the region, and between the lakes Skagern and Uden it runs south-west. Here it is about 550 feet above the sea-level, 416 feet above Lake Wener, and 263 feet above Lake Wetter. Soon afterwards it turns to the south, and is interrupted by a deep depression, containing Lake Viken, which is only 296 feet above the sea-level, or 11 feet above Lake Wetter. South of Lake Viken the ridge gradually rises higher, and south of the middle of Lake Wetter it attains a general elevation of 800 feet, and soon joins the table-land of Småland. The northern edge of this table-land constitutes the southern boundary of the plain, which descends from it gradually and with a gentle declivity northward. On the plain there are a few isolated mountains of considerable height, consisting of sandstone, limestone, and alum-slate. The *Bilungen*, one of these heights, is nearly in the centre of this region, north-east of the Lake of Hornborga, and is above 10 miles long, with

an average width of 3 miles. It is 899 feet above the sea. The Kinne Kulle, another of these, stands on the banks of Lake Wener, and is 9 miles from south to north, and 5 miles wide. The highest part is 902 feet above the sea-level. The declivities of this mass, where they consist of limestone, are very fertile, well cultivated, and populous. Though the general slope of the plain is regular, its surface is often undulating. The soil is an alluvium, composed of sand and clay, and possesses a considerable degree of fertility. Some tracts, where the sand predominates, are covered with heaths. Rye, barley, and potatoes are extensively grown. The meadows and pasture-grounds are of little value except on the borders of the lakes.

13. The *Rocky Region* extends for about 90 miles in length, between the Göta on the east and the Skagerack on the west, as far as 59° N. lat. and the boundary-line of Norway. The width at the southern extremity hardly exceeds 10 miles, but it increases rapidly to the northward, so that at the northern boundary it is rather more than 55 miles. It may be divided into three districts, which extend longitudinally over the region—the rocky district, the middle or woody district, and the agricultural district. The rocky district lies along the shore of the Skagerack, and extends 10 or 12 miles inland; the southern part of the region, as far north as Trolhättan, is entirely occupied by it. The surface of this tract is covered with rocks, rising near the sea with a precipitous ascent from 100 to 300 feet, and then extending in some parts on a level, with very inconsiderable depressions or eminences, and in others with a hilly surface. Farther north, especially near the boundary of Norway, the rocky masses rise 400 or 500 feet, and on them there occur other masses, which are from 100 to 200 feet higher. The rocks are in general covered only with lichens; most of the narrow valleys between them are mere peat-mosses, or overgrown with juniper bushes. Fire-wood is scarce. The middle or wooded district begins in the parallel of the southern extremity of Lake Wener, where it is of inconsiderable width, but it grows wider as it proceeds farther north, where it is 25 miles across. The hills and rocks here have rounded tops and less precipitous slopes. The hills are generally covered by a layer of earth, on which grow birch, fir, and pine woods, and tolerable pastures. The depressions and valleys are rather wide, and contain many cultivated tracts and meadows. The eastern or agricultural district lies along the shore of Lake Wener, with a width of 6 or 8 miles. The surface of this tract towards the south is very even and slightly elevated above the level of the lake, and has a rich alluvial soil. Towards the north however the surface is undulating, and in some places hilly; but the soil is of good quality, being a mixture of clay and loam. In this district much rye and barley are cultivated, and a considerable proportion of wheat. Peas and potatoes are grown extensively.

The ratio of cultivated, meadow, and pasture land to the unimproved portion of the surface of Sweden is much greater in the southern provinces than in the northern. This difference is less the effect of the climate than of the soil. Though in the southern portion there are several extensive tracts which consist of bare rocks, they are small in proportion to tracts of the same kind in the north. The boulders, which are extremely numerous, diminish the extent and value of the cultivable tract. There hardly occur ten square miles, with the exception perhaps of the level plain of Scania, in which there are not erratic rocks in great numbers, and in some places they cover nearly half the surface. These rocks, as well as those 'in situ,' are of gneiss, and the soil derived from their disintegration is barren.

The lowering of the sea along the coast of Sweden is a fact that has been established by continued observations for a whole century. This decrease of water is greatest towards the northern extremity of the Gulf of Bothnia. It diminishes gradually to the southward, and its effect seems to disappear along the southern coast of Sweden; but it has been noticed in the Cattagat north of Cape Kullen, and still more north of the mouth of the Göta, where it is about as much as on the eastern coast, under the same parallel. The difficulty of explaining this phenomenon satisfactorily has suggested the notion that the whole Scandinavian peninsula is raised gradually higher by the force of some internal power.

Lakes; Rivers; Canals; Railways.—The number of lakes in Sweden is very great. It is estimated that they cover 21,946 square miles, or nearly one-eighth of the area of the kingdom.

The largest lake is the *Wener*, which is traversed by 59° N. lat. The surface is 144 feet above the sea-level. Two headlands projecting from the northern and southern shores divide it into two unequal parts, of which the western and smaller is named Lake Dalbo. Lake Dalbo extends from south to north about 55 miles, and from east to west 20 miles. The strait by which it is connected with Lake Wener is about 15 miles wide, but numerous small rocky islands lie across it, leaving only narrow passages, a circumstance which renders the navigation dangerous, on account of the gales, which are not unusual on the lakes. Lake Wener is 60 miles long from south to north, and 30 miles wide where broadest. A large part of the shore is lined with rocky islands; this is also the case with Lake Dalbo. The rivers which fall in from the south have not a long course, and do not bring much water; but the northern rivers flow from other lakes of considerable extent, and contain much more water.

The largest feeder of Lake Wener is the *Klar*, which rises in Lake Fämund, on the confines of Sweden and Norway, 2280 feet above the

GEOG. DIV. VOL. IV.

sea. The outfall of Lake Fämund is called the *Tryssild*, and runs southward. After a rapid course of more than 70 miles, it enters Sweden a little north of 61° N. lat., and takes the name of Klar. At this point it is probably not more than 600 feet above the sea-level. Its course in Sweden is generally south-east, and it runs more than 120 miles. In the upper part of its course in Sweden its current is comparatively gentle; but in the vicinity of 60° N. lat. it descends from a higher country to a lower, and falls more than 180 feet within a few miles, and is broken by rapids and cataracts. Below this place the river runs with less rapidity, but it cannot easily be navigated except in the last 20 miles of its course. Wood however is floated down from the upper country. Near its mouth it divides into two arms, which inclose a small island called Tingwalla, on which the town of Carlsad is built.

The waters of Lake Wener are carried to the Cattagat by the *Göta*, which runs more than 50 miles to the west of south. It has a great volume of water, and about 14 miles from its mouth divides into two arms, which inclose the large island of *Hisingen*. In its natural state the river was rendered unfit for navigation by several cataracts—one at Rännum, 12 feet high, two miles from the lake; another at Trolhättan, where the river descends by rapids 108 feet in 5 miles; and a third at Lilla Edet, where there is a cataract 10 feet high about 18 miles from the lake. But all these obstacles are now overcome by means of canals and locks. Small steamers and vessels of not more than 6 feet draught ply regularly from Göteborg (Gothenburg) to Lake Wener; thence the West Göta Canal, which traverses Lake Vicken, conveys them to the Wetter Lake; and by the East Göta Canal, which runs parallel to the Motala, traverses Lake Roxen, and thence runs eastward to the Bay of Släte Baken, below Söderköping, on the east coast of Sweden, the steam navigation is completed between the Cattagat and the Baltic. This important line of internal navigation (260 miles in length, including the lakes), was completed by the English engineer Telford. It shortens considerably the route from Göteborg to Stockholm, and frees the commerce of Sweden from the Sound dues. The navigation is closed from Christmas to May by ice.

A line of railway is now (August, 1855) in progress of construction from Stockholm to Göteborg, sweeping round the north shore of Lake Mälär, through Koping, Orebro, and down the isthmus between the Wener and Wetter lakes. Another railway has been spoken of from the head of the Kelder Wik, up the valley of the Ronne, and through Christianstad to the port of Ahus on the Baltic.

Lake Wetter, which occupies the centre of Southern Sweden, extends from south to north about 80 miles, and its width is about 10 miles. The surface is 288 feet above the sea, while at the distance of a few miles east and west the level country is several feet lower. It is surrounded by rocks and hills except on the north-east, where for nearly 20 miles it is contiguous to the plain of Linköping, and the shores rise only a few feet above its level. All the streams that flow into it are only torrents. The lake in one place is more than 70 fathoms deep. It is subject to heavy gales.

The river *Motala* issues from this lake on the north-east, and after having traversed the plain of Linköping and the lakes of Boren, Roxen, and Glan, carries its waters to the Bay of Bräviken, an inlet of the Baltic which runs up to the town of Nörköping, 24 miles inland. The whole course of the river, exclusive of the lakes, is only about 25 miles; and it descends 288 feet, or 11½ feet per mile. The channels by which the lakes are connected with one another are too rapid for navigation.

About 25 miles N.E. of Wetter Lake is *Lake Hielmar*, which is about 40 miles long and 2 miles wide at both extremities; but it enlarges in the middle to 12 miles. The surface is 78 feet above the sea-level. It communicates by a canal (and locks) with the river Arboga, which runs into Lake Mälär.

The *Mälär Lake* differs greatly from all the other lakes of Sweden. It consists of many small lakes, united by short channels, which inclose islands. The number of these small islands is in some places very great. Hardly a clear sheet of water of a mile square can be found. From what may be called the main body of the lake several narrow arms branch off to the south and north, and penetrate to a great distance inland. One of them, which extends northward, is more than 25 miles long. All these numerous arms and branches are navigable for boats. If we consider the town of Stockholm to be built at the eastern extremity of the lake, the length of the Mälär Lake exceeds 70 miles. It is nearly on a level with the Baltic.

The advantages of the navigation on Lake Mälär have been increased by the Södertelge and Strömholms canals. The Södertelge Canal is a cut about 2 miles long, which unites a southern arm of Lake Mälär with a deep inlet of the Baltic called the Järne Fiord. By means of this cut the steamers and other vessels that reach the Baltic by the Göta Canal ply to and from Stockholm without passing through the long channels that lead to that city. This canal is about 18 miles west-south-west of Stockholm. The Strömholms Canal joins the lake not far from its western extremity, and comes from the north. It leads to the interior of the Region of the Mines, and terminates in the Lake of Barken, which is 327 feet above the sea-level. Its length, including the lakes Barken and Amänningen, which together occupy more than 20 miles, exceeds 50 miles. It can only be navigated by vessels drawing 4 feet of water, and has 25 locks.

The only navigable rivers in Sweden are those which have been rendered so by art. The rivers south of 60° N. lat. have generally a short course, but north of 60° N. lat. there are several which run above 300 miles, descending from the higher portion of the Kiölen range, and falling into the Gulf of Bothnia. Nearly all of them run from north-west to south-east. The largest is the *Dal*, which is formed by the junction (near Falun) of the Öster-Dal, which traverses the Siljan Lake, and the Väster-Dal, or Fulu. Both of these head-streams run nearly south-east from their sources on the eastern slope of the mountains that inclose Lake Fämund. Near 60° 20' N. lat., 16° 20' E. long., the Dal turns east by north, and expands into a series of lakes for about 50 miles. At Elf Carby the Dal contracts and forms a magnificent cataract, below which it runs in a compact stream for about 6 miles nearly due north into the Gulf of Bothnia, a little south of Gefle.

Farther north is the *Liume*, whose most remote branches originate on the southern declivity of Mount Sylsellen. Its upper course is in the elevated valley of Herjedalen, and is very rapid. East of 15° E. long. it descends into the lower country, forming numerous small cataracts. In the lower country it often extends to the width of 2 or 3 miles, so as to resemble a lake. This river falls into the Gulf of Bothnia south of the town of Söderhamn, after having run about 250 miles. Farther north the Gulf of Bothnia receives the Liungan, the Indala, and the Angerman, which are described under ANGERMANLAND; farther north the Umea, the Skelleftea, the Pitea, the Lulea, the Calix, and the Tornea, all of which are noticed under BOTHNIA.

Climate.—The difference in the climate of various places in Sweden is chiefly to be attributed to the differences of latitude and elevation above the sea-level. The most northern point of the country lies 2½ degrees beyond the polar circle; the most southern is situated nearly 11 degrees to the south of it. A small portion of the country is so elevated that it is always covered with snow, and large tracts along the sea-coast are only a few feet above the sea. The elevation at which perpetual snow occurs is less as we proceed farther north. Near 60° N. lat. it is about 5600 feet, at 61° N. lat. 5400 feet, at 62° N. lat. 5100 feet, at 64° N. lat. 4650 feet, and at 71° N. lat. 2300 feet above the sea. The inclined plane in the most northern district of Sweden rises near the boundary of Norway to 2000 feet above the sea. The following table gives the mean temperatures of five places in Sweden, south of 60° N. lat., and of Edinburgh and London:—

	Lat. 57° 42' Lund, altitude 60 feet.	Lat. 56° 53' Wexiö, altitude 500 feet.	Lat. 57° 42' Göteborg, near the sea-level.	Lat. 53° 23' Carlstad, altitude 175 feet.	Lat. 59° 20' Stockholm, 125 feet.	Lat. 55° 58' Edinburgh, 60 feet.	Lat. 51° 31' London, altitude 120 feet.
Winter	29.54	28.23	31.51	27.11	25.82	38.27	38.22
Spring	41.78	41.53	43.74	40.40	38.20	44.95	48.34
Summer	62.07	63.45	62.13	61.16	60.45	57.32	61.74
Autumn	47.03	44.73	47.74	44.47	44.37	47.33	50.29
Annual Mean	45.10	44.56	46.34	43.28	42.18	46.97	50.05

On comparing the climate of Edinburgh and London with the climates of five towns in Sweden, it appears that the mean temperature of the summer is greater in three of the Swedish towns than at London, and in all five greater than at Edinburgh. It is remarkable that the mean temperature of the summer of Wexiö exceeds that of Edinburgh by more than 6 degrees, though Wexiö is 500 feet above the sea, and nearly a degree farther north than Edinburgh; but the difference of the mean temperature of winter is 10 degrees in favour of Edinburgh. The above table shows the result of several years' observations, and proves that the climate of Southern Sweden is not so cold as is commonly supposed. At times however the maximum cold in winter is extremely intense. On the 20th of January, 1814, the thermometer at Stockholm sunk to 26° 6' below zero, whilst at London and Edinburgh it never sinks to zero. On the 3rd of July, 1814, the thermometer at Stockholm rose to 96° 8' in the shade, a degree of heat never experienced in the British Islands; but such extremes of cold and heat never last more than a few days.

Of five places north of 60° N. lat. the mean temperatures, deduced from observations made during a series of years, are as follows:—

	Lat. 60° 39' Falun, altitude 400 feet.	Lat. 62° 38' Hernösand.	Lat. 63° 24' Östersund, altitude 1050 feet.	Lat. 63° 50' Umea.	Lat. 68° 30' Enontekis, altitude 1440 feet.
Winter . . .	22.04	17.35	15.17	13.41	1.49
Spring . . .	37.82	35.73	34.03	33.15	24.96
Summer . . .	58.33	56.06	56.11	57.48	64.61
Autumn . . .	41.51	38.41	37.91	37.67	27.07
Annual Mean .	39.92	36.36	35.80	35.42	27.04

The difference in the mean temperature of the summer in these five places lies within four degrees, though the most southern and the

most northern are nearly eight degrees of latitude distant from one another, and the most northern is more than 1000 feet more elevated above the sea-level. This fact is to be attributed to the long stay of the sun above the horizon in that season, which at Enontekis lasts more than three weeks. This circumstance enables the inhabitants of these northern countries to cultivate a few plants which require a sudden heat, as barley, which is sown and reaped within seven weeks. The winters however are extremely cold: north of 61° N. lat. quicksilver frequently freezes, a fact which indicates that the thermometer descends at least 40° below zero. Hot summer almost immediately follows cold winter, and the winter almost immediately follows summer, spring and autumn being extremely short. The annual quantity of rain is not known for the northern provinces, nor for the interior. In the low country bordering on the Baltic it amounts to between 21 and 22 inches; the snow is probably not included in this account.

At Enontekis only barley and turnips succeed, but only one crop out of three is worth the labour. Rye cannot be grown with advantage north of 66° N. lat., and so far also the cultivation of hemp extends. Oats do not ripen north of 64° N. lat., and up to this latitude wheat is cultivated in a few spots, but in general it cannot be grown north of 62° N. lat. Flax does not ripen to seed north of 63° N. lat. Tobacco rarely succeeds north of 61° N. lat. Potatoes are cultivated as far as 66° N. lat., but cabbages only to 64° N. lat. Hops grow as far as 62° N. lat. Cherry-trees are met with as far north as 63° N. lat., but other fruit-trees rarely beyond 60° N. lat. In the plain of Scania mulberry-trees, chestnut-trees, and walnut-trees are planted, and the fruit ripens. The pine, fir, and birch extend to the most northern parts of Sweden. Alders are found up to 63° N. lat., ash and willows to 62° N. lat., and elm, oak, and lime-trees to 61° N. lat. Beech grows in the forests up to 57° N. lat. Pine-trees cease to grow at an elevation of 3000 feet below the snow-line. Bears are not met with above 3000 feet, and at that height barley ceases to ripen. Firs are only found at 2600 feet under the snow-line, but full-grown birch within 1800 feet. In the lakes which occur at such an elevation only the *Salmo alpinus* is found. Some bushes and the dwarf-birch grow at 1200 feet below the snow-line, and so far the Arctic Bramble (*Rubus arcticus*) is found; but above them trees and bushes cease to grow, and the mountains are covered with brown plants and lichens.

Agriculture and Productions.—The climate and soil are less favourable to the growth of grain in Sweden than in most other parts of Europe. It is stated that in seven years one year occurs in which the crops entirely fail; that in three years the produce is indifferent, and in three rather plentiful. The principal objects of cultivation are wheat, rye, barley, oats, mixed grain, and peas. Since the introduction of the cultivation of the potatoe the produce is generally sufficient for home consumption. Other objects of cultivation are hemp, flax, tobacco, buckwheat, carawayseed, hops, and madder. Common kitchen vegetables are grown in the southern provinces of Sweden. Cherries, apples, and pears are abundant only in the southern districts; cranberries and other berries abound in the northern districts.

The forests are very large, covering about 48,000 square miles, or more than a fourth of the surface. But a great portion of the northern provinces (north of 64° N. lat.) is destitute of trees. The woods however contain a comparatively small number of timber-trees. In most parts only small trees occur, and at the distance of many feet from each other, the intervals being bare or covered with underwood. Accordingly the export of timber, though considerable, is not in proportion to the immense extent of the woods. But these forests supply charcoal and firewood, of which a great quantity is consumed, as Sweden has no coal. Tar and pitch are extracted from the roots of pine-trees, and are articles of export. Several kinds of coniferous trees and birch compose the greater part of these forests. There are small oak and beech forests in the southern districts. The immense tracts of country which are still uninhabitable, are generally used as pasture-ground; the domestic animals must be kept in stables from four to six or seven months, and their number is consequently limited by the extent of the meadows. Cattle and sheep are the most numerous, but the former are of small size, and the wool of the sheep is coarse. In the northern districts reindeer are kept by the Laplanders. Wild animals are very numerous, especially in the northern parts, but some of the larger size begin to be scarce, as bears and beavers. A few wild reindeer are still found in some places. Wolves, lynxes, gluttons, foxes, hares, squirrels, martens, and others are common. Lemmings sometimes come down in large numbers from the Kiölen Mountains, and lay waste the low country. Elk and deer are found in some of the forests. Among wild birds are eagles, capercaillies, and woodcocks. The seas of Sweden contain abundance of fish. It is stated that 88 different kinds of salt- and fresh-water fish are brought to the markets of Göteborg, among which turbot is common. There are also oysters and lobsters. The fishery in the Baltic gives subsistence to a great number of families. A smaller kind of herrings, called strömmings, is caught in the summer along the east coast. This fish is very numerous. Salmon is caught abundantly in almost all the rivers and lakes.

Sweden is rich in minerals. Gold is found on the table-land of Småland. Silver is worked at Sala, in Westera-Län, and at some

other places, and in Falu-Län; but the produce hardly pays the expenses. Copper is more abundant. The richest mines are those at Falun, in Falu-Län; next to them are those of Otvidaberg, in Linköping-Län. Other copper-mines are worked in Westerås, in Öresund near Mount Areskuta, and in Örebro, but their produce is small. Lead-mines also are worked in Westerås and in Falu. Iron-ore is found in nearly every district of Sweden, and there is no part where it is not worked more or less, with the exception of the plain of Scania, where it seems that no iron-ore exists. The richest iron-mines are worked in that part of Sweden which has been noticed under the name of the Region of the Mines. The mountains near Gellivare in Pitea-Län, are composed entirely of iron-ore, containing from 70 to 80 per cent. of metal; but they are far from the sea, in a country nearly uninhabited, and almost destitute of fuel. The best iron is obtained from the mines of Dannemora in Upsala-Län. Nearly the whole of the produce, amounting annually to more than 8000 tons, goes to England. But the largest quantities of iron are produced in Carlstad, Örebro, Gefle, Falu, and Westerås. In Örebro-Län are rich mines of cobalt; others are found in Calmar and Nyköping-Län, but their produce is not great. Other mineral products are alum and vitriol, which are found in small quantities; brown coal, which is worked near Cape Kullen in Scania; and marble.

Inhabitants.—The bulk of the population are Swedes, a nation of Teutonic origin. Besides the Swedes, there are Fins and Laplanders. The Fins are numerous on the banks of the Tornea Elf. The Laplanders were formerly in possession of all Låpland, but many Swedes and Fins have settled among them. They call themselves Sami, and their country Samilanda. Though their language proves that they are only a branch of the Finnish nations, they are distinguished from them by the form of their body and their mode of life. Their stature is short, varying in general between four and five feet. Their complexion is a dirty yellow; face generally broad, nose short; hair rather black; eyes brown, narrow, and lengthened; and mouth small. The greater number live on the produce of their herds of reindeer, which supply the Laplanders with food, dress, and articles of exchange. They live on the milk and flesh of the reindeer, convert their skins into dresses, and sell their smoked flesh, and especially their tongues, which are considered a great dainty. These animals are also used in drawing the sledges. The Laplanders live only in the country north of 64° N. lat.; in winter they come with their herds to the lower country near the Gulf of Bothnia, and in summer they migrate to the Kiölen Mountains.

At the end of 1750 the population of Sweden amounted to 1,785,727; in 1800 it reached 2,347,303; and at the end of 1850 it was 3,482,541, distributed as shown in the following table, which gives also the läns, or provinces, into which Sweden is divided:—

Läns.	Area in Square Miles.	Population, December 31, 1850.
Malmö	1,774	253,084
Christianstads	2,421	189,627
Halmstads	1,892	105,726
Carlskrona	1,180	107,827
Wexiö	3,771	136,623
Jönköpings	4,274	168,426
Calmar	4,240	202,178
Linköpings	4,236	222,484
Mariestads	3,301	199,897
Wenersborgs	5,015	216,136
Göteborgs	1,883	187,583
Wisby	1,222	44,572
Stockholms	2,899	114,848
Upsala	2,059	83,323
Westerås	2,650	96,601
Nyköpings	2,497	120,113
Örebro	3,250	137,660
Carlstads	6,916	221,885
Falu	12,209	151,497
Gefleborgs	7,529	120,158
Härnösands	9,461	99,558
Österrunds	19,058	82,271
Umeå	29,268	70,788
Piteå	32,893	85,751
Total	165,883	3,389,471

This area, increased by 3548 square miles of water not included in the läns, and the population column by 98,070, the number of the inhabitants of Stockholm, the capital of the kingdom, gives the total area 169,381 square miles, and the total population 3,482,541 as before stated.

Divisions and Towns.—Sweden is divided into three great sections, of which the most southern is called Götaland, or Göta-Rike, the central section more properly Sweden, or Swes-Rike, and the northern Norrland. The towns of Sweden are very small. There are only four or five towns whose population exceeds 10,000, and about a dozen are inhabited by more than 4000. Most of the smaller towns are inhabited by farmers, a few tradesmen, and mechanics.

1. *Götaland*, or *Göta-Rike*, comprehends nearly the whole country

south of 59° N. lat., and also that portion of the Region of the Mines whose drainage runs southward into Lake Wener. It was formerly divided into ten provinces, and now contains 13 läns. The island of Gothland constitutes part of it.

1. *Stane*, sometimes called *Scania*, or *Schonen*, extends over the Plain of Scania, and the high ground which lies north of it, comprehending also a small portion of the table-land of Småland. It is divided into two läns, Malmö-Län and Christianstads-Län.

a. Malmö-Län extends over the south-western and best cultivated portion: it contains three towns with more than 4000 inhabitants, Malmö with above 9000; LUND with about 5000; and *Ystad*, which is on the south coast, has a good harbour (with however a narrow entrance), and about 4500 inhabitants, who carry on a brisk trade. Steamboats plying to Stockholm, Lübeck, Kalmar, Stettin, Stralsund, and Copenhagen, put in at Ystad. LANDSKRONA, on the Sound, is a fortress, and has a good harbour. *Helsingborg* is situated at the narrowest part of the Sound, opposite Helsingör in Denmark, and has a harbour, and about 3000 inhabitants, who manufacture hats, ribands, and cast-iron pots. Steamers ply daily on the Sound between Helsingborg and the Danish coast. The small island of *Huseen*, in the Sound, on which are still some ruins of the observatory of Tycho Brahe, belongs to this läns. A statue of the great astronomer has been recently erected on the island by the Danes.

b. Christianstads-Län contains the eastern and northern and less fertile part of the plain of Scania, and a small portion of the table-land of Småland. The capital is CHRISTIANSTAD.

2. *Blekinge* contains the whole maritime region of Blekinge, with a narrow strip of the table-land of Småland. It forms—

c. Carlskrona-Län, which has for its capital CARLSKRONA, with above 12,000 inhabitants. The most commercial town is *Carlskrona*, with 4200 inhabitants, and a good harbour, from which steamers ply to Stockholm. Sail-cloth, starch, and tobacco are manufactured, and ships are built.

3. *Småland* comprehends nearly the whole of the table-land and maritime region of Småland. It is divided into three läns, Calmar, Wexiö, and Jönköping.

d. Calmar-Län comprehends all the maritime region and a small portion of the table-land. CALMAR, the chief town, is the subject of a separate article. *Westervik*, farther north, has a good harbour, and above 3000 inhabitants: it exports timber and the produce of the cobalt-works in its vicinity. Vessels also are built. The island of *Oland* is included in this läns, and has a population of about 35,000, who are engaged chiefly in agriculture and in fishing. The largest town is *Borgholm*, on the west side of the island: population 500. The island is famous for its breed of small ponies; it abounds in forests, in which are many deer, wild boars, and feathered game. It is composed of a mass of limestone covered with fertile soil. It is traversed by good roads, and contains some curious specimens of antique church architecture.

e. Wexiö-Län extends over the southern and lower portion of the table-land of Småland. It is a poor country, but it has some mines of iron. The capital, *Wexiö*, has 2000 inhabitants. Paper and hats are made.

f. Jönköping-Län extends over the northern and more elevated portion of the table-land: the soil is not much better than that of Wexiö-Län, but the iron-mines are more considerable, especially those at the *Taberg*. The capital, *Jönköping*, is built at the southern extremity of the Wetter Lake, and has above 4300 inhabitants, and a considerable commerce with the countries that surround the lake. There are an arsenal and a manufacture of arms. The gold-mine of Adelfors is within this läns.

4. *Halland* comprehends the maritime region of that name, and the western declivity of the table-land of Småland. It forms one läns.

g. Halmstads-Län has good forests and salmon-fisheries in the rivers. The capital, *Halmstad*, built at the mouth of the *Nissa* in the Kattegat, has 2000 inhabitants, who export timber, pitch, tar, and the produce of the mines of Jönköping-Län.

5. *Western Götaland* comprehends the north-western portion of the table-land of Småland, and its declivity in that direction to the banks of the Göta-Elf, and also the plain south of Lake Wener. The whole of Mariestad-Län, the largest part of Wenersborg-Län, and a small part of Göteborg-Län, are in this province.

A. Mariestad-Län comprehends the greater part of the plain south of Lake Wener, and is fertile, well cultivated, and populous. It has some iron-mines and alum-works at Mount Kinne-Kulle, and glass-works. The capital, *Mariestad*, is on the shore of Lake Wener, not far from the pine-clad Kinne-Kulle, and has 1573 inhabitants.

i. Wenersborg-Län extends over the western and smaller part of the plain south of Lake Wener, the north-western part of the table-land of Småland, and the eastern part of the valley of the Göta-Elf. It contains the province of Dalaland. The chief town, *Wenersborg*, is built near the efflux of the Göta-Elf from Lake Wener. The population is 2500, who carry on a good trade in deals, iron, and other products. Steamers that ply between Göteborg and Stockholm by the Göta Canal put in at Wenersborg.

6. *Bokusland* extends over the western and more sterile portion of the rocky region. It forms the greatest part of Göteborgs-Län.

k. Göteborg-Län comprehends Bohusland and a small portion of Western Götaland. The chief town is Göteborg, which is described under GOTHEMBOURG and is the most rising town in Sweden. *Marstrand*, built on a rocky island, about 20 miles N.W. from Göteborg, has a good harbour, and is much frequented for sea-bathing. *Vävealla*, built at the head of the Haftens-Fiord, has a good harbour, and 3500 inhabitants, who export timber and manufacture cables and sugar. *Strömstad*, near the boundary of Norway, has a harbour, and 1500 inhabitants, who are mostly occupied in fishing for lobsters and oysters, which abound along this coast.

7. *Dalaland* is the smallest province of Sweden, and forms the northern part of Wenersborg-Län. It comprehends the eastern and more fertile districts of the rocky region. In this province is the small town of *Amal*, on the south shore of Lake Wener, with 1500 inhabitants.

8. *Vernland* comprehends that part of the Region of the Mines whose drainage runs into Lake Wener, and extends northward to 61° N. lat. It is richer in iron-mines than any other province of Sweden. From Göteborg this iron is exported to all parts of the world. *Vernland* forms *Carlstads-Län*.

l. *Carlstads-Län* has for its capital a town of the same name, built on the small island of *Tingvalla*, at the mouth of the *Klar* in Lake Wener: it is the centre of a considerable commerce with all the mining districts of *Vernland*: the population exceeds 3000. *Christinehamn* is situated at the north-eastern angle of the Wener Lake, and exports iron and timber to Wenersborg and Göteborg: the population is about 1300.

9. *Eastern Götaland* lies between Lake Wetter and the Baltic, and contains the whole of the plain of *Linköping*, together with the higher grounds south and north of it. It forms

m. *Linköpings-Län*. The chief town, *Linköping*, is situated on the *Stanga*, in the centre of the province, about 2 miles S. from Lake *Roxen*: it is a pretty, well-built place, with a fine cathedral and a gymnasium, which has a library of 25,000 volumes, and fine collections of coins and natural history. It has some manufactures of stockings and tobacco: the population is about 3700. *Söderköping* is situated on the *Göta Canal*, about 2 miles from the place where it joins the Bay of *Släte-Baken*: it is a small place, with about 1000 inhabitants. The largest place is *NORRKÖPING*.

10. The island *Gothland* [GOTHLAND] forms

n. *Wisby-Län*.

II. *Sweden*, properly so-called, or *Swea-Rike*, comprehends the central provinces of the kingdom, which lie chiefly between 59° and 61° N. lat. It extends over the country surrounding the lakes *Mälär* and *Hielmar*, and over the basin of the *Dal*. It was formerly divided into five provinces, and contains six läns.

11. *Nerike*, the most south-western part of *Swea-Rike*, is composed of a portion of the region of mines, and of another belonging to the central agricultural region. It has mines of iron, copper, cobalt, alum, brimstone, and vitriol. It forms

o. *Orebro-Län*. The chief town, *Orebro*, is built near the western extremity of Lake *Hielmar*, and is one of the most commercial places in the interior of Sweden: the mining districts north of the town bring their produce to this town, and take in return corn, and manufactured articles and foreign goods, which are brought to *Orebro* by Lake *Mälär* and the *Arboga Canal*. The population exceeds 4000. *Woolen-stuffs*, *wax-cloth*, and *arms* are manufactured.

12. *Södermanland*, or *Sudermania*, comprehends the country between the *Kolmören* ridge on the south, and the lakes *Hielmar* and *Mälär* on the north; and contains the best part of the central agricultural region. It has some mines of iron, and marble of good quality is worked in the *Kolmören* range. The western part of this province forms *Nyköpings-Län*, and the eastern, which is much smaller, constitutes a part of *Stockholms-Län*.

p. *Nyköpings-Län* has for its chief town *Nyköping*, which is built at the innermost recess of a short inlet of the Baltic, forming a harbour, which admits small vessels. It has some manufactures of woollens, linen, silk, tobacco, stockings, pins, paper, and brass ware. Cannons are also cast. It exports iron, timber, and brass: the population is 3000. *Eskilstuna*, situated between lakes *Hielmar* and *Mälär*, is the most important manufacturing place in Sweden for iron. *Arms* and *cutlery* are made to some extent. There is also a copper-work. It is a thriving place, and contains above 2500 inhabitants.

13. *Upland* extends from the northern shores of Lake *Mälär* to the banks of the *Dal*, along the Baltic, and about 60 miles inland. It comprehends the largest portion of the central agricultural region, and has also considerable iron-mines, among which are those of the mines of *Danemora*. *Upland* is divided into two nearly equal parts, of which the western forms *Upsala-Län*, and the eastern belongs to *Stockholms-Län*.

q. *Stockholms-Län* comprehends the eastern half of *Upland*, and also the eastern districts of *Södermanland*. It is named from *Stockholm*, the capital of the kingdom. *Södertelje*, a small town with 1100 inhabitants, lies W.S.W. of *Stockholm*, on the *Södertelje Canal*: it has some commerce in provisions, and is famous for its biscuits. *Oregrund*, near the northern extremity of the län, has a good

harbour, in which the produce of the iron-mines of *Danemora* is shipped to England; the population is about 700.

r. *Upsala-Län* has for its chief town *UPSALA*.

14. *Vestmanland*, west of *Upland* and east of *Nerike*, contains a small part of the central agricultural region, and a larger part of the region of mines. At *Sala* there are the richest silver-mines in Sweden. There are also copper- and lead-mines, but the iron-mines are the most important. This province forms *Westerås-Län*.

s. *Westerås-Län* has obtained that name from its capital, *Westerås*, which is built on an arm of Lake *Mälär*, and carries on a considerable commerce in iron. It has a red brick gothic cathedral which dates from the 11th century, an old castle, 3500 inhabitants, and manufactories of tobacco and some dye-houses. *Sala*, N. of *Westerås*, has 3000 inhabitants; in its vicinity are the silver-mines. *Arboga*, on the river *Arboga*, which begins to be navigable for river-boats at that place, has some commerce in iron and grain, and 3000 inhabitants.

15. *Dalarna*, or *Dalecarlia*, lies entirely within the Region of the Mines, with the exception of the northern part, which belongs to the southern mountain region. [DALECARLIA.] It constitutes *Falu-Län*.

t. *Falu-Län* contains *FALUN* and *Hedemora*, a small town situated in a fertile district, with above 1000 inhabitants.

III. *Norrland* extends over the three mountain regions, with the exception of a part of the southern, which is included in *Dalecarlia*, and forms part of *Swea-Rike*. It is composed of eight provinces, which form five läns.

16. *Gestrikland* is situated within the region of the mines, of which it constitutes the most north-eastern portion.

17. *Helsingland*, N. of *Gestrikland*, is within the southern mountain region.

u. *Gefle-Län* is composed of *Gestrikland* and *Helsingland*, and has rich iron-mines which yield an annual produce of more than 9000 tons. A great deal of linen is manufactured. *Gefle*, the capital, is built on a small inlet of the Gulf of *Bothnia*, which forms a good harbour. It is one of the best-built towns of Sweden, and has 8200 inhabitants. The commerce is considerable. The exports consist of iron, timber, tar, flax, and linens; and the imports principally of corn and salt. Many vessels are built. *Söderhamn*, at the extremity of a narrow inlet of the Gulf of *Bothnia*, has 1629 inhabitants, and exports butter, flax, and linens.

18. *Medelpad*, and

19. *Angermanland*, form

v. *Hernösand-Län*, of which a description is given under *ANGERMANNLAND*.

20. *Herjedalen* consists only of the elevated and narrow valley of the upper course of the *Ljuanan Elf*, and extends to the declivity of *Mount Sylfiellen*. It forms part of *Oresunds-Län*.

21. *Jemtland* contains the table-land of *Jemtland*, the upper valley of the *Ljungan-Elf*, and a large mountain tract which contains the upper valleys of the *Indals* and the *Angerman*. There is a copper-mine at the base of the *Areskuta*.

w. *Ostersunds-Län*, consisting of the provinces of *Herjedalen* and *Jemtland*, has for its capital the town of *Ostersund*, a small place with 418 inhabitants, situated on the eastern shore of Lake *Störaion*.

22. *Westerbotten*, and

23. The *Lapmarks*, namely, *Asele*, *Umea*, *Pitea*, *Lulea*, and *Tornea* *Lapmark*, constitute the two läns of

x. *Umea* and

y. *Pitea*, which are noticed under *BOTENIA* and *LAPLAND*.

Manufactures.—The industrial products of Sweden comprise vast quantities of linen, which is manufactured in almost every house, woollen-cloth and other stuffs, refined sugar, tobacco, paper, leather, glass, some calicoes and other cotton goods, cotton twist, silks, china-ware, cast-iron, sail-cloth, soap, spirits, beer, &c. Ship-building is carried on to some extent in most of the harbours of the Baltic.

Internal Commerce.—The internal commerce in corn, salt, and manufactured goods, especially the linens of *Wenersborg-Län*, which are carried to the most remote parts of the country, is very considerable. This commerce is facilitated by the excellent roads, and in winter by the whole country being covered with snow for four or five months, which renders the conveyance of goods in sledges easy and expeditious. In summer a like advantage is derived from the navigation of the sea, which washes most of the provinces. The *Trolhättan Canal* is navigated by a great number of barges, which bring down to Göteborg, for export, large quantities of iron and steel, and timber in planks and boards; and they carry into the interior corn, whiskey, salt, herrings, sugar, butter, fish, wine, and some other articles. Large barges ply also on the other canals, conveying heavy goods of different descriptions, such as bar-iron, alum, corn, salt, herrings and strömings, whiskey, bricks, and tiles.

Navigation and Foreign Commerce.—The Swedes are much given to a sea-faring life. Their vessels visit most of the countries contiguous to the Atlantic, and they are also employed in the carrying-trade between other countries, especially in the Mediterranean and on the coasts of South America. The mercantile navy in 1852 numbered 1407 vessels (carrying together 86,757 lasts), exclusive of those carrying less than 10 lasts; and 61 steamers. The total number of foreign (including Norwegian) ships that entered Swedish ports in

1853 amounted to 7804, carrying 348,693 lasts; the departures numbered 6749 vessels, measuring 342,648 lasts. The imports were valued at 29,049,000 crowns; the exports at 27,658,000 crowns. The foreign trade extends to most countries in Europe and America. The chief imports are brought from the following countries, which are named in order of the values:—the Hanse Towns, Great Britain, Brazil, Norway, Russia, Denmark, United States, East Indies and Australia, Prussia, and the West Indies. The best customers for Swedish exports are Great Britain, Denmark, the Hanse Towns, France, Prussia, United States, Russia, and Portugal.

The Swedish navy in 1854 numbered 10 ships of the line, 8 frigates, 8 brigs, 6 schooners, 8 vessels armed with mortars, 22 transports, 256 gun-boats, and 12 steamers.

In the same year the army numbered an aggregate of 144,013 men, exclusive of officers, composed of the *Vasfrvade*, amounting to 7692 men, enrolled by voluntary enlistment for six years; the Gothland militia, 7621, who serve only in the island; the *Indelta* (a sort of militia, who receive, partly from the crown and partly from the landed proprietors, an annual payment in money or in kind, besides a house and some land), 33,405; and 95,295 men raised by conscription, every Swede between 20 and 25 years of age being bound to serve.

The principal articles of export from Sweden are iron and timber. Norway takes a considerable quantity of iron, and sends fish in return. Stockholm receives from Finland three fourths of the fire-wood which it consumes, the northern provinces not being able to supply the article either so cheap or so good. Finland also exports to Stockholm meat, butter, cheese, bacon, flour, hides, pitch, and tar. Other articles of export are copper, cobalt, alum, tar, pitch, hemp, oil, paper, tree-bark, tobacco and snuff, bricks, furs, some linens, vessels, and some minor articles. The chief articles of import are sugar, coffee, salt, fish, hides, cotton-twist, cotton in wool, woollen stuffs, linens, cottons, wine and brandy, wool, dye-stuffs, raisins, almonds, pepper, cinnamon, arrack and rum, butter, bacon, tobacco, soap, train-oil, ginger, lacquered ware, tea, tallow, potashes, and oil.

Education.—Sweden has two universities, Upsala and Lund. The average annual attendance at the former is about 1000 students; at the latter, between 400 and 500. There are besides, 12 gymnasia for higher instruction, preparatory to the universities; 41 lardoms skola, or grammar schools; and 40 apologist schools, where the common branches are taught, with, in some instances, French and German. For elementary education, the law of 1842 commanded the erection of a school in each commune or parish. Owing to the sparseness of the population this was found to be in many instances impracticable; in such cases however the communes are divided into districts, each of which is visited in turn by ambulatory schoolmasters. Schoolmasters are trained by government and paid by the communes in kind. In 1850 there were 2107 stationary and 1351 ambulatory schoolmasters. Of the masters, 218 were clergymen and 690 church clerks. In that year, 143,526 children were receiving instruction in the stationary schools, 126,178 in ambulatory schools, 128,996 were instructed at home, 6228 in the secondary schools above named, and 17,465 in private schools, making a total of 422,388 altogether under instruction. It is a general practice in Sweden for parents, especially those who live in the country, to instruct their children in the long winter evenings.

History.—The early history of Sweden is known chiefly from the Sagas, or chronicles, which present little more than a confused mass of fables and heroic legends. According to these, the first dynasty of kings was that of the Ynglings (so called from the third of their number, Freyer-Yngve, a grandson of Odin), who reigned from the arrival of Odin in the north, an event variously fixed at from B.C. 50 to A.D. 250, till about A.D. 630, when the last of these princes, Olaf Trastelia, was expelled by Ivar Vidfadme, a Danish king of the race of the Skjoldungs, another branch of the progeny of Odin. The thrones of Sweden and Denmark continued for some time united under the descendants of Ivar, till at the death (794) of the famous pirate-king Ragnar Lodbrok, who fell in an expedition against the English coasts, Sweden again became a separate kingdom under his second son, Biorn Ironside. Under Biorn II., grandson of Biorn Ironside, Christianity was first introduced in Scandinavia; but the mass of the people still adhered to paganism, and Erik, who reigned 993-1001, perished in a popular revolt provoked by his demolition of the heathen temples. His son Olaf however (1001-26) formally established the Christian faith. The male descendants of Biorn Ironside failing upon the death of King Edmund Slemme, who fell in battle against the Goths of Gothland, a fresh dynasty was founded (1056) by Stenkil, under whom the Swedes and Goths were for the first time united. On the death of Inge II., the Swedes conferred the royal dignity on a private individual named Sverker (1129-50); while to obviate the discontent of the Goths, who supported the claims of Erik, a descendant by females of the house of Stenkil, it was agreed that Erik should succeed Sverker, and that the representatives of the two families should in future reign alternately. The reign of St. Erik (1155-61) was signalled by the final conquest and conversion of the Fins, and by the compilation of an excellent code of laws; but after his death the strange arrangements above mentioned gave rise, as might have been foreseen, to endless dissensions and civil wars. The alternate succession was however adhered to through the reign of

Charles. With Erik Erikson (1222-50), surnamed *Læsepe*, or the *Stammerer*, expired the male line of St. Erik, as that of Sverker had done with John.

Waldemar, a minor of the Folkungar family, and a nephew of Erik Læsepe by the sister's side, was raised to the vacant throne by election of the states. Waldemar was dethroned (1276) by his brother Magnus Ladulæse, a wise and politic monarch; but the reign of his son Birger (1290-1319) was again a scene of fraternal discord, ending in his deposition in favour of his infant nephew Magnus Smek (1319-63), who also succeeded in right of his mother to the crown of Norway. The long reign of this weak and perfidious prince was a series of domestic treasuries and disastrous and civil wars. He was deposed by the Diet in 1343, and his son Erik XII. substituted; and, though restored on the death of Erik in 1359, he was soon finally displaced by his sister's son, Albert of Mecklenburg (1363-89). But the rule of Albert was as unpopular as that of his predecessor; and he was overthrown and made prisoner (1389) by Margaret, queen of Norway and Denmark.

This remarkable princess formed the three realms of Sweden, Denmark, and Norway, into a confederate monarchy by the Union of Calmar (1397), the three crowns being declared indissolubly united, though the internal administration of each kingdom continued independent and separate. Margaret was succeeded by her grand-nephew Erik of Pomerania (1413-39), but his tyranny irritated the Swedes, who expelled the Danes in 1433. For nearly a century the Danish kings struggled to effect the subjugation of Sweden. Finally, Christian II., aided by the powerful family of Trolle, defeated and slew Sten Sture II. at Bogesund, and massacred at Stockholm (1520) 94 prelates, senators, and nobles of the opposite party. The Swedes now flew to arms under Gustavus Erikson Vasa, the son of one of the victims; and the expulsion of the Danes (Christian being opportunely dethroned at the same time in Denmark) was followed by the unanimous proclamation of Gustavus as King of the Swedes and Goths. Thus ended the Union of Calmar.

The Lutheran doctrines were introduced in 1522 by Olaus Petri, and in 1528 the Confession of Augsburg was solemnly adopted as the standard of faith by the king and people at the diet of Westerås. Under Gustavus the country attained a degree of affluence and prosperity hitherto unknown, and was raised from the condition of a semi-barbarous and dependent territory to the rank of a considerable state. But Erik XIV. (1560-8), son and successor of the great Gustavus, was a gloomy and cruel tyrant. He became insane from remorse for the slaughter of the Sture family (1567), and was deposed in favour of his brother John III. (1568-92), who confined Erik in a dungeon, and at length (1577) put him to death. The rule of John was at first prosperous; but the attempts which he made to restore Catholicism gave rise to religious disputes which occupied a great part of his reign. John was succeeded by his son Sigismund (1592-1604), who had in 1587 been elected king of Poland in right of his mother: but his open profession of Catholicism speedily alienated the Swedes, a civil war commenced, which continued till 1604, the king being supported by Polish troops. At length the diet of Norrköping formally prohibited the obnoxious faith, and raised the duke of Sudermania to the throne as Charles IX. (1604-11) in the place of his nephew. From this revolution arose the Swedo-Polish war of succession, which continued almost without intermission for sixty years (1600-60). Charles IX. was succeeded by his son, the famous Gustavus Adolphus (1611-32). The first acts of his reign were directed to the improvements of his kingdom, in which he was aided by his illustrious minister Oxenstiern. By the peace of Stolbova (1617), concluded under the mediation of England, Russia ceded all her remaining territory on the Baltic; and the king, heading his army against the Poles, took Riga (1621), and subdued Livonia and Polish Prussia, which were ceded to Sweden (1629) by the truce of Altmark. His arms were now turned towards Germany, where the success of Austria in the Thirty Years' War seemed to threaten Protestantism with annihilation; and being chosen captain-general of the Protestant league, he landed in Pomerania June 1630: his campaigns and victories occupied him till his fall in the moment of triumph at the battle of Lützen (November 6, 1632).

Christina (1632-54), the daughter of Gustavus Adolphus, succeeded at the age of six years, under the guardianship of Oxenstiern, who administered the kingdom with consummate ability. A war with Denmark (1643-45) terminated to the advantage of Sweden by the peace of Bromsebro; and at the general peace of Westphalia (1648), Sweden received Pomerania, Rugen, Bremen, &c., with the annexed rights as a state of the empire: acquisitions which elevated her to the rank of a first-rate power. In 1654 Christina abdicated the crown in favour of her cousin, the Count Palatine of Deux-Ponts, retired to France, and afterwards to Rome, where she died a Roman Catholic in 1689. The new king, Charles Gustavus (1654-60), renewed the war with Poland, overran the country, and attacked Denmark, which had sided with Poland, obtaining by the peace of Roskilde, in 1658, the cession of Scania and the other Danish provinces beyond the Sound. In a subsequent attack on Denmark the Swedes were repulsed from Copenhagen by the assistance of the Prussians and the Dutch, and the disappointed ambition of the king is said to have hastened his death. During the minority of his son Charles XI. (1660-97), the long contest with Poland was concluded (1660) by the peace of Oliva; Livonia,

Eathonia, and Oesel were confirmed to Sweden, and the claim of the Polish kings to the Swedish crown was given up. In the war with Prussia and Denmark (1675-79), the Swedes were worsted, but at the peace of Fontainebleau (1679) they regained all that they had lost. This reign was also the epoch of the first struggle between the crown, supported by the burghers and peasants, and the power of the senate and nobles. In 1693 the king was formally declared absolute by an act of the diet. He died in 1697, leaving his dominions to his son, the famous Charles XII. (1697-1718), then only fifteen, in the highest state of prosperity and organisation; but the inexperience of the young king tempted the attacks of his neighbours, and a coalition was formed against him (1699) by Poland, Denmark, and Russia. Charles assumed the offensive, and leading his forces first against Denmark, in six weeks reduced the king to sue for peace: he next utterly routed the czar before Narva; then invading Poland he expelled the king, Frederick Augustus, elector of Saxony, and dictated the election of Stanislaus Lecziński (1704) in his room. But his invasion of Russia (1708-9) was fatal to his schemes of ambition, and in the course of a year or two all his conquests, in spite of the efforts of his generals, were lost as rapidly as they had been gained. In 1715, while he was endeavouring to re-establish his power both by arms and by the diplomacy of his minister Görz, he fell at the siege of Fredericshall in Norway, leaving his kingdom on the verge of ruin. His sister Ulrica-Eleonora (1718-20), after she had been compelled to renounce her hereditary right, resigned the crown in favour of her husband Frederick of Hesse-Cassel (1720-51). The treaty of Nystad with Russia (1721) at length gave peace to the exhausted kingdom; but Ingria, Livonia, Eathonia, Carelia, Oesel, &c., were ceded to the czar. For the next twenty years the court of Stockholm was a scene of foreign intrigue and corruption, in which the Hats, or French party, and the Caps, or Russian faction, alternately predominated. Agriculture and commerce nevertheless flourished. Linnæus and his disciples gave a new impulse to science, and legislation was improved by the publication of a new code (1734). The ascendancy of the Hats led to a war (1741) with Russia, in which the Swedes were everywhere defeated, and at the peace of Abo (1743), through British mediation, part of Finland was ceded to Russia.

The reign of Adolphus Frederick (1751-71) was peaceful in its foreign relations, with the exception of the share taken against Prussia, through the influence of the Hats, in the Seven Years' War. His son Gustavus III. (1771-92), in 1772, supported by the army and the body of the people, forcibly repealed the constitution of 1720, re-establishing the relative powers of the various branches of government nearly as before 1680: while the party names of Hats and Caps were for ever prohibited, the use of torture abolished, and the press declared free. In 1780 Sweden joined the Armed Neutrality of the northern powers against England, headed by the czarina; and in 1783 a commercial treaty was concluded with the United States of America. An alliance with the Porte (1787) led to a war the next year with Russia, and with Denmark as her ally: but the mutinous conduct of the Swedish officers, who refused to invade Russia without orders from the States, produced the Act of Safety (1789), which gave the king absolute power of war and peace, at the same time abolishing the senate, the last stronghold of aristocratic power. The peace of Werela (1790) was concluded on the basis of mutual restoration. In 1792 Gustavus was assassinated, and his successor, Gustavus IV. (1792-1809), formed an alliance in 1805 with Russia and England against Napoleon I.; but the French occupied Pomerania and Stralsund (1807); and Russia, after the conference of Tilsit, turned her arms against her late ally, and seized upon Finland, the impregnable fortress of Sveaborg being, it is said, betrayed by the governor. An auxiliary force of 11,000 English, under Sir John Moore, was dismissed without effecting anything: the Danes also declared war; and Tornea and the Aland Isles were taken by the Russians (1809). These multiplied misfortunes were ascribed to the incapacity of the king, who was considered to have shown symptoms of mental derangement; and he was deposed (March 1809) by a conspiracy of military officers, his uncle Charles XIII. (1809-18) being called to the throne to the exclusion of the son of Gustavus, who was declared incapable of ever inheriting. The peace of Fredericksham with Russia (1809) was dearly purchased by the cession of Finland, East Bothnia, and Aland (or nearly one fourth of the territory, with one-third of the population, of the kingdom): but France restored Pomerania (1810) on the adoption of the continental system prescribed by Napoleon I. In 1810, on the election of a Crown Prince, in consequence of the age of the king and the want of an heir, the choice of the states fell on Bernadotte, prince of Pontecorvo, the ablest of the marshals of Napoleon I. Bernadotte assumed the reins of government; but though compelled by France to declare war against England, he too clearly perceived the true interests of Sweden to enter on active hostilities; and, on the reverses of Napoleon I. in Russia, peace and alliance was concluded with England at Orebro, and with Russia at Abo. During the War of Liberation (1813) in Germany the Swedish troops were led by the crown-prince, and their services were rewarded (1814) by the acquisition of Norway, which Denmark was compelled to cede by the peace of Kiel, Sweden at the same time resigning to Prussia Pomerania and her remaining German possessions. The two crowns were declared indissolubly united, though each kingdom retained its separate constitution. On

the death of the king in 1818 the crown-prince mounted the throne as Charles XIV., and was crowned at Stockholm and Trondhjem; and his rule was marked by the uniform and increasing prosperity of the Scandinavian kingdoms. Notwithstanding the loss of Finland, the commerce of Sweden is now more than double what it was in 1800, and the opening of the Gotha Canal in 1832 greatly added to the facilities for internal water-communication. The present sovereign, Oscar I., succeeded his father in March 1844.

By the Swedish constitution of 1809 the crown is declared hereditary in the male line, and the king is required to profess the Lutheran religion, which is the established creed of the realm. The state-council consists of nine members, of whom six are appointed by the king, but three of these must be civil functionaries: the chancellor and the ministers of justice and foreign affairs are ex-officio members; and the four secretaries of state may be summoned to give advice on matters relating to their own departments. The king has a negative voice on the resolutions of the diet, and the right to introduce measures for their consideration: but he can neither control the freedom of their deliberations, nor (without their sanction) impose new taxes, contract loans, or alienate any part of the territory. The diet, or parliament of the kingdom, in which resides the supreme legislative power, consists, as of old, of the four orders of nobles, clergy, burghers, and peasants (landholders who are not noble). In the house of nobles, the head of each of the 2800 noble families has a seat by right, but seldom more than 400 to 500 attend. The ecclesiastical order (of which the archbishop of Upsala is always president) consists, besides the twelve bishops, of about sixty deputies from the various dioceses. The presidents of the burgher and peasant houses are named by the king, and a small property qualification is required for a deputy: the proper number of burgher representatives is 97; the peasant deputies should be 144, returned by different districts; but the full number rarely if ever make their appearance. The four orders sit and deliberate sometimes separately, and at other times altogether; and in ordinary cases the question is carried or lost by a simple majority. The diet meets at Stockholm every fifth year, and the session should close at the end of three months, unless prevented by press of business.

SWINDON, Wiltshire, a market-town, and, conjointly with High-worth, the seat of a Poor-Law Union, in the parish of Swindon, is situated on an eminence, in 51° 33' N. lat., 1° 45' W. long., distant 19 miles N.E. by N. from Devizes, 80 miles W. from London by road, and 77 miles by the Great Western railway. The population of the parish of Swindon in 1861 was 4876. The living is a rectory in the archdeaconry of Bristol and diocese of Gloucester and Bristol.

Swindon has been considerably increased since the establishment of the railway station here. The streets are lighted with gas. A new town has sprung up in connection with the locomotive engine-factory of the Great Western railway company. A new church, a parsonage, and several chapels have been erected. There are a handsome new gothic parish church; chapels for Wesleyan Methodists and Independents; National schools, partly endowed; and a savings bank. There is a new market-house of stone in the Doric style. The market is on Monday for corn and provisions, and for cattle every alternate Monday: there are five yearly fairs.

SWINFORD, county of Mayo, Ireland, a market-town and the seat of a Poor-Law Union, is seated on a feeder of the river Moy, in 53° 57' N. lat., 8° 54' W. long., distant by road 16 miles N.E. by E. from Castlebar, 181 miles W.N.W. from Dublin. The population in 1861 was 997. Swinford Poor-Law Union comprises 22 electoral divisions, with an area of 152,594 acres, and a population in 1861 of 46,922. The town contains a church, a Roman Catholic chapel, a court-house, market-house, dispensary, the Union workhouse, a constabulary barrack, and bridewell. Quarter and petty sessions are held. There are three annual fairs.

SWINESHEAD, or SWINSTEAD. [LINCOLNSHIRE.]

SWINFORD. [STAFFORDSHIRE.]

SWITZERLAND (Schweits, Suisse, Svizzera), a mountainous country in Europe, situated between 45° 48' and 47° 49' N. lat., 5° 55' and 10° 30' E. long., is bounded W. by France, between Basel on the Rhine and Geneva on the Rhône, the boundary being formed by one of the ridges of the Jura Mountains, and by the river Doubs, an affluent of the Rhône; S. by Savoy, Piedmont, and Austrian Italy, the boundary-line being formed generally by the Lake of Geneva, high ranges of the Alps, and a part of the crest of the main chain of that great mountain system; E. by the Tyrol and Bavaria, from which it is separated by lofty mountain ranges, and by the Rhine from Sargans to the Lake Constanz; and N. by the Lake of Constanz and the Rhine, which divide Switzerland from Würtemberg and Baden. The territory of the canton of Schaffhausen, and the territory of Eglisau, belonging to the canton of Zürich, however, lie on the Baden side of the Rhine. The town of Constanz and a small tract round it, on the south side of the Lake of Constanz, belong to Baden.

Switzerland extends a little more than 180 miles near 46° 30' N. lat., where its length from west to east is greatest, and about 180 miles at 9° E. long., where it is widest. The boundary however is most irregular: from the head of the Val Formazza in Piedmont to the Rhine below Eglisau the width is only 76 miles; and between the Val

Formazza and the Rhine near Sargans, on the Tyrolean border, the distance only just exceeds 60 miles. The area of Switzerland is 15,179 square miles; the population, according to the census of 1850, amounted to 2,392,740, of whom 971,809 were Catholics, 1,416,786 Protestants chiefly of the Calvinist faith, 3146 Jews, and 2198 were houseless or vagrants. The number of foreigners, including refugees, amounted to 71,570.

The surface of Switzerland presents a greater variety than most countries of Europe. Monte Rosa, on the southern boundary, attains an elevation of 15,226 feet above the sea-level; while the surface of the Rhine at Basel is only 800 feet, and that of the Lago Maggiore, on the southern boundary, only 678 feet above the sea. The greater part of the country is mountainous. The ranges of the Alps and their numerous offsets extend over the southern and south-eastern districts, and occupy about one-half of Switzerland. Along its western boundary run the ridges of the Jura Mountains. The country between these two mountain systems has towards the south the form of a plain, interspersed with isolated hills; and towards the north it is traversed by ridges or groups of hills of moderate elevation. Thus Switzerland is naturally divided into four regions: the Alps, the Plain, the Hilly Country, and the Jura Mountains.

I. The Region of the Alps, which is the most extensive, is divided from the Plain and Hilly Country by a line which begins on the north bank of the Lake of Geneva, at the town of Vevay, and running north by east passes over Mont Moleson, which may be considered as the most western summit connected with the Alps in these parts. It traverses the river Saane at Gruyère, north-east of Mont Moleson, and thence runs east by north to the western extremity of the Lake of Thun. From the northern shores of the Lake of Thun it runs again north by east to Mont Napf, which is on the boundary-line between the cantons of Bern and Luzern, near 47° N. lat., 8° E. long. From Mont Napf it runs due east to the northern extremity of the Lake of Luzern, and thence east by north crossing the Lake of Zug to Mont Hoch Ezel, which is near the most southern part of the Lake of Zürich. From this point it follows the depression which runs east by south from the Lake of Zürich through the valley of the Limmat, the Lake of Wallenstadt, and the low ground which extends from the eastern extremity of the last-mentioned lake to Sargans and the banks of the Rhine. The whole country south of this line is occupied by the mountain masses and chains of the Alps, and only a small portion of it is cultivable; a larger portion, which is on the upper declivities of the mountains, is available as pasture-ground.

The natural division of the Alps of Switzerland is formed by the immense mountain knot which is on the west of the mountain pass of the Saint Gothard, and surrounds the sources of the Rhône. A space exceeding 100 square miles rises above the snow-line, and is overtopped by numerous pointed summits, rising from 10,000 to 12,000 feet above the sea. The most remarkable of these summits are the Gallenstock, the Gletcherhorn, the Diechtenhorn, the Triftenstock, the Stüstenhorn, and the Spitaliberg. From this mountain knot a chain runs northward, and terminates at the narrow channel which connects the Lake of Uri with that of Luzern. This chain contains several lofty summits, among which is the Tölis, 11,406 feet high, and the Urner Rothstock, 10,065 feet high. The chain which extends southward from the mountain knot between Val Formazza on the west and Valle Maggia on the east does not contain any summit which rises above the snow-line, though several of them are between 6000 and 7000 feet high. From the western edge of the mountain knot issue two ranges, of which the northern, called the Bernese Alps, runs west by south; and the southern, called the Lepontian Alps, runs south-west. Two other ranges branch off from the east side of the mountain knot. The southern, which runs nearly east, is called the Rætian Alps, and near 9° 50' E. long. divides into two ranges, of which the northern is called the Septimer Alps and the southern the Bernina Alps. These two ranges however do not run east, but north-east, and extend beyond the boundary-line of Switzerland into Tyrol. The northern range, branching off from the mountain knot of the Saint Gothard on the east, is also comprehended under the general name of the Rætian Alps, but has lately received the name of the Dödi Range, from its highest summit. It runs north-east, and terminates near the banks of the Rhine between 46° 40' and 47° N. lat. These mountain regions and the valleys inclosed between them differ considerably in their productive powers.

The basin of the Upper Rhône, which constitutes the canton of Valais, is inclosed by the two most elevated and widest ranges of the Alps, the Lepontian and Pennine Alps on the south, and the Bernese Alps on the north. The southern range runs from the great mountain knot south-south-west as far as the mountain pass of the Simplon, a distance of about 30 miles, and so far it bears the name of the *Lepontian Alps*. Its mean elevation is about 7500 feet, but several summits attain 10,000 feet; the width does not exceed 10 miles. There are several glaciers, but none of them of great extent. Some of them descend to the vicinity of the Pass of the Simplon, over which the great road leads from the Valais to Italy.

This road, which not long ago was considered one of the most magnificent works of modern times, was made by the French government between 1800 and 1805. It connects the town of Briegg in Valais with Domo d'Ossola in Piedmont, and is about 33 miles long.

The width is about nine yards, and its rise and fall only about one inch and a quarter for every yard, so that it can easily be passed by carriages. It runs in most places between steep and nearly perpendicular rocks, and at six places tunnels 30 feet high, with openings at the side to admit light, have been made through the rock. In several other places the road traverses precipices of great depth by means of substantial bridges. The highest part of the road is 6576 feet above the sea-level: Briegg is 2334 feet, and Domo d'Ossola 1004 feet above the sea-level. The road is in parts exposed at certain seasons to the ravages of torrents and avalanches, and is frequently out of repair.

West of the Pass of the Simplon are the *Pennine Alps*, which rise much higher, and occupy a much greater surface. The highest part of this range extends from the Pass of the Simplon, nearly due south, about 20 miles, to the enormous mountain mass of Monte Rosa, where it turns west, and in that direction extends to the northern part of the mountain mass of Mont Blanc. [BLANC, MONT.] With the exception of two or three passes not much exceeding the elevation of 8000 feet above the sea-level, the general elevation approaches to the height of 10,000 feet above the sea; and the higher part of this range, with the exception of the passes, is covered with snow all the year round. This elevated mountain tract is of great extent. On its eastern edge are the summits of Mont Parabranc, Cima de Jazzi (13,840 feet high), and Monte Rosa (15,226 feet); and on its southern edge, Mont Cervin (14,764 feet), Mont Combin (14,126 feet), and Mont Velan (11,043 feet), and several other summits of equal elevation. Towards the east and south the mountains descend with a rapid declivity, and the valleys on that side in Piedmont are inhabited to the vicinity of the most elevated mass. But on the north the high masses extend many miles without falling below the snow-line, and are overtopped by many summits rising to the height of 12,000 feet above the sea. They terminate about 6 miles from the banks of the Rhône. A tract between the Simplon on the east and Mont Combin on the west, and measuring in that direction 30 miles, with an average breadth of 15 miles, is covered with snow, ice, and glaciers, with the exception of only two valleys, Seas and San Nicolai, which are inhabited, and, uniting about 5 miles from the banks of the Rhône, are called the Valley of Visp.

The *Valley of the Rhône* lies north of the mountain region which has just been described. [RHÔNE.] It is about 92 miles long. Its eastern portion, as far down as Briegg, varies between a quarter and half a mile in width. Below the confluence of the Rhône with the Visp the valley is from one to two miles wide, and in a few places the width is greater. Besides the valley of the Visp, the branches of which are inhabited to the distance of eighteen miles from the Rhône, several lateral valleys open into the valley of the Rhône, which are from a quarter to half a mile wide, and inhabited to the extent of six miles from the banks of the river. They occur in both the southern and northern mountain chains, and thus the inhabited portion of this part of the country occupies about twelve miles in width. But between Sion and Martigny the unbroken mountain masses approach the river, and the inhabited tract is not more than two or three miles wide. Below the great bend, the rocky masses of the Dent-de-Morcles on the east, and of the Dent-du-Midi on the west, approach so near to the river, that in several places there is hardly room enough for a road along the banks of the stream. About eight miles from its influx into the Lake of Geneva, the low ground along the banks of the river becomes two miles wide. It is a swampy tract, very little elevated above the level of the lake, which is about 1210 feet above the sea-level. The descent of the valley amounts to 3720 feet. Above Briegg corn remains in the fields till the beginning of October, and it is reaped west of Sion in the month of June. The climate in the higher parts is cold even in summer; whilst in the lower, at the same season, the thermometer frequently rises to 88° and 90°. Only the common grains and roots of northern Europe are cultivated above Briegg, and some fruit-trees do not grow; the lower districts produce maize; and the vine, almond, and fig-tree flourish.

On the northern side of the valley of the Rhône are the *Bernese Alps*, the most elevated edge of which is parallel to the course of the river. Their eastern extremity is formed by a ridge called the Grimsel, over which a mule-road leads from the valley of Hasli to that of the Rhône. The highest part of this road is 8300 feet above the level of the sea. To the west of the Grimsel and the valley of Hasli begins the largest continuous mass of ice and snow on the Alps. It extends on both sides of the highest edge of the range, and occupies from east to west, from the valley of Hasli to that of Kander, a space 30 miles long in a straight line, and from north to south a space of about 20 miles, constituting nearly the whole of the country between the lakes of Briens and Thun and the valley of the Rhône. Its area is about 600 square miles. The outer edges of this region only are indented by three short valleys, Lötsch, Grindelwald, and Lauterbrunnen, which are inhabited. The valleys of Grindelwald and Lauterbrunnen are annually visited by many foreigners, as they offer the most easy access to the glaciers. From this immense lake of ice rise numerous summits, chiefly in the form of pyramids: along the highest portion of the region, from east to west, are the Finsteraarhorn (14,107 feet), the Mönch (13,502 feet), the Jungfrau (13,621 feet), the Breithorn (12,462 feet), the Altals (12,172 feet), the Rinderhorn (11,633 feet), the Wildstrubel (10,980 feet), and between them several

others hardly inferior in elevation. To the north of this series are other summits, among which the highest are the Eiger (12,922 feet), the Schreckhorn (13,444 feet), the Wetterhorn (12,220 feet), the Blumlis Alp (12,145 feet), and the Dolderhorn (11,920 feet). The Faulhorn, not far from the Lake of Brienz, rises only to 8750 feet, but it is frequently ascended by travellers on account of the magnificent view which it offers of the numerous mountains and glaciers which lie to the south of it. At the western extremity of this region a road leads from the valley of the Kander to the valley of Lötsch in the Valais. It traverses the ridge called the Gemmi, and in its most elevated point rises 6446 feet above the sea. It is partly cut through rocks, and only practicable for beasts of burden.

The valley of the Kander separates this region from that which lies farther west, and in which the Alps rise above the snow-line only in a few places. The highest part of the mountains continues to run south-west, as far as the three-headed summit, called the Diablerets, or the Teufelshörner, which is nearly due north of the great bend of the Rhône and somewhat more than 12 miles from it. The passes over this chain vary between 3000 and 5000 feet in elevation, but some of the summits rise above the snow-line and attain more than 10,000 feet. The highest summits from east to west are the Gletscherhorn (10,393 feet), the Wildhorn (10,724 feet), the Arpelhorn (10,948 feet), and the Diablerets (10,447 feet). At the Diablerets the chain divides into two branches, one of which runs south-south-west and terminates on the banks of the Rhône, opposite the Dent-du-Midi, in high rocks; the other extends westward towards the eastern extremity of the Lake of Geneva, and in approaching the lake turns gradually to the north and terminates in Mont Moleson (6577 feet). In the first of these two chains is Mont Möveran (9882 feet) and the Dent-des-Morcles (9567 feet), and in the second Mont Oldenhorn (10,362 feet). Though these summits and a few others rise above the snow-line, they occur at considerable distances from one another, and the glaciers which surround them are of comparatively small extent.

The country which extends north of the Bernese range, between the Kander on the east and the Saane River on the west, and terminates in the parallel of the northern extremity of the Lake of Thun, is a mountainous country: but it does not appear that the summits which are always covered with snow are numerous; several summits attain an elevation of 8000 feet above the sea-level, and from 4000 to 5000 feet above their base. The form also of these mountains differs from that of the higher Alps, their summits not terminating in peaks or sharp ridges, but being rounded and rather flat at the top: the declivities are generally steep, though much less so than those of the higher mountains. In many places the higher parts of the ridges and groups are above the line of vegetation, but as the lower declivities are covered with fine grass, which supplies excellent pasture during the summer months, and with trees, this region contains a much greater portion of productive land than the other parts of the Alps, though the proportion which is cultivated is very small. It is eminently a country of pasture. The most continuous ridge of mountains in this part of the country is that which lies nearest to the preceding region, and extends to the west of the valley of the Kander, from the great range to the banks of the Lake of Thun, where it terminates in Mont Niesen (7824 feet). Among the isolated summits is the Stockhorn, which is west of the Lake of Thun, 7213 feet high.

The *Valley of Hasli*, at the most southern extremity of which the river Aar originates in the Aar Glacier, lies between the largest fields of ice and snow, and extends in the form of a semicircle more than 20 miles to the influx of the Aar into the Lake of Brienz. Though the valley in the upper parts is only between a quarter and half a mile wide, and in the lower between half a mile and a mile, several short valleys open into it from all sides, and the declivities of the mountains which inclose these lateral valleys, and those of the principal valley, contain rich pasture. The lower part of the valley is partly cultivated and partly meadow-ground. There are extensive plantations of walnut-trees. The low and level tract which lies between the lakes of Brienz and Thun, and is about four miles long and two miles wide, is fertile, well cultivated, and has extensive plantations of walnut-trees. The climate here is so temperate that the flowers blossom in the month of February. Along the northern banks of the Lake of Thun the mountains approach close to the water; but as they are not high, nor their sides precipitous, there is a considerable tract between them and the lake, which is used for the cultivation of grain, plantations of vines and trees, and as pasture-ground. There is a similar tract of greater extent on the south of the lake; and towards the western extremity of the lake the mountains disappear and the plain begins.

The country which extends north-east of the river Aar and the lakes of Brienz and Thun to the Lake of Luzern, is much less mountainous and broken than the region south of the Lake of Thun; the mean elevation of this region is about 2000 feet. The most elevated tract is north of the Lake of Brienz, where the Rothhorn attains 7536 feet above the sea, the Tannhorn 6962 feet, and the Hohgant 7352 feet. Among the numerous summits which are dispersed over the country north of them are Mount Pilatus, south-west of the town of Luzern, 6904 feet above the sea-level; and Mount Napf, which is the north-western point of this region, is only 5277 feet. The surface of this country is a succession of rapid acclivities and declivities, with

very small tracts of level ground between them. Nearly the whole of the country is pasture-ground, except the vicinity of the Lake of Luzern, where large tracts are planted with walnut- and chestnut-trees.

Along the eastern edge of the mountain knot, west of the pass of St.-Gothard, lies the valley of the Upper Reuss, the upper part of which, called the valley of Ursern, is extremely cold, being in its lowest part 4644 feet above the sea-level; the lowest part, or the valley of Uri, has a very temperate climate, being little elevated above the surface of the Lake of Luzern, or about 1500 feet above the sea. In the valley of Ursern the winter lasts eight months, and even during the remainder of the year a fire is constantly kept up. No grain is cultivated, but there are good pastures. The valley of Uri produces maize and other grain, and also peaches and chestnuts. The highest part of the mountain road of the St.-Gothard, which passes through this valley, is about 7100 feet above the sea.

The country between the valley of the Reuss and the Lake of Luzern on the west, that of Wallenstadt on the north, and the valley of the Upper Rhine on the east and south, is, probably the most broken portion of the mountain region of the Alps in Switzerland. The valleys are extremely narrow, and the declivity of the surrounding mountains is exceedingly broken, and so steep that large tracts on the mountains' sides are bare of trees and bushes, and only a very small surface is fit for pasture. The upper part of the mountains consists either of sharp narrow ridges or of isolated summits, which generally constitute large masses with a very uneven surface. The mountains, though connected with one another by ridges, are not disposed in regular ranges, but scattered over the surface in the greatest disorder, except along the valley of the Rhine, where they form a tolerably continuous range. This range, the most northern of the three ranges comprehended under the name of the Rhetian Alps, and now commonly called the range of the Dödi, is connected with the mountains which line the valley of the Aar on the east, and thence runs east-north-east over the Krispalt, the Oberalpenstock (10,873 feet), the Dödi (11,811 feet), the Kistenberg (11,068 feet), the Scheibe (10,000 feet), and the Graue Hörner (9338 feet), terminating near the Rhine, and on both sides of the deep and closed valley of the Tamina, in precipitous masses of rock. The glaciers on this chain are numerous, but with the exception of those which surround the Dödi and Kistenberg, they are not of great extent. In the country north of this range there is also a considerable number of single mountains, which rise above the snow-line, as the Windgellen (10,336 feet), the Scheerhorn (10,809 feet), the Clariden Alps (10,489 feet), the three mountains of Glärnisch, of which the most elevated, Hoch Glärnisch, rises to 9509 feet, the Käpfstock (8954 feet), and several others. But as these mountains are isolated, the glaciers are of small extent. The mountains are less elevated along the northern edge of this region; the Mürtchenstock, which runs along the southern banks of the Lake of Wallenstadt, attains an elevation of only 7750 feet above the sea-level. In proceeding north-west, the mountains decrease in elevation, and their declivities are much more gentle. But though the declivities of the mountains are generally accessible to cattle, and supply pasture-ground, few places are cultivated. There are however some large tracts which are planted with vines and other fruit-trees. The narrow valleys of this tract have a temperate climate.

The valley of the *Upper Rhine* extends along the Rhine from its source in Mount Badus to its influx into the Lake of Constance. It is about 90 miles long. The upper part of the valley runs from south-west to north-east, and is formed by a few basins from 3 to 4 miles long, from $1\frac{1}{2}$ to 2 miles wide, and separated from one another by mountains, which generally come close to the banks of the river. That portion of the valley which lies above Trons is not cultivated, partly on account of the steep declivity of the mountains, and partly owing to the rigour of the climate: the winter lasts from eight to nine months. At Trons agriculture begins, but it is on a very moderate scale, as a part of the basin is covered with swamps. Lower down are the basins of Ilanz and of Reichenau, and then follows the basin of Chur, where the lower portion of the valley begins, which runs nearly north and south. This lower valley is divided into two parts by two mountains, the Fächerberg on the east, and the Schollberg on the west, which come close up to the river north of Meyenfeld, near $47^{\circ} 5' N.$ lat. The southern district, called the Valley of Meyenfeld, descends gradually from about 1775 to 1600 feet. It is about 15 miles long, and varies in width from 2 to 3 miles: the whole of it is under cultivation, and it produces maize, wheat, and other grains; and near the base of the adjacent mountains there are vines and fruit-trees. The northern portion of the valley, called the Rheinthal, is about 30 miles long, and from 3 to 6 miles wide; but only the smaller part of it, which extends along the western banks of the river, belongs to Switzerland: the low country east of the river, which is much wider, belongs to Austria. It is one of the best cultivated tracts in Switzerland, and produces very large quantities of maize and other grains. The vine and fruit-trees are abundant. Great quantities of cider are made and exported. The descent of the valley is from 1600 to 1340 feet above the sea-level.

The principal range of the *Rhetian Alps* branches off to the east of the mountain-pass of St.-Gothard, south of Mount Badus, and runs eastward. A continuous range of mountains, of which however no

summit seems to rise above the snow-line, extends 20 miles, to Pis Valrhin, which attains an elevation of 10,960 feet, and is surrounded by extensive glaciers, which are the source of the Hinter-Rhein, the largest of the upper branches of the Rhine. Not far from it to the east is the Muschelhorn (10,234 feet); and between the roads leading over the St. Bernhardin and the Splügen is the Tambohorn (10,436 feet). The range continues eastward to the source of the Inn, where it turns to the north of north-east, in which direction it runs to the eastern frontier of Switzerland, and enters the Tyrol. This last portion of the range is very high, and the snow along the crest is almost continuous. Some of the glaciers are extensive, especially as we approach the eastern boundary of Switzerland: the glacier which surrounds Mount Fermund, or the Iron Mountain, is calculated to cover nearly 100 square miles. From this immense field of ice and snow that range of mountains branches off which is called *Rhätikon*, and which runs north-west by west until it terminates on the Rhine with the Füscherberg, north of Meyenfeld. The crest of this mountain-wall, which is about 10 miles wide and 30 miles long, is generally above the snow-line, and glaciers descend down its sides. The most elevated summit, the Scesa Plana, is 9818 feet above the sea-level. The Rhätikon divides Switzerland from the Tyrol.

The country between the ranges just described and the valley of the Upper Rhine extends more than 40 miles in length, and about 24 miles in width: it is filled with extensive mountain-masses, which are connected with the principal range by lower ridges. These lower ridges sometimes constitute ranges several miles long, rising above the snow-line, and covered with glaciers. Of their summits the Zaporthorn, north of Pis Valrhin, rises to 10,841 feet; and the Pis Beverina, on the west of the valley of the Hinter-Rhein, and south of Reichenau, to 8933 feet. The valleys which lie between these ranges and mountain-masses are very numerous, but they rarely exceed half a mile in width. The larger valleys are from west to east. Very little grain is cultivated in them, but potatoes and other vegetables are grown. Fruit-trees do not succeed, except in the lower parts. Most of them however have excellent pasture-grounds on the Alps, and the level tracts are converted into artificial meadows, which are irrigated. The valley of the Hinter-Rhein is the longest: the great roads between Coire, or Chur, and Italy pass through it. A road leads from Chur to the village of Splügen, where it divides. The western road passes over the Bernhardin and leads to Bellinzona, in the canton of Ticino: the highest point of this road is 6961 feet above the sea. The eastern road traverses the Splügen and leads to Chiavenna, in the valley of Bregaglia: the highest part is 6715 feet above the sea. Both roads are passable for carriages.

The southern chain of the Rhätian Alps, called the Bernina range, which name is derived from a mountain-pass crossed by the road from the valley of Engadin into Italy, runs parallel to the principal range from south-south-west to north-north-east; its southern extremity extends into Lombardy, and the northern into the Tyrol. It appears to be as high as the principal range, for a great part of the most elevated ridges are always covered with snow, and contain numerous glaciers. The most elevated summit is said to be that called Monte dell'Oro, which stands south of, and not far from, the boundary-line of Switzerland, within the Austrian dominions. Between the Bernina range and the principal range of the Rhätian Alps the beautiful pastoral valley of Engadin is inclosed. [ENGADIN.] On the southern declivity of the Bernina range only two valleys of some extent belong to Switzerland: the valley of Münster, which opens into the valley of the Adige at Glurns in the Tyrol; and the valley of Poschiamo, which is 15 miles long, and opens into the valley of the Adda at Tirano, in the province of Sondrio. The valley of Poschiamo is a rich pastoral district, and derives considerable advantage from the road over the Bernina Pass, which runs through it. Large droves of cattle go by this road from the valley of Engadin to Italy.

Numerous rivers rise on the southern declivities of the Rhätian Alps, between the great field of ice in which the Aar and Rhône originate, and flow southward: they all unite in the river Tesin, or Ticino. The country drained by these rivers is called Italian Switzerland, because the Italian language is spoken by the inhabitants. It is traversed by several mountain-ranges, which run southward and occupy the greater part of its area. Many parts of these ranges rise above the line of trees and shrubs, but none of the summits attain the snow-line. Between the ranges there are several valleys of considerable extent; the three largest are those of Misocco, Levantina, and Maggia. All of them are very fertile. In their upper parts, which are about 3000 feet above the sea-level, very little grain is cultivated, and the inhabitants live on the produce of their herds. In the middle parts of the valleys maize and other kinds of grain are grown, and vines and fruit-trees abound, especially the chestnut and walnut-tree. The lower parts, whose climate approaches that of Italy, have considerable plantations of fig-trees and mulberry-trees. A considerable quantity of silk is annually collected in these valleys and sent to the manufacturing districts: no other part of Switzerland contains such extensive forests and such fine trees. The great road which traverses the mountain-pass of Saint Gothard runs through the valley of Levantina, and that which crosses the St. Bernhardin through the valley of Misocco. As the southern declivity of the

GEOG. DIV. VOL. IV.

Alps is very steep, these valleys are subject to very extensive and destructive inundations during heavy rains.

The brooks and rivers which drain the valleys traverse the basins generally with a gentle current, but in the gorges they form nearly a continuous rapid, which is frequently interrupted by cataracts. It thus appears that the rivers of the mountain region are not navigable, with the exception of the Rhine, which is navigated by river-barges from the town of Reichenau. But even if their course were not interrupted by cataracts, these rivers could hardly be navigated, owing to the great changes in the volume of water, which occur very suddenly. It frequently happens that in a few hours a river rises several feet and inundates the low tracts contiguous to its banks, and in a few hours it subsides again. These changes sometimes follow very rapidly. Small lakes are very numerous. A few of them occur in the basins of the valleys, but the greater number lie in the mountains, being inclosed by high walls of rocks. Some of them are at such an elevation as to be covered with ice all the year round. Larger lakes do not occur within the mountain region, with the single exception of the Lake of Brienz, but several of considerable size are found along the outer edge of the region, so that the larger portion of the lake is inclosed by mountains, whilst the lower extremity is within the adjacent plain. Such are the lakes of Luzern and of Thun on the northern, and the Lake of Lugano and the Lago-Maggiore on the southern side of the Alps. All alpine lakes are deep; in some cases the depth is 100 fathoms. They contain few fish.

II. The Hilly Region extends over the north-eastern portion of Switzerland, and comprehends the country between the Lake of Constance, the Rhine, and the lower course of the Aar, between the mouth of that river and its confluence with the Reuss. The river Reuss and its tributary the Lörze, which issues from the Lake of Zug, separates the hilly region from the plain. The line dividing the hilly region from the Alps runs from the middle of the Lake of Zug to Mount Hoch-Esel, on the southern banks of the Lake of Zürich, and thence along the depression in which the lower course of the Linth and the Lake of Wallenstadt are situated, and which from that lake extends to the Rhine north of Sargans. This depression, which continues across the western district of the hilly region through the Lake of Zürich and the valley of the Limmat, terminates at the confluence of the last-mentioned river with the Aar. The length of this depression is nearly 70 miles, but half of this space is occupied by the lakes of Wallenstadt and of Zürich. The level tract which separates the two lakes, and that which lies between the Lake of Wallenstadt and the Rhine, are hardly more than 20 feet above the waters.

Part of the country inclosed by these boundaries is mountainous. This higher tract occupies the eastern portion of the hilly region. On the northern side of the low and narrow tract between Sargans and the Lake of Wallenstadt above noticed, the country rises with a steep ascent to an elevation of between 3000 and 4000 feet, which increases as we proceed westward, and on the northern shores of the Lake of Wallenstadt it attains an elevation of 7000 feet above the sea-level. This continuous range, which extends along the northern banks of the lake and descends towards it with a steep declivity, is called the Kurfirsten, and terminates on the west in the elevated summit of Mont Speer (6636 feet). It is about 4 miles wide. Its northern declivity is comparatively gentle. North of the eastern extremity of the Lake of Wallenstadt, a lower ridge, called the Graber Alpen, branches off towards the north and connects the Kurfirsten with the mountain group called the Alpstein, which from east to west extends about 10 miles, and whose lower offsets advance to the very shores of the Lake of Constance, so that in length it exceeds 15 miles. Towards its southern border are the highest summits, of which the Sántia, or Hoch-Sántia, attains an elevation of 8272 feet, and has a small glacier on the northern declivity of its summit. The Alte-Mann, which stands east of it, is only about 200 feet lower. North of these summits are several others, rising from 4000 to 6000 feet, but at the distance of 6 miles from the Lake of Constance they sink down to 4000 feet, and gradually decrease in height. This mountainous tract resembles very much the country north of the Dödi range, except that the valleys are somewhat wider; and as the mountains do not rise to such an elevation, and have less rapid slopes, the pasture-grounds on the upper declivities are more extensive. Very little grain is cultivated, but there are some fruit-trees and vines.

The remainder of this region can only be called hilly, and its surface is nothing but a succession of high swells with moderately gentle declivities and rounded or flat tops. These swells are sometimes several miles long. In several places round-topped summits rise upon their backs. None of these high hills exceed 4000 feet above the sea-level, though several rise 3000 feet above the sea, and about 1800 feet above their base. The highest summits are arranged in small chains, which in the western districts are between the river Thur and the Lake of Zürich. The most eastern is called the Altman chain, which divides the valleys of the Thur and the Toss, and terminates on the Rhine opposite Eglihan. The western, called the Albis chain, from its highest summit (2921 feet), runs between the lakes of Zürich and Zug, and terminates a short distance west of Zürich. The Albis commands an extensive view over all the adja-

countries and the snow-capped mountains of the Finsteraarhorn region. Between the lakes of Zug and Luzern stands the isolated summit of the Righi, which is much visited by travellers, and rises to 5916 feet. The district between the Lake of Constance and the Thur is comparatively level; the hills rise to a very moderate elevation, and their slopes are so gradual, as to admit of cultivation. This is considered to be the most fertile tract in all Switzerland. The lake-shore between Arbon and Stein on the Rhine presents a succession of cultivated fields, orchards, vineyards, and artificial meadows. Besides maize and all other sorts of grain cultivated north of the Alps, large quantities of hemp and flax are here grown. The soil of the remainder of this region is less fertile; the larger portion of the surface is used as pasture and meadow land. The country along the northern banks of the Lake of Zürich is very little inferior to the tract along the Lake of Constance. There are many small lakes in this hilly country, and they contain more fish than the alpine lakes. The largest lakes of these are those of Wallenstadt and Zürich. The *Lake of Wallenstadt*, the *Lacus Riparius* of the ancients, is 10 miles long and 2½ miles in width. It is in most places from 60 to 80 fathoms deep. Its northern shores are extremely steep, rocky, and high, and at the distance of barely a mile from them the Kurfirsten range rises from 4000 to 5000 feet above the sea-level; on the south the shores are also rocky and steep, but less elevated, and the Mörtschenstock range attains its highest elevation at the distance of 2 or 3 miles from the lake: at the two extremities it is bordered by low tracts. The surface is 1424 feet above the sea-level. The *Lake of Zürich* is about 24 miles long, 3 miles wide, and has the form of a section of a circle, the curvature being directed towards the south-south-west. It is divided by two projecting points into two sections, of which the eastern is called Ober-See: the surface is 1310 feet above the sea-level. Near its eastern extremity is a level tract of some extent, but, with this exception, the shores are surrounded by gently-sloping hills, covered with vineyards, orchards, and cultivated fields. In a few places it is stated to be 100 fathoms deep. The largest rivers of this region are the Thur and Limmat. The Thur rises in a valley which separates the Kurfirsten range from the Alpstein Mountains, and at first runs west, but turns gradually to the north. After a course of about 30 miles it makes a great bend to the east, and then flows westward to its confluence with the Rhine above Eglisau. Its whole course exceeds 65 miles. Nearly one-half of it lies in a narrow but rich pastoral valley, the Toggenburg [GALL, ST.], between mountains; and the remainder of the course between moderate and well-cultivated or wooded hills. The Thur is too rapid for navigation. The Limmat originates, under the name of the Linth, on the northern declivity of the Dödi, and traverses the mountain region of that name in a northern direction, and in a very narrow valley until it meets the Lake of Wallenstadt [GLARUS.] Formerly it did not fall into the lake. It is subject to a very sudden and great increase of water, and it frequently inundated the low tract between the lakes of Wallenstadt and Zürich, and destroyed the crops of that fertile district. In 1821 a canal was made, by which the waters of the Linth are carried to the Lake of Wallenstadt, and another canal in the middle of the low tract, which is wide and deep enough to receive all the water from the Lake of Wallenstadt, and to carry it to the Lake of Zürich. This canal is called the Linth Canal. The river issuing from the western extremity of the Lake of Zürich is called the Limmat. It runs about 18 miles in a west-north-west direction, until it falls into the Aar, a few miles below Baden, in the canton of Aargau. The Limmat is navigated, but it can only be ascended by empty boats, on account of the rapidity of the current.

III. The Plain of Switzerland extends in the direction of north-east from the banks of the Lake of Geneva to the lower course of the Reuss from Roth to its confluence with the Aar. Its western border joins the Jura Mountains. This plain is properly a large valley, surrounded by mountains, and extending south-west and north-east more than 100 miles in length, with a breadth varying from 20 to 30 miles.

On the southern and western border of the plain are four considerable lakes: the lakes of Geneva, Neuchâtel, Morat, and Bienne, which are at different elevations above the sea-level; the Lake of Geneva is 1228 feet above the sea, Morat is 1450 feet, Neuchâtel 1429 feet, and Bienne 1410 feet. A high swell, which is called *Mont Jorat*, extends westward from the Dent-de-Jaman, the most western summit of the Alps in this part of Switzerland, to the Lake of Geneva, between Montreux and Vevey. It proceeds westward along the lake and close to its banks to Ouchy, west of Lausanne. The rocky declivity with which it descends towards the lake is in many places between Vevey and Lausanne so steep, that the road between these two towns is cut in the rock. At Ouchy it recedes from the lake, and runs north-west towards the Jura Mountains; but it does not reach them, being divided from these mountains by a narrow depression. This depression is chiefly covered with swamps, from which a small river, called Nosen, runs northward and joins the Orbe, which falls into the Lake of Neuchâtel; whilst the Veiron, another small river originating in the same depression, flows southward to the Lake of Geneva. *Mont Jorat* descends gradually towards the north, and its long slopes extend to the distance of 10 miles from the Lake of Neuchâtel. Where it is crossed by the road leading from Lausanne

to Moudon, its upper crest is 3039 feet above the sea-level; but farther east, in the vicinity of the Alps, it rises to 3800 feet. The whole country between the lakes of Geneva and Neuchâtel, with the exception of the steep descent towards the Lake of Geneva, presents a succession of round-backed hills or short ranges, sloping very gradually on all sides, and interspersed with open valleys, which frequently enlarge to small plains. The eminences decrease in elevation as they approach the Lake of Neuchâtel, and the country on its banks can only be called undulating. There are few tracts which cannot be cultivated. The soil is rather fruitful; the whole country is covered either with corn-fields, on which maize, wheat, barley, &c., are grown, or with orchards or vineyards. The vineyards are very extensive on the Lake of Geneva, and yield some good wine. The plantations of chestnut-trees are extensive, and almond-trees and fig-trees abound.

Another swell of high ground traverses the plain in a different direction. It is connected with the Jorat Mountains south-east of Moudon, and extends thence in a north-east by east direction to the town of Freyburg. From Freyburg it passes south of the town of Bern, where it declines more to the east, terminating at Mont Napf, which stands on the north-western border of the mountain region. This swell rises about 1000 feet above its base, which may be 1500 feet above the sea-level. It contains a few summits: one of the highest of them is *Mont Bütschel*, south of the town of Bern, which rises to 3450 feet above the sea-level. On the spacious and level summit and the gentle declivities of this swell, pastures and cultivated fields succeed one another, with orchards and vineyards.

The remainder of the plain has generally an undulating surface, the eminences rarely rising into hills, and most of the slopes being gentle. There occur also some level tracts, the largest of which is the low country between the lakes of Neuchâtel, Morat, and Bienne, which, when the rains have been very abundant, is overflowed. Within this portion of the plain only a few isolated summits occur, which rise from 1000 to 2000 feet above their base. The highest of them is the *Büntiger*, north-east of Bern, which rises to 3438 feet. The soil is of moderate fertility; it is mostly under the plough, and produces all kinds of grain, as well as hemp and flax. Vineyards are not extensive, and the wine is not good; but other fruits, especially apples, pears, plums, walnuts, and cherries, are very abundant: from the cherries *kirschwasser* is made. At the north-eastern extremity of this country is the *Lindenberg*, a moderate swell, about 500 feet above its base, which is remarkable for the horizontal line in which its crest runs for 20 miles, between Roth and Lenzburg. Not an eminence is observed on it.

The principal river of this plain is the Aar, which receives the Saane, Thiele or Ziel, Emmen, and Reuss. None of these affluents of the Aar is navigable, except the Thiele, which is navigated by river-barges and steam-boats to the lakes of Bienne and Neuchâtel. The largest lakes are those of Geneva [LEMAN], Neuchâtel [NEUCHÂTEL], Morat [FREYBURG, vol. ii. col. 1095], and Bienne [BERN, vol. i. col. 1050]. These lakes abound in fish. In the north-eastern districts of the plain are several smaller lakes. The largest of them is that of Sempach, north-west of Luzern, which is about 5 miles long, but in no part more than a mile wide. It is 1695 feet above the sea-level, and 256 feet above the Lake of Luzern, which shows that the country has a considerable rise between the two lakes.

IV. The Region of the Jura Mountains occupies the west part of Switzerland, lying between the plain and France. This elevated region occupies about 150 miles in length, with a width of about 30 miles. It extends from the Rhône, where that river runs underground (Perte-du-Rhône), in a north-east direction, to the banks of the Aar and the Rhine. About half of this region lies within France. In Switzerland it extends over the western districts of the canton of Vaud, the whole area of that of Neuchâtel, the north-western districts of Bern, the greater parts of Solothurn and Basel, and a portion of Aargau. It rises from the Plain of Switzerland with a steep ascent to an elevation of 3000 feet, and at this elevation it is traversed in its length by many low chains, which divide the whole surface of the region into numerous longitudinal valleys. Many of these valleys are connected with one another by depressions, while others are entirely surrounded by hills, and the water which collects in them escapes by natural tunnels. On the low and narrow ridges which divide these valleys a few summits rise from 600 to 2000 feet above their base. The highest summits of the Jura Mountains are in France. Within Switzerland are *Mont Dole* (5515 feet) and *Mont Tendre* (5522 feet), which lie west and north-west of the Lake of Geneva, and *Mont Chasseron* (5223 feet), west of the Lake of Neuchâtel, and *Mont Chasseral* (5211 feet), north-west of the Lake of Bienne. *Mont Terrible*, which stands close to the great band of the Doubs and on the north-west edge of the Jura Mountains, attains only 2558 feet above the sea-level. But in the southern and central part of this region are several other summits which rise between 4000 and 5000 feet.

South of the Lake of Neuchâtel the Jura Mountains do not rise abruptly from the plain, but a lower range, a kind of terrace of small width, lies between them, which is called *La-Côte*, and in its southern parts is covered with vineyards, between Geneva and Morges. Farther north are plantations of mulberry-trees for the use of silk-worms. There are also numerous orchards, and in some parts the slopes are

wooded. In the mountain region itself there are two large and several smaller valleys. The two larger valleys are those of Joux and of Valorbe, and they may be considered as one valley 30 miles long and about 2 miles wide. This valley is divided into two valleys by the summit called Dent-de-Vaulion, which rises to 4831 feet above the sea-level. The valley of Joux, or that south of this summit, is 3375 feet above the level of the sea. It is drained by the river Orbe, which in approaching the Dent-de-Vaulion enters the Lake of Joux, which is 5 miles long and more than a mile wide. After leaving this lake the river forms a small lake, that of Brenet, on flowing from which it is precipitated into an opening at the foot of the Dent-de-Vaulion, from which it issues as a considerable stream on the north side of the mountain. Here begins the Valorbe, which extends to the town of Orbe, where the river leaves the mountains, at the foot of which it flows through the plain to its mouth, which is at the southern extremity of the Lake of Neuchâtel. In the valley of Joux, which is more than 700 feet higher than Valorbe, only barley and oats are grown, and there are no trees, except a forest of fir-trees, in the southern portion of the valley, which belongs to France. The greater part of the valley is used as pasture and meadow ground. The Valorbe contains fine forest-trees, and is generally well cultivated, except on the slopes of the surrounding mountains, which produce grass. All kinds of fruit-trees abound.

That portion of the region of the Jura which extends from the south of the Lake of Neuchâtel to the northern extremity of the Lake of Biemme, consists of numerous valleys divided from one another by low ridges. The waters from several of them have apparently no outlet. The whole region is destitute of trees, with the exception of the lower portion of the eastern slope, where there are extensive vineyards and orchards. Mulberry-trees are grown to feed silkworms. Here also, and in the valleys which open towards the lakes, every kind of grain is grown, and agriculture is carried to a high degree of perfection. But the mountain region itself, with its valleys and ridges, is in its natural state only covered with grass, and though the soil is dry, the pastures are rich and maintain large herds of cattle. The inhabitants of this district are noted for their great manufacturing industry. [NEUCHÂTEL; BERN.] In spite of many disadvantages, among which is the long winter that lasts seven months, these districts are among the most populous in Europe, though every article of food is very dear, owing to the difficulty of transporting it from the lower country. Within the mountain region nothing is cultivated except some barley and oats.

North of the lake of Biemme the steep declivity of the region of the Jura Mountains continues along the banks of the river Aar, and in the whole of its long extent from the Lake of Biemme to the confluence of the Aar with the Rhine, a distance of 60 miles, it is only once interrupted by a valley. Though less elevated than farther to the south, it rises more than 1000 feet above its base, and has some summits, of which the Weissenstein, north-west of Solothurn (4616 feet), is perhaps the highest. As far as this summit the valleys extend longitudinally in the direction of the whole system, and resemble in some degree those of the central district, but they are partly covered with wood. North of the Weissenstein however the slope of the country is to the north, and the numerous valleys with which it is furrowed are transverse valleys. These valleys sink much lower, and the ridges which separate them from one another are wider and have more the form of ranges than in the central district. They have the advantage of a more fruitful soil, and a much more moderate climate. A large portion of this country is well adapted for the rearing of cattle and for dairies; the lower declivities and the level grounds in the valleys and depressions produce all kinds of grain. The orchards also are very extensive. The valleys possess a considerable degree of fertility. Many of the mountains are covered with wood.

Climate.—The climate of Switzerland presents great differences, which are the effect of the greater or less elevation above the sea-level. Some regions of considerable extent, as about Monte Rosa and the Finsteraarhorn, rise above the line of perpetual congelation, and some of the inhabited valleys to 4000 feet above the level of the sea. About one-fourth of the area of Switzerland is useless to man by its too great elevation and the rigour of its climate.

The climate of the lower districts is more temperate than that of most countries of Germany, and the valleys south of the Alps approach very near in climate to that of Lombardy. The following table shows the mean temperature of the four seasons at Geneva, Zürich, Bern, and the Hospice of St. Gothard, as compared to that of Milan:—

	Geneva.	Zürich.	Bern.	St. Gothard.	Milan.
Winter . .	33·35°	30·34°	29·37°	17·94°	36·03°
Spring . .	50·17	47·25	45·88	27·48	54·88
Summer . .	68·10	64·15	58·78	45·71	73·10
Autumn . .	49·37	49·05	46·44	32·20	56·84
Mean Annual } Temperature }	49·50°	47·95°	45·12°	30·10°	55·18°

The mean temperature of London for the winter is 38·22°, for the spring 48·84°, for the summer 61·74°, for the autumn 50·29°; and for

the year 50·50°. Hence it appears that all these places, except Milan, have a lower annual temperature than London, and for Bern this difference amounts to more than five degrees. The mean annual temperature of the Hospice on the St. Gothard is lower than that of the North Cape in Norway by nearly two degrees, but the summer is nearly four degrees warmer: the other seasons are colder by some degrees than at the North Cape.

The greatest quantity of rain falls on the southern declivity, where it annually amounts to 57·83 inches, whilst on the western side it is only 47·17 inches, and on the northern not more than 36·13 inches. In some parts a great quantity of snow falls, especially on the Jura Mountains, where in parts it accumulates to a depth of 30 feet.

Divisions.—The Swiss confederation consists of 22 cantons, which, with the area, population, and representatives of each in the National Council, are as follows:—

Cantons.	Area in Square Miles.	Population in 1850.	Representatives.
Aargau . . .	501	199,852	10
Appenzell . . .	152	54,893	3
Basel . . .	184	77,583	3
Bern . . .	2,556	458,801	23
Freyburg . . .	503	99,891	5
St. Gall . . .	758	169,625	8
Geneva . . .	91	64,146	3
Glarus . . .	279	30,213	2
Grisons . . .	2,962	89,895	4
Luzern . . .	566	132,843	7
Neuchâtel . . .	250	70,753	4
Schaffhausen . . .	115	35,300	2
Schwyz . . .	338	44,168	2
Soleure . . .	254	69,674	3
Thurgau . . .	268	88,908	4
Ticino . . .	1,033	117,759	6
Unterwalden . . .	262	25,188	2
Uri . . .	420	14,505	1
Valais . . .	1,658	81,559	4
Vaud . . .	1,180	199,575	10
Zug . . .	85	17,461	1
Zürich . . .	684	250,698	18
Total . . .	15,179	2,392,740	120

About three-fourths of the Swiss speak dialects of the German, which is the language used by the authorities. French is the written as well as the spoken language of the educated classes of Geneva, Vaud, and Neuchâtel, and a part of Bern, Freyburg, and the Valais. The inhabitants of the canton Ticino, and of some valleys of the Grisons, on the south side of the Alps, speak a dialect of Italian; and one-half of the population of the Grisons speak the Romanunch and Ladin, which are peculiar dialects, apparently of old Italian origin.

With regard to religion, the majority of the population belong to the Calvinist or Helvetic Confession of Faith. There is however no obligatory uniformity among the Swiss congregations: there is no Swiss church, in the common sense of the word: in each of the Reformed cantons the ecclesiastical affairs are regulated by a synod. There are Roman Catholics in all the cantons, but these and all Dissenters or 'separatists' from Calvinism enjoy liberty of conscience and freedom of worship. But the religious houses of the Catholics have been suppressed since the revolution of 1847. The more exclusively Protestant cantons are Aargau, Appenzell, Bern, Basel, Geneva, Glarus, Graubünden, Neuchâtel, Schaffhausen, Thurgau, Vaud, and Zürich. But in Geneva the Catholics are fast approaching to an equality in numbers with the Protestants, having increased since 1837 from 17,000 to 29,764, while the latter had decreased from 41,666 to 34,212 in 1850. The Catholics have increased also in Zürich, Basel, Schaffhausen, Vaud, Neuchâtel, and Grisons. But Protestants have spread into the once exclusively Catholic cantons of Luzern, Zug, Schwyz, Uri, Unterwalden, the Valais, and Ticino, and the ratio of Catholics to the whole population of Switzerland remains nearly unaltered, being 40·6 per cent., while the Protestants make 59·4 per cent. The number of Jews in Switzerland is not stated. The number of foreigners resident in Switzerland is more than balanced by the number of Swiss resident in foreign countries. The sexes approach very nearly to equality on the whole population, the ratio being 102 females to 100 males.

Natural Productions.—These are wheat, buckwheat, maize, barley, rye, oats, potatoes, flax, and hemp; fruits including grapes, pears, apples, cherries, and plums; peas, beans, and other common vegetables; chestnuts, walnuts, filberts, &c. The localities of these products are mentioned in the preceding part of this article. The mulberry is grown in the Italian cantons for feeding silkworms. Two-thirds of Switzerland do not produce corn enough for the consumption: this is particularly the case in the central and eastern cantons which lie in the highlands of the Alps. The cantons which produce most corn are Soleure, Bern, Freyburg, Aargau, Schaffhausen, Luzern, and Vaud. There is nearly a million of head of horned-cattle in summer,

one-fourth of which consists of milch cows; and the produce of the dairy is reckoned annually between one and two millions sterling. The finest races of horned-cattle are those of the Emmenthal and Simmenthal, in the canton of Bern, of Gruyères in Freyburg, of Schwyz, of Zug, of the Frickthal in the canton of Aargau, and of Appenzell. The sheep are mostly of inferior breed, and the wool is short and coarse. Goats are very numerous in the highlands; pigs are plentiful and fine.

Kirschwasser is distilled from cherries, and is commonly used all over Switzerland. Walnut-oil is the common substitute for olive-oil north of the Alps.

The highlands of Switzerland abound with timber-trees, especially firs of various kinds, maple, beech, larch, birch, and oak-trees. There are certain forests on the declivities of the high Alps which protect the valleys beneath from the avalanches, and are therefore carefully preserved; but the rest, which for the most part are communal property, are subject to great waste, through injudicious cutting, the inroads of cattle, and especially of goats, and the ravages of storms. Most of the cottages and farm-houses are built of wood, and the same material is used for fuel, the annual consumption of which is enormous: a great quantity of timber is also exported to France and other countries. Coal-mines are worked in the cantons of Freyburg, Vaud, Basel, and Thurgau, but the coal is mostly of inferior quality. Turf is used in Aargau and other cantons.

The Alps and other Swiss mountains contain a rich and inexhaustible supply of summer pasture for the cattle and flocks of the greater part of Switzerland. A large proportion of land in the valleys and plains is kept as grass-fields, and mowed for winter fodder, an essential and rather dear article in a country so largely stocked with cattle. In the two cantons of Vaud and Neuchâtel the cultivation of the vine obtains the preference over the other branches of agriculture. In the mountain cantons the old grass-lands are never broken up.

Iron is found in the Jura; and there are furnaces and iron-works in the cantons of Vaud, Bern, Soleure, Basel, and Aargau, and likewise in the Grisons. In the Grisons there are mines of lead, zinc, and galena. Salt-springs abound in Switzerland, but they are generally neglected, except those of Bex in the canton of Vaud. Switzerland imports much salt from Germany and other countries. There are mineral springs at Baden and Schinznach in the Aargau, at St. Moriz, in the Grisons, and at several other places.

The lakes and rivers of Switzerland abound with fish, especially trout of various kinds. In the lakes of Geneva and Constance there are trout that weigh from 30 to 60 lbs. The salmon is found in the Rhine, the Aar, and the Lake of Zürich; tench, carp, perch, eels, and crabs are found in most Swiss waters.

The game consists chiefly of chamois, hares, marmots, and partridges. Bears and wolves are hunted in the Alps and the Jura. Birds of prey of large dimensions are common in the mountains.

Trade and Manufactures.—Switzerland has been, at least in part, a manufacturing country for centuries. In the canton of Zürich the manufacture of silks, florentines, gros-de-Naples, taffetas, serges, levantines, silk-handkerchiefs, and ribbons, give employment to several thousand hands. The cotton-manufactures and cotton-printing establishments of Zürich are also of great importance, and give employment to a large number of the population. Zürich and Winterthur and the villages along the banks of the Lake of Zürich are the principal seats of manufacturing industry. The cantons of St. Gall and Appenzell constitute another important manufacturing district, especially of cotton goods. Appenzell manufactures some very fine plain and embroidered muslins. St. Gall also manufactures muslins and prints in considerable quantities, leather, linen, glass, and goldsmith-ware.

The city of Basel, besides being a great centre of foreign and domestic trade, manufactures largely silk-ribands, silk-thread, taffetas, and satins. The export of ribands from Basel to the United States, Germany, Holland, Sweden, and other countries is very large. The other branches of manufacture at Basel are leather, paper, and tobacco. Geneva manufactures vast numbers of watches, also jewellery, and musical-boxes. The watches and musical-boxes are sold all over Europe, the Levant, America, and the north of Africa; the jewellery is sold mostly in Italy. The other branches of manufacture at Geneva are cabinet-work, saddlery, lithography and engraving, cutlery, fire-arms, enamels, &c.

The manufactures of the canton of Neuchâtel comprise the printing of cottons and watch-making for the export trade. The districts of Locle and La-Chaux-de-Fond, among the highlands of the Jura are the great centres of the watch-making trade. The watches are exported to the same countries as those made at Geneva. The canton of Thurgau has a considerable manufacture of cotton goods, several cotton-printing establishments, and some linen factories. The small canton of Glarus manufactures a considerable quantity of cotton-goods, prints, and muslins. Aargau manufactures cotton-cloth of all descriptions, white and coloured handkerchiefs, prints, stockings, and other hosiery, also silks, and ribands, and silks mixed with wool and cottons, linens, and cutlery.

The rest of the cantons of Switzerland cannot be considered as manufacturing countries, although most of them have some manufactures, but only to supply their own wants. Special manufactures are noticed in the articles on the several cantons. The trade of

Switzerland with foreign countries is founded upon the principle of reciprocal trade and free transit. It is greatly facilitated since the invention of railroads. These means of rapid transit connect Basel with all the chief towns of France and Germany. A good deal of Swiss produce is exported from Geneva.

In the interior of the country there are as yet but few railroads completed; but several lines are projected, among which is a great trunk line from Basel to Geneva, through Bern. This line curves round the north shore of the Lake of Geneva, from Geneva to Morges, whence a branch, now completed, continues along the lake eastward to Lausanne. The main line runs north-by-east from Morges to Yverdon (this section is completed), thence east-north-east along the east shores of the lakes of Neuchâtel and Morat to Bern; from Bern north-east down the lower part of the Emmenthal and across the Aar below Soleure to Olten; and from Olten north-west to Basel. From Olten a line was authorised in 1852, running south-south-east through Zoffingen to Luzern on the lake of that name, which is to be navigated by swift steamers; and from the Uri end of the lake a railroad is projected to run up the valley of the Renas nearly to the foot of the St. Gothard. From Olten a line has been projected by the Aar and the Limmat to Zurich, and thence to Rorschach on the Lake of Constance, whence steamers will communicate with the termini of the Wurtemberg and Bavarian railroads at Friedrichshafen and Lindau respectively on the east shore of this lake. A part of the line between Zurich and Baden in Aargau is already open. In connection with the Morges and Yverdon section steamers ply on the lakes of Neuchâtel and Bienna. The French and Sardinian governments have each contemplated making railroads to terminate at Geneva.

Army.—The federal army consists of the Bundesauszug, a regular force which comprises men from 20 to 34 years of age; the reserve, which includes all those that have served the full time in the Bundesauszug up to their 40th year; and the Landwehr, composed of all men able to bear arms, who are not enrolled in either of the preceding. In 1852 the federal army numbered 108,000 men—72,000 regulars and 36,000 reserve. In addition to this there are also corps of cavalry, artillery, and engineers. Foreign enlistment is generally prohibited, but the Swiss still volunteer to serve in foreign armies. Formerly they had about 15,000 men in the service of the kings of France, about half that number in the service of Holland, besides several regiments in Spain, in Piedmont, and at Naples. Those cantons from which the respective regiments were drawn received an annual subsidy from the state for whose service they were recruited. There is now (August 1855) a Swiss legion in the British service.

The estimated revenue for 1855 is stated at 16,065,000 francs; and the expenditure at 15,475,000 francs.

Education and Instruction.—Elementary instruction is generally diffused. Secondary instruction is given in gymnasia and grammar schools, which exist in most of the towns. Private schools are numerous, and some of them rather famous for combining industrial training with scientific instruction. For higher education Switzerland has the Universities of Bâle and Zurich, and the Academies of Bern, Geneva, and Lausanne, in which degrees in law, divinity, and arts are granted. There are public libraries at Zürich, Bern, Basel, Soleure, Luzern, St. Gall, Aarau, Lausanne, and Geneva. Above thirty newspapers and reviews, weekly, monthly, or quarterly, are published in Switzerland.

Savings banks and insurance societies are pretty numerous in Switzerland. Hospitals for the infirm poor exist in every town, and some of them are richly endowed. The indigent receive assistance from the funds of the commune to which they belong. It is therefore of great importance for every man to be inscribed as freeman of a commune. There are also numerous local charities and subscriptions for the poor; but there is a class of poor outcasts called 'heimathlosen,' or people without a domicile, who are rejected by all the cantons. They are people descended from individuals who lost their civil rights in their respective cantons, or from foreigners settled in Switzerland who did not purchase their citizenship. A few years ago several cantons offered to come to an arrangement for distributing these individuals among the cantons, and restoring them to society; but at the census of 1850 they still numbered 2198, as stated above.

History of Switzerland.—The greater part of modern Switzerland was known in Roman times by the name of the Country of the Helvetii, a warlike and powerful Celtic people, who, after emigrating from their country westward, were defeated with great slaughter near Bibracte, the modern Autun, by Julius Cæsar. (Cæsar, 'Bell. Gall.,' i.) The eastern part of Switzerland, or the present Grisons country, was called Rætia by the Romans, and was inhabited by a different race of men, who are said to have been descended from the Etruscans.

After the conquest of Gaul, the Romans sent colonies into the country of the Helvetians; and, with the exception of the insurrection (if it can be so called) in A.D. 69, when they were mercilessly treated by Cæcina, the lieutenant of Vitellius, as related by Tacitus ('Hist.,' i. 57, 58, 59), the Helvetians remained subject to Rome till the downfall of the empire. During this long period the Roman language, and Roman habits and manners, became prevalent throughout Helvetia,

though it is supposed that the more central valleys and alpine recesses may have retained a sort of rude independence.

At the breaking up of the Western empire, the Burgundians, a tribe from the shores of the Baltic, were the first to form a permanent settlement in Western Switzerland, between the Jura, the Lemman Lake, and the river Aar; and Gebena, or Geneva, became the occasional residence of their kings. Meantime the Alemanni, a wilder and more barbarous race than the Burgundians, occupied the banks of the Rhine as far as Eastern Helvetia. These were defeated by Clovis at Tolbiacum, near Cologne (A.D. 496), and the Franks became masters of the country of the Alemanni, including a great part of Helvetia. The mountainous district of Rhetia was seized upon by the Goths from Italy, under King Theodoric. The old natives of Helvetia themselves became by turns subjects or serfs of these various masters. Being no longer a nation, their very name became obliterated, and they were included in the general appellation of Romans, by which the northern conquerors designated the inhabitants of the countries once subject to Rome. About A.D. 534, the Franks, having overpowered the kingdom of the Burgundians, became masters of all Helvetia, and soon after, at the breaking up of the gothic kingdom of Italy, they occupied Rhetia also. The Burgundians however, on submitting to the Franks, made conditions for themselves, by which they remained as a distinct nation, retaining their laws, usages, and privileges. The king of the Franks assumed the additional title of King of Burgundy. Several governors, with the title of Duke or President, were appointed by the Merovingian kings of the Franks to govern the various divisions of Helvetia. That part of the country which belonged to the kingdom of Burgundy was called Transjurane Burgundy, the country between the Aar and the Rhine was called Alemannia, and Rhetia formed another distinct division. When the Frankish empire became divided into several kingdoms, Transjurane Burgundy formed part of the kingdom of Orleans, while the rest of Helvetia was attached to the kingdom of Austrasia or of Metz.

The Burgundian part of Helvetia became converted to Christianity soon after the establishment of the Burgundian kingdom, towards the end of the 5th century. The Alemanni of Eastern Helvetia remained much longer in the rude heathenism of their Teutonic ancestors. Towards the beginning of the 7th century, the Irish monk Columbanus, and his disciples, preached the Gospel to the Alemanni of Helvetia, and as they made progress among them they broke the images of their god Wodan, and built chapels in various parts of the country. This was the origin of the afterwards celebrated churches and abbeys of St-Gall, Disentis, Seckingen, Glarus or St-Hilarius, St Leodegav of Luzern, and the Münster of Zürich. The monks taught also the rude natives to cultivate the soil, to sow corn, to plant the vine, and other useful arts.

Under the successors of Charlemagne, the feudal system was established in Helvetia. The counts or governors however soon made themselves hereditary; they became suzerains of their respective districts, of which they were before only magistrates; they took possession of the crown lands, and received the fees of the crown tenants, who became vassals of the local lord. The abbeys and monasteries likewise had their own vassals, many of whom, being originally small proprietors of allodial property, preferred placing themselves under the protection of the church.

When the Frankish empire became divided among the successors of Louis le Debonnaire, in 840, German or Eastern Helvetia fell to the share of Louis of Bavaria, and continued afterwards attached to the duchy of Suabia. Burgundian Helvetia fell to the lot of Lotharius, who had the title of emperor and king of Italy.

The chief events in the history of Switzerland may be conveniently given in the form of a chronological table:—

889. Rudolf, count of Transjurane Burgundy, was proclaimed by the bishops and lay lords of his government, assembled at St-Maurice, in the Valais, King of Upper Burgundy. This new kingdom of Burgundy lasted till 1016, when Rudolf III, having no male issue, made over his kingdom to the emperor Henry II.

1097. Berthold of Zähringen, a great Suabian lord, is made by the emperor Henry IV., 'kastvogt,' or warden, of the town and district of Zürich, and afterwards his son Conrad of Zähringen is made landgraf of Burgundy.

1152. Frederick of Hohenstauffen appoints Berthold IV. of Zähringen imperial warden of the bishoprics of Lausanne, Geneva, and Sion.

1178. Berthold IV. of Zähringen builds Freyburg.

1191. Berthold V. incloses the town of Bern.

1218. Frederick II. gives imperial charters to the towns of Bern, Soleure, Basel, and Schaffhausen.

1264. Rudolf of Habsburg, by various inheritances, becomes one of the most powerful lords in Helvetia.

1273. Rudolf is elected emperor. He favours the independence of the towns.

1291. Death of Rudolf. His son Albert, desiring to annex the free towns and their territories to his patrimonial estates, attacks Bern and Zürich, but is repulsed.

1300. The three forest cantons, Schwyz, Uri, and Unterwalden, which had been for ages free communities under the protection of the empire, refuse to acknowledge Albert as their duke.

1307. Werner Stauffacher of Schwyz, Walter Furst of Uri, and

Arnold von Melchthal in Unterwalden, conspire to free their country from the tyranny of Gessler. William Tell kills Gessler.

1308. The insurrection of the Waldstätter, or Forest Cantons. Albert's officers are driven away, and their castles razed. Albert, whilst preparing to march against the Waldstätter, is murdered by his nephew, John of Habsburg.

1315. Leopold, son of Albert, defeated at Morgarten by the people of the Waldstätter, who begin to be called by the general name of the Schwyzers. Federal pact of Brunnen, among the three Waldstätter.

1332. Luzern joins the confederation of the Waldstätter as the fourth canton.

1351. Zürich and Glarus join the confederation, and the Zurichers defeat Duke Albert of Austria.

1352. Zug and Bern join the confederation as the seventh and eighth cantons. A federal Diet is appointed.

1386. Leopold II. of Austria marches an army against Luzern, and is defeated and killed at Sempach, on the 9th of July.

1388. The Austrians invade Glarus, and are defeated at Näfels.

1389. Truce of twenty years between Austria and the Swiss.

1415. The Swiss cantons invade the Aargau, which they divide among themselves. Origin of the subject bailiwicks.

1418-22. The people of the Waldstätter invade the Val Levantina and other valleys south of the Alps, which they constitute subject bailiwicks.

1422. The Valais becomes an independent state allied to the Swiss cantons.

1424. The Graubund ('Gray league') formed at Trons gives its name to the whole of Rhetia.

1436. Death of the last count of Toggenburg. Civil war between Zürich and the other cantons.

1444. Siege of Zürich by the confederates. A large force of mercenaries under the Dauphin attack Basel. Battle of St-Jacob. The Dauphin makes peace with the Swiss.

1446. Peace between Zürich and the other cantons.

1452. A fresh war between Austria and the cantons. Austria loses Rapperschwyl, Freyburg, and Thurgau. Duke Sigismund of Austria mortgages to Zürich the town of Winterthur, his last remaining possession in Helvetia.

1457. Mühlhausen, an imperial town of Alsace, forms an alliance with the Swiss.

1475. War between the Swiss cantons and Charles the Bold.

1476. (March). Defeat of the Burgundians at Granson. (June). Battle of Morat; total defeat of Charles.

1478. Battle of Giornico, in which the Swiss defeat the troops of Milan.

1481. Convention of Stans. Soleure and Freyburg admitted as cantons.

1495. The Swiss refuse to furnish the emperor Maximilian I. with a contingent of troops for his war against France.

1499. War between Maximilian and the Swiss. The Imperial troops being several times defeated, Maximilian makes peace. This was the last war which the Swiss had to sustain for their independence.

1501. Basel and Schaffhausen are received into the confederation.

1513. Appenzell is also admitted, and completes the number of thirteen cantons composing the Helvetic or Swiss confederation, which existed till the French revolutionary invasion of 1798. The 'socii,' or states associated to the confederation with vote in the diet, were the abbot of St-Gall, and the free cities of St-Gall, Mühlhausen, and Biel, or Bienna. The allies without vote were Geneva, Neufchâtel, the Valais, and the Grisons.

1523. Zürich adopts the doctrines of the Reformation.

1528-30. The towns of St-Gall, Bienna, and Mühlhausen, and the cantons of Basel and Schaffhausen proclaim the Reformation; Glarus and Appenzell remain divided between the two communions.

1531. War between the Roman Catholic and the Reformed cantons on the subject of the election of a new abbot of St-Gall. The troops of the Reformed cantons are defeated at Cappel with great loss. Peace of Bear.

1532. Helvetic confession of faith proclaimed by a synod held at Bern.

1535-36. Bern, as an ally of Geneva, makes war against the duke of Savoy, and takes the Pays-de-Vaud from the Duke of Savoy.

1538. Calvin and Farel expelled from Geneva.

1541. Calvin is recalled. The Reformation adopted at Geneva.

1603. The Duke of Savoy acknowledges the independence of Geneva.

1648. The emperor acknowledges, in the treaty of Westphalia, the Swiss Confederation as an independent state in Europe.

1653. Second war of religion in Switzerland. Battle of Willmergen; the Protestants defeated. Peace made.

1710. The district of Toggenburg revolts against the abbot of St-Gall, and is supported by the Reformed cantons.

1712. Third and last war of religion in Switzerland. The Bernese defeat the troops of Luzern and the Waldstätter at Willmergen. The Roman Catholic cantons sue for peace, which is concluded at Aarau, in August, 1712.

1793. The French invade the territory of the bishop of Basel, and annex it to their new republic.

1797. General Bonaparte seizes upon Valtellina, Chiavenna, and Bormio, which were subject to the Grisons, and annexes them to the Cisalpine republic. In the meantime another body of French troops occupies the free town of Bienne, an ally of the Swiss.

1798. Democratic revolution at Basel. Insurrection in the Aargau. Diet held at Aarau, the last of the old Confederation. The French general Ménard, with 15,000 men, enters the Pays-de-Vaud, and proclaims its independence. The French enter Bern, and spread over the greater part of Switzerland. The Forest cantons refuse to submit; the French attack them, and are repulsed at Rothenthurm by Aloys Roding. In September a large French force under Schauenburg invades the district of Nidwalden, or Lower Unterwalden, the inhabitants of which made a desperate resistance, and most of them were slain.

1799. The Austrians and Russians enter Switzerland, and drive the French from the central cantons. Massena defeats the Russians at Zürich in September. Suvarrow enters Switzerland from Italy by the St.-Gothard, but is obliged to retire into the Grisons.

1801. Peace of Luneville; the French evacuate Switzerland. A new federal constitution is proclaimed, but rejected.

1802. Bonaparte, first consul of France, offers his mediation to the Swiss. The Act of Mediation is framed and accepted, constituting Switzerland into nineteen cantons, upon an equal footing, under the protection of France. The Valais, Geneva, Neuchâtel, and other districts, are annexed to France.

1813. After the battle of Leipzig the allied troops pass through Switzerland on their way to France. The allied sovereigns refuse to recognise Napoleon's Act of Mediation.

1815. The allied powers at the Congress of Vienna acknowledge the independence of Switzerland within its former limits. New confederation of twenty-two sovereign cantons, represented in a Federal Diet, ordered to assemble at least once a year, by turns at Bern, Zürich, and Luzern, and to discuss all matters internal and external concerning the general interest of the confederation. The Diet was vested with power to declare war, make peace, and form alliances with foreign powers. No canton allowed to take up arms against another, but all serious differences between one canton and another must be referred to the Diet. Each canton had a single vote in the Diet, in which measures were carried by a simple majority. The executive council of the canton in which the Diet assembled in any year, and which was styled the Vorort, or directing canton, had to carry into execution the resolutions of the Diet, and otherwise to provide for the well-being of the confederation during the prorogation of the Diet.

1830-31. Most of the larger cantons, whose representation was based upon the principle of property, effect a change by which universal suffrage is established. The proposed change finds a strong opposition in Basel, in consequence of which the town separates itself from the country districts, which form themselves into a separate republic, or half canton. Neuchâtel, after some bloodshed, retains its old constitution under the king of Prussia, who is prince of Neuchâtel. Geneva retains its constitution with a small property qualification for electors. The Forest cantons retain their pure democratic form, with general assemblies of the whole male population.

1832. The Diet decides to revise the Federal Pact, and the Catholic cantons of Schwyz, Uri, and Unterwalden, from distrust of the influence of the radicals (whose object was to establish a closely united republic worked by a central government) form the League of Sarnen, which was subsequently joined by Luzern, Freyburg, Zug, and Valais.

1834-36. Polish and other political refugees endanger the neutrality and tranquillity of Switzerland, and are expelled.

1839. A new law comes into operation, to establish a system of education independent of the clergy. It is opposed at first by the Protestant pastors, who in Zürich put themselves at the head of the peasants, and effected a dissolution of the radical government. The Jesuits, who were the chief instructors in the canton of Luzern and some other Catholic cantons, become in consequence of this law, direct marks of radical antagonism.

1844. Aargau demands the expulsion of the Jesuits from Switzerland, and is supported in the Diet only by the half-vote of Bâle-Campagne.

1845. The radical party, in order to effect the expulsion of the Jesuits, organise bodies of armed men called the Free Corps, which, commanded by colonel Ochsenbein, invade Luzern and are defeated. The radical cantons refuse to dissolve the Free Corps.

1846. The League of Sarnen dissolved, and the *Sonderbund*, or separate League of the Seven Catholic Cantons, formed for mutual defence against the Free Corps.

1847. A resolution from Geneva (in which a revolution had taken place, giving the radical party the supremacy in that canton) is adopted by the Diet, which decrees (July 29) the illegality of the *Sonderbund*, and (Sept. 3) the expulsion of the Jesuits. The *Sonderbund* protests, and both parties are for war. The federal army under general Dufour defeats the forces of the *Sonderbund* at Freyburg (Nov. 18) and at Luzern (Nov. 24), whereupon the leagued cantons submit, and are made liable for all expenses of the war; the monasteries are suppressed, and the Jesuits expelled.

1848. (Sept. 12). Promulgation of a new constitution.

By this constitution the sovereign power is vested in the Federal Assembly, which consists of two chambers, the National Council and the Council of State, or Senate. The National Council consists of

members, elected by the cantons for three years, in the proportion of one member for every 20,000 inhabitants, the half-cantons returning one member at least; and when a canton has a surplus population amounting to 10,000, it is entitled to have an additional representative. The Council of State consists of 44 members, two representatives for each canton, the half-cantons returning only one each. The confederation, represented by the two councils, alone has the right to declare war and make peace, and to settle matters between the cantons and foreign governments. The federal assembly chooses, from among the citizens eligible to the national council, the Federal Council, which consists of seven members, and holds office for three years. The federal council is the ministry of the confederation; its members conduct the departments of politics, the interior, the military, finance, commerce and customs, public works, justice and police. The president and vice-president of the federation, and of the federal council, are named annually in a united sitting of the federal assembly, and may not be re-elected for the space of a year after their term of office expires. The Federal Tribunal, also appointed by the federal assembly for three years, consists of 11 members and 11 substitutes. This tribunal decides in civil matters between the cantons, between these and the confederation, between the cantons and private parties, and in suits arising about the reception of the Heimathlosen. For criminal business it is divided into sections. On the 23th of Nov., 1848, the city of Bern was chosen as the federal city by both chambers of the federal assembly.

SWORDS. [DUBLIN, County of.]

SYBARIS. [CALABRIA.]

SYDENHAM. [KENT.]

SYDLING, ST. NICHOLAS. [DORSETSHIRE.]

SYDNEY, New South Wales, the capital of the colony, a city and sea-port, in the county of Cumberland, is situated on the south shore of Port Jackson, an inlet on the east coast of Australia, in 33° 50' S. lat., 151° 10' E. long., distant about 13,000 miles from Great Britain by the Cape of Good Hope. The city is governed by 6 aldermen and 24 councillors, one of whom is mayor; and sends two members to the Provincial Parliament. The population in 1838 was about 20,000; in 1846 it was 38,358; in 1851 it was about 50,000.

The harbour of Port Jackson, entered by a narrow passage between the North and South Heads, two bold headlands in the precipitous coast-line, is completely protected from easterly winds and the swell of the Pacific by a third point called Middle Head, which stretches from the south shore just within the entrance. On south head there are a lighthouse and signal station; the light, which is 345 feet above the sea-level, is seen at 30 miles' distance. The harbour affords excellent anchorage in all parts for vessels of any burden. Within the entrance, which is less than a mile in breadth, the harbour suddenly expands to a width of 3 miles, and at 7 miles inland contracts to a width of a mile and a half. Here two ridges and an intervening level—bounded by Woolloomooloo Bay on the east, and Darling Harbour, a deep inlet, on the west, with Farm Cove and Sydney Cove part—form the site of the city. George-street, the chief business part of the town, is a fine thoroughfare nearly two miles long. The houses, many of which are small, are constructed of wood or brick, or of sandstone. There are several handsome streets, containing many good dwelling-houses and shops. The city is well paved, lighted with gas, and supplied with water by a tunneled aqueduct nearly 2½ miles long.

In the vicinity of Sydney are numerous suburbs. The ridge of the west promontory is occupied by Dawes's Battery. Macquarrie Fort stands at the point of the eastern promontory, on the summit of which is the government-house, a handsome edifice lately erected in the gothic style. A principal place of public resort is Hyde Park, an inclosed common on the south side of the town. The Botanic Gardens comprise a rich and well-arranged collection of shrubs and flowers. The cathedral church of St. James's, a plain brick building with a lofty spire, stands on the north side of Hyde Park. St. Philip's church, the oldest in the colony, was built in 1798. The Roman Catholic cathedral, an imposing gothic structure, stands near St. James's. There are several chapels for Scotch Presbyterians, Independents, Methodists, and Baptists. Sydney college in Hyde Park, and the Australian college, afford superior instruction in classics, mathematics, and English literature. There are also a normal institution, some free schools supported by government, a female school of industry, and a mechanics institute. The other public buildings are—the court-house, the council chambers, the new market-place, the custom-house, the colonial offices, the jail, the new military barracks, the convict barracks, the colonial hospital, the lunatic asylum, the asylum for the aged and infirm, the theatre, the museum, the Australian library, and the commissariat store, an extensive stone building, into which the largest vessels may discharge their cargoes. The manufactures of the city are coarse woollens, tallow, soap and candles, starch, tobacco and snuff, hats, and ropes. There are several breweries and distilleries, tanneries, coach-works, saw-mills, and flour-mills. The adjacent heights are occupied by a number of windmills, and at Canterbury, 4½ miles from the city, there is a large manufactory for

the refining of sugar. Sydney is the emporium of the coasting and foreign trade of the colony. Steamers ply between the city and various ports along the coast. Regular communication is kept up with Great Britain by the Australian mail steamers. The harbour for merchant vessels comprises the two inlets of Sydney Cove and Darling Harbour, which afford a convenient line of wharfage nearly two miles in length, and admit ships of the largest tonnage to the wharfs, where their cargoes are transferred into stores. At Cockatoo Island, a convict station at the mouth of the Paramatta River, a range of stone quays has been built by the prisoners, and excavations made for an extensive dry-dock. The principal export is wool. The produce of the gold-fields of New South Wales is shipped at Sydney. Oil and whalebone from the southern whale-fishery, and timber, are exported in considerable quantities. The imports are principally articles of British manufacture, grain and provisions, tea, coffee, and sugar.

The number and tonnage of vessels registered as belonging to the port of Sydney on December 31st 1854 were:—Sailing-vessels, under 50 tons, 161, tonnage 4107; above 50 tons, 180, tonnage 32,082; steam-vessels, under 50 tons, 8, tonnage 242; above 50 tons, 15, tonnage 2808.

Sydney is the seat of government, of the legislature, and of the supreme court of justice for the colony of New South Wales. The mean temperature of the city is 74° Fahr. in summer; 55° 5' in winter; 66° 8' for the whole year.

SYDNEY. [CAPE BRETON.]

SYENE. [EGYPT.]

SYLFIELLEN. [SWEDEN.]

SYMPHORIEN DE LAY, ST. [LOIRE.]

SYRA, or SYROS, one of the Cyclades Islands in the Ægean, lies south of Gyarus, and between Ceos and Tenos. Homer and other Greek poets describe the island as rich in pastures, wine, and corn. Homer ('Od.' xv., 402), says it contained two towns. There are still ruins of one of the ancient towns, and many valuable relics of antiquity have been discovered in this small island. The surface is hilly, the soil fertile, and the climate mild; trees never lose their verdure. The principal products are corn, wine, oil, cotton, and fruits. The inhabitants, who previous to the year 1821 amounted to about 5000, are Roman Catholics. In the revolutionary war with the Turks, Syra remained neutral, and the population then soon rose to about 40,000, Syra having become the central point of the commerce of Greece. After the pacification, the commerce of Syra declined. The chief town of the island Syra, or Asprana, built on the east coast round a conical hill above the harbour (which is good), is still an important position. Near it is the fountain celebrated of old, gushing in a limpid stream from the solid rock. Syra has wide, clean, well-built streets; it is the residence of a Catholic bishop, and has several Catholic churches, and a lazaretto. French steam-boats from Marseille to Constantinople put into Syra.

SYRACUSE (*Siracusa*), a town on the east coast of Sicily, 30 miles S.S.E. from Catania, and about the same distance N. by E. of Cape Passaro, the southern extremity of Sicily. Ancient Syracuse, in the time of its splendour, was the largest city in Sicily, and one of the largest in the ancient world: it was of a triangular form, and consisted of five towns, adjoining one another, but separated by walls: the oldest of these towns was Ortygia on the peninsula, originally an island of an oblong shape, about two miles in circumference, lying between the Great Harbour on the west, which is a splendid piece of water about five miles in circumference, and the Little Harbour, which was paved with marble flags, on the east. On the other side of the Little Harbour was the town of Acradina, which extended for about three miles to the eastward along the sea-coast, until it reached a bay, where was the port Troglus, outside of the city. The western part of Acradina, adjoining Ortygia, stood on low ground, on a level with the island; but the remaining and larger portion of it lay on a range of heights which stretch from the sea for several miles inland, and are divided from the lowland by a natural wall of rocks. North of Acradina, and inland, stood the town of Tyche, on the same range of heights as the upper part of Acradina, being divided from the latter only by a double wall and intermural road. Tyche extended inland to the northward for a length of above two miles, and at its western extremity was the Epipolæ, consisting of several commanding heights, which were inclosed and made into a vast fortress by Dionysius the elder. South-west of Tyche, in the lower ground at the foot of the heights, was Neapolis, or the New Town, which, at its southern end, adjoined the lower part of Acradina. The whole was surrounded by an external wall, the length of which was 180 stadia. Ortygia was the first part inhabited; but the population increasing, the island was joined to the mainland by a causeway across the narrow channel of the sea, and the neighbouring low grounds were built upon. Suburbs and gardens extended south of Neapolis to the mouth of the river Anapus, and beyond it, round the western shore of the Great Harbour to the steep peninsula of Plemmyrium, which faced Ortygia. After the Roman conquest, the population, having gradually decreased, became restricted to the original Ortygia and the lower part of Acradina, and all the upper city was already abandoned in the time of Augustus. The Saracens in the 9th century plundered and devastated Syracuse, which contained till

then about 100,000 inhabitants; and from that time Ortygia, or the island, has been the only part inhabited.

The greater part of the upper town of Acradina, especially near the sea, is now a naked dreary rock, the surface having been thoroughly cleared of the materials of the ancient city. No traces of antiquity, except some steps and a few courses of stones, not a vestige of a house, temple, or monument is to be seen on the extensive plain. The sea has undermined the shore, and the town-walls have fallen in and disappeared. Considerable remains of the external wall, built by Dionysius the elder, are seen farther north round Tyche and the Epipolæ. Not far from Scala Græca, at a place called Targetta, are the remains of a gate, whence a street can be traced across the site of Tyche to the ancient theatre at the other end near Neapolis. Traces of other streets are also seen, with foundations for walls cut in the rocks. The fields within and near the external walls of this part of the town are covered with immense heaps of stones thrown confusedly together. On the outside of the walls a green slope reaches from the foot of the rock to the plain, and is covered with old olive-trees.

Between the upper and the lower parts of the town, and near the borders of Tyche, Acradina, and Neapolis, is the ancient theatre, hewn out of the solid rock, now half-hidden with bushes. Not far from the theatre are the remains of an amphitheatre of the Roman period; and nearer to Ortygia are the remains of the palace of the 60 beds, said to have been built by Agathocles. Near it are vestiges of the wide street mentioned by Cicero, which may be traced from the isthmus of Ortygia, and across the site of the upper town, to a spot called Santa Bonaccia, on the edge of the Portus Troglus.

The Latomæ were originally quarries excavated in the rocks that divide the upper from the lower town, from whence the stone for the construction of the city was drawn. They are from 60 to 80 feet deep. Some of them afterwards served as prisons; and on the surrender of Nicias the whole of the Athenian prisoners were confined in them and mostly died. The largest of these Latomæ is annexed to the Capuchin convent. Another Latomia is near the ancient theatre. On one side of it, cut in the rock, is the remarkable excavation called the Ear of Dionysius.

The catacombs are vast excavations, of very remote antiquity, for the purpose of burying the dead; they form subterraneous streets of tombs cut out of the solid rock. They were converted by the early Christians into places of refuge from persecution. The entrance to them is under the small church of San Giovanni, in the lower part of Acradina. This church is one of the oldest Christian churches in Europa. The catacombs were filled with tombs of the dead of all ages and faiths—Greek, Roman, Christian, and Saracen.

The aqueduct was begun by Gelon and enlarged by Hiero. The stream is brought in subterraneous channels from Monte Crimiti, outside of the Epipolæ, until it enters the walls at the place where the fort of Labdalum stood. It then appears above ground, being received into an aqueduct upon arches and conveyed to some mills, after which the water falls down the steps of the great theatre at Neapolis.

Outside of the walls, and on the left bank of the Anapus, near the Great Harbour, are parts of the shafts of two fluted columns of the temple of Jupiter Olympicus, which was enriched by Gelon with the spoils of the Carthaginians. There are other ancient remains scattered here and there, but of no ascertained character.

The modern town of Siracusa is fortified, and has a regular garrison, but is commanded by the height of Acradina. It is a bishop's see; has 14,000 inhabitants, narrow streets, numerous churches and convents, and other public buildings, the most remarkable of which is the cathedral, once the identical temple of Minerva, which was plundered of its ornaments by Verres. Its exterior dimensions are 185 feet in length and 75 feet in width. There are also some remains of Diana's temple near St. Paul's church.

A bath, with a spiral staircase about 40 feet deep, is seen in the church of St. Philip; and there are also vestiges of the baths of Daphne, in which the emperor Constantine was murdered in 868.

The celebrated fountain of Arethusa is a large pool of water, supplied by a spring, and separated from the sea by a wall, in the Ortygia, near the Great Harbour; and about 80 yards from it rises from the bottom of the harbour a copious spring, called L'occhio della Zilica, which, according to the ancient poets, was the Alpheus of Elia.

There is a museum at Siracusa containing the statues of the Lando-lina Venus and Æsculapius, some sarcophagi, a handsome collection of vases, inscriptions, coins, &c., and a public library.

Siracusa enjoys a delightful climate in winter, but the alluvial plain on the west side of the harbour, through which flows the Anapus, exhales pestilential miasmata in the summer months. The country around is very fertile. On the left bank of the Anapus is the fountain of Cyane, now called the Pisma: it is a circular basin of the purest water, about 60 or 70 feet in diameter, and 26 feet deep. The people of Siracusa carry on some trade by sea, but the place is by no means thriving. Some salt, wine, oil, and fish are exported.

Syracuse was founded about B.C. 735 by Archias, a Corinthian, the head of a colony of Corinthians and Dorians, who settled in the island of Ortygia, having overpowered the native Siculi. This settlement,

which afterwards extended to the mainland, was the origin of the great city of Syracuse. The city seems to have had an aristocratic government at first, the descendants of the original settlers holding the chief power in their hands. But about B.C. 492 a revolution took place, by which the aristocracy was expelled, and a democratic government established. This government however did not last long, for Gelon, tyrant of Gela, having taken the part of the exiles, marched to Syracuse with an army, and the people willingly opened the gates to him, when he was acknowledged as sovereign of Syracuse, B.C. 485. The rule of Gelon was temperate, and his reign was prosperous for Syracuse. He enlarged and embellished the town. Gelon was succeeded by his brother Hiero, whose administration was tainted with suspicion and tyranny.

Hiero's brother Thrasybulus, whose accession took place in B.C. 467, was driven away for his tyranny by the people after one year's reign. An assembly was then convened, in which a new constitution was framed, the public offices being filled chiefly by the ancient citizens.

In the year B.C. 427 the people of Leontini, being hard pressed by the Syracusans, applied to Athens for assistance. An Athenian fleet, with troops, was sent to Sicily, but after several desultory actions peace was made between Syracuse and Leontini, and the Athenian expedition withdrew. In B.C. 416 a quarrel between the towns of Eggesta and Selinus brought in the Syracusans, who took the part of Selinus. The Eggestans and Leontinians applied to Athens for aid. The Athenians declared war, and a formidable armament sailed for Sicily, B.C. 415. The Athenian expedition of 136 triremes, with a considerable land force, under Nicias, Alcibiades, and Lamachus, after sailing round Sicily, in quest of auxiliaries against Syracuse in vain, seized Catana, where they passed the winter. Meantime Alcibiades had been recalled, and the supreme command remained with Nicias. The Syracusans sent envoys to Corinth to request assistance, and both Corinth and Sparta resolved to send succour to Syracuse under Gylippus, a celebrated Lacedæmonian captain.

In the spring of B.C. 414 Nicias, having embarked his troops at Catana, landed a party of them in the bay of Thapsus, north of Syracuse, which took possession of the heights of Epipolæ, and built there a fort which they called Labdalum. They then began to build a wall from Port Trogius to the Great Harbour, so as to inclose Syracuse on the land side, whilst their fleet blockaded it by sea. In the meantime Gylippus arriving, marched against Epipolæ, seized the fort Labdalum, and annoyed the Athenians in their encampment. The Syracusans attacked the Athenian fleet at the entrance of the Great Harbour; the fight was not decisive; but Gylippus with his land forces surprised the forts which the Athenians had raised on the peninsula of Plemmyrium. Another sea-fight took place, in which the Athenian galleys were worsted. Soon after Demosthenes and Eurymedon arrived from Athens with a new fleet of 73 galleys and about 8000 soldiers. Demosthenes attacked the heights of Epipolæ by night, but was repulsed with great loss. After several discordant councils among the Athenian generals, it was resolved to embark the soldiers secretly and sail away with the fleet. The Syracusans having heard of this, attacked the Athenian fleet in the Great Harbour, and defeated it. Eurymedon was killed, and 18 Athenian galleys were taken. The Syracusans then blocked up the entrance of the Great Harbour by means of galleys and other vessels, connecting them together with chains, and thus shut up the Athenians. Nicias then resolved to fight his way out with the fleet. The Athenian vessels were heavy, those of the Syracusans light: the former, in trying to break through the chain, got crowded in one mass and became unmanageable; the crews were exposed to showers of stones from the enemy, the Athenian fleet was driven against the shore, and the greater part of it was taken or sunk. At last the Athenians resolved to abandon their remaining vessels and stores, their sick and wounded, and commenced their disastrous retreat. Of 40,000 men who had been engaged in the expedition, all were killed or taken prisoners, and not one of 200 vessels returned to Athens.

Of the prisoners all the free-born Athenians and the Sicilians who were with them were confined in the quarries; the rest, servants, followers of the camp, &c., were sold as slaves. Nicias and Demosthenes were put to a cruel death. The prisoners in the quarries receiving but a small pittance of barley-bread and water, and having no shelter by day or night, diseases broke out among them. The bodies of the dead were left to putrefy among the living, and this created contagion, of which most of them perished. Thus ended this formidable expedition, the ill success of which broke down the power of Athens, and had a great influence on the result of the Peloponnesian war.

After the defeat of the Athenians, Diocles proposed a law for the establishment of a democratic constitution in Syracuse, and compiled a criminal code of a very severe kind. This democratic constitution lasted very few years, for in B.C. 406 Dionysius was elected commander, and soon became tyrant of Syracuse. During the reign of this able and unscrupulous man, Syracuse reached the highest point of power and prosperity. Dionysius carried on long wars with the Carthaginians, whom he defeated and deprived of all their possessions in Sicily, B.C. 397. But the Carthaginians returned the following year, and after various successes laid siege to Syracuse by land and sea. A pestilence however broke out in their camp, and Dionysius taking

advantage of the calamity, defeated the besieging forces and burnt great part of the fleet, whereupon the Carthaginians withdrew, but peace was not made till B.C. 392. Dionysius also conquered several of the Greek cities of southern Italy, and removed their inhabitants to Syracuse. For some years previous to his death, in B.C. 367, he was again engaged in wars with Carthage. He was succeeded by his son Dionysius the younger, who was expelled by Timoleon. Timoleon established a government of mixed democracy and aristocracy. After Timoleon's death, B.C. 337, there was a period of twenty years marked by no very important events, till B.C. 317, when Agathocles, originally a potter, became autocrat of Syracuse. Agathocles was defeated by the Carthaginians at the battle of Himera, and immediately after closely besieged in Syracuse, from which sailing forth with a small force he carried war into the enemy's country, landing in Africa (August 15, 310 B.C.). He quitted Africa, where he was constantly victorious over the Carthaginians, B.C. 307, and returned to Sicily, which he soon reduced to subjection. After the death of Agathocles, B.C. 289, Syracuse recovered its independence, but being distracted by factions, the people chose, B.C. 275, for their prætor, Hiero, who was a descendant of king Gelon, and after five years more he was made king. He died B.C. 216. His son Hieronymus rashly quarrelled with Rome, and although he was murdered shortly after, his false policy was persevered in, and a Roman army, under Marcellus, laid siege to Syracuse, and took it in B.C. 212. From that time Syracuse was merely a town of the Roman province of Sicily. After the downfall of the empire it was taken and plundered by the Saracens (May 21, A.D. 878). Many ancient monuments were still remaining in 1693, when they were destroyed by an earthquake.

SYRACUSE, U. S. [NEW YORK.]

SYRIA (*Es Sham*), a country in Asia belonging to Turkey, is situated along the eastern shores of the Mediterranean, from 29° 45' to 37° 25' N. lat., 34° to 38° 45' E. long. The name Syria occurs in the Greek writers; the Asiatics call the country Beled-es-Sham, or 'country on the left.' The Mohammedans of Mecca direct their face to the rising sun when they pray, and then Syria, which they call Beled-el-Sham ('country on the left'), is to their left hand and Beled-el-Yemen, is on the right. The boundary of Syria towards the north is formed by the Amanus Mountains, which divide it from Asia Minor; towards the west by the Mediterranean Sea. The boundary between Syria and Egypt begins on the shores of the Mediterranean, south-west of the town of Gaza, and thence runs in an irregular line eastward across the desert, until it meets the Wady Arabah, which it crosses at the base of a high mountain, called Tor Hesma, about eight hours' journey from the head of the Gulf of Akabah. From this summit eastward Syria borders on the desert of Arabia, and in these parts the boundary is undefined, except by part of the Haj road from Damascus to Mecca. North of 32° 5' N. lat., Syria extends eastward to the desert, and includes the plain and mountain region of the Haouran, which extends to 37° E. long., and perhaps somewhat farther east. From the parallel of Damascus the boundary is considered to run north-east, passing about 20 miles east of Palmyra, and striking the Euphrates about 30 miles above Rakka. From this point the eastern boundary of Syria is formed by the Euphrates, which separates it from Mesopotamia. A rough estimate gives to Syria an area of about 70,000 square miles. The population is supposed to exceed a million and a half.

The situation of Syria is peculiar. It forms the greater part of an isthmus which separates a sea of water and a sea of sand. On the west extends the Mediterranean over more than 2000 miles. On the east is the desert of Syria and Arabia, which extends about 600 miles to the Persian Gulf and an inlet of the Indian Ocean. To the south of the isthmus lies the Red Sea, whose two great inlets, the gulfs of Suez and Akabah, penetrate deeply into the land.

The form of the surface is no less peculiar. The central part is furrowed by a longitudinal depression, or wide valley, which extends from the Gulf of Akabah, to the base of the Alma Dagh, where it terminates with the Lake of Bohhaire (36° 45' N. lat.). This long valley, which extends over more than seven degrees of latitude, is divided in the middle (between 33° 15' and 33° 25' N. lat.,) into two valleys by a high narrow ridge of mountains, the Jebel Arbel. The southern valley is traversed by the river Jordan on the greater part of its extent, and is in parts considerably below the surface of the sea. The northern valley is drained by the rivers Litany (Leontes) and Azy (Orontes). In its most elevated part, near the town of Bealbek, it attains an elevation at which in Europe corn can seldom be grown. The countries on each side of these valleys extend in some parts in elevated table-lands, in other places sink down into large plains, and again rise into mountains, the summits of some of which are always covered with snow. The changes which the surface and its productive powers undergo in Syria are almost innumerable.

Southern Syria extends from the southern boundary of the country to the Bahr-el-Huleh, or Lake Merom, the ancient Semechonitis (33° 10' N. lat.), and comprehends the southern valley, and the countries contiguous to it on the west and east.

1. The Southern Valley extends from the most northern point of the Gulf of Akabah to the Bahr-el-Huleh more than 250 miles in a

straight line, and is naturally divided into three sections by two deep depressions, which are occupied by two large lakes—the Dead Sea and the Lake of Gennesareth, now called Bahr Tabarieh, from the town of Tabarieh on its western shore, which occupies the site of the ancient Tiberias. The southern part of the valley, between the Gulf of Akabah and the Dead Sea, is called Wady-el-Arabah; the central portion, between the Dead Sea and the Bahr Tabarieh, El-Ghor; and the northern, or that part of it which extends from the Bahr Tabarieh to the Bahr Houleh, is called Wady Seisaban.

The Wady Arabah extends from south to north in a straight line for above 110 miles. Many were formerly inclined to think that, at some remote period, it had served as the channel by which the Dead Sea had discharged its waters into the Bahr Akabah, but if the physical condition of the region remains unaltered, this can never have been the case, as the level of the Dead Sea is considerably lower than that of the Red Sea. [DEAD SEA; RED SEA.] The watershed between the two seas occurs somewhat north of 30° N. lat., and is about 500 feet above the sea-level. On each side of the Wady-el-Arabah the mountains rise to a great elevation. Near the watershed those on the west attain 2000 feet; and those on the east rise to 3000 feet. In approaching the Dead Sea they increase in height, or perhaps it may be more correct to say that the level of the valley here sinks much lower. The distance between the two mountain masses varies considerably. Near the two extremities they are only 8 or 10 miles apart, but towards the middle the valley is 20 miles wide. The surface of the valley presents considerable varieties. South of the watershed it is generally level, but has a considerable slope from east to west, so that near the western mountains it is very little above the sea-level, whilst along the eastern it may be from 200 to 300 feet higher. About three miles from the Bahr Akabah the soil is strongly impregnated with salt, but farther north sand prevails, and is intermixed with pieces of granite, porphyry, and greenstone. After the rains the country produces some grasses, and supplies indifferent pasture for sheep, goats, and camels; but in several places low hills of moving sand occur, which are destitute of vegetation. North of the watershed there are some ridges of low hills running lengthwise through the valley, and dividing it into two valleys. In the western valley during the rains, there is a stream, called El-Jib, which at that season collects all the waters that descend from the eastern and western mountains, and carries them to the Dead Sea. A few acacia-trees, tamarisks, and a few mimosas and shrubs grow among these sand-hills. Water is found even in summer a few feet below the surface. In proceeding farther north, the Arabah does not appear to have any considerable descent towards the north, but it is longitudinally furrowed by a narrow valley, in the midst of which is the bed of the Jib. This narrow valley gradually sinks lower, so that at its northern termination it is 150 feet below the general level. Its width at the beginning is about one mile, but towards its termination hardly more than half a mile. The dry bed of the river, especially in the narrower part of the small valley, is overgrown with tamarisks, and in one or two places there are a few date-trees, but otherwise this tract is a desert. Near 31° N. lat. the general level of the Wady-el-Arabah descends abruptly about 150 feet, forming apparently a line of hills running east and west, and composed mostly of marl. All along the base of these hills there are springs of brackish water, which form a tract of marshy land towards the north. Between this salt-marsh and the Dead sea extends the most desolate portion of the Arabah. No trace of vegetation, no living creature is met with. At the base of the western mountains is a low ridge (called the mountains of Udum), in general about 150 feet high, which runs for about 10 miles parallel to the Wady Arabah and the southern portion of the Dead Sea, and which is one mass of solid rock-salt, covered with layers of soft limestone and marl, through which the salt often breaks out, and appears on the sides in precipices 40 or 50 feet high, and several hundred feet long. From the base of this chain of rocks, which is called Udum, there break out several rills of transparent water, which run to the Dead Sea, but the water is as salt as the saltiest brine. The tract between them, the bed of the Jib and the Dead Sea, is a perfect level, and extremely barren; but that on the east of the Jib is traversed by some rivulets descending from the eastern mountains, which have fresh water, and impart to the soil a considerable degree of fertility, so that there are some tracts which are cultivated. That part of the Arabah which lies north of 31° N. lat. is called El-Ghor, the lowest part of which is occupied by the Dead Sea. The region round this sea is intensely hot and very unhealthy in summer, where also it is barren and desolate in the extreme. In winter and early spring the shores of the Dead Sea present in parts considerable verdure. The Dead Sea and its shores are noticed in a separate article. [DEAD SEA.]

That portion of the *Ghor* which lies between the Dead Sea and the Lake of Tabarieh extends about 65 miles in a straight line. This valley is below the level of the Red Sea. The width of the valley is about 6 miles; but towards the Dead Sea it grows much wider. It is traversed by the river Jordan, the course of which is traced in the article PALESTINE (vol. iii., col. 51.) The mountains which inclose the valley on the east are steep and high: they are also high and steep on the western side for nearly half the length of the valley, beginning from the south; but farther north they sometimes sink

GEOG. DIV. VOL. IV.

down to low hills, and continue so for several miles. The river flows in a bottom about half a mile wide, and at least 40 feet below the general level of the Ghor. This bottom is overgrown with high trees, and exhibits a luxuriant vegetation of plants and grasses, which present a striking contrast with the sandy and bare slopes which border it on both sides. In winter, the river inundates the bottom, but never rises to the upper plain. In the well-watered parts of the upper plain, there is a luxuriant growth of herbage and wild grass, but the greater part of the ground is a parched desert. The most important articles of cultivation are wheat, barley, and dhurra. On the banks of the river there are willows, poplars, and tamarisks, and on the higher ground plantations of vines, pomegranates, &c. South of the ruined village of Richa (Jericho), and as far as the Dead Sea, the valley is nearly level, and the soil consists of clay impregnated with salt.

The Bahr Tabarieh, anciently called the Sea of Tiberias and of Gennesareth, is noticed under PALESTINE. It is surrounded with steep and lofty mountains, except on the south, and along the western shore, from the town of Tabarieh northward, where an undulating plain, with a width of a mile or more, intervenes between the mountains and the lake. A considerable portion of this plain is cultivated by means of irrigation, and produces wheat, barley, dhurra, tobacco, grapes, melons, and several kinds of vegetables. The heat in summer is excessive. Melons ripen four weeks sooner than at Damascus. Dates are also grown here. The water of the lake is slightly brackish, and some of the rivulets which descend from the western mountains are salt. There are also hot-springs.

The Wady Seisaban extends from the Bahr Tabarieh to the Bahr Houleh, about 15 miles in a straight line. About one-half of its extent is below the sea-level, as the bridge called Beni-Yakoub is 350 feet above the sea, whilst the Lake of Tabarieh is 572 feet below it. The higher grounds of the valley of the Jordan, which is here about two miles wide, are partly cultivated; and on the greater part of the cultivated tracts different kinds of vegetables are grown, especially cucumbers and gourds, which ripen three weeks sooner than at Damascus, where the produce finds a ready sale. There are many sakkum-bushes, and the thorny rhamnus (*Spina Christi*), in the lower part of the valley. The Bahr Houleh, the Merom of the Old Testament, is not large, and its extent varies according to the seasons. The low country which surrounds it to some extent is only inhabited on the eastern border, where the banks are overgrown with reeds and papyrus plants. The western and south-western banks are covered with a saline crust.

2. The Desert called El-Tyh-Beni-Israël (the Wandering of the Children of Israel) belongs partly to Syria and partly to Egypt, as the boundary-line between these two countries lies across it. It extends on the west of the Wady Arabah, and reaches southward to the Jebel-el-Tyh (29° 10' N. lat.), which is connected with the extensive mountain-masses of Mount Sinaï. On the north the Tyh extends to the elevated table-land of Judæa. The Tyh is a desert and elevated table-land between 1000 and 2000 feet high. Along its eastern border its surface is much furrowed by deep watercourses, or wadis; in some parts lower depressions occur. In such places verdure is found in winter, and trees all the year round. Some of the deep valleys are of considerable extent, and are visited by the Beduins in winter with their herds, and in summer for the purpose of collecting gum-arabic, which is carried to Cairo. The higher parts of the table-land have a hard gravelly soil without vegetation; and in many places there are low irregular ridges of limestone hills.

3. The Table-land of Judæa joins the Tyh on the north, and extends from the parallel of the southern extremity of the Dead Sea to 32° 30' N. lat., having on the east the Dead Sea and the Ghor, and on the west the Plain of Falastin. The dividing-line between the last-mentioned plain and the table-land is near 35° E. long. The elevation of this table-land diminishes as we proceed farther north. North of 31° N. lat., the desert of the Tyh passes insensibly into a fertile country. The table-land there extends into an undulating plain, occasionally interrupted by low ridges of hills, which in summer are barren, but a part of the year are covered with grass and rich pasture. The lower parts preserve their verdure all the year round. The plain is furrowed by valleys, which sink considerably below the general level, and are full of corn-fields, and vineyards and orchards that produce excellent grapes and figs. Corn-fields are also numerous on the higher grounds, but they are interrupted by large tracts of naked limestone rocks. This description applies to the interior of the table-land, as far north as Jerusalem, except that cultivation, and especially the plantations of olives, fig-trees, vines, pistachio-trees, apricots, pomegranates, oranges, and lemon-trees increase as we proceed farther north. The plains between the limestone rocks are covered with grass, which supplies pasture to sheep and goats, and herds of cattle, horses, asses, and camels. The mountains which form the eastern border of the table-land however, and extend along the Dead Sea, are a picture of desolation; they consist of yellow rocks without the least traces of vegetation. These mountains are distinguished from all other ranges of Syria by their summits, which do not present rounded masses, but rise in the form of pointed peaks and sharp edges, like the summits of the Alps. The barrenness which characterizes this tract extends over the whole table-land in

parallel of Jerusalem; for in this part even the mountains that form the western border of the table-land are comparatively barren, but farther south they are fertile.

North of the parallel of Jerusalem the unevenness of the table-land is much greater, and the hills frequently rise to the height of mountains. Such are the mountains of Ephraim (north of 32° N. lat.), which are covered with woods and bushes. The depressions between the hills are of considerable extent. The slopes of the surrounding hills are gentle, and generally susceptible of cultivation, which is effected by making terraces on their declivities. At a few places there are valleys, some between the hills, and others formed by the action of the rivers in the more level country. The country is much less naked than it is farther south; at several places forests consisting of high trees occur, and large tracts are covered with bushes. Cultivation is attended to in some degree, but large tracts lie waste. Fruit-trees are very common, and olive- and fig-trees in some places cover several square miles in extent.

There are two rainy seasons on the table-land. The early rainy season sets in about the beginning of November, and lasts till the beginning of January. The late rainy season sets in at the beginning of April and somewhat later. The winter is rather cold, and frost in January and even February is not rare. Snow falls also, and sometimes very heavily. The summers are very hot. The thermometer sometimes rises to more than 100°, when the dry south-east and east winds, which blow from the Arabian and Syrian desert, have continued for several days.

4. On the west of the table-land of Judæa is the Plain of Falastin, as the ancient country of the Philistines is still called by the Beduins. It extends from the Tyh, to the base of Mount Carmel, 150 miles, but the width varies greatly. It is widest on the south, where it is more than 60 miles across, or rather 120 miles, as it extends to the Isthmus of Suez and to the delta of the Nile. In the parallel of Gaza it is about 25 miles wide or somewhat more, but to the northward it grows gradually narrower, and near Mount Carmel it is only a few miles wide. The most southern portion of the plain, between the delta of the Nile and the town of Gaza is a scorched sandy desert, and the sand blown from it into the sea is the principal reason why all the harbours of the Syrian coast as far north as Cape Carmel are choked up, and admit only small vessels. On the sea-coast the desert terminates near Gaza; but at the foot of the table-land of Judæa it extends about 10 miles farther north. The fertile portion of the plain of Falastin consists of a tract extending along the sea, with an average width of 5 or 6 miles, as far north as 31° 40' N. lat., where it widens so as to reach the table-land of Judæa. A tract with a sandy barren soil, and an entirely level surface, extends along the sea; but farther inland the country is undulating, or interspersed with low hills, between which there often occur cultivable spots which contain plantations of fruit-trees. The most fertile part of the plain extends on both sides of 32° N. lat., and is known by the name of the Plain of Ramleh, or Rama. The soil, consisting of a reddish sand intermixed with gravel, has a considerable degree of fertility where it can be irrigated, and produces good crops of grain, figs, olives, pomegranates, oranges, and lemons; the water-melons of this tract are of superior quality. There are many date-trees, sycamores, prickly pears, and aloes. The surface is interspersed with numerous small isolated hills; only a comparatively small portion is under cultivation, for want of water. The most northern part of the plain, or the narrow tract between the base of Mount Carmel and the Mediterranean, has a still better soil, and, where cultivated, produces wheat, barley, and cotton; but a great part of it has been converted into a swamp by the rivulets descending from Mount Carmel, and not finding their way into the sea owing to a series of sand-hills which have been thrown up along the shore by the south-west winds, which prevent their discharge. These swamps make rich pasturage for cattle.

5. Mount Carmel is noticed in a separate article. [CARMEL.]

6. Between Mount Carmel and the north-east corner of the table-land of Judæa, which comes close up to the Lake of Tabarieh, extends the plain of Ebn Omer, the ancient plain of Esdraelon. At its eastern extremity, near the mountains on the banks of the Lake of Tabarieh, it is only from 5 to 6 miles wide; and in the middle of it rises a round isolated summit, Jebel Tor, or Tabor. Farther west the plain widens, and between Nazara (Nazareth) and Jenin it is nearly 15 miles wide. Its extent from east to west probably does not exceed 15 miles. At the foot of Jebel Tor the surface is 466 feet above the sea; but it lowers rapidly to the westward, so that the greater part of it has a very moderate elevation above the sea-level. The Nahr-el-Mekana (the ancient Kishon), which traverses the plain, inundates the adjacent country after the heavy rains, and converts it into a swamp; but the swamp supplies good pasture for cattle, which in this plain are of a larger size than in any other part of Syria. Though the soil is of considerable fertility, only a small portion of this tract is inhabited. Corn and cotton are grown. Near the base of the hills and mountains surrounding the plain there are forests of evergreen oak, and in these parts there are also plantations of fruit-trees.

7. To the north of the plain of Ebn Omer extends the hilly region of Galilee, which is the most fertile part of southern Syria. The surface presents great varieties. The hills rise with gentle acclivities, and subside into plains several miles in extent, or are separated by

wide valleys. The highest hills lie west and north-west of Nazara, which attain an elevation of from 1700 to 1800 feet above the sea. The town of Nazara is in a flat valley on the declivity of a hill, 876 feet above the sea-level. The whole region seems to be fit for cultivation, and a considerable portion of it is cultivated, though there are extensive tracts, especially in the smaller valleys, which are covered with forest-trees. Corn and cotton are extensively grown, and form considerable articles of internal commerce. The olive- and fig-trees cover considerable tracts. Date-trees do not succeed.

The country west of the southern valley, between Safed and Sur, is thus described by Dr. Robinson: After having crossed three valleys, a wide plain is entered by a considerable ascent. Volcanic rocks are dispersed over it, and they increase in number towards the north-west, until they cover the whole surface of the ground. In the midst of this plain is a depression, which seems to have been the crater of a volcano; the lowest part of it is occupied by a lake. The whole tract is entirely barren. From this high ground a descent leads into another basin-like plain of smaller extent, which is cultivated and surrounded by bushy hills, and separated by a valley from a high undulating table-land, the soil of which is fertile and cultivated, and which is inclosed by swelling hills covered with shrubs and trees. So far the country is drained by water running to the Bahr-el-Houleh. A higher ground, interspersed with hills, but otherwise presenting an almost level tract on the top, forms the watershed between the Bahr-el-Houleh and the Mediterranean. This tract is covered with dwarf oaks. The remainder of the country presents a succession of wooded hills and valleys, of which the cultivated portion is small, the whole being employed as pasture for cattle, which are so numerous, that butter is here used instead of oil, which is the case in no other part of Palestine. The hills are much more thickly wooded than in any other part of southern Syria west of the Great Valley, and fire-wood is a considerable article of export from Sur, to which it is brought from this country. In approaching Sur, an extensive undulating and well-cultivated region is passed, which is 1200 to 1500 feet above the sea-level. The slope from this high ground to the Mediterranean presents numerous ridges and valleys opening towards the sea, in which there are woods of prickly oak, maple, arbutus, and sumach, and extensive plantations of tobacco.

8. Along the Mediterranean extends the Plain of Akka, which begins on the south at the base of Mount Carmel, and extends northward to Ras-el-Abiad, a distance of more than 20 miles. Between Mount Carmel and the town of Akka (Acre) it may be four or five miles wide, but farther north it rarely exceeds two miles in width. The southern and wider portion has a sandy soil in the vicinity of the sea, but farther east it is tolerably fertile and moderately cultivated. In the northern district there are some stony tracts, though in general it is stated that the country possesses a considerable degree of fertility, but nearly the whole is uncultivated.

9. We pass to the east of the Southern valley. The most southern part of Syria is occupied by the extensive table-land of Petraea, which contains the mountain regions of Shera and Belka, which inclose the Wady Arabah, the Dead Sea, and the Ghor on the east, and also an extensive plain lying east of these regions, and continuing in that direction to the desert of Arabia. The Syrian Hadji road runs along the eastern declivity of the mountain regions of Belka and Shera, having on the east a continuous chain of hills called El-Zoble: thus the road traverses a long valley, in which, wherever there is water, wheat and durras are cultivated, and extensive plantations of vines are found. The El-Zoble range terminates on the south at the source of the river Modjeb, and farther south the Hadji road lies within the plain; but durras and barley are grown only at a few places, though in several other places, especially at Maan, there are large plantations of pomegranates, apricots, and peaches; with the exception of these isolated spots along the road, the plain is only used as pasture-ground by the Beduins.

The mountain region of Shera extends from Jebel Hesma to the river Modjeb, from 29° 40' to 31° 30' N. lat., between the Hadji road on the east and the Wady-el-Arabah on the west, and occupies about 20 miles in width. When seen from the Wady-el-Arabah it has the appearance of a high range, at least 1000 feet higher than the mountains which inclose the Wady on the west, or about 3000 feet above the level of the valley: but when seen from the east, or the great plain, the mountains appear only as hills a few hundred feet elevated above the level of the plain, which shows that the great plain of Petraea is also at a considerable height above the sea. The mountain region of Shera comprehends three districts, of which the southern properly is called Shera, that in the centre Jebel, and the northern Kerek. The southern part of this region consists of high ridges running generally from south-east to north-west, and separating deep and in some instances wide, depressions from one another. The largest of these depressions is that called El-El-Hoyyer, which is upwards of 12 miles across at its eastern extremity, but it is narrower towards the west. The surface is rocky and uneven, and it is intersected by numerous glens and by three or four valleys, watered by rivulets, which unite and flow into the Arabah. This basin is noted for its excellent pasture. Villages are rather numerous in these depressions, and are mostly inhabited by Beduin tribes, who have applied themselves to agriculture. They cultivate wheat, barley, and durras, and

their orchards contain apples, apricots, figs, pomegranates, olive- and peach-trees, and numerous vines. Dried figs and grapes constitute the principal articles of export, together with soda. The rivers which traverse this region generally contain water even during the summer, but it is only in winter that the water reaches the valley of the Arabah. The climate of this mountain region is extremely agreeable. The air is pure; and though the heat is very great in summer, and increased by the reflection of the sun's rays from the rocky sides of the mountains, yet the temperature never becomes suffocating, owing to the refreshing breeze which generally prevails. The winter is very cold, deep snow falls, and the frost sometimes continues to the middle of March. This part of Syria would be much better cultivated and more populous if the inhabitants were not exposed to frequent incursions of the Beduins of the eastern plain.

The mountain region of the Belka, the ancient Bashan, still abounding in pastures and woodlands, extends from the river Modjeb on the south to that of Zerka on the north, or from 31° 30' to 32° 20' N. lat. Its width between the Dead Sea and the Ghor on the west, and the Hadji road on the east, rather exceeds 40 miles. The eastern district, or that contiguous to the Hadji road, is little elevated above the road, and constitutes a barren sandy or rocky plain, most parts of which are interspersed with numerous low and isolated hills. Towards the north the plain has a chalky or clayey soil, and is covered with a rich verdure in winter. The western districts consist of a succession of ridges and deep valleys opening into the Dead Sea or the Ghor. The ridges occupy a much larger space than the valleys, and are generally level on the top. In a few places however high hills rise above them. The upper part of the ridges is bare of trees, and generally covered with flints. The narrow valleys between them are always wooded at the bottom, and sometimes on their declivities.

The northern district, or the country north of 32° N. lat., is an extensive mountain mass, whose highest part is in the middle of the tract, and is called *Jebel Jelaad* (Gilead). This higher ridge extends about ten miles from east to west, and near its most elevated summit, *Jebel Oba*, is what is called the tomb of the prophet *Hosea*, which is a place of pilgrimage for Turks and Christians. This mountainous country is almost entirely covered with high trees; oak, wild pistachio-trees, and many others not known in Europe. In scenery it resembles a European country. It has numerous springs and small rivers; some of the rivers run underground, as the mountains consist of limestone. On the southern declivity of this tract, and in the vicinity of the town of *Szalt*, are the only tracts in the Belka which are under regular cultivation, though some other places are occasionally sown with *dhurra* by the wandering Beduins. The numerous and extensive ruins show that cultivation was formerly carried on here to a great extent, and probably has been discontinued on account of the frequent incursions of the nomadic tribes who live to the east. At present the Belka is considered the best pasture-ground in Southern Syria; and the most powerful tribes of the Beduins are frequently at war with one another for the possession of this region. Wheat, barley, and *dhurra* are cultivated. The vineyards are extensive near *Szalt*. *Sumach* and *soda* are collected. The climate of the Belka is as pleasant as that of the *Shera*, and the winters are as cold.

10. The *Haouran* is to the east of the *Ghor*. Along the valley it extends from 32° 21' to 32° 45' N. lat., but where it borders on the Syrian desert, which lies between it and the valley of the *Euphrates*, it advances as far north as 33° N. lat. It consists of two mountain-regions, the *Jebel Ajelun* on the west, and the *Jebel Haouran* on the east, and a plain which lies between the mountain-regions.

The *Jebel Ajelun* extends about 80 miles south and north, and about as many east and west. It is the most mountainous district of Southern Syria, and the best cultivated to the east of the southern valley. The highest part of the mountains is towards the south, north of the river *Zerka* (the ancient *Jabbok*), where the mountains of *Moerad* and of *Jebel Ajelun* rise much above the *Jebel Jelaad* of the *Belka*. The whole surface is a succession of mountain masses and valleys, and the valleys are rather large: the region is abundantly watered by streams, which either originate in this region or traverse it in its width, flowing from the plain of *Haouran* to the *Jordan*. Wheat and barley are extensively cultivated in all the lower grounds, and in some places on terraces made on the declivity of the mountains. There are numerous plantations of olives and vines. The orchards contain pomegranates, figs, lemons, oranges, and other fruit-trees. Every kind of vegetable is grown. The climate of the valleys is very hot in summer. The thermometer rises to 100° in the shade. The sides of the mountains are chiefly covered with wood, consisting of oak, wild pistachio, walnut-trees, and several kinds not found in Europe.

The Plain of the *Haouran*, which extends east of the *Jebel Ajelun*, is a level, the northern part of which is frequently interrupted by isolated hills, which however are less numerous towards the south, and at last disappear entirely. These southern districts have a very sandy soil, and are almost uninhabited. But the northern districts have a soil consisting of a fine black earth, which possesses a considerable degree of fertility, but is very little cultivated. A village is built at the foot or on the declivity of almost every hill, but very few of them are inhabited. It frequently happens that these habitations are taken possession of by some wandering peasant for a short time.

The *Haouran* peasants do not fix themselves in one place: they wander from one village to another, and they find commodious dwellings in the ancient deserted houses. They are chiefly induced to change by the exactions of the Beduin tribes, who are considered the true proprietors of the plain. During the winter the plain produces excellent pasture for the herds of the Beduins. There are no trees. The cold in December and January is severe.

The *Jebel Haouran* is much less extensive than the *Jebel Ajelun*. It extends from 32° 25' to 33° N. lat., but no part probably is more than 12 miles across. It is surrounded by plains, which are lower than the base on which the mountains rise; though the cold of the winter proves that they are at a considerable elevation above the sea. The mountain region is covered with several ridges running in different directions. The highest part of the mountain-system is near 32° 40' N. lat., where the *Kelab Haouran*, a summit in the form of a cone, rises considerably above the lower ridge on which it stands. It is wooded on the north and west, but bare on the east and south; and this observation applies to the whole mountain-region. In its present state only the northern and western base of this region are inhabited and cultivated, and cotton and tobacco are extensively grown. Wheat, barley, *dhurra*, and beans are cultivated. The wood with which the mountains are clothed is only stunted oak. In the mountains there are extensive pasture-grounds, even where there are no trees, and a great number of uninhabited villages and towns occur, the houses of which are generally in a tolerable state of preservation. East of the *Jebel Haouran* is the Syrian desert.

Central Syria extends from 33° 10' to 34° 40' N. lat. Within its limits are *Libanus* and *Antilibanus*, and the southern and highest portion of the northern valley. To the east of the *Antilibanus* is the elevated plain of *Damascus*.

1. *Mount Libanus*, called by the natives *Jebel Libnan*, constitutes a continuous range of mountains, which begins a little south of 33° 20' N. lat., and, running to the east of north, terminates near 34° 40' N. lat., with a ridge of hills called *Jebel Shara*. The northern portion of the range is called *Jurd* (that is *Jebel*) *Baalbec*, and the southern *Jebel Sunin*. As the higher part of the range is destitute of trees, it is considered that its average elevation above the sea must be at least 8000 feet. The highest part of it occurs between 34° 10' and 34° 15' N. lat., and is called *Jebel Makmel*. It rises to more than 12,000 feet above the sea-level, and is covered with snow all the year round. The highest part of the range, which passes over the range to the east and north of the *Jebel Makmel*, is 7590 feet above the sea. This range of mountains, with its declivities extending eastward and westward, varies between 12 and 18 miles in width in a straight line, of which extent less than one-fourth lies on the east side of the highest crest, so that on this side the declivity is much steeper than on the west, where its offsets generally approach the shores of the Mediterranean and in a few places, as north of *Beyrut* and at *Ras-el-Shakka*, come close to the water's edge. On both sides of the range a terrace occurs somewhat about the middle of its height, which divides the Upper and Lower *Libanus*. The Upper *Libanus* usually presents only steep declivities, either entirely bare, or clothed with a scanty vegetation, but a few spots have a fine growth of grass, and in summer they are used as pasture-ground by the mountaineer Arabs who visit this place. The level ground which separates the Upper *Libanus* from the Lower is also generally without trees, but always covered with shrubs and grass. It contains small groves of cedars, not far from the northern base of *Jebel Makmel*, more than 6000 feet above the sea-level.

The Lower *Libanus*, to the west of the range, is one of the most interesting countries in Asia. That part of it which extends from *Beyrut* (33° 50' N. lat.) to *Tarabloc* (34° 25' N. lat.) is called *Kesrawan*, the most southern part of which is entirely in possession of the *Maronites*. The *Kesrawan* is very well watered. The water-courses however lie in very narrow and deep valleys, the sides of which rise with a steep ascent several hundred feet above the narrow level at the bottom. As these water-courses are very numerous, the ridges between the valleys are very narrow, and there is no level on their tops. The valleys, even where widest, never exceed a mile in breadth; but every cultivable spot is turned to account. The inhabitants build terraces on the declivities of the mountains to obtain a space of level ground, and to prevent the earth from being swept down by the winter rains, and at the same time to retain the water requisite for the irrigation of their crops. On these terraces and in the level spots of the valleys there are orchards, mulberry-plantations, vineyards, and fields of *dhurra* and other grain. The silk which is collected in these places is not inferior to any in Europe, and constitutes the principal article of commerce. The lower ranges and hills, with which the offsets of the *Libanus* terminate, are covered with plantations of olive-trees, but the narrow plain along the shores of the sea is generally not cultivated, except at the very base of the hills. There are however some small groves of date-trees. The higher parts of the ridges which separate the valleys are generally wooded with fir-trees.

The eastern declivity of *Mount Libanus* differs greatly from the western. It is furrowed by ravines, in which the water descends only during the rains. This part of the Lower *Libanus* is covered with

low oak-trees. On the narrow level plain which divides the Lower Libanus from the higher part of the range are some cultivated spots; other spots are planted with walnut-trees. Higher up the mountain is very steep, and vegetation scanty.

2. The Northern Valley, as far as it is included within Central Syria, extends along the eastern base of Mount Libanus in all its extent, or about 90 miles in length. South of Baalbec it is only from 2 to 8 miles wide. At Baalbec it is about 5 miles wide, and in the parallel of the northern extremity of the Antilibanus (near $34^{\circ} 25'$ N. lat.) more than 10 miles. It is naturally divided into two sections, as the waters of the southern districts run off to the south by the river Litany (the ancient Leontes), and the northern portion is drained by the Asy, or Orontes. The two river-basins however are not contiguous, for near 34° N. lat., and chiefly north of that parallel, is a tract about 12 miles in length, the waters of which do not reach either of these rivers, but are lost in the plain. This tract is the most elevated part of the valley; the town of Baalbec, which is built towards the southern border of it, is 3808 feet above the sea-level. The southern part of the valley (called the Bekaa) is watered by the Litany River, which rises about 5 miles south-west of Baalbec, in a small lake. The river has water all the year round, being supplied by several copious rivulets which descend from the western declivity of the Antilibanus. Where the valley terminates on the south, near the castle of Kalaat-el-Shkif, the river turns west, and reaches the Mediterranean a few miles north of Sur (Tyrus). The Bekaa is well watered and famous for its fertility; not more than a sixth part of it is cultivated; the greater portion serves only as pasture-ground for the Beduins and Turkmans, who pass the winter here, and ascend in summer to the upper declivities of the Antilibanus. The northern and wider portion of the valley is called Belad Baalbec. The soil of this tract is not much inferior to that of the Bekaa, but the proportion of cultivated land to that which is only used as pasture, or not used at all, is still less than in the last-mentioned district. Only a few villages occur in the middle of the valley, which, as well as the Bekaa, is destitute of trees; but there are numerous villages at the base of the mountains whence small rivulets descend and supply the means of irrigating the corn-fields and orchards.

3. The Antilibanus, which stands to the east of the valley just noticed, extends much farther to the south than the Libanus. It is divided into two portions by a long and narrow depression which occurs near $33^{\circ} 40'$ N. lat., and is called El-Bogaz (the Gorge). That portion of the range which lies north of the Bogaz, descends towards Belad Baalbec and the Bekaa with a very steep declivity, which is barren and destitute of wood except at a few places where rivulets descend in narrow glens: these glens are overgrown with trees. This part of the range has no great elevation. The highest point of the road which crosses the Bogaz from Beirut is only 3148 feet above the sea-level, and less than 1500 feet above the adjacent plain of the Bekaa. It does not appear that any part of the Northern Antilibanus exceeds 6000 feet in elevation.

The Southern Antilibanus attains a much greater elevation. At the distance of about 12 miles south of the Bogaz an extensive mountain mass, called Jebel-es-Sheik, is always covered with snow. This mountain-mass and its declivities cover a space of 20 miles from east to west. From the western declivity branches off a narrow ridge, which, towards the north, is called Jebel Arbel; but its southern prolongation, called Jebel Safed, terminates on the south with the elevated mountains which lie to the north of the town of Safed: its length is about 35 miles. South of the summit of the Jebel-es-Sheik lies an extensive mountain-tract, extending about 15 miles east and west, and as much to the south. It is mostly covered with thick wood, and only used as pasture-ground. From this mountain region a ridge runs southward, which is called Jebel Heiah, and which terminates with a hill, called Tel-el-Faras, in the elevated plain of Jolan, about 5 miles south of 33° N. lat. The two ridges of the Jebel Safed and of the Jebel Heiah inclose that part of the valley of the river Jordan which lies north of the Lake of Tabarieh, and is called Wady Seissaban. The road leading from Jerusalem to Damascus crosses the Jebel Heiah about 12 miles north of the Tel-el-Faras, and at this place it is perhaps not more than 500 feet above its base: but the plain on which it stands is from 3000 to 3100 feet above the sea-level. The mountains are covered with forests of small oak.

4. The Plains of Damascus lie on the eastern side of the Antilibanus, and extend as far south as the Haouran. They form an intermediate terrace between the mountain region and the low Syrian desert, which is farther east. At their southern extremity these plains extend to a distance of 70 miles from the range; but farther north their width is less. In the parallel of Damascus they are only 30 miles wide. North of Damascus the boundary diverges towards the east; but in these parts it cannot exactly be determined, as the desert sometimes approaches near the caravan road leading from Damascus to Aleppo, but generally remains at a considerable distance from it. It appears that many cultivable though uncultivated tracts occur as far east as Tadmor [PALMYRA], which is about 75 miles from the range of the Antilibanus.

The lowest part of these plains is about 12 or 15 miles east of Damascus, where an extensive lake, or rather swamp, occurs, called Bahr-el-Merdj, in which several rivers are lost that descend from the

eastern declivity of the Antilibanus, and from the Jebel Haouran, from north, west, and south. The most remarkable of these rivers is the Barrada, which brings down the waters collected on the eastern declivity of the Antilibanus between $33^{\circ} 15'$ and $33^{\circ} 50'$ N. lat. These waters unite at some distance from the foot of the range, in a wide depression of the plains, called El-Gutha, in which the town of Damascus is built, and which is the most productive spot in Syria, if not on the globe. Gardens and orchards, yielding all the fruits and vegetables of the most favoured parts of southern Europe, surround Damascus to the distance of several miles, the area which they cover being estimated at 130 or 150 square miles. The cultivated fields surrounding this forest of fruit-trees extend to a farther distance of some miles. The astonishing fertility of this tract is produced by the abundance of water, as the country is traversed by seven branches of the river Barrada, which always yield a copious supply of water for irrigation. As the town of Damascus is 2337 feet above the level of the sea, the climate is far from being so temperate in winter as is commonly supposed.

The most western portion of the plain between the southern extremity of the Jebel Heiah and the Jebel Ajelun, and from the Lake of Tabarieh eastward to the Hadji road, is called the Plain of Jalon. The ascent from the Lake of Tabarieh is very steep and long. The surface is uneven and undulating, and there are a few isolated hills. Several considerable tracts have their surface formed of rocks, which are commonly covered with a thin layer of earth, on which grass springs up after the rains, but which are quite bare at other times. Other districts have a fine soil, either black, gray, or red, and some produce rich crops. The greater part of them however is uncultivated and overgrown with a wild herb, on which cows and camels feed.

The plains extending east of the Hadji road, south of El-Gutha, are rather hilly in the northern districts, short and low ridges running in different directions. These parts contain several stony tracts, and others which might be cultivated, if water was abundant. The greater part is at present only used as pasture-ground. The southern districts, or those which approach the northern extremity of the Jebel Haouran, contain two extensive rocky regions, called Es-Szaffa, on the east, and El-Ledja, on the west, which are divided from one another by a wide valley called El-Lowa. The Lowa is traversed by the river Lowa, which originates in the Jebel Haouran and falls into the Bahr-el-Merdj. On its banks is a plain of considerable extent, which is covered with the most luxuriant herbage, and was formerly well cultivated, as is proved by the ruins of numerous villages and towns in the valley. But at present it serves only as pasture-ground for the Beduins, who occasionally cultivate some spots with dhurra.

That part of the Plains of Damascus which lies north of the Gutha is traversed by the road from Damascus to Aleppo. The road passes over two low ridges, which appear to be connected with the Antilibanus. The country through which it passes is in a few places covered with sand, but in general it has a rich cultivable soil, free from stones and sand, though, like all the plains of Damascus, it is destitute of trees and even of shrubs. Villages and cultivated tracts occur only at great distances.

Northern Syria, which lies north of $34^{\circ} 40'$ N. lat., differs in physical constitution from the more southern parts. A high mountain range runs along the Mediterranean. At the back of this is the northern portion of the Northern Valley, which is divided by a hilly tract, extending from south to north, from the Eastern Plains.

1. The Mountain Region of Northern Syria is divided into two portions by the lower course of the river Asy. The southern part, which comprehends about two-thirds of the whole, is known by the name of Jebel-el-Anzeyry, and the northern by that of Jebel Ahmar.

The Jebel-el-Anzeyry is divided from Libanus by a gap or depression, called El-Junie, which is about ten miles across nearly a dead level, swampy, and only used as pasture-ground by the Turkmans and Kurds. The Jebel-el-Anzeyry occupies with its branches the whole tract between the Mediterranean and the Northern Valley, and is in width about twenty miles or somewhat more, except towards the southern extremity where one of its offsets, Jebel Erbayn, branches off eastward, and terminates on the banks of the river Asy, near the town of Hamah. In this part the Jebel-el-Anzeyry is about forty-five miles wide. The highest part of the range lies in general close to the valley of the Asy, so that the space between it and the sea is filled up by numerous offsets, which sink down to low hills and inclose valleys of moderate extent. The principal chain terminates east of the town of Antakia, in the great bend of the Asy. Where it terminates it is connected with another chain of mountains, which rises a few miles north of the town of Latakia, and runs so close to the shores of the sea, that no road can be made along its western base. The declivities towards the sea are extremely precipitous and barren. It is the Mons Cassius of the ancients, and is now called Jebel Akrah. It attains an elevation of 5818 feet above the sea. The Jebel-el-Anzeyry nowhere exceeds 6000 feet above the sea-level. Its eastern declivity is generally very steep, and only covered with shrubs and low trees, but the western declivity is clothed with fine trees, and the wide valleys which lie between its offsets are cultivated or laid out in orchards and plantations of mulberry-trees.

Jebel Ahmar, or the northern portion of the mountain region, begins

on the Mediterranean, occupying the space between Ras-el-Khansir on the north, and Jebel Musa, the Mons Pierius of the ancients on the south. Near Ras-el-Khansir the summit called Jebel Keserik attains 5550 feet above the sea-level. From this summit the range runs north-east, but by degrees turns more to the north, so as to inclose the Gulf of Scanderoon on the east with a curved line. It joins the Alma Dagh about 10 miles north of 37° N. lat. Near 36° 30' N. the road between Scanderoon and Antakia traverses it, and the most elevated pass is 4063 feet above the sea-level. This range never exceeds five miles in width. The mountains generally descend towards the Gulf of Scanderoon with a gentle declivity, and approach near its shores, except towards the north, where a level tract about two miles wide intervenes, which gradually increases to the breadth of seven miles. This wider part is fertile and cultivated, and it is diversified with orange and lemon groves. The remainder is almost entirely uncultivated, but full of ruins.

2. The northern portion of the Northern Valley begins at the termination of Mount Libanus (34° 40' N. lat.) and Mount Antilibanus (34° 20' N. lat.). North of these places a level country extends across the whole breadth of Syria, from the Mediterranean to the Euphrates. It is quite destitute of trees; and though a great part of it is fit for cultivation, the extent of the cultivated tracts is small, which is mainly owing to the want of water.

The Jebel-el-Anzeyry begins in 34° 40' N. lat., and on the plain extending east of the river Azy a ridge of hills called Jebel-el-Aala rises near 35° N. lat. This last-mentioned ridge runs from south-east to north-west, and thus approaches the Jebel Erbayn, or eastern offset of the Jebel-el-Anzeyry, south of the town of Hamah, near 35° 5' N. lat. From this point the river Azy runs for 12 miles in a narrow valley, which is inclosed by rugged mountains, but it widens in some parts, and in one of these plains the town of Hamah is built. At the northern extremity of this valley the eastern ridge sinks down to the level of the plain, but two or three miles farther north it rises again under the name of Jebel Shaehabon, and here begins that fine valley which is called El-Ghab, and which is about thirty-five miles in length; its width is about five miles, but it grows narrower towards the north. The river flows near the base of the Jebel-el-Anzeyry, where it forms numerous marshes. In winter it inundates the level ground, through which it flows and leaves many small lakes. The valley is watered also by numerous rivulets. The villages are pretty numerous, and mostly built at the base of the mountains: they are surrounded by fields on which dhurra and wheat are grown. The remainder is used as pasture-ground for cattle and buffaloes. Large herds of buffaloes are kept in the swampy part of the valley. The wider valley of the Ghab terminates at Jebel Shogher, and hence the Azy runs northward in a narrow valley, which contains very little land fit for agriculture; but the sides of the mountains are covered with plantations of fruit-trees: those of mulberry-trees and olive-trees are very extensive.

Where the Azy emerges from this valley, and, turning north-west and west, flows along the base of the Jebel-el-Anzeyry, an extensive plain opens to the north, the ancient plain of Antiochia, now called El-Umk, which stretches to the base of the Alma Dagh. It is about 35 miles long, with an average width of 15 miles. Towards the middle of the plain is a deep depression, which receives all the rivers that descend from the mountains surrounding it on the east, north, and west, and form an extensive lake, called El-Bohhaire, the ancient Lake of Antiochia. It is about 12 miles long and 6 miles wide, and noted for its eels, which form an article of commerce. The country surrounding the lake rises in very gentle slopes towards the base of the Alma Dagh. The northern part of the valley is cultivated, and produces wheat, barley, and several kinds of pulse. The Lake of Bohhaire discharges its waters into the Azy by the Kara-su, which runs through the southern and lower part of the plain, which for the greater part of the year is nearly a swamp. No part of it is cultivated, and it is only used as pasture-ground.

The Umk constitutes the most northern portion of the Northern Valley, which is connected with the Mediterranean by the valley in which the Azy reaches the sea by a west-south-west course. This last-mentioned valley is nearly 30 miles long, and from 4 to 6 miles wide between the Jebel-el-Anzeyry and the Jebel-el-Ahmar. The river runs near the base of the Jebel-el-Anzeyry, and on its northern banks is an undulating country, generally well cultivated. Much tobacco is grown, and the plantations of mulberry-trees are extensive: other fruit-trees also abound. The Azy, from its source, about 12 miles north-east of Baalbec, to its mouth runs above 200 miles. After having entered the plain north of the mountain ranges, it falls into a lake called Bahr-el-Kades, which is about 6 miles long and 2 miles wide. The river is not navigated, but it is said that it could be easily rendered navigable for barges to a distance of 27 miles above Antakia. Its mouth is obstructed by a bar, over which there is from three and a half to nine feet of water in winter.

3. The Hilly Region, which extends to the east of the valley of the Azy and of the El-Umk, from the town of Hamah to the base of the Alma Dagh, may occupy about 10 miles in width, south of 36° 10' N. lat., but where it is contiguous to the El-Umk it is more than twice as wide. The southern portion has somewhat the form of a range, the limestone rocks rising to a considerable elevation, and inclosing valleys; but many of these hills are only covered with bushes, and

the arable grounds are not extensive. Barley and dhurra are grown. Vines are much cultivated, and grapes and debs are sent to Aleppo. The northern portion of the Hilly Region is an undulating country on a large scale. The limestone soil absorbs all moisture, and there are no watercourses. The country however is rather fertile, and yields good crops of wheat and other grain, and cotton of excellent quality. On the hills there are plantations of fig-trees and olive-trees.

4. The Eastern Plains occupy about two-thirds of the surface of Northern Syria, and extend from the Hilly Region to the banks of the Euphrates. They are divided into two parts by a ridge of low hills, the western part of which is called Jebel-el-Sis and the eastern Jebel-el-Has. This ridge is near 35° 50' N. lat., and appears to extend from the hills north-west of Hamah to the vicinity of the Euphrates. The southern part of the plain contains in the west large tracts of good soil, which cannot be cultivated for want of water; towards the east it gradually passes into a desert, which is divided from the Euphrates by a wooded tract several miles wide, and called El-Zawl, or Gharabat.

The northern part of the plain is of a different description. It is traversed by three rivers, two of which rise on the southern declivity of Alma Dagh, and run southward. The river *Sajur* drains the north-eastern portion of the plain. It rises north of the town of Aintab, brings down a great volume of water from the mountains, and falls into the Euphrates about 20 miles below Bir, after a course of about 80 miles. The *Kowak*, or *Kott*, also called the River of Aleppo, rises in one of the great offsets of the Alma Dagh, and runs with numerous windings through the plain southward, until, in approaching the Jebel-el-Has, it is lost in swampy ground, called El-Matkh. The third river, called *Zehab*, or *Duhab*, rises in a ridge of hills which run west and east, and terminate on the banks of the Euphrates south of the mouth of the Sajur. These hills compel the last-mentioned river to join the Euphrates. The *Zehab* runs southward, and after a course of about 40 miles falls into a salt lake called El-Sabkh, which is surrounded by low rocky hills. The lake is about 6 miles long and 2 miles wide. After the rains it inundates the narrow strip of land which in summer lies between its banks and the rocks; and when the water has been evaporated by the heat of the summer this narrow strip is covered with pure salt, in some places two inches thick. This salt is collected in the month of August, and extensively used over a great part of Syria. The surface of the plain is far from being level. Short ridges of low hills occur at several places, especially near Aleppo, the plain of that town being inclosed by such ridges on three sides. When the plain extends in a level, or in slight undulations, as is mostly the case, isolated hills, called 'tells,' which some consider to be artificial, are frequent. In their neighbourhood there are wells and villages. East and south of Aleppo the soil of the plain is very stony. West and south-west of Aleppo the soil is better, especially in the neighbourhood of the hilly range, where it yields abundant crops of wheat and other grain. To the north-west and north of Aleppo the soil is indeed stony, but the earth is deeper, and cultivation is rather extensive. The best part of the plain appears to be that which is contiguous to the road leading from Aleppo to Aintab. These plains are about 1000 feet above the sea-level, except near the Euphrates. Between Aleppo and Aintab the surface of the *Kowak*, at Toybeak, is 1263 feet above the Mediterranean; and that of the *Sajur*, farther east, 1363 feet. The Euphrates, below Bir, is only 628 feet above that sea.

In the plains the winter lasts from the 12th of December to the 20th of January. There is generally some slight frost; snow seldom rests more than one day on the ground. In February the vegetation is vigorous, and the trees are in blossom; but the spring soon passes, and at the end of May nearly all the smaller plants are dried up. From that time rarely a cloud passes over the clear sky, and the heat is very great. West winds are cool, east winds suffocating. The first rains occur about the middle of September, and are followed by settled and pleasant weather, which lasts from twenty to thirty days; but towards the end of November the later and more heavy rains set in, and continue to the beginning of the winter.

5. The Alma Dagh constitutes a portion of that extensive mountain range which the ancient geographers called Taurus. The Alma Dagh is the ancient Amanus. It lies along the boundary of Syria and Anatolia, and its crest is considered as the boundary between these two countries. The range occupies in width about 30 miles, of which the larger portion belongs to Anatolia. The mountains are very precipitous, and can only be traversed by beasts of burden in a few places. The most frequented road runs from Aleppo due north to Aintab, and thence over the Alma Dagh to Kaisariyeh and Angora. There are some mountain roads farther west, which are noticed in the article AMANUS. These mountains are well wooded. Many thousand acres are covered with large cedars, and in other places there are firs and juniper trees.

Products.—Most of these have been already incidentally mentioned. They comprise wheat, barley, dhurra, spelt, some rice, lentiles and other pulse, artichokes, melons, cucumbers, capsicum, potatoes. Among other products are—cotton, hemp, silk, madder, indigo, sesamum, castor-oil, tobacco, &c. Of fruits there are figs, olives, mulberries, grapes, almonds, apricots, peaches, pomegranates, oranges, lemons, dates, &c. Vineyards are numerous in the mountainous

districts and on the table-land of Judæa. The wine of the Libanus is of excellent quality. Zakkum and storax are grown in gardens. The most remarkable trees that are partly cultivated and partly grow wild are—sycamore, carobs, Indian fig, mulberry, and pistachio-trees. The mountain forests, where there are any, consist of cedars, firs, and pines. On the table-lands grow dwarf-oaks, which produce the best galls known; there are also the aserol, the walnut, the arbutus, the laurel, the terebinth, and several kinds of junipers. A good deal of scammony and sumach is gathered about Mount Libanus.

The domestic animals comprise horses, cattle, asses, sheep, and goats. Few horses are kept by the agricultural population; but the wandering tribes, the Arabs, the Turkmans, and Kurds, pay great attention to the breed of horses. The Arabian horses are noted for beauty and speed. The number of cattle is comparatively small, and, except in a few places, of small size. The asses and mules are of a large breed, and they serve as substitutes for horses in the transport of goods. Sheep and goats are very numerous. In Northern Syria that species is kept which has the large broad tail. Camels are found everywhere, even on Mount Libanus. Buffaloes are only found on the sea-coast between Beyrut and Tarablous, and in the Wady Ghab. Those which are kept on the sea-coast are large, and not inferior to those of Egypt.

Among wild animals, jackals, foxes, and hyenas are frequent in some parts of the desert mountains. There are bears on Mount Libanus and Antilibanus. Wolves are only found in the forests of Alma Dagh. Wild boars are very numerous in many parts. Deer are met with on the Alma Dagh and near Mount Tor, and in the desert parts are several kinds of antelope. In the mountains of the Belka the bouquetin (*Capra ibex*) is said to be very numerous. Hares and porcupines abound, and the *Dipus jerboa* is common in the southern deserts. There are several varieties of eagles. Partridges and pigeons abound in many parts, especially on Mount Libanus. In the mountains east of the Southern Valley there are immense numbers of a bird called katta, which is considered to be the Tetrao Alkatta. Several kinds of fish and shell-fish are found in the Mediterranean, but not in large quantity; but a considerable fishery is carried on in an inland lake of the Ghab, where a fish, called black fish (*Macropteronotus niger*), is so abundant, that annually, between October and January, a great quantity is taken, cured, and sent to remote places. This fish is from five to eight feet long. Fish are also very abundant in the Bohhaire Lake. The tortoise occurs frequently on the table-land of Judæa, and turtles in the Barrada. None of the snakes are considered to be poisonous. Bees are very abundant on Mount Libanus, whence wax and honey are exported. The rearing of silk-worms is carried on to a great extent on the mountainous tracts near the coast, and silk constitutes the most important article of export from Syria. The locusts frequently lay waste the fields; the Arabs eat them, and salt them for food. There are no metals found in Syria except iron, which is worked in the Kesrawan in Mar Hanna, south-east of Beyrut, where also coal has been discovered. Burckhardt found iron and quicksilver at the western base of Jebel-es-Sheik. Salt is got from the lake called El-Sabkh, and also from the sea-water of the Mediterranean. In the Tyh-Beni-Israeli, and at the southern extremity of the Dead Sea, there are mountains almost entirely composed of rock-salt. Bitumen, or asphaltum, is collected on the west shores of the Dead Sea. Tacitus ('Hist., v. 6) speaks of asphaltum being collected on the Dead Sea. It constitutes an article of export. In the northern Ghor pieces of native sulphur are found at a small depth beneath the surface.

Inhabitants.—The population of Syria consists of agricultural and nomadic tribes. Nearly all the Fellahs, as the agricultural population of Syria is called, belong to one race, resembling in the structure of their body the Beduin Arabs, and speaking also the Arabic language. The Fellahs are divided, according to their religion, into Christians, Jews, and Mohammedans. The Jews are numerous in Southern Syria, west of the southern valley, but they are rarely found east of that valley, or in the other parts of the province. They are most numerous in the vicinity of the five holy cities—Jerusalem, Tabarieh, Safed, Nablous, and Khalil (Hebron). The Christians are found everywhere. Even in the Haouran the Christians constitute one-fourth of the agricultural population. They are either of the Greek Church or Roman Catholics. Among the Roman Catholics are included all religious denominations who acknowledge the authority of the Holy See:—the Latins, who use the Roman liturgy, and have a patriarch at Jerusalem, and numerous convents there and in different parts of the Holy Land; the Melchites, or United Greeks, who have a patriarch at Damascus, and eight suffragan bishops; the Maronites, who are Catholics, live exclusively on the western declivity of Mount Libanus, in the Kesrawan, and are a very industrious people; the United Armenians, who have a patriarch at Bezumma in the Libanus, and a bishop in Aleppo; and the Syrians, or United Chaldeans, who have a patriarch at Aleppo. The Maronites, who number about 140,000, have a patriarch at Kanobin, in the Kesrawan, and seven suffragan bishops.

There are also three religious sects in Syria which are neither Christians nor Mohammedans—the Druses, Anseyries or Ansairians, and the Imanlies. The most powerful of them are the Druses, who number about 80,000; they pay tribute to the Turkish pashas, but otherwise are independent, and their chief may be considered as the

master of a great part of Mount Libanus, with the adjacent districts of the Bekaa. The Anseyries, or Ansairians, inhabit the mountain region which has received its name from them, and which lies between the lower course of the Azy and the Mediterranean. They are likewise an industrious people. The Imanlies are few in number, and inhabit some villages in the mountains of the Anseyry. They are considered to be a remnant of the Assassins and Ismaelitea.

The nomadic tribes consist of Arabs, who are dispersed over the country as far north as 36° N. lat., and Turkmans and Kurds. The Arabs, with the exception of the Anneze tribe, do not live exclusively on the produce of their herds and flocks. They also cultivate small spots of ground, but they change their abode according to the season and the growth of pasture, taking to the mountains in summer and to the plains in winter and spring. There are some Metualis Mohammedans of the sect of Ali in the southern parts of the Libanus and about Bealbec. They are a settled people, and number about 30,000. They oblige the settled agricultural portion of the population to pay them a tribute for not laying waste their fields and carrying off their cattle. But even on the table-land of Judæa the peasants are generally tributary to the Arab emira. There is probably no part of Syria in which this state of things does not exist, except in the country of the Druses and Maronites, and in the immediate neighbourhood of some great towns.

The Anneze is the only tribe of Beduins in Syria who never cultivate the ground, but who live exclusively on the produce of their herds of camels, sheep, and goats. They wander about in the Syrian and Arabian deserts, and pass the winter there, which lasts from the beginning of October to the end of April, when the rains cause grass and herbs to spring up in many parts of the deserts, on which their flocks feed; but they enter the limits of Syria at the beginning of May, and remain there till after September. At this time they approach the caravan road leading from Aleppo to Damascus, and the Hadji road leading from Damascus to Mecca. They come to these places for a two-fold purpose, water and pasture for the summer, and to exchange their cattle for corn as winter provision. If they are at peace with the pasha of Damascus they encamp quietly among the villages near the springs or wells.

The most powerful of the other Arab tribes are the El Howeytat and the Beni Neym, who live in the mountain region of El-Shera and in the adjacent plain; the Beni Szakher, who are in possession of the rich pasture-grounds in the Belka, and likewise visit the plain of Haouran; the Adouan, who are found in the Jebel Ajelun; and the Fehily and Serdie, who move about in the plain of Haouran and the mountains in their vicinity. All these tribes are only nominally dependent on the Turkish governor, and though they pay a small tribute, they levy much larger sums on the agricultural inhabitants of these countries.

The Turkmans and the Kurds are in almost exclusive possession of the elevated range of the Alma Dagh and the tracts at its base. The eastern districts of these mountains are occupied by the Kurds, and the western by the Turkmans. They descend from the mountains in winter, and spread over the plains to a considerable distance south of Aleppo. Some small tribes of both nations have settled on the northern districts of Mount Libanus.

The Turkmans are of the same stock from which the Turks are sprung. In the level parts of their country they cultivate wheat, barley, and several kinds of pulse. The cultivation is not carried on by the Turkmans themselves, but by Fellahs. The Turkmans remain with their herds in the Umk from the end of September to the middle of April, when they go to the mountains. They have horses, camels, sheep, and goats, and a few cattle. Their women, who have complexions as fair as any European women, are very industrious. They make tent-coverings of goats'-hair, and woollen carpets. They have also made great progress in the art of dyeing; they use indigo and cochineal, which they purchase at Aleppo. The brilliant green which they give to the wool is produced from herbs gathered in the mountains in summer. The Kurds who inhabit Syria are originally from Kurdistan. They possess the western portion of the Alma-Dagh, from which they descend in summer to the plains east of Aleppo. Most of these Kurds live in villages, and are occupied in agriculture and the rearing of cattle; but there is still a considerable number of families that change their abode according to the seasons, in order to procure pasture for their cattle.

Divisions and Towns.—Syria is divided into four eyalets, two of which, Akka and Tarablous, extend over the countries on the shores of the Mediterranean as far north as 35° 55' N. lat.; the third, Aleppo, occupies the most northern part, from the Mediterranean to the banks of the river Euphrates, and as far south as 35° 45' N. lat.; and the fourth, Damascus, the interior of the country south of 35° 45' N. lat.

1. The *Eyalet of Akka*, better known in Europe by the name of St-Jean-d'Acre, to which the eyalet of Gaza was added at the beginning of this century, occupies the whole coast from the boundary-line of Egypt to the Bay of Junie or Kesrawan (33° 55' N. lat.), and extends over the plain of Falastin, Mount Carmel, the plain of Ibn Omer, the hilly region of Galilee, the plain of Akka, and the Bekaa and Belad Bealbec. The most remarkable places from south to north are—Gaza [GAZA]. Jaffa, or Joppa [JAFFA]. Ramleh, or Ramah,

E.S.E. of Jaffa, lies in a fertile and well-cultivated plain; it has 15,000 inhabitants, who derive some advantages from the road from Joppa to Jerusalem, which passes through this town. *Kaisariyeh* [CAESAREA]. *Tantura* has a harbour for small boats, and carries on some commerce with Egypt, from which it receives rice and linens. It exports cattle and fruits. *Khaisfa* [CARMEL]. *Akka* [ACRE]. *Sur* is built on an isthmus about 400 feet wide, which is supposed to have been formed by the embankment that Alexander the Great made for the purpose of taking the ancient Tyre. The harbour has been filled up with sand, and the roadstead is unsafe, but it is better than that of either Akka or Saïda. The population amounts to 3000 individuals, most of whom gain their livelihood by fishing and agriculture. It exports tobacco, wax, and fire-wood. [TYRUS.] *Saida* [SIDON]. *Beirut* [BEIRUT]. *Junch* is a small town in the Kesrawan with a landing-place for small boats. It carries on some commerce with the island of Cyprus. In the interior are the following towns:—*Nazareth*, or *Nazara*, which is built in a beautiful valley that opens into the plain of Ibn-Omer, and is one of the most fertile and best-cultivated districts of Galilee. It has about 2000 inhabitants, and a fine church. *Tabarieh*, the ancient *Tiberias*, is on the banks of the Bahr-el-Tabarieh, on a small plain surrounded by mountains. Towards the land it is inclosed by a thick and well-built wall. It contains about 4000 inhabitants, who have some commerce with the Beduins. It is a place of pilgrimage for the Jews, who constitute about one-third of the population; the remainder of the population are Turks, with the exception of a few Christians. *Seafed*, or *Safed*, nearly due north of Tabarieh, is a neatly-built town, situated round a hill, on the top of which is a Saracenic castle. It contains about 600 houses, of which about 150 are inhabited by Jews, who consider this one of their holy cities, and about 100 houses by Christians. The population is between 6000 and 7000. *Zahle*, in a narrow valley which opens into the Bekaa, at the eastern base of Mount Libanus, contains from 800 to 900 houses, and is almost exclusively inhabited by Christians, who make much cotton-cloth and some woollen stuffs. They have 20 dyeing-houses, and a considerable trade with the Beduins of the Bekaa. *Baalbec* [BAALBEC]. *Deir-el-Kamr*, the capital of the emir of the Druses, in a valley of Mount Libanus, is a considerable place eight or nine hours S.E. from Beirut. It has five or six thousand inhabitants, some of whom are Christians, for in the town are two Maronite and two Melchite churches. The town is built like a second-rate town in Italy. Some silk-stuffs are manufactured. The emir of the Druses resides in the castle of Breddin, about one hour from the town.

2. The *Eyalet of Turabious* extends along the sea-coast from the Bay of Junch to Cape Basit or Possid, about 12 miles S. from the mouth of the river Ary, and comprehends the northern and more elevated portion of Mount Libanus, the plain separating this mountain from the Jebel Anzeiry, and the largest portion of the last-mentioned range. The whole of it, with the exception of the plain, is fertile and well cultivated. It produces silk, tobacco, oil, fruits, galls, and wax, for exportation. The following are the chief places in this eyalet, from south to north:—*Meinet Berdia*, a small harbour, and a still smaller town, which has some commerce with Cyprus. *Jebail*, or *Jubel*, the ancient *Byblus*, is a small town, inclosed by a wall a mile and a half in circumference. It has a small harbour, and carries on some commerce with Cyprus. *Byblus* was famous for the birth and worship of Thammuz, or Adonis. The most ancient name of the place appears to have been *Giblah*. The land of the Gibletes was assigned to the Israelites, but they never got possession of it. There are remains of a Roman theatre, and many fragments of granite columns on its site. *Giblah* gave title to a Christian bishop before it fell into the hands of the Moslem. *Batrun*, the ancient *Bostrys*, is a town consisting of from 300 to 400 houses, mostly inhabited by Maronites. There is no harbour, but an artificial inlet has been formed in the rocks, which admits a few coasting boats. Excellent tobacco is grown along the shores of the Mediterranean. *Tarabious*, the ancient *Tripolis*, one of the most commercial places of Syria, is built on the declivity of the lowest hills of Mount Libanus, and is divided by a river, called Kadish, into two parts, of which the southern is the more considerable. The town is well built, and is much embellished by gardens, which are not only attached to the houses in the town, but cover the whole triangular plain between the town and the sea. It is supplied with excellent water by an aqueduct, which crosses the river upon arches. The population amounts to between 15,000 and 18,000. There are some large manufactures of soap for exportation. The harbour is about two miles from the town; it is called *El-Myna*, or *El-Minyeh*, and is itself a small town, inhabited by sailors and shipwrights. This harbour is formed by a line of low rocks stretching from the western side of *Myna* about two miles into the sea towards the north, but it is not safe in northerly winds. In a north-north-west direction from the harbour there is a line of small islands, the farthest of which is about 10 miles from the mainland. The exports consist of a large quantity of silk, sponges, soap, and alkali, to Anatolia, galls brought from the Anzeiry Mountains, yellow wax from Mount Libanus, madder from Hamah and Hems, scammony, and tobacco. *Tartus*, the ancient *Antaradus*, and perhaps also *Orthosis*, formerly a strongly-fortified town on the coast, nearly opposite the Isle of Ruah, retains some remnants of its old Phœnician walls and vast castle. The place is often mentioned in the history of the

Crusades. Here, as in many other places along the Phœnician coast, sepulchral excavations are numerous. *Antaradus* was rebuilt by the emperor Constantius, after whom it was sometimes called *Constantia*. It gave title to a bishop till the Saracenic conquest. Tasso calls the town *Tortosa*. It is now a small place. *Jebit* is a small town, in the neighbourhood of which much tobacco is grown, which is exported to Latakia. There is a small port and an ancient theatre here. *Latakiah*, or *Ladikiyeh*, the ancient *Laodicea*, stands on the northern edge of an elevated tongue of land called Cape Ziarst, which advances nearly two miles beyond the general line of coast. The houses stand partly in the midst of gardens and plantations, and most of them have flat roofs. The port, called *Scala*, or *Marina*, is about half a mile from the town, and separated from it by gardens and plantations. The harbour, which is well sheltered, except to the west, admits only vessels of 100 tons burden. The chief exports of the place are tobacco of excellent quality (most of which goes to Egypt), cotton, raw silk, and wax. The imports are rice from Egypt, wine from Cyprus, and assorted goods, especially hardware, from England. In Mount Libanus is *Kanobin*, a convent, the seat of the patriarch of the Maronites. In its vicinity are the famous cedars of Mount Libanus. About a mile and a half from the coast is the island rock of *Ruad*, on which the ancient Phœnician town of *Aradus* was built. *Aradus*, the *Arpad* of the Old Testament, was next in importance to Tyre and Sidon; it was founded by a colony from the latter. It continued to be a flourishing place through the whole course of ancient history till the reign of the emperor Constantine, when it was demolished and its inhabitants expelled by a lieutenant of the khalif Omar. The town was never rebuilt; but about 3000 inhabitants dwell on the island, which is only about a mile round. Part of the old Phœnician walls, and also the ancient cisterns, still remain. As in ancient times, the inhabitants draw their fresh water from subterranean springs.

3. The *Eyalet of Haleb*, or *Aleppo*, contains the northern part of the Jebel Anzeiry, the valley of the lower Ary, together with the Ghab, the Jebel Amar, the Umk, the Hilly Region of Northern Syria, and the Northern Plain. The western and northern portion is very fertile, and in many places is well cultivated; the eastern is partly stony and partly sandy, and for the most part a desert.

On the coast are the harbours of SCANDEROON and *Sweidiyah*, or *Suadeiah*. The latter is not far from the mouth of the river Ary, and has good anchorage, but is much exposed to western and south-western winds. Near it there is a large and scattered village of the same name.

In the valley of the river Ary is *Antab* [ΑΝΤΙΟΧΗΑ], and in the plain is the capital, *Aleppo*, or *Haleb* [ALEPPO]. To the south-west of Haleb, and near the base of the Hilly Region, is the town of *Eddip*, containing more than 1000 houses, some manufactures of cotton-stuffs, a few dyeing-houses, and a large manufactory of soap. It has a considerable trade with the fertile and well-cultivated district in which it is situated, which it provides with rice, coffee, oil, tobacco, and manufactured goods. *Antab*, a large town at the base of the Alma Dagh, is the subject of a separate article. [ALM-DAGH.]

4. The *Eyalet of Damascus*, or *Sham*, extends over the southern of the two great plains which occupy the north-eastern portion of Syria, over the plains of Damascus, the southern portion of Mount Antilibanus, the greater part of the Wady Seisaban and El-Ghor, the table-land of Judæa, the Haouran, and the mountain regions of the Belka and the Shera. There are Beduin Arabs in every district.

On the table-land of Judæa is JERUSALEM, Nablous, and Khalil *Nablous* (a corruption of *Neapolis*), on or near the site of Sichem, is situated in a valley between Mounts Ebal and Gerizim. About two miles east of the town is another valley called *Eri-Mukhna*. At the north-east base of Gerizim is the village of *Astar*, probably the ancient *Sychar*, close to which are Jacob's Well and Joseph's Tomb. Nablous is a large and well-built town, with about 14,000 inhabitants, who are Mohammedans, with the exception of about 200 Samaritans. The streets are narrow and roughly paved, but the houses are well-built with stone and dome-roofed. The town is well supplied with water by streams and by fountains which spring up in the valley between Nablous and Astar. Nablous is commonly said to occupy the site of the *Sichem*, or *Schechem*, of the Old Testament, which however Eusebius and St. Jerome say was a suburb of Neapolis; and St. Jerome also maintains that Sychar in St. John's Gospel (iv. 5) is a corruption of Sichem. Pliny and Josephus respectively give the native name as *Mamortha* and *Mabortha*, which Reland corrects from coins to *Mortia*. This last name the same writer says is the classical form of *Moreh*, and both names (*Moreh* and *Sichar*) he supposes to have been adopted by the Jews from the prophet Habakkuk's '*Moreh Shaker*,' 'teacher of lies,' and applied to the Samaritan city as the seat of error. Sichem is a very ancient site. Abraham sojourned in it on his first coming into Canaan, and built an altar in it. Jacob's connection with it is marked by the well. It fell to Ephraim, and was a Levitical city, and a city of refuge. Here was the tabernacle in the time of Joshua, who set up a pillar near it shortly before his death. Here Gideon defeated the Midianites, and Rehoboam was made king. The name Neapolis was given during the occupation of Syria by the Greeks, who probably extended the city to the westward on account of the abundant supply of water. Simon Magus practised his sorceries in Neapolis, and Justin Martyr was a native of the same

city. About 10 miles S. from Nablous is *Silvan*, the ancient *Skiloh*. *Khalil*, the *Hebron* of the Bible, and one of the holy cities of the Jews, is south of Jerusalem, not far from the place where the table-land of Judæa joins the Desert of El-Tyh. It contains about 3000 inhabitants, and has some glass-houses. Hebron was frequently the residence of Abraham, Isaac, and Jacob, who were buried here in the cave of Macpelah; the tombs are still shown. David, as king of Judæa, resided above seven years in Hebron. The town was taken and burnt by the Romans in the great Jewish war. Outside the town are two reservoirs, one of which is supposed to be the 'pool of Hebron,' mentioned in 2 Sam., iv. 12.

On the banks of the river *Asy* are the towns of Hamah and Hems. *Hamah*, the ancient *Epiphaneia*, lies on both sides of the river, and is partly built on the declivity of a hill and partly on a plain. It contains between 30,000 and 40,000 inhabitants, among whom are many rich Turkish families. Though the houses make no great show, they are well arranged and furnished. It is one of the principal places to which the Arabs resort to buy tent-furniture and clothes, and it has several manufactures; the abbas, or woollen cloaks, made here are much prized. There are four bridges over the river. Hamah retains almost unaltered its ancient name *Hamath*, which it bore in the time of St. Jerome. *Hems*, the ancient *Emesa*, situated higher up the *Asy*, at a short distance from the northern extremity of the *Bahr-el-Kades*, contains a population of between 25,000 and 30,000 individuals, and several manufactures. It is not so well built as Hamah. *Emesa* was celebrated for its Temple of the Sun. Heliogabalus was a priest of this town before he was raised to the imperial dignity by the Roman legionaries of Syria. Near *Emesa*, Aurelian defeated Queen Zenobia, A.D. 272. To the south-east of Hems, at the distance of nearly 100 miles, are the ruins of PALMYRA.

In the valley of the Upper Jordan, or *Seissaban*, are *Hasbeya*, *Rasheyat-el-Fukhar*, and *BANEA*. *Hasbeya* is built on the top of a mountain, and is a thriving place, with 700 houses, and manufactures of cotton-cloth for shirts and gowns, and a few dyeing-houses. In the vicinity are traces of quicksilver, iron-ore, and upwards of 25 bitumens, which supply an article of trade to Aleppo, Damascus, and Beyrut. *Rasheyat-el-Fukhar* is a village on the top of a mountain; it contains about 100 houses, each of which may be considered as a manufactory of earthen pots. They are moulded in very elegant shapes, painted with red earth, and form a considerable article of inland trade, especially in the eastern districts of Syria. *Damascus* is the subject of a separate article. [DAMASCUS.]

In the mountain regions east of the Jordan are the towns of Szalt, Kerak, Tafyle, and Maan. *Szalt*, which is nearly in the centre of the Belka Mountains, is situated on the declivity of a hill. It constitutes a republic, independent of the Turkish pashas, who have made several attempts to subjugate it, but without success. The population consists of about 400 Mussulman and 80 Christian families of the Greek Church. The greater part of the population is agricultural; a few are weavers; and there are about 20 shops, which furnish the Beduins who inhabit this region with articles of dress and furniture. Much sumach, which is collected in the mountains, is sent to Jerusalem for the use of the tanneries; and ostrich-feathers are taken by the Beduins to Damascus. In its neighbourhood, to the south-east, are the ruins of Amman, or Philadelphia; and to the northward is *Jebel Jelad*, the ancient Mount Gilead. North of the *Zerka*, the ancient *Jabbok*, and nearly in 36° E. long., is *Jerash*, in which are many ruins of Roman buildings—a triumphal arch, Corinthian temple, a Christian church, theatre, and amphitheatre. *Kerak* lies in the northern district of the *Shera* Mountains, and is built on the top of a steep hill, which is surrounded by a deep and narrow valley. It is inhabited by 400 Mussulman and 150 Christian families. Whilst Syria was subject to *Mehemet Ali*, *Szalt* and *Kerak* were subjected to a strict obedience to government by Ibrahim, but under the Turks the chiefs of *Kerak* are nearly independent. The population send sheep, goats, mules, hides, wool, and madder to Jerusalem; and provisions to the *Hadji* road, which is about 15 miles to the east of the town. *Tafyle* is in the centre of the *Shera* Mountains, on the declivity of a hill, in a country abounding in springs and rivulets, and full of plantations of fruit-trees. Figs, wool, butter, and hides are sent to Gaza. The town contains about 600 houses, but suffers much from the exactions of the *Howeitah* Beduins, the authority of the Turkish government being very small. The town of *Maan* stands on two small hills on the desert table-land which is east of the mountains of *Shera*. It consists of about 100 houses on both sides of the *Hadji* route, which divides the town. There are several springs, by means of which the extensive plantations of figs, pomegranates, apricots, peaches, and plums are watered. The town owes its existence to the *Hadji*-road, and derives considerable profit from the pilgrims by selling them provisions brought from other parts, especially from *Khalil* and *Gaza*. West of *Maan* are the ruins of *Petra*, and a little farther west, *Mount Hor*, now called *Jebel-Neby-Harun*.

Manufactures.—Syria is the most manufacturing country in Western Asia. The most manufacturing town is Damascus, famous for its silk stuffs, especially satin and silk damasks and brocades, cottons, linens, and leather. The manufacture of saddles, and horse- and camel-trappings, is also important. Other products of Damascene industry are—jewellery, works in gold, silver, copper, and iron;

sword-blades, tobacco, soap, and articles in ivory and precious woods: perfumes, balms, aromatic oil, sweet-scenting essences, confectionary, pastry, &c. [DAMASCUS.] The manufactures of Aleppo are small compared with those of Damascus, and mostly limited to cotton and silk stuffs, and gold and silver lace. It must also be observed that some branches of manufacturing industry are carried on in all the towns, and even in some villages, such as cotton-stuffs for gowns and shirts, the dyeing of cotton, mostly blue and red, tanning leather, and making soap. Such places however supply only the neighbourhood and the Beduins who resort to them for such articles, and they rarely if ever work for a distant market.

Commerce.—The imports consist of rice, hardware, some French tissues, indigo, cochineal, and coffee. Very little sugar is imported: the *debe*, an extract from grapes, being used as a substitute; and this article is manufactured in Syria to a great extent. The most important article of export to Europe is silk. Other less important articles are galls, olive-oil, sponges, fruits, and tobacco. The fruits, which are principally exported, are dates, raisins, figs, and pistachio-nuts. Madder is also exported to a moderate extent. There is some coasting trade between Syria and Egypt, Cyprus, and the south coast of Asia Minor. Egypt receives chiefly live stock and tobacco, for which it pays with rice.

The commerce between Syria and the countries to the east and north of it is very extensive. At all seasons of the year numerous caravans are on the road going or returning from these parts. This commerce is concentrated in Aleppo. Manufactured goods go from Damascus to Aleppo, whence they are carried to Antolia and Constantinople, and to Mosul, Baghdad, and Basra. Two well-frequented routes lead from Aleppo to Constantinople through Anatolia. The most western leads from Aleppo westward to Antioch, and thence through the *Ballan Pass* to Scanderoon, whence it runs along the shores of the Bay of Scanderoon to Adana and Konieh in Asia Minor. The eastern commercial route runs due north from Aleppo, and traverses the chain of the *Alma Dagh* between Aintab and El-Bostan, where it proceeds to Kaisariyeh. Two routes lead from Aleppo to Persia, which divide at Orfa in Mesopotamia. From Aleppo the road runs north-east to Bir, where the Euphrates is crossed, and from which place to Orfa it continues eastward. The northern road leads from Orfa to Diarbekr, where it passes the Tigris, and thence goes over a very mountainous district to *Bedlis* and *Van*, and from *Van* it continues to *Tabris*. The southern road on leaving Orfa passes through *Mardin*, *Nisibin*, and *Mosul*, where it crosses the Tigris, and whence it continues through *Kirkuk*, *Kirmanshab*, and *Hamadan* to *Teheran*. This road is also sometimes used by the Baghdad caravans as far as *Mosul*. But the most frequented caravan route between Aleppo and Baghdad runs from Aleppo in a south-eastern direction through the northern part of the Syrian desert, which it enters after leaving the lake of *El-Sabkh*. It reaches the Euphrates at *Annah*, and runs along the river to *Hit*, where it crosses the stream, and then goes due east to Baghdad, or continues south-east by *Hilla* to *Basra*. It may be unnecessary to state that, though these routes are sometimes called roads, it must be understood that there are no roads in the European sense in the Turkish empire.

History.—Syria was the Greek and Roman name for the district called in the Bible *Aram*. [ARAM.] The Arabian name is *Sham*. The name is said by some to be taken from *Sur*, an ancient name (and also the modern name) of Tyre. Others say it is a shortened form of *Assyria*; and indeed the two names, Syria and Assyria, are often used indifferently by ancient writers, who differ however as to the extent of Syria. In its widest extent, Syria included all the country to the west of the Euphrates, as far south as Egypt and Arabia, while on the north and west it embraced the greater part of Cilicia, Cappadocia, and Pontus, its boundaries on this side being the river *Halys* and the *Euxine Sea*. (Herod., i. 72; v. 49; Strabo, xvi. p. 787; Rennell, 'Geog. to Herod.') *Pliny* (v. 13) and *Mela* (xi. 1) make it include Mesopotamia and Armenia. It appears indeed that all the tribes of the great *Aramean* family were called Syrians, in the widest and most ancient sense of the word.

In the most usual application of the word, Syria was bounded as stated at the beginning of this article. The Syrians (not including the inhabitants of Phœnicia and Palestine under the name) derived their descent from *Aram*, the youngest son of *Seth*. (Gen., x. 22).

The earliest records of the state of Syria represent it as consisting of a number of independent kingdoms. Damascus was the most powerful city, and in some sense the capital of the country. Its kings were frequently engaged in war with the Jews. The conquests of *David* (B.C. 1055, &c.) brought these states into subjection to the kingdom of Israel; but they again became independent at the close of *Solomon's* reign (B.C. 975). From this time the kingdom of Damascus especially is frequently mentioned in connection with the history of the Israelites, and it appears gradually to have grown in power, and to have held supremacy over the other states of Syria (1 Kings, xx. 1), and even to have given the kings of Israel great trouble, till the reign of *Joash* (B.C. 845), who obtained considerable successes against *Benhadad* (2 Kings, xiii. 22-25). The last king of Damascus was *Resin*, who having engaged with *Pekah*, king of Israel, in war against *Ahas*, king of Judah, *Ahas* invited *Tiglath-Pileser*, king of Assyria, to attack Damascus, which he took, and carried the

inhabitants captive to Kir about the year B.C. 740. From this time Syria formed a part of the Assyrian, Babylonian, Persian, and Macedonian empires in succession.

After the battle of Ipsus (B.C. 301), Syria, with the exception at first of Coele-Syria and Palestine, fell to the share of Seleucus Nicator, and henceforth it became the central portion of the kingdom of the Seleucids, the usual abode of the kings being at its capital, Antioch. The empire of the Seleucids was destroyed, and Syria was declared a Roman province by Pompey in the year B.C. 65. The small district of Commagene was left for a time under its own princes. During the civil wars of Rome, Syria suffered much from the conflicts of the two parties, the power of native robbers, and the incursions of the Parthians, and it was not till the reign of Augustus that it became quietly settled as a part of the Roman empire. It was governed by a pro-consul, who commonly resided at Antioch. In the year A.D. 6, upon the banishment of Archelaus, Judæa and Samaria were added to the province of Syria, to which they henceforth belonged, with a short interruption during the reign of Herod Agrippa I.

Under the Cæsars, Syria was one of the most populous, flourishing, and luxurious provinces of the empire. It had a considerable commerce, and formed indeed the emporium which connected the eastern and western quarters of the world. Hadrian, upon his accession (A.D. 117), fixed the eastern boundary of the empire at the Euphrates, and henceforth the frontier province of Syria was exposed to repeated inroads, first from the Parthians, and afterwards from the Persians. The province was overrun and almost subdued by Sapor (A.D. 258), from whom it was rescued by the Arab Odenathus (261-264), who was raised to a share in the empire by Gallienus. Odenathus was murdered by a cousin or nephew, with the consent of his wife, the celebrated Zenobia, in 266. The attempt of Zenobia to establish an independent sovereignty in the eastern part of the empire led to her defeat and capture by Aurelian (273).

At the end of the 3rd century, and in the 4th, the Saracens, or Arabs of the Desert, began to appear sometimes in the legions, but oftener among the enemies of Rome. In the reign of Phocas, Chosroes II., after reducing Mesopotamia and the neighbouring states, crossed the Euphrates, reduced Hierapolis, Chalcis, and Beroea, and finally Antioch, which he almost completely destroyed in 611. Heraclius, who had obtained the empire in 610, took the field in 622 against Chosroes, who had in the meantime conquered not only Syria, but also Palestine (614), and had overrun Egypt and Asia Minor (616). In a series of brilliant campaigns, Heraclius repeatedly defeated Chosroes, and at last drove him beyond the Tigris (627), and Siroes, his son (and, by the murder of his father, his successor) made a treaty of peace with Heraclius (628), one of the conditions of which was the restoration of the 'true cross,' which had been carried into Persia after the sacking of Jerusalem in 614. But this brilliant recovery of the eastern provinces was only the prelude to their final loss under the same emperor.

Mohammed, at the head of the Arabs, had taken a few towns of Syria (630), and his successor, Abu Bekr, had scarcely mounted the throne when he sent a circular letter to the Arabian tribes, calling them to the invasion of Syria (632). A large army of Saracens assembled at Medina, whence they marched into Syria under the nominal command of Abu Obeydah, but virtually led by the fierce Khaled, 'the sword of Allah.' They first attacked Bosra, on the east of the Jordan, which was betrayed by the governor Romanus. They then laid siege to Damascus (633). The defence was obstinate; and in the meantime Heraclius had assembled an army of 70,000 men at Emesa, under the command of his general, Vardan. The armies met at Ainsadin—the Greeks were utterly routed, and the Arabs returned to the siege of Damascus, which fell, after an obstinate resistance, in 634, about July or August. After some irregular exploits, the conquest of the country was carried on by the reduction first of Heliopolis and Emesa, and then of other important towns. In the meanwhile Heraclius had prepared for a last effort in defence of Syria. An army of 80,000 men, brought from the different provinces of the empire, with a light-armed force of 60,000 Christian Arabs, encountered the Mohammedans on the banks of the river Yermuk; but few Christians escaped from the field of battle (634). Henceforward the conquest proceeded with but little opposition. The sacred character of Jerusalem procured for it an honourable capitulation, which the khalif Omar himself came from Medina to receive (637). Aleppo submitted, but the castle offered an obstinate resistance, and was taken by surprise; and Antioch purchased its safety at the expense of obedience and 800,000 pieces of gold (638). In the same year Heraclius fled from Antioch to Constantinople, and, after a show of resistance at Cæsarea by Constantine, his eldest son, the province was abandoned to the Saracens, to whom the remaining cities at once submitted.

Under the Ummeyyads, or Ommayyads, the seat of government was at Damascus, whither it was removed from Kufa by Moawiya, who reigned from 656 to 679, but it lost this distinction in 749, when the Abbassides took up their residence at Baghdad. Syria was subjected, together with Egypt, to the Turkish usurper Ahmed Ebn 'e' Tooloon, whose dynasty lasted from 868 to 906, when the khalif Moktafee recovered both countries; and afterwards to another Turkish usurper, Akshahed Mohammed Ebn Tugh (986), whose dynasty lasted till 970,

ÆTIO. DIV. VOL. IV.

when Moes, a successor of Mahdee, conquered Egypt, and soon afterwards Syria, as far as Damascus, and founded the dynasty of the Fatimite khalifs, whose capital was at Cairo. In 1076 the Turks invaded Syria and Palestine, took Damascus and Jerusalem, and established an independent kingdom under the princes of the house of Ortok. The khalif Mostali retook Jerusalem in 1098, but lost it again, with a large portion of Syria, in the first crusade, at the close of which the Christian kingdom of Jerusalem was established, which included the ancient Palestine and a tract of country round Antioch. This kingdom lasted from 1099, the year in which the Crusaders took Jerusalem, to 1187, when Salah-ed-Deen (Saladin) recovered it. His dynasty, the Eyoobites, lasted till 1250, when it was destroyed in Egypt and Damascus by the revolt of the Baharite Memlooks. Seif-ed-Deen, the sultan of Aleppo, great-grandson of Salah-ed-Deen, recovered Damascus; but he was overthrown and slain in an invasion of the Moguls from Persia in 1260.

Syria continued subject first to the Baharite and then to the Circassian Memlooks. Their possession of the country was however interrupted for a short time by Tamerlane, who invaded Syria and sacked Aleppo in 1400, and in the next year destroyed Damascus. He did not however attempt to keep possession of the country. In the year 1516 Syria was conquered and united to the Turkish empire by the sultan Selim I. It was unsuccessfully invaded by General Bonaparte in 1799. In the year 1831, Mehemet Ali, viceroy of Egypt, formed the design of erecting Egypt and Syria into an independent kingdom. His son, Ibrahim Pasha, invaded Syria, took Gaza, and on the 9th of December attacked Acre, which he took on the 21st of May following, and Damascus on the 18th of June. On the 7th of July he defeated the army of the sultan at Hama, took Antioch on the 1st of August, and on the 21st of December utterly routed the forces of the sultan at Konieh in Asia Minor, taking the grand vizier prisoner, and then pressed on for Constantinople. In the meantime the sultan claimed the help of Russia. That power prepared to act against Mehemet Ali by sea and land. By the interference of France and England a peace was concluded, and the sultan (May 6, 1833) confirmed Mehemet Ali in his government of Egypt and Candia, granting to him in addition that of Damascus, Tripoli, Said, Safed, Nablous, and Jerusalem. Mehemet Ali still cherished his project. Hostilities were renewed in May, 1839. At the battle of Nezib (June 25) Ibrahim defeated the Turkish army, and soon after the Turkish fleet deserted to Mehemet Ali (July 4). Upon this, Mehemet announced to the new sultan, Abd-ul-Medjid, his determination to assert his claim to the hereditary government of all the provinces under his command, as a reply to the sultan's offer of the hereditary government of Egypt. England, France, Austria, Russia, and Prussia, now tried to bring about a settlement. Negotiations which followed ended in the secession of France and the conclusion of a treaty between the remaining four other powers and Turkey, to compel the submission of Mehemet. The treaty was signed in London on the 15th of July 1840. In pursuance of this treaty, a fleet, consisting of English, Austrian, and Turkish vessels, commenced operations on the coast of Syria by the storming of Beyrut. Acre and Sidon shared the same fate; and, after much negotiation, Mehemet consented to give up Syria, and receive the hereditary government of Egypt (January 11, 1841).

(Pococke; Volney; Burckhardt; Buckingham; Schubert, *Reise in das Morgenland*; Robinson, *Travels in Palestine and Syria*; *London Geographical Journal*; Robinson, *Biblical Researches*; Chesney, *Expedition to the Euphrates and Tigris*; Lynch, *Expedition to the River Jordan*; De Saulcy, *Discovery of the Site of the Destroyed Cities of the Plain*.)

SYRITES was the name given by the Greeks and Romans to two gulfs on the northern coast of Africa, one of which they called Syrtis Major, and the other Syrtis Minor. Both were the terror of the ancient mariners. The name is said to be derived from the Greek word for 'draw,' from their drawing in ships and swallowing them up in their sandy shoals. A more probable derivation is the Arabic 'sert' (sand), which is at this day applied to the district on the shores of the Syrtes.

The Greater Syrtis, now called the *Gulf of Sidra*, is a very large bay on the northern coast of Tripoli, lying between the promontories of Boreum (Ras Teyonas) on the east, and Cephalæ (Ras Kharras) on the west, the distance between which is 264 miles: its greatest depth is about 126 miles. The Sahara, or Great Desert, comes down almost to the sea, leaving here and there only a narrow strip of land inhabitable. The gulf is very shallow and full of quicksands, and the coast is covered by a chain of little islands. On this dangerous shore it was difficult to prevent ships from being driven by the north winds, to which the gulf is completely exposed, while the effect of such winds on the water made the soundings very uncertain.

The Lesser Syrtis, now the *Gulf of Khabs*, on the southern corner of Tunis, lies between the promontory of Brachodes, or Caput Vada (Ras Kapondiah), on the north, and the island Meninx (Jerbah) on the south. Besides this island, those of Cercina and Cercinitis (Karkennah) lie in its mouth, the width of which from these islands to that of Meninx is 69 miles. This gulf is said by Scylax to be even more dangerous than the Greater Syrtis. Its dangers however, say Rennell, arise not so much from quicksands as from "the variation and uncertainty of the tides on a flat shelvy coast." The Sy.

were known to the Greeks in very early times. (Herod. ii. 82, 150; iv. 189.)

The Lesser Syrtis is remarkable for the great variations of its tides, in consequence of the east winds, to which it lies open. The lake bordering upon it, which is now called El-Sibkah, seems to have been once connected with the Syrtis by a channel; and this lake must be included under the Lake Tritonis of Herodotus, if we suppose the latter to be the Lesser Syrtis.

TAB, RIVER. [PERSIAN GULF.]

TABARKAH, a small island on the north coast of Africa, about 50 miles east of Bonah, is situated at the mouth of the river Tusca (now the Zaine), on the left bank of which there was an ancient Roman town called *Tabarca*. (Pliny, 'Hist. Nat.' v. 2.) Of this town many ruins still remain. (Shaw, 'Travels,' p. 99.) The Genoese, who formerly held the island, built a fort upon it to protect the coral fisheries of the neighbourhood. It is now in the possession of the French, to whom it was given up in 1830 by the dey of Tunis.

TABASCO. [MEXICO.]

TABERG. [SWEDEN.]

TABLE BAY. [CAPE OF GOOD HOPE.]

TABOR, a walled town in Bohemia, is situated in 49° 24' N. lat., 14° 30' E. long., on an eminence called Mount Tabor, on the river Lunchnitz, and has about 4500 inhabitants. It was rebuilt, and strongly fortified in 1420 by the Hussites. The principal buildings are the cathedral and the Augustinian monastery. The chief industrial products are linen, coarse woollens, and room-paper.

TABOR, MOUNT. [SYRIA.]

TABRIZ, pronounced and often written *Tabreez*, the capital of Azerbaijan, in Persia, is situated in a plain about 4800 feet above the sea-level, in about 38° 4' N. lat., 46° 8' 30" E. long. It is said to have been founded by the wife of Harun al Raashid, in A.D. 791. The population amounts to about 50,000 or 60,000. The larger part of the area inclosed by the ancient walls is covered with ruins and gardens. The town has been often taken by the Turks, and it has been frequently damaged by earthquakes. Owing to its elevated site the town enjoys a moderate climate in summer, but the winters are intensely cold, the thermometer sometimes sinking to zero, and snow often lying from December to March.

Tabriz is built on a plain, surrounded on the north and south by ranges of high, bare, and rugged hills. The plain widens gradually as it approaches Lake Urmiyah, which lies to the westward. It is very fertile, and produces abundant crops of grain where it can be irrigated: it also contains extensive plantations of fruit-trees. The town is surrounded by a wall of sun-burnt bricks, which has a circuit of about three miles and a half, and in which are seven gates. The streets are tolerably straight, but not paved. The houses are made low, on account of the earthquakes, and mostly built of sun-burnt bricks. They have no windows towards the streets, but are convenient in the interior. The suburbs are extensive, and the orchards, which cover large spaces, are kept in good order, and watered by numerous karezis (subterranean canals). Grapes, melons, apricots, quinces, pears, and apples are of superior quality. In many of the gardens there are the ruins of magnificent old buildings. There are no buildings distinguished by architectural beauty, not even the mosques. The most remarkable is the old castle, which was built by Ali Shah.

Tabriz has some manufactures of coarse cotton-goods and silk stuffs. It is one of the most commercial towns of Persia. Its principal commerce is with Tiflis in Russia, with Trebizond, and with Constantinople. It exports to Tiflis silk, cotton, rice, galls, and dried fruits, and receives from Russia, iron, copper, caviar, cloth, leather, cochineal, and manufactured goods. European and especially British manufactures reach Tabriz by way of Trebizond, whence they are carried overland through Erzurum, Bayazid, and Khoi. English goods also reach Tabriz by caravans from Constantinople. The exports by this road are rice, wool, hides, sheep and goat skins, furs, carpets, shawls, and some minor articles. The foreign commerce of Tabriz annually introduces into Persia goods to the value of about a million and a half sterling. The European part of this trade has considerably suffered since the commencement of the war between Russia and Turkey. Tabriz receives the goods of India and Bokhara and some other eastern countries by the way of Herat and Teheran.

TACNA. [PERU.]

TADCASTER, West Riding of Yorkshire, a market-town, in the parish of Tadcaster, is situated on both sides of the river Wharfe, in 53° 52' N. lat., 1° 12' W. long., distant 9 miles S.W. from York, 192 miles N.N.W. from London by road, and 185 miles by the Great Northern and North Midland railways. The population of the town of Tadcaster in 1851 was 2527. The living is a vicarage in the arch-

deaconry and diocese of York. The Wharfe is crossed at Tadcaster by a handsome stone bridge. The town is lighted by gas. The parish church is a fine old building, probably of the 14th century. The Wesleyan Methodists and Independents have chapels, and there are National schools, a Grammar school, and Dawson's Charity for the education of 40 girls and the maintenance of poor widows. The lord of the manor, Colonel Wyndham of Petworth, grants small allotments of land to the labouring classes. The market is on Wednesday, and there are several fairs, chiefly for cattle, in the course of the year.

TADMOR. [PALMYRA.]

TAEKHA. [ASAM.]

TAFALLA. [NAVARRA.]

TAFILET. [MAROCCO.]

TAGANROG, a town in European Russia, in the government of Ekaterinoalaf, stands on the summit of a lofty promontory, near the north-eastern extremity of the Sea of Azof, in 47° 12' N. lat., 48° 40' E. long., and has about 16,000 inhabitants. The town, which was founded in 1688 by Peter the Great, had formerly a considerable commerce. But the bay has become so shallow that only ships of moderate burden can now enter it; larger vessels unload at Kertsch or Feodosia. The bay is frozen up from December to March. Taganrog has a gymnasium, ten churches, three of which are of stone, dockyards, large and numerous warehouses, and many very handsome private dwellings. The climate is temperate and remarkably healthy; the surrounding country is very fertile in wheat, excellent fruits, and vegetables. The emperor Alexander I. died in Taganrog on the 1st of December, 1825. The town was bombarded by the Anglo-French fleet in July, 1855.

TAGAVOST. [MAROCCO.]

TAGGIA. [NICE.]

TAGLIACOZZO. [ABRUZZO.]

TAGUS, named *Tajo* by the Spaniards, and *Tejo* by the Portuguese, is the largest river of the Spanish Peninsula. *Tagus* is the name in the Roman writers, and has been adopted in our language. The rivers by the confluence of which the Tagus is formed originate in the highest part of the table-land of Spain. In the elevated mountain-masses of the Sierra Molina and Sierra de Albaracin rise three rivers, the Molina, the Tagus, and the Guadiela, which flow west-north-west between high ridges and in narrow valleys. The Molina and Tagus unite on the boundary-line of the provinces of Soria and Cuenca, and after running south-west about 50 miles, are joined by the Guadiela where the three provinces of Cuenca, Guadalajara, and Madrid meet. The united river continues to flow in a south-west direction until it enters the more open country of the plain, when it turns to the west, and is joined by the Jarama (Xarama). This river originates on the Soma Sierra, not far from Buytrago. It runs south, and is first joined by the Henares about 15 miles east of Madrid, and then by the Tajuna, which joins the Jarama a few miles above its confluence with the Tagus. The country which is traversed by these branches of the Tagus is not much elevated above the water-courses, possesses a considerable degree of fertility, and is the most populous tract on the table-land of Spain. The Jarama joins the Tagus a little below Aranjuez, and at this place the river flows through a wide level plain very little elevated above its bed, and so fertile, that it is justly called the Garden of Castile. From this place the general course of the Tagus, as far as it lies within Spain, is nearly due west. Below Aranjuez the bed of the river gradually sinks deeper beneath the surrounding country; its banks are steep, and composed of rocks, which in some parts rise from the water abruptly to the height of 200 feet. The adjacent country is uneven and somewhat broken, but not hilly. After having received the Cedron from the south, and encompassed the hill on which the city of Toledo stands, the river again enters a level country, which extends for many miles westward, and in which it is joined by the Guadarama and Alberche from the north, and several smaller rivers from the south. Below the town of Talavera de la Reina the Tagus enters a hilly country, where it flows with great rapidity in a deep bed filled with rocks, and is joined from the north by the rivers Tietar and Alagon, which descend from the high ridge that divides the table-land of the two Castiles. The Alagon originates in the icy masses which cover the summit of the Sierra de Griegos, and the volume of

water which this river brings down is so considerable, that from the place of confluence at Alcantara the Tagus becomes navigable. Though the Tagus has run above 350 miles before it reaches Alcantara, no part of it is navigable, which is partly to be ascribed to the great rapidity of its current through the plain of Castile. Besides this, the greater part of its course is through narrow valleys, between steep hills, from which heavy masses of rocks have fallen down, which in many places greatly encumber the bed of the river, and cause rapids, which continue for several miles; but the greatest impediment to the navigation of the river is the small volume of water. The soil of the table-land absorbs a great quantity of moisture without forming springs, and at the same time the quantity of rain which falls on this region is much less than what falls in other parts of Europe; consequently the river is very scantily supplied with water, except during the few months when the rains are more abundant.

At Alcantara the level of the river is probably less than 300 feet above the sea, and it has still a course of about 200 miles to its mouth. Its course below Alcantara and as far as the mouth of its tributary the Zesere, below Abrantes, is west and south-west. For about 20 miles it constitutes the boundary-line between Spain and Portugal. In this part of its course the river is navigable, but the navigation is extremely tedious and not without danger, as the sandbanks are numerous and subject to change. It can only be navigated by small flat-bottomed boats. The Zesere, in which the numerous rivulets unite that collect the waters originating on the southern declivity of the Serra de Estrella, always brings a considerable volume of water to the Tagus, and from this point downwards the river may be navigated by vessels of 150 tons burden. In this part of its course numerous islands occur, which at first are small and rocky, but lower down are larger and alluvial. Below these islands the river expands into a lake-like basin, which extends from north-east to south-west, in the direction of the course of the river, nearly 80 miles, and is mostly about 12 miles wide, but in several places it is narrowed to 6 miles by projecting headlands. The country north-west of the basin is covered with gently-sloping hills, the offsets of the Serra do Junto, and on the south-east of it is the sandy plain of Alemtejo. The most western part of the basin constitutes the harbour of Lisbon, which is spacious enough to contain all the fleets of Europe. Where the town of Lisbon terminates on the west, the Tagus turns westward, and a broad rocky headland, consisting of high hills, advances northward from the Serra de Arrabida, and narrows the basin to about a mile or a little more in width. At the same time the offsets of the Serra da Cintra come close up to the river on the north, so that the Tagus passes to the sea between two rocky masses. The whole course of the Tagus exceeds 550 miles, and the area of the country drained by the river probably does not fall short of 40,000 square miles.

TAHAURAWE. [SANDWICH ISLANDS.]

TAHITI. [SOCIETY ISLANDS.]

TAHRAH. [CUTOH.]

TAIN. [DRÔME; ROSS-SHIRE.]

TAI-WAN, a Chinese island, known in Europe by the name of *Formosa*, or *Hermosa*, and called by the aborigines *Pekan*. It lies between 21° 58' and 25° 15' N. lat., 120° and 122° E. long., and extends from south-by-west to north-by-east about 240 miles. At its most southern point it is only about 4 miles wide, but at 28° N. lat. it is 60 miles wide, and at 24° N. lat. nearly 100 miles wide. Its northern portion decreases slowly in width, and near its northern extremity it is still 60 miles wide. The area is about 14,000 square miles; the population is about two millions Chinese, besides the native inhabitants, whose numbers are unknown. The island is separated from the mainland of China by the channel of Fokian, which at its narrowest part, opposite the north-western point of Tai-wan, is only about 80 miles across. In the widest part of the channel are the Ponghu, or Pescadore, Islands. The southern extremity of Tai-wan is divided from the Bashee Islands by the channel of Formosa, which is nearly 80 miles wide, and like the Fokian Channel has very irregular soundings.

The broad promontory which terminates the island on the south, and forms the south-east and south-west cape, is a low flat, but at the distance of about 2 miles the country suddenly rises into mountains, called Ta Shan, which continue to run in an unbroken chain northward nearly through the middle of the island to its northern extremity, terminating with high cliffs at the north-east cape. The Ta Shan Mountains are covered nearly the whole year with snow. They contain several volcanoes, and are supposed to attain an elevation of about 12,000 feet above the sea. The declivities are covered with fine trees and pasture-grounds, and thus the island when seen from the sea, presents a very pleasing appearance, whence it was called *Hermosa* ('beautiful') by the Spaniards, who first saw it. Besides the active volcanoes there are in this range some other mountains which exhibit traces of former volcanic action. Sulphur constitutes an important article of export.

The mountains have a steep declivity on both sides, but on the west side they terminate at a considerable distance from the sea, so as to leave a wide undulating tract between them and the shore. The adjoining sea is full of sand-banks and shoals, and can only be approached in a few places by vessels drawing more than 8 feet of water. On the east of the Ta-shan range the mountains seem to

occupy nearly the whole space between the crest of the range and the sea, and high rocks line the shore. A strong current runs from south to north along the east coast of the island, which is almost unknown, as vessels do not visit it.

Rivers are numerous on the west side. They descend from the mountains in rapids and cataracts, and are turned to advantage to irrigate the land. They generally form bars at their mouths, over which only small vessels can pass. There are numerous islands however along the shore, between which junks of 200 tons find good anchorage. Some of the rivers however are said to be navigable for a considerable distance inland, especially the *Tan-shuy-khy* which falls into Tan-shuy-kiang Bay, in the narrowest part of the channel of Fokian.

At the change of the monsoons the most violent gales come on suddenly, and are accompanied by typhoons, whirlwinds, and water-spouts. In the vicinity of the island the north-eastern monsoon generally lasts nine months, as it continues to blow to the beginning of June. In other respects the climate of the island is very temperate. Earthquakes are frequent and sometimes very violent. In 1782 the whole lower portion of the island was laid waste, and the sea inundated the country to the base of the mountains for twelve hours.

The soil of the lower tracts and the more gentle slopes of the mountains is very fertile, and produces abundance of corn, which is exported to the harbours of Fokian. The chief products are rice, wheat, millet, maize, vegetables, truffles, sugar, oranges, pine-apples, guavas, cocoa-nuts, areca-nuts, and other eastern fruits; also peaches, apricots, figs, grapes, pomegranates, and chestnuts. Melons are also much grown. Tea is cultivated. The blossoms of the wild jasmine are dried and exported to China, where they are used to give a scent to the tea. Other articles of export are camphor, pepper, aloes, and timber. Timber abounds in the large forests in the northern districts of the island. It is also stated that coffee, cotton, and silk are produced to a small amount.

The domestic animals are cattle, buffaloes, horses, asses, and goats, but sheep and hogs are rare. The horses are small. It is said that on the eastern portion of the island there are tigers, leopards, and wolves. On the western side, wild hogs, deer, monkeys, pheasants, and game are very abundant. Salt is largely exported.

The population consists of Chinese settlers and of aborigines. The Chinese are only found on the west side of the island. A considerable number of aborigines are settled among the Chinese, to whom they are subject, and are obliged to pay a tribute in corn and money. These aborigines are of a slender make; in complexion and language they resemble the Malays, but they do not differ from the Chinese in features. Nothing is known of the aborigines who inhabit the east side of the island. They are not subject to the Chinese, and are said to be continually at war with them. Inhabiting a country covered with lofty mountains, they are said to subsist mostly on the produce of the chase and by fishing.

The Chinese portion of Tai-wan is divided into four districts, which, from south to north, are Fung-shan-hian, Tai-wan-hian, Tahul-lo-hian, and Thang-hua-hian. The capital, *Tai-wan-fu*, is a considerable walled town, and has a garrison of 10,000 troops. The streets are straight, and intersect one another at right angles: they are full of shops, which are abundantly provided with all articles of Chinese industry. The largest building is that which was erected by the Dutch during their short sway in Tai-wan. There is still a small church built by the Dutch. It is stated that 1000 junks can anchor in the harbour; but the entrance even at spring-tides has but 9 or 10 feet of water. The commerce of this place with China is considerable. *Wu-teaou-kiang* has a harbour, which is frequented by junks and numerous coasting vessels, which bring the produce of the country, especially rice and sugar, to this place. *Tan-shuy-kiang*, at the embouchure of the river Tan-shuy-khy, is at the innermost recess of a fine bay, which is large enough for a numerous fleet. The best harbour is near the northern extremity of the island, and is called Ky-long-shai, or Quelong. It is capacious enough to contain 30 large vessels, and is the station of the Chinese navy at the island. An active commerce is carried on at this place.

The commerce of the island is limited to that with the eastern provinces of China, especially Fokian, to which it sends its agricultural produce, with sulphur and salt, and from which it imports tea, raw-silk, woollen- and cotton-stuffs, and other manufactures.

Opposite the southern extremity of the eastern coast of Tai-wan is the island of *Botol Tabago-xima*. It is elevated, about ten miles in circumference, and surrounded by a sea without soundings. It is said to be very populous.

The Dutch in 1634 built the fortress of Zelandia at the entrance of the harbour of Tai-wan-fu, where there was then a small town. At this time the Chinese had not settled on the island, but soon after many families emigrated from Fokian to Tai-wan; and on the overthrow of the Ming dynasty many of their adherents abandoned the mainland, and, under a chief named Tshing-tshing-kung, occupied the Ponghu Islands. Tshing-tshing-kung then proceeded to Tai-wan, and finding only a very weak garrison in the Dutch fortress, he took it, after a siege of four months, in 1662. Thus the Dutch lost the island, which was rapidly colonised by the Chinese. After the death of Tshing-tshing-kung a Chinese fleet in 1682 took possession of the

Ponghu Islands; and in the following year Tai-wan surrendered, without a struggle, to the court of Peking.

TAMAN, a peninsula, or rather a deltoid island, is formed by the main branch of the Kuban, which empties itself into the Black Sea, and a small branch of the same river, which flows into the Sea of Azof north of the old fortress of Temruk. The western or large part of the island stretches between the Sea of Azof on the north and the Black Sea on the south, and is bounded on the west by the Strait of Yenikale, the ancient Bosphorus Cimmerius, and the Bay of Taman. The length of the island is 57 miles, and its greatest breadth 22 miles, but the real surface is far from corresponding to these dimensions, the middle of the island being occupied by the large Temrskoi Liman, or Lake of Temruk, and the whole of the remaining part being notched by creeks and bays in such a manner as to present rather the skeleton of an island than a real island. The south-western part of Taman, the ancient peninsula of Corocondama, presents a solid mass traversed by several ranges of hills from 150 to 180 feet high: they run from west to east, and near the village of Sennaya-Balka form a bifurcation. One branch runs between the Kubanskoi Liman, or the lake formed by the Kuban before it reaches the sea, and the Lake of Temruk, and terminates in a slip of land which divides this lake into two unequal parts. The other branch, the direction of which is north-east, forms the isthmus between the Lake of Temruk on the east, and the Bay of Taman on the west, and terminates before it reaches the isthmus between the Lake of Temruk and the Sea of Azof. The north-western part of Taman, or the peninsula between the Sea of Azof and the Bay of Taman, is no less elevated above the sea, but although it is a continuation of the mainland, it is separated from the eastern hills by a flat sandy isthmus, which seems to have been covered by the sea at a period not very remote from our own times. All these hills are mere masses of sand and pebbles cemented with clay. The higher part of them is barren, but the slopes, and the low grounds between them and the sea or the lakes, are covered with soil and fit for agriculture. They also make rich pasture-grounds. The isthmus between the Temrskoi Liman and the Bay of Taman, and principally that between the Lake of Temruk and the Kubanskoi Liman, are dotted with the neat farmhouses of the Cossaks; and on the meadows numerous flocks of cattle are fed. The eastern part of Taman is formed by two flat and narrow isthmuses, and a somewhat broader tract of lowland between the two branches of the Kuban. The whole of this country is marshy, partly covered with pastures and partly with a rank vegetation of rushes and reeds. In the rainy season all the low country is overflowed by the waters of the Kuban, and the higher part of Taman is separated from the continent by an immense lake which extends from one sea to the other. The whole of the eastern part of the island of Taman is a mere recent production of the immense quantities of clay and mud which the Sea of Azof and the Kuban have deposited before the mouth of this river. The western and elevated part however in its whole geognostical structure belongs to the opposite continent of the Crimea, from which it has apparently been separated by the current of the Cimmerian Bosphorus. In this latter part is the Sewernaya Kossa, a long but very flat and narrow slip of land which stretches from the north-west extremity of the northern peninsula in a south-west direction to the middle of the mouth of the Bay of Taman. A cluster of small islands extends from Point Yunays north-west till they reach the centre of the strait. Numerous small craters are situated on the ridge of the hills around the Bay of Taman, as well as along the Lake of Temruk. They present all the external appearances of volcanoes; though the matter which they throw out is not lava, but a thick mud of a deep black colour, which they discharge at irregular periods.

The Greeks knew this remarkable island under the name of Eion, and founded several colonies in it. The most considerable of them were—*Phanagoria*, a famous commercial town, which contained a beautiful temple of Aphrodite; *Kepeo*, or *Kepi*, a colony of the Milesians; *Hermonassa*, founded by the Ionians; and *Achilleion*: some ruins and marbles are the only traces that remain of their ancient splendour. There are now only two towns—*Tmatarakán*, the *Phanagoria* of the Greeks; and the present town of *Phanagoria*, which was built by the Russians on the shore of the Bay of Taman, 3 miles east from *Tmatarakán*, on account of its harbour being deeper than that of the latter town.

TAMAQUA. [PENNSYLVANIA.]

TAMATAVE. [MADAGASCAR.]

TAMAULIPAS. [MEXICO.]

TAMBOV, a province of Great Russia, is situated between 51° 30' and 55° 20' N. lat., 39° 40' and 43° 40' E. long. The area is 25,464 square miles, and the population 1,750,900. It is bounded N. by Nischni-Novgorod and Vladimir; S. by Woronezh; W. by Riasan, Tula, and Orel; and E. by Penza.

This government is a uniformly level country, without mountains, large rivers, or considerable lakes: on the north there are great forests, and on the south extensive steppes. The soil in the northern half is sandy, marshy, and poor; in the southern part it mostly consists of loam or black mould, and is fertile and productive. The steppes produce excellent pasturage, and when they have been brought under cultivation make good arable land: they are designated as steppes only because they are destitute of wood. The river Oka enters the government from Riasan, but passes only through one circle, where it is joined by the Mokscha, a considerable stream of which the Zna is a tributary. The Oka runs northward to join the Volga. The Don passes through a small part of the government. In the forests on the north there are marshes. The mineral waters at Lepetsk are much frequented. The climate is temperate and healthy, but cold in winter.

All kinds of corn usually grown in Russia are raised, rye, oats, millet, buckwheat and wheat, pease and other pulse; poppies, great quantities of hemp, barley, and flax; some hops are grown in the gardens, but there is little fruit, and that of the most ordinary kinds. The total annual produce of corn of all sorts varies from 11,500,000 to 17,500,000 quarters: of this only about 401,000 quarters are wheat; rye makes up about half the total amount; buckwheat a fourth, and oats about a sixth. In the vicinity of the forests the inhabitants are for the most part carpenters, coopers, and cartwrights, or employed in making pitch, tar, lamp-black, and charcoal. The breeding of cattle is carried on to a very great extent in the steppes; and the steppes from Tambow to Nova Khopertakaja-Krepost is covered with immense herds of oxen and horses. Oxen are used for draught, and great numbers are fattened for exportation. Sheep and swine respectively number about 1,200,000 and 800,000. The wool is coarse. Domestic poultry suffices for the consumption of the inhabitants: there is little game, and fish is by no means plentiful. Among the wild animals are the marmot and the hamster. Great quantities of bees are kept. The mineral products are lime, freestone, iron, and some saltpetre.

The manufactures of this government are unimportant: the peasantry barely make their own clothing. Spirit distilleries are numerous. The export trade in the products of the country is very considerable. The principal articles are rye, cattle, honey, tallow, butter, cheese, wool, hemp, iron, grain-spirits, hides, coarse cloth, and wooden wares.

The great majority of the inhabitants are Russians. There are some thousands of converted Tartars and Mordwines, and a few gipsies. Education is at a low ebb. The Greek Church is under the bishop of Tambow and Schask. The Mohammedan Tartars have their mosques, imams, and teachers.

Tambow, the capital of the government, is situated nearly in the centre of the province, on the river Zna, in 52° 44' N. lat., 41° 45' E. long. It is a large town, with 20,000 inhabitants, and was founded in 1636, as a bulwark against the Nogay Tartars. Almost all the houses are built of wood: the principal buildings are the monastery of Our Lady of Casan, in which there are two churches; seven stone and six wooden churches, the gymnasium, and the civil hospital. There is a military school, a seminary for priests, and a district school. The bishop resides in this city. The inhabitants manufacture shawls, kersey, sailcloth, cordage, and woollen-cloth, and there is an imperial alum and vitriol manufactory; they also carry on some trade, but their chief occupation is agriculture.

Jelasma, the most northerly town in the government, situated on the left bank of the Oka, carries on by means of that river a very great trade with Moscow: it has ten churches; the inhabitants, 6000 in number, have some manufactures of woollen-cloth, vitriol, and sulphur. *Koslow*, situated on the Lesnoi Woronezh, has above 8000 inhabitants: near the town is the convent *Troitkoi*, where a great annual fair is held. There are eight churches, of which five are of stone: the principal trade of the town is in oxen, salt meats, and hides. *Lepetsk*, on the Woronezh, near the north extremity of the government of that name, a town with 6500 inhabitants, is celebrated for its mineral-waters. *Morschansk*, a town of 6000 inhabitants, situated on the Zna, has manufactures of linen, sail-cloth, cordage, and tallow, and a brisk trade in corn, cattle, and honey.

TAMPICO. [MEXICO.]

TAMWORTH, Staffordshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Tamworth, is situated on the right bank of the river Tame and Anker just at their junction, in 52° 38' N. lat., 1° 42' W. long., distant 25 miles S.E. by E. from Stafford, 115 miles N.W. from London by road, and 109½ miles by the Trent Valley branch of the London and North-Western railway. The church is in Staffordshire, on which account the town is commonly described as being in that county. The population of the municipal borough of Tamworth in 1851 was 4059; that of the parliamentary borough was 3655. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The living is

a vicarage in the archdeaconry of Stafford and diocese of Lichfield. Tamworth Poor-Law Union contains 24 parishes and townships, with an area of 46,740 acres, and a population in 1851 of 13,941.

Several of the Mercian kings appear to have resided at Tamworth. After the Conquest, the castle and adjacent territory were granted to Robert Marmion, hereditary champion to the dukes of Normandy. The castle now belongs to Lord Charles Townshend. The streets of Tamworth are lighted with gas and paved. The church, which was formerly collegiate, is one of the finest in the county. The transepts are Norman, some portions are of decorated date, and some perpendicular: some of the windows have had very fine tracery. The tower has been lately restored. There are an almshouse, founded by Guy, the founder of Guy's Hospital, Southwark; a town-hall, with a small jail beneath; a handsome stone building for the savings bank; a railway station, in the Elizabethan style, used jointly for the Trent Valley and Midland railways; and two bridges, one over the Tame, the other over the Anker. The remains of the castle are of various periods, and modern buildings have been added to adapt the whole to the purposes of a modern residence: the castle commands a fine prospect. The Wesleyan Methodists, Independents, Baptists, and Roman Catholics have chapels in the town. There are National and Infant schools; a Free Grammar school, founded in 1587; Sir Robert Peel's school, which educates 50 poor boys and provides for each a suit of clothes annually; Rawlet's Trustees' school for 20 boys, and a school of industry for 30 girls, both endowed; a library and reading-room, founded by the late Sir R. Peel, and a valuable library called the Permanent Library, containing upwards of 5000 volumes.

Coals and brick-earth are dug in the neighbourhood, and bricks, tiles, and glazed drain-pipes are extensively made. There are two manufactories for elastic garters and fancy articles. The market is on Saturday: there are several fairs for cattle and merchandises. In the market-place is a fine bronze statue of the late Sir Robert Peel. The Coventry Canal passes near the town. A county court is held in Tamworth.

TANDERAGEE. [ARMAGH.]

TANGIER. [MAROCCO.]

TANGNU-OOLA. [ALTAI MOUNTAINS.]

TANGUT is the historical name of a country in Asia, which occupies the centre of the eastern and more elevated table-land of that continent. This country still goes by the name of Tangut, though at present a part of it is incorporated in the Chinese province of Kansai, whilst another is mostly in the possession of two Mongol nations, the Olöth Tshoros and the Torbod Mongols. Tangut extends between 33° and 42° N. lat., 94° and 107° E. long. It is bounded S. by Tibet; W. by Chinese Turkistan, or the government of Thian-Shan Nanlu; and N. by Mongolia, of which also a portion is included within the lately erected province of Kansai.

The southern portion of Tangut, or that which lies south of 38° N. lat., is one of the most mountainous tracts on the globe, and extends over the upper course of the river Hoang-ho and the basin of the Lake of Khookhoo-nor. Along its southern border there are the BAYAN KHARA MOUNTAINS. Another elevated range traverses the country in the same direction from east to west near 38° N. lat. This range rises at a short distance from the banks of the Hoang-ho north of the town of Lantcheou, and in its eastern part is called Kilian-Shan; but farther west it takes the name of Nan-Shan. It rises to a great elevation, especially towards the west, where many of its summits are covered with snow and united by extensive glaciers. This mountain chain is supposed to be connected with the Kuenlun range near 92° E. long. The Bayan Khara and the Nan-Shan mountains occupy a great portion of the country between 33° and 38° N. lat., and nearly the whole of the remainder of the country is filled up by a third range, Siue-Shan, which connects these two, and extends from south-east to north-west. The Siue-Shan, or Snowy range, contains numerous summits which rise above the snow-line. The river Hoang-ho breaks through this range, but the huge rocky masses compel the river to make a great bend towards the west between 34° and 36° N. lat., and the circuit which the river makes shows the immense extent of these masses of rock. In this part of its course the river is said to be hemmed in by lofty mountains, so that no communication can be established along the banks. Its course above this bend is very imperfectly known. The river enters a wide valley by a narrow gorge formed by two very elevated mountains a little above the town of Ho-tocheou (36° N. lat., 102° E. long.). At the opening of this gorge is a fortress, called Tay-ahy-kuan.

Tangut is separated from China proper by a fourth range, the mountains of Sifan, which run south and north; they are connected at their southern extremity with the Bayan Khara Mountains and the Siue-Shan by an extensive mountain knot, which is in the country formerly called Sifan, whence the chain has obtained its name. Though this range is less elevated than the Siue-Shan, it rises in several places above the snow-line, and occupies a considerable width. It is supposed to terminate near the banks of the Hoang-ho, a few miles south of 38° N. lat. Opposite to it and on the northern banks of the river rises another chain, called Holang-Shan, which continues

along the western bank of the river as far north as 42° N. lat., rising only to a moderate elevation, and occupying in many places only three or four miles in width: it slopes on the west down into the steppe of the Olöth Tshoros. This range is distinguished from all the other ranges of Tangut by being thickly wooded on its eastern declivity.

Only a small portion of the countries inclosed by these mountain masses is fit for cultivation. It does not appear that there is any cultivation in the upper valley of the Hoang-ho above the fortress of Tay-ahy-kuan. Below that place and as far as Lan-tocheou, the valley is wider, and narrow tracts along the banks of the river are cultivated and fertile. Farther down, and as far as the neighbourhood of Ning-hia, a town built on the western banks of the Hoang-ho, at the eastern declivity of the Holang-Shan (38° 32' N. lat.), the valley has not been visited by Europeans. At this place the river runs in a wide valley, which has been rendered fertile by numerous canals, fed by the waters of the river; here rice is extensively cultivated. There are also numerous plantations of fruit-trees. The soil contains much saltpetre. The town of Ning-hia, the former capital of Tangut, is of considerable extent, being five miles in circuit. It has manufactures of carpets and paper, and a considerable commerce with the nomadic tribes who wander about in the country west of the Holang-Shan. Below the town of Ning-hia the valley of the Hoang-ho grows wider, but its fertility decreases. About eighteen miles from Ning-hia the canals cease and no rice is cultivated. Other grain is still grown about 30 miles farther north, where the country gradually changes into a sandy, arid desert, interspersed with hills, swampy tracts, and pastures.

The lateral valley of Si-ning-tcheou opens to the Hoang-ho from the west above the town of Lan-tcheou between the Kilian-Shan and the most elevated portion of the Siue-Shan. The valley is not extensive, but appears to be fertile: it contains the town of *Si-ning-tcheou*, which is not quite as large as Ning-hia, but a much more commercial place, as the road which connects northern China with Hlassa in Tibet passes through it. This road runs westward to the Lake of *Khookhoo-nor*, which is of great but unknown extent. It is an alpine lake inclosed by high mountains, and has no outlet. The remainder of the road lies partly over numerous large mountain masses, furrowed only by narrow glens and ravines, and partly over rocky and sandy table-lands; but in spite of the difficulties it is much travelled, and the bazaars of Si-ning-tcheou are well provided with provisions and articles of luxury. This town is a great depot for rhubarb, which grows on the more elevated parts of the Siue-Shan and Kilian-Shan, and is sent through Kischta and Russia to all parts of the world.

The northern part of Tangut, with the exception of the valley of the Hoang-ho, is occupied by a wide desert plain, which constitutes a portion of the GOBI. The steep declivities of the Kilian and Nan-Shan however do not come close to the desert, but are separated from it by a hilly tract from 30 to 50 miles wide, which contains some extensive tracts fit for cultivation, and in which some large towns have been built, as the great commercial route which connects China with the countries of Western Asia runs through it. The ranges of the Kilian-Shan and Nan-Shan are said to be covered with perpetual snow. The water which flows from these ranges is partly consumed in irrigating the adjacent fields, and the remainder is absorbed by the sandy soil, as soon as it reaches the plain, after having left the hilly tract. The hilly tract is diversified by high lands and depressions. The upper surface of the high lands is broken and rocky, and for the most part bare. The depressions, which are less extensive, exhibit a considerable degree of fertility where they are irrigated. To protect this hilly region, and the great commercial road which runs through it, the Chinese have continued the Great Wall along its northern border westward to 98° E. long., and along the wall are built the fortresses which protect the line and the towns through which the road runs. The road leaves the valley of the Hoang-ho at the town of Lan-tcheou, the capital of Kansai, and runs in a north-north-west direction to the towns of *Liang-tcheou* and *Kan-tcheou-foo*. This last is a large and well-built town, which has many manufactures of woollen stuffs and felts, articles in great demand among the nomadic tribes, who bring to the place their wool, horses, cattle, and sheep. It receives also large quantities of rhubarb from the Kilian-Shan. From *Kan-tcheou-foo* the road continues in a north-west direction to *So-tcheou*, a large and well-fortified town, with numerous bazaars, well provided with provisions and manufactured articles. The town is divided into two sections, one of which is occupied by the Chinese, and the other by the foreign merchants from Bokhara and Turkistan. The latter is divided from the former by a separate wall. As *So-tcheou* is the last large place through which the caravans pass before they enter the desert between Tangut and Thian-shan-nahr, the commerce is very great, especially in provisions. About 50 or 60 miles west of *So-tcheou* is the most western gate of the Great Wall, called *Kia-yu-kooan*, through which the caravans pass to enter the desert of Han-hai, which must be traversed in order to reach Hami in Thian-shan-nanlu. The last-mentioned town is 320 miles from the gate of *Kia-yu-kooan*, and that is the width of the Gobi at this place, which is considered the narrowest part of it.

The towns hitherto noticed lie along the great caravan-road, but farther west the Chinese geographers mention other places of importance. The largest is *Nyan-si-foo*, a town of the first rank, and the

capital of the whole district. North-west of it, and on the border of the desert, is the town of *Yu-men-kiang*, which is built near a pass between high hills, traversed by a road to Hami. South-west of Ngan-si-foo are the towns of *Toong-hoang-kiang* and *Sha-tcheou*. Marco Polo describes *Sha-tcheou* as rather a large place; he says that the inhabitants live on the produce of their fields and orchards, and have little commerce. Marco Polo reached it after traversing the desert of Lop by a thirty days' journey, having departed from the town of Lop, which is on the banks of a lake of the same name.

The cold in winter in Tangut is intense, and lasts for several months. The Jesuits found the Hoang-ho, near 40° N. lat., at the end of November, covered with thick ice, so that the caravan was able to pass over it, though the river was more than 300 yards wide. At Ning-hia a heavy fall of snow was experienced in the middle of April. In summer the heat is great, but much less than in the low countries of China; the climate is considered to be extremely healthy.

Every kind of grain is grown in the few tracts whose soil is fit for cultivation, and rice is raised where irrigation is practicable. The nomadic nations have numerous herds of camels, horses, and cattle, and large flocks of sheep and goats. In the mountain region is found the yak, whose tail gives the chowry. It is used for riding. In the desert are wild hogs, deer, argali, and hares. Wild horses and cattle are found, it is said, in some of the mountain forests. In the desert some extensive tracts are covered with agates, cornelians, and other precious stones.

The inhabitants of Tangut are a very mixed race. Mongol tribes inhabit the Gobi, and occupy also the mountain ranges north of Lake Khookoo-nor, but the mountaineers south of that lake derive their origin from Tibet. The agricultural population is mostly composed of Chinese and their descendants. In the towns the number of Turkish settlers seems to be considerable. They are Mohammedans, and there are mosques in the larger towns of Tangut. All the other inhabitants are Buddhists. In the time of Marco Polo there were also Nestorian Christians in the towns, but these have disappeared.

The Chinese emperors subjected the country of Tangut shortly before the birth of Christ. In the 8th century Tangut was occupied by a nation of Tibetan origin, called Tang, which founded in these parts the empire of Thufan. This was overthrown by the Chinese in the 9th century; but the Tibetans erected in the following century the empire of Tangut, or Hia, which maintained its power till it was destroyed by Genghis Khan in 1227. With the downfall of the dynasty of the Mongols (1341), the best part of Tangut remained under the sway of the emperors of the dynasty of Ming, though the Mongols after their retreat from China had occupied the northern and more desert portion of it, where they maintained their independence to the end of the 17th century. In the wars of the Galdan of the Olöth [SONGARIA], a tribe of the Olöth Mongols expelled the Khalkas from the country west of the Hoang-ho, and took possession of it; but after the defeat of the Galdan they submitted to the Chinese emperor in 1690, and since that time the whole of Tangut has been annexed to China. (Du Halde, *History of China*; Ritter, *Erdkunde*.)

TARA. [MEATH; SIBERIA.]

TARAI. [HINDUSTAN.]

TARAKAI, or SAGHALIEN, a large island in the North Pacific Ocean, extends from 46° to 54° 20' N. lat., more than 600 miles in length. The width towards the southern extremity, north of the Bay of Aniva, is nearly 100 miles, but it soon contracts to about 25 miles, which is about its average width as far north as the Bay of Patience, where it suddenly expands to 120 miles, Cape Patience running far out into the Pacific. From this point (49° N. lat.) northward the island again grows narrower, but very gradually, so that at 51° N. lat. it is still nearly 80 miles wide. Farther north its average width does not exceed 50 miles. The area of the island probably exceeds 30,000 square miles.

Tarakai extends along the eastern coast of Asia between 142° and 145° E. long., and is separated from the continent by the Gulf of Tartary, which is 200 miles wide at its most southern extremity, but grows narrower farther north, until near 51° 30' N. lat. the width is less than 40 miles. At this point a shoal extends across the gulf, on which there is only water for boats. The gulf is almost always covered with thick fogs. Near 52° 30' N. lat. a low sandy cape stretches so far to the east as to approach very near the western shores of the island. North of this narrow and shallow part the gulf presents a circular basin, sometimes called the Gulf of Saghalien, about 50 miles wide, which receives the waters of the Amur. Krusenstern calls it the Liman of the Amur. This basin is united with the Sea of Okhotsk by a strait, which in the narrowest part is about 10 miles wide. The southern extremity of Tarakai is divided from the island of Yeso by the Strait of La Perouse, which is hardly 30 miles wide and in which the tides run with great velocity.

Though the coast of the island is of great extent and much indented, it does not appear that there are many good harbours. Along the western shores only open roadsteads have been found. At the southern extremity of the island, between Cape Crillon and Cape Aniva, is a wide open bay, the Bay of Aniva, which is inclosed by two projecting tongues of land, and extends 50 miles from south to north. There is good anchorage at its most northern extremity. The projecting headland, which occurs near 49° N. lat., on the eastern side of Tarakai, and terminates with Cape Patience, incloses the Bay of Patience, which is very extensive, but open and exposed to eastern and southern winds. At the most northern extremity of the island is the Northern Bay, between Cape Elizabeth and Cape Maria. It offers good anchorage and shelter.

The island is naturally divided into three tracts: the mountainous, which occupies the southern portion; the level, in the middle; and the hilly tract, which extends over the northern districts. The mountain region is the largest, and comprehends more than one-half of the island, terminating on the north near 51° N. lat. A chain of mountains begins at Cape Crillon, and continues in an uninterrupted line northward to an elevated summit called Peak Bernizel, where it seems to be united to another and lower chain, which traverses the eastern peninsula, and incloses the Bay of Aniva on the east. Farther north occur other summits, as Peak Lamanon, Peak Mongez, and Mount Tiara: the two last mentioned are north of 50° N. lat. None of these summits have been measured, but their elevation probably does not exceed 5000 feet above the sea-level. On the summits of the mountains snow lies till June. Along the western coast the mountains in some places come close up to the water's edge, but a narrow level tract generally separates them from the shore, and this tract is covered with high trees, while the declivities of the mountains are mostly bare. Extensive flats occur at Aniva Bay and the Bay of Patience. The low country which skirts the shore on the eastern side of the mountains appears to be more extensive and less interrupted than that along the western shores. The country extending from 51° to 53° N. lat. is so low that the shores are not visible at the distance of five or six miles, and it is sandy and overgrown with bushes. The interior is in general level, partly sandy and partly swampy, and a great part of it is covered with short bushes or small trees. A number of low sand-hills are dispersed over the country. The hilly tract occupies the most northern part of the island, or that which extends from 53° N. lat. to Cape Elizabeth. The coast is in general high and steep, being generally composed of perpendicular white cliffs. There are only a few tracts in which the coast sinks down to the level of the sea, and here the villages are built. The interior consists of a succession of high hills covered with full-grown trees to the very summits; the valleys which intervene between them are partly wooded and partly covered with a fine close turf. The winter seems to be long and severe, the summer months temperate, but continual fogs inclose the island nearly all the year round.

Productions.—The inhabitants derive profit from the spontaneous products of the soil: they dry the roots of a species of lily for winter food, and collect great quantities of garlic and angelica. The forests consist of oak, maple, birch, and medlar, but chiefly of fir. Large tracts are covered with juniper-trees. Gooseberries, raspberries, and strawberries abound, and also wild celery and watercress. Among wild animals martens and bears are mentioned. The sea supplies the inhabitants with abundance of salmon, herring, and cod. Dried and smoked salmon, skins of salmon, salt-herrings, and train-oil are the principal articles of export. Whales are numerous in the Strait of La Perouse and along the eastern coast. In the same parts, seals of different kinds and sea-otters are very frequent.

The inhabitants are aborigines, among whom a few Japanese have settled on the Bay of Aniva, and a few Mantchoos on the Northern Bay. In the Japanese settlements are a few Japanese officers, but no Chinese authorities have been seen, nor is this island enumerated among the possessions of the Chinese. The aborigines call themselves *Ainos*, that is, men: the same race inhabits the Kurile Islands, and extends along the shores of Asia from the Corea to Kamtschatka. They never cultivate the soil, nor apply themselves to hunting wild animals, and they keep no domestic animals except dogs, which they use in winter for drawing their sledges, like the inhabitants of Kamtschatka. They rarely exceed five feet six inches in height. They have tolerably large eyes, thick lips, high cheek-bones, and a somewhat broad and compressed nose. Their cheeks and chins are covered with long, thick, black beards. They manufacture a kind of cloth from the bark of the willow. Their huts are of wood, covered with the white bark of birch, and have a roof of wood thatched with dry straw. Their boats are of large size and strongly built.

TARANCON. [CASTILLA LA NUEVA.]

TARANTASIA. [SAVOY.]

TARANTO, an archiepiscopal town in the Kingdom of the Two Sicilies, in the province of Terra d'Otranto, is situated in 40° 23' N. lat., 17° 35' E. long., and contains 15,000 inhabitants. It occupies a small part of the site of the ancient *Tarentum*, being confined to the island or peninsula at the entrance of the inner harbour, or *Mare Piccolo*, on which formerly stood the fortress or acropolis of *Tarentum*. There are few remains of the ancient town. Taranto is ill built: it is fortified and has a castle, and several churches and convents.

It carries on some trade by sea in small craft, and has some manufactures of linen and of gloves and other articles from 'pinna marina.' A part of the population is employed in fishing. Excellent oysters are found on the coast. The inner port is nearly filled up, but the outer or large port is accessible to vessels of good size, and is protected by two islands which are situated at the mouth. The large gulf which lies between the coast of Calabria and the Iapygian peninsula is called the Gulf of Taranto. Two shore lakes, one of them of considerable extent, which lie south-east of the town, yield a great quantity of salt by evaporation.

Ancient *Tarentum*, the principal Greek city on the east coast of Italy, is said to have been originally a town of the Messapians, which Phalantus and the Parthenias took about B.C. 694. Tarentum, after many struggles with neighbouring cities and peoples, gained great prosperity by commerce, and acquired a considerable extent of territory. Archyta, a native of Tarentum, is said to have compiled a body of laws for the Tarentines.

About B.C. 338 the Tarentines, being engaged in war with their neighbours the Lucanians, applied to Sparta for assistance. Archidamus, the son of Agesilaus, was sent to them, and he was killed in fighting on their side. Some years after, being hard pressed by the Lucanians and Brutii, the Tarentines applied to Alexander, king of Epirus, and uncle to Alexander the Great. He came to Italy with troops, obtained considerable advantages, but was at last surprised and killed by the Brutii near Pandosia, B.C. 328. (Justin, xii. 2; Livy, viii. 24.) The Tarentines had by this time degenerated. (Ælian, 'Var. Hist.,' xii. 80.)

In the year B.C. 282 the Romans, after having conquered the Samnites, made war upon the Lucanians. The Tarentines, jealous of the encroachments of Rome, unexpectedly attacked the Roman fleet, which was sailing near their coast, and killed a great many of the crew. The Romans sent commissioners to demand reparation for the outrage, but the Tarentines treated them with insult. Aroused however to a sense of their danger, they applied to Pyrrhus, king of Epirus, for assistance, and sent vessels to convey him over with his troops, B.C. 281. Pyrrhus soon found that the Tarentines were too effeminate to give him much support. Chiefly with his own troops he carried on the war against Rome for several years, but was at last defeated by the consul M. Curius Dentatus, and obliged to re-embark for Epirus, leaving however a garrison in Tarentum, B.C. 275. The Tarentines having shortly after quarrelled with the Epirote garrison, applied to the Carthaginians for assistance to drive away the Epirotes. The Romans having had notice of this, sent the consul L. Papirius Cursor, who took Tarentum, and allowed the Epirote garrison to return home. Tarentum was thenceforward styled an ally of Rome till after the battle of Cannæ, when the Tarentines entered into some intrigues with Hannibal.

In the year B.C. 212 the hostages of the Tarentines ran away from Rome, but being pursued and overtaken near Terracina, they were brought back, and after being beaten with rods were thrown down the Tarpeian rock. This cruel punishment irritated the people of Tarentum; an agreement was made with Hannibal, and his troops were admitted into the city by night. The Roman garrison stationed in the citadel was besieged by sea and by land. In B.C. 209 the consul Q. Fabius Maximus retook Tarentum by surprise, and his soldiers plundered the city.

From that time Tarentum remained in subjection to Rome, and although it greatly declined in wealth and importance, it was still a considerable place in the time of Augustus. It was one of the chief strongholds of the Byzantine emperors in Southern Italy. About A.D. 774 Romauldus, the Longobard duke of Beneventum, took Tarentum from the Byzantines. The Saracens landed at Tarentum about A.D. 830. The town was afterwards several times taken and retaken and sacked, and it was during this period that the old town on the mainland was abandoned, and the inhabitants retired to the island. In the 11th century it was taken by the Normans, and Robert Guiscard made his son Bohemund prince of Tarentum.

TARMA. [PERU.]

TARN, a river in France, rises near Mont Lozère, in the department of Lozère, and flows first west to Sainte-Enimie, in the same department, 27 miles, and then south-west 27 miles to Milhau, in the department of Aveyron; from thence west-south-west 88 miles, by Alby and Gaillac, in the department of Tarn, to St-Sulpice; and thence 48 miles north-west and west by Mantauban (department of Tarn-et-Garonne) into the Garonne below Moissac. The navigation, commencing at Alby, has a length of about 90 miles.

TARN, a department in the south of France, is bounded N. by that of Aveyron, E. by that of Hérault, S. by that of Aude, and W. by

Haute-Garonne and Tarn-et-Garonne. The extreme length from north-west to south-east is 65 miles; the breadth is 46 miles. The area is 2218 square miles. The population in 1851 amounted to 363,073, giving nearly 164 inhabitants to a square mile.

The department is very mountainous in the south-east part, where it comprehends a portion of the Cévennes. A range of hills branching off from this chain, and running nearly parallel to it, crosses the north-west part of the department, skirting the valley of the Tarn; and there are some other ranges of less elevation and importance. The eastern side of the department is chiefly occupied by the granitic or other primary, or by the earlier secondary formations. West of this district the tertiary formations prevail. In the north and south of the department the secondary formations crop out in a few places from beneath the tertiary rocks. The mineral products are coal, iron, lead, copper, marble, gypsum, porcelain, and potters'-clay.

The department belongs entirely to the basin of the Garonne. The TARN flows westward to Alby and then south-west to the junction of the Agout, shortly after which it quits the department to enter that of Haute-Garonne. Just above Alby the Tarn has a fall, or rather a series of falls, over the steep face of a limestone rock: this fall is called *Saut-du-Tarn*. The tributaries of the Tarn which belong to this department are the Aveyron, the Tescou, and the Agout. None of them, except the Aveyron, is navigable.

There are in the department, 5 imperial, 28 departmental, and 25 communal roads.

About one-half of the surface is under the plough. The soil, except in the mountainous parts, is generally fertile; but agriculture is in a backward state. The produce in wheat, barley, oats, rye, maize, and buckwheat, leaves a surplus for exportation. Pulse, flax, hemp, aniseed, coriander, woad, and saffron are grown. The meadow and grass lands may be estimated at about 100,000 acres, and the heaths, commons, and other open pastures at 150,000 acres. The valleys and the slopes of the hills afford good pasturage, and the breeding of cattle is one of the principal sources of the wealth of the department. Sheep and pigs are numerous, and the veal is in high repute. The vineyards occupy nearly 80,000 acres; the cultivation of the vine is very carefully and skilfully managed, but none of the wines are of first-rate eminence. The woodlands occupy 200,000 acres; the oak, the beech, the ash, the maple, the chestnut, the walnut, the mulberry, and the wild cherry-tree are common.

Bees are numerous, and silk-worms are bred. The wild boar, the roebuck, the wolf, the fox, the badger, the polecat, and the hedgehog are found; and small game is tolerably abundant.

The department is divided into four arrondissements, which, with their population and subdivisions, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Albi	8	91	92,167
2. Castres	14	92	144,855
3. Gaillac	7	75	72,074
4. Lavaur	6	57	54,007
Total	35	315	363,073

1. In the first arrondissement are—ALBI, the capital of the department, which is described in a separate article; *Pampelonne*, N. of Albi, on the Viaur, population 2025; and *Realmont*, a well-built town, 10 miles S. from Albi, with about 3000 inhabitants in the commune.

2. In the second arrondissement are—CASTRES; *Brassac*, on the Agout, population 2055; *Angles*, 14 miles E. from Castres, population 2785; *La-Bruguière*, on the Tauré, population 3656 in the commune; *La-Coume*, population 3965 in the commune; *Vabres*, on the Gijou, population 2529; *Downgne*, 2250 inhabitants; *Lautrec*, N.W. of Castres, population 3467; *Masamet*, a considerable town, with a population of about 9700 in the commune, engaged largely in the manufacture of woollen goods; *Montredon*, 16 miles N.N.E. from Castres, population 5213; *Murat*, 2908 inhabitants; and *Roquecorbe*, population 2053, engaged in the manufacture of hosiery and woollen cloth.

3. In the third arrondissement the chief town is *Gaillac*, a large ill-built place with a college, tribunal of first instance, and 8152 inhabitants in the commune. It is situated on the right bank of the Tarn. It is an old town without any striking public buildings; there are an hospital and a small theatre. East of the town is a suburb, well laid out and pleasantly situated. There are brandy-distilleries and cooperages, and one or two tan-yards, dye-houses, and yards for building boats and other river-craft. Trade is carried on in corn, wine, and vegetables. *Cordes*, a mediæval town, built on a conical hill, 13 miles N. from Gaillac, has 2779 inhabitants. *L'île-d'Alby*, on the right bank of the Tarn, is a small town, with a place or square regularly laid out and adorned with a fountain. Considerable trade is carried on in corn and wine. Population of the commune 4951. *Rabastens*, in a fertile plain on the right bank of the Tarn, is an ill-laid-out and ill-built town, 11 miles S.W. from Gaillac, and has 5825 inhabitants, who manufacture blankets, and trade in corn, wine, and fruits. *Castelnau-de-Montmirail*, a considerable market-town, situated

in a district fertile in corn and fruit, has marble-quarries, and 3086 inhabitants.

4. In the fourth arrondissement the chief town, *Lavaur*, is situated on the left bank of the Agout (which is here spanned by a noble arch), and has a tribunal of first instance, a college, a public library, and 7113 inhabitants, who manufacture silks, serge, hosiery, leather, and cotton-yarn. *Graulhet*, prettily situated on the Dadou, 10 miles E. from Lavaur, has 5197 inhabitants in the commune. *Puy-laurens*, on a hill 14 miles S.E. from Lavaur, has silk-mills and 6095 inhabitants in the commune, who trade in horses and mules.

The department forms the diocese of the Archbishop of Albi. It is included in the jurisdiction of the Imperial Court and within the limits of the University-Academy of Toulouse; and in the 12th Military Division, of which Toulouse is head-quarters. Tarn returns three members to the Legislative Body of the French empire.

TARN-ET-GARONNE, a department in the south of France, is bounded N. by the department of Lot, E. by those of Aveyron and Tarn, S. by Haute-Garonne, and W. by Gers and Lot-et-Garonne. Its form is irregular; the greatest length is from north-east to south-west, 64 miles; the greatest breadth at right angles to the length is 44 miles. The area is 1436.6 square miles. The population in 1841 was 239,297; in 1851 it amounted to 237,553, which gives 165.3 to the square mile, or 9.2 below the average per square mile for the whole of France.

This department was formed by a senatus-consultum under the reign of Napoleon I. in 1808. It has no mountains and scarcely any hills; slight undulations alone vary its surface. The greater part is occupied by the tertiary formations of the basin of the Gironde: the most eastern district on the Aveyron is occupied by secondary formations. Among the mineral products are coal, iron, marble, freestone, limestone, marl, and potters'-clay.

The department belongs altogether to the basin of the Garonne. The GARONNE itself enters it on the south side, a little below Grenade, and has about 49 miles of its course in this department, navigable throughout. The Tarn enters the department on the south-east: it flows north-west and west to the Garonne, which it joins on the right bank: its whole course in this department is 40 miles, navigable throughout. These are the only navigable rivers. Of smaller streams the Garonne receives on the left bank the Lambon, the Gimone, and the Serre, above the junction of the Tarn; and the Larax, or Rats, below the junction of that river. The Barguelone joins the Garonne on the right bank. The AVEYRON, a considerable feeder of the Tarn, which it joins on the right bank, between Montauban and La-Française, has the lower part of its course in this department or along the boundary. The Tarn receives also the Tescou (of which the Tescoumet is a feeder) and the Lemboulas (of which the Latté is a feeder), both on the right bank. The Aveyron receives the Seye, the Bonnette, and the Lerc, on the right bank; and the Verre and the Tause on the left bank.

Highway accommodation is afforded by 7 imperial, 17 departmental, and a great number of communal roads. The railway in course of construction from Bordeaux to Cette passes through Moissac and Montauban.

The climate is generally mild but variable. Rains are frequent in spring; the summer heat increases gradually towards the end of July, when it is very great: autumn is the pleasantest season of the year: winter, though sometimes very cold, is generally dry. Snow rarely falls.

The area of the department may be estimated at about 910,000 acres in round numbers, of which about 575,000 acres, or above six-tenths, are under the plough. The soil is various; in some parts stiff and clayey, in others light and sandy; so sandy in some places as to be incapable of cultivation. The greater part however is very fertile: the plains and alluvial tracts which line the banks of the Garonne, the Tarn, and the Aveyron, are among the richest in France; but those along the banks of the Garonne are liable to be injured by the inundations of that river. The farms are generally separated by quick-hedges, and adorned with clumps of the wild quince-tree. The most important article of agricultural produce is wheat, which is of excellent quality. It is ground into flour, especially at Montauban; and large quantities are exported to America. Barley, oats, rye, maize, pulse, potatoes, vegetables of excellent quality, rape, flax, hemp, and tobacco are also cultivated to a considerable extent.

The meadows have an extent of about 48,000 or 44,000 acres, the heaths and open pastures of more than 41,000 acres. The number of horned cattle and pigs is considerable. Sheep are few. Horses, fitted for the light cavalry, are reared; and a considerable number of mules are bred for the Spanish market. Ducks, geese, turkeys, and other poultry are numerous. Quills and feathers are important articles of trade.

The vine is extensively cultivated on the slopes and more elevated plains. The district between the Tarn and the Garonne is particularly adapted to the growth of the strong red wines. The vineyards have an extent of about 90,000 acres. A large part of their produce is made into brandy for exportation.

The orchards and gardens occupy about 4500 acres: the walnut and chestnut-trees are of great size: the white mulberry is cultivated in order to rear the silk-worm. The woods occupy about 110,000 acres.

Game and fresh-water fish are abundant: great quantities of the lamprey and the shad are taken in the Garonne in the spring.

Manufactures are confined chiefly to the towns. They comprise broadcloth, serge, silk hosiery, paper, cutlery, soap, some cotton-stuff, leather, beetroot sugar, iron, and flour.

The department is divided into 3 arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Montauban . . .	10	62	106,323
2. Moissac . . .	6	49	60,598
3. Castel-Sarrasin . .	7	81	70,632
Total . . .	23	192	237,553

1. In the first arrondissement the chief town is *Montauban*, which is also the capital of the department, and is noticed in a separate article. [MONTAUBAN.] Among the other towns are the following, the population in each case being that of the commune:—*Cassan*, on the left bank of the Lère, with a population of 4292, who manufacture linen, broadcloth, sugar, and leather; and trade in agricultural produce. *Caylus*, 24 miles N.E. from Montauban, has remains of an ancient castle, and a population of 5152. *Moliers*, population 2542. *Monclar* (2210). *Montpezat* (2900). *La-Française*, population 3222, has a manufacture of pottery from the fine clay which is dug in the neighbourhood of the Tarn. *St-Antonin*, on the right bank of the Aveyron, at the junction of the Bonnette, has manufactures of serge and other woollen stuffs, and there are tan-yards and paper-mills: considerable trade is carried on in leather and dried plums. *Nègrepelisse*, on the left bank of the Aveyron, has 3122 inhabitants, who manufacture cotton goods, and trade in corn, wine, and hemp.

2. In the second arrondissement the chief town, *Moissac*, is situated on the Tarn, 15 miles N.W. from Montauban, and has a tribunal of first instance, a college, and 10,541 inhabitants. The town is well built. The church of St-Pierre, which, with the cloister adjoining, formed part of the Abbey of Moissac, dates from about the year 1104. A walk shaded by fine trees surrounds the town on the site of the former ditch; there is also a fine public walk along the right bank of the river. Moissac trades in flour, oil, wine, and wool. Among the other towns are *Auvillar*, near the left bank of the Garonne: population, 2178. *Lasserre*, north of Moissac, on a hill near the Barguelone, with 3444 inhabitants, who trade in corn, wine, fruits, and cattle. *Montagny*, 18 miles N. from Moissac, population 4073; and *Valence*, on the right bank of the Garonne, population 3088.

3. In the third arrondissement the chief town, *Castel-Sarrasin*, is situated in a fertile plain on the Axin, near the right bank of the Garonne, and has a tribunal of first instance, a college, and 6500 inhabitants in the commune. It is a well-built place, with some remains of its old ramparts, and two fine gate-entrances. Serge, hosiery, hats, and linen are manufactured, and there is some trade in corn, oil, saffron, &c. *Beaumont-de-Lomagne*, on the Gimone, 12 miles S. from Castel-Sarrasin, is a well-built town with 4112 inhabitants, who manufacture coarse woollens, tiles, and leather. *Verdun-sur-Garonne*, on the left bank of the Garonne, has much declined, but has still some woollen manufactures and 4213 inhabitants. *St-Nicolas-de-la-Grave* (population 2033), is known for the excellent melons grown in the surrounding district. *St-Porquier* (population 1437), is known for the extensive cultivation of tobacco and saffron in the neighbourhood. *Montech*, on a hill 9 miles S.E. from Castel-Sarrasin, has a population of 2758.

The department forms the diocese of the bishop of Montauban; it is under the jurisdiction of the High Court and within the limits of the University-Academy of Toulouse; and belongs to the 12th Military Division, of which Toulouse is headquarter. The department returns 2 members to the Legislative Body of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Annuaire du Commerce.*)

TARNOPOL. [GALICIA, AUSTRIAN.]

TARPORLEY. [CHESHIRE.]

TARQUINIUM, an ancient town of Etruria, on the southern bank of the river Marta, which empties itself into the sea a few miles below. According to Strabo the town was founded by Tarcon, one of the companions of Tyrrhenna. In the reign of Anus Marcius, Demaratus of Corinth is said to have come with a band of his countrymen to Etruria, and to have been favourably received by the Tarquinians; and the story describes him as the father of L. Tarquinius Priscus. This tradition shows that Tarquinius experienced at an early period considerable influence from Greece. Tarquinius appears to have become in a short time a great and powerful city, as is clear from the war which it carried on with Rome, and from the important remains which have recently been discovered; and there is little doubt that it formed one of the twelve republics of Etruria. After the expulsion of Tarquinius Superbus from Rome, in B.C. 509, the Tarquinians unsuccessfully endeavoured to restore him by force of arms. In the 4th century before Christ they carried on frequent wars against Rome. At last in B.C. 356 they were defeated by the dictator Marcus Rutilius, and the year after they were compelled by C. Sulpicius to lay down their

arms. Shortly after the Tarquinians sued for a truce, which was granted for forty years. At a later period Tarquinii became a Roman Municipium (Cicero, 'pro Cæciliis,' 4).

The site of the ancient Tarquinii is clearly discernible in the ruins still extant on the hill of Tarchino, near the modern town of Corneto. The place has in modern times acquired a peculiar interest through the numerous works of art which have been discovered in the tombs and catacombs. Most important are the paintings with which the walls of the catacombs are decorated; but besides these, thernæ and temples with inscriptions, mosaics and vases, and other works of art, are found there.

TARRAGONA. [CATALUÑA.]

TARSHISH, a place mentioned in the Old Testament, particularly in connection with the commerce of the Hebrews and Phœnicians. In Gen. x. 4, the name occurs among the sons of Javan, who are supposed to have peopled the southern parts of Europe. In other passages it is mentioned as sending to Tyre silver, iron, tin, and lead. The prophet Jonah, attempting to avoid his mission to Nineveh, fled from Joppa in a ship bound to Tarshish. In several passages of the Bible 'ships of Tarshish' are spoken of, especially in connection with Tyre. Tarshish is generally identified with the Phœnician emporium of Tartessus in Spain, a place which would undoubtedly furnish the products said to have been brought from Tarshish. Aramsan pronunciation of 'Tarshish' would be 'Tarthesh,' which would at once become the Greek Tartessus. There seems now little doubt that the Tarshish of the Hebrews and Phœnicians and the Tartessus of the Greeks are identical with *Carteia*, an ancient city, which stood at the head of the bay of Algeciras, about 4 or 5 miles W. from Calpe, or Gibraltar. A hill called El-Rocadillo, midway between Gibraltar and Algeciras, is ascertained to have been the site of *Carteia*. Numerous coins of the city have been found; there are remains of an amphitheatre, and the ancient walls may still be partly traced. These remains however and the coins belong to the Roman imperial period; the coins bear the head of the Tyrian Hercules, who was especially worshipped here, and in whose Phœnician name (*Mel-Carthā*) Bochart seeks the original root of all the names of the city. The Romans would retain the Punic name *Carteia*, which, according to statements in Strabo, Pliny, Pausanias, Mela, Appian, and other ancient authors, was considered to be identical with Tartessus.

Of Tartessus nothing is known except its traditional renown as a great and wealthy emporium of the Phœnician trade. *Carteia* was one of the cities of the Bastuli Pœni, who were a mixed Iberian and Phœnician race. It was an important naval station in the second Punic war, when it witnessed the defeat of the Carthaginian fleet under Adherbalby Lælius (B.C. 206). In B.C. 171 it was colonised by 4000 men, the offspring of Roman soldiers and Spanish women. During the civil war in Spain *Carteia* was the chief naval station of Cneius Pompey, who took refuge here after his defeat at Munda, but was obliged to leave it on account of the disaffection of part of the citizens.

TARSUS, a city of Cilicia Campestris, on the Cydnus, in Asia Minor, is situated about 12 miles from the sea, in about 36° 55' N. lat., 34° 59' E. long. There are various fabulous legends about its origin. Stephanus Byzantinus says it was founded by Sardanapalus. Xenophon, 'Anab.,' i. 2, describes Tarsus as a great and flourishing city when it was taken and plundered by the younger Cyrus, who afterwards concluded a treaty with Syennesis, king of Cilicia, who had his palace there. Alexander the Great arrived at Tarsus just in time to save it from being burnt by the Persians. The city joined the party of Julius Cæsar, in honour of whom it took the name of Juliopolis; it was in consequence severely punished by Cassius, and rewarded afterwards by Antony, who made Tarsus a free city. Tarsus enjoyed the favour of Augustus, whose tutor Athenodorus, a Stoic, was a native of this place, and persuaded the emperor to release his countrymen from all taxation. Tarsus continued to be a wealthy and important city under the emperors. The Tarsians, according to Strabo, excelled in quickness of repartee and every kind of ready wit; and their schools of philosophy were not less celebrated than those of Athens and Alexandria. Tarsus was a metropolis, a free city, and tax-free, as before stated. St. Paul was a native of Tarsus. Jupiter, Apollo, Hercules, and Perseus are frequent types on the coins of Tarsus, and confirm the testimony of Dion Chrysostom ('Orat.,' 33, 20), who mentions these among the chief deities of the place.

Tarsus was seized by the Arabs during the early times of their empire, and was strongly fortified by Harun al Raahid, whose son and successor, Al Mamun, was buried there, A.D. 833. It was recovered by Nicephorus Phocas, the successor of Constantine Porphyrogenetus, after a great resistance. Ebn Haukal, who wrote in the 10th century, describes 'Tarsous' as a considerable town, with a double wall of stone, as a strong and pleasant place, and as containing above 1000 horsemen. Tarsus was afterwards retaken by the Arabs, but it was wrested from them by the Crusaders, under the command of Tancred. William of Tyre describes it at this time as a metropolis of Cilicia, with suffragan towns, and a population of Greeks and Armenians, much oppressed by the Arabs. In the 13th century, during the khalifate of Mostazem, the Arabs attempted to recover Tarsus, but failed. It was finally taken by Mohammed II., in 1458.

Very few remains of ancient Tarsus exist; at the north-west end of

the ancient town is part of an old gateway, and near it a very large mound, apparently artificial, with a flat top; on an eminence to the south-west are the ruins of a spacious circular edifice, probably the gymnasium. The Cydnus (now called the river of Tersoos) was navigable up to Tarsus in ancient times. It flowed into a kind of lake called Rhegma, which had dockyards and formed the port of Tarsus. The deposits of the river have filled up the lake, and the mouth of the Cydnus is so obstructed by sand-bars that only small boats can enter, but inside the bar the river is still deep and about 160 feet wide,

TAUNTON, Somersetshire, an ancient market-town, parliamentary borough, and the seat of a Poor-Law Union, is situated in a fertile vale called Taunton Dean, in 51° 1' N. lat., 3° 6' W. long., distant 46 miles S.W. from Bath, 141 miles W.S.W. from London by road, and 163 miles by the Great Western and Bristol and Exeter railways. The population of the borough in 1851 was 14,176. The borough is governed by two bailiffs chosen annually, two constables, and two portreeves, and returns two members to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry of Taunton and diocese of Bath and Wells. Taunton Poor-Law Union contains 38 parishes and townships, with an area of 70,452 acres, and a population in 1851 of 35,114.

Taunton was a place of considerable importance in the Anglo-Saxon period. A castle was built after the Conquest by one of the bishops of Winchester, to whom the town and manor were granted. Perkin Warbeck held the castle and town for a short time; and in the civil wars Taunton sustained a long siege under Blake against 10,000 Royalist troops.

The town is about a mile long; the principal streets are well paved and lighted with gas. The woollen manufacture was established at Taunton in the 14th century, but has long since decayed; at present the only manufacture is that of silk, called here 'silk throwing.' The river Tone is crossed here by a stone bridge of two arches; but the river is only partially navigable, and the water communication is mainly by a canal between Taunton and Bridgewater, a distance of 12½ miles; there is a branch from this canal to Chard. The market-house stands in a spacious open area called the Parade. On the west side of the Parade is a handsome building of the Ionic order, erected in 1821, the upper part of which is appropriated as a library, museum, and reading-room; and underneath, and in the rear, are the markets for fish, poultry, dairy produce, &c. The castle is used for the assize courts. The Taunton and Somerset Institution, established in 1823, contains a good library, and a large public reading- and news-room. The church of St. Mary Magdalen, formerly a chapel to Taunton Priory, is a spacious and handsome edifice in the perpendicular style. St. James's church is a plain edifice with an ancient square tower. Trinity church is a gothic building, erected in 1842. The Wesleyan Methodists, Roman Catholics, Independents, Baptists, Quakers, and Unitarians have chapels. The Grammar school was founded by Fox, bishop of Winchester, in 1522. There are National, British, and Infant schools. The West of England Dissenters' Proprietary school, founded in 1847, had 112 pupils in 1854. The Wesleyan Methodists have a college here. There are in Taunton a mechanics' institute, a savings bank, and a philharmonic society. The Somerset Archaeological Society has its museum and its meetings in Taunton. A county court is held. Among the benevolent institutions are the Taunton and Somerset Hospital, and the Eye and Ear Infirmary. The markets are held on Wednesday and Saturday; a fair is held on June 17th.

TAUNTON. [MASSACHUSETTS.]

TAUNUS. [PRUSSIA.]

TAURICA CHERSONESUS was the ancient name of the peninsula which juts out southward from European Sarmatia, between the Pontus Euxinus (Black Sea) and the Palus Mæotis (Sea of Azof). It is now called the CRIMEA, under which head its form and physical features are described. The isthmus which connects it with the mainland was called *Taphros*, or *Tuphros*, and there appears to have been a town called Taphros upon the isthmus; and both most probably took their name from the ditch (*Tápros*) which crossed the isthmus and was fortified. (Strabo, vii. p. 308; Pliny, iv. 26; Mela, ii. 1.) On the west of this isthmus was the Sinus Carcinites, now the Gulf of Perekop; and on the east the shallow waters of the Putrid Sea (Palus Putris), now called the Saiwash. The south-western point of the peninsula was the promontory Parthenion, which is either the modern Cape Kherson or Cape St. George. The southern promontory was

called Criu-Metopon, now Aia-burun, or Cape Aia (1200 feet high); and either the south-eastern or the eastern point was called Korax. On the east the peninsula is divided from the coast of Asia by the Cimmerian Bosphorus, now the Strait of Kertch or Yenikale. In the south-western angle of the Crimea is a small peninsula terminated by Cape Kherson, and inclosed on the north by the Gulf of Achtiar, or Sevastopol, the ancient Portus Ktenus; and on the south by the Gulf of Balaklava, the ancient Portus Symbolorum. On this peninsula, at the distance of 100 stadia from the promontory Parthenion, stood the city of Chersonesus, which was a colony of Heraclea in Pontus, and therefore distinguished as the Heracleiotis Chersonesus. The peninsula itself was called the Small Chersonesus, and the Chersonesus Taurica the Great Chersonesus, for the sake of distinction. The other important towns were, on the isthmus, *Taphros*, now *Perekop*; on the west coast *Eupatoria*, now *Kazlov*, built by Mithridates Eupator; on the east coast *Theodosia*, now *Kefa*, *Kaffa*, or *Feodosia*, a colony of the Milesians; and near the eastern extremity of the peninsula, on the Bosphorus, *Panticapaeum*, now *Kertch*. There were several towns in the interior, of which one was named *Cimmerion*.

The earliest inhabitants of the peninsula appear to have been the Cimmerians (Herod., iv. 1, 11, 12.) Clear traces of this people remain in the names of Cimmerion, the Cimmerian Bosphorus, the Cimmerian Chersonesus (as the peninsula was sometimes called), and in its modern names of Crimea and Crim-Tartary. A Scythian or Slavic horde seems to have early mixed with or partially expelled the Cimmerii. In the earliest notices of the Chersonesus, by Greek writers, we find the mountainous region of the south and south-east inhabited by a piratical people, called Tauri, from whom the Chersonesus was called Taurica, and whose name remains in that of the modern Russian province of Taurida, in which the Crimea is included. Herodotus (iv. 99) says that the Tauri were a different people from the Scythians. It seems probable that the Tauri were a remnant of the old Cimmerian inhabitants, who had maintained themselves in the mountains, and that they got the name of Tauri from this very circumstance—'tau' being an old root, meaning a mountain. The Tauri were reputed by the Greeks to be inhospitable and cruel to strangers: they were said to offer human sacrifices, especially of shipwrecked mariners, to a virgin goddess, whose temple stood on the promontory of Parthenion. In this temple Iphigenia, the daughter of Agamemnon, was a priestess; and Herodotus says that the Tauri identified Iphigenia with the goddess. This legend enters into the *Agamemnon* of Euripides.

From about the sixth century before Christ downwards, several Greek colonies were planted on the Chersonesus, and these were gradually formed into two states, that of Chersonesus, comprehending the smaller peninsula on the south-west, and the kingdom of Bosphorus on the south-east. These two states were united under Mithridates. [BOSPORUS; CRIMEA.]

TAURIDA, a government of South Russia, situated on the Black Sea, consists of the Crimea or Tauric Peninsula and the Nogay Steppe. It is bounded N.W. by Kherson, N.E. by the country of the Don Cossaks, E. by Caucasia, S.E. by the Kuban, and S. by the Black Sea. The Crimea is described in a separate article. [CRIMEA.] The area, exclusive of the Saiwash, or Putrid Sea (which covers 990 square miles), is 24,617 square miles, with 572,200 inhabitants of many different nations, Tartars, Cossaks, Russians, Jews, Gipsies, Germans, and other foreign colonists, &c. It lies between 44° 30' and 47° 50' N. lat., 31° 25' and 40° 25' E. long. The Nogay Steppe includes the whole of the extensive country from the Dnieper and its limans to the Berda. It is a dry elevated steppe, on a basis of granite. The soil is dry, poor, in part sandy, and saltish, without wood; but there are here and there extensive hollows with rich black mould, which produce the finest grass. The climate is extremely mild, and differs little from that of the peninsula. The winter, though short, is severe. The only rivers are those which form the boundaries: the Dnieper on the north-west, the Konskaia on the north, and the Berda on the east. On the south-east of the steppe is the Sea of Azof, and on the south-west the Gulf of Perekop and the Black Sea. [RUSSIA.] In the Nogay Steppe are numerous lakes, some of them of considerable size. Lake Molotschnaia, into which the river Molotschnaia runs, and which is separated from the Sea of Azof by a narrow sandy spit, covers an area of over 108 square miles. The southern coast of the steppe presents a great number of those remarkable long narrow projections of sandy alluvial deposits called Kosas, or 'tongues.'

The long tongue west of the Gulf of Perekop and south of the estuary of the Dnieper, was anciently called Achilleos Dromos, or Racecourse of Achilles, from a legend, which gave it to Achilles as a stadium on which to exercise his celebrated swiftness of foot. This spit extended about 80 miles in length, including the part of the mainland to which it was attached near its centre. The western portion of it is now isolated by a narrow gap, and forms the Kosa Tendra. To the north of the Kosa Tendra is another long but rather broad and notched projection, which separates the Bay of Kil-burun from the estuary of the Dnieper, and is also called Kil-burun, which is a corruption of Achill-burun, or Cape Achilles, for the name of the old hero is connected with several localities in the west of the Black Sea. The name Kil-burun is further corrupted in many maps and books into Kilburn and Kinbourn. The point of Kil-burun and

both sides of the bay have been recently strongly fortified by the Russians.

The country of the Tschernomoraki, or Black Sea Cossaks, including the island or peninsula of Taman, is separated from the Crimea only by the Strait of Yenikale. It was formerly included in the government of Taurida, but now forms a separate region, territorially connected with Circassia, and under the peculiar government of the Cossak districts of the empire. [CIRCASSIA; COSSAKS; KUBAN; TAMAN.] The only towns worth naming in the government of Taurida are those of the Crimea, which are noticed either under that head or in separate articles. [CRIMEA; BARTCHERABAI; BALAKLAVA; KAFFA; KOZLOFF.]

TAVISTOCK, Devonshire, a market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of Tavistock, is situated on the right bank of the river Tavy, in 50° 33' N. lat., 4° 10' W. long., distant 11 miles N. from Plymouth, 81 miles S.W. by W. from Exeter, and 138 miles W.S.W. from London by road. The town is governed by a portreeve, and returns two members to the Imperial Parliament. The population of the parliamentary borough in 1851 was 8086. The living is a vicarage in the archdeaconry of Totness and diocese of Exeter. Tavistock Poor-Law Union contains 24 parishes and townships, with an area of 152,434 acres, and a population in 1851 of 27,850.

At Tavistock the Tavy flows rapidly through a narrow valley, from which the ground rises steeply on both sides to the height of several hundred feet. The river is crossed by two bridges within the town. A narrow valley, or gully, from the north, is covered by houses. In 961 an abbey was founded at Tavistock, which was burnt by the Danes, and afterwards rebuilt on a larger scale. Henry I. (1100-35) granted to the abbot a weekly market and a fair. In 1539 the then abbot surrendered the abbey to the king, when its revenue was estimated at 902*l.* A printing-press was established in the abbey soon after the introduction of the art into England. Fragments of the abbey still remain, but they are chiefly incorporated with other buildings. The upper room of the gate-house contains a public library. The parish church is a spacious edifice, with a tower at the west end supported on arches. The Independents, Unitarians, Quakers, and Wesleyan and Association Methodists have places of worship. There are in the town a Grammar school; National, British, and Infant schools; almshouses for 19 poor persons; and a savings bank. The Tavistock Institution has a small collection of Devonshire minerals. Tavistock has had the privilege of returning two members to parliament since 1295 (23 Edward I.).

Tavistock is one of the four stannary towns in the county of Devon. A county court is held in the town. Friday is the market-day: several fairs and great cattle markets are held in the course of the year. A canal connects Tavistock with the river Tamar at Morwell Ham quay, and with the town of Plymouth. Sir Francis Drake was a native of Tavistock.

TEIGNMOUTH, Devonshire, a market-town, in the parishes of East and West Teignmouth, is situated at the mouth of the river Teign, on its left bank, in 50° 32' N. lat., 3° 31' W. long., distant 15 miles S. from Exeter, 179 miles S.W. by W. from London by road, and 209 miles by the Great-Western and Bristol and Exeter railways. The population of the town of Teignmouth in 1851 was 5013. The livings are in the archdeaconry and diocese of Exeter.

East and West Teignmouth now form one town. East Teignmouth church is near the sea-shore; it was lately rebuilt on an enlarged scale. West Teignmouth church is a large inelegant octagonal structure, with a tower at one of the angles; it was built in 1815. The Independents, Wesleyan Methodists, and Baptists have places of worship, and there are National schools. The public assembly rooms, erected in 1826, is a large building with an Ionic pediment and a Doric colonnade. On the Den, an open space by the sea, is a fine promenade. Teignmouth is much frequented as a bathing-place. There are large exports of granite from the Haytor quarries, manganese, pipe-clay, potters'-clay, timber, bark, and cider: the imports are of culm, coal, deals, iron, &c. There is a considerable fishery for soles, mackerel, and pilchards on the coast, and for salmon in the river Teign. The bridge over the Teign, opened in 1827, is 1671 feet long. It consists of 34 arches supported on iron trusses; over the main-channel there is a swing bridge, to allow the passage of ships. The market in East Teignmouth is on Saturday for provisions: there are three fairs also in East Teignmouth.

TELLICHERRY. [HINDUSTAN.]

TEME, RIVER. [SHROPSHIRE.]

TEMESH, or TEMES, RIVER. [AUSTRIA; HUNGARY.]

TEMESWAR. The southern part of the country formerly called Hungary, from the Danube and the Save on the south to near 46° N. lat. on the north, from Transylvania on the east to the Danube on the west, has been recently formed into a Crownland of the Austrian empire, called the *Woiwodeschaft of Servia* and *Temeswar Banat*. The Crownland comprises what used to be called the Banat of Temeswar and the Bacscs. The total area of the Crownland is 10,686 square miles, and the population in 1851 was estimated at 1,380,757. The area and population are thus distributed among the 5 circles into which the Crownland is divided:—

Circles.	Arrondissements.	Area in Sq. Miles.	Population in 1851.
Temeswar .	6	2165	280,808
Lugos . . .	4	1978	219,805
Becserek . .	8	2694	336,765
Zombor . . .	6	2294	349,436
Neusatz . .	5	1555	193,943
Total . . .	29	10,686	1,380,757

The Temeswar Banat comprises the districts of Torontal, Temes, and Krassova, with certain portions of the Military Frontier towards Wallachia. It is bounded N. by the Maros, W. by the river Theiss and the Danube, S. by the Danube, and E. by the Cserna and the offsets of the Carpathians, which divide it from Little Wallachia and Transylvania. It is remarkable for great varieties of climate: in the eastern districts the snow on the high mountains and in the deep ravines never melts, and in other districts snow falls only in severe winters. A third part of the country, from the district of Krassova and extending between the Maros and the Danube, east of the Karasch, is mountainous, and almost everywhere well watered.

The district of Torontal extends from the Maros along the Theiss, and comprises the lower parts of the basins of the Temes and the Bega. It is a country of vast plains and marshes, with a warm but not salubrious climate, and a very fertile soil. The central part of the Banat comprises the circle of Temeswar, which is similar in soil and climate to the preceding, but lies nearer the mountains.

The ground which has been gained by draining the morasses on the banks of the Theiss and the Danube, and in the more elevated tracts by clearing the old forests, is extremely fruitful. The principal points of the high mountains are Sarko, Gugu, Murarn, Godjan; on the lower mountains there are vast forests and fine pastures. The principal rivers are the Danube, Theiss, Maros, which flow on the boundaries; the *Alt-Bega*, a feeder of the Theiss, which traverses part of the plain of Temeswar and Torontal: the *Temes*, or *Temesch*, which rises in the high mountains on the eastern frontier, and flows north-west past Lugos, thence westward, and then south-south-west through a vast plain intersected by marshes and woods to the Danube, which it enters by two mouths below Pancsova: the *Bega*, a feeder of the Temes, which flows northward from Mount Buska and joins the Temes on the right bank between Lugos and Temeswar: the *Karasch*, or *Karas*, which flows nearly south from the western slopes of the mountains in the Krassova district to its mouth in the Danube near Uj-Palanka: the *Nera*, which drains the southern slopes of the same mountains, and joins the Danube just below the mouth of the Karasch: and the *Cserna*, which rises in Little Wallachia and flows southward between high mountain ridges into the Danube on the frontier below Alt-Orsova.

Canals have been made to drain the marshes. The principal of these is the Bega Canal, 75 miles in length, which commences in the Krassova district, and after skirting the Bega, passes into the district and through the town of Temeswar. It then turns south-west, and traversing a great part of the plain of Torontal, it joins the Alt-Bega above Nagy Bekskerek. The Allibunar marshes, between the Karasch and the Temesch, are drained by the Borzava Canal and some connected cuts. By the draining of the marshes, tracts which were

formerly sources of pestilential exhalations, are now covered with the finest corn-fields, or, where they have been imperfectly reclaimed, with crops of rice, and the salubrity of the country has been greatly improved. The protection which the mountains give against the east and north-east winds, and the mitigation which the north winds experience in traversing the great plain, raise the temperature to that of a southern country, and the rich soil yields abundant crops. The wheat and maize of the Banat are of the finest quality. Rice is extensively cultivated. Successful attempts have been made to cultivate cotton and silk, and in some parts a sweet wine is produced. Mineral springs are frequent, but little use is made of them. Only those of Mehadia, which were known to the Romans by the name of 'Therma Herculis,' are still much resorted to, especially by the Wallachian and Moldavian nobles. About this place, as well as in other parts of the Banat, Roman antiquities are frequently found. The population of the Banat, which is continually increasing by the accession of foreign settlers, consists chiefly of Servians, Wallachians, Rascians, Magyars, Bulgarians, Gipsies, Germans, Jews, and other foreign settlers. In the mountainous districts, the Wallachian language is prevalent; in the towns and colonised plains, the German; and in the districts of the military frontier, the Illyrian. The natural productions are horses, horned cattle, swine, wheat, rice, flax, hemp, tobacco, fruit, wine, woad, madder, saffron, silk, timber, honey: game of all kinds and fish abound. The minerals are gold, silver, copper, zinc, and some iron. The gold is obtained by the Gipsies, by washing the sand of the rivers. The chief occupations of the inhabitants are agriculture and the breeding of cattle. There are no manufactures of any importance. There are remains of Roman entrenchments from Uj-Palanka, on the Danube, all the way across the plain to the Marosch near Alt-Arad.

The Bacscs, or district of Bacs-Bodrogh, forms the western part of the *Woiwodeschaft of Servia*; it lies between the Danube and the Theiss, the banks of the former river constituting its western and southern boundaries, and those of the latter its eastern. Its surface, with the exception of a semicircular and rather elevated plateau, arching to the south, between Szatanisits above Zombor and Maria-Theresiopel, is an uninterrupted plain. The plateau just mentioned, termed the 'Teletakan Hills,' is situated immediately north of what are called the 'Lesser and Greater Roman Entrenchments,' which extend in a serpentine line from Apatin near the Danube to Földvar on the Theiss. Between these entrenchments and the Teletakan Hills runs the Bacscs, or Franz Canal, which commences on the Danube, passes Zombor and Verbasz, and joins the Theiss: it is nearly 70 miles in length, and has a breadth of 62 feet, and a depth varying from 4 to 6 feet. Vessels from 250 to 300 tons navigate it. The district contains no stream of note besides the Moeztonga, which flows with a sluggish current, forming numberless swamps in its course, into the Danube below Bacs. There are several large sheets of water, such as the salt-lake of Polity, near Maria-Theresiopel, and the adjoining lake Ludasto. The soil is in parts of such great natural fertility as not to require manuring; in others it is utterly arid and sandy: the latter is more especially the character of many districts around Maria-Theresiopel, Madaros, Bája, and Monostor, and others in the northern part of the Bacscs. The productive portion of its surface is estimated at about 1,785,700 acres, of which nearly one-half is arable land. In consequence of the swamps the climate is in general insalubrious. The country yields vast quantities of grain; its wheat in particular is in great request, from the excellence of its quality, and it is exported in large quantities. The vineyards occupy about 90,000 acres, and an abundance of wine is made in the neighbourhood of Maria-Theresiopel, Bája, Zombor, and the Franzen Canal. Fruit is largely produced; hemp is cultivated to a great extent, and good tobacco is raised. Madder and woad are grown near Apatin. Woods, particularly of oak, abound along the banks of the Danube. Fuel is scarce; the poor use straw, dried-rushes, and cattle-dung as a substitute. The district contains above 550,000 acres of pasturage, on which cattle, horses, and sheep in considerable numbers and of excellent breeds are reared.

The Crownland comprises also the Syrmian districts of Ruma and Illok, which lie between the Danube and the Save, and were formerly included in Slavonia. [CROATIA.] The limits given to it in this article comprise also a portion of the Military Frontier; but this is under the peculiar government of that portion of the empire as explained under MILITARY FRONTIER. According to the decree issued on the formation of this Crownland, the emperor is styled the Grand-Woiwode of Servia, and the actual governor of the Crownland takes the title of Vice-Woiwode. The governor is assisted by a ministerial commission and a native administrative council. Temeswar is the capital of the Crownland.

Towns.—*Temeswar*, the capital formerly of the Banat and now of the whole *Woiwodeschaft of Servia*, is situated in 45° 45' N. lat., 21° 20' E. long., on the Bega Canal, and has 20,300 inhabitants. It is one of the strongest fortresses and one of the handsomest and most regular towns in the whole Austrian empire. When Prince Eugène took it from the Turks in 1718, strong fortifications were erected, and the town was built in the modern style. The inner town, or fortress, is surrounded with triple walls and moats, and consists of large uniform stone houses, in straight, broad, well-paved streets,

There are three gates, which are defended by strong blockhouses. The casemates are capable of containing 3000 men. Temeswar is the seat of the Roman Catholic bishop of Csanad, and of the schismatic Greek bishop of Temeswar: here too are the superior courts of justice for the Crownland and the offices of the governor, a military academy, a great arsenal, and many other offices connected with the administration. The most remarkable buildings are, the old castle of John Hunyady, the fine Gothic cathedral of St. George, the cathedral of the schismatic Greeks, the Roman Catholic parish church, the churches of the Piarists, and of the seminary; the elegant residence of the Bishop of Csanad, the remarkably fine building in which the chapter resides, the house of the commander of the military frontier on the parade, the large and handsome county-hall in the great square, the barracks, the military and civil hospitals, the synagogue, and the Rascian town-hall, which contains a theatre and assembly-rooms.

Temeswar has three suburbs, one before each gate, at the distance of 800 paces, with fine avenues of trees leading to them. Before the Vienna gate is the suburb Michala, inhabited by Wallachians, who have their own churches, and whose occupations are agriculture and the breeding of cattle. Before the Peterwardein gate is Josephstadt, an extremely pleasant suburb, with very broad straight streets, and trees planted in front of the houses. The inhabitants of this suburb are Germans. The fine Bega Canal passes through the middle of this suburb, and communicates with the Danube. Before the Transylvania gate lies the manufacturing suburb, so called from the great manufactories that were formerly established here, but most of which were broken up in 1738, when a Turkish war was apprehended. In this suburb there is a hydraulic engine, by means of which water is conveyed in iron pipes underground into the fortress. There is a considerable trade at Temeswar in the productions of the country, and some manufactures of cloth, paper, iron-wire, and silk. Under the walls of Temeswar, the Magyar insurgents were utterly and finally defeated by the Austrians under Marshal Haynau, August 9, 1849.

Lugos, or *Lugosch*, capital of the circle of the same name and of the Krassova district, is situated about 20 miles E. from Temeswar, on the Teme, which divides the town into two parts, one of which on the left bank is inhabited chiefly by Germans, while the part on the right bank is inhabited chiefly by Wallachians and Rascians. The population is about 10,000.

Becserek, or rather *Gross Becserek*, chief town of the circle of that name and of the district of Torontal, is situated on the Bega, a little below the junction of the Bega Canal. It is a place of some trade, and has about 12,000 inhabitants.

Zombor, in the Bacscs, is situated on the Mosztunka, near the Franzsen Canal and the Danube, by means of which it carries on some trade in corn and cattle. It has important silk manufactures and about 22,000 inhabitants, mostly Illyrians. The town is the seat of a Greek bishop, has several Catholic and Greek churches, and a gymnasium.

Neusatz, also on the Bacscs, is situated nearly opposite Peterwardein, on the left bank of the Danube, and has about 20,000 inhabitants, who trade extensively on the Danube, the Theiss, and the Save, with the principalities and the frontier provinces of Turkey. The town, which is inclosed by walls, and is joined to Peterwardein by a causeway and a bridge of boats, has numerous churches belonging to Catholics, Greeks, and Armenians, a synagogue, a gymnasium, and several special schools. Danube steamers put in at Neusatz.

TEMPIO. [SARDEGNA.]

TEMPLE SOWERBY. [WESTMORLAND.]

TEMPLEMORE. [TIPPERARY.]

TENASSERIM is a long slip of country lying along the upper part of the west coast of the Malay Peninsula, acquired from the Birman empire by the peace of Yandobo, in 1826, and forms now a province of the government of Penang, in the presidency of Bengal. A continuous range of mountains, varying in elevation from 3000 to 5000 feet, runs along the peninsula, and forms the division between Tenasserim and Siam on the east, while the Saluen, which falls into the Gulf of Martaban, forms for some distance the boundary of Birmah on the west. At its southern extremity it narrows to a point where the river Pakcham, which is navigable for 40 miles, by a portage of about 20 miles, reaches to a Siamese river which falls into the Gulf of Siam near the town of Bardia. At this point the ridge of mountains which separates Tenasserim from Siam approaches the shore, but in the north it extends backwards to a distance of about 100 miles. The total area is about 30,000 square miles, and the population has been estimated at about 100,000. The soil is, on the whole, fertile, but the productions are few and inconsiderable, and the chief exports have been a small quantity of rice and some teak timber; coffee and nutmegs have been cultivated with some success. Domestic animals are not numerous, except the buffalo, which is of large size. Tigers, elephants, and rhinoceroses are numerous, as are also various species of deer. Among the birds are found parrots, the Indian peacock, the *Phasianus gallus*, hawks, and pigeons; and the *Hirundo cuculatus* breeds in the cliffs of the islands of the Mergui Archipelago, the nests of which are collected in considerable numbers and sold to the Chinese; fish is abundant in the neighbouring sea, and trepang, tortoise-shell, and ambergris are obtained. The climate is considered healthy. There are two seasons at Moulmein; the rains commence

towards the end of May, and for three months are heavy and incessant, but they diminish in September, and cease in October, which is the hottest part of the year. The thermometer has never been known to rise above 90°; in June it varies between 72° and 76°.

The country is known to be rich in minerals. Gold is found in small quantities in some of the rivers. Tin is the only metal which has been worked. Iron-ore of good quality is found in abundance in several places, especially in the districts south of the Tenasserim river. Antimony occurs in the neighbourhood of Moulmein. There are extensive coal-measures on the banks of the Tenasserim River. The coal is generally of good quality, and the best kind is near the banks of the river below the last rapids, so that it can be brought to Mergui at moderate expense.

The rivers are numerous, but those in the southern parts have very short courses, descending from the mountains which form the watershed between it and Siam. The most important are those which run parallel with the mountains, such as the Tenasserim, which rises in about 15° N. lat., and flows in a southern direction for more than 200 miles in a straight line. The upper part of its course is broken by rapids as low down as 13° 15' N. lat., up to which the tides ascend, but in the dry season it becomes there very shallow. At its confluence with the Little Tenasserim it becomes deeper, and here the town of Tenasserim is built, up to which vessels of 100 tons burden can ascend. It then takes a turn to the north and disembogues itself by several mouths a little south of the town of Mergui. The river Tavoy, which rises near 15° N. lat., has a course of not less than 100 miles. The town of Tavoy is in 14° 7' N. lat., and so far vessels of 120 tons burden may ascend. The navigation is intricate, owing to the numerous shoals and low islands. The Saluen rises in Yun-nan in China, and runs in a southerly direction between Birmah and the Shan states (Laos) subject to Siam. At its confluence with the Thoug-Yin, though it brings down a great volume of water, and is only 100 miles from the Gulf of Martaban, it is not navigable, owing to the numerous rapids. In 17° N. lat. it is divided into two streams by Colan Island, and the eastern branch then becomes navigable. The Zitang, the Atta-yan, and the Gyeng, fall into the Saluen near its mouth. The confluence of these rivers forms a broad sheet of water, 15 miles long from north-east to south-west, and from 5 to 6 miles wide, interspersed with numerous small islands, and separated from the sea by the island of Pelew Gewen, 20 miles long and 10 miles wide. The channel running westward along the end of the island is called the Martaban River: the eastern channel runs due south past Moulmein. Amherst is lower down, and though there are some dangerous sands, there is from 11 to 5 fathoms water up to the town.

Numerous islands occur along the western coast of the peninsula without the Ganges, between 14° 40' and 8° N. lat. North of 12° N. lat. they extend to the distance of 70 or 80 miles from the shore, but south of 12° N. lat. they occupy a space of only 30 miles in width. These islands are comprehended under the collective name of the Mergui Archipelago. The larger islands from north to south are Tavoy Island, King's Island, Ross Island, Domel Island, Kisseraing Island, Sullivan Island, and Kalegouk, or Bentinck Island. Tavoy harbour, on the east side of that island, is safe and good, and affords an abundant supply of wood and water, and with the other islands to the southward affords a continuous anchorage for 50 miles. The spring-tides rise here 50 feet. The harbour of King's Island Bay, opposite the town of Mergui, is spacious and safe, but the entrance has some difficulties, as a shoal extends over a part of it. Bentinck Sound, on the east side of the island, also affords good anchorage.

The inhabitants of the province are a mixed race; Birmans, Thilians, Siamese, and Karens. The greater part of them are Buddhists in religion. Of the towns, which are few, AMHERST and MOULMEIN have been noticed. Tavoy is small, but it has some commerce with Rangoon and Mergui. Mergui has the advantage of a safe and well-protected harbour. The roadstead is between the mainland and Madramacan Island, with a soft bottom in from 6 to 16 fathoms water, where large vessels are sheltered from all winds. The neighbourhood is well adapted for plantations of spice-trees, and is conveniently situated for commercial intercourse overland with Bangkok and the countries of Siam which surround the gulf of that name. Tenasserim, an ancient town, was destroyed in the wars between the Siamese and the Birmans; it is now in ruins. Coal has been found in the neighbourhood.

TENBURY, Worcestershire, formerly called Temebury, a small market-town, and the seat of a Poor-Law Union, in the parish of Tenbury, is situated in a fertile district on the right bank of the river Teme, in 52° 18' N. lat., 2° 35' W. long., distant 22 miles N.W. by W. from Worcester, and 133 miles W.N.W. from London. The population of the parish of Tenbury in 1851 was 1786. The living is a vicarage in the archdeaconry of Salop and diocese of Hereford. Tenbury Poor-Law Union contains 19 parishes and townships, with an area of 35,941 acres, and a population in 1851 of 7047.

At Tenbury the river Teme separates Worcestershire from Shropshire, and is crossed by a stone bridge of six arches. The Kyre, a small but rapid stream, which falls into the Teme at the upper end of Tenbury, often occasions inundations in the town: this river is also crossed by a handsome bridge. The Leominster Canal passes near the town. There is a considerable trade in hops, cider, and perry. A

county court is held. The old church was carried away by a flood in 1770, and the present edifice was erected in 1777. The Baptists have a place of worship; there are National schools and a savings bank. The market-day is Tuesday; several yearly fairs are held.

TENBY, Pembrokeshire, a market-town and parliamentary borough, is situated in 51° 40' N. lat., 4° 41' W. long., distant 10 miles E. from Pembroke, and 244 miles W. by N. from London. The population of the borough, which is contributory to Pembroke in returning a member to the Imperial Parliament, was 2982 in 1851. The living is a rectory and vicarage in the archdeaconry and diocese of St. David's.

Tenby was originally built by the Flemish colonists. It was defended by bastioned walls and a strong castle, of both of which there are considerable remains. Its Flemish inhabitants were celebrated for their woollen manufactures, and kept up a considerable trade with the continent. The fortifications were strengthened on the approach of the Spanish Armada. Tenby was twice besieged during the civil war, after which the town rapidly fell into decay; but within the present century it has risen into repute as a watering-place. St. Mary's church, originally built by one of the old earls of Pembroke, consists of a nave, aisles, and chancel. The tower is surmounted with a spire 152 feet high, which is painted white to serve as a landmark. There are chapels for Wesleyan Methodists, Independents, and Baptists, National and Infant schools, a literary and scientific institute, a subscription library and reading-room, baths, billiard-rooms, and a small theatre. Horse races are held in August, and there is a cricket club. Markets are held on Wednesday and Saturday. The fisheries are chiefly in the hands of the Brixham fishermen. The fish are sent by steamer to Bristol, or sold in the town. A new fish-market was opened in 1847. The supply of fish is abundant.

TENDA. [NICÆ.]

TENDRING, Essex, a village, and the seat of a Poor-Law Union, in the parish of Tendring, is situated on the left bank of a rivulet which flows into the sea at Holland Creek, in 51° 53' N. lat., 1° 7' E. long., distant 32 miles E.N.E. from Chelmsford, and 62 miles N.E. by E. from London. The population of the parish of Tendring in 1851 was 953. The living is a vicarage in the archdeaconry of Colchester and diocese of Rochester. Tendring Poor-Law Union contains 32 parishes and townships, with an area of 89,803 acres, and a population in 1851 of 27,710. Tendring is a rural village of scattered houses, containing a very ancient church, a chapel for Wesleyan Methodists, and National schools.

TENEDOS, an island in the Greek Archipelago, off the coast of Troas, lies between 39° 47' and 51° N. lat., 25° 58' and 26° 5' E. long. It is said to have been anciently called Leucophrys. According to Homer ('Il., xi. 624), it was sacked by Achilles, and occupied by the Greeks when they retired from the siege of Troy, immediately before its capture. (Virg., 'Æn., ii. 21.) It was colonised by Æolians from Amyclæ in Laconia, under the command of Peisander and Orestes. Tenedos was independent in the time of Cyrus, king of Persia, but was made subject to Persia after the revolt of Ionia in the time of Darius (B.C. 493); it was afterwards a tributary of Athens. On the ancient silver coins of the island are the types of a double-edged axe of a peculiar form, and on the reverse a bifacial head like that of Janus. The 'Tenedica Securis' (axe of Tenedos) was a proverb expressing any summary mode of executing justice or dispatching an affair.

Tenedos was made by the emperor Justinian a depôt for corn going from Egypt to Constantinople when detained by contrary winds. It contains few remains of antiquity worth notice. The greatest length of the island from east to west is 5 miles; the breadth is about 2 miles. In the market-place is the Soros of Atticus, father of Herodes Atticus. To the north of the harbour and town, which are at the north-east corner of the island, is a fortress mounted with cannon. The aspect of Tenedos from the sea is barren, but it is cultivated in the interior, and produces wheat, cotton, and very fine red wine.

TENERIFE. [CANARIES.]

TENIMBER ISLANDS. [SUNDA ISLANDS, Lesser.]

TENNESSEE, one of the United States of North America, extends between 35° and 36° 35' N. lat., 81° 37' and 90° 28' W. long. It is bounded E. by North Carolina; N.E. by Virginia; N. by Kentucky; W. by Arkansas; and S. by Mississippi, Alabama, and Georgia. Its form is that of a parallelogram, with a projecting point at the north-eastern angle. Its extreme length from east to west is about 450 miles; its breadth is 110 miles. The area is about 44,000 square miles. The population in 1850 was 1,002,717, of which 6422 were free coloured persons, and 239,459 slaves: the density of population was 22.79 to a square mile. The federal representative population, according to the census of 1850, was 906,830, in which number three-fifths of the slaves are included. This, according to the present ratio of representation, entitles the state to send ten representatives to Congress. To the Senate, like each of the other United States, Tennessee sends two members.

Surface and Soil.—This state is naturally divided into three regions, which may be called the Eastern or Mountain Region, the Middle or Hilly Region, and the Western or Level Region; and this division coincides tolerably well with that made for the administration of justice, according to which the country is divided into the Eastern, the Middle, and the Western District. The first and the last are

nearly equal in extent, each comprehending about 10,000 square miles, but the Middle District is about double that size.

The Eastern or Mountain Region lies within the ranges of the Appalachian Mountains. [ALLEGHANY MOUNTAINS.] The Kittatinny range, under the local designations of the Stone, Iron, Smoky, and Unika Mountains, forms the boundary between Tennessee and North Carolina. West of this ridge, traversing the state nearly north and south, is the Chestnut Ridge; and farther west, forming the western limit of the mountain region of Tennessee, is the Cumberland Ridge, known elsewhere as Laurel Ridge, which likewise runs in a generally northern and southern direction. None of the mountains exceed 2000 feet in height. The mountain region thus occupies the tract inclosed between the Kittatinny and Cumberland ranges, whose most elevated parts are about 70 miles distant from one another. The northern half of this tract is traversed by three minor ridges, which in general run parallel to the larger ranges, and thus with the outer ranges form four valleys, which are traversed by four of the upper branches of the Tennessee River, namely, Powell's, Clinch, Holston, and Frenchbroad rivers. The valleys are rather wide, but as there is little alluvial land along the watercourses, their surface is uneven and broken, and the soil, which consists mostly of siliceous gravel, is of indifferent quality, except in the valleys of the Holston and Frenchbroad rivers, where it contains a mixture of clay. Only a comparatively small portion of it is strong enough for the growth of wheat; the greater part produces rye and oats; but the mountains afford good pasture-grounds, and large herds of cattle and sheep are kept. The most elevated part of the mountains is overgrown with forests of pitch-pine, which yield timber, and from which tar, pitch, and turpentine are extracted. The country south of 35° 50' N. lat. can only be called mountainous near the southern portion of the Kittatinny Ridge and the Cumberland Mountains, the interior being covered by a succession of hills rising hardly more than 300 feet above their base. The soil of this tract is of indifferent quality, and mostly used as pasture-ground, but the forests contain many large trees, as pitch-pine, red-cedar, and black walnut. Along the watercourses there are some tracts of moderate extent fit for the growth of corn.

The Hilly or Middle Region extends from the Cumberland Mountains westward to the Tennessee River, where it traverses the state by running from south to north. The general level of this region is several hundred feet above the sea-level, and it is covered with numerous hills, which form several continuous ridges, such as that which, under the name of Elk Ridge, runs from east to west, near 35° 20' N. lat., between the Elk River and Duck River. The watercourses are usually much depressed below the general level, and most of them run in narrow channels. This tract varies greatly in fertility. Near the Cumberland Mountains, and to the distance of twenty miles from them, the soil consists chiefly of gravel mixed with limestone, and is of moderate fertility; but in general it is better than in the mountain region, and larger tracts are fit for the growth of wheat. The country west of this tract is the most fertile portion of Tennessee; it extends over the whole of the state from north to south, and reaches westward to 87° W. long. The soil is not inferior to the best part of Kentucky, and consists of a large portion of clay and loam mixed with sand and gravel. A large quantity of wheat is produced, but the staple articles are tobacco and maize. In the better lands, especially along the Cumberland River, the common produce of maize is from 60 to 70 bushels for one, and in other places 40 or 50 bushels. The forests, which still cover a great part of the surface, consist chiefly of ash, elm, black and honey locust, mulberry, sugar-maple, and the wild plum; and wild grapes are abundant. The western districts, or those which lie near the Tennessee River, and extend about 80 miles east of it, are less hilly, but they are also less fertile; they produce the same articles, but the crops are less plentiful. In some places cotton is cultivated.

The Western or Level Region lies between the Tennessee and Mississippi rivers. The surface is traversed by some swells of high ground; but the north-west districts are nearly a dead level, which descends imperceptibly to the banks of the Mississippi, where it terminates in a large wooded swamp, called the Wood Swamp. This level tract is very unhealthy and but thinly peopled. In these regions every kind of grain is grown, and cotton and tobacco are extensively cultivated.

Hydrography and Communications.—Numerous rivers drain this state; some of them have a long course, and are navigable for steam-boats for a considerable distance; the others are of much value for mechanical purposes. The Mississippi forms its western boundary for 160 miles, and is of great commercial importance. [MISSISSIPPI.]

The Tennessee River rises with numerous branches in the Appalachian Mountains: the most remote of these branches originate in Virginia near 37° N. lat. and 81° 20' W. long., and run south-west. The largest branches are the Clinch and Holston rivers: they unite with other branches, which rise in North Carolina, in the country inclosed by the Blue Ridge and the Iron Mountains, and break through the last-mentioned chain. The largest of them are the Frenchbroad River, the Tennessee, and the Hiwassee. After these numerous branches have united, the Tennessee traverses the mountain knot between 34° and 35° 20' N. lat. It passes through the ridge, which on the south is called Look-out Mountains, and on the north Walden's Range, with great impetuosity over a rocky bed: this place is called the Suck. Its

course within the mountain tract is very rapid, and it escapes from it by another gap near Fort Deposit, in Alabama. At this place it changes the south-west course into a western course, and after draining Alabama for about 200 miles, returns to Tennessee. In Alabama the river widens from two to three miles, and in this part there are extensive rocky shoals, which are known under the name of the Mussel Shoals, and occupy for seven or eight miles the whole of the bed. A canal 36 miles long enables steamboats to avoid these falls; the navigation is unimpeded for nearly 250 miles above these falls up to the Suck. The lower course of the Tennessee River, as far as it lies within Tennessee, is from south to north. After having entered Kentucky it gradually declines to the west, and falls into the Ohio. The whole course of the Tennessee exceeds 1000 miles; its descent from its source to its mouth is about 1700 feet.

The *Cumberland* rises in Kentucky, in the valley formed by the Cumberland Mountains and the Laurel Mountains, and traverses the south-eastern district of that state by a general western course: after a run of about 150 miles it turns to the south-west and enters Tennessee, where it soon resumes its western course. It drains the northern districts of Tennessee by a course of above 200 miles; and turning gradually more to the north, re-enters Kentucky, where its general course is to the north. It falls into the Ohio a few miles above the mouth of the Tennessee. This river runs about 600 miles, and as the current is very gentle, the navigation is easy for sloops and steamboats as far as Nashville, 200 miles from its mouth. Steamboats have ascended to Burkesville in Kentucky, but their usual upward limit is Carthage, at the confluence of the Caney Fork. The upper course is obstructed by extensive shoals in several places.

There are no canals in the state, but several of the rivers have been improved and rendered navigable by artificial adjuncts. In all, there are twelve lines of railway in Tennessee, having, on the 1st of January, 1855, a total of 517 miles in operation; and upwards of 900 miles are stated to be in course of construction. The chief railway centres are Nashville and Knoxville. From Nashville lines diverge northwards towards Louisville, Cincinnati, &c.; eastward towards Charleston and Savannah; southwards towards Mobile and New Orleans; and westwards towards the Mississippi at Memphis, &c. From Knoxville lines diverge to Louisville, Richmond, and the South Atlantic ports.

Geology and Mineralogy.—There is a considerable diversity of geological formations in the state. Lower Silurian strata, known as the Stone River and Nashville groups, occupy a considerable portion of the centre of Tennessee. A narrow strip of Upper Silurian, locally designated gray limestone, and by Mr. Safford the Harpeth and Tennessee River group, extends along the whole of the eastern border of the state. Strata belonging to the Devonian formation, comprising the upper gray limestone, and extending to a depth of from one to two hundred feet, traverse the state from north to south, west of both the Upper and Lower Silurian deposits. Carboniferous rocks are extensively developed around the Central Silurian group. The Lower Carboniferous strata consist of black slate, siliceous, encrinital, and oolitic limestone. Upper Carboniferous strata, or coal measures, traverse the state from south-west to north-east, and form a connecting link between the great coal basins of the Ohio and Pennsylvania, and those of Alabama. West of the Devonian formation is a broad belt of cretaceous rocks; and west of these, lying along the Mississippi River, are tertiary and recent deposits.

The eastern and middle sections of the state possess considerable mineral wealth. Gold has been found in small quantities in the mountains bordering on North Carolina. Lead exists in the same mountains, but is not much worked. Iron ore is found in great abundance along the Cumberland River; about 45,000 tons are produced annually. Copper has been found, and is expected to afford rich workings. Coal of tolerable quality is obtained in the Cumberland Mountains, but owing to the inaccessible position of the mines, is only available for local use. Limestone and marble are got in the Cumberland Mountains; and nitre in abundance in some extensive caves near the mountain region. Salt-springs are numerous in the eastern part of the state, where are also sulphur and other mineral springs.

Climate, Productions, &c.—The soil and general character of its products have been already noticed. The climate is mild and on the whole salubrious, the exceptions being the low valleys and the borders of the great rivers. In the countries west of the Cumberland range the rivers are generally covered with ice for a few days in the winter. Snow falls to the depth of ten inches, but seldom lies more than twelve or fifteen days on the ground. In winter and spring a considerable quantity of rain falls; but in the other seasons rain is not frequent, nor does it continue for any length of time. The air in some parts of Tennessee is remarkable for its dryness.

The agricultural products are similar to those of the valley of the Ohio in general, with the addition of cotton, which is largely grown in the south and west. The chief grain crop is of maize, above 50 million bushels of which are annually raised. Wheat is grown in considerable quantities, but not so extensively as formerly. Oats are very largely raised. Rice is grown to some extent. Tobacco forms one of the leading products, from 20 to 80 million pounds being grown annually. Cane-sugar, flax, and hemp, are also important crops in some districts. Both common and sweet potatoes are extensively cultivated. The

sugar maple abounds. In the eastern part of the state are extensive pine forests, from which turpentine, tar, &c., are obtained.

The raising of cattle, chiefly for export to the south, is a principal employment in the eastern part of Tennessee. Horses, sheep, and swine are also reared in large numbers. Buffaloes were once numerous, but they have entirely disappeared; the elk and moose-deer are only found in the mountain region, where deer are still abundant. Bears, pumas, wild-cats, wolves, beavers, otters, and musk-rats are still met with. Racoons, foxes, squirrels, &c., are numerous. Pheasants, partridges, pigeons, swans, wild turkeys, ducks, and geese abound. Fish are found in all the rivers, but not very abundantly.

Manufactures and Commerce.—Although there are no great manufacturing towns in the state, there is a considerable amount of manufacturing industry displayed in and around Nashville, Knoxville, Memphis, &c., and several villages possess extensive works. The chief manufactures are of cotton and woollen goods, iron, machinery, hardware, tobacco, paper, earthenware, cord, carriages, saddlery, &c. The grist-, flour-, and saw-mills employ about a third of the capital invested in manufactures. There are likewise numerous tanneries and distilleries, together with breweries, brick-yards, &c.

Tennessee has no direct foreign commerce, its products being forwarded, and its imports received, by way of New Orleans and the South Atlantic ports, and northwards by way of Pittsburgh and the lakes. The internal trade is very large.

Divisions, Towns, &c.—Tennessee is divided into 79 counties; 28 in Eastern, 32 in Middle, and 19 in Western Tennessee. Nashville is the political capital and the largest town in the state. There are few towns of much size; the following are among the most important: the population is that of 1850:—

Nashville, the capital, is a city and port of entry, situated on an elevated bluff on the left bank of the Cumberland River, 120 miles from its mouth, and 714 miles S.W. from Washington, in 36° 9' N. lat., 86° 49' W. long.: population, 10,478. Nashville stands in the midst of a district rich in agricultural and mineral wealth, and is rapidly increasing in trade and population since it has been made the centre of a well-planned system of railways. The city is regularly laid out, contains a spacious state-house, court-house, university, state prison, lunatic asylum, 14 churches, some of them large and handsome edifices; numerous schools, and other public buildings. Considerable manufactures are carried on, and there is an extensive river trade. In 1850 Nashville district owned river steamers amounting to 3797 tons. In the vicinity of the city is Franklin College. Five daily and seven weekly newspapers are published at Nashville.

Clarksville, at the confluence of Red River with Cumberland River, 40 miles N.W. from Nashville, is a place of considerable trade. *Columbia*, the capital of Maury county, situated on the Duck River, about 40 miles S.S.W. from Nashville, population about 2000, is likewise a place of local importance, and the seat of Jackson College. *Knoxville*, a city and the capital of Knox county, stands on the river Holston, at the head of the navigation, 160 miles E. by S. from Nashville: population, 2076. It is one of the chief centres of the state railways, and appears likely to become an important commercial town. The city is regularly laid out, contains a court-house and other county buildings, several churches and schools, East Tennessee College, and other public buildings. *Memphis*, next to Nashville the chief town in Tennessee, stands on a bluff on the Mississippi River, near the south-western corner of the state, about 200 miles W.S.W. from Nashville: population, 8889. Memphis has considerable cotton and other manufactories, and is said to be likely to rise into some consequence as a commercial city. A navy-yard is established here capable of building vessels of the largest size. None of its public buildings are of much architectural value. *Murfreesborough*, the capital of Rutherford county, and formerly the capital of the state, occupies an elevated site on a branch of Stone River, 30 miles S.E. by S. from Nashville: population, 1917. It is a place of considerable trade, being the centre of a fertile corn and tobacco district. It contains the usual county buildings, churches, schools, &c.; also Union Baptist College.

History and Constitution.—The first settlements in Tennessee were made about the middle of the last century, but in 1760 they were destroyed by the Cherokees, then the possessors of this country, from the northern and central part of which they were expelled in 1780. Since that time the number of settlements has continuously increased. Up to 1790 Tennessee formed a part of North Carolina, but in that year it was ceded by that state to the United States, who in 1794 converted it into a territory. In 1796 it was admitted into the Union as a sovereign state.

The original constitution of Tennessee was amended in 1834. By it the right of voting is vested in every white male citizen 21 years old—every man to be considered white who is a competent witness in a court of justice. No person who denies the being of a God, or the existence of a future state of rewards and punishments, can hold any office in the state. The general assembly cannot emancipate slaves without the consent of their owners.

The legislature consists of a Senate of not more than one-third the number of representatives (at present composed of 25 members), and a House of Representatives of 75 members. The executive power is vested in a governor, who, like the members of the legislature, is

chosen by the electors for the term of two years. The judges of the supreme and inferior courts are elected by the people for the term of eight years.

The total public debt of the state was returned in October 1853 at 7,100,065 dollars, of which the absolute debt amounted to 5,746,856 dollars, and the contingent debt to 1,353,209 dollars. The total revenue of the state for the same year was 1,202,046 dollars, and the expenditure 1,218,387 dollars. The state militia at the last return was composed of 71,252 men, of whom 3607 were commissioned officers. The number of public schools in the state in 1850 was 2667, with 2804 teachers, and 103,651 pupils. There are 8 colleges and 4 theological, medical, and law schools in the state.

(*Statistical Gazetteer of the United States; Seventh Census of the United States; Troost, Geological Survey of Tennessee; Marcou, Geological Map of the United States; American Almanac for 1855, &c.*)

TENNSTADT. [ERFURT.]

TENOCHTITLAN. [MEXICO.]

TENTERDEN, Kent, a market-town, municipal borough, and the seat of a Poor-Law Union, in the parish of Tenterden, is situated in 51° 4' N. lat., 0° 41' E. long., distant 19 miles S.E. from Maidstone, and 55 miles S.E. from London. The population of the borough in 1851 was 3901. The borough is governed by 4 aldermen and 12 councillors, of whom one is mayor. The living is a vicarage in the archdeaconry of Maidstone and diocese of Canterbury. Tenterden Poor-Law Union contains 11 parishes and townships, with an area of 46,889 acres, and a population in 1851 of 11,279.

Tenterden is a member of the cinque port of Rye. The town stands on an eminence, in a rich agricultural district. The church is a spacious and handsome edifice, chiefly of perpendicular character, having a lofty tower at the west end, to which a beacon was formerly attached. It was as early as the 16th century a popular saying that "Tenterden steeple was the cause of Goodwin Sands." This has been supposed to originate from the circumstance of the funds destined for keeping up Sandwich Haven having been applied to the building of this church. There are places of worship for Wesleyan Methodists, Bryanites, Baptists, and Unitarians; National schools, partly endowed; a British school; Dr. Curtis's endowed school for girls; two Commercial schools; an Athenaeum; and a mutual improvement society. The town-hall is a modern building. The market is held on Friday; and a yearly fair for cattle, wool, &c., on the first Monday in May. A county court is held in the town.

TEOS, now called Búdrún, a town of Ionia, situated on the south side of a peninsula between the Gulf of Smyrna and the Gulf of Clazomena, very near Cape Courco, in 38° 15' N. lat., 26° 30' E. long. It was originally colonized by Minyæ from Orchomenus, and afterwards strengthened by colonies from Athens and Bœotia. Teos was one of the twelve cities which formed the confederacy of the Panionium (Herod., i. 142). It was also one of the four cities of Ionia which participated in the Hellenism at Naucratis in Egypt, in the time of Amasis. (Herod., ii. 178.) On the conquest of Ionia by Cyrus the Teians retired to Abdera in Thrace, where they founded a colony which eclipsed the parent state. (Herod., i. 168.) At the battle of Lade 17 Teian ships are mentioned among the forces of the Greeks. Teos was the birth-place of Apellicon, the preserver of the works of Aristotle, and of Anacreon, who is represented on the coins of the city playing on his lyre. It appears from Livy (xxxvii. 28) that it had two ports, one in front of the city, which is now partly dry and choked up with sand; and the other, Gera, 4 miles to the north-west, the entrance to which was so narrow as hardly to admit two ships at a time; it is now the site of the castle and town of Sigha-jik. The site of Teos is now covered with olive-trees and corn-fields, divided by walls and hedge-rows. The city walls, of which traces are extant, were about 5 miles in circuit. Chandler found remains of the temple of Bacchus and a theatre. Hamilton mentions several other temples and ruins, and the mole of the city harbour, on which are still seen "several projecting stones terminating in a ring," for the purpose of mooring vessels to the quay. [ASIA MINOR, vol. ii., pp. 11—17.] At a short distance east of Sigha-jik are the celebrated marble-quarries, in which several gigantic blocks, chiselled and marked for some great building, still lie. The Teians believed that Bacchus was born there, and on his account their territory was sacred, or protected against violation.

TERNATE, one of the Moluccas, situated near 0° 50' N. lat., 127° 20' E. long., is 10 miles long and about 5 miles wide. Its sovereignty is in possession of a considerable portion of the islands of Gilolo and Celebes. The Dutch have an establishment on the island at Fort Orange, which numbers about 3000 residents. The northern group of the Moluccas is sometimes called the Ternate Islands.

The greater part of the island consists of a volcanic mountain 4095 feet above the sea-level. The remainder of the island is very fertile, and affords rice and the other productions of the Indian Archipelago. The Dutch have recently made Ternate a free port. The exports are—rice, edible birds-nests, trepang, sharks-fins, tortoise-shells, small pearls, and lories. The inhabitants are Malays, who have embraced Islam. The king is dependent on the Dutch.

Ternate was first visited by the Portuguese in 1521, and some years afterwards they formed a settlement, which passed into the hands of the Dutch in 1606, who in 1680 reduced the king to a state of dependence on them, and enlarged their establishment. In 1797 it was taken, together with Amboyna, by the English, who restored it at the peace in 1801; it was again taken in 1810, and again given up to Holland by the treaty of Paris in 1814.

TERNI. [SPOLITO.]

TERRACINA, a town in the States of the Church, near the Neapolitan frontier, about 56 miles S.E. from Rome, has about 4000 inhabitants. The old town, which is built on the site of the ancient *Anxur*, rises in the form of an amphitheatre on the slope of a calcareous rock, which is a projection of the ridge called Monti Lepini, leaving but a narrow strip of land between it and the sea, along which runs the high road to Naples in the track of the ancient Via Appia. Along the road are the modern buildings of Terracina, consisting of the post-house and inns, custom-house, granaries, and other structures for public use. The old harbour, which was restored by the emperor Antoninus, has been long since filled up, but remains of the mole are still seen. The old town is an assemblage of poor-looking houses, perched one above another, surrounded and overtopped by white cliffs, which are seen from afar. (Horace, *Sat.*, l. 5.) Above all rises the cathedral with its lofty steeple; an elegant palace built by Pius VI.; the remains of the palace called that of Theodoric, which is a structure of the 5th century of our era, and is situated on the summit of the hill, and about 600 feet above the sea; and an old castle raised in the middle ages. Remains of an ancient theatre are also seen. The climate of Terracina is very mild and genial in winter, but unwholesome in summer.

Anxur was a thriving town of the Volsci; was taken by the Romans in the year B.C. 403; was retaken by surprise in B.C. 399; and taken again by the Romans three years after. It afterwards became a Roman colony by the name of *Tarracina*. The Temple of Jupiter at Tarracina is mentioned by Livy. (Livy, iv. 59; v. 10-13; xxviii. 11.)

TETBURY, Gloucestershire, an ancient market-town, and the seat of a Poor-Law Union, in the parish of Tetbury, is situated near the Wiltshire border, on elevated ground, in 51° 38' N. lat., 2° 9' W. long., distant about 20 miles S. by E. from Gloucester, and 98 miles W. by N. from London. The population of the town in 1851 was 2615. The living is a vicarage in the archdeaconry of Gloucester and diocese of Gloucester and Bristol. Tetbury Poor-Law Union contains 13 parishes and townships, with an area of 25,641 acres, and a population in 1851 of 6,254. The manufacture of woollen cloth employs some of the inhabitants. The market-day is Wednesday. Fairs are held three times a year for cheese, cattle, sheep, horses, &c. The parish church was rebuilt in 1784, with the exception of the tower; a modern spire was placed on the tower. The Baptists and Independents have chapels, and there are a Grammar school, a savings bank and almshouses for eight poor persons.

TEWKESBURY, Gloucestershire, an ancient market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish and hundred of Tewkesbury, is situated on the left bank of the Upper Avon, near its junction with the Severn, in 51° 59' N. lat., 2° 10' W. long., distant 10 miles N.N.E. from Gloucester, 103 miles W.N.W. from London by road, and 130 miles by the Great Western and Bristol and Birmingham railways. The population of the borough in 1851 was 5878. The borough is governed by 4 aldermen and 12 councillors, of whom one is mayor; and returns 2 members to the Imperial Parliament. The living is a vicarage in the archdeaconry of Gloucester and diocese of Gloucester and Bristol. Tewkesbury Poor-Law Union contains 23 parishes and townships, with an area of 38,918 acres, and a population in 1851 of 15,131.

The immediate neighbourhood of Tewkesbury is subject to floods. Within half a mile of the town is a handsome iron bridge of one arch, 172 feet in span, over the Severn; and there is an ancient bridge of several arches over the Avon, with a causeway leading from it to the above-mentioned iron bridge. Tewkesbury has returned two members

to parliament since the 7th James I. The town appears to be of Saxon origin. Early in the 8th century two brothers, dukes of Mercia, founded a monastery here, which became the chief seat of the monks of Cranborne. A great battle was fought on the 14th of May 1471 within half a mile of Tewkesbury, when the Lancastrians sustained a disastrous defeat. In 1644 the town was taken by the parliamentary forces, who held it until the close of the war.

The principal manufacture carried on in Tewkesbury is the cotton and lambs-wool hosiery. On the Avon are several corn-mills. Tewkesbury possesses an extensive carrying trade on the Severn and Avon. A short branch-line joins the Bristol and Birmingham railway. The collegiate church of the ancient monastery, now the parish church, is a noble structure of Norman date, and consists of a nave, choir, and transepts, with a tower rising from the centre, supported on massive and lofty piers with circular arches. The Wesleyan Methodists, Independents, Baptists, and Quakers have places of worship. There are a Free Grammar school; National, British, and Infant schools; a savings bank; almshouses; and several medical and other charities. Besides the town-hall and borough court-room, there are a jail, penitentiary, and house of correction. A county court is held in the town. The market-house is a handsome building, with Doric columns and pilasters supporting a pediment in front. There are a small theatre, and a public library and news-room. The market-days are Wednesday and Saturday. Eight fairs are held in the year. In the vicinity is a race-course, where races take place annually.

TEXAS, one of the United States of North America, lies between 26° and 36° 30' N. lat., 93° 30' and 106° W. long. It is bounded E. by the state of Louisiana; N.E. by that of Arkansas; N. by the Indian territory; W. by the territory of New Mexico; S.W. by the republic of Mexico; and S. by the Gulf of Mexico. Its greatest length from north to south is 700 miles; its greatest width from east to west, 800 miles. The area is estimated at 325,520 square miles, or nearly equal to the united areas of Great Britain and France. The population in 1850 was 212,592 (of whom 58,161 were slaves), or 0.65 to the square mile. This however does not include the Indians, chiefly occupying the hill country, who were in 1853 estimated by the Commissioner of Indian Affairs at 29,000. The federal representative population according to the Census of 1850 was 189,327, in which number three-fifths of the slaves are included. This, according to the present ratio of representation, entitles the state to send two representatives to Congress. To the Senate, like each of the other United States, Texas sends two members.

Surface, Hydrography, &c.—The surface of so vast a country is of course greatly varied, but it may be broadly described as comprising a low and level region, an undulating or prairie tract, and a hilly or mountainous district, answering generally to what have been called Southern and Eastern, Middle, and Western Texas.

The level region occupies the entire coast, and reaches 60 or 80 miles into the interior. For 10 or 12 miles inland the country is subject to inundation, but behind this swampy tract it rises imperceptibly for some miles, and then stretches out in a wide plain with a nearly level surface. This plain is from 10 to 30 feet above the water-courses, and with the exception of the low bottoms along the banks of the rivers, it is not subject to inundation. The tide, though it varies only from two to three feet, ascends the rivers to the distance of 45 or 50 miles from the sea in a straight line. The whole of the plain is wooded, with the exception of the highest tracts of land between the rivers, which are destitute of trees, and exhibit fine prairies. The forests consist of different kinds of oak, hickory, iron-wood, sugar-maple, and other useful trees, which are found in the southern states of the American Union. The whole of this tract is in process of conversion into an immense field, producing cotton, maize, wheat, tobacco, and every kind of plants and fruit-trees which grow in the temperate zone and on the borders of the tropics; the sugar-cane flourishes here, but is not much cultivated.

The undulating country at the back of this plain, though naturally less fertile, has a more genial and healthy climate, and with moderate culture appears capable of producing almost unlimited supplies of corn, cotton, and tobacco, while the uplands afford vast and excellent grazing-grounds, being covered with grass, which maintains its verdure during many months. This is the most populous and productive portion of the state. The country between the river-bottoms generally rises from them with a gentle acclivity to an elevation of 200 to 400 feet, and presents for the most part an undulating surface, on which isolated hills of moderate elevation are dispersed. By far the greatest part of this tract is destitute of trees, which occur only in isolated clumps about the bases and declivities of the hills, and at considerable distances from one another.

Western Texas, the hilly and mountainous district, includes the southern portion of the Sierra Sacramento, and a nearly parallel range on the east called the Guadalupe Mountains. This region is little known, being as yet left to the Indian tribes, chiefly Comanches, to the wild animals, and to the hunter. Many of the mountains are believed to rise more than 2000 feet above their bases. Most of the rivers of Texas have their origin in the mountain region, and American writers speculate freely on what it may become when the 'water-power' is fairly turned to account.

Texas owes much of its great capability for agricultural purposes

to its numerous rivers and the regularity of their course. Nearly all the rivers, even those which run only 50 miles, are navigable for small craft in the greatest part of their course. The most remarkable of these rivers from west to east are—the *Rio Grande*, noticed under MEXICO, between which country and Texas it forms the boundary; the *Rio Nueces*, which flows about 250 miles with a general south-eastern course, the *San Antonio*; the *Rio Guadalupe*, which falls into a lagune forming the harbour of Espiritu Santo; the *Colorado*, or *Red River of Texas*, which traverses in its upper course the mountain tract of San Saba, flows upwards of 400 miles, and falls into the lagune constituting the harbour of Matagorda; the *Rio Brazos*, or *Brazos de Dios*, whose origin is near to that of the Red River, and which, flowing chiefly in a south-south-easterly direction, intersects nearly the centre of Texas and the most fertile districts, and enters the sea after a course of more than 400 miles; and the *Rio Trinidad*, which, after a course of more than 300 miles in a south-south-easterly direction through a very fertile tract, falls into Galveston Bay. Red River and Sabine River, which separate Texas from the Indian territory and Louisiana, are noticed under LOUISIANA. The *Sabine* has a length of 350 miles, and is navigable for 150 miles, and much higher, by keel boats. Before reaching the gulf it expands into a lake 30 miles long and 8 miles wide. The bar at its mouth has 4 feet of water over it at low tide.

There are several good harbours along the coast. The low coast is skirted by a number of long flat islands, separated from the main by narrow straits; but these are much deeper than those farther south, and afford in several places good anchorage for vessels of moderate burden. The bars at the mouths of the rivers have tolerably deep water on them, and there is no part of the extensive Gulf of Mexico which has more or better harbours, bays, and inlets than those of Texas. There are no lakes of any importance in the state; and no canals have yet been constructed.

A southern Pacific railway is to cross Texas from east to west, and several other railways are projected, but none have as yet been carried into execution. The ordinary roads are many of them well laid out, and in good condition.

Geology, Mineralogy, &c.—The geological features of Texas have been but cursorily examined. The mountainous country consists chiefly of igneous and metamorphic rocks. In the eastern portion of this district a considerable belt of Lower Salurian strata has been observed. North of this, along the Saba River, carboniferous strata occur. Much of the centre and north of the state appears to belong to the cretaceous system of rocks; while the whole of the level region, and the low districts bordering the Gulf of Mexico, consist of tertiary and recent deposits.

In minerals the state is believed to be very rich. Gold has been found along several of the smaller streams of the western portion of the mountain district. Silver also occurs in the hill country, and the silver-mine of Saba is said to have been one of the richest in America during the Spanish occupation. Iron ore appears to be very widely diffused. Lead and copper have also been found in several places. Coal occurs on the Trinidad and Brazos rivers. Alum is obtained in two or three places. Salt occurs very extensively in salt springs and lagunes; large quantities are annually taken from a salt lake near the Rio Grande. Potash and soda are also obtained in dry seasons near the salt lagunes. Asphaltum is obtained on the coast. From the limestone of the prairie country abundance of lime is obtained. Red and white sandstone, or freestone, may be quarried through a large portion of the state. A soft white stone, which becomes quite hard on exposure to the atmosphere, and is very useful for building purposes, is found in several places along the eastern side of the hill country. Agate, chalcedony, and jasper, are found. Saline, white and blue sulphur, and other mineral springs, said to possess considerable curative properties, are very numerous.

Climate, Productions, &c.—The temperature varies according to the locality, from tropical to temperate; yet, except along parts of the coast and the rivers where subject to inundations, the climate is said to be generally pleasant and salubrious—in some places eminently so. The summer heat is modified by refreshing breezes, which blow almost uninterruptedly from the south. In winter, ice is seldom seen, except in the northern part of the state. Texas has periodical winds: from March to November they are from the south, and little rain falls; the rest of the year northerly winds prevail, and in December and January they are strong and keen.

The characteristics of the soil and productions have been noticed in speaking of the surface of the country. Cotton has now become the staple of Texas: it generally grows well and of good quality; that grown along the coast is said to be little inferior to the celebrated Georgian Sea Island cotton. Tobacco also thrives well, and is becoming an important product of the state. The sugar-cane flourishes, but, as already noticed, engages very little attention from the Texan farmer. All the cereals produce abundant crops. Maize is the chief grain staple: two crops of it are frequently obtained annually. Wheat and oats are the next in importance among the cereals, and both are grown extensively. Buckwheat, rye, and millet are also grown. Rice is somewhat largely cultivated, and its culture could be very greatly extended. Both common and sweet potatoes are largely raised. Indigo, vanilla, and the chill, or cayenne pepper, are indigenous almost throughout the state.

All kinds of fruit ripen well. The vine grows luxuriantly, and it appears probable that Texas will become a wine-growing country. The orange, lemon, fig, peach, nectarine, pine-apple, olive, paw-paw, plum, apple, gooseberry, and many other fruits of both southern and northern climes ripen here side by side; while indigenous fruits are very numerous. Garden vegetables of almost every kind thrive remarkably here. Among the indigenous plants are the yaupon, or Texan tea-tree, the leaves of which yield an infusion which serves as an agreeable and cheap substitute for the tea of China; and the nopal, which is a favourite food of the cochineal insect, while cattle and horses feed on its fruit and leaves, and its wood is used for making fences, and for fuel. The native wild flowers include many of the choicest favourites of the European garden and conservatory; among others are the dahlia, stellaria of every variety, geraniums, passion-flowers, trumpet-flowers, perpetual roses, mimosas, and an endless variety more of the most brilliant hues.

The forests of live oak and cedar surpass those of any other state in the Union. The entire coast, the river bottoms, and the chief part of the eastern section of the state, are heavily timbered with pine, oak, ash, hickory, walnut, cedar, cypress, and other forest trees, often of noble dimensions; and forest islands occur all over the prairie country.

Horses and cattle form an important portion of the wealth of Texas, the rich prairies affording unlimited pasture-grounds. Swine are also raised in vast numbers. The wild animals, once so numerous, are rapidly diminishing in numbers. Buffaloes however yet roam the wilds in herds of many thousands; as do also deer. Wolves and foxes are still numerous, and the black bear abounds among the canyons of the coast. The peccari and the wild-hog are numerous in the woods. Mustangs are found in droves in the west and north; when domesticated, they are much prized for their fleetness. Moose-deer, antelopes, mountain-goats, racoons, opossums, rabbits, squirrels, and numerous smaller animals abound in the forests and about the hills. Wild-fowl, in almost interminable numbers and of the most various kind, afford ample supplies of game to the sportsman; and there are numerous singing-birds, paroquets, mocking-birds, &c. All the rivers abound in fish, both of the ordinary kinds, as cod, mullet, pike, &c., and of species not usually met with, as the red-fish (which gives its name to Red-Fish River, where it abounds), a fish of delicious flavour and large size, sometimes weighing 50 lbs.; the gar-fish, remarkable for the length of its snout; the alligator-gar, which is said to measure several yards in length, and to resemble the alligator in shape, &c. The common alligator is met with of very large dimensions, in the lagoons and the lower course of several rivers. Oysters, lobsters, crabs, and other shell-fish are taken all along the coast. Turtles abound in the bays and harbours.

Manufactures, Commerce, &c.—The manufacturing industry is chiefly that incidental to an agricultural state, the bulk of the capital being invested in grist- and saw-mills, tanneries, implement-manufactories, &c. There are somewhat considerable iron-works, machine-shops, and carriage and harness factories.

The direct foreign commerce, though steadily increasing, is not very great, most of the exports being made coastwise to New York, New Orleans, &c. The exports during the year ending June 30, 1853, amounted to 1,029,681 dollars, of which 569,918 dollars were of domestic produce. The imports during the same period amounted to 281,459 dollars, of which 156,144 dollars were carried in American, and 125,315 dollars in foreign vessels. The total shipping owned in the state in 1850 was 3897 tons, of which 3309 tons belonged to the district of Galveston.

Divisions, Towns, &c.—Texas is divided into 77 counties. Austin City is the political capital, but Galveston is the chief commercial emporium, and the most populous town in the state. The following are the more important towns: the population is that of 1850:—

Austin City, the capital, is situated on the left bank of the Rio Colorado, in 30° 28' N. lat., 97° 45' W. long.: population 629. It is merely a village, but it contains the state buildings, and supports two weekly newspapers.

Galveston, a city and port of entry, and the capital of Galveston county, is situated near the east end of Galveston, about 200 miles S.E. from Austin: population, 4177. The harbour of Galveston is the best in Texas, and six-sevenths of the shipping of the state belong to this port. The trade of Galveston is very considerable, and steadily increasing. A regular line of communication by steamships is maintained with New Orleans. There are a few good public buildings in the city, and numerous warehouses, hotels, &c. Galveston Island, on which the city stands, is 32 miles long and about 2 miles wide. It was once a favourite lurking-place for pirates, but is now thoroughly cultivated, and the residence of several wealthy farmers. During summer it is much resorted to by invalids.

Houston stands at the head of steam-navigation on Buffalo bayou, 160 miles E.S.E. from Austin City: population, 2396. Next to Galveston, Houston is the chief business town in the state, being the centre of a rich cotton district. There are several public buildings, churches, and schools. A wharf 500 feet long, with a cotton press at each end, extends along the front of the city.

San Antonio, near the source of the river of the same name, 75 miles S.E. by S. from Austin City, population 3488, is the oldest town in

GEOL. DIV. VOL. IV.

Texas, and one of the oldest in North America. It contains several ecclesiastical edifices erected during the Spanish occupation, a large ruinous fortress, and other vestiges of its former possessors; also a United States arsenal and some modern structures.

History, Government, &c.—Until 1836 Texas formed a part of Mexico. For some years prior to that date the American colonists, an active, numerous, and united body, had been making every possible effort to prepare the way for a revolt against the Mexican authority. In 1835 hostilities commenced in earnest. The Mexican government was unable to suppress the rising; and eventually the Mexican army, under General Santa Anna, the president of Mexico, was defeated at Jacinto by the Texans, under the American general Houston. Santa Anna was made prisoner, and, as a condition of his release, agreed to sign a treaty acknowledging the independence of Texas. The Mexican senate disavowed the authority of Santa Anna to make such a treaty, but no steps were taken towards effecting a re-conquest of Texas; and in 1845 the United States of North America formally admitted Texas into the Union as a sovereign state. This led at once to war between Mexico and the United States; but the former country was in too disorganised a condition to hope for success in such a contest, and, after suffering a series of humiliating defeats, was constrained to accept peace on terms of acknowledging the independence of Texas, and ceding to the United States a large portion of territory, including the whole of the northern provinces. [MEXICO.]

The constitution was adopted in August, and ratified in October, 1845. By it the right of voting is vested in every free white male citizen who shall have resided in the state for one year. The legislature consists of a Senate of not less than 19 nor more than 33 (at present 21) members, who are elected for four years; and a House of Representatives, of not less than 45 nor more than 90 (at present 66) members, who are elected for two years. The governor is elected for two years. The admitted public debt was returned by the state auditor in November 1851 as—Ostensible debt, 9,647,253 dollars; par value, 4,807,764 dollars. But the real condition of the state finances is difficult to understand from the involved and incomplete accounts published. The state militia is composed of about 18,500 men and 1248 commissioned officers. In 1850 there were in the state two colleges, having 7 teachers and 165 students; and 349 public schools, having 360 teachers and 7946 scholars.

TEXEL. [HOLLAND.]

TEYNHAM. [KENT.]

TEYS, THE. [ESSEX.]

TEZA, or TAZA. [MAROCCO.]

TEZUCCO, LAKE. [MEXICO, City of.]

THAKEHAM, Sussex, a retired rural village, and the seat of a Poor-Law Union, in the parish of Thakeham, is pleasantly situated in 50° 57' N. lat., 0° 24' W. long., distant 10 miles E. by S. from Petworth, and 48 miles S.S.W. from London. The population of the parish of Thakeham in 1851 was 631. The living is a rectory in the archdeaconry and diocese of Chichester. Thakeham Poor-Law Union contains 15 parishes and townships, with an area of 35,599 acres, and a population in 1851 of 7434.

THAME, Oxfordshire, a market-town, and the seat of a Poor-Law Union, in the parish of Thame, is situated on the left bank of the river Thame, a feeder of the Thames, in 51° 45' N. lat., 0° 59' W. long., distant 14 miles E. from Oxford, and 44 miles W.N.W. from London. The population of the town in 1851 was 2869. The living is a vicarage in the archdeaconry and diocese of Oxford. Thame Poor-Law Union comprises 35 parishes and townships, with an area of 54,562 acres, and a population in 1851 of 15,624.

The town consists chiefly of one long and spacious street, with a commodious market-place. The church is a large and handsome structure, of early English architecture; it consists of a nave, with side aisles, transepts, and chancel, with an embattled tower rising from the intersection. There are chapels for Wesleyan Methodists, Independents, and Baptists; National, British, and Infant schools; a Free Grammar school, a mutual improvement society, almshouses, and a savings bank. The market is on Tuesday, for corn and cattle. There are four annual fairs. A county court is held in the town.

THAMES, the most important river in Great Britain, rises in the central part of England, and flows eastward into the German Ocean. Our description will comprehend a notice of its basin, course, and affluents, and its commercial importance.

Basin.—The limits assignable to the basin of the Thames will depend on the place at which the mouth is fixed. We may consider as such the opening between Whitstable in Kent and the east extremity of Foulness Island in Essex, where the tideway has a breadth of 18 miles. Here the Thames opens into a large bay, separating Kent on the south from Essex and Suffolk on the north, and having for its extreme points the North Foreland in Kent and Orford Ness in Suffolk, 50 miles distant from each other. The basin of the Thames, commencing at Whitstable, is bounded by the high grounds which there run down to the coast, and form the cliffs east of that town. The boundary runs in a very irregular line across the county of Kent and the Weald district of Kent and Sussex to the high ground on the

southern border of Ashdown Forest, in the latter county. From Ashdown Forest the boundary runs across the high ground of Tilgate and St. Leonard's forests to Leith Hill in Surrey, and thence, in a very irregular line, past the head of the Wey in Woolmer Forest to the verge of the chalk downs near Alton, Hants. This boundary separates the basin of the Thames from the basins of the Sussex Ouse and the Arun. From the neighbourhood of Alton, the boundary of the basin is formed by the chalk downs which extend across Hants and Wilts by Basingstoke, Kingsclere, Highclere, and Burbage, near Great Bedwin; and from thence by the downs which run north-westward to the neighbourhood of East Kennet and Abury. From near East Kennet the boundary turns along the green-sand hills by Compton Bassett and Chadderton; and from thence to the western extremity of the basin near the commonly reputed head of the Thames amid the Cotswold Hills between Cirencester and Tetbury. From the neighbourhood of Tetbury the boundary runs northward along the ridge of the Cotswolds, to the head of the Churn (or true Thames), about three miles south from Cheltenham; and from thence along by the same hills to near Campden, and by Long Compton Hill and Edge Hill to the Arbury Hills near Daventry, at the northern extremity of the basin. From the Arbury Hills the boundary of the basin runs south to the neighbourhood of Bicester, and thence eastward across Buckinghamshire, Bedfordshire, and Hertfordshire, along the Dunstable, Luton, and Royston downs, to the north-western corner of Essex. This part of the basin of the Thames is drained by its affluents the Cherwell, the Thame, and the Lea. An irregular line drawn through the county of Essex from its north-western corner, first south-south-east by Dunmow and Brentwood, and then east by Rayleigh and Rochford to the coast, will complete the boundary. The greatest extent of this basin from east to west is from the mouth of the Thames to the neighbourhood of Tetbury, about 136 miles; the greatest extent from north to south is from the neighbourhood of Daventry, Northamptonshire, to that of Alton, Hampshire, about 78 miles. The basin comprehends the whole or part of the counties of Kent, Surrey, Sussex, Hants, Berks, Wilts, Oxon, Bucks, Herts, Middlesex, and Essex, with small portions of Warwickshire, Northamptonshire, and Bedfordshire; its area may be estimated at about 6500 square miles. The basin of the Thames is occupied wholly by the secondary and tertiary formations. The sources of the river and the course of its upper waters are in the oolitic beds of the Cotswold Hills. Owing to the entire absence of coal, the basin of the Thames has no manufactures except those of the metropolis; but it contains some of the richest agricultural districts in the kingdom.

Course and Affluents.—Thames Head, the spring which has commonly been regarded as the head of the Thames, is about 3 miles S.W. from Cirencester, near a bridge over the Thames and Severn Canal, which is called 'Thames-Head Bridge;' but that which is to be regarded as the true head of the Thames is about 3 miles S. from Cheltenham. Two streams rise, the principal one from several openings at a spot popularly called The Seven Springs, and the other from four springs near Ullen Farm, the westernmost of which springs is the remotest head of the river: both streams rise on the south-eastern slope of the Cotswolds, and form by their junction, about a mile from their respective sources, the river Churn. At Cricklade, 20 miles S.E. from its source, the Churn joins the commonly reputed Isis or Thames, the length of which above the junction is only about 10 miles. From Cricklade the river flows 9 or 10 miles east-north-east to Lechlade. Just above Lechlade it receives, on the left bank, the Colne, from the Cotswold Hills, east of Cheltenham; and below Lechlade it receives the Lech, or Leach, which also rises in the Cotswolds. From Lechlade the Thames flows 14 miles eastward to the junction of the Windrush. The Windrush rises in the Cotswolds between Winchcombe and Campden, and after a course of 34 miles joins the Thames on the left bank. Below the junction of the Windrush the Thames receives on the left bank the Evenlode, which rises in the Cotswolds near Moreton-in-the-Marsh, and receives the Glyme, which flows through Woodstock and Bleubheim Park. The Thames then turns south, and flows to Oxford, where it joins the Cherwell. The Cherwell rises in the Arbury Hills, near Davenport in Northamptonshire, and flows southward by Banbury: it joins the Thames on the left bank.

From the junction of the Cherwell the Thames flows south-south-east to the junction of the Thame at Dorchester, making however a considerable bend westward to Abingdon, where it receives the Ock on the left bank. The Thame rises near Stewkley in Buckinghamshire, between Winslow and Leighton Buzzard, and flows south-west by the town of Thame into the Thames, which it joins on the left bank. From Dorchester the course of the Thames is south-east by Wallingford to the junction of the Kennet near Reading. The Kennet rises near Broad Hinton, a village to the north of Marlborough Downs, flows south to East Kennet, and then, turning eastward, flows by Marlborough, Newbury, and Reading into the Thames, which it joins on the right bank. It receives the Lambourn and the Embourn or Auburn.

From the junction of the Kennet the Thames flows eastward, though in a very winding channel, making first a considerable circuit to the north by Henley, Great Marlow, and Maidenhead, to Windsor; and then a considerable circuit to the south by Staines, Chertsey,

Kingston, and Richmond, to Brentford, whence it proceeds by Hammersmith, Putney, and Chelsea, to the metropolis. In this part of its course the Thames receives several feeders. The Loddon rises in the chalk downs of North Hants, near Basingstoke; the Colne rises, under the name of the Ver, in the chalk downs of Hertfordshire, and passes St. Albans, Watford, Rickmansworth, Uxbridge, and Colnbrook; the Wey rises near Alton, Hants, passes Farnham, Godalming, and Guildford, and joins the Thames at Weybridge; the Mole rises on St. Leonard's Forest, in Sussex, passes through Leatherhead, and joins the Thames at East Molesey; the Cran and the Brent, two small streams, rise on the borders of Middlesex and Herts, and join the Thames, the first at Isleworth, the second at Brentford; and the Wandie, a short stream, joins it at Wandsworth. Of these, the Colne, the Cran, and the Brent, fall into the Thames on the left bank; the others on the right bank.

Below London, up to which sea-borne vessels ascend, the river flows eastward, but with various reaches or bends, 54 miles to its mouth, or to the Nore Light (at the commonly reputed mouth), 46½ miles. Between Deptford and Greenwich, about four miles below London Bridge, the Thames receives on the right bank the Ravensbourne, from Keston, near Bromley, in Kent; about two or three miles farther down, on the left bank, the Lea, which rises in Bedfordshire; four or five miles lower, the Roding, from near Dunmow, also on the left bank; and six miles lower, on the right bank, the Darent, which passes Dartford and receives the Cray. The only remaining feeder of the Thames which here requires notice is the Medway, which rises in Sussex, and flows by Maidstone, Rochester, and Chatham. The principal arm of the Medway joins the Thames at Sheerness just above the Nore; but the smaller arm, called the Swale, which cuts off the Isle of Sheppey from the mainland, opens into the Thames just above Whitstable.

The whole course of the Thames, from its source to its mouth, is about 220 miles. The principal affluents of the Thames are more fully described under the counties to which they respectively belong. The Thames, in the first part of its course, belongs wholly to Gloucestershire, but below Cricklade is almost entirely a border river, dividing Gloucestershire from Wiltshire, Oxfordshire and Buckinghamshire from Berkshire, Middlesex from Surrey, and Essex from Kent. Some part of its course is therefore described in the articles on those counties.

Commercial Importance.—The navigation of the Thames commences at Lechlade, where the river is about 258 feet above low-water mark at London Bridge. Its importance was early appreciated, and there are Acts of Parliament relating to it as early as the 2nd Henry VI. The Thames and Severn Canal, which follows the valley of the Churn and the Thames from near Cirencester, opens into the Thames at Lechlade, thus connecting it with the Severn and the western coast of the island. None of the tributaries above Oxford are navigable. At Oxford the Oxford Canal joins the Thames, and opens a communication with the grand canal system of the central counties. It follows the course of the Cherwell from above Banbury. At Abingdon the Wilts and Berks Canal joins the Thames, and, as well as the Kennet and Avon Canal, which joins the Kennet at Newbury, opens a communication with the Somersetshire (or Bristol) Avon, and by it with the Severn. The Wey is navigable from Godalming, about 17 miles from its junction, and is connected with the Wey and Arun Canal, and the Basingstoke Canal, the former of which opens a communication with the river Arun and the Sussex coast. The Grand Junction Canal, which unites with the Oxford Canal at Braunston, in Northamptonshire, opens into the Thames by the mouth of the Brent, the lower part of which is incorporated with the canal. Below London Bridge, the Lea, which is navigable chiefly by artificial cuts for 25 miles, and has one of its feeders (the Stort) also navigable, opens into the Thames; and just above the Lea, the Regent's Canal, which encircles the north and east sides of the metropolis, and communicates with the Paddington Canal, and so with the Grand Junction Canal, also opens into the river.

The corporation of the city of London has the almost uncontrolled conservancy of the Thames, and the regulation of its navigation and fishing. The navigation of the upper part of the Thames is kept up by locks and weirs, the lowest of which is at Teddington, which is consequently the limit of the tide. Teddington is about 18 miles above London Bridge. Vessels of 800 tons get up to the St. Katherine's Docks, and those of 1400 tons to Blackwall, about 6 miles below bridge. No river in the world equals the Thames in its commercial importance. The river for some two miles or more below bridge is crowded with vessels, chiefly coasters, steam-vessels of all sizes, and colliers, which moor alongside the quays or in tiers in the stream; and for larger vessels there are several docks excavated on the banks of the river. There is a dockyard for the navy (now little used) at Deptford, about 4 miles below London Bridge; one at Woolwich, 9 miles below; one at Sheerness, in the Isle of Sheppey, at the junction of the Thames and Medway; and one at Chatham, the most important of the four, on the Medway. The fortifications at Sheerness defend the entrance to both rivers. The passage of the Thames is further protected by Tilbury Fort, and that of the Medway by Gillingham Fort.

The width of the river at London Bridge is 290 yards. For nearly the whole way below London Bridge the river is embanked, and is

almost throughout its lower course skirted with narrow marsh-lands. The width of the river at Woolwich, at high water, is 490 yards; at Gravesend Pier, 26 miles below London Bridge, it is 800 yards; at Coal-house Point, three miles below Gravesend, it is 1290 yards; it then gradually increases to the width of about 6 miles at the Nore, and to 18 miles at the point where we have fixed the mouth.

It is a common opinion that this river in the upper part of its course is properly called Isis, and that it is only below the junction of the Thames that it is called Thames, which name is said to be formed by combining the two names Thame and Isis. But this is a mistake: the name Isis never occurs in ancient records.

THAMES, River. [CANADA.]

THANAAN-ARIVE. [MADAGASCAR.]

THANET, ISLE OF, or Ringalow hundred, a hundred forming the north-east corner of the county of Kent, which has been constituted a Poor-Law Union. The Isle of Thanet is noticed in the article KENT. The Isle of Thanet Poor-Law Union contains 11 parishes and townships, with an area of 29,783 acres, and a population in 1851 of 31,798.

THA'PSACUS, or THA'PSACUM, was a very ancient, populous, and commercial town in Syria, on the right bank of the Euphrates, about 24 miles W. from the junction of the river Chaboras with the Euphrates. Thapsacus, the *Thapsach* of the Bible, the *Tapasa* of the Vulgate, and the *Thapsa* of Josephus ('Antiq.,' ix. 11), was the most eastern town of the kingdom of Solomon after David had conquered the country as far as the Euphrates. At an equal distance from Tyre by land and from Babylon by water, Thapsacus became an emporium, where the Gerrhaei kept stores of the commodities and spices of Arabia, which they carried there on barks, and which were afterwards transported by land to Syria and Phœnicia. (Strabo, xvi. p. 766, Cas.) Its military position was also of great importance. At the time of the expedition of the younger Cyrus (B.C. 401), there was a ford at Thapsacus, but no bridge: subsequently there was a bridge. This town was the most southern passage by which an army could penetrate, either from Mesopotamia into Syria and Cilicia, or from these countries into Mesopotamia and Persia, without being obliged to traverse the deserts of Arabia. The younger Cyrus crossed the Euphrates at Thapsacus (Xenophon, 'Cyropæd.,' i. 4); Darius also crossed the river at Thapsacus when he was advancing against Alexander in Cilicia; and Alexander, when he was pursuing Darius into Assyria. (Arrian, 2, 13; 3, 7.) In the age of Strabo the bridge at Thapsacus existed no longer. (Strabo, p. 747, Cas.) Eratosthenes chose Thapsacus as the centre of his geographical measurements in Asia Minor and the adjacent countries. (Strabo, ii. p. 77-91, Cas.) The site of Thapsacus is now marked by the island and Arab village of Deir, in the Euphrates.

THASOS, an island belonging to Turkey, situated off the coast of Thrace, at a short distance from the mouth of the river Nestus or Karaou, and a little to the south-east of the Gulf of Kavalo. Volgaro, which is nearly in the centre of the island, is in 41° 45' N. lat., 24° 40' E. long.

Five generations before the time of the Grecian Hercules, Thasos was peopled by Phœnicians, who came from Tyre in quest of Europa, led by Thasos, son of Agenor, from whom the island is said to have taken its name. (Herod., ii. 44; Pausan., v. 25.) It was afterwards colonised by settlers from Paros, among whom was Archilochus the poet, about B.C. 708. Thasos was enriched in very early times by the possession of gold-mines in the island, and at Scepte Hyle, on the opposite coast of Thrace. According to Herodotus, who visited them, the most considerable were those which had been worked by the Phœnicians on the north-east side of the island, the excavations for which were very evident.

The Thasians, who were very rich, were besieged by Histæus of Miletus about B.C. 492, for a short time. In consequence of this attack, they built ships of war and strengthened their fortifications. They were reduced by Mardonius, and compelled by Darius (B.C. 491) to throw down their walls and surrender their ships of war. (Herodotus, vi. 46.) On the expedition of Xerxes into Greece, the honour of receiving his army in their continental territory was imposed upon them, and on this entertainment they expended 400 talents of silver. (Herod., vii. 118.) After the Persian war they became subject to Athens, from which they revolted B.C. 465. (Thucyd., i. 100.) Cimon, after defeating them at sea, took Thasos after a three years' siege, B.C. 463. The Thasians were compelled to destroy their fortifications, to surrender their ships, to pay a large sum of money at the time and tribute for the future, and to give up their mines and settlements on the continent.

On the ascendancy of the party of Pisander at Athens, at the close of the Peloponnesian war, Diotrophes was sent by him to Thasos, and established an oligarchy there. This injudicious policy furnished an immediate opportunity of revolting from Athens. The island, reduced by famine and civil war, was finally restored to the Athenians by Thrasybulus, B.C. 407. Subsequently the Thasians appear to have regained some of their continental possessions, and in B.C. 359 they fortified Crenides, probably as a frontier post for their Thracian territory: this was seized by Philip, son of Amyntas, king of Macedon, who placed a number of Macedonian settlers in it, and gave it the name of Philipp. Under his management its gold-mines were made

much more productive than before. When attacked by Philip V., king of Macedon, they submitted to him, with the stipulation that they should retain their own laws, and be exempt from garrison, tribute, or other burdens, B.C. 202. (Polyb., xv. 24.) They were shortly afterwards released from his rule by the Romans, B.C. 197. Under the emperors Thasos is styled *Libera*, or a free state.

The coins of Thasos are very numerous. The most ancient generally represent a satyr carrying off a nymph; on some are two fish. To these succeed massive coins in a good but rather heavy style, with a head of Bacchus on the obverse, and Hercules kneeling, shooting an arrow, on the reverse. The Thasians originally worshipped the Tyriau Hercules, and afterwards the Grecian Hercules. The broad tetradrachms of the Macedonian period had the head of the young Bacchus, and Hercules on the reverse. These coins are abundant, and many of them, with letters and type ill executed, are found in Transylvania.

Coin of Thasos.

Actual size. Silver. Weight, 117½ grains.

The ancient town of Thasos is situated on the north coast of the island, and occupies three eminences. On the site are remains of the Greek walls, mingled with towers built by the Venetians during their occupation of the island after the taking of Constantinople by the Latins. Near it is a large statue of Pan in a niche in the rock, and upwards of fifty sarcophagi of white marble.

Thasos is nearly circular in shape, and has an area of about 85 square miles. It is longest from north to south. In the northern and highest part of the island three peaks extend in a north-west and south-east direction. The inhabitants, who are all Greeks, live in nine villages—Volgaro, Casawith, Sotiro, Kaikarahi, Moriss, Kastro, Potamia, Liman or Panagia, and Theolog, the largest situated nearly in the centre of the island. The chief produce of this fertile island is oil, maize, fruit, honey, and timber; the last grows in great abundance, and forms the chief article of export: the plane-trees in particular are of great size. In ancient times this island was celebrated for its wine, but little wine is now made here, and some is imported from Tenedos: the principal food of the inhabitants is maize. Large herds of cattle and flocks of sheep are kept in the island; asses and mules are more used than horses on account of the steepness of the roads. The inhabitants are hospitable, industrious, and simple in their manners.

THATCHAM. [BERKSHIRE.]

THAXTED, Essex, a market-town in the parish of Thaxted, is situated on the left bank of the river Chelmer, in 51° 57' N. lat., 0° 20' E. long., distant 19 miles N.N.W. from Chelmsford, and 41 miles N.N.E. from London. The population of the parish of Thaxted in 1851 was 2556. The living is a vicarage in the archdeaconry of Essex and diocese of Rochester. Thaxted is a very ancient place; it was incorporated by charter of Philip and Mary, but the corporation became extinct in the time of James II. The chief ornament of the town is the church; it is mostly in the perpendicular style, and consists of a nave and chancel with side aisles, transept, and an embattled tower and handsome spire at the west end. There are meeting-houses for Quakers, Independents, and Baptists; a Free Grammar school; National and British schools; almshouses; and some minor charities. Rope making, brewing, and malting are carried on. A small market is held on Thursday. There are two fairs in the year.

THEBAID, or THEBAIS, signifies the territory or district belonging to Thebes, and is consequently applied to the whole territory subject to the city of Thebes in Bœotia. [THEBES IN BŒOTIA.] In a similar, though a much wider sense, the name was given to the whole of Upper Egypt, the modern Said, of which Thebes was the principal city. This territory extended from Hermopolis Magna southward as far as the first cataracts of the Nile, or to Philæ; or, according to others, as far as Hiera Sicamina. This great province was, according to Strabo (xvii. p. 787), originally divided into ten nomes (*royai*); but Pliny ('Hist. Nat.,' v. 9) enumerates eleven, and others mention fourteen—Lycopolites, Hypseliotis, Aphroditopolites, Tinites, Diosopolites, Tentyrites, Phaturites, Hermonthites, Apollinopolites, Antsopolites, Pano-polites, Coptites, Ombites, and Dodscaschoenus. Respecting the nature of these nomes and the physical features of the Thebaid, see EGYPT.

THEBES. Towns and cities of this name occur in several parts of the ancient world, but the two which are most renowned in history are the Egyptian and the Bœotian Thebes.

The Egyptian *Thebes*, in the Bible called No, or No Ammen, was situated in the central part of Upper Egypt, on both banks of the Nile. The city extended on each side from the river to the foot of the hills which inclose the valley of the Nile. This gigantic city, whose ruins still excite astonishment, was believed to be the most ancient town of Egypt, and the original metropolis of Egypt. Its original circumference is stated to have been 140 stadia. Its most

flourishing period appears to have been about B.C. 1600, when it was the capital of all Egypt, and when, according to Herodotus and Aristotle, the whole country of Egypt bore the name of Thebes. During that period, which probably comprises several centuries, Thebes was the residence of the Egyptian kings, whose tombs are still extant in the rocks on the western side of the city, and extend even to the borders of the desert. Homer ('Iliad,' ix. 381, &c.) speaks of the splendour, greatness, and wealth of Thebes, and calls it "the city with a hundred gates, each of which sent out two hundred men with horses and chariots." During the invasion of Egypt by the Persians under Cambyses, Thebes, like other towns, suffered very severely, especially the private dwellings, which were for the most part constructed of wood, while the great architectural works defied the flames as much as they have defied the slower influence of time. After this catastrophe the city appears never to have recovered its former greatness. During the time of the Ptolemies, when the seat of government was in the northern extremity of the country, Thebes appears to have been neglected by the Egyptian kings. In the reign of Ptolemy Lathyrus, about B.C. 86, it revolted, and after a siege of three years it was taken and plundered by the Greeks. As early as the time of Strabo, when its name had been changed to Diospolis ('City of Jove'), and the circuit of the city, which could still be traced, amounted to 80 stadia, the place consisted of a number of villages, and what remained of the ancient city consisted chiefly of temples. Under the Roman dominion something appears to have been done to preserve the venerable city; but new calamities broke in upon it when Christianity was introduced into Upper Egypt, and the Christians in their religious zeal destroyed as much as they could of the works of the ancient idolaters. At present, the site of the city is occupied by four principal villages—Luxor and Carnac on the eastern, and Gournou and Medi-net-Abou on the western side of the river. The buildings and sculptures still extant are the most ancient of any that exist in Egypt, and are the best and most genuine specimens of Egyptian art and architecture; for we have every reason to believe that by far the greatest part of them were executed before Egypt had yet experienced the influence of the Greeks, that is, long before the Persian invasion. (B.C. 525.) The ruins, chiefly consisting of temples, colossi, sphinxes, and obelisks, occupy nearly the whole extent of the valley of the Nile, a space of six miles from east to west; and on the western side, where the ruins of the city end, there begins, as it were, the city of the dead, the tombs in the rocks with their paintings, which are still as fresh as if they had been made only a few days ago.

At Luxor, near the river, are the remains of a temple, the entrance to which is through a magnificent propylon, or gateway, consisting of two pyramidal moles, the lower part of which is now concealed by accumulated sand, but which probably form a propylon as large as that of Carnac, hereafter described. In front of the propylon, which is covered with elaborate sculptures, stood two of the most perfect obelisks known to exist; one about 82 feet high, the other 76 feet, and from 8 to 10 feet wide at the base. The smaller obelisk was removed by the French in 1831, and erected in the Place de la Concorde, in Paris, on October 25, 1836.

But the remains of Carnac, about a mile and a quarter lower down the river, are still more wonderful than those of Luxor. An irregular avenue of sphinxes, 2180 yards in length, connects the southern entrance of Carnac with the northern entrance of the temple of Luxor. Carnac is about 830 yards from the east bank of the Nile, and is surrounded by a wall of unburnt bricks about 5300 yards in circuit, or more than three miles. The largest building, which some have thought to be a temple and some a palace, is 1215 feet in length, 360 feet in its greatest width, and 321 feet in its least width. The entrance to it fronts the Nile, with which it is connected by an alley of crio-sphinxes. This alley conducts to a propylon, without sculpture, 360 feet long and 148 feet high, with a great doorway in the centre 64 feet high; passing through which a large court is entered, having a range of pillars on the north and south sides, and a double row of loftier pillars down the middle, which terminate opposite two colossal statues in front of a second propylon. A flight of 27 steps then leads to an enormous hall, 338 feet by 170½ feet, and comprising an area of 57,629 square feet. The roof, which is flat, and when perfect was formed of very large slabs of stone, is supported by 134 columns, the largest of which are about eleven feet in diameter, and the smallest nearly nine feet. The interior propylon, pillars, and walls are covered with sculptures. Four beautiful obelisks form the entrance from the hall to the adytum, or sacred place, which consists of three apartments, all of granite; and the central room, or sanctuary, is adorned with sculptures, and painting and gilding. Beyond the adytum are porticoes and galleries, which were probably continued to another propylon at the eastern end.

Four propylæ, with colossi in front of them, form the entrance on the south side, at the end of the long avenue of sphinxes leading from Luxor; and there was probably a similar entrance on the north side.

(*Egyptian Antiquities*, vol. i.; Wilkinson, *Handbook of Egypt*.)

THEBES (in Bœotia), one of the most ancient and most important cities of Greece, was situated in the plain between Lake Hylœ on the north, and a range of low hills on the south. The Acropolis of the city, built upon an eminence in this plain, was said to have been founded by Phœnicians under Cadmus, whence it was called Cadmea.

Around this citadel the city arose at a later time, and was so disposed, that the greater portion of it occupied the part north of the citadel. Previous to the Trojan war the city was destroyed by the Epigoni; it took no part in that war. In the time of Homer, however, who calls it "a city with seven gates," it appears to have again been in a flourishing condition. In B.C. 335 Thebes was destroyed a second time, by Alexander the Great, who left nothing of the lower city standing, except the gates, the temples, and the house of Pindar the poet: 6000 inhabitants were killed, and 30,000 sold as slaves. Cassander rebuilt the city in B.C. 316, with the generous aid of the Athenians, Messenians, and Megalopolitans. (Pausanias, ix. 7.) The city suffered a third time in B.C. 291, under Demetrius Poliorcetes. Dicaearchus, who saw Thebes about this time or shortly after, has left an interesting description of it. After the Macedonian time the city declined still more, and Sulla seems to have given it the last blow by depriving it of half of its territory, which he assigned to the Delphians (Pausanias, ix. 7, 4); and Strabo remarks that in his time it had scarcely the appearance of a village (ix., p. 403, ed. Casaub.). In the time of Pausanias, the citadel, then called Thebes, was still inhabited, but the lower city was entirely abandoned; and he only saw the walls, gates, and temples, of which he gives a description. The place which now occupies the ancient Cadmea is called Theba, or Pheba; and here, as well as in the surrounding plain, there are many remains of ancient buildings, sculptures, and inscriptions. The inhabitants of ancient Thebes were once distinguished above all the other Greeks for rusticity, fierceness, and passion. The women were celebrated for their gentleness and beauty.

As a state, Thebes comprised the whole territory between the eastern coast of Lake Copais and Mount Cithæron, and extended to the north as far as the river Cephissus, which empties itself into the sea between Eubœa and the mainland. This whole territory was called Thebais, and contained a great number of towns, which were subject to Thebes. Among the fourteen confederate states of Bœotia, Thebes was the first, whence it is generally called the capital of Bœotia, which, in the strict sense of the word, it certainly was not.

Besides the Egyptian and Bœotian Thebes, the following towns of this name are mentioned by ancient writers:—

1. Thebes in Phthiotis, in Thessaly, an important commercial town with a good harbour. [THESSALY.]

2. Thebe in Troas, in Asia Minor, was celebrated as a fortified place as early as the Trojan war. It was situated north of Adramyttium, and taken and destroyed by Achilles. The plain in which the town had been situated was known down to the latest times as the Plain of Thebe.

3. Thebes in Arabia Felix.

4. Thebes in Lucania, in Italy.

THEISS, RIVER. [AUSTRIA; HUNGARY.]

THENON. [DORDOGNE.]

THEIRA, an island in the Grecian Archipelago, and the chief of the Sporades. Its modern name is *Santa Thira*, which is usually written *Santorini*. It is about 36 miles in circumference, and in figure like a horse-shoe. When it first emerged from the sea, it is said to have been called Calliste; *Therasia*, a small island to the west, and called at present by the same name, was torn away from it, according to Pliny. Volcanic action seems at one time to have been actively at work in this part of the sea. (Strabo, i. 57.) Pliny speaks of an island which arose between Thera and Therasia, to which he gives the names of Hiera and Automate, and of another which appeared in his own age, called Thia. The former is now called Aspronisi, or 'the white island'; the latter Kaimeni, or 'the burnt.'

Thera was originally inhabited by the Phœnicians, who are said to have been left there by Cadmus. It was subsequently colonised by a mixed colony of Minyans and Spartans (Herod., iv. 147, 148), and always remained faithful to its mother-city Sparta. Thera founded the colony of Cyrene in Africa, under the guidance of Battus, in B.C. 631. (Herod., iv. 150, &c.)

In the present day the island is covered with pumice-stone; and though the soil is dry and barren, it produces a large quantity of cotton and wine. The wine is strong, and is exported to all parts of the Archipelago. There is no wood in the island. They have hardly any cattle, and very little fruit except grapes, and there is only one spring in the island. It contains a few castles, surrounded by some houses; but the majority of the inhabitants live underground in caves cut out of the pumice-stone, which are arched over with very light stones of a reddish colour. The island has a very desolate appearance, the coast being craggy and rugged, and the rocks burnt and scorched. It has only one harbour, in the shape of a half-moon; but no ship can anchor in it, as no bottom has yet been found by the plumb-line.

The inhabitants number about 13,000; they are under a Greek and a Catholic bishop. [See SUPPLEMENT.]

THERESIENSTADT. [BOHEM.]

THERMOPYLÆ. [SPARTA; THESSALY.]

THESPROTIA, a district of the ancient Epirus, around the river Acheron. It seems to have included the coast from the mouth of the Ambracian Gulf northwards to the river Thyamis, and the country inland as far as Mount Tomarus. The south-eastern part of Thesprotia, south of the river Acheron, was called Casopœa.

Thesprotia was one of the chief abodes of the Pelægi. In Thesprotia was the oracle of Dodona (Herod., ii. 56), the chief seat of the old

Pelasgic religion. [DODONA.] In Thesprotia Aristotle found the Hellenes under their ancient name of Græci (Aristot. 'Meteorolog.' i. 14.) From this country the Thessali migrated to take possession of Thessaly, about sixty years after the Trojan war, having previously left their original seats in Thessaly, and proceeded into Thesprotia, about eight generations before the Trojan war.

THESSALONICA (*Saloniki*), an ancient city of Macedonia, in the district of Mygdonia, was formerly called Therme or Therna: it is in 40° 38' N. lat., 22° 57' E. long., about ten miles east of the ancient river Echedorus, at the head of the modern Gulf of Saloniki, formerly called the Thermaic Bay, from the ancient name of the city. Therme was at first an inconsiderable place. Xerxes made some stay here on his march into Greece (Herod., vii. 128). A short time previous to the commencement of the Peloponnesian war (B.C. 432) it was taken and occupied by the Athenians, but it was soon afterwards restored to Perdiccas, the king of Macedonia. The name of Thessalonica was given to it by Cassander, the son of Antipater, in honour of his wife Thessalonica, who was sister of Alexander the Great. With a view to its aggrandisement, Cassander collected together (about B.C. 315) the population of several adjacent towns, so as to make it one of the most important cities of northern Greece. (Strabo, l. c., p. 330.) After the battle of Pydna (B.C. 168), in which the Romans defeated Perseus, the then king of Macedonia, Thessalonica, with the other Macedonian towns, surrendered to the Romans, and was made the capital of the second of the four regions into which Macedonia was divided by them. (Livy, lib. xlii., c. 10 and 45; lib. xlv., c. 29.) Livy speaks of it as being then a very celebrated city. It possessed an excellent harbour, and had the additional advantage of lying on the great Roman military road, the Via Egnatia, which, commencing at Dyrrachium, on the western side of Greece, and extending to Byzantium, afforded the easiest land communication with Thrace, Asia Minor, and the shores of the Euxine. In St. Paul's time it was much frequented by people of different nations; the Jews had a synagogue in it; and it was also the seat of the Roman government. Under the empire, it continued to be so flourishing and important a city, that it was selected as the residence of the prefect of Illyricum, and the metropolis of the Illyrian provinces. In the reign of the emperor Theodosius, Botheric, commander of the garrison, with his principal officers, was murdered by the people of the town for having imprisoned one of the popular characters of the circus (A.D. 390). The emperor Theodosius gave orders for the punishment of the people, and no less than 7000 persons were massacred by barbarian soldiers in a promiscuous carnage, which lasted for three hours (Gibbon, 'Roman Empire,' c. xxxvii.).

Saloniki is a large walled commercial town, imposingly built on the slope of a hill, and commanded by a strong castle called Heptapyrgium, or the 'Seven Towers,' and has about 75,000 inhabitants. Part of the walls are of polygonal architecture; the gate of Varlar was built in honour of Augustus, after the battle of Philippi. There are two other ancient triumphal arches in the town. The hippodrome is a vast area in the centre of the town, entered by a propylæum, formed by five magnificent Corinthian pillars supporting an entablature in Attic, with figures in high relief. The rotunda is built after the model of the Pantheon in Rome; its interior is covered with mosaics. The church of Santa Sophia is now a mosque. The metropolitan church of St. Demetrius has been also converted into a mosque. An ancient temple of Venus has been likewise appropriated to Mohammedan worship. The town has handsome and large bazaars, and important silk factories. It has a good trade in British produce, and exports corn, cotton, wool, raw silk, wine, tobacco, bees-wax, sponges, sesamum, timber, and staves. Foreign consuls reside in Saloniki. It is the capital of an eyalet, which comprises ancient Macedonia and Thessaly.

THESSALY, one of the principal divisions of Northern Greece, and the cradle of many of the inhabitants of Greece in general, is an extensive and generally unbroken plain, about 80 miles in extreme length and 70 miles in breadth, comprising an area of about 5500 square miles, and forming an irregular sort of square. This description applies only to what may be called Thessaly Proper, which is bounded W. by the range of Pindus; N. towards Macedonia by the Cambunian Mountains; S. by the range of Mount Othrys; E. by a range of mountains running along the coast nearly parallel to Pindus, and including the summits of Pelion and Ossa. The basin of Thessaly is thus surrounded by mountain barriers, broken at the north-east corner only by the valley and defile of Tempe (or the Cut), which separates Mount Ossa from Olympus, and presents the only road from Thessaly to the north which does not lead over a mountain pass. At the eastern base of the mountain range which runs from Tempe to the Bay of Pagassa, now the Gulf of Volo, there is a narrow strip of land called Magnesia, between the hills and the sea, interrupted in several places by lofty headlands and ravines, and without any harbour of refuge from the gales of the north-east. South of Othrys, the southern boundary of Thessaly Proper, lies a long narrow vale, through which winds the river Spercheius, and which, though generally considered as a part of Thessaly, is separated from it by the range of Othrys, and is very different from it in physical features. It is bounded on the south by the range of Ceta, which runs from Pindus to the sea at Thermopylia in a general direction nearly parallel to the Cambunian Mountains; and on its eastern side by the shores of the Bay of Malis, now the Gulf of Zeitoun. According to Greek

traditions, Thessaly was known in remote times by the names of Pyrrha, Æmonia, and Æolia. The two former names belong to the age of mythology; the last refers to the time when the country was inhabited by the Æolian Pelasgi, previous to the occupation of any part of it by the Thessalians, who, according to Herodotus (vii. 176), came from Thesprotia, a region in the west of Epirus, and settled in the country, which from them derived its future name. The name does not occur in Homer, although the several principalities of which it was composed at the time of the Trojan war are enumerated. ('Iliad,' ii. 700.)

From very early times Thessaly was divided into four districts, or tetrarchies, Hestiasotis, Pelasgiotis, Theasalotis, and Phthiotis; and the division still existed in the time of the Peloponnesian war (B.C. 404).

Hestiasotis was the mountainous country between Pindus and Olympus; having generally for its southern limit the river Peneus. Herodotus (i. 150) applies this name to the country in the neighbourhood of Ossa and Olympus, the original abode of the Dorians before they settled in Peloponnesus. From a statement in Strabo (ix., p. 437), it would seem that the name of Hestiasotis was derived from a district in Eubœa, whose inhabitants were transplanted to this part of Thessaly by the Perrhæbi. In historical times the Perrhæbi dwelt in the valley of the Titaresius under Olympus. The north-western part of Hestiasotis was in ante-historical times (Homer, 'Il.' ii. 774) occupied by a mountain tribe of uncertain origin, called the Æthices. In the time of Strabo (ix., p. 434) scarcely any trace remained of them.

The most remarkable towns of Hestiasotis were as follows:—*Phaloria*, or *Phaloria*, the first town of any importance on entering Thessaly from Epirus by the passes of Pindus (Liv., xxxii. 15): *Oryneia* and *Eginium*, the latter of which Livy describes as a place of great strength, and almost impregnable. *Gomphi*, an ancient fortress, situated on the Peneus to the south of Phaloria: it was a place of great strength, and might be said to be the key of Thessaly on the side of Epirus to the north. In the time of Cæsar ('Bel. Civ.,' iii. 80) it was a large and opulent city: it is supposed to be represented by the modern Stagoua. *Tricca*, now *Trikkala*, on the left bank of the Peneus, about 12 miles south from Gomphi: it is celebrated by Homer ('Il.' ii. 729), and placed by him under the rule of the sons of Æsculapius, who was said to have been born in the neighbourhood; about 12 miles to the north of it is now situated the convent of Meteora, whose name (the Hanging) is descriptive of its situation upon lofty columns of rock. *Metropolis*, a town to the north of the Peneus, which contained within its territory the lands of three other places not so famous, but more ancient, and which contributed to the formation of the new city. *Metropolis*, with *Gomphi* to the north-west, *Tricca* to the south-west, and *Pelionna* to the south-east, formed a square of fortresses, in the middle of which was the ancient Ithome, called by Homer the 'precipitous.' *Pelionna*, more commonly *Pellinæum*, was an important city on the north of the Peneus, and about 10 miles east of *Tricca*. *Ithome* is supposed to have occupied the site of the castle which stands on the summit above the village of Fanari. *Echalia*, a city celebrated in mythology, is coupled by Homer with *Tricca* and *Ithome*. *Gonnus*, or *Gonni*, a town of considerable importance and antiquity, was situated on the left bank of the Peneus, about 20 miles from the great city of Larissa, and close to the entrance of the gorge of Tempe. *Gonnocondylon*, a stronghold in the windings of the valley, was situated in the defile above *Gonnus*. The Pelagouian *Tripolis*, also a district, which included the three towns of *Pythium*, *Asorus*, and *Doliche*, was situated in the north-east of Hestiasotis, and is also reckoned under Perrhæbia by Livy.

Pelasgiotis was in the southern part of the lower valley of the Peneus, and includes the Pelasgian plains which stretch from Larissa to Phæra, near Pelion, having for its boundary on the east the range of Pelion and Ossa. According to Strabo (ix., p. 441), this part of Thessaly was originally occupied by the Perrhæbi, an ancient tribe of apparently Pelasgic origin. It was however wrested from them by the Lapithæ, another Pelasgic nation, whose original abode was in Magnesia. They forced some of the Perrhæbi to retire northward and across Pindus, while those who remained in the plains were incorporated with themselves, under the common name of Pelasgiota. The principal towns of Pelasgiotis were as follows:—*Larissa*: this was one of the most ancient and flourishing towns of Thessaly: it was situated in the most fertile part of the old country of the Perrhæbi. The constitution of the city was democratical, the magistrates being elected and removable by the people. (Aristot., 'Politica,' v. 6.) The territory of this city was extremely rich and fertile, but it frequently suffered by the inundations of the Peneus. The name is Pelasgian. *Cranon*, or *Crannon*, to the south of Larissa, was one of the most ancient and considerable towns of this part of Thessaly. *Scotussa*, to the east of *Cranon*, though noticed by ancient authors, does not appear to have been known to Homer. (Strabo, ix., p. 441.) Within its territory was the hill of Cynocéphale, or Dogs' Heads, where a victory was gained by the Romans over Philip of Macedon (B.C. 197). It is one of the hills which separate the plain of Larissa from that of Phæraia. *Phæra* was near the southern extremity of the Lake Boebei. Its territory, according to Polybius (xviii. 2), was most fertile, and the suburbs were surrounded by gardens and walled inclosures. Its port was Pagassa, about 11 or 12 miles distant. There

are hardly any traces of antiquity here. The fountain Hypereia, mentioned by Homer ('Iliad,' vi. 457), is in the suburbs of the modern town of Belestina, at the foot of the ancient Acropolis. A small lake of about 100 yards in diameter, and with water as clear as crystal, bubbles up out of the ground. The Dotius Campus is also in Pelasgiotis, on its eastern side: it is a considerable plain, encircled by hills to the north, and terminated to the south by the Lake Boebeis, the most extensive in Thessaly, and included within the limits of Pelasgiotis.

Thessaliotis was so called from its having been first occupied by Thessalians, who came from Thesprotia, and inhabited the plains below Hestiotis, having the district of Pelasgiotis on the east. This tetrarchy contained towards the south-east the city of *Pharsalus*, celebrated for the battle fought in its plains between Pompey and Cæsar. It is situated not far from the junction of the Enipeus and the Apidanus, and was a city of great size and importance. There is a modern town called *Pharsala*, on or near the site of the old Pharsalus. South-west of it there is a hill surrounded with ancient walls, and on a lofty rock above it are ruins of an ancient Acropolis. Other towns of Thessaliotis were—*Cierium*, supposed to be identical with the ancient *Arne*, the chief town of the Æolian Boeotians. *Ichnæ*, or *Achnæ*, where the goddess Themis was especially worshipped. *Proerna*, not far from Pharsalus.

Phthiotis, according to Strabo, included all the southern part of Thessaly, stretching lengthwise from the Maliac Bay on the east to Dolopia and Pindus on the west, and in breadth from Mount Oeta on the south as far as Pharsalus and the Thessalian plains on the north, an average distance of about 30 miles. Homer comprised within its limits the districts of Phthia and Hellas properly so called, and the dominions of Achilles. Its inhabitants were the Achæans, or Achæi Phthiotæ, a double name under which they were generally enumerated in the lists of the Amphictyonic nations. The principal cities of Phthiotis were *Halos*, or *Alos*, on the west side of the Gulf of Pagassa. It contained a temple sacred to Jupiter Laphystius, which was visited by Xerxes as he passed through the city. *Iton*, about 6 miles west from Halos, on the river Cuarius, celebrated for a temple of Minerva Itonia. The district of *Arne*, from which the Æolian Boeotians were expelled by the Thessalians, is by some supposed to have been near these towns and on the shores of the Pagassæan Bay; but Müller ('Dorians,' ii. 475) adduces satisfactory reasons for believing that the *Arne*, which the Thessalians first occupied, lay to the north-west in Thessaliotis, and that it was identical with the ancient Pierium. North of Halos and Iton lay *Thebes*, the most important town of this part of Thessaly. It was called Phthiotic, to distinguish it from the Thebes of Boeotia. In a military point of view it possessed considerable importance, as it commanded the avenues of Magnesia and the upper parts of Thessaly. Philip, son of Demetrius, changed its name to Philippopolis. Some ruins between the modern towns of Armiro and Volo are supposed by Sir W. Gell to be those of Thebes. They consist of an Acropolis, with very ancient walls constructed with very large blocks; some towers also are still standing. The port of Thebes appears to have been *Pyræus*, about 2½ miles distant. A little south of Thebes was *Larissa Cremaste*, or the Hanging, so called from its position on the side of a hill; it was also called the Pelagian. It lay in the dominions of Achilles, whence he is called Larissæus by Virgil ('Æneid,' ii. 198). The ruins of it still exist, and Sir W. Gell says of it, "The form of Larissa was, like that of many very ancient Greek cities, a triangle, with its citadel at the highest point. In the Acropolis are the fragments of a Doric temple; and from it is seen the magnificent prospect of the Maliac Gulf, the whole range of Oeta, and over it Parnassus." *Melitia* was situated at the foot of Mount Othrys, on the river Enipeus. Its ancient name was *Pyrrha*, and it boasted of possessing the tomb of Hellen, the son of Deucalion. To the north-west of Melitia lay the town of *Thaumaki* (the Wonderful), so called from the singularity of its position on a lofty and perpendicular rock. It was on the great road leading from Thermopylæ by Lamia to the north of Thessaly. "After a rugged route over hill and dale," says Livy (xxxii. 4), "you suddenly open on an immense plain like a vast sea, which stretches below as far as the eye can reach." Dodwell says of it, "It is about five hours from Pharsalia. It must always have been a place of importance. The view from it is one of the most wonderful and extensive I ever beheld."

On the west of Phthiotis, and close to it, but still separated from it, lay the territories of the Dolopians. According to Homer ('Il,' i. 480), *Dolopia* was at the extremity of Phthiotis; but it does not follow that it was included in that district; nor are the Dolopians in early times ever mentioned as the vassals of the Thessalians. They occupied the extreme south-west angle of Thessaly, formed by the chain of Tymphrestus, a branch of Pindus, on one side, and Mount Othrys on the other. They were a very ancient nation, as appears from their sending deputies to the Amphictyonic council. At a later period they were subjects of Jason, the tyrant of Phæra. It was conquered by Peræus, the last king of Macedonia. Dolopia was a rugged mountainous district, with few towns of note. Ctemene, or Ctimene, was perhaps the most important.

The *Ænians* lived in the upper valley of the river Spercheius, being separated from the Dolopes by the hills of Tymphrestus and Othrys. They were also called *Æteans* from their position on the

slopes of Mount Oeta. They were a tribe of great antiquity and of some importance, as appears from the fact of their belonging to the Amphictyonic council. Their origin is uncertain, and they made many migrations from one part of Thessaly to another. Their chief town was *Hypata*, on the banks of the Spercheius.

The *Malians* were the most southern tribe connected with Thessaly. They occupied principally the shores of the Maliac Gulf (the Bay of Zitun), from the pass of Thermopylæ on the south to the northern boundary of the Valley of the Spercheius. Their country is generally flat; the plains in some parts are extensive, in others narrow, where they are confined on one side by the shores of the Maliac Gulf, and on the other by the mountains of Trachinia. They were always a warlike people. The Amphictyonic council was held in their country, and the Malians are included in the lists of the Amphictyonic states. They always maintained friendly relations with the Dorians of Lacedæmon. The principal towns of the Malians were—*Anticyra*, at the mouth of the Spercheius; it was said to produce the genuine hellebore, considered by the ancients as a cure for insanity. *Lamia*, 4 or 5 miles N. of Anticyra; it was celebrated as the scene of the Lamian war, carried on between the Athenians and their confederates against the Macedonians under Antipater; on its site is the modern Zitun. *Trachis* (the 'rough') was so called from the mountainous character of the surrounding country; it was once the chief town of the Trachinians, who were always in close alliance with the Dorians. In later times *Heraclea* was the most important town of Trachinia. It was a colony from Lacedæmon, founded (B.C. 426) at the request of the Trachinians, about 3 miles from the sea. Their object in making the request was to gain additional strength against the Ænians, or Æteans, with whom they were at war. It soon became an object of jealousy with the other Thessalian tribes. It was seized by Jason of Phæra, who caused the walls to be pulled down; but it again became a flourishing city under the Ætolians, who sometimes held the general council of their nation there. It sustained a long siege from the Roman consul Acilius Glabrio, after the defeat of king Antiochus at Thermopylæ (B.C. 191). The surrounding country was marshy and woody, but the vestiges of the city itself are observable on a high flat on the roots of Mount Oeta. On the coast of Trachia, close to the mouth of the small river Asopus, which runs through a gorge in the mountain inclosing the Trachinian plain, was the village of *Antikele*, near to which was the temple of the Amphictyonic Ceres, and the place of meeting of the Amphictyons. This locality was also famous for the celebrated Pass of *Thermopylæ*.

Magnesia is a country physically distinct from Thessaly, but in historical times was subject to it, and politically included within it. It is a narrow strip of country between the mouth of the Peneus and the Pagassæan Bay on the north and south, with the chain of Pelion and Ossa on the west, and the sea on the east. The people of this district were called Magnetæ, and they were in possession of it from very early times. ('Iliad,' ii. 756.) They were an Amphictyonic state. The extreme northern point of Magnesia was Mount *Homole*, a limb of Ossa, celebrated by the poets as the abode of the ancient Centaurs and Lapithæ, and a favourite haunt of the god Pan. (Virgil, 'Æneid,' vii. 874.) To the south, at the foot of Ossa, was *Melibœa*, a town on the coast, ascribed by Homer ('Iliad,' ii. 716) to Philoctetes. Still farther south was the promontory of *Sepias*, off which the fleet of Xerxes was wrecked. Beyond the southern promontory of Magnesia, now called Hagios Georgios, the coast takes a south-westerly direction to the entrance of the Pagassæan Bay, the Gulf of Volo. Among the principal towns of Magnesia were Iolœa, Demetrias, and Aphetæ. *Iolœa* was a place of great antiquity, and the birthplace of the mythological hero Jason and his ancestors. It was situated at the foot of Pelion, near the small river Anaurus: it was once a powerful city. Pagassæ, the port of Iolœa, and afterwards of Phæra, was famed in Grecian story as the harbour from which the ship Argo set sail on her voyage to Colchis: the name, according to Strabo (ix., p. 436), was derived from the number of springs near it. The site is nearly occupied by the present castle of Volo. Iolœa no longer existed in the time of Strabo. *Demetrias*, founded by Demetrius Polioretetes about B.C. 290, soon became a flourishing city, and was one of the most important fortresses in Greece, being well situated for defending the approaches to the Pass of Tempe, both on the side of the mountains and of the plains. Its maritime position also contributed to its importance. After the battle of Cynoscephalæ it became the chief town of the Magnesian republic, and the seat of government; subsequently it was attached to the house of Macedon, until the battle of Pydna, when it fell under the Romans. (Livy, xlv. 13.) Many ruins mark its site.

The principal mountain ranges of Thessaly were—the Cambunian, on the north; Pindus, on the west; the ridges of Othrys and Oeta, on the south; and those of Pelion and Ossa, on the east.

The *Cambunian Range* is a branch from Mount Pindus, running in a direction nearly at right angles to it, and separating Thessaly from Macedonia. In this chain is the Mount Olympus. The principal road between the two countries over the mountains was by the Pass of Voluatana, marked in modern maps as Volutza. Another important defile, leading from Thessaly into Macedonia, passed by Pythium, a village with a temple sacred to the Pythian Apollo, situated on Mount Olympus, at the north-east extremity of the range.

Through this latter defile many armies (that of Xerxes among the number) marched in ancient times. The road which led through Thessaly to this Pythium was called the Via Pythia. The defile is still much frequented by travellers going to Larissa from the north-western parts of Macedonia. *Mount Olympus*, one of the most celebrated mountains of Greece, is represented in Greek mythology as the habitation of the Gods. It divides the north-east of Thessaly, or Perrhæbia, from Pieria, the extremity of Macedonia on the south-east. It rises to the height of about 6500 English feet, and the highest parts of it are scarcely ever entirely free from snow. The part of the Cambunian range which lies to the west of Olympus was called *Mount Titarus*, an outlier or limb of which, *Mount Cyphus*, rises in the upper valley of the Peneus. Olympus and Ossa lie on opposite sides of the defile by which the Peneus enters the Vale of Tempe.

Mount Pindus, the western boundary of Thessaly, is part of the range of mountains which issues from the Thracian Scomius. On the north it joins the Illyrian and Macedonian ranges, and to the south it is connected with the branches of Cæta and the Ætolian and Acarnanian Mountains. It separates the waters which fall into the Ionian Sea and the Ambracian Gulf, from those which empty themselves into the northern part of the Ægean. The most frequented pass over Pindus from Thessaly into Epirus lays over a part of it called *Mount Ceresius*, probably not far from the modern town of Metzovo. One of the highest points of *Mount Pindus* was *Tymphrestus*, forming its southern extremity, from which branched the ridge of *Mount Othrys*, closing the great basin of Thessaly on the south, and separating the waters which flow into the Peneus from those which run into the southern Spercheus. Its eastern extremity separates the Maliaic from the Pagæsean Gulf, sinking gently toward the coast. It is now known by the different names of Hellovo, Vari-bovo, and Goura. To the south of Othrys lies the ridge of *Cæta*, which however has no connection with Thessaly Proper. It is a huge pile of mountains stretching from Pindus to the sea, which it meets at the Pass of Thermopylæ; it forms the inner barrier of Greece, as the Cambunian range does the outer, to which it is nearly parallel in direction and equal in height. On the west it branches out into the country of the Dorians and into Ætolia. On the south-east, beginning from *Mount Callidromus*, the highest summit of the range, it is continued without interruption along the coast of the Eubœan Sea, till it sinks into the valley of the river Asopus. By means of another branch to the south-west, it is connected with Parnassus, and after skirting the Corinthian Gulf under the names of Cirphis and Helicon, it forms the northern boundary of Attica, under the names of Cithæron and Parnes.

Pelion is a chain of some extent, running from the south-east extremity of the lake called Boeësis to the extreme south of Magnesia, forming a part of the boundary of Thessaly on the east. Homer ('Iliad,' ii. 743) alludes to it as the seat of the Centaurs, and it was associated with many remarkable events in Grecian story. It was exceedingly well wooded. To the north of Pelion and following the line of the coast lies the chain of *Ossa* (now *Kissovo*), the roots of which unite with one of the branches of *Mount Pelion*. At its northern extremity it towers into a steep conical peak, and according to the songs of the country, rivals its neighbour Olympus in the depth and duration of its snows, though it is 1100 feet less in height. Between Ossa and Olympus lies the celebrated Vale and Pass of Tempe.

The two principal rivers of Thessaly into which the smaller streams fall are the Peneus and the Spercheus. The *Peneus* (now called the *Salymbria*) rises in the north-west of Thessaly under Pindus, between the lower ridges of which and the outliers of the Cambunian range its upper valleys are confined. Near *Metsora*, not far from the rocky Ithome of Homer, its basin opens somewhat towards the south. At *Tricca* it makes a turn to the east, and its valley expands into a vast plain towards the south-east, on the right of the river, though it is still confined by the hills on the left, till within about 10 miles from Larissa, where there is a considerable flat on the north, the soil of which is said to be alluvial. After leaving *Tricca* the course is generally north-east, and passing along the Vale of Tempe, the only outlet for the waters of Thessaly, it empties itself into the Ægean Sea. It is a very small stream, sluggish and shallow, except after the melting of the snows, when it sometimes floods the surrounding plains. The *Marab*, or *Lake Nesonia*, on the road between Larissa and Gonnus, is said to be caused by the floods of the river. The principal tributary of the Peneus on the north is the *Titaresius*, now the *Saranta Poros*, which joins the Peneus a little above the Vale of Tempe. The waters of the two rivers did not however mingle; those of the *Titaresius* being impregnated with a fat unctuous substance, which floated like oil on the surface. (Strabo, ix., p. 441.) This river was also called the *Eurotas*, and supposed to be a branch of the *Styx*, one of the rivers of the Infernal Regions. At the present day the inhabitants of its banks are remarkable for their healthy complexion, while the Peneus is surrounded by a sickly population. Its waters also are said to be clear and dark-coloured, while those of the Peneus are muddy and white. On the south, the affluents of the Peneus were the *Pamius*, the *Onochonus*, the *Enipeus*, and the *Apidanus*. Herodotus describes the *Apidanus* as one of the largest rivers of

Achaia, but still inadequate to the supply of the Persian army with water.

The second great river of Thessaly was the *Spercheus*, now the *Hellada*. It flows from *Tymphrestus*, a branch of Pindus, and after winding through a long narrow vale between the ridges of Othrys and Cæta, it falls into the Maliaic Gulf. It was much celebrated by the ancient poets, and Homer mentions it as belonging to the territory of Achilles round the Maliaic Gulf. Its bed and mouth have undergone many changes from the deposit of alluvial matter.

The plains of Thessaly were amongst the most fertile and productive of Greece in wine, oil, and grain, but more especially in grain, of which it exported a considerable quantity. The Thessalians consequently became very rich, and luxurious in their mode of life ('Athen.,' xii. 624). Thessaly was also famous for its cavalry, the best in Greece; its plains supplied abundance of forage for horses.

The lands of Thessaly were not cultivated by the Thessalians themselves, but by a subject population, the *Penestæ*, who were the descendants of the Æolian Boeotians, who did not emigrate when their country was conquered by the Thessalians, but surrendered themselves to the conquerors on condition that they should remain in the country and cultivate the land for the new owners of the soil, paying, by way of rent, a portion of its produce. Many of them were richer than their lords. (Athenæus, vi. p. 264.) They sometimes accompanied their masters to battle, and fought on horseback as their knights or vassals. They formed a considerable portion of the population, and frequently attempted to emancipate themselves.

Thessaly is now included in the Turkish eyalet of Selanik or Saloniki. Its chief products are corn, cotton, olive-oil, and silk. The chief towns are Larissa, Trikala, Volo, and Ambelakia.

Larissa stands on rising ground on the right bank of the Peneus, in 39° 37' N. lat., 21° 28' E. long., about 20 miles from the sea, and has about 30,000 inhabitants. It occupies the site of the ancient Larissa, and has been through all historical times a place of considerable importance. The Turks call it *Yeni-Sheher*. It is the seat of an archbishop and the residence of a pasha. The population numbers about 30,000. There are no ancient remains here; the walls are about 3 miles round.

Trikala is a large straggling town, about 40 miles W. from Larissa, with several churches, mosques, and synagogues, and 12,000 inhabitants, who manufacture cotton and woollen stuffs, and trade in corn with Albania and Epirus.

Volo, on the north shore of the Gulf of Volo, to which it gives name, is a small place with about 2000 inhabitants. In the gulf is the island of *Trikeri*, which gives name to the *Trikeri Channel*, connecting the Ægean with the Gulf of Volo, and Ziton to the north of Eubœa.

Ambelakia, N.E. of Larissa, in the vale of Tempe, has about 4000 inhabitants, who have some cotton manufactures.

History.—Homer ('Iliad,' ii. 710) describes Thessaly as divided into several independent principalities and kingdoms, and enumerates the chiefs to whom they were subject at the time of the Trojan war. Soon after a new constitution was adopted. The different states agreed to unite in one confederate body, under a president or *Tagus*, elected by the members of the confederacy. Strabo (ix. 429) informs us that this confederacy was the most considerable as well as the most ancient society of the kind established in Greece. It is deserving of remark that the majority of the Amphictyonic states were either Thessalian or connected with Thessaly. Except during a very short period, under Jason of Phœra, Thessaly never assumed that rank among the states of Greece to which it was by its position and extent entitled. In the Persian invasion under Xerxes the Thessalians, being left to their own resources by the Greeks, submitted to the invaders, to whom they proved active and zealous allies. The Athenian general Myronides marched into Thessaly to restore Orestes, son of Eocheatidas, to his throne, and advanced as far as Pharsalus; but he was checked in his progress by the Thessalians, who were superior in cavalry, and he was forced to retire, without having accomplished the objects of his expedition. In the Peloponnesian war the Thessalians did not as a nation take any part. In B.C. 394 they leagued themselves with the Boeotians and their allies against Sparta. The Thessalians, with their cavalry, endeavoured to harass and obstruct Agesilaus on his march through their country from Asia. His skilful manœuvres however thwarted their designs, and Agesilaus gained considerable credit by defeating on their own ground, with horsemen of his own training, the most renowned cavalry of Greece. Towards the close and after the end of the Peloponnesian war, most of the Thessalian cities acknowledged the ascendancy of Pharsalus or Phœra, the latter of which was, about B.C. 400, under the dominion of Lycophron. This prince endeavoured to extend his power over all Thessaly; and Xenophon ('Hellen.,' ii. 4) mentions a victory which he gained over the Thessalians of Larissa as one of the events which happened in the year of the fall of Athens (B.C. 404). Ten years afterwards Lycophron was still engaged in a contest with Larissa, then subject to Medius, who was probably one of the powerful family of the *Aleuada*. Lycophron was supported by Sparta, and Medius by the Boeotian confederacy, by the assistance received from which he was enabled to make himself master of Pharsalus, then occupied by a Lacedæmonian garrison.

The success of Agesilaus on his return from Asia produced some

change in the affairs of Thessaly, for Pharsalus soon recovered its independence, and rose to such eminence as to become a rival of Pheræ. Polydamas, whose character and virtue had gained the confidence of all parties, was intrusted with the citadel and the administration of the revenues of the city, a trust which he discharged with the strictest integrity.

At Pheræ, the supreme power passed into the hands of Jason, who kept a standing army of 6000 mercenaries, all picked men, and, notwithstanding the opposition of Pharsalus, compelled most of the principal Thessalian cities to enter into alliance with him. The objects of Jason's ambition were, the supremacy of Greece, and the overthrow of the Persian empire in the East; the same schemes, in fact, as were subsequently executed by Alexander, king of Macedon. The first objects which he had to gain were the title of Tagus, and the union of Thessaly under his authority. After a frank statement of his views, Jason prevailed upon Polydamas to second them. A compact was then made between them; and Polydamas exerted his influence so successfully in Jason's behalf, that the Pharsalians entered into an alliance with him, and a general pacification followed. Not long afterwards Jason was elected Tagus, and by his influence and talents several important cities were induced to join the confederacy. He then fixed the contingents of infantry and cavalry to be furnished by the different states, and raised them to a greater amount than they had ever been before. The army which he could bring into the field consisted of 8000 cavalry and more than 20,000 heavy-armed infantry; and his light troops, as Xenophon ('Hellen,' vi. 1, 6) observes, were enough to oppose the world. He built and manned a considerable fleet. But these schemes were too vast for the ordinary duration of a human life, though he kept them constantly in view, and made all his actions subservient to them. After the battle of Leuctra, in which the Thebians defeated the Lacedæmonians, they invited him to join them in overpowering Lacedæmon. Jason joined them with his forces, but he did not comply with their request. His policy was to keep an even balance between the two states, so as to ensure the dependence of both on himself, and therefore, instead of annihilating the power of Sparta, he offered his services as a mediator between the contending states, and obtained a truce for the Lacedæmonians, under favour of which the remnant of their forces decamped by night (B.C. 371). In the following year, whilst making preparations for an expedition to the south of Greece, he was assassinated by seven young men; and the honours which were paid in many of the Grecian cities to the assassins, showed the alarm which his ambition had excited. On the death of Jason, Thessaly relapsed into its former insignificance, though his dynasty survived him, and two of his brothers, Polydorus and Polyphron, for a short time shared his authority between them. Polydorus was soon assassinated, and Polyphron became sole Tagus. By his administration the office was changed into a tyranny, and he put to death Polydamas and eight other principal citizens of Pharsalus. After a reign of one year he was murdered by his nephew Alexander, who thus gained the government, in which he became infamous for his cruelty. The atrocities which he committed filled all his subjects with terror, but especially the ancient families, who were likely to be the objects of his jealousy. The Aleuads of Larissa accordingly applied to Alexander, the then king of Macedon, who, on being thus invited by the Thessalians, complied with their request. He defeated the tyrant, and took possession of Larissa and its citadel, and afterwards of Crannon, and garrisoned both with his troops. The affairs of his own kingdom however obliged him to withdraw from Thessaly; and the Thessalians, being thus exposed to the vengeance of Alexander, solicited aid (B.C. 368) from the Thebans, who accordingly sent Pelopidas to assist them. The tyrant granted him an interview, which ended in Pelopidas settling the affairs of the country on an apparently firm footing. But the order which he had established was soon deranged by the conduct of Alexander; and the Thebans, on being applied to again, sent out Pelopidas, with his friend Ismenias, but simply in the character of ambassadors, and without troops. They imprudently put themselves into the power of the tyrant, who threw them into prison. To rescue them and avenge the insult, Thebes sent out an army, which however was reduced to such a strait by his cavalry that it was obliged to retreat; and but for the interference of Epaminondas, who accompanied it, though not as general, it would have been destroyed.

In the following year (B.C. 367), an army was again sent out under Epaminondas, through fear of whom the prisoners were released. Subsequently, Alexander renewed his attacks on the liberty of the Thessalian cities, and greatly extended his dominion in the tributary districts. The Thessalians again appealed to the Thebans, and Pelopidas was sent out to aid them (B.C. 364), who fell in his first battle, in which however Alexander was defeated. The campaign ended in the tyrant being obliged to resign his conquests, withdraw his troops from Phthiotis and Magnesia, and enter into an alliance with Thebes. At last, his wife Thebe conspired with her three half-brothers to murder Alexander (B.C. 359). They effected their purpose; and one of them, Tisiphonus, assumed the government. At the end of B.C. 358, Lycophron, another of the brothers, was at the head of affairs. The new dynasty, however, seems to have been as unpopular with the Thessalians as the old one, and accordingly, with the Aleuads

at their head, they applied to Philip, king of Macedon, and requested his assistance. Philip invaded Thessaly, and, after gaining some success, was obliged to retire; but he shortly afterwards returned at the head of a large army, and made himself master of the whole country, Lycophron withdrawing into Phocia. Philip restored popular government at Pheræ (Diodorus, xvi. 38), but kept possession of its port, Pagasæ, and garrisoned Magnesia with his own troops. About B.C. 344, either the tyrants of Pheræ or their party there had regained their ascendancy, and Philip was again invited to dislodge them. This he effected with ease, and then availed himself of the opportunity to make Thessaly entirely subservient to his interests. After expelling the dynasty of the tyrants, he garrisoned the citadel of Pheræ with his own troops—revived the tetradarchies as political divisions of the country—and at the head of the four governments he placed his devoted adherents, the chiefs of the Aleuad party, so that they were in reality his viceroys or deputies. He also received the harbour duties and customs of the country, and appropriated to himself the tribute which had always been paid to Larissa by her subject Perrhæbian cantons. (Strabo, ix. p. 440.) On Philip's death, the states of Thessaly passed a decree confirming to his son Alexander the supreme station which Philip had held in their councils. The Thessalians took a very prominent part against Macedon in the Lamian war, which followed soon after Alexander's death (B.C. 323), and which nearly proved fatal to the Macedonian influence, not only in Thessaly, but over the whole continent of Greece. By the skillful generalship of Antipater, Leonnatus, and Craterus, however, Thessaly was preserved to the Macedonian crown till the reign of Philip, son of Demetrius, from whom it was taken by the Romans after the battle of Cynoscephalæ (B.C. 197). All Thessaly was then declared free (Liv., xxxiii. 32) by a decree of the Roman senate and people; but from that time it may be considered as under the dominion of Rome, though its possession was disputed by Antiochus (Liv., xxxvi. 9), and again by Perseus, son of Philip, between whom and the Romans it was the arena of more than one conflict. It was already a Roman province when the fate of the empire of the world was decided by the battle between Pompey and Cæsar on the plains of Pharsalus.

The slave-merchants of Greece were generally Thessalians. (Aristophanes, 'Plutus,' 517.) Their chief slave-market was Pagasæ, the port of Pheræ.

THETFORD, Norfolk, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Thetford, is situated chiefly on the left bank of the Little Ouse, in 52° 24' N. lat., 0° 44' E. long., distant 30 miles S.W. from Norwich, 80 miles N.N.E. from London by road, and 95 miles by the Eastern Counties and Norfolk railways. The population of the borough in 1851 was 4075. The borough is governed by 4 aldermen and 12 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry and diocese of Norwich. Thetford Poor-Law Union contains 34 parishes and townships, with an area of 117,870 acres, and a population in 1851 of 19,040.

The town of Thetford is very ancient. Under the East Angles it was a place of importance: a synod was held here in 669. When the Danes invaded England in the reign of Ethelred I., they fixed their head-quarters, in 870, at Thetford, which they sacked. In the reign of Ethelred II. the town was burnt by the Danes, in 1004, under Sweyne. They burned the town again in 1010. The bishopric of the East Angles was transferred in 1075 from North Elmham to Thetford, and was again removed in 1094 to Norwich. About the same time a Cluniac priory was founded here. There were several other religious houses at Thetford. The town was the seat of one of the suffragan bishoprics established by Henry VIII. There have been as many as twenty churches in the town; thirteen are mentioned in the Domesday Book. Thetford now comprehends three parishes; the parishes of St. Cuthbert and St. Mary are very much intermingled, and are partly in Suffolk and partly in Norfolk; the whole of the other parish (St. Peter) is in Norfolk.

The town has no manufactures, but a good deal of malting is carried on, and the trade of the place is favoured by the river being navigable up to the town. St. Peter's church consists of a nave with two aisles, chancel, and tower; the last rebuilt in 1789. The ancient part is built chiefly of flint, whence it has obtained the name of 'the black church.' St. Mary's is on the Suffolk side of the river, and is meanly built. There are places of worship for Wesleyan Methodists, Independents, Quakers, and Roman Catholics, a Free Grammar school, founded in 1610, and National and Infant schools. Considerable remains of the Cluniac priory, and of other religious structures, still exist.

THEUX. [LIÈGE.]

THEZENAY. [SÈVRES, DEUX.]

THIAN SHAN MOUNTAINS. [SONGARIA.]

THIAN SHAN NANLU is the name of a Chinese government, situated nearly in the centre of Asia. European geographers generally call it Eastern or Chinese Turkistan, and also Little Bucharia. The name of Turkistan is applied to it because the bulk of the inhabitants in that part of Asia is composed of Turkish tribes; and as these tribes are frequently designated by the collective name of Bucharians, from the town of Bokhara, Eastern Turkistan is also called Little

Bucharia, or rather Bokharia, to distinguish it from Western or Proper Turkistan, which is called Bucharia without any epithet. Thian Shan Nanlu, in Chinese, signifies the 'southern road of the Thian Shan Mountains,' and has been applied to the countries south of that mountain system, because they are traversed by the southern of the two great commercial roads which connect China Proper with the countries of Western Asia, whilst the countries north of the Thian Shan are traversed by the northern commercial road, and on that account are called Thian Shan Pelu, 'the northern road of Thian Shan.' The last-mentioned countries constitute the government of Ili, or SONGARIA.

Thian Shan Nanlu lies between 36° and 44° N. lat., and extends from 71° to 96° E. long. From east to west it extends about 1250 miles, and its width from south to north varies between 550 and 300 miles. Its area probably exceeds 500,000 square miles. It is bounded N. by Songaria, or Thian Shan Pelu; E. by the province of Kansai and South Tibet. On the south-west is Ladakh, on the west Kundus, including Badakshan and Bokhara, and on the north-west Khokan.

Thian Shan Nanlu is a country entirely isolated from the rest of the world. On the north, west, and south it is inclosed by mountain ranges of such extent and elevation that the places which are permanently inhabited can only be reached by passing for several days over mountains, which are not inhabited except for two or three months in the year, when they are visited by a few families of wandering tribes of mountaineers. On the east of Thian Shan Nanlu is an extensive desert, which appears to be uninhabitable. The country inclosed by the three ranges and the desert receives an abundant supply of water from the mountains, a considerable portion of which is always covered with snow, and the numerous rivers which descend from them form a large river, called the Tarim, which is as large as the Danube, and terminates in an extensive lake situated on the western edge of the desert. The basin of the river Tarim is the largest closed river-basin on the globe.

Mountains.—At the south-western angle of Thian Shan Nanlu stands an extensive mountain knot called Pushtikhur, which occupies the space between 36° and 37° N. lat., 71° and 74° E. long. From its western side issues that elevated chain which is known in Afghanistan by the name of Hindu Kush; from its northern edge another range, called the Tartashling, or Bolor-Tagh, which extends northward; and in the eastern part begins a third range, which traverses the whole of Central Asia, and extends through China Proper to the shores of the Pacific. This last-mentioned range is called by the Chinese Kuenlueu, but that portion of it which is contiguous to the mountain-knot of Pushtikhur goes by the name of Tsungling.

The Tsungling may be considered as that portion of the Kuenlueu range which extends from the Pushtikhur on the west (72° E. long.) to the mountain-pass of Karakorum on the east (between 76° and 77° E. long.), and occupies nearly the whole of the space between 35° and 37° N. lat. Little is known of this region, but it is stated that a mass of perpetual snow covers these mountains for more than 300 miles in length, and that on their northern declivity there is a continuance of rain for three successive months. That portion of the Kuenlueu range which is east of the Pass of Karakorum is still less known. Two roads traverse the Kuenlueu range. The most western leads through the Karakorum Pass from Hindustan and Cashmir by the way of Leh in Ladakh, to Khoten in Thian Shan Nanlu. The highest part of the pass probably does not exceed 12,000 feet above the sea-level. This road is much more frequented in winter than in summer, because the melting of the snow on the mountains adjacent to the road renders travelling in summer almost impossible. The eastern road connects the town of Lhassa in Tibet with Khoten, and traverses a very mountainous country of great extent, passing near the large lake of Tengri-Nor, and issuing from the mountains by the narrow valley in which the town of Keriya is built.

The western districts of the Thian Shan Nanlu are occupied by several ranges, belonging to the Tartashling, or Bolor-Tagh. This mountain-system extends north of the mountain-knot of Pushtikhur, from 37° to near 41° N. lat., where it descends with long slopes towards the valley of the river Sihoon, or Jaxartes. In the interior of the mountain region, and within the boundary-line of Thian Shan Nanlu, an extensive elevated plain occurs, which is called the table-land of Pamir. The elevation of this table-land is so great, that no trees are found on it, and travellers feel their respiration rendered difficult by the rarefaction of the air. The nomadic Kirghis, who visit this elevated region in summer on account of its excellent pastures, keep herds of camels and sheep, and of kashgaw, or yaks. [BADAKSHAN.] Among the wild animals peculiar to this region are the kutch-kar and the raa.

The Thian Shan range extends along the northern boundary-line of Thian Shan Nanlu, which is separated by it from the government of Ili. This mountain range has been noticed under SONGARIA, where also the road is mentioned which connects Thian Shan Nanlu with the government of Ili.

Rivers.—The largest supply of water is derived from the Tartashling, in which three of the great branches of the Tarim River rise. The principal branch originates within the mountain region in a large lake, called Karakol, which is situated near 39° N. lat., and receives the drainage of a considerable country which surrounds it on all sides.

GEOG. DIV. VOL. IV.

The river issuing from this lake runs eastward, and is called *Yaman-gar*. It leaves the mountain region below Tashbalik, near 73° 30' E. long., and is soon afterwards joined from the north by the *Kashgar Daria*, which brings to it the drainage of the north-eastern part of the Tartashling. Near the point of confluence the rivers are met by a third river, the *Kesyl Daria*, which flows about 200 miles in a direction from east to west, and brings down the waters collected on the mountain-chain which unites the Tartashling to the Thian Shan. After the union of these three branches the river continues to be called *Kashgar Daria*, and to flow eastward for 300 miles; between 80° and 81° E. long., it is joined from the north by the *Aksu Daria*, from the west by the *Yarkiang Daria*, and from the south by the *Khotan Daria*, which flow respectively from the Thian Shan, the Tartashling, and the Kuenlueu mountains, and are from 300 to 400 miles in length.

After the confluence of these several branches the river is called *Tarim*, or *Tarim-gol*, and continues to flow in a nearly due east direction for 400 miles more, when, near 88° E. long., it is lost in an extensive lake, *Lop-Nor*, which is surrounded by still more extensive swamps. No river joins the *Tarim* from the south, east of 81° E. long., but it receives a considerable supply of water from the Thian Shan Mountains, by two rivers, the *Ukiat*, or *Chagar Daria*, and the *Barun Yulduz*, or *Kaidu River*. The *Ukiat Daria* runs more than 200 miles in a south-east direction, and joins the *Tarim* near 84° E. long. The *Kaidu River* is probably the largest of the confluents of the *Tarim*, as it collects the drainage of the Thian Shan Mountains between 80° and 87° E. long. Its course for about 100 miles is in an elevated valley, parallel to the Thian Shan range from east to west, after which it drains another parallel valley about 200 miles long by an eastern course, and falls into a large lake called *Bostu-Nor*, which is surrounded on the north and south by chains of high hills, but on the east by a sandy desert. In the hills which inclose the lake on the south is a break by which the *Bostu Nor* discharges its waters into the *Tarim*. The whole course of the *Tarim* amounts to nearly 1200 miles in a straight line, or about 1500 miles including the windings of the river.

The plain is of great extent, measuring on an average more than 300 miles from north to south, and about 900 miles from west to east. It is about 2000 feet above the sea-level. The eastern parts of it are a complete desert, which occupies the whole country east of 88° E. long., and surrounds the lakes of *Lop-Nor* and *Bostu-Nor* on the east. South of the river *Tarim* it extends westward to the banks of the *Khotan Daria* (81° E. long.), so that it covers about one-half of the plain. The worst part is that which lies east of 88° E. long., and is called *Han-hai*, or the *Dry Sea*. Its surface is covered with a very fine sand, which is frequently raised into the air by the wind, so that the traces of the caravans soon disappear. Through this desert is the nearest road from China to Hami in Thian Shan Nanlu. On the north, where it approaches the Thian Shan range, this vast extent of desert is skirted by a narrow tract of hilly ground, which is fit for cultivation or used as pasture-ground. Its width may vary between 20 and 30 miles, and it is in many places abundantly watered by rivers which descend from the mountains on the north, but which as soon as they have traversed the hilly region are lost in the sand of the *Han-hai*. Only a small portion of this tract can be irrigated, but it is cultivated with the utmost care, and produces various grains, vegetables, and fruits. It is especially famous all over China for its excellent melons and grapes. Cotton is also grown. The greater part of this tract however is used as pasture-ground for horses, camels, cattle, and sheep.

The country west of 88° E. long., and between the *Tarim River* and the Thian Shan Mountains, contains a much larger portion of cultivable ground, especially in the valleys of the *Barun Yulduz*, or *Kaidu River*. The hills inclosing the valley rise probably more than 1000 feet above their base, and are used as pasture-ground. Along the base of the southern ridge of hills are also considerable tracts of cultivated land.

Farther west, between 84° and 80° E. long., the hilly country is not so wide, extending only to the distance of 40 to 50 miles from the Thian Shan Mountains. The hills also have less elevation, and yield only a scanty supply of water for irrigation. Between 77° and 80° E. long. is the valley of the *Aksu Daria*, which is inclosed by high hills, and in its upper part contains very extensive tracts of fertile land, which are cultivated with great care, producing every kind of grain, and a variety of excellent fruits. The rich pastures feed herds of horses, sheep, camels, and cattle.

In the plain, west of the *Aksu Daria*, which extends between the *Kashgar Daria* and the Thian Shan Mountains, the cultivated land seems to be almost entirely limited to the bottom of the *Kesyl Daria*, where considerable tracts produce rice and other grain in abundance, as well as rich crops of cotton. The uplands north of the river produce abundance of grass during some parts of the year, and are used as pasture-grounds by the *Kara Kirghis*, or *Black Kirghis*, who go in summer with their herds of horses and camels to the Thian Shan Mountains. The uplands between the *Kesyl Daria* and the *Kashgar Daria* have a sandy soil.

The western districts of the Thian Shan Nanlu, or those which extend at the base of the Tartashling, are not more favourable to cultivation

than the northern districts which we have just noticed. It is chiefly on the banks of the rivers that the ground is cultivable. The principal objects of agriculture are rice, wheat, barley, and millet, with beans and vetches. The mulberry plantations are extensive, and large quantities of silk are collected at Yarkand; cotton, hemp, and flax are also grown. Fruit-trees are abundant. Melons and cucumbers are of excellent quality. The greater part of the country is covered with grass, especially those tracts which are mountainous, and accordingly it abounds in horses and sheep. The wool collected in these parts is of very fine quality. There are numerous herds of cattle and camels.

Along the base of the Thsungling our knowledge is limited to the tracts that surround the town of Khotan, where a large district is under cultivation, and produces rice, wheat and millet, cotton, hemp, and flax; large quantities of silk of the first quality are collected. The vineyards are extensive. Some plants are raised which yield dyeing-stuffs, which are exported to China. Among the domestic animals the yak is numerous, and also horses and sheep. North of this cultivated tract is the desert of Kara-kitai, or Rikistan, mostly covered with sand, and extending westward to the vicinity of Yarkand, and northward to the banks of the Yarkand-Daria.

Climate.—The climate of the Thian Shan Nanlu is distinguished by that dryness which is characteristic of all table-lands which are considerably elevated above the sea. Heavy gales are very frequent, and often so strong as to throw down travellers and their beasts of burden. The moisture required for the growth of plants is derived from the mountain rivers, which yield an abundant supply of water for about two or three months of the year. In the districts south of the Thian Shan Nanlu Mountains large reservoirs have been made, which are filled by the watercourses after the melting of the snow, and from these reservoirs the greater part of the water supply is taken. The western districts are much colder in winter; at Yarkand the river is for three months covered with thick ice, and caravans pass over it with their beasts of burden. The heat in summer is very great all over the country, but the cold of the winter seems to decrease as we proceed from west to east, as frost is hardly known at Hami. The country is subject to earthquakes. An extinct volcano exists in the Thian Shan Mountains, and traces of volcanic action are frequently met with in that range.

The domestic animals of Europe abound, with the exception of hogs, which are only kept by the few Chinese settled in the country; the other inhabitants, being Mohammedans, hold this animal in abhorrence. Camels are kept in the plains and on the mountains. In the Tartashling Mountains the yak is reared by the Kirghis; the larger species of the domestic animals are found in a wild state in the deserts of Thian Shan Nanlu. Of wild sheep there appear to be several kinds. On the Thian Shan Mountains the argali is found, and on the Tartashling the kutch-kar and the raa above mentioned. Among wild animals are jackals, tigers, wolves, lynxes, and foxes. On the Thian Shan Mountains a black eagle of great size is met with, and on the Tartashling a still larger kind, called syrm.

Gold is said to be found in the affluents of the Khotan Daria, and also in the eastern portion of the Thian Shan Mountains. Copper and iron are found at several places, and are worked. From the Thian Shan Mountains sulphur and sal-ammoniac, asbestos and saltpetre, are obtained. Several precious stones are abundant, and two kinds, the yew and the agate, form considerable articles of commerce to China.

Inhabitants.—The bulk of the population is of Turkish origin. The language of Thian Shan Nanlu is not intermixed, as that of the other Turkish tribes, with terms derived from the Persian and Arabic languages, and it is considered the purest of the Turkish dialects. The Turks of Thian Shan Nanlu are divided into two tribes, Ak-tak and Kara-tak, which hate one another, and frequently make war on each other. Each tribe is ruled by its own chief, or Beg, the Chinese reserving to themselves only military affairs, police, and customs. The army which the Chinese keep in the country, and which amounts to between 20,000 and 30,000 men, is commanded by Mantchoo officers. The tribute which the Chinese government levies upon the inhabitants is small, but is somewhat increased by the duty on imports. The inhabitants however are much oppressed by their own chiefs, and the Chinese do not interfere between them. The foreign commerce is carried on partly by the Turks, but mostly by the Tajicks. Both are Mohammedans. The Tajicks, or Tadjicks, are that nation which considers the Persian as its native language, and which is widely spread over Central Asia. In other countries their industry is mostly directed to the cultivation of the soil, but in Thian Shan Nanlu they are chiefly engaged in trade. They conform in costume to the Turks, but preserve their own language. There are in the eastern districts, especially in the town of Hami and its vicinity, a considerable number of Olöth Kalmucks, who after the defeat of the Galdan quietly submitted to the sway of the Mantchoos. [SONGARIA.] The number of Chinese is not large. Besides the officers of government, a small number is established in the large commercial towns as merchants and traders. In the mountains at the north-west corner of Thian Shan Nanlu is a tribe of Kirghis, called the Kara-Kirghis, and another tribe of that nation is met with in the ranges of the Tartashling. Both are nomadic tribes.

Commerce, Towns, and Manufactures.—About 1800 years ago a commercial road was established, which traverses this country in its

length from east to west, and by which the commerce between China and Western Asia has been carried on nearly without interruption. This road passes through the countries which lie along the base of the Thian Shan Mountains. Another road, which has probably been used for an equal length of time, connects Thian Shan Nanlu and China with the northern parts of India, especially with Cashmir, and is also much used at the present day.

The caravans of China, bound for the western countries, or Siyu, as they are called, after leaving the town of Shataheou and the gate of Kia-yu-kooan [TANGUT], pass through the Desert of Han-hai, and arrive after twenty days' journey at Hami (42° 53' N. lat., 98° 50' E. long.). Hami, or Khami, is a fortified place, surrounded by high walls, which inclose a space about two miles and a half in circuit. The town is surrounded by large suburbs, and is populous. The streets are straight and regular, but the houses low and built of dried clay. The district round the town is carefully cultivated.

About 240 miles west of Hami is *Pidahan*, a fortress which is nearly 2 miles in circuit, and near which the caravan road passes. About 60 miles farther is *Turfan*, a considerable place, which however suffered much in the wars of the last century. *Karashar* is 290 miles west of Turfan. Its fortress does not exceed one mile in circuit. The town is populous, and built on the banks of the Kaidu River. Its commerce is considerable; the inhabitants excel in embroidery. *Kurli*, or *Kurungli*, is situated on that portion of the Kaidu River which connects the Bostu-Nor with Lop-Nor, and contains a population of about 4000 individuals. The soil in the vicinity is very fertile. The town is 50 miles distant from Karashar to the south-west. *Bugur*, or *Bugur*, nearly 200 miles distant from Kurli, contains 10,000 inhabitants, and has a considerable commerce in copper, oil, sheep-skins, butter, and furs, especially lynx-skins.

Kutsho, which is 100 miles distant from Bugur, is a large town, which is three miles in circumference, and contains a great population, of which 6000 are Turks. The mountains north of the town contain several mines, from which copper, saltpetre, sulphur, and sal-ammoniac, are obtained. At this town begins the road which leads across the Thian Shan Mountains to Kuldaha in Ili, by the mountain pass called Musur Dabahn. Before it reaches the mountain pass, it runs through the town of *Sailim*, which is built in an elevated valley, and near some mines. South-west of Kutsho is the town of *Stager*, in a district producing abundance of rice, melons, and fruit. It contains a population of 4000 individuals.

In the valley of the Aksu Daria are the towns of Aksu and Uahi. *Aksu* is a large commercial and manufacturing town, which contains about 8000 houses. It is not fortified. Its commercial importance is derived from its situation at the junction of the road from Kuldaha in Songaria with the great western caravan route. Its manufactures are numerous, especially those of cotton-stuffs, and a kind of stuff, half silk and half cotton, deer-leather, harness and saddles (which are embossed with great art). There are also some potteries, and many persons are employed in cutting and polishing precious stones. The Chinese garrison, consisting of 3000 men, inhabits a separate quarter of the town. *Uahi*, which lies higher up in the valley of the Aksu Daria, is built in the centre of an extensive country of great fertility, and is stated to contain 10,000 families. This place appears to carry on a considerable commerce.

The town of *Kashgar* is situated in the north-western angle of Thian Shan Nanlu, and at the commencement of the mountain road which leads to Ferghana and the towns of Khokand and Tashkend. At this place also begins the other caravan-road, which, passing along the eastern declivity of the Tartashling, leads over the Karakorum Pass to Leh, Gertope, and Cashmir. Besides these two lines of communication and the great caravan-road to China, a fourth road, commencing at Kashgir, runs north-east over the Thian Shan Mountains by the Rowat Pass, to Kuldaha and the banks of the Irtish. These roads concentrating at Kashgar render it one of the most commercial towns in the interior of Asia. It is said to contain 15,000 houses, and a population of 80,000. All persons who are of Turkish origin have free access to the town; but the entry of Europeans is prevented by the Chinese authorities. In the middle of the town is a large square, from which four extensive bazaars branch off. The Chinese garrison consists of 8000 men, who are stationed here to repress any invasion from the side of Khokand, and are quartered in a strong fortress. The manufactures are silk-stuffs, as satin, damask, cottons, &c. The jewellers are very expert in cutting the yew and in working gold. Kashgar suffered much by the invasion and rebellion of the Kodjas (1827). South-west of Kashgar is the important town of *Tashbalig*, on the banks of the Yaman-yar River. On the road leading from Kashgar to Yarkand is *Yengi Hisar*, a place of considerable extent.

Yarkand, or *Yarkand*, may be considered the capital of Thian Shan Nanlu, as the Chinese military governor generally resides here. The city or fortress is surrounded by a high wall of stone, and is more than three miles in circumference. Numerous suburbs lie round it. In the fortress a garrison of 7000 men is kept. The houses are mostly built of sun-dried bricks. The river Yarkand Daria is divided into two arms, and by canals from them the streets are supplied with water. There are numerous public buildings, especially mosques and medrasses, or colleges. There are two large

bazaars, one in the city and the other in the suburbs, which are more than three miles long. Most of the shopkeepers are Chinese. The country surrounding the town supplies it with three important articles of commerce, silk, fine wool, and small Kirghis horses. The commerce with the countries north of Hindustan and with Tibet is very considerable. There are several kinds of manufactures. The number of inhabitants who pay capitation-tax is stated to be between 30,000 and 40,000, which would give a population of between 180,000 and 240,000. Many foreigners are settled in this place.

Kaotan appears to have been formerly the name of the town which at present is called *Ilitai* or *Eelohi*, whilst the name of *Khotan* is applied to the country which extends along the northern base of the *Thuingling*. This country contains 700,000 persons who pay capitation-tax, which would give a population of 3,500,000. This is by far the most populous and important part of *Thian Shan Nanlu*. A large number of the inhabitants are Buddhists. The town of *Ilitai* is large and populous, and is of commercial importance. The eastern road passes from *Ilitai* to *Keriya*, and *Tibet*. The western road joins the great caravan-road which leads from *Yarkiang* to *Leh* and *Cashmir*. The principal articles which the country supplies for exportation are the yew-stone and silk, the last of which is produced in large quantities. Silk and cotton-stuffs are made to a great extent, and there are glass-houses. Every week a fair is held, which is sometimes attended by 20,000 persons. Horses are exported in great numbers. Near the town of *Keriya*, through which the road passes to *Tibet*, are gold-mines. The articles which are sent from *Yarkiang* to *Cashmir* are silver, goats' and sheep's wool, Russia leather, embroideries of gold and silver, rice, and some articles of Chinese manufacture; there are taken in return shawls of different qualities, cotton-stuffs, sheep- and goat-skins, and some minor articles. A caravan goes annually from *Yarkiang* to *Badakhan*, which carries a large quantity of tea and some silver, and brings back slaves and precious stones, especially rubies. The articles exported to *Khokand* are silver, china-ware, tea in boxes, and pressed tea. The imports from *Khokand* are raw silk and different kinds of cotton-stuffs. The commerce of *Yarkiang* with the northern provinces of China is very active. The articles sent to China are raw silk, great numbers of horses and cattle, the yew and other precious stones, and some dyeing stuffs; in return there are sent to *Yarkiang* tea, china-ware, and several manufactured articles.

History.—Before and at the beginning of our era this part of Central Asia formed a portion of the powerful empire of the *Hiongnu*, a Turkish race, which for more than two centuries made war on China, and sometimes laid waste the northern provinces; but in the first century after Christ was overthrown by the dynasty of the *Han* emperors. The Chinese soon afterwards extended their conquests to the *Caspian Sea*. But in the 5th century after Christ the Chinese were dispossessed of this country by the *Tang-hiang*, a Tibetan race; and this and other races of the same origin continued to govern *Thian Shan Nanlu* up to the time of *Gengis Khan*. From the 10th to the 13th century it formed a part of the empire of *Tangut* [*TANGUT*], the overthrow of which, in 1227, was the last of the numerous exploits of the *Mongol* conqueror. As the *Mongols* soon afterwards got possession of China, *Thian Shan* was again united to that country, and remained so as long as the descendants of *Gengis Khan* were masters of China. But when the *Yuan* dynasty was overthrown, in the 14th century (1366), by the *Ming* dynasty, and the *Mongol* empire was split into several states, *Thian Shan* became independent, and several small sovereignties arose under chiefs of Turkish origin. *Tamerlane*, towards the end of the 14th century, brought it under his dominion. After his death the Turkish chiefs gradually resumed their independent station, and preserved it to the middle of the 16th century, when the *Galdan* or emperor of the *Olöth Kalmucks* made *Thian Shan Nanlu* tributary. When the *Galdan* had been defeated by the Chinese (1697), the country was subjected to the *Songares*, who kept it till 1756, when they were conquered by the Chinese. The most powerful of the Turkish princes, the *Kodjas* of *Yarkiang* and *Kashgar*, now made an effort to gain their independence, and refused to submit to the authority of the *Mantchoo* emperor. But the emperor sent two armies from *Ili* over the *Thian Shan Nanlu* Mountains, which subjected the whole of the country, and in 1759 the *Kodjas* were obliged to retire to *Badakhan*. In 1826 the descendants of the *Kodjas* obtained from the *Khan* of *Khokand* the support of a small army, entered *Thian Shan* by the *Terek Pass*, and succeeded in taking *Kashgar*, *Aksu*, *Yarkiang*, and *Khotan*; but a Chinese army of 60,000 men being sent against them, they were defeated in three battles, and again retired to *Badakhan*.

(Du Halde; Klaproth; Ritter; *Journal of the Asiatic Society of Bengal*, vol. iv.; Wood, *Journey to the Source of the Oxus*.)

THIBET. [TIBET.]

THIEL. [GUELDERLAND.]

THIELT. [FLANDERS, West.]

THIERS. [PUY-DE-DÖME.]

THINGOE, a hundred in the western part of the county of Suffolk which gives name to a Poor-Law Union. The hundred of Thingoe consists of 22 parishes and hamlets, with an area of 31,114 acres, and a population in 1851 of 7064. Thingoe Poor-Law Union, which includes portions of the neighbouring hundreds of *Risbridge*, *Black-*

bourn, and *Thewestry*, contains 46 parishes and townships, with an area of 82,464 acres, and a population in 1851 of 19,014.

THIONVILLE. [MOSELLE.]

THIRSK, North-Riding of Yorkshire, a market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of *Thirak*, is pleasantly situated on both sides of the *Codbeck* stream, a feeder of the *Swale*, in 54° 14' N. lat., 1° 20' W. long., distant 23 miles N.N.W. from *York*, 217 miles N. by W. from *London* by road, and 213 miles by the *Great Northern* and *York Newcastle* and *Berwick* railways. The population of the town of *Thirak* in 1851 was 5319. The borough returns one member to the *Imperial Parliament*. The living is a perpetual curacy in the archdeaconry of *Cleveland* and diocese of *York*. *Thirak* Poor-Law Union contains 41 parishes and townships, with an area of 62,444 acres, and a population in 1851 of 12,760. At the south-western extremity of the town is the site of the ancient castle. Over the *Codbeck* there are two substantial stone bridges. In the new town, which is built on the west side of the stream, is an extensive market-place. The church is a large and handsome gothic structure, said to have been formed out of the ruins of the ancient castle. There are places of worship for *Independents*, *Wesleyan Methodists*, and *Quakers*; a *British school*, a *Charity school* for girls, an *Infant school*, and a *savings bank*. At the market, held on *Monday*, great quantities of provisions are disposed of. Fairs are held seven times a year. A county court is held.

THIS. [ABYDOA.]

THISTED or TISTED. [AALBORG.]

THIVIERS. [DORDOGNE.]

THOISSEY. [AIN.]

THOMAR. [ESTREMADURA, Portuguese.]

THOMAS, ST., or ST. THOMAS THE APOSTLE, Devonshire, a suburb of *EXETER*, and the seat of a Poor-Law Union, is situated on the right bank of the river *Ex*, opposite to *Exeter*, with which it is connected by a handsome stone bridge. The living is a vicarage in the archdeaconry and diocese of *Exeter*. The population of the parish in 1851 was 4577. *St. Thomas* Poor-Law Union contains 49 parishes and townships, with an area of 129,927 acres, and a population in 1851 of 48,787.

THOMAS, ST. [VIRGIN ISLANDS.]

THOMASTOWN, county of *Kilkenny*, Ireland, a market-town and the seat of a Poor-Law Union, is situated on the river *Nore*, in 52° 32' N. lat., 7° 8' W. long., distant 11 miles S.S.E. from *Kilkenny*, 92 miles S.W. by S. from *Dublin* by the *Waterford* and *Kilkenny* railway, and 75½ miles from *Dublin* by road. The population in 1851 was 1843. *Thomastown* Poor-Law Union comprises 27 electoral divisions, with an area of 107,577 acres, and a population in 1841 of 37,187; in 1851 of 27,298. The town consists chiefly of three rather wide and well-paved streets, in which are some good houses. The parish church was the chancel of an ancient *Dominican* abbey. There are a large and handsome *Roman Catholic* chapel, two *National schools*, a court-house and *bridewell*, a *dispensary*, and a *Union workhouse*. Barges of 80 tons burden ascend the *Nore* to the town, from which considerable quantities of flour, corn, and provisions are exported. Three large flour-mills, two breweries, and a tannery give some employment. Quarter and petty sessions are held. Fairs are held *March 17th*, *May 25th*, *June 29th*, and *September 15th*.

THORN. [MARIENWERDER.]

THORNBURY, Gloucestershire, a market-town and the seat of a Poor-Law Union, in the parish of *Thornbury*, is situated in 51° 36' N. lat., 2° 30' W. long., distant 23 miles S.W. by S. from *Gloucester*, and 124 miles W. by N. from *London*. The population of the borough of *Thornbury* in 1851 was 1470. The living is a vicarage in the archdeaconry of *Gloucester* and diocese of *Gloucester* and *Bristol*. *Thornbury* Poor-Law Union contains 21 parishes and townships, with an area of 52,520 acres, and a population in 1851 of 16,341. The parish church is a large handsome structure, having a lofty tower, which is ornamented with rich open-worked battlements and eight pinnacles. The *Independents*, *Baptists*, and *Wesleyan Methodists* have places of worship. There are *National schools* and a *savings bank*. *Saturday* is the market-day; fairs are held three times a year. A county court is held in the town.

THORNE, West Riding of Yorkshire, a market-town and the seat of a Poor-Law Union, in the parish of *Thorne*, is situated on the right bank of the river *Don*, in 53° 37' N. lat., 0° 58' W. long., distant 28 miles S. by E. from *York*, and 166 miles N. by W. from *London*. The population of the town was 2320 in 1851. The living is a perpetual curacy in the archdeaconry and diocese of *York*. *Thorne* Poor-Law Union contains 13 parishes and townships, with an area of 71,946 acres, and a population in 1851 of 15,886. The town is situated in the district called the *ISLE OF AXHOLME*. *Thorne* contains an ancient parish church; chapels for *Wesleyan* and *New Connexion Methodists*, *Independents*, *Quakers*, and *Unitarians*; *Brook's Charity school*; *Travis's Charity school*; a school supported by *Wesleyan Methodists*; and a *mechanics institute*. On the bank of the *Don* are ship-, rope-, and timber-yards, and wharfs for merchandize. Steam-vessels ply daily between *Thorne* and *Hull*, except at neap-tides, when they stop at *Newbridge*, on the *Dutch river*, 4 miles below *Thorne*. *Wednesday* is the market-day; fairs are held twice a year.

THORNEY, Cambridgeshire, a town, formerly a market-town,

the parish of Thorney, is situated on a slight eminence rising out of the midst of the fens, in 52° 37' N. lat., 0° 6' W. long., distant 35 miles N.N.W. from Cambridge, and 82 miles N. by W. from London. The population of the parish in 1851 was 2174. A monastery is said to have been founded here by Saxulph, first abbot of Medeshamsted, or Peterborough; and here, in the year 870, were a prior and several anchorites. In 972 this establishment, which had been destroyed by the Danes, was refounded by Ethelwold, bishop of Winchester, for Benedictine monks. The abbot was mitred. The nave of the conventual church, rebuilt in 1085 and 1125, now serves as the parish church. The west end presents a very mixed style, the lower part being Norman, the upper part of perpendicular character. There are National and Infant schools, a subscription library, a Sunday library, and some almshouses. Fairs, held on July 1st and September 22nd, are much frequented for the sale of horses and cattle.

THOUARS. [SEVRES, DEUX.]

THOUROUT. [FLANDERS, WEST.]

THOYDON. [ESSEX.]

THRACE was in earlier times the name of the country bounded N. by the Danube, S. by the Propontis and the Ægean Sea, E. by the Black Sea, and W. by the river Strymon and the chain of mountains which form the continuation of Mount Rhodope. This country is divided into two parts by Mount Hæmus (now the Balkan), which runs from west to east, separating the plain of the Lower Danube from the rivers which flow into the Ægean Sea. Two extensive ranges branch off from the southern side of Mount Hæmus: one at about a hundred miles from the Euxine, which runs in a south-eastern direction towards Constantinople; the other, which is far larger, branches off near the sources of the Hebrus, and likewise runs to the south-east. The latter bore the name of Rhodope, and is now called the Despoto Mountains. Between these two ranges there are many plains, which are drained by the Hebrus (the Maritza), the principal river of Thrace, and its tributaries. [BALKAN MOUNTAINS; MARITZA.]

In ancient times there was a great quantity of corn and wine grown in the valley of the Hebrus. In the 'Iliad' the ships of the Æchiæans are described as bringing wine every day to Agamemnon from Thrace (ix. 72); and the Maronean wine, which retained its reputation in the time of Pliny ('Hist. Nat.' xiv. 6), is spoken of in the 'Odyssey' (ix. 197). In the mountainous parts of the country there were also mines of precious metals. (Justin, viii. 3.)

The Thracians were divided into many separate and independent tribes; but the name of Thracians seems to have been applied to them collectively in very early times. Oceanus, it was said, had four daughters, Asia, Libya, Europa, and Thrace, from whom the four parts of the world were named. Josephus and many Biblical scholars suppose that the name Thrace is derived from Tiras, the son of Japhet.

The Thracian nation, according to Herodotus (v. 3), was, next to the Indians, the most numerous of all, and if united under one head would have been invincible. The Thracians, says Herodotus (v. 6), sell their children to be carried out of the country as slaves; they do not guard their young women, but permit them to have intercourse with whatever men they please; they purchase their wives with great sums; they puncture or tattoo their bodies, which they regard as a sign of noble birth; agriculture they despise, and consider it most honourable to live by war and robbery. Deep drinking prevailed among them extensively, and the quarrels over their cups became almost proverbial. In earlier times however there must have been a greater degree of civilisation among some of their tribes at least, than prevailed at a later period. The earliest Greek poets, Orpheus, Linus, Musæus, and others, are all represented as coming from Thrace; and Eumolpus too, who founded, according to tradition, the Eleusinian mysteries at Attica, is also said to have been a Thracian. At an early period likewise the Thracians spread extensively over southern Greece.

The first historical event respecting them is their conquest by Megabazus, the general of Darius, who conquered all the separate tribes, with the exception of the Satra, who were the only Thracian people that had retained their independence down to the time of Herodotus. (Herod., v. 2; vii. 111.) After the failure of the expedition of Xerxes, the Thracians recovered their independence; and in the time of the Peloponnesian war we find a powerful native empire in Thrace, which was under the dominion of Sitalces, who is called by Thucydides (ii. 29) king of the Thracians. The empire was founded by the father of Sitalces, Teres, the king of the Odryæ, one of the most powerful of the Thracian tribes. The power of the Odryæan empire however did not last long. In little more than twenty years from the death of Sitalces it had lost its former greatness; and when Xenophon crossed over into Thrace, B.C. 400, he found Medorus, the reigning king of the Odryæans, unable to command the obedience of his Thracian subjects. (Compare 'Anab.' vii. 2, s. 32, &c.) Philip, the father of Alexander, reduced the whole of Southern Thrace at least, and compelled it to pay tribute. (Diodorus, xvi. 71.)

On the death of Philip there was a general movement among the Thracians to throw off the Macedonian supremacy, at the head of which the Triballi placed themselves. But Alexander crossing the Hæmus, defeated the Triballi, advanced as far as the Danube, which he crossed, and offered up a sacrifice on its right bank. (Arrian, 'Anab.' 1, 2, 3; Strabo, vii. 301.) On the death of Alexander, Thrace fell to the share of Lysimachus, who erected it into an independent monarchy; but it subsequently came under the dominion of the Macedonian kings. On the conclusion of the war with Perseus however, Cotys, a native Thracian prince, was allowed to continue in possession of his kingdom, notwithstanding the assistance he had rendered to Perseus. (Livy, xlv. 42.)

Thrace was not reduced to the form of a Roman province till a late period. The part north of the Hæmus was conquered by the Romans in the reign of Augustus, and was afterwards erected into a separate province under the name of Moesia. The name of Thrace was then confined to the country south of the Hæmus, and between the Euxine, the Propontis, and the Ægean Sea. Its boundary on the west differed at various times: in the time of Ptolemy (iii. 11) it seems to have been the Nestus; but the Strymon was anciently the boundary between Macedonia and Thrace.

Amphipolis, founded by the Athenians on the left bank of the Strymon, was one of the most important towns in Thrace. [AMPHIPOLIS.] The next town of importance east of Amphipolis was Philippi, which was founded by Philip of Macedonia: it was previously called Crenides, but was then only a small place inhabited by the Thasians, who settled there for the purpose of working the gold and silver mines in its neighbourhood. West of Philippi the country was an extensive plain stretching towards Amphipolis, which has become memorable on account of the battle fought there by Antony and Octavius against Brutus and Cassius. Under the Romans Philippi became a colony, and was the chief city in that part of the country, when it was visited by St. Paul.

West of the Nestus the first town of importance on the coast is Abdera. [ABDERA.] Next comes Dicaea or Dicosopolis, which was a Greek city on the shores of the Lake Bistonis (Herod., vii. 109); and then Maroneia and Ismarus, which were both in the country of the Cicones, where Ulysses landed and was defeated by the inhabitants, after he had taken their city. ('Odyss.' xi. 39, &c.) The Maronean wine has been already mentioned, and the city was in consequence sacred to Dionysius, as may be seen from its coins. Its ruins are still named Maroni. Ismarus is not mentioned by later writers as a city, but only as a mountain celebrated for its wine. Following the coast we next come to Stryme, a colony of the Thasians; then to Mesembria, built by the Samothracians (Herod., vii. 108); and next to Doriscus, situated in a large plain, in which Xerxes numbered his army. Crossing the Hebrus we come to Ænos, which is mentioned under this name by Homer, as the place from which Pirous came to the Trojan war. ('IL.' iv. 520.) It was a place of considerable importance in later times, and under the Romans was a free town. (Pliny, 'Nat. Hist.' iv. 18.) It is still called Enus.

After passing round the head of the Gulf of Melas, now the Gulf of Saros, we come to the Thracian Chersonese, now Gallipoli, which was very early colonised by Greek settlers, and though but of small extent is of considerable importance in ancient history. On the isthmus was Lysimachia, which was founded by Lysimachus, who made it his capital. It was on the western side of the isthmus, not far from the ancient Cardia, the inhabitants of which he removed to his new city. (Diodorus, xx. 29; Pausan., i. 9, s. 10.) South of Lysimachia were Agora, Ide, Pæon, and Alopeconesus, the last of which only was of any importance. It was an Æolian colony, and was one of the chief towns of the Chersonese in the time of Demosthenes. On the eastern side of the Chersonese, upon the Hellespont, the most southerly town was Cynossema, near which the Lacedæmonian fleet was defeated by the Athenians, in B.C. 411. Above Cynossema was Madytus, and north of Madytus was Sestos. North of Sestos was the small river of *Egospotamoi*, with apparently a town of the same name at its mouth, near which the Athenian fleet was totally defeated by Lysander, in B.C. 405. Above *Egospotamoi* were *Callipolis*, now Gallipoli, which has given its name to the peninsula, and *Pactya*, opposite Lysimachia.

On the Propontis the chief seaport was *Perinthus*, afterwards called *Heraclea*, and sometimes also *Heraclea Perinthus*. On the Bosphorus the ancient Greek city of *Byzantium* was situated, which occupied part of the site of the modern Constantinople. [BYZANTIUM.]

On the European coast of the Euxine the chief towns were *Salmessus*, *Apollonia*, and *Mesembria*.

In the interior of the country the towns most worthy of mention are *Trajanopolis*, on the Egnatian road to the west of the Hebrus; *Plotinopolis*, so called in honour of Plotina, the wife of Trajan, to the north of *Trajanopolis*; *Hadrianopolis*, on the Hebrus, originally called *Orestias*, and now *ADRIANOPLE*; and, lastly, *Philippopolis*, also on the Hebrus.

The Via Egnatia [MACEDONIA] entered Thrace at Amphipolis, and passed by the towns of Philippi, Neapolis, Abdera, Maximianopolis, *Trajanopolis*, *Cypsela*, *Apri*, *Heraclea*, till it reached Byzantium.

Xenophon ('Anab.' vi. 4), speaks of Thrace in Asia, which he describes as extending from the junction of the Bosphorus and the

Euxine along the Asiatic coast as far as Heracleia: the country within these limits was inhabited by Thraces Bithyni.

THRACIAN SEA. [ÆGEAN SEA.]

THRAPSTON, Northamptonshire, a market-town and the seat of a Poor-Law Union, in the parish of Thrapeton, is pleasantly situated on the right bank of the river Nene, in 52° 24' N. lat., 0° 32' W. long., distant 21 miles N.E. from Northampton, 73 miles N.N.W. from London by road, and 89 miles by the North-Western and Northampton and Peterborough railways. The population of the parish of Thrapeton in 1851 was 1183. The living is a rectory in the archdeaconry of Northampton and diocese of Peterborough. Thrapeton Poor-Law Union contains 26 parishes and townships, with an area of 51,188 acres, and a population in 1851 of 12,841. The church is of early English, decorated, and perpendicular characters. The Wesleyan Methodists and Baptists have places of worship, and there are National schools. A county court is held. Corn-mills and a paper-mill are on the river, and sand-pits and stone-quarries in the neighbourhood. The market is on Tuesday, for corn and live-stock; there are two yearly fairs for live-stock, pedlery, and shoes, and for hiring servants. The Nene is here crossed by a handsome stone bridge.

THREE RIVERS. [CANADA.]

THUIN. [HAINAULT.]

THUN, TOWN and LAKE. [BERN.]

THURGAU (*Thurgovie*), a canton of Switzerland, bounded N. partly by the Lake of Constance, and partly by the Rhine, which divides it from the canton of Schaffhausen; E. and S. by the canton of St. Gallen, and W. by that of Zürich. The river Thur, which comes from the canton of St. Gallen and is joined by the Sitter from Appenzell, has given its name to the canton 'Thurgau,' or 'district of the Thur,' the river crossing the middle part of it from east to west. The valley of the Thur is separated from the basin of the Lake of Constance by a succession of hills which rise in terraces on both sides, and are intersected by several valleys. On the south and west sides other hills divide the Thurgau from the valley of the Toss in the canton of Zürich. The whole country belongs to the plateau or table-land of Switzerland, and is a considerable distance from the Alpine region. The climate of Thurgau is comparatively mild; a great part of the country is planted with fruit-trees, especially apple, pear, and cherry: the vine also thrives in several localities. The produce of corn is not sufficient for the consumption. Horned cattle are numerous. The rivers and the lake abound with fish. The area of the canton is 268 square miles; the population in 1851 was 88,908, of whom about 67,000 are Protestants, and the rest Catholics. German is the language of the country. The principal manufactures consist of cotton goods, linen, cotton-yarn, and silks. The other exports consist of wine, cattle, oats, dried fruit, and cider. The principal imports are—iron and metal ware, woollen goods, cotton-yarn, salt, colonial articles, and wheat.

Thurgau is divided into eight districts—Frauenfeld, Arbon, Bischofzell, Tobel, Weinfelden, Gottlieben, Steckborn, and Diessenhofen. The principal towns are—*Frauenfeld*, which is the head town of the canton, situated in a fertile valley near the confluence of the Murg with the Thur. The inhabitants amount to 3544. The old castle, formerly the residence of the Swiss vogten or governors of Thurgau; the town-house, where the Helvetic diet used to assemble in the time of the old confederation; the arsenal; and the Protestant and Roman Catholic churches, are the chief buildings. *Steckborn*, a small town on the Zellersee, or smaller basin of the Lake of Constance, has several manufactories, and about 2000 inhabitants. In the neighbourhood of Steckborn is the residence of Arensburg, which was purchased by Queen Hortense, and in which she died in 1840. Thurgau returns 41 members to the Swiss national council.

THURINGIA (*Thüringen*) is the ancient name of an extensive tract of country in the central part of Germany, situated between the Harz Mountains, the rivers Saale and Werra, and the Thüringerwald. It was in ancient times inhabited either by the Catti or the Cherusci. Vegetius mentions the Thuringi about the year 404. Thuringia long gave the title of margrave to the elector of Saxony. It is now divided among Prussia, Saxe-Weimar, Saxe-Coburg, and Schwarzburg. The name is still preserved in Thüringerwald, a continuation of the Fichtelgebirge, from which it branches out near the Münchberg and Gefree, in the kingdom of Bavaria, and runs north-west to its termination near Eisenach. The length of this range is 70 miles, and its breadth varies from 9 to 18 miles. The two highest points in it are the Schneekopf, 2700 feet, and the Inselsberg, 2604 feet above the level of the sea. The highest points consist of granite, clay-slate, and porphyry: the whole chain is clothed to the very summit with pine-forests, mixed in a few places with oak and other timber. Numerous rivers rise in this chain, which flow on one side into the Elbe, and on the other into the Weser.

THURLES, county of Tipperary, Ireland, a market-town and the seat of a Poor-Law Union, is situated on the river Suir, in 52° 42' N. lat., 7° 47' W. long., distant 29 miles N. from Clonmel, 90 miles S.W. from Dublin by road, and 86½ miles by the Great Southern and Western railway. The population was 5921 in 1851. Thurles Poor-Law Union comprises 22 electoral divisions, with an area of 148,350 acres, and a population in 1841 of 62,639; in 1851 it was 48,539.

The town of Thurles consists of several streets on both sides of

the river, which are intersected by the main street which crosses the river from east to west. In the town are a neat parish church, erected in 1812; a large Roman Catholic chapel, the cathedral of Cashel, which cost 10,000*l.*, and ranks among the finest ecclesiastical buildings in Ireland; a convent of Ursuline and one of Presentation nuns; a monastery of religious brothers; and a chapel for Baptists. St. Patrick's Roman Catholic College is a seminary for ecclesiastical and general education, with a president and seven professors. There are a new court-house, a market-house, bridewell, infantry barracks, dispensary, and Union workhouse. The town has a savings bank. It has an extensive retail trade, and there are considerable sales of grain at the two weekly markets. Quarter and petty sessions are held. Fairs are held on Easter Monday, August 21st, December 21st, and on the first Tuesday of every month. The market-days are Tuesday and Saturday. Thurles is a place of considerable antiquity, and was in the 10th century the scene of a severe battle between the native Irish and the Danes. A Carmelite monastery was founded here about the year 1300.

THURSO. [CAITHNESS.]

THYATEIRA. [LYDIA.]

TIBER. [PAPAL STATES.]

TIBERIAS. [PALESTINE.]

TIBET is the most southern of the three great table-lands of Middle Asia. The Bolor Mountains, a branch of the Hindu Kush, which stretches towards the north-west, in 72° 30' E. long., form the western boundary. The length of this frontier is about 87 miles. It is bounded on the south-west by the Hindu Kush, from Mount Tutukan Mutlami and the north-western part of the Himalaya as far as the western frontier of Nepal, a distance of about 480 miles. The southern boundaries are formed by the range of the Himalaya from the western frontier of Nepal to the eastern frontier of Bootan, a distance of about 740 miles, and by the northern boundaries of Assam, Burma, and part of the Chinese province of Yunnan. This latter part runs in a south-eastern direction, and most probably as far as the junction of the Yu-leang-ho, or Li-tchou, with the Kincha-kiang, or Yang-tse-kiang, in Yunnan, between 102° and 103° E. long. The length of this part of the frontier in a straight line between the two extremities is about 320 miles. The whole length of the southern frontier, according to a rough estimate, is 1540 miles, but as this frontier forms a curve, its real length is much more. The eastern frontier of Tibet is formed by the western boundaries of the Chinese province of Sitchuan (Setchuen), Shen-si, and Kansu. From the junction of the Yu-leang-ho with the Kincha-kiang it stretches northward, and probably along the river Ya-long-kiang as far as 30° N. lat. It then takes a north-eastern direction, and stretches as far as Kiai, along a range of wild and snowy mountains, which, on some maps, are called the Yun-ling Mountains. At Kiai it takes a north-west direction, crosses the Hoang-ho, or Yellow River, runs to the east as far as Hongchin, and then takes a north-west direction as far as a point situated in the mountains of Amegangar, in 38° 25' N. lat., 100° E. long. That part of Tibet however which lies south of 29° N. lat., and east of the Kincha-kiang, or the mountains of Batang, was ceded to China in 1727, and is now under the immediate sovereignty of the emperor of China. The whole extent of the eastern frontiers of Tibet is at least 900 miles. The northern frontiers begin in the Bolor Mountains, whence they are said to stretch east-south-east along the mountains of Kárakorum as far as a point situated in the mountains of Kuenlun (Onouta, or Kulkoun) in 35° N. lat., 85° E. long., across the deserts of Khor and of Katchi, or Katche. Thence they run north-east and east, until they reach the eastern frontier at that point which we have mentioned above as situated in 38° 25' N. lat., 100° E. long. The whole length of the northern frontier, including the larger bends, amounts to about 1300 miles. It is however doubted whether the extensive country of Khukhu-nor, in north-eastern Tibet, belongs to Tibet in the political sense of the word; and if so, the northern frontier of Eastern Tibet will not extend beyond 36° N. lat. But geographically speaking, Khukhu-nor belongs to Tibet. Thus Tibet is bounded W. by Independent Turkistan; S.W. and S. by Hindustan, Nepal, Bootan, and Assam; S.E. by Assam and China; E. by China; and N. by the desert of Gobi and Chinese Turkistan.

Mountains.—Tibet is a table-land, the highest plains of which are more than 10,000 feet above the level of the sea. This table-land is divided into three great and distinct parts. The first, which is long, and not very wide, begins in the east, near Mount Kailasa, in the Himalaya, and stretches to the north-west, between parts of the Himalaya and of the Hindu Kush in the south-west, and the range of the mountains of Kárakorum in the north-east. It is traversed in its whole length by the upper part of the Indus. Its lower or north-western part, Balti, or Baltistan, is also called the First Tibet, or Little Tibet, and is an independent state. Its upper, or south-eastern part, has the name of Ladakh, and is also called the Second Tibet, or Great Tibet, because it is larger than Baltistan. Sometimes the name of Little Tibet is given to the whole valley of the Indus. Ladakh is also an independent state, but the most eastern part of it, as far as Teshigang on the Indus, belongs to China. The second great division of Tibet begins in the south, near Mount Kailasa, and is an immense elevated desert, the western part of which is called Khor, and the

eastern part Katchi. Its boundaries are the range of Kárforum on the west; the Kuenlun Mountains on the north; the Snowy Mountains around the sources of the Kincha-kiang, the Om-tsu, and the Lake of Tengri-nor in the east; and the mountains of Dzang and Ngari in the south. Katchi is traversed by the great road which leads from H'Lassa to Yarkand, in Chinese Turkistan. The third great division of Tibet contains the remainder of this country, which lies east and south of Khor and Katchi.

The second and third natural divisions have the common name of Eastern Tibet, or Tibet proper. Eastern Tibet is subject to China.

Khor and Katchi are an immense table-land, some parts of which are 10,000 feet above the level of the sea. This table-land however is not a level plain. It is a country traversed by chains of mountains, which have a height varying from 3000 to 4000 feet above their base, or from 13,600 to 14,000 feet above the sea. The middle part seems to be less elevated than the boundaries, as the country contains several rivers which terminate in the table-land; and the southern and western parts are higher than the eastern and northern parts, the direction of the greater number of those rivers being from the west to the east, and from the south to the north.

The aspect of the southern and eastern parts of Tibet proper, is very different from that of Khor and Katchi. It is traversed by numerous ranges of lofty mountains, the direction of which is from west to east and from north-west to south-east. From these ranges lateral branches run out in different directions, and contain deep valleys between them. In proportion as the principal chains advance towards the south-east, they converge towards one another, and thus the valleys between them gradually become narrower, until at last, on the frontiers of Yunnan and Burma, they are mere mountain-passes. On this spot there are four parallel valleys, traversed by four of the greatest rivers of the world, and the breadth of these four valleys together seems not to be more than 100 miles. But the range of the mountains of Ngari and Dzang diverges from the Himalaya; and the valley between them, which is traversed by the Dzangbo, becomes broader as it advances towards the east. The chain which, in the south-eastern corner of Tibet, separates the Kincha-kiang in the east from the Langtang-kiang in the west, has the name of Ning-taingshan, or Man-li (Moung-lan), the summits of which are covered with perpetual snow. The height of the mountains in southern and eastern Tibet is much greater than in the northern and central parts of the country, and the whole tract towards China, Nepal, and Bootan, is an immense alpine country. Several passes in the Mang-li Mountains are from 10,000 to 11,000 feet above the sea; the region of perpetual snow seems to begin at 12,500 feet, and the number of summits which have an absolute elevation of above 12,500 feet must be very considerable. Some of them probably attain the height of 26,000 feet above the sea. The extent of the Mang-li Mountains between Bathang on the Kincha-kiang, and Tsiamdo on the Lang-tan-kiang, according to the Chinese itineraries, is 1405 li, of 250 to a degree. All this country is intersected by deep valleys and chasms. The summits of the mountains are covered with perpetual snow, and the traveller crosses the chasms by means of bridges, which are enveloped in the clouds. The mountains north of the Mang-li, around the sources of the Lang-tan-kiang, in the province of Tsiamdo, are no less elevated. A very extensive range begins at Mount Kailasa in the Himalaya, and stretches to the east as far as 90° E. long. These are the mountains of Ngari and Dzang, the most western part of which is called Gangdiar, or the country of the snow mountains. At the beginning of this westernmost part, and in the north-eastern part of the province of Ngari, is situated the celebrated Mount Kailasa, or Onouta, which is said to be higher than the Dhawalagiri. The Kailasa is steep on all sides, and is 140 li (above 50 miles) in circumference; its summit is always covered with snow, and the water tumbles down from it in cataracts into the surrounding valleys. East of the Kailasa are situated four mountains, or perhaps groups of mountains, the K'habhabha, each of which resembles a different animal. The length of these four mountains is said to be 800 li (300 miles), and with respect to the valleys which begin at their foot and stretch in different directions, they resemble Mount St. Gothard in Switzerland.

Rivers.—The sources of the *Dzangbo*, or *San-poo*, are on the east side of the K'habhabha, in the province of Ngari. Its complete name is Yaru-dzangbo-tau, that is, the pure frontier river of the west. According to the Chinese geographers, the source of the Dzangbo is on Mount Tamtsiogh, in 30° 10' N. lat., 81° 55' E. long. It flows in an east-south-eastern direction, through the whole of southern Tibet, a distance of about 700 miles, and waters the provinces of Ngari, Dzang, and Wei. The valley of this river is formed by the Himalaya on the south, and the mountains of Ngari and Dzang on the north. The country through which it flows being very extensive, and all the mountains being covered in winter with snow, of which an immense quantity melts in the summer, the volume of water in this river must be very considerable. The tributary rivers of the Dzangbo, on its left, or northern side, are—the Nauk-dzangbo; the Dzang-tsu, or Galdjao-muren, which has its sources about 200 miles to the north-east near H'Lassa, and which is sometimes confounded with the Dzangbo itself. There are five considerable rivers between the Nauk-dzangbo and the Dziang-tsu. The tributary rivers on the right or southern side are—the Guyang, which has its source near Mastang, in

the Himalaya, and the Pai-nom-tsu, or Fuang-dse, along which Turner travelled, from its source at Phari to its junction with the Dzangbo, and which has a fine iron bridge of thirteen arches. An iron suspension-bridge is thrown over the Dzangbo, south of H'Lassa, on the great road from the west to this town. The course of the Dzangbo is known as far as a point which is situated about 100 miles east of H'Lassa. It has been conjectured that the Brahmaputra is the continuation of the Dzangbo [BRAHMAPUTRA], but according to Klapproth the continuation of the Dzangbo is the Irawaddy. The Nu-kiang is a northern tributary of the Dzangbo.

The sources of the Gakbo-dzangbo-tsu, or the Clear River of Gakbo, are situated in 31° 30' N. lat., on the frontiers of the provinces of K'ham and of Wei. Its upper course has the name of Sang-chu, or Dziangbo-tsu. Its direction is at first south-east. The great road from China to L'Hassa crosses this river some distance east of the celebrated temple of H'Lari. Dzangbo-tsu then enters the country of Gakbo, where it receives a considerable river called Bo-dzangbo, which enters it on the left or eastern side. After having entered the country of H'Lokba, it probably takes a southern direction as it enters the Chinese province of Yunnan, and there receives the name of Lung-chuan-kiang. The Om-tsu is formed by the junction of three rivers—the Ser-sumbu, or Ser-tsu, in the east, the Uir-chu in the west, and the Kárf-us-su, the largest of the three, in the middle. It has a south-east course, through a very deep and narrow valley, inclosed by steep rocks of an immense height, whence it flows into the province of Yunnan in China, where it receives the Chinese name Nu-kiang, that is, 'the river of the barbarians.' The Lang-tang-kiang traverses almost the whole extent of Eastern Tibet from north-west to south-east. Two rivers, the Om-chu in the west and the Dzo-chu in the east, the sources of which are situated north of the upper part of the Om-tsu, in the province of K'ham, join at Tsiamdo, and thus form the Lang-tang-kiang, the direction of which is from north-west to south-east. This river is also called La-chou and Lo-tsu. After having traversed Yunnan, it enters Leo, forms the frontier between Siam and Cochinchina, and flows into the Chinese Sea in 10° N. lat., after a course of more than 1700 miles. The sources of the Kincha-kiang, or Yang-tee-kiang, which traverses China from west to east, are situated between 37° and 38° N. lat., 89° and 92° E. long., on the table-land towards the north-western frontiers of Eastern Tibet. Its upper part is called Muru-us-su by the nomadic Mongols of that country; its middle part has the Tibetan name of Bourai-tsu, and it is only in China that it is called Kincha-kiang. Its direction is east as far as 95° E. long.; from this point to Batang the direction is south-east and south; from Batang to its junction with the Litohou (the old frontier of Tibet), it is again south-east. This latter part of the Kincha-kiang forms a part of the present frontier between Tibet and China. The Ya-long-kiang is an important tributary of the Kincha-kiang. Its sources are in the Bayan-Khara Mountains. Its direction is generally south-east. The Hoang-ho, or Yellow River, has its sources north of the Bayan-Khara, in the province of Sifan. [HOANG-HO.] The country between the upper part of the Hoang-ho in the north-west, the Ya-long-kiang in the south-west, and the frontier of China in the east, or the eastern parts of Sifan and Khu-khu-nor, is traversed by ranges of high mountains covered with perpetual snow. Very little is known about it in Europe.

Lakes.—The Tengri-nor, the largest lake of Tibet, is nine days' journey north of H'Lassa. The Chinese call it Thian-ohhi, or the Celestial Lake. This lake appears to be surrounded by high mountains and rocks covered with snow and ice. It receives the Tarku-dzangbo, a river which comes from the west. The Lake of Palte, which is situated south-west of H'Lassa, in the valley of the Dzangbo, resembles a large ditch surrounding an extensive island which fills up the middle of the lake. On the Tibetan maps it has the name of Bhal-di-Yumtso, and the Chinese call it Yar-brok-Yumtso. It is said that north of this lake there is a high mountain called Kambala, from the summit of which extensive high snowy ranges may be seen to the north. In the extreme north of Tibet is situated the Lake Khu-khu-nor, or Kóke-nor, that is, the Blue or the Celestial Lake, which name has been given to all the surrounding country.

Climate.—Tibet is known in India and China as a country of hunger and misery. The climate of the valleys, and especially of the valley of the Dzangbo, is hot. From March to September the weather is fair. In H'Lassa the trees bud at the end of April and in the beginning of May. The harvest is reaped in August and September. Dew falls in the summer nights; it hails often; the snow is not deep in winter. On the high table-lands the climate is very different. From May to October the sky is always clear, and the sun shines with uncommon brightness. From October to May there are violent gales. The surface of the weather-beaten rocks breaks in pieces, which the air dissolves into fragments as small as dust; and clouds of this dust, raised by whirlwinds, are driven from the plain to the summits of the mountains, and from the mountains down to the houses of the inhabitants. The air is excessively dry, and its effects resemble those of the dry heat of the Sahara. The cold in winter is intense. The mountains and table-lands are characterised by cold and barrenness.

Productions.—Among the minerals there are gold, silver, copper, tin, salt, corundum stone, lapis lazuli, turquois, and agate. Besides a great number of grasses which are common in Europe, Tibet pro-

duces a kind of gray barley, grapes, assafotida, rhubarb, madder, safflower, apples, nuts, apricots, peaches, pomegranates, and figs in the valleys. The cedar grows in Tibet. Among the animals, there are wild oxen with long hair, buffaloes, yaks, goats with a very fine fleece, goats with long fine hair, silk-worms, wild cats, tigers, leopards, lynxes, argali with horns of one hundred pounds weight, pigs, white eagles, and swans. All our domestic animals are known in Tibet. Fish are abundant in the rivers, but they are not eaten, being prohibited by the religion of Buddha.

Political Divisions.—1. The territory of the Dalai-Lama contains the eastern and north-eastern parts of Tibet. The capital, *H' Lassa* or *Lassa*, is situated in a beautiful plain on the banks of the Dzung-tsu, about 12 leagues above its junction with the Dzungbo. It is a populous and very commercial town, and distinguished by many fine public buildings, especially Buddhist convents and temples. There are a small-pox hospital, a printing-office, and several schools. The town has walls and five fortified gates. In the neighbourhood of the town are four magnificent convents, the largest among the 3000 convents of Tibet. The residence of the Dalai-Lama is in the convent of Pobrang-Marbu (the Red Town), on Mount Botala, north-west of H' Lassa. It is said that the principal building of this residence is 367 feet high, and that it contains 10,000 rooms. *Figa-gung-ghar*, a town inhabited by 20,000 families, is situated east of H' Lassa, on the Dzungbo.

2. The territory of the Teshu-Lama contains the provinces of Dzung and Ngari, and perhaps also the countries of Khor and of Katchi. His residence is at the palace of Teshu-H' Lumbu, in 29° 4' N. lat., 89° 7' E. long. It was founded in 1447, on a small plain surrounded by lofty mountains; but as this plain is a part of the high table-land, the environs are cold and desert. Teshu-H' Lumbu lies almost opposite to a pass across the Himalaya of Bootan, which is defended by the fortress of Dzigidze-Jeung. Teshu-H' Lumbu, or, more correctly, Iachi-H' Lumbu, contains from 300 to 400 houses, convents, temples, and palaces, which are surrounded by a wall, and all communicate with each other. The chief building, where the Lama resides, has the name of Lapranza. The greater part of the country between Teshu-H' Lumbu and H' Lassa is a fertile and beautiful tract, which extends along the river Dzungbo from west to east. At one day's journey east of Teshu-H' Lumbu is *Pina* (Bainsam), a small town with a fortified castle. *Baldi*, or *Bedi*, another small town, lies on the northern bank of Lake Paite.

Inhabitants and History.—The first accounts of the history of Tibet are in the annals of the Mongols and of the Chinese. The Tibetans belong to the Mongol race; they were at first divided into many independent tribes which led a nomadic life. The first king of Tibet was Seger-Sandilitu-Khaghan-Tül-Esen, who was exposed by his father, and afterwards found in a copper box swimming on the river Ganga. He became king in B.C. 313, and united the four great tribes of Ngari, of Dzung, of K'ham, and of H' Lassa or Wei. One of his descendants was H' latotori, who was born in A.D. 348, and who became king in 367. In the fortieth year of his reign (407) Buddhism was introduced into Tibet. Srongdsan-Gambo, who ascended the throne A.D. 629, founded the town of H' Lassa, where he held his residence. His reign is particularly remarkable for the introduction of the Tibetan alphabet, which is a modification of the Sanscrit alphabet. Srongdsan-Gambo died in 699. His successors carried on war with China, in which they were often successful; but in 821 Tibet was compelled to pay tribute to China. Under King Dharma, who ascended the throne in 901, Buddhism was almost destroyed, the king having adopted the Black religion, or the Islam. Buddhism again became the dominant religion after Dharma had been murdered in 925.

In the beginning of the 11th century, each of the seven grandsons of King Bilamgur-Dzung became an independent prince; and from this event dates the entire decline of the kingdom of Tibet, the power of which had been already broken by the civil troubles which accompanied the persecution of Buddhism. One of the new kingdoms was TANGUT, in the northern part of Tibet. Genghis Khan subdued all Tibet in 1206, and it was not before the end of the 13th century that the country recovered from the calamity of the Mongol war by the careful administration of Khublai Khan. The easternmost parts of Tibet were gradually conquered by the Chinese in 1125, 1255, 1362, and 1371. Since the year 1720 all Tibet has been a tributary vassal of China, and Chinese garrisons are in its towns, and they watch the passes in the frontier mountains. The number of Chinese troops in Tibet amounts to about 64,000 men. The government of Tibet is supported by a hierarchy. The name of the chief priest is Lama, and the Dalai-Lama is the first of them; the second is the Teshu, or Bogdo-Lama. The people are kind, tolerant, polite, and much more civilized than the Mongols, although they are generally poor. Brothers are allowed to have one woman in common. Arts and literature are cultivated. Both the lamas are absolute princes in religious matters, but their sovereignty is checked by the authority of the emperor of China, whose generals in Tibet have the command of the army and the direction of temporal affairs. The high functionaries are almost all Chinese.

TIBUR. [TRVOLL.]

TICEHURST, Sussex, a village and the seat of a Poor-Law Union, in the parish of Ticehurst, is situated in 51° 2' N. lat., 0° 26' E. long., distant 23 miles N.E. from Lewes, and 45 miles S.E. from London. The population of the parish in 1851 was 2850. The living is a vicarage in the archdeaconry of Lewes and diocese of Chichester. Ticehurst Poor-Law Union contains eight parishes and townships, with an area of 51,659 acres, and a population in 1851 of 15,507. The parish church is a neat building. The Wesleyan Methodists have a chapel, and there are National schools and an extensive asylum for lunatics. Fairs are held May 4th and October 7th.

TICINO, one of the Swiss cantons situated on the Italian slope of the Alps, takes its name from the river Ticino, which has its sources in the great central group of the St-Gothard, flows southward along the Val Levantina, passes by Bellinzona, and then enters the Lago Maggiore at its northern extremity, and issues out of it at the opposite end by the town of Sesto in Lombardy. [Po.] The canton is very mountainous, being intersected by several offsets from the great chain of the Lepontine and Rhätian Alps. A number of valleys, large and small, lie between these offsets, the largest running nearly parallel to each other, and sloping towards the south. The principal valleys are the Val Levantina, which runs in a southern direction through the centre of the canton, and the Val Maggia, one of the largest in the canton, which in its upper part is called Val Lavizzara; it is drained by the river Maggia, a rapid Alpine stream, which enters the Lago Maggiore near Locarno.

A ridge called Monte Cenere runs across the southern part of the canton from north-east to south-west. It detaches itself from the Iöri Berg, and runs to the east bank of the Lago Maggiore. South of this ridge lies the basin of the Lake of Lugano, which is thus separated from the rest or northern part of the canton, the waters of which run into the Lago Maggiore. The Lake of Lugano, called also Ceresio, lies within the territory of the canton, with the exception of its north-east extremity, which stretches into Austrian Lombardy. Its length is about 20 miles, but the breadth is little more than a mile, except in front of the town of Lugano, where it is about two miles wide: the surface is about 800 feet above the sea, and the greatest depth is 500 feet. A number of trading-boats ply on the lake. Its outlet is formed by the river Tresa, which runs into the Lago Maggiore. The Lake of Lugano separates the southern part of the canton, consisting of the district of Mendrisio and the circle of Ceresio, which form part of the district of Lugano, from the rest of the canton, which lies north of the lake.

The canton is bounded N. by the cantons of Uri, Valais, and the Grisons; E. partly by the Grisons and partly by the Austrian provinces of Como; S. by the Milanese and Piedmont. The surface of the canton of Ticino may be divided into five regions:—1. The region of the vine, the fig, and the peach, which includes the lower valleys and hills, and extends to the height of 2400 feet above the Lago Maggiore. The olive, orange, and lemon-trees thrive in some favoured spots. 2. The region of the chestnut, the pear, the apple, and cherry-tree, which rises about 1000 feet higher. 3. The region of the fir-tree, which rises to about 4500 feet above the level of the lake. 4. The alpine pastures, which reach as high as 6000 feet. 5. The region of perpetual snow, which includes several Alpine summits between 8000 and 9000 feet high. There is consequently a great variety of climate as well as of productions in the canton. Horned cattle, sheep, goats, and pigs are numerous; there are few horses or mules. Wolves and bears are hunted in the mountains. The rivers and lakes abound in fish. The principal articles of export are cattle, cheese, wine and fruits, hay, hides, and marble. Corn is imported from Lombardy. The manufactures are of no very great importance; they consist chiefly of coarse cloth, leather, platted straw, and tobacco. The silk-worm is reared.

The area of the canton is 1033 square miles, and the population in 1850 was 117,759, all Catholics but 50. The language of the canton is a dialect of Italian. Several thousand people emigrate every year to work in other countries, as masons, porters, glaziers, chocolate-makers, and sellers of barometers.

The principal towns are:—*Lugano*, a pretty thriving town on the north-west shore of the Lake of Lugano, in a lovely situation, enjoying an Italian climate, has some fine churches, some large mansions, an hospital, a theatre, manufactories of silk, paper, tobacco, leather, iron and copper works, and 5142 inhabitants. There are at Lugano many merchants, it being on one of the great high roads between Switzerland and Italy. A fair is held in the month of October. Lugano has a college, several elementary schools, and a reading-room. Three newspapers are published in the Italian language. The country around Lugano is planted with vines, olives, and other southern trees, and full of country-houses. *Bellinzona*, a walled town situated in the valley of the Ticino, on the high road of the St-Gothard, has a very fine church, a college, an arsenal, and 1926 inhabitants. *Locarno*, a small town with a fort on the Lago Maggiore, has several churches, a castle which is now the government-house, and 2676 inhabitants. *Mendrisio*, a town of 1700 inhabitants, in a fertile country, and on the high road to Como and Milan, has a college, several churches, a printing-press, and some silk manufactories.

At the beginning of the 16th century the Swiss obtained possession

of Locarno, Lugano, and the rest of the country, which they formed into several Landvogteyen, or bailliages, some of which were under the exclusive dependence of the three Forest cantons, and others, such as Lugano and Locarno, were subject to the whole Swiss confederation. These districts were united into one canton by the name of Ticino, and as such it was acknowledged by Bonaparte in his Act of Mediation, and afterwards by the allied powers in 1814. The franchise is vested in all natives of the canton who are 25 years old, and possessed of real property or capital of the value of at least 300 francs. The Great Council, or legislature, consists of 114 members, elected for 4 years; it appoints the executive, as well as the judges of the various courts. In ecclesiastical matters the canton of Ticino depends partly on the bishop of Como and partly on the archbishop of Milan. The canton returns 6 members to the National Council of SWITZERLAND.

TICKENHALL. [DERBYSHIRE.]

TICKHILL. [YORKSHIRE.]

TIDESWELL. [DERBYSHIRE.]

TIDORE, one of the Moluccas, is situated in the strait which divides the island of Gilolo from that of Celebes, and is traversed by 127° 25' E. long. It is well wooded, and about 21 miles in circumference. Near the southern coast rises a conical mountain, which is of volcanic origin, and above 4000 feet above the sea. The soil is abundantly watered and of great fertility, well cultivated, and produces rice in abundance. The sago-tree, the clove- and nutmeg-tree, grow wild. The island is very populous, and governed by a sultan, who also possesses portions of Gilolo. The sultan is dependent on the Dutch government. The inhabitants are Mohammedans.

TIFLIS, or TEFLIS, the capital of the Russian province of Georgia, is situated in 41° 41' N. lat., 44° 50½' E. long., on the river Kur, at an elevation of 1100 feet above the level of the Black Sea, and has about 50,000 inhabitants. The Kur here flows through a valley confined between two ranges of lofty mountains. The town stands at the foot of a line of dark and barren hills, whose high and caverned sides gloomily overshadow it. Every house, every building within its walls, seems to share the dismal hue of the surrounding heights. It is built on both sides of the river; but the larger portion, which is on the right or west bank, contains the houses of the wealthiest inhabitants, the great bazaar, the principal squares, the finest churches, the public offices, the residence of the military governor, and of the commander-in-chief. This is the city properly so called, which again is divided into two parts, the old and new town. The limits of the old town are distinctly marked by the ruins of the ancient fortifications. The new town extends to the north and west beyond these walls, and is distinguished from the old town by its new buildings in the European style and broader streets. The greater part of it is called by the Georgians Goretuban, that is, the 'street out of the city.' On the left bank is the extensive suburb Awlabar, a large caravansary, the barracks, and the fortress, or citadel, built by the Turks in 1576. Towards the south the town leans against the chain of hills running from the south-west, on the summit of which are extensive ruins of a very ancient fortress; its highest point at the western end of the old wall is 392 feet above the bridge over the Kur; towards the west it rises higher, and thence a small stream of water is conducted to the city, the bed of which however is generally quite dry except immediately after rain.

There are in Tiflis 15 Greek churches, 20 Armenian and 2 Roman Catholic churches, some of which are very handsome structures; several hotels, many elegant shops, a fine bathing establishment, and numerous schools. At a point where the river is hemmed in by rocks, a bridge of a single arch connects the town with the suburb of Awlabar. Here also are the ruins of an ancient fort, church and houses, and about two miles farther from this side of the city stand the remains of another sacred edifice, on the summit of a lofty hill. In the older parts of Tiflis the houses are ill built, and the streets so narrow that only one carriage can pass through the widest, and in the smaller streets there is scarcely room for a horseman.

Tiflis has been chiefly indebted for its celebrity to its warm baths, and its Georgian name, Tphiliak Alaki, is equivalent to 'warm town.' The building of Tiflis and the transferring of the royal residence to this place from Mzchet, on the declivity of the Caucasus, were effected about the year 455, by king Waktang I., Gork-Aslan. The mineral springs rise in considerable numbers at the south end of the city, between the strata of limestone, whence they are conducted into the cavern excavated in the solid rock, under one immense roof, divided into different apartments for the men and the women. These waters are reputed to be very beneficial in rheumatic complaints and cutaneous disorders. The hottest spring marks 115° 25' on Fahrenheit's thermometer; the coldest 74° 75'.

The situation of Tiflis would certainly make it one of the most delightful spots in the world, if the mountains between which it lies were not totally destitute of trees. They reflect the rays of the sun from the southern slope of the Caucasus, and thus produce in the valleys an oppressive heat, which may perhaps be the cause of the bilious diseases prevalent here. The heat in July rises to above 100° Fahr. In 1820 the population did not exceed 15,000, and it now probably exceeds 50,000, about one-half of whom are Armenians, the remainder chiefly Georgians, some Roman Catholics, and about a hundred Mohammedans. It is the residence of a Georgian patriarch,

a Georgian metropolitan, and an Armenian archbishop. There are some manufactories of woollen, cotton, and silk.

Tiflis is most favourably situated to be the medium of an extensive trade between Europe and Asia, but the restrictive tariff of Russia prevents its commerce from attaining its natural expansion; although since Georgia has had the advantage of a settled government under the Czar the commercial transactions of Tiflis have vastly increased. European goods were formerly landed at Redout-Kaleh on the east coast of the Black Sea, and carried to Tabriz and other towns of the east by way of Tiflis—giving rise to a most important transit trade. But the high duties on imports imposed by the ukase of 1831, and the vexatious regulations for their transit, have driven all this trade to Trebizond. The trade with Persia is still very important, and is almost entirely in the hands of the Armenians.

TIGRANO'CERTA, for some time the capital of Armenia, was built by king Tigranes after he had extended his dominion over Mesopotamia, Syria, and Phœnicia, about B.C. 80. Artaxata, the old capital on the Araxes, was situated in the north and in the neighbourhood of the Caucasian nations. Tigranocerta was situated a short distance from the Upper Tigris, on the Nicephorius, a river of considerable breadth, as Tacitus states. Sert or Sered, a small town, surrounded by ancient ruins, is generally supposed to be on the site of Tigranocerta. Sert is situated on the Bithlis River, which is considered to be identical with the Nicephorius. [ARMENIA, vol. i. col. 516.] According to Tacitus, Plutarch, and Appian, Tigranocerta had very strong fortifications; its suburbs contained gardens and fish-ponds. The town was inhabited partly by barbarians, and partly by Greeks, the inhabitants of twelve Greek towns who were transplanted thither by Tigranes after he had ravaged Cappadocia. Lucullus, in his campaign against Mithridates and Tigranes, laid siege to this key of Armenia before he ventured to enter the defiles that lead to the central table-land of Armenia. The united kings hastened to relieve the town, but they were beaten, and Tigranocerta with immense treasures fell into the hands of the victor (8th October, B.C. 69), who sent the greater part of the Greek inhabitants back to their homes in Cappadocia. Strabo says that, when Lucullus took Tigranocerta, it was only half finished, and that after its destruction there was nothing but a little village on the spot. However it soon became again a town, and in the wars of Corbulo, A.D. 63, it was a considerable and well-fortified place. (Tacitus, 'Annal,' xv. 4.) The termination *certa*, Kerta, Cirta, is a modification of the Phœnician *Carth*, 'a city'; *Kird*, or *Kerd*, and *gherd*, its modern forms, occur in the names of several towns in Armenia and Persia.

TIGRÉ. [ABYSSINIA.]

TIGRIS and EUPHRATES, two large rivers of western Asia, unite their waters at Kurnah, in the lower part of the plain of Babylonia, and take the name of *Shait-el-Arab*, which falls into the Persian Gulf near 30° N. lat., 48° 30' E. long. Both rivers rise in the central table-land of Armenia, and after breaking through the Taurus inclose the great plains of Mesopotamia, the Euphrates forming the boundary on the west and south, and the Tigris on the east.

The Euphrates is formed about two hours above Kebban Maden, (39° N. lat., 39° E. long.) by the confluence of two rivers, to both of which the name *Frat* is occasionally applied, but which are more generally known, the eastern as the Murad, the western as the Kara-Su.

The *Murad* rises on the west side of Ala-Tag, near the north-east termination of the mountain group that encircles Lake Van. [ARMENIA.] The stream flows down a mountain ravine nearly six hours due north to Diyadin (39° 32' N. lat., 43° 40' E. long.), where it enters the plain of Arishkerd, and turning north-west flows in that direction about 24 miles to Kara-Kilisa. At Kara-Kilisa it receives the *Sharwan-Su*, which flows east from its source near Molla-Suleiman. From Kara-Kilisa to the junction of the Char-Buhur (about 39° N. lat., 41° 30' E. long.) the Murad flows in a general direction of south-west, having the mountain range of which Ala-Tag, Sapan-Tag, and Nimrud-Tag are the most remarkable summits, stretching parallel to it at a considerable distance on the south-east, and the Bingöl Mountains south of the Aras and of Erzurum at about an equal distance to the north-west. [ARMENIA.] Near Malaskird, a town about 36 miles below Kara-Kilisa, the Murad is joined by the *Kaleh-Su*, which has its source at Khinis, and flows from the north-west. Near the source of the *Kaleh-Su* is Khinis. The Char-Buhur rises in the angle between the Dujik and the Bin-Göl Mountains, and flows nearly east by south till it joins the Murad: the rivers meet in a straight line, the former coming from the west, the latter from the east, and the surface of the water at the point of junction is about 70 yards wide in the month of June, and 4188 feet above the sea. The united stream turns off at right angles to the south, through a narrow valley which widens gradually till it becomes part of the plain of Mush. The river retains the direction of south for about 10 miles, when it receives the Kara-Su, which traverses the plain of Mush. The Murad from its junction with the Kara-Su to the plain of Kharput flows in a general western direction, between the Dujik-Dagh on the north and the continuation of the Taurus Mountains on the south. Between the plain of Mush and Kharput the river is navigated by keleks, or rafts, loaded with charcoal, fire-wood, &c. For a short distance before the Murad enters the plain of Kharput the mountains close in upon it on both sides, so that the stream is narrowed in some places to a breadth of 33 yards. The basin of the Murad between the plain of Mush and the plain

of Kharput is described in the article ARMENIA, vol. i. cols. 518, 514. At Palu, on the northern side of the plain, the river in the month of July is 100 yards wide and the current very rapid: there is a ford opposite the town, but intricate and precarious. Below Palu the Murad receives a considerable feeder on the right, which is called the Perez-Su, and carries down the drainage of a considerable portion of the Dujik Mountains. A few miles below the junction of the Perez-Su the river turns north-west, and flows in that direction through a mountainous country for about 50 miles to its junction with the Kara-Su, or Western Euphrates, a little above the village and lead-mines of Kebban-Maden, and near the point indicated by 39° N. lat., 39° E. long. Where the Murad turns north-westward, below the junction of the Perez-Su, a small stream flowing eastward enters the river at this its most southern point, flowing through the plain of Kharput, and past the village of Alshan. Here the Murad is not more than 25 miles from the source of the Tigris.

The Kara-Su, or Western Euphrates, rises, according to Mr. Abbott, at Domlu, 7½ hours N.N.E. from Erzurum. Two hours below Domlu the stream enters the plain of Erzurum, through which it flows from east to west for about 40 miles. It there receives a torrent flowing from Kara-Kulak to the east, and the united stream turning to the south descends through a ravine into the plain of Tergan. The south boundary of the plain of Erzurum is formed by the mountains already noticed under the names Bingol-Tag and Dujik-Tag; the northern boundary by a range of highlands, continuations of the Antitaurus, which divide the basin of the Euphrates from the rivers which flow into the Black Sea. At the point where the river quits the plain of Erzurum it is 100 yards broad in the month of October. The plain of Terjan, at the lower end of the ravine by which the Kara-Su escapes from the plain of Erzurum, lies considerably lower, and has a much milder climate than the table-land about Erzurum. In the lower plain the Kara-Su receives the Mama-Khatun (a considerable stream, which rises in the Bingol-Tag near the sources of the Aras), and becomes a considerable river, fordable only in few places even in the driest season. From the plain of Tergan the course of the Kara-Su to its junction with the Murad-Chai, a distance of about 130 miles, is in a general south-west direction, through a succession of difficult mountain passes and narrow but fertile plains, which are described in the article ARMENIA (vol. i. cols. 511, 512). From Erzingan (which gives name to the fine plain of Erzingan) to Kemakh, a distance of about 26 miles, the Kara-Su flows through a mountain defile, having the Dujik range on the left, and on the right mountains all but precipitous. Immediately above Kemakh the river forces its way through a deep narrow chasm; and just before it precipitates its waters into this rent in the mountains it receives the Keumer-Su from the west, a stream by which great quantities of wood are floated down. The Keumer-Su descends from the plain of Divrigi, about 60 miles to the west, and 3116 feet above the sea. The valley of the Keumer-Su has a considerable declivity, and the Kara-Su must therefore have sunk at the point of their junction much below its level in the plain of Erzurum.

From Kemakh to Egin is a distance of nearly 43 miles. There is sufficient water in the Kara-Su between Kemakh and Egin to render it navigable for boats, but the frequent rapids, rocks, and shoals impede the navigation. At Egin the mountains rise from the banks of the river by a steep slope, which is terminated by abrupt precipices; the whole height of the mountains above the stream may be about 4000 feet, and the valley is so narrow that they seem to overhang the town. From Egin to the confluence of the Kara-Su and Murad-Chai (about 35 miles), and thence to Kebban-Maden (about 5 miles farther), the channel of the river is obstructed by shoals and rocks and only employed in floating timber-rafts. At the ferry near Kebban-Maden the river is about 120 yards wide, deep, and rapid. The elevation of the confluence of the Kara-Su and Murad-Chai has not been ascertained, but it seems to be about 2700 feet above the level of the Black Sea. Below the confluence of its two head streams, near Kebban-Maden, the Euphrates follows the direction of the Kara-Su, and flows south-west through a naked mountainous country; and, after sweeping to the westward and half encircling the remarkable peninsula of Abdu-l'Wahab, formed by the rocky heights of Munghar, it receives the Tokhmah-Su at the pass of Is-Oglu, the ancient Elegia, and takes an easterly bend to pass through the Taurus, between the rocky mountains of Bhagli-Khanli and the Beg-Tagh. The Tokhmah-Su rises more to the west than any other affluent of the Euphrates. The Injeh-Su and the Balikli-Su, which by their junction form this river, have their sources about 36½° E. long., and between 38½° and 39° N. lat., about 4000 to 5000 feet above the sea. The Tokhmah-Su has a course of upwards of 100 miles, and runs a little to the northward of Malatiah, which is about 12 miles from the right bank of the Euphrates.

Near the ferry of Fex-Oglu, a few miles below the confluence of the Tokhmah-Su, the Euphrates precipitates itself through a gap in the mountains which extend from east to west between the Murad and the Upper Tigris, and curves through them with a general easterly direction to Gergen-Kaleshi, a distance of about 45 miles. In this part of its course the stream is hemmed in by lofty precipices and interrupted by rocks and small rapids, but warlike stores have been floated downwards on rafts. The subsequent course of the river as far as the mouth of the Saklawiyah Canal (about 33° 25' N. lat.,

40° 50' E. long.), where it may be considered as having entered the central plain, is through an upland country, furrowed by alternate ridges and depressions, with a general declivity to the south-east. From Sumeisat (the ancient Samosata), 45 miles below Gergen-Kaleshi, the Euphrates is navigable without serious interruption to the sea. From Sumeisat to Rum-Kaleh, a distance of 51 miles, following the windings of the stream, the river flows W.S.W. Its course thence to Balis (36° 1' N. lat., 38° 7' E. long.), a distance of 114 miles, winds along a line running north and south. Fourteen miles below Rum-Kaleh, at Graun, the channel of the Euphrates is only 80½ miles distant in a direct line from the Mediterranean at Bayas. The Tigris steamer ascended the river as high as Bir in Colonel Chesney's expedition to the Euphrates. At this point the river is 628½ feet above the level of the Mediterranean at the mouth of the Orontes, from which it is distant 133 miles in a direct line, which gives only a fall of little more than 6 inches per mile to the Persian Gulf (distant 1117 miles), assuming the level of that sea to be the same as the level of the Mediterranean. Twenty-five miles below Bir the Euphrates receives from the west one arm of the Sajur, and 5 miles lower down another; this is a considerable affluent, the lowest of any importance that falls into it on that side. At Balis, 88 miles below Bir, the river turns to the south-east, a general direction which, making allowance for its windings, it may be said to retain till it reaches the Persian Gulf. Near Rakkah it receives on the east bank the Belik, which rises near Harran, to the north. After a tortuous course of 80 miles the Euphrates breaks through a chain of hills which comes on the west from Palmyra, and on the opposite side of the river, from the direction of Sinjar. In this pass the river flows in a small channel 250 yards wide and 7 fathoms deep, between precipices which rise abruptly 200 or 500 feet from the water's edge. Fifty miles from this pass, by the windings of the river, but little more than half that distance in a straight line, the Khabur (the ancient Chaboras) falls into the Euphrates from the north, bringing down the drainage of Mount Masius and the eastern part of the Taurus. [BAGHDAD, Pashalic of.] The Khabur enters the Euphrates in 35° 6' N. lat., 40° 27' E. long. From the Khabur to the Werdi, 75½ miles by the river, 45½ in a straight line S.E. by S., the Euphrates has an average width of 400 yards, with an ordinary depth of 18 feet, and a current of four miles an hour during the floods: it forms many islands. Between Werdi and Anah (the ancient Anathe), 92 miles, 50½ miles east in a straight line, the river has at the same season a breadth of 350 yards, a depth of 18 feet, and a current of 4 miles an hour. About 100 miles below Anah the Euphrates passes Hit, well known for its bituminous fountains, which are mentioned by Herodotus (i. 178) under the name of Ia. Seventy miles below Hit, at the mouth of the Saklawiyah Canal, it has entered the great central plain. From Werdi to near the mouth of this canal a range of hills extends at a distance of some miles along the north-eastern bank of the Euphrates, the opposite declivity of which sinks to the bed of the Tarthar. [BAGHDAD, Pashalic of.] The high ground on the south-west side of the Euphrates extends a few miles farther to the south than that on the opposite bank; and at its termination, curving round to the north-east, approaches nearer the river, and terminates in an abrupt cape, surrounded on all sides by the level plains of Babylon.

The Tigris.—The principal source of this river is on the southern declivity of the mountain range which forms the southern wall of the valley of the Murad-Chai, near Alshan, and not much more than 10 miles distant from the most easterly point of the bend of the Euphrates, between Malatiah and Sumeisat. The Tigris runs from its source 25 miles to the north-east, and about 4568 feet above the sea. It then flows southward for nearly the same distance, and, receiving near the mines of Arghana-Maden a small stream from the west, adopts the course of this tributary, and then flows again towards Diar-Bekr (about 37° 55' N. lat., 39° 55' E. long.), distant 40 miles in a straight line. Opposite Diar-Bekr the Tigris is about 250 yards wide in the season of floods, but it is only used to float timber-rafts from the mountains. At Diar-Bekr the Tigris turns suddenly round to the east, and continues to flow in that direction for 105 miles, till it receives the Bitlis River on its left bank. In this part of its course the Tigris flows parallel to the high mountains which separate its valley from that of the Murad-Chai, an extensive plain intervening between its banks and their bases. On the south the river has the hill range, on the opposite side of which are the sources of the Khabur. This upper plain of the Tigris is described in the article ARMENIA (vol. i. cols. 514-516).

From its junction with the Bitlis River, the Tigris bends round to the south, and it continues nearly in the direction of south-east to the mouth of the Great Zab (36° N. lat., 43° 20' E. long.). For the greater part of this distance the range of hills which separates the valley of Diar-Bekr from the basin of the upper Khabur accompanies the Tigris on the south-east; they terminate on its banks a little to the north of Mosul (36° 20' N. lat., 43° 15' E. long.). In this interval the Tigris receives a number of affluents on both banks, the most important of which is the Eastern Khabur. The Khabur, at its junction with the Tigris, comes from the north of east, but 80 miles farther up it comes from the north. It rises high up among the Arjerosh-Dagh, which bound the southern shores of Lake Van.

The main branch of the Zab Ala, Upper or Great Zab, has its

source on the slope of the Sar-al-Bagh range, at an elevation of about 7500 feet above the sea, and nearly midway between the lakes of Van and Urumiyah. [ARMENIA, vol. i. col. 518.] At first the Zab flows to the south, but about 37° 19' N. lat. it turns to the west-south-west. Near the village of Kiyau it receives the Berdisawi (called also by the inhabitants the Lesser Zab), which is said to rise in the Erdoash, or Arjerash-Tag, a few miles south of the eastern termination of Lake Van, and which descends to the principal stream in a succession of cataracts. After the junction the Zab flows south-east till about 12 miles east of Amadiyah, from which point its course is rather to the north of east, to 10 miles west of Rowandiz, where it receives a large affluent. Between Amadiyah and Rowandiz, the Zab has on the north the colossal mountains in which it has its rise; on the south a range of hills which stretch from near the mouth of the Eastern Khabur to the base of Mount Rowandiz (11,000 feet above the sea). Turning round between the base of Rowandiz and the eastern extremity of this ridge, the Zab crosses a hill-range parallel to it on the south, and flows south-west to the Tigris, which it enters with a deep stream 60 feet wide, but the width is much greater a little higher up.

About 84 miles below the mouth of the Great Zab the Tigris forces its way through the Hamrin Hills. About 12 miles below the Great Zab there is a ford in the Tigris; 20 miles farther down it receives an affluent from the west near Kalah Shirkat; and 23 miles below this it is joined by the Zab-Afsal, Lower or Lesser Zab from the north-east. The main branch of this tributary rises 20 miles south-west of the south extremity of Lake Urumiyah; flows 30 miles to the south-east, and then turns abruptly to the south-west; about 20 miles onwards it receives four affluents from the mountains to the south-east, and carries to the Tigris, after flowing parallel to the Great Zab for the last 50 or 60 miles of its course, a deep stream 25 feet broad. At the point of junction the Tigris has a breadth of 500 yards. Below the passage of the river through the Hamrin Hills, high grounds, which separate its valley from the Valley of the Tarthar, extend close to the termination of the Median Wall. Here the Tigris issues from the hills into the great central plain. Between Diar-Bekr and Mosul (296 miles) the river is navigable for rafts at certain seasons; below Mosul it is navigable throughout the year; in 1838 the 'Euphrates' steamer ascended it to within 20 miles of Mosul.

A few miles below Baghdad the Tigris is joined by the Diyalah, which is known in its upper course as the river of Shirwan. This river rises among the mountains above Hamadan near 34° 40' N. lat., 47° 30' E. long., and flows for about 30 miles from east to west; then, turning at first to the north of west, for nearly 100 miles in a semi-circular sweep round the base of Mount Dalahu, it receives a number of streams on its south bank. Some of the summits of this mountain group rise, by the estimate of Major Rawlinson, 5000 feet above their base. At the most northern part of its course the Shirwan receives the waters of the Taj, one of whose branches comes from Suleimaniyah. It then flows south-east for about 30 miles, till it issues into the plain through a gap in the Hamrin Hills. Above these hills the river flows in a strong rapid current 400 yards broad. Its breadth at its mouth at Ctesiphon, above the Zak Keasa, is about 60 yards. From the Kermandah district the Diyalah receives the Holwan and the Arwand. The other feeders of the Tigris above Kurnah, and the tributaries of the Shalul Arab below that town, are noticed in the article BAGHDAD, Pashalic of (vol. i. cols. 820, 821).

Five miles below Baghdad the Saklawiyah Canal, from the Euphrates, joins the Tigris; the distance along this canal from river to river was found by Lieutenant Lynch (who sailed along it in 1838, in the Euphrates steamer) to be 45 miles. The current (in the season of floods) was about 4 miles an hour, from the Euphrates to the Tigris. On the parallel of Baghdad, the canal expands to a considerable lake, which again contracts into a narrow channel before it joins the Tigris. The Diyalah, which joins the Tigris 21 miles below the mouth of the Saklawiyah Canal, brings into the Tigris a large body of water. From the confluence the course of the Tigris is extremely winding, but its general direction is south-east. About 97½ miles in a straight line from Baghdad in that direction, it reaches Kut-el-amarah, a small town on its left bank, where a bifurcation takes place; and here the Tigris, instead of receiving an addition to its waters from the Euphrates, as by the Saklawiyah, sends a considerable stream to that river. The smaller branch, called Shat-el-hai, flows south and joins the Euphrates, after giving off a number of canals on both sides, about 140 miles from Kut-el-amarah: it is navigable throughout for light boats. The main branch of the Tigris turns off at that town to the north of east, with an apparently undiminished stream (200 yards broad), and flowing in that direction 28 miles, and then south by east 32 miles, reaches Imam Gharbi, the most distant part of its course in the plain from the Euphrates (95 miles). At 66 miles (by water) a channel called Hud flows off on the east bank, and joins the Kerkhah near Hawisah. Ten or eleven miles below Imam Gharbi, the Tigris turns south to 84° E. long., becomes deep and narrow, and makes a number of abrupt bends through a marshy plain for 40 miles to the tomb of Esra. It there resumes its former breadth, and winds in a general south direction to its junction with the Euphrates at Kurnah, a distance of about 123 miles by the windings of the river. The current of the Tigris in the plain averages one mile and a half in the hour.

From the Saklawiyah Canal the Euphrates flows south-east, through

a pastoral country, 43 miles, to the Mounds of Mohammed: it is here only 18 miles distant from the Tigris. From the Mounds of Mohammed the river flows across a flat barren country to Hillah (32° 28' 35" N. lat., 44° 28' 40.5" E. long.), which is almost due south of Baghdad, and between 50 and 60 miles distant from it. In this part of its course the stream has an average breadth of 200 yards, with an ordinary depth of 15 feet, and a current of barely 2¼ miles an hour. From Hillah to a bifurcation a short way above Lemlun (a distance of 75½ miles by water, or 55½ miles S.E. by S. direct), the volume of water in the Euphrates is materially diminished by canals of irrigation. The two narrow channels formed at this point reunite at Karayem (33½ miles from the bifurcation), after flowing in short bends through a marshy country. On issuing from these marshes the Euphrates suddenly re-appears on its former large scale, inclosed between high banks covered with jungle. At 56½ miles from Karayem the Euphrates is joined by the Hai, the branch which diverges from the Tigris at Kut-el-amarah; and 78 miles farther on it receives at Kurnah the waters of the main branch. The distance (by water) from the remotest sources of the Tigris to Kurnah is about 1146 miles, little more than half the length of the Euphrates. The Euphrates and Tigris now form one tidal channel, known by the name of the Shat-el-Arab, about half a mile wide, which flows S.E. by S. almost in a straight line. Five miles below Kurnah, it is joined by the Kerkhah, which, near Hawisah, where it leaves the hills, receives the Hud from the Tigris. [BAGHDAD, Pashalic of.] From Kurnah to Basrah is 39½ miles by the river, and thence to Mohammarah, where the Harfar Canal brings the main portion of the Karun into the Shat-el-Arab, is 22½ miles by water. [BAGHDAD, Pashalic of.] Between Kurnah and Basrah the river has an average breadth of 600 yards, with a depth of 21 feet; between Basrah and Mohammarah, a breadth of 700 yards, and a depth of 30 feet. The current below Kurnah is 2 miles an hour during the flood and 3 miles during the ebb tide. Between Kurnah and Mohammarah the river forms five islands, all large. The Shat-el-Arab discharges the united waters of the Euphrates and the Tigris into the sea at Basrah. It is navigable in mid-stream for vessels of 500 tons.

The basin of the Euphrates (giving that name to the area drained by all the waters which enter the Persian Gulf by the Shat-el-Arab) comprises about 108,000 square miles. The physical features, products, &c., of this vast region are described in the articles ARMENIA, BAGHDAD, Pashalic of, MESOPOTAMIA, ASSYRIA, BABYLONIA, &c. The melting of the snows on the mountains and tablelands of Armenia, causes the Euphrates to rise from the end of March to the end of May, when the floods are at their height, about 14 feet. The same cause, aided by the melting of the snows on the mountains of Kurdistan, occasions a rise in the Tigris of about 20 feet. The tide ascends the Euphrates above Kurnah, a distance of 60 miles; it scarcely extends 35 miles up the Tigris.

TIMANA. [NEW GRANADA.]

TIMBUCTOO, a city in the interior of Northern Africa, is situated in about 17° 8' N. lat., 2° 58' W. long., on the declivity of an inconspicuous eminence about 8 miles N. from the Niger, and at the most northern part of its course where it makes the great semicircular bend from the north-east to the south-east direction. Cabra, the port of Timbuctoo, stands at a distance of 5 miles from the town, and is connected with the Niger by a narrow canal. Between Cabra and Timbuctoo there are two lakes. A wady, filled during the rainy season with a stream of water, extends from north-east of Timbuctoo, and, passing to the south of that town, disembogues into the Niger to the south-west of it. All round the wady extend immense plains of loose shifty sands of a yellowish-white colour. Timbuctoo has been from remote antiquity the meeting-place of many converging lines of traffic. It is the nearest point at which the traders from the commercial districts that skirt the coasts of the Mediterranean west of Barca, and of the Atlantic north of Cape Nun, can strike, after crossing the great desert, the fertile lands extending to the south-east and south-west along the Upper and Lower Niger.

Leo Africanus states that Timbuctoo was built by Mansa Suleiman, about the year 610 of the Hejira (A.D. 1214), and that it soon became the capital of a powerful state. But there is strong reason to suppose that either the Kúpha or Nigeira Metropolis of Ptolemy, previously occupied the site of the town built by Mansa Suleiman. Indeed, according to an author quoted by Cooley ('Negroland of the Arabs,' p. 68), a town bearing the name *Tombuti* existed hereabouts as early as the year 297 of the Hejira. Rulers with the title Mansa continued to govern Timbuctoo from 610 to 792 of the Hejira. The chiefs of Morocco

and Fex rendered Timbuctoo tributary, and from that time the communications of the Arabs with that country became more frequent and regular. Leo Africanus mentions that the grand mosque of the town and the palace of the king were built by an architect from Granada. The Arab conquerors allowed however the native dynasty to remain on the throne. The expulsion of the Arabs from Spain, and the weakening of the Arab power in North Africa by the Turkish conquests in Tunis, Tripoli, and Algiers, in the course of the 15th century, increased the impunity of the predatory nomad hordes; and about the same time, or a little later, the formation of settlements on the west coast of Africa, first by the Portuguese and afterwards by the English and French, by creating a new line of traffic with the interior, diminished the importance of Timbuctoo as a commercial entrepôt. About the year 1500 a negro general of Souheili, king of Timbuctoo, raised the standard of revolt on the death of his master, overturned the Moorish supremacy, conquered a number of the neighbouring provinces, and recalled to Timbuctoo a part of the trade which had left it for Jenné on the Niger. About 1670 Timbuctoo seems to have fallen under the dominion of the king of Bambarra. Since 1727 it appears to have been governed by a negro ruler, that is, by one who is neither an Arab, nor a Tuarik, nor a Fellatah.

Caillié estimates the permanent inhabitants of Timbuctoo at from 10,000 to 12,000. After the arrival of the caravans the town assumes for a portion of the year a much more populous and probably a much more bustling appearance. The streets are clean, and wide enough to allow three horsemen to pass abreast. The houses are of sun-dried bricks, and consist entirely of a ground-floor; in some a sort of closet is constructed over the entrance; the apartments are built on the four sides of an open court in the centre. Both within the town and round about it there are numerous straw huts of a conical form. The town is not walled. In the centre of the town is a square surrounded by circular huts, and planted with a few trees: in the middle of it a large hole is dug as a receptacle for filth. Two enormous heaps outside of the town appeared to be accumulations of rubbish. Some buildings on the east side of the town are overwhelmed with sand. There are seven mosques; two of them large, and part of the largest apparently of considerable antiquity; each is surmounted by a brick tower. To the west-south-west of the town are large excavations from 35 to 40 feet deep, which collect in the rainy season the supplies of water which serve the inhabitants for drinking and culinary purposes throughout the year. There is no spontaneous vegetation near the town except some stunted mimosa-trees. Near the reservoirs are some small plantations of bad tobacco. The inhabitants of Timbuctoo draw from Jenné their supplies of millet, rice, vegetable butter, honey, ootton, Soudan cloth, pepper, onions, dried fish, pistachios, &c. Fire-wood and timber for building, and provender for cattle, are brought from Cabra. They purchase cattle from the nomads of the tribe of Zawât, who possess the country two days' journey distant from Timbuctoo to the north-east; from the people of Sala, ten days' journey to the east; and from the Tuariks, who are the most powerful race, on all sides. They procure salt for their own consumption and for the trade with Soudan from Tâdei il, which lies twenty days' journey north-west of the town.

The negro and Arab inhabitants of Timbuctoo are exclusively engaged in trade. The negro inhabitants dress like the Moors, and are zealous Mohammedans. They have several wives, whom, as well as their slaves, they employ in menial affairs. Caillié represents all classes of the inhabitants as cleanly both in their persons and houses. Cabra, the port of Timbuctoo, is secured against inundations by being slightly elevated above the marshes; the sandy desert commences immediately to the north of it. This place has about 1000 or 1200 inhabitants, all of the poorer class, engaged in the service of the merchants of Timbuctoo. The dwellings are either mean houses or small huts; the street is neat, but the landing-place is dirty. The merchandise is conveyed between the port and Timbuctoo on asses and camels: these belong in general to the inhabitants of Cabra; but sometimes the poorer Tuariks hire their camels for the purpose.

TIMOR and TIMOR LAUT. [SUNDA ISLANDS, *Lesser*.]

TINCHEBRAI. [ONE.]

TINIAN, one of the Ladrone or Mariane Islands, lies nearly in 15° N. lat., 146° E. long. It is uninhabited and of small extent. Lord Anson remained on the isle of Tinian from the 26th of August to the 21st of October, 1742. It extends about 12 miles from south-south-west to north-north-east, and the breadth is about half as much. The soil is somewhat sandy, but very dry and healthy. The land rises in gentle slopes from the beach to the middle of the island, but the ascent is often interrupted by small level valleys, many of which wind irregularly through the country. These valleys and the gradual swellings of the ground are most beautifully diversified by an alternation of woods and lawns, which traverse the island. There are no running streams, but good water is found by digging. Near the middle of the island there are three small lakes. Black cattle, in a wild state, are numerous. The common domestic fowl is plentiful in the woods. There is also an abundance of wild hogs. Besides the

cocoa-nut palm and the bread fruit-tree there are guavas, limes, and sweet and sour oranges. There is no harbour, but only an open roadstead near the south-western extremity of the island. The island contains some remarkable ruins. [LADRONES.]

TIPPERAH MOUNTAINS. [HINDUSTAN; SILHET.]

TIPPERARY, an inland county in the province of Munster, Ireland, is bounded N. by Galway and King's County, E. by King's County, Queen's County, and Kilkenny, S. by Waterford, and W. by the counties of Cork, Limerick, Clare, and Galway. It lies between 52° 12' and 53° 9' N. lat., 7° 20' and 8° 26' W. long. Its greatest length from north to south is 70 miles, from east to west 40 miles. The area is 1659 square miles, or 1,061,731 acres; of which 843,887 acres are arable, 178,188 acres uncultivated, 23,779 acres in plantations, 2859 acres in towns, and 13,523 acres under water. The population in 1841 was 435,553; in 1861 it was 331,487.

Surface, Hydrography, and Communications.—The greater part of the county is comprehended in the basin of the Suir, which falls into Waterford Harbour. The other rivers, which are small and unimportant, are the Nore, the Nenagh, and the Broma. The Suir rises north of Templemore, on the south-eastern slope of the mountains that there cross the county, and flows by Thurles, Golden, and Cahir, to the junction of the little river Nier; after which it flows along the border of this county and Waterford, by Clonmel and Carrick, below which it quits the county. Its course in Tipperary may be estimated at about 76 miles. The Suir is navigable by large barges up to Clonmel.

The lakes in this county, of which there are many, are very small, the largest not exceeding 40 acres; but Lough Derg, which forms its western boundary with Galway and Clare for a length of 22 miles in a straight line, affords, with the Shannon and the Suir, its southern boundary with Waterford from Clonmel to Carrick, the only navigation of the county.

The coach road from Dublin to Cork enters the south-eastern side of the county, and passes through Clonmel and Clogheen. Another road from Dublin to Cork by Athy passes through Cashel and Cahir. The road from Dublin through Kildare and Maryborough (Queen's County) to Limerick crosses the northern part through Roscrea, Toomevara, and Nenagh; another road from Dublin through Parsonstown (King's County) and Borris-o-Kane unites with the foregoing at Nenagh. The road from Waterford to Limerick enters the county on the south-east at Carrick-on-Suir, and passes through Clonmel, Cahir, and Tipperary. The road from Clonmel to Ballinaloe in Galway, passes through Fethard, Cashel, Thurles, and Roscrea. There are other roads of less importance.

The Great Southern and Western railway enters the county near Roscrea, and runs in a generally southward direction past Templemore to Thurles, whence it is continued in the same direction to Gool'd's Cross, and is connected with Cashel. From Thurles the main line turns south-westward to the north of Tipperary, and past Emly, a few miles beyond which it quits the county. There is a branch to Limerick, of which only a small portion is within this county. There is also a short branch to Tipperary.

Geology, Mineralogy, &c.—A considerable part of the county is hilly or mountainous, but the mountains lie in groups, and not in connected ranges. The Knockmeledown Mountains, on the south border of the county, rise to the height of 2700 feet above the level of the sea. They are placed in a table-land of clay-slate, partly bordered on the flanks by sandstone, and on the higher grounds sustaining isolated caps of the same rock, or upholding more continuous mountain-masses. On the north the limestone track separates the Knockmeledown Mountains from the Galtees, of which the principal summits (3000 feet high) are in this county. North of the Galtees rise the Slieve-na-Muck Mountains, which form a subordinate and lower range. Both the Galtees and the Slieve-na-Muck are composed wholly of sandstone, and the intermediate valley or glen appears to be occupied by the same formation. The sandstone is in general composed of grains of quartz closely aggregated. The sandstone of Slieve-na-Muck yields excellent flags. In the south-eastern corner of the county, north of Clonmel and Carrick-on-Suir, is a group of hills called Slieve-na-Man, the geological character of which is similar to that of the mountains already described: the group consists of a nucleus of clay-slate, surrounded and surmounted by sandstone.

The principal bogs are in the eastern and central part of the county; one continuous line of bog extends from near the border of the coal-field, near Killenaule, to the south-eastern foot of the central range of hills at Roscrea, a distance of nearly 30 miles; and there are smaller detached bogs westward of this, and some in the northern part of the county, between the Lower Broma and the Shannon.

In the centre of the county is another important group of mountains. It commences in the county of Limerick, and is there known

as the Doon Mountains; but as it extends north-eastward into Tipperary, the most important summits are known as the Bilboa and Keeper Mountains (the latter 2100 feet high), and the Devil's-Bit Mountain: it crosses the county of Tipperary in a north-eastern direction by Temple-derry and Roscrea, and enters Queen's County and King's County, which it separates from each other, and where it is known under the designation of Slieve Bloom. Keeper and Bilboa and the adjacent parts of the range consist of clay-slate, generally flanked by sandstone. To the north-east of Temple-derry the range is entirely composed of sandstone. Copper was formerly dug in these mountains, at Lackamore, five miles east of Newport. Copper is now found at Hollyford, and lead mixed with silver is obtained at Shallee and Silvermines.

Near the lower part of Lough Derg, one of the lakes through which the Shannon flows, are the Arra Mountains, a group occupying a small part of this county on the western side, and extending across the Shannon into the county of Clare. There are quarries in these mountains which yield slate not inferior to that of North Wales.

The rest of the county is occupied by the stratified limestone, except a portion of the district between the southern groups of mountains (Slieve-na-Man and the Galties) and the central range, which is occupied by the coal-field of Killenaule; and one or two small tracts on the western side of the county, where trap-rocks appear interstratified with the limestone.

The coal-field of Killenaule extends about 18 miles in length from north-east to south-west, from near the river Nore to the neighbourhood of Cashel, and about 6 miles in breadth. It is partly in this county and partly in that of Kilkenny. There are two very small outlying portions near Cashel. This coal-field varies in its elevation, being highest and most abrupt on the north-western side, where the hills rise from 300 to 600 feet above the limestone plain. Towards the south-east the surface declines gradually, and the streams which water the tract mostly flow in that direction. Immediately above the limestone, shale and gritstone alternate, there being two beds of each: the upper gritstone, when not covered by the superior beds, constitutes the main body of the elevated part of the coal-hills: it is marked by repeated undulations, forming unequal ridges, with intervening hollows or troughs, having their greatest extension or length generally from north-east to south-west. In these troughs the coal-beds are found resting upon fire-clay, which intervenes between them and the gritstone, and forms the floor of the coal, and covered by shale, grit, and then shale again. The coal is of the nature of blind coal, or anthracite.

Climate, Soil, and Agriculture.—The climate of Tipperary, though drier than that of the maritime counties, is sufficiently moist, and the hilly districts are cold, but it is reckoned very healthy on the whole. The soil, a rich calcareous loam, is of extraordinary fertility, especially in the lower grounds of the districts called the Golden Vale, and of which Tipperary town forms the centre, extending from Limerick to the borders of the county of Kilkenny; and another district, occupying the level tracts of the baronies of Upper and Lower Ormond. The number of acres under crop in 1853 was 310,264; of which 42,125 acres were wheat; 89,883 acres, oats; 17,756 acres, barley, bere, rye, peas, and beans; 46,006 acres, potatoes; 30,687 acres, turnips; 5301 acres, other green crops; 336 acres, flax; and 73,170 acres, meadow and clover. In 1841 the total extent of plantation, including detached trees and orchards, amounted to 29,602 acres. In 1852 there were 24,786 holdings, on which were 25,386 horses, 12,326 mules and asses, 160,496 cattle, 177,866 sheep, 81,789 pigs, 14,806 goats, and 437,948 head of poultry. Agriculture forms nearly the entire occupation of the county; wheat of excellent quality is largely grown and exported, as is also flour and meal; and dairies are numerous, butter being the next largest product for exportation. There are establishments at Nenagh and Roscrea for the preparation of flax.

Divisions, Towns, &c.—The county is in the dioceses of Cashel, Emly, Killaloe, and Lismore, and contains 193 parishes. It is divided into two ridings, North and South; and the North Riding into 6 baronies—Ormond Lower and Upper, Owney and Arra, Ikerrin, Eliogarty, and Upper Kilnemanagh; the South Riding into 6 baronies—Slieveardagh, Lower Kilnemanagh, Middlethird, Clanwilliam, East and West Offa and Iffa. The principal towns are—CAHIR, CLONMEL, NENAGH, CARRICK-ON-SUIR, THURLES, TIPPERARY, CASHEL, ROSCREA, and CLOGHEEN, which are noticed under their respective titles; with Fethard and Templemore, which we notice here, together with the smaller towns and principal villages: the population is that of 1851.

Fethard, a municipal, market, and post town, 9 miles N. from Clonmel, population 2767. The town is chiefly on the left bank of a small stream, the Glashall. There are a parish church, and chapels for Presbyterians, Primitive Methodists, and Roman Catholics. There are also an infantry barrack, a police station, a loan-fund office, and a dispensary. The town was formerly walled, and most of the walls and of the gateway towers remain. A market is held weekly, and fairs are held four times a year. The town was incorporated at an early period, and sent two members to the Irish Parliament, but was disfranchised at the Union.

Templemore, a market and post town, 9 miles N. from Thurles, population 4375. It is supposed to derive its name from the Knights Templars, who had a house here. The town is pleasantly situated

near the right bank of the Suir, and is well built and neat. The church has a handsome tower and spire. There are chapels for Roman Catholics and Methodists, a good market and court-house, a bridewell, extensive barracks, a fever hospital and dispensary, and ball-and-news-rooms. A market is held weekly, and eight annual fairs are held.

Ballina, a village on the left bank of the Shannon, near where it leaves Lough Derg, is a suburb of Killaloe, county Clare. [KILLALOE.] *Borris-o-Kane*, a small town, 91 miles W.S.W. from Dublin, on the road from Parsonstown to Nenagh: population 1176. The town is watered by a small stream which flows into Lough Derg. There are a parish church, a chapel, police barracks, a dispensary and fever hospital, and a small bridewell. There are some remains of a square castle of massive construction, called Tumbriane. Four fairs are held in the year. *Borris-o-Leagh*, a small town, 5 miles S.W. from Templemore: population 1125. There are a church and a Roman Catholic chapel. Three yearly fairs are held. A body of the county constabulary are posted in the town, and there is a dispensary. *Clogh-jordan*, a village and post-town, about 8 miles N.E. from Nenagh: population 1058. There is a district church, of light and elegant architecture, built in 1830; and there are meeting-houses for Baptists, Wesleyan and Primitive Methodists; also a dispensary and fever hospital. *Emly Golden*, a small market and post-town, about 4 miles W. from Cashel, on the road to Tipperary, population about 500, is delightfully situated in the Golden Vale, one of the most fertile districts of the county, and is divided into two parts by the river Suir, over which is a stone bridge. In the neighbourhood are the remains of Athassel Abbey. The parish church and a Roman Catholic chapel are in the town. Four markets are held in the year. *Killenaule*, a market and post-town, 16 miles N. from Clonmel, population about 1500. There are a church, a Roman Catholic chapel, a dispensary, and police barracks. A weekly market and six yearly fairs are held. *Mullinahone*, a small post-town, on the road between Callan and Fethard, population 1011. A considerable quantity of butter is sold here at the weekly market, and there are four yearly fairs for cattle and pigs. There are a church, a Roman Catholic chapel, a dispensary, and a loan-fund. *Newport*, a small market and post-town, on the road from Silvermines to Limerick, population 1114. The parish church is in the town; and there are a Roman Catholic chapel, a bridewell, a dispensary, and infantry barracks. There are four yearly fairs, one of them a large cattle fair. *Silvermines*, a village, about 5 miles S. from Nenagh, population about 600. It is surrounded by a mountainous district called the Silvermines, forming a part of the Keeper Mountains. Lead-mines were formerly worked here, the produce of which yielded an unusual quantity of silver; but in the parliamentary war of 1641 the works were destroyed, and the miners (chiefly foreigners) massacred. The working of the mines has been resumed of late years. The parish church and a Roman Catholic chapel are in the village, and there is a dispensary. There are four yearly fairs.

The county returns four members to the Imperial Parliament: two for the county at large, and one for each of the boroughs of Cashel and Clonmel. It is in the Leinster circuit. The assizes for the North Riding are held in Nenagh, for the South Riding in Clonmel, each of these towns having a county jail. Quarter sessions for the North Riding are held at Nenagh, Roscrea, and Thurles; for the South Riding at Clonmel, Carrick-on-Suir, Cashel, Clogheen, New Birmingham, Newport, Roscrea, Templemore, Thurles, and Tipperary. Petty sessions are held in 22 places. There are three stipendiary magistrates in the North Riding, two at Nenagh and one at Borris-o-Kane; and four in the South Riding, one each at Cahir, Carrick-on-Suir, Thurles, and Tipperary. The Lunatic Asylum is at Clonmel, the county infirmary at Cashel, and Fever hospitals are at Cahir, Carrick-on-Suir, Cashel, Clogheen, Clonmel, Roscrea, Templemore, Thurles, and Tipperary. There are 46 dispensaries in the county. Savings banks are at Cashel, Clonmel, Roscrea, and Thurles; and loan-funds at Cahir, Cashel, Fethard, Nenagh, Roscrea, and Tipperary. The Union work-houses are at Clonmel, Borris-o-Kane, Nenagh, Carrick-on-Suir, Cashel, Clogheen, Roscrea, Thurles, and Tipperary. The northern part of the county is in the military district of Limerick; the eastern part, including Clonmel and Carrick-on-Suir, is in the Kilkenny district. In September 1852 there were 199 National schools, attended by 14,839 male and 14,054 female children.

History and Antiquities.—Sir James Ware supposes that the Coriondi and the Udise, or rather Uodias, of Ptolemaeus, occupied this county and the adjacent ones to the west and south-west. We think it not improbable that the Brigantes may have occupied the south-eastern parts, while the Uodias occupied the south-western. In the division which prevailed before the English conquest, Tipperary appears to have been divided between the kingdom of Thomond, or North Munster, governed by princes of the Dalcaasian race; and Desmond, or South Munster, held by princes of the Eoganacht, or Eugonian, family; the princes of which two kingdoms appear to have possessed in alternate succession the paramount dominion of Munster. One of these sovereigns, Mukertach, in 1101, gave the city of Cashel to the church, dedicating it to God and St. Patrick.

In the English invasion, Henry II. (1172) summoned an assembly of the Irish prelates and princes at Cashel, where the sovereignty of the English king was recognised, and various regulations were made,

increasing the power of the clergy, and more completely assimilating the practices of the Irish Church to those of the Church of Rome. Tipperary was one of the districts erected into counties by King John (1210), during his expedition to Ireland, at the head of a considerable army. It is probable that the northern part at least of the county was part of the seat of war (1274-1277) between the O'Briens, who retained a portion of Thomond, and the Anglo-Norman, or as we may now term them, Anglo-Irish family of the De Clares. In 1328 the royal privileges in the county were granted to James Butler, earl of Carrick, now created also Earl of Ormond; these royalties were long retained by the earls of Ormond. The county was the scene of frequent contests between the Geraldines and the Butlers. The burning of the cathedral of Cashel was one of the charges brought against the Earl of Kildare in his examination before the privy council (1496). His reply to the charge was characteristic: "Spare your evidence," said he; "I did burn the church; for I thought the bishop had been in it." In the great civil war in 1642, Cahir, Cashel, Fethard, Clogheen, and Clonmel were all taken by Cromwell, and suffered severely. In the war of the Revolution, Clonmel was abandoned by the Jacobites on William's advance towards the south after the battle of the Boyne (1690).

The antiquities of the county consist chiefly of the ruins, more or less dilapidated, of castles and monastic buildings. The Mitchelstown stalactitic caverns, situated within two small hills, about 100 feet high, of gray-limestone, are remarkable and beautiful natural curiosities. They lie on the northern side of the Galtees Mountains, about 12 miles from Cahir, on the road from that town to Mitchelstown, in the county of Cork. They both contain many chambers and galleries, with singular stalactitic deposits, and the series called the New Caves, which are connected with each other, has a length from north to south of 870 feet, while the breadth in an east and west direction is 570 feet.

TIPPERARY, county of Tipperary, a market-town and the seat of a Poor-Law Union, is situated on the Arra, an affluent of the river Suir, and on the Waterford and Limerick road, in 52° 28' N. lat., 8° 8' W. long., distant 23 miles W.N.W. from Clonmel, 111 miles S.W. from Dublin by road, and 110 miles by the Great Southern and Western, and Limerick and Waterford railways. The population was 7001 in 1851. Tipperary Poor-Law Union comprises 80 electoral divisions, with an area of 179,987 acres, and a population in 1841 of 76,405; in 1851 it was 60,886. The town, which is agreeably embowered by the rich landscape of the Golden Vale of Tipperary, consists of one principal street, with some branches at right angles to it. It contains the parish church, a fine cruciform building, with a tower and spire 142 feet high, erected in 1830; a large Roman Catholic chapel, a Presbyterian meeting-house, a classical school on Erasmus Smith's foundation, two National schools, a neat market-house with a new-room over it, a new court-house and jail, a dispensary, fever hospital, and Union workhouse. A chalybeate spring in the neighbourhood is much frequented in summer. A good deal of farm produce is disposed of at the market. Quarter and petty sessions are held in the town. Fairs are held April 5th, June 24th, October 10th, and December 10th. A castle was built here by King John, which was soon after captured by the Prince of Thomond, one of the hereditary chiefs of the neighbouring territory.

TIPTON. [STAFFORDSHIRE.]

TIRRE, or TYREE. [ARGLESHIRE; HEBRIDES.]

TIRHUT. [HINDUSTAN.]

TIRLEMONT. [BRABANT, South.]

TIRNAN. [HUNGARY.]

TIRYNS, an ancient city of Argolis, in the Peloponnesus, situated in 37° 40' N. lat., 41° 1' E. long., on a low flat rocky hill which rises out of the level plain, at no great distance from the head of the Argolic Bay. According to an ancient tradition related by Strabo it was built by Proetus, an ancient king of Argolis, who in the construction of the citadel employed masons from Lycia, who were called Cyclopes. The Greeks attributed most architectural works which were characterised by rude massiveness and great antiquity to the Cyclopes, and such works were consequently described as Cyclopean. Homer ('Iliad,' ii. 559) calls Tiryns the 'walled,' or perhaps the 'wall-walled' Tiryns; and Pausanias (ii. 25), 1000 years after him, thus describes the remains as they existed in the second century of our era:—"The wall of the fortification, which still remains, is the work of the Cyclopes, and is built of unwrought stones, so large that not even the least of them could be even moved by a pair of mules. The intervals between them have been long since filled up with smaller stones, so as to make the whole mass solid and compact." The entire circuit of the walls still remains more or less preserved. Some of the masses of the stone are shaped by art, some of them are rectangular; but these are probably repairs, and not a part of the original work described by Pausanias. The finest specimens of the Cyclopean masonry are near the remains of the eastern gate, where a ramp, supported by a wall of the same kind, leads up to the gate. On one side of this gateway Colonel Leake measured a stone of 10·6 by 3·9 by 3·6. Here the wall is 24½ feet in thickness; in other parts from 20 to 23 feet.

The fortress, or citadel of Tiryns appears to have consisted of an upper and a lower inclosure of nearly equal dimensions, with an intermediate platform. The southern entrance led, by an ascent to the

left, to the upper level, and by a direct passage between the upper inclosure and the eastern wall of the fortress into the lower inclosure, having also a branch to the left into the middle platform, the entrance into which last was nearly opposite to the eastern gate already described. There was also a postern on the western side. In the eastern, as well as in the southern wall, there were galleries in the body of the wall of singular construction, the angle of the roof being formed by merely sloping the courses of the masonry. In the eastern wall there are two parallel passages, of which the outer has six recesses in the exterior wall. Of the upper inclosure very little remains. The fortress itself is only a third of a mile in circumference, so that in all probability it must have been no more than the citadel of the Tirynthii, the town itself being situated in a plain of 200 or 300 yards in breadth, on the south-west of the fortress: beyond this plain lies a marsh, extending a mile farther towards the sea.

Proetus, the reputed founder of Tiryns, was succeeded by his son Megapenthes, who is said to have transferred it to Perseus. Perseus transmitted it to his descendant Electryon, whose daughter Alcmena married Amphitryon. The latter prince was expelled from Tiryns by Sthenelus, king of Argos; but his son Hercules recovered his inheritance, and was in consequence called Tirynthius. (Diodorus, iv. 10; Pindar, 'Olymp.,' x. 87.) From Perseus to Amphitryon, Tiryns was a dependency of Mycenæ. At the time of the Trojan war it seems to have been subject to the kings of Argos. ('Iliad,' ii. 559.) Subsequently it was partially destroyed by the Argives, perhaps about B.C. 468. The Tirynthian citadel was called Licymnia, from Licymnius, a son of Electryon, and brother of Alcmena. (Pindar, 'Olymp.,' vii. 49.)

(Leake, *Morea*; Cramer, *Greece*; Gell, *Itinerary of the Morea and Argolis*; Dodwell, *Classical Tour*.)

TISBURY, Wiltshire, a village and the seat of a Poor-Law Union, in the parish of Tisbury, is situated near the left bank of the river Nadder, in 51° 4' N. lat., 2° 4' W. long., distant about 28 miles W. from Salisbury, and 109 miles W.S.W. from London. The living is a vicarage in the archdeaconry and diocese of Salisbury. Tisbury Poor-Law Union contains 20 parishes and townships, with an area of 42,494 acres, and a population in 1851 of 10,181. Besides the parish church, which is a spacious Norman structure, there are a chapel for Independents, and National schools. Fonthill Abbey, the once celebrated seat of Beckford, the author of 'Vathek,' is about two miles W. from Tisbury.

TITCHFIELD. [HAMPSHIRE.]

TITLESHALL. [NORFOLK.]

TIVERTON, Devonshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Tiverton, is situated on the slope of a hill at the confluence of the rivers Ex and Loman, in 50° 54' N. lat., 3° 39' W. long., distant 13 miles S. by E. from Exeter, 165 miles W.S.W. from London by road, and 184 miles by the Great-Western and Bristol and Exeter railways. The population of the borough of Tiverton in 1851 was 11,144. The borough is governed by 6 aldermen and 18 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry and diocese of Exeter. Tiverton Poor-Law Union contains 27 parishes and townships, with an area of 106,291 acres, and a population in 1851 of 38,521.

Tiverton is watered by a brook called the Town Leat, which rises above five miles north of the town. On the west side of the river Ex is a large suburb called Westex, very densely populated, and principally inhabited by operatives. One of the greatest attractions of the town is the trout-fishing in the two rivers. The oldest part of the parish church was built in 1073; the south front and porch, with other portions, were rebuilt, and the whole of the church new seated, in 1825. It is a noble edifice, 136 feet long, and 82 feet wide; the tower is 116 feet high. St. George's Chapel is of the Doric order. The Independents, Baptists, and Wesleyan Methodists have places of worship. There are in Tiverton Blundell's Free Grammar school; National schools; a British school; Chilcott's Endowed school for boys; a Blue-Coat school for boys, and a Blue-Coat school for girls. There are several almshouses and various minor charities.

The woollen trade of Tiverton was formerly very extensive, but early in the present century it yielded to the superior capabilities of the Yorkshire manufacturers. The cotton manufacture was subsequently introduced, but it soon declined. The making of bobbin-net introduced in 1816 is still carried on, and gives regular employment to a considerable number of persons, besides temporary employment to several hundred girls and women. A county court is held in the town. Tuesday and Saturday are the market-days; fairs are held on the second Tuesday after Whitsuntide, and on September the 29th. A spacious market-place was erected in 1830, with a suite of rooms for assemblies; there is also a theatre. Races are held annually on the Castle Meadows for two days in the month of August.

TIVOLI, the ancient *Tibur*, a town of the Comarca di Roma, 16 miles E.N.E. from Rome, is situated on the slope of a hill on the left bank of the Anio, or Teverone, just above the spot where that river falls by a succession of rapids into the lowlands of the Campagna. Tibur was a much more ancient city than Rome itself. Virgil, in relating the wars of the Latins and Rutuli against Æneas, speaks

repeatedly of Tibur. Coras and Catillus, two brothers of Tiburtus, the reputed founder of Tibur, fought against Æneas and his Trojan followers. ('Æneid,' vii., 670-672.) Pliny ('Hist. Nat.,' xvi. 87) mentions three old oak-trees, existing in his time, which were reported to be older than Tiburtus, the founder of Tibur, and were consecrated to him. According to a passage in Horace ('Od.,' i. 7), they were called 'Tiburni lucus.' The fane and grove of the Sibyl Albuca at Tibur are celebrated by Horace and Virgil, and her oracles were consulted from the oldest times.

In the early part of the history of Rome Tibur is mentioned as one of the principal towns of the Latin Confederation. It stood where it still stands, on the left bank of the Anio, which river divided the territory of the Latini from that of the Sabini, and it was strong by its situation between the mountain and the river. It was finally subjected by Rome, B.C. 337. [LATIUM.] During the Samnite wars the Romans made a road from Tibur over the Apennines to the country of the Peligni, which was called Via Valeria. The aqueducts of the Anio Vetus and Anio Novus, and of the Aqua Marcia, which supplied Rome with wholesome water, passed through the territory of Tibur, where their remains are still seen. The healthy and romantic situation of this district induced the wealthy Romans to construct in it handsome country residences. Scipio Æmilianus, Metellus Numidicus, the famous Marius, Mæcenas, Munatius Plancus, and Manlius Vopiscus, had their Tiburtine villas. The families of the Munatii, the Coponii, and the Plautii, which flourished at Rome in the latter times of the republic and under the first emperors, were from Tibur. The mausoleum of the Plautii (a massive round tower) is still seen at Ponte Lucano, a few miles from the town on the road to Rome.

Augustus used to visit Mæcenas at his villa at Tibur, and Suetonius ('Octav.,' 72) mentions his holding his tribunal under the porticoes of the splendid temple of Hercules, part of the cells of which is still seen behind the choir of the modern cathedral, which has been partly constructed with the materials of the ancient temple. Gellius (xix. 5) mentions a public library as annexed to the temple. Horace preferred Tibur to all other places of resort, and he had a country house in the neighbourhood, distinct from his Sabine farm at Digentia.

The emperor Hadrian constructed near Tibur a magnificent villa, of which extensive remains are still seen. Under his reign Getulius, a native of Tibur, and his wife Simphorosa, with their seven sons, being converts to Christianity, suffered martyrdom. Zenobia, queen of Palmyra, after her capture by Aurelian, was ordered to reside at Tibur, and here she lived many years. The grammarian Nonius Marcellus, who belongs to the 4th century, was a native of Tibur.

In A.D. 543 the Goths under Totila took Tibur, and slaughtered most of the inhabitants, including the bishop. During the Longobard dominion in Italy, Tibur was included in the duchy of Rome. After the fall of the Carolingian dynasty, Tibur, like most other towns of Central Italy, governed itself as a municipal community. Its territory, which extended westward about half-way between Tibur and Rome, embraced in the opposite direction the whole valley of the Anio as far as the borders of Naples. In the 12th century the Tiburtines were frequently at war with the abbots of Sublaqueum, now called Subiaco, who had assumed the civil jurisdiction over the upper part of the valley, of which they had already acquired by various grants the 'utile dominium.' In 1141 the Tiburtines acknowledged the anti-Pope Anacletus, and the people of Rome, who had had frequent border quarrels with them, seized this opportunity to assail their town with a considerable force. While they were trying to break open one of the gates, the inhabitants turned off part of the waters of the Anio, and made them fall with overwhelming force down the declivity upon the assailants, part of whom were swept away; and the citizens, rallying out at the same time, routed the remainder of the besiegers, who ran away, leaving behind their tents and baggage. In the following year the people of Tibur, being threatened with another attack, thought it prudent to make their peace with Pope Innocent II., and they swore allegiance to him, which so incensed the Romans, who were bent upon the destruction of Tibur, that they rose in arms against the pope, restored the senate, and proclaimed the republic. In 1145 Pope Eugenius III. took refuge at Tibur from the turbulence of the Roman people. During the subsequent dissensions between the emperor Frederick I. and the pope, the people of Tibur remained faithful to the latter. Frederick II., in his wars against the pope, held for a time possession of Tibur. After a course of desultory warfare between Rome and Tibur, a treaty was concluded and signed by the magistrates of both towns in August, 1259, by which the city of Rome secured the right of sending to Tibur a count, rector, or podestà; but the judges, the captain of the militia, and the councillors of the commune, continued to be chosen by the citizens of Tibur as heretofore. The town of Tibur was to pay to the senate of Rome an annual tribute. After this the people of Tibur remained attached to the pope. Pope Pius II. built a castle at Tivoli, which remains.

Tivoli is one of the few ancient towns of Latium which stand on its ancient site. The temple of the Sibyl, with its Corinthian pillars, still occupies its commanding position on a rock that overhangs the Valley of the Cascades; the temple of Hercules has been transformed into a cathedral; the Roman road, or Via Tiburtina, traverses the town; the Roman bridge called Ponte Celio, or Ponticelli, is still extant. There are considerable remains of the villa of Mæcenas near the

Cascate. A ruined octagonal building, with a circular interior, vulgarly called Tempio della Tosca, stands outside of the Roman gate, near the villa of Mæcenas. This building, according to Nibby, dates from the 4th century, and was a Christian church. On the walls are still remains of paintings representing our Saviour and the Blessed Virgin. The churches of San Andrea and La Carità date from the 5th century.

Tivoli is a bishop's see. It has a college, and a library of about 6000 volumes; several manufactories of iron, leather, and paper; and 6300 inhabitants. The surrounding hills are covered with olive-trees. The streets of the town are narrow and steep. Near Tivoli is the extensive Villa d'Este, constructed about the middle of the 16th century. It has all the formal magnificence of the gardens and pleasure-grounds of that age: its trees cut in architectural shapes, its mosaic-like parterres, its handsome fountains and water-works, its avenue of Italian pines, and its terraces, constitute a princely residence, suited to the character and style of its former owners. The mansion is adorned with frescoes by Zuccari and Musiano. The view from the terrace before the house is magnificent. The vines of Tivoli are famed for a superior sort of grape, called pisrutello and pergolase, which is much in request for the table. This grape is spoken of by Pliny the elder. ('Hist. Nat.,' xiv. 4.) The stone commonly called travertino, of which many of the buildings of Rome are built, is dug near Tivoli.

TLASCALA. [MEXICO.]

TLEMSSEN. [ALGÉRIE.]

TMOLUS. [LYDIA.]

TOBAGO, an island in the Columbian Archipelago, in 11° 16' N. lat., 60° 30' W. long., is the most southern of the Caribbee Islands, and lies about 25 miles N.N.E. from Trinidad, and 82 miles S.E. from Grenada. Its greatest length from north-east to south-west is 32 miles; the greatest breadth, 12 miles. The area is 97 square miles, or 62,080 acres, of which about 8000 acres were under cultivation in 1852. The population in 1852 was 14,794, of whom 190 were whites. Scarborough, the capital of the island, situated at the foot of a hill, on the south-east coast, has a population of about 3000. A mountainous ridge, 2000 feet high, at its north-eastern extremity, extends the whole length of the island, descending towards the south and west in a succession of conical heights and hills of no great elevation, which are separated from the coast by broken plains and lowlands. Eight rivers, with numerous tributaries, water all parts of the island. The rocks are chiefly limestone. The soil of the lower grounds is generally a rich dark mould, which, with the climate of the island, is extremely favourable to the cultivation of the sugar-cane. On both sides of the island there are bays admitting vessels of from 150 to 250 tons burden; vessels of the largest size find shelter in King's Bay on the south-east coast, and in the bays of Man of War, Courland, and Sandy Point, on the north-east coast.

The climate is agreeably tempered by the sea breeze, but in the less open parts the heat is oppressive, and acting on the extensive marshes, produces at times much fatal sickness. The rate of mortality among the white troops has been found during a series of years to be above 15 per cent., being double that of the other West India islands. The climate however has considerably improved with the increase of cleared lands. At Fort King George, which occupies the summit of a hill above Scarborough, the mean temperature of the year is 79° Fahr. The hurricanes, so frequent in other West India islands, seldom reach Tobago, which however suffered considerably from one of those visitations in October, 1847. The most valuable productions of the island are the sugar-cane, coffee, cotton, Indian and Guinea corn, cocoa-nuts, figs, pine-apples, pomegranates, oranges, lemons, bananas, grapes, tamarinds, papaws, cashew-nuts, melons, and pumpkins. Potatoes, yams, onions, and cassavas are grown. Horses, asses, cattle, and sheep have multiplied greatly in the island, and wild hogs are very numerous. Cultivation is confined to the low grounds and a few patches on the declivity of the hills, and the chief article of produce and export is sugar.

Tobago is included in the government of the Windward Islands, and its affairs are administered by a lieutenant-governor, a legislative council of 9 members, and a house of assembly of 16 members. It possesses nine courts of judicature. The revenue is derived from import tonnage and lighthouse dues, export duties, assessed taxes, and an income and land tax. The exports are chiefly sugar, rum, and molasses, with small quantities of cotton and arrow root. The imports are cotton, linen, and woollen manufactures, hardware, earthenware, saddlery, stationery, soap and candles, flour, fish, and lumber. In 1852 the revenue of the island was 7476*l.* The colonial expenditure was 7677*l.* The value of the imports was 53,519*l.* The value of the exports was 56,831*l.* The shipping inward amounted to 8172 tons; the shipping outward amounted to 9296 tons. Tobago is in the diocese of Barbadoes and the archdeaconry of Trinidad, and is divided into three rectories, comprising five churches and chapels. The Wesleyan Methodists have five chapels, and the Moravians two. The Church of England has eight schools in the island; the Wesleyan Methodists have six schools; the Moravians have two schools.

Tobago was discovered by Columbus in 1496, and derives its name from the pipe ('tobacco') used by the natives in smoking the herb 'kohiba' (tobacco). At an early period the British flag was planted

on the island, and James I. granted it to the Earl of Pembroke, but no attempt was made by the English to colonise it. In 1632 the Dutch formed a settlement and called the island New Walcheren, but the Spaniards from Trinidad attacked and destroyed the colony. Twenty years afterwards the Dutch returned, and soon after a party of about 100 Courlanders arrived, the Duke of Courland, godson of James I., having obtained a grant of the island. In 1763 it was ceded by France to England. In 1781 the French captured it. In 1793 General Cuyler, with 2000 men, took the island; and it has ever since been a British possession.

TOBERCERRY, or TUBBERCERRY, county of Sligo, Ireland, a market-town, and the seat of a Poor-Law Union, is situated in 54° 4' N. lat., 8° 39' W. long., distant 21 miles S.S.W. from Sligo, and 128 miles W.N.W. from Dublin by road. The population in 1851 was 755. Tobercurry Poor-Law Union comprises 21 electoral divisions, with an area of 125,773 acres, and a population in 1841 of 87,983; in 1851 of 26,081. The town, a small place in a bleak and craggy district, contains a neat chapel of ease, built in 1830, a Roman Catholic chapel, a court-house, market-house, dispensary, constabulary barracks, and the Union workhouse. Petty sessions are held monthly. Fairs are held seven times a year.

TOBERMORY, the town and port of the island of Mull.

TOBOLSK, Government of. [SIBERIA.]

TOBOLSK, the capital of the government of Tobolsk, in Asiatic Russia, is situated in 58° 12' N. lat., 68° 15' E. long., at the junction of the Tobol with the Irtysh, 582 feet above the level of the Caspian Sea. It is divided into the upper and the lower town: the former built on a hill on the east bank of the Irtysh; the latter, which is the larger, occupies the interval between the ridge and the river, and is exposed to inundations. The communication between the upper and lower town is by a gently rising causeway laid with planks, which is practicable for carriages. At the foot of the ridge some springs issue, with temperatures varying from 41° 45' to 42° 35'; this temperature is however much higher than the mean temperature of the earth, which is here only 35° 05' Fahr.

Tobolsk is the see of a Russian archbishop, the metropolitan of all Siberia, and has a theological seminary, an establishment for the education of schoolmasters, a gymnasium, and several other schools; some printing-offices, and a theatre. The only manufactures of importance are of Russia leather; the Russian and Tartar women make linen, carpets, and woollen-cloth. There are in all twenty-three churches, two mosques, and two convents. Among the other buildings are the cathedral, which is surmounted by five domes; the archbishop's palace, the palace of the governor of western Siberia, the prison, and the monument of the Cossak hero Yermak, who conquered this part of Siberia for Russia in the 16th century. The population amounts to 20,000, exclusive of the soldiers, the clergy, and the exiles, for whom there is a house of correction. The bulk of the population is composed of Russians, Tartars, and Germans. The Tartars inhabit the lower town, which is defended by a ditch and palisade. The upper town, or city proper, is surrounded by a strong brick wall. The style of living and the manners of the upper classes of society are not very different from those of Europe. The inhabitants are distinguished for their hospitality to strangers. Game is so extremely abundant in the vicinity of the city, that partridges and grouse are the daily and almost necessary food of all classes. The capercazie, or cock of the wood, is found in great numbers near the city only in winter, but it is brought from the country of the Ostiaks to the north, all the year round, as well as the black cock and other game.

Though Tobolsk has no manufactures, it has a very considerable transit-trade between European Russia and China. The European traders arrive in the spring with the goods destined for the Chinese, and at the end of summer the boats return with their cargoes for Moscow and St. Petersburg. The merchants from Tartary and Bokhara arrive at the beginning of the winter, and remain at Tobolsk till the spring. All the sums collected as tribute from the wandering tribes of the immense deserts are brought to Tobolsk, where there are extensive magazines for the deposition of the various descriptions of goods.

TOCANTINS, RIO. [BRASIL.]

TOCCO. [ABRUZZO.]

TODDINGTON. [BEDFORDSHIRE.]

TODI. [PERUGIA.]

TODMORDEN, Lancashire, a market-town and the seat of a Poor-Law Union, in the parish of Rochdale, is situated in 53° 48' N. lat., 2° 6' W. long., distant 53 miles W.S.W. from Lancaster, 202 miles N.W. by N. from London by road, and 210 miles by the North-Western and Lancashire railways. The population of the town of Todmorden in 1851 was 4632. The living is a perpetual curacy, in the archdeaconry and diocese of Manchester. Todmorden Poor-Law Union contains six townships, with an area of 84,994 acres, and a population in 1851 of 29,727.

Todmorden is situated chiefly on the left bank of the Calder River, which here divides Lancashire from Yorkshire. The town is lighted with gas. The manufactures of the town are important. There are several large cotton-spinning and manufacturing establishments, with powerful machinery; silk, woollen, and worsted works; and manufactories of steam-engines and machinery. Coal-works, chemical-

works, corn-mills, and iron- and brass-foundries, afford considerable employment. The old church is now only used for reading the burial service in. There are a modern church, and chapels for Independents, Baptists, Wesleyan, Primitive, New Connexion, and Association Methodists, Inghamites, Quakers, and Unitarians. There are a Grammar school, National schools, an Odd Fellows' hall, and a Rechabites' hall. A county court is held in the town. A market for corn is held on Thursday, and one for meat and vegetables on Saturday; also a monthly cattle-market. Fairs are held on the Thursday before Easter and on September 27th.

TOGGENBURG. [GALL, ST.]

TOKAT, or TOCAT, an open town of Asia Minor, situated in 40° 16' N. lat., 36° 45' E. long., is inclosed by hills on three sides, the only opening being to the north-east. A small stream runs through the town in the same direction, which joins the Tokat-Su (ancient Iris) a little below the city. The houses are built in some instances with unburnt bricks, but the greater part are merely wooden sheds, all are covered with tiles, and none of the roofs are flat. The streets are paved, but filthy, narrow, and, from the eaves of the houses nearly meeting overhead, very gloomy. Still some of the edifices are of good size, and parts of the town are tolerably neat for a Turkish city. Fires are frequent in Tokat. The luxuriant vegetation of the gardens in and near the town, the filthiness of the streets, and the abundance of fruit, occasion malignant fevers in summer and autumn. Tokat is under the Bey of Sivas. It contains about 8730 families, chiefly Musulmans and Armenians. An Armenian bishop resides here, who has under him 7 churches and 80 priests. The place has lost much of its former commercial importance, and the import trade is now limited to supplying the local consumption of the neighbouring villages. There are extensive cotton-dyeing and printing establishments; the cloths are partly those of the country, partly British calicoes and muslins. Copper from the mines of Arghana is brought to Tokat to be refined; and there are manufactures of the raw silk brought from Amasia and other places.

TOKAY, an ill-built town in Upper Hungary, on the river Bodrog, at its confluence with the Theis, contains 4500 inhabitants. It is situated in 48° 7' N. lat., 21° 25' E. long., at the foot of the Hegyalla, a chain of hills which is about 80 miles in length, and about 700 feet above the level of the sea. The whole of it, to the height of 250 feet, is planted with vines, which Bela IV. had brought to Hungary by Italian colonists. At the foot of the several vineyards of the Hegyalla the places are situated, the inhabitants of which are employed in the cultivation of the vine: the wines of Tallya, Tarczal, Zombor, Tolsva, and Mad, all which are in the neighbourhood of Tokay, are considered as the best. The whole annual produce is estimated at three to four millions of wine gallons. All these wines of the Hegyalla are comprehended under the name of Tokay.

Tokay, though a small town, is a place of considerable trade, not only as being the centre of the wine trade, but likewise having great magazines of salt, which is exported to all parts of the kingdom. The annual fairs are much frequented.

TOLEDO, Province of. [CASTILLA LA NUEVA.]

TOLEDO, a city of Spain, capital of the modern province of Toledo, in Castilla la Nueva, is situated on the north bank of the Tagus, in 39° 52' N. lat., 4° W. long., 42 miles S.S.W. from the city of Madrid. It is the see of an archbishop, who is primate of all Spain. The population in 1845 was 13,431.

The city of Toledo stands on a rocky eminence, nearly surrounded by the deep and narrow channel in which the Tagus flows, and is protected by a Moorish wall on the north or land side. The Tagus is here crossed by two fine stone bridges. The bridge of Alcantara was built by the Moors, and is a noble work, consisting of a single arch, which spans the whole stream, and affords a fine view of the river flowing far below, and of the castle, which stands on an eminence above. The streets are very narrow and crooked. The houses, which are mostly built in the Moorish style, have generally only one or two stories, and the apartments are arranged round a court. In this court, which is frequently ornamented with a fountain and flowers, and over which an awning is thrown, the family usually sit in summertime. The principal square is planted with trees and furnished with seats, and is much frequented as a promenade. The environs of the city are bare and unproductive, but the neighbouring mountains contain some green valleys, where the wealthy inhabitants have their country-houses.

The cathedral is one of the largest and finest in Spain. It stands on the site of the Moorish mosque, and the foundations were laid in 1258 by Fernando III. of Castilla, and Rodrigo Ximenez, at that time archbishop of Toledo. It consists of five naves, and measures 404 feet in length and 204 feet in width. The naves are supported by 84 colossal pillars, and the whole church is paved with white and blue marble. The architecture is of different periods and of different styles, but is for the most part of early gothic. The double clerestories produce an effect of singular lightness and elegance, and every window is filled with painted glass of the richest colours. Several of the chapels are exceedingly beautiful, and contain interesting monuments of kings and queens and other distinguished persons. The cathedral of Toledo was formerly celebrated for its jewels and its silver and gold ornaments, but most of them disappeared during the Peninsular

War, and the rest have since been disposed of by the government. Annexed to the cathedral is the archbishop's palace, which contains a very fine library rich in old manuscripts.

Besides the cathedral, there are several churches and conventual buildings of fine gothic architecture; and there are also some interesting structures of Moorish architecture. The convent and church of San Juan de los Reyes was built in 1476 by Fernando and Isabel, in commemoration of the victory gained over the Portuguese at Toro in that year. At a later period, the chains and fetters which had been worn by the Christian captives of Ronda and Granada were, after the taking of the latter city in 1492, suspended to the outside walls of this building, where they are still to be seen. The church and the cloister, built in the richest gothic, are particularly admired. The founding hospital of Santa Cruz, founded by Cardinal Mendoza in 1304—that of St. John the Baptist, called also El Hospital de Afuera, because it stands outside the city walls, built and richly endowed by Cardinal Tavera—San Juan de la Penitencia, which is a foundation of Cardinal Ximenez—are all well worthy of inspection. La Iglesia del Tránsito, which was formerly a Jewish synagogue, built during the reign of Pedro the Cruel, at the expense of his treasurer, Sammel Levi, is a curious specimen of Saracenic architecture. The church called Santa Maria la Blanca was once a Moorish mosque.

The Alcazar, or royal palace, stands on an eminence, at the foot of which flows the Tagus. It was built by Alfonso X. on the site of the Moorish palace, and was almost entirely rebuilt by Carlos V., who employed the best Spanish architects of his time. His son, Felipe II., made also considerable additions to it, which were principally directed by his chief architect Herrera. At present it is in a very dilapidated state. The court-yard, with its pillars and vaulted corridors, and the double staircase, are in a ruinous and neglected condition. The view from the top is very extensive, showing the whole of the city, the course of the river, and the brown waste of undulating ground which surrounds the city.

Toledo has a university, four colleges, several hospitals and asylums, a town-hall, and a mint. The Fabrica de Armas, where the famous swords of Toledo were and are still manufactured, is on the bank of the Tagus, about 2 miles S.W. from the city. Only some 70 or 80 workmen are now employed, but the fine temper, polish, and elasticity of the blades, are as perfect as in the times of their highest reputation. Other manufactures are coarse woollens, paper, guitar-strings, common glass, and leather.

Toledo is a very ancient city. It was the *Toletum* of the Romans, and portions of walls and an amphitheatre built by them still remain. It was taken by the Goths in the year 467, and by the Moors in 714. Under the Moors it became a city of the first class, second only to Cordova, the capital of the Mohammedan empire. It was taken by Alfonso VI., king of Castilla and Leon, in May 1085. It became afterwards a very flourishing city, and had at one time a population of 200,000, and contained, besides the cathedral, 20 parish churches, 6 other churches, 9 chapels, 3 colleges, 14 convents, 23 nunneries, and 10 hospitals.

TONBRIDGE, or TUNBRIDGE, Kent, a market-town and the seat of a Poor-Law Union, in the parish of Tonbridge, is situated chiefly on the left bank of the river Medway, in 51° 12' N. lat., 0° 16' E. long., distant 13 miles S.W. from Maidstone, 30 miles S.E. from London by road, and 41 miles by the London and South-Eastern railway. The population of the town of Tonbridge in 1851 was 4539. The living is a vicarage in the archdeaconry of Maidstone and diocese of Canterbury. Tonbridge Poor-Law Union contains 10 parishes and townships, with an area of 46,179 acres, and a population in 1851 of 28,545.

In the time of the Conqueror a castle was built at this place by Richard Fitz-Gilbert, afterwards earl of Clare; and the town rose under the protection of the castle. In the civil troubles of the reign of Henry III. the castle was besieged and taken from its owner, Gilbert Rufus, earl of Clare, Gloucester, and Hertford, by Prince Edward. During the siege the garrison burnt the town. There was a priory at Tonbridge, founded by Richard de Clare, first earl of Hertford, for canons of St. Augustine. The town consists chiefly of one street, which is broad, and lighted with gas. There are several bridges over the Medway, which is navigable for barges up to this point, and is here divided into various arms. Near the principal bridge is a wharf, whence the timber brought from the Weald is sent down the Medway. The church is a large and handsome fabric, in various styles of architecture. The Independents, Baptists, and Wesleyan Methodists have places of worship. There are a well-endowed Free Grammar school,

in the management of the Skinners' Company; National and Infant schools; a mechanics institute; a literary and scientific institution, with reading-room and library; a savings bank; and some almshouses. The town-hall and the market-house are good buildings. The market is held on the first and third Tuesdays in each month, and a fair on October 11th. The trade of the town is in coal and timber brought from Maidstone for the supply of the neighbourhood; gunpowder and fancy wooden wares (called Tonbridge wares, from the town) are made to a small extent. The ruins of the castle, which are near one of the bridges, consist of the gate-house, flanked with round towers, and tolerably perfect, and of the artificial mound on which the keep stood: the outer walls inclosed an area of six acres.

TONBRIDGE (or TUNBRIDGE) WELLS, Kent, a fashionable watering-place and market-town, is situated in 51° 7' N. lat., 0° 15' E. long., distant 18 miles S.W. by S. from Maidstone, 36 miles S.S.W. from London by road, and 46 miles by the Hastings branch of the London and South-Eastern railway. The population of the town in 1851 was 10,587. The living is a perpetual curacy in the archdeaconry of Maidstone and diocese of Canterbury.

The chalybeate spring, to which the town of Tonbridge Wells owes its origin, was first noticed in the reign of James I., when the wells were sunk and inclosed, but the visitors lodged at Tonbridge town, six miles distant. The soil is dry, and the air of the place is healthy, though somewhat cold. When Henrietta, queen of Charles I., visited the Wells, she and her suite remained under tents. Permanent habitations were subsequently erected in the immediate vicinity of the Wells. After the Restoration the place rapidly increased. A chapel was built at Tonbridge Wells dedicated to King Charles the Martyr; a subscription school was established, and an assembly-room, coffee-house, bowling-greens, and other places of amusement, were erected in the neighbourhood. The Wells, properly so called, are in the centre of the town, and near them are the markets, the chapel, the assembly-rooms, and the public walks or parades. The town-hall is a commodious building. Different groups of houses, forming boundaries of the town, are distinguished by the names of Mount Zion, Mount Ephraim, Mount Pleasant, and Bishop's Down. Trinity church is a handsome stone building, erected in 1829. Christchurch is a new gothic edifice. There is also an Episcopal chapel. The Roman Catholics, Wesleyan Methodists, Baptists, Independents, and the Countess of Huntingdon's Connexion, have places of worship. There are a Church of England Proprietary school; National, British, and Infant schools; a literary and scientific institute; a useful knowledge society; several libraries; an infirmary and dispensary; and a savings bank. A corn and general market is held on Friday. Horse-races are held annually. A horticultural society holds several exhibitions in the course of the year. Tonbridge Wells is famous for toys and small articles turned in holly, plum-tree, cherry-tree, sycamore, and various foreign woods, known as Tonbridge ware.

TOPCLIFFE. [YORKSHIRE.]

TÖPLITZ, a town in Bohemia, celebrated for its warm sulphureous springs, is situated in 50° 38' N. lat., 13° 50' E. long. The name is Slavonian, and given by the Bohemians and Croats to warm springs in general. This small town, which has not above 2800 inhabitants, is situated on a stream called the Saubach, in a beautiful plain or valley four leagues in length and one league in breadth, formed by the Erzgebirge and the Mittelgebirge. The town forms an irregular quadrangle, is about half a league in circuit, and has three gates. The principal buildings are—1, the palace of Prince Clary, to whom the town belongs, with an extensive garden and park open to the public, in which there is a ball-room and a pretty theatre; 2, the church of St. John the Baptist; 3, the town-hall, built in 1806; 4, the Chapel of the Cross, outside of one of the gates. The town is connected by a row of handsome houses with the village of Schönau. There are several springs both in the town and in Schönau, each of which supplies several public and private baths distributed in different establishments. "The quantity of water which the principal spring yields," says Dr. Granville, "is one million one hundred and eighty-nine thousand six hundred and seventy cubic inches in an hour." The temperature of these springs is 113° to 119° Fahrenheit in Töplitz; in Schönau 101° to 104°. The hot springs of Töplitz are very beneficial in cases of suppressed gout, chronic rheumatism, diseases of the joints, contracted limbs, old wounds, obstinate cutaneous eruptions, and paralytic affections. The waters have been used almost exclusively for bathing; of late they have been recommended and used internally. There are about 90 bathing establishments, many of which are fine buildings. The Austrian and Prussian governments have erected military hospitals. Between 10,000 and 20,000 visitors, including sometimes imperial and royal personages, visit Töplitz in the autumn. Gaming in Töplitz is wholly prohibited.

TOPPERSFIELD. [ESSEX.]

TOPSHAM, Devonshire, a market-town and seaport, in the parish of Topsham, is situated on the left bank of the river Ex, at the junction of the Clist, in 50° 41' N. lat., 8° 28' W. long., distant about 3 miles S.E. from Exeter, and 170 miles W.S.W. from London by road. The population of the town of Topsham in 1851 was 2717. The living is a perpetual curacy in the archdeaconry and diocese of Exeter.

Topsham was anciently called Apsam, or Apsom. The town extends about a mile along the bank of the Ex, with a quay at the lower end. The parish church is situated in the middle of the town, on a lofty cliff which rises abruptly from the river. In the church are monuments by Chantrey in memory of Admiral Sir J. T. Duckworth, and of his son, Colonel George Duckworth. The Wesleyan Methodists, Independents, and Unitarians have places of worship. There are National schools partly endowed. Topsham has a small coasting-trade, and likewise imports Baltic and American timber. Ship-building, and the manufacture of anchors, cables, and cordage, are carried on. The market is held on Saturday; and a fair on the first Wednesday in August.

TORBAY. [DEVONSHIRE; TORQUAY.]

TORGAU. [MERSEBURG.]

TORIGNY. [MANCHE.]

TORINO, an administrative division of Piedmont, is bounded N. by the province of Ivrea, W. by the Cottian Alps which divide it from France, S. by the provinces of Saluzzo and Alba, and E. by those of Asti and Vercelli. The division comprises the province of Torino, Pignerol, and Susa, the area and population of which are as follows:—

Provinces.	Area in Square Miles.	Population in 1848.
Torino	1,117	411,959
Pignerol	593	133,233
Susa	539	81,634
Total	2,249	627,026

The province of Torino extends on both banks of the Po, and along the watercourses of the Dora Ripuaria, the Sangone, the lesser Stura, the Oro, and other streams which come from the Alps and flow into the Po. The valley of Lanzo, north-west of Turin, which is drained by the lesser Stura, and reaches to the foot of Mount Iscran, which divides it from Savoy, is one of the finest and most picturesque districts in Piedmont. It supplies Turin with cattle and the produce of the dairy. It has also mines of iron and other minerals.

The principal towns, besides the capital, are the following:—*Chieri*, a well-built town of 12,000 inhabitants, situated on the hills of Monferrato, 6 miles E. from Turin, has several churches and convents with good paintings, and some noblemen's palaces, and a very fruitful territory. It is one of the chief markets for silk in Piedmont. *Moncalieri*, on the right bank of the Po, S. of Turin, on the high road to Alexandria and Genoa, has a royal palace, and 7300 inhabitants. *Carignano*, a town of 7000 inhabitants, in a fertile plain on the left bank of the Po, 11 miles S. from Turin, on the high road to Nice. *Carmagnola*, on the right bank of the Po, has 12,000 inhabitants, and is a great market for silk. *Chivasso*, a town of 7000 inhabitants, on the left bank of the Po, near the confluence of the river Orco, 12 miles N.E. from Turin, on the high road to Milan, in a plain abounding with corn and cattle. *Rivarolo*, in the valley of the Orco, has 5000 inhabitants. *Poirino*, on the road to Alexandria, has 5600 inhabitants. The province of Turin is very fertile and thickly inhabited. It is traversed by several railroads which connect the capital with Genoa, Cuneo, Pignerol, and Susa.

The province of Pignerol comprises the south-western part of the division, and lies between the Po and the Cottian Alps, branches of which also bound it on the north and south. In the south-east of the province are some level plains, but the greater part of the surface presents deep valleys screened by lofty ridges, covered partly with fine forest timber. The chief products are wheat, maize, fruit, good wine, chestnuts, and silk. Horned-cattle are numerous and of good breed. The province is traversed by the Clusone, a feeder of the Po; their confluence is on the eastern border between Villa-Franca and Carmagnola. The chief town, *Pignerol*, or *Pinerolo*, is situated on the Clusone, at the foot of the Alps, about 20 miles S.W. from Turin, with which it is connected by railway. It is a walled-town with a noble square, a fine cathedral, several churches and convents, large barracks, and a population of about 8000. The principal manufactures are broadcloth, paper, leather, iron, and silk.

The province of Susa is noticed under **SUSA**.

Biella, which has been referred to Torino, forms part of the administrative division of **VERCELLI**.

TORINO, **TURIN**, the capital of Piedmont, residence of the King of Sardinia, and place of meeting of the national parliament, is situated in 45° 5' N. lat., 7° 44' E. long., on the left bank of the Po (which here runs in a northern direction), and at the confluence of the Dora Ripuaria, in a wide and fertile valley, between the lower offsets of the Cottian Alps on the west, and the hills of Monferrato, which

GEOG. DIV. VOL. IV.

rise immediately above the right bank of the Po. The valley opens to the north-east into the wide plain of Lombardy. The population of the city is about 140,000.

Turin is one of the most regularly-built towns in Europe; most of the streets being in straight lines and intersecting each other at right angles, and the squares being also of a regular form. The streets are washed during the night by water drawn from the Dora. The buildings, though massive and lofty, are, generally speaking, plain, chiefly built of brick, and their appearance is uniform and monotonous. The town is about one mile and a quarter in length, and little more than half a mile in its greatest breadth; it was formerly surrounded by ramparts, which have been razed of late years, and additional buildings and promenades have been constructed in their place, and the city is still extending beyond its former limits. The citadel, which is regularly constructed, and one of the strongest in Italy, lies outside of the town to the westward. The principal streets of Turin are those leading to the four entrances of the town, which are—*Porta del Po*, on the road to Alexandria and Genoa; *Porta Susina*, on the western or *Mont Cenis* road; *Porta Nova*, on the southern road to Saluzzo and Nice; and *Porta Vittoria*, leading to Ivrea, Vercelli, Novara, and the other northern provinces. Several of the principal streets and squares are lined with arcades.

The principal square is the *Piazza Castello*, in the centre of the town, so called from an old castle, or palace, which stands in the middle of it, and which was formerly the residence of the dukes of Savoy. It has a handsome façade, ornamented with sculptures. The northern side of the square is formed by the modern royal palace, a vast structure, with gardens at the back of it: the apartments are handsome, and contain a rich collection of Flemish and Italian paintings and a library. Adjoining to the palace is the cathedral of San Giovanni Battista, with the annexed handsome *rotonda* chapel, *Del Sudario*, cased with black marble, and adorned with gilt bronzes. On the eastern side of the square is the great theatre, one of the largest and finest in Italy, constructed by the architect *Alfieri*. Another remarkable building of Turin is the University, built by king Victor Amadeus at the beginning of the 18th century. It is a fine building, with a spacious court, surrounded by arcades, which are lined with ancient bassi-relievi, and inscriptions fixed in the walls. The library of the university contains above 112,000 volumes and about 2000 manuscripts. The Gallery of ancient Statues contains many remarkable objects of ancient art. The Cabinet of Medals, one of the richest in Europe, contains 30,000 pieces. The Egyptian Museum, which is in the building of the Royal Academy of Sciences, is one of the richest collections of the kind in Europe. It contains among others the colossal statue of *Ozymandias*, 15 feet high; those of *Thothmes II.* and of *Amunoph II.*: and that of *Remeses II.*, or *Sesostris*, which is considered one of the handsomest specimens of Egyptian sculpture; a collection of Egyptian paintings on stone, a quantity of utensils, articles of dress and ornaments, numerous mummies, and a vast collection of papyri and manuscripts on linen, found in the catacombs of Thebes: among others, a funeral ritual, 60 feet in length; and the fragments of a chronological table of the dynasties of the kings of Egypt previous to the 18th dynasty.

The University consists of five faculties—divinity, law, medicine, surgery, and arts. There are also belonging to the University a museum of natural history, a museum of anatomy, a chemical laboratory and hydraulic apparatus, and a rich botanical garden at the *Valentino*, outside of the town, near the banks of the Po. The Royal Academy of Sciences consists of forty members, besides non-resident and corresponding members: it is divided into two classes, mathematical and physical sciences, and moral, historical, and philological sciences. The academy, which was instituted in 1783, has published many volumes of memoirs.

Turin has also an observatory, an academy of the fine arts, a philharmonic academy, a royal agricultural society, and a military college. There are communal schools, divided into classes, in each district of the town; and also schools for drawing applied to the mechanical arts; and schools for the deaf and dumb and the blind. Turin has also a great number of well managed charitable institutions, and a *monte-di-pietà*, which lends money to the poor without interest upon pledge.

Turin is an archbishop's see, whose province extends over the sees of Alba, Acqui, Asti, Cuneo, Fossano, Mondovì, Ivrea, Pinerolo, Saluzzo, and Susa. The metropolitan diocese contains the chapters of Turin, Moncalieri, Rivoli, Chieri, Carmagnola, Sandalmazzo, Giaveno, and Savigliano; and the clerical seminaries, or colleges of Turin, Giaveno, Erà, and Chieri. The archbishop formerly had a court for ecclesiastical suits; but by recent legislation these institutions have been suppressed in Piedmont, and the clergy made amenable to the common law tribunals of the country.

Turin contains a great number of churches, few of which are remarkable for their external architecture. The most worthy of notice are those of San Filippo Neri; the *Consolata*; the *Corpus Domini*, which is very richly decorated; *Santa Teresa*; *Santa Cristina*; *La Trinità*; and *San Carlo Borromeo*. There are numerous convents and nunneries; but these by a recent law have been all suppressed, with the exception of those belonging to orders such as the Brothers of the Christian Schools, the Sisters of Charity, and a few others,

whose inmates are engaged in works of active benevolence. In the suburb, on the right bank of the Po, facing the bridge, is the fine church Della Gran Madre di Dio, raised by the municipality of Turin, in memory of the restoration of the dynasty of Savoy, in 1814. It is an imitation of the Pantheon of Rome: it is cased with marble, and adorned with marble pillars. Higher up on the hill is the Capuchin church and convent Del Monte, beautifully situated, and enjoying a splendid view of the plain of Turin, the town, and the river, and of the crescent of the snow-capped Alps, from the lofty pyramid of Mont Viso on the west, to the picturesque group of Monte Rosa on the north-east. On a higher hill on the same side of the Po, but farther north, about 2000 feet above the sea, and 5 miles from Turin, is the Royal Basilica of La Superga (super terga montium), containing the tombs of the princes of the house of Savoy. It is a handsome structure; its lofty dome is seen at a great distance, and is the first object that strikes the traveller on approaching Turin. Every year, on the 8th of September, a great festival takes place at Superga: high mass is performed, at which the court generally attends, and multitudes from Turin and the country around repair to the spot. A handsome Protestant church has been recently opened in Turin.

The manufactures of Turin consist chiefly of woollens, silks, hosiery, leather, paper, chinaware, carriages, arms, and tapestry.

Turin has several theatres, besides the royal theatre already mentioned: the theatre of Carignano, for the opera; the theatre d'Angennes, for dramatic pieces unaccompanied by music; and the new theatre. The coffee-houses of Turin are numerous. Besides the buildings already mentioned may be named as worthy of notice the palace of Carignano, the palace Birago di Borgaro, and that of the Marquis de Prié. The royal country-house, called Vigna della Regina is a pretty villa finely situated on the hill on the right bank of the Po. The royal hunting palace and park of Stupinigi, 4 miles from Turin, are very fine; the palace was begun by Giuvara, and enlarged by Alfieri, the architect. At La Venaria, once a royal residence, about 8 miles north of Turin, is the royal riding-school, stud, and veterinary college. The King of Sardinia has also palaces at Moncalieri, on the south side of the Po, about 5 miles from Turin, and at Rivoli, 10 miles from the capital, on the high road to Susa and Mont Cenis; besides the royal palaces of Chambery and Gance, which he uses when he visits those parts of his dominions.

Turin is connected by railways with Genoa, Alessandria, Novara, Cuneo, Pignerol, and Susa; and by electro-telegraphic wires with all the chief towns of Europa. Diligences and post-coaches, called velociferi, run between the capital and the provincial towns that do not lie on any of the railway lines. The common language of conversation among the natives is the harsh Piedmontese dialect; but Italian is the written and official language, and educated people speak both Italian and French. The climate of Turin is colder in winter than that of Genoa or Rome.

The ancient Taurini were a tribe of the Ligures, who inhabited the country between the Po and the Cottian Alps. They were the first people whom Hannibal met after descending the Alps, and he took their town by force previous to advancing to the Ticinus. (Livy, xxi. 39.) They and the other Ligurians north of the Apennines were subdued by the Romans about B.C. 166. Augustus sent a Roman colony to the town of the Taurini, which then took the name of *Augusta Taurinorum*. Under the Longobards Turin was the head town of a duchy: under the Carlovingians it gave name to a county of considerable extent and importance. In the 10th century Odelric Manfredi was count of Turin, as marquis of Italy. His daughter the marchioness Adelaide married Oddo, count of Maurienne, and from this marriage the house of Savoy derives its origin. [SARDINIAN STATES.] During the war of the investitures Turin gained a kind of independence, but in the early part of the 12th century the emperor Lotharius reduced it again to subjection; and appointed a count for its political governor. The emperor Frederick I. made over, in 1159, to Charles, bishop of Turin, all his imperial rights over that town and the territory for ten miles round. The bishops and commune of Turin remained for about a century after this independent of, often at variance with, the counts of Savoy, who at last asserted again their suzerainty over the town and the right of appointing its chief magistrates. From that time the history of Turin is merged into that of the dynasty of Savoy, whose permanent residence it became ultimately. [SARDINIAN STATES.]

TORNEA. [FINLAND.]

TORNEA-ELF. [BOTENIA.]

TORO. [LEON.]

TORONTO, province of Canada, North America, an incorporated city and the capital of Canada West, is situated in the Home District, about 40 miles from the head of Lake Ontario, on its northern shore, in 43° 35' N. lat., 79° 20' W. long., distant 399 miles S.W. by W. from Montreal, 560 miles S.W. from Quebec. The city is governed by ten aldermen and ten councillors, one of whom is mayor; and returns two members to the provincial parliament. The population was 1200 in 1817; in 1836 it was 9652; in 1851 it was 30,775.

The city of Toronto occupies a low and gently-rising site, fronting a fine bay, and extends nearly three miles along shore, and above a

mile inland, the streets intersecting each other at right angles. Many of the houses are neat frame buildings, the greater number are of brick, and there are some superior stone structures. The streets are well paved and lighted with gas, and there is a plentiful supply of good water from wells. The cathedral church of St. George was destroyed by fire in 1849, and has been rebuilt. Trinity church is a spacious structure of brick, erected by means of a donation from an English gentleman, in order to provide free sittings for the poor. St. Paul's church is a handsome gothic structure with a lofty slender spire. The Roman Catholic cathedral is a vast and richly-finished brick pile, having attached a handsome residence for the bishop. The Endowed Scotch church is a small well-built structure, with a turret; the Free Scotch church is a fine brick edifice, with a lofty well-proportioned spire; the United Presbyterian church, built in 1849, at a cost of 2500*l.*, is a handsome gothic structure of brick, with a tower and octagonal turret 80 feet high. There are two Independent and two Methodist churches; one Reformed Presbyterian, one Baptist, one Primitive Methodist, and one African Methodist church. The educational institutions are—the University of Toronto; the Upper Canada College, an excellent classical seminary, supplementary to the district Grammar schools; the Normal and Model schools and education offices for Upper Canada; the Episcopal college; the Free church college for general tuition and theological training; the United Presbyterian and Independent Divinity halls; and the common schools of the city districts. There is a mechanics institute in the city. The government house is a handsome brick mansion, in a well-planted enclosure; the halls of the Legislative Council and Legislative Assembly, a brick edifice, consisting of a centre and wings, occupy a terrace fronting the bay; the court-house is a plain building in the centre of the town; an elegant stone structure, containing the town-hall and assembly-rooms, has been recently erected on the site of one destroyed by fire; Osgood Hall, comprising law-courts and lecture-rooms, is a handsome Grecian structure of stone, occupying a spacious square adjoining the University grounds; the jail is a substantial building of granite on the radiating plan; the hospital, the market, the mechanics hall, and the custom-house are respectable brick buildings. The old barracks are at the west end of the town on the shore of the bay, and about a mile farther the new barracks, or garrison, form an extensive group of buildings at a point where a regular battery has been constructed to command the entrance to the harbour. At a short distance inland from the garrison is the Provincial Lunatic Asylum.

The harbour of Toronto is formed by a long flat strip of land called the Island, extending from the east side of the town in a south-westerly direction about six miles, and terminating in Gibraltar Point, on which there is a lighthouse. The bay, which is about a mile and a half wide, is entered by a channel near the northern shore. There are several wharfs and landing piers, lined in some places with extensive storehouses. Toronto is the centre of the wholesale trade to an extensive back country, from which a large proportion of the exported grain and flour is shipped at the harbour. Schooners, sloops, and propellers ply between the port and Oswego, Rochester, Niagara, Hamilton, and the other places on Lake Ontario, and ascend to the upper lakes. Propellers convey great quantities of flour to Montreal, and some proceed as far as Halifax or Nova Scotia. Mail and passenger steamers sail daily across the lake, up to Hamilton and down the St. Lawrence to Montreal. There are in the city a brewery, a foundry, and a considerable establishment for the manufacture of furniture by machinery. Extensive nurseries are in the neighbourhood, and some flour-mills are on the Don, a small river which flows from the north, and has a marshy outlet at the head of the bay.

Toronto has been since 1849, alternately with Quebec, for a period of four years, the residency of the governor of the province and the seat of the legislature. It contains the supreme courts of law for Canada West, the courts of Queen's Bench, of Common Pleas, and Chancery, besides the assize courts for the district, and mayor and police courts. The city is for the most part remarkably healthy, and the extremes of temperature are seldom oppressive. The mean temperature of summer is 63.8° Fahr., of winter 26.4°, of the whole year 44.4°. The town was founded by Governor Simcoe in 1794, under the name of York, which name it retained till 1824, when it was incorporated by Sir John Colborne, who gave it the name of the district—Toronto.

TORPHICHEN. [LINLITHGOWSHIRE.]

TORPOINT. [CORNWALL.]

TORQUAY, Devonshire, a small sea-port and watering-place on the coast of the English Channel, in the parish of Tor-Moham, or Tor-Moham, and hundred of Haytor, is situated in 50° 28' N. lat., 3° 33' W. long., distant about 80 miles S. from Exeter, 194 miles W.S.W. from London by road, and 219 miles by the Great Western and South Devon railways. The population of the town of Torquay in 1851 was 7903. The living is a perpetual curacy in the archdeaconry of Totnes and diocese of Exeter.

About fifty years ago Torquay consisted only of a few mean huts inhabited by fishermen. The mildness of the climate, and the favourable position and picturesque character of Torquay, induced many eminent physicians to recommend it as a winter residence for invalids. The abundance of building stone, which is found in the vicinity, pre-

sents great facilities for building. The town has consequently very much increased. Torquay lies in a small sheltered recess at the north-eastern extremity of Torbay. On all sides landward it is inclosed by lofty hills, on the sides of which the houses are built. The town is lighted with gas and paved, but the supply of water is insufficient. There are two chapels of the Establishment, a Free Episcopal church, chapels for Independents and Baptists, and National schools. Torquay contains assembly-rooms, a club-house, subscription- and reading-rooms, a museum, and baths. The pier, which is used also as a promenade, incloses a small but convenient tidal harbour. The rise of tide at spring-tides is about 18 feet. The imports consist chiefly of American timber, coals and culm, Portland stone, corn, bricks, slates, and general goods; the exports include earthenware, elder, elm and oak timber, and yellow-cobra.

TORRE DELL'ANNUNZIATA. [NAPLES, Province of.]

TORRE DEL GRECO. [NAPLES, Province of.]

TORRES STRAIT was named after the Spanish navigator Luis Vaez de Torres, who was the first to pass through it in 1606. It is situated between the most north-eastern part of Australia and the southern coast of Papua or New Guinea. Properly speaking it does not exceed 80 miles in length from east to west, and is situated between 142° and 142° 40' E. long. The most northern point of Australia, Cape York, is in 10° 42' S. lat., and the opposite coast of Papua is 9° 15' S. lat. Thus the extent of the strait from south to north is about 100 miles. Navigators however give to the strait a much greater extent, as they consider it to begin on the east with the Pandora Entrance, situated between extensive reefs near 144° 40' E. long., so that, according to them, Torres Strait extends from 142° to 144° 40' E. long., or 180 statute miles from east to west. The navigation of Torres Strait though practicable is rendered dangerous and tedious by innumerable shoals, ledges, coral reefs, and islands. Among the islands the principal groups are the Prince of Wales Islands, Mulgrave Islands, and Banks Islands. The strait can only be navigated between March and September, during the south-east monsoon; in the other six months of the year, or during the period of the north-west monsoon, the fogs prevail in the strait to such an extent, that no vessel can venture to enter among its almost innumerable reefs and rocks.

Two different routes are taken by vessels in sailing to Torres Strait, and in passing through it. They are distinguished as the Inner and Outer route. The Inner route lies along the coast of Australia, and between it and the Great Barrier Reefs, which begin, according to Flinders, in 22° 50' S. lat., 152° 40' E. long., and extend nearly parallel to the coast of Australia to Torres Strait, through 14 degrees of latitude and 9 degrees of longitude, and are as to length not equalled in any part of the world. Their breadth is about 50 or 60 miles in their southern part, but diminishes to the northward. The arm of the sea inclosed between the barrier and the coast is from 60 to 80 miles wide towards the south, but it contracts gradually to 20 miles near the great opening, and is still narrower farther north. Numerous islands are scattered in this inclosed space, but no other coral-banks occur except those which surround some of the islands. Being sheltered from the strong swell of the Pacific by the barrier, the water is smooth, and it also offers the advantage of regular soundings, its depth not being very unequal, and varying only from 60 fathoms at the southern end to 80 fathoms at the great opening, and to 20 fathoms at Cape Tribulation. This was the common route of communication between Sydney and Port Essington. Vessels sailing by this track pass through Torres Strait by sailing round Cape York and through Endeavour Strait. The last-mentioned strait is formed by the mainland of Australia and some of the islets belonging to the Prince of Wales Islands, and constitutes the southern part of Torres Strait. It is about 80 miles long, and from two to six miles wide, and offers a safe passage for vessels of good size.

The Outer route, which lies through the Corallian Sea, is dangerous, owing to the great number of reefs which are dispersed over it north of the southern tropic. After passing through Pandora Entrance the vessels enter Torres Strait by sailing north of the long reef, situated at the entrance of the strait (144° E. long.), to Murray Islands, and traverse the strait by sailing west-south-west between innumerable low islands, shoals, and rocks. They do not enter Endeavour Strait, but keep at the distance of about 20 miles from it to the northward, until they have passed on the north of Wednesday and Good's Islands, when they leave the strait and enter the Indian Sea.

TORRES VEDRAS. [ESTREMADEIRA, Portuguese.]

TORRINGTON, or GREAT TORRINGTON, Devonshire, a market-town, municipal borough, and the seat of a Poor-Law Union, in the parish of Great Torrington, is situated on a hill on the right bank of the river Torridge, in 50° 57' N. lat., 4° 10' W. long., distant 85 miles S.W. from Exeter and 194 miles W. by S. from London. The population in 1851 was 3308. The borough is governed by 4 aldermen and 12 councillors, of whom one is mayor. The living is a perpetual curacy in the archdeaconry of Barnstaple and diocese of Exeter. Torrington Poor-Law Union contains 23 parishes and townships, with an area of 81,472 acres, and a population in 1851 of 17,491.

Torrington is a town of some antiquity. A castle formerly stood on its south side; the site is now a bowling-green. The town is lighted with gas. The church is perpendicular in its general style, with some

traces of decorated character. The Wesleyan Methodists, Independents, and Baptists have places of worship. There are National schools. A county court is held in the town. The chief manufacture is that of gloves, which are made of Lisle thread, silk, and kid; some cloth is made. The market-day is Saturday. Several fairs are held in the course of the year.

TORRISDALSL-ELF. [NORWAY.]

TORSCHOK. [TWEE.]

TORTOLA. [VIRGIN ISLANDS.]

TORTONA, a province of Piedmont in the administrative division of Alessandria, is bounded N. by the Po, which divides it from the province of Mortara; E. by the provinces of Voghera and Bobbio; S. by the Ligurian Apennines, which separate it from the duchy of Genoa; and W. by the province of Alessandria. The rivers of torrents, Scrivia and Curone, both affluents of the Po, rise in the Ligurian Apennines, and cross the province of Tortona from south to north. The surface is generally level except towards the south, which is covered by branches of the Apennines. The soil is fertile, and yields rice, wheat, flax, hemp, fruits, wine, silk, &c. The province contains 257 square miles, with a population of 58,858. The head town, Tortona, built upon an eminence near the right bank of the Scrivia, 12 miles E. from Alessandria, is a bishop's see, and has about 9000 inhabitants, several churches and convents, and a royal college. The citadel of Tortona was built by King Victor Amadeus III., and destroyed by the French in the revolutionary wars. West of Tortona, in the direction of Alessandria, is the plain of Marengo, with the villages of Marengo and San Giuliano, where Bonaparte defeated the Austrians in June, 1800. Tortona was anciently a town of the Ligurians, and was called Derton or Dertona. After the Roman conquest it became a colony (Pliny, 'Hist.' iii. 7), and was a place of importance, being situated on the road leading from the banks of the Po to the coast of Liguria and Southern Gaul. The other towns of the province of Tortona are—*Osténeso di Sorivia*, a town of 5500 inhabitants, north of Tortona, and near the confluence of the Scrivia and the Po, and *Sala*, a town of 4000 inhabitants, near the confluence of the Bormida and the Po. In these Apennine districts in the south of the province the inhabitants are mostly shepherds and goatherds, and their cheese is an article of exportation, as likewise are the mushrooms which grow abundantly here, and are dried and exported chiefly to Genoa.

TORTOSA. [CATALUÑA.]

TORTUGA. [ANTILLES, *Venezuela*.]

TORTUGAS. [FLORIDA.]

TOTANA. [MURCIA.]

TOTHAM, GREAT. [ESSEX.]

TOTNES, or TOTNESS, Devonshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Totnes, is pleasantly situated on the slope of a hill on the left bank of the river Dart, in 50° 25' N. lat., 8° 41' W. long., distant 23 miles S. by W. from Exeter, 196 miles W.S.W. from London by road, and 223 miles by the Great Western railway. The population of the borough in 1851 was 4419. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. Totnes Poor-Law Union contains 28 parishes and townships, with an area of 98,842 acres, and a population in 1851 of 34,022.

Totnes is mentioned in the Exon Domesday as held by Jubal de Toteneis, who founded here a Clunian priory, and erected a castle. A handsome modern bridge of three arches over the river Dart connects Totnes with the small suburb of Bridgetown. Totnes is lighted with gas. The principal street runs down the hill to the bridge, and is paved; several of the houses are ancient, with upper stories projecting over the footpath, and supported by pillars. In the main street is an ancient gateway, which was purchased a few years ago by Lord Seymour (now the Duke of Somerset) for 1000*l.* and presented to the town for the use of a literary institute and library. On an artificial mound, commanding a fine view of the town and the surrounding country, is the circular keep of the ancient castle. The Church Walk, or Exchange, consists of a large room with ten windows fronting the street, supported by granite pillars: underneath is a colonnade for the merchants. The church is a handsome structure of late perpendicular, having a well-proportioned tower with pinnacles at the west end. There are chapels for Independents and Wesleyan Methodists. There are a Grammar school; an endowed Blue-Coat Charity school; National, British, and Infant schools; and a mechanics institute with a library. There are a guildhall and a small jail, a handsome and spacious market-house, a small theatre, and an assembly-room. An island in the river Dart, just below the bridge, is laid out in an ornamental manner as a garden with walks. The extensive grounds around the castle are open to the public. Totnes has some trade in corn, coal, and culm, which are imported, and in cider, which is exported. There is a salmon fishery in the river above the town. The market is held on Saturday; a great cattle-market monthly; fairs are held on May 12th and October 28th. Races are held yearly. Totnes has sent two members to Parliament from the 23rd of Edward I.

TOTONICAPAN. [GUATEMALA.]

TOTTENHAM. [MIDDLESEX.]

TOUL. [MEURTHE.]
TOULE. [FINISTÈRE.]

TOULON, a seaport-town and naval harbour in France, on the coast of the Mediterranean, capital of the fourth arrondissement in the department of Var, 428 miles in a direct line S.S.E. from Paris, is situated in 43° 7' 18" N. lat., 5° 56' E. long., and has 45,570 inhabitants in the commune, according to the census of 1851.

Toulon existed in the time of the Romans, and is noticed as a harbour in the Itinerary of Antoninus, under the name of *Telo Martius*. The geographer of Ravenna calls it simply Telo; and from the 'Notitia Dignitatum per Gallias,' it appears that the principal government dye-house in Gaul was here. (Bouquet, 'Recueil des Historiens des Gaules et de la France,' tom. i.) A bishopric was established here in the 4th century, which continued till the Revolution: the bishop was a suffragan of the archbishop of Arles.

In the middle ages Toulon was repeatedly ruined by the Saracens, and as often recovered from the disaster. Louis XII., to protect it from the pirates of Barbary, commenced the erection of a large tower, which was completed by François I. In the year 1536 it was taken by the Constable of Bourbon, then commanding the imperial army. Henri IV. strengthened the fortifications of the town, and formed a harbour for merchant vessels. Louis XIV., designing to make it one of the barriers of France on the side of Italy and the Mediterranean, established the royal dockyard, and caused the whole town to be fortified by Vauban. It was attacked without success in 1707 by the Duke of Savoy by land at the head of a formidable army, and by the combined English and Dutch fleets by sea. In 1793 it was occupied by a detachment of marines from the English and Spanish fleets then cruising off the port, and was subsequently garrisoned by a strong force of the English and their allies and of the French royalists. It was soon besieged by the French, the artillery being directed by Napoleon Bonaparte. The capture of General O'Hara, and the taking of Fort Eguillette, on a point of land between the inner and the outer road, obliged the allies to evacuate the town, after burning the arsenal and carrying away or burning nearly all the vessels in the harbour. The town, in consequence of its having been given up to the allies by the townsmen, lost its rank of capital of the department, which has never been restored to it.

Toulon is open on the south side to the harbours and road, but is sheltered on the north by the lofty Mount Pharon, and on the east and west by hills of less elevation: from its position, the heat in summer is very great. The road is an inlet of the Mediterranean, having its opening towards the east; and is divided into two parts, the inner and the outer road, by two headlands, which extend into the road on each side so as to form a narrow strait: on the north side of the inner road are the Old Harbour, or mercantile harbour, on the east, constructed by Henri IV.; and on the west the Naval Harbour, constructed by Louis XIV. North of these two harbours is the town. These two inner harbours are separated from the inner road and from each other by moles or piers: they have each a narrow entrance, passable only by one vessel at a time; and there is a passage communicating between the two with a swing-bridge. The Old Harbour is surrounded by a large and handsome quay, along which, on the north or town side, are a number of good houses. The New or Naval Harbour is surrounded by the various buildings connected with it as a naval port. On the north side are the dockyard and arsenal, containing the various storehouses for the navy; covered slips for building vessels; sailmakers' and other workshops; armouries, in which is a fine collection of ancient arms; the naval school, with a fine library, and a collection of models of vessels of every kind; the school of naval artillery; and, on the north side of the dockyard, the rope manufactory, above 2000 feet long, built of freestone, with a vaulted roof. On the east side of the naval port, and at the eastern extremity of the south side, are the bagne, or convict-house, and the hospital for convicts: they are built on the moles which inclose the harbour, and usually contain from 4000 to 5000 convicts. In the same quarter are three basins for the construction or repair of vessels. The dépôt of artillery is on the west side of the harbour, and is inclosed in one of the bastions of the town. Both town and harbours are surrounded, except towards the road, by a wall strengthened by bastions, and by a ditch. Without the ditch, on the west side, adjacent to the dockyard, is the government bakehouse. At the south-eastern angle of the town new basins, wet docks, and yards for the construction of steamers and sailing-vessels have been formed: this quarter is entered from the quay along the commercial harbour by a new gate.

The town is entered by two gates, the Gate of France on the north-west and the Gate of Italy on the north-east, through which the road from Genoa, Nice, and Fréjus enters. Adjacent to the town, on the north side, is a walled inclosure, called the Entrenched Camp of St. Anne: a great number of detached outworks occupy various positions round the town, and are considered to form so well arranged a system of defence, that the place is regarded as impregnable. The dépôt of artillery for the land service occupies one of the bastions on the north side of the town, and there are handsome barracks. The Champ de Mars, or exercise ground, is on the north-east side, without the walls.

The older part of the town is in the centre, and is surrounded on the north and east by a wide street or boulevard, apparently occupying the site of the old town-wall. The southern part of this boulevard is

called the Cours, which runs from the harbour past the former cathedral into the Rue-la-Fayette, forming a long symmetrical promenade bordered with fine trees. East of the Cours are streets whose regularity indicates their modern origin; and on the west side of the old town, and north of the dockyard, are other new streets regularly laid out. The streets are well paved and the houses well built; there are some squares, but all small, except the Place-d'Armes. Both streets and squares are furnished with fountains.

Toulon has the ex-cathedral of Notre-Dame, now called L'Eglise-Majeure, and three other parish churches—St. Jean, St. Pierre, and St. Louis. Notre-Dame is decorated by several works of the sculptor Puget. The front of the church of St. Louis has a good colonnade. Adjacent to the Eglise-Majeure is the college, which is a good building. There are a marine hospital, a military hospital, a foundling, and another hospital; the ex-episcopal palace; the office of the maritime prefect, forming one side of the Place-d'Armes; a court-house; an exchange; a town-hall on the quay of the old or mercantile port; a theatre; and several bathing establishments. Some of these are outside of the walls of the town. Toulon has a public library of 8000 volumes, a medical library, a museum of natural history, a botanic garden, an observatory established in the naval hospital, a savings bank, a mont-de-piété, and several charitable institutions. The lazaretto is on the south side of the outer road, at some distance from the town.

The business of the place connected with the government establishments is very great. There are also manufactures of soap, coarse woollens, morocco leather, chocolate, vermicelli, and candles. Merchant vessels are built. Trade is carried on in wine, brandy, oil, olives, dried fruits, corn, flour, and other productions of the neighbourhood. The low grounds in the neighbourhood produce excellent vegetables, figs, olives, oranges, grapes, and capers.

Toulon ranks as the second naval port in France, and is the residence of a number of officers connected with the administration of the naval department. It has a tribunal of first instance, a tribunal of commerce, and a marine tribunal. Steamers ply regularly between Toulon and Algiers, Corsica, Italy, and most parts of the Mediterranean.

TOULON-SUR-ARROUX. [SAÔNE-ET-LOIRE.]

TOULOUSE, the ancient *Tolosa*, a city in France, formerly capital of the province of Languedoc, now of the department of Haute-Garonne, is situated at a distance of 363 miles S. from Paris, in 43° 35' 40" N. lat., 1° 26' 35" E. long., and had 85,554 inhabitants in the commune at the census of 1851.

Tolosa belonged to the Volca Tectosages, a Celtic nation. An enormous treasure in gold and silver, deposited in the temples or consecrated places of the city, was seized by the Romans under Cæpio, B.C. 106. (Anlus Gellius, 'Noctes Atticæ,' III. ix.) Toulouse was afterwards subject to the Romans, the Visigoths, and the Franks, and in the middle ages had counts of its own, who were potentates of great importance in the south of France. [LANGUEDOC.] The last historical event of importance connected with it was the battle fought (April 10th, 1814) between the allied army under the Duke of Wellington and the French under Marshal Soult, who was defeated, and obliged to evacuate the town.

Toulouse is situated on the right bank of the Garonne, which, flowing from the south, bends westward, forming a crescent, on the concave side of which the town stands. As the Canal-du-Midi, or Canal-de-Languedoc, which unites the Garonne with the Mediterranean, opens into the river a short distance below the town, and has its course for some distance parallel to the river, the site of the town and its suburbs is a peninsula, inclosed between the Garonne, close to the town, on the west, and the canal at a little distance on the north and east. On the south side, but at some distance, are the heights of Pech-David; and on the east, beyond the canal, and between it and the little river Lers (which flows parallel to the canal, and falls into the Garonne below it), are the heights of Mont Rave, on which the fiercest part of the battle of Toulouse, in 1814, took place.

The town and the suburb of St.-Cyprien, which is on the opposite bank of the river, are inclosed by walls, erected in the middle ages, and are united by a bridge of seven arches, the Pont-Neuf, about 860 feet long, erected under Louis XIV., from the designs of Souffron, which crosses the river in the middle of the bend. The river is lined with handsome quays. The walls, which have nine gates, were in 1814 tolerably entire (Napier, 'Peninsular War'), but are fast disappearing in the progress of improvement. Besides St.-Cyprien, there are several other suburbs. On the south-east side of the town, between the suburbs St.-Etienne and St.-Michel, is the Esplanade, a circular space surrounded by trees, planted so as to form four concentric circles, and having six avenues radiating from it, each with four rows of trees, forming three alleys. The streets of the town are narrow, crooked, ill paved, and dirty; the squares irregular in form; the houses high, built generally of brick in an old rambling style, but many are constructed with planks. Improvements however have been recently effected. Of the squares, the Place-Royale, Place-St.-George, and Place-Angoulême are the handsomest. Numerous detached fountains, some of which are very handsome, and a hundred fountains issuing from walls, serve to cleanse and refresh the streets.

The principal public buildings are the cathedral, the capitol or Hôtel-de-Ville, the ex-archiepiscopal palace, and the church of the Grands

Augustina, now occupied as a museum. The nave and portal of the cathedral are more ancient than the choir. The choir, erected in the 16th century as part of a new edifice designed to replace the older one, is described by the same author as one of the most beautiful in France. The choir is not in a line with the nave; so that the whole structure has a very irregular figure. The town-hall, or capitol, is almost entirely a modern building, erected on the site of a more ancient one. It has a front of about 380 feet long by 128 feet high, and is of most imposing appearance. A gallery termed 'Galerie des Illustres,' is set apart for busts of those persons, natives of the city or connected with it, whom the town has thought worthy of the honour of a place.

The ex-palace of the archbishop, now occupied by the prefect of the department, is the handsomest modern building after the capitol. The museum in the cloister and church of the Grands Augustins contains a number of antiquities, which have been collected in the department. Besides these edifices may be noticed the theatre, the new court-houses, the veterinary school, the church of La-Dorade, built on the site of an ancient heathen temple, and that of St. Saturnin, the interior of which is very impressive; the vast hospitals of the Hôtel-Dieu and St. Joseph-de-la-Grave, the Bazacle and Château corn-mills, the Calvinist chapel, the synagogue, the abattoirs, and the bridge and bas-relief at the junction of the Canal-du-Midi and the Canal-de-Brienne. This latter canal, which is very short, connects the Garonne at the mill of Bazacle, adjacent to the town wall, with the Canal-du-Midi. In the Île-de-Tounis, a small island in the Garonne opposite the town, and indeed forming part of it (for the island is covered with buildings), are the ruins of the Castle of Narbonnais, the former residence of the counts of Toulouse. Toulouse has scarcely any remains of Roman buildings. There are a large public garden, a botanic garden, rich especially in plants from the Pyrenees, and in exotics, where courses on instruction in botany are given; an observatory and a public walk, 'Cours Dillon,' in the Faubourg St.-Cyprien, on the bank of the Garonne.

Toulouse has bell-foundries and copper-mills, a very large manufactory of sickles, files, and other hardwares, and a number of establishments for different branches of the iron-manufacture; printing-offices, oil-mills, brandy-distilleries, breweries, dye-houses, tan-yards, rope-walks, flour-mills; manufactories of wax, wax-candles, paper-hangings, oil-cloth, musical strings, morocco leather, cotton- and woollen-yarn, blankets, counterpanes, printed cottons, hats, straw-hats, earthenware, porcelain, and snuff. Trade is carried on with Spain, with the ports of Bordeaux and Marseille, and with the interior: the Spanish trade is the most important. The chief export is of wheat and flour, the produce of the surrounding country, which was eminent for its productiveness in corn as early as in the time of Cæsar. ('De Bell. Gall.' i. 10.) Toulouse is celebrated also for its duck-liver pies, of which a great number are sent to other parts of France. There are two great markets in the year for flowers and salt-pork; and eight fairs, including four or eight days each, and two of three days; one of the eight-day fairs is an important fair for wool and woollen-cloth. By means of the Canal-du-Midi and the Garonne, Toulouse has ready water communication with the Mediterranean and Atlantic ports of France. A railway in course of construction from Bordeaux to Cette passes through Toulouse.

Toulouse is the chief town of the department; it is the seat of a High Court, whose jurisdiction comprehends the departments of Ariège, Haute-Garonne, Tarn, and Tarn-et-Garonne, and of a University-Academy, the limits of which embrace the departments just named, and also those of Aveyron, Gers, Lot, and Hautes-Pyrénées. It is also the head-quarters of the 13th Military Division, comprehending the departments of Haute-Garonne, Lot, Tarn, and Tarn-et-Garonne. It has an assize-court, a chamber and tribunal of commerce, a tribunal of first instance, a mint, and several fiscal government offices. There are a royal cannon foundry, an arsenal, and an artillery school.

St. Saturninus, the first bishop of Toulouse, suffered martyrdom, A.D. 250; the city did not attain to metropolitan rank till the 14th century. The provinces of Toulouse and Narbonne are under the archbishop of Toulouse and Narbonne. The archdiocese includes the department of Haute-Garonne, and the archbishop's suffragans are the bishops of Montauban, Pamiers, and Carcassonne.

Toulouse possesses many establishments for public instruction; and there are several learned societies which distribute prizes. The most eminent of these is the Académie des Jeux Floraux, or Society of the Floral Games, instituted in 1828. The poetical contests held by the society were either established or revived by Clémence Isaure, a young lady of family, who devoted her property to form a perpetual endowment for these games, which are still kept up. There are an academy of inscriptions, sciences, and belles-lettres; an academy of painting, sculpture, and architecture; an endowed college, a seminary for the priesthood, a secondary school of medicine and surgery, schools of chemistry, and midwifery; and societies of medicine, of the fine arts, and of agriculture. Toulouse has a public library containing about 60,000 volumes, and many printing and publishing offices, a botanic garden, a departmental nursery, a mont-de-piété, two hospitals, an orphan asylum, and an observatory, where courses of instruction on astronomy are given.

TOURCOING. [NORD.]

TOURNAY (*Doornik*), an important town in the province of Hainault, in the kingdom of Belgium, 160 miles by railway S.W. from Brussels, and 47 miles S. from Ghent. This town was called *Tornacous* in the 5th century, when it was seized by the barbarians who overran Gaul. It was among the early acquisitions of the Franks, and was for a while the capital of Clovia. It was besieged and taken (1513) by the English under Henry VIII. Having reverted to the French, it was again taken (1521) by the count of Nassau, one of the generals of the emperor Charles V. and ceded by the treaty of Madrid (1525) to the emperor. During the religious troubles of the Netherlands, the Protestants committed great disorders here (1566); and the town, having joined in the revolt against Spain, was taken (1581) by the Duke of Parma, and remained under the dominion of Spain. It was taken by Louis XIV. (1687) and ceded to France by the peace of Aix-la-Chapelle (1688); but having been again taken (1709) by the allies under Marlborough and Eugene, it was at the peace of Utrecht (1713) ceded with the rest of the Spanish Netherlands to Austria. It was taken (1745) by the French under Louis XV., but restored at the peace of Aix-la-Chapelle, 1748. It was repeatedly taken (1792-94) in the early part of the war of the French revolution.

Tournay is situated on the Schelde, which divides the town into two parts, the old town on the left bank and the new town on the right: the old town occupies the site of the Tornacous of the ancients; the new town is of later origin, and is distinguished from the old by the neatness and straightness of its streets, by its wall-built houses, and by its handsome quay planted with trees, which forms the most frequented promenade of the city. The cathedral in the old town is a large and fine gothic building with several towers, surmounted with spires. The interior of the church is adorned with some of the paintings of Rubens, several fine marble sculptures, and a profusion of finely executed ornamental carvings. The tomb of the Frankish king Childéric I. was discovered nearly two centuries ago, in demolishing an old house, near the cathedral. The church of St.-Martin, the episcopal palace, the town-hall, the bell-tower, and the hospital for old clergymen, are among the other principal edifices. The town is fortified, and is entered by seven gates: it has several suburbs.

The population of Tournay is about 40,000. The manufactures of the town are important, and comprehend woollen-stuffs, cotton-yarn, printed cottons, dimities and other cotton goods, carpets, hosiery, linen, swanakin, paper, hats, leather, earthenware, porcelain, oil, liqueurs, bronze, &c. There are dye-houses and lime-kilns, and several large flour-mills. Considerable trade is carried on. Vessels of 150 tons reach the town by the Schelde, and it is connected by railways with all the important towns of Belgium and the north of France. The town has a commercial court, a chamber of commerce, an exchange, a theatre, an academy of drawing, sculpture, and architecture, an orphan-house, five hospitals, several churches, and a public library of 22,000 volumes. Tournay is the seat of a bishopric which dates from the 5th century; the bishop is a suffragan of the archbishop of Mechelen or Malines.

TOURNON. [LOT-ET-GARONNE.]

TOURNUS. [SAÛNE-ET-LOIRE.]

TOURS. [INDRE-ET-LOIRE.]

TOW-LAW. [DURHAM.]

TOWCESTER, Northamptonshire, a market-town and the seat of a Poor-Law Union, in the parish of Towcester, is situated on the right bank of the river Tow, in 52° 8' N. lat., 0° 59' W. long., distant 8 miles S.S.W. from Northampton, 60 miles N.W. from London by road. The population of the town in 1851 was 2478. The living is a vicarage in the archdeaconry of Northampton and diocese of Peterborough. Towcester Poor-Law Union contains 23 parishes and townships, with an area of 42,218 acres, and a population in 1851 of 12,806.

Towcester appears to have been the Roman station, *Lactodorum*. The town contains some well-built houses and shops, and is lighted with gas. The church is a neat building, with a tower 90 feet high; the nave is early English, the chancel decorated, and the rest of the church perpendicular in style. There are chapels for Wesleyan Methodists, Baptists, and Independents, a Grammar school, and National schools. The manufacture of pillow-lace, and of boots and shoes for exportation, are the chief employments in the town. The market is on Tuesday; fairs are held on May 13th, October 29th, and on Shrove Tuesday. A county court is held in the town.

TOWY, RIVER. [CAERMARTHENSHIRE.]

TOWYN. [MERIONETHSHIRE.]

TRAJANO'POLI, a small town in European Turkey, situated on the Maritza between Adrianople and Enos, and a place of no importance except that it marks the site of the ancient *Trajanopolis*. The ancient town was most probably built and adorned with beautiful buildings by the emperor Trajan. Trajanopolis was situated on the Hebrus, at a little distance north of the pass which is formed by this river through the range of Mount Rhodope, and about 40 miles from its mouth. In the 4th century A.D. Trajanopolis was still a considerable town, and so it was in the time of Constantine Porphyrogenitus. An ancient aqueduct still remains near Trajanopoli.

TRAJANO'POLIS, or SELINUS, was the most western town of Cilicia. The emperor Trajanus having died at Selinus, this town was for some time called Trajanopolis. It was situated at the mouth

the river Selinus, on a steep rock, surrounded on three sides by the sea, and it was renowned for its commerce and navigation. Its present name is *Selenus*.

Hamilton discovered the ruins of a large ancient city (which he gives strong reason to believe was called *Trajanopolis*) about 20 miles S.W. from the Morad-Dagh, the ancient Dindymene, and near the source of the Banas-Chai, a feeder of the Mendereh. Its site is marked by the modern Abat-Kieui, situated near the northern extremity of the Bourgas-Dagh, and a little west of 80° E. long. Ptolemy mentions a *Trajanopolis* in Mysia, the site of which could never be fixed, in consequence of an error in his longitude. Cellarius's conjecture that it was not in Mysia but farther east in Phrygia Major seems verified by Hamilton's discovery.

(Hamilton, *Researches in Asia Minor*, vol. i. pp. 118-116.)

TRALEE, Ireland, the chief town of Kerry, a market-town and seaport, a parliamentary borough, and the seat of a Poor-Law Union, is situated on the river Lea, in 52° 15' N. lat., 9° 48' W. long., distant by road 62 miles S.W. by W. from Limerick, 181½ miles W.S.W. from Dublin. The borough returns one member to the Imperial Parliament. The population was 9957 in 1851. The borough is under the management of a board of 21 commissioners. Tralee Poor-Law Union comprises 39 electoral divisions, with an area of 221,845 acres, and a population in 1841 of 71,626; in 1851 of 58,645.

The town consists of several streets, four of which meet in a small square. The main streets are spacious and well built, and the whole place has been much improved of late years. The castle grounds, on the south side of the town, have been laid out as a promenade for the inhabitants. The parish church is a large and handsome building, with a square tower. There are two spacious Roman Catholic chapels, a presentation nunnery, chapels for Presbyterians, Independents, and Wesleyan Methodists, several Free schools, the county court-house, the county jail, barracks, the county club and news-room, a market-house, a county infirmary, a fever hospital, a neat row of almshouses, and the Union workhouse.

At the west end of the town is a basin, which vessels of 300 tons burden reach by a ship-canal from the bay. The custom-house is at Blennerville. The port carries on an extensive trade in grain, flour, bacon, and other exports. The chief article of import from Great Britain is coal; the foreign imports are mainly timber, deals, and staves. In 1853 there were registered as belonging to the port 18 vessels of 790 tons. During 1853 there entered the port 243 sailing-vessels of 14,536 tons, and 6 steam-vessels of 1248 tons; and there cleared 178 sailing-vessels of 14,112 tons, and 6 steam-vessels of 1040 tons. Tralee carries on an extensive retail trade with the surrounding district. It has three breweries and a distillery. The markets are well supplied with fish. The county assizes and quarter sessions are held in the town, and petty sessions every Wednesday. Fairs are held on May 8rd, August 4th, October 9th, November 7th, and December 18th. Tuesday and Saturday are the market-days. Races are held near the town, and a yearly regatta in the bay.

A Dominican friary was founded at Tralee in 1213 by John Fitz-Thomas, one of the great Geraldine family. The knights of St. John of Jerusalem had a commandery in the neighbourhood. The Earl of Desmond had a castle here, which having come, on the forfeiture of the earl, into the hands of Sir Edward Denny, served as a place of refuge for the English families resident in and about the town when Tralee was entered by the insurgents in the great rebellion of 1641. The castle held out for six months, but was at last obliged to surrender. The town was soon after burned. Tralee Castle is on the south-east of the town.

TRALLEE. [KARIA.]

TRANCOSO. [BEIRA.]

TRANENT. [HADDINGTONSHIRE.]

TRANI. [BARI, TERRA DL.]

TRANQUÉBAR. [CARNATIC.]

TRANSYLVANIA, a crownland of the Austrian empire, lies between 45° 12' and 47° 42' N. lat., 22° 15' and 26° 20' E. long. Its greatest length from north-west to south-east is 194 miles, and its greatest breadth from west to east is 184 miles. It is bounded N. by Hungary, E. by Bukowina and Moldavia, S. by Wallachia, and W. by the Woiwodeschaft of Servia and the Temesvar Banat. The area is 23,335 square miles, and the population, according to an official return for 1854, amounted to 2,074,202.

Transylvania is the western part of the Roman Dacia. It was so named by the Hungarians, from the circumstance of its lying 'beyond' or on the eastern side of the 'wooded' mountains that separate it from Hungary. The German name is Siebenbürgen.

Mountains.—The range of the Carpathian Mountains, which inclose Transylvania on the east and south, are described under CARPATHIAN MOUNTAINS. The passes by which the range is crossed are of great military importance, being the only ways of communication between Transylvania on one side, and Moldavia and Wallachia on the other side. The following lead to Wallachia:—1. The pass of Zaikan in the valley of the Hatzeg. This pass is called the 'Iron Door,' on account of the high and steep rocks by which it is bounded. 2. The pass of Valkan, near the village of Krivadia, famous for the bloody defeats which the Turks have suffered there in different wars. 3. The

pass of the Rothen-Thurm, or the 'Red Tower,' the most remarkable of all. Formed by the narrow valley of the Alt, it begins near the village of Boitza, or Ochaenkopf in Transylvania, and it ends near the convent of Kosia in Wallachia. The length of this pass is 11 leagues, and the greater part of the road is hewn in the rock. 4. The pass of Fortschwar, or Teraburg, in the district of Kronstadt. 5. The pass of Tomosch, south of Kronstadt, formed by the valley of the river Tomosch. 6. The pass of Bosau, in the district of Kronstadt. The passes of Oytosch, Gymesch, and Paritsch, or Bereczk, lead into Moldavia, and the Borgo pass makes the communication with Bukowina.

Transylvania is a table-land bounded on the east and the south by the principal range of the Carpathians; on the north by a branch of the Carpathians, which beginning at Mount Gallatz, stretches westward as far as Mount Pleaska, and thence to the north-west as far as Mount Pretrossa in Hungary; and on the west by an extensive system of mountains which is composed of three large groups. The first or southern group begins near Mount Kosstara, in 46° 18' N. lat., 22° 40' E. long., stretching to the north as far as the river Maros: the centre of this group, Mount Ruuka-Poyana, is 9300 feet, or perhaps 9900 feet high. The second group lies between the Maros in the south, and 47° N. lat. in the north, sending out lofty and extensive branches to the east and to the west. The third group begins in 47° N. lat., and stretches as far as 47° 35' N. lat.; the southern part of it is called the Reuss Mountains, and the northern part known by the German name of the Buch-gebirge. Between the northern slopes of the Buch-gebirge and Mount Pleaska in the east, lies the valley of the Szamos, which is one of the few larger passes between Transylvania and Hungary, another being formed by the valley of the river Maros. The middle of Transylvania is traversed by several parallel ranges of mountains, which, being links between the Carpathians in the east, and the mountains on the west frontier, give to the country the aspect of a gigantic gridiron. The direction of these ranges is generally from north-east to south-west; the elevation of the summits is less than that of the Carpathians, and in many districts they are mere hills. The first or northern of these ranges begins at Mount Bistriksora in the east, and joins the western system in 46° 30' N. lat.; it is not interrupted by any river or plain, and separates the valley of the Szamos, or the northernmost part of the country, from the valley of the Maros. The second lies between the Maros and the river Little Kockel; the third is between the Little Kockel and the Great Kockel; and the fourth forms a barrier between the Great Kockel and the Alt. Plains are rare in Transylvania. Extensive tracts of the hilly and mountainous parts are covered with forests, the largest of which are those of Rioka, Hargit, Parayde, Mikoane, and Zeidna.

Rivers.—All the rivers of Transylvania are tributaries of the Danube, either flowing directly into this river, or joining the Theiss; a few, of little importance, join other affluents of the Danube. The *Maros* (Maros) has its sources on the eastern frontier at the foot of Mount Tarko, or Tatarrhago. It runs first north-west and west for about 46 miles, and afterwards south-west, west, and south-south-west for upwards of 100 miles till it reaches Karlsburg; from this town to its junction with the Theiss at Szegedin it has a generally west course. The whole length of this river is above 300 miles, but its course within Transylvania is only from 180 to 190 miles. The mouth of the Maros at Szegedin is 600 feet wide, and it becomes navigable for boats at Karlsburg: it contains abundance of fish, and it brings down particles of gold. The most important of its southern tributary rivers is the *Great Kockel*, which receives the *Little Kockel*. On its northern side the Maros receives the *Aranyos*, which has its sources in the west on the frontiers of Hungary, and which flows eastward in a direction opposite to that of the Maros. The lower part of the Aranyos is navigable.

The *Szamos* (Szamos) is formed by the junction of the Great and the Little Szamos. The *Great Szamos* comes from Mount Kaliberg, or Gallatz, in the district of Bistritz, in the north-eastern corner of Transylvania, and runs south-west as far as Dees, where it is joined by the Little Szamos, the sources of which are at the foot of Mount Kalata, in the district of Klausenburg, on the frontiers of Hungary. The direction of the Little Szamos is north-east. From Dees the united stream first runs north-west, then south-west, and at last north, till it reaches the frontiers of Hungary a little above Szada: it joins the Theiss at the village of Apati. The whole length of the Szamos is upwards of 200 miles, and three-fourths of its length are within Transylvania. The *ALT* (Aluta), which forms the subject of a separate article, rises in the Carpathians, near the sources of the Great Szamos. Its length is about 250 miles, and about 134 miles are within Transylvania. The navigation on the Alt within Transylvania has many obstacles, the bed of the river being full of rocks, part of which however have been blown up by order of the Austrian government. This river affords a natural communication between southern Transylvania and Wallachia and the Danube, and is therefore of great importance for commerce, especially as the valley of the Alt is the most fertile and the most civilized part of Transylvania, being almost entirely inhabited by German colonists. The whole Wallachian part of the river however is still in a state of primitive wildness. There are some lakes of importance. The Lake of Hados in the county of Doboka is 15 miles long; the Lake of St. Anna near Lazarfalva in the country of the Szeklers is 10 miles long and as many broad; the Lake of Piritch in

the Carpathians is renowned for the gas which its surface exhales, and which suffocates birds that fly over it: the Holt-Maros is a lake formed by the Maros near Karlsburg.

Climate.—The temperature is generally very variable. The summer is very hot, but even then in the western and southern parts of the country, the nights are cold; in winter the cold is almost insupportable. Cold winds prevail in the spring and autumn, and they blow with great regularity. Dreadful storms followed by severe cold are frequent; they have given the name to a district called Burzenland, or 'the country of the storms.'

Soil, Productions, and Commerce.—The southern and western parts are intersected by hills which contain pleasant valleys, and the soil is of great fertility: the eastern and northern parts and a narrow tract along the western frontier are covered with forests, and the soil is stony in many districts; but even the stony surface is covered with a layer of soil which renders it fit for agriculture. The chief minerals are iron, lead, copper, quicksilver, sulphur, silver, gold, and rock-salt. Salt is made from 112 salines. Near the foot of the Carpathians are many mineral and warm springs, and caverns filled with carbonic acid gas. There are serpentine, topazes, chrysolites, emeralds, and amethysts in the high mountains; agates, opals, chalcedony, and carnelians in the hills and rivers. Besides enormous quantities of timber, Transylvania produces wheat, barley, corn, oats, millet, and maize; apples, pears, and other fruits in abundance; wine and tobacco, especially in the valley of the Alt, both of excellent quality. Horned cattle are bred in great numbers. Sheep are numerous, and their flesh has that aromatic taste which distinguishes the sheep that feed on the mountainous pasture-grounds of southern Europe. There are fish, wild and tame fowl, and game of all sorts, in abundance; wolves are frequent in the Carpathians, and even bears and lynxes appear. The horses are of small size, but swift. Manufactures scarcely exist, except in the valley of the Alt, where the Germans produce some fine dyed cloths and cotton, felt hats, leather ware, and a considerable quantity of linen. The commerce with Wallachia, Moldavia, and Turkey is of some importance.

Divisions and Population.—The crownland is divided into 10 circles, which, with their subdivisions and population, are as follows:—

Circles.	Arrondissements.	Population.
Hermannstadt	13	320,268
Kronstadt	10	274,709
Udvarhely	6	174,127
Maros-Vasarhely	6	194,888
Bistrizs	10	178,844
Dees	6	198,783
Szilagy	6	174,088
Klausenburg	6	178,891
Karlsburg	6	172,345
Broos	9	213,118
Total	79	2,074,202

Of the population, with regard to race, rather more than five-eighths are Wallachs and Moldavians, who are the modern representatives of the ancient Dacians; about two-eighths are Magyars; and one-eighth Germans. There are mixed with these, about 8500 Serbs and other slaves, 9000 Armenians, 60,000 Gipsies, and 7000 Jews. With regard to religion, the population is divided in round numbers as follows:—221,400 Roman and 608,300 Greek Catholics, all of whom acknowledge the supremacy of the Pope; 725,700 Schismatic Greeks; 220,000 Lutherans; 858,000 Calvinists, 44,000 Unitarians, and 7000 Jews.

The former and still popular division of Transylvania was threefold:—1. The Country of the Hungarians; 2. The Country of the Szeklers; 3. The Country of the Saxons.

1. The Country of the Hungarians occupies the northern, middle, and south-western parts of Transylvania. The principal towns in it are—*Klausenburg* [CLAUSENBURG], *Karlsburg*, or *Weissenburg*, a strongly-fortified town, with 12,000 inhabitants, on the Maros. It has a mint, observatory, public library, and is the seat of the Roman Catholic bishop of Transylvania. The citadel is built on a height above the town. In the environs are the richest gold-mines of Europe. *Nagy-Enyed*, with 6000 inhabitants and a Calvinist college. *Varhely* (*Gredistye*) is in the beautiful valley of Hatzeq, on the site of Zarmice-Gethusa, the capital of the ancient Dacians, and the Ulpia Trajana of the Romans. [DACIA.] The environs are full of Roman antiquities, among which the most remarkable are the remains of an amphitheatre, and the foundation of a Roman house containing the pavement of two rooms, which are in fine mosaic, representing scenes from the Greek mythology. This house was discovered in 1823. *Thorenburg* (*Thorda*), on the Aranyos, is a large market-town, with about 8000 inhabitants, and rich mines of rock-salt. *Dees*, a market-town, with about 6000 inhabitants, is situated at the confluence of the Great and Little Szamos. There are salt-works and mines near it. *Szilagy-Szeg*, a fortified town, further defended by a castle, is situated in the north of the Country of the Hungarians, on the river Szilagy, a feeder of the Szamos: population about 5000.

2. The Country of the Szeklers (*Parv Siculorum*) is bounded on the north and north-west by part of the country of the Hungarians, and

extends from it to the Carpathians, when it borders upon Moldavia and Wallachia. The principal town is *Neumarkt*, or *Maros-Vasarhely*, with 10,000 inhabitants: it contains the chief seat of justice of the country of the Szeklers, a Roman Catholic gymnasium, a Calvinist college, a mineralogical museum, and a public library, the largest and best in Transylvania. *Udvarhely*, also called *Szekely*, and by the Germans *Ober Hellyen*, has a handsome town-hall, a Calvinist church and college, two Catholic churches, a convent, Catholic seminary, and 6000 inhabitants, many of whom are tanners and shoemakers. The town is situated on the left bank of the Great Kockel, 40 miles E.S.E. from Neumarkt.

3. The Country of the Saxons. The main or southern part of it is bounded on the east and north-east by the country of the Szeklers; on the north and west by the country of the Hungarians; and on the south by Wallachia. Another smaller part, the district of Bistrizs, lies in the north-eastern corner of Transylvania, on the frontier of Bukowina. [BISTRITZ.] The country of the Saxons is popularly divided as follows:—1, *Weinland*, with the capital *Schäasburg*; 2, *Altland*, with the capital *Hermannstadt*; 3, *Land vor dem Walde*, with the capital *Mühlenbach*; 4, *Burzenland*, with the capital *Kronstadt*.

The principal towns of the Country of the Saxons are the following:—*HERMANNSTADT*, the capital of Transylvania. The village of *Hellas*, near *Hermannstadt*, is renowned for the gigantic size of its inhabitants. *Mühlenbach*, about 80 miles N.W. from *Hermannstadt*, and about 6 miles S. from *Karlsburg*, is a walled free town, with about 5000 inhabitants, who have several breweries. The town stands on the right bank of the *Mühlenbach*, a feeder of the *Marosch*. *Kronstadt*. [KRONSTADT.] *Schäasburg* (*Segesvar*), on the Great Kockel, in a beautiful valley, with 6000 inhabitants, has manufactories of cotton and cloth; wine is made in the environs. *Bistrizs* is the subject of a separate article. [BISTRITZ.] *Broos*, or *Sas-Zvaros*, a well-built town, with a large castle and about 9000 inhabitants, is situated on the left bank of a small feeder of the *Marosch*, in 45° 49' 46" N. lat., 23° 13' 38" E. long., 45 miles W. from *Hermannstadt*.

That tract of Transylvania which lies on the frontier of Moldavia and Wallachia belongs to the Austrian Military Frontier, and has a separate administration with regard to military affairs.

History.—The early history of Transylvania has been given under DACIA. From the 5th century it was successively occupied by the Goths and Huns, and remained at last in the hands of the Polovzians, or Petshegues, who were a Turkish tribe. When the Magyars conquered the country between the Carpathians and Germany, they also settled in Transylvania, and subdued or drove out the Petshegues; however, Transylvania became independent of Hungary until it was conquered by king Stephen I. in 1004. John Zapolya, disputing the crown of Hungary with Ferdinand I. of Austria, was supported by the Turks, and he at last compelled Ferdinand to allow him to possess Transylvania as an independent principality. But Zapolya was forced in his turn to acknowledge himself a vassal of the Osmanlis. During 150 years Transylvania was governed by princes of the houses of Zapolya and Bathori; and some of her princes, especially *Betlan Gabor* and *George Ragozi*, were dangerous enemies of the houses of Austria. *Leopold I.* conquered Transylvania in 1687, and the Porte was obliged to renounce her supremacy over it by the peace of *Carlowitz* in 1699. Transylvania however became only a vassal state of Austria until the death of her last prince, *Michael Apafi II.*, who died in 1713. In 1765 the empress *Maria Theresa* erected Transylvania into a grand principality.

After the conquest of Transylvania by Stephen I., the country was almost entirely depopulated, but it was gradually re-peopled by German and other foreign colonists. The first arrival of the German colonists is generally said to have taken place in 1148 from Westphalia, the Lower Rhine, and the Low Countries, some also from Lower Saxony. The Szeklers are said to be descendants of the Turkish Petshegues, who were allowed by the Magyars to remain in the country on condition of guarding the frontier against the invasions of the eastern barbarians.

TRAPANI, a province of Sicily, comprises the western extremity of that island, and is bounded N.E. by the provinces of Palermo and Girgenti, being separated from the latter by the river Belice, the ancient Hypsa. The area is 1858 square miles, and the population 182,809. [SICILY.]

The province is divided into three districts, *Trapani*, *Mazara*, and *Alcamo*, and 21 communes. *Trapani*, the capital, is noticed in the next article [TRAPANI]. *ALCAMO* and *MAZARA* are also subjects of separate articles. *Mazara* and *Salemi* are noticed under SICILY (vol. iv., col. 562). *Castel Vetrano*, about 12 miles E. from *Mazara*, inland, is an old-looking town, built on a hill, in a fertile country, producing good wine and abounding with cattle. It has several churches and convents, an old castle, and several palaces. Six miles S. from *Castel Vetrano* is the site of the ancient *Selinus*, on the sea-coast, with the ruins of several temples, consisting of extensive heaps of broken columns, capitals, and other fragments. Fragments of marble, alti-rilievi of curious workmanship, were discovered in 1822, among the ruins. East of *Salemi*, in the mountains, is *Gibellina*, with a castle and 5000 inhabitants. Farther north is *Calatani*, a town of 10,000 inhabitants, with several fine churches. The best cheese in

Sicily is made in its territory. A few miles west of Alcamo, in the midst of a solitude, are the remains of *Segesta*, consisting of a fine Doric temple in good preservation, the ruins of a theatre, and part of the city walls. *Partanna*, an inland town east of Castel Vetrano, has about 10,000 inhabitants. Near Trapani is the town of *San Giuliano*, on the top of Mount Eryx (2184 feet high), with about 9000 inhabitants. San Giuliano has grown up round the site of the famous temple of Venus Erycina, which is now occupied by a castle used as a prison. The temple was strongly fortified in ancient times. The city of Eryx was situated about half-way up the mountain.

The islands of Favignana, Levanzo, and Maretimo, as well as the smaller group of the *Ægades*, and the small islands near Cape Lilybæum, one of which is the ancient Motya, early colonised by the Phœnicians, and subsequently a stronghold of the Carthaginians, an early Phœnician colony, belong to the administrative province of Trapani. [SICILY.]

TRAPANI, a town on the north-west coast of Sicily, built on the site of the ancient Drepanum, on a point of land projecting into the sea, and facing the island of Levanzo, which is 10 miles west from it. The port of Drepanum was a place of traffic from the oldest times on record, and its Greek name, 'Drepanon' (a scythe), is expressive of the form of the promontory on which it stands. There are however no remains of antiquity at Trapani. On an insulated rock which stands at the entrance of the harbour is a small fort called Columbara. The harbour of Trapani is formed by nature, being an inlet of the sea between the promontory and the mainland, protected on the west by the rock above mentioned, but open to the south-west wind. Trapani is one of the principal ports of Sicily, and carries on a considerable trade. One of the chief articles of export is salt, which is obtained by the evaporation of the sea-water in the extensive salterns along the coast. Great numbers of tunny fish are caught in May and June; the fish is pickled and largely exported to Italy. The coral fishery is another branch of trade. Boats from Trapani gather the coral along the coast of Barbary, after which it is worked in the town for export. Great quantities of anchovies are also caught along the coast in February, March, and April, and cured for export. Sumach is also exported. Trapani has a collegiate church, numerous other churches and convents, among which those of the Jesuits and Carmelites are most worthy of notice; a handsome town-house, with a fine façade adorned with the statues of Philip V. of Spain and of Victor Amadeus of Savoy, both kings of Sicily; several palaces of the nobility, a royal college, an orphan asylum, several hospitals, a monte-di-pieta, and about 24,000 inhabitants. The town is inclosed by walls, and is defended by a fortress. The streets are wide and well-paved.

TRAPANI ISLANDS. [SICILY.]

TRAPEZUS. [TREBIZOND.]

TRAS-OS-MONTES, a province of Portugal, situated between 41° 4' and 41° 57' N. lat., 6° 13' and 8° 7' W. long., is bounded E. and N.E. by the Spanish province of Leon, N. by that of Galicia, W. by the Portuguese province of Entre Douro e Minho, and S. by that of Beira. The greatest length from east to west is about 90 miles; the greatest width from north to south is about 60 miles. The area is 4020 square miles. The population in 1852 was 311,406. The province is divided into two districts as follows:—

Districts.	Area in Square Miles.	Population in 1852.
Bragança . . .	2,374	126,627
Villa Real . . .	1,646	184,779
Total . . .	4,020	311,406

The districts are subdivided into 11 comarcas, or judiciary divisions, 44 concelhos, or communal divisions, and 560 parishes, as follows:—

Districts.	Comarcas.	Concelhos.	Parishes.
Bragança . . .	5	19	399
Villa Real . . .	6	25	261
Total . . .	11	44	560

Surface.—The great offset from the Cantabrian mountain-chain which forms the main boundary between Galicia and Portugal, throws off several ridges into Tras-os-Montes. These ridges have a general direction from north to south, the Serras of Geres, Santa Catarina, and Marão, separating this province from that of Entre Douro e Minho, whence the name 'tras os montes,' 'beyond the mountains.' The northern and western parts of the province consist entirely of mountains with narrow valleys between them. Towards the south the mountains diminish in height and extent, and the valleys have a greater width.

Rivers.—The Douro, changing its direction above Miranda from west to south-south-west, forms the greater part of the boundary on the east between this province and Spain. It afterwards flows westward, forming the line of separation on the south between Tras-os-Montes and Beira. All the other rivers have a southern course, and

enter the Douro by the northern bank. The Sabor rises in the north-eastern part of the province, and having been joined by the Macas and the Azibo, enters the Douro below the town of Torre de Moncorvo. The Tua originates from several streams, all of which rise among the mountains which separate this province from Galicia. The Corgo rises in the mountains of the western side of the province. The Tamega enters this province from Galicia, and flowing in a south-west direction, afterwards enters the province of Entre Douro e Minho.

Soil and Productions.—The valleys of the Sabor, the Tua, the Corgo, and the Tamega, are very fertile, and produce abundantly wheat, rye, maize, beans, and fruits. In those parts which are sheltered from the northern winds olive-trees and mulberry-trees are cultivated. On the well-sheltered banks of the principal rivers, and especially on the right bank of the Douro abundance of grapes are grown, which supply the finest of the red wines shipped from Oporto. Cattle, sheep, horses, and mules are pastured on the slopes of the mountains, and large numbers of hogs are fattened on the produce of the chestnut-trees. Game is very abundant, and the streams contain plenty of fish. There are manufactures of woollens, linens, and silk.

Towns.—*Bragança*, the capital of the province and the see of a bishop, is situated in 41° 52' N. lat., 6° 40' W. long., on the Fervença, an affluent of the Sabor. It was formerly surrounded by walls, which are now in ruins, and it has an old castle of some strength. It contains two churches and a college, and has manufactures of velvet and other silk fabrics. The population is about 5000. It was erected into a duchy in 1442. In 1640 João II., eighth duke of Bragança, became King of Portugal, and from him the sovereigns of that country have since descended. *Chaves*, 48 miles W. from Bragança, stands on a rocky eminence, and is irregularly fortified, but the works are now in a ruinous state. It has a small citadel in somewhat better repair. The river is crossed by a Roman bridge of 18 arches. There are hot sulphureous springs and baths in the vicinity, which are well frequented. The population of the town is about 6000. *Miranda de Douro*, 28 miles S.E. from Bragança, stands on the west bank of the Douro, which is here very narrow and rapid, with deep banks almost perpendicular: the population is about 5000. There is no bridge here; but about two miles higher up the river is passed by means of a barge, forming a communication with the roads of Zamora and Salamanca. *Mirandella*, 37 miles S.W. from Bragança, stands on the east bank of the Tua, over which there is a stone bridge of 19 arches and 200 yards in length. It is surrounded by old walls, and contains a population of 1700. *Torre de Moncorvo*, 50 miles S. by W. from Bragança, is situated near the eastern bank of the Sabor, about 7 miles above its confluence with the Douro. It is defended by ramparts, and has a square citadel. It contains a handsome church, and has a population of about 2000. *Villa Real*, 65 miles S.W. from Bragança, is situated on a steep hill, near the west bank of the Corgo, which is here crossed by a stone bridge. The town is partly surrounded by an old wall, and contains two churches. The population is about 4500.

TRASYMENUS, LAKE. [PERUGIA.]

TRAU. [DALMATIA.]

TRAUN, RIVER. [AUSTRIA.]

TRAVANCORE. [HINDUSTAN.]

TRAVE, RIVER. [HOLSTEIN.]

TRAVEMÜNDE. [LÜBECK.]

TRAVNIK, TRAUNIK, TRAWNİK, or TRAWNITZ, a town in Turkish Bosnia, residence of the pasha of the province, and the military capital of Bosnia, is situated in a narrow valley screened by high hills on the left bank of the Laschwa, a feeder of the Bosnia, and has a permanent population of about 10,000 inhabitants. It is defended by a castle flanked with towers, which serves also for a prison. The town is ill built; the streets are narrow, gloomy, crooked, and dirty. The houses are built of wood; and the pasha's residence, and the mansions of the rich proprietors, are distinguished from ordinary dwellings only by their greater size. There are several mosques and bazaars, and two or three khans. Travnik is famous for the manufacture of sabres of good temper; it is also a place of some commercial importance. The environs are covered with orchards and gardens. The inhabitants are almost all Mussulmans; there are however a few resident Jews. Besides the permanent population there is usually a large body of troops quartered in Travnik, for whom several new fortified barracks have been recently erected.

TREBBIA. [Po.]

TREBES. [AUDE.]

TREBIZOND, the ancient *Trapezus*, a town situated on the Pontus Euxinus, in the eastern corner of Pontus in Asia Minor. Trapezus was a colony of Sinope, a town founded by the Milesians. Xenophon with his 10,000 Greeks came to Trebizond in his retreat ('Anabasis,' iv. 8). During the wars between the Romans and Mithridates, Trebizond fell into the hands of the Romans, and henceforth belonged to the Roman empire. Hadrian ordered the port to be secured by a mole. Trebizond was a free town and had its own coins: on some of these there is on one side an anchor, and on the other the prow of a ship, two emblems which seem to prove the importance of the commerce of this town. During the reign of Valerian, Trebizond was a large and opulent town, but it was taken, plundered, and partly destroyed by the barbarians. During a long period Trebizond seems

to have been only the shadow of its former splendour; but it recovered during the wars with the Persians in the reign of Justinian. This emperor ordered the public buildings to be restored by him (*Ibid.*, p. 234). Trebizond afterwards became the capital of a province which contained the ancient country of Pontus, and sometimes also some adjacent tracts of Armenia. The Genoese repaired Hadrian's mole, which is now destroyed, with the exception of the foundations.

At present Trebizond belongs to the Turkish empire; its Turkish name is Tharabesun or Trabesun. It is the capital of the eyalet of Trebizond [*ARMENIA*, vol. i., 506-7], the seat of a pasha, and of a Greek archbishop. Its population is variously estimated from 24,000 to 50,000, chiefly Mohammedans, with about 4000 Greeks, and 2000 Armenians. The Christian part of the population lives without the walls. Among the public buildings the most remarkable are, the castle or citadel, partly of ancient, partly of modern construction, situated in the middle of the town on a steep rock, the summit of which is flat as a table (*Ἰσπερ*, hence the name of the town); the bazaar; public bath-houses of marble, and of a beautiful architecture; the ruins of a temple of Apollo, part of which has been converted into a Greek church. The commerce of Trebizond has much increased since the navigation of the Black Sea has been opened to all nations. The town has regular communication by steam-boats with Constantinople, Odessa, and the Danube; and it may now be said to be the first commercial port on the Black Sea; however, the ancient port is almost filled up with sand, and larger vessels are obliged to cast anchor in the road. The commerce of Trebizond with Armenia, Persia, and Georgia is very extensive. The exports from these countries, consisting of silk, wool, tobacco, wax, gall-nuts, oil, opium, drugs, honey, timber, carpets, shawls, saffron, cotton, &c., amount to about a million sterling a year. The imports are composed of European manufactures, such as cotton fabrics, hardware, glass, fire-arms, &c.; together with iron, corn, wine, tin, salts, spices, and colonial produce. The value of the imports is nearly two millions sterling; the greater part is sent to Persia. Surrounded by a range of high and woody mountains, the town presents a beautiful appearance from the sea. Trebizond is the birthplace of Cardinal Bessarion, who was born here in 1395. [*ARMENIA.*]

TREGARON, Cardiganshire, a market-town and the seat of a Poor-Law Union, in the parish of Caron-ys-Clawdd, is situated on the right bank of the river Berwyn, in 52° 13' N. lat., 3° 55' W. long., distant 38 miles E.N.E. from Cardigan, and 204 miles W.N.W. from London. The population of the township in which Tregaron is situated was 839 in 1851. The living is a vicarage in the archdeaconry of Cardigan and diocese of St. Davids. Tregaron Poor-Law Union contains 22 parishes and townships, with an area of 122,050 acres, and a population in 1851 of 10,404. The town, which is picturesquely seated among mountains, is much frequented by anglers. The parish church is an old building, with a good tower. The market is held on Tuesday; fairs are held on March 15th, and on the first Tuesday of May.

TRENT. [*TYROL.*]

TRENT AND HUMBER, a river flowing through the central parts of England. Although the Trent and Humber are commonly spoken of as distinct, they are strictly parts of the same river. The Humber is simply the estuary formed by the junction of several streams, and is therefore to be regarded as a part of that one of its affluents which for length and importance stands first in the system.

Basin.—If we consider the mouth of the Humber as defined by Spurn Head in Yorkshire and Donna Nook in Lincolnshire, and all the waters flowing into it within those limits as belonging to the system of which it is the outlet, the limits of its basin are as follows:—On the north-east it is bounded by the uplands which, rising from the alluvial district of Holderness, form the cliffs which skirt with some intervals the Yorkshire coast between Spurn Head and Hornsea. All this part of the basin is alluvial; but near Bridlington Quay the Yorkshire Wolds, which consist of an insulated range of chalk hills, rise above the alluvium. The Yorkshire Wolds encroach upon the basin of the Humber, extending southward in the form of a crescent more than 30 miles between its extremities, from Flamborough Head near Bridlington almost to the banks of the Humber, about 8 or 10 miles above Hull, and separating the sub-basin of the Hull from that of the Derwent. The northern part of the Wolds is drained by a stream which flows through a valley in the chalk, and falls into the sea at Bridlington Quay. North-west of Flamborough Head the basin of the Humber extends to the coast, for the source of the Hartford, a feeder of the Derwent, is as near the shore at Filey Bay as that of the

GEOG. DIV. VOL. IV

Hull at Bridlington Bay; nor is the head of the Derwent itself more than two or three miles distant from Robin Hood's Bay, which is the north-eastern extremity of the basin.

From the western end of the Eastern Moorlands, a range of colliery hills, which extend inland from Robin Hood's Bay, the basin is bounded still on the north side by a lateral branch or offset of the great Pennine chain, which branch separates the basin of the Humber from those of the Tees and the Eden. The branches which the Pennine chain throws off toward the east, and which constitute the western moorlands of Yorkshire, are separated from each other by long narrow valleys, in which the Swale, the Yore, the Wharfe, the Aire, and the Calder, all directly or indirectly tributaries of the Ouse, have their course. At the southern end of the Pennine chain the western boundary is formed by the highlands of the Peak of Derbyshire and the moorlands of Northern Staffordshire. The western boundary from Staffordshire southward separates the basin of the Trent and Humber from that of the Severn. The southern limit, commencing at the head of the river Rea, runs eastward through Worcestershire and Warwickshire, past the head of the Blythe, 5 miles north-west from Henley-in-Arden, to Wroxhall, 4 miles north-west from Warwick; it then proceeds by Meriden and Nuneaton to Bulkington (4 miles north-east of Coventry), and turning north-east is defined by the hills which run through Leicestershire and Rutlandshire past Lutterworth, Kibworth, Billesdon, to Burleigh, the south-eastern limit of the basin. The eastern boundary is formed by the uplands on the border of Lincolnshire and Nottinghamshire, which separate the valleys of the Witham and the Trent, passing Newark and extending to Gainsborough. The eastern boundary separates the basin of the Trent from those of the Glen, the Witham, and the Steeping, all flowing into the Wash. These limits comprehend some important manufacturing districts: as the great seat of the woollen manufacture in Yorkshire; of the hosiery and lace manufacture in Nottinghamshire and Leicestershire; of the cotton and silk manufacture of Derbyshire; and of the iron manufacture of Staffordshire and Warwickshire. The entire area of the basin is probably about 9100 square miles, which makes it by far the largest in Great Britain; that of the Severn and Wye being only 5900 square miles; and that of the Thames and Medway 6500 square miles, little more than two-thirds of that of the Trent and Humber.

Course and Affluents.—The Trent rises in the hills of North Staffordshire, near the Cheshire border. It is formed by the confluence of several streams in an extensive pond or reservoir near Knipersley or Knypersley Hall, and flows south, through the Pottery district, by Hanley and Stoke-upon-Trent, to the junction of the little river Lyme (about five miles long) from Newcastle; and thence through Trentham Park, where it expands into a noble pool of 80 acres. After passing through Trentham Park it flows past Stone to the junction of the Sow, at the village of Great Haywood. From the junction of the Sow the Trent flows south-east, turning gradually towards the east, and receiving the Blythe on the left bank, to the junction of the Tame, which joins the Trent on the right bank a little below Alrewas; and with its feeders, the Anker, the Blythe (which is not to be confounded with the river of the same name just mentioned), and the Rea, drains the south-western part of the basin, the seat of the great iron and hardware manufacture. From the junction of the Tame the Trent turns northward, and flows by Burton-on-Trent to the junction of the Dove. It then flows eastward to the junction of the Derwent, which joins it on the left bank. From the junction of the Derwent the Trent flows to the junction of the Soar, on its right bank, and thence to the junction of the Erewash, on its left bank. The course of the Trent gradually changes from an eastern to a north-eastern direction; the change commences above the junction of the Derwent, and becomes more decided near the junction of the Erewash. After the junction of the Erewash the Trent receives several important tributaries, including the Deven or Devon, and the Lene, and passing Gainsborough and Burton-upon-Strather, is joined by the Ouse on its left bank. In Lincolnshire it receives on the left bank the Idle, which joins the Trent by an ancient cut, called 'Byker's Dyke,' at West Stookwith, below Gainsborough. A navigable cut, called 'the new river Idle,' joins the Trent at Keadby considerably lower down.

The Yorkshire rivers which form the system of the Ouse are described under YORKSHIRE. It is sufficient to notice here that the length of the Ouse is from 130 to 135 miles; and that from the importance of this river and its tributaries it may dispute with the Trent the pre-eminence among the rivers which flow into the Humber. From the confluence of the Trent and Ouse the river (or rather estuary, for the tide flows up both rivers above their junction) assumes the name of Humber, and takes an eastward direction. It expands in some places to the width of a mile, and below Barton Ferry acquires a permanent breadth of more than a mile. The channel is however occupied by shoals, or by the mud or sand-banks which line the shore, so that the low-water channel is narrow. A little below the town and port of Hull, the Humber turns south-east, and gradually increasing in width till it acquires, below Patrington, a breadth of 4 or 5 miles at high water, and 2½ to 3 miles at low-water, enters the German Ocean at Spurn Head, where, on what would be an island, were it not connected with the mainland by a narrow causeway a mile and a half long, are two lighthouses. The projection of Spurn Head narrows the high-water channel of the river from about

3 L

six miles to less than four miles; the low-water channel is also contracted by it, but not in so great a proportion to its whole width. The length of the Humber, from the junction of the Trent and the Ouse to the sea, is about 42 miles.

The Humber receives on the left, or Yorkshire bank, the Hull River, at the town of Hull, to which it gives name. On the right, or Lincolnshire bank, it receives the Anholme, or Ancholme, which joins the Humber above Barton; and some other streams of smaller importance.

The whole length of the Trent is about 148 miles, of the Humber 42 miles, in all 190 miles. The Trent and Humber yields in length to the SEVERN, which is estimated at 200 miles, and to the THAMES, which is estimated at 220 miles. But, with the exception of these two, no river in Great Britain can compare with it.

The feeders of the Trent and Humber, with their tributaries, are more particularly described elsewhere:—the Sow, the Blythe, and the Tame, under STAFFORDSHIRE; the Dove, the Derwent, and the Erewash, under DERBYSHIRE; the Soar, under LEICESTERSHIRE; the Deven and the Idle, under NOTTINGHAMSHIRE; the Ouse, with its tributaries, and the Hull, under YORKSHIRE; and the Anholme, under LINCOLNSHIRE. Different portions of the Trent, or Humber, are also described in the same articles.

Navigation.—The navigation of the Trent commences at Burton-upon-Trent, in Staffordshire, where a cut from the Grank Trunk, or Trent and Mersey Canal, joins it, and opens a communication with the complicated canal system of the Midland counties, and ultimately with the Mersey, the Severn, and the Thames. This canal follows the valley of the Trent from the junction of the little river Lyne in the Staffordshire Potteries, and it continues to follow the course of the valley below Burton, till it finally joins the Trent at Wilden Ferry, at the junction of the Derwent. Nearly midway between Burton and Wilden Ferry the Derby Canal opens into the Trent, and communicates with the town of Derby, and (by a railway) with the collieries near Belper. The river Derwent is also navigable up to Derby, but the navigation of it has been in a great degree superseded by the Derby Canal. The Soar is navigable by the help of some artificial cuts beyond Leicester, and is connected with the Leicester Union Canal and the Grand Junction Canal, and so with the metropolis. The river Wreak, or the Melton Mowbray Navigation, and the Oakham Canal, connect the eastern part of Leicestershire and the county of Rutland with the navigation of the Soar and the Trent. Nearly opposite to the outfall of the Soar, the Erewash Canal opens into the Trent. This and the Nottingham Canal (which opens into the Trent near Nottingham) convey to the Trent the produce of the coal- and iron-district of the valley of the Erewash, as well as the manufactures of the town of Nottingham. The Cromford Canal, which joins the Erewash and Nottingham canals, and the Cromford and High Peak railway, open a communication between the Trent and the great manufacturing district of Southern Lancashire. The Grantham Canal connects the town of Grantham and the adjacent agricultural district with the Trent, into which the canal opens just opposite to the Nottingham Canal; and the ancient Fosse Dyke connects the Trent with the Witham, and so with the agricultural districts of central Lincolnshire. The Idle is navigable to East Retford; it joins the Trent at West Stockwith, where also the Chesterfield Canal opens into the Trent, and brings down the produce of the coal- and iron-works of Chesterfield and its neighbourhood. The Stainforth and Keadby Canal, which connects the Don below Doncaster with the Trent, joins that river still lower down, at Keadby tide-lock.

The navigation of the Yorkshire rivers and their connected canals is described under YORKSHIRE. The navigation of the Anholme, which extends upward nearly to Market-Rasen; and the Louth Navigation, which commences at the town of Louth, and opens into the Humber just within Donna Nook, belong to Lincolnshire.

The value of the Trent and Humber as a means of inland communication is very great. The tide flows up the Trent as far as Gainsborough, to which town seaborne vessels of considerable size can ascend. The lowest bridge over the Trent is at Gainsborough. The whole length of the Trent navigation from Burton to the junction of the Ouse is about 100 miles, that of the Humber 42 miles: together 142 miles.

TREVI'GLI, or TRÉVISO, a province of Austrian Italy, formerly included in the Venetian territory, is bounded N. by the province of Belluno, E. by Friuli, W. by the province of Vicenza, and S. by the provinces of Padua and Venice. It has an area of 929 square miles, is divided into 12 districts and 204 communes, and reckons 286,199 inhabitants. Two-thirds of the province consist of a fine plain, which is one of the most fertile parts of the Venetian territory; the other third, which lies northward of the town of Treviso, is hilly. The river Piave, coming from Belluno, crosses the province of Treviso

from north-west to south-east, and enters the Adriatic north of the lagoons. Farther north, in a direction nearly parallel to the Piave, flows the river Livensa. Both the Piave and the Livensa are navigable for large boats to the sea. The principal productions of the province are corn, wine, fruit, wool, silk, cheese, and cattle. There are also manufactories of silks, woollens, and paper. Twelve miles N. from Treviso, where the hills begin to rise, is an extensive forest called Montello, belonging to the crown; it supplies Venice with timber for ship-building. The principal towns of the province are—TRÉVISO: *Asolo*, a very old town, now decayed, contains 3000 inhabitants; it was in the castle of Asolo that Caterina Cornaro, last queen of Cyprus, was kept in a kind of honourable confinement by the Venetian senate from 1489 till her death, which occurred in 1510: *Castelfranco* has 6000 inhabitants, a handsome collegiate church, and considerable traffic; it is the native place of the painter Giorgione: *Conegliano* has 6000 inhabitants: *Ceneda* is a bishop's see, and has 5000 inhabitants: *Oderzo*, an ancient but decayed town, 12 miles N.E. from Treviso, has about 6000 inhabitants: *Porto Buffole*, on the Livensa, where the river becomes navigable for large boats, about 22 miles from the sea, has 3000 inhabitants.

TREVI'GLI, or TRÉVISO, a bishop's see, and the head town of the province of Treviso in Austrian Italy, is situated in a fertile plain on the banks of the river Sile, which is navigable by large boats, and communicates by means of canals with the lagoons of Venice. A small river called Bottega flows through the town and joins the Sile. The town is old; the streets are irregular, mostly lined with arcades, and adorned with several fine buildings. The cathedral, first built by the Longobards, and afterwards restored, but never finished, has some fine paintings by Veronese, Tiziano, and Bordone, the last a native of the place, and the relics of several saints. There are several other churches worthy of notice, as well as the episcopal palace, the town-house, and the palaces of the families Pola, Bressia, and others. Treviso is surrounded by walls and a ditch, and has a circumference of about three miles. It has a spacious hospital, a monte-di-pietà, a public library, a handsome theatre, an academy of sciences and literature, and about 15,000 inhabitants, independently of the suburban parishes which form part of the commune of Treviso, and contain about 6000 inhabitants. A great fair is held here in the month of October, and it lasts a fortnight.

TRÉVOUX. [AIN.]

TRICARICO. [BASILICATA.]

TRICHINOPOLE. [CARNATIC.]

TRIER (*Trèves*) is one of the five governments of Rhenish Prussia. It is bounded N. by the government of Aix-la-Chapelle, E. by that of Coblenz, W. by the principality of Birkenfeld and the Bavarian circle of the Rhine, S. and S.W. by France, and W. by Belgium. It is divided into 12 circles; the area is 2775 square miles, and the population 488,698, of whom 414,698 are Roman Catholics, 68,395 Protestants of different sects, 125 Mennonites, and about 7000 Jews. The face of the country is hilly, with a considerable extent of forest and pasture land, but not much that is adapted to tillage. There are mines of iron, lead, calamine, copper, and coal. Some wine is produced in sheltered situations on the banks of the Moselle. [RHEIN-PROVINZ; EIFEL.]

The chief town, *Trier*, is described in a separate article. [TRIER.] Among the other towns are—*Merzig*, S. of Trèves, on the Saar, population 4000; *Ottweiler*, S.E. of Trèves, near the Bavarian frontier, population 2500; *Prüm* [EIFEL].

Saarbrück, or *Sarrebruck*, is situated on the navigable river Saar, over which there is a stone bridge connecting the town with the suburb of St. John. It is a neat pleasant town, and the houses are all built of stone. It has a gymnasium; a Lutheran, a Calvinist, and a Roman Catholic church; and a synagogue. In this town are the court of justice for the circles of Saarbrück, Saarlouis, Ottweiler, and St. Wendel; a mining-office, a custom-house, and other public offices. The inhabitants, who number about 9000, have manufactories of woollens, linens, tobacco, iron-wire, porcelain, &c. They have also breweries, tanneries, and alum-works, and carry on a thriving trade by means of the river, especially in coals and timber.

Saarlouis, called during the French revolution *Saar-libre*, is the extreme fortress of Prussia on the frontier next to France. It is situated in a plain on the left bank of the Saar, in the government of Trier, in the Rhein-Province. Including the garrison, the population is about 7000. The inhabitants manufacture iron and steel wire, hardwares, fire-arms, and leather. In the neighbourhood there are mines of iron and lead. Saarlouis is the seat of various public offices, has a gymnasium, one Protestant and two Roman Catholic churches, a synagogue, an hospital, an arsenal, and two barracks. The fortress was erected by Vauban in 1680 to defend Lorraine. By the treaty of Ryswick, in 1697, France was left in possession of it. By the treaty of Paris (1815), France was obliged to cede Saarlouis, with three other fortresses, to the allied powers, who assigned it, with the two banks of the Saar above Saarbrück, to Prussia.

TRIER, or TRÉVES, the capital of the government of Trier, in Rhenish Prussia, is situated in 49° 46' N. lat., 6° 38' E. long., on the right bank of the Moselle, over which there is a stone bridge of eight arches, 690 feet long, and 24 feet wide. It lies in a valley of extraordinary fertility, bounded by low hills covered with vines. This city

is undoubtedly one of the oldest in Germany. When Julius Cæsar was in Gaul, the Treviri were a powerful people. The chief city of the Treviri was afterwards called Augusta. In later times it was the residence of the emperors Constantius, Constantine the Great, Julian, Valentinian, Valens, Gratian, and Theodosius; and was so eminent for its commerce, manufactures, wealth, and extent, that Ausonius calls it the second metropolis of the empire. It was nearly annihilated by the Huns, the Goths, and the Vandals, yet subsequently almost recovered its ancient splendour under the archbishops of Treves, some of whom maintained large armies, which they led to the field in person, and greatly enlarged their dominions, so that they obtained considerable political influence in Germany. Treves was taken by the Duke of Marlborough in 1704, and during the wars of the French revolution suffered, like other German cities, by having its churches and convents plundered of their wealth, their buildings being converted into stables or warehouses. It was assigned to Prussia by the congress of Vienna. The population (exclusive of the garrison and the suburbs) is about 17,000. The city is an oblong parallelogram a mile and a half in length, and including within its limits several large gardens. The streets are irregular and for the most part narrow; there are nine suburbs and eleven gates. Treves is the seat of the governor, of a Catholic bishop and chapter, and of several tribunals and public offices. The university, founded in 1454, and greatly extended in 1722, was converted by the French into a central school, and is now called a gymnasium; it has a library of above 70,000 volumes and 2000 manuscripts, among which is a Codex Aureus of the four Gospels. Among the public buildings, the following are the most worthy of notice:—The ancient electoral palace, now converted into barracks; it stands partly on the site of an immense Roman edifice, of which only a fragment now remains, the walls of which are 90 feet high and 10 feet thick. It is said to have been the residence of Constantine. The cathedral of St. Peter and St. Helena, in the earliest Byzantine style, is chiefly remarkable for its altars and its marble gallery. It is believed to have formed part of the basilica, or palace of the empress Helena, who converted her residence into a church. The Liebfrauenkirche (church of Our Lady), built between 1227 and 1248, is one of the finest specimens of the pointed style. But the church of St. Simeon is the most important Roman monument in Germany. It was probably built in the time of Constantine, between 314 and 322. In the 11th century it was consecrated and dedicated to St. Simeon by Archbishop Poppo. The double gateway, or portal, formed the entrance to the city, and was called Porta Martia, and also Porta Nigra, and is now called the Roman Gate. Since Treves has been in the possession of Prussia, all the additions by which the Roman Gate was deformed have been cleared away, and it is restored as far as possible to its original form. Few cities are so rich in Roman antiquities. Among other Roman remains are the baths, the amphitheatre, now nearly destroyed, and the bridge over the Moselle. The village of Igel, about 6 miles from Treves, is remarkable for a Roman obelisk 72 feet high, presumed to be the monument of the family of the Secundini. It is the most richly-ornamented Roman monument in all Germany. Treves, though not a manufacturing town, properly speaking, has however some manufactures of cloth, woollens, porcelain, hats, tobacco, paper-hangings, soap, several breweries and distilleries, and a very considerable trade in wine, timber, coals, and corn.

The archbishop of Treves was archchancellor of the holy Roman empire, and had the bishops of Metz, Toul, and Verdun as his suffragans. He was the second in rank among the electors, and gave the first vote at the election of the emperors. From Eucherius to the last archbishop there were 114 bishops and archbishops. When France, by the treaty of Lunéville, obtained the greater part of the country, the archbishopric, with the electorate, was abolished. Clemens Wenceslaus, of the house of Saxony, the last elector, received as an indemnity an annuity of 300,000 florins, and the episcopal palace at Augsburg, where he died in 1812.

TRIESTE, a circle of the Maritime Crownland, or Illyrian Littoral, on the Adriatic, in Austria, consists of the immediate territory of the city of Trieste, the rest of the crownland being distributed between the circles of Görz and Istria. The area is about 84 square miles, and the population about 100,000.

TRIESTE, or TRIEST, once a Roman colony (called by Pliny and Pomponius Mela *Tergeste*), is now a flourishing commercial city and sea-port, the capital of the Austrian Littoral. It is situated in 45° 48' N. lat., 13° 38' E. long., at the north-western extremity of the Gulf of Venice. It consists of two parts: the old town, standing on a hill with a castle on the summit, and the new town, called *Theresienstadt*, which is built on level ground extending to the sea-side. Between the two parts is a spacious thoroughfare called the *Corso*, which opens upon several handsome squares, one of which is adorned with a column surmounted by a statue of the emperor Charles VI. The old town has narrow, crooked, dirty streets, especially in the old Jews' quarter; the new town however forms a regular square with broad streets crossing each other at right angles, and some canals, one of which, called the Great Canal, presents a very animated appearance. There are 31 squares, or market-places, of which the *Theresienplatz* and *Joseph's Platz* in the new town are the handsomest. There are 9 churches, among which are 1 Lutheran, 1 Calvinist, 1 Greek, 1 Oriental

Greek, and 1 Servian; besides other great public buildings, such as St. Peter's church, the ancient cathedral, the synagogue, and the noble exchange, the city contains many very large and handsome private houses. In the year 1719 the emperor Charles VI. declared Trieste a free port, which it still continues to be. At that time there were scarcely 8000 inhabitants. The privileges of the place were extended by the empress Maria Theresa, so that all goods, with very few exceptions, can be imported duty free. The consequence has been that the population has increased very rapidly, and the town, including its immediate territory, has about 95,000 inhabitants. Trieste is now the most important and wealthy commercial city and the chief sea-port in the Austrian dominions. Foreign consuls reside in it. The commerce of Trieste was much increased by the institution of the Austrian Lloyd's, which is supported by the government, and has above 30 steamers, which ply to all parts of the Adriatic, the Mediterranean, and the Black Sea. Of large merchantmen there arrive at Trieste about 1500 of all nations, and the number of arrivals of coasting vessels is not less than 8000. Steamers ply between Trieste and Venice, and others to Greece, Constantinople, Trebizond, and Egypt. The harbour, which is small but secure, is defended by a strong battery on the new mole; it is bordered by a wide stone quay, close to which vessels of 800 tons can ride at anchor. By the Maria Theresa Canal, which partially intersects the city, vessels can load and unload at the doors of the warehouses. There are two lazarettos near the harbour, where ships from suspected places perform quarantine. Among the manufactures are soap, leather, rosoglio, wax, liqueurs, wax-lights, refined sugar, spirits, pottery, &c.

Trieste is a sea-port for a very large tract of country, comprising the Austrian territories from the Tyrol to Transylvania. Among the exports are—metals, linens, tobacco, woollens, printed calicoes, wax, hemp, wool, skins, furs, timber, corn, rice, wine, oil, and shumac. The imports are—cotton, hides, raisins, silks, rice and oil, wheat from Odessa, and all kinds of tropical and colonial produce from the West Indies and Brazil. Goods from the Black Sea coasts, from Turkey and Egypt, are warehoused in Trieste. Ship-building is carried on to a great extent, and the ship-builders of Trieste are much esteemed for their skill. A railway to Vienna through Laybach is all but completed.

Trieste gives title to a Catholic bishop. It has an imperial academy, a scientific and nautical school with 16 professors a town library containing 24,000 volumes, a gymnasium, many banking establishments, and insurance offices. The hills surrounding the city are adorned with beautiful country seats and gardens. These hills were formerly naked and desolate, but in the latter half of the 18th century mould was brought at a great expense by sea from Istria, and this barren tract was gradually transformed into a paradise. After the Treaty of Vienna in 1809, Trieste with its territory was annexed by Napoleon I. to Illyria. In 1814 it returned to the dominion of Austria.

TRIM, Ireland, the county town of Meath, a market-town and the seat of a Poor-Law Union, is situated on the river Boyne, in 53° 34' N. lat., 6° 45' W. long., distant 11 miles S.W. from Navan, and 27 miles N.W. from Dublin by road. The population in 1851 was 1905, besides 707 inmates of the workhouse, and 233 in the jail. Trim Poor-Law Union comprises 20 electoral divisions, with an area of 119,519 acres, and a population in 1841 of 35,293; in 1851 of 29,604.

The town contains many well-built houses. The streets are paved. The parish church, of which the ancient tower still stands, was rebuilt in 1802. There is a spacious and handsome Roman Catholic chapel. There are a school of the Incorporated Society of Dublin, a National school, and a Workhouse school. In Trim are the county court-house, the county jail, fever hospital, Union workhouse, an infantry and a constabulary barracks. At the south-western extremity of the town is a handsome Corinthian column, erected in 1817, and surmounted with a statue of the Duke of Wellington, who received part of his education in the town. Near the jail are the remains of Trim Castle. The Yellow Tower, a part of St. Mary's abbey, rebuilt by the De Lacy's in the 18th century, stands on the left bank of the river. Trim has little trade. It has a tannery, brewery, and extensive flour-mills. The county assizes and quarter and petty sessions are held in the town. Fairs are held five times a year. Saturday is the market-day.

TRINCOMALEE. [CEYLON, in SUPPLEMENT.]

TRING, Hertfordshire, a market-town, in the parish of Tring, is situated in 51° 47' N. lat., 0° 41' W. long., distant 29 miles W. from Hertford, 31 miles N.W. from London by road, and 31½ miles by the London and North-Western railway. The population of the town in 1851 was 8218. The living is a perpetual curacy in the archdeaconry of St. Albans and diocese of Rochester. The town is neat, and is lighted with gas. The church is of perpendicular character, with a massive tower, built about 1450. There are chapels for five sections of the Baptist denomination, National schools, and a mechanics institute with a reading-room and library. A large silk factory, several canvass factories, and strawplat and bonnet factories give employment. Friday is the market-day; fairs are held on Easter Monday and Michaelmas-day.

TRINIDAD, one of the British West India islands, is situated on the north-east coast of Colombia, from which it is separated by the Gulf of Paria, and extends between 10° 5' and 10° 50' N. lat., 61° and 62° W. long. The Serpent's Mouth, a passage 7 miles wide, separates it from the delta of the Orinoco at the southern extremity of the

gulf; at the northern extremity it is separated from the peninsula of Paria by the Dragon's Mouth, a passage 13 miles wide, divided into four straits by three small islands. The whole length of the gulf, which affords good anchorage throughout, is 100 miles, with an average breadth of 40 miles. The island, which is of an oblong form, with a projection at each of the angles except the south-east, is 50 miles long from north to south, and 30 miles broad at the centre, where it is slightly compressed. Its area is 2000 square miles, or 1,280,000 acres, of which almost 43,000 acres are waste, and 200,000 acres are private property. About 60,000 acres are under cultivation. The population in 1834 was 43,678; in 1845 it was 59,815; in 1851 it was 68,600, of whom 727 were natives of Great Britain and Ireland. Three ranges of hills, corresponding to those on the adjacent coast of Venezuela, cross the island from west to east; the highest runs close to the northern coast, over a breadth of about 10 miles, and is broken in many places into deep valleys and rugged peaks, with an extreme elevation of 3000 feet. The second range occupies the centre of the island in a series of flat or round-topped hills from 600 to 1000 feet in height, and a range of nearly the same elevation extends along the southern coast. By these ranges the surface of the island is divided into two extensive valleys, which unite on the western coast in a low sandy plain, interspersed with occasional swamps. In other parts they are diversified by level and undulating tracts, and in some places, especially towards the south, are considerably broken. The northern valley is watered by two navigable rivers, one of which, the Caroni, flows westward into the gulf of Paria, receiving several tributaries from the hills to the north. The Oropuche, which flows eastward to the Atlantic, rises not far from the Caroni. In the same valley, the Lebranche falls into the Atlantic to the south of the Oropuche, and the southern valley is drained towards the same coast by the Nariva and the Ortoire, which collects numerous tributaries from the centre of the island. A number of small streams fall into the Gulf of Paria.

A great part of the island is alluvial and seems to have been formed by the mud of the Orinoco, opposite to which the coast is receiving constant accretions. The mountains, like those on the mainland, consist chiefly of the clay-slate and mica-slate formations. Among the minerals found in the island are milky quartz, pyrites, arsenic, alum, sulphate of copper, plumbago, and sulphur. The most abundant is asphaltum, which in Lake Brea, or Pitch Lake, in a volcanic district on the west coast, occupies an area of 150 acres in extent, and of unknown depth. At the inner edge it is cold and firm and rent into shallow chasms from 8 to 30 feet wide; nearer the sea it is heated and liquid, continuing in a state of slow ebullition with strong exhalations of bitumen and sulphur. It requires too much oil to be profitably applied to the ordinary uses of pitch or tar, but has been employed with advantage in the formation of roads. Volcanic traces appear in various parts of the island. Bitumen is thrown up by the sea at a spot on the south side of Point Brea, and there is an active mud volcano at the extremity of the southern promontory.

The climate is hot, but is free from the destructive droughts which visit the other islands. At Port of Spain, the capital, the temperature ranges from 74° to 86° in the hottest months, and from 70° to 81° in the coldest. The nights are generally cool and pleasant, and in some parts of the interior the temperature is mild and the air elastic all the year round. The dry season extends from December to May. The heat increases till June. In June and July showers are frequent, and in the three following months the rains are heavy and attended by violent storms. The fall of rain is about 65 inches during the year. Slight shocks of earthquakes are occasionally felt, but the island is beyond the range of hurricanes. Fevers and dysentery are frequently fatal, especially among the white population.

The higher portions of the island are covered with dense forests and underwood. The soil is for the most part exceedingly fertile. The most important productions of Trinidad are the sugar-cane, coffee, and cocoa. Indigo, tobacco, and cotton are raised in small quantities. The nutmeg, cinnamon, and cloves have been introduced, and succeed remarkably well; and vines from France and Spain grow in great perfection. The wild animals are, two species of small deer, the paria, an animal a little larger than a hare, the opossum, armadillo, porcupine, ant-bear, sloth, musk-rat, tiger-cat, peccary, water-dog, monkeys in great numbers, and two species of lizards. The shores abound in fish, among which are some varieties of the shark.

Besides the anchorage of the gulf, in which vessels of all sizes may ride securely, Trinidad has three excellent harbours: Puerta d'España, within the northern promontory, on the west coast, and on the south coast Chaguaramas, near its western extremity, and Guaya-guayara, protected by Point Galeota, at the eastern extremity. The ports of Cumana, Rio Grande, and Toco on the north-east coast, and Maqueribe and Las Cuevas on the north coast, are inferior. Las Cuevas is defended by a fort.

The settled parts of the island, which occupy chiefly the north-west coast and the adjacent valley of the Caroni, with some detached spots along the south-west coast, are divided into 8 counties. Along the principal road, which extends eastward from Port of Spain along the north side of the Caroni, are the towns of San Juan, San Joseph and Arima, of which San Joseph, population 307 in 1851, is the most considerable. San Fernando, another principal town, population 2877 in 1851, stands above 20 miles S. from Port of Spain, on the

shore of the gulf. Port of Spain, one of the finest towns in the West Indies, is situated near the mouth of the Caroni, on the shore of a bay environed with hills, and consists of wide and well-kept streets, regularly laid out, and some of them shaded with rows of trees. The houses are built of stone or brick. It contains an English and a Roman Catholic church, both handsome buildings; a United Presbyterian and a Methodist church; a Church of England boys school; three Infant schools; two Roman Catholic schools; the government-house; the court-house; the royal jail and lunatic asylum; the colonial hospital; an excellent market-house of stone; and numerous stores. In the neighbourhood are the botanic gardens, St. James's barracks, and Fort George, which rises in a series of batteries on a height, commanding the valley, and forming the principal defence of the island. The population in 1851 was 17,563.

The affairs of the island are administered by a governor and a council of 12 members, acting under the orders of the imperial government. The members of council, of whom six are official and six are chosen from among the inhabitants, are removable at the pleasure of the crown. The laws are partly English and partly Spanish, and are administered by a chief justice, two puisne judges, and six stipendiary justices, including a Coolie magistrate. The Church of England has 11 clergy in the island, including the archdeacon and several rectors, who are subject to the Bishop of Barbadoes. According to the Return of the Census, taken on 1st July, 1851, it appears that the following is the state of the population in reference to religious profession:—Church of Rome, 43,605; Church of England, 16,246; Gentoo, 2649; Wesleyan, 2508; Presbyterian, 1017; Mohammedan, 1016; Heathen, 880; Baptist, 148; Independent, 133. The amount of revenue for the year 1852 was 107,311*l.*; the expenditure was 110,944*l.* The value of imports for the year 1852 was 493,274*l.*, of exports 458,851*l.*

Trinidad was discovered by Columbus in 1498, when it contained a numerous aboriginal population. It was first colonised in 1538, by the Spaniards; in 1676 it was taken by the French, but almost immediately restored, and in 1797 it was taken by the British, in whose possession it has since remained.

TRINIDAD DE CUBA. [CUBA.]

TRIORA. [NICÆ.]

TRIPLOW. [CAMBRIDGESHIRE.]

TRIPOLI, a country in Northern Africa, which extends along the southern shores of the Mediterranean, from 11° to 25° E. long. In this direction alone the boundary-line of the country is tolerably well determined; on all other sides it is surrounded by countries which form portions of the Sahara, or Great Desert, or are unfit for cultivation. Though Fezzan, which lies south of Tripoli, is governed by its own chief, he is really dependent on the Basha of Tripoli, as he pays regularly an annual tribute.

About the middle of the coast-line of Tripoli is a wide and open gulf, which the ancients called the Greater Syrtis, and is now the Gulf of Sidra, or of Sert. The Beduin Arabs who inhabit the coast call it Giun-el-Kebrit, or the Gulf of Sulphur. Cape Mesurata is on the west side of it, and the town of Bengasi on the east; the distance between these places is 282 miles. The circumference of the gulf is 438 miles. Where it extends farthest to the south, its depth does not much exceed 120 miles. [SYRTIS.]

Coast-line and Harbours.—West of the town of Tripoli the coast is low and sandy, and contains no harbour except that of Old Tripoli, which is almost choked up with sand. Tripoli itself is a good harbour, having from 4 to 6 fathoms water, and being sheltered by a chain of rocks which project from the north-east angle of the town, north-eastward, and by a shoal lying on the eastern side of the entrance. The low and sandy coast continues eastward of the town as far as Cape Sciarra, and contains no harbour. Eastward of Cape Sciarra the coast is higher, and consists of rocky points and capes, with sandy bays between them, a few of which afford shelter for small vessels. The port of Lebda (the ancient Leptis Magna) is now filled up, but there is a small place, called Mersa Ligatah, a mile and a half to the west of the ruins of Lebda, where small vessels find a shelter, except when the wind is from the east. Near Zeliten Point, which is rocky, is a small cove called Mersa Zeliten. East of Zeliten the coast is rocky and at times rises into cliffs. Along this coast are several reefs of rocks which form Mersa Zoraig and Mersa Guaser, small harbours which do not afford shelter for shipping. Near Cape Mesurata is a line of high rocky coast, forming three projecting cliffs, of which the eastern is Cape Mesurata, the Cephalus Promontorium of Strabo. But the entrance of the Gulf of Sidra is formed by a low rocky point, and a mile south of it is the Bay of Bushaifa, which has good anchorage in 6 fathoms water.

The west coast of the Gulf of Sidra, south of the Bay of Bushaifa and as far as Mersa Zafferan, runs in an unbroken line south, south-east, and east for nearly 150 miles. It is very low and sandy, and a low ridge of sand-hills extends parallel to the shores at the distance of from one to three miles from them. Some parts of this coast are strewn with wrecks, masts, and yards, &c., which shows that there must be a great set of the sea from the north-east upon it, as none of them are seen on the eastern shore of the gulf. Mersa Zafferan is a small port, in which boats may find shelter with all winds. A few miles east of it the coast rises into cliffs. The high coast continues for

nearly thirty miles, when it again sinks nearly to the level of the sea, but has sand-hills a short distance from it. There are here several small bays, and one in particular at Hammah, in which boats may find shelter. Five miles eastward of Hammah the coast is hilly, but soon declines again to the low sandy beach which continues to Ras How-y-er, having a range of hills about two or three miles from the coast. Ras How-y-er is a bluff rock, which stands at the entrance of a spacious bay, formed between it and a bold rocky promontory called Bengerwad. In this bay ships may find shelter from east to west-north-west, and boats may land in the sandy bay with almost all winds. Bengerwad is about 60 feet high, but east of it the coast gets low, and small sandy bays are formed between very low rocky flats, some of which project a mile into the sea, and are not more than a foot above water. Towards the most southern extremity is a low rocky islet called Busbaifa. Sachrin, at the bottom of the gulf, is in 30° 16' N. lat.; and hence the coast trends to the north-east. From Sachrin to Gartúbbah is a sandy beach, but the general appearance of the coast is hilly. Near Gartúbbah is Mersa Braiga, the only place in the Gulf of Sidra that is entitled to the name of a port; and here the protection is made by breakers. A rocky point runs into the sea, and within this point there is always safe landing. From Braiga the coast trends north-east by east, is rocky and slightly indented, and the shore generally speaking is high and hilly. Ras Tabilba is a bold promontory with a sandy bay on each side of it. The high rocky coast terminates opposite the rock of Ishaifa, from which some reefs extend to the island of Gara, which is small, but tolerably high and steep. The low coast, which begins near Ishaifa, trends north-east to Shawhan, and thence to the west of north to Carcora: it is sandy, and does not offer a place of refuge even for a boat; but the coast near Carcora is much indented, and there are two small places somewhat sheltered by projecting points, which offer protection for boats with northerly or easterly winds. From Carcora to Bengazi the shore is low and sandy, but it rises as it recedes from the coast, and is covered with vegetation.

Bengazi, which is situated at the entrance of the Gulf of Sidra, has a safe port, which however is fast filling up with sand. [BENGAZI.] The coast north of that port trends in general to the east-north-east as far as Cape Ras Sem, and is low and sandy, with the exception of a few small hills. This coast has no harbour, except east of a rocky promontory near the ruins of the town of Tolmeta, where a small bay offers a convenient landing for boats, except with the wind on shore. A few miles east of Tolmeta the mountains, which extend over the interior of Barca, come close up to the shore of the Mediterranean in steep precipices from 600 to 800 feet high. This part of the coast, extending about 30 miles in length, is inaccessible both by sea and land, and terminates at Cape Ras Sem. Between this cape and that called Ras-el-Hilal is a large open bay, in which is a small indentation called Mersa Susa Hammám, near which are the ruins of the ancient town of Apollonia. It has at present no harbour, but boats find some shelter behind the islet that lies off the town. On the east side of Ras-el-Hilal is a bay about three-quarters of a mile deep, in which vessels may ride with the wind any way from the southward to westward. The coast between Ras-el-Hilal and Cape Bujebára is also very high and rocky, but the mountains do not run in an unbroken line, as they do west of Ras Sem, being broken by deep chasms, which extend far inland. Still the landing is very bad, except in a small sandy nook two miles west of Cape Bujebára. From Cape Bujebára the same rocky coast continues, but the ravines are few, and the mountains somewhat farther removed from the coast. At Derna is a good roadstead, about a mile and a half off shore, and some shelter for small craft close in shore with the wind from north-north-west to north-east. Cape Razat, or Razatu, which is east of Derna, is a vast promontory rising to a considerable elevation: farther east the coast grows lower, but continues rocky; it recedes to the south so as to form a wide bay, called the Bay of Bombah, which is said to contain good anchoring-ground. The boundary-line between Tripoli and Egypt is considered to be east of the Bay of Bombah.

The coast-line of Tripoli probably exceeds 1000 miles, and hardly contains three or four harbours in which vessels of moderate size can find tolerable shelter. There is perhaps no other coast-line on the globe of equal extent which is so little favourable to intercourse with countries by sea.

Surface and Soil.—We are very imperfectly acquainted with the interior of Tripoli. The western districts, or those which are situated west of the Gulf of Sidra, are known in a few directions; but of the country surrounding the gulf nothing is known except the districts contiguous to the sea-shore; and as to the countries east of the Gulf of Sidra our knowledge extends hardly anywhere farther than about 20 miles inland, if we except two oases, which are situated far to the south, in the Desert.

Western Region.—Two ranges of mountains traverse this part of Tripoli from west-north-west to east-south-east, running nearly parallel to the sea. The northern of these two ranges is called the Ghurian, Gharian, or Wahryan range, and is visible from the sea, being only from 15 to 20 miles distant from it. The southern range is supposed to be about 30 miles farther to the south, and is called the Sudah, or Black Mountains, where it is traversed by the road leading from Tripoli to Fezzan. The commercial town of Ghadamis is situated

within this range, and rather on its southern declivity. The name 'Black Mountains' is derived from the colour, as nearly the whole of the range is covered with lava and basalt. The Ghurian Mountains, south of the town of Tripoli, seem to have a considerable elevation, probably however not exceeding 4000 feet above the sea-level. In proceeding farther east the range lowers considerably, and its most eastern offsets, which occur about five or six miles south-west of the town of Meurata, terminate only in high hills. Several minor ridges branch off from the eastern portion of this range on its northern side, and approach close to the Mediterranean between Cape Sciarra and the ruins of the town of Lebda. The most western of these minor branches is called the Tarhoona Mountains: it hardly attains a thousand feet above the sea.

The country which is inclosed on the east by the Tarhoona Mountains extends southward to the base of the Ghurian range, and on the west reaches the boundary of Tunis: it is a low and level plain, about 60 miles long and 16 miles on an average width. It is by nature divided into two sections, the fertile district and the Desert. The fertile district, called Mesheea, occupies only about 15 miles along the sea-coast, and the greater part of it is to the east of the town of Tripoli; its width nowhere exceeds five miles. Though the soil is light and contains a great portion of sand, and is destitute of rivers and springs, it possesses a high degree of fertility, which, by means of irrigation derived exclusively from tanks and cisterns, produces rich crops of wheat, barley, dhurra, and Indian corn. The whole of the Mesheea is planted with palm-trees arranged in long rows, which are kept in the finest order. Their number is stated to exceed ten millions, and the annual value of the produce of each tree is estimated at a Spanish dollar. The plantations of olive-trees are also extensive, and the oil is considered superior to the best oils of Italy. There are several kinds of oranges, of which the sweet orange is reckoned finer than that of China. The pomegranates, lemons, limes, figs, and Indian figs are highly prized. There are two kinds of apricots, several sorts of fine plums, and some very high-flavoured sweet grapes and peaches. Water-melons are particularly excellent and plentiful. From November to March the country is refreshed by abundant rains, which fill the numerous tanks and cisterns; and in this season the thermometer descends frequently to 40° and even to the freezing-point in the night-time, whilst in the day it sometimes rises to 70° and even higher. In the remainder of the year, and especially from the middle of May to September, rain occurs rarely, and sometimes not a drop falls for several months. The heat is then so intense that even the hardy Arab, inured to the climate, at ten in the morning retires from his work, and all his beasts of labour are put under the shade. A sudden cool breeze arises from the sea regularly every afternoon during these intense heats; but the air brought by it from the sea is so damp that it rusts all sort of steel-work, even in the pocket, and wets a person's dress entirely through in a few minutes. The Moors then retire to the terraces on the top of their houses, where they sleep for hours. In this season of the year a strong land-wind sometimes blows incessantly for several days, and as it blows over the heated sands of the Desert, which lie south of the Mesheea, the heat of the atmosphere is increased to such a degree that respiration is rendered difficult, and death sometimes occurs. The air is at the same time filled with burning sand, which darkens the sky, and the natives wear a silk handkerchief tied over the face when they walk the streets. In spite of this disadvantage the climate is very healthy; no kind of disease except ophthalmia is common, and many people are said to reach the age of 110 and 130 years. The Mesheea is very thickly peopled, so that the population of this district is said to amount to 300,000. They live dispersed over the country in isolated dwellings or in villages.

The Mesheea is surrounded on all sides, except the sea, by a desert, whose surface consists of loose sand. This long sandy tract begins on the east on the banks of a small river called Wady'm Seyd, and thence stretches westward to the Ghurian Mountains, occupying nearly the whole of the space between the mountains and the sea west of the town of Tripoli. Its western portion has no springs nor running water. Where it borders on the Mesheea, and at the distance of several miles from it, the sand rises in irregular hills, and is totally barren. But in approaching the mountains small spots covered with shrubs and grass occur, which afford pasture to the flocks of the Beduins, and near the base of the mountains the pasture-grounds are nearly contiguous, and frequently interspersed with corn-fields. The eastern districts of the Desert, or those near the Tarhoona range, are also covered with high sand-hills, which reach to the base of the mountains, but they are traversed by two small perennial streams, called Wady Ramleh and Wady'm Seyd, which run in rather narrow valleys, considerably depressed below the general level of the Desert. These valleys are covered with bushes, and between them corn-fields often occur. Barley and dhurra are cultivated.

The Ghurian Mountains, south of Tripoli, occupy a tract 12 or 15 miles in width. The northern declivity appears to be very irregular, several hills of basalt being dispersed over their base. The mountains rise with a rather steep ascent, but on the top they spread out in plains of moderate extent, which are divided from one another by hills, many of which have a conical form. The plains are in a high state of cultivation. They are covered with corn and saffron fields,

interspersed with olive-trees, but the elevated situation prevents the cultivation of the palms. The sides of the hills, which are too steep for the growth of corn, are planted with almonds, figs, apples, olives, and vines. A considerable portion of this tract however is used as pasture-grounds. The inhabitants of the Ghurian Mountains live mostly underground, in caves which have been dug for the purpose.

Farther to the east, and where the Tarhouna Mountains branch off, the mountain region sinks much lower and assumes a different character. It is a table-land about 80 miles in width, which runs towards Cape Mesurata, and only on its edges assumes the aspect of high hills or mountains, especially towards the Desert which lies north of it. The greatest part of the surface of this table-land is a plain, nearly level, whose soil is very stony, or covered with gravel, and completely barren. But in the vicinity of the higher grounds which inclose it on the north, it is furrowed by depressions, or wadies, which are partly cultivated, and yield good crops of corn, and the level grounds separating them are covered with fine grass for sheep and camels.

The eastern portion of this table-land, in approaching the Gulf of Sidra, splits into several short ranges of hills, which fill up the space between Cape Sciarra and the town of Mesurata, and in many places come close up to the sea. Thus a hilly tract is formed, which extends about 60 miles from west to east, along the seashore, and from 5 to 6 miles inland, where it terminates on the plain of the table-land. This tract is the best-watered district in Tripoli, as several small streams which descend from the table-land run through its valleys, and reach the sea after a course of 6 to 8 miles, but there is always water in them. The western district consists of a succession of hill and dale. They possess a considerable degree of fertility, and produce wheat, barley, and dhurra. In the eastern districts the hills are separated from the sea by a level plain about two miles wide, which in two places is interrupted by ranges of low hills, so as to be divided into three plains of moderate extent, which are known as the plains of Lebda, Zeliten, and Mesurata. The hills south of them are mostly pasture-grounds, between which some corn-fields are found; but the plains themselves, which slope gently towards the sea, are well cultivated. Thick groves of olives and date-trees rise above the numerous villages, which are scattered over their surface, and the intermediate spaces are either covered with the most luxuriant turf or rich with abundant crops of grain. The plains of Lebda and Mesurata especially are distinguished by their rich crops of corn, and large quantities of it are sold to the wandering tribes living east of them or exported by sea. The cultivated grounds in the plain of Mesurata extend along the shores of the Gulf of Sidra as far as Bushaifa. A ridge of low sand-hills separates the plains from the sea.

The country south of the table-land, extending to the Sudah Mountains, contains a much smaller portion of cultivated ground than that north of it; the greater part of it is a complete desert. According to the scanty information which we possess, it appears that its surface presents a succession of several wide depressions, running from west to east, and terminating on the east in the low grounds which extend along the western shores of the Gulf of Sidra. From each of these wide valleys smaller valleys branch off, and penetrate a few miles into the higher grounds, which inclose them. These higher grounds are many miles wide, and rise rather steep above the valley to an elevation of 400 to 500 feet. A large portion of them is probably 1000 feet above the sea-level. Their surface is neither level nor yet hilly. It presents everywhere a useless waste, though it greatly varies in aspect. At some places it is what the natives call a 'sahár,' or a level plain consisting of loose sand, without either stones, rocks, water, or vegetation. Other tracts, called 'sereer,' are gravelly plains from which the sand has been swept by the winds. The gravel is generally small, and in some instances rounded as pebbles on the sea-beach; in others sharp and pointed, as if recently broken; and a third kind, which sometimes covers spaces of many miles in extent, is mostly composed of small stones which have a shining exterior. In the sereers alone sand-hills are found. A third kind of desert is called 'warr;' it presents a rough plain covered with large detached stones lying in confusion, and very difficult to pass over, as its surface is much broken and interspersed with numerous rocks and small hillocks. A few spots in these deserts are covered with bushes. The few wells which are found are generally above 100 or even 200 feet deep, and yet their water is bitter and brackish. The habitable portion of this region is limited to the depressions above mentioned, where several villages are found close together, whilst all the other parts are uninhabited. But even in those districts which are far from the villages a few fields are cultivated, and produce barley and dhurra. The inhabitants of the villages cultivate them, but do not venture to form agricultural settlements on them for fear of the wandering tribes of the adjacent desert. These valleys have generally a watercourse in the middle, in which however water is found only for a few weeks in the year, as the rains south of the Ghurian Mountains and the table-land are far from being so abundant as north of them. The greater part of the depressions is overgrown with shrubs, and supply only pastures for camels, sheep, and goats; the most fertile of them is that of Benioloed, which is situated on the south of the table-land south of the Tarhouna Mountains. The 'warr' which borders on the south of the valley of Benioloed is covered with lava and columnar greenstone, and is of great extent.

Country on the West and South of the Gulf of Sidra.—The region just noticed does not reach the western shores of the Gulf of Sidra, being separated from it by a tract of very low country, or rather by a marsh. This marsh begins at Bushaifa, about 4 miles S.E. from Mesurata, and extends along the sea-shore as far as Giraf, a distance exceeding 100 miles. It reaches however the beach only in two places, being separated from it by a narrow tract of more elevated ground, which consists of small but irregular heaps of sand, with occasionally a little vegetation on it. The marsh is widest in its most northern part, between Mesurata and Sooleb, which are 40 miles from one another. In these parts it is from 9 and 10 to 15 miles wide. In approaching Sooleb it contracts to 2 or 3 miles, but widens again farther south to 4 and 5 miles. At the end of the rainy season, in March, nearly the whole surface of this marsh is covered with water. At the end of the dry season by far the greater part of it is dry, but interspersed with numerous pools of water. Many of these pools are some miles in extent. The surface of the marsh consists of alternate layers of incrustations of salt and of an alluvial deposit, and is entirely destitute of vegetation. In some parts small shells cover the surface, which renders it probable that the sea at times inundates the marsh. In the most level part of the marsh many places occur in which a solid crust, sometimes not more than two inches or an inch and a half in thickness, covers deep hollows, the lowest parts of which contain bitter and stinking water several feet deep. This circumstance renders the traversing of the marsh very dangerous. In this extensive tract of country the habitable ground is limited to two or three low hills, which rise within the marsh, and on which date-groves are met with, and to three or four places where the narrow tract along the sea is somewhat wide, and consists of high ground covered with grass and bushes, which afford pasture to sheep and camels. This is the worst part of Tripoli bordering on the sea.

Though the Gulf of Sidra is inclosed by countries entirely barren and sandy, the tract which is found farther east, and which extends from Giraf (16° 30' E. long.) to Hudia (18° 30' E. long.), a distance of more than 100 miles, has a different character. Its surface in general is undulating, in a few places even rising into hills. The hills are mostly covered with shrubs and grass, affording good pasture-ground for camels, sheep, and goats. In some of the lower tracts are fields on which the Beduins, the inhabitants of this coast, cultivate barley and dhurra. But there are no trees in all the tracts surrounding the Gulf of Sidra. In a few places there are lagoons near the sea, but they are not of great extent, and the only marshes which are met with in this region are on the banks of these lagoons.

The country occupying the bottom of the Gulf is of a much worse description. It extends from Hudia to Braiga (19° 40' E. long.), a distance of more than 60 miles. The shores of the sea are lined with low sand-hills, which have been accumulated by the northern wind from the sand thrown up by the sea. Behind them, marshes frequently occur, or the ground is a rough stony plain, nearly without vegetation. In a few spots only bushes and grass are met with, and in these parts a few families of Beduins wander about with a small number of camels, sheep, and goats. A continuous ridge of hills extends at a little distance from the shore, rising to an elevation of between 400 and 500 feet above the sea-level. The nature of the country south of these hills is not known.

Respecting the climate of this region, it is observed that in winter the atmosphere after sunset is always very chilly, and that there is usually a heavy deposit of dew. In summer however the weather is said to be excessively sultry.

Country East of the Gulf of Sidra.—This part of Tripoli is commonly called Barca [BARCA], and was known to the ancients under the name of Cyrenaica. It comprehends the country which, between 20° and 28° E. long., projects into the Mediterranean nearly in the form of a semicircle, and the countries lying south of it as far as about 29° N. lat. It is supposed that the greater portion of it is mountainous. This part of Tripoli is described under BARCA and CYRENAICA.

The interior of the mountain region, as already observed, is not known. The authority of the Basha of Tripoli however extends much farther south, as the oasis of Augila is within the country governed by him or his deputies. The mountain range which lies to the north of this oasis runs in an unbroken line east and west. It rises from the level ground at its base abruptly, and consists of bare rocks without the least covering of soil. The Oasis of Augila, to the south of this mountain range, is said to consist of three oases, Augila, Ialoo, and Leshkerreh, of which the two last-mentioned are a short distance to the east and north-east of Augila itself. All three, taken together, contain a population of about 10,000. These oases are only forests of palm-trees, surrounded by an immense plain of red sand. The wells are more than 20 feet deep, and the water brackish. Dhurra and barley and a little wheat are cultivated, but provisions, consisting of corn, butter, and cattle, are imported from Bengazi. The exports consist especially of dates and ostrich feathers. Ostriches are numerous in the adjacent desert. Three smaller oases occur between Augila and the southern extremity of the Gulf of Sidra, nearly equally distant from these places. The most western and largest is called Maradeh. They are forests of palm-trees, surrounded by hills of shifting sand. As they are too small to afford sustenance to a popula-

tion sufficiently numerous to resist the attacks of the nomadic tribes of the desert, these oases are uninhabited, but some families living in the plain of Bengasi resort annually to them to gather the dates. A considerable oasis, called Fughha, is situated (it is said) south of the most southern part of the Gulf of Sidra. It seems to be situated in the basalt mountains called Harutsh, which extend westward to the very boundary-line of Fezzan.

Productions.—Besides the different articles of agricultural produce before mentioned, some bushes grow in desert wadies bearing small black berries of a very sweet and agreeable taste; a kind of wild artichoke is met with; prickly-pears and aloes are abundant in several places. The wild trees and bushes are only used to make charcoal. Where charcoal is not to be had, camel's dung is used as fuel.

Cattle are numerous in Barca, where great numbers are found on the table-land, whence they are sent to Bengazi to be shipped for Malta and other places. The domestic animals are horses, camels, sheep, goats, dogs, and poultry. The horses are of a fine breed. Camels are the only animals used as beasts of burden. The common dogs of the country are white, and resemble wolves in form: they are fierce, and defend the herds against the attacks of the hyenas and jackals. The most common wild animals of prey are wolves, foxes, hyenas, and jackals. There are antelopes, gazelles, the jerboa dipus, hares, rabbits, hedgehogs, and a small animal, resembling the guinea-pig in form, called gundy.

Ostriches are found only in the deserts. The other wild birds are bustards, cranes, plovers, quails, ducks, snipes, curlews, pigeons, partridges, and flamingoes. Swarms of locusts frequently proceed from the deserts to the cultivated ground, whence they are frightened away, and then they fall into the hands of the poor, who eat them roasted or salt them. Salted locusts appear to be a considerable article of inland trade. Bees abound in the hilly and mountainous tracts of the country, and honey is an important article of inland trade. Small quantities of honey are exported. Salt and sulphur are the only minerals found and worked.

Population and Inhabitants.—The population is estimated at about two millions. In the country it consists of Arabs and Jews; in the towns, mostly of Moors and Jews: there is a small number of Turks, Mamelukes, Christians, and Arabs. Black slaves are numerous in the towns.

The Arabs of Tripoli, who compose the bulk of the people, are of the same stock as the Beduins of Arabia, whom they resemble in feature, form, and language. Their language generally is not much different from the Arabic, though in some districts it is intermixed with a great number of words derived from other languages. There are two kinds of Arabs in Tripoli; one wanderers, the other fixed residents in villages and small towns. Many of those who live in villages also travel about the country, but always return to what they consider their home. The wanderers have no permanent place of abode, but remove their tents as pasturage or circumstances require. There are large tracts in the deserts which are partially covered with grass and bushes, and afford pasture for their sheep, goats, and camels. These wandering Arabs cultivate some small tracts with barley or durrha. These fields are usually at a great distance from the places to which they go with their flocks, but they are respected by other wanderers, and the corn is rarely stolen. When it is ripe, the proprietors come to gather it. They prepare the soil by turning up the earth with a rude plough, or more generally with a hoe. When the date season commences, many families come and pitch their tents in the Meshees of Tripoli, in order to purchase dates for their future subsistence. These they deprive of their stones, and, when kneaded together, keep them in skins, so as to preserve them from insects or wet: these dates form their chief support, with the milk of their sheep and camels. A great article of commerce is furnished by the fat of sheep. It is boiled until it bears some resemblance to the grease used by tallow-chandlers: it is then poured into skins, and is fit for use. It is put into almost every article of food by the Arabs, and also extensively used in Tripoli and other towns. From the wool of their sheep the women make strong barracans, carpets, shirts, and turbans. Their tents are also made of wool and goats'-hair, and also the sacks which are used for the carrying of corn and merchandises on their camels. Mats and ornaments of palm-leaves or grass are neatly made. Their dyes are generally brilliant, black, blue, red, and orange. As in Western Asia the Arabs are divided into tribes, each governed by a sheikh. In religion they are Moslems, very bigoted and superstitious.

The Jews are numerous in the towns and in the villages of the Arabs. In the towns, though much oppressed, and paying large sums as tribute, they have succeeded in monopolising several branches of commerce. Among the Arabs, where they are much better treated, they apply themselves to several mechanical arts and trades. In Tripoli and the large towns they have several synagogues.

The Moors are most numerous in the towns and in the Meshees of Tripoli. They are either landed proprietors or merchants. As merchants they are mostly engaged in the kafilas which go to Fezzan and Bornou. They resemble exactly the Moors of Morocco, but are less instructed than the Moghrebins, having no colleges, though there are several schools in which the children are taught reading and writing. They are less bigoted than the Arabs.

The number of Turks and Mamelukes has increased since the country has again become dependent on Constantinople. They are either officers of government or serve as soldiers. Christians are only found in the town of Tripoli, where they are better treated than in any other place in the Turkish dominions. They are permitted to build churches. The greater part of them are Maltese, but there are natives of Italy. The black slaves, who are mostly kept by the Moors, are nearly all natives of Soodan.

Government.—The bashalic of Tripoli, like the other Barbary states, is a sordid despotism; and, whether ruled by a Turkish or Moorish chief, is held for the sole purpose of exacting a revenue, without any regard to the wellbeing of the people or the prosperity of the country. A considerable sum was formerly drawn from the plunder obtained by her corsairs, and a very lucrative branch of it was derived from the traffic in European slaves. To supply this deficiency, caused by the abolition of these sources of profit, the country was burdened with monopolies, and the people were ground down with new taxes. The distant beys of Bengasi and Derna, holding their office at the pleasure of the basha, make the most of their uncertain tenure by arbitrary exactions for themselves, as well as to enable them to comply with their master's demands; while the sheiks of Barca and Sert pay likewise a tribute, in return for which their power is acknowledged in the Desert. Thus the system throughout is one of extortion.

History.—The early history of this country will be found under the heads AFRICA, BARBARY, BARCA, and CYRENAICA. After the destruction of Carthage it became a Roman province, and the three flourishing cities of Oea, Leptis, and Sabrata, constituted a kind of federal union under the name of Tripolis. On the conquest of Northern Africa by the Vandals in the 5th century, it passed into the hands of those barbarians, from whom it was rescued in the reign of Justinian, by Belisarius, in 534. About a hundred years afterwards Tripoli, after an obstinate contest, in which the prefect Gregory was slain, the town was forced to yield to the conquering khalifa. After the Arabian conquerors had consolidated their power in Northern Africa, and detached themselves from the khalifa of Egypt, Tripoli was generally governed by the Arabian dynasties settled at Cairoan. [TUNIS.] It was besieged by the Egyptians in 877 and in 1054. In 1146 it was seized by Roger II., king of Sicily, who held it however but a short time; for in 1184 its walls were raised by Yakub, and it followed the political condition of Tunis and was subject to its kings. From this time until its conquest, about 1510, by the Spaniards, Tripoli is scarcely mentioned by historical writers. In 1580 the emperor Charles V. ceded it, with the island of Malta, to the Knights of St. John of Jerusalem, after their expulsion from Rhodes. Its only strength was then a castle, which they engaged to keep and to hold in defence of Christendom; but in 1551 it was wrested from them by Simon Basha, sent to the attack by their inveterate enemy the sultan Solyman, who appointed the famous corsair Dragut (whose forces formed part of the expedition) its first governor; and about this time its present walls were built, and the tract of country now composing the regency was first made a Turkish pashalic. Tripoli now became one of those systematic piratical powers which for centuries attacked the commerce of Christian nations, making slaves of their prisoners. In 1683 the town was bombarded by a French fleet, when the pasha sent an humble submission to Louis XIV. Nevertheless, the Tripolitan cruisers seldom allowed a ship at sea to escape them if they thought they could make a prize of her with impunity; and it was not until 1816 that slavery and piracy were abolished. Previous to the attack in that year on Algiers, a British naval force appeared off Tripoli, and the pasha bound himself to treat all prisoners in future according to the usage of European nations.

For the last 300 years Tripoli, like the other Barbary states, has been considered a dependency of the Ottoman Porte; but the allegiance of these states principally arose from the sultan being the chief of the Mohammedan religion. Yet, as has been seen, they made separate and distinct treaties with other powers, and were so far independent. At first the governors or bashas of Tripoli were sent from Constantinople, supported by a garrison of Turks, who kept the Moors in subjection; and being liable to be recalled, they generally purchased the continuance of their appointment by remitting a handsome tribute to the supreme government, and exacting as much as possible for themselves. But in 1718, Hamet Caramanli, a Moorish chief, and second in command, headed a well-concerted rebellion, and was proclaimed basha by the people. After murdering the Turkish officers and garrison he contrived to render the government hereditary in the family, which continued so until 1832, when the last basha of the family, Yussuf, after a tyrannical reign of forty years, was obliged to abdicate, and the Porte established again the old policy of governing the country under a chief appointed from Constantinople. The interior of the country however enjoys no settled government. The chiefs of Aujilah and Ghadamis keep on terms of friendship with the basha only because the situation of their territories requires an outlet for their commerce. The Arab chiefs frequently break out into actual hostilities against the Turkish rule: as lately as July 1855 headed by a chief named Gourmah, the Arabs, after defeating a large Turkish force, were reported to be approaching the very gates of the city of Tripoli.

The foreign trade of Tripoli is carried on chiefly with Malta, Tunis,

and the Levant, whither the produce of the country and goods brought from the interior of Africa by caravans (which convey slaves, ivory, gold-dust, senna, natron, &c.) are sent in exchange for European and other manufactured goods. Tripoli has at present no marine of its own. She never had a standing army beyond the three or four hundred Mamluk guards of the basha; but the town is now garrisoned by 4000 Turkish troops.

Antiquities.—Most of the towns in the regency possess interesting remains, particularly in the Pentapolis, where innumerable chambers are hewn out of the rocky hills throughout: some of them with architectural elevations, sculpture, and inscriptions. The ruins of temples, theatres, and aqueducts of Roman construction, are particularly traceable at Ghrenna (Cyrene), Tauchira (Arsinoë), Tolmeta (Ptolemais), and Marsa Susa (Apollonia). Lebida (Leptis Magna) seems to have been completely ravaged, and what ruins there are, are deeply buried in sand. In the city of Tripoli stands a fine Roman arch, whose solidity of construction has preserved it from ruin. It was built in the 2nd century; the inscription is perfect, but the sculptures are almost wholly effaced. At Tripoli Vecchia there is an amphitheatre of Roman construction still entire of 148 feet in diameter, with five rows of seats; and in the same direction still exists the remnant of one of the great Roman ways, on the borders of which are observable the ruins of ancient buildings in stone. Money, coins, and precious stones and gems, mostly intaglios, for which the people of Cyrene were once famed, have been found on the site of the ancient Berenice.

Ghadamis.—The oases of Aujilah, Fezzan, and Ghadamis are generally dependent on Tripoli. [AUJILAH; FEZZAN.] Ghadamis is situated to the south-west of Tripoli, in 30° 40' N. lat., 10° 25' E. long., distant from it about fifteen days' journey, and as many from the town of Gabes, in the kingdom of Tunisia. The inhabitants, amounting to about 6000 or 7000, are a quiet trading people, and seldom take part in the political vicissitudes of Tripoli. The town, which contains the ruins of Roman buildings, is said to have been a Roman establishment, the Cydamum of Pliny. ('Nat. Hist.,' v. 5.) Its importance arises from the four commercial roads which from this point strike into the interior regions of Africa. The first passes through Mezda and Sockna, takes a southern course to Mourzouk, and so on to Bourrou and the Lake Tchad, and its neighbouring countries of Kanem and Beghermi; the second, or direct southern road, leads to the city of Graat and across the desert of Soudan, passing through Agadez to Houssa and Kaseena; the third, crossing the Great Desert, and passing through Ainel-Salah and Akabli, in the country of Tuat, leads directly to Timbuctoo, where some of the people of Ghadamis are settled; the fourth is the western road, which, passing to the south of the great chain of Mount Atlas, directs its course towards Morocco by Taffilett.

TRIPOLI, a city and port of the Mediterranean, on the northern coast of Africa, which gives its name to one of the regencies of Barbary. Its castle is in 32° 53' 56" N. lat., 13° 10' 53" E. long. It is the capital of the state of Tripoli and the residence of the basha. The city is built upon the site of the ancient Oea, which, with the cities of Leptis Magna and Sabrata, formed the province called Tripolis under the Roman emperors; and being the only one of the three which is still an inhabited town, has preserved the name of the district or province.

The town is built upon a rocky promontory which stretches a short distance into the sea, which washes it to the northward on two sides, while the south and west sides are bounded by a sandy plain which is partly cultivated. It is defended by a castle, whose walls are unusually high, and which, being situated at the south-east angle connects the line of batteries on the sea-front with a high wall that defends the town on the land side, and this is strengthened by six bastions. The town has two gates; one towards the sea, the other opening to the south-east on the plain. The extreme length of the town, which is very irregular in shape, is about 1360 yards, and its breadth about 1000 yards.

The streets are for the most part like narrow lanes; and the whole town is so uneven with accumulated rubbish, on which the houses are in fact sometimes built, without regard to a general level, that those who are unaccustomed to the indifference of the Moors and Turks in such matters, might imagine they had wandered to some deserted and ruinous part of the town, when in reality they were traversing its best streets. The houses are built of irregular stones and mud formed into a mass, and whitewashed. They seldom have an upper story, and an aperture is rarely seen in the exterior walls, the rooms being entered and lighted from a spacious square yard in the centre of the building. Tripoli contains six mosques of the first order with a number of tall minarets, besides many smaller mosques. The exterior of the great mosque, built by the Caramauli family, which stands in the main street, is extremely handsome and majestic; the roof, composed of many small cupolas, is supported upon sixteen Doric marble columns, said to have belonged to a Christian temple. The floor is laid with rich carpets, and the subdued light and richness of the ornaments create an imposing effect. The Jews have their synagogues, and the Christians enjoy the free exercise of their religion, an endowed convent of Franciscan friars being under the protection of the Roman Catholic powers. The bazaars are extensive: one contains the shops of the traders, which are ranged on each side, and are very small; the other is appropriated to slave-dealing. The slaves are brought with other

articles of trade from the interior of Africa by the kafilas, or caravans. The shops in the town are miserable-looking hovels, although some of them contain diamonds, pearls, gold ornaments, rich gems, and scarce drugs. These are principally in the hands of the Jews, who have a quarter allotted to themselves, in which they are confined every evening; but notwithstanding this apparent persecution they engross the greatest part of the trade, and are intrusted with employments of accountability and profit. The Roman arch, mentioned in the preceding article, stands near the sea-gate. Several fondooks, or caravanserais, receive merchants and their goods from distant parts. The baths make a considerable show by their picturesque clusters of cupolas; some of them are chiefly of marble, and are crowded with bathers. The winter rain furnishes the inhabitants with water for the summer, during which not a drop falls for months together. It is collected from the flat roofs of the houses, and carefully conducted by channels into a reservoir beneath the courtyard, where the water is preserved pure and clear. Water however for common purposes is easily found on the plain near the surface, but it is brackish.

There are a few schools, at which the reading of the Koran and sometimes writing is taught. The people apply themselves principally to commerce, which they conduct upon the footing of barter, and seldom by ready money transactions, so that a little arithmetic suffices them. There are however several regular European houses of business, chiefly French, Italian, and Maltese, whose principals, together with the European consuls, form the only educated class of the community. The inhabitants spend their time in the Turkish bazaar, smoking and drinking coffee, and gossiping upon the events of the day. A corrupt Italian is generally spoken by the people of the town. The basha, whether Moor or Turk, generally confers the offices of state upon some of his own family, or upon renegades. Justice is administered and executed for heinous crimes with great promptitude and little form. The common people are bigots in their religion, but they do not possess the Mussulman virtue of sobriety—wine-shops, which yield a great revenue to the government, being public, and intoxication very common. The population is estimated at 15,000 to 20,000, of whom about 2000 are Jews. The Christians fluctuate in numbers; they are principally Maltese, and may amount to about 2000. The great bulk of the inhabitants are of Turkish descent.

Outside of the town are the burying-places; and as great respect is paid to the dead, the tombs are decent and numerous. The basha has several country palaces in the surrounding district, where some of the European consuls (many of whom reside here), and other persons of note also have country-houses and gardens. The Arabs may not enter the town without leave, and their chief is answerable to the basha for their good conduct. There are good weekly markets outside the town, and others at a distance of five or ten miles, well supplied with cattle of all sorts, poultry, game, vegetables, and fruit, the produce of the cultivated districts. Fish, taken on the coast by Maltese fishermen, is abundant and good.

The harbour is formed by a long reef of rocks running out from the northern point of the town into the sea in a north-easterly direction, and by other reefs at some distance to the eastward of these, which together form a tolerably good shelter. The western side is protected by the projection of land on which the town stands. In the deepest part however there is not more than five or six fathoms water. Ships of war are consequently obliged to anchor in the outer roads, where there is good holding-ground in sixteen and eighteen fathoms; but the anchorage is exposed to northerly winds. Two batteries, erected on commanding points of the reefs, and two others situated on the beach, defend the entrance of the harbour. The white square buildings, intermixed with cupolas and minarets, and with Indian fig- and date-trees growing among them, give to the city a very pleasing appearance from the sea.

The foreign commerce is liable to much variation. The government reserves to itself certain monopolies of the produce of the country; while other monopolies, both of imports and exports, are farmed out to the Jews, according to circumstances, and to raise money. But the measure most ruinous to trade is the power assumed of coining and fixing the value of a debased currency, which has sometimes been made to lose 15 or 20 per cent. in a week. Arms and warlike stores, and timber, as well as all sorts of grain and pulse, are generally admitted free of duty; and articles for the use and consumption of the Christians established in the regency are similarly privileged.

From the nature of its port the trade of Tripoli is carried on in small vessels, seldom larger than brigs, few of which are now owned in the country. It has an indirect trade with England through Malta, Marseille, Leghorn, Trieste, and the commercial towns of the Levant likewise trade with Tripoli. The imports from Europe are woollen-cloths of all sorts, coarse linens, printed and striped cottons, silk-stuffs of various colours and descriptions, common white muslins and calicoes, earthenware, common writing-paper, gold and silver tissues, cotton, cotton twist, beads, common looking-glasses, sword-blades, hardware, and fire-arms of all sorts, gunpowder, shot, lead, tin, tin-plates, sugar, coffee, spices, common wines, and spirits. The exports consist of some articles of produce, and commodities brought from Central Africa by the caravans, such as morocco leather, wool, hides, goats' and sheep's skins, soda, salt, oil, sal-nitron, madder

roots, wax, saffron, senna and other drugs, ostrich feathers, gold-dust, ivory, gum, dates, horned-cattle, sheep, poultry, and butter. Among the exports are black male and female slaves, brought from Fezzan and Ghadamis, and generally shipped to Tunis, Egypt, and the Turkish ports of the Levant, in vessels of those countries or of Tripoli.

The trade of Tripoli profits once or twice a year from the passage of the pilgrims from western Barbary on their way to Mecca. Formerly these caravans amounted sometimes to 3000 persons, and half as many camels and horses, with their goods and merchandise. But since the suppression of piracy in the Levant, devout Moslems prefer the passage by sea to Alexandria, as less fatiguing and less dangerous. This has worked a change for the worse in the traffic of the place, and the caravans which stop there now seldom amount to more than a few hundred people and animals. The kafilas, or small caravans, from Fezzan and Ghadamis, are now the principal medium of inland trade. These people exchange their merchandise for that of Europe, and pay the balance in gold-dust.

TRIPOLITZA, one of the chief towns in the Morea, is situated in a plain in Arcadia, 3000 feet above the sea, in which the ancient towns of Mantinea, Tegea, and Pallantium formerly stood. The name points to its having been formed from a union of three cities; and the current tradition in Greece is, that these cities were Mukhli, Tegea, and Mantinea. Mukhli is said by the Greeks to have been a settlement from Amyclæ in Laconia, and it appears in the middle ages to have been one of the chief places in this part of the Morea. It was taken by Mohammed II., in 1458, and it is not improbable that Tripolitza was built soon after this event, when Mukhli declined in importance. The bishop who resides at Tripolitza is still called Bishop of Mukhli.

Before the Greek revolution Tripolitza had a population of 15,000 to 20,000, and was the residence of the Pasha of the Morea. It was taken in 1822 by the Greeks, who put to the sword 8000 male Turks. Ibrahim Pasha took the town in 1828 and razed every house it contained. It has been since partially rebuilt.

There are several remains of ancient art in Tripolitza, as the ruins of Tegea have been plundered for the purpose of building the mosques and other edifices. The climate is cold in winter, and snow often lies very thick upon the plain.

TRISTAN DA CUNHA, a group of islands in the Southern Atlantic, lying S.S.E. of St. Helena. The largest and central island lies about the point 37° 6' N. lat., 12° 2' W. long. The islands are three in number: the largest, to which the name of Tristan da Cunha properly belongs, is between 19 and 20 miles in circumference; of the two smaller, that which is named Nightingale Island is to the south of the principal island, and that named Inaccessible Island to the south-west. The two smaller islands, from the steep and craggy nature of their shores, can only be approached in a calm. The north side of the largest island is very striking; an extensive plain stretches along the base of a mountain, the sides of which are clothed with thick brushwood, and which towers abruptly to the height of 8326 feet. In 1816 a company of artillery was stationed on this island: it was withdrawn after the death of Napoleon. Water is good and abundant in the island, and vessels which touch there can easily procure supplies of fresh provisions. Off the coast is great abundance of seals, and whales, both black and white. These islands were discovered in 1506, by the fleet under Tristan da Cunha, whose name has been given to them.

TRONDJEM, or DRONTHEIM, is the most northern of the provinces of Norway, extending from 62° to 71° 10' N. lat., and from 5° to 31° E. long. Near its southern boundary it extends more than 200 miles from west to east, but between 65° and 69° N. lat. its width hardly ever exceeds 60 miles. North of 69° N. lat. however it grows wider, and in some places the width amounts to 150 miles. On the west and north it is bounded by the sea, on the east are Russia and Sweden, and on the south the Norwegian province of Christiania and Bergen. Its area is about 57,600 square miles. [NORWAY.]

Trondhjem comprehends the countries situated on the northern declivity of the Norraka-fjellen, and those which lie on the western and steeper slope of the Kiölen Mountains: the greater part of it is exceedingly mountainous, and very little fit for agricultural purposes. This circumstance, united to the severity of the climate, must be considered as the cause of its very small population, amounting to only 265,349. Trondhjem is divided into three sections, Proper Trondhjem, Nordland, and Finmarken.

Trondhjem Proper comprehends the countries inclosing the Bay of Trondhjem, or Trondhjem-fjord. Among the numerous inlets by which the rocky coast of this country is indented the Trondhjem-fjord

GEOG. DIV. VOL. IV.

is the most important. Its entrance from the sea is near 63° 30' N. lat., and it runs about 60 miles inland, measured in a straight line; but as it forms as it were the section of a circle, its whole length is near 90 miles. Towards its eastern extremity it is divided into three arms by an island (Ytteröe) and a peninsula, and these arms are called, from south to north, Verdals-fjord, Ytteröe-fjord, and Beitstad-fjord. Beitstad-fjord is united to Trondhjems-fjord by a narrow channel about 5 miles in length. The width of Trondhjems-fjord varies in general between 3 and 5 miles, exceeding these dimensions only where short arms branch off from the main body of the fjord.

The country south of Trondhjems-fjord, or *South Trondhjem*, lies on the northern declivity of the Lang-field and Dovre-field, which are portions of the Norraka-fjellen. [NORRKA-FIELLEN.] The coast-line extends from Cape Stadland, the most southern extremity of the province, to the entrance of Trondhjems-fjord, nearly due north-east. It is more than any other part of the Norwegian coast intersected by arms of the sea, which extend in different directions, so that a portion of the country near the sea is converted by them into islands, whilst the remainder forms numerous peninsulas. The largest of the islands thus formed are Froyen, Hitteren, and Smölen. Hitteren is nearly 30 miles long, and on an average 10 miles wide. These islands are rocky and high, but not mountainous, the heights on them rising only to the elevation of hills. Their soil is indifferent, and agriculture is limited; but they are partly covered with woods, in which deer are common. The islands which lie farther south and nearer the coast are much more elevated, and the summit of that of Tusteren, south of Smölen, probably exceeds 4000 feet above the sea-level, as it is hardly ever free from snow. The coast of the mainland is high, and usually rises with a steep precipice from the sea to an elevation of a few hundred feet. Along the whole of the outer coast no tracts of cultivable land of any extent are met with, and the few hamlets which occur are inhabited by fishermen. The rocks are mostly bare, and in a few places only are there small woods of stunted trees, or rather bushes. The fish taken along this coast are chiefly lobsters, cod, ling, and herring. The fjords themselves penetrate to the distance of 50 miles from the open sea. Their average width varies between one and two miles, and they are very deep, but much exposed to sudden gales from the mountains, which, though of short duration, are extremely violent. Along the shores of these inlets tracts of cultivable land occur, but they are of moderate extent. They are cultivated, and yield most kinds of grain, except wheat, and several kinds of vegetables. The mountains and high hills which separate the fjords from each other descend with a gentle declivity, which is partly covered with woods of birch, elm, fir, and pine, among which however forest-trees are not common, and is partly used as pasture-ground.

The interior of the country is occupied by the mountain region of the Norraka-fjellen. The highest part of it lies along the southern boundary-line of Trondhjem, where the Sneehätten rises to 7489 feet above the sea-level. The base on which the Sneehätten and other lofty peaks near it stand is a mountain plain, from 3000 to 4000 feet above the sea. It is partially free from snow during two or three months of the year, and a portion of it is then used as pasture-ground. In some parts are small woods of stunted birch and willows, but in general it is destitute of wood. On the west the table-land is furrowed by a few valleys of considerable length, whose width however never exceeds a mile. These valleys are in their lower districts from 2000 to 4000 feet below the adjacent mountains. They have the advantage of a very hot but short summer, and the greatest part of them is cultivated with much care, and yields abundant crops of rye, barley, potatoes, and flax. The largest of these valleys are, from south to north—Romsdalen, which is famous for its picturesque beauty; Eikidalen; and Drivdalen. As this country does not offer anything to the foreign market, except fish and some timber, it has only two small towns, Christiansund and Molde. *Christiansund* lies south-west of the elevated island of Tusteren, and is built on three small islands, inclosing a narrow arm of the sea, which constitutes its harbour. It contains about 3000 inhabitants. *Molde*, south-south-west of Christiansund, has only 1500 inhabitants. The inhabitants are partly engaged in commerce, but the greater number in the fishery of the Lofoden, to which these towns send a number of small vessels. Their commercial relations are almost exclusively with Spain, to which country the produce of the fisheries is sent.

The country along the southern shores of Trondhjems-fjord contains a much greater portion of arable land, and is more extensively cultivated and more populous. It is watered by four rivers, which from west to east are called Oerkef, Guul, Nid, and Stor-elf. From the shores of the fjord to the Dovrefield the country rises in three terraces, whose lines of separation are marked by the Lake Salbøe, which is about 520 feet above the sea, and the course of the river Guul, where it runs from east to west. Each of the terraces occupies about 20 miles in width. The lowest terrace, along the shores of the fjord, is an undulating plain about 9 or 10 miles in width, which is however intersected with a few steep rocks. A large portion of it is cultivated, though the soil is not fertile. Near the lake of Salbøe, and in general about 10 miles from the fjord, the country becomes hilly, and the soil is stony. Only a small portion of it is under cultivation, and the remainder is indifferent pasture-ground. The second terrace is broken in all its extent, with the exception of the river valleys, which are

from 1 to 3 miles wide, of considerable fertility, and well cultivated. The high hills and mountains which lie between the valleys are almost overgrown with pine, fir, birch, and other trees, and in some parts contain excellent pasture. The third terrace rises by degrees from 1500 to 3000 feet, and partly resembles the table-land above-mentioned, which lies farther west, but its surface is broken by numerous rivers which descend from the Dovrefield, and in some of the narrow valleys along their banks cultivation is carried on to some extent, whilst the adjacent mountains afford good pasture for several months of the year. [NORRKA-FIELLEN.]

The small district of Røraas lies on the Dovrefield, close to the boundary of Sweden, and comprehends the country in which the Glommen-elf originates. It is so much elevated above the level of the sea that the country is unfit for agricultural purposes on account of the cold of the climate; the frost sometimes even in June kills the animals on the pastures. In this tract three copper-mines are worked with success. The ore from them is brought to the town of Røraas, where the smelting-houses are built. This town contains a population of about 1500 individuals, all of whom are employed in the mines or smelting-houses. The copper is carried to Trondhjem, where it is shipped. In the most elevated part of this tract are a few families of Laplanders, who live on the produce of their herds of rein-deer.

Country North of the Trondhjem-fjord.—An immense mass of high rocks extends along the sea from the shores of the fjords to the mouth of the Namsen-elf. A great part of it rises above the line of trees, and it is considered as the most elevated mountain of Scandinavia in this parallel; for the great range which divides Norway from Sweden is here interrupted by the remarkable depression which is noticed in NORRKA-FIELLEN. East of it is a wide depression called Nummedalen, a part of which is cultivated, but the greater portion of it is covered with a forest of fine timber-trees. The same description applies to the valley of the Namsen-elf, which is contiguous to Nummedalen on the north. The forests covering this country are the most northern large forest of timber-trees in Norway, and from Namsen-fjord all the countries lying farther north are supplied with logs and deals. The Namsen-elf is too rapid for navigation, but timber is floated down. Along the whole coast of Trondhjem Proper the rocks, partly above and partly below water, are so numerous that the navigation of this sea is extremely dangerous.

Nordland comprehends all the countries lying between the parallel of the island of Leköe and the Quänanger-fjord. The southern part is called Helgeland, the central district Salten, and the northern portion Tromsøe. The islands of Lofoden and of Senyen are also included in it.

Helgeland extends from the parallel of the island of Leköe to Cape Kunnen. The Kiölen range is in these parts not more than 60 miles distant from the sea. The coast here also is rocky, but of moderate elevation, much lower than farther south or north. It has likewise numerous inlets, but they are short, only a few exceeding 10 miles in length. Numerous islands, islets, and rocks line the shores. Some of the islands rise to a great elevation, and are inhabited only by a few fishermen. Other islands are low, and have some farms for breeding cattle rather than for cultivation. Among these is Tiötöe, which is mostly under cultivation, and on which the small town of Alstahong is built. The interior of Helgeland is filled up by mountains rising from 1000 to 1500 feet, between which occur numerous narrow valleys and depressions, which in general are well wooded, though the trees rarely attain the size of timber-trees. There is however a moderate portion of land which could be cultivated; but in this tract agriculture is neglected for the herring and other fisheries. Near the polar circle and north of the valley of Ranen an extensive and elevated mountain-mass lies across the country, and terminates on the sea with Cape Kunnen, which rises from the edge of the water with perpendicular precipices to more than 1000 feet above the sea, and in a course of four or five miles inland it attains more than 4000 feet. The more elevated portion is always covered with snow and ice.

Salten comprehends the country between Cape Kunnen and Ofoden-fjord (68° 30' N. lat.). The Kiölen range here approaches nearer to the sea, being hardly in any part 40 miles distant from the shore. At the same time it rises in elevation, for in this interval occur the group of Sulitelma, the highest part of the Kiölen Mountains. [NORRKA-FIELLEN.] The space between the Kiölen and the sea is filled up by peninsulas, and wide and deep inlets. The peninsulas are formed by high ridges of rocks rising with frightful precipices on both sides, and terminating at the top with a sharp ridge, in most places scarcely sufficient to afford a resting-place for a bird. The inlets penetrate so far into the land, that most of them wash the very base of the mountain range. Salten is the most desolate part of Norway. The steep sides of the mountains are nearly bare of vegetation. The small depressions which occur here and there are partly filled with swamps, and partly overgrown with stunted birch, pine, and fir. The pastures are small in extent, and the cattle of very diminutive size. The inhabitants derive their subsistence almost exclusively from the fishery on the Lofoden Islands.

Lofoden Islands lie opposite the coast of Salten, and are divided from it by an arm of the sea called West Forden, which at its southern extremity is nearly 100 miles wide, but narrows in advancing

northward, until, at its most northern extremity between the continent and the island of Hindöen, it terminates in a strait hardly 2 miles across. The Lofoden Islands constitute a rocky chain, which near the continent runs nearly due west, but farther to the west declines to the south-west. The islands and islets of which this chain is composed are separated from one another by narrow straits, through which the sea flows during the tides with a rapidity resembling a torrent. In some parts it forms very deep and extensive eddies, among which the whirlpool called the *Malström*, and which is found between the islands of Moskenäsöe and Mosköe, has obtained celebrity, as it is impossible to navigate it during the strength of the tides, and it has caused much loss of life. All the islands are rocky, with high shores: those however which lie most to the westward rise only to a moderate elevation. The largest of them are Varöe, Moskenäsöe, Flagstadöe, and West Wagöe. East Wagöe rises to 3000 feet above the snow-line, and Hindöe to 3200 feet. The mountains however in summer furnish pasture for a few cattle and sheep of diminutive size. In winter these animals live on fish, and on different kinds of sea-plants.

Tromsøe extends from Ofoden-fjord to Quänanger-fjord (70° N. lat.). Opposite the termination of the Lofoden Islands, the chain of the Kiölen, forming the water-shed, recedes farther inland, and runs nearly east. In these parts this chain grows much lower, and it does not appear that any portion of it is above the snow-line. The highest mountains are some distance from the range on the shores of the sea and of the fjords. The Faxfield (near 69° N. lat.) rises to 4260 feet; and the mountains inclosing Malanger, the Storhorn near Tromsøe, and the ranges on Lyngen-fjord, are nearly as high. The last mentioned are the highest mountains between 69° and 72° N. lat. Large tracts of them are always covered with snow, and glaciers descend down on their sides. The deep and extensive fjords by which this country is indented have level tracts on their shores, which are of some extent near the innermost recesses of the inlets; and though the climate is very severe, some barley and potatoes are raised. A part of the mountains is covered with woods, which contain a few timber-trees, so that logs and deals are exported. The pastures are much more extensive and richer than in Salten, and cattle and sheep are more numerous. Near 69° 30' N. lat., the town of Tromsøe has been built on an island situated in the strait between the continent and the island of Hvalöe (Whale Island). The island on which the town stands is from 4 to 5 miles in length, and rises to the height of about 600 feet. The town contains about 800 inhabitants; it has some good houses, a saw-mill, and wooden quays along the harbour. It is a thriving place. The mean annual temperature does not exceed 32°. Cod, halibut, and smelts are taken in large quantities along the coast.

Finmarken comprehends the most northern portion of Trondhjem, extending from Quänanger-fjord to the Tana-elf and Varanger-fjord. Along its western side, between Quänanger-fjord and Alten-fjord, extends a mountain range, which terminates near the sea in the isolated Yakulsfield, rising 3700 feet above the sea, the most northern glacier (70° N. lat.). The country east of this range contains a more elevated and a lower region, of which the former lies to the north and the second to the south. The highest mountains of the elevated region are found at the most northern extremities of the long peninsulas that lie between the gulfs, or fjords, of Alten, Porsanger, Laxa, and Tana. They stand mostly isolated, and are divided from each other by valleys, which are filled up by an alluvial soil, so that it appears the mountains formerly constituted islands and the valleys straits. On the mainland itself, the highest portion of the elevated region lies near the inner extremities of the inlets, whence it extends on the whole as a plain, which insensibly grows lower as it proceeds southward. On the north the plain is in general from 2500 to 3000 feet above the sea, but towards the south and east it sinks to 1500 feet. No trees are found on it except birch and mountain-ash, which do not attain their full height. This plain is visited in summer by the Laplanders, as it produces excellent pasture for their rein-deer.

On the fjords the scanty population subsists by fishing; but on the Alten-elf there are a considerable number of agriculturists, who cultivate barley and potatoes, this being the most northern point of the globe where cultivation is carried on with success. There are numerous cattle, and the Finlanders, called Quäns in this part, have dairies. There are also some copper-mines, which are worked by an English company. The ore is shipped to Swansea to be smelted.

The lower region is in general a plain, which in its highest point, near the sources of the Alten-elf, is about 1200 feet high, but gradually decreases in height as it proceeds north and north-east. On this plain a few isolated mountains rise to a height of between 3000 and 4000 feet. From the last mountain a lower chain extends between the Laxa-fjord and Tana-fjord, which terminates north of 71° N. lat., with Cape Nordkyn, the most northern promontory of the European continent. The surface of the plain is interspersed with innumerable lakes, but most of it is covered with rein-deer moss. It is therefore used by the Laplanders as winter pasture. The more elevated parts of the plain are overgrown with stunted birch. On this plain rises the Alten-elf. [ALTEN.] The Tana-elf, which is much larger, running about 150 miles, is less rapid, and might be navigated, if the inhabitants of the country through which it flows had any occasion

for it. An immense quantity of salmon is annually taken in this river, which are considered the finest in all Norway.

Several large islands lie along the coast of Finnmarken, west of the Porsanger-fjord. The largest of them, Seyland and Sorøe, rise to a great elevation, and are inhabited by a few fishermen. On Qualøe is a commercial place, *Hammerfest*, which has about 500 inhabitants. The harbour, being safe, is much visited by foreign vessels. Russian vessels from Kola and other places come for fish, and bring hemp, flax and tow, sailcloth, linen, tar, nails and ironmongery, and sometimes considerable quantities of corn. Steamers ply from Christiania to Hammerfest in summer. The most northern island is Magerøe, a bare rock, which towards the north terminates in the North Cape, a huge mass of rocks rising to 1500 feet above the sea. At the eastern extremity of Finnmarken is the small island of Wardøe.

Particulars on the climate of Trondhjem are found in the article NORWAY.

TRONDHJEM, the capital of the province of Trondhjem in Norway, is built on the southern shore of Trondhjem-fjord, at the mouth of the Nid-elf, and has about 13,000 inhabitants. It has regular and wide streets, with water-cisterns at their intersections. The houses are generally of two stories, and built of wood, hardly half a dozen of them being of brick. The cathedral is a gothic building, a part of which was erected as far back as 1033. In the fjord, and at a distance of about a mile, is a small rocky island, Munkholm, on which a fortress is built. The roadstead for shipping is exposed to a heavy swell from the north and north-west, and has a loose ground in 20 fathoms. There are a society of arts, a grammar school, an hospital, a workhouse, a public library, and a museum. The commerce is considerable. The exports consist of fish, fish-oil, timber, tar, copper brought from Røraas, and millstones. The town employs many vessels in the foreign and coasting trade and in the fisheries.

TROON. [ATYSHIRE.]

TROPEA. [CALABRIA.]

TROPFAU. [MORAVIA.]

TROWBRIDGE, Wiltshire, a market-town, in the parish of Trowbridge, is chiefly situated on a rocky eminence on the right bank of the river Were, in 51° 18' N. lat., 2° 11' W. long., distant 13 miles W. by S. from Devizes, 99 miles W. by S. from London by road, and 105 miles by the Great Western railway. The population of the town of Trowbridge in 1851 was 10,157. The living is a rectory in the archdeaconry of Wilts and diocese of Salisbury.

Trowbridge had a fortress in the reign of Stephen. The castle was in ruins in Leland's time; the site is now covered with buildings. The houses in the town are chiefly of stone, and generally old and of mean appearance. The parish church is a spacious edifice, with a nave, chancel, two aisles with chapels attached, and a large western tower and spire. There are places of worship for Baptists, Wesleyan Methodists, and Independents; National schools; an infant school; and a savings bank. The principal branch of industry at Trowbridge is the manufacture of kerseymer and broadcloth. Markets are held on Tuesday, Thursday, and Saturday; a fair is held on August 5th. Petty sessions are held monthly, and there is a county court.

TROY, the name both of the country in which the city of Troy was situated and of the city itself. The country of Troy, more commonly called Troas, formed the north-western part of Mysia in Asia Minor. It was bounded W. and N.W. by the Ægean Sea and the Hellespont, the extent of its coast being from the promontory of Lectum on the south to the river Rhodius, which falls into the Hellespont below Abydos on the north. Its eastern boundary was a ridge of Mount Ida, extending from the source of the Rhodius to the sea-coast near the promontory of Lectum.

The inhabitants of the Troad were most probably of Thracian origin. At the time of the Trojan war they had reached a higher state of prosperity and civilisation than their opponents the Achæans. There seems however to have been no considerable town in the district except the capital, Ilium or Troy. The cities mentioned by Homer would seem, from the ease with which they were taken, to have been nothing more than villages. ('Il.,' ix. 328, &c.)

The whole of the Troad is intersected by the branches of Mount Ida. Two of its summits, which bore special names, were Cotylus and Gargara. ('Il.,' viii. 46, &c.)

The following were the principal places in the Troad at the time of Strabo.—Near the promontory of Lectum were the villages of *Hama-zitus* and *Chrysa*. At the latter, which stood on the coast, was the temple of Apollo Smintheus ('Il.,' i. 37), which was still standing in the time of Pliny. *Skepzia* was so called from its having been first built on the highest summit of Ida, whence, according to Strabo, it was afterwards removed to a spot 60 stadia lower. Aristotle collected a library at *Skepzia*, which was ultimately removed by Sulla to Athens. *Alexandria Troas* was on the coast, a little to the north of *Chrysa*. [ALEXANDRIA, Troas.] From Alexandria to the promontory *Sigeum* (*Yenisehr*) the coast was called *Achaïum*. The promontory of *Sigeum* formed the southern side of the entrance to the Hellespont, and near it was a town of the same name. Near *Sigeum* also was the *Achilleum*, a mound of earth supposed to be the grave of Achilles. Not far to the east of *Sigeum* was *Rhætium*, and near it the *Æantium*, or monument of the Telamonian Ajax. The coast between *Sigeum* and

Rhætium was, according to Strabo, the naval station of the Greeks during the siege of Troy. Here is the mouth of the united rivers of Simois and Scamander or Xanthus. The principal city in Troas was *Troy*, in ancient times more commonly called *Ilium*, which exercised a kind of sovereignty over the other towns of the country. Its site, which has been the subject of so much discussion in modern times, is placed by some upon the western branch of a range of hills extending from the river Simois into the plain towards the river Scamander. Its citadel lay on the south-eastern side of the city. Others have traced its site a little farther north in the modern Turkish village of Bunar-Bashi. Others again have denied the existence of ancient Troy altogether, or have declared it to be a useless task to investigate its site, since it was totally destroyed by the Greeks, and abandoned by its inhabitants. Homer however clearly suggests, that, after the calamity that befell Troy in the reign of Priam, it continued, at least for some time, to be ruled over by the *Æneads*, a branch of the house of Priam. The city of Troy which Xerxes (Herod., vii. 42, &c.) and afterwards Alexander the Great visited, may have been of later origin, but it is nevertheless attested that it was built on the site of the ancient Troy. This town appears to have gradually decayed after the time of Alexander, and a new town of the same name was built somewhat below the spot where the Simois is joined by the Scamander. (Strab., xiii. p. 597.) In the times of the Romans this Troy was regarded and treated as the genuine ancient Troy from which they derived their descent.

The first king in Troas is said to have been Teucer, whence the Trojans are also called Teucricians. Dardanus, one of the neighbouring chiefs, married a daughter of Teucer, by whom he had two sons, Ilius and Erichthonius: the latter became the father of Troas, from whom the names Troy and Troas are derived. He had three sons, one of whom, Ilius, founded the town of Ilium or Troy, which became the capital of the country of Troas. In the reign of his successor, Laomedon, the city was said to have been fortified with walls by the assistance of Poseidon (Neptune) and Apollo. Soon after this Troy was taken by Hercules, but was restored to Priam, son of Laomedon, who reigned for a long time in peace and prosperity, until his kingdom was attacked by the united forces of the Greeks, in consequence of his son Paris having carried off Helen, the wife of Menelaus. After a siege of nine years the Greeks took and destroyed the city of Troy. This event is usually placed about the year B.C. 1184.

The most important among the remaining towns of the Troad were Dardanus, Thebe, and Thymbra.

(Upon the topography of Troy and its neighbourhood, the reader may consult the earlier works of Pococke, Le Chevalier, Choiseul Gouffier, Spon, Wood, Wheeler, and others; Leake, *Travels in Asia Minor*; *Journal of the Geographical Society of London*, vol. xii.; Lord Carliana, *Travels in the East*.)

TROY. [NEW YORK, State of.]

TROYES, a city in France, capital of the department of Aube, is situated in the middle of a vast and fertile plain on the left bank of the Seine, 112 miles by railway S.E. from Paris, in 48° 18' N. lat., 4° 5' E. long., at an elevation of 361 feet above the level of the English Channel, and had a population of 25,656 in the commune at the census of 1851. It occupies the site of the ancient *Augustobona*, or *Augustobana*, the chief town of the Tricasses, a Celtic nation, whose name it afterwards took, and from this by corruption the modern name has been derived. It was plundered by the Normans A.D. 889, and in the feudal period was the capital of the important county of Champagne. Troyes was taken by the Duke of Bourgogne in 1415; and here, in 1420, the marriage of Henry V. of England with Catherine of France was concluded, and the treaty arranged by which Henry was appointed to succeed Charles VI. on the throne. Troyes was retaken from the English by Charles VII. in 1429.

The Seine flows on the northern and eastern sides of the town, which is surrounded by walls, and entered by six gates. The ramparts are planted with trees, and there are other trees at their foot, so that the town is surrounded by a double alley of trees: the ditch also is laid out as a garden. There are five faubourgs, or suburbs. The streets are irregularly laid out, and are with some exceptions narrow and crooked; the houses, many of which are of wood, are generally ill-built: the gables towards the streets are built of wood painted or plastered, and are frequently adorned with carving, and have dark penthouses, which overhang the shops. These old structures however are gradually giving way to modern and more solidly-constructed buildings. The neighbourhood of the town is pleasant.

There are three parish churches, namely, the cathedral of St. Pierre, St. Jean, and La Sainte-Madelaine; and five succursal churches, or chapels of ease, namely, St. Nicolas, St. Pantaléon, St. Remi, St. Urbain, and St. Nizier. The cathedral of St. Pierre is a fine specimen of gothic architecture: the height and width of the nave, the beautiful stained-glass windows which adorn the aisles, three beautiful rose windows, and the handsome pavement of the choir, are among the features which attract the greatest notice. The church has never been completed: there were to have been two western towers, but only one, 205 feet high, has been erected. The church of St. Jean is remarkable for the narrowness of the nave: it contains a fine tabernacle, sculptured by Girardon; and a fine painting of the baptism of Christ, by Mignard. The church of St. Remi contains a figure of Christ in

bronze by Girardon. The churches of La Sainte-Madeleine and St. Urbain are considered as very beautiful, and St. Nicolas has a handsome front. All the churches of Troyes are more or less rich in painted windows. Of the other public buildings, the Hôtel-Dieu, or hospital, is a handsome building of the last century; the town-hall has a handsome stone front, the work of Mansard, adorned with columns of black marble; the gate of St. Jacques, or St. James, which is flanked by two towers, and surmounted by a light spire, is sometimes ascribed to Cæsar. There are besides these the theatre, the episcopal palace, the wine mart, the abattoirs, the gaol, and house of correction.

The manufactures of Troyes are important, and are promoted by the distribution of the waters of the Seine through the town by means of numerous canals. The chief products are cotton and woollen yarn, hosiery, printed cottons, dimities, tapes, and other cotton goods; blankets, flannel, cloth, and other woollen goods; linens, printing paper, playing cards, chamois and other leather, gloves, hats, wool-cards and combs, spinning-wheels, knitting-needles, agricultural implements, furniture, musical strings, leaden utensils and wares, and whitening. There are dye-houses, bleach-grounds, bleaching-houses for wax, and tan-mills. There are five fairs, two of eight days each. Several important roads converge at Troyes; the Seine is navigable below the town, which is joined to Paris by railway. These numerous means of communication greatly facilitate the trade of the town, which is very considerable in the industrial products above named, and in corn, wine, brandy, pulse, colonial produce, raw cotton, wool, hemp, iron, lead, zinc, timber, &c.

Troyes is the seat of a bishop, whose diocese comprehends the department of Aube. The town has a tribunal of first instance, a tribunal of commerce, a chamber of commerce, and a council of prud'hommes. Printing was established at Troyes about the middle of the 15th century, and the trade still flourishes there. The public library contains 55,000 volumes and 5000 manuscripts: it is kept in a spacious hall 164 feet long, 32 feet wide, and 22 feet high. Troyes has several learned societies; two seminaries for the priesthood; a college; and four hospitals, or asylums. Troyes was the native place of Pope Urban IV.

TRUJILLO. [ESTREMADURA, Spanish; VENEZUELA.]

TRÜLAU. [MORAVIA.]

TRUMPINGTON. [CAMBRIDGESHIRE.]

TRURO, Cornwall, a municipal and parliamentary borough, a market-town, and the seat of a Poor-Law Union, is situated at the head of Truro Creek, in 50° 16' N. lat., 5° 2' W. long., distant 21 miles S.W. from Bodmin, and 255 miles W.S.W. from London by road. The population of the borough was 10,733 in 1851. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor, and returns two members to the Imperial Parliament. The livings are in the archdeaconry of Cornwall and diocese of Exeter. Truro Poor-Law Union contains 24 parishes and townships, with an area of 92,211 acres, and a population in 1851 of 42,270.

The earliest mention of Truro appears to be about the year 1175, under the name of Triueru. It is first found under the form Truro in the reign of Henry VII. Its market is held by prescription. Elizabeth granted it a charter in 1589. Truro is the nearest town in Cornwall. The houses are well built; the streets are partially paved and lighted. St. Mary's, the parish church, is a handsome building, with a spire 125 feet high. In the town are a chapel of ease, and chapels for Wesleyan and Primitive Methodists, Baptists, and Independents. There are a Grammar school, and National and British schools. The Royal Cornwall Institution holds its meetings in Truro: its museum contains a rich collection of Cornish minerals, birds, and antiquities. The county library and the Cornish Horticultural Society are established in the town. There are assembly-rooms, a county infirmary, and a jail. The town-hall is a handsome new building in the Italian style: the court of the Vice-Warden of the Stannaries is held in it.

Truro has a considerable trade, and is the residence of several of the gentry of the county. East Huel Rose, one of the largest lead-mines in the county, is near the town. Some tin is smelted, and tin and copper are exported. The imports are iron, coal, and timber. Markets for meat, fish, and other provisions are held on Wednesday and Saturday; the Wednesday market is also for corn. There are four yearly cattle-fairs. Truro is one of the coinage towns (for the coinage of the tin): the process is carried on only here and at Penzance. The mound and a few other vestiges of Truro Castle remain.

TRURO. [NOVA SCOTIA.]

TRUXILLO. [HONDURAS; PERU.]

TSCHERKASK. [DON COSSAKS.]

TSCHERNIGOF. [CZERNIGOF.]

TSCHERNO-YA. [ASTRAKHAN.]

TSCHUGUJEW. [CHARKOF.]

TUAM, Galway county, Ireland, a market-town and episcopal city, and the seat of a Poor-Law Union, is situated on the Harrow, a branch of the river Clare, in 53° 32' N. lat., 8° 50' W. long., distant 20 miles N.N.E. by road from Galway, and 125 miles W. from Dublin. It is governed by a sovereign and 12 burgesses. The population in 1851 was 4938, besides 2381 in public institutions. Tuam Poor-Law Union comprises 34 electoral divisions, with an area of 190,649 acres, and a population in 1841 of 69,326, in 1851 of 51,194.

Tuam occupies a low and nearly level site on both sides of the river, which is crossed by a bridge. It consists of several streets radiating from the market-place. St. Mary's Cathedral, which is also the parish church, stands on the west side of the town. It is a small structure, and is of mixed Norman and gothic architecture. The Roman Catholic cathedral, which occupies a raised site on the east side of the town, is one of the finest ecclesiastical structures in the island; it is a cruciform edifice of gothic architecture with a lofty tower at the west end. There are in the town another place of worship for Roman Catholics, a convent of presentation nuns, a Franciscan monastery, and St. Jarlath's College, a seminary for general and ecclesiastical education. The Tuam Diocesan Education Society has a Free Model school in the town, and there are three National schools. The bishop's palace is a plain mansion, situated on extensive grounds on the north-east verge of the town. The residence of the Roman Catholic archbishop adjoins his cathedral. The other principal buildings of the town are the market-house, a neat court-house, the globe-house, dispensary, bridewell, and Union workhouse. The stone-cross, although much decayed, is a remarkable specimen of its class. Tuam has an extensive grain-market, a large brewery, several tanneries and flour-mills, and a small manufacture of canvass and coarse linens. Quarter and petty sessions are held. Fairs are held May 10th, July 4th, October 20th, and December 15th. Thursday is the market-day.

The diocese of Tuam is the largest in Ireland, and comprehends the greater part of the county of Galway, a considerable portion of Mayo, and a small part of Roscommon. It includes 33 benefices. The chapter consists of a dean, provost, archdeacon, and eight prebendaries. The income of the bishop is 4600*l.* By the Church Temporalities Act the sees of Killala and Achonry were annexed to it in 1835. Tuam was an archbishopric from the 12th century till 1839, when the archbishopric became extinct, and the province was united to that of Armagh.

TÜBINGEN, a walled city of Würtemberg, in the circle of Schwarzwald, is situated in 48° 32' N. lat., 9° 4' E. long., on the Neckar, over which there is a stone bridge, at its confluence with the Ammer, about 20 miles S. from Stuttgart. The town is irregularly built in the old style. The most regular portions are the two suburbs, one of which, on the right bank of the Neckar, contains the handsomest houses. The inhabitants, in number about 9000, are partly employed in the manufacture of woollen cloths; but Tübingen is chiefly interesting on account of its university, which was founded in 1477: Reuchlin and Melancthon were among its professors. After the Reformation it remained entirely Protestant till 1803, when Roman Catholic students were admitted at Tübingen. The university has faculties of medicine, jurisprudence, philosophy, Protestant and Roman Catholic divinity, and political economy, above 60 professors and teachers, and above 800 students yearly. The university has a library which numbers, it is said, 200,000 volumes of printed books; a good collection of natural history, a cabinet of medals, a collection of mathematical, astronomical, and philosophical instruments, an observatory, and botanic garden. There are a Protestant and a Roman Catholic seminary, and an anatomical theatre. The library and many of the collections of the university are in an ancient palace or castle called Hohen-Tübingen, which was formerly strongly fortified. Among the principal public edifices, besides the university, are St. George's church; the town-hall, built in 1435; the two seminaries; the museum; the court-house; the city hospital; the infirmary and lying-in hospital. The town has several printing-offices, dyeing-houses, breweries, and manufactures of woollen-cloth.

TUCHAN. [AUDE.]

TUCUMAN, one of the provinces of the Argentine Confederation, South America, lies between 25° 30' and 27° 30' S. lat., 62° and 66° 30' W. long. It is bounded S. by the province of Santiago del Estero; E. by the desert Indian country called El Gran Chaco; N. by the province of Salta; and W. by that of Catamarca. The area is about 42,500 square miles; the population is about 45,000.

The province of Tucuman comprehends the greater part of the slightly-inclined plain which extends from the base of the Sierra de Aconquija towards the Rio Salado, but does not reach its banks, being separated from them by a broad tract of waste land. The surface, &c., of the country is described under ARGENTINE CONFEDERATION. The Rio Salado divides the province from the nomadic tribes of the Gran Chaco, the Rio Tala from the province of Salta, and the Sierra de Aconquija from that of Catamarca. It unites great fertility of soil with abundance of water, and is not only the most fertile but also the best cultivated state in the Argentine republic; well deserving its appellation of the 'Garden of the United Provinces.' The climate though hot is dry and salubrious. Rice, wheat, maize, and tobacco are raised and exported. The sugar-cane grows naturally in the low lands, but it is not cultivated. There are extensive groves of orange and orange-trees. The declivities of the mountains contain noble timber-trees, and afford excellent pasturage. The cattle are larger and the horses finer than in any other province. In the mountains gold, silver, copper, and lead are said to exist, but no mines are worked at present. The people are a hardy and warlike race, proud of their country, and always ready to take up arms in its defence. The men generally prefer greatly those pursuits which allow them to be much on horseback. There are in the province a great many Indians, who speak the Quichua language. Like the other provinces Tucuman is a

federal state, owning a qualified dependence upon the central government. The executive power is vested in a governor elected by the junta, or provincial assembly.

San Miguel de Tucuman, the capital of the province, occupies a remarkably pleasant site on an elevated and well-wooded plain, in 27° 10' S. lat., 65° 20' W. long.; it contains about 7000 inhabitants, and is a place of some trade. It was at Tucuman that the declaration of the independence of the provinces of the Rio de la Plata was formally made in 1810 by the congress of deputies from the several provinces.

TUDELA. [NAVARRA.]

TULA, a government of European Russia, is situated between 52° 53' and 54° 56' N. lat., 35° 54' and 38° 50' E. long. It is bounded N. by Moscow, E. by Riasan and Tambow, S. by Orel, and W. by Kaluga. The area is 11,744 square miles, and the population 1,227,000.

This country is a uniform undulating plain, where hardly anything is to be seen but boundless cornfields or meadows, traversed by low hills, with little wood, and no remarkable natural scenery. The province is one of the best cultivated and most populous in the empire. The soil is dry, and generally poor, and owes its fertility to skilful cultivation. The principal river is the Oka, which comes from Kaluga, and partly forms the boundary towards Moscow and Kaluga. The Don, which rises in Lake Ivanof, near the frontiers of Riasan, is little more than a brook in its short course in this government before it enters that of Riasan. There is however no want of water, there being above 200 small rivers.

The bishop of Tula and Bjelew is at the head of the clergy; he has 857 parishes under him. The government is divided into twelve circles. Except in the capital there are no manufactories; woollen and linen fabrics are manufactured for their own use by the country-people.

The most considerable town next to the capital, TULA, is *Bjelew*, or *Bjeleff*, situated on the Oka, in the western part of the government. It is a large old town, with a rampart and moat: it has fifteen churches; a monastery; a nunnery; and several public buildings. The population exceeds 7000. There are several tanneries, breweries, tallow-melting houses, and manufactories of hardware, especially knives, which are highly esteemed all over Russia. The inhabitants carry on a considerable trade. *Wenew*, on the *Wenewka*, 32 miles N.W. from Tula, has eight churches, 3500 inhabitants, a silk-mill, a soap-manufactory, and some breweries. *Odojew*, on the *Upa*, has seven churches and 3300 inhabitants, who derive subsistence from agriculture, mechanical trades, and a considerable commerce in hemp and corn with Kaluga. *Jefremow*, on the *Metscha*, has seven churches and 3000 inhabitants.

TULA, the capital of the government of Tula in European Russia, situated in 54° 15' N. lat., 37° 25' E. long., at the confluence of the *Tulitza* and the *Upa*, is an important commercial and manufacturing town. It has 51,000 inhabitants, 28 churches, two monasteries, with a seminary and a gymnasium, a theatre, a foundling hospital, and a house of correction: there is likewise an institution, called the *Alexandrium*, for the education of children of noble families. The imperial manufactory of arms, founded by Peter the Great in 1712, is the most extensive and important in the empire. Cutlery of various kinds is also manufactured here. There are in Tula numerous tanneries and breweries, manufactories of Russian leather, candles, soap, beet-root, sugar, and great tallow-melting houses, besides manufactories of woollens, linen, sealing-wax, paint, and Prussian blue. There is a very great trade in all these articles, as well as in corn and hemp. The two annual fairs are much frequented.

TULLA, or TULLAGH, Clare county, Ireland, a market-town, and the seat of a Poor-Law Union, is situated on an eminence, in 52° 52' N. lat., 8° 43' W. long., distant by road 12½ miles E. by N. from Eunis, 140 miles W.S.W. from Dublin. The population in 1851 was 1215, besides 659 in public institutions. Tulla Poor-Law Union comprises 18 electoral divisions, with an area of 84,723 acres, and a population in 1841 of 28,703, in 1851 of 19,248. The town contains a small plain church, a neat Roman Catholic chapel, a Church Education school, National schools, a glebe-house, court-house, dispensary, bride-well, and Union workhouse. Quarter and petty sessions are held in the town. Fairs are held May 13th, September 4th, and October 1st.

TULLAMORE, Ireland, the chief town of King's County, a market-town, and the seat of a Poor-Law Union, is situated on the Grand Canal, in 53° 17' N. lat., 7° 26' W. long., distant 59 miles W. by S. from Dublin by road. The population in 1851 was 4630, besides 2234 in public institutions. Tullamore Poor-Law Union comprises 29 electoral divisions, with an area of 155,395 acres, and a population in 1841 of 53,861, in 1851 of 41,158.

The town stands in a small fertile district near the centre of the Bog of Allen, from the moors of which it took its name. The opening of the Grand Canal, and its subsequent extension to the Shannon, and the county business, which was transferred from Philipstown about the year 1830, have given increasing importance to the town. It is a neat, clean, well-arranged place. The Tullamore River, which passes through the town, is crossed by a neat bridge. The parish church, which occupies an eminence a quarter of a mile from the town, is a handsome building, with a pinnacled tower. There are a Roman Catholic chapel, a convent of the sisters of mercy, two chapels for Methodists, two Free schools, National schools, and a savings bank.

The town possesses a handsome court-house of Grecian architecture, the county jail, a castellated building on the radiating plan, the town-hall and market-house, constabulary and military barracks, canal stores, the county infirmary, and the Union workhouse. Large sales of grain are made at the weekly markets. By the Grand Canal barges for goods and swift passenger-boats ply daily to and from Dublin. There are two breweries, a large distillery, and two tanneries in the place. The assizes for the county and quarter and petty sessions are held in the town. Fairs are held six times a year.

TULLINS. [ISERE.]

TULLOW. [CARLOW, County of.]

TUNBRIDGE. [TONBRIDGE.]

TUNIS, one of the Barbary States, situated in the central part of the northern coast of Africa, and forming a province of the Turkish empire, is bounded N. and E. by the Mediterranean, W. by French Africa, and S. by the Beled-el-Jerid. Its greatest length from north to south is about 300 miles, while its breadth from west to east varies from 65 to 140 miles. The area is about 30,000 square miles. In this estimate the country south of 33° N. lat., which is part of the Sahara, is not included.

Occupying the countries formerly known as *Zougitana* and *Byzacium*, and projecting towards the centre of the Mediterranean to within 80 miles of Sicily, Tunis is important, not only on account of its position, but for the ports it possesses on a coast measuring about 400 miles. These advantages made its inhabitants a warlike and commercial people in the time of the Carthaginians, the strength of the barbarians and the Saracens against Southern Europe in the middle ages, and an unceasing annoyance to the Christian states after it fell into the hands of the Moalem pirates in the 16th century.

That portion of the country which is situated north of 36° N. lat., is in general hilly, in parts mountainous, but there are also several plains of some extent. The southern districts however, which comprehend more than three-fourths of the area, are level; such ridges as occur are neither extensive nor elevated, with the exception of the *Jebel Usalat*.

Sea-Coast.—The northern coast, from the boundary-line of Tunis and Algiers to *Ras Sidi Ali-el-Mekki*, or *Cape Farina*, is rocky and high. The western part of it, as far as *Ras-al-Mun-Shikhar*, or *Cape Serat*, is steep, and the mountains near it rise to a considerable elevation: it is also mostly wooded, but east of that promontory the coast is much lower, and in many parts considerable tracts of barren sand extend from the summits of the hills to the water's edge. The most eastern portion, which lies east of *Ras Sidi Booshusha*, or *Cape Zibeeb*, contains only hills, most of which are covered with large plantations of olives, between which there are a few tracts of yellow sand.

The coast here takes a sudden direction to the southward into the Bay of Biserta, so called from the former town of that name (now *Bensart*), the *Hippo-Zaryus* of the ancients, situated upon a narrow channel which connects the waters of two magnificent lakes with the sea. It was formerly the safest seaport of Northern Africa, and was a great naval station of the Barbary corsairs; but the channel is now choked up by neglect, and the town, although governed by an agha, and containing 10,000 or 12,000 people, presents the miserable remains of a place which flourished at no very remote period. Farther to the east, about 10 miles, is the headland called *Ras Zibeeb*; and 14 miles beyond this *Cape Farina* (sometimes called *Capo di Guardia*), the Promontorium Apollinis of the ancients, forms the western limit of the great Gulf of Tunis: its Moorish name is *Ras Sidi Ali-el-Mekki*.

The coast of the Bay of Tunis, from *Ras Sidi Ali-el-Mekki* to *Ras Ghamart*, is low and generally swampy. But along that projecting tract on which the ruins of Carthage are found the coast is rocky, though in general slightly elevated above the sea. [CARTHAGE.] The shores of the innermost recess of the Bay of Tunis are low, and in many parts marshy. From *Ras Zafran* to *Ras Addar*, or *Cape Bon*, and thence to *Ras Mustapha*, the coast is alternately rocky and high, and low and swampy.

A few miles within *Ras Sidi Ali-el-Mekki* the river *Mejerdah*, the ancient *Bagradas*, falls into the sea through a lagoon, commonly called *Port Farina*, upon which stands the once populous town of *Ghar-el-Milah*, with its ports, moles, dockyard, and arsenal; where, at the beginning of the present century, large frigates rode at anchor: but the decline of the Moorish power and the filling up of the port by the alluvium of the river have left it a deserted place, more wretched than *Biserta*. At the eastern limit of the Gulf of Tunis and beyond the two small islands of *Zembra*, or *Zowamores*, which lie at the entrance of the gulf, is *Cape Bon* (*Ras Addar*), the Promontorium *Mercurii* of the ancients. The coast here takes a sudden direction to the south, as far as *Ras-el-Zargias*, the frontier of the kingdom of Tripoli.

From *Ras Mustapha* to *Ras-el-Mahmoor* the coast is low and generally swampy, being formed by the alluvial deposit brought down from the adjacent hills by numerous torrents. A tract of low and rocky coast extends from *Ras-el-Mahmoor* to *Hammamet*, and it is followed by a low sandy coast, which occupies the interior of the

Bay of Hammamet, and terminates near Susa. There is a considerable lagoon connected with the sea near Hercla. From Susa to Ras Capoodia (the ancient Caput Vada), and thence to the town of Sfakkur, the shores are in general rocky, but not high; in a few places they are low and sandy. Between Lambta and Tobulba is another 'sibha,' or lagoon, which is not connected with the sea. It is three miles long and half a mile wide. Salt is collected there to a large amount.

Hammamet, which gives its name to the gulf, is a town of about 4000 inhabitants, the cleanest and neatest in the regency. It is the capital of an agricultural district of 15,000 souls. Not far from it stands *Hercla*, the *Heraclea* of the lower empire. *Susa* was the ancient *Adrumetum*, and the capital of the rich and fertile region of Byzacium. With its battlements, castles, and mosques, Susa still presents from the sea a pleasing appearance, and is a place of considerable commerce, and one of the wealthy cities of the Tunisian state, being the chief mart for oil, linen, and soap: it has about 6000 inhabitants. The ruins of the ancient harbour are clearly traceable under water, and at the present day it has a mole, and good anchorage in seven, nine, and ten fathoms, secure from all winds except the north-east. The castle appears to be kept in good order. *Mistis*, further along the gulf, which is a walled and fortified town, but has no safe anchorage, and the village of *Lampia*, the *Leptis Parva* of antiquity, now an insignificant place, and Cape Demas, the southern limit of the Gulf of Hammamet. Here are the remains of the once large and powerful town of *Thapsus*, whose solid mole is yet partly in existence. *Mahadesah*, called also Africa by the moderns, and *Turris Hannibalis* by the ancients, stands on a point of land about 9 miles to the southward of Cape Demas. It was a place of great strength and importance in the 16th century, when it was taken by Charles V., who demolished its fortifications, the remains of which show that they were of great solidity. The inner harbour, which was within the fortifications, is now quite dry. About 21 miles farther to the south, bounded by Cape Capoodia, the Caput Vada of Procopius, on the north, and the island of Gerba on the south, opens the Gulf of Khabs, or *Cabes* (the Little Syrtis). Among the towns on its shores is *Sfax*, or *Sfakus*, the ancient *Taphra*, or *Taphura*, where there is a mole, and good anchorage, although the approach to it is intricate, by reason of the Karkenna Islands and innumerable low rocks which run for miles along this coast. It was formerly a great nest for pirates, but is now a mart for inland produce and European as well as Eastern merchandise, in which it carries on a brisk commerce; the inhabitants, amounting to 12,000, are a thriving and rich people. Farther to the south, on the bank of a small river, is the town and small port of *Gabs*, *Khabs*, or *Cabes*, from which the gulf takes its modern name. The town stands about a mile from the sea. *Gerba*, or *Jerba*, the *Memix* of Strabo and Pliny, is a considerable, fertile, and populous island. Its greatest curiosity is a tower constructed of human skulls, said to be those of 1400 Christians who fell in battle here with the Turks in 1588. The inhabitants of Gerba manufacture shawls of brilliant colours, fabrics of a beautiful texture made of silk and fine wool, bournous, and a sort of woollen blanket.

The Gulf of Khabs seems to have undergone great changes, and by no means resembles the Minor Syrtis of the ancients. [SYRTIS.] The dangers of the Minor Syrtis arose from the variations and uncertainty of the tides on a flat shelvy coast. From Caput Vada to the island of Gerba lie a number of little flat islands, banks of sand, oozy bottoms, and small depths of water, which make its navigation intricate and difficult to strangers, but easy to the natives who know its channels and innumerable windings. The gulf is not more than 75 miles in extent from its northern to its southern point, and it penetrates into the mainland about 60 miles. Rennell is of opinion that the gulf at one time entered deeper into the land, and formed a junction with the Lake Lowdesah, called also the Lake of Marks, the Tritonis Palus of the ancients. Shaw describes the land also to have gained and to be still gaining on the sea at Khabs, where the ancient town of Tacape is left half a mile inland. Nothing appears more probable than that such a change should have taken place in a situation where the continued operation of the sea is depositing sand on a flat coast where there is no backwater to sweep it into the sea again. If the lake and the gulf were separated from each other by a bar of sand only, the perils of the Syrtis would naturally be deemed by the ancients greater than they are at present.

Interior.—The north-western portion of Tunis, between the boundary-line of Algiers and the valley of the Mejerdah, on the south and east, is very mountainous. A range of mountains enters Tunis near 36° 30' N. lat., 8° 40' E. long., and spreads over the whole district. The most elevated part of this range is at the distance of a few miles from the banks of the river Mejerdah, where it runs from west to east, and is called the Frigean range, from a district called Frigea, in which it is situated, and which is one of the most fertile and populous districts of the regency. The mountains probably do not exceed 4000 or 5000 feet above the sea, and their sides are generally covered with fine trees. The lower hills, which surround the more elevated portion of the range, are partly cultivated and partly covered with olive-plantations, more especially in the upper valley of the Wady Zain, where the mountains which lie east of it contain rich lead-mines. Near 9° 20' E. long. the Frigean range turns

to the north, and forms a wide-spread mass of rocks of moderate elevation, which is divided into two parts by a small river that falls into the Lake of Benzart, and drains a narrow valley. West of this valley is a table-land, which descends with rather a steep declivity towards the Mediterranean. It is called Mogody, and its upper part is covered with shrubs and brushwood, and is without cultivation; but where it declines towards the Lake of Benzart it is well wooded, and near its base planted with olive-trees. The Lake, or rather Lakes, of Benzart (for the lake is divided into two parts by a projecting promontory), extend from north-east to south-west 28 miles; the greatest breadth is 14 miles. The lakes are connected with the sea by a channel about 10 miles long, which near the town of Benzart is little more than a fathom deep, but above it increases in depth to 6 and 10 fathoms. The depth of the northern lake varies from 10 to 60 fathoms of water. It abounds in several kinds of fish, among which is the gray mullet, from the roe of which is made the famous botarga of Benzart. The lakes are surrounded by a level tract one or two miles in width, partly cultivated, but chiefly planted with olive- and fruit-trees. The peaches of Benzart are in great repute. That part of the Frigean Mountains which lies east of the valley and lakes of Benzart rises only into hills. It contains a portion of cultivable land and many olive-plantations.

The river Mejerdah rises within the territories of Algiers, where it is formed by the junction of the waters of the Wady Serrat and those of the Wady Khamees or Hamis. [MEJERDAH.] As far as the Mejerdah runs eastward the valley is of moderate extent, and frequently interrupted by spurs from the adjacent hills and mountains, but soon after it has begun to run north-north-east it emerges from the hills and runs through a plain of considerable width. It flows in a deep bed in a light sandy soil, and is constantly changing its direction when the waters are high. Unless swelled by rains, its lower course is sluggish, not exceeding a mile an hour; and it probably could be navigated by boats for the greater part of the year. Near the mouth of the river is a wide plain, partly occupied by lakes, which have been formed by the inundations of the river. This plain, along the lower part of its course, is of moderate fertility, and only partially cultivated.

An elevated tract of ground traverses the country in a diagonal line between 35° and 37° N. lat., beginning on the south-west on the boundary-line of Algiers, west of the town of Kasareen, and terminating on the north-east in the peninsula of Dakhul and Ras-Addar. This tract appears in most places to attain only a moderate elevation above its base, but it rises to a considerable height in the Jebel-Truzza, Jebel-Ussalat, Jebel-Zunghar, and Jebel-Zaghwan. Parts of these mountains are covered with pine-forests, and a large quantity of tar and pitch is made. Another chain of heights, called Jebel-al-Kaff, runs across the country from west to east, near 36° N. lat., beginning west of Al-Kaff, and joining the former range at Mount Zunghar, near a point where the parallel of 36° N. lat. is cut by 10° E. long. This chain appears to consist of single mountain masses, frequently separated by deep depressions or valleys, through which some of the tributaries of the Mejerdah flow to the principal river. Some of its summits towards the west are very high. It is in many parts well wooded, especially on the lower declivities and in the valleys.

Between the valley of the Lower Mejerdah and that portion of the first-mentioned mountain range which extends from Jebel-Zunghar to Ras-Addar, lies the plain of Tunis, which extends 20 miles on the north and west side of the town, but to double that distance towards the south. In several places there are extensive rocky tracts upon it 300 or 400 feet above the sea-level. In other parts there are short isolated ranges. This plain is not distinguished by fertility, but it is better cultivated than any other part of the country, and more populous, owing to a large commercial and populous town being situated nearly in its centre.

The Dakhul, or the peninsula which lies east of the Bay of Tunis, is nearly occupied by the range which extends from Jebel-Zaghwan to Ras-Addar. In this range occur two deep depressions of inconsiderable width. Through the southern depressions the road is made which leads from Tunis to Nabal and Hammamet. The northern depression occurs near the northern extremity of the peninsula, where a low plain unites the large and elevated masses forming Ras-Addar with the continent. The eastern side of the Dakhul is noted for its fertility; but the interior appears to consist of naked rocky masses with little vegetation on them. The soil of the fertile part of it consists of alluvium, deposited at the base of the highlands over a tract two or three miles wide. This tract is well cultivated, and produces abundant crops of grain, and the fields are interspersed with villages surrounded by groves of olive-trees and orchards, in which fig-trees are common. The adjacent hills have excellent pasture for cattle, which are numerous. The dairies are well attended to. The western shores of the Dakhul are far from being fertile. North of the Jebel-Zaghwan there are some lead-mines.

The countries hitherto noticed may be considered as the agricultural part of Tunis. The greater part of the inhabitants are chiefly engaged in cultivating the ground and in planting olive-trees and orchards. In some parts these occupations are united with the rearing of cattle and attending to the dairy. They all live in fixed habitations, with the exception of a few families of Arabs. In the countries farther to the

south however the bulk of the population consists of wandering tribes, who only occasionally cultivate a few patches of ground.

The region which is separated on the north from the upper valley of the Mejerdah by the Al-Kaff Mountains, and extends southward to 35° N. lat., and eastward to Jebel-Ussalat (10° E. long.), seems to consist of an alternation of hills and plains of considerable extent. Some of the hills are connected so as to form long ridges; others are isolated. Part of them are wooded, especially in the valleys and glens which intersect them, and these valleys contain the small tracts which are cultivated by the Arabs. The plains are entirely without cultivation, and serve only as pasture-grounds for sheep and camels. The Arabs who frequent it live in dowars, or clusters of tents. The numerous ruins of large towns which are dispersed over it show that a considerable portion of this tract was once cultivated. This country must be considerably elevated above the sea-level, as frost appears to be common in winter.

To the east of this region lies the plain of Kerwan, which extends from the innermost recesses of the Gulf of Hammamet to the town of Sfax. Nearly in the middle of this plain, which is more than 100 miles in length and about 30 miles in width, the town is situated from which its name is derived. The degree of cold which is experienced in the town of Kerwan proves that this place must be considerably above the sea. The plain is destitute of trees, and nearly without cultivation, except in the immediate vicinity of the town, where a large tract is sown with several kinds of grain. The Arab tribes who wander about over it appear to be much more wealthy than the other Arab tribes in Tunisia.

The plain of Kerwan reaches to the shores of the sea between Hammamet and Susa, but farther south it is separated from the sea by hilly tracts, which extend from the town of Susa southward to a point opposite the islands of Karkenah. This tract may be about 24 miles in width in the widest part, as it approaches on the west the ruins called Al-Jem. The interior of this region is composed of a succession of sterile hills; but the eastern border, and the low tract which lies between it and the sea-shore, are tolerably fertile, though the soil is stony. It is chiefly planted with olive-trees, which frequently form forests many miles long and from two to three miles wide. This coast has several sea-ports, from which oil, wool, and wax are exported: the two last-mentioned articles are brought by the Arabs from the interior. At the most southern extremity of this region is the town of Sfax, whose olive-plantations extend 10 or 12 miles along the sea and from 5 to 6 miles inland, and are intermingled with groves of pistachio-nuts, and fields of rye, barley, maize, and lentils.

The country which lies to the south of the three last-mentioned regions, and which contains the larger part of the country called by the ancients Byzacium, once noted for its fertility, is at present almost a desert. Along the sea-shore extends a plain, whose surface is varied only by some swelling grounds and a few low hills. A few mountain summits occasionally appear rising far to the west. Along the sea-shore the soil consists of sand, but farther inland it is composed of more compact materials. The whole however is without cultivation, but it supplies pasture to some tribes of Arabs, who have large herds of camels, horses, cattle, and sheep. In one or two places on the sea-coast indigo is cultivated to a small extent; the whole plain is destitute of trees, and even bushes are rare. The western districts, or those contiguous to the boundary-line of Algiers, consist of a long valley, which extends nearly 100 miles, from 35° N. lat. to some distance south of 34° N. lat. Its soil is dry, and only a few small rivers are met with, the waters of which are soon exhausted by irrigation: these are the only spots in the valley which are cultivated. The ridges which inclose the valley are destitute of trees, and nearly without vegetation. Towards the northern extremity of the valley water is more abundant, and there are large tracts of pasture-ground for the wandering tribes.

The southern portion of Tunisia is called the Jerid, or Beled-al-Jerid (the country of date-palms). It extends from about 34° N. lat. southward to the parallel of the southern extremity of the great salt lake Al-Sibbah, and on the south is contiguous to the Sahara. This lake is 70 miles long from south-west to north-east, and about 26 miles wide on an average. In summer it is dry, with the exception of the southern part, where there is always a considerable sheet of water. When dry, the central part, for 15 or 18 miles, is covered with a layer of salt, which is not so strong as sea-salt, and not adapted for preserving provisions; but it has an agreeable flavour. Between this layer of salt and the banks of the lake is a tract whose surface is sandy, or partially overgrown with bushes. In winter the whole surface is covered with water to a depth of two or three feet. It may however be passed even in this season along a track which is marked by stones, trunks of trees, skulls of animals, and sticks. The country which extends from the eastern shores of the salt-lake to the Gulf of Gabs consists of a succession of hills. It contains a great number of springs and small watercourses, to which circumstance its fertility is owing: the water is employed in irrigating the adjacent fields until it is exhausted. It is particularly employed in irrigating the plantations of date-trees, which in some places cover several square miles. In other parts the country is studded with numerous little oases of palm-trees, each of them surrounding a village; but between these cultivated

spots there are large tracts that exhibit no sign of vegetation. In this tract considerable quantities of henna are cultivated. Great care is taken in cultivating these grounds, and manure is applied to them. Some of the gardens are extensive, and contain a great variety of fruit-trees, as the peach, apricot, vine, almond, orange, lotus, pomegranate, and fig. Melons and onions are grown in considerable quantities. On the west of the Sibbah occurs a similar tract, which extends from the southern extremity of the salt-lake to its middle, and is of superior quality. The dates which are collected in these plantations are of an exquisite flavour, and considered superior to any in Barbary. The inhabitants of this tract are wealthy, and live in well-constructed houses of stone.

Climate.—The climate is generally healthy. The plague is known only when introduced from other parts. In all other respects the climate and seasons resemble those of Tripoli. The summer heats are moderated by sea-breezes along the coast, and the winters resemble our spring. Although the habits of the people are far from cleanly, and vermin are plentiful, yet fevers are not frequent, and epidemic maladies are scarcely known. During the summer and autumn rain is very rare: it usually falls in November, and continues at intervals until the month of April. The mean temperature at the town of Tunis, deduced from a series of meteorological observations, is found to be as follows:—Winter, 55·9°; spring, 71·0°; summer, 83·9°; autumn, 64·0°. The mean annual temperature is 69·2°.

Government.—The ruler of the territory of Tunis at present bears the title of Bey, and in state documents he is called the Basha-Bey of Tunis, because he is invested with the rank of pasha (which in the dialect of Barbary is basha) by the Grand Sultan, to whom he sends tribute as often as his political circumstances require the Sultan's favour or protection. But the Porte has little control over him, and he is the sovereign of the country, with whom the states of Europe enter into treaties, and to whom they send their consuls; and he is represented by ambassadors at the chief courts of Europe. Although he is nominally elected by a divan, yet (the members of this body being chosen by himself) he easily obtains their suffrages for the nomination of his successor in the person of one of his own family; and thus the sovereignty has remained in the same dynasty for nearly a century. His power is despotic, for the divan is only formally assembled to confirm the will of its master. The country is not divided into provinces, but the whole is under the direct control of the Bey. As his revenue depends greatly upon the tribute which he exacts from the Arab tribes in the interior, he is obliged to keep up a standing force, which he annually sends to scour the country and extort payment. The regular troops amount to about 8000; they have been trained in European tactics under French officers, and wear the new Turkish uniform. The contingent furnished by the Arab tribes, amounting to 40,000 men, chiefly cavalry, receive no pay, but are exempt from tribute. The tribute is estimated and collected in a most arbitrary manner. The collector goes into a field whilst the crop is still green, and values it according to his caprice. The owner is then obliged to pay a tithe on this supposed value of his future crop, although when the harvest arrives he may find that it perhaps does not exceed the fourth part of the sum at which it was estimated. The same is the case with olives and dates, in which consist the principal resources of the country. All sorts of animals, including horses, are also similarly taxed at pleasure. Those who have the art to conceal their herds and flocks are made to pay in money, which is often extorted by the bastinado. The Bey draws other revenues from the customs; from the sale of permits to export grain and other produce, and to import wine and spirits; from monopolies of various sorts; from a tax on the Jews; and from his own lands. He has also some sources of revenue of a casual nature, such as the wealth of his rich subjects who die; his profits in trade, which are considerable; and his extortions from those who have money whenever a public pretext furnishes him with an excuse to draw upon their hoards. The Tunisians formerly had a powerful fleet, and were desperate pirates; but their navy is reduced to insignificance since 1816, as well by gales on their own shores as by the total loss of the Bey's contingent in the battle of Navarino. At present his force consists of a few corvettes, brigs, schooners, and gun-boats, for which he has no real use. The Bey is the chief of the religion of the state in Tunis, and is himself the first judge in his kingdom. He sits in the hall of justice almost daily, and his decisions, which are summary, are immediately put into execution. The kaidas administer justice in the same manner in the interior towns. The kaidas judge only in matters of religion.

Commerce.—The foreign commerce of Tunis is not confined to the capital, but is also carried on briskly from the ports of the eastern coast. Among the manufactured articles of export are—soap, marocco leather, Gerba shawls, red skull-caps, wheat, barley, olive-oil, wool, hides, bees'-wax, dates, almonds, sponges, and orchilla-seed: these are the principal articles of produce exported. From the interior of Africa are received and exported—ivory, gold-dust, ostrich-feathers, senna, and madder-roots. The imports are woollen-cloths, cotton-prints, calicoes, muslins, coarse linens, damasks, raw and wrought silks, fine wool, gold and silver tissues, coffee, sugar, spices, alum, vitriol, cochineal, vermilion, gum-lac, iron, tin, lead, hardware, cutlery, ammunition and arms of all sorts, earthenware, glass-beads, paper, wine, spirits, and tobacco. The European trade is entirely with

France, Italy, Trieste, and Malta. As ports of loading those of Sfax and Susa are preferred to Tunis, in consequence of the distance and delay of transporting merchandise in lighters across the lake to the Goletta, where ships generally lie; the commerce of the country is consequently best carried on in vessels under 150 tons burden. The trade with Central Africa passes through Gadamia. [TRIPOLI.] The caravans arrive at Tozer, Cabes, and Sfax about twice in the year, and barter their merchandise, which is thence introduced in various directions into Tunis. Besides the articles already mentioned they bring black slaves, and they take in return dates, woollen-cloths, maulins, silks, colonial produce, skull-caps, arms, and such like.

Towns.—The next city in rank and importance after TUNIS is *Cairoan*, or *Kairwan*, which was the principal station of the first Arabian conquerors. It was founded by the Arabs about A.D. 669. It is situated about 70 miles to the south of the capital, and about 24 miles west of Susa. The town is large and has good houses, and is surrounded by a crenelated wall with four gates. The great mosque, which is esteemed the most sacred as well as the most magnificent in all Barbary, is supported by many marble or granite pillars, said to amount to 500; but no Christian has ever been allowed to see them. Cairoan is the holy city of Africa, and strangers are obliged to pass through it in deep silence. Its kaid is almost independent of the Bey, his will being absolute in his own district; and he commands no less than 30,000 Arabs, besides governing the 50,000 inhabitants which the town is supposed to contain. The inhabitants are famed for the beauty of their yellow marocco boots and slippers.

Kaff is the third city in riches and strength, and is the key of Tunis on the western frontier. Its walls are kept in good repair, and the fortress mounts 132 pieces of cannon. Standing in a fertile country, on the declivity of a rocky range of mountains, the view from it is very fine. The town is not populous, but the kaid commands a district containing 50,000 males.

The towns and villages are more numerous, and the population is greater in the northern parts of the state. The Dakhul, besides being an agricultural district, abounds in game; is the seat of a large fishery; and has several small rivers running into the sea, which fertilise the country. At *Hamman Leuf* the bey has a palace, and at *Hamman Ghorbus* are mineral baths famous for curing rheumatism and cutaneous disorders. Beyond these is *Lowhareah*, where there are extensive marble-quarries, which are said to have furnished the materials for the building of Carthage and Utica. *Zowan*, or *Zagwan*, a flourishing town built upon the skirts of a very high mountain of the same name, about 30 miles S. from the city of Tunis, supplied water to the city of Carthage by an aqueduct 52 miles long, some parts of which are still standing. The stream is now employed in dyeing the woollen-scarlet caps worn throughout Turkey and the Levant; and this mountain, as well as that of *Kaff*, furnishes ice for the Bey's use in summer. The site of Carthage is unoccupied, and on that of Utica there are only a few miserable huts, known by the name of *Booshater*, standing almost in a marsh. The banks of the Mejerdah are covered with the sites of ancient places.

The lion, the panther, the ounce, the lynx, the wolf, and the wild boar, are the principal ferocious animals that inhabit the western parts of Tunis; for to the eastward of the meridian of Tabarca the forests cease, and the country is less woody. Flies, noxious vermin, mosquitoes, gnats, ants, and the scorpion are the torment of Europeans in all parts of the country.

Inhabitants.—The Tunisians are a mixed race of Turks, Moors, and Jews, in the towns, interspersed with a few Christians and renegades; while the people of the country are Arabs and Kabyles of different tribes. The Moors of Northern Africa are a white race. Whether from a mixture with the Spaniards during their abode in Spain, or with the Turks, who were afterwards their masters, or from the blood of renegades and female slaves taken during three centuries of warfare with European nations, they are in Tunis a comely people, and many of their women would be reckoned handsome in any part of the world. Although the people of this country are more civilised than those of the other nations of Barbary, it being the principal seat of refuge to which the Moors fled who were driven out of Spain, some of whose manufactures have thriven amongst them, yet they are very ignorant: their most instructed men have only a knowledge of reading the Koran, writing, and a little arithmetic. The language is a dialect of Arabic, but the *Lingua Franca*, a bastard Italian, used in all the trading places of the Levant, is spoken in the ports. The inhabitants are strict Mohammedans. The Arab inhabitants of Tunis resemble the Beduins of Arabia in the way of life; but they are rude and unkind to strangers. Any attempt to manage them by mild means would be vain. The idea of the Bey's power is so rooted among them by the annual excursion of his troops through the country, that his firman or mandate and the appearance of a few soldiers never meet with a direct opposition. The Kabyles live in the mountains, in villages made of hurdles and clay. Like the Arabs, they are simple and abstemious, subsisting on bread, milk, and dates. [ALGERIE.] As to that part of the country situated on the frontiers of Algiers, the Kabyles and Arabs who live there acknowledge no obedience to either government; and when they have committed a crime, they have only to pass from one country to the other to place themselves in safety. The use of arms is universal: the traveller,

the shepherd, the labourer, the camel-driver, the rich and poor, are all prepared with dagger, gun, or pistol, to repel attacks, and sometimes to make them. Although their country lies within two days' sail of the continent of Europe, the people have made little or no advance in civilisation for 1000 years. The total eradication of Christianity may in some degree account for this. The number of churches which formerly existed in Barbary is almost incredible. In the 'Notitia Episcopatum Ecclesie Africanae,' are the names of 132 episcopal sees, in the proconsular province alone. Never however was a religion and its symbol so completely eradicated from any country as that of the cross from Barbary. Egypt in its Coptic population, and Turkey in its Armenian, Greek, and Maronite subjects, still preserve remnants of it, but Barbary has none.

The number of inhabitants of the state of Tunis is supposed to amount to about two millions and a half; amongst whom there may be 7000 Turks, about 9000 Christians (principally Roman Catholics and Greeks), and perhaps 100,000 Jews. In its former prosperity this country must have contained double this number, if we may judge from the numerous sites of towns of ancient times and of the middle ages which are now uninhabited.

Produce.—All sorts of grain, except oats, are grown, as well as maize, beans, garbanzos, lentils, the cicor, or chick-pea, and the like. The sugar-cane is easily reared, but the people have not learned to extract the sugar. Tobacco, coffee, and cotton flourish, and might be turned to profitable account, yet they are imported in large quantities. Olive-oil is the great staple produce, and is of excellent quality. All the vegetables of Europe are easily raised. The artichoke and the gourd, or calabash, are the common food of the people; and the coriander and tomato are grown in great quantities, and serve as a necessary relish in Moorish cookery. Among fruits the first is the produce of the palm- or date-tree. The date is the principal food of the Arabs of the Sahara and the Atlas. Most European fruits, as well as those of warm climates, such as the orange, the pomegranate, the jujube, the prickly-pear, the fig, the melon, and the grape, are common. The oleander and the geranium, roses, bulbs of various sorts, pinks, and a number of aromatic herbs and rare plants, which render the Tunisians renowned for distilled waters and honey, grow luxuriantly. Game is plentiful, as well as all sorts of poultry. Wool is produced in great quantities. The breed of horses, formerly so celebrated, is now entirely neglected. An extensive tunny fishery is carried on by Sicilians off Capes Farina, Monastir, and Bon. The Genoese, Neapolitans, and sometimes the French, fish for coral on the northern coast near Tabarca. It is asserted that the mountains near the capital contain ores of silver, copper, and lead.

Antiquities.—There are no vestiges of antiquity in the capital, although ancient columns and capitals may be found in some of its buildings. The ancient sites on the banks of the Mejerdah abound in ruins, particularly at *Dukkah* (the ancient *Thugga*), consisting of temples, an arch, a number of cisterns, baths, barracks, gates, theatres, an aqueduct, and many inscriptions. At *Ayedrah* is a handsome triumphal arch dedicated to the emperor Septimius Severus, and columns of various beautiful marbles. The walls of the town retain their original height in some places, and have three gates; yet antiquaries have not been able to assign to the place its ancient name. At *Kaff* (Sicca), which, like *Ayedrah*, is on the western frontier, is still to be seen a paved street like those of Pompeii, and here likewise capitals, columns, and trizees are numerous. But the most stupendous monument of ancient times is on the site of *Tydrus*, now called *El-Jem*, a village situated midway between Susa and Sfax, and about 20 miles from the eastern coast. Here rises in its pristine majesty an amphitheatre, which is one of the most perfect, vast, and beautiful remains of former times that is known to exist. Its extreme length measures 429 feet and its breadth 368 feet. Of the fourth or uppermost story little remains, and one of the entrances was destroyed about 100 years ago: but with these exceptions it is in a complete state of preservation, with its seats, arenas, and vomitories, and retains almost the freshness of a modern erection. *Sufetula*, now called *Sbeitla*, about 120 miles S. from Tunis, is the most remarkable place in Barbary for the extent no less than the magnificence of its ruins. It stands in a large plain totally abandoned by man. The principal ruins consist of three contiguous temples, whose ornaments are very rich and of excellent execution, two triumphal arches, another temple, and an aqueduct which spans the clear stream on which the town stood. *Kazareem* (the ancient *Colonia Scillitana*), distant only a few leagues from Sbeitla, has also the remains of an arch and other ruins of minor interest. The great aqueduct which conveyed the water from the mountain of Zagwan to Carthage, 52 miles in length, may yet be traced by masses of stone and cement, which lie, like the vertebrae of a huge winding serpent, along the whole of this distance; and in its preserved portions it is still a mighty construction, rising in some places to 98 feet. [CARTHAGE.]

History.—The town of Tunis, once known by the name of *Tunes* or *Tuneta*, is of great antiquity. But whether it was founded by a Phœnician colony or by the native Africans seems to be an undecided point. It was taken and retaken several times during the Punic wars. In A.D. 439 it fell into the hands of the Vandals; but in 533 was rescued from them by Belisarius. It continued to be subject to the Greek emperors until the irresistible arms of the kalifs overran Northern

Africa, towards the end of the 7th century, when the conqueror Okbah, or Akbah, with a view to secure the country for them, founded the city of Cairoan, or Kairwan, as a place of refuge against the accidents of war. It was here that the Arabians began to consolidate their power in Africa, and they became so thoroughly intermixed with the natives, that Christianity was extinguished, and the Africans have remained a Moslem people to the present day. The Arabian viceroys, at first under the name of Ameer, were in fact kalifs of Africa, and established an independent government at Cairoan, which became the capital of the country which now constitutes the regency of Tunisia. Here the Aglabite dynasty took its rise in the 9th century. The Aglabites were succeeded by the Zeirides; and these were in their turn obliged to yield to the Almoravides, who established themselves in Morocco, and soon extended their power over all the provinces of Barbary, including Tunisia. But in 1206, Abu-Ferez, who held the delegated government of Tunisia, assumed an independent authority, and from him sprung the race denominated Lasis, who are considered the first kings of Tunisia, being the first who established a court in the town of Tunisia. Their dominion soon spread itself over Constantina, Bona, and Tripoli; and their vessels infested the Mediterranean, and intercepted the succours sent to the Christians in the Holy Land. Louis IX. of France undertook, in 1270, his chivalric expedition against this new power, which ended in his own death, and the destruction of his troops by disease among the ruins of Carthage. Muley-Hassem was the last of these kings. He was deprived by stratagem of his throne in 1531, by the pirate Khairadeen, commonly called Barbarossa II., who had been lately acknowledged as chief of Algiers by the Turkish Sultan. Muley-Hassem was restored to his throne as a tributary prince by Charles V. in 1535. But in 1574 the Sultan Selim sent an expedition of 40,000 men from Constantinople, under the command of Sinau Pasha, who made the country a dependency of the Ottoman Porte. At first a Turkish Basha was appointed as governor, aided by a divan, or council of military men, and by a body of Janissaries; but the rapacity of the latter disgusted the Moors, and they obtained permission to elect a Dey from among themselves.

It was in Tunisia and its territory that Aroodge, the first Barbarossa, organised his maritime expeditions before he got possession of Algiers; and even after Algiers was established as the first piratical power, the Algerines moored and refitted their vessels in the ports and roadsteads of Tunisia. Her northern and eastern sea-fronts offered a convenient refuge to the corsairs of all these states, whence they sailed forth in every direction, plundering the ships of Christian nations, and making slaves of their crews. This horrid warfare was at one time carried on so successfully, that a Genoese renegade who commanded the galleys of Biserta is said to have reduced no less than 20,000 persons to slavery. The Tunisian corsairs continued their excursions at sea until 1655, when Admiral Blake, with a powerful English squadron, destroyed the castles of Porto Farina and the Goletta with his artillery, and compelled the Bey to promise that his piratical subjects should not commit further depredations on the English. France and Holland soon followed the same course. These promises were afterwards often renewed, but were never faithfully observed. At length, in 1816, in consequence of an agreement between the European powers, Tunisia renounced for ever Christian slavery, under the threat of that punishment which Lord Exmouth with a naval force inflicted upon Algiers.

Of twenty-three Deys who reigned at Tunisia all were strangled or otherwise assassinated, with the exception of five. Since the accession of the present family in the person of Hassan ben Ali (the grandson of a renegade Greek), who died in 1753, there have been few revolutions in Tunisia. His grandson Hammoodah, the fourth of his race, came to the throne in 1782, and died in 1815. This prince was a man of great talents, and his long reign is distinguished among those of the Moorish dynasty by many acts directed to the public good. His brother Othman reigned only three months, and was put to death. Othman was succeeded by his cousin Mahmood, who died in 1825, leaving the power in the hands of his son Hussain, who died in 1835. Hussain was succeeded by his brother Mustapha, who was followed by his son Achmet, a man full of energy and intelligence, and an acute politician, who has done much for the advancement of his country.

TUNIS, a large and flourishing city and port in north Africa, the capital of the regency of Tunisia, situated on the coast of the Mediterranean, in 36° 48' N. lat., 10° 11' E. long., in a beautiful and vast plain, bounded at a distance of about 30 miles by an amphitheatre of high mountains. It stands on the western side of a lagoon of an oval shape, about 20 miles in circumference, which by a narrow outlet, called the Goletta, defended by a castle, opens into the extensive Bay and Gulf of Tunisia. The city is encircled by a high wall with six gates, around which is another wall encompassing the suburbs, having eleven gates or passes into the country, and measuring about five miles in circumference. The town contains about 12,000 houses, and from 130,000 to 200,000 inhabitants, comprising Moors, Arabs, Turks, negroes, probably 25,000 Jews, and about 8000 Christians. Although each house has its cistern of rain-water collected from the flat roofs, the town is well supplied also with water from a neighbouring spring, conveyed by an aqueduct, which was built when the country was subject to the emperor Charles V.; and no place enjoys by nature a greater plenty of the necessaries of life. But the streets are narrow, irregular, and filthy in the extreme, becoming after a few hours' rain

GEOG. DIV. VOL. IV.

a perfect marsh, and in summer still more intolerable from their dust, rubbish, and vermin, and from the effluvia of the open drains. Contagious diseases nevertheless are not prevalent. There are five principal and many smaller mosques. The houses in general, according to Moorish custom, are only one story high, with a court in the centre, and usually without windows to the street. In the middle of the city is an open space of no great extent, surrounded by shops for the sale of manufactures. A mosque built in the reign of Hammooda Bey, whose minister Yusuf brought columns and marbles from the ruins in the interior, to decorate it, is the finest building in the city. The Bey's palace is a modern building in the Saracenic style; although situated in a narrow street, it is a handsome edifice, with marble courts and galleries. In different parts of the town are five extensive barracks, built also by Hammooda Bey; but the finest building is the new barracks, erected by his successor Hussein, near the citadel. It is a quadrangle of two stories, each comprising 134 rooms, and will easily accommodate 4000 men. Tunisia has a theatre, at which Italian operas are sometimes acted.

The chief manufactures of this city are linen and woollen cloths, and embroidery, red woollen caps, famous all over western Asia for colour, fineness, and strength. The bazaars and shops offer for sale also essences of musk, rose, and jasmine, as well as spices, gold ornaments, precious stones, silver articles, marocco slippers, burnouses, wearing apparel, horse accoutrements, shawls, silk kerchiefs interwoven with gold, embroidery of all kinds, straw mats, carpets, fire-arms, daggers, and swords. Slaves from the interior of Africa are brought to Tunisia, but the practice of selling them openly in the market-place is now discontinued, and they are no longer exported, but individuals are still permitted to keep slaves. The Bey Achmet emancipated all his slaves in 1841, and his example has had great influence throughout the regency, so that there is a considerable number of free blacks among the population. In the suburbs vegetables, fruit, butter, oil, meat, charcoal, wood, and skins are exposed to sale, as well as all sorts of cattle, horses, and poultry; on all of which duties are collected by officers of the bay. The town presents considerable bustle. From sunrise to sunset, when the Moors retire to rest, the streets are filled with people, among whom are women muffled up from head to foot to conceal their persons. A crier or broker walks before each shop, calling out the value of an article held in his hand, and inviting the passers-by to purchase it. Valuable articles are thus exposed in the most unreserved manner.

Being more given to commerce, the government and people of Tunisia are more civilised and more civil to foreigners than those of the other towns of Barbary. They are very tolerant in matters of religion: the Jews have their synagogues, the Greeks and Roman Catholics have several places of worship, and the French government was permitted in 1841 to erect a chapel among the ruins of Carthage, on the spot where their king St. Louis died. The Maltese are the only British subjects resident here; they are under the care of a few Capuchin friars who have a convent in the city. At the principal Moorish college the studies are almost confined to theology and jurisprudence; the operations requiring mathematical or philosophical knowledge, as well as the profession of physic, being mostly in the hands of Europeans or Jews. The Jews manage the monetary affairs of the government. There are a few minor schools for boys, at which they are taught reading and writing, and to repeat passages from the Koran. The women, even of the upper classes, receive no education. The old Turkish costume of the men has been laid aside for the unbecoming blue jacket and European trowsers; but the splendid trappings of their horses are still preserved.

Of the defences of Tunisia little need be said. The gates in its ruined walls are closed every night, and for two hours on every Friday in the middle of the day, in consequence of a prophecy, that the Christians will take possession of the city on that day of the week, and in those hours. The citadel, called the Kasbah, is of great extent, but in a ruinous condition. The Bardo is a fortified palace of the Bey, situated about 2 miles W. from the town. It is surrounded by a high wall and a ditch, and is flanked with towers. Being the usual residence of the court, it is fitted up with great luxury, and even grandeur, and is said to contain upwards of 4000 inhabitants. The lagoon, upon the banks of which the town is built, forms the access from seaward to Tunisia; but as there is not more than six or seven feet of water within it, the town can only be closely approached by boats. Even merchant-ships loading and unloading lie outside the Goletta forts, which guard the narrow entrance from the bay to the lagoon, and their cargoes are conveyed to and from the town in lighters. The Goletta castle is strongly fortified towards the sea, and defends likewise the anchorage and the artificial harbour cut in the isthmus which separates the lagoon from the bay, where there is a dock and basin, in which the ships of war are built.

The Gulf of Tunisia comprehends a coast of 80 miles between Cape Farina and Cape Bon, which are 39 miles asunder; while the two inner promontories, called Cape Carthage and Cape Zaphran, approach each other within 12 miles, and form an inner bay, which is almost circular, and has from 10 to 20 fathoms depth in the centre, gradually decreasing towards the shore. The ground within this bay, which is sometimes called the Bay of Carthage, holds well.

TUNJA. [NEW GRANADA.]

TUNSTALL. [STAFFORDSHIRE.]

TUNSTEAD, a hundred in the county of Norfolk, which, with the adjoining hundred of Happing has been constituted a Poor-Law Union. The two hundreds comprise 43 parishes, with an area of 66,859 acres, and a population in 1851 of 18,525. Tunstead and Happing Poor-Law Union contains 41 parishes, with an area of 62,607 acres, and a population in 1851 of 15,614.

TURENNE. [CORREZE.]

TURKEY, TURKS. Turkey is an empire situated in Europe, Asia, and Africa. The several portions of which it consists have been described under the heads ANATOLIA, ARMENIA, BAGHDAD, BULGARIA, CANDIA, EGYPT, RUM-ILI, SYRIA, &c. Besides those extensive provinces which are under the immediate sovereignty of the Sultan, this empire contains the following vassal states:—MOLDAVIA; WALLACHIA; SERBIA; EGYPT; TUNIS; TRIPOLI. These vassal states have also been treated under their several heads.

The Turkish empire is divided into eyalets or general governments each administered by a pasha, who is generally styled Vali, or viceroy. The eyalets are divided into Livas, governed by Kaimakans, or lieutenant-governors. The Livas are subdivided into Cazas, or districts, and these again into Nahiges, or communes, containing villages and hamlets.

Turkey in Europe contains 15 Eyalets divided into 43 Livas, and 376 Cazas. Turkey in Asia is divided into 18 Eyalets, 78 Livas, and 858 Cazas; Turkey in Africa into 3 Eyalets, 17 Livas, and 86 Cazas. The following table gives the names of the Eyalets, with the chief town of each, extracted from M. Ubcini's recent work upon Turkey:—

Quadavendigular . . .	Brussa	Tarabloni Gharb, or African Tripoli . . .	Tripoli
Aydin . . .	Smyrna	Tunis . . .	Tunis

A general estimate of the population in 1844 made the inhabitants amount in round numbers to 35,350,000, distributed as follows among the great popular divisions of the empire:—

TURKEY IN EUROPE.		TURKEY IN ASIA.	
Thrace . . .	1,800,000	Asia Minor . . .	10,700,000
Bulgaria . . .	3,000,000	Syria . . .	4,450,000
Moldavia . . .	1,400,000	Mesopotamia . . .	
Wallachia . . .	2,600,000	Kurdistan . . .	
Boenia . . .	1,100,000	Arabia . . .	900,000
Rumill . . .	2,700,000	TURKEY IN AFRICA.	
Albania . . .	1,300,000	Egypt . . .	2,000,000
Serbia . . .	1,000,000	Tripoli, Fes, Tunis . . .	1,800,000
Islands . . .	700,000		

The numbers of the different races of which the population is composed are given as follows:—

Races.	In Europe.	In Asia.	In Africa.	Total.
Ottomans . . .	2,100,000	10,700,000	—	12,800,000
Greeks . . .	1,000,000	1,000,000	—	2,000,000
Armenians . . .	400,000	2,000,000	—	2,400,000
Jews . . .	70,000	80,000	—	150,000
Slaves . . .	6,200,000	—	—	6,200,000
Rumani . . .	4,000,000	—	—	4,000,000
Albanians . . .	1,500,000	—	—	1,500,000
Tartars . . .	16,000	20,000	—	36,000
Arabs . . .	—	900,000	3,800,000	4,700,000
Syrians . . .	—	235,000	—	235,000
Druses . . .	—	30,000	—	30,000
Kurds . . .	—	1,000,000	—	1,000,000
Turkomans . . .	—	85,000	—	85,000
Gipsies . . .	314,000	—	—	314,000
Total . . .	15,600,000	16,080,000	3,800,000	35,350,000

With regard to religion the classification is as follows:—

Religion.	In Europe.	In Asia.	In Africa.	Total.
Musulmans . . .	4,550,000	12,650,000	3,800,000	21,000,000
Greek Church . . .	10,000,000	3,000,000	—	13,000,000
Catholics . . .	640,000	260,000	—	900,000
Jews . . .	70,000	80,000	—	150,000
Different Sects . . .	—	—	—	300,000
Total . . .	15,260,000	15,990,000	3,800,000	35,350,000

The total area of the Ottoman empire, including the tributary provinces, is estimated at 1,220,000 square miles, of which about 300,000 are in Europe, 560,000 in Asia, and 360,000 are in Africa.

With regard to the administrative division of the empire it must be observed, that neither the eyalets nor the sanjaks, or livas, have such invariable limits as provinces in Europe usually have; and with regard to the population, it is clear that, deducting the numbers placed opposite the tributary but almost independent states of Serbia, Moldavia, Wallachia, Egypt, Tripoli, and Tunis, the inhabitants subject to the Porte do not much exceed 26 millions.

Government.—The Sultan of Turkey is absolute in this sense, that there is no political body in the empire which has any recognised power to check his will: but he is obliged to reign conformably to the religious, political, and civil principles contained in the Korán; conformably to the Sunna, or the words of Mohammed preserved by tradition; and to the unanimous decision of the assembly of the ulemas (wise men), in which the mufti presides; and conformably to the Kanun-námé. The Kanun-námé is a kind of code containing decisions and institutions which have been made since the beginning of the empire, and conformably to the Korán. This legislation is also called 'Urfi,' or the arbitrary legislation, because it treats of such matters as have only been decided in a general way by Mohammed. However, as the principles of absolute monarchy contained in the Korán are very large, and the Sultan is the chief of the Mohammedan religion as successor of the kalifs, his power is less checked by law than it is by custom, by public opinion, and by the rebellious spirit of his subjects.

The civil and religious law having only one source, the Korán, the highest dignitary is the Mufti, or Sheik-ul-Islam, who is the supreme authority with regard to the legality of religious, civil, and political acts: he is the patriarch and the high chancellor of the empire. The Sultan does not declare war nor conclude peace: nor does he undertake anything of importance without previously asking the mufti and his ulemas 'if it is conformable to the law;' and the mufti decides the matter by a fetwa. Ulema is the general name of theologians and jurists, who are bound to aid the mufti with their advice when he summons them to his assemblies.

State dignities are of two classes—Dignities of the Pen and Dignities of the Sword. Dignities of the Pen are divided into three classes, namely, Rijál, Khojá, and Agha. The members of the class Rijál form the Sublime Porte of the grand-vizir, or the state ministry and state council, the president of which is the grand-vizir. Under him are the kiaya-bey, or minister for home affairs; the reis-efendi, or foreign minister; the chaush-bashi, or minister of the executive power.—The members of the class Khojá form the porte of the defterdar, or the ministry of finance, the director of which is the first defterdar. Under him are the second and the third defterdar; the nishanji-bashi, or secretary of state for the Sultan's signature (seal-keeper); and the defter-emini, or the superintendent of the office of finance, who have the rank of ministers. The ministers have the title of Vizir, and their assembly is called the Diwan.—To the class of Agha belong, or belonged, several military and civil officers, such as the bostanji-bashi, or commander of the guard of the gardens within the seraglio; the topji-bashi, or commander of the artillery; the miri-alem, or bearer of the standard of the prophet; the ihtisab-agma, or prefect of the public markets; the kapijiler-kiayazi, or great chamberlain; and others. Several of these functions have been abolished.

To the class of Dignities of the Sword belong the governors of the eyalets, or heylar-bey, who are pashas of two tails; the governors of the sanjaks, or livas, who are pashas of one tail; and the governors of subdivisions of the livas, who are not pashas, but only beya. The vizirs are pashas of three tails, and so is the serasker, or general-field-marshal; but the rank of a vizir is often given to the governors of eyalets, and the governors of the sanjaks are very often pashas of two tails. The governor of an eyalet has always a sanjak, or sometimes several, of which he is also the governor; and he has little authority over the subordinate governors. The pashas combine the functions of military commanders, of judges, and of receivers of the taxes.

The late sultan, Mahmud II., made great changes with regard to the high functions of the empire. A considerable number of subordinate places, especially in the porte of the defterdar (finance) was abolished, and important changes were made concerning the rank of the different functionaries, who all wear a kind of European uniform. The changes in the army were radical: the Janissaries were exterminated, and the regular troops received a European organisation. The general-field-marshal has still the name of Serasker, or Serasker-Pasha. The second in rank is now the Beyler-Bey Vizir, or the commander of the Sultan's

life-guard. The beyler-bey vizir has been substituted for the bostanj-bashi, a dignity which was abolished, like that of the miri-alem mentioned above. The army, foot as well as horse, is divided into 'ferik,' or divisions commanded by a ferik-pasha. Each ferik is divided into 'liwa,' or brigades commanded by a miri-liwa-pasha; a liwa contains two 'álai,' or regiments commanded by a miri-álai-bey, or colonel; an álai is composed of four 'tabur,' or battalions, commanded by a bin-bashi, or major; each tabur has eight 'buluk,' or companies, commanded by a yúz-bashi, or captain; and a buluk is composed of eight 'on,' or sections, each commanded by an on-bashi, or corporal. The military force of the porte, according to its new organization, consists of 80 regiments composing the active army, which numbers 178,680 men; and a reserve (redif) of 148,680 men, making a total of 327,360 men, including infantry, cavalry, and all grades. This number however, does not include the contingents of the tributary provinces, or of those parts of the empire that are not yet subject to the regular recruiting law; neither does it comprise the irregular troops or occasional auxiliaries raised in emergencies of the empire.

At the beginning of 1858 the Turkish navy was composed of 6 men-of-war carrying 130 to 74 guns each; 10 frigates, with 60 to 40 guns each; 6 corvettes, with 26 to 22 guns each; 14 brigs, carrying 20 to 12 guns each; 16 cutters, schooners, &c., with 12 to 4 guns each; 6 steam-frigates, of 800 to 450 horse-power; and 12 corvettes and smaller vessels—in all 70 vessels, manned by 3400 sailors and 4000 marines. Several of these vessels however were destroyed by the Russian fleet, under Admiral Nachimoff, off Sinope, November 30, 1853.

All the officers, attendants, soldiers, and servants employed in the seraglio amounted in former times to 12,000 'swords,' that is, 'men,' besides the females: the number of 'swords' has been in recent times greatly diminished. The first officer of the harem (a word which signifies 'the apartment of the women'), and of the whole seraglio of the Sultan, is the Kialar-Agha ('the master of the girls'), who is also called Babes-Seadet-Agha, or 'master of the door of happiness.' He has under him many subordinate officers. The women of the harem are divided into five classes:—1, Kádin, or 'wives of the sultan,' in number from four to seven; 2, Gedikli, or 'chamber-maids,' among whom the Sultan usually chooses his kádin. Those who are preferred by the Sultan are called Ikbál, or 'children of happiness,' and Khaas-odalik, or 'private women of the sultan.' In Europe they are generally called Odalik, which is not correct. 3, Ustá, or 'mistresses,' generally called Khalísh, or 'attendants,' divided into 'takim,' or companies of thirty women each; 4, Shagird, or 'apprentices'; 5, Jariyeh, or 'slaves.'

Mahmud II. also introduced many remarkable changes into the system of scientific education. He improved the school for engineers founded by Selim III., and he founded a school for architects, and another for students of medicine: the latter are taught Turkish, Arabic, and French; anatomy, physiology, materia medica, and therapeutics; physics and chemistry.

The ordinary revenue of Turkey, according to M. Ubicini, is 6,724,400*l.* sterling, derived from tithes, land-tax, poll-tax, customs duties, indirect taxes, 276,000*l.* from the Egyptian tribute, 18,400*l.* from Wallachia, the same amount from Servia, and 9,200*l.* of tribute from Moldavia. The ordinary expenditure is stated at 6,922,000*l.*, composed of the following sums:—Civil list of the Sultan, 700,000*l.*; allowances to the Sultan's mother and sisters, 67,280*l.*; army, 2,760,000*l.*; navy, 345,000*l.*; artillery, fortresses, &c., 276,000*l.*; public functionaries, 1,794,000*l.*; grants for works of public utility, 92,000*l.*; religious establishments, 115,000*l.*; subvention to the Ottoman bank, 276,000*l.*; life-annuities in compensation of fiefs, 404,800*l.*

Inhabitants.—The inhabitants are divided into two great classes—the Turks, or, more correctly, Turks-Osmanlis, who are the ruling race; and the Rayas, that is, 'the flock,' who are the ancient inhabitants of the countries conquered by the Turks-Osmanlis. The Rayas, who are Christians, except some pagan tribes, are subject to the capitation or poll-tax, which the Osmanlis do not pay: they have the exercise of their religion with some restrictions, and they are dressed in a different way from the Turks. In general the Rayas, although they form communities and have their local authorities, are entirely in the position and have all the disadvantages of a subdued race. The Rayas are far more numerous than the Turks, especially in Europe: they belong to different nations. Several nations which have an origin different from that of the Turks-Osmanlis are nevertheless not reckoned among the Rayas, because they have adopted the Mohammedan religion. To this class belong a great number of Kurd, Arabic, and Tartar tribes, the Mohammedan Bosniaks, and the Albanians, the inhabitants of ancient Epirus. Foreigners in Turkey are considered as Rayas, but they are protected by the authority of their ambassadors and consuls. In 1839 an imperial decree was issued, by which great privileges were granted to the Rayas, especially with regard to the administration of justice between them and the Turks, and the payment of taxes. This decree, which introduced the tanzimat or reformed system into the empire, has remained a dead letter in most of the provinces. It is opposed by the Turks, who have so long enjoyed an ascendancy over the Rayas, and who have risen in rebellion in some of the provinces in defence of their old privileges. Since the outbreak of the war with Russia, the Sultan and his government have given repeated orders for the strict execution of the tanzimat, which, if

carried fairly out, will put an end to all the grievances of which the Christians have long and justly complained. By a special decree in 1855, the Sultan ordered the reception of the evidence of Christians by the tribunals.

History.—The Turks-Osmanlis are a branch of the Asiatic Turks, who are thinly spread over an immense extent of Asia, from the desert of Gobi to the shores of the Mediterranean, and from the northern part of Siberia to the Persian Gulf. In some parts, as in South Siberia, in Turkistan, and in the greater part of Asia Minor, they form a compact population; in others, as in Syria, Armenia, and Mesopotamia, they are much less numerous than the original inhabitants. In Europe the Turkish population is compact in Rúm-ili, and in the government of Kazan and some adjacent tracts in Eastern Russia. In Africa there are only a few Turks-Osmanlis.

Herodotus (iv. 22) mentions a nation by the name of Iurcæ ('Iúrcæ), which probably lived south-west of the present town of Kiew. A nation which lived in the same country is named Turcæ, or Turks, by Pliny ('Hist. Nat.,' vi. 7) and Pomponius Mela (i. 19). Some have proposed in the above-mentioned passage of Herodotus to read Túrca, instead of 'Iúrcæ. But the names are the same, and Yürük, or Yuruk, is still the well-known name of all nomadic Turks in Asia Minor and Persia. Strabo mentions a nation called Urgi ('Oúργoi); which occupied nearly the same tract as the Iurcæ and Turcæ.

The general opinion is, that the Turks became first known to the Europeans through the Byzantines, in the 4th or 5th century; they were known to the Chinese however several centuries before there was an historian in Europe.

The Turks have been divided from the remotest times into a number of different tribes, the most remarkable of which in connection with the Turks-Osmanlis were the Oghuzes, the Seljuks, and the Osmanlis.

1. **Oghuzes.**—Tradition says that Oghuz-khan, the son of Kárá-khan, a descendant of Turk, who is the common ancestor of all the Turks, was a mighty king in the time of Abraham. His empire was the country called Turkistan [TURKISTAN], known to the Persians by the name of Turán. Under his successors the empire was divided: three khans, 'the three arrows,' ruled over the eastern Oghuzes, and extended their dominions towards China; three other khans, 'the three breakers,' were masters over the western Oghuzes, around the Oxus and the Jaxartes. The first of these 'three breakers' was the 'khan of the mountains': he is the ancestor of the younger Oghuzes, or that part of the Oghuzes which preserved their name in later times, and of the Turkomans. The second was the 'khan of the sea,' the ancestor of the Seljuks; and the third was the 'khan of the heaven,' the ancestor of the tribe Kayi, from which are descended the Osmanlis. For many centuries the Oghuzes were perpetually at war with the Persians, and afterwards with the Arabs, who (A.D. 711) conquered Bokhara and Samaraand. Boghra-khan Harún extended his dominions as far as China (999). His empire was broken up by civil troubles during the 11th century, and became a prey to the Seljuks.

2. **Seljuks.**—Their ancestor Seljuk was a mighty under-khan of the Oghuzes, and lived towards the end of the 10th century. The influence of his family increased during the civil troubles by which the empire of the Oghuzes was shaken after the death of Boghra-khan Harún. Toghrol-Bey, his grandson, who lived in the middle of the 11th century, was an independent Mohammedan prince. His power was felt at Baghdad, whose kalif, Al Kayim, he saved from the ambitious designs of his son Basairi, who was put to death by order of the kalif of the Seljuks. The kalif rewarded his liberator with the title and power of the Amiru-l-omra, or 'prince of the princes': he married a sister of the khan, and Toghrol-Bey married a daughter of the kalif. In 1069 Toghrol-Bey was succeeded by his nephew Alp-Aralán, who also married a daughter of the kalif Al-Káyim. Alp-Aralán conquered a large part of Turkistan, the north-western part of Persia, Armenia, Georgia, Mesopotamia, and Syria. He was involved in long wars with the Greeks, which he terminated successfully, 1071, by a victory over the emperor Romanus, who became a captive of the Turks. Alp-Aralán's son and successor, Melek-Shah, conquered the greater part of Asia Minor. His successors were the masters of Asia Minor, Syria, Mesopotamia, Armenia, part of Persia, and Western Turkistan, during 180 years. Towards the end of the 13th century, their power was broken by civil dissensions. Mesud, who died in 1297, was only the shadow of a king. 'Alá-ed-din II., his successor, was the last Sultan of the empire of the Seljuks. He was killed by the Mongols in 1307, and the Seljukian monarchy was divided into the following states, all, except one, governed by princes of the tribe of the Seljuks.

Kárái became master of Mysia; Sarú-khan and Aidin reigned each in a part of Lydia; Mentashe in Caria; Teke in Lycia and Pamphylia; Hamid in Pisidia and Isauria; Kárámán, the most powerful of all, was Lord of Lycaonia, and reigned as Sultan in the city of Koniah, once the capital of the Seljukian empire; Kermián founded a petty state in northern Phrygia; Ghasi Chelebi, the only one among these princes who was descended from the reigning dynasty of the Seljuks, led the life of a pirate at Sinope and Heraclea on the Black Sea. Another tribe, which had lately arrived in these western countries, had subdued Galatia and Bithynia; this was the tribe of the Turks-Osmanlis.

Turks-Osmanlis.—Soliman-Shah, the son of Kay-alp, the chief of

the tribe of the Káyi, lived in the environs of Mahán in Khorásán in the beginning of the 13th century. He fled before the approach of Genghis-khan, in 1234, and settled with 50,000 of his men in Erzenján and Akhláth in Armenia. Seven years later, after Khorásán and Khováresm had been conquered by 'Alá-ed-dín, the Sultan of the Seljuks in Koniah, Soliman commenced his return to the steppes of his native country. Crossing the Euphrates near Ja'ber, he was drowned in that river, and his tribe erected a tomb to his memory, which still exists. One part of his tribe continued their march to Khorásán; another, commanded by Ertoghrl, one of the four sons of Soliman, resolved to remain in the western countries, and to settle there under the protection of 'Alá-ed-dín, the Sultan of Koniah. On their march to the west, they saw in a plain two armies preparing for battle; one of them was numerous, the other feeble, but of warlike appearance. Ertoghrl resolved to assist the feeble. It was the army of 'Alá-ed-dín going to fight with the Mongols; and with Ertoghrl's assistance the Seljuks gained the day. 'Alá-ed-dín rewarded Ertoghrl with a dress of honour, and gave him and his tribe the fertile pasture-grounds near Angora. Ertoghrl assisted the Sultan in all his wars with the Greeks and the Mongols, and afterwards received the district of Sultan-óné, on the frontiers of the dominions of 'Alá-ed-dín and the Byzantine empire, as a fief, on condition of defending the frontiers against the invasions of the Byzantines. Ertoghrl died in 1288. His successor as chief of the tribe was his son Osman.

[1288-1326.] Osman was the founder of the Turkish empire; he is the ancestor of the reigning dynasty; and he has given his name to a numerous and powerful nation. During the life of his father, Osman had signalled himself as an intrepid warrior. His power grew gradually by conquests from the Greeks, and after the death of 'Alá-ed-dín, who was killed by the Mongols in 1307, from some petty Seljukian princes of Asia Minor. Ten years afterwards he made the conquest of Brusa. In 1321 the first Turks-Osmanlis crossed the Bosphorus and appeared in sight of Constantinople. At his death, which took place in 1326, he left to his successor, Urkhan, a state which comprehended a considerable part of Bithynia in the north, Galatia in the east, and Phrygia in the south, the western frontiers of which were the river Sangarius and its southern tributary the Thyabria.

[1326-1359.] Urkhan was the successor and eldest son of Osman. His reign was signalled by conquests, and by some political and military institutions which have been the groundwork of the Turkish constitution until our days. By advice of his brother, 'Alá-ed-dín (the first grand vizir mentioned in the Turkish annals), Urkhan coined money, and ordered the public prayer to be said in his name, which had formerly been pronounced in the name of the Sultan of Koniah; and thus assumed two prerogatives which, according to the Islám, constitute the privilege of majesty. His vassalage to Koniah was abolished, and the state of the Turks-Osmanlis became an independent empire. To secure the rising power of his brother 'Alá-ed-dín, assisted by the high judge Kára Khalil Chendereli, he established a standing army long before any such thing was known in Europe. This was the famous body of the Janissaries, a word mutilated by Europeans from the Turkish *Yeni-cheri*, or 'the new troop.' The new troops decided the victory in the battle of Philoere, where the emperor Andronicus the younger was entirely defeated by Urkhan and 'Alá-ed-dín (1330). The conquest of Nicsea was the fruit of this victory; and six years afterwards the rest of Bithynia and the greater part of Mysia fell into the hands of the Turks. Nicsea became the residence of Urkhan. By the first peace concluded between the Osmanlis and the Greeks (1333), the emperor Andronicus surrendered his provinces in Asia which had been conquered by Urkhan. But in 1337 a strong body of Osmanlis again crossed the Bosphorus, commanded by Urkhan, who was the first Turkish sultan that ever put his foot on the soil of Europe. He repeated his predatory expeditions in the following years, till at last the emperor John Cantacuzenus tried to reconcile Urkhan by giving him his daughter in marriage (1346). Hostilities were continued however, and Urkhan's son Soliman, in 1354, crossed the Dardanelles and surprised the castle of Tzympe, now Chini, near Gallipoli, which from that time remained in the hands of the Turks, who were thus settled in Europe. During the civil troubles between the emperor John Cantacuzenus and his son-in-law John Palæologus, Urkhan seized the castle of Gallipoli, the key of the Dardanelles. Urkhan died in 1359, at the age of 75 years. His empire was divided into several provinces, which were governed by pashas, a title derived from the Persian 'pal-shah,' which means the foot or chief supporter of the shah. (Xen., 'Cyrop.,' viii. c. 2, 10.)

[1359-1389.] Urkhan was succeeded by his younger son Múrad, the elder, Soliman, having lost his life by a fall from his horse. No sooner was Múrad on the throne than he formed the plan of conquering the remaining part of the Byzantine empire in Europe, and of subduing the Seljukian princes in Asia Minor. In 1361 he took Adrianople, which he afterwards chose for his residence. In the following year he conquered Philippoli. The kings of Hungary, Bosnia, Servia, and the prince of Wallachia, formed a league against Múrad; but they were totally defeated by the Turks in 1363. After this victory, the greater part of Thrace, Bulgaria, and parts of Macedonia, Thessaly, and Epirus fell into the hands of the victors. In 1386 Múrad carried his arms into Asia, and defeated 'Alá-ed-dín, the

Seljukian prince of Karamania, who was compelled to take the oath of vassalage. Meanwhile Lazarus, the kral or king of Servia, who had recovered from his defeat, prepared an attack on the Turkish dominions, assisted by strong bodies of Bosniak, Bulgarian, Hungarian, Polish, and Wallachian auxiliaries. Although his army was twice as numerous as that of the Turks, he was attacked by Múrad near Kosova, in the southern corner of Servia, in 1389. The allies were routed with dreadful slaughter, and Lazarus was made a prisoner. Múrad received the principal captives in his tent. Miloah Kobilowich, a noble Servian, prostrated himself before the throne, and kissed the feet of the victor; but suddenly he seized a dagger, which was hidden under his clothes, and stabbed Múrad to the heart. Múrad ordered King Lazarus to be beheaded in his presence, and then expired on his throne. Servia was now added to the empire of the Turks.

[1389-1403.] Bayazid I., the eldest son of Múrad I., was the first chief of the Osmanlis who assumed the title of Sultan. His first act was an order by which his youngest brother Yakub was put to death. Already known as a general, and surnamed from the rapidity of his manoeuvres and the impetuosity of his charges Ilderim (lightning), Bayazid successfully pursued the career of conquests opened by his ancestors. He laid siege to Constantinople, the first siege of this city by the Turks, in 1391; but a fleet with a body of French knights, commanded by Boucicault, reached Constantinople, and saved the capital. The siege however was changed into a blockade, which lasted for seven years. In Asia Minor, Bayazid conquered Karamania and several of the Seljukian principalities. Meanwhile Sigismund, king of Hungary, levied a strong army, with the view of driving the Turks back to Asia, and he was reinforced by a body of French troops, commanded by John of Burgundy, count of Nevers, and the flower of the French chivalry. But this powerful host was annihilated by Bayazid in the battle of Nikipoli in 1396, in which however 60,000 Turks were slain. King Sigismund was pursued by the victorious Turks, and Bayazid, leaving the prosecution of the Hungarian war to his generals, turned his arms against Greece, which he overran in one campaign in 1397. He was preparing an invasion of Hungary, when he was compelled to defend Asia against Timur, or Tamerlane, by whom he was defeated and taken prisoner in the battle of Angora in 1402. Bayazid died the following year in the Tartar camp at Ak-Shehr, in Pisidia.

[1403-1413.] After the battle of Angora, Timur reinstated the Seljukian princes of Karamania, Aidin, Mentese, Tekke, and Kermian, who soon after Timur's death, in 1405, began to quarrel with one another. The succession to the throne of Osman also was disputed among three of his sons, Soliman, Isa, and Mohammed. Soliman, from the moment of the death of his father, was independent in Europe; and Isa and Mohammed found adherents enough to defeat the Seljukian princes, and to recover each a part of the vast dominions of their father. Thus Isa became independent at Brusa, and Mohammed at Amasia. Thrice defeated by his brother Mohammed, Isa fled to Karamania, and was heard of no more. Another son of Bayazid, Musa, who until then had not aimed at independence, was appointed by Mohammed to attack Soliman, who was acknowledged by the Byzantine court as the only legitimate sultan. Musa crossed the Dardanelles in 1406, and surprised Soliman in 1410. Soliman, forsaken by his officers, fled to Constantinople, but was killed on his way in the village of Dugunji, and Musa became master of the Turks in Europe. War now broke out between Musa and Mohammed, who, having allied himself with Stephen, the vassal king of Servia, crossed the Dardanelles. On the plain of Chámurlí, near the sources of the Kára-Su, towards the southern frontiers of Servia, Musa, forsaken by his best troops and generals, was entirely defeated in 1413. In consequence of this victory, Mohammed became sole sultan.

[1413-1421.] Mohammed I., gifted by nature with beauty, strength, courage, and talents, commenced his reign by ordering the murder of his nephew, the son of his late brother Soliman. From the field of Chámurlí he hastened to Asia, and in two years expelled the Seljukian princes from their possessions. The Venetian admiral Loredano destroyed a Turkish fleet off Gallipoli in 1416; but peace was soon concluded, and a Turkish ambassador appeared at Venice. In 1418 a Turkish army, which had made an expedition into Germany, was destroyed at Radkersburg, in Syria, by the Austrians under the archduke Ernest. In 1421 the Sultan paid a visit to the emperor Manuel in Constantinople, where he was received with extraordinary splendour. He died in the same year, and left the empire to his son, Múrad II.

[1421-1451.] Múrad II., the third son of Mohammed I., was a youth of eighteen when he ascended the throne. Immediately after the death of Mohammed he was called upon to defend his throne against Mustapha, supposed to be a son of Bayazid, who had disappeared after the battle of Angora. Múrad defeated and killed his rival with the assistance of Adorno, doge of Venice, and commander of the Venetian fleet then assembled in the Sea of Marmara. In 1442 Múrad was involved in a war with Ladislaus, king of Hungary, whose general, John Hunyad, defeated the Turks at Nissa in the following year, and penetrated as far as Philippopoli, whence, laden with booty, he led his army back to Hungary. A peace with Hungary having been sworn with solemn oaths, the Sultan was persuaded that there was no danger on the side of Hungary; and the state of Asia being satisfactory,

Mürad, who was a lover of peace and of philosophical studies, retired into Asia, renouncing the throne in favour of his son Mohammed, then a child. Ten weeks after the treaty had been sworn, the Hungarian army re-entered Turkey. Upon this news Mürad left his solitude, and with 40,000 men crossed the Bosphorus in 1444. At Varna he met the enemy. The Hungarians were entirely defeated; Hunyad saved himself by a hasty flight, but King Ladislaus, Cardinal Julian Cesarini, and several other Christians of high rank, were killed. After this victory Mürad renounced the throne a second time, but was again obliged to take the reins of government by a mutiny of the Janissaries, which however he soon quelled. The latter years of his reign were as glorious as the beginning. Corinth and Patras were conquered, and Hunyad, having again invaded Turkey, was routed at Kossova in 1448. Mürad was less fortunate against the famous Scanderbeg, the prince of Epirus, who maintained himself in his principality in spite of all the efforts of the Sultan.

[1451-1481.] Mohammed II., the son of Mürad II., was twenty-one when he ascended the throne. His reign is memorable for the siege and capture of Constantinople, which he entered as a conqueror on the 29th of May, 1453. Mohammed now began a series of victories and conquests by which his empire became one of the most powerful states in the world. Servia, formerly a vassal state, became a Turkish province; the Peloponnesus was conquered, but it was afterwards lost; Trebizond, the last remnant of Greek independence, was also taken; Kaffa was captured; and the khans of the Crimea took the oath of vassalage. In Asia the frontiers of Turkey were extended by the victories obtained over several petty Seljukian princes, and Europe was alarmed at the incursions of the Turks into Wallachia, Moldavia, Transylvania, Hungary, and Germany, and especially by the fall of Otranto in Italy, which was taken by Ahmed Kedük in 1479. Scanderbeg was defeated, and his dominions, Epirus and the Herzegovina, were united with Turkey. During the reign of Mohammed II. great numbers of Turks settled in Europe, where they received lands which had been taken from the Greeks. Mohammed was very active in the administration of his empire. His criminal laws imposed a money fine payable to himself for injuries to the person, and sanctioned his assumption of power to put his brothers to death on the plea of preventing troubles. He established schools and academies for the study of theology, jurisprudence, mathematics, and philosophy.

[1481-1512.] Bayazid II., the son of Mohammed II., having only one brother, Jem, or Zizime, did not avail himself of his power to put him to death; the consequence was a rebellion of Jem, who disputed the crown with his brother: after a long civil war, Jem was at last obliged to fly to Rhodes. The Knights of St. John sent him a prisoner to France, whence he went to Rome under the protection of the Pope. Pope Alexander VI. again put him into the hands of Charles VIII., and eight days afterwards Zizime died, 1494. Besides these civil commotions the reign of Bayazid was troubled by wars with Egypt, Venice, Hungary, Poland, and Austria. In 1495 the first Russian ambassador appeared at Constantinople. Bayazid towards the end of his life experienced the bitterness of a civil war with his youngest son, Selim, which ended in Bayazid being compelled by Selim to abdicate, and he died soon afterwards, in 1512.

[1512-1520.] The reign of the cruel, but most active and gallant Sultan Selim I., though short, is one of the most glorious in Turkish history. Immediately on his accession he put to death his brother Korkud and five of his nephews. He then marched against his brother Ahmed, whom he defeated, seized, and murdered in 1513. In a war with Persia, Selim, after having routed Shah Isma'ül in a decisive battle, took Tabris in 1514. After this victory he attacked 'Alá-ed-dewlet, who reigned over the extensive country between Armenia, Kurdistan, Syria, and Karamania. 'Alá-ed-dewlet was defeated, and lost his life in 1515: his dominions were united to Turkey. The third and most important conquest was that of Egypt and Syria (1516-17). Al-mutawakkel, the last kalif of Cairo, was deposed from his rank as Chief of the Believers, and Selim was acknowledged as his successor by Mohammed Abú-l-Berekiat, the Sherif of Mecca, who presented him with the keys of the Ka'bah. Selim returned to Constantinople in 1517 with 1000 camels laden with the spoil of Egypt. He died in 1520, in consequence of his passion for taking opium. One of his last acts was the creation of a powerful navy. Selim, a zealous Sunnite, persecuted to death great numbers of the heretical Shiites who lived in his empire. He also resolved to kill all the Christians who would not adopt the Mohammedan religion; but he was prevented by his ministers, who besought him not to violate the Korán, which commands toleration of non-believers who pay the capitation-tax.

[1520-1566.] Soliman, or Suleiman I., surnamed the Great, the son of Selim I., is the greatest sultan of the Osmanli, and his reign is the most important period of Turkish history. In the first year of his reign he took Belgrade, and Rhodes, which was defended by the Knights of St. John; and he made Radul, the prince of Wallachia, his vassal. In 1526 Louis, king of Hungary, lost his life in the battle of Mohacs against Soliman, who overran Hungary in one campaign; took the capital, Buda; and received Zapolya, the waiwode of Transylvania, into vassalage. Soliman penetrated into Germany, and laid siege to Vienna in September, 1529; but he was compelled to raise the siege in 1533. From Hungary Soliman proceeded to Persia, then governed by Shah Thamasp, who had protected Sherif-Bey, the khan

of Bedlis, who had revolted against the Sultan. This war lasted till 1554; and although the Turks took Baghdad, Soliman gave up his conquests on condition of the Shah not aiding the rebellious subjects of the Sultan.

While one Turkish army was thus occupied against Persia, another, supported by a fleet, made war against the Venetians, who lost several of their islands in the Archipelago. Zapolya having died in 1539, Ferdinand of Austria seized the kingdom of Hungary, whereupon the Sultan invaded Hungary in 1541. In this war Soliman was victorious, and Ferdinand was compelled to cede to Soliman the greater part of Hungary, with the capital, Buda or Ofen, in 1547. In two years fresh hostilities broke out, and after a long war, a new peace was concluded in 1562, by which Soliman maintained possession of his conquests, and Ferdinand promised to pay an annual tribute for Upper Hungary. Previously to this, Selim and Bayazid, sons of Soliman, disputed the future succession to the throne. After the loss of the battle of Koniah, Bayazid with his four sons fled to Persia, and Soliman having declared himself for Selim, the Shah delivered the fugitives to the messengers of the Sultan. Bayazid and his sons were put to death in 1561.

During the reign of Soliman the Turkish navy was the first in the world, and became the scourge of the Mediterranean. His admirals ravaged the coasts of Italy, Spain, and Africa: they took Reggio, Sorrento, Bujia, Oran, and the island of Majorca; and in 1580 Piale defeated the united fleets of Spain and Italy off Jerba. Another Turkish fleet swept the coasts of the Red Sea and the Persian Gulf from Suez to Basrah, and fought several times with the Portuguese in the Indian Ocean. After the victory at Jerba, Soliman resolved upon the conquest of Malta, and a powerful fleet left Constantinople for that purpose in the beginning of 1565, but the expedition failed after a siege of five months. During this time the war with Austria was renewed. Soliman, notwithstanding his old age, took the command of his army and hastened to Hungary. He died there in his camp in September 1566, whilst besieging Saiget, a small fortress west of Fünfkirchen.

[1566-1574.] Selim II., son of Soliman the Great, immediately after his accession, quelled a dangerous mutiny of the Janissaries, whereupon he concluded peace with the emperor Maximilian II., by which each remained in possession of his share of Hungary as fixed by the peace of 1562. Turkey was increased by the province of Yemen in Arabia, which was conquered in 1570; by the addition of Cyprus, taken from the Venetians in the same year, and by the acquisition of Tunis, which was taken from the Spaniards in 1574. The Turkish navy, commanded by 'Ali Mozzin, was almost annihilated by Don Juan of Austria, in the battle of Lepanto, in 1572.

[1574-1595.] Mürad or Amürad III., succeeded his father Selim II. A war having broken out with Persia, the Turks, after a victory at Childir, conquered Eriwán, Georgia, and Daghistán. From this country, Osman Pasha, the commander of a part of the Turkish army, proceeded northward, crossed the Caucasus in order to relieve the khan of the Crimea, who had been attacked by the Russians; and in 1584 returned to Constantinople by way of Bessarabia. The following years of Mürad's reign were signalised by a fresh war with Persia, and by dangerous troubles among the Druses in Mount Lebanon, in Egypt, and in Arabia. Transylvania, Moldavia, and Wallachia refused to pay the annual tribute, and war was declared against Austria, but Mürad died before it was concluded. During his reign, Turkey had diplomatic relations with almost all the nations of Europe; and the first commercial treaty with England was concluded.

[1595-1603.] Mohammed III., son of Mürad III., secured his succession by putting to death his nineteen brothers, and seven female slaves of his father who were pregnant. The war with Austria continued during his whole reign with no signal success on either side. Sigismund, prince of Transylvania, who had taken arms against the Porte, submitted to the Sultan, and was invested with his principality as a vassal of Turkey. Towards the end of this reign, Deli-Husein rebelled in Asia.

[1603-1617.] Ahmed I., son of Mohammed III., ascended the throne when only fourteen. The rebels in Asia having been supported by Shah Abbás the Great, of Persia, a war broke out between him and the Sultan, which lasted till 1613. In this war the Turks were worsted, and Ahmed was compelled to cede to the victor Daghistán, Georgia, and Eriwán. The Turkish commanders in Hungary were less unfortunate. The emperor Rudolph II., assisted by the princes of the empire, defeated the Turks in several bloody battles, and Ahmed was obliged to conclude the peace of Sitvatorok (1606). By this peace the Sultan recognised the emperor as his equal, and the tribute which Austria had paid for her part of Hungary was abolished. Ahmed concluded a commercial treaty with the United States of the Netherlands. During his reign a body of Cossaks descended the Don in a fleet of boats, crossed the Black Sea, and surprised the town of Sinope, which they plundered and destroyed. Turkey was still a powerful state, but her gradual dissolution became apparent during the reign of a weak prince who was governed by favourites and women.

Mustapha I., the brother of Ahmed, ascended the throne in 1617, but was deposed in six months in consequence of a revolution in the seraglio, and shut up in prison.

[1618-1622.] Osman II., son of Ahmed I., succeeded. A short but unhappy war with Poland was the most remarkable event of the reign of this prince, who soon incurred the hatred of the nation. In violation of the law which declares that the Sultan shall have no women in his harem, except slaves, Osman chose three wives among the daughters of his first officers; and he conceived the fantastic plan of making a pilgrimage to Mecca: the Janissaries, being informed of this, rose in open rebellion, and put the question to the Mufti, if it was legal to kill those who gave bad advice to the Sultan and urge him to innovations. The answer of the Mufti was affirmative. Osman, having refused to deliver up his counsellors, was deposed and put in prison, where he was strangled. His counsellors were likewise put to death. His uncle, the deposed Mustapha, was delivered from his captivity, and again proclaimed Sultan. During his second reign Mustapha showed symptoms of insanity, and he was again deposed by the Janissaries.

[1623-1640.] Mürad or Amürad IV., brother of Osman II., and son of Ahmed I., a child of twelve years, was raised to the throne. For the first ten years he reigned under the guardianship of his mother. During the last seven years of his reign, he evinced the character of a cruel but active and enterprising tyrant. Soon after his accession a rebellion, which broke out in Asia, headed first by Bekir, pasha of Baghdad, and after his death by Abazah Pasha, led to a long series of misfortunes and defeats, with the temporary loss of several of the Asiatic provinces, and Baghdad fell into the hands of the Persians. A rebellion broke out also among the Tartars of the Crimea, who in 1624 defeated the troops of the Kapudan Pasha. In the same year 150 long barks, manned each with 70 Cossaks, appeared in sight of Constantinople, and ravaged the shores of the Bosphorus. The Janissaries, exasperated by all these disasters, set fire to a quarter of Constantinople, and Mürad heard their cries, "The only means to save the empire is thy sword!" This encouraged the young Sultan: he left the seraglio and presented himself to the troops, who received him with shouts of joy (1633). Two years afterwards Mürad, at the head of a strong army, marched to the rescue of his Asiatic provinces. In his first campaign he took Ers-rum, Eriwán, and Tabris; the people in the rebellious provinces were burnt, together with their villages and towns, and the least fault of his officers was punished with torture and death. He returned to Constantinople, and in 1638 opened a fresh campaign for the deliverance of Baghdad. He took one of the great military roads across Asia Minor and Mesopotamia, and arrived before Baghdad on the 197th day after leaving Scutari. Baghdad was taken by storm (Dec. 25, 1638). According to some historians the number of the killed was 80,000, including 30,000 Persian Shiites, inhabitants of Baghdad, who were massacred some days after the storm. Of the Persian garrison of 30,000 men, 10,000 fell during the siege, and the remainder were massacred during and after the storm. A peace was concluded with Persia in 1639, the Persians retained Eriwán, but Baghdad and its extensive territory was ceded to the Porte. Mürad IV. died soon after his triumphal entrance into Constantinople in 1640.

[1640-1648.] Ibráhim I., youngest brother of Mürad IV., and son of Ahmed I., succeeded. The conquest of Azof from the Cossaks, and a war with Venice, which resulted in the temporary conquest of a part of Candia, were the most remarkable events of the short reign of Ibráhim I. He spent his time in luxury and debauchery: and frequent rebellions characterised his reign. Ibráhim perished in consequence of a revolt of the Janissaries.

[1648-1687.] Mohammed IV., son of Ibráhim, a boy of seven years of age, began his reign under the guardianship of his grandmother, the widow of Ahmed I. A long series of disasters marks the minority of this sultan. An expedition against Candia failed, and in two battles off Chios and at the outer entrance of the Dardanelles the Venetians destroyed a considerable part of the Turkish navy. The pages of the Sultan revolted; the troops in Candia mutinied; the Janissaries ravaged the environs of Constantinople; bands of robbers ravaged the best provinces of Asia; from 1648 to 1656 there were fifteen grand-vizirs, making as many changes of ministry; and in consequence of a revolution in the seraglio, the old Sultana Mah-peiker was strangled (1651). At last Mohammed Köprili became grand-vizir in 1656, and under his and his successor's administration Turkey recovered from her depression.

Ragotzi, the vassal prince of Transylvania, having ceded a considerable territory to Austria, war ensued between the Sultan and the emperor Leopold I. (1660). Ahmed Köprili, the son and successor of Mohammed Köprili, conducted this war with great energy, and the Turkish arms were signalised by the conquest of Neu-häusel, Leutra, Lewenz, and Novigrad. The auxiliaries of the Tartar khan penetrated into Moravia and Silesia. But in 1664 the grand-vizir was routed by the Austrians at St-Gotthard. Some days after his defeat Ahmed Köprili concluded the peace of Vasvár, by which the Turks were compelled to evacuate Transylvania, and to cede to Austria that part of Hungary which is situated between the Danube and the Theiss. This loss was compensated by the conquest of Candia by Ahmed Köprili in 1669. In a war with Poland the Turks were at first beaten at Choczim; but they afterwards took this important fortress, as well as the country between the Dniester and the Dnieper, and encamped under the walls of Lemberg (1675). There they were

routed by John Sobieski, king of Poland; but their power was still so great that, by the peace of Zurawna (1676), they acquired Podolia and the fortress Kaminiac Podolski. The rebellion of Emmerich Tököli in Hungary, who was supported by the Turks, led to a renewal of the war with Austria in 1682. Kára Mustapha Pasha, the grand-vizir, commanded the Turkish army as serasker, or general-field-marshal; and the Sultan, preceded by the standard of the Prophet, left Constantinople and accompanied his army to Hungary (1683). Few Austrian troops were in Hungary to detain the Turks, and on the 14th of July 1683, Kára Mustapha, with 200,000 men, encamped under the walls of Vienna. The heroic resistance of the citizens and the feeble garrison, commanded by Count Starbemberg, saved Vienna from the fate of Constantinople. On the 12th of September Kára Mustapha was attacked by an army composed of the Austrian troops, commanded by the Duke of Lorraine; of the troops of the empire, commanded by Maximilian-Emanuel, elector of Bavaria; and by a body of Polish auxiliaries, commanded by their gallant king, John Sobieski. [POLAND.] The Turks were completely defeated: the victory was mainly due to the military talents of the king of Poland. Kára Mustapha, abandoning his camp, fled to Hungary with the remnant of his army: 6000 men, 11,000 women, 14,000 girls, and 50,000 children had been carried off by the Turks into slavery. The imperial troops pursued the Turks, and in three years took the capital and the most important fortresses of Hungary, and drove the enemy across the Danube. The Venetians acceded to the league against Turkey, and captured Santa Maura and several places in Epirus and Greece, and at last Morosini took Athens from the Turks, and forced them to evacuate Greece. So much disgrace after so many triumphs made the Turks despair. The Janissaries revolted, and Mohammed IV. exchanged his throne for a prison in the seraglio.

[1687-1691.] Soliman II., brother of Mohammed IV., and son of Ibráhim I.

[1691-1695.] Ahmed II., brother of Soliman II. The Austrians continued their victories; they took Belgrade, and routed the Turks at Sankamen, whereupon the fortress of Grand-Waradin surrendered to Leopold I. The Venetians conquered Chios. The internal state of the empire was deplorable; there was rebellion in all the provinces.

[1695-1703.] Mustapha II., son of Sultan Mohammed IV. Under this reign the Turks gained some advantages over the Venetians by recovering Chios; and the Tartars ravaged part of Poland. But in Hungary the Austrians were still victorious, and a strong body of them crossed the Danube and penetrated as far as the foot of the Balkan. In 1696 Peter the Great concluded an alliance with Austria against Turkey, and took Azof. In the following year the Venetian fleet was defeated by the Turks at Mitylene, but Prince Eugene defeated the grand-vizir in the battle of Zenta. These events led to the peace of Carlowitz in 1699. Venice was confirmed in the possession of the Morea as far as the isthmus of Corinth, and of Dalmatia; Russia made only a truce for two years; Poland received Podolia, the Porte renouncing this conquest, and the fortress of Kaminiac Podolski; Austria received all Hungary, except the Banat of Temesvár, and the protectorship of Transylvania, which country, as well as Hungary, ceased to be vassal states of Turkey. The Osmanlis felt the decline of their power with deep regret. An insurrection was prepared; the rebels marched to Constantinople, and Mustapha was deposed in 1703.

[1703-1730.] Ahmed III., brother of Mustapha II., and son of Mohammed IV., succeeded. He was at first unable to quell those disorders which were the cause of his accession, and in fifteen years he had fourteen grand-vizirs. In his reign Charles XII. of Sweden took refuge in Turkey. The Sultan, after trying in vain to get rid of the king, at last declared war in his behalf against Russia, and but for the treason of Baltáji Mohammed, Peter the Great would have been obliged to surrender to the Turks with his whole army. The empress Catherine, who was with him in the camp, saved him by bribing the grand-vizir. The peace of the Pruth was concluded in 1711, and the czar was allowed to retire to his empire after having ceded the fortress of Azof. Charles XII. left Turkey in 1713. In 1714 the Sultan led his army into Greece, and the grand-vizir, Damah 'Ali Pasha, wrested the Morea from Venice in one campaign. Upon this the emperor Charles VI. concluded an alliance with Venice, and Turkey became involved in a war, the result of which was to lessen her influence in Europe. Defeated by Prince Eugene at Peterwaradin in 1716, and at Belgrade in 1717, the Turks were disbanded; and in 1718 the Sultan concluded the peace of Passarowitz, by which he ceded to Austria the Banat of Temesvár, and the western part of Wallachia and Servia, with Belgrade; he also restored his Venetian conquests, except the Morea, which was ceded to Turkey. A war against Persia soon followed, in which the Turks were allies of Peter the Great, and acquired a considerable part of north-western Persia, which was afterwards (1726) ceded to the Sultan. In 1730 Shah-Tahmásp suddenly recommenced hostilities, and recovered the ceded provinces. When the news of this invasion reached Constantinople, the Janissaries revolted, and the Sultan was deposed. During the reign of Ahmed III. the first printing-office was established in Constantinople under the patronage of the grand-vizir Ibráhim.

[1730-1754.] Mahmud I., the son of Mustapha II., next mounted the throne. His serasker, 'Ali Hekim-Zade, defeated the Persians at

Hamadan, and conquered Tabris; the divan then concluded a peace with Tahmasp, which dissatisfied the nation. A revolt ensued, and the brave 'Ali Hekim-Zade was appointed grand-vizir. Shortly after this, Nadir-Khuli-Khan usurped the throne of Persia, and renewed the war with the Turks, who, though at first victorious, were entirely defeated under 'Abd-Allah Köprülü, and compelled to renounce the provinces which had been ceded to them during the reign of Ahmed III. (1736). Previously to this peace differences had arisen between the Porte and Russia. Feth-Ghiray, the khan of the Crimea, had received orders from Constantinople to march across the steppe of the Kuban, to cross the Caucasus, and to attack the Persians in Georgia. The territory in his line of march was in part claimed by Russia, whose commander in Daghestán, the Prince of Hesse Homburg, declared to the khan that he considered his march through the Kabarda as a violation of the Russian territory; and as the khan continued his march in spite of his menaces, he attacked the Tartars as soon as they had crossed the range of the Caucasus, and approached the river Samur, near the frontiers of Daghestán. Feth-Ghiray defended himself until orders came from Constantinople to return to the Crimea. In 1737 Austria concluded an offensive and defensive alliance with Russia, and declared war against the Porte. The Austrians, defeated in several pitched battles, concluded peace with the Porte at Belgrade (1739), and ceded to Turkey the western part of Wallachia, and Servia, with Belgrade. But the Russians overran part of the Crimea, took Choczim by storm, and conquered Moldavia.

The latter years of the reign of Mahmud I. were troubled by a short war with Persia; by troubles in Egypt and at Baghdad, and by the disturbances produced in Arabia by the Wahabites. Mahmud I. died a natural death in 1754.

[1754-1757.] The short reign of Osman III., brother of Mahmud I. is not remarkable for any events of importance, except some diplomatic transactions with Persia.

[1757-1773.] He was succeeded by Mustapha III., son of Ahmed III. This prince took an active share in the administration. The increasing power of Russia induced him to declare war against the empress Catherine II. The pretext for this war was to save Poland from ruin through Russian interference in her civil troubles. The first idea of dismembering Poland however was formed by the same Sultan, Mustapha III., at whose order the Reis Efendi İsmail Râfî proposed to the Austrian ambassador, Baron Thugut, in a secret conference, to divide Poland between the Sultan and the emperor Joseph II. This proposition, rejected by Austria, was made ten months before Prince Henry of Prussia, who is generally believed to be the first author of that project, suggested the partition of Poland to Catherine.

War was declared in 1768. It was glorious for Russia and most disastrous for Turkey. The Russian field-marshal Rumanzow took all the fortresses between the Danube and the Dnieper, and the whole country between these two rivers fell into the hands of the Russians. They overran the Crimea, and after having conquered the island of Taman, crossed the strait and took Kertch, Yenikale, and Kaffa in 1771. The khan Maksud-Ghiray abandoned his capital Bakje-Seral, and fled to Constantinople, and the Russians had Shahin-Ghiray elected in his place. In the beginning of the war, a Russian fleet, commanded by Spiritow, Alexis Orlov, and Elphinstone, left Kronstadt for the Mediterranean, proclaimed the independence of the Greeks, and in 1770 destroyed the Turkish fleet in the bay of Chesme, the greatest disaster which had befallen the navy of Turkey since the battle of Lepanto. A truce followed at the interposition of Austria, and congresses took place at Fokshan and Bukarest; but the negotiations proved abortive, and hostilities recommenced in 1773. The Turks were again beaten at Rujuk and Kalnarji, and although the serasker Osman-Pasha obtained considerable advantages over the Russians at Silistria, Rumanzow defeated him in his turn at Kárásu in Bulgaria. Shortly afterwards Sultan Mustapha III. died (Dec. 24, 1773).

[1773-1789.] 'Abdu-l-Hamid I., or Ahmed IV., son of Ahmed III., succeeded. Field-Marshal Rumanzow continued his victories: his generals, Kamenski and Suwarow, defeated the Turks at Basarjik and Koelje, and in the month of July Kamenski entering the passes of the Balkan besieged the grand-vizir Musa Oghli. The Porte now yielded to the propositions of Russia, and peace was concluded in July, 1774, at Kuchuk-Kainarji. By this peace Russia obtained the Great and the Little Kabarda, the fortresses of Azof, Kilburun, Kertch, and Yenikale; the country between the Bog and the Dnieper; the free navigation of the Black Sea, and a free passage through the Bosphorus and the Dardanelles; the co-protectorship over Moldavia and Wallachia; and the protectorship over all the Greek churches within the Turkish empire. The khanat of the Crimea was declared independent, but it soon became a prey to Russia. Three years afterwards the Porte was obliged to cede the Bukowina to Austria.

After Catherine had united the Crimea with her empire, immense preparations for war with Russia were made throughout the Turkish empire, and Catherine in her turn concluded an alliance with Austria. The Porte declared war in 1787. Her armies obtained some advantages against the Austrians, but the Russians defeated the Turks and took Ocsakow by storm in 1788. Sultan 'Abdu-l-Hamid died soon after.

[1789-1807.] Selim III., son of Mustapha III., and nephew of 'Abdu-l-Hamid, who succeeded, was one of the most enlightened men

of the east, but his enlightenment did not ward off heavy disasters from his country. The war continued: the Turks were beaten at Martinestie by the united Austrians and Russians; the Austrians took Belgrade; the Russians, Bender and İsmail; and Turkey would have been overrun, but for the intervention of England, Prussia, and Sweden. Thus peace was concluded in 1791 at Ssistowa with Austria, which restored her conquests to Turkey; and with Russia in 1792 at Jassy. By the peace of Jassy the Porte consented to the incorporation of the Crimea with Russia, and the Dniester became the frontier between the two empires. Sultan Selim now began his work of reformation, but during a long period his efforts were checked by troubles in Syria and Egypt: by the rebellion of Paswán Oghlu, pasha of Widdin; and by the increasing power of 'Ali Pasha of Janina. The conquest of Egypt by Bonaparte led to a war with France. The grand-vizir, Yúsuf Pasha, was routed in the battle of Abukir, and his army was completely destroyed by the French, but Egypt was taken by the English, who restored it to the Porte in 1803. Previously to this, Selim had concluded an alliance with Russia, Naples, and England, in consequence of which a united Turkish and Russian fleet took possession of the Ionian Islands, which, conformably to a treaty concluded between Selim and the emperor Paul, were constituted into a republic (1800). Selim acquired the protectorship of this new republic on condition of consenting to the incorporation of the kingdom of Georgia with Russia. Peace with France was concluded in 1802, France acquiring the free navigation on the Black Sea, a privilege which was soon afterwards granted to England and to several other European powers. Selim at last began his reforms. He put his forces on a footing similar to that of European armies; introduced several changes into the system of taxation, and into the administrative divisions of the empire; he gave a new organisation to the divan; but in order to fill the treasury he debased the money. In the meantime the jealousy of England and Russia was excited by the increasing influence of the French ambassador, Count Sebastiani; and a war broke out between Turkey and Russia, assisted by England (December, 1806). Admiral Duckworth forced the passage of the Dardanelles, and threatened to bombard Constantinople, but fearing that his retreat would be cut off, sailed back to the Mediterranean. The Russians, on the other hand, made continual progress on the Danube. The defeats of the army were considered by the people as a consequence of the new organisation; the Janissaries breaking out in rebellion, occupied Pera, and directed their ordnance against the seraglio. The Mufti joined their party, and by a fetwá declared "that Sultan Selim III. had forfeited the throne because he had procreated no heir, and introduced the Nizam Jedid and several other innovations." Thus Selim III. was deposed, and confined to the seraglio.

[1807-1808.] Mustapha IV., son of 'Abdu-l-Hamid I., succeeding, immediately abolished the reforms of his predecessor. The Turkish fleet was entirely defeated by the Russians off Lemnos, and terror spread over Constantinople. Mustapha Bairaktar, pasha of Ruestschuk, appeared suddenly with an army before the capital, and demanded the deposition of Mustapha. The murder of Selim, by order of Mustapha IV., was the first consequence of this bold step; but the pasha entered Constantinople, and Mustapha was deposed.

[1808-1840.] Mahmud II., the son of 'Abdu-l-Hamid I., and the brother of Mustapha IV., was instructed for sometime before his accession by the deposed Sultan Selim III., in the principles of reform necessary for Turkey. He was indebted for his accession to Mustapha Bairaktar, who, after having been appointed grand-vizir, re-established the Nizam Jedid. The Janissaries again revolted, and they stormed the seraglio and the barracks of the new troops (Seymen). To save the empire, Mustapha Bairaktar put to death the deposed Sultan, Mustapha IV., and then blew himself up, together with crowds of the Janissaries. Mahmud owed his life to the circumstance of his being the only adult descendant of Osman; and to secure himself on his throne, he put to death the infant son of Mustapha IV., and ordered four pregnant slaves of the deposed Sultan to be drowned in the Bosphorus. Compelled to yield to the claims of the Janissaries, he abolished the Nizam Jedid. He concluded peace with England in 1809, and continued the war against the Russians, who were forced to retire beyond the Danube. Internal troubles divided the forces of the Sultan. The Servians however, commanded by Czerny George, and supported by Russia, shook off the Turkish yoke; the pashas of Widdin, of Damascus, of St. Jean d'Acre, of Trebizond, of Halep, of Baghdad, of Latakia, and several others, were in revolt; 'Ali, pasha of Janina, was independent in Epirus, and aimed at the possession of Greece; and Mahemet Ali in Egypt was laying the foundation of a hereditary and all but independent power. Under these circumstances the Sultan concluded with Russia the peace of Bukarest (1812), by which the Porte ceded the country east of the Pruth, Bessarabia, with the principal mouth of the Danube, and part of the eyalet of Childir in the Caucasus. During the ensuing years the Sultan effected several radical reforms, which have rendered his name famous in Europe. The destruction of the power of 'Ali, pasha of Janina, was a great triumph, but the insurrection of the Greeks and their final deliverance was a fatal blow to Turkey. Several European powers took the Greeks under their protection. The Turkish navy was destroyed in the battle of Navarino, October 20, 1827, by the combined fleets of England, France, and Russia; and Greece was erected into an independent

kingdom under King Otho, a prince of the house of Bavaria. Subsequently to 1822 (when to quell a turbulent revolt he sacrificed his favourite wife and several of his best officers), Mahmud succeeded in destroying the Janissaries, and with the downfall of this military body, which was once the bulwark of the empire, begins a new era in the history of Turkey. Serious differences with Russia on account of Moldavia and Wallachia were settled by the treaty of Ak-kermán in 1826; but Mahmud, having shortly afterwards succeeded in finishing the reform of his army, declined European intervention in the affairs of Greece, which was then still in insurrection. Thus war broke out with Russia in 1828. In the second campaign, field-marshal Diebitsch defeated the main army of the Turks at Shumla, and took Adrianople. At the same time field-marshal Paskiewicz conquered Erz-rum in Asia. Mahmud concluded the peace of Adrianople (1829), by which Russia acquired parts of the eyalets of Childir and Kars towards the Caucasus, and the fortress of Anapa near the mouth of the Kuban; and the Sultan recognised the independence of Greece; Moldavia and Wallachia acquired an independent administration, guaranteed by Russia; Servia was recognised as a vassal state of the Porte; the Sultan had to pay ten millions of ducats; and the Russians acquired the right of occupying Moldavia, Wallachia, and the town of Siliustria, until the payment of this sum. In 1831 the Sultan attacked Mehemet Ali, pasha of Egypt (who was aiming at establishing his independence of the Porte) in Syria, but his armies were defeated; and in the following year Ibrahim-Pasha advanced as far as Kutayah, about 130 miles distant from Constantinople. Peace was concluded in 1833, at Koniah, by which Mehemet Ali, who had held the eyalet of Candia since the war against the Greeks, acquired all Syria, and Ibrahim-Pasha was invested with Adán as Mutesellim. In this war Constantinople was saved by the intervention of the emperor Nicholas of Russia, and a Russian army was transported by sea to Asia Minor to stop the progress of the victorious Ibrahim. A consequence of this assistance was the treaty of Unkiar Skelessi (1833), by which the Porte engaged herself not to allow the passage of the Dardanelles to any enemy of Russia. In 1835 a Turkish fleet took possession of Tripoli, which thus again became dependent on Turkey. Mahmud II. was next engaged in a new war with Mehemet Ali; his armies were totally defeated at the battle of Nezib by Ibrahim Pasha, June 24th, 1839. Mahmud II. died on the 1st of July following.

Abdu-l-Mejid, son of Mahmud II., ascended the throne of Osman in his 16th year. The loss of the battle of Nezib, the treachery of the Capudan pasha, who deserted to Mehemet Ali with the whole of the Turkish fleet, and the advance of the victorious Ibrahim, seemed to foreshadow the immediate dissolution of the Turkish empire. This disaster was prevented however by the treaty of London (July 16, 1840), in fulfilment of which an Austro-English fleet bombarded and took Acre, Sidon, and several other towns on the coast of Syria, which Ibrahim Pasha was obliged to evacuate. Negotiations for peace soon followed, which terminated in the restoration of Syria to the Porte, and the recognition of Mehemet Ali as hereditary pasha of Egypt and its dependencies, upon payment of an annual tribute.

[1840-1855.] On the death of Mahmud II., the old Turkish party, opposed to all innovations, and especially to all imitations of the polity of Christian states, hoped that no more would be heard of reform. But their hopes were blasted by the appearance of the Hattisharif of Gulhané, dated Nov. 3, 1839, and countersigned by Reshid Pasha, which contained guarantees for the life, property, and honour of all the subjects of the Sultan, irrespective of person or religion, and promised the abolition of the arbitrary recruiting system, and the introduction of an impartial system of taxation. The issue of this charter threw the empire into commotion; the old Turks, headed by Riss Pasha in the capital (who was accused of being under the influence of Russia), made a formidable opposition to the execution of the decree; the Turkish subjects of the Sultan, brought up in principles of ascendancy and contempt for Christians, rose in insurrection to defend their privileges. The Christians of European Turkey, by far the most numerous class of the subjects of the Sultan in that part of the empire, long groaning under oppression, were accustomed (and taught) to look for protection and deliverance to Russia. France had to interpose frequently (but never offensively to the Porte) to protect the Christians of the east; and the English and Austrian ambassadors at the Sublime Porte embraced every opportunity of keeping up the influence of their several governments. Thus, not only did foreign nations interfere in the internal administration of the empire, but their ambassadors seemed to be a set of players with Turkey for a chessboard. The fair execution and firm establishment of the system mooted in the Hattisharif, would have put an end to this state of things, by giving the Christian subjects of the Porte the protection of law, and depriving them of all excuse and desire for seeking foreign protection. Russia could never coax a people to take shelter behind her shield who lived secure under theegis of law. The Sultan's government it is true has given many indications of perseverance in reform, and has issued many orders in furtherance of the system (among others one in 1855 for the reception of Christian evidence in the courts of justice), but the fact is undeniable, that the central government is not able to enforce the *tanzimat* in the provinces.

A fine instance of the noble generosity that lies at the bottom of

the Turkish character was exhibited to the world in the refusal of the Sultan Abdu-l-Mejid to surrender the Hungarian refugees to the imperious demands of Austria and Russia in 1849. Nevertheless the influence of Russia, however it might diminish at court, was rapidly extending among the Christian population of the Porte. Indeed, from the mere terms of the treaties of Kainarji, Adrianople, and Unkiar-Skelessi, it is clear that Russia was ever drawing the noose of political dependence closer and tighter round the neck of Turkey. The crisis seemed to arrive, when in 1853 the Czar Nicholas, through his minister Menzikoff, demanded openly the protectorate of the Christian subjects of the Sultan, and even the right to adjudicate in certain cases of dispute; and insolently occupied Moldavia and Wallachia, as a 'material guarantee' for compliance with his demands. In consequence of this, a Turkish army under Omar Pasha occupied the Balkan and the fortresses of the Danube; and French and English fleets cast anchor in Besika Bay. In October following the Porte declared war against Russia, and appealed to France and England for aid. In the campaign that followed in Little Wallachia the Russians were on every occasion defeated by the Turks; but in November the Russian fleet, issuing from the harbour of Sevastopol, attacked and utterly destroyed the Turkish fleet in the roads of Sinub. In the following March (1854) the Russians crossed the Danube, and seized the fortresses in the Dobrukscha; and about the same time England and France declared war, and the fleets entered the Black Sea. On the 15th of June the Russians, after great efforts and a vast loss of men, raised the siege of Siliustria (French and English armies now appearing in Turkey, encamped at Varna), and retreated across the Danube. The Turks also crossed the Danube. The Russians were defeated at Giurgevo, and soon after evacuated the principalities, which, in accordance with the terms of a treaty with the Porte, were occupied by Austrian forces. Meanwhile the French and English fleets entered the Black Sea, bombarded Odessa, and forced the Russian fleet to take refuge in the harbour of Sevastopol. An Anglo-French army landed in the Crimea on September 14, 1854, under the command of Marshal St. Arnaud and Lord Raglan. The battle of Alma followed on the 20th, in which the Russians under Prince Menzikoff were utterly defeated by the allies, and the road was open to Sevastopol. To secure ready communication with their fleets however the allied army, by a flank march, seized upon the harbours of Balaklava and Kamiesch, and the southern side of Sevastopol was invested on the 26th of September, the Russians having in the interim, by sinking seven men-of-war at the mouth of the harbour, blocked up the entrance by sea to this great naval and military arsenal. Here, on the dreary heights of Sevastopol, throughout the terrible winter of 1854-5, the allies maintained the hard struggle and obstinate siege against a skilful foe within and a countless Russian army without, humbling the name and prestige of Russia by the victories of Inkermann and Balaklava; and kept the eyes of the world fixed upon the spot where the whole interest of the war was now concentrated throughout the entire spring and summer of 1855, electric agency flashing to all parts of Europe tidings of losses and sufferings often, of defeat never, and of many a brilliant success (not least of which was the victory of Tahernays, August 16, in which the Sardinians, now numbered among the allies, won their spurs); until at last, after a long bombardment, the French captured the Malakoff tower on the 8th of September, and the allies occupied the southern side of Sevastopol.

TURK'S ISLAND. [BAHAMAS.]

TURKISTAN, or *Independent Tartary*, a region of Central Asia, inhabited by many tribes of Tartar race, extends from about 36° to 55° N. lat., and from 52° to 89° E. long. It is bounded N. by Russia, E. by China, S. by Afghanistan and Persia, and W. by the Caspian Sea.

Lake Sir-i-Kol, situated in 37° 27' N. lat., 73° 40' E. long., on the high table-land of Pamir, near the southern frontier of Turkistan, appears to be 15,000 feet above the level of the sea. It is bordered by hills on three sides; those on the south rise to the estimated height of 3500 feet above the level of the lake. [BADAKSHAN; OXUS.] Near Hasrat-Imam, in 69° E. long., the bed of the river is said to be only 500 feet above the level of the sea, and here are its lowest fords. As far as the meridian of 68° E. long., the passes across the mountain range which extends south-west from Sir-i-Kol do not sink lower than 13,000 feet above the level of the sea. Twenty-five miles W. from the lake the bed of the Amu is 1200 feet below its level; 85 miles farther west it is only 10,000 feet above the sea. The village of Robot, on the banks of a southern affluent of the Amu, 60 or 70 miles W. from this latter point, is 8100 feet above the sea. The crest of the pass east of Taliaskan is 6600 feet above the sea.

These elevations indicate that the general level of the land south of the Amu above its lowest fords immediately attains a high level; it is in fact an elevated plain furrowed and intersected by numerous deep narrow valleys down which flow the Kokcha and Kunduz rivers and their affluents. In the low ridge at the east end of Sir-i-Kol the

Yarkand River, which runs to the north of east, has its rise; and from the sources of the Yarkand and Amu rivers the country slopes down on every side except to the south-east. The high ground north of the Amu, at the mouth of the Kokcha, is at a greater distance than that on its south, and does not rise so high. At Kurahi however, two degrees farther north, Sir A. Burnes saw mountains covered with snow in July about 150 miles to the west, which would be nearly in the meridian of the mouth of the Kokcha. Their summits must have been about 18,000 feet above the sea; they continued in sight nearly at the same distance for about seven hours, and appeared connected. The Sir-Deria (Jaxartes) has its rise on the north side of the ridge of hills extending westward from the north side of the Sir-i-Kol, opposite Issar, which is about 70 miles S.W. from the lake. The Zer-Afshan, which flows by Samarcand and Bokhara, is said to have its sources not far distant from those of the Sir-Deria. From the latitude of Kurahi (38° 52' N.) the high land seen by Burnes appears to stretch to the north-east, to beyond the meridian of Samarcand (about 67° E.). North of the Zer-Afshan the high land appears to continue as far west as the meridian of Bokhara (64° 55' E.), and is visible to the north of that town. About the meridian of 68½° E., and the parallel of 41° N., the Sir-Deria, which flows to that point in a direction a little north of west from its source, turns to the north. The high land comes nearly close up to the east bank of the river in this part of its course, but does not appear to continue farther north than the ridge which separates the lake called Isi-Kol from the Balkash Lake (about 42° N. lat.). Yarkand and Kashgar, which appear to have an extensive plain to the east, and are evidently on a much lower level than the country to the west of them, may be assumed as the eastern limit of the high table-land of Pamir. From Kashgar to Kokand the road lies up the Kashgar River to its source, and through the pass of the Terek to the valley of the Sir-Deria. A road leads in winter from the Terek Pass to Sir-i-Kol in two or three days; in summer the road is said to be impassable on account of torrents fed by the melted snow. The high table-land of Pamir slopes down on the north towards Kokand.

At the western base of this enormous table-land is the broad valley of the Oxus. At its eastern base is the plain which extends between the high land of Tibet on the south and the Thian-Shan on the north, as far as Lake Nor; and north of it is the comparatively low country which slopes from the plains of Songaria westward to Lake Aral and the Caspian. These three natural divisions of Turkistan will be described in the order in which they are here enumerated.

Under the designation Plain of the Oxus is embraced the level tract extending from the base of the mountains east of Kurshi (68° E. long.) to the Caspian, and from the shores of the Aral to the south of Balkh. From the junction of the river of Kunduz with the Amu-Deria the latter river maintains a generally north-west direction till it loses itself in the sea or lake called Aral. Below the junction of the Kunduz, the Amu receives no affluents of any magnitude. Woodforded the Amu at Jan-Kila, a short way above its junction with the Kokcha. [BADAKSHAN.] A man on foot could not have forded the river here; and fewer than three horses abreast could with difficulty stem the current. At the ferry between Balkh and Kurahi, Burnes found the Amu about 800 yards across, with an average depth of 20 feet and a current of ¾ miles an hour. At Charjui, on the road from Bokhara to Meshed, he found the river 650 yards broad, and in some places 25 and 29 feet deep. Kunduz is 498 feet above the sea. A barometrical levelling by Russian officers, in the winter of 1825, gives the height of Lake Aral above the Caspian 117 feet. [ARAL; CASPIAN.] From the banks of the Amu to the Elbors on the south-west, and to the snowy mountains east of Kurshi on the east, extends an immense plain, the elevation of which, towards its southern extremity, is at Balkh 1718 feet above the level of the sea, and at Khulm, 1437 feet. At Bokhara its elevation is 1201 feet. The northern boundary of this plain is formed by a ridge of high broken ground north of Bokhara, which extends from the eastern mountains to the Amu above Khiva; west of the Amu it is bounded to the north by the Aral and by the abrupt termination of the Ust-Urt, a high table-land rising precipitously from the shores of the Aral and the Caspian, to an average level of nearly 600 feet above the latter, occupying the whole breadth of 138 miles between the sea, and extending south of the southern termination of the Aral, almost to 41° N. lat. The central plain maintains a considerable elevation from Sherrukhs to the base of the Ust-Urt, and the maximum depression of the level of the basin of the Caspian extends a very little way to the eastward.

The wide tract extending from the shores of the Aral to the Caspian, and the Russian and Chinese frontiers, is known as the Steppe of the Kirghiz Tartars. From Orak to Uralak the course of the Ural River is nearly east and west, and sinks from 582 feet to about 200 feet above the level of the sea. From Orak to Guriev, near the Caspian, the Ural runs nearly south, and sinks to 140 feet above the sea at Kalmukovah, and to nearly 82 feet at Guriev. The steppe on the south bank of the Ural, between Orak and Uralak, appears to rise immediately to an average elevation of 500 to 800 feet. Mount Airuk, 224 miles S.E. from Orenburg, the highest summit of the Mongojar Hills, rises 800 to 1000 feet above the level of the steppe. From this culminating point the ground slopes, still in a south-east direction, gradually down to the level of the Aral, a distance of 300

GEOG. DIV. VOL. IV.

miles. To the south-west the ground sinks gradually to the level of the Ust-Urt. The Emba (which flows south-west to the Caspian), the Uil (which flows west till it is lost in the sands east of the Lower Ural), the Khobda and Ileik (which flow to the north of west, and after uniting their streams fall into the Ural midway between Uralak and Orenburg), and the Or (which flowing to the east of north, joins the Ural at Orsk), all rise on the sides of Mount Airuk. The eastern base of the Mongojar range is washed by the Irgbiz, which, rising in an undulating plain south of the sources of the Tobol, nearly in 51° N. lat., flows to the south and loses itself in a chain of lakes called Ak-Sakal, about 60 miles north-east of the north-eastern corner of Lake Aral. From the sources of the Irgbiz and Tobol, about 60° E. long., to those of the Turghai, about 3 degrees to the eastward, there extends a plain considerably elevated above the level of the ocean, but considerably depressed below the hilly countries to the east and west of it, covered with a multitude of salt-lakes, and sending its waters southward to Lake Ak-Sakal, northward to the Tobol and Ishim, both affluents of the Irtish. The numerous streams which unite to form the Turghai rise about 64° E. long., over a range of country extending from about 49° to 52° N. lat., and converging into one main stream flow westward to the Ulkiak, which coming from the north joins the Irgbiz near its termination in Ak-Sakal. The course of the upper rivulets of the Turghai appears to form the western termination of a belt of high land which extends in a north-western direction, parallel to the course of the Irtish, between Ust-Bukhtarminak and Omak, from the high lands between the Nor-Saisan and Tarbagatai, about 85° E. long., to the meridian of 64° E. From its outlying hills on the north, about 100 miles from the banks of the Irtish, to its southern base, this high land must have a horizontal breadth of nearly 180 miles. Its central ridges reach an estimated elevation of at least 5000 to 6000 feet above the sea. To the north it sends out the Ishim (which joins the Irtish), the Nura (south-west of the Ishim), the Selenta, Ulenta, Chanderli, and other rivers to the eastward, which lose themselves in the steppe lakes before they reach the Irtish. To the south this high land sends forth the Ainguz, the Jurgutu, and some other rivers which fall into the Lake Balkash on the Chinese frontier; and the Sari-Su and the Kongur, which meet about 47° N. lat., 67° E. long., and from their point of junction flow south-west till they are lost in brackish lakes about 40 and 50 miles from the Sir-Deria. The Tahui, which is believed to issue from Lake Isi-Kol, at the northern base of the Thian-Shan range, about 42° N. lat., 81° E. long., flows in a north-west direction till it is lost in a salt-lake a little to the south of that which receives the united streams of the Kongur and Sari-Su. The hills south of Isi-Kol extend westward from the meridian of that lake to the Sir-Deria, about 69° E. long. The Sir-Deria flows at their southern base to 69° E. long., then turns and flows past their termination to the north till it reaches within a degree of latitude of the lakes in which the Tahui terminates; hence it bends away to the west and flows to Lake Aral in 61° E. long. The apex of the delta of the Sir-Deria is not less than 5 degrees to the east of the shores of the Aral; the most northerly branch joins that lake not far from its north-east angle, about 46° N. lat., and the most southerly near its south-east angle, about 43½° N. lat. The mountains which intervene between the upper valley of the Sir-Deria and the valley of Samarcand, and the hills which extend from their western termination to the Amu, form the extreme southern boundary of the Kirghiz Steppe, between 42° and 43° N. lat. Humboldt estimates the elevation of Lake Balkash as not more than 800 feet above the ocean. The Aral is about 30 feet above the level of the Black Sea. [CASPIAN.]

The extensive range of country which lies east of the great elevation of Pamir, has been called by recent geographers Chinese Turkistan or Tartary. The Thian-Shan extends along its northern side, from the junction of the range with Pamir to its junction with the high desert plain of the Gobi, and the high land of Tibet along its southern side. Lop-Nor appears to form its eastern boundary. Kashgar and Yarkand stand on a plain much depressed below the level of the highlands to the north, south, and west of them, in 39° 25' N. lat., 73° 56' E. long.; Yarkand in 38° 19' N. lat., 76° 18' E. long. A river flows past Kashgar, formed by two streams, one of which comes from the pass of Karakorum on the road to Ladak; the other from a range of hills at the east end of Sir-i-Kol. A river flows past Yarkand, formed by the junction of two streams, one of which comes from the Terek Pass, on the road to Kokand; the other from a lake on the high plain of Pamir, situated between the Terek Pass and Sir-i-Kol. Ushi is situated among the hills at the base of the Thian-Shan, in 41° 3' N. lat., 78° E. long.; Khotan, at the base of the high land of Tibet, about 37° N. lat., 80° E. long. The rivers of Yarkand and Kashgar unite about 40° N. lat., 80° E. long., and receive near their junction rivers from Ushi and Khotan. The united stream flows eastward to the Lop-Nor (41° N. lat., 89° E. long.), receiving on the way affluents on its north bank from Kulchis (41° 37' N. lat., 82° 50' E. long.), and from Kharashar (42° 10' N. lat., 87° 10' E. long.). The river formed by the union of the rivers of Khotan, Yarkand, Kashgar, and Ushi, flows close to the hills at the base of Thian-Shan. East of Khotan the country is represented as a sand-waste, and the same account is given of the country east of Lop-Nor. The country between Lop-Nor and the upper Hoang-ho attains to a considerable elevation.

So extensive a portion of the earth's surface as Turkistan is, and which varies from an elevation of more than 18,000 feet above the level of the sea to about 82 feet below it, must necessarily present a great variety of climate and geological structure, and, in consequence of that variety, an equal diversity of vegetable and animal life. So small a portion of this region has however been hitherto accessible to scientific research, and the investigations of the few scientific travellers who have visited it have been distracted by so many impediments, that our information on these points is meagre in the extreme.

The line of perpetual snow in the neighbourhood of Sir-i-Kol appears to be above 17,000 feet. In Wakhan on the Amu (8000 to 10,000 feet above the sea) the seed-time is in April, the harvest in July. During winter and spring a strong wind blows steadily down the valley from the north-east, which is unfavourable to vegetation. On the 6th of April, 1838, according to Lieutenant Wood, not a leaf of the mulberry-trees was open at Khulm; the plum-trees had blossomed at Kunduz a month earlier. The harvest at Balkh is 50 days later than at Peshawur, and it is a fortnight later at Bokhara than at Balkh. Between Balkh and Bokhara, Burnes observed that the thermometer in the latter half of June rose to 103° in the day and fell to 60° at night. Fruit-trees begin to blossom at Bokhara about the middle of February; there are heavy rains in March; the summer heat is overwhelming; there are two or three weeks of heavy rains in October; in January the ice is sometimes three or four inches in thickness, and the snow sometimes lies fifteen days. The communication between Khiva and the Caspian is interrupted in summer by the great heats. Snow lies on the Ust-Urt in the winter; the Aral is frozen so that the Kirghiz can pass on the ice from the mouths of the Sir-Deria to the mouths of the Amu. The Amu too is sometimes frozen as high up as Charjui (west of Bokhara), so that caravans can cross on the ice. Along the Russian frontier the weather is more inclement than the latitude and elevation of the country would lead one to expect. The most violent storms come from the north-west.

The vegetation of the upper part of the valley of the Oxus is noticed under **BADAKSHAN**. Groves of tolerably-sized firs occur in the ravines of the Khulm River, south of Kunduz; but there are no timber-trees on the Hindu-Kush. The assafotida plant and the furze of Tartary are the characteristic plants of the mountains south of Balkh. The grass on the pastures around the Sir-i-Kol, and on the high lands west of that lake and south of the Amu, is in general very luxuriant. Large quantities of wheat and other grains are reared round Hasret Imam and Kunduz; and apricots, plums, and other fruits in great abundance and of excellent quality at Kunduz, Kulm, and Balkh. The almond and pistachio nut are natives of the secondary ranges on the north face of the Hindu-Kush. The great plain on both sides of the Amu is in most places a barren waste, or thinly covered with straggling furze. Wherever there is water however its clayey soil is easily rendered fertile by irrigation. In the oases of Khulm, Balkh, Serukha, Merve, Kurahi, Bokhara, and Khiva, and on the banks of the Gurgan, most kinds of fruit, vegetables, and grain are brought to perfection. The mouths of the rivers which fall into the Caspian and Aral, and the borders of the salt lakes in the Kirghiz steppe, which receive considerable rivers, are choked up with gigantic reeds and other aquatic plants. The characteristic plant of these steppes is the sachsaul. In the sands it is a shrub, in clayey soils it assumes the appearance of a tree. It is a dry desert plant, invaluable to the wanderers of the steppe on account of the slowness with which it consumes, and the length of time which it remains burning. On the Upper Ishim there is a considerable extent of forest land.

The most important animals on the highlands of Pamir are the yak, the argali, the markhor, a large species of goat, wolves, foxes, and hares. Eagles are numerous among the inferior ranges; large flocks of the hooded crow frequent the hills in summer, and come down to the plains about Kunduz in winter. House-sparrows, partridges, and pheasants are found on the plains of the Amu, over which also deer and antelopes roam in considerable numbers. In the northern parts of the Kirghiz steppe are found the saiga, a kind of antelope, and a species of small eagle, called berkut, which is trained for the chase. The steppe would seem to be the native country of the *Murida*, which are found there in almost every possible variety. The wild-bear inhabits the reedy margins of the lakes and rivers; and a tiger, supposed to be the same as that of Bengal, frequents the delta of the Sir-Deria. The Upper Turgai swarms with snakes. There is an astonishing quantity of water-snakes in the lower delta of the Ural.

Turkistan, or Tartary, is named from its predominant race, the Turk, or Tartar, for they are the same or a kindred people. The Kirghiz Tartars, properly so called, inhabit the high table-land of Pamir, and its bordering mountains and valleys. They are nomads. They are a people of low stature, with Mongolian countenances, though speaking a Turkish dialect, which differs little from that of the Uzbek Tartars of Kunduz. The tribes called Kirghiz by the Russians, who roam the steppes from the north declivity of Pamir and the southern shore of the Aral to the Russian frontier, and from the Caspian to the Chinese frontier, are divided into the three great hordes. That which ranges the country on the south-east acknowledges the designation

Kirghiz, and appears to resemble in most respects the highlanders of Pamir. The horde on the Siberian frontier, and that which roams from the Ural range to the Ust-Urt, call themselves Kassak, or Cossak. The men of the Middle Horde have less of the Mongolian features than the Kirghiz, and those of the Little Horde, as it is called, still less. The Turkoman tribes range the deserts around the Amu and Caspian, from the Ust-Urt to the frontiers of Persia and Balkh: these tribes appear, from their lineaments as well as from their language, to be more free from any mixture of Mongol blood than those previously mentioned. The Turkish clans possessed of political power in Khiva, Bokhara, Kunduz, and Kokand, are called Usbeks: in their lineaments they bear a considerable resemblance to the Kirghiz, differing from them mainly in those peculiarities which distinguish a people long civilised from one which has scarcely emerged from savage life. A number of tribes of alien lineage and language live intermingled with the Turkish clans. The Afghans, Jews, Hindoos, and other colonists, present no uncommon feature in Asiatic society; but the Persian Tajiks, or agricultural settlers, and the Sarts, or mercantile classes of the same race, who preponderate in Bokhara and some other towns, are remarkable as vestiges of an earlier population which possessed the country previous to the arrival of the Turks. In the cities west of Pamir these Persian tribes are said to preponderate in number; in the cities east of Pamir, on the other hand, the Turkish population would appear to be the most numerous. The predominant religion among all these tribes is the Mohammedan.

The political divisions of independent Tartary are:—The steppes of the Kassaks and Kirghiz; the plain of the Turkomans, between the Amu and the Caspian; the territory subject to the Khan of Khiva; the territory subject to the Mir of Bokhara; the territory subject to the Khan of Kokand; the territory subject to the Mir of Kunduz; and the territory east of Pamir, incorporated into the Chinese empire.

1. The Kirghiz and Kassaks number about 400,000 tents or families; of these 75,000 belong to the Great Horde: they encamp on the rivers Sara-Su and Tshui, on the middle course of the Sir-Deria, and around the lakes on the west side of the Chinese province of Songaria. The Middle Horde numbers 165,000 tents: its families encamp on the streams and lakes north of the sources of the Turgai and Sara-Su. The tents of the Little Horde amount to 160,000, which are scattered over the delta of the Sir-Deria and the country west of the Turgai, between the Russian frontier and the southern termination of the Ust-Urt. Along the Chinese and Russian frontiers an uncertain deference is paid to the injunctions of these governments. 2. The Turkomans number about 366,000 families or tents, including a number of tribes subject-d by the khans of Khiva. 3. **KHIVA**. 4. **BOKHARA**. 5. *Kokand* extends on the north to within 45 miles of the south bank of the Tshui: its most western station is Urutuppah, formerly a frontier town of Bokhara; on the east it is bounded by the Chinese frontier, and on the south all the wandering Kirghiz of the Pamir profess to be subjects of the Khan of Kokand. The government of this state much resembles in its character that of Khiva; it is however less favourably situated for participating in the gains of the Turkoman and Kirghiz slave-trade, and for levying black-mail on caravans, and is therefore less heard of. 6. Chinese Turkistan forms a Chinese province, under the designation of the Country of the New Frontier. Chinese garrisons are placed in all the towns along the base of the Thian-shan, in Kashgar and Yarkand, and lines of pickets keep up the communication between these principal stations. Double rows of custom-houses are placed along the frontier of the province to examine strangers and act as a check upon each other. The administration of justice and the exercise of the local police is left to the Uzbek authorities; the general military and civil authority is vested in Chinese or Mantohu officers. The public revenue is employed to defray the expenses of the provincial administration, and any surplus is sent to Ili. 7. The Mir of Kunduz exercises an authority much of the same kind as that exercised by the khans of Khiva and Kokand. His dominions extend on the west to a station nearly midway between Khulm and Balkh; on the south to Sykan, north of Bamian, and farther west to the crest of Hindu-Kush; on the east to the Chinese frontier. North of the Amu he exercises a precarious authority over all the settlers who are so unfortunate as to live within reach of his shupaco, or predatory incursions. The forces of the Mir consist chiefly of cavalry: he can bring together on a surprisingly short warning 15,000 horsemen inured to predatory warfare. He has raised every hill-fort in his country; the fastnesses on the plain are held by members of his own family. Within his own territories he is strict and impartial in the exercise of justice, and subjugated tribes are on the whole leniently dealt with. Besides these states, there are at least four towns, with their adjoining territory, in Turkistan, which may be considered independent of any external government—Maimanu, Andkho, Shibbergen, and Sir-i-Pul. They are all situated in oases formed by streams from the Hazareh Mountains, south of the plain of the Oxus. The chief of Maimanu can raise 6000 horse among his Turkoman adherents; the chief of Sir-i-Pul can raise 1000 Uzbeks; the chiefs of Andkho and Shibbergen 500 each. The chief of Andkho is an Afshar Turk; the rest are Uzbeks.

Turkistan is formed by nature to be the scene of a transit commerce between the countries which surround it on all sides, rather than of a trade in its own productions. Balkh, Bokhara, and Kokand produce

silk and cotton; the Pamir and Hindu-Kush supply furs, all the oases large quantities of fruit and grain; metals are raised and smelted in various localities; the steppes supply beasts of burden and for food; and at Kokand and Bokhara silk and cotton stuffs are manufactured. The traces of former cultivation which abound in so many places, are proofs of the extent to which this transit-trade was once carried. The present lawless and unsettled state of the greater part of Turkistan is the consequence of the decline of this trade, not its cause. These now deserted sites continued to flourish in the times of Tamerlane and Tshinghis-Khan (Genghis-Khan); they have become waste and desolate since the discovery of the route by sea from Europe to India and China. There is however still a considerable trade carried on in these regions. Caravans from Bokhara to Russia proceed by way of Khiva to the Lower Ural, carrying the products of India, Kashmir, and Tartary, to Nishnei-Novgorod. The trade between Bokhara and Russia is more extensive and valuable than that from the south of Hindu-Kush. Next in importance to the trade with Russia is that carried on with Kashgar. A caravan is annually dispatched by way of Kokand to that city, and here the interchange of commodities with the Chinese is effected. A branch of this trade goes up the valley of the Upper Oxus to Kashgar. Kokand is an entrepôt of the trade between Bokhara and Kashgar, but it is also visited by Russian fur caravans on the Russian frontier. Kundus has little trade: it lies off the direct line of commerce from Bokhara to the Indus, and the difficulty of the road across the high land of Pamir makes merchants prefer the northern pass of Terek in travelling between East and West Turkistan. Kashgar and Yarkand, lying at the intersection of the great lines of traffic which connect Russia with Tibet and Kashmir, and China with West Turkistan and Tibet, and being moreover situated in productive countries, are the centres of an active and lucrative trade. Even the Kirghis and Kassaks of the northern steppes of Turkistan have a considerable barter trade. They exchange camels, oxen, horses, sheep, goats, wool, hides, horns, and furs, for manufactured goods, grain, and flour. Their principal dealings are with the Russians and Chinese; with the former at Uralak, Orenburg, Troitsak, Omsk, Semipolatinak, Ust-Kamenogorsk, and some intermediate frontier forts, from the middle of June to the beginning of November; with the latter at Ili and Tshugutahak or Tarbagatai. They also visit Khiva, Bokhara, Kokand, and Tashkend to exchange their raw material for grain and clothing; and passing caravans keep up a petty traffic with the tribes they meet in crossing the desert, while more adventurous traders make the desert itself the scene of their speculations.

Alexander crossed Western Turkistan from the western termination of the Hindu-Kush by the sites of Balkh, Kurshi, and Samarcand, to the south-west curve of the Sir-Deria. After his death the Grecian dynasty of Bactria appears to have ruled the country as far north as the Aral till about 120 years before the commencement of the Christian era. [BACTRIA.] The Greek power north of Hindu-Kush was then subverted by Scythian invaders from the east, who in their turn were overthrown by the Parthian kings, about the time of the birth of our Saviour. The Parthian kings introduced the worship of fire, of which religion traces are still every where to be met with. The early historians of the Chinese remark that upon reaching the country around Lop-Nor the Mongol tribes are succeeded by a race with long or 'horse-like' faces. The Lop-Nor continues till the present day the south-east frontier of the Turkish race. In 569 the ambassadors of the younger Justinian found the most powerful of the Turkish tribes seated around the Altai, and Turkish hordes had pushed their encampments as far west as the Caspian. When the kalifs succeeded to the Persian throne, they found the frontier of Iran extending beyond Samarcand, and for a time they kept it there. The conquests of the Mongol chiefs who overthrew the kalifate broke down this frontier, and opened the way to successive incursions of nomad hordes from the east. The first princes who inherited the power of Genghis-Khan were Mongols; but the Turkish or Tartar tribes would appear to have predominated in their armies. All the Turkish tribes who have played a conspicuous part in history embraced at an early period the Mohammedan religion. Of the tribes in Turkistan, the Kassaks, who occupy the north-western steppes, are probably the oldest settlers. The Little and Middle Hordes may be descendants of those who wandered in the same regions in the 6th century. The Great Horde, the mountain Kirghis, and the Turks of Chinese Tartary, received a reinforcement from the Siberian Turks, who submitted to Russia in 1606, emigrated from its territories in the beginning of the 18th century, and settled among their independent brethren to the south. The origin of the name Turkoman is difficult to ascertain. The Turkomans are the Turkish tribes who in the 11th and 12th centuries crossed the Amu and invaded Persia; the name is common to those who still inhabit Turkistan with many tribes in Persia and the Ottoman empire. The Uzbeks are a mixture of the descendants of the Uigur and Naiman, Turkish tribes who originally inhabited the country from the north-east of Lop-Nor to Kashgar, and from Ushi to Khotan, and who figure in the annals of China. They crossed the Sir-Deria in the beginning of the 16th century, and spread terror and desolation wherever they came. They are at present masters in Kundus, Kokand, Bokhara, Khiva, and the oases to the west of Balkh. In the seats of an ancient civilisation, such as Bokhara and others, we find the Turks of Turkistan

raised to the average level of Mohammedan civilisation; the nomad tribes appear to be much in the same state that their ancestors were at the time when history first takes notice of them.

TUSCANY (*Toscana*), a grand-duchy of central Italy, situated between the main ridge of the Apennines and the Mediterranean. It is bounded W. by the sea and the Sardinian territories, N. by the duchies of Parma and Modena, and by the States of the Church, and E. and S. by the States of the Church and the Mediterranean sea.

Tuscany has a breadth of about 95 miles from west to east, from the sea-coast near Leghorn to Borgo San Sepolcro on the banks of the Upper Tiber, which part of the valley of the Tiber belongs to Tuscany. There is also a mountainous tract belonging to Tuscany on the northern slope of the Apennines, extending to within a few miles of Faenza and Forlì. This district, which is styled Romagna Grand-Ducale, contains the sources and upper course of a number of streams which flow towards the Adriatic. With this exception, the waters of the grand-duchy of Tuscany flow southward to the Mediterranean. The principal rivers of Tuscany are, beginning from the north—1, the Magra, which flows through the Tuscan district of Lunigiana, and afterwards enters the Sardinian state; 2, the Serchio, which flows through Garfagnana and Lucca; 3, the Arno, which, with its numerous affluents, including the Chiana, drains more than one-third of Tuscany; 4, the Cecina, which drains the valley of the same name; 5, the Ombrone, the principal river of the province of Siena; 6, the Albegna, which flows for about 36 miles through the southern part of the Maremma, and enters the sea north of Mount Argentaro; 7, the Fiora, which flows through the border district of Santa Fiora, Pitigliano, and Sovana, and then enters the States of the Church.

The territory of Lucca fell to Tuscany in 1847. [LUCCA.] The Grand-Duchy is divided into compartimenti, or provinces, as in the following table:—

Provinces.	Area in Square Miles.	Population in April, 1854.
Florence	2,246	715,701
Lucca	510	265,304
Pisa	1,174	231,473
Siena	1,455	190,159
Arezzo	1,265	221,090
Grosseto	1,710	80,980
Livorno	38	89,420
Isle of Elba	96	21,559
Total	8,494	1,815,686

The surface of Tuscany presents four different regions:—1, the highlands of the Apennines, which skirt the grand-duchy on the north and north-east; 2, the hilly tract, which forms the greater part of the province of Siena, between the valley of the Chiana on one side and that of the Arno on the other, and which slopes on the south-west towards the lowlands of the Maremma. The Ombrone forms the principal drain of this extensive plateau, which is intersected by rather high ridges, some of which are ramifications of the great Apennine Chain, whilst others, like Monte Amiata and the mountain of Radicofani, are of volcanic formation. The lower hills are of the description called 'Subapennine'; 3, the great valley of the Arno, with the lateral valleys of the Chiana, Elsa, Era, and other affluents. This constitutes the finest, most productive, and most densely inhabited part of Tuscany; 4, the maritime plains, or Maremma. These four regions are noticed under ARNO; CHIANA, VAL DI; FLORENCE; GARFAGNANA; LUCCA; MAREMME; PISA; SIENA, &c.

About one-sixth part of the area of Tuscany is planted with vines and olive-trees; another sixth is cultivated as arable land; nearly two-sixths are either forests or plantations of chestnut-trees, which afford food to the population of the mountains; and nearly as much again is pasture land, chiefly natural pasture. There is a class of tenants who hold their tenements by 'livello,' a kind of life-estate for four generations, paying a fixed yearly rent either in money or kind to the owner. When the fourth generation is about to expire, the contract is often renewed by mutual agreement. But the most common way of letting land is on the 'metayer' system, by which the farmer finds the seed and implements, and gives the owner half the produce in kind. The landlord stocks the farm, and a valuation is given to the farmer, who is to make all good on leaving.

Tuscany imports some corn yearly to supply its own consumption. The principal articles of produce are wine, oil, of which a quantity is exported; and silk, which is also an article of export both in its raw and in its manufactured state. The other articles of native produce exported are—fruit of various sorts, lambskins and kidskins, potash, timber, cork, juniper-berries, marble and alabaster, iron from Elba.

borax, sulphur, alum, and anchovies, which are fished off the coast. Nearly the whole trade of Tuscany with other countries is carried on through the port of Leghorn, which is also a great mart or exchange for all kinds of foreign produce. [LIVORNO.] Horned cattle are not very numerous in Tuscany; the sheep are reckoned at 600,000; most of the flocks migrate in the autumn from the highlands to pass the winter in the Maremma. Cheese is made of ewes' as well as goats' milk. The common horse is of an inferior kind; some studs however keep up a superior breed. The asses are strong and fine. Pigs are reared in great number in the woods of the Maremma, where they feed upon acorns. A herd of about 200 camels is kept up on the grand-ducal farm of San Rossore near Pisa, and is said to have been perpetuated there ever since the time of the Crusades. Game of most kinds is abundant.

The mineral products are iron, from the island of Elba, copper, lead, marble, sulphur, rock-salt, alabaster, alum, and sea-salt.

The manufactures of Tuscany consist of woollen-cloths, woollen caps for the Levant; hemp and linen-cloth; thread-silk, and silk-stuffs, paper, glass, leather, wax, coral, which is gathered on the coast of Barbary and worked at Leghorn; iron-ware, alabaster vases and other ornaments, china, and delft-ware. The straw-plat manufacture has greatly declined.

The grand-duchy of Tuscany is divided into compartimenti, or provinces, each administered by a provveditore, or prefect. The provinces are divided into communes. Each commune is presided over by a municipal officer styled gonfaloniere. For the judicial administration there is in every commune a magistrate, called in some places vicario, and in others podestà; there are primary courts for civil and criminal affairs, in each of the principal towns; high courts, or courts of appeal, at Florence and Lucca; and lastly, a supreme court, or court of cassation at Florence, which watches over the whole judiciary administration. In commercial affairs there are tribunals of commerce at Florence and Leghorn. A board at Florence directs the police of the whole grand-duchy; there are commissaries of police in the principal towns, and a police-force (Sbirri) scattered about various points of the country.

The military establishment amounts to about 15,000 men, including the police and frontier and coast-guard. The commercial marine numbered 929 vessels, of all sizes, carrying 50,178 tons, in 1854.

The yearly public revenue of Tuscany amounted in 1854 to 35,307,400 lire, the expenditure to 37,037,500 lire. The income is derived chiefly from customs, land-tax, income-tax, stamps, government monopoly of salt and tobacco, lotteries, and crown demesnes. Provisions on entering the walled towns pay an 'octroi,' or duty, at the gates, as in France.

The grand-duke of Tuscany is an independent sovereign. He is absolute, but he governs according to the established laws, customs, and precedents; he is assisted by a ministry and a council of state, composed of his secretaries of state. He keeps chargés d'affaires at the courts of Austria, France, and the Porte. At the other courts he is represented by the imperial minister of Austria. Tuscan consuls are appointed to all the principal ports of Europe, the Levant, and America.

The Roman Catholic is the established religion of Tuscany, and is professed by all Tuscan subjects, with the exception of the Jewish population, which amounts to about 7000 individuals, chiefly at Leghorn and Florence. Foreigners of other Christian communions are tolerated, but proselytism among the subjects of the grand-duke is punished. The church establishment of Tuscany consists of four archbishops (Florence, Lucca, Pisa, and Siena) and about twenty bishops. There are many collegiate churches, besides cathedrals, about 200 convents and monasteries, and about 60 conservatorj, or houses for female education attached to convents, under the direction of nuns. The regular and secular clergy number about 15,000.

There are grammar schools at Florence, and all the other principal towns. They are kept by the fathers of the Scolopian order (Scholarum Piarum), and are attended by about 2500 students: the instruction is gratuitous. There are besides Collegj Convitti, or schools for boarders, as well as for day students, in most of the towns, and attended by above 1000 students; they are mostly under the direction of the same order, who are the chief instructors of the Tuscan youth. In every diocese there is at least one clerical seminary for those who study for the church, and several of them also admit external or day students. Lastly, the two universities of Pisa and Siena are attended, the former by about 550 students, the latter by about one-half that number. Each of these universities has four faculties—divinity, jurisprudence, medicine and surgery, and the physico-mathematical sciences—and confers degrees in each of these faculties.

Female education is afforded by the Conservatorj, or boarding-schools, which are directed by nuns. There is one or more of these establishments in every town. Several of them have at the same time a charity day-school for poor girls. In Florence and other principal towns there are Educatorj, or houses of education attached to several convents for ladies of the higher classes, who have the assistance of able teachers and professors. That of L'Annunciata at Florence is one of the best: it contains generally about 100 pupils, and the expense of each is about 100*l.* sterling a year. The system of domestic instruction is also common among the rich. For the general education of the

people there is a primary school in every commune of Tuscany; a secondary school in every town with a population of 4000; and lycœums in Florence, Lucca, Leghorn, Pisa, Siena, and Arezzo. Private instruction is free, but subject to government inspection. The public schools are under the care of a minister of instruction; religious teaching is in the hands of the clergy. Among the special schools we must mention the Academy of the Fine Arts at Florence, and the College of Medicine and Surgery attached to the hospital of Santa Maria Nuova in the same city. The education of youths of noble families is generally pursued at the colleges for the nobility, the principal of which is the Collegio Tolomei at Siena, directed by the Scolopian fathers. The Tuscan nobility has produced in all ages men distinguished for learning, and for their patronage of learning. Owing to the diffusion of education, industry, and commerce, and to the thrifty habits of the people, and the subdivision of property, the middle classes are more numerous and have more influence in Tuscany than in other parts of Italy; the mercantile class enjoys great consideration.

Charitable institutions are numerous, including hospitals for the infirm, founding hospitals, orphan asylums, workhouses, monti-di-pietà, infant asylums, and societies of charitable persons who assist the sick poor, relieve prisoners, give portions to poor girls being married, afford instruction to children, distribute clothes and other necessaries to the indigent, and bury the dead. The Jewish population at Leghorn have their own charitable institutions and schools.

The principal states of Europe and America have representatives at Florence, and consuls from all the great commercial nations and cities of the Christian world reside in Leghorn. Railways connect Florence with Pisa—one running through Pistoja and Lucca, the other through Empoli and Pontedera. From Pisa a line runs down the coast to Leghorn, and from Empoli another line runs south-east to Siena. Steamers ply from Leghorn to Naples, Marseille, and other ports of the Mediterranean.

History.—A sketch of the ancient history of the country is given under ETRURIA. After the fall of the Western Empire, Etruria became a province of the kingdom of the Goths, and afterwards of the Longobards. Under the Longobards it was divided into Tuscia Regni, which included the duchies of Lucca, Florence, and Clusium; and Tuscia Longobardorum, which comprised the duchy of Castro, the present papal province of Viterbo. Gradually the name of Tuscia, or Tuscany, became restricted to the former division only. Under Charlemagne and his successors Tuscany was administered by marquises, from whom was descended Matilda, daughter of Count Boniface III, who during a long life was a strenuous supporter of the Holy See against the German emperors, and enriched it by large donations of territory. Matilda died in 1115, leaving no issue, and the series of the marquises of Tuscany ended with her; for though the emperors of Germany as kings of Italy continued for a time to appoint imperial vicars in Tuscany, their authority was little more than nominal, as the republics of Florence, Pisa, Siena, Arezzo, Pistoja, and Lucca divided the country among them. [FLORENCE; PISA; SIENA.] Florence, having conquered Pisa, became the predominant power in Tuscany. After the fall of the republic in 1530, Charles V. appointed Alessandro de' Medici, an illegitimate son of Lorenzo, duke of Urbino, to be duke of Florence. Alessandro was murdered by his cousin Lorenzino de' Medici in January 1537; but the party of the Medici, headed by Guicciardini, the historian, proclaimed Cosmo de' Medici, son of Giovanni. Cosmo was the founder of the grand-ducal dynasty of Tuscany, having united Siena to his other dominions.

1574. Cosmo died, and was succeeded by his son Francis I. 1587. Francis died without issue, and was succeeded by his brother Ferdinand I, who was the great benefactor of Leghorn. 1609. Ferdinand died, and was succeeded by his son Cosmo II, who, in defending the coast against the Barbary corsairs, obtained various successes at sea. 1621. Cosmo II died, and was succeeded by his son Ferdinand II, whose long reign was an age of decline for Tuscany. 1670. Ferdinand was succeeded by his son Cosmo III, under whom the condition of Tuscany continued to decline. 1723. Cosmo was succeeded by his son Gian Gastone, a debauchee, who died without issue, and with him ended the grand-ducal dynasty of Medici. He was succeeded, according to an agreement between the great powers, by Francis, duke of Lorraine and Bar, whose territories were given to Stanislas Lecinski (ex-king of Poland). Francis married the archduchess Maria Theresa, daughter and heiress of Charles VI. of Austria, emperor of Germany. Tuscany was governed by a regency, while Francis and Maria Theresa resided chiefly at Vienna.

1765. Francis II. of Tuscany and I. of Germany died. His eldest son Joseph succeeded him as emperor of Germany, and his second son Leopold succeeded him as grand-duke of Tuscany. The reign of Leopold I. will ever be memorable in the history of Tuscany as a period of revival of industry and prosperity, of improvement in every department of administration, of order, peace, and an enlightened legislation.

1790. Leopold having succeeded his brother Joseph II. as emperor of Germany and sovereign of the Austrian dominions, and his eldest son Francis being thereby hereditary prince of the Austrian monarchy, the grand-ducal crown of Tuscany devolved upon his second son, Ferdinand III., who followed the wise and liberal system of adminis-

tration pursued by his father. In the war of the French revolution he strove to remain neutral, but Bonaparte (1796) disregarded the neutrality of Tuscany. The grand-duke however retained a precarious possession of Tuscany till 1799, when the French Executive Directory ordered the occupation of Tuscany by its troops, and the grand-duke was obliged to withdraw to Germany. By the peace of Luneville (1801), between France and Austria, Ferdinand renounced Tuscany, which Bonaparte gave to Don Ludovico Bourbon, hereditary prince of Parma, with the name of 'kingdom of Etruria.' In 1803 Ludovico died, and his widow, Maria Luisa of Spain, became regent of Tuscany in the name of her son, a minor.

In 1808 Napoleon I. united Tuscany to the French empire, of which it formed three new departments, Arno, Ombrone, and Mediterranée. Napoleon's sister Eliza, the princess Baciocchi, was placed at the head of the administration, with the title of Grand-Duchess. In 1814 however Tuscany was occupied by the allied troops in the name of Ferdinand III., who returned to Florence in September.

1815. The congress of Vienna confirmed the possession of Tuscany to the grand-duke Ferdinand and his successors, and annexed to it the whole of the island of Elba, and some other territories. To Maria Luisa, ex-queen of Etruria, as guardian of her son, was assigned the duchy of Lucca, to revert to Tuscany on the death of the arch-duchess Maria Louisa of Austria. This event took place in 1847, and Lucca has since been incorporated with Tuscany.

Ferdinand, after his restoration, applied himself to the internal improvement of his territories, especially by the drainage of the Val di Chiana and the Val di Nievole. He died in 1824, and was succeeded by his son Leopold II. The new grand-duke continued the system of progressive improvement by draining the marsh of Castiglione and other marshes which corrupted the atmosphere of the Maremma, opening new roads, embanking rivers, extending the privileges of a free port to the suburbs of Leghorn, supplying that important town with wholesome water by means of an aqueduct, and by other measures of like utility. He also reformed the judiciary administration, established new tribunals, encouraged popular education as well as scientific instruction, and issued several useful legislative and economical enactments. Tuscany, under his rule, continued to be the happiest, quietest, and most free country in Italy till 1848. In the anarchical tempest that followed the French revolution of 1848, the grand-duke was obliged to fly from his states, and a republic was established for a time in Florence. In the following year however Ferdinand was restored to his states by the Austrian army, which continued to occupy the country for several years. Since his restoration, the grand-duke Leopold has greatly abridged the political privileges of his subjects.

TWEEDMOUTH. [BERWICK.]

TWER, a government of Great Russia, is situated between 56° and 58° 47' N. lat., 31° 46' and 38° 20' E. long. It is bounded N. by Novogorod, E. by Yaroslav and Wladimir, S. by Moscow and Smolenak, and W. by Pakow. The area is 25,886 square miles; the population in 1846 amounted to 1,327,700. This government, especially the northern part, is an elevated table-land; there are no mountains, the *Wolkonsky* Forest, which covers the greater part of the circle of Ostuschkow, is but a range of hills, in which however many rivers have their source, among which is the Volga. This chain rests on limestone, and consists almost entirely of an impenetrable forest, in which there are extensive morasses; some offsets extend into the neighbouring country, which are scarcely more elevated than the banks of the river. Besides the Volga, which becomes navigable before it passes into the government of Yaroslav, there are numerous rivers, the chief of which are the Dwina, the Wäuga, the Twerza, the Sestra, the Socha, and the Mologa. The canal of Wysohnei-Wolotchok unites the Volga and the Neva. There are many lakes; the most considerable is the Seliger, which covers an area of 76 square miles. The climate is healthy, but variable. The rivers generally freeze by the beginning of December and thaw towards the end of March. Agriculture and cattle breeding are the general occupations of the inhabitants. The soil is poor, and the produce is scarcely more than sufficient for the home consumption. Rye, barley, and oats are cultivated, but little wheat. Much flax and hemp are grown. Fruit is scarce. Timber is very fine and abundant. Bears, wolves, foxes, badgers, and martens are numerous; fish are very plentiful. The population consists almost wholly of Russians. Except in the towns there are no manufactures. Many hands are employed in the country in the sawing-mills, brick-kilns, ship-building, and in land and water carriage. The transit trade between the southern provinces and the Baltic ports and St. Petersburg is important.

The chief town, Twer, is situated in 56° 52' N. lat., 35° 48' E. long., on the right bank of the Volga, which is here joined by the Twerza and the Tmaka: population 24,000. Twer is surrounded with palisades, which are closed by barriers, and consists of three parts: the fortress

lying between the Volga and the Tmaka, which is surrounded with a rampart; the city, which is divided by the rivers into four parts, united by three bridges; and the suburb. After a great fire in 1763, the empress Catherine II. caused it to be rebuilt in its present regular form. There are in the city a cathedral, 28 churches, 2 convents, a bazaar (which contains 400 shops), a palace, a theatre, a founding asylum, an hospital, and various establishments for education, among which are a gymnasium, a school for 120 young noblemen, and an ecclesiastical seminary for 700 students, who are instructed in the sciences and the classics. The inhabitants manufacture linen, leather, hardware, and candles, and carry on an extensive trade.

Among the other towns are—*Neschew-Wladimir*, population 10,000; *Torschok*, 15,000; *Wischnei-Wolotchok*, 6500; *Ostuschkow*, 6500; and *Kaschia*, 4000.

TWERTON. [SOMERSETSHIRE.]

TWICKENHAM. [MIDDLESEX.]

TYWFORD. [HAMPSHIRE.]

TYLDESLEY. [LANCASHIRE.]

TYNEMOUTH, Northumberland, a village, and the seat of a Poor-Law Union, in the parish of Tynemouth, is situated on the left bank of the river Tyne near its mouth, in 55° 1' N. lat., 1° 25' W. long., distant 8 miles E. by N. from Newcastle, 280 miles N.N.W. from London by road, and 287 miles by the Great Northern and York Newcastle and Berwick railways. The population of the township of Tynemouth in 1851 was 14,493; that of the parliamentary and municipal borough, was 29,170 in 1851. The living of Tynemouth is a vicarage, with the curacy of North Shields annexed, in the arch-deaconry of Northumberland and diocese of Durham. Tynemouth Poor-Law Union contains 24 parishes and townships, with an area of 89,737 acres, and a population in 1851 of 64,248.

Tynemouth Castle occupies a peninsula on the left bank of the mouth of the Tyne. In the time of William the Conqueror, the peninsula was inclosed on the land side by a wall and a ditch; the place was afterwards more completely fortified, and was known as Tynemouth Castle. The castle was taken from the Royalists in 1644, by the Scotch. It was restored and garrisoned by the Parliament, but the garrison having revolted, the place was stormed by a parliamentary force from Newcastle, under Sir Arthur Haselrig. The gateway tower of the castle on the west or land side is in tolerably good condition, and the circuit of the walls appears to be entire. There are considerable remains of the priory church. It was used as the parish church until the time of Charles II., when a new church was built at North Shields, distant a mile to the west. There are also a chapel of ease and a chapel for Wesleyan Methodists. A lighthouse and some other modern buildings are within the area of the castle; and near it is a fort to command the entrance of the river. The village of Tynemouth consists chiefly of one long street. Rope-making is carried on. The place is much resorted to in the bathing season. There are here a Natural History society and a savings bank. A house of correction is at Tynemouth.

TYRE. [TYRUS.]

TYROL, a crownland of Austria, lies between 45° 40' and 47° 44' N. lat., 9° 32' and 12° 55' E. long. On the west of Tyrol there is a portion of Austrian Italy and of Switzerland, from which it is divided by an uninterrupted chain of high mountains [SWITZERLAND], and the Rhine. On the north of the Tyrol is Bavaria; on this frontier also there are high mountains. East of the Tyrol are the Austrian provinces of Austria and Illyria, from which it is chiefly divided by the continuous ranges which separate the river basins of the Salsa and Drau from those of the Inn and Eisach; only a small portion of the basin of the Drau is included in the Tyrol. The mountains which on the south separate the Tyrol from Italy are frequently interrupted by streams, which escape from the mountain region of the Tyrol by very narrow valleys.

The crownland includes the Vorarlberg, and is divided into 4 circles, 75 arrondissements, and 1093 communes. The area and population of the circles are as follows, according to official returns published in Vienna in 1854:—

Circles.	Arrondissements.	Area in Sq. Miles.	Population in 1854.
Innsbruck .	19	4,094	215,153
Brixen . .	23	3,656	217,577
Trent . . .	27	2,404	323,186
Bregenz . .	6	987	102,506
Total . . .	75	11,141	858,422

The Tyrol is much more mountainous than Switzerland. One-third of Switzerland is an undulating or hilly plain, but the Tyrol, with the exception of a comparatively small tract, is covered with high mountain masses, on which a great number of summits rise above the snow-line and are surrounded by extensive glaciers. Level tracts, admitting of cultivation with the plough, are found only on the banks of the rivers, where they sometimes attain a width of a mile, and in a few places more, but they are usually not more than half a mile wide. All these tracts taken together do not cover one-tenth of the surface of the country; nine-tenths are occupied by the higher and lower mountain masses of the Alps.

The Tyrolean Alps form the eastern portion of the Central or Rhaetian Alps. The most elevated parts lie along the western boundary-line, south of the Inn River, and in the great chain which runs through the country from west to east, dividing the waters which run northward to the Danube, from those that flow southward to the Adriatic, or eastward to the river Drau. The western chain runs uninterruptedly from the Lake of Idro to the Ortler Spitz. South of $46^{\circ} 8' N.$ lat. it probably does not exceed 7000 feet above the sea-level. But near $46^{\circ} 8' N.$ lat. it rises in Monte Adamello to more than 11,000 feet, and from this summit to the Ortler Spitz ($46^{\circ} 30' N.$ lat.); hardly any portion of the range is free from snow even in the latter part of the summer. The general elevation of this range probably exceeds 9000 feet above the sea. The Ortler Spitz is the highest summit of the Rhaetian Alps, being 12,855 feet above the sea. It is surrounded by other summits, and is always covered with snow.

The deep and wide valley of the Upper Etsch (Adige), called Vintschgau, separates the mountain masses of the Ortler Spitz from the mountain range which traverses the Tyrol from west to east. This range is divided into two high and elevated mountain masses, which are divided by a large and wide depression, which occurs near $11^{\circ} 30' E.$ long., and through which the road over the Brenner passes from Germany to Italy. The mountain region west of this road consists of two extensive and very elevated mountain masses, which are connected by a high ridge. The western mountain mass is called the mountains of the Platey Kögl, or of the Great Oetzthaler Ferner, and the eastern is named the mountains of the Winacher Ferner. The mountains of the Platey Kögl occupy nearly the whole country between the Inn and the Achen, a space of nearly 30 miles from south to north, and 20 miles from west to east. A considerable portion of this tract is always covered with snow, from which rise numerous pinnacles, among which the highest are Mount Gebatsch, 12,276 feet; the Similaun Spitz, 11,859 feet; and the Great Oetzthaler Ferner, 10,434 feet above the sea-level. This is one of the most broken portions of the Alps, and the snowy masses are furrowed by only two deep and very narrow valleys. The mountains of the Winacher Ferner, or the eastern part of the region, are connected with those of the Platey Kögl by a high and narrow ridge, which only in a few places is free from snow in summer. The Winacher Mountains also rise above the snow-line, but the mass is less extensive than that of the Platey Kögl. Several summits rise above 10,000 feet, among which are the Kitzkamp, the Winacher Ferner, the Winter Stuben, and the Bock Kögl.

The depression which occurs east of the Winacher Mountains is of considerable extent, for no summit always covered with snow occurs in a space extending more than 18 miles from west to east. No summit of this part of the Tyrolean Alps probably exceeds 7500 feet in height; and in the middle, near $11^{\circ} 30' E.$ long., it sinks much lower: the road from Innsbruck to Trent, over the Brenner, is at its highest level ($47^{\circ} N.$ lat.) not more than 4374 feet above the sea-level. This is the lowest mountain-road across the Alps, and has accordingly become the most frequented line of commercial intercourse between Germany and Italy. Innsbruck is about 1920 and Trent 960 feet above the sea-level.

East of the Brenner the most elevated masses of the Tyrolean Alps constitute an elevated ground running from west to east. Towards its eastern extremity this high tract constitutes the boundary between the Tyrol and the district of Salsach in Austria. It contains an almost uninterrupted series of snow-capped mountains. The highest summits appear to be the Schwarzenstein, the Drei Herrn Spitz, and the Gross Glockner, which rises to 12,438 feet above the sea-level.

On the north-west and north of the mountain region hitherto noticed, and separated from them by the valley of the Inn River, extends another range, containing the sources of the rivers Lech and Isar, which descend from it northward, and enter the Plain of Bavaria. In this range only a few summits rise above the snow-line. The highest are the Arlberg, which is 10,200 feet, and the Great Solstein, which is 9702 feet above the sea-level. West of the last-mentioned summit runs the road which leads from the Plain of Bavaria to Innsbruck.

The mountains which fill up the south-eastern portion of the Tyrol are called the Carnic Alps. They begin on the south-west, on the banks of the Etsch, north-west of Verona, and extend partly within the Tyrol, and partly on its boundary-line with the Lombardo-Venetian kingdom, in a north-eastern direction to the source of the river Drau, where they turn to the east and leave the Tyrol. Very few summits of this extensive mountain region reach the snow-line. The most elevated is Monte Marmolata, which rises to 11,500 feet above the sea-level. The connection between this range and the Eastern Tyrolean Alps is formed by a moderately elevated and narrow ridge, which occurs near $12^{\circ} 12' E.$ long., and separates the sources of the Drau, which flows eastward, from those of the river Rienz, which runs westward and joins the Eisach at Brixen. On the north this ridge is connected with the extensive snow masses and glaciers which occur south of the Drei Herrn Spitz. Over this ridge runs the road which connects the Tyrol with Austria, running from Brixen to Lienz and Illyria. From this another road branches off at Toblach to the southward, which leads over the Pentalsteiner Pass to Treviso and Venice.

The mountain road over Monte Stilvio, or the Stilfsjerloch, was

constructed by the Austrian government between 1820 and 1825, for the purpose of establishing a direct communication between the Tyrol and the Valteline. This road passes over the elevated and snow-covered mountain masses which lie north-west of the Ortler Spitz, and its highest level rises to 9174 feet above the sea, or nearly 1500 feet above the snow-line. It is the loftiest carriage-road in Europe; but it has been abandoned for a new road constructed since 1853 through the defile of Tonale, the highest part of which is only 6250 feet above the sea-level. The old road over the Stilvio, besides being exposed to avalanches, was often impassable for months on account of the snow.

The largest rivers of the Tyrol are the Inn [AUSTRIA, vol. i. col. 719], and the ADIGE, or Etsch. The Inn enters the Tyrol by a very narrow valley at Finstermünz. Its course within the Tyrol is about 100 miles, and it becomes navigable for small river-boats at Telfs, about 20 miles above Innsbruck, and for larger river-boats at Hall, about 8 miles below Innsbruck. Below Kufstein it leaves the Tyrol and enters Bavaria. The Etsch runs east-south-east, and after its junction with the Eisach, below Botzen, southward, and here begins to be navigated. At Borghetto it leaves the Tyrol and enters Austrian Italy. The navigation of these rivers is difficult, and frequently interrupted by their rapidity, especially after the melting of the snow in the mountains.

As a great portion of the country, probably one-tenth, is always covered with snow, whilst its most southern valleys are hardly 500 feet above the sea-level, the climate of the Tyrol must differ greatly in different places. At Innsbruck the mean temperature of the winter is $30^{\circ} 5'$ Fahr., and that of the summer is 64° . The mean annual temperature is 49° , or one degree less than at London. At Trent the mean annual temperature is 53° .

All those parts which on the north are 7500 feet, and on the south 8500 feet above the sea-level, are always covered with snow. Lower down, to an elevation of 6000 feet above the sea, snow is found all the year round in places which are not much exposed to the sun, but in other places the declivities of the mountains are covered with grass and flowers. In the region between 6000 and 5000 feet trees do not grow, but there are some bushes, between which the soil is covered with grass that serves for pasture during two or three months in summer. There are no houses inhabited all the year round at this elevation. Fir-trees occur only at an elevation of between 5000 and 4000 feet, where a few permanent habitations are found, and some potatoes and vegetables are cultivated. The winter lasts in this region eight or nine months. Agriculture is carried on with success in all places below 4000 feet. Rye and barley are grown, and potatoes to a considerable extent. Apple- and pear-trees succeed at the elevation of 4000 feet, but plum-trees only up to 3800 feet, and walnut-trees to 3600 feet. The beech is found between 3000 and 4000 feet, and the oak between 1800 and 3000 feet above the sea-level. Wheat does not succeed above 3000 feet, and vines only between 800 and 1800 feet.

In the Tyrol, owing to the great unevenness of the surface, the air is in continual motion, and a calm day is a rare occurrence. The southern winds are much feared on account of the effect that they produce on the health, especially in the southern valleys. They are most frequent towards the end of summer and in the beginning of autumn, and dissolve in a few hours an immense quantity of snow, and the volume of water which is thus conveyed to the rivers produces extensive inundations in some parts of the valleys. The most fertile lands are in the valleys of the Inn and of the Etsch; the valley of the Etsch is the most fruitful.

Wheat, rye, barley, and oats are cultivated where the climate or stony soil is not unfavourable. In some parts buckwheat is grown to a great extent. Millet is also grown. Indian corn is the principal object of agriculture in the valleys on the border of Italy. Hops grow wild in the southern districts, where also tobacco is grown. Flax and hemp are cultivated. Fruit-trees abound in the southern valleys, and large quantities of fruits are exported to Bavaria. Near Trent are plantations of fig-trees, and at Roveredo chestnuts are very common. In these parts are also plantations of olive-trees and mulberry-trees. A considerable quantity of silk is annually collected. On the northern shores of the Lago di Garda are plantations of oranges, whose fruits get quite ripe. Wine is made in large quantities, and some sorts are very good, but they do not keep.

Cattle are of middling size and numerous: horses are less abundant, and better for the draught than for the saddle. Sheep and goats are very numerous, but pigs are not much kept. There are chamois, hares, marmots, partridges, and some large birds of prey, especially eagles.

The minerals are gold, silver, copper, lead, iron, calamine, coal, and rock-salt, mines of which are worked near Hall, about eight miles below Innsbruck. In the southern districts there is a valuable kind of marble, resembling that of Carrara, which is much worked.

Manufactures and Trade.—Though the inhabitants have a remarkable talent for mechanical arts, the Tyrol is not a manufacturing country. The chief industrial products, which are mostly designed for home consumption, are flaxen-yarn, linen, knit-caps and stockings, baskets, straw-hats, and wooden ware. The transit trade is considerable, and it is much facilitated by the admirable new roads. Besides

the export of the natural productions of the country, thousands of the inhabitants annually migrate as pedlars or hawkers, with gloves, carpets, carvings in wood, and engravings. The Tyrolese have a remarkable talent for the fine arts. Kneller and Angelica Kauffman were natives of the Tyrol. Education is generally diffused among the population. For higher education the crownland had a university at Innsbruck, 45 superior schools, 7 infant schools, and 3306 popular schools in 1847. Charitable institutions are numerous and well conducted.

Of the inhabitants about 600,000 are of German descent; the remainder are Italians. They are all Roman Catholics.

The Tyrolese are honest, frank, with a very independent spirit and a strong attachment to their native land. They are especially distinguished by their devoted attachment to the house of Austria. They are fond of the chase and of manly games, and are a poetical and musical people. The German part of the population which occupies the northern parts of the Tyrol is much given to drinking, smoking, and fighting; and frays, often attended with the infliction of dangerous wounds, are more numerous in the Tyrol than in all the other provinces of the empire together. The inhabitants of Southern Tyrol have more of the Italian in their manners, language, and dress.

History.—In ancient times the Tyrol formed part of Rætia, and was subdued by the Romans in the reign of Augustus. After being ravaged by successive hordes of barbarians, it was divided into several petty lordships, all of which acknowledged the supremacy of the dukes of Bavaria. In the 12th century the Tyrolese became immediate subjects of the empire, and the petty lordships were absorbed under two heads: the two families being united by marriage, the country was governed by one sovereign, the last of whom dying in 1335, left one daughter, Margaret Maultasche, who made over her dominions to her cousins, the dukes of Austria. Austria, after having remained in possession of it several centuries, was compelled to cede it by the peace of Presburg, in 1805, to Bavaria. The people, dissatisfied with the change of masters, rose in arms in 1809 under Andreas Hofer; but the great disasters of Austria left them without support, and the country was again occupied by the French and Bavarians, in whose possession it remained till 1814, when, to the great joy of the people, they were restored to the dominion of Austria, and reinstated in all their ancient privileges.

Towns.—*Innsbruck*, the capital, forms the subject of a separate article. [INNSBRUCK.] *Trent* is situated on the navigable river Adige, in a beautiful and fertile valley, which is surrounded with high mountains. The houses are very high, with flat roofs; the streets tolerably wide, and well paved with broad flag pavement for pedestrians. There are many handsome buildings in the city, and some churches worthy of notice. Among the former are the theatre, the episcopal palace, and the palace of Tertaga Tabarelli, built of red marble by Bramante d'Urbino. Of the thirteen churches the most remarkable are the cathedral, a large edifice in the old Greek style, entirely of marble, the building of which was begun in the 10th century and finished in the 16th; Santa Maria Maggiore, built entirely of red marble, with an extremely lofty chapel, which is much admired, and is memorable as having been the place in which the Council of Trent held its sittings from 1545 to 1562; the church of the seminary (formerly belonging to the Jesuits), adorned with a profusion of costly marble; the church Dell' Annunziata, the lofty cupola of which is supported by immense pillars of red marble, each consisting of a single block. Some of the churches and palaces have fine paintings. Trent is the residence of a bishop and chapter. The city has 13,000 inhabitants, whose occupations are the silk manufacture and the cultivation of the vine. There are in the city extensive sugar-refineries, a large tobacco-manufacture, and many distilleries of brandy and spirits of wine. Among the public institutions are a gymnasium, a lyceum, a Franciscan and a Capuchin convent, and various hospitals. *Borgo*, which is situated 16 miles E. from Trent on the Brenta, on the great road from Trent to Venice, has a population of 2500. *Botsen*, about 30 miles N. from Trent on the Adige, is a well-built town with about 10,000 inhabitants, a gymnasium, and manufactures of linen, silk, hosiery, and leather. A strong dyke, two miles in length, protects the town from the floods of the Adige. Near the town is the castle of Tyrol, which gives name to the crownland.

Roveredo is situated in the middle of the pleasant Lazzarina valley, which is planted with vines and mulberry-trees, on the river Leno, which flows through the town, and at a short distance from the left bank of the Adige, over which there is a stone bridge. The town, though not large, has many handsome houses, mostly built of marble. The new street, Corso Nuovo, in particular, is adorned with fine edifices: the theatre stands at the beginning of this street. The castle, which is surrounded with high walls, is worthy of notice. The town is the seat of several courts of justice, and has a gymnasium, three monasteries, a convent with a school for girls, a public library, and some charitable institutions. The inhabitants, about 8000 in number, manufacture silk, leather, and tobacco, and have a considerable trade in silk and twist. *Schwatz*, in the Lower Innthal, on the right bank of the Inn, about 13 miles below Innsbruck, is a well-built town, with two churches, some cotton manufactures, and about 4000 inhabitants, who are chiefly engaged in mining.

Brizen, a fortified town in the Pusterthal, about 40 miles S.E. from Innsbruck, on the road that traverses the Brenner Pass, has about

4000 inhabitants, a cathedral, a bishop's palace, and some iron- and steel-works.

The *Vorarlberg* comprises the north-western part of the crownland. It is drained by the Rhine, the Ill, and the Lech, a feeder of the Danube. The chief town, *Bregenz*, a well-built place of 3000 inhabitants, on the eastern shore of the Lake of Constance, near the mouth of the Aach, is a place of considerable trade; wooden houses, straw-plat, timber, and vine-poles are exported. Steamboats on the Lake of Constance touch at Bregenz. The other towns are—*Bludenz*, S. of Bregenz, on the Ill, with a castle and 2000 inhabitants; and *Feldkirch*, farther down the Ill, which has a gymnasium and a population of about 2000. The *Vorarlberg* takes its name from its position in front of the Arlberg, looking from Switzerland.

TYRONE, an inland county in the province of Ulster, Ireland, is bounded N. by the county of Londonderry, E. by Lough Neagh and the county of Armagh, S. by the counties of Monaghan and Fermanagh, W. by the county of Fermanagh, and N.W. by the county of Donegal. It lies within 54° 19' and 54° 57' N. lat., 6° 35' and 7° 56' W. long. Its greatest length from east to west is 60 miles, and from north to south 46 miles. The area, including part of Lough Neagh, is 1,260 square miles, or 806,640 acres, of which 450,286 acres are arable, 311,867 acres uncultivated, 11,981 acres in plantations, 710 acres in towns, and 31,796 acres under water. The population in 1831 was 304,468; in 1841 it was 312,956; in 1851 it was 255,734.

Surface, Hydrography, and Communications.—This county lies, for the most part, between the two mountainous districts which cross Ulster from east to west. The northernmost of these districts (that of Antrim, Londonderry, and Donegal) encroaches upon the northern border; and the southernmost (that of Down, Armagh, Monaghan, and Fermanagh) encroaches on the southern border. Outlying groups of mountains occupy portions of the intermediate district. Another group, connecting the two great mountain districts, crosses the county a little to the eastward of the centre, and divides the lower ground, which occupies most of the central and eastern parts of the county, into two parts—the plain or basin of Omagh in the centre, and the plain of Lough Neagh on the east. The diversity of surface renders the county very picturesque, lovely valleys alternating with brown moorlands, and narrow and precipitous gorges with extensive plains.

The plain of Lough Neagh extends south-eastward across the border of the county, which is here formed by the river Blackwater, into the adjacent county of Armagh; and south-westward to the foot of the mountains which border on the county of Fermanagh: northward it extends along the shores of Lough Neagh into the county of Londonderry. It is drained by the Ballinderry in the north, and the Blackwater in the south; both have the upper part of their course in the county and the lower part on the border; the length of the Ballinderry is about 25 miles, of the Blackwater 46 miles. The Blackwater is navigable for about eight miles, namely, below Charlemont, where the Ulster Canal, which skirts its course on the Armagh side for many miles above the junction, opens into it. A canal, 5 miles long, conveys the produce of the Coal Island collieries into the Blackwater.

The plain of Omagh is inclosed on nearly every side by mountains: it extends to the south-west into the county of Fermanagh, to the border of Lough Erne; and to the north-west to the border of the county of Donegal; and is drained by the streams which unite to constitute the Foyle.

The Camoan, or Camowen, the principal of the streams which unite to form the Foyle, rises in the mountains that separate the plains of Lough Neagh and Omagh, and flows westward, then northward, to the border of the county at Strabane; and after separating for some miles Tyrone from Donegal, enters the county of Londonderry. Its whole length, including Lough Foyle, is about 76 miles, of which above fifty miles are in this county or on the border. It is navigable below Newtonstewart, about thirty miles from its source. The lakes are numerous, but are all small except Lough Neagh, of whose surface 27,355 acres 1 rood 28 poles, or nearly 43 square miles, are assigned in the Ordnance Survey to this county. [NEAGH, LOUGH.]

The Dublin and Londonderry road crosses the county from south-east to north-west by Aghnacloy, Omagh, Newtonstewart, and Strabane; the Armagh and Coleraine road crosses the eastern side of the county, through Moy, Dungannon, and Cookstown. The cross-roads are numerous, and are kept in good repair. The Londonderry and Enniskillen railway enters the county near Strabane.

Geology and Mineralogy.—The mountains bordering on Londonderry and Donegal are chiefly of mica-slate interspersed with primitive limestone; the chief heights here are Slieve Sawel, 2236 feet; Mullagh Clogher, or Straw Mountain, 2083 feet; and Oughtdoorish, 1866 feet. The mountain group which bounds the plain of Omagh on the Doorish is 1119 feet; and north of the plain, Mullagh-carn, 1778 feet; Bessy Bell 1386 feet; Slieve Ard, 1381 feet; and Mary Gray, 826 feet. The hills north-east of the plain of Omagh, between the Owen Killew and the Glenelly, feeders of the Camoan, are of greenstone, and rise to the height of 1432 feet. There is some granite towards the north-eastern corner of the county. Rocks of old red-sandstone and sandstone conglomerate occupy the central district of the county, extending into Fermanagh.

The part of the plain adjacent to Lough Neagh, and to the river Blackwater as far up as Charlemont, is occupied by tertiary forma-

tions, probably lacustrine, consisting of beds of white, brown, and greenish-blue clay, alternating with white and gray-sand. Irregular beds of lignite occur, and this mineral is dug by the inhabitants, when other fuel is scarce, for their domestic use. To the north-west of the tertiary beds, the secondary formations, chalk, greensand, and lias crop out, being covered in places by masses of tabular trap. These are succeeded by the red-marl or new red-sandstone, which on the south-west immediately succeeds the tertiary beds. Between Dungannon and Stewartstown is a coal-field which, though small, contains more beds of workable coal than any other in Ireland, and affords coal similar to that of Ayrshire. The formations of the limestone group occupy nearly all the remainder of the plain, and extend south-westward to the neighbourhood of Clogher, where, contrary to its general character in Ireland, it rises into tolerably lofty mountains. The eastern and southern part of the plain of Omagh, and the extension towards Lough Erne, are occupied by the old red-sandstone, which abuts upon and in some places covers the granite, and protruded greenstone, which form the mass of the mountains that separate the two plains of Lough Neagh and of Omagh. The rest of the plain of Omagh and the mountains which on other sides environ it consist of mica-slate, covered in extensive tracts by the old red-sandstone, by the different members of the carboniferous limestone series, or by the millstone-grit. There are some quarries of inferior slate. Freestone and limestone are quarried in various parts of the county; the limestone of Cookstown is remarkable for the number and variety of its fossil remains. Traces of lead and iron are also found.

Climate, Soil, and Agriculture.—The climate is healthy, though moist, for much rain falls, and the lowlands are frequently flooded. The soil in the hilly districts and on the mountain slopes is in general sandy or gravelly; in the south and east it is a light fertile loam, and in the centre much of it is reclaimed moor or bog. Turf is the usual fuel, and is abundant. Grain is grown in the more fertile parts, and cattle are reared on the hills. The number of acres under crop in 1853 was 282,151, of which 4195 acres grew wheat; 150,977 acres oats; 2668 acres barley, bere, rye, peas, and beans; 44,840 acres potatoes; 16,859 acres turnips; 3838 acres other green crops; 24,131 acres flax; and 34,643 acres were in meadow and clover. In 1841 the plantations covered 14,652 acres, yielding oak, ash, elm, beech, fir, mixed timber, and fruit. The holdings in 1852 were 29,150, the stock on which was 22,378 horses, 1414 mules and asses, 148,745 head of cattle, 30,676 sheep, 30,880 pigs, 6187 goats, and 481,794 head of poultry.

Divisions and Towns.—The county is in the dioceses of Armagh and Derry, with a small part in that of Clogher, and contains 46 parishes. It is divided into four baronies:—Clogher; Dungannon, Upper, Lower, and Middle; Omagh, East and West; and Strabane, Upper and Lower. The principal towns are—STRABANE, DUNGANNON, COOKSTOWN, and OMAGH, which, with CASTLEBERG, CLOGHER, and GORTIN, are noticed under their separate names. The following are some of the smaller towns and more important villages, with the population of each in 1851:—

Arboe, a village about 6 miles N.E. from Stewartstown, has a church, a Presbyterian meeting-house, and a Roman Catholic chapel, which has two altars in the open air. Here are the remains of a monastery, said to have been founded by St. Columb, and to have received his body: the walls of the church and a cross are yet standing. *Aughier*, a small market and post-town, population 614, stands on the Blackwater, near its head, 2 miles N.E. from Clogher, and, prior to the Union, was a parliamentary and municipal borough. Four fairs are held here in the course of the year. In the neighbourhood are, Augher Castle, built in 1618, now converted into a mansion; the hill of Knockmanly; and Lumford Glen, a most picturesque spot. *Aughnacloy*, a market and post-town, on the left bank of the Blackwater, 20 miles S.E. from Omagh: population, 1704. It contains some good houses, the parish church of Carranteel, a Roman Catholic chapel, a Presbyterian meeting-house, two Wesleyan chapels, several schools, a dispensary, a loan-fund office, and a convenient market-house. Besides the weekly market there is a monthly fair for live stock. *Ballygowley*, a small market and post-town, about 4 miles N.W. from Aughnacloy: population, 768. It has some well-built houses, a neat parish church, a Presbyterian meeting-house, a dispensary, and some schools. The manufacture of gloves is carried on. There is a considerable sale of linen. *Caledon*, a market and post-town, between Armagh and Aughnacloy, on the left bank of the Blackwater: population, 999. The town is extremely neat and well built. There are a handsome church, a Roman Catholic chapel, a Methodist meeting-house, a dispensary, and several schools. Near the town is Caledon House and demesne, the residence of the Earl of Caledon. There is a large flour-mill, and round the town are a number of limestone quarries. *Coal Island*, a mining village and post-town, 2 miles S. from Stewartstown: population, 627. At this village, and the neighbouring one of *Drumglass*, are the two principal collieries of Tyrone; a canal, 4 miles in length, was cut to the Blackwater to afford facilities for the transport of the coal. There is an iron-work in the village. *Drumore*, a village and post-town, about 9 miles S.W. from Omagh: population, 581. It has an old church, a Presbyterian meeting-house, a Methodist meeting-house, a Roman Catholic chapel, several schools, and a dispensary. Five fairs are held in the course of the year. *Fintona*, a

market and post-town, on a feeder of the Drumragh, 9 miles S. by W. from Omagh: population, 1504. Unbleached linens are woven and sold in considerable quantity in the market, and at the monthly fairs. There are a parish church, a Presbyterian meeting-house, a Methodist meeting-house, a Roman Catholic chapel, a dispensary, and a loan-fund office. *Five-Mile-Town*, a small market and post-town, about 6 miles S.W. from Clogher: population 703. It has a chapel of ease. A considerable number of the inhabitants are employed in the linen trade. It has eight fairs yearly. *Moy*, a market and post-town, is on the banks of the Blackwater, over which is a bridge communicating with the town of Charlemont, in Armagh: population, 833. It contains the parish church, a Roman Catholic chapel, several Dissenting meeting-houses, and a commodious market-house. Considerable trade is carried on in coal, corn, timber, salt, iron, and slate; the market is well supplied, and there is a monthly fair for live stock, especially for horses. *Newtonstewart*, a market and post-town, is on the bank of the Strule, over which there is a bridge, 10 miles from Omagh, on the mail-road to Londonderry: population, 1402. The houses are neat and well built; and the town contains the parish church of Ardstraw, a Roman Catholic chapel, two Presbyterian and two Methodist meeting-houses, a dispensary, and the ruins of an ancient castle. *Pomeroy*, a village and post-town, on the road from Dungannon to Newtonstewart, about 8 miles from the former town: population, 505. There are a church, a Presbyterian meeting-house, a Roman Catholic chapel, a school, and a dispensary. Petty sessions are held monthly, and there is a monthly fair. *Stewartstown*, a market and post-town, about 5 miles S.E. from Cookstown: population, 1022. Some linens and mixed fabrics of linen and cotton (called unions) were formerly made, but the manufacture has declined. In the neighbourhood are several limestone quarries. Stewartstown contains a number of well-built houses of stone, slated; the parish church of Donaghery, a Roman Catholic chapel, two Presbyterian meeting-houses, a school-house, a dispensary, a loan-fund office, and a market-house. Fairs are held monthly, and petty sessions every fortnight. The ruins of an old monastery and of Mountjoy Castle are near the town. *Tyrllick*, a small post-town, between Omagh and Enniskillen, about 8 miles S.W. from Fintona: population 449. The parish church is about a mile from the town, but there are two meeting-houses, a Roman Catholic chapel, schools, and a dispensary. Fairs are held monthly, and petty sessions every fortnight. Near it are the ruins of Tyrllick Castle.

Divisions for Ecclesiastical and Legal Purposes.—Tyrone returns to the Imperial Parliament two members for the county at large, and one for the borough of Dungannon. It is in the north-western circuit. The assizes are held at Omagh, where the county jail is. Quarter sessions are held there, and at Clogher, Dungannon, and Strabane, which three towns have bridewells. Petty sessions are held in nineteen places. There is a resident magistrate at Omagh. The Lunatic Asylum and a fever hospital are at Omagh; fever hospitals are at Aughnacloy and Strabane, and dispensaries at twenty-two places. There are savings banks at Clogher, Cookstown, Dungannon, and Strabane. The Union workhouses are at Castleberg, Clogher, Cookstown, Dungannon, Gortin, Omagh, and Strabane. The county is in the military district of Belfast, and there is a barrack station at Omagh. The staff of the county militia is stationed at Caledon. In September, 1852, there were 270 National schools in the county, attended by 10,731 male and 8,493 female children.

History and Antiquities.—This county seems to have been included in the territory of the Darnii, a nation mentioned by Ptolemaeus. At a subsequent period, parts of it were known by the names of Hy-Briun and Hy-Fiachria (the latter being the country about the river Derg); and the whole appears to have been called Kinel Eoguin, or Tir-oen, modernised Tyrone. About 1177 the county was invaded by John de Courcy, one of the Anglo-Norman invaders; but appears to have remained in the hands of the O'Neills of Tir-oen, who were among the most powerful of the native chieftains, until 1601, when the Lord-Deputy Mountjoy compelled him to submit. Tyrone was comprehended in the great settlement made in Ulster, after the accession of James I. [ULSTER], and was in great part parcelled out among 'undertakers' (that is, persons who undertook to form settlements or colonies), partly Scotch and partly English.

In the great rebellion of 1641 Dungannon Fort was seized by Sir Phelim O'Neill. In 1646 the Scots and English were defeated by the Irish insurgents at Benburb, with the loss of above 3,000 men. This victory restored to the insurgents a predominance in Ulster, which however they finally lost on the arrival and success of Cromwell in 1649. In the revolutionary war the army of James, after raising the siege of Londonderry, retired to Strabane, in this county.

TYRUS, TSUR, TYRE, a city on the coast of Phœnicia, 24 Roman miles S. from Sidon. The most ancient name of the city seems to be *Sar*, which is supposed to be the root of Syria. Tyre is called in the Old Testament the 'daughter of Sidon;' and Justin states that it was a colony of Sidon. In process of time however Tyre exceeded the mother city in importance, and came to be the chief city of Phœnicia. In the time of David and Solomon it was a very great commercial emporium, and was governed by a king (Hiram), who maintained friendly relations with those princes, and assisted Solomon in building the temple and his palaces, and in his naval expeditions. About half a century later Ahab married Jezebel,

the daughter of the king of Tyre and Sidon. There seems to have been a constant commercial intercourse between the Tyrians and the Israelites. Tyre is repeatedly mentioned by the Hebrew prophets, who speak of its strength, wealth, beauty, and its flourishing commerce, and threaten it with destruction for its pride.

The original site of Tyre was on the mainland, but at some unknown period (probably before the time of Solomon) another city of the same name was built on a narrow island, about a mile in length, parallel to the shore, and nearly half a mile distant from it, and not quite four miles from the ancient city. The latter was distinguished by the name of Old Tyre, which it already bore in the time of Shalmaneser, the Assyrian conqueror, who took it. He also blockaded the insular city for five years, but was at last compelled to raise the siege (about B.C. 720-715). The insular city, which from its position soon eclipsed Old Tyre, was again besieged by Nebuchadnezzar for thirteen years. It was taken, after a siege of seven months, by Alexander the Great (B.C. 332), who, in order to attack the city by land as well as by sea, connected the island with the mainland by a mole, formed chiefly out of the materials of Old Tyre, which was razed to the ground for the purpose. This mole was consolidated in the course of time

into the isthmus which still connects the former island to the mainland. After the death of Alexander, Tyre came under the power of the Seleucids, and subsequently under that of the Romans. It was still a strong fortress, and (in the time of Strabo) a flourishing port. Septimus Severus sent thither a Roman colony, as his medals show. It afterwards became the seat of a Christian bishop, and was, in the time of St. Jerome, the most beautiful city of Phœnicia. During the Crusades it suffered several sieges, and remained in the hands of the Christians much longer than any other city of Phœnicia. Its fortifications were almost entirely destroyed by the Mamelukes about the end of the 18th century. It is now a small insignificant place; but several new stone houses have been recently erected on the north side of the peninsula.

The Tyrians, in ante-historic times, colonized the coasts of Spain, Italy, and Africa. Their commerce reached to Britain and India. Their most famous colony was CARTHAGE.

TYWARDREATH. [CORNWALL.]

TZANA or ZANA, LAKE. [ABYSSINIA; NILK.]

TZARSKOSELO. [PETERSBURG, Province of.]

UBEDA. [JAEN.]

UBES, ST., or SETUBAL. [ESTREMADURA, Portuguese.]

UCAYALI, RIVER. [AMAZONAS; PERU.]

UCKFIELD, Sussex, a village and the seat of a Poor-Law Union, in the parish of Uckfield, is situated on the left bank of the river Ouse, in 50° 58' N. lat., 0° 6' E. long., 9 miles N. by E. from Lewes, and 41 miles S. by E. from London by road. The population of the parish in 1851 was 1590. The living is a perpetual curacy in the archdeaconry of Lewes and diocese of Chichester. Uckfield Poor-Law Union contains 11 parishes and townships, with an area of 74,230 acres, and a population in 1851 of 17,631. The church, a plain stone building, was enlarged in 1840. The Wesleyan Methodists and Baptists have places of worship; and there are National and Infant schools, a Grammar school, and a savings bank.

UDEWALLA. [SWEDEN.]

UDINE, or FRIULI, a province of Austrian Italy, formerly included in the Venetian territories, is divided into 21 districts, has an area of 2519 square miles, and a population of 429,844.

Udine, the capital, situated in an elevated plain near the foot of the Carnic Alps, and about 20 miles from the sea-coast of the Adriatic, on the high road from Venice to Vienna, is a walled town, between four and five miles in circumference, and has a population of about 25,000. Upon an eminence in the middle of the town is the old castle, once the residence of the patriarchs of Aquileia, who were for several centuries lords of Friuli. Udine is a bishop's see: it has some fine churches, among others the cathedral and the church of San Pietro Martire; several palaces of the nobility; a handsome square lined with arcades and adorned with a fountain; several good streets; a communal gymnasium, a royal lyceum, a clerical seminary, three colleges for the education of females, several public libraries, a museum, a philharmonic institute, a monte-di-pietà, and a theatre. A considerable trade in silk, the produce of the country, is carried on at Udine. There are silk and leather manufactories, and a sugar-refinery. About two miles from Udine is the village of Campoformio, memorable for the treaty of peace of 1797 between General Bonaparte and the Austrian plenipotentiaries. *Cividale* is noticed under FRIULI. *Porto-donone*, near the borders of the province of Treviso, is a thriving town of 5000 inhabitants, with manufactories of linen and paper. *Spilimbergo*, on the banks of the Tagliamento, is a town of considerable trade; population, 4000. *Palma Nuova*, a fortified town, important for its situation on the eastern frontier of Italy, has a population of 3000.

The province of Udine is covered in the north-east by the Carnic Alps and their ramifications. In the south are several plains which become marshy along the shore of the Adriatic. The principal river is the Tagliamento, but all the streams of the country are little more than torrents. Its forests, pastures, cattle, fish, game, and corn are the chief sources of wealth in the province. Wheat, rye, maize, oats, rice, buckwheat, hemp, flax, chestnuts, pulse of all kinds, silk and honey, are produced; and some good wine is made. The minerals are iron, copper, marble, limestone, and siliceous earth used by potters. The inhabitants of the mountain districts manufacture linen and all kinds of woodwork, and common pottery. The country is further noticed under FRIULI. The projected railway from Trieste to Venice will necessarily cross the south part of the province of Udine.

UGENTO. [OTRANTO, TERRA DI.]

UIST, the name of two of the larger HEBRIDES, belonging to GEOG. DIV. VOL. IV.

Inverness-shire, and distinguished as North Uist and South Uist. North Uist is separated from Long Island by the Sound of Harris, and from Benbecula by a narrow strait which is dry at low water. South Uist lies south of Benbecula, from which it is separated by a narrow strait, and at its southern extremity it is separated by a strait from the little island of Barra. These islands are separated on the east from the Isle of Skye by the Little Minch, here about 15 miles broad; on the west they are washed by the expanse of the Atlantic. They lie between 57° 7' and 57° 48' N. lat., 7° and 7° 32' W. long.

North Uist is 16 miles long from east to west, and 13 miles wide from north to south in direct lines: the population in 1851 was 3302; the entire parish, which includes eight other islands, had a population of 3918. It is much intersected by inlets of the sea, several of which form commodious harbours. The hills on the east side of the island are from 300 to 700 feet high; Mount Eval, in the south-east, is above 2000 feet. On the west side of the island lie the pasture and cultivated lands, with a shore generally low, but having a few bold rocky headlands. The island is chiefly formed of gneiss: but at the entrance of Loch Maddy are two basaltic rocks rising out of the sea. In the interior are numerous fresh-water lakes, in some of which are islands containing red-deer. There are a parish and also a government church, a parochial and several other schools, some of which possess libraries. There are several antiquities, as upright stones, rude crosses, and cairns; 'duns,' and 'Uaighs,' or Picts' houses.

South Uist, population of the island 4006 in 1851, is about 22 miles long from north to south, and about 8 miles broad from east to west. The eastern side is rugged and mountainous: Hecla, the highest mountain in the island, is 2500 feet high; other mountains are from 1200 to 1300 feet high. The eastern coast is bold and irregular; its three principal inlets, lochs Skipport, Eynort, and Boisdale, are good harbours: the western coast has a more regular outline, and has, except about some rocky headlands, a low sandy shore. The island contains numerous lakes. The island is formed of gneiss, coarse granite, and hornblende; mica-slate occurs. The chief articles produced are potatoes, bere, and oats. The population of the entire parish, which includes the islands of Benbecula, Eriskey, and Flodda, was 6173 in 1851. There are two churches attached to missionary districts, and three chapels for Roman Catholics, who form two-thirds of the population. The population of North and South Uist has been considerably reduced of late years by emigration.

UITENHAGE. [CAPE OF GOOD HOPE.]

UJIJAR. [GRANADA.]

UJITZA. [SERVIA.]

UKRAINE, a name probably derived from the Polish (in which it signifies boundary) is a term which has been in general use since the conquest of Kiev by the Lithuanians, and at that time designated the frontier towards the Tartars and other nomad tribes. Subsequently the name Ukraine was applied to the extensive and fertile tract of land on the banks of the Dnieper, together with the territory of the Cossaks, with rather indefinite boundaries. These countries, which till the time of Peter the Great were a constant source of quarrels between Russia and Poland, constitute the greater part of Little Russia, that is, the four governments of Kiev, Podolia, Poltawa, and Charkow. This tract is remarkable for its rich pastures, and a fine breed of horses and horned cattle. The country is described in the articles KIEV; PODOLIA; POLTAWA; CHARKOW.

ULEABORG. [FINLAND.]

ULEY. [GLOUCESTERSHIRE.]

ULLESWATER. [CUMBERLAND; WESTMORLAND.]

ULM, a city in the kingdom of Würtemberg, situated in 48° 24'

N. lat., 10° 0' E. long., in a beautiful and fertile country at the south-eastern foot of the Swabian Alps, on the left bank of the Danube, which here forms the boundary between Würtemberg and Bavaria, and is joined by the Blau, which flows through the town. The Danube is here navigable, being about 200 feet broad and 12 feet deep. The city is nearly of an elliptical shape, and the ground on which it stands is tolerably level. Previously to the year 1805, it was strongly fortified, but the works have been nearly demolished. Like most of the old German towns, it has in general irregular and crooked streets, and antique-looking wooden houses; there are however some broad handsome streets. Within the city there are three stone and two wooden bridges, over the Blau; but the handsomest is a stone bridge of three arches over the Danube, which connects the town with the Bavarian village of New Ulm, on the right bank of the Danube. The cathedral of Ulm, a very fine specimen of ancient gothic architecture, and one of the largest and loftiest churches in Germany, is 485 feet long, including the choir, 200 feet broad, and 150 feet high above the pavement of the nave. The steeple is 337 feet high, and a splendid monument of German art in the middle ages. The minster, or cathedral, was built in the interval 1377-1488. It contains many curious monuments and works of art; paintings by old German masters, admirable carved-work, painted-glass windows, and a remarkably fine organ. The town-house is a very ancient and spacious edifice. The German-house (das Deutsche-haus), containing the principal public offices, is considered the handsomest and most regular building in the city. The theatre is adorned externally with Corinthian columns. Besides the minster there are two Lutheran and two Roman Catholic churches. There are in Ulm a gymnasium, a museum, a city library, a large hospital, and numerous charitable institutions. The city has about 14,000 inhabitants, who manufacture linen, silks, snuffs, tobacco, tobacco-pipes, porcelain, &c. This city has a very considerable trade; great quantities of manufactured goods and of the productions of the country are sent down the Danube to Vienna. Ulm capitulated to Napoleon (Oct. 17, 1805); General Mack and the Austrian garrison of 28,000 men were made prisoners of war. It is connected with Stuttgart, Augsburg, and Munich by railways.

ULSTER, the northernmost of the four provinces into which Ireland is divided, comprises the following nine counties:—Antrim (including Belfast and Carrickfergus), Armagh, Cavan, Donegal, Down, Fermanagh, Londonderry, Monaghan, and Tyrone, to the separate articles on which we refer for more particular information. Ulster is bounded N. and W. by the Atlantic Ocean, E. by the Irish Sea, S.E. by the province of Leinster, and S.W. by that of Connaught. It is comprehended between 53° 45' and 55° 25' N. lat., 5° 25' and 8° 50' W. long. The area comprises 5,475,438 acres, of which 1,851,995 acres were under crops in 1851. The population in 1851 was 2,011,791.

Ulster is mountainous. Two mountain groups cross the province from east to west. The northernmost, which passes through the counties of Antrim, Londonderry, and Donegal, is divided into three parts by the valleys or depressions through which the Bann and the Foyle reach the sea. The mountains of Donegal are the loftiest: several of the peaks rise to the height of more than 2000 feet; and one (Erigal) is 2460 feet above the level of the sea. The coast of Donegal is very rugged, marked by deep inlets, as Lough Swilly and Lough Foyle, stupendous cliffs, bluff headlands, and numerous islands. The southern mountains commence on the east coast, in the county of Down, where Slieve Donard, one of the Mourne Mountains, rises to the height of 2796 feet above the level of the sea. A lower and comparatively level district intervenes between the northern and southern mountains, and occupies a considerable part of the counties of Down, Armagh, and Tyrone. LOUGH NEAGH is in this central low country.

Ulster was one of the five provinces into which, at an early period, Ireland was divided. In this province the northern Hy Nialls, or O'Neills, had their seat. In the Anglo-Norman invasion, John de Courcy conquered part of the province. He assumed or received the title of Earl of Ulster; but on his decease his lands and title were transferred to Hugh de Lacy, and the title was inherited by the De Burgh and Mortimer family, from the last of whom it came to the dukes of York, and with them to the crown of England. The counties were formed at various periods. Several insurrections having led to extensive forfeitures in the six counties of Donegal, Tyrone, Coleraine (now Londonderry), Fermanagh, Cavan, and Armagh, it was determined to bestow them on Englishmen or Scotchmen, or 'Servitors in Ireland,' or on natives of Ireland, who were to be made freeholders. All were termed 'undertakers,' to whom were severally assigned lots of 1000, 1500, and 2000 English acres, upon different tenures, on certain conditions, including the settling of tenants, who were to be Scotch or English, except on the lands of the 'Irish servitors,' who might take English or Irish tenants at their choice. Large grants were assigned to the corporation and some of the trading companies of the city of London, from which the town and the county of Derry received the distinctive prefix of their name, Londonderry. Accordingly so many English and Scotch settlers were permanently established as have stamped a peculiar character on the population of Ulster, which is at present the great seat of manu-

facture in Ireland, and the part in which the Protestant religion (Episcopal and Presbyterian) is most prevalent.

The population of the counties and two chief towns in the province is given in the article IRELAND.

ULSTER, NEW. [ZEALAND, NEW.]

ULVERSTONE, Lancashire, a market-town and the seat of a Poor-Law Union, in the parish of Ulverstone, is situated in a district called Furness, in 54° 11' N. lat., 3° 4' W. long., distant 22 miles N.W. from Lancaster, and 272 miles N.W. by N. from London. The population of the town in 1851 was 6433. The living is a perpetual curacy, in the archdeaconry of Richmond and diocese of Chester. Ulverstone Poor-Law Union contains 27 parishes and townships, with an area of 135,043 acres, and a population in 1851 of 30,524.

The town of Ulverstone rose to prosperity on the dissolution of Furness Abbey. In the town are a theatre, an assembly-room, a subscription library, and a neat building for the savings bank. The church has been almost entirely rebuilt in the present century; the tower and a Norman doorway remain of the old edifice. A new district church, erected in 1832, possesses a handsome tower and spire; there are chapels for Wesleyan Methodists, Independents, Quakers, and Roman Catholics; a Grammar school; National schools; and schools supported by the Roman Catholics. The market is held on Thursday, for grain and provisions; there are two large yearly cattle-fairs. A canal from the estuary of the Leven enables large vessels to come up and discharge their cargoes in a spacious basin, almost close to the town, from which there is a considerable export of iron-ore, iron, and slate. Petty sessions and a county court are held.

UMMERAPOORA. [AMARAPURA.]

UNITED PROVINCES. [NETHERLANDS.]

UNITED STATES OF NORTH AMERICA, a republic formed by the federal union of 31 sovereign states, with five territorial appendages. It occupies the middle portion of North America; and extends between 25° and 49° N. lat., 67° and 125° W. long.; from the Atlantic Ocean on the east to the Pacific Ocean on the west. It is bounded N. by British America, S.W. by the republic of Mexico, and S. by the Gulf of Mexico. The boundary lines between the United States and British America, and the United States and Mexico, are described under BRITISH AMERICA and MEXICO. The greatest width of the United States from east to west is 2900 miles, the greatest length from north to south is 1730 miles. The entire area of the United States has been very differently estimated. As estimated by the United States authorities for the Census office in 1850, it amounted to 3,306,865 square miles. But a more elaborate and careful estimate made by the United States 'Topographical Bureau,' January 1854, reduces the area to 2,936,166 square miles, and if to this be added the additional territory of 27,500 square miles, ceded by Mexico by treaty in July 1854, the total area at the present time will be 2,963,666 square miles. The population in 1850 was 23,191,876, or 7.90 to a square mile: but this does not include the native Indians, who were estimated by the Indian Commissioner in 1853 at 400,764. The table at the head of the following page shows at a glance the states and territories which are comprised in the Union, with the extent of each, the number and character of its population in 1850, and various other particulars.

The areas of several of the states and territories in this table it will be found on comparison differs in some instances considerably, from those given under the respective titles of the states in this work. For that difference we are clear of responsibility. All the areas of the states were given from the official reports published by the government of the United States. Those in the following table are given from the new computations made by the United States 'Topographical Bureau,' with a view to obtaining greater accuracy; and just made public in the 'Statistical View of the United States,' drawn up and printed by order of Congress.

Surface, Coast Line, &c.—The physical geography of the United States has been given generally under AMERICA; and more particularly under the heads of the several states and territories as enumerated in the following table; of the rivers COLUMBIA; MISSISSIPPI; MISSOURI, &c.; the ALLEGHANY, and ROCKY MOUNTAINS, &c.; the lakes ERIE; ONTARIO, &c. Here it will suffice to remark that this extensive region is naturally divided into three parts, widely differing in their characteristic features, by the Alleghany and Rocky Mountain ranges:—in the centre the enormous drainage basin of the Mississippi, and on either side of it the eastern and western sea-boards. There is a remarkable parallelism between the physical structure of this part of the northern continent of America and that part of the southern contained between the parallel of the head-waters of the southern affluents of the Amazonas and the parallel of the embouchure of the Rio de la Plata: the Rocky Mountains correspond to the Andes; the Alleghany range to the mountains of Brazil; and both in the northern and southern continents the parallel mountain-systems are connected by a tract of undulating country of no great elevation, forming a watershed between river-systems which flow respectively to the north and to the south. The total area of the United States, as already stated according to the revised calculations of Colonel Abert, of the United States Topographical Engineers, is 2,963,666 square miles, which he thus apportions:—Area of the Pacific Slope, or of the region watered by rivers falling into the Pacific, 783,702 square miles; the Mississippi Valley, 1,217,562 square miles; and the region whose waters fall into the Atlantic, 952,602

square miles, of which 514,416 square miles belong to the Atlantic slope proper, 112,649 square miles to the Northern Lake region, and 325,537 square miles to the region whose waters fall into the Gulf of Mexico, east and west of the Mississippi. The main shore line of the United States on the Atlantic coast amounts to 6861 statute miles, on the Pacific to 2281 miles, on the Gulf of Mexico to 3467 miles; the island shore on the Atlantic to 6328 miles, on the Pacific to 702 miles, and on the Gulf of Mexico to 2217 miles, giving a main shore line of 12,609 miles, and an island shore-line of 9247 miles.

Agriculture, Manufactures, and Commerce.—The raw products of the industry of the United States may be classed under the heads—Mines and quarries; agriculture and horticulture; fisheries; the forest. The products of the mines consist of gold, iron, lead, and other metals; coal, kitchen salt, and stone for building. In 1850 the number of miners was 77,410, of whom 14,437 were coal-miners (11,753 belonging to Pennsylvania); the iron- and lead-miners are not distinguished in the Census Report. Since the discovery of gold in California, that metal has added very largely to the wealth of the Union. Gold is also found in small quantities in Virginia, North and South Carolina, Georgia, Alabama, Tennessee, and Illinois. There are rich quicksilver-mines in California. The most productive iron-mines are in Massachusetts, Vermont, New York, Pennsylvania, Tennessee and Ohio. Lead is most abundant in Illinois, Missouri, and Iowa. Pennsylvania, Ohio, and Virginia, are the great coal states, but it occurs in several others. Salt and stones are more equably diffused through the settled parts of the Union.

Agriculture employed of the free male population over 15 years of age 2,400,583 persons in 1850. In no census have the occupations of slaves been returned; but Mr. De Bow, the Superintendent of the Census of 1850, is of opinion, as the result of a well-considered examination, that "about 2,500,000 slaves are directly employed in agriculture, including males and females and persons of all ages. Slaves under 10 and over 60 are seldom employed industrially." Of the above about 1,815,000 slaves are employed in the cultivation of cotton, 350,000 in that of tobacco, 150,000 of sugar, 125,000 of rice, and 60,000 of hemp. The number of acres of improved land in farms was 113,082,614; of unimproved, 180,528,000 acres; the average number of acres to each farm being 213. Only about one-thirteenth of the whole area of the organized states is improved, and about one-eighth more is occupied and not improved. The principal grain-crop is maize (Indian corn), about 31,000,000 acres of land being in 1850

employed in its growth, and the crop raised amounting to 592,071,104 bushels; of wheat about 11,000,000 acres were cultivated, and the total crop raised was 100,485,944 bushels: of rye 14,188,813 bushels were raised; oats, 146,584,179 bushels; barley, 5,167,015 bushels; buckwheat, 8,596,912 bushels. The cultivation of rice is confined to the slave states. The total quantity of rice raised in 1850 was 215,313,497 lbs.; of which 159,930,613 lbs. were raised in South Carolina. Of potatoes 65,797,896 bushels, and of sweet potatoes 38,268,148 bushels, were grown. Of peas and beans, 9,219,901 bushels. Tobacco was cultivated on 400,000 acres; the total crop was 199,752,655 lbs. Cotton was cultivated over 5,000,000 acres. Of ginned-cotton the quantity packed was 2,469,093 bales of 400 lbs. each. Of cane-sugar 247,577,000 lbs. were produced, of which Louisiana alone produced 226,001,000 lbs.; of maple-sugar, 34,253,436 lbs.; and of molasses 12,700,896 gallons were made, 10,931,177 gallons being made in Louisiana. Of wine 221,249 gallons were made. Of hops 8,497,029 lbs. were grown. Of hay 13,838,642 tons were made. Of flax-seed 7,709,676 lbs. were gathered. The value of the three staple products of the Union in 1850 was respectively about—maize, 296,000,000 dollars; wheat, 100,000,000 dollars; and cotton, 98,000,000 dollars. The value of orchard-products was 7,723,136 dollars; of market-garden produce, 5,280,030 dollars.

The live stock consisted of 4,336,719 horses; 559,331 asses and mules; 6,385,094 milch cows; 1,700,744 working oxen; and 10,293,069 other cattle; 21,723,220 sheep; and 30,354,213 swine. The products of animals were returned as—Butter, 313,845,306 lbs.; cheese, 105,535,898 lbs.; wool, 52,516,959 lbs.; bees-wax and honey, 14,853,790 lbs.; silk-cocoons, 10,843 lbs.

Manufactures, mining, and the mechanic arts, employed of the free population, over 15 years of age, 719,479 males, and 225,512 females in 1850. The entire capital invested in manufactures was returned at 527,209,193 dollars. The number of establishments of every description producing any kind of manufactured article to the amount annually of 500 dollars, was 121,855. The cotton manufacture employed 33,150 males and 59,136 females, the states chiefly engaged in the manufacture being Massachusetts, New Hampshire, Rhode Island, Pennsylvania, Connecticut, and New York, their respective rank being in the order given. The woollen manufacture employed 22,878 males and 16,574 females, the leading states engaged in the manufacture being Massachusetts, New York, Connecticut, and Pennsylvania. The iron manufacture employed a large number of hands,

namely, pig-iron, 20,298 males and 150 females, iron-casting, 23,541 males and 48 females, and wrought iron, 16,110 males and 138 females. The fisheries employed 20,704 males and 429 females.

The commerce of the United States has gone on rapidly extending, until next to that of Great Britain it is the largest in the world. In the year ending June 30, 1853, the total imports of the United States amounted to 267,978,647 dollars; the exports to 230,976,157 dollars, of which 218,417,697 dollars were of domestic produce, and 17,558,460 dollars of foreign produce. The lake and river commerce was estimated at 653,976,202 dollars. Of the foreign trade, considerably more than half is with Great Britain and its dependencies. In 1853 the imports from Great Britain amounted to 130,265,340 dollars, and from the colonies to 12,954,138 dollars; the exports to Great Britain were 121,302,271 dollars, and to the colonies, 24,251,353 dollars. The next greatest amount of foreign trade was with France and its dependencies, the imports from which amounted to 33,525,999 dollars, and the exports to 27,044,479 dollars. The total amount of tonnage engaged in the foreign trade was 4,407,010. The number of ships built in the Union during 1853 was 1710, of the aggregate burden of 425,572 tons. The total number of American vessels entered from foreign countries in 1853 was 9955, of foreign vessels, 11,722; the clearances during the same year were, of American vessels, 10,001, of foreign vessels, 11,680. There were in 1854 of canals 4798 miles; of railways 17,317 miles completed, and 12,526 miles of railway in course of construction; and there were 89 lines of electric telegraph, having 23,261 miles of wire.

Education, Religion, &c.—The educational statistics may be stated very briefly. In 1850 there were in the United States 239 colleges, having 1678 teachers and 27,821 pupils; 80,978 public schools, having 91,966 teachers and 3,335,011 scholars; and 6,085 academies and private schools, having 12,260 teachers and 263,096 scholars. The number of newspapers was, daily 254, with an annual circulation of 235,119,966 copies; 115 tri-weekly, with an annual circulation of 11,811,140 copies; 31 semi-weekly with an annual circulation of 5,565,176 copies; and 1902 weekly, with an annual circulation of 153,120,708 copies. There are besides 95 semi-monthly, 100 monthly, and 19 quarterly periodicals.

There is no established system of religious worship in the United States, entire freedom of faith and worship being guaranteed by the Constitution. The great majority of the population is Protestant, but the proportion of the respective religious bodies can only be estimated by the number of their churches and church accommodation, which, as the provision for worship is wholly voluntary, may be supposed to be nearly proportionate to the requirements of the several sects. From the Census Report it appears that the Methodists and Baptists have together more than half of the entire number of churches. "In New England the Congregationalists preponderate; in all other parts, except the Territories, the Methodists; in the Territories and California the Catholics. The Baptists are second in rank everywhere, except in the Middle States and California." The principal sects, arranged according to the number of churches, are as follows:—Methodists 13,338 churches, affording accommodation for 4,354,101 persons; Baptists 9360 churches, with accommodation for 3,248,580 persons; Presbyterians 4863 churches, with accommodation for 2,079,504 persons; Congregationalists 1706 churches, with accommodation for 801,835 persons; Episcopalians 1461 churches, with accommodation for 644,598 persons; Roman Catholics 1227 churches, with accommodation for 675,721 persons; Lutherans 1221 churches, with accommodation for 535,180 persons; Quakers 723 churches, with accommodation for 287,073 persons. In all there are 38,183 churches, with accommodation for 14,270,139 persons.

History.—The British colonies of North America, prior to the revolution, were in number 13: Virginia, the oldest, having been founded in 1607; Georgia, the newest settlement, in 1732. The settlers in them were scattered in a straggling line, along the sea-board, from 31° to 44° N. lat. Albany was the western termination of the settled country in the north; the Blue Ridge, in Virginia; in the Carolinas and Georgia the breadth of the settled countries from the sea was still less. The varied circumstances under which the colonies had been originally planted, and the difficulty of intercourse between those which were at a distance from each other, had promoted a striking diversity of provincial character. But the institutions of all the colonies were calculated to develop both the taste and talent for political business. In all new settlements it is found expedient to task private individuals with the discharge of functions which in more matured societies devolve upon professional men. The range of jurisdiction intrusted to justices of the peace was necessarily much wider in the colonies than in the mother country; the licence to practice as legal agents was more easily obtained. In all the colonies, elective assemblies participated largely in the legislative and financial authority. An organised militia was required for defence against the aggressions of the Indians and French settlers. Under the influence of these circumstances, a class of professional public men had grown up in the colonies: men indisposed by their tastes, or incapacitated by their want of powers of continuous industry, for trade or agriculture, devoted themselves to public business, not merely as amateurs, but as a means of gaining a living, and sometimes affluence and power. The narrow sphere in which they acted heaped a number of incon-

gruous employments upon them: they were in general a strange mixture of the lawyer, politician, and soldier, not entirely secluded from mercantile and agricultural pursuits.

The almost incessant wars between France and England had developed more comprehensive views and more ambitious aspirations among these men than could find sustenance in the petty domestic business of one colony. The remoteness of the central government not unfrequently rendered it necessary for the local authorities to take measures which, in strict propriety, could only originate with it, and employ the nearest and readiest agents in carrying them into execution. Undertakings too were at times found necessary which surpassed the powers of a single colony, and for which the combined efforts of several were required. Cases of this kind are numerous, but belong properly to the history of individual colonies. The enterprise however which led to the capture of Louisbourg in 1745, may be mentioned as the first in a train of operations which led to a gradually extending federation of the colonies.

The treaty concluded between Great Britain and France in 1748 produced no peace, but only a hollow truce, during which both parties were digesting and maturing more extensive plans of war; and in 1753 the French crossed the Ohio in force, and entrenched themselves on the upper waters of the Ohio. Orders from England had by this time reached the governors of all the colonies, instructing them, in the event of encroachments on the part of the French, to repel force by force, and recommending union for defence. In compliance with this recommendation, a general convention of delegates from all the colonies was summoned for the purpose of holding a conference with the chiefs of the Indian tribes north of New York, called the Six Nations. The convention met at Albany, on the 14th of June, 1754. It was composed of delegates from New Hampshire, Massachusetts, Rhode Island, Connecticut, Pennsylvania, and Maryland, with the lieutenant-governor and council of New York, and it was met by 150 men of the Six Nations. This assembly constituted an epoch in the history of the United States. A plan was presented to it for a permanent union of all the colonies under one government, so far as might be necessary for defence and other important general purposes.

Several of the commissioners came prepared with plans for a union of the colonies to be submitted to the congress. A vote was taken whether a union should be established, which passed unanimously in the affirmative; a committee was then appointed of one from each colony, to report on the different plans, and that which had been drawn up by Franklin was preferred, and with a few amendments reported. Franklin's proposal was, that application should be made for an Act of Parliament to include all the British colonies in North America within one government, under which each colony might retain its own constitution; that this general government should be administered by a president-general, appointed and supported by the crown, and a council nominated by the legislative assemblies of the different colonies; that the general government should have the power to purchase Indian lands for the crown, to make new settlements on those lands, to make laws for the new settlements till the crown should form them into particular governments, to raise and pay soldiers, build forts and equip vessels for the defence of the colonies, to make peace or declare war with the Indians, to regulate the Indian trade, to levy duties for these purposes, and to appoint a treasurer. After lengthened debates this plan was agreed to, and copies ordered to be transmitted to the board of trade and the assemblies of the several provinces. The board of trade disapproved of it as too democratic—the assemblies as too favourable to prerogative. That such a plan should be proposed was however an indication of the direction which the minds of the American leaders had taken, and its discussion in the provincial assemblies riveted men's minds upon a tangible and practical measure of union. It formed public opinion; for, with the exception of an elective president, it embodies all the essential features of the constitution ultimately adopted by the United States.

The British ministers devised a scheme of their own, whereby the governors of the provinces, with some members of their respective councils, were to meet and make arrangements for the common defence; they were to draw on the treasury of Great Britain for the expense, which was afterwards to be refunded by a tax levied in America by Act of Parliament; but no immediate arrangements were made for realizing this project.

Hostilities had been carrying on in America in 1754 and 1755; but war was not formally declared between Britain and France till 1756. It was ended in 1763 with the cession of Canada to Great Britain by France. Immediately after the ratification of the treaty of peace, the intention of the British ministers to quarter troops in America and support them by taxes levied on the colonies was announced. On the 10th of March 1764, the House of Commons adopted a resolution—"That it was proper to charge certain stamp-duties in the colonies and plantations;" and on the 5th of April an act was passed granting certain duties in the colonies. This act was in substance only a renewal of the Sugar Act of George II., but instead of the reason (commercial regulations) assigned in the preamble of the old statute, the new was avowedly intended for the raising of revenue. Instructions were at the same time very unwisely given by the British

government to the commanders of king's ships stationed in America to enforce the law against smuggling, which had hitherto been very generally connived at by the authorities. Both the act and the instructions were met in a spirit of the most determined resistance.

The Assembly of Massachusetts protested against the Sugar Act and the quartering of troops as unconstitutional; and appointed a committee to sit during the recess, to write to other governments to inform them of the resolutions, and to invite all the colonial assemblies to join with them to obtain a repeal of the Sugar Act and prevent the enactment of a Stamp Act. In Virginia the House of Burgesses, on receiving information of the declaratory act, prepared an address to the king, a memorial to the House of Lords, and a remonstrance to the House of Commons. The confiscations of the naval commanders put a stop to the commerce which the English colonies had carried on with the French islands and the Spanish settlements. The consequence of these acts and discussions was a universal ferment throughout the colonies; nevertheless the Sugar Act, being regarded as a commercial regulation, was not openly disobeyed.

In the beginning of 1765 the British parliament followed up the declaratory resolution of the preceding year by passing an act for raising a revenue by a general stamp-duty through all the American colonies. The Assemblies of Massachusetts and Virginia protested against the act as unconstitutional. On the 7th of October a Congress, consisting of twenty-eight delegates, from the Assemblies of Massachusetts, Rhode Island and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, the Delaware counties, Maryland, and South Carolina, met in the city of New York. The results of its deliberations were, a petition to the king, a memorial to each House of Parliament, and a recommendation to the colonies to appoint special agents to solicit redress of grievances. The Stamp Act was never enforced; and in 1766 it was repealed by parliament. But the repeal was accompanied by a declaratory act, asserting the right and power of the British Legislature to bind the colonies in all cases whatever; and in conformity with this declaration an act was passed in 1767, imposing a duty on paper, glass, painters' colours, and teas, to be paid by the colonists in the colonies. This act was met on the part of the Americans with the same determined spirit of resistance as the Stamp Act. The Assembly of Massachusetts addressed, in February 1768, a circular letter to the burgesses and representatives of the people throughout the colonies, requesting them to unite to obtain redress. The colonial legislatures generally expressed their approval of this letter and were consequently dissolved. The members of the Massachusetts Assembly, on being dissolved by the governor, re-assembled under the name of a Convention, and continued to sit and act as a legislature in defiance of his authority. When the new colonial legislatures met, in 1769, they proved as intractable as their predecessors. In 1770 Lord North, who had succeeded the Duke of Grafton as premier, prepared a bill to repeal so much of the act of 1767 as imposed duties on glass, paper, and painters' colours, and to continue that part which imposed a duty on tea. Such an alteration could have no effect on the sentiments of the colonists, who objected to the right of the British parliament to tax them, not to the amount of the tax.

From the meeting of the Congress of 1765 till 1774, the authorities were able to carry into effect none of the parliamentary or ministerial measures throughout the thirteen colonies, except where soldiers were present to enforce them. But the resistance was everywhere local, spontaneous, unpreconcerted, though none the less resolute. In 1771 the Regulators of North Carolina shut up the courts of justice, and were only put down after a pitched battle. In 1772 the colonists of Rhode Island captured the armed government schooner Gaspee. In 1773 the citizens of Boston threw the cargoes of tea, which had been brought into their harbour notwithstanding their non-importation resolutions, into the sea. Every attempt on the part of the government officers to enforce the obnoxious laws called forth petitions, protests, and remonstrances from the colonial legislatures; and when these bodies were dissolved, their members met as congresses or conventions without the authority of the governors, and transacted business as before. The destruction of the tea in Boston in 1773 was punished in 1774 by an act of parliament ordering the port to be shut up. The enforcement of this act converted the community of Boston into martyrs for American liberty. At Philadelphia a subscription was set on foot for the poorer inhabitants; the Assembly of Virginia proclaimed a solemn fast to be observed on the day the port was closed; the neighbouring ports offered the use of their stores and wharfs to the merchants of Boston. Boston became a central point towards which the sympathies of all America converged—the nucleus of a combination of all the colonies. Committees of correspondence already existed in most of them. The first had been appointed at a town-meeting in Boston in 1772; another by the House of Burgesses of Virginia in 1773. In June 1774 the Massachusetts House of Representatives appointed a committee of five persons to meet committees or delegates from the other provinces at Philadelphia on the 1st of September. The colonies represented on this occasion were—New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, and Virginia. On the 14th the deputies from North Carolina arrived. This first Continental Congress continued to sit for eight weeks. During that

period it prepared and published—1. A Declaration of Rights, enumerating the acts by which they had been violated, and declaring a repeal of these acts indispensable to the restoration of harmony between Great Britain and the colonies. 2. A loyal address to the king. 3. An address to the people of Great Britain. 4. Letters to the people of Canada, to the colonies of St. John's, Nova Scotia, and Georgia, and the Floridas, inviting them to unite in the common cause of British America. 5. A memorial to the people of British America. The resolutions of the Continental Congress received the sanction of the thirteen provincial congresses and colonial assemblies, with the exception of that of New York.

A second Congress met at Philadelphia on the 10th of May, but before that time hostilities had been commenced by the battle of Lexington in Massachusetts. The intimation of this collision to Congress called forth a declaration that hostilities had already commenced, and that the colonies ought to be placed in a state of defence. On the 27th of May it was voted that 20,000 men should be immediately equipped, and George Washington appointed general and commander-in-chief; articles of war were framed, and the organisation of the higher departments of the army commenced; bills of credit were issued to defray the expenses of the war, and 'the Twelve United Colonies' pledged for their redemption: in short, all the functions of an independent legislature were now assumed, and from this time continued to be carried on. Before the second Congress dissolved Georgia had elected delegates; and the members of Congress despairing of any of the mainland colonies wrested from the French and Spaniards joining their standard, had forbidden all exportations to Quebec, Nova Scotia, and East and West Florida, and prohibited the supply of provisions to British fisheries on the American coast. Thus, before the adoption of the Declaration of Independence, the United Colonies had already all the essentials of their future general government as well as states' governments. The want of a chief magistrate was supplied by appointing an Executive Committee of twelve, one-third of whom were to retire every year by rotation. The Declaration of Independence, framed by a committee of five persons, including John Adams, Jefferson, and Franklin, appointed by the third Congress for the purpose, was finally adopted by the delegates on the 4th of July, 1776; a day which has ever since been kept by the Americans as a public festival.

In 1777 Articles of Confederation and perpetual union between 'The United States of America' were drawn up by Congress and sent to the legislatures of the several states, with the request that, if they approved of them, they would authorise their delegates to ratify the contract in Congress. By these articles the states were to bind themselves to a league for common defence; the free inhabitants of each state were to be citizens of the whole Union; each state was to retain its sovereignty, and every power not expressly delegated to Congress. Congress was to consist of delegates from all the states, to be invested with the power of determining on peace and war, and other supreme executive powers. These articles, if adopted, were to be binding until alterations were made by Congress, and approved by the legislatures of every state. Massachusetts, Rhode Island, Connecticut, Vermont, New York, Virginia, and South Carolina, acceded to this confederation in 1777; New Hampshire, New Jersey, Pennsylvania, North Carolina, and Georgia, in 1778; Delaware in 1779; Maryland not before 1781. Under this make-shift constitution, in which the legislative, executive, and judicial functions were all vested in one body, the United States brought the war with Great Britain to a successful termination in 1783; and it was not till six years later that they attempted to organise the general government upon a more permanent system.

In 1778 the first public audience was given by the king of France to the American ambassadors. In April, 1782, Holland recognised the independence of the United States. In 1783 peace was concluded between Great Britain and the United States. Their independence was recognised in the course of the same year by Sweden, on the 5th of February; by Denmark on the 25th; by Spain on the 24th of March; and by Russia in July. Treaties of amity and commerce were concluded with all these nations, and thus the United States of North America took their place among the nations of the earth. The original extent of the territory of the United States was from the British possessions on the north to Florida, which had again fallen to Spain, on the south; and from the Atlantic on the east to the Mississippi on the west.

The inadequacy of the Congress, as constituted under the Articles of Confederation, to exercise the functions of government, soon became apparent. A convention, sanctioned by the recommendation of Congress, assembled at Philadelphia, in May, 1787, to frame a constitution for the United States. The great difficulty in this task arose from the jealousies which existed between the large and the small states: it was obviated by instituting a legislature of two chambers, the members of the one (the House of Representatives) to be elected directly by the people in proportion to the population; the members of the other (the Senate) to be elected as each state should determine, two for each state. A president was to be elected for four years, and to be re-eligible at the close of the term. A supreme court of judiciary was also to be created. A qualified negative on the proceedings of the legislature was given to the president, and a right of concurrence in the ratification of treaties to the Senate. The power of taxation

was conferred upon the legislatura. In other respects the provisions of the new constitution were a recognition of those of the old Confederation. On the 17th of September, 1787, this constitution was signed by all the members of the convention present except three. It was then sent to the state legislatures, for the purpose of being submitted in each state to a convention of delegates chosen by the people. Before the close of 1788 all the states except Rhode Island and North Carolina had adopted the constitution. These did not ratify it till May, 1790. An act was passed by Congress appointing the first Wednesday of February, 1789, for the people to meet and choose electors, and the first Wednesday of March following for the electors to meet and choose a president.

A quorum of the House of Representatives had met at New York on the 1st of April, and elected a speaker; a quorum of the Senate had met on the 6th, and elected a speaker pro tempore to count the votes for president. George Washington, it was found, had been unanimously elected president, and John Adams vice-president of the United States. Washington took the oath of office on the 30th of April, and opened the proceedings of Congress by a speech. The constitution was now completely in operation, and since that time down to the present day it has only experienced a few immaterial modifications.

We append a list of the

Presidents of the United States.

1. George Washington	1789	to 1797
2. John Adams	1797	" 1801
3. Thomas Jefferson	1801	" 1809
4. James Madison	1809	" 1817
5. James Monroe	1817	" 1825
6. John Quincy Adams	1825	" 1829
7. Andrew Jackson	1829	" 1837
8. Martin Van Buren	1837	" 1841
9. William Henry Harrison (died in office)	1841	" 1841
10. John Tyler	1841	" 1845
11. James Knox Polk	1845	" 1849
12. Zachary Taylor (died in office)	1849	" 1850
13. Millard Fillmore	1850	" 1853
14. Franklin Pierce	1853	

From the establishment of their position as an independent republic until the present time, the United States have been chiefly occupied in the development of their vast resources. Many questions of internal government and relationship have occurred and excited much interest, but it does not belong to us to notice them.

With foreign countries the intercourse has been for the most part commercial and pacific, the chief exceptions being the war with England 1812-15, which occasioned great losses to both powers, unattended with any material advantage to either, and the war with Mexico, 1845-48, which, as noticed under MEXICO, resulted in the transference of a large extent of territory to the United States.

Since the declaration of independence, the United States have increased with unparalleled rapidity in population and in territory. The first Census of the United States was taken in 1790, at which time there were included in the Union 17 states, or territorial governments, occupying an area of 820,680 square miles, with a population of 3,929,827: at the present time the Union consists of 31 states and 5 territories, occupying an area of 2,963,666 square miles, with a population (in 1850) of 23,191,876.

The following table taken with a few slight changes to render it more readily understood by English readers, from the official 'Compendium to the Census,' will show at a glance the extent of the territorial acquisitions, and the occasions on which they were made:—

Territorial Increase of the United States.

TERRITORY.	Square Miles.
Area of the United States at the peace of 1783	820,680
Purchase of Louisiana from France, 1803	899,579
Cession of Florida by Spain, 1819	66,900
Admission of Texas [see TEXAS], 1844	318,000
Territory obtained by Oregon treaty with Great Britain, 1846	308,052
Territory ceded by Mexico [see MEXICO], 1848	523,955
" additional, ceded by Mexico by a new treaty, 1854	27,500
Total	2,963,666

The following table shows the rate of increase of the various classes of the population at the several censuses of the Union:—

Classes.	1790	1800	1810	1820	1830	1840	1850
Whites	3,172,464	4,304,409	5,962,004	7,861,937	10,537,378	14,195,685	19,558,068
Free Coloured	59,468	108,395	186,446	238,156	319,599	388,203	434,496
Slaves	697,897	893,041	1,191,364	1,538,088	2,006,043	2,487,455	3,304,313
Total	3,929,827	5,305,845	7,339,814	9,638,181	12,866,020	17,069,463	23,191,876

Government, &c.—At their Union the states formed a federal govern-

ment, to which was intrusted all those general measures which had regard to the relations of the Union with foreign countries, and the common interests of the several states; to the local government of each separate state being left the management of its immediate concerns. Both the general and state governments are essentially democratic. By the constitution the power of the general, or federal, government is divided into a legislative, an executive, and a judicial branch.

The legislative authority is vested in a Congress, consisting of a Senate and House of Representatives; it must by law assemble at least once a year, on the first Monday of December. The Senate is composed of two members from each state, and of course at the present time consists of 62 members; they are chosen by the legislatures of each state for six years, one-third of them being elected biennially. The vice-president is president of the Senate ex-officio. The House of Representatives is composed of 233 members from the several states (with one additional accorded for the present to California), elected by the people for the term of two years. The representatives are apportioned among the different states according to population; one member being returned, according to the present ratio of representation, for every 93,423 of the 'representative population,' which consists of all the free persons in the several states with three-fifths of the slaves. The number of representatives apportioned to each state is shown in the table at the commencement of this article. The Congress has power to raise, maintain, and regulate a navy and army; to declare war and grant letters of marque and reprisals; to constitute tribunals inferior to the supreme courts; to define and punish piracies and felonies on the high seas and against the laws of nations; to frame general laws of naturalisation; to establish post-offices and post-roads; to coin money and make laws for punishing forgers; to regulate commerce with foreign nations, the Indian tribes, and among the states; to impose and collect taxes for the common defence and welfare of the United States. All money-bills must originate in the House of Representatives.

The executive power is vested in a president; the vice-president is ex-officio president of the Senate, and successor to the president should he die during his term of office. The president is elected for four years, and may be re-elected; but the usage has been never to elect the same person for more than two terms. He is chosen by electors, who are themselves chosen by an electoral college in each state; the number of these electors being equal to the representatives which such state sends to both houses of Congress. The president has a salary of 25,000 dollars, and the use of the 'White House' (with its furniture) at Washington. The vice-president has a salary of 8000 dollars. The president is commander-in-chief of the army and navy of the United States, and of the militia of the several states when called into active service of the United States; he has power to make treaties, provided two-thirds of the Senate concur; he appoints the officers of state, ambassadors, consuls, and judges of the supreme court; he receives foreign ambassadors; he can grant reprieves and pardons for offences against the United States, except in cases of impeachment.

The principal officers of the executive department of the government are the secretaries of state, of the treasury, of war, of the navy, and of the interior, the postmaster-general, and the attorney-general, whose respective duties are sufficiently indicated by their titles. They form the cabinet, and hold office at the will of the president. Their salary is 8000 dollars each.

The judicial authority of the United States is vested in one supreme court, forty-six district courts, and nine circuit courts. The supreme court consists of one chief justice, with a salary of 5000 dollars, and eight associate justices, with salaries of 4500 dollars each, who hold a court in Washington annually; an attorney-general, reporter, clerk, and marshal. Each district court consists of one judge, an attorney, marshal, and clerk. The circuit courts are composed of one associate justice, and the judge of the district in which it is held. The supreme court has exclusive jurisdiction in all cases to which a state is party, except cases between a state and its citizens; in suits or proceedings against ambassadors, it has appellate jurisdiction from the circuit courts, and authority to issue writs of prohibition to the district courts. The circuit courts have original jurisdiction in all suits of a civil nature at law or equity, concurrent with the courts of the several states, where the value in dispute exceeds 500 dollars, where the United States or an alien is a party, or where the suit is brought by a citizen of one state against a citizen of another. The circuit courts have appellate jurisdiction from the district courts. They have exclusive cognisance of offences against the United States. The district courts have jurisdiction in admiralty and maritime cases, in all suits against consuls and vice-consuls, in some minor offences against the United States, and in causes where an alien sues for a 'tort' in violation of the law of nations.

Provision is made by the constitution for its own amendment. Such amendment can however only be made when it is proposed by a majority consisting of two-thirds of both houses of Congress, or by a convention called on the application of two-thirds of the states; but in either case the amendment must be ratified by three-fourths of the states to give it effect.

Revenue, Army, and Navy.—The total receipts of the United States

for the year ending June 30th, 1854 (exclusive of a balance in hand from the previous year of 21,942,892 dollars), was 73,549,705 dollars; the total expenditure for the same period was 75,354,630 dollars. The entire outstanding public debt, October 1st, 1854, was 45,640,606 dollars.

The regular army in 1853 comprised in all 964 commissioned officers and 9284 non-commissioned officers and privates. The militia force of the several states amounted to an aggregate of 2,259,037 men, of whom 66,289 were commissioned officers. The navy in 1853 consisted of 11 vessels of the line, mounting in all 860 guns, 14 frigates mounting 618 guns, and 49 other vessels,—the whole fleet mounting 2026 guns.

UNNA. [ARNSBERG.]

UNST. [SHETLAND ISLES.]

UNTERWALDEN, a canton of Switzerland, and one of the three Waldstätten, or Forest Cantons, which began the Helvetic Confederation, is bounded N. by the Lake of Luzern, W. by Luzern, S. by the Bernese Oberland, and E. by the canton of Uri. The area is 262 square miles, and the population 25,138. The canton consists mainly of two great parallel valleys, each about 15 miles in length, running from south to north, and terminating on the southern coast of the Lake of Luzern. The eastern valley is drained by the Engelberg Aa, a torrent which rises in the Surenen Alps on the borders of Uri, flows by the abbey of Engelberg, and enters the lake below Stanz. The western valley is drained by the Sarner Aa, the outlet of the little alpine lake of Lungern, at the foot of the Brünig, near the borders of the Bernese Oberland, and which, after passing through the Lake of Sarnen, enters a bay of the Luzern lake below Alpach. The lower part of the eastern valley constitutes the district called Nidwald, or 'below the forest,' and the western valley, with the upper part of the eastern valley, forms the district called Obwald. These denominations relate to the Kernwald, or forest of Kerna, which lies on the borders of the two districts. The Obwald and Nidwald have formed two separate communities ever since 1150. They both joined Schwyz and Uri in the insurrection of 1308, and when the first federal union was entered into at Brunnen, in December, 1315, Obwald and Nidwald were recognised as forming together one canton, by the name of Unterwalden.

Unterwalden is surrounded, except on the north side, by offsets of the Alps, which detach themselves from the great central group of the St. Gothard, and divide the basin of the Aar from that of the Reusa. One branch runs along the southern border of the canton, separating it from the Bernese Oberland. Another ridge runs along the eastern part of Unterwalden, and divides it from Uri, forming the summits of Titlis (10,500 feet above the sea), Wallenstock, and Rothstock, each above 8000 feet. Lastly, another offset of minor elevation runs along the western border of Unterwalden, dividing it from the canton of Luzern. Mount Pilatus (about 7000 feet) is the highest summit of this last offset. In the interior of Unterwalden there are no very high mountains, but the surface of the country consists chiefly of hills and terraces, several valleys, and some tracts of plain bordering on the Luzern or Waldstätter Lake. Unterwalden is chiefly a pastoral country. There are about 12,000 cows, 3000 sheep, 6000 goats, 3500 pigs, but very few horses. About 20,000 cwts. of cheese are annually made. The cheese of Unterwalden, of the first or best sort, is much esteemed in Switzerland and Italy. The canton abounds with fruit-trees: a little bad wine is made. The honey is excellent. The canton imports corn, wine, salt, manufactures, and colonial articles; it exports cattle, cheese, butter, timber, and hides. The canton is not favourably situated for trade, being confined between the Alps and the lake, with no high road passing through it, and none but mountain passes leading out of it. All the native inhabitants who are of age, with the exception of a few *heimathlosen*, are members of the landgemeinde of their respective district, Nidwald or Obwald, each of which has also its own administration. In 1835 there were as yet no prisons: serious offences are punished by fines, corporal punishment, and in certain cases by death. Each of the two divisions of the canton has an hospital and a poor-house. A dialect of the Swiss-German is the language of the country. The Roman Catholic is the religion of the whole canton. The Benedictine monastery of Engelberg, a foundation of the 11th century, and possessed of a library of 20,000 volumes and several valuable manuscripts, has been suppressed since the revolution of 1847. Nidwald and Obwald return each one member to the National Council of Switzerland, as they did also formerly to the Swiss Diet.

The principal towns or villages are—*Sarnen*, the head town of the Obwald, on the northern extremity of the lake of Sarnen, has a fine town-house, with historical portraits of the worthies of Obwald. *Sarnen* has also a college, a theatre, an hospital, a poorhouse, a public school, several churches, and 1999 inhabitants. The arsenal of Obwald is on the hill called Landenberg, where was once the castle and residence of the Austrian governors. *Stanz*, the head town of the Nidwald, situated in a fine plain at the foot of the mountains, has a splendid parish church with a noble dome, and a fine square before it, with two

fountains, and a statue of Winkelried, the hero of Sempach. The convent of the Capuchins (now suppressed) has a considerable library. The town-house contains several paintings. The population of Stanz is 1877.

The canton of Unterwalden is one of the most interesting districts of central Switzerland, on account of its historical recollections, and the old simplicity of manners and pastoral habits of its inhabitants.

UPHAM. [HAMPSHIRE.]

UPHOLLAND. [LANCASHIRE.]

UPLAND. [SWEDEN.]

UPMINSTER. [ESSEX.]

UPPINGHAM, Rutlandshire, a market-town and the seat of a Poor-Law Union, in the parish of Uppingham, is situated in 52° 35' N. lat., 0° 43' W. long., distant 7 miles S. by E. from Oakham, and 89 miles N.W. by N. from London. The population of the town in 1851 was 2068. The living is a rectory in the archdeaconry of Northampton and diocese of Peterborough. Uppingham Poor-Law Union contains 35 parishes and townships, with an area of 52,698 acres, and a population in 1851 of 12,701. Uppingham church is large, with a lofty spire. There are two chapels for Dissenters. The Grammar school is well endowed, and has several valuable exhibitions. There are also National schools, and an hospital for poor men. A county court is held. The market is on Wednesday, and there are two annual fairs.

UPSALA, a town in Sweden, situated in 59° 51' N. lat., 17° 30' E. long., in an extensive undulating plain, about 300 feet above the sea-level, and has about 5000 inhabitants. The town, which is large for Sweden, extends over a considerable area, as there are large gardens to most of the houses. The houses are partly of stone and partly of wood, and mostly two stories high. The streets are wide and straight, and there is a spacious square in the centre of the town. The cathedral was erected between 1258 and 1435, and is considered the finest gothic building in the north of Europe. It contains monuments of many distinguished persons, among others of Gustavus I. and Linnaeus. Formerly the kings of Sweden were crowned in this cathedral. The square in which the church stands is surrounded by buildings belonging to the university, which has a library containing nearly 100,000 volumes, a collection of coins, an anatomical theatre, an observatory, a chemical laboratory, and a very extensive collection of natural objects. There is also a botanical garden. The university was established in 1478; it is governed by a chancellor, and has four faculties—law, medicine, philosophy, and theology. The number of regular professors amounts to 24, and that of adjunct professors to 14. The average annual number of students who attend the lectures is about 1000. The curriculum is modelled on that of the German universities. The Society of Sciences, instituted in 1719, has published several volumes of 'Transactions.' Upsala has also a grammar school, several charitable institutions, and an agricultural society. About 6 miles S.E. from Upsala are the 'mora-stones,' at which the Swedes elected their kings between 1140 and 1520.

UPTON-ON-SEVERN, Worcestershire, a market-town and the seat of a Poor-Law Union, in the parish of Upton, is situated chiefly on the right bank of the river Severn, in 52° 4' N. lat., 2° 12' W. long., distant 10 miles S. from Worcester, and 111 miles W.N.W. from London. The population of the parish in 1851 was 2,696. The living is a rectory in the archdeaconry and diocese of Worcester. Upton Poor-Law Union contains 22 parishes and townships, with an area of 53,016 acres, and a population in 1851 of 18,070.

Upton is a neatly-built town, situated in a flat and fertile plain. The river is here navigable for vessels of 100 tons' burden. There are a basin for barges, and a wharf for loading and unloading. The town is lighted with gas. The market-house, assembly-room, and magistrates' court-room compose one building. The stone bridge of six arches and the old church were injured during the civil wars, and in 1756 the church was taken down and the present edifice erected. The old gothic tower however still remains. The Wesleyan Methodists, Baptists, and Roman Catholics have places of worship. There are National and Infant schools, a mechanics institute, and a savings bank. Petty sessions and a county court are held. Thursday is the market-day. Fairs are held on St. Peter's Day and on Midlent Thursday.

UPWELL. [NORFOLK.]

URAL, a river of Russia, which forms part of the boundary-line between Europe and Asia. It rises in the Southern Ural, at the foot of Mount Kalyan, near 55° N. lat., at an elevation of 2182 feet above the sea-level. It first runs south about 200 miles in a straight line to the fortress of Orskaya, where it turns to the west, in which direction it passes south of the town of Orenburg, and continues to flow about 300 miles in a straight line to the fortress of Uralak. Near this place it again turns to the south, and reaches in that direction the Caspian Sea after a course of 300 miles, measured in a straight line. The whole course of the river is about 900 miles. The first 60 miles it runs in a narrow valley, between the Ural Tau on the west, and the Ilmenes Mountains on the east. At Verkh-Urask, where the level of the river is still about 1248 feet above the sea, it begins to be navigable for small boats. South of Verkh-Urask the Ural flows along the eastern base of the table-land of Sakmara, and on the east of it extend the steppes of the Kirghises. At Orskaya,

where the river turns westward, its level is about 550 feet above the sea. From this place it may be navigated by large barges, as it has no rapids and a considerable depth. Below Orakaja the Ural flows in a bottom from one to three miles wide, which is inclosed by higher grounds rising from 60 to 100 feet above it. These higher grounds are the edges of the steppes. The bottom is chiefly covered with woods, but in parts there are extensive meadows. The greater part of this bottom is annually inundated, and only a few tracts are cultivated. In its middle course the Ural is joined by the Sakmara from the north, and the Ilek from the south. About 40 miles from its mouth the Ural divides into two channels, of which the eastern preserves the name of Ural, and the western is called Mokroi Backsai. Lower down the Ural again divides into two channels, of which the western is called Ural, and the eastern Bukharka. The last-mentioned channel is the most convenient for vessels, and on its banks are the fortress and town of Guriew. The islands forming the delta of the Ural are covered with salt-swamps, and entirely unfit for cultivation or pasture. The quantity of fish annually taken in the Ural is very great. The fish ascend the river to the fortress of Urask, where their course is stopped by a weir. Belugas have been taken weighing 1000 lbs., and yielding 200 lbs. of caviar; and sturgeons weighing 200 lbs., and yielding 40 lbs. of caviar, have been taken in the Ural. Besides the caviar and isinglass, a great quantity of fish is sent to various parts of Russia. In summer the fish is salted, but in winter it is exported in a frozen state.

URAL MOUNTAINS extend along the eastern border of Europe, which they divide from Asia. The whole of the range lies within the dominions of Russia. Its most southern extremity is on the banks of the river Ural, where that river runs from east to west, near 51° N. lat., and on both sides of 55° E. long. The most northern extremity reaches the Arctic Ocean on the Straits of Waigatz, and terminates opposite the island of Nova Zembla in 70° N. lat., and about 60° E. long. As the range reaches its culminating point near the meridian of 60° E. long., and as it extends from south to north, it is classed among the meridional ranges of mountains.

The length of the range is about 1250 miles; towards the southern extremity, near 53° N. lat., the ridges spread over a tract about 100 miles wide, but farther north the breadth is less than 50 miles, and nearly in the centre, between 56° and 60° N. lat., the mountain range is hardly 20 miles across. Farther north it grows wider, but this portion of the mountains is very imperfectly known. The whole area of the Ural Mountains is about 120,000 square miles. The general elevation of the range is not great, none of the summits rising to more than 6800 feet above the sea, and the highest parts of the range often fall short of 2000 feet. The chain descends with steep declivities to the great plains of Asia, which are contiguous to its base. On the west the mountains do not immediately border on the great plains of Eastern Europe, but are separated from them by a hilly tract of from 20 to 40 miles wide. The whole range may be divided into three portions—the Southern, Central, and Northern Ural.

The *Southern Ural* extends from the banks of the Ural River to 55° 30' N. lat. The high ground approaches the right bank of the river so as to leave only a comparatively narrow tract of low and level ground along its course. The ascent of these high grounds is very much broken and rapid, but they are only from 600 to 700 feet above the surface of the river. When this elevation is attained the country gradually rises higher, and near 53° N. lat. may be from 1200 to 1800 feet above the surface of the sea. This tract is called the table-land of the Sakmara, from an affluent of the Ural River which drains nearly the whole of it. On the east the table-land declines with a steep descent to the river Ural, where it flows from north to south, but on the west its slope is very gentle, and it is connected with the low ridge called Obetshel Sirt, which traverses the steppe that lies farther west, and terminates on the banks of the Volga, opposite Kamyshin (between 50° and 51° N. lat.). The surface of the table-land is very much broken, and in many parts there are rocky hills of moderate elevation, but they do not constitute ridges except on the banks of the Ick, a small affluent of the Sakmara. A considerable portion of the table-land is wooded and well stocked with animals, which supply the Bashkirs with a part of their subsistence. There are some large swamps.

On the north side of the table-land of Sakmara are two ranges of mountains, of which the eastern is called the Irendik Mountains, but farther north it takes the name of Ural-Tau (or Girdle Mountains). It runs north by east to 55° 30' N. lat. In a few places it contains elevated summits, for instance, near its southern extremity, east of Lake Tolkaah, where it is more than 2900 feet above the sea; but in general the summit is a level plain about 2000 feet high and seven or eight miles wide: it is mostly covered with swamps. The western chain has no general name. It rises in the most southern bend of the river Bialaya, and runs nearly north-east, gradually approaching the Ural-Tau. Near its southern extremity, which is less than 50 miles distant from that of the Ural-Tau, it does not rise much above the general level of the table-land of Sakmara; but farther north it increases in elevation, and exhibits several high summits, among which are the Yaman-Tau, at the source of the Bialaya, and the Iremel-Tau, north of it. The last-mentioned mount is the highest in

the Southern Ural, and rises more than 4700 feet above the sea-level; and snow is found in some ravines near its summits all the year round. The whole western chain is thickly wooded, but many of the slopes are nearly inaccessible, owing to the deep swamps on their sides. Wild animals are very numerous, especially bears, deer, and elks. The valleys between the ranges are either destitute of trees and covered with thick grass or swamps. In some places however there are extensive woods.

The two chains just mentioned approach one another at the place where the rivers Ural, Bialaya, and Ai, an affluent of the Ufa, originate, but they do not join. They run parallel to one another from 54° 30' to 55° 30' N. lat., being hardly ten miles distant from one another. The eastern, which preserves the name of Ural-Tau, is a continuous range, but not so high as the western, which is composed of three ridges, called from south to north Oorengal-Tau (3000 feet), Tagannai-Tau (3500 feet), and Yeorma-Tau, which is the highest of the three. Between these ridges are depressions, through which the rivers flow westward to the Ufa and Bialaya. The Ural-Tau does not rise in these parts above 2000 feet, and is frequently much lower. The valley between the two chains is about 1000 feet above the sea-level, and occupied by a considerable number of insulated hills. In this valley are the principal mines of Slatoust.

A third range lies farther east, and runs parallel to the Ural-Tau, but is not connected with it. Between 55° 30' and 54° 30' N. lat. it is not inferior to the Ural-Tau in elevation, but farther south it decreases considerably in height, and terminates between 54° and 53° in isolated hills. It bears the name of Ilmenes-Tau, and appears to be sterile and destitute of trees.

The *Central Ural* extends from 55° 30' to 58° N. lat., and may be considered as a wide swell, which begins on the west on the banks of the river Kama, an affluent of the Volga, and rises gradually for 50 or 100 miles more, until it attains its highest level, whence it extends in an uneven plain, and then descends on the eastern side, likewise with a rather gentle but much shorter slope. The lower edge of the western slope at the town of Perm, on the Kama, is only 378 feet above the sea-level, the highest point, on the road leading from Perm to Ekatarinburg is 1638 feet, and Ekatarinburg, on the plain east of the eastern declivity, is 858 feet above the sea-level. The region presents vast swamps destitute of trees in some parts; in others it is overgrown with stunted woods. This part of the Ural Mountains is traversed by the great commercial road between Russia and Siberia, and most of the mines which are worked are in this portion of the range.

Between 58° and 61° N. lat. are the mountains called the *Ural of Verkhotoori*, which some writers consider a part of the Central Ural, and others as attached to the Northern Ural. In these parts the higher portion of the range is covered with rocky mountains, which usually form elevated summits. The most southern of these summits, the Pawdinakoi Kamen, according to some authorities, rises to the height of 6329 feet above the sea; but, according to others, only to about two-thirds of that elevation. On the north of it are other summits, which rise to between 5000 and 6000 feet above the sea. The low depressions by which these summits are separated from one another are very swampy, but generally covered with woods, which also extend over the lower declivity of the summits, whilst the higher part is above the line of trees, and presents either bare rocks, or, where it is covered with soil, swamps of great depth. Though none of these summits appear to be covered with snow all the year round, masses of ice are found even at the end of the summer in the ravines which furrow the northern declivities.

The *Northern Ural* occupies that portion of the range which extends from 61° to 70° N. lat. It is very little known. The Russians call it the *Barren Ural*, to distinguish it from the Central and Southern Ural, which are rich in mines and covered with wood, whilst the Northern Ural consists of rocks, and is destitute of trees. These rocky masses are nearly always covered with fogs. The lower tracts between them are occupied by moors or covered with mosses. There are forests of large pines as far north as 63° N. lat.; but farther north the growth of these trees is stunted, and near 65° N. lat. they disappear. The Northern Ural does not seem to rise to a great elevation, and where it terminates on the Arctic Ocean it is composed of broken rocks covered with swamps.

The basis of the Ural chain is granite, and the superior stratifications are limestone and quartz, and many erratic blocks are scattered over the surface. The central and southern portions abound in wood, chiefly pines, cedars, larches, and other natives of a northern climate; but the oak and ash are found in the south-western parts. There are many rich valleys and fine pastures, where great numbers of cattle are bred. Numberless rivers abounding in fish issue from both sides of the chain, the principal of which are the Sosva, the Isset, the Tobol, the Emba, the Ural, the Belaia, the Kama, and the Petchora. There are seven passes over these mountains: the five that are the most easy to cross are—the road from Perm to Ekatarinburg; that to Petropaulskaja; and the three roads to Orenburg.

The Ural Mountains abound with mineral wealth; and valuable mines of iron, copper, gold, and platinum are worked. The iron- and copper-mines had long been considered among the most valuable sources of the national wealth, when, in the middle of the 18th century, it was discovered that gold-mines also existed there. The

gold-mines of the Ural were considered the most productive in the world previous to the discovery of the auriferous deposits of California and Australia. Very rich veins were met with between 1844 and 1850, but the total yield in any year during this interval did not much exceed a million sterling. Many splendid blocks of malachite are cut in the copper-mines of the Ural, and manufactured into articles of decorative furniture, of which many specimens appeared in the Universal Exhibition in London in 1851. [EKATARINBURG; PERM.]

URBAN. [NATAL.]

URBANIA. [PESARO E URBIÑO.]

URBIÑO, a town of Central Italy, in the States of the Church, is situated partly on a hill, about 20 miles from the coast of the Adriatic, and about the same distance S.W. from Pesaro. It is a walled town, and has several fine buildings, among others the former ducal palace, now the government-house, which contains a collection of ancient inscriptions and sculptures; the palace Albani; the cathedral; and several churches and convents. Urbino is an archbishop's see; it has a college, a theological seminary, an academy of sciences and literature, and about 7000 inhabitants. The house in which Raffaele was born still exists. Urbino was for three centuries the capital of a duchy. In 1626 the duchy was incorporated with the States of the Church. Urbino is the birthplace of Raffaele, Bramante, and other distinguished artists, and of Pope Clement XI. and several cardinals of the Albano family.

URFAHR. [ENS.]

URGEL. [CATALUÑA.]

URI, one of the Swiss cantons, is bounded N. by Schwyz, W. by Unterwalden, Bern, and the Valais, S. by the group of the St. Gothard, which separates it from the canton Ticino, and E. by the Grisons and Glarus. It consists of a rugged mountainous territory inclosing a valley, about 30 miles long, and traversed by the Reusa, which has its sources on Mount St. Gothard about 6000 feet above the sea, and flows northward until it enters the Lake of Luzern, the southern branch of which is called the Lake of Uri. Several minor valleys branch out right and left from the valley of the Reusa. A great part of the surface of the canton is mostly covered with ridges of the Pennine Alps, several of which exceed 10,000 feet in height. There is a tract of open country, called Bodengemeinden, in the lower part of the valley of the Reusa, near the shores of the Waldstätter or Luzern Lake. Uri is essentially a pastoral country: horned-cattle, sheep, and goats are numerous.

The population of the canton, by the census of 1850, was 14,505; the area is 420 square miles. Uri is a pure democracy, like Schwyz and Unterwalden, with annual landsgemeinde, and a landrath or executive council, presided over by the landamman. The religion is the Roman Catholic. The head town, *Altorf*, or *Altdorf*, is the subject of a separate article: population at the last census, 2112. [ALTDORF.] The high road to Italy by the St. Gothard begins properly at Altorf.

URK. [HOLLAND.]

URLINGFORD, county of Kilkenny, Ireland, a market-town and the seat of a Poor-Law Union, is situated in 52° 43' N. lat., 7° 34' W. long., distant by road 17½ miles W.N.W. from Kilkenny, 80½ miles S.W. from Dublin. The population was 1168 in 1851. Urlingford Poor-Law Union comprises 16 electoral divisions, with an area of 76,151 acres, and a population in 1851 of 19,681. The town contains a Roman Catholic chapel, National schools, a dispensary, bridewell, and Union workhouse. Quarter sessions are held in the town. Fairs are held every month.

URUGUAY, REPUBLIC ORIENTAL DEL, formerly known as the BANDA ORIENTAL, South America, comprehends the country lying between the southern limit of Brazil and the Rio de la Plata. It extends between 30° 20' and 35° S. lat., 53° 30' and 58° 50' W. long.; and is bounded E. by the Atlantic Ocean, N. by the empire of Brazil, W. by the province of Entre Rios, from which it is separated by the river Uruguay, and S. by the Rio de la Plata, which divides Uruguay from Buenos Ayres. The area is about 100,000 square miles; the population has been estimated at 250,000, but, including the few native tribes, it probably does not much exceed half that number.

By far the greater part of the country is hilly and elevated. It forms, as it were, the most southern prolongation of the Serro do Mar (the sea mountain range of Brazil), which extends northward to near the mouth of the Rio de San Francisco (9° S. lat.) In Uruguay the range rises rather abruptly on the southern coast, where it forms the hill of Cape de Sta. Maria, the Pao de Asucar (Sugar-Loaf) some miles to the west of Maldonado, the Monte Video on the west side of the bay to which it gives its name, and the hill of Sta. Lucia, farther to the west, near the mouth of a small river bearing that name. At no great distance, however, from the shore, it takes the shape of an extensive table-land, whose surface in many places presents hardly any perceptible irregularity, and in others is covered with extensive ranges of low hills; both the plains and the hills are without trees, and afford only pasture for cattle. The hills are called Cochilhas, and the highest range, which forms the watershed between the ocean and the river Uruguay, is named the Grand Cochilha. It extends into the Brazilian province of Rio Grande do Sul, where it is called Serra de Herval. The eastern declivities of the Grand

GEOG. DIV. VOL. IV.

Cochilha, which terminate abruptly in the plains about the lakes Mirim and dos Patos at about 12 or 20 miles from their banks, are called Serra de los Tappes. On the west the table-land extends to the banks of the river Uruguay, but it is there cut by numerous valleys, and presents the aspect of an extremely hilly country. In these valleys, as well as in those which lie along the southern coast, west of Cape de Santa Maria, many fertile tracts occur in which the grains and fruits of Southern Europe succeed very well; but the remainder is only fit for pasture.

The coast north of Cape Santa Maria is low, sandy, and intersected with numerous lakes; it forms a small portion of the great extent of similar coast belonging to Brazil, which reaches up to near 30° S. lat. This low country extends inland for about 50 or 60 miles, and possesses little fertility. West of Maldonado, and along the embouchure of the Rio de la Plata, the coast is much more broken, and affords many accessible bays and harbours, which would afford great facilities for commerce if the inhabitants were prepared to avail themselves of them.

Along this coast there are a few islands, but none of great extent. The largest, called Dos Lobos (of the wolves), is not far from the harbour of Maldonado: it is two miles in circumference, and contains good water, but is almost all rock and stones.

The Rio de la Plata and the Uruguay are the chief rivers of the Republic. The La Plata, the left bank of which belongs wholly to Uruguay, is noticed in a separate article. [PLATA, RIO DE LA.] The *Uruguay* originates in that portion of the Serra do Mar which stretches along the ocean opposite the island of Santa Catherina, and under the name of Pellotas, runs for a considerable distance westward, between banks consisting principally of pointed and massy rocks. It assumes the appearance of a large river, about where it begins to bend its course to the south-west. Numerous small streams increase its waters in this part of its course. In latitude 29½° S. it receives the Ibecuy, and then begins to flow in a southern direction. Not far from the place where it enters the Rio de la Plata it receives the Rio Negro on the left bank. The Uruguay is navigable for large boats to the first great fall, called Salto Grande, situated about midway between the mouths of the Ibecuy and Rio Negro. About 40 miles below the Ibecuy is the Salto Chico, or Little Fall, which again interrupts the navigation of the smaller boats or canoes. The whole course of this river is considerably over 1000 miles.

The *Rio Negro* is formed by the union of several small streams which rise in the Grand Cochilha near the Brazilian border. Its general course is west by south to near 58° W. long., when it turns more southward and expands into a river of considerable width. It falls into the Uruguay about 12 miles above the union of that river with the La Plata; its whole course is upwards of 300 miles.

On the east coast, as already mentioned, there are several salt lakes; but the two largest, lakes Mirim and Mangueira, or Mangheira, which formerly belonged, at least in part, to Uruguay, are now we believe wholly included within the Brazilian territory.

Of the geological character of Uruguay no survey has been made; and little is really known of its mineralogy. Gold and silver are said to have been found, but neither has been worked. At San Carlos west of Cape Maria, a mine of copper was formerly found to be very profitable. From the banks of the Uruguay great quantities of lime are exported to Buenos Ayres, and in some districts potter's-earth and amber are found.

Being situated without the tropics, Uruguay enjoys a temperate climate, resembling that of Spain or Italy. The air is pure and healthy. There is a good deal of rain in the valleys and on the low plains during the winter, which lasts from May to October. Frost is occasionally felt in July and August. The high table-land is annually exposed to it, sometimes for more than a month together; but as very little snow falls, the cattle find pasture in these districts all the year round.

The country contains a large portion of fertile land, and a vast extent of profitable pasturage; but cultivation is everywhere neglected, and in the constantly-disturbed state of the country even those pastoral occupations which alone seem to have any attraction for the natives are generally pursued in a careless manner. The valleys on the west and south are well adapted to a great diversity of productions. Wheat, maize, barley, and rice flourish with little attention. Peas, beans, melons, onions, and numerous other vegetables are cultivated. Cotton, the sugar-cane, and mandioc are grown. Hemp and different qualities of flax grow in great abundance. The fruit-trees of the south of Europe succeed here better than farther to the north, and none so well as the peach. The vine grows well, and produces abundantly. Timber is by no means abundant. It is only on the banks of the principal rivers that any forests of full-grown timber occur, the table-land being either quite bare or only covered with shrubs.

More than four-fifths of the country being only fit for pasture, cattle of course constitute the chief wealth. The richest proprietors often possess thirty or forty square miles of land, and feed from five to ten thousand head of cattle and upwards. By far the greatest number are those called 'bravo,' because they live in a state of wildness. Some cattle are consumed in the country, and others sent to the slaughter-houses of Montevideo and Buenos Ayres; but by far the greater proportion is manufactured into jerked beef, which is salted without

the bones, dried in the sun, and exported to different parts of America, especially Brazil. Every great proprietor breeds also a certain number of horses and mules, and some of them a great number of sheep, which have a fine wool. Neither goats nor pigs are numerous.

Game is very abundant, though little sought after. Among other species of wild quadrupeds, there are the anta or tapir, the deer, the ounce, the monkey, the paca, the rabbit, the armadillo, the squash, the boa, the fox, and some others peculiar to the country. The European species of dogs, known as Chimmaroe Dogs, have multiplied so excessively that they live wild in the plains, and have become a great pest.

Birds are very numerous. In the lakes of the eastern plain there are wild ducks and several varieties of large wild geese. A few other birds of the species found in Europe are also met with, as the heron, the quail, and partridge; but there are other species not known in Europe, as different kinds of parrots, the Macuco partridge, the tucan, and many more.

The only manufactures are of the rude articles required for domestic use. The commerce is comparatively inconsiderable; though, from the position of the country on the Atlantic and the great estuary of the La Plata, with the excellent harbour of Montevideo and others of an exceedingly useful class, and with the facilities for internal communication afforded by the Uruguay, it is the natural entrepôt of the commerce of a vast region of the interior; while its own fertile soil and healthy climate would alone render it, in the hands of a peaceful and industrious people, a great exporting country. At present the trade is chiefly centred in MONTEVIDEO. The exports consist almost wholly of the produce of the herds, as hides, horn, hair, jerked and salted beef, tallow, &c., and do not now probably exceed 1,000,000*l.* sterling annually. The imports are chiefly of articles of British and colonial manufactures, &c.; and of North American and some continental produce. There is also a considerable but fluctuating trade between Uruguay and Brazil, the Argentine provinces, &c. The imports of British goods in 1853 amounted to 529,883*l.* The exports to the United States in 1853 amounted to 302,980 dollars; the imports to 308,446 dollars.

Uruguay is a republic with an elective president, a senate, and a house of representatives; but the actual power is generally centred in the president, who is usually some successful general. The country is divided into nine departments—Montevideo, Maldonado, Canelones, San José, Colonia, Soriano, Paisandu, Durango, and Cerro Largo.

MONTEVIDEO is the political capital, the commercial metropolis, and much the largest and most populous city of the republic. Between it and Cape Santa Maria stands the town of Maldonado, with a fine harbour, good fortifications, and about 2000 inhabitants: it exports hides and copper. *Colonia del Santo Sacramento* is a small town, with a harbour, opposite Buenos Ayres. None of the other towns are of any importance.

The Banda Oriental was, during the Spanish supremacy, the name of that portion of the vice-royalty of Buenos Ayres which was situated to the east of the river Uruguay, and comprehended the present republic of Uruguay and the country called the Seven Missions. The continual civil wars by which the declaration of independence was followed in Buenos Ayres, induced the government of Brazil to take possession of the Banda Oriental in 1815. The republic of Buenos Ayres protested against this step, and, as no amicable settlement could be made, a war ensued between the two countries in 1825. Through the intervention of the English government a treaty of peace was concluded in 1828, by which the northern district known as the Seven Missions was ceded to Brazil, and the more exclusive southern district was declared an independent republic under the title of Republica del Uruguay Oriental. But instead of securing peace to the country its independence appears hitherto to have only entailed discord upon it. Internal hostilities broke out at a very early period, and this was soon followed by the incursion of troops from Buenos Ayres; the assistance of Rosas, the president of Buenos Ayres, having been invoked by Aribe, one of the unsuccessful aspirants to the rulership of Uruguay. After a long continuance of strife without any prospect of either party securing a manifest superiority, Brazil was induced by the appeals of Paraguay and other neighbouring powers to interfere. In order to show her good faith, Brazil sent ministers to the courts of England and France, with a view to obtain their assistance either as umpires or active agents in compelling the respective parties to come to terms. Those powers accordingly sent some ships of war to the Rio de la Plata in 1845. The English ships blockaded Montevideo till 1848 and the French till 1849, when both England and France made treaties with Rosas. On these powers withdrawing, Brazil commenced more active hostilities—the Argentine provinces of Corrientes and Entre Rios uniting with her. The war was however prolonged till 1851, when Aribe was forced to capitulate in Uruguay, and Rosas was soon after deposed in Buenos Ayres. Treaties between the several parties gave peace to Uruguay as far as regarded hostilities with foreign powers, and secured the recognition of the republic by the neighbouring states. But internal discord in this as in so many other of the petty republics of South America appears to have become chronic, and the latest accounts (received in October, 1855) speak of affairs as in the most disorganised condition. Brazil, which by assisting the

government with money and men, had hoped to enable it to re-establish peace, order, and security in the country, finding that no reliance could be placed on the president Flores or his ministers, had withdrawn its subsidy, and was about to withdraw its troops; and the country was fast relapsing into a state of anarchy. The revenue of Uruguay has for some time been inadequate to meet the current expenses, and the interest on its heavy public debt has been long unpaid.

USTICA. [PALERMO, Province of.]

USTIUG (VELIKI, namely Great), a considerable town in the government of Wologda in Russia, situated in 60° 47' N. lat., 46° 5' E. long., at the confluence of the Suchona and the Jug, has a population of 14,000. It is an ancient town; the houses are for the most part of wood; there are 2 cathedrals, 23 churches, 5 convents, a bank, an exchange, and several buildings and warehouses belonging to the crown. The town, being situated on the direct road from Archangel to Siberia, and to the southern provinces, has an important commerce and transit trade with Archangel, St. Petersburg, Casan, Kostroma, Yaroslav, and Novogorod, which is greatly facilitated by many navigable rivers. The chief articles which pass in transit are Russian productions from the other governments, the furs of Siberia, silks and tea from China, and fish from the North Sea. The inhabitants have also manufactures of linen, woollen, leather, soap, candles, hosiery, and wooden utensils, and there are in the town many gold and silversmiths, whose works in enamel and bronzed silver are much esteemed.

USTJUSHNA. [NOVOGOROD.]

USUMASINTA, RIVER. [MEXICO.]

UTAH, a territory of the United States of North America, lying between 37° and 42° N. lat., 106° and 120° W. long. It is bounded S. and S.E. by the territory of New Mexico; E. by the territories of Kansas and Nebraska; N. by that of Oregon; and W. and S.W. by the state of California. The area of Utah is estimated by the 'Topographical Bureau of the United States' at 269,170 square miles. The population in 1850 was 11,380 (of whom 24 were free coloured persons, and 26 slaves en route to California), or 0.04 to the square mile: but this does not include the native Indian population, who were estimated by the Commissioner of Indian Affairs in 1853 at 11,500.

Surface, Hydrography, &c.—The territory of Utah occupies for the most part a vast broken depression, known as the Great Basin, which lies between the ROCKY MOUNTAINS on the east and the Sierra Nevada [CALIFORNIA] on the west; these lofty mountains rising in parts above the line of perpetual snow, while across them are only a few difficult passes. On the north of the Great Basin there is no continuous mountain chain, the watershed being formed by an elevated tract, which is sometimes a swamp. On the south-east the rocky barrier is broken through by the head streams of the Colorado, the only river which finds its way out of the Great Basin; all the others which flow into the basin from the slopes of the mountains being lost in the plains or in the lakes which occupy the bottoms of the larger valleys. The Great Basin is about 500 miles long, from east to west, and little less wide, and some 4000 feet above the level of the sea. Parallel to the main ranges of the Sierra Nevada and the Rocky Mountains are several inferior ranges, of which the Wahsatch Mountains on the east are the most important. Some of these secondary chains attain an elevation of from 2000 to 3000 feet; and from these diverge cross ridges, which form lesser valleys. A large portion of the Great Basin consists of arid plains, on which artemesias and salicornias are almost the only plants, but in many parts these plains are so impregnated with salt as to be unfit to sustain vegetable life. The most remarkable features of this singular country are the great valleys. Of these by far the largest is the Great Salt Lake Valley, which is about 120 miles long and from 20 to 40 miles wide, the Great Salt Lake occupying the greater part of the northern portion of it. In the centre of this valley the surface is level, but it rises gently on both sides to the mountains. There are few or no trees viable. On the south and west of the Great Salt Lake the land is a soft sandy irreclaimable barren, on the north it is a swamp, on the east and south-east, where is the Great Mormon settlement, it is fertile and cultivated from the mountains to the shore. The climate of the valley is dry and mild; but rain seldom falls during the summer months, so that the agriculturist is to a great extent dependent on irrigation. The other valleys bear a general resemblance to Salt Lake Valley, but they are much smaller. The chief are—Utah Valley, about 60 miles long by 20 miles wide; Sand Pitch Valley, 45 miles long by 20 miles broad; Bear River Valley, South Valley, Yuab Valley, Cache Valley, and Sevier Valley. Of that portion of the territory which does not strictly belong to the Great Basin, the Valley of Green River with its tributaries, which occupies the eastern portion of the territory from the Sierra Madre to the Bear River Mountains, is the most extensive, being more than 150 miles long; but it is so elevated and so badly watered that it is thought not to

contain a single spot available for agricultural purposes. The little valley of the Uintah River, a more southern tributary of the Colorado, is much warmer and more promising. But all this eastern part of the country is, with this exception, barren.

Utah possesses no great navigable rivers. The Colorado, as already mentioned, is the only river which flows out of the Great Basin, and it is a stream of little consequence till it has flowed some distance along the territory of New Mexico. There are indeed accumulated in the gorges of the mountains unfailing stores of snow, which furnish during the whole of the summer abundant and perennial streams, which in some instances possess a considerable volume of water; but many of these never reach the bases of the mountains, and the great majority are lost in the arid plains. A few find their way to the lakes, but from the lakes, except from one to another, there is no outlet. Some of the streams which connect the lakes are however of considerable value for irrigation, and may become of essential importance for manufacturing purposes. The most valuable of these rivers is the Jordan, a rapid stream which unites the Great Salt Lake with Lake Utah; it is on this river that Salt Lake City is built, and already several manufactories are established along its banks.

Of the numerous lakes which are in the territory the largest and most remarkable is the Great Salt Lake, which lies at the northern end of Great Salt Lake Valley. This lake is about 70 miles long, from 20 to 30 miles wide, and has a shore-line of 291 miles. Its water is saturated with chloride of sodium (salt); Dr. Gale, who made an analysis of its water for the United States government, says that it contains full 20 per cent. of pure chloride of sodium, and not more than 2 per cent. of other salts, and is one of the purest and most concentrated brines in the world. The specific gravity of the water is 1.170. Several picturesque islands rise to a great altitude above the surface of the lake. On the mountains on each side of the lake are several distinct terraces, exhibiting unmistakable evidences of this valley having been at some time the bed of a great inland sea. The other lakes are much smaller than the Great Salt Lake; the water of Lake Utah, which is connected with the Great Salt Lake by the river Jordan, is said to be quite fresh. It receives several streams from the mountains. In the neighbourhood of the Great Salt Lake, and in other parts of the territory, are several hot and sulphureous springs.

Geology, &c.—Metamorphic, Silurian, and Carboniferous rocks prevail. In the neighbourhood of the Great Salt Lake rocks of granitic and sienitic character occur, with hornblende rocks, and talcose and mica-schists. The more elevated portions of the lake shore and mountain summits appear to consist of carboniferous limestone, which, in some localities, lose their granular character, and become sub-crystalline, or threaded with veins of calcareous spar. All the elevated ranges on the north, south, and west of the Great Salt Lake, seem to be capped with the carboniferous limestone, which generally rests on a coarse granular sandstone. In some localities the sandstones are overlaid with a coarse conglomerate, which is sometimes partly altered so as to assume the character of a quartz rock. Cretaceous strata occur in several places; and along the valleys are tertiary clays, &c. Good building-stone is quarried in the vicinity of Salt Lake City. Of the mineral wealth of Utah little is really known.

Soil, Climate, Productions, &c.—A large proportion of the country is uninhabitable and unproductive, but that portion which is available for agricultural purposes, though limited in extent as compared with the intervening desert tracts, is much of it of extreme fertility; and according to Captain Stansbury, who made a careful survey of the territory for the government of the United States, fully sufficient for the support of a large, though not dense, population. These fertile and habitable tracts are for the most part confined to the narrow strips of alluvial land along the bases of the mountains and the bottoms of the warmer and more sheltered valleys. Along the western foot of the Wahsatch range occurs one of the richest of these tracts, a narrow slip only a mile or two wide, but stretching for more than 300 miles in length. In the valley of the Jordan it is much wider; and there are wider patches in several other of the valleys, as in those of the Tuilla, of the Timpougas and others of the Traverse Range. In fact the most available part of the Great Basin appears to consist of the valleys along its eastern border, sheltered by the Wahsatch range. The most productive of the cultivated soils consist of disintegrated feldspathic rocks, mixed with the debris of the limestones. There also occur in the valley bottoms very rich vegetable and marly loams. So productive are some of the soils that Captain Stansbury mentions an instance of a bushel of wheat producing on three acres and a half of land a yield of 180 bushels; and other authorities speak of 50 or 60 bushels of wheat to the acre as being by no means unusual, but there can, we think, be no doubt that such must be exceptional cases.

In the valleys the climate is milder and drier than in the same parallel of latitude on the Atlantic, and the winters are much more temperate; in the Salt Lake Valley the thermometer seldom descends to zero. But on the higher arid plains the heat is often oppressive. Over these plains the mirage is frequently observed in the warm season. The eastern section of the country is cold. Throughout the habitable portions of the territory rain seldom falls between May and October,

and can never be relied on for agricultural purposes. Artificial irrigation is therefore requisite to agricultural success; but the character of the country happily admits of irrigation being effected with comparative ease in the more fertile valleys, although there are extensive tracts of land which will not admit of cultivation on account of their being beyond the application of irrigation.

The principal cereals grown are wheat, oats, maize, barley, and rye. Very little buckwheat is raised. The common potatoes grow luxuriantly; of sweet potatoes the crops are limited. All the vegetables peculiar to the middle and western states succeed here. The sugar-beet grows to a large size, and is being raised, though not largely, for making sugar. Cotton, the sugar-cane, and rice will, it is said, grow in some districts, but they are evidently not suited to the climate. Tobacco and flax are raised in small quantities. A portion of the territory is well adapted for grazing, though the bunch grass on the lower slopes of the mountains, which at present feeds vast herds of antelopes and deer, is burnt up during the summer months. Horses are the animals of which the inhabitants perhaps possess the largest proportionate number; but they have a considerable number of cattle, and there is a growing attention being paid to sheep, which are in great request for their wool.

The country in its natural state is almost destitute of trees. The only timber found is in the more sheltered ravines, on the banks of a few of the streams, and occasionally on the bases of some of the mountains. Wild game abounds. The antelope, deer, bear, and panther are very numerous. The lake-islands are frequented by aquatic birds in astonishing quantities. The more common kinds are swans, geese, ducks, curlews, plovers, gulls, blue herons, cranes, pelicans, &c. Mosquitoes and sand-flies are very numerous and troublesome. But the greatest insect pest is a large kind of cricket, which at irregular periods appears in enormous numbers, and commits terrible ravages; it is said that the corn crops are this year (1855) almost entirely destroyed by them.

Utah from its insulated situation must be to a great extent thrown upon its own resources, if the peculiarities of its population did not cherish by every means their separate self-dependent condition. Cut off by lofty and difficult mountains and vast deserts from all other settled states, with agricultural resources little more than sufficient for the supply of its own increasing requirements, and without any staple product or material required by the arts or luxuries of other communities, it is not likely to have any considerable amount of external trade or commerce; while there will probably be a sufficient stimulus to the growth of such manufactures as are required for ordinary domestic purposes. With California regular communication is maintained, but the cost of transit is too great for California to offer a market for the produce of Utah. On the other hand, from Salt Lake City to St. Louis, the nearest considerable market, is upwards of 1600 miles. Some modification would undoubtedly be wrought by the construction of the projected Great Pacific railway, but in any case Utah must remain to a great extent a country separated geographically, politically, and commercially. The local government has done everything it could to encourage the establishment of factories, and there are already several woollen-mills, potteries, hardware-works, &c., especially along the valley of the Jordan. Flour-mills are in operation very generally.

Divisions, Towns, &c.—Utah is divided into 12 counties. *Fillmore*, a little village, in the south-western part of the state, is the political capital; but the chief city, indeed the only one of any consequence is Salt Lake City. There are several other 'cities,' but they are merely collections of a few adobe cottages.

Salt Lake City, or as it is officially designated, the *City of the Salt Lake*, is situated on the east side of the Jordan River, a strait which unites Utah Lake with the Great Salt Lake, in 40° 45' N. lat., 112° 5' W. long., and at an elevation of 4300 feet above the sea. The population in 1850 was over 5000; it has since largely increased, but we have only vague estimates of its numbers. The city was laid out in July 1847, under the direction of Brigham Young, the Mormon prophet, as the great central city of the Mormon people. The space marked out was four miles long and three miles broad, the same size as Nauvoo; the streets intersect at right angles, and are 132 feet wide; and the houses are ordered to be set back 20 feet from the front line of the lot, and the intermediate space to be planted with shrubs or trees. A plot of several acres is set apart for the site of the great temple, which is to be built on a scale of the greatest possible splendour, far surpassing the famous temple of Nauvoo. The houses are mostly built of adobe, or sun-dried bricks, and have a neat appearance; but large houses and public establishments are now built of stone. There are several manufactories and mills in the vicinity of the city, and salt is largely made on the borders of the lake. Several schools have been established, and a site has been set apart on one of the terraces of the Wahsatch Mountain for the erection of a university.

Government, History, &c.—The government of Utah territory is exactly similar to that of New Mexico.

The territory of Utah originally formed a part of the Mexican province of Alta, or Upper California, and, with the rest of that province, was transferred to the United States by treaty in 1848. But the whole of the province had really passed out of the hands of Mexico for some years before the formal transfer; and while the tract

west of the Sierra Nevada, or what now forms the state of California, was already in the possession of the citizens of the United States, the Great Basin, hitherto abandoned to the native Indians, lay open to any body of settlers strong enough to maintain themselves within it. By such a body it was occupied in 1847. It does not fall within our province to relate here the early history of that remarkable sect the Mormons, whose occupation of the territory has invested Utah with so singular an interest. It will be enough to remind the reader, that the Mormons first settled as a community at Independence, and afterwards in Clay county, Missouri; and that on being expelled in succession from each of these places, they left the state, and established themselves at Nauvoo in Illinois. Here they speedily became a large and flourishing body; and, besides various public edifices, erected a spacious temple at a cost of nearly a million dollars. Joseph Smith, their prophet, governed them with absolute and almost unquestioned authority until his death in 1844, which was brought about in a very shocking manner. A newspaper established in Nauvoo by some opponents of the sect, having published certain scandalous statements respecting him, the town council directed its publication to be stopped and the office to be razed. The editors appealed to the mayor of Carthage, who issued a warrant for the arrest of Smith and his brother. Smith at first refused to obey, and placed the city in a state of defence; but he was induced to surrender in order to prevent a collision between his followers and the state authorities, on receiving a pledge of protection from the populace. A mob was however permitted to break into the state jail and murder both Smith and his brother. The Mormons elected a new prophet, Brigham Young, as the successor of Smith, and affairs again became prosperous. But organised mobs several times attacked the city, and at length regularly invested it; and the leaders were forced to undertake that the whole body should entirely quit the state. The prophet and elders now formed the bold resolution to lead their followers across the vast western wilderness, to the far distant and nearly unknown country lying beyond the Rocky Mountains—there to seek some secluded retreat beyond the reach of their persecutors. They had been promised to be allowed till the spring to make their preparations for the departure of the first or pioneer party; but their enemies became clamorous, and they were obliged to set out in February 1846, while it was yet winter. The sufferings of this pioneer party were of the most terrible and trying kind; but they struggled on resolutely, planting crops and otherwise preparing the way for those who were to follow them. It was not till July of the following year that the first section of the pioneers reached the promised land. The remainder were soon to follow; for although the authorities had engaged that the rest of the community should be allowed to stay in Nauvoo till apprised of the safe arrival of the first migration, their old opponents came down and drove them all out of the city in September 1846.

On taking possession of the site of their new city by the Great Salt Lake, the elders at once set about organising a regular government, at the head of which they placed their prophet Brigham Young; and as soon as what they deemed a sufficient number of their followers had arrived, and their territory had become by cession from Mexico a part of the United States, they elected the usual state officers, and applied to the federal government to be admitted into the Union as a sovereign state under the name of the State of Deseret. But Congress refused their application, and remanded the state back to a territorial condition, entitling it Utah. Brigham Young was however appointed or continued as governor; and the community, though nominally under the laws of the Union, remained virtually independent, and governed by the maxims of the Mormon leaders. Within the last year or two however Young has been superseded by the president, who has appointed a 'Gentile' governor, and the federal government has assumed a more direct control.

The religious opinions of the Mormons do not properly belong to Geography. Here however, as Utah is their appointed Zion, and as they are almost its only inhabitants, we may just state that the Mormons profess to be a separate people, living under a patriarchal dispensation, with prophets, elders, and apostles, who have the rule in temporal as well as religious matters; their doctrines being embodied in the 'Book of Mormon' and the 'Book of Doctrine and Covenants,' revealed to their first prophet, Joseph Smith; that they look for a literal gathering of Israel in this western land; and that here Christ will reign personally for a millennium, when the earth will be restored to its paradisaical glory. The practice of polygamy, which has drawn upon them so much obloquy, has not been, we believe, officially admitted; but there is little doubt that it has been allowed, at least to their leaders, and some of their more ardent advocates defend it by reference to the practice of the ancient Jewish patriarchs. That such a system could possibly grow up into such magnitude in these times is sufficiently startling; but that it can long maintain itself if not subjected to persecution is inconceivable.

As we did not notice Nauvoo under ILLINOIS, we may add to what we have said of it above, that it stands on the Mississippi, 125 miles N.N.W. from Springfield; and that after the departure of the Mormons, Nauvoo became the seat of a colony of French communists, or Icarians, under the direction of M. Cabot, who were however far from successful. Of its present state we have no trustworthy

particulars; its population has dwindled down to a very insignificant number. The great Mormon temple of Nauvoo was, in October 1848, set on fire by an incendiary and destroyed.

(Capt. Howard Stansbury, Topographical Engineer, U.S. Army, *Expedition to the Valley of the Great Salt Lake of Utah*; Fremont, *Report of Expedition to the Rocky Mountains*; Lieut. J. W. Gunnison, *The Mormons, &c.*; *Statistical View of the United States*; *Seventh Census of the United States*; *Gazetteers of the United States, &c.*)

UTICA, U. S. [NEW YORK.]

UTIEL. [CASTILLA LA NUEVA.]

UTRECHT, one of the Dutch provinces, is bounded N. by Holland and the Zuiderzee, E. by Gelderland, S. by Gelderland and Holland, and W. by Holland. Its area is 534 square miles; and the population at the end of 1853 numbered 155,324. In the northern and western parts, and on the banks of the Leck, the surface is level and low; towards the south-east there are some low hills. The low ground is rich and fertile; in the more elevated tracts the soil is sandy, with here and there some low thickets, extensive heaths, and peat-moors. The province is traversed by the Rhine and its branches, and by several canals. The climate is not so damp as that of the province of Holland: the air is pure and healthy, and there is good fresh-water. The natural productions are the common domestic animals, poultry, fish, bees, corn, pulse, garden-fruit, culinary vegetables, flax, hemp, and tobacco. The manufactures are carried on chiefly in the towns, and consist of woollen, cotton, silk, and linen fabrics; there are also breweries and distilleries. The exports are corn, cattle, swine, butter, cheese, manufactured goods, bricks, and tiles. Railways run from Utrecht, the capital of the province, to Arnhem, Amsterdam, the Hague, and Rotterdam. A direct line from Utrecht to Rotterdam has been for some years in course of construction; it is now open to Gouda, 20 miles west by south from Utrecht. The chief towns of the province are AMERSFOORT and UTRECHT.

UTRECHT, the capital of the province of Utrecht in Holland, is situated in 52° 7' N. lat., 5° 6' E. long., in a pleasant country, at the bifurcation of the Old Rhine and the Vecht, 22 miles by railway S.E. from Amsterdam. The Rhine divides the city into two parts, and there are likewise two canals with 36 drawbridges. The position of the city is healthy, and free from the inconvenience of damp, so common in Holland, it being situated on a dry and rather elevated soil, with a descent towards the river. The approaches to the city are very beautiful, especially that from Amsterdam, which consists of a broad avenue, bordered with rows of trees. The appearance of the city itself is antique, many of the houses being in the gothic style. It was formerly strongly fortified, but the ramparts have been converted into public walks. There is a beautiful walk called the Mallebaan, above half a mile in length, planted with eight rows of lime-trees. The cathedral with its tower, 388 feet high, was destroyed by fire a few years ago. There are 8 Calvinist, 1 Lutheran, 1 Anglican, 1 Moravian, and 8 Roman Catholic churches. The town-house is a handsome modern building. The university, founded in 1634, has five faculties, between 300 and 400 students annually, a botanic garden, observatory, &c. The population of Utrecht is about 45,000: the inhabitants manufacture broadcloths, silk, lace, linen, needles, refined sugar, salt, fire-arms, tiles, &c. The town has also important bleach-works, and an extensive general commerce. Utrecht is the birthplace of Pope Adrian VI.; it gives title to a Catholic archbishop, who is metropolitan for his co-religionists in the Netherlands.

UTTOXETER, Staffordshire, a market-town and the seat of a Poor-Law Union, in the parish of Uttoxeter, is situated in 52° 54' N. lat., 1° 51' W. long., distant 14 miles E.N.E. from Stafford, 135 miles N.W. from London by road, and 136 miles by the North-Western and North Staffordshire railways. The population of the town in 1851 was 3463. The living is a vicarage in the archdeaconry of Stafford and diocese of Lichfield. Uttoxeter Poor-Law Union contains 21 parishes and townships, with an area of 62,980 acres, and a population in 1851 of 15,140.

At Uttoxeter the river Dove is crossed by a handsome stone bridge. The houses in the town are generally well built. The church has been rebuilt of late years, but the lofty tower and spire of the former edifice remain. There are chapels for Wesleyan Methodists, Baptists, Independents, and Quakers. Alleyne's Grammar school is under the care of a head-master and an assistant. There are National schools and a savings bank. The market is on Wednesday: there are several yearly fairs. A county court is held. The Caldon Canal, which joins the Grand Trunk Canal near Stoke, ends at Uttoxeter.

UXBRIDGE, Middlesex, a market-town and the seat of a Poor-Law Union, in the parish of Hillingdon, is situated on the left bank of the river Colne, in 51° 38' N. lat., 0° 29' W. long., distant 15 miles W. by N. from London. The population of the town of Uxbridge in 1851 was 3236. The living is a perpetual curacy, in the archdeaconry of Middlesex and diocese of London. Uxbridge Poor-Law Union contains 10 parishes and townships, with an area of 25,906 acres, and a population in 1851 of 19,475.

Uxbridge was formerly a place of strength and a corporate town, and in the civil wars of Charles I. was the scene of an unavailing negotiation for peace between the commissioners of the king and those of the parliament. The mansion in which the conferences were held is still standing. The town, which is lighted with gas, extends for

about a mile along the Oxford road. There are two bridges over the arms of the river Colne, and one over the Grand Junction Canal. The market-house is a commodious brick structure supported on wooden columns. The Independents, Baptists, and other Dissenters have places of worship. There are a British school, a School of Industry, a literary and mutual improvement society, and a savings

VAELS. [LIMBURG.]

VAILLY. [AISNE.]

VAL DE PENAS. [CASTILLA LA NUEVA.]

VALA'IS, a canton of Switzerland, consists mainly of a great longitudinal valley traversed by the Rhône, and screened by two lofty and massive chains of Alps, one of which, on the south side, divides it from Italy, and the other from the canton of Bern on the north. Both chains are connected at the eastern end of the Valais with the central group of the St-Gothard by means of the Gallenstock, the Furka, and the Muthorn. The Rhône has its sources in a glacier which lies on the west side of the Gallenstock and the Furka, whence it flows westward through the whole length of the Valais, receiving numerous affluents on both banks of the mountains. The offsets form sixteen transverse valleys, some of them more than 20 miles in length, which slope down into the great valley of the Rhône. Near St-Maurice the valley of the Rhône becomes contracted between two lofty masses—the Dent-de-Morcles on the north, and the Dent-du-Midi, a projection of the southern chain—which leave between them at the bridge of St-Maurice merely space enough for the river. This is the geographical termination of the Valais, but the canton continues to stretch over a narrow and partly mountainous tract along the left bank of the Rhône for about 16 miles farther down, to the entrance of the river into the Lake of Geneva: the opposite or right bank below the bridge of St-Maurice belongs to the Canton-de-Vaud.

The area of the Valais is 1658 square miles, of which more than one-half consists of high alps and glaciers, and the remainder of lower offsets and intermediate valleys. The breadth of level ground in the valley of the Rhône varies from a quarter of a mile to three miles. The heat in the summer is very great in the valley, especially in the neighbourhood of Sion and Siders (Sierre in French), where the fig, mulberry, almond, and pomegranate thrive in the open air. [RHÔNE; LEMAN, Lake.] The vine and Indian corn are cultivated up to the height of 1000 feet above the level of the lake, barley to 2500, and potatoes to 3000 feet. Walnut, chestnut, cherry, apple, and pear trees are abundant. In several localities excellent wine, both white and red, is made. Cider is made in other districts. In common years the crop of corn is sufficient for the consumption. The forests are extensive; great quantities of timber are cut down and sent by the Rhône into France. The horned cattle, sheep, and goats, are very numerous; horses and mules are few in number. Mines of iron, copper, lead, silver, cobalt, and zinc have been found.

The population of the Valais amounted in March 1850 to 81,559, 81,096 of whom were Catholics and 463 Protestants. In the Lower Valais cretinism is a common infirmity. A French patois is spoken in the western part of the canton; German in the upper or eastern part. The canton returns four members to the National Council of Switzerland.

The canton is divided into 13 communities or little republics, called 'dixains'; every dixain has its council, the members of which are appointed by the respective communes, and which regulates all local affairs. Each dixain sends four deputies to the diet, or legislature of the whole canton, which meets every year at Sion. The diet appoints the members of the council of state, or cantonal executive. The bishop of Sion is president of the Diet of the Valais, and has four votes.

The Valais was, in Roman times, occupied by the Mantuates, Veragri, and Seduni. On the decline of the empire it fell successively under the Burgundians and the Franks. The Upper Valais maintained its independence during the middle ages, and conquered the Lower Valais in 1475, which it held by right of conquest till 1798, when the whole territory became a canton of the Helvetic republic. Previously the Valais had been only the ally of the Swiss Confederation. In 1802 Bonaparte formed it into a separate republic, which he united to the French empire in 1810. In this interval the Simplon road, through the Valais and over the Alps to Italy, was made, and the newly annexed territory was in consequence called the department of the Simplon. In 1814 the country was restored to its independence, and made a canton of the Swiss Confederation. A constitution was formed, in which the political distinction between the Upper and the Lower Valais was obliterated, but the aristocratic principle was maintained in the elections till 1830, since which date more democratic forms have been introduced.

The principal towns of the Valais are—Sion (Sitten), an old-looking town, surrounded with walls and towers and a ditch, in a picturesque situation at the foot of two insulated rocks, on the right bank of the Rhône. It has large cathedral, several other churches, a fine old

bank. The market on Thursday is important for corn. A market for provisions is held on Saturday; fairs are held on March 25th and September 29th. A county court is held.

UZEL. [CÔTES-DU-NORD.]

UZERCHE. [CORRÈZE.]

UZES. [GARD.]

V

town-house, a college, a curious old tower said to have been raised by Charlemagne, two ruinous old castles on the summit of the two hills, an hospital, an arsenal, and 3516 inhabitants. Sion is the ancient *Sedunum*, a Roman military station; it is called *Civitas Sedunorum* in an inscription in honour of Augustus, which is preserved in the cathedral. *Martigny* (*Martinach*), near the junction of the Dranse with the Rhône, is the chief town of the Lower Valais. It is built on the site of the ancient *Octodurum*, a Roman military station, has several good buildings, inns, and shops, and above 8000 inhabitants in the commune. The high-road of the Simplon, and that leading over the St-Bernard into Italy, pass through Martigny. *St-Maurice*, on the left bank of the Rhône, 10 miles below Martigny, a small town of 1327 inhabitants, is remarkable for its ancient Augustinian abbey, now suppressed. There is (or was before the recent suppression of the monasteries in Switzerland) a college annexed to the abbey, in which the classical languages, mathematics, physics, history, and geography were taught. There are, or were, colleges also at Sion and Brieg. The celebrated convent and hospice of St-Bernard was in the territory of the Valais. [BERNARD, St.]

VALDIVIA. [CHILE.]

VALENÇA DÓ MINHO. [ENTRE DOURO E MINHO.]

VALENÇAY. [INDRE.]

VALENÇE, a city in France, capital of the department of Drôme, is situated in a fertile plain on the left bank of the Rhône a few miles below the junction of the Isère, on the Paris-Lyon-Marseille railway, 381 miles S.S.E. from Paris, 65 miles S. from Lyon, and 143 miles N. by W. from Marseille, in 44° 56' N. lat., 4° 53' 40" E. long., at an elevation of 421 feet above the level of the sea; and had 13,829 inhabitants in the commune at the census of 1851.

Valence occupies the site of the Roman *Valentia*. It was a place of considerable strength, and afforded a refuge to Constantine, who was fruitlessly besieged here by Sarus the Goth. Jovinus sought refuge here, but the town was taken by the Visigoths, under their king Ataulfus. It was afterwards subject to the Burgundians, and passed from them to the Franks. In the middle ages it formed part of the kingdom of Arles, and was the capital of the Valentinois, a district of Dauphiné. The territory of Valentinois was made a duchy and conferred by Louis XII. on Caesar Borgia.

The town is united by an iron suspension-bridge with the famous wine district of St-Péray on the right bank of the Rhône. It is ill laid out, with winding and narrow streets, and ill built; it is surrounded by old walls, flanked with towers, and entered by several arched gateways. The high road from Paris and Lyon to Marseille skirts the wall on the outside and passes through the southern suburb of Saunière. On the north side of the town is a citadel, fronting a parade or exercise-ground planted with trees. The principal buildings are—the cathedral of St-Apollinaire, which contains a monument by Canova of Pope Pius VI. (who died here August 29th, 1799); the former residence of the bishop; the prefect's residence, formerly an abbey, with extensive gardens; the house in which Pius VI. resided; a house in the Grande Rue, the front of which is a rich specimen of gothic architecture; the court-house; the barracks; and the theatre. There are two public walks. There are scarcely any Roman remains existing at Valence.

The manufactures of Valence comprise cotton-yarn, printed cottons, silks, gloves, hosiery, and outlery; there are dye-houses, tan-yards, rope-walks, saw-yards for marble, tile-yards, potteries, lime-kilns, and a great number of cartwrights' shops. Trade is carried on in the wines, fruits, and silks of the south of France; in brandy, liqueurs, corn, and manufactured goods: there are six fairs in the year. Steamers ply daily to Avignon and Lyon. The well-known Hermitage and St-Péray wines are grown in the neighbourhood of Valence. [ARDÈCHE; DRÔME.]

Valence gives title to a bishop whose diocese consists of the department of Drôme. It has tribunals of first instance and of commerce, a college, an ecclesiastical school, a school of artillery (in which Napoleon I. was a pupil from 1785 to 1791), and a public library of 15,000 volumes.

VALENCE. [TARN-ET-GARONNE.]

VALENCIA, an ancient province of Spain, formerly a kingdom, is bounded E. and S.E. by the Mediterranean Sea, W. and S.W. by the provinces of Castilla la Nueva and Murcia, N. by Cataluña and Aragón; on the south it terminates by a point. It is situated between 37° 50' and 40° 45' N. lat., 0° 32' E. long. and 1° 25' W. long. The greatest length north to south is about 220 miles; the greatest width east to west is little more than 50 miles. The area is 7683 square miles. The

population in 1849 was 1,110,960. It is divided into the three following modern provinces:—

Provinces.	Area in Square Miles.	Population in 1849.
Valencia	7,683	500,000
Alicante		363,219
Castellon		247,741
Total	7,683	1,110,960

Surface.—The province of Valencia consists of a long and rather narrow tract extending along the Mediterranean Sea, the modern province of Valencia, forming the central portion, Alicante the southern, and Castellon the northern. The whole of the interior is mountainous, the low and level tracts lying along the coast and the courses of the rivers. The mountains are a portion of the great buttress which in this province and that of Murcia supports the table-land of Castilla la Nueva. The mountains are mostly lofty, rugged, and bare, and in some parts they extend close to the coast. The Sierra de Penanquilla crosses the province north of Alicante in a direction from south-west to north-east, terminating at Cape San Martin. This range consists of schistose rocks capped by limestone. The other sierras, which are very irregular, but have mostly a direction from west to east, consist for the most part of limestone, marbles of various colours, and gypsum. The valleys are generally narrow, but there are a few level tracts of considerable extent.

Rivers.—The rivers mostly originate in the provinces west of Valencia. The Turia, or Guadalaviar, rises in Aragon, and crossing Valencia in a direction from north-west to south-east passes the city of Valencia, and falls into the sea below the small port of Grao. The Jucar rises in Castilla la Nueva, and soon after entering this province receives the Cabriel on the north bank; it then flows westward, receives the Magro, and enters the sea at Cullera. The other rivers have a shorter course. The Alcoy, which rises near the town of Alcoy, and the Palancia, which enters the sea below Murviedro, are the only rivers of considerable size which belong entirely to this province. The Mijares rises in Aragon, and receives in this province the Villahermosa and the Monleon. The Segura crosses the southern angle of the province on its way from Murcia to the sea.

Soil and Productions.—The numerous streams and rivers of this province afford the means of irrigating the lands to perhaps a greater extent and in a more perfect manner than anywhere else in Spain. The most extensive of the level tracts are those of Valencia, Orihuela, Alicante, and Jativa (Xativa), or San Felipe. These flat and rich lands are called Huertas, 'gardens.' The Huerta of Valencia has a main-trunk canal, filled from the Turia, whence numerous smaller canals, called acequias, distribute the water in regulated proportions to the various beds into which the land is divided. These beds are quite flat, and the water is allowed to stand on them for a few days, after which it is let off. The seed is then sown, and no sooner is one crop removed than the land is prepared for another. Three or four crops are thus obtained in the year. The Huerta of Alicante is watered from a vast reservoir called El Pantano, constructed in the mountains about fifteen miles from the city of Alicante. This huerta comprehends an expanse of about 30,000 acres, everywhere encircled by lofty mountains, except towards the sea. The huertas of Jativa and of Orihuela, are also of considerable extent, well watered, and exceedingly productive.

All the level grounds are under cultivation, and wheat, barley, oats, maize, beans and peas, flax and hemp, are produced in abundance. In the swampy grounds large crops of rice are obtained, which are generally consumed in the province, rice forming a large portion of the food of the lower classes; but these tracts are very unwholesome. Much rice is grown in the vicinity of the Albufera. [ALBUFERA DE VALENCIA.] The higher grounds and slopes of the hills are allotted to vines, mulberry-trees, olives, figs, oranges, lemons, quinces, and pomegranates. The forest-trees are mostly elms, chestnuts, the ilex-oak, cypress, and poplars, whilst lofty pines cover the summits of the rocky hills. The rugged moors, unfit for cultivation, are abandoned to the various species of cistus, rosemary, thyme, lavender, and other odoriferous shrubs.

The quantity of wine produced annually in Valencia amounts to about 9,000,000 gallons. In the districts of Benicarlo and Penicola a strong red wine is produced, of which a large quantity is exported to Germany and to Bourdeaux, for mixing with the second-class clarets to give them body and colour. Large quantities of raisins are exported to England, which are called Valencias, and are used for making plum-puddings. The exports of fruit are large, especially of figs.

No great number of cattle or horses is kept in Valencia; and the sheep, though numerous, yield wool of indifferent quality. Mercury, copper, sulphur, arsenic, argentiferous-lead, iron, &c. are among the mineral products, but they are procured only in small quantities. The manufactures are unimportant. Woollen and linen stuffs are indeed made in several towns of the province, and silk goods in Valencia and other places, but they are chiefly consumed within the province.

The manufacture of satins, silk-ribands, and velvets, has so much improved and increased as to render a supply from France no longer necessary. Cloth of superior quality is made at Alcoy, and silk is no longer exported in its raw state, but is spun at Valencia and other places by steam. Cordage and matting are made from the fibre of the esparto-rush; and tiles, soap, glass, paper, pottery, and earthenware, are exported to other parts of Spain.

Towns.—The city of Valencia is the capital of the ancient province and also of the modern. [VALENCIA.] Alcoy, 60 miles S. by W. from Valencia, stands on the main road from Alicante to Valencia, on a tongue of land between two streams which are the head-waters of the river Alcoy. The houses are built among terraced gardens in a ravine overlooked by hills. There are many new houses, for it is a busy commercial place, and has considerable manufactures of paper, and of woollen-cloths of a superior quality. It contains three parish churches, and has a population of about 27,000. The city of Alicante, capital of the province of Alicante, is described under that head. [ALICANTE.] Benicarlo, 80 miles N.N.E. from Valencia, is a walled town with a ruined castle, and with a small fishing port. It is a straggling ill-built place, and contains a population of about 6000. The vicinity is celebrated for full-flavoured red wines, which are exported to Bourdeaux and elsewhere to give body to the inferior clarets. Castellon de la Plana, 40 miles N.N.E. from Valencia, the capital of the province of Castellon, stands in a well-irrigated and fruitful plain, whence the addition to the name. It is a well-built and flourishing town, surrounded by walls, and contains some fine old churches, and a remarkable octagon bell-tower, Torre de las Campanas, 260 feet high. It has brandy distilleries and an active trade. Ribalta, the Spanish painter, was born here, March 25, 1551. The churches and convents once contained several of his finest works, and a few still remain. The population in 1845 was 16,952. Concentina, 55 miles S. from Valencia, contains a square Moorish tower, and has manufactures of woollen-cloths. The population in 1845 was 5972. Cullera, 28 miles S.S.W. from Valencia, is a small town on the coast of the Mediterranean Sea, at the mouth of the Jucar. It contains an old castle and a church, and had in 1845 a population of 7114. Elche, the *Illici* of the Romans, 15 miles S.W. from Alicante, stands at a short distance from the left bank of the Elda, a tributary of the Segura; it occupies both sides of a ravine, over which there is a handsome bridge. The houses are Moorish, with flat roofs and few windows, and rise above each other on the rugged slopes. The old castle has been turned into a prison. The church of Santa Maria is handsome, and has a fine portico, and a tower from which may be seen a vast extent of plantations of date-trees, which encircle the town on all sides: these trees are tens of thousands in number, and many of them are of great age. The dates are exported from Alicante, and are sold as Barbary dates. Elche is a flourishing place, and in 1845 contained a population of 18,068. Jativa (Xativa), or San Felipe, 40 miles S. by W. from Valencia, was the Roman *Setabis*, celebrated for its castle, and its fine linen handkerchiefs, which were greatly prized at Rome. The castle, of very large size, occupies a rocky height above the town. The town is well-built, and well supplied with public fountains. It contains a collegiate church and five parish churches. There are beautiful public walks, and the huerta, abundant in grain, fruits, and flowers, extends northward till it communicates with the huerta of Valencia. The population of the town is about 15,000. Monovar, 27 miles W.N.W. from Alicante, has manufactures of coarse woollens, and contained in 1845 a population of 7590. Morella, 50 miles N. from Castellon, stands on a rugged slope, with a castle above it. The town contains many good houses, and has three or four churches, and several fountains supplied from an aqueduct. The population in 1845 was 6211. Murviedro, 18 miles N.N.E. from Valencia, stands on the site of the *Saguntum* of the Romans, which was besieged and taken by Hannibal, B.C. 219. The town is built on the south bank of the Palancia at the base of a mountain, and is now a poor straggling place. It contained in 1845 a population of 7476. Long lines of walls and towers crown the heights above the town, where are also the remains of the Roman theatre. There are portions of the walls of the Circus Maximus and other Roman antiquities. There is a large Moorish castle, and the place, with its fortifications, is of the highest military importance for the defence of Valencia. Novelda, 20 miles W. from Alicante, stands on the western bank of the Elda, which enters the Segura at its mouth. The town stands in a fine plain, and has manufactures of brandy and lace. Population, 8095. Orihuela, 35 miles S.E. from Alicante, a city, and the see of a bishop, is situated at the foot of a mountain which overlooks it on the north, and is built on both banks of the Segura, which is here crossed by two bridges. The plain, or huerta, is about 17 miles from east to west, and about 5 miles in average breadth from north to south. It is bounded N. and S. by ranges of hills and mountains bare of trees, E. by the Mediterranean, and W. by the Huerta of Murcia, of which it is a prolongation. This huerta is of extraordinary fertility, and produces in abundance all kinds of grain, fruits, and vegetables. There are large plantations of olive-trees, mulberry-trees, and orange-trees. The town is long and narrow, winding round the base of the mountain. The streets are wide, but not paved, the houses tolerably good, and the general aspect agreeable. It contains a cathedral, and ten other churches, a

university-college, hospital, barracks, manufactures of linen and hats, and also tanneries, corn-mills, and oil-mills. The population in 1845 was 17,459. It is of very ancient foundation, and has been possessed successively by the Carthaginians, the Romans, the Moors, and Spaniards. *Peníscola*, 75 miles N.N.E. from Valencia, is a small town and fortress, situated on a rock 240 feet high, and connected with the mainland only by a narrow strip of sand. It possesses a fountain of fresh water. Population, 2000. *Saguntum* is the name of the Roman town which occupied the site of *Murviédro*. *Segorbe*, 30 miles N.N.W. from Valencia, stands near the right bank of the Palancia. It is the see of a bishop, and is tolerably well built. It has 6 plazas, 13 public fountains, and more than 40 fountains not public. The cathedral is used as the parish church, and there is a handsome bishop's palace. There are manufactures of earthenware, paper, starch, and brandy. The population in 1845 was 6015. *Villarreal*, 35 miles N.N.E. from Valencia, and 4 miles inland from the Mediterranean, is inclosed by ruined walls, which are entered by four gates. It has manufactures of woollens and tape, and brandy distilleries. The population in 1845 was 8207. *Vinaros*, 85 miles N.N.E. from Valencia, is a sea-port town near the mouths of the Ebro. It is an ill-built town, partly inclosed by ruined walls. It contains a fine parish church, and has a ship-building yard, a considerable coasting-trade, and active fisheries. The population in 1845 was 10,600.

History, &c.—Valencia under the Moors formed a part of the kingdom or kalifate of Cordova. It was taken by the Cid, Rodrigo Diaz de Bivar, in 1094, and he held the city and province till his death in 1099. The Moors dispossessed his widow Ximena in 1101, but Valencia was retaken in 1238 by Jaime I. of Aragon. It was brought under the crown of Castilla by the marriage of Fernando with Isabel, and afterwards became a province of the kingdom of Spain. Like the other provinces composing the kingdom of Aragon, Valencia preserved its representative body and its privileges; but the inhabitants having taken an active part against the Bourbon dynasty during the War of the Succession, Felipe V. deprived the province of its old constitution, and obliged the inhabitants to conform in every respect to the general laws of Spain. It retained however its title of kingdom (Reino de Valencia) till the ancient province was divided into the present three modern provinces.

The dialect spoken in the province, though much akin to the Catalanian, differs considerably from it, as it retains more of the Provençal.

(Madoz, *Diccionario Geográfico de España*; Ford, *Handbook of Spain*; Swinburne, Townsend, Hoskins, and other travellers.)

VALENCIA, a city of Spain, capital of the ancient kingdom and province of Valencia, and named *Valencia del Cid*, and of the modern province of Valencia, is situated in 39° 30' N. lat., 0° 25' W. long., in a fine plain, on the southern bank of the Turia, or Guadalaviar, about 200 miles E.S.E. from Madrid, 2 miles above its small port called Grao, and 4 miles above the entrance of the river into the Mediterranean Sea. It is the residence of a captain-general, formerly styled viceroy, and is the see of an archbishop. The population in 1845 was 71,018.

The city of Valencia is of a circular form. It is surrounded by a wall built by Pedro IV. in 1356, 80 feet high and 10 feet thick, with a road on the summit. The Turia flows at the base of the wall on the northern side, and the shallow bed of the river is crossed by 5 bridges, which, besides their proper use, serve also to discharge the water in times of inundation. The wall is about 2½ miles in circuit, is flanked at intervals by towers, and is entered by 8 gates. The streets, like those of most Moorish-built cities, are narrow, crooked, unpaved, and frequently without thoroughfares; but those which have been built of late years on the site of demolished convents and churches are wider and tolerably well paved. The houses are lofty and gloomy-looking, and many of them have flat roofs. The principal plaza, called El Mercado, contains the only fountain. In this plaza is the Lonja de Seda, or Silk Hall, a beautiful gothic building of 1482. The city is furnished with public sewers of great solidity, which are said to be the work of the Romans: it has also a quay, or rather promenade, faced with stone and planted with trees, which lines the whole length of the Turia down to the Grao.

The cathedral was begun in 1262, and was extended in 1482; the original architecture was gothic, but it has since been much altered, and mixed with Grecian styles. The interior is richly adorned with gilt-work and marbles, and contains many fine pictures by Juanes, Ribalta, Orrente, and other Spanish painters. The cathedral-tower is an isolated octangular gothic belfry called El Miguelete, 162 feet high, and commanding a magnificent view of the huerta, or surrounding plain. There are 14 parish churches. The church of Nuestra Señora de los Desamparados, and the seminary called La Escuela Pia, both rotundas, are worthy of notice. The archbishop's palace, which is near the cathedral, once contained a fine library, but many of the books were destroyed during the French occupation. There is also a library belonging to the university, which is open to the public: it contains about 15,000 volumes. The university in 1841 had 1600 students and 70 professors. Besides the university there are 6 colleges and several academies. Since the suppression of the monasteries, a collection of the pictures which they had contained has been formed in the convent called the Carmen, where the paintings of the

Valencian school may be studied and appreciated. There are from 600 to 700 pictures by Juanes, Ribalta, Ribera, and others. The citadel was constructed during the reign of Charles V. There is a palace called El Templo, which was built by Charles III. for the knights of the military order of Montesa. The Casa Consistorial is a noble Doric pile, where the Audiencia, or supreme court of justice, holds its sittings. The Casa de Misericordia, or poor-house, is a fine edifice. The custom-house is a large modern structure. The principal theatre is also modern. Outside the wall are botanic gardens, a bull-arena, and a public promenade, called La Glorieta, planted with trees and shrubs, and ornamented with fountains and statues. The principal manufactures are silks, linen- and woollen-cloths, hats, leather, glass, paper, artificial flowers, and tiles for flooring. The suburbs are extensive, and contain a large population, probably not less than 30,000 or 40,000. The Grao is little more than a small roadstead in the bed of the river. The roadstead at the entrance of the river is exposed to south and south-west gales. The city was taken by the French under Suchet in 1812, and they held it till June, 1813. A few miles south from Valencia is a large inlet from the sea called the Albufera. [ALBUFERA DE VALENCIA.]

VALÉRY, ST. [SEINE INFÉRIEURE; SOMME.]

VALLADOLID, a city of Spain, capital of the modern province of Valladolid, in the ancient province of Leon, is situated in 41° 40' N. lat., 4° 42' W. long., about 100 miles N.W. from Madrid. The population in 1845 was 19,191. The city is built on the left or eastern bank of the Pisuerga, at the confluence of the Esqueva, in an extensive valley encompassed by eminences which are not properly hills or even high grounds, but the rugged and precipitous sides of the limestone plain out of which the Valladolid valley seems to have been scooped. The city occupies both banks of the Esqueva, which thus answers the purpose of drainage. The bridges over the river, the arches, narrow streets, and overhanging houses, are very picturesque. With the exception of the Plaza Mayor, or great square, and the streets leading to it, the city has a melancholy and deserted aspect.

Valladolid was called Pincia by the Romans. The name was changed by the Moors into Belad Walid, or 'the town of Walid,' after Walid Ibn Hishám, the eleventh kalif of the race of Umeyyah, in whose time Spain was conquered by Tárik Ibn Zeyyád and Músa Ibn Nusseyr. The town was reconquered by the Christians under Ordoño II., who was the first of the kings of Oviedo who assumed the title of King of Leon. Early in the 15th century Juan II., king of Castilla and Leon, made Valladolid his place of residence. Under him and afterwards under Carlos V. it was adorned with splendid residences, and still more so under Felipe II., son of Carlos, who was born here, and who in 1595 induced the Pope Clement VIII. to elevate the town to the dignity of a bishopric, and who gave it the title of Ciudad (city). Felipe III. resided here almost constantly. Valladolid having been thus favoured by several kings, became a city of splendid palaces, conventual buildings, churches, public edifices, and mansions of the nobility.

The Plaza Mayor is very imposing from its size and style of architecture. It occupies a central space where there was a great fire in 1561, which lasted three days, and burnt down several streets. The granite pillars which support the arcades give it an air of solidity, and perhaps of gloom, but it is the most frequented part of the city, and contains the best shops. The cathedral was designed and commenced by Herrera under Felipe II., and if completed according to the model which still exists, would have been a grand specimen of Greco-Romano architecture. Only one of the four intended towers was finished, and that fell down in 1341, and has not been rebuilt; and the building is incomplete in other parts. There are several conventual buildings and churches of beautiful architecture, gothic and Grecian; but most of them have been much injured, chiefly during the occupation of Valladolid by the French. Among them may be mentioned—the San Benito, a church and convent of the Benedictines; the Penitencial de las Augustias; the Colegio de San Gregorio; the Dominican convent of San Pablo, distinguished for the exquisite finish of the carvings of its portada (grand entrance); and the Huelgas. The Colegio Major de Santa Cruz, formerly one of the six largest colleges of Spain, a beautiful gothic structure, has been converted into a Museo, in which have been collected the pictures, sculptures, carvings, and other works of art of the suppressed convents. The royal palace of Felipe III. still remains, but it suffered much during the French occupation: it is of mixed architecture. The university, one of the best in Spain, was founded in 1346; it is chiefly distinguished for its schools of jurisprudence, and was attended in 1841 by 1800 students. The Colegio de los Irlandeses is attended by Roman Catholic students from Ireland. The Chancilleria, or building where the chief court of justice holds its sittings, is a large and fine structure of the Tuscan order of architecture. There are beautiful alamedas, or public walks, on the banks of the Pisuerga and Esqueva.

Valladolid has manufactures of silk, cotton and woollen-cloths, jewellery, hats, linen and cotton-thread, paper, perfumery, earthen-

ware, and leather; and also a trade in white wines, olive-oil, and silk, produced in the vicinity.

Valladolid is the see of a bishop, suffragan to the Archbishop of Toledo; and is the residence of a captain-general, a military intendant, and other authorities.

VALOIS, LE, a province of France, belonging originally to Picardie, but incorporated in the military government of the Ile-de-France. Its capital was Crépy: it is now included in the departments of Oise and Aisne. Philippe III., king of France, gave the county of Valois (A.D. 1285) as an appanage to his second son Charles, whose son became king of France as Philippe VI., or Philippe of Valois. Philippe VI. bestowed the county of Valois on his fifth son Philippe; from him it came to his wife Blanche, and on her death (1392) it came to Louis, duke of Orléans, second son of Charles V. of France. The accession of the Duke of Orléans to the crown as Louis XII. reunited the county or duchy of Valois to the crown domains.

VALONA. [AVLONA.]

VALPARAISO, the principal port of Chili, is situated in 71° 45' W. long., 33° 2' S. lat., 55 miles S. from Santiago, and 225 N. from Concepcion. The town has been nearly rebuilt since the great earthquake in 1822. It consists of a long narrow street, built under a cliff, following the sinuosities of the shore close to the sea-side. The houses have all stories above the ground-floor, and they are not flat-roofed. Painted piazzas are substituted for balconies almost at every house, and their different colours give the town a gay appearance. The custom-house and several of the churches and other public buildings are handsome edifices. The Protestants have a cemetery and a place of worship. Trade is in the hands of the English, Americans, and French, and a handsome suburb on the heights above Valparaiso is almost exclusively inhabited by them. The population numbers about 30,000. In 1809 only nine vessels entered the harbour in twelve months; the entries now number nearly 1000 annually. The harbour is good, with nine fathoms water close in-shore, of easy entrance, and sheltered from all winds except the north; it is defended by three forts and a battery on a level with the water. The customs revenue in 1849 exceeded two millions of dollars. The chief exports are—copper, gold, silver, wheat, tallow, hides, timber, indigo, wool, sarsaparilla, fruits, &c. The imports consist of foreign manufactures, tea, chocolate, sugar, tobacco, hardware, &c. The trade of the port has greatly increased since the discovery of gold in California. Steamers ply regularly to Callao and other Pacific ports, and a railway has been constructed to Santiago. There are extensive bonding-warehouses and large shipbuilding-yards. Besides the ships engaged in the import and export trade of Chili, Valparaiso is much resorted to by vessels in the Pacific for the purpose of obtaining provisions. [See CHILE, in SUPPLEMENT.]

VALSESIA. [NOVARA.]

VALTELLINA, a longitudinal valley on the Italian side of the Rhetian Alps, drained in its whole length by the river Adda. The Adda rises at the foot of the Stilsfer Joch, crosses the district of Bormio, which lies east of Valtellina, and then entering Valtellina at the defile of La Serra, flows in a general direction from north-east to south-west until it enters the lake of Como at the western extremity of the valley. Valtellina Proper is about 45 miles in length, but if we include Bormio, which is a continuation of the same valley, the whole length is 55 miles. It is bounded N. by the Swiss canton of the Grisons, the main ridge of the Rhetian Alps dividing the valley of the Adda from that of the Inn, or Engadin; N.E. by the Tyrol, from which it is separated by the lofty group of the Ortler and the Stilsfer Joch; S. by the Austrian provinces of Brescia and Como; and W. by the lake of Como and by the district of Chiavenna, with which it is politically united. Chiavenna consists mainly of the valley of the Liro, a stream which rises at the foot of the Splugen, and flowing from north to south joins the Maira, which comes from the Grisons country. A few miles lower the united stream enters the Laghetto, or Upper Lake of Como. From the Splugen to the lake is a distance of about twenty miles. The three districts of Valtellina, Bormio, and Chiavenna have been for ages united under the same administration, and now form the Austrian province of Sondrio. Valtellina proper is the largest and finest part of the whole: it has a genial climate and a fertile soil. The heat is very great in summer. All the fruit-trees of Italy thrive there. It produces abundance of wine, Indian corn, millet, and wheat. It has excellent pastures and meadow-land, and its cheese rivals the best made in Lombardy. The slopes of the lower hills along the northern side of the valley are covered with vines planted in terraces. The level land along the banks of the Adda is not more than a mile and a half in breadth, the mountains rising gradually on both sides and forming numerous transverse valleys between their offsets. The Val Poschiavo and the Val Bregaglia however belong to the canton of the Grisons. The southern ridge, which

separates the Valtellina from the province of Brescia, is a lower offset of the Rhetian Alps, which detaches itself from the Ortler-Spitz, and runs in a south-west direction towards the Lake of Como. Its principal summit is Monte Legnone, about 8000 feet above the sea. The district of Bormio, being more elevated than Valtellina, is colder and less fertile. [BORMIO.] The northern part of the district of Chiavenna is likewise an alpine country, but there is a fine plain between the town of Chiavenna and the Lake of Como, which is as productive as any part of North Italy.

The area of Sondrio is 1253 square miles; the population 98,550, of whom more than seven-tenths live in the Valtellina. The spoken language is an Italian dialect. The province is divided into seven districts. The principal towns are—Sondrio, the head town of the whole province, situated on the right bank of the Adda. Sondrio has a handsome cathedral, a gymnasium, a college, a court of justice, a theatre, an hospital, and about 4500 inhabitants. Chiavenna, a pretty town on the river Maira, at the branching off of the two roads over the Splugen and the Septimer, has six churches, a town-house, a castle, an hospital; manufactures of silk, paper, cloth made of amianthus, and pottery made of 'pietra ollaria,' a soft stone found in the neighbourhood; and about 3600 inhabitants.

VAN LAKE. [ARMENIA.]

VAN DIEMEN'S LAND, now called *Tasmania*, is an island and British colony situated in the southern hemisphere, south of Australia. It lies between 40° 45' and 43° 45' S. lat., 144° 45' and 148° 30' E. long. It is separated from Australia by Bass's Strait. On the west of the island is the Indian Ocean, on the east the Pacific, and on the south the Southern Ocean. The greatest length is 230 miles; the greatest breadth is 190 miles. The area is about 22,630 square miles. The population in December 1847 had increased to 70,164, of whom 47,828 were males and 22,336 females. Of this total 33,173 were either free emigrants, or were born in the colony; the rest were then or had been convicts. Emigration to Victoria colony has combined with other causes to prevent any material increase of the population of Van Diemen's Land of late years.

Coast-line and Islands.—The western coast is about 240 miles long. It is only broken by the two large inlets which form Macquarie Harbour and Port Davy. The shores elsewhere are steep, exposed to a strong swell and surf, and without anchorage or shelter. The southern coast is about 50 miles long, and runs in a serpentine line, forming several bays, of which a few have good anchorage. The south-eastern coast extends about 60 miles in a straight line. It contains a greater number of safe anchorages than probably any other country of the same extent on the globe; in fact there is hardly a mile along this coast-line which does not offer a safe refuge to vessels. This great advantage is owing partly to the size and form of the island of Brune, which extends along the coast, and partly to two far-projecting promontories, called Ralph's Peninsula and Tasman's Peninsula. The strait which divides Brune Island from the mainland is called D'Entrecasteaux Channel, or Storm Bay Passage, and extends 45 miles in a straight line. The eastern coast extends more than 150 miles in a straight line. It has many good anchorages and inlets, of which Oyster Bay is the largest. On this coast is Maria Island, which is about 12 miles long, and consists of two large masses of rock connected by a neck of land. It is a convict establishment, and Smith O'Brien was for a while confined upon it. North of Maria Island, and near to Oyster Bay, is Schouten Island, which is about 6 miles long and 3 miles wide. The northern coast extends about 160 miles in a straight line. North of this coast is Bass's Strait, at the eastern entrance of which is the group of the Furneaux Islands. The largest, Great Island, extends 40 miles from north to south, and is on an average 9 miles wide. South of Great Island is Cape Barren Island, which extends east to west about 20 miles, with an average width of about 5 miles. North of the Furneaux Islands is the Kent group. The strait which divides Furneaux Islands from Van Diemen's Land is called Banks's Strait, and is 10 miles wide. Lighthouses have been erected at various points on the islands.

Surface and Soil.—The soil is generally good and fertile, but the cultivated land has been much exhausted. Above 4,000,000 acres have been appropriated or leased as pasture; a large proportion of the remaining land is not available even as pasture. The unoccupied country lies west of the range of hills dividing the Derwent from the Jordan. The mountain region, south of 42° S. lat., occupies the southern and western districts of the island, and reaches north-east to the banks of the river Derwent. This river, from its source in Lake St. Clair to its mouth, separates the well-known part of the island from that which is unknown except the coasts and the districts in the immediate vicinity of the river. These districts are occupied by an apparently continuous mountain range, which extends along the river at a short distance from its banks. Many of the summits are from 3000 to 4000 feet high. The valley of the Lower Derwent extends from Mount Nelson upwards to the confluence of the Derwent with the Ouse, and is rather more than 50 miles long. It is a tract of great fertility. A hilly region extends from this valley eastward to the shores of the Pacific. North of this hilly region are elevated plains crossed by woody tracts. Besides the Derwent, this region is watered by the Nive, the Dee, the Ouse, the Clyde, the Jordan, the Huon, Coal River, and Pitt's Water. There are several considerable lakes.

The watershed of the eastern districts of Van Diemen's Land north of 41° 50' S. lat. lies close to the Pacific. The mountains which extend along the shores of the Pacific, and connect the northern part of the Eastern Tier with the range of the Ben Lomond, constitute a high range, overtopped by several summits. Ben Lomond is estimated to rise 4200 feet high. The valleys of the North Esk and South Esk are fruitful portions of this district. North of the upper valley of the South Esk extends a region, the whole of which is probably occupied by mountains; but the interior of it has not been explored. The gorge through which the South Esk flows above Launceston separates the valley of the Tamar, which lies north of it, from the Basin of Lincoln, which extends south of it. The Tamar is only a deep inlet of the sea, which runs up to the town of Launceston, where the two Eskas fall into it. The tide flows no higher than Launceston. The Basin of Lincoln is the most fertile portion of Van Diemen's Land. It extends from south-east to north-west about 25 miles, and as much from north-east to south-west; it is watered by several large rivers, which unite, and ultimately fall into the South Esk. The rivers are, ranging from east to west—Elizabeth River, Macquarrie River, Lake River, Pennyroyal River, and Mæander or Western River. Westward of this basin is the Western Tier, or Western Mountains.

Proceeding westward from the banks of the Mersey, two high and steep mountain ridges must be passed before that region is reached which is called the Surrey Hills, and which constitutes one of the most remarkable features of Van Diemen's Land. It seems to be of somewhat a square form, and each side is about 40 miles long. It gives origin to a great number of rivers, which run off in all directions. The region is elevated, cold, dry, and covered with good herbage. Between the valley of the Mæander and the Surrey Hills on the south, and Bass's Strait on the north, is the hilly region of Devonshire. West of the Emu River begins the Great Plain. It occupies the north-western portion of the island, extending along the northern coast from the Emu to Cape Grim, and along the western coast to the Arthur River. It consists of an alternation of plains, swamps, and forests, and contains only a few spots fitted for cultivation. The river Arthur, whose mouth is near 41° 10' S. lat., is a river of considerable size, and brings down a large volume of water. The Emu river is navigable for boats for a few miles.

Climate and Productions.—There is a considerable difference between the climate of Hobart Town on the southern and that of Launceston on the northern coast. At Hobart Town, heat, cold, rain, and sunshine succeed each other with great rapidity; in winter, the same alternations, with the addition of hail and snow, follow each other in quick succession. Thunder-storms are less frequent than in Australia, but violent gusts of wind sometimes occur, which cause great destruction in the forests. Along the western coast strong south-western winds prevail nearly all the year round, and render this tract almost inaccessible on account of the want of harbours. The climate is very healthy; no epidemic or contagious diseases have been observed, and acute diseases are generally mild and of short duration, and yield more easily to the usual remedies than in any other country.

The minerals of Van Diemen's Land include copper, iron, lead, zinc, manganese, coal, slate, salt, and sandstone. Gold is said to have been found, but as yet the quantity produced is small.

All grains cultivated in England succeed well in Van Diemen's Land. Wheat is of excellent quality. The vegetables and fruits of Europe are cultivated by the colonists in great abundance. The native forest-trees and shrubs are all evergreens. The most useful trees are the stringy-bark tree, which is used for building and fencing; and the blue gum tree, of which most of the boats in the colony are built.

The domestic animals of Europe thrive very well here. Sheep are most numerous. Wool and live stock are exported. Black cattle are numerous, and many head are annually exported. Some horses are also exported.

The spermaceti-whale is very abundant in Bass's Strait, and many of them are annually taken, but more by the inhabitants of Australia than by those of Van Diemen's Land. Black whales abound in all the seas round the island, and a very lucrative fishery is carried on along the southern coast. Whalebone and train-oil are important articles of export. Most of the land animals are similar to those of the neighbouring continent. [AUSTRALIA.]

Colonisation.—In 1808 Lieutenant Bowen, commissioned by the government of New South Wales, landed on the east bank of the Derwent, and formally took possession of Van Diemen's Land as a place of settlement. In the following year Colonel Collins, the first lieutenant-governor, arrived, and established the seat of government on the west bank of the Derwent: he gave to the spot the name of Hobart Town, in compliment to Lord Hobart, then secretary of state for the colonies. In 1819 the immigration of free settlers from England commenced, the colony having been previously exclusively formed of criminals sent from New South Wales for crimes committed there, and of the civil and military officers charged with their superintendance. Till the year 1824 the government was subject to that of New South Wales; but it was then made independent of that colony. Great progress was made by the colony between the

years 1824 and 1836, during the administration of Colonel Arthur. Roads were formed and bridges constructed in different parts of the island; wholesome laws were introduced, and the fruits of enterprise and industry were secured by an improved police system.

Trade and Commerce.—The efforts of the local government are rapidly extending improvements over the island. Among the greatest works is a bridge over the Derwent, on the high road from Hobart Town to Launceston; it is of wood, and has 20 bays, or arches, of 32 feet span each.

The exports to Great Britain in 1853 included 5,514,756 lbs. of wool (the average quantity for four years, 1849-52, had been upwards of 5,000,000 lbs.); 9599 hides (the average number for the previous four years had been about 300,000); 778 cwt. tallow; 4762 cwt. bark; and 405 tons spermaceti-oil. The declared value of the imports of British produce and manufactures from Great Britain in 1853 was 1,408,927*l.*, the average for the preceding four years being only about 420,000*l.* Of foreign and colonial produce, chiefly spirits, wine, and tobacco, imported from Great Britain, the declared value for 1853 was 694,790*l.* The number of sailing vessels entered as belonging to Van Diemen's Land on December 31st, 1854, was, Hobart Town 219, tonnage 21,473; Launceston 62, tonnage 6389. Of steam-vessels 6, of 510 tons aggregate burden, were entered at Hobart Town, and 2 of 356 tons at Launceston.

Hobart Town, the capital of the colony, is built upon an undulating surface, on the left bank of the river Derwent. The streets are of good width, and laid out on a regular plan, and contain many good dwelling-houses and shops. Some improvements have been made of late years, particularly in the construction of a new market-place in the town, and of docks and wharves at the river-side. Several of the public buildings are handsome. A small rivulet which runs through the town, affords a supply of fresh-water. The population on December 31st, 1847, was 21,467, of whom 38 were aborigines.

Launceston, the second town of the colony, is situated at the confluence of the North Esk and South Esk, which there form the Tamar, 45 miles from its outfall in Bass's Strait. It is 124 miles N. by W. from Hobart Town. Launceston contains a government house, a court house, jail, barracks, and other public buildings, and several places of public worship. Convenient wharfs have been constructed. The population in 1847 was 10,100. The shipping trade is important. A good highway extends from Hobart Town to Launceston, and there are inns along it at short distances from each other.

Richmond is situated on the Coal River, about 12 miles N.E. from Hobart Town, and contains a population of 8300. *Longford* has a population of 3,690. *Avoca* is a small town in the rural deanery of Longford, with a population of 963.

Van Diemen's Land is divided into 19 police districts, and each of the districts generally contains a town or village of the same name. Lincoln, Perth, and George Town at Port Dalrymple, are places of some importance. They are seated on the Tamar, or the Macquarrie, as it is called in the upper part of its course.

Government.—Van Diemen's Land is administered, under the 13 & 14 Vict., cap. 59, by a Lieutenant-Governor, who is assisted by an Executive Council and a Legislative Council, of whom two-thirds are elected and one-third nominated. The judicature consists of a supreme court, courts of quarter sessions, and courts of requests.

A bishop of Tasmania was appointed in 1842, whose diocese includes the whole island and its dependencies, and is divided into the arch-deaconry of Hobart Town, containing 34 places of worship, and the rural deanery of Longford, containing 19 places of worship. There are also 13 places of worship of the Church of Scotland, 3 for Roman Catholics, 21 for Wesleyan Methodists, 15 for Independents, 3 for Baptists, and 2 for Jews. Of these bodies all except the Independents and Jews receive government aid. There are numerous private schools in Hobart Town and Launceston, besides schools supported by the Government.

VANCOUVER ISLAND (or *Quadra and Vancouver Island*) lies off the western coast of North America in the North Pacific. It is long and narrow, extending in a direction from south-east 48° 24' to north-west 50° 3' N. lat., and between 122° and 129° W. long., the length being about 250 miles, the average width 50 miles. It is overlapped at its southern end by the continental headland of Cape Flattery, and between is the strait of Juan de Fuca, five leagues wide at its entrance, and running in an east-south-east direction for about 100 miles, widening in several parts, extending southward into Puget's Sound, and forming several bays on the continental shore, then, suddenly narrowing, turning northward through an archipelago of small islands, called the Arro Archipelago, thence widening into the Gulf of Georgia, and re-entering the ocean amidst another archipelago, through Johnstone's Strait into Queen Charlotte's Sound. Vancouver first discovered this passage in 1792. There are many bays and harbours all round the island. Three islands of the Arro group are separated from the coast of Vancouver Island by a passage called the Arro Canal, which is narrow at both extremities, but expands to a considerable width in the middle. At Wentuhuyzen Inlet, which is at the north end of the Arro Canal, several extensive beds of coal have been recently discovered, the site of which has been named Newcastle. Coal exists also in the northern part of Vancouver Island. At the southern end the settlement of Victoria has been formed, on a harbour

named Camosack, safe and easily accessible for vessels, but having the drawback of being scantily supplied with water. The other principal harbours are, Nootka Sound, Clayquot, Nitinat, all on the western coast. The shores of the island present an alternation of rocky cliffs and sandy beaches. At no great distance from the sea is a compact mass of rugged mountains, whose summits are covered with snow. The island contains a considerable quantity of fertile land, covered with good natural grass. There are numerous small tribes of Indians on the island, of whom some have been found of a friendly disposition.

The possession of Nootka Sound had nearly given rise to a war with Spain, who claimed it, and had expelled some English settlers from Nootka, but it was at length resigned to England, and has since continued in their hands. Vancouver Island was made over in 1846 to the Hudson's Bay Company by a charter, on condition that they should colonise it. To some extent this has been done.

North of Queen Charlotte's Sound lie *Queen Charlotte's Islands*, between 52° and 54° N. lat. The group consists of three islands, extending about 150 miles in length, by about 60 miles in breadth. In these islands are several excellent harbours. At Mitchell Harbour, on the middle island, and at other spots, gold has been found, embedded in quartz rock. Traces of silver have been found in the rocks. The interior of the islands is hilly and well wooded, the climate is healthy, and the soil remarkably fertile. The islands contain some beds of coal, and several fine specimens of lead and copper have been obtained.

VANDALIA. [ILLINOIS.]

VANDOTENE. [PONZA.]

VANNES. [MORBIHAN.]

VAR, a department in the south-east of France, is bounded N. by Basses-Alpes, E. by Piedmont (from which it is partly separated by the river Var), S. by the Mediterranean, and W. by the department of Bouches-du-Rhône. Its greatest length is 83 miles; the extreme breadth is 49 miles. The department, including its islands, lies between 42° 57' and 43° 55' N. lat., 5° 41' and 7° 15' E. long. The area of the department is 2790 square miles. The population in 1851 was 357,967, giving 128.3 inhabitants to a square mile, or 46.28 below the average per square mile for the whole of France.

The coast is rocky, and is skirted by numerous islands. From the mouth of the Var, at the eastern extremity of the department, to Cape-de-la-Garoupe, the coast forms an open bay, on the shore of which is the town of Antibes. Westward of Cape-de-la-Garoupe are the somewhat deeper bays of Juan and Napoule, separated from each other by a small intervening headland, and protected seaward by the Lerins Islands, comprehending the islands of Sainte-Marguerite (which lies opposite Cannes) and St-Honorat, with some smaller ones. These islands are defended by a fort, and further protected by the surrounding rocks: they abound with rabbits and partridges. Some other small gulfs, as the port of Agay, the gulf of Fréjus, the gulf of Grimaud, and the roadstead of Hyères, lie to the west of the gulf of Napoule. The roadstead of Hyères is bounded on the west of the peninsula of Giens, which is connected with the mainland by a low sandy isthmus. [HYÈRES.] The coast is for the most part high, but some of the bays present a low sandy shore. There are several small seaports, but none of any importance except Toulon.

The department is mountainous. A branch of the Alps extends from east to west through the department, and separates the valley of the Argens and the tracts watered by the Siagne, Loup, and Var, all of which flow into the Mediterranean from the valley of the Durance, which belongs to the river-basin of the Rhône. Another range of mountains parallel to the above, and known as 'Les Monts des Maures,' extends along the coast between Hyères and Fréjus, separating the coast from the valley of the Argens, which river after draining the valley in its eastern course turns to the south-east and flows past the eastern extremity of 'Les Monts des Maures' into the Mediterranean near Fréjus. A group of mountains forming the continuation of 'Les Monts des Maures,' extending north-eastward from Fréjus, is known as Mont-Esterel, and is distinguished by its picturesque character. The hill of Faron, immediately above Toulon, rises to the height of nearly 1400 feet; and Mont Caoume, near the same town, is 2806 feet above the level of the sea. The summit of the mountain La-Sainte-Baume, which is near the boundary of Bouches-du-Rhône, is 3285 feet; and the mountain of Sainte-Victoire, a little farther north, is 3125 feet. The coast eastward from Toulon is occupied by the primary and lower secondary formations, and presents in many parts a rugged and sterile soil; in the more inland parts these formations are covered by the limestones and other secondary rocks which intervene between the cretaceous and the carboniferous groups.

Among the minerals of the department are coal, lignite, marble, alabaster, porphyry, granite, serpentine, jasper, and gypsum. There are salt-works on the coast, especially at Hyères.

The rivers are small, and none of them are navigable. The Var, from which the department is named, rises in the department of Basses-Alpes, a few miles east of Colmars; after running a few leagues it enters the Sardinian states, and lower down separates the Italian province of Nice from the French department of Var. In its upper course it forms some cascades. Timber is floated down the stream. The course of the river is generally south; in its lower part are many small islands. The whole length of the river is about 70 miles. In spring the Var is subject to great floods; it frequently changes its

bed, and is useless to navigation. The chief feeder of the Var, on the French side, is the Esteron. The Gapou, or Gapeau, in the western part of the department, the Argens in the centre, and the Siagne and Loup in the eastern part, flow into the Mediterranean, and, with their several tributaries, belong wholly to this department. The Verdon flows into the Durance, and forms in one part the northern boundary. The Durance itself just touches the north-west corner. The length of the Argens, the most considerable river which belongs wholly to this department, may be estimated at about 60 miles: it receives the Caulon, the Calami, the united stream of the Bresque and the Braque, the Artuby, and the Endre. Three shore-lakes of considerable extent are found near the coast: the chief is that of Pesquier, in the isthmus of Giens; the others are those of Napoule and Villepey.

The climate of the department is temperate; the winters are mild except when 'the mistral' blows. The south-east wind is very relaxing.

The soil is by no means favourable, taken as a whole, however fertile particular spots may be; and from the hilly nature of the country, cultivation is very much carried on by manual labour. Only about a sixth part of the surface of the department is under the plough. The produce in grain is not equal to more than half the consumption of the department. There is a considerable extent of heath or other open pasture: in summer however the grass is so scorched up, that the sheep are chiefly sent at that season to feed in the mountain pastures of the department of Basses-Alpes. Sheep, goats, mules, asses, and pigs are numerous. The vineyards cover 170,000 acres, and the orchards and gardens 5000 acres. The vine and the olive are cultivated in terraces on the slopes of the hills. The department yields about 17,600,000 gallons of white and red wines and good muscatel annually. The olives are used for making oil, or are exported for use at the table. The pomegranate, the citron, the orange, the almond, and the fig grow in the open air; the plum and the peach are grown and preserved for exportation; and the caper and the jujube are cultivated. Mulberry-trees are extensively grown for the production of silk. Tobacco is an important crop, and odoriferous plants are abundantly cultivated. The woodlands, which cover about 570,000 acres, yield fir, cork-trees, and the kermés oak. Game is abundant, and a great number of bees are kept, which produce exquisite honey.

The tunny, anchovy, and sardine fisheries are actively carried on along the coast; and the rivers yield abundance of fish—the sturgeon, trout, eel, shad, barbel, tench, carp, and cray-fish.

The department is divided into four arrondissements, as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Draguignan . . .	11	60	86,079
2. Brignoles	8	54	68,664
3. Grasse	8	60	67,753
4. Toulon	8	28	135,471
Total	35	202	357,967

1. In the first arrondissement the chief town is DRAGUIGNAN, which is also the capital of the department. *Callas*, population 2125; *Salernes*, population 2544; *Lorgues*, population 4106, on the road between Brignoles and Draguignan; *Le-Luc*, population 3441, on the road from Toulon to Fréjus; *St-Tropez*, a small sea-port with 3538 inhabitants; and *Fréjus*, population about 3000, on the coast. Fréjus, the representative of the ancient *Forum Julii*, is built on an eminence about a mile from the sea and the mouth of the Argens. Forum Julii was a place of importance in Roman times; it has remains of an aqueduct, an amphitheatre, a triumphal arch, of the two moles that form the entrance to the harbour, and other ancient buildings. The ancient harbour communicated with the sea by a canal fed from the Argens. Long neglect converted the harbour and canal into a marsh which has been recently drained, and corn now grows where the Roman galleys formerly rode at anchor. Fréjus gives title to a bishop, whose diocese is the department of Var.

2. In the second arrondissement the chief town, *Brignoles*, is situated in a fertile basin screened by hills, 25 miles W. by S. from Draguignan, and has 5581 inhabitants in the commune. It is a well-built town, and has manufactures of broadcloth, soap, glue, wax, candles, pottery, leather, and brandy. The trade in these articles and in silk, wine, liqueurs, olive-oil, plums, and fruits, is considerable. *Bargols*, situated on a small affluent of the Argens, in a beautiful district, has about 3000 inhabitants, who manufacture paper, leather, brandy, and confectionery. *Cottignac*, population 3602 for the commune, in the country between the Bresque and the Argens. *St-Maximin*, a walled-town near the source of the Argens, has 6385 inhabitants in the commune, manufactures for cotton-yarn and woollen-stuffs, some brandy-distilleries, marble-quarries, and some trade in saffron. There are a school of arts and trades, a public library of 3000 volumes, and a handsome church built in 1283. *Roquebrussane*, 8 miles from Brignoles, stands at the foot of a rock, crowned with the remains of a castle, which was burnt by the Piedmontese in 1707: population 1500.

3. In the third arrondissement the chief town, *Grasse*, situated on

the slope of a high hill, 23 miles E. from Draguignan, has tribunals of first instance and of commerce, a college, an ecclesiastical school, and 11,381 inhabitants, who manufacture coarse woollens, silk, liqueurs, olive-oil, soap, leather, and a great quantity of essences and perfumes, particularly those made from orange flowers, roses, mint, &c. The houses of the town are well built; but the streets are steep, crooked, and narrow. In the highest part of the town there is an abundant spring, which supplies water to two public wash-houses, and drives the machinery of several mills; after performing these services the water is conducted by canals to irrigate the environs of the town, which abound in flower-gardens. *Antibes* is noticed in a separate article [ANTIBES.] *Cannes*, a small town of 3381 inhabitants, situated on the slope of a hill above the shore of the Mediterranean, 8 miles S. from Grasse, is pretty well built, and has a large quay, but vessels cannot come close to shore. The vicinity of Cannes presents many beautiful sites in which the orange and citron flourish; the climate is delicious. *Vence*, an ill-built walled town, with pretty suburbs, is situated 12 miles N.E. from Grasse, in a well-cultivated district and a most delightful climate; it occupies an ancient site, as is proved by its old ruins with inscriptions, and has 3165 inhabitants, who manufacture leather and oil.

4. In the fourth arrondissement the chief town is *TOULON*. *HYÈRES*. *Cuers*, situated 13 miles N.E. from Toulon, among vineyards, olive-grounds, and orchards, has an agricultural population of 4300. *Ollioules*, on the road from Toulon to Marseille, and at the extremity of a savage gorge, has a population of 3000. *La-Seyne* is a well-laid-out and a well-built town, with large quays, a good port, a small ship-building yard, and about 8000 inhabitants: it is at the western end of the inner road of Toulon, about 3 miles from that town; the tunny and sardine fisheries are actively carried on. *Soliers-le-Pont* is on the river Gapeau, 7 miles N.E. from Toulon; the neighbourhood comprehends some of the best grass-lands in the department: population about 3000.

The department constitutes the diocese of Fréjus, the bishop of which is a suffragan of the archbishop of Aix, Arles, and Embrun. It is in the jurisdiction of the High Court, and within the limits of the University-Academy of Aix, and is included in the 9th Military Division, of which the head-quarters are at Marseille. It sends three members to the Legislative Body of the French empire.

VARALLO. [NOVARA.]

VARDHARI, RIVER. [AXIUS.]

VAREL. [OLDENBURG.]

VARENNE. [ALLIÈRE; MEUSE.]

VARESE. [GENOA.]

VARNA, a fortified town and sea-port of Turkey-in-Europe, in the province of Bulgaria, is situated at the head of a small bay on the west coast of the Black Sea, in 43° 12' N. lat., 27° 53' 58" E. long., and has a population of 16,000 to 20,000. The bay or road of Varna is protected from the north and north-east winds, and has a good bottom, with a depth of 8 to 15 fathoms. The entrance of the bay is formed by two steep rocky capes (Galata and Hodrova, or Sughanlik), $\frac{1}{4}$ miles asunder. The shores sink gradually to the head of the bay, where in the neighbourhood of the city they are level. The Paravati River (the ancient Lyginos), which rises in the Balkan near Shumla, after traversing the two lakes of Devne, discharges itself by a broad stream into the Black Sea, along the foot of the southern walls of Varna. The distance between the eastern shore of the eastern Lake of Devne and the Black Sea is little more than half a mile. It has lately been proposed to deepen the channel of this river so as to admit ships to the lake, which would thus be converted into a harbour capable of affording shelter and accommodation to the largest fleets in all weathers. In the isthmus between the two lakes Alexander the Great defeated the Triballi. The isthmus is from a mile to a mile and a half broad.

Varna is a wretchedly built town, surrounded by old stone walls and a dry ditch. It is a place of considerable trade, the exports of corn, barley, tallow, eggs, and other Bulgarian produce, amount in value to about 600,000*l.* Austrian steamers between Constantinople and Galatz put in at Varna. Under the walls of Varna the Sultan Murad II. in 1444 defeated the Hungarians under King Ladislaus (who was killed) and John Huniades. The Russians took Varna in 1828. An Anglo-French army encamped in Varna and its environs in the summer of 1854, previous to its embarkation for the Crimea.

VARZY. [NIÈVRE.]

VASAREHELY. [HUNGARY.]

VASSY. [MARNE, HAUTE.]

VASTO, IL. [ABRUZZO.]

VATAN. [INDRE.]

VAUCLUSE, a department in the south of France, bounded N. by the department of Drôme, E. by Basses-Alpes, S. by Bouches-du-Rhône, from which it is separated by the Durance, and W. by the departments of Gard and Ardèche, from which it is separated by the Rhône. Its greatest length from north-west to south-east is about 69 miles, its breadth 38 miles. It lies between 43° 38' and 44° 27' N. lat., 4° 40' and 5° 46' E. long. The area is 1372 square miles: the population in 1851 was 264,618.

The eastern side of the department is mountainous: the mountains of Lure, which separate the department of Hautes-Alpes from that

of Drôme, enter this department on the north-east side, where they rise to the height of 5500 feet, and are connected with Mont Ventoux, which has an elevation of 6423 feet above the level of the sea. This eastern side of the department is occupied by secondary geological formations. The western and south-western sides, where the hills subside, and plains extend along the banks of the Rhône and the Durance, are occupied by the tertiary formations. The mineral wealth of the department includes lignite, iron, coal, potter's-clay, gypsum, limestone, and freestone. Peat is found. There are several mineral springs.

The department belongs wholly to the basin of the RHÔNE, which flows along its western boundary, as its tributary the DURANCE does along the southern. The Rhône is the only navigable river. Large rafts are formed of the timber floated down the Durance from the well-wooded districts about its upper waters; and the produce of the country is sometimes transmitted on these rafts to the neighbourhood of Avignon. The other rivers of the department are the Lez, the Aigues, and the Sorgues (with its affluents the Neaque, the Auzon, and the Ouvèze), all three tributaries of the Rhône; and the Calavon and the Leze, tributaries of the Durance. There is a number of canals for purposes of irrigation.

The fountain of Vaucluse, to which the verses and letters of Petrarch have given celebrity, and from which the department takes its name, is the source of the Sorgues: it rises in a cavern in the secluded valley of Vaucluse ('vallis clausa') midway between Apt and Avignon. The spring is sufficiently copious to form at once a stream capable of bearing a boat. Not far distant from the fountain is the village of Vaucluse, in which Petrarch lived; and between the village and the fountain is an old castle, formerly belonging to the bishops of Cavillon, in which the poet frequently resided, and which has derived from that circumstance the name of Petrarch's Castle.

The department is traversed by 4 imperial, 22 departmental, and 9 parish roads; and also by the railway from Paris to Marseille, which passes through Orange and Avignon.

The climate is on the whole temperate and healthy: the variations of the weather are however rapid; tempests are frequent, and the hail is often destructive to vegetation.

About one-half of the area of the department is under cultivation, but from the poorness of the soil the produce in grain is not sufficient for the consumption: rye, barley, and wheat are the principal corn crops. The meadow-lands occupy about 15,000 acres; the heaths and open pastures about 170,000 acres. There are numerous flocks of sheep. The ass and the mule are much employed in agricultural labour. The vineyards occupy an area of 70,000 acres, yielding about 9,000,000 gallons of strong red wine. The department yields abundance of olives, almonds, and walnuts; good pears, peaches, plums, apricots, figs, and melons. Saffron, madder, artichokes, anise, coriander, fustic, and the evergreen oak are cultivated. The silkworm is extensively reared (between two and three millions of mulberry-trees are planted for this purpose), and honey and wax are abundant. The woodlands occupy above 150,000 acres.

The department is divided into four arrondissements, as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Avignon . . .	5	30	78,382
2. Carpentras . . .	5	31	55,916
3. Apt . . .	5	30	57,034
4. Orange . . .	7	48	73,286
Total . . .	22	149	264,618

1. In the first arrondissement are the following towns:—*AVIGNON*. *Cavillon*, an ill-built formerly fortified town, in a pretty country on the right bank of the Durance, with a handsome town-hall; madder-oil and silk-mills, about 7000 inhabitants, and a weekly market for raw silk; and *L'Isle*, a town on an island of the Sorgues, with above 6000 inhabitants, who manufacture woollen-yarn, blankets, woollen-stuffs, silk, and leather; and trade in silk, oil, wine, and madder.

2. In the second arrondissement the chief town is *Carpentras*, which stands on the left bank of the Auzon, at the foot of Mont Ventoux, and has a college and 10,473 inhabitants. The town is surrounded by turreted walls, and has well-built houses, but crooked narrow streets. Amongst some remarkable structures are the cathedral, the Orange-gate, the court-house, the Hôtel-Dieu, the theatre, and the public library, which contains 22,000 volumes, 2000 manuscripts, and 6000 medals. The library building and its contents were bequeathed to the town by Bishop Inquimbert.

3. In the third arrondissement the chief town *Apt*, 30 miles E. from Avignon, on the left bank of the Calavon, has a college and 5699 inhabitants, who manufacture cotton- and woollen-stuffs, confectionary, brandy, silk-twist, and leather. The town is well built and clean, and surrounded by strong walls. The gothic church is a building of high antiquity; it stands over crypts still more ancient. A Roman bridge of three arches over the Calavon is still perfect. Several Roman antiquities have been found in Apt, which takes its name from, and occupies the site of, the ancient *Apta Julia*, a city of the Celtic Vulgiones. *Cadenet*, population 2441; and *Pertuis*, population 4380, on

or near the Durance. At Pertuis woollen-yarn, brandy, and earthenware are manufactured.

4. In the fourth arrondissement the chief towns are—ORANGE; *Bollène*, population 4790 in the commune, on the Lez; *Malacène*, population 3290; *Vaison*, on the Ouvèze, population 2879; and *Vairéas*, at the foot of the Dauphiny Mountains, population 4569 in the commune. *Vaison* has an ancient Roman bridge over the Ouvèze of one arch and of considerable width, the remains of an amphitheatre, an ancient temple, and various other fragments of Roman buildings; and an ancient cathedral, some portions of which are probably as old as the 10th century. *Vaison* was the *Vasio* of the Romans. *Malacène* has silk-mills, oil-mills, copper-works, and a paper-mill.

The department constitutes the metropolitan diocese of Avignon, the archbishop of which has for his suffragans the bishops of Nîmes, Valence, Viviers, and Montpellier. It is in the jurisdiction of the High Court of Nîmes, within the limits of the University-Academy of Aix, and in the 9th Military Division, of which the head-quarters are at Marseille. *Vaucluse* returns two members to the Legislative Body of the French empire.

VAUD, a canton of Switzerland, is bounded N. by the canton of Neuchâtel and by France, from which it is separated by the chain of the Jura Mountains; E. by the cantons of Freyburg, Bern, and the Valais; S. by the Lake of Geneva, which separates it from Savoy; and W. by France and the canton of Geneva. The area is 1180 square miles; and the population in 1850 was 199,575, of whom about 7000, or only 1-27th, are Catholics.

The central part of the canton is traversed from east to west by the Jorat, a succession of highlands which connect the Jura with the Alps, and divide the waters that flow northward into the Lake of Neuchâtel and the Aar from those which run southward into the Lake of Geneva and the Rhône. The southern part of the canton slopes to the shores of the Lake of Geneva, and is one of the finest regions of Central Europe. The vine is planted in terraces along the slopes of the hills, and its cultivation employs above 20,000 persons. The vineyards yield good white wines. The canton is essentially agricultural. The highlands of the Jura and those of the Alps on the east towards the borders of Bern, feed considerable herds of cattle. Horned cattle, sheep, goats, horses, and pigs are reared in great numbers. Corn is not produced in sufficient quantity for the consumption of the population. Fruit-trees are abundant; and the forests cover considerable tracts. There are no manufactures of any importance.

The principal towns of the canton are—LAUSANNE. *Vevay*, 12 miles E. from Lausanne, in a beautiful situation on the banks of the Lake of Geneva, has a handsome church, a college, a public library, and about 5000 inhabitants, who carry on a considerable trade. To the east of *Vevay* is the castle of Chillon. Farther eastward, in the valley of the Rhône, are *Aigle*, a small town at the entrance of the romantic valley of Ormonts; and *Bex*, with salt-mines, sulphur-baths, and about 3000 inhabitants. West of Lausanne, along the shore of the Lake of Geneva, is a succession of picturesque small towns—*Morges*, *Rolle*, *Nyon* (population about 2500), *Coppet*, and, higher up the hill, *Aubonne*. In the northern part of the canton is *Yverdon*, on the Lake of Neuchâtel, with a castle, and about 3000 inhabitants. In the interior of the canton are *Moudon*, with 2350 inhabitants, and a college; and *Payerne*, on the river Broye, an affluent of the Lake of Neuchâtel, with 2700 inhabitants. *Orbe*, at the foot of the Jura, on the road from Lausanne to Paris by *Beaumont*, has about 1900 inhabitants. The high valley of the Orbe, with the romantic Lake of Joux, in the Jura Mountains, is a most interesting district in the summer season. Watch-making, outlery, and iron-works are carried on in this remote district. The canton is traversed by the railway from Geneva to Bern, which is now open between *Morges* and *Yverdon*, as is also a branch from *Morges* to *Lausanne*. Steamers ply on the Lake of Geneva between Geneva and Lausanne and *Vevay*.

The canton of the Vaud forms an important part of the *Suisse Romande*, called also *Suisse Française*, because the common people speak Romance patois or dialects, and the educated people speak French. The *Suisse Romande* comprises Vaud, Neuchâtel, part of Freyburg, the Lower Valais, and Geneva. The people of German Switzerland in common discourse designate the whole by the name of *Wälschland*. These countries formed part of the ancient kingdom of Burgundy, having been occupied by the Burgundians as early as the 4th century.

The Pays-de-Vaud was conquered about the middle of the 13th century by Peter, count of Savoy, and was annexed to the dominions of that house as a great fief, which was given in appanage to a branch, with the title of barony of Vaud. In 1359 the barony reverted to Amadeus VI., count of Savoy, by a cession made by Catherine, the heiress of the barons of Vaud. The country was then parcelled out among a number of feudal lords. The Pays-de-Vaud, as the collective territory was styled, had states or assemblies of the clergy, the nobility, and the deputies of the towns, which used to meet generally at *Moudon*.

In 1476, the Bernese and their confederates, having defeated Charles the Rash (who was joined by James of Savoy) at *Granson* and *Morat*, overran the Pays-de-Vaud, took and pillaged *Lausanne*, and finally

detached the eastern districts of *Bex*, *Aigle*, and *Ormonts*, which were incorporated with Bern, and those of *Morat*, *Granson*, and *Orbe*, which were administered as common bailiwicks subject to both Bern and Freyburg. In 1536 the Bernese made themselves masters of the whole Pays-de-Vaud, which soon after embraced the doctrines of Calvin.

The Pays-de-Vaud was divided for the purpose of administration into fifteen bailiwicks, the baillis, or governors, of which were appointed by the government of Bern. Several of the old noble families were inscribed among the patricians of Bern, and thus obtained a share in the government of the whole canton. All the rest of the population were subjects of Bern. But the communes had their own councils, and appointed their local officers and magistrates. In 1798 the French directory imperiously required Bern to restore the Pays-de-Vaud to its independence. Meantime popular assemblies were formed in the Pays-de-Vaud, countenanced by a strong body of French troops assembled along the frontier. The council of Bern acted with indecision, the French troops entered the Pays-de-Vaud, and that fine country was lost to Bern for ever. In 1803 it was constituted as a sovereign canton of the Swiss confederation by Bonaparte's Act of Mediation. Napoleon I. being overthrown in 1814, the Act of Mediation fell with him; but in the Federal Pact, established by the allied powers in 1815, Vaud was constituted a canton of Switzerland. After the French revolution of July, 1830, several thousand *Vaudois*, armed with sticks, repaired to *Lausanne*, to oblige the council of state to convoke the assemblies of circles, for the purpose of appointing deputies to frame a new constitution. The council yielded a constituent assembly to be convened, which framed a new constitution on the principles of equality of political rights and rotation of office, without any property qualification, which constitution was laid before the primary or communal assemblies, in June, 1830, and accepted. The members of the great council, or legislature, are elected by the assemblies of circles, one for each thousand inhabitants. All citizens of the canton, being bourgeois of a commune, who have completed twenty-three years of age, and are neither bankrupts nor paupers, nor interdicted, are possessed of the elective franchise. The members of the legislature are elected for five years. Candidates for seats must be twenty-five years old, citizens of the canton, and have their domicile in it. The great council meets twice a-year for about a month each time: its members receive a remuneration. It appoints the members of the executive, and those of the courts of justice.

There are primary schools in every commune, middle schools, or schools of industry, colleges, and lastly the Academy of *Lausanne*, a sort of university, with fifteen professors and four faculties—theology, law, philosophy, and belles-lettres.

VAULRY, ST. [CREUZE.]

VAUVERT. [GARD.]

VECHT. [RHINE.]

VEERDT. [LIMBURG.]

VELAY, a small territory in France, which formed part of *Vivaraia*, and of which *Le-Puy* was the chief town. It is now included in the department of *Haute-Loire*.

VELEIA, an ancient city at the base of the Apennines, 23½ miles S. from *Piacenza*, and 45 miles from *Parma* by the existing roads. The population of this part of Italy was brought under the Roman dominion about A.U.C. 595, by M. Fulvius Nobilior. The inhabitants of *Veleia* up to the fourth year of the reign of *Tiberius* lived in villages; but a town was formed subsequently, which became a municipium, probably between the fourth year of the reign of *Tiberius* and the eighth of *Vespasian*. The period of the ruin of *Veleia* is not accurately known, though it is conjectured to have taken place in the fourth century of the Christian era. Tradition reports a slip of the mountains called *Moria* and *Rovinazzo* to have been the cause of the catastrophe which most probably buried the city unexpectedly.

Presuming the city of *Veleia* to have been buried shortly after the reign of *Constantine*, it remained unknown and forgotten for fourteen centuries and a half. The first notice of the revival of this ancient city was owing to the *Trajan* tablet, or bronze table, called the 'Alimentary Table,' which contains a law under the directions of which 279 children were maintained. This remarkable document was discovered in 1747 by a peasant of the commune of *Macinisco* (now called by its ancient name of *Veleia*), while working in a field. In 1760, excavations ordered by *Duke Philip* of *Parma* led to the discovery of the foundations of the forum and of some public and private buildings. Twelve marble statues also (some of them of superior workmanship), and numerous small bronze statues, medals, money, stamps, inscriptions, and small instruments and implements of bronze (including a pair of snuffers of the form now in use), were brought to light. Another bronze table was also found at a short distance from the spot where thirteen years previously the Alimentary Table of *Trajan* had been discovered. This table is nearly square, being 2 feet 2 inches and 7 lines (*Paris*) wide, by 8 feet 8 inches high, and about 2 lines thick. On the sides and in the middle are holes by which it was probably attached to a wall. The writing, like the large table, is divided into pages; the first contains 52 lines, and the second 58. At the beginning of the division between the pages, the number IIII is marked, from which it is manifest that this table was preceded by three others, forming six pages. There are good reasons for supposing that this

table dates at the latest from about the middle of the 8th century of Rome. The inscription seems to have been a copy of a law which prescribed to the municipalities of Gallia Cisalpina a constant rule of procedure. Most of the objects found in this ancient town are now in the museum of Parma.

In the centre of the buildings discovered are the forum, on the left the amphitheatre, on the right the baths, and at the south end the basilica. Among the most remarkable objects in the forum are the remains of the marble tables and seats of the money-changers, or perhaps officers of the treasury, and the inscription, originally of bronze letters, inserted in the stone pavement of the centre of the forum. A dorio portico ran round three sides of the area of the forum, interrupted only on the north by the portico of a small amphiprostyle temple, and was stopped on the south by the wall of the basilica. The basilica contained the twelve marble statues preserved in the museum at Parma. The city was well provided with sewers and drains. The buildings were constructed of rough materials, and stuccoed and painted. A painted fragment is preserved in the museum at Parma, showing that the taste for arabesque decoration was the same as in the south of Italy. Bricks were used to make the foundations level. Some of the bricks are stamped with the maker's name. A few mosaic floors have been removed to the floor of the museum in Parma.

VELEZ MALAGA. [GRANADA.]

VELIA. [PRINCIPATO CITRA.]

VELINO, MONTE. [ABRUZZO.]

VELINO, RIVER. [RIETI.]

VELLETRI, a city in the States of the Church, prettily situated on the lower slopes of the Monte Artemido (which forms the northern boundary of the Pontine Marshes), at a distance of 16 miles S.E. from Rome, and has 12,500 inhabitants. It is an ill-built town, with narrow and inconvenient streets; but the climate is healthy. The town is the residence of a Cardinal Legate, and conjointly with Ostia gives title to a bishop. There is a spacious piazza, or square, named from the church of Santa Maria, in Trivio, which is surmounted by a lofty campanile, erected in 1353. The principal structures are the cathedral of San Clemente, rebuilt in 1660; the church of Santa Maria del Orto; the Palazzo Publico, or town-hall, which was built by Bramante; the Ginetti, or Lancellotti palace, which was the headquarters of Carlo Borbone during the battle of Velletri, and is now deserted; and the Borgia Palace, formerly famous for its museum. The town is surrounded by old turreted walls crumbling to ruin. The beauty, majestic bearing, and graceful costume of the women of Velletri are celebrated by travellers.

Velletri occupies the site of the Volscian *Velitra*, which after long hostilities with Rome was destroyed, and the inhabitants removed to the city on the Tiber. The city seems however to have been afterwards rebuilt. Augustus Caesar was born at Velitra. It was occupied by Belisarius in the 6th century, and suffered severely in the Lombard invasion subsequently. The hills north of the town were the scene of Carlo Borbone's great victory over the Austrians in 1734, which secured the kingdom of the Two Sicilies to the Spanish Bourbons.

Velletri is the capital of the Legation, or province of Velletri, which has an area of 629 square miles, and a population of 59,356 (in 1850). The province lies between the Comarca-di-Roma and the Neapolitan frontier, and includes a vast extent of marsh-land, which is infested by malaria in summer and autumn. Corn, wine of good quality, and cattle are among the chief products.

VELLORE (*Velur*), a town and fortress in Hindustan, is situated in a small district of the same name, in the presidency of Madras, on the right bank of the river Palar, in 12° 55' N. lat., 79° 12' E. long., about 20 miles W. from Arcot by road. Vellore is a large fortress, containing spacious barracks and a curious pagoda, commanding the main road from the coast of the Carnatic to the province of Mysore. The fortress is surrounded by a strong stone wall, with bastions and round towers, and by a wide and deep ditch. The town, which is large and populous, is connected with the fortress by extensive outworks.

VENAFRO. [LAVORO, TERRA DI.]

VENAISSIN, LE. [COMTAT VENAISIN.]

VENASQUE. [ARAGON.]

VENCE. [VAR.]

VENDÉE, a department in the west of France, is bounded N. by Loire-Inférieure, N.E. by Maine-et-Loire, E. and S.E. by Deux-Sèvres, S. by Charente-Inférieure, and S.W. and W. by the Atlantic Ocean. Its greatest length from north-west to south-east is 82 miles; its greatest breadth, at right angles to the length, is 56 miles. This department comprehends also the islands of Boin, Noirmoutier, and Dieu. The whole is comprehended between 46° 18' and 47° 4' N. lat., 0° 35' and 2° 30' W. long. The area of the department is 2596 square miles. The population in 1851 was 383,734.

The coast of this department is generally low. The north-western coast forms, with the islands of Boin and Noirmoutier, the Bay of Bourgneuf. The south-western coast forms, with the Isle of Ré, the gulf Pertuis-Breton. The shore is low, and lined with marshes, which rest on the north-west on a bed of sand, and on the south-west on a very thick stratum of stiff clay. Industry has rendered these marshes remarkable for fertility; they are intersected in every direction by

ditches for the purpose of drainage. The island of Boin is insulated only by a small river, Le Dain, which is not navigable. It is united to the mainland by a causeway across the Dain. The island appears to be formed by alluvial deposits on a limestone rock; and is about 7 miles long and 4 miles wide. Noirmoutier protects the Bay of Bourgneuf to seaward: it is about 12 miles long from north-north-west to south-south-east, and in one part nearly 5 miles broad. It is separated from the mainland at its south-eastern extremity by a narrow channel about half a mile across. The coast of the island is lined in some parts by sand-hills or low flat rocks, in others by sands and shoals extending far out to sea; on the east side, in the Bay of Bourgneuf, is a small road or anchorage. The soil of the island is very fertile; sea-weed is used for manure; some of the most productive parts are considerably below the level of the sea, from which they are protected by embankments. The produce of the island includes grain, pulse, fruit, salt (made in the salt-marshes), and good cheese. The oyster fishery is actively carried on; and the inhabitants, who amount to about 7000, are excellent seamen. The *Île d'Yeu* lies farther out from the mainland, from the nearest part of which it is distant more than 10 miles: its chief town, *St.-Aubin*, which is in a central position, is in 46° 42' N. lat., and about 2° 23' W. long. The length of the island is about 6 miles; its breadth about 3 miles. Its western coast, towards the open sea, is high and inaccessible; the eastern coast is low and flat, affording ready and safe access to small boats. The whole island is little else than a vast granitic rock, covered with a vegetable soil three feet in thickness in the lower part, but in the higher ground so thin as to leave the rock almost bare.

The department is crossed on the north-eastern side by the heights, which extend from the mountain-district of central France north-westward to the mouth of the Loire. These heights cross just within the border of the department, here formed by the little river Sèvre-Nantaise, the valley of which they overlook. The hills are none of them lofty, having their greatest elevation under 500 feet; but they overspread a considerable tract. These higher grounds consist for the most part of granitic or other primitive or lower secondary rocks: the flat country, which extends southward and westward towards the coast, is occupied chiefly by the limestones, and other formations intervening between the cretaceous and new red-sandstone groups. The department has three coal-mines, some iron-works, and a number of mineral springs. The manufacture of salt is actively carried on in the marshes which line the coast.

The greater part of the department is drained by several small rivers, which flow into the Atlantic; but the northern and north-eastern parts belong to the basin of the Loire, and are drained by its two tributaries, the Sèvre-Nantaise, with its affluent the Maine (formed by the juncture of the Grande Maine and Petite Maine) and the Boulogne, which flows into the Lake of Grand Lieu, and then, under the name of Achenau, reaches the Loire. The rivers which flow directly into the Atlantic are the Sèvre-Niortaise, which, with its feeders the Autize and the Vendée, drains the south-eastern part; the Lay, formed by the junction of Le-Grand Lay and Le-Petit Lay, which, with its affluents, drains the central and south-western parts; and the Gui-Chatenay, the Ausance, the Jaunay, the Vic, and several canals, drain the western and north-western sides of the department. The Sèvre-Niortaise is navigable in all the part which is in this department or on the boundary; the Autize is navigable for about 6 miles above its junction with the Sèvre-Niortaise, and the Vendée (which gives name to the department) from Fontenay about 16 miles above its junction with the same river; the Lay has by labour been made navigable for about 20 miles above its outfall; and the Vic is navigable for about 5 miles. The only navigable canal is that of Luçon, which has a course due south, 9 miles from the town of Luçon, into the road of Aiguillon, south of which is a remarkable spit of land projecting about 3 miles into the sea. The department is crossed by 5 imperial, 16 departmental, and 11 military roads.

The climate varies with the elevation of the soil. The district of *Le-Bocage* in the north and north-east of the department, is the most elevated and the healthiest. This district, which extends into the adjacent departments, derives its name from the abundance of wood found in it, rather however in the form of copse or thicket, than of forest, though intermingled with the underwood are forest-trees, as oak, ash, chestnut, and elm. The soil of this part is chiefly a stiff loam, sometimes sandy, and at other times clayey. The valleys which intersect this hilly country are watered by numerous brooks, and afford good meadow-land; the hills are cultivated, except on the north side of the higher hills, where little grows except heath and furze. The Bocage covers about two-fifths of the whole department. The temperature is colder than in the rest of the department; but the air is purer: the summer is usually very dry, the winter wet. The inhabitants are the most robust in the department, and are remarkable for the simplicity of their manners, and their attachment to old opinions and habits.

The district which extends between the Bocage and the southern boundary of the department is called the Plain, and has an extent nearly 300 square miles: it is the most fertile district in the department, and has a clayey soil resting upon limestone.

The rest of the department consists of the *Marais*, or the Marsh the most extensive district, but the most unhealthy, the air bel

loaded with fogs rising from the ditches and drains. The changes of temperature on the coast are sudden.

Above three-fifths of the area of the department are under the plough, but agriculture is in a very backward state. Wheat, barley, oats, rye, millet, buckwheat, hemp, and flax are grown. The grasslands measure about 270,000 acres, and the heaths and open pastures amount to above 160,000 acres; they are chiefly in the Bocage and the Marais. The breed of horses is small but vigorous; a great number of mules and asses are bred. Horned cattle and sheep are of inferior breeds. The vineyards occupy above 40,000 acres, yielding annually about 5,000,000 gallons of bad white wine. The woodlands occupy about 70,000 acres, and the orchards about 20,000 acres; the apple, the cherry, and the chestnut are the principal fruits.

The department is divided into three arrondissements, as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Napoleon-Vendée . . .	10	104	140,969
2. Fontenai . . .	9	111	133,530
3. Les-Sables-d'Olonne	11	79	109,185
Total . . .	30	294	383,734

1. In the first arrondissement the chief town, *Napoleon-Ville*, originally *Roche-sur-Yon* (which name it bore till 1803, when the population was only about 800), after the restoration *Bourbon-Vendée*, after the revolution of 1848 *Napoleon-Vendée*, and since again *Napoleon-Ville*, is the capital of the department. It is situated in 46° 40' 17" N. lat., 1° 25' 23" W. long., 235 miles S.W. from Paris, on a hill above the little river Yon, and has a college, a tribunal of first instance, and 6186 inhabitants. Napoleon I. chose the village and castle of Roche-sur-Yon to be the site of the capital of the department, and authorised the erection of the necessary public buildings. In the centre of the town, and on the summit of the hill, is the Place Royale, a spacious rectangle bordered with rows of trees, and surrounded by good buildings; into this square the principal streets, which are straight, wide, clean, and well built, open. Many of the streets are still only traced out. The chief buildings are—a handsome parish church; the residence of the mayor, a beautiful Grecian structure, adorned with a peristyle; a market-house, which is a square building, surrounded by a peristyle supported on several steps; a theatre; the prefect's residence; the great barrack; and the hospital.

2. Of the second arrondissement the chief town is *Fontenai-le-Comte*, situated on the slope of a hill above the left bank of the Vendée, in a plain between the Bocage and the Fens, has a tribunal of first instance, a college, and 7348 inhabitants. The town has a very pretty appearance, and is approached by four fine roads, leading from Nantes, Rochelle, Saumur, and Niort. The streets in the older parts of the town are narrow and winding. The principal buildings are the beautiful gothic church of Notre-Dame, with a spire 266 feet high; the college, which is surrounded by walls and gardens, and has accommodation for 400 boarders; the hospital, the new prison, the theatre, and the pretty fountain, whence the town has its name, near the ruins of the old castle of the counts of Poitiers. The trade of Fontenai in corn, timber, seeds, oak-staves, coals, charcoal, provisions, and Bordeaux wines, for which Fontenai is an entrepôt, is greatly facilitated by the navigation of the Vendée. The manufactures are linen and coarse woollen-stuffs. The Republicans were defeated here by the Vendéans under Larochejacquelin, Lecuire, and Bonchamps, May 24, 1793. *Luçon*, a gloomy town, situated on the eastern edge of the Fens, and at the extremity of the Luçon Canal (which is navigable for vessels of 60 tons) gives title to a bishop, and has a diocesan seminary and 4300 inhabitants.

3. The third arrondissement has for its chief town *Les-Sables*, or *Les-Sables d'Olonne*, which is situated on a peninsula on the coast, and consists of several long, clean, and well-paved streets. The southern part of the town stands on a slight eminence; the suburb of La-Chaume, built on a level rock, is separated from the town by a canal. The harbour admits vessels of 200 tons. The town is protected in one part by the salt-marshes, in another by a wall, and towards the port and the sea by a fort and batteries. There are two churches, a nunnery, a school of navigation, a lighthouse, two almshouses, or hospitals, and a prison. The townsmen are engaged in ship-building, rope-making, and in the fishery, particularly of the pilchard. Corn, salt, and wine are exported. *Noirmoutier*, a small sea-port on the isle of Noirmoutier, with about 2500 inhabitants, is well-built and well-paved: the road affords good anchorage for vessels of 200 tons, and there is a tide harbour with 12 feet of water when the tide is up.

The department constitutes the diocese of Luçon, the bishop of which is a suffragan of the archbishop of Bordeaux: it is included in the jurisdiction of the High Court and within the limits of the University-Academy of Poitiers. It is comprehended in the 15th Military Division, the head-quarters of which are at Nantes; and sends three members to the Legislative Body of the French empire.

VENDEUVRE. [AUBE.]

VENDÔME. [LOIR-ET-CHER.]

VENEZIA. [VENICE.]

VENEZUELA, Republic of, South America, extends over the north-

eastern portion of that continent, being situated between 1° 10' and 12° 20' N. lat., 60° and 73° W. long. It is bounded N. by the Caribbean Sea, W. and S.W. by New Granada, S. by Brazil, and E. by Brazil, English Guyana, and the Atlantic Ocean. The area is estimated at about 417,000 square miles, but the boundaries are very irregular, and not very strictly defined. The population in 1851 was 1,356,000.

Sea-coast.—The sea-coast of Venezuela extends from the Boca de Navios, or principal mouth of the river Orinoco, in a general west-north-west direction to the innermost recess of the Gulf of Paria and the peninsula of Paria, a distance rather exceeding 200 miles. The whole of this tract is very low; it is composed of a great number of islands, which consist of alluvium brought down by the Orinoco and the Rio Guarapiche, which traverse it by several channels; and it is overgrown with trees, which in some parts are high, but in others are only bushes. The peninsula of Paria divides the gulf of that name from the Caribbean Sea. It is occupied by a ridge of high rocks, which on the southern side approach near the sea and form several small harbours. The northern shore, from the Punta de Paria to the Punta d'Araya, presents only naked rocks, less elevated than those along the Gulf of Paria, which in some places also come close up to the water, but in others recede to some distance, leaving along the shore small plains, the soil of which is arid and sterile. The elevated coast which surrounds the Gulf of Cariaco shelters it against the swell and against all prevailing winds, and renders its waters as smooth as a lake. Opposite the peninsula of Araya is the island of Margarita, which constitutes one of the provinces of the republic. It is about 40 miles long and 20 miles wide in its broadest part, and consists of two large masses connected by a narrow isthmus about 10 miles in length. The eastern mass, called Cerro de Copei, is 3240 feet, and the western, called Cerro del Macanao, is 4573 feet high. Between Cumaná and Barcelona, about 72 miles, the coast is of moderate elevation, but rather steep, and it contains several good harbours. Between the high and rocky islands which lie along this coast are some narrow but deep straits. From Barcelona to Cape Codera, about 128 miles, the shores are low and sandy, and in most places covered with salt-swamps, lagoons, or morasses. The coast between Cape Codera and Puerto Cabello, about 155 miles, is very high. Mountains rise like a wall from the water's edge, with a steep ascent to a great elevation. It contains several harbours, but they are mostly open. From Puerto Cabello to La Vela de Coro, 165 miles, the coast is in general low, sandy, and arid; but in many parts covered with mangrove-trees (*Rhizophora mangle*), and in others swampy and overgrown with bushes. The isthmus which connects the peninsula of Paraguán with the continent is about 13 miles long and 3 miles wide, and consists of low sand-hills, interrupted by some swamps and small lagoons. The peninsula of Paraguán is occupied by an isolated mountain mass called El Cerito de Santa Ana. There are several small harbours on the western shores of the peninsula. Farther west, as far as the channel of the Lake of Maracaibo, the coast is low, sandy, arid, and in some places covered with swamps or lagoons; and the same description of coast continues westward on the islands of Zapara and San Carlos, and, west of them, on the peninsula of Goajira to Coroja, at which place it rises to some elevation, and this elevation generally continues to Cape Chichibacoa, the most western point of the coast of Venezuela. The whole coast-line of the republic is 1534 miles, of which about 150 miles are washed by the Atlantic Ocean, an equal extent borders on the Gulf of Paria, and the remainder forms the southern shores of the Caribbean Sea.

Surface and Soil.—Venezuela contains three distinct mountain regions, separated from each other by plains, and extending respectively over the north-west, the north-east, and the south-east parts of the republic. The north-western parts are occupied by the Andes and the mountains of the coast, which are connected with the Andes; the north-eastern districts are mostly covered by the ranges of the Sierra de Bergantín; and the south-eastern region comprehends the western portion of the Sierra de Parima. According to the estimates of Codazzi, the mountain regions occupy somewhat less than one-fourth of the republic, or 96,000 square miles; whilst the plains extend over about 312,000 square miles.

The Mountain Region of the Andes and the Coast-range (Sierra Costanera).—The Andes of Venezuela are the most northern portion of the Eastern Andes of New Granada. [ANDES, vol. i. col. 357.] Before the range leaves the territories of New Granada it divides, south-west of the town of Pamplona, into two branches, one of which runs north, with a small inclination to the east, whilst the other extends to the north-east. The western of these two ranges, which incloses the basin of the Lake of Maracaibo on the west, is called in the south Sierra de Ocaña, in the middle Sierra de Perijá, and on the peninsula of Goajira, where it terminates with Chichibacoa, it is called Montes de Oca. This chain, from the sources of the Rio del Oro to its termination on the Caribbean Sea, constitutes the boundary-line between Venezuela and New Granada; but its southern portion is entirely within New Granada. The highest summit of the Sierra de Perijá is said not to exceed 4200 feet above the sea-level. The whole of the range is covered with thick woods, and no part of it is cultivated. It is only inhabited by the independent tribes of the Cucinas and Goajiras.

The eastern or principal branch of the Andes enters Venezuela at the source of the river Tachira, an affluent of the Zulia, and terminates on the north-east, on the banks of the Rio Cojedes, south of Barquicimeto, near 9° 10' N. lat. It constitutes an enormous mass of rocks, occupying with its declivities a mean width of more than 60 miles, and its length is nearly 330 miles. The highest portion of this range is generally a narrow table-land, but so elevated that only a few hardy alpine plants are found on it. These table-lands, called paramos, are from 10,000 to 12,000 feet above the sea-level, and the best known of them are the Paramos de Zumpador, Agrias, Batallon, Portachuelo, Apure, Nequitao, and Rosas. Several summits rise above these table-lands, but only one, the Sierra Nevada de Merida, is always covered with snow: its two pinnacles rise respectively to 15,310 and 15,342 feet above the sea-level. The Picacho de Mucuchies and the Salado rise to 14,168 feet. The descent from the table-lands on both sides is steep, but frequently interrupted by plains of moderate extent, which lie one below another like terraces. In their natural state the plains have no trees, but in many places they are overgrown with bushes; whilst the valleys and declivities of the mountains, where they are not too steep, are thickly wooded. The most elevated terraces and the upper portion of the valleys are not inhabited; but cultivation has advanced to an elevation of from 8000 to 9000 feet. At this height wheat, barley, potatoes, and different European vegetables are grown, and continue to form the principal objects of agriculture to about 4000 feet, where they are replaced by maize, coffee, yuccas, and other tropical productions. Numerous rivers originate in the higher part of the range, and descend along its declivities with continual rapids and cataracts until they reach its base, where they become navigable, and continue to be so in the plains until they reach on the north the Lake of Maracaibo, and on the south the Rio Apuré.

Between the Sierra de Perijá and the Andes lies the basin of the Lake of Maracaibo. This Lake, the largest in South America, covers a surface of 8400 square miles: it is about 2500 square miles less than Lake Erie, the smallest of the five great lakes of North America. The main body of the lake is 92½ miles long, and the channel 46½ miles, so that the whole lake extends 139 miles from south to north; in its widest part it is 32 miles across; the channel varies from 14 to 4 miles in width. The water of the lake is sweet, but in the northern portion of the channel it is brackish. From the base of the mountain ranges which surround the lake the surface lowers very gradually to its borders, a distance varying between 50 and 80 miles. That portion of the plain which lies within a distance of from 10 to 20 miles from the lake is for a great part of the year inundated by the water which descends in numerous rivers from the Andes and Sierra de Perijá. The whole region in its natural state however is covered with thick woods, containing excellent timber-trees and others which afford dye-woods. By the channel there are several tracts which supply pasture for cattle and goats, and sheep find food in most places. Some parts, especially near the town of Maracaibo, are cultivated, and produce maize, manioc, yucca, and several other tropical roots. It is stated that 105 rivers, which always contain water, and 400 smaller ones, which contain water only for a part of the year, fall into the lake. The largest rivers are—the Catatumbo, which runs more than 200 miles, and has a navigation of 135 miles; the Zulia, which runs nearly 230 miles, and is navigable 160 miles; the Escalante, whose course is nearly 140 miles, of which about 80 are navigable; and the Motatan, which flows more than 180 miles, and is navigable for more than one-half of its course. The lake could be navigated by large vessels if they could pass the channel, whose depth varies in general between 10 and 12 feet. About 10 miles north of the islands of San Carlos and Zapara a bar above a mile wide runs across the entrance, with a channel near the middle, from 15 to 30 fathoms wide, and having not more than 12 feet of water; so that only vessels of moderate size can enter the lake. In 1499, when Ojeda and Vespucci first entered the lake, they found houses in the midst of the channel, which were built on wooden piles; and comparing them with Venice, they called the country Venezuela, or Little Venice.

The coast-range (Sierra Costanera) begins where the Andes terminate on the left bank of the Cojedes, an affluent of the Portuguesa. The mountains themselves do not constitute a large mass of rocks, but divide into several ridges, and their elevation is little more than half that of the mountains south of the Cojedes. The mountain region grows narrower as it proceeds north; by the mouth of the Yaracui, where it is called Sierra de Nirgua, two continuous ridges branch off to the east, and on the north-west of it is a mountainous tract of considerable extent, but of moderate elevation, called the mountains of Corogaa. But north of the Rio Tocuyo the country rises higher, and extends in its most elevated part in an uneven table-land, which in general is a few miles wide, and in this part, where it is called Sierra San Luis, attains an elevation of 4200 feet above the sea. Between this high ground and the sea on the north is a tolerably level tract, several miles wide, but on the east along the shores of the Golfo Triste the hills come close up to the sea at several places, and leave between them level tracts, which form part of the valleys that traverse the country from east to west. This part is swampy and very unhealthy; and although the alluvial soil of the valleys, and the declivities of the hills, which are covered with thick forests, are extremely

fertile, and yield rich crops of cacao, coffee, sugar, and other tropical productions, it would be entirely uninhabited if the mines of Aroa and the valuable timber of the forests did not attract a few adventurers. Farther west the country differs a good deal in character, but it suffers from want of water, and is little cultivated. The climate and the vegetation are however favourable to the sheep and goat, which are numerous; the skins of the animals constituting the principal wealth. The Sierra San Luis contains a greater portion of cultivable land; and coffee, sugar, plantains, cotton, maize, yucca, and several kinds of vegetables are grown.

The peninsula of Paraguaná is an appendage to the region of the mountains of Coro, being united to it by a narrow isthmus. The centre of the peninsula is occupied by a rocky mass, called El Cerito de Santa Anna, which rises to 1320 feet, and from which a high ridge extends to Cape San Roman. On the other sides it is surrounded by a low and level tract, the soil of which is arid and of indifferent quality. Cotton and a few tropical vegetables are grown: it is rather populous, and a considerable number of the inhabitants are employed in making salt.

The eastern portion of the coast range is composed of two well-marked ridges and one which is frequently interrupted. The most northern of these ridges branches off from the Sierra de Nirgua, near the innermost recess of the Golfo Triste, and runs close to the sea as far eastward as Cape Codera, about 130 miles; its mean elevation exceeds 4500 feet. The highest summits are north-east of the town of Caracas; the Silla de Caracas is 8308 feet, and the Picache de Naiguatá is 9480 feet above the sea-level. Between Puerto Cabello and the town of Valencia there is a considerable depression in this range, called Abra de Puerto Cabello, through which the road leads that unites these two commercial towns.

The southern ridge, called the interior ridge, branches off from the Sierra de Nirgua at Mount Tuouragua (3660 feet high) and runs eastward, parallel to the northern ridge; it terminates south-east of the mouth of the Rio Tui with the Cerro de Altagracia (5040 feet), but its continuation to the banks of the Rio Unare is marked by some lofty isolated hills. The Cerro de Platilla 6217 feet, and the Cerro Azul 5816 feet high, are its highest summits. These two parallel ridges of the coast range are connected by a transverse ridge, which occurs east of the Abra de los Llanos, and attains an elevation of more than 5800 feet above the sea. The country inclosed by the two parallel ridges is divided by this ridge into two parts, of which the western, in which the Lake of Valencia is situated, has the name of Valles de Aragua, and the eastern constitutes the valley of the river Tui. The Lake of Valencia extends from west to east about 80 miles, and from north to south 13 miles in the widest part, and has no outlet. The soil about it, which in most parts is alluvial, as the whole of the plain once seems to have formed part of the lake, is much more productive than that of any other portion of the republic. This tract is very populous, and its lower and more level parts are covered with plantations of sugar, coffee, tobacco, indigo, plantain, and cotton, and with fields of wheat, maize, yucca, and other tropical roots and vegetables. The surrounding mountains are partially covered with woods, but large tracts are only overgrown with bushes or grass.

The valley of the river Tui is, next to the vales of Aragua, the most populous and best cultivated portion of the republic. It extends from west to east about 100 miles, and is in general about 20 miles wide, but only a small portion of this extent is level enough to admit of cultivation. The course of the Tui is above 150 miles, and it becomes navigable for small river barges between Aragiita and Santa Lucia, about 68 miles from its embouchure. East of the mouth of the river is the Laguna de Tacarigua, which is 15 miles long and more than six miles wide; and is separated from the sea by a narrow strip of low land, over which in one place the sea breaks at high-water. This lake contains an incredible quantity of fish of different kinds, and is much frequented by fishermen; but the bulk of the population of the valley of the Tui are occupied in agriculture: they raise coffee, cacao, indigo, tobacco, sugar, maize, rice, and in a few places wheat, yuccas, plantains, manioc, and nearly all the roots and vegetables which are cultivated in South America and the West Indies. Many extensive tracts are covered with grass for the greater part of the year, on which numerous herds of cattle pasture.

South of the southern ridge of the coast-range is another but much lower ridge, called Galera de San Carlos and Del Pao. It is not connected with the Andes, like the other ridges, but originates in the savannas of San Carlos, several miles from the base of the Andes, and terminates before it reaches the banks of the Rio Orituco, an affluent of the Guarico, which falls into the Orinoco. This ridge is remarkable as forming the line of division between the mountain region above described and the Llanos, which extend south of it, and as marking also the limit of cultivation.

The mountain region, called Sierra del Bergantin, which occupies the north-eastern portion of the republic, is of comparatively small extent. The river Neveri, where it flows from south to north, incloses it on the west; and from that river it extends along the coast to the most eastern point of the peninsula of Paria. Its length is about 130 miles, but its width varies between 50 and 10 miles, and where it approaches the Bocas dos Dragos, or the strait called the Dragons' Mouths, it is still narrower. Its highest summit is the Turumiquire,

at the source of the river Nevori, 6863 feet. Other high summits occur between the upper course of that river and the sea, among which the Cerro Pionia rises to 6860 feet and the Arrempuja to 5820 feet above the sea. The table-lands which lie between the summits and ridges are generally from 3000 to 4000 feet high, and covered with grass, while the acclivities of the summits and the valleys are overgrown with high trees. In the fertile valleys of this range wheat, maize, and all tropical roots and vegetables are cultivated, and also cacao, coffee, sugar, cotton, and tobacco.

South of the mountain regions hitherto mentioned lie the Llanos, or Cattle-Plains, which extend from the banks of the Rio Orinoco to the foot of the ridges, generally without the intervention of a hilly tract, and between the eastern extremity of the coast-range and the western extremity of the Bergantin they reach to the shores of the Caribbean Sea. Westward they extend to the base of the Andes, along which they run southward to the Rio Meta, by which they are separated from the Wooded Plains. This region, according to the statement of Codazzi, covers a surface of 116,592 English square miles. Though one immense plain, this tract presents a great variety in elevation, climate, rivers, and productive powers. Some tracts are hardly elevated above the sea, whilst others rise to nearly 1300 feet: some are arid deserts, while the vegetation of others is extremely vigorous nearly all through the year. The whole however is characterised by a want of forests. The trees which are found stand singly or form groves of small extent, with the exception of the delta of the Orinoco.

Beginning on the east we find, first, the Delta of the Orinoco, which consists of a deep alluvial soil, formed by the deposit of the earthy matter brought down during the inundations, which last from April to August. Except on the banks of the branches of the rivers which traverse it, the whole is a swamp covered with trees. In the forests the mauritia-palms are numerous; and from the means of subsistence which these trees offer, the few inhabitants of this tract, the Warrows (Guaraunos) derive their maintenance. During the rains they live on scaffolds which are erected between the trunks of the high trees, several feet above the water—a circumstance which has given rise to the opinion that this tribe lives in trees. The low swampy tract extends beyond the Delta westward along the southern shores of the Gulf of Paria, nearly to the innermost western recess of that basin. From this low tract the country rises slowly to the west, until at the distance of about 50 or 60 miles it reaches the table-lands. This region is a prairie, destitute of trees and shrubs, except that in many places groves of mauritia-palms occur, where water is always found. It is traversed by numerous rivers, which during the rains inundate the adjacent low grounds; and hence it forms an excellent pasture-ground during the dry season, when the table-lands do not contain a blade of grass.

The table-lands, called in the country Mesas, constitute a peculiar and well marked feature in this part of Venezuela. They begin on the east, at the southern base of the mountain-system of the Bergantin, attain their highest elevation in the Mesa de Urica, whose surface is 1300 feet above the sea-level, and continue westward to the river Orituco, where they join the southern ridge of the coast-range. Their surface is quite level, and the soil consists chiefly of sand, which in many places is mixed with chalk. This soil is unproductive, and the vegetation even in the rainy season is limited to a few hardy grasses covered with a kind of hair, which afford indifferent pasture. The rains, which fall in abundance from April to July, quickly find their way through the upper layers of the soil, until they meet an argillaceous chalk, where they collect and form springs and rivulets, and give origin to a hundred rivers, which run south to the Orinoco, east to the Gulf of Paria, and north to the Caribbean Sea. The rivers running southward are deep, and have always a great volume of water; but those which run to the north soon leave the table-lands and enter an arid and much lower plain, where their waters are soon exhausted. Between the table-land and the Caribbean Sea a level plain extends about 60 miles from north to south; it has a sandy soil, and is chiefly covered with grass, but there occur many tracts covered with oaks and some palms. A kind of lily spreads over extensive tracts, and it is supposed that all the parts covered with this plant were formerly cultivated by the Indians. At present it is only used as pasture for cattle, except near the coast where a few tracts are planted with cotton, cacao, coffee, sugar, tobacco, and several tropical roots and fruits.

The most uneven portion of the cattle-plains is that which extends on the south side of the coast-range, and lies west of the river Orituco, reaching to the banks of the Portuguesa; but south of this tract the country continues to be uneven, as there are several small Mesas; while on its southern edge are several isolated hills, which are surrounded by extensive plains covered with fine grass.

South-west of the uneven tract just mentioned are the Plains of Barinas (Varinas), which are considered the most fertile part of the great plain, and the best adapted for cultivation. These plains extend along the base of the Andes from the Rio Portuguesa to the Rio Sarare and Apure, a distance of more than 150 miles, and are from 60 to 80 miles wide. The mountains terminate abruptly on the plain. From their base a very gentle slope descends in a south-eastern direction towards the banks of the rivers Portuguesa and Apure. This slope is furrowed by numerous large rivers, which descend from the mountains

and drain the plain, running nearly parallel to one another. They are navigable nearly to the base of the mountains, but during the rains they inundate a considerable portion of the plain, the higher tracts along the river banks being the only parts not subject to inundation. These high banks are also the only parts of the plain which are covered with woods, and which contain tracts fit for cultivation. Numerous hamlets and single farm-houses are built on these higher grounds, where maize, yucca, and plantains are extensively grown: the lower parts, which are subject to inundation, serve as pasture-grounds during the dry season.

Between the Rio Apure and the Rio Meta, both affluents of the Orinoco from the west, are the Plains or Llanos of Apure. They contain the lowest portion of the Cattle-Plains. This tract is so level, that the current of the Apure and Meta is imperceptible, and a strong eastern gale, or the least rise in the Orinoco, causes their waters to flow back. No rock, no stone, not even a pebble is seen in these plains. The soil consists of a mixture of sand and chalk. It is covered with grass, but is entirely destitute of trees and bushes, except a few scattered groves. The only inequalities of the surface are some hills, mainly of sand, which rise a few yards above the common level, and some slightly elevated grounds called banks. In the dry season this plain is one immense pasture-ground; but during the rains from April to July or August it becomes an immense lake, in which the banks appear like islands.

South of the Rio Meta begins a Woody Region, which extends southward to the limits of Brazil, and may be considered as the northern portion of that immense forest, or series of forests, which occupies South America on both sides of the equator. In their present state these forests can only be entered by means of the rivers which, descending from the Eastern Andes of New Granada, traverse them in their course to the Orinoco. In the southern districts of this region is the Rio Casiquiare, or that branch of the Orinoco which separates from the river soon after it issues from the mountains, and running south by west joins the Rio Negro, or Guainia, an affluent of the AMAZONAS.

That portion of Venezuela which lies east of the Rio Orinoco and north of the Pacaraima ridge is mostly occupied by the Parime Mountains and their offsets. [ORINOCO.] The greater part of this immense tract, which comprehends more than one-third of the territories of the republic, is entirely unknown, as the interior has been traversed only by a few adventurers, who followed the course of the large rivers in search of the famous El Dorado. They found nearly the whole covered with an interminable forest of tall trees, amidst which rocky masses frequently rose in fantastic forms. A few tribes of aborigines inhabited the banks of the rivers, and lived mostly on the produce of their fisheries and a few wild fruits. The country adjacent to the banks of the Orinoco River however was more populous, and in these places the Capuchin monks established some missions. Though in some places the ridges of the Parime Mountains approach the river, in general they remain at a considerable distance from its banks: and this intermediate space is generally an uneven plain, on which a considerable number of wooded rocks rise to a moderate elevation. Below the rapids of Atures both sides of the river, with the exception of a few places, are skirted by a low ground which is annually inundated. It varies from half a mile to three miles in width. The district of Uputa, which lies south of the delta of the Orinoco, and extends from the river Caroni on the west to the Sierra Imataca, the most maritime ridge of the Parime Mountains on the east, is the only part which is occupied, except by two or three scattered families. It is a table-land, whose surface is 1400 feet above the sea-level, and whose northern declivity approaches the Orinoco within a few miles. The surface of this table-land is very uneven, and presents a quick succession of small grassy savannas, well-wooded isolated rocks and hills, and delightful valleys. The fertility of this tract in many parts is said to be hardly inferior to that of the Vales of Aragua, while its climate is less hot and dry than that of other parts of the republic. This tract is no less fit for rearing cattle than for cultivation. Coffee, cacao, cotton, sugar, indigo, and all the roots and fruits which grow between the tropics are cultivated. The cascarilla is collected in great quantities.

Venezuela is well watered, with the exception of the Mesas and that tract of the coast which extends from the town of Cumarebo westward to the Gulf of Venezuela. The number of rivers is very great, and that of the navigable rivers considerable. Most of them join the Orinoco, which runs about 1300 miles, and is navigable for the greater part of its course. This river, with its principal tributaries, is noticed elsewhere. [ORINOCO, vol. iv., col. 13.] Of the rivers joining it from the west, the Inirida flows 424 miles; the Guaviare flows more than 800 miles; and the Meta flows an equal distance, and all of them are navigable for a large part of their course. Farther north the Orinoco is joined by the APURE, which is more navigated than the other rivers of the republic. The rivers which fall into the Orinoco from the east descend from the Parime Mountains, and preserve the characteristic of all the rivers originating in that mountain system, being impeded in their course by cataracts and rapids. The largest are the Caura, and the Caroni, each of which flows for about 600 miles. The navigation of these two rivers is interrupted at several places by cataracts.

The southern portion of Venezuela is drained by the Rio Negro, which in its upper course is called Guainia. It is joined from the north by the Casiquiare, a branch of the Orinoco, which connects the Rio Orinoco with the Rio Amazonas. This natural channel is 240 miles long, in general 80 feet deep, and on the average about 400 yards wide. It is navigable, as well as the Rio Negro, as far as it drains the territories of the republic; but lower down in Brazil the navigation is interrupted by numerous rapids and small cataracts.

One of the principal affluents of the Essequibo, the Cuyooni, rises in Venezuela. It flows 600 miles, of which above 400 miles are navigable; but only the upper portion of this river belongs to the republic.

The rivers which fall into the sea within the territory of the republic without joining the Orinoco, Rio Negro, or Essequibo, have a comparatively short course. A few of them however are navigated, as the Guaripeho, which rises in the mountain-system of the Bergantin, and falls into the Gulf of Paria. It runs about 180 miles, of which more than 70 miles are navigable. The Neveri, on which the town of Barcelona is built, rises in Mount Turumiquire, runs about 60 miles, and is navigable for small boats for 40 miles, and for larger boats 18 miles. The Unare, rising in the Mesas, flows about 170 miles, and is navigable for 90 miles. The Tui, which drains the principal valley of the coast-range, flows 190 miles, and is navigable for more than 80 miles. The largest of the rivers falling into the Caribbean Sea is the Tocuyo, which rises on the northern declivity of the Paramos of Niguitao and of Rosas, and falls into the Golfo Triste at a course of 300 miles, of which more than 150 miles are navigable. The largest of the navigable rivers falling into the Lake of Maracaibo have been noticed.

Climate, Productions, &c.—With respect to climate, Venezuela is divided by the natives into three zones, called Tierras Calidas, Templadas, and Frias. Hot countries (tierras calidas) are all those which do not rise more than 2000 feet above the sea, and in which only tropical plants and fruits succeed. The temperate countries (tierras templadas) are between 2000 and 7000 feet above the sea; the agricultural productions of Europe succeed best in them. The cold countries (tierras frias) are those which, from 7000 feet above the sea-level, rise to the summit of the Sierra Nevada de Merida (15,348 feet), 148 feet above the snow-line (15,200 feet), and are uninhabited. The cold and temperate regions however occupy only a comparatively small portion of the country, by far the greater portion of which has a hot climate. In Venezuela, as in other countries between the tropics, the year is divided into two seasons, a wet or winter, and a dry or summer season. The north-east trade-wind, which properly blows the whole year round in this country, is modified in its direction and force by these seasons. As soon as the sun crosses the equator, the wind passes to the south of east, and the rains begin, accompanied by thunder-storms. The rains are generally abundant and continual, though there occur a few days in which not a drop falls; and there is also an interval, either before or after mid-summer, when it does not rain for a whole month. This season is called the Little Summer of St. John. The dry season, or summer, begins when the sun has entered the southern hemisphere. This general order of the seasons is however subject to numerous modifications in several parts of the country.

Codazzi gives a list of 180 plants which are cultivated in Venezuela; there are also 240 kinds of trees and shrubs, whose wood is used for domestic purposes, 36 plants yielding gums and resins, and 45 which produce medical drugs. The articles of cultivation which are grown for exportation are coffee, cotton, indigo, cacao, sugar, tobacco, and cocoa-nuts. Cotton is grown chiefly in the valleys of the coast-range, and in the country adjacent to it on the south, and also in Barinas. Indigo, which was once the most important object of cultivation, is much neglected, and coffee, cotton, and sugar have taken its place; but indigo is still grown in some places within the coast-range. The cacao of Caracas is known as the best, but its cultivation has greatly extended in the valleys of the coast-range and of the Bergantin, and in the plains of Barinas. Coffee has of late years become the staple product: it is very largely grown in the valleys of the coast-range, on the declivities of the Andes, and in the plains of Barinas. The plantations of sugar are much less extensive: nearly all of them are in the valleys of the coast-range, especially in the vales of Aragua. The cocoa-palm is met with to the height of 700 feet, and large quantities of the oil are exported. The tobacco of this country is of the best quality, and grows in the valleys of the Bergantin, the declivities of the Andes, and the plains of Utapa and Barinas. The tobacco of Barinas (Varinas) is well-known in Europe, but that of Cumauca in the Bergantin Mountains is said to be better. Maize is most extensively cultivated all over the country; but wheat only in the more elevated tracts, especially in those which are more than 1800 feet above the sea-level. Rice is grown in a few places in the lower tracts, and barley only on the declivity of the Andes. Millet is an object of cultivation. The plantain (*Musa paradisiaca*), is cultivated in all the agricultural districts up to 7000 feet. The roots which are grown as food are chiefly potatoes, batatas (*Convolvulus batatas*), yucca (*Jatropha manihot*), &c. The cultivation of almost every kind of leguminous plants is considerable, especially beans, haricots, lentils, vetches, and garbanzas. Melons and water-melons are much attended to, but vegetables are in general neglected.

GEOG. DIV. VOL. IV.

The number of fruit-trees is great, but the cultivation is little attended to. Besides the vine, which succeeds well in some of the higher valleys, the fig, pomegranate, orange, lime, and lemon have been transplanted from Europe. Some of the indigenous trees bear excellent fruits, among which the most remarkable are the *Laurus Persea*, *Annona squamosa*, *A. Humboldtiana*, *Sapota mammosa*, the pine-apple, and the tamarind.

The domestic animals constitute one of the principal branches of the wealth of Venezuela. The large plains supply pasture for cattle, horses, mules, and asses, and the number of these animals is very great. It is also considerable in the other districts, as the greater part of the country is uncultivated. Sheep and goats are also generally kept, but are only numerous in the mountains of Nirgua and the hilly tract which lies north of them. Pigs abound in the valleys of the mountain ranges and the countries contiguous to them.

Wild animals are numerous; among them are the jaguar (called in the country the tiger), the puma, the ounce (which is found in the forests of the Sierra de Nirgua), the tiger-cat, the tapir, the capybara, the venado (a kind of deer), the aguti, porcupine, rabbit, several kinds of wild hogs, the sloth, the ant-eater, and several varieties of monkeys and apes. Two kinds of whales, the physeter and narwhal, are frequently met with along the northern coast; and in the large rivers are the manati and the touina, a kind of dolphin, which attains a length of 9 or 10 feet. The birds are numerous, especially those belonging to the *Falconidae*, *Ardeidae*, *Syrigidae*, *Turdidae*, *Tanagridae*, *Picidae*, and *Psittacidae*; among the last-mentioned the loris are distinguished by the beauty of their plumage. There are also pelicans, wild geese and ducks, and flamingoes.

Fish are abundant in the sea, the rivers, and lakes and lagoons. The greatest fishery is carried on in the strait which divides the peninsula of Araya from the island of Margarita, round the island of Coche, where a great quantity of a fish called liza is taken, salted, and exported to all the ports of the republic and the West Indies. The salted and dried eggs of the fish are also a considerable article of commerce. Turtle are found in the sea, and manteca made from their eggs is an important article of commerce. Manteca is also made from the fat of the manati. The alligator abounds in the Orinoco, Apure, and Portuguesa, and is also found in several other rivers. The iguana is eaten, and considered a dainty. The chameleon is common in some parts. There are boa-constrictors and several venomous snakes. The pipa abounds in the Parime Mountains. Pearl-oysters were very abundant soon after the discovery of America in the strait between the peninsula of Araya and the island of Margarita, and a very advantageous fishery was carried on for several years. In the hilly tract between the Golfo Triste and the lake the cochineal insect is found, but is not turned to any account.

Venezuela is not rich in minerals. Gold is found in several places, and has been worked, but not to much purpose. Silver, tin, and copper-ore are also met with, but only the last is profitably worked. Iron- and lead-ore occur, but are not worked. Coal is found at some places in the coast-range. A kind of natron is extracted from a small lake on the southern declivity of the Andes, in the province of Merida, and is mixed with tobacco. At several places petroleum occurs, especially in the peninsula of Araya. Salt is produced to a great amount in the salt-works of the peninsulas of Araya and Paraguana, and in the Gulf of Maracaibo.

Manufactures and Commerce.—The few manufactures of this country are carried on in the Sierra Nirgua and on the declivities of the Andes, at Tocuyo, Barquisimeto, Trujillo, and Merida, where straw-hats, hammocks, coarse cotton-cloth, some worsted stuffs, and earthenware are made. The tanneries are rather numerous, and nearly all the articles of leather which are consumed in the country are made within it, and constitute one of the most important branches of internal commerce.

The commerce of Venezuela diminished greatly during the War of Independence, cultivation having been much neglected during that period; but though the state of society has been unsettled ever since the termination of the war, the trade has recovered, though very different of course to what it might be were the country in the hands of a peaceful and industrious people. The total value of the exports do not average much over a million and a quarter sterling, and the imports are little over a million. More than half the entire amount of both the export and import trades is with the United States and Great Britain. The exports to the United States in 1853 amounted to 2,613,780 dollars; the imports were 844,527 dollars. The imports from Great Britain in 1853 were 248,190*l.*; in 1854 they amounted to 300,899*l.* The countries with which the trade of Venezuela is next largest in amount are, Denmark, Germany, France, Holland, and Spain. The exports are chiefly cacao, coffee, indigo, cotton, sugar, tobacco, vanilla, sarsaparilla and dye-woods, copper-ore, horses, mules, cattle, jerked beef, hides, horns, &c.

Inhabitants.—The inhabitants consist of Indian aborigines, of Spaniards and Africans who have settled among them, and of the offspring which has resulted from the mixture of these three nations. The unmixed aboriginal Indians are distinguished by a large head, narrow forehead, lank and long black hair, eyes of middling size, sharp nose, wide mouth, thick lips, and broad face. They are generally

copper-coloured, some very dark, others almost as fair as Europeans; they are short in stature, and have little hair, though they are not altogether beardless. Their limbs, large and muscular, have the appearance of great strength, but they support hard labour with difficulty. The greater part of them are acquainted with agriculture, and cultivate cotton, plantains, yucca, batatas, and even the sugarcane. They live in houses, but all of them go nearly naked. The following was given as the distribution of the population in 1844, but we have no similar semi-official summary for 1851, when the total population was said to have increased to 1,356,000:—

Independent Indian tribes	52,000
Subjected Indians of pure blood	14,000
Indians mixed with the other population, who have adopted the manners of the other inhabitants, but preserve the characteristic features of their race	160,000
Whites or creoles, Spanish Americans, and foreigners	298,000
The mixed race, mulattoes, mestizoes, zamboes, tercerones, and quarterones	480,000
Negroes or slaves (by the law of 1830, the importation of slaves was forbidden, by an act of 1854 they were emancipated)	48,000
	1,052,000

Divisions, Towns, &c.—Venezuela is divided into 5 departments—Maturin, Venezuela or Caracas, Tulia, Apure, and Orinoco. These are subdivided into 13 provinces, 88 cantons, and 523 parishes.

The capital of the republic is CARACAS. The following are some of the other more important towns: the populations are merely vague estimates:—

ANGOSTURA.

Angostura, the capital of the province Margarita, stands in a narrow valley on the east side of the Island of Margarita. It has about 3500 inhabitants, and carries on some trade in coffee, palm-oil, and the other products of the island.

BARCELONA; BARQUICIMIENTO.

Barinas, or *Varinas*, the capital of the province of the same name, is built on the St. Domingo River, at the base of the Nevado de Mérida, in 7° 30' N. lat., 70° 12' W. long.: population about 6000. It is the centre of a very fertile district, and a large trade is carried on, the inhabitants of the higher country bringing in their corn and fruit, and taking in exchange the produce of the numerous herds which pasture on the plains. A good deal of tobacco is grown in the vicinity.

Carora, on the left bank of the Tocuyo, 100 miles N.W. from Barquicimento, population 4000, has some manufactures of cotton-stuffs and several tanneries, and carries on a good trade.

Coro, the capital of the province of Coro, stands on an arid plain about 2 miles from the sea, at the western angle of the Gulf of Maracaibo: population, 4000. It carries on some trade, chiefly with the Dutch island of Curaçao, by means of the small harbour called Vela de Coro, which is about 7 miles from the town.

Cumaná, the capital of the department of Maturin, stands about a mile from the sea, at the entrance of the Gulf of Cariaco: population 12,000. The gulf itself is spacious and safe, but its entrance is somewhat dangerous, owing to a sandbank, which extends from Punta Araya, and a shoal off the opposite coast. The town has no remarkable buildings; the houses are low and slightly built, on account of the frequent earthquakes. There is a considerable trade in cattle, dried meat, salted fish, and salt, with Caracas and the Windward Islands.

Guayra, or *La Guayra*, the port of CARACAS, from which it is distant in a straight line only 6 miles, but by the road over the mountains about 13 miles: population, 6000. It is built on a narrow and uneven plain between two huge masses of rock, and at the back of the town the mountains rise almost perpendicularly. The town is rather well built; but it has only an exposed roadstead, and the anchoring ground is not good. The climate is exceedingly hot, and it is considered very unhealthy, but it is said without reason.

Maracaibo, the capital of the province of the same name, is built on the western shores of the strait which connects the great lake with the Gulf of Maracaibo: population, 14,000. It contains some good buildings, but the greater part of the houses are of wood and thatched. The town has a considerable trade, as it is the harbour of the provinces of Mérida and Trujillo, and also of several districts of New Granada, especially those surrounding Cúcuta, from which cacao, coffee, honey, sugar, preserves, tobacco, ropes, and some smaller articles are brought to Maracaibo, and then exported by English, American, Dutch, French, and Danish vessels. By the same way these provinces are supplied with European articles and with salt. Besides the ordinary schools the town has a college and a school of navigation. A considerable number of vessels are built here, the forests on the southern banks of the lake supplying abundance of excellent timber.

Maturin is a considerable place on the banks of the Rio Guarapiche, which falls into the Gulf of Paria. The river is navigable at the town for barges, and for larger vessels at the Caño Colorado, about

27 miles lower down in a straight line. The town exports to Trinidad a great number of cattle, horses, and mules.

Merida, the capital of the province of the same name, population 6000, is built on a plain, or rather table-land, 10 miles long and 3 miles wide, which on one side joins the range of mountains, and on the other sides is encompassed by deep valleys. It is 5518 feet above the sea-level, and on the south of the town is the Sierra Nevada. The coffee grown in the vicinity is of excellent quality. Several kinds of woollen and cotton stuffs are made. There are a college and several schools.

Puerto Cabello, is situated at the bottom of the Gulf of Triste, in 10° 20' N. lat., 69° 10' W. long.: population, 10,000. The port is considered the best on the south coast of the Caribbean Sea. The harbour is formed on the west by a peninsula projecting northward, and terminating about 100 yards from the island, and is sheltered by a narrow low island, about 2 miles long, which is overgrown with mangrove-trees, and at its eastern extremity is united to the continent by a shoal. The space between the peninsula and island forms the entrance of the port, which is deep, but so narrow that only one vessel can pass through it at a time. The harbour itself is spacious, and the largest vessels may lie there in safety: the water being always as smooth as that of a lake. The city is small, but contains several good houses and is well fortified. There is an excellent wharf, close to which vessels of large burden may lie. A suburb, much more extensive than the city, but built with less regularity, is separated from it by a cut. The commerce of the town is considerable. The exports consist of cacao, coffee, sugar, and a great number of mules. Formerly 10,000 mules are said to have been annually shipped for Jamaica and other parts of the West Indies.

San Felipe, near the left bank of the Yuracuy, about 60 miles N.E. from Barquicimento: population, 7000. The town is well built and has a considerable trade, but it stands in a low unhealthy region which is subject to frequent inundations. In its neighbourhood are the copper mines of Aroa.

Tucuyo is situated in an elevated valley near the source of the river Tucuyo: population, 10,000. The town is the centre of that part of the province of Barquicimento which is best adapted for the cultivation of wheat. It is a well built place, and the inhabitants are enterprising and industrious: they make cotton and woollen-stuffs, and tan leather, of which they make boots, shoes, and leathern girdles, which they send to the plains. In the town are a college and some elementary schools.

Trujillo, the capital of the province of Trujillo, stands on the great road from Caracas and Barquicimento to Mérida and New Granada: population, 4000. The town is built on a slope between two ranges of high mountains, and is 2744 feet above the sea-level. In its vicinity much wheat is grown. Many worsted stuffs are made in the town, also preserves and cheese. There are a college and several elementary schools.

Valencia, the capital of the province of Carabobo, stands on a slope, near the opening of a valley, about six miles from the west bank of the Lake of Valencia: population, 15,000. Its position is important for commerce, as all the products of the provinces of Barinas and Barquicimento pass through the town to Puerto Cabello. It is well built, and contains among other institutions for education, a college, a grammar school, and several elementary schools.

Victoria, or *La Victoria*, is situated in the vale of Aragua, about 40 miles S.W. from Caracas: population, 8000. The town is advantageously situated for the commerce with the great plains; for to the south of it the southern ridge of the coast range presents a great depression, through which the road leads to the town of Cura, which is built at the southern opening of the depression. In the southern plains is the town of Calabozo, a thriving place. Maracai and Turmero, both in the vale of Aragua, are also considerable places.

History, &c.—The most eastern part of this coast, and the Island of Margarita, were discovered by Christopher Columbus in his third voyage, 1498, and the following year the whole northern coast of South America, from the Gulf of Paria to Cape de la Vela in New Granada was discovered by Ujeda and Vespucci. In the same year Christobal Guerra made a voyage for the purpose of ascertaining the commercial wealth of the country. The first settlements on the continent were at Cumaná, which was built in 1520, and at Coro, which was built in 1527. About this time the emperor Charles V. gave up the whole northern coast as far west as Cape de la Vela to the Welsers, a family of merchants in Augsburg, to be held as a fief of the crown of Castile; but he resumed possession of it in 1542. Several places in the coast range had already been discovered where there were indications of gold; and the Spaniards now began to form their settlements. Tucuyo was established in 1545, Barquicimento in 1552, Valencia in 1556, and Caracas in 1567. In 1634 the Dutch took possession of the island of Curaçao, and from that time Venezuela began to rise. The continually increasing demand for cacao on the part of the Dutch induced the Spanish settlers to attend to its cultivation, and in a short time a considerable quantity of cacao was exported. This excited the jealousy of the Spanish court and of the Spanish merchants. Various means were employed to direct this branch of commerce to Spain, but with little success. In 1700 the company of Guipuzcoa was established, in which was vested the exclusive right of

carrying on the commerce with Venezuela; but the cultivation of cacao, as well as of indigo, was more promoted by the smuggling trade with the Dutch, than by that of the company, and in 1778 the company dissolved, and the trade was opened to all the ports of Spain. Venezuela remained under the sway of Spain till 1808, when Napoleon I., having deposed the royal family, made his brother Joseph king of Spain. Venezuela, like all the American colonies of Spain, declared for the ancient dynasty; but being dissatisfied with the measures of the regency of Spain, it proclaimed its independence in 1810, but in 1812 was brought back to its ancient political condition. In 1818 Bolivar, a native of Venezuela, made an unsuccessful attempt to liberate his native country from the yoke of Spain; in 1816 he was more successful. In that year a war began between the Spaniards and the inhabitants, which lasted till 1823, when the Spaniards who had remained in the country gave up Puerto Cabello, their last place of refuge. In 1821 Venezuela united with New Granada and Quito, and formed one republic under the name of Colombia, [COLOMBIA]; in 1830 they separated amicably, and since that time they have constituted the three republics of Venezuela, New Granada, and Ecuador. In the year in which the union was dissolved Venezuela formed a new constitution, which underwent some modifications in 1843. By it Venezuela has a central government, the legislature of which is invested with the power of making laws on all subjects. The legislative power is vested in a Congress, which consists of a house of representatives and of a senate. Each province sends two members to the senate, and one member to the house of representatives for every 25,000 inhabitants. The executive power is vested in the president, who, like the vice-president, is chosen for four years. Like the other South American republics Venezuela has since its independence been in a continually disturbed state; and like two many of them it has a heavy public debt, the interest on which it has for a long time made no attempt to pay. Its finances are in a thoroughly disorganised state, as may be judged from the fact, that in 1853 its expenditure was about three times its receipts.

VENICE (*Venezia*), the capital formerly of the Republic of Venice, now of the Crownland of Venice in Austrian Italy, is situated in 45° 26' N. lat., 12° 20' E. long., and has a population of about 100,000, exclusive of the garrison. It is built on a cluster of islets, about 80 in number, that rise in the middle of the lagoons, or shore-lakes, which here skirt the Adriatic, and about 2 miles from the mainland of Italy, with which it is now connected by a viaduct of above 200 arches, supporting a railway to Mestre, where is the junction of the Venice-Milan and Venice-Trieste railways. The lagoons are divided from the Adriatic by a long narrow tongue of land called Littorale, which however is broken into islands by a few openings whereby ships enter the canals that lead up to the city. The islands on which the city is built are divided from each other by narrow canals, which serve for the purpose of communication, as streets in other towns. Above 450 bridges connect the various islands. Narrow streets and lanes, alleys and courts, separate the buildings of each island from one another, and there are also narrow quays along the canals. Carriages and horses are useless, and therefore not seen in Venice; and their place is supplied by boats called gondole, which are continually plying in all parts of the town, and of which it is said there are above 4000. The circumference of the city is nearly eight miles. There is a tide from the Adriatic which rises three feet over the lagoons, part of which is left nearly dry at the ebb, except the seven large canals by which communication is kept up between Venice and the ports of Malamocco and Chioggia on the Adriatic, and the landing-places of Mestre, Fusina, and others on the mainland.

The city is divided into two parts by a canal broader than the rest, called Canal Grande, or the Great Canal, over which there is only one bridge, the Rialto. Another and much broader canal, or rather arm of the sea, bearing the names of Canal della Giudecca and Canal di San Marco, divides the city properly so called from the long island and suburb of La Giudecca, and from the neighbouring island of San Giorgio.

The finest part of the town is the district of San Marco, which contains the splendid cathedral dedicated to the patron saint of Venice, with its lofty detached belfry, the handsome square (Piazza) before it, with its arcades and numerous coffee-houses—the fashionable place of resort of the Venetians; and the vast and massive ducal palace, which was the seat of the republican government, and contains the halls of the various councils of the administration. The vast hall in which the Great Council of the republic used to assemble is now the repository of the library of St. Mark. All the apartments of the Palace of the Doges are adorned with paintings by Titian, Tintoretto, Paul Veronese, and other masters of the Venetian school, which commemorate the great events in the history of the republic. The library of St. Mark contains 65,000 volumes, and about 5000 manuscripts.

The Piazzetta, or lesser square of St. Mark, which is open on one side to the sea, has two handsome pillars of granite brought from Greece in the 12th century. Upon one is the winged lion, of brass,

the ancient emblem of the republic, known by the name of the Lion of St. Mark; and upon the other is a statue of St. Theodore, a patron saint of the republic.

Among the many remarkable churches of Venice, besides St. Mark's, the following deserve especial mention:—1. San Giorgio Maggiore, which was constructed by Palladio, and contains the monument of the Doge Domenico Michieli, the conqueror of Jaffa, Tyre, and Assalon, who afterwards, when attacked by the Byzantines, sailed with his fleet through the Archipelago, and ravaged many of the islands, so as to deserve the title of 'Terror Græcorum,' which is on his epitaph. 2. Il Redentore, also by Palladio, one of the handsomest churches in Venice, situated on the island of La Giudecca, is, like most other Venetian churches, rich in paintings. 3. Santi Giovanni e Paolo has numerous and splendid monuments of doges, senators, commanders, and other illustrious men. The church is also adorned with paintings, some of which are historical. A bust of Titian above the door of the vestry-room preserves the memory of that great master. 4. I Frari, a splendid church which contains numerous monuments, among others that of Canova, and several good paintings. In the suppressed convent of the Frari are deposited the archives of the old republic, which were taken to Paris, but were afterwards restored.

The banks of the Canal Grande are lined with splendid marble mansions of the nobility, whose historical family names have in many instances outlived the fortunes of their former possessors. Some of them are used as government offices, others are let to foreign consuls and other strangers. Several of the Venetian palaces possess valuable paintings and sculptures. In the Manfrini palace is a rich gallery, containing among others the painting of the 'Three Portraits' by Giorgione, which Byron in his 'Beppo' has so highly extolled. The Academy of the Fine Arts, of which the patriotic Count Cicognara was the originator, has been the means of saving many masterpieces of the Venetian school which otherwise would have been lost to Venice. Many of them belonged to the suppressed monasteries; others were restored from Paris in 1815; some, such as the famous Assumption by Titian, were discovered in a corner of a church, where they lay forgotten, covered with dust and filth. A painting by Gentile Bellini represents a procession passing through the square of St. Mark in the 15th century, with the costumes and localities of that age. 'The Slave Emancipated by St. Mark' is a masterpiece of Tintoretto. The academy has altogether about 400 paintings, besides models of the Elgin and Parthenon marbles, and of other masterpieces of sculpture; and a collection of original drawings of Leonardo da Vinci, Michel Angelo, and Raffaele.

The arsenal or dockyard of Venice, begun in 1504, celebrated in Dante's 'Inferno' (canto xxi.), long the main instrument of the power of the republic, formerly employed 16,000 workmen, a number which was reduced in the last century to 1500. The arsenal is situated at the eastern extremity of the town, is surrounded by a high wall, and occupies an area of about three miles in circumference. It has been recently fortified by the Austrian government. The arsenal of Venice is now the dockyard for the Austrian navy. A naval college is established at Venice. A body of artillery and a battalion of marine infantry are attached to the service of the navy. The arsenal contains a number of docks and basins, foundries for cannon, forges, a rope-walk above 1000 feet long, a vast timber-yard, and an armoury. There is also a monument to the memory of Angelo Emo, great admiral of Venice, who died in 1792, and was the last who caused the Venetian flag to be respected in the Mediterranean. This monument to Emo was one of the first works of Canova. At the land entrance of the arsenal, which is a gate adorned with several statues, are two marble lions, brought from Athens by Morosini in the latter part of the 17th century.

Venice has several theatres; that of La Venice is one of the largest in Italy. The Venetians are fond of music; and the songs in their dialect, set to music by native composers, are very pretty. The Carnival at Venice is still very long; but masks are not used now except by the lower orders. The people are naturally lively and light-hearted: their festivals and public rejoicings, however noisy, are unattended by quarrels or disorderly conduct. The educated classes have a social affability and ease of manners which are very fascinating.

Venice has a gymnasium, a lyceum for scientific instruction, a patriarchal seminary for clerical students, two colleges for female education under the direction of nuns, an atheneum of sciences and literature, and the academy of the fine arts already mentioned. Besides the library of St. Mark there are libraries belonging to the different colleges and academies, as well as to several convents and palaces of the nobility. The printing-press of Venice is still active.

The charitable institutions are numerous, but not more so than what is absolutely required by the decayed condition of Venice. When the French evacuated the town in 1814, nearly one-half of the population was in want of charitable assistance. The Austrian administration after the restoration applied itself to alleviate the distress of Venice. Pecuniary assistance from the treasury of the kingdom, a better administration of the communal revenue, a great diminution of local taxation, the establishment of a free port, and important public works undertaken at the expense of the government, in great measure answered the intended purpose. Out of the treasury of Austrian Italy above two millions sterling were spent for the relief of the city.

Venice. The mercantile shipping of Venice assumed a new activity; and traded all over the Mediterranean. In consequence of its rebellion against Austria in 1848-9 (when the city was long besieged by the Austrians by sea and land, and at last capitulated), the returning prosperity of the city received a new check; it lost its privileges as a free port, and the entrepôt of foreign commerce was confined to the island of San Giorgio; but in 1851 the freedom of the port was restored. Since that time railways have been completed nearly to Milan in one direction, and to beyond Pordenone, on the way to Udine and Trieste, in another, but the stream of commerce that so long flowed into the lagoons of Venice has turned away into other channels, and no change of government could restore Venice to its former prosperity.

Among the island towns in the neighbourhood of Venice the following deserve notice:—1. *Murano*, about a mile N. from Venice, is a town of about 6000 inhabitants, and has manufactories of glass and plate-glass, and also of mock pearls and beads. The principal churches are those of San Michele and San Donato. The latter, which is called the Domo di Murano, is of Byzantine architecture of the 12th century, with mosaics and columns of Greek marble. The church of St. Peter and St. Paul is rich with paintings. 2. *Torcello*, farther distant to the north-east, is remarkable for its ancient and splendid church, built A.D. 1008 by the bishop Orseolo; it is covered with mosaics, and adorned with marble, a testimonial of the wealth of Venice in that remote age. The neighbouring church of Santa Fosca, of the 9th century, is built with remains of structures of the Roman times. These islands were peopled with the fugitive inhabitants of the neighbouring towns of Altinum and Julia Concordia, on the mainland, which were devastated by the northern barbarians. Martial (iv. 35) speaks of the shores of Altinum as rivalling in his time those of Baia in attractions. 3. *Sant' Elena*, with a church dedicated to the mother of Constantine, whose remains were carried thither from Constantinople in the 12th century. 4. *Lazaretto Nuovo and Vecchio* with the quarantine establishment. 5. *Malamocco*, the residence of the doges in the early ages of the republic: it gives its name to the port of Malamocco, one of the principal entrances from the sea into the lagoons. 6. *San Lazaro*, an island south of Venice, with a celebrated monastery of Armenian monks, who are in communion with Rome and acknowledge the supremacy of the pope. They have a library of 10,000 volumes, and about 400 manuscripts, mostly in the Armenian language, a printing-press for works in the same language, and a college for clerical students. 7. *San Andrea del Lido*, with a fortress which is considered a masterpiece of the architect and engineer San Micheli, and which commands the entrance into the lagoons on that side. 8. *Paestrina*, a small town south of Malamocco, on the Littorale. Near it are the 'Murazzi,' or breakwater, made of large blocks of marble laid on piles driven into the sand: it rises ten feet above high water. 9. *Chioggia*, a well-built town and a bishop's see, situated at the southern entrance of the lagoons, has a good harbour, a fine cathedral, a theatre, and about 16,000 inhabitants. The salt-pans in the neighbourhood are very productive. To the south of Chioggia is the port of *Brondolo*, at the mouth of the Adige.

The metropolitan province of Venice, formerly called *Il Dogado*, contains an area of 1056 square miles, with a population of 298,425. It comprises, besides the islands in the lagoons, a long strip on the mainland from the estuary of the Po to that of the Tagliamento, with the small towns of Ariano, Loreo, Dolo, Fusina, Mestre, San Donà, and Porto Gruaro. The area and population of the Crownland of Venice are given in the article LOMBARDO-VENETIAN KINGDOM. Of the whole of the dioceses in the old Venetian states the archbishop of Venice, who is styled patriarch, is metropolitan.

In A.D. 421 the inhabitants of Aquileia, Padua, and other Italian cities, in order to escape from the fury of the savage followers of Attila, fled for refuge to the islands at the mouth of the Brenta. There they founded two cities, Rivoalto and Malamocco, which were incorporated in A.D. 697, under one magistrate, entitled Doge, or duke. The first doge was Paolo Lucio Anaseto. Pepin, as king of Italy, granted to the rising town some territory along the Adige, and Rivoalto (Rialto), united with neighbouring islands (now also built upon), took the name of *Venetia* from the province Venetia (territory of the ancient Veneti), of which these islands formed a dependency. The secure position of the city, its facilities for trade, and the commercial enterprise of its inhabitants, had already in the 11th century raised it to great prosperity. Its fleets were powerful, and its flag respected in all parts of the Mediterranean. In the 12th century the fleet of Venice conveyed the Crusaders to the Holy Land, the crafty republic having first made them help her to conquer the coast of Dalmatia. The end of the 14th century saw Venice conquered by her rival Genoa, which however declined in consequence of the efforts she had made during the war; while, on the contrary, Venice rose to a higher pitch of power. Jealous of the power of the Republic, almost all the states of Christendom, suspending their quarrels with each other, united in the league of Cambray in 1508 for the destruction of Venice. By the battle of Agnadell, the republic lost all her continental territories, but her fleet, her wealth, the courage and firmness of her citizens, and the disunion that soon broke out among the allies, saved the city and prolonged the term of her greatness. Venice joined the crusade against the Turks, and shared in the victory of Lepanto in 1571. A conspiracy, formed by the emissaries of Spain in 1618, placed

the city on the brink of destruction; but the senate obtaining information in time seized the accomplices, and had the greater number of them drowned in the canals. Venice continued a great flourishing state till the capture of Candia by the Turks. This war, which lasted from 1611 to 1669 (for nearly 20 years of which the siege of Candia continued), exhausted the resources of the republic. From this time Venice began to decline, not however entirely owing to the war.

The greatness of Venice originated in the commercial spirit of her citizens, which made them early cultivate the art of navigation and ship-building, which for centuries were neglected in Western Europe. The products of the east reached the coast of the Levant (as in the time of the Phœnicians), and the ships of Venice transported them to the island city, whence they were distributed over Europe. The crusades threw into the city enormous sums for the mere transport of troops, and helped to render her mistress of the Morea, the Ægean Islands, and other parts of the Greek empire. But after Vasco da Gama showed the way to India by doubling the Cape of Good Hope, and ships were able to convey the produce of the east to Western Europe without breaking bulk, the commerce of Venice naturally and gradually declined, and with it her political importance also gradually dwindled away. By the treaty of Campo Formio in 1797, Venice, which had been taken by the French, was ceded to Austria. In 1805 it was included in the kingdom of Italy. Lastly, in 1814, it fell again to Austria.

In its earliest period Venice was governed by an elected council which shared the legislative power with the Doge. The council afterwards obtained a preponderance of power, and its members even appointed their successors, so that the government became a class oligarchy. In the course of time a senate was instituted to settle questions of peace and war. The senate, as well as the councillors of the Doge, were appointed by the great council. The discontents and frequent revolts that broke out in the 14th century led to the appointment of the Council of Ten, which by degrees sapped the foundations of republican government, and established a system of espionage, assassination, and terror.

VENLOO. [LIMBURG, Dutch.]
VENOSA. [BASILICATA.]
VENTIMIGLIA. [NICE.]
VENTNOR. [WIGHT, ISLE OF.]
VERA. [GRANADA.]

VERA CRUZ, a sea-port and commercial town in the republic of Mexico, is situated in 19° 11' N. lat., 96° 8' W. long., on the southwestern shores of the southern part of the Gulf of Mexico; population about 11,000. The town is built on a level and arid shore, consisting of sand, and almost entirely destitute of vegetation. At the back of the town are shifting sand-hills from 25 to 36 feet high, which it is supposed owe their origin to the gales of the north. The high temperature which these sand-hills acquire in summer, and the reflection of the solar rays from them, are regarded as the principal causes of the great heat then experienced in the town. During the summer months, from May to September, both inclusive, the mean temperature of Vera Cruz is 81.5° Fahr., or somewhat higher than the mean annual temperature of the equator. During three of these months (July to September) the rains are very abundant. Water is scarce and of bad quality. The water used by the poorer classes for drinking is brought by an aqueduct from a lake about 6 miles from the town; but the water collected in the tanks is much better.

Vera Cruz is the port of the city of Mexico, and the most important commercial town of the republic, though its harbour is in fact only a roadstead formed by several shoals, which inclose in a semicircular form a tract of sea which in many parts offers good anchorage. The largest of these shoals, called La Gallega, lies opposite the town; and at its western extremity is a rocky island, on which the fortress of San Juan de Ulua is built. The strait which separates the fortress from the town, and is the most secure portion of the harbour, is less than 700 yards wide, and about 1000 yards long. Vera Cruz is always dangerous to navigators. From October to April the norths blow with incredible violence; the air is filled with sand, and the sky darkened with clouds; whilst the waves are driven with such impetuosity on the beach, that the whole line of coast is one sheet of foam. All communication between the shipping and the town is suspended, even when vessels are at anchor under the walls of the castle, or secured to the rock on which it stands by iron rings fastened there for the purpose; but these gales purify the atmosphere, and tend to abate or remove the vomito prieto, a kind of yellow fever, which during the summer proves fatal to foreigners along the whole eastern coast of Mexico. During the prevalence of the vomito prieto the wealthier merchants and others retire to Xalapa. [MEXICO, vol. iii. col. 790.]

Vera Cruz is inclosed by walls, and has straight, wide, and well-paved streets. Many of the houses are excellent, and erected at great expense, on account of the scarcity of materials. They are constructed of a porous white coral, which composes the cliffs on the coast; and their flat roofs, covered with cement, receive the rain-water for the tanks, or albiges, with which every good house is furnished, and which hold sufficient water for two or three years' consumption. The public buildings are not distinguished by beauty. There are several churches and hospitals.

During the War of Independence, the Spaniards kept possession of the castle of San Juan de Ulua till November 1825, and the town lost more than half its inhabitants, as well as a large part of its trade. It has since recovered much of its population, but it has not regained its commerce. Before 1820 Vera Cruz was the only port on the eastern coast of Mexico from which the produce of the country was exported, and by which foreign goods destined for the consumption of the interior reached their destination. At that period the value of the articles exported amounted to 21,780,000 and those imported to 14,650,000 Spanish dollars. Other ports of the country have since been thrown open to the foreign trade, and many of its productions, especially the produce of the northern mines, have found their way to other ports, especially to Tampico. Vera Cruz however serves still as an outlet for the produce of the mines situated south of 21° N. lat., for all the cochineal destined for the markets of Europe and the United States, and for the tobacco, sugar, and coffee which are grown in the plain between the Gulf of Mexico and the table-land of Anahuac, with the jalap, vanilla, and sarsaparilla which are collected mostly on the declivities of the table-land. It is probable however that all these articles taken together do not reach half of the above sum. The imports however have not decreased in the same proportion, as the greater part of the table-land, and even some tracts along the Pacific, are supplied with foreign goods from the capital, which receives them by way of Vera Cruz.

The island on which the castle of San Juan de Ulua is built was visited for the first time by Europeans under the command of Juan de Grijalva in 1518, and in the following year Cortes landed his army at the place where the town now stands; but the town founded by him, and called Villa Rica de Vera Cruz, was some miles farther north. After three years that place was abandoned, and another town was built a little farther south, at a place still called Antigua, to distinguish it from the present town. This situation was also found inconvenient, and the present town was built towards the close of the 16th century, but it was not incorporated before 1615. The fortress of San Juan was taken by the United States army in the late war with Mexico.

VERA PAZ. [GUATEMALA.]

VERAGUA. [PANAMA.]

VERBITZA, RIVER. [BOSNIA.]

VERCELLI, an administrative division of the Sardinian continental dominions, consists of three provinces, which, with their area and population, are as follows:—

Provinces.	Area in Square Miles.	Population in 1848.
Vercelli	473	121,808
Biella	377	136,691
Casale	335	120,428
Total	1,185	378,925

The Province of Vercelli is bounded N. by the provinces of Val di Sesia and Biella, E. by the provinces of Mortara and Novara, S. by the Po, which divides it from the province of Casale, and W. by the provinces of Ivrea and Turin. It is mostly a plain sloping towards the south, and through which runs from north to south the river Sesia, an affluent of the Po. The rivers Cervo and Elvo, which rise in the mountains of Biella, flow through the province of Vercelli in a south-east direction and join the Sesia above the town of Vercelli. A canal for the purpose of irrigation, called Canale d'Ivrea, and also Canale di Santhia, from the town of that name, receives part of the water of the Dora Baltea below Ivrea, and after irrigating the plain of Vercelli empties itself into the Sesia near Vercelli. This canal is one of the largest in Piedmont. The lower part of the province of Vercelli consists of rice-fields, which are laid under water during the summer until September, when the water is let out, and the rice is reaped. This system of cultivation renders the country unhealthy. The province of Vercelli produces also corn, wine, and silk in abundance.

Vercelli, the head town, situated on the left bank of the Sesia, about midway between Milan and Turin, near the site of the ancient Verocella, a town of Cisalpine Gaul, is a large and well-built but somewhat decayed town, in an atmosphere rendered unhealthy by the rice-grounds; it is a bishop's see, has many churches, convents, and palaces, a gymnasium, a clerical seminary, a large hospital with a botanical garden and a museum of anatomy attached to it, and about 15,000 inhabitants.

Borgo Vercelli is a suburb on the opposite or left bank of the Sesia, with about 2000 inhabitants. It was in the plains of Verocella that the Cimbric were defeated by C. Marius, B.C. 101.

The other towns of the province are—Santhia, a town of 3300 inhabitants, on the road from Vercelli to Ivrea. Trino, a town of about 7000 inhabitants, in a low marshy plain near the Po. Trino is a great market for cattle and pigs. The hams of Trino are in repute in northern Italy. Crescentino, west of Trino, on the high road to Turin, has about 4000 inhabitants, and some remains of Roman buildings in its neighbourhood. Livorno, not far from Crescentino, has 3600 inhabitants, who deal in silk, the produce of the country,

Gattinara, on the banks of the Sesia, north of Vercelli, has 3700 inhabitants; its territory produces good wine.

The Province of Biella is drained by the upper courses of the Cervo and Elvo. Its northern districts are covered by offshoots of the Pennine Alps, but a great part of the surface is level and productive. The chief products are wheat, rice, silk, hemp, and good wine. Cattle are very numerous. Among the minerals are iron and copper. The system of irrigation is extensively adopted. Biella the chief town, on the slope and at the foot of a hill on the right bank of the Cervo, has a college, manufactures of silks and woollens, and a population of 8000. The trade of the town in raw-silk, oil, chestnuts, and wine is considerable. Biella gives title to a bishop.

The Province of Casale is noticed separately. [CASALE.]

VERCHNEI UDINSK. [SIBERIA.]

VERD, CAPE, ISLAND. [CAPE VERD.]

VERDEN, the chief town of the former principality of Verden, now comprised in the province of Brunen in Hanover, is situated in 52° 56' N. lat., 9° 15' E. long., on the navigable river Aller, which here divides into two arms, and over which there is a bridge 400 paces in length. It is surrounded with walls, and has three gates. The principal building is the gothic cathedral, besides which there is another church, an hospital, and a school attached to the cathedral. The inhabitants, about 5000 in number, have tobacco and snuff manufactories, breweries and spirit distilleries, but are chiefly engaged in cultivating the fields and gardens of the environs. Verden is a station on the railroad that connects Hanover and Bremen, from which cities it is distant 54 and 22 miles respectively.

VERDUN. [FRANCE: SAONE-ET-LOIRE.]

VERGARA. [BASQUE PROVINCES.]

VERKHOTURYE. [SIBERIA.]

VERMAND. [AIGNE.]

VERMANDOIS, or VERMANDAIS, LE, a province in France, formerly included in Picardie. Its capital was St. Quentin. The province was the territory of the ancient Vermandui, from whom it obtained its name. It is now included in the departments of Aisne and Somme.

Héribert IV., count of Vermandois, a descendant of Charlemagne (1077), united, in right of his wife, the county of Valois to that of Vermandois, and the united counties came into the hands of Hugues, son of Henri I. king of France, and one of the principal leaders of the first crusade (1096). The counties of Valois and Vermandois were united to the crown by Philippe-Auguste (1215).

VERMLAND. [SWEDEN.]

VERMONT, one of the United States of North America, extends between 42° 44' and 45° N. lat., 71° 30' and 73° 25' W. long. It is bounded E. by the state of New Hampshire; N. by the British colony of Lower Canada; W. by the state of New York; and S. by Massachusetts. Its length from north to south is 157 miles, its breadth varies from 40 to 92 miles. The area is 10,212 square miles. The population in 1850 was 314,120, of whom 718 were free coloured persons: the density of the population was 3076 to a square mile. The inhabitants being all free the federal representative population is the same as the entire population in 1850; this, according to the present ratio of representation, entitles the state to send three representatives to Congress. To the Senate, like each of the other United States, Vermont sends two members.

Surface and Soil.—The surface of Vermont is for the most part mountainous. Vermont in fact constitutes a part of that irregular mountain region which extends over the greater part of the United States which lies east of the River Hudson, and of Lake Champlain. A range, called the Green Mountains, traverses the state from south to north, and is a continuation of that known in Massachusetts as the Hoosic Mountains. They form a continuous ridge to near 44° N. lat., where they divide into an eastern and a western branch. Up to this point their width varies between 10 and 15 miles. The highest summit is Killington Peak, 8675 feet above the sea-level. The summits of the mountains are rocky, and only covered with winter grass and a spongy green moss. Their sides are covered with forests of evergreen-trees, especially pine, spruce, and hemlock, which near the base of the mountains attain large dimensions, but towards their summits are only from 2 to 3 feet in height. There are some good farms among the hills, and much excellent pasture-ground.

From the division of the range the mountain region widens till between Richmond and Danville it occupies more than half the width of the country. Of the two branches the eastern ridge is the lowest; it forms the watershed between the basin of the Connecticut River and the streams which run eastward into Lake Champlain. In the western branch are the highest summits of the Green Mountains, Camel's Rump, west of Montpelier and south of the river Onion, being 4188 feet, and Mount Mansfield, north of Montpelier, 4279 feet above the sea-level. Between the mountains are valleys of considerable extent, well sheltered and of great fertility, their soil, the debris from the mountains, containing a large proportion of mould. The lower part of these northern mountains is covered with large trees, from which great quantities of pearlshells are obtained. The extreme north of the state is much inferior in fertility to the region farther south. The valleys are rather narrow, and contain a comparatively small portion of cultivable land; but as the hills are not very steep or elevated, the

are covered with tall forest-trees, and in most places afford good pasture. The tract of country which lies between the eastern ridge and the Connecticut River is very hilly and broken, and is the least fertile part of the state. Its elevation above the sea-level can hardly be less than 1000 feet, and it has a bad climate and a poor soil, consisting mostly of rocks and coarse gravel.

The country surrounding the Green Mountains on the south is of indifferent quality. The soil is chiefly stony and gravelly, but it is well drained; and it is much used as pasture-ground, especially for sheep. A large part is still covered with beech, sugar, maple, elm, oak, button-wood, bass-wood, ash, and birch; and a number of swine are fed in the forests. In proceeding northward the country improves. The soil is less stony, and contains a larger proportion of loam or clay: along the banks of the Connecticut River some very fertile tracts occur. In these parts an isolated summit, Mount Ascutney, rises, near the town of Windsor, to 3320 feet above the sea-level.

The most level part of Vermont is that which lies on the banks of Lake Champlain, though the surface is broken by numerous water-courses. Near the banks of the lake are some low swampy tracts, from which the country rises gradually to the base of the mountain region, and becomes hilly in approaching it, but the hills have such gentle slopes as to admit of cultivation almost everywhere. This plain is about 100 miles long, and in its southern districts less than 10 miles wide, but widens northward to 30 miles. The soil varies greatly, consisting in many places of coarse gravel, while in others it contains much clay or loam, but a large portion of it is productive. It enjoys great facilities by the lake and the Sorel River for exporting its produce to Montreal in Canada.

Hydrography, Communications.—More than two-thirds of the drainage of Vermont runs into Lake Champlain, which is navigable by large vessels. [CHAMPLAIN.] The largest rivers falling into that lake are Otter Creek, Onion River, Lamoille River, and Missisquoi River. *Otter Creek* rises on the western declivity of the Green Mountains, near 43° 15' N. lat., and runs north by west, nearly parallel to Lake Champlain, draining the southern part of the fertile plain on the east of the lake. Lake vessels ascend it to Vergennes, about eight miles from its mouth, where the first falls occur; it is navigable by boats to Pittsford, 17 miles higher. *Onion River* originates in the mountain region of the centre; runs south-west past Montpelier, and falls into Lake Champlain, 5 miles N. from Burlington. Much of its course is remarkable for the romantic character of its scenery, and it is of great value for irrigation and for mechanical purposes. The *Lamoille*, which rises in the same region, also affords great hydraulic power. Both are greatly interrupted by rapids; have a very impetuous current, and are unnavigable. *Missisquoi River* rises in Canada, and at first flows southward, parallel to Lake Memphramagog. In approaching Vermont it turns westward, but soon afterwards enters that state by a south-western course. At Sheldon, about 10 miles from its mouth, it becomes navigable for river-boats, and falls into Missisquoi Bay, the north-eastern arm of Lake Champlain, which is about 15 miles long and 3 miles wide, and in its whole extent navigable for lake vessels. The northern portion of Missisquoi Bay is within Lower Canada.

A few small rivers which drain the northern district of the mountain region fall into Lake Memphramagog, of which about one-fifth part lies within Vermont. This lake has a curved form: it is nearly 30 miles long, but in no part exceeds 2 miles in width. It is surrounded by mountains covered with forest-trees, and it discharges its waters into the St. Francis River of Canada by a channel which is called Magog, and which enlarges about the middle of its course into a small lake called Scaswaninepus. Lake Memphramagog contains several kinds of fish, especially salmon-trout.

The *Connecticut River*, which divides Vermont from New Hampshire, presents in the upper part of its course a continual succession of rapids and cataracts. The last of these cataracts, which entirely prevent navigation, are the Barnet Falls, which occur near 44° 15'. Farther down there are several small falls and rapids; but from Haverhill (44° N. lat.) downwards the river is usually navigable for boats. All the rivers falling into the Connecticut from the Green Mountains are small, and none of them navigable.

The only canals in Vermont are three short cuts, altogether not a mile in length, made to avoid rapids and falls on the rivers. The railways are nearly all portions of the great trunk lines which connect New York, Boston, and the coast of New England with Canada and the North-West. On the 1st of January 1855, there were in Vermont seven lines of railway, having 419 miles in operation, and 59 miles were in course of construction. The ordinary carriage-roads are numerous, and generally well kept.

Geology, Mineralogy, &c.—The geology of Vermont belongs almost entirely to the Green Mountain system of M. Marcou, or the Oldest Meridional and Hoosac Mountain system of Professor Hitchcock. The rocks are for the most part eruptive, consisting chiefly of granites, but there are also many metamorphic rocks, including very fine crystalline limestones; Mr. Logan has pointed out metamorphic fossiliferous rocks about Memphramagog Lake. The only non-igneous rocks are the Lower Silurian strata, which skirt the eastern bank of Lake Champlain. The minerals are as might be expected numerous. At several points of the Green Mountains quartzose veins traverse itacolumites

(a quartzose conglomerate, which in South America and India forms the matrix of some of the most precious gems), and contain native gold, though not as far as is known in sufficient richness to be profitably worked. In the neighbourhood of Brandon on the Otter Creek, copper of some richness has been found, in some instances in union with silver. Lead, zinc, and manganese are also met with. Iron-ore occurs in great abundance along the western base of the Green Mountains. Sulphuret of iron is found in several localities, and an immense quantity of copperas is manufactured from it. Kaolin, or porcelain earth, is extensively wrought. Marbles of various colours, and of very fine qualities are quarried in several places. Slate, soap-stone, oil-stone, granite, and other useful minerals are also quarried, and some of them very extensively.

Climate, Productions, &c.—Vermont is distinguished by the severity of its winter, which continues almost without intermission from the early part of December to the beginning of April. The frost is very intense, and the thermometer sometimes descends to 27° or even 30° below zero. A great deal of snow falls; and the ice on the lakes and rivers, except where the rivers have rapids or cataracts, will bear heavy loads. The spring lasts only about six weeks, to the end of May, and the weather is then mild and pleasant, with frequent showers. In summer, from June to August, both months included, the heat in the middle of the day is oppressive, as the thermometer generally rises above 80°, and sometimes even to 94°, but the evenings and nights are cool. The most pleasant season is from the beginning of September to the middle of October, the heat being then moderate, and the air dry, elastic, and invigorating.

The soil and general character of the products have been already noticed. Vermont is an agricultural state, but the greater part of the state is more adapted for grazing than for tillage; indeed it is said that scarce any part of the United States is better suited to the rearing of horses, horned cattle, and sheep, all of which are reared in large numbers in this state. Swine are also numerous, but much less so than formerly. Of the cereals oats are raised in the greatest abundance, and next maize. Wheat is most grown on the western side of the mountains. Buckwheat, rye, and barley are grown, but not to any great extent. Very large quantities of potatoes, and considerable crops of peas and beans are raised. Garden vegetables are also carefully cultivated. Some hops and flax are grown. A large quantity of maple-sugar is obtained. Apples and most of the hardier fruits ripen well everywhere; but the peach seldom comes to perfection. A great deal of butter and cheese is made; and wool is one of the staple products of the state.

There are still many wild animals in the mountains and forests, but their numbers have greatly diminished, and many kinds once common are now extinct. Fish is plentiful, especially in the lakes; and abundance of salmon ascend the Connecticut River to Lake Champlain.

Manufactures, Commerce.—Vermont has no great manufacturing towns, but it has a good deal of capital, and above 8300 persons employed in various branches of manufacture. In 1850 about 1300 persons were employed in the woollen, 230 in the cotton, 1100 in the iron manufacture; and 400 in tanneries. The other manufactures were chiefly such as are incidental to an agricultural region.

The foreign commerce of the state is principally carried on at Burlington, and finds its chief outlet by the Chamby River to Canada. The exports for the year ending June 30, 1853, amounted to 94,117 dollars; and the imports to 184,512 dollars—all in American vessels. The shipping owned in the state in 1850 amounted to 4530 tons, of which 3097 tons were navigated by steam.

Divisions and Towns.—Vermont is divided into 14 counties. Montpelier is the political capital. There is no large town in the state. The following are some of the more important towns; the population is that of 1850:—

Montpelier, the capital, is beautifully situated between two green and lofty hills, in a rich plain, on the right bank of the river Onion, in 44° 17' N. lat., 72° 36' W. long., 524 miles N.N.E. from Washington, population 2810; but *East Montpelier*, separated from it in 1848, contained 1447 inhabitants in 1850. The town consists chiefly of a broad street lined with fine trees on each side; and contains many well-built houses, several churches, a court-house, prison, &c. The state-house is a handsome building of fine-grained gray granite with a portico, and is surmounted by a handsome dome. Several mills and factories are in the town and its vicinity. The state-road centre here, and the Vermont Central railway increases the commercial facilities.

BURLINGTON, the largest town in the state, is noticed in a separate article.

Bennington, the oldest town in Vermont, is situated on the right bank of the Hoosac River, 103 miles S. by W. from Montpelier: population 3923. It is the market-town of a busy agricultural district, and contains several mills, furnaces, and factories. *Brandon*, on Otter Creek, about 46 miles S.S.W. from Montpelier, population 2835, is a place of some trade. *Brattleborough*, on the right bank of the Connecticut, 110 miles S. from Montpelier, population 3816, is a flourishing place, with woollen and cotton manufactures, paper-mills, &c. The Vermont Asylum for the Insane is at Brattleborough; it had 389 patients in the institution in 1854. In connection with the asylum there is a library of 1200 volumes, and a large number of newspapers

and periodicals are taken in. *Castleton*, on Castleton River, 60 miles S.W. from Montpelier, population 3016, is a place of some trade; the point of intersection of the Saratoga and Castleton, the Rutland and Washington, and the Vermont and Canada railways; and the seat of a medical college. *Danville*, on a tributary of the Passumpsic River, 23 miles N.E. from Montpelier, population 2577, has several manufacturing establishments. *Middlebury*, about 35 miles S.W. from Montpelier, on both banks of Otter Creek, which is here 170 feet wide, with falls of 20 feet perpendicular height, affording water-power for many mills: population, 3517. There are several manufactures of woollen and cotton goods, nails, &c., and white and variegated marble is extensively quarried and wrought. There are several churches, a court-house, and two academies. Middlebury College, pleasantly situated on elevated ground, consists of a spacious stone edifice, and had, in 1854, 7 tutors and 55 students. *Newbury*, on the Connecticut River, 30 miles S.E. by E. from Montpelier, population 2984, has considerable trade and manufactures, and is the site of a Methodist seminary. *Rutland*, on Otter Creek, about 60 miles S.S.W. from Montpelier: population, 3715. The town is well situated for business, and three railways pass through it. In the town are several marble and slate-works, iron-foundries, machine-shops, &c., besides a court-house, jail, churches, schools, &c. Iron-ore, lime, white and variegated marbles, &c., are largely worked in the neighbourhood. *St. Albans*, on Lake Champlain, about 60 miles S.W. from Montpelier, population 3567, is the port of a fertile district, and has a large trade and some manufactures. *Vergennes*, on Otter Creek, near Lake Champlain, about 36 miles W.S.W. from Montpelier: population, 1378. This 'city' stands at the head of navigation, and though the city itself has but few inhabitants, a large business and considerable manufactures are carried on in it and in its vicinity. *Windsor*, on the Connecticut, 61 miles S. by E. from Montpelier, population 1928, is a flourishing and rather handsome town, with some manufactures. *Woodstock*, 14 miles N.W. from Windsor, on an affluent of the Connecticut, population 3041, contains a handsome court-house, churches, and other public buildings, Vermont medical college, &c.; and has some manufactures.

History, Constitution, &c.—The tract of country between Lake Champlain and Montpelier, called Vermont by the French settlers from its green mountains, was ceded by them to the British in 1763. The French had commenced their settlement as early as 1731, but little progress was made in colonising Vermont till after the British had conquered Canada in 1760, after which time it began to be settled rapidly. Vermont was at first claimed by Massachusetts, and afterwards by New Hampshire and New York. The rival claims were decided by the king of England in council in 1764, in favour of New York. A serious quarrel was the result of this decision, which was interrupted by the war of the Revolution, in which the 'Green Mountain boys,' as they were called, distinguished themselves by their hardness and bravery. In January, 1777, they declared the state independent, but New York still claimed jurisdiction; and the differences were only finally adjusted in 1790 by Vermont paying to New York 30,000 dollars in full of all demands. In 1791 Vermont was admitted into the federal union.

The constitution was adopted in 1793, but has since been several times modified. Every seventh year 13 censors are elected, whose duty it is to inquire whether the constitution has been duly observed, and to call a convention if it requires modification. Slavery is prohibited; imprisonment for debt is permitted only in cases of fraud; perpetuals are abolished. The right of voting is vested in every man 21 years of age, who has resided in the state for a year, and is of quiet and peaceable behaviour. The legislature consists of a Senate of 30 members, and a House of Representatives of 230 members, one for each town (township). The executive power is vested in a governor. The governor and the members of the legislature are elected by the people annually. The judges are elected by the general assembly in joint ballot.

Vermont has no state debt. The entire receipts for the financial year 1853-4 (including the balance from the previous year) was 165,111 dollars; the total expenditure was 152,443 dollars. The state militia at the last return consisted of 23,915 men, of whom 1088 were commissioned officers. The number of colleges in the state in 1850 was five, having 30 teachers and 464 students. The number of public schools was 2781 having 4178 teachers and 93,457 scholars. There is no state school fund.

VERNEUIL. [EURR.]

VERNON. [EURR.]

VEROLI. [FRANCONE.]

VERONA, a province of the Austrian crownland of Venice in North Italy, is bounded N. by the Tyrol, E. by the provinces of Vicenza and Padua, S. by the provinces of Rovigo and Mantua, and W. partly by Mantua and partly by the Lake of Garda, which separates the northern part of the province of Verona from the province of Brescia. The length of the province is about 50 miles from north

to south, and its greatest breadth is about 25 miles. The area is 1094 square miles; the population in 1850 was 302,902. The northern part of the province is hilly, and even mountainous near the borders of the Tyrol; the highest summit of Monte Baldo is above 6000 feet high. The southern part merges into the great plain of the Po; but the territory of Verona does not touch that river, its southern boundary being marked by the Tartaro or Castagnaro, an affluent of the Adige, which divides it on that side from the province of Mantua. The province is divided into thirteen districts.

The river Adige crosses the province of Verona in its length from north to south-south-east. It runs through a very narrow valley from the frontiers of the Tyrol down to the defile of Chiusa, near Rivoli, after which it emerges into the plain of Lombardy. The province of Verona has few towns of any consequence besides the capital. *Legnano* is a fortress of considerable strength, on the Adige, south of Verona: population, 6000. *Villafianca* is a bustling market-town on the road from Verona to Mantua. *Rivoli*, on the right bank of the Adige, north of Verona, is famous for the battle won by Bonaparte and Massena over the Austrians in January, 1797. This country is full of the recollections of those memorable campaigns, and also of the campaigns of the Sardinians and Austrians in 1843 and 1849. On the banks of the Alpone, near the wooden bridge of Arcole, is an obelisk, raised in commemoration of the battle of Arcole. The eastern bank of the Lake of Garda, which belongs to the province of Verona, is not so favoured by nature as the opposite or Brescia side: the ridge of Monte Baldo ranges close to the shore of the lake, and joins on the north the Alps of the Tyrol. The town of *M.lesius* (population 3000), with an old gothic castle, is on this coast, as well as the little town of *Garda*, which has given to the lake its modern name. [GARDA.] In the mountains near Verona is the village of *Gargamago*, where Dante, for a time a guest of Can della Scala, lord of Verona, wrote part of his 'Purgatorio.' The valley of Ronca, 15 miles distant from Verona, is worth the notice of the geologist for its fossil fishes and its shells.

VERONA, the chief town of the province of Verona, and the military capital of the Crownland of Venice, is situated in 45° 25' N lat., 11° E. long., on the Adige, which divides the town into two parts, and at the foot of hills which are the lower offsets of the mountains of the Tyrol. The situation of Verona is pleasant and healthy; the town is substantially built, with long and tolerably wide streets, is surrounded by old walls flanked with towers, and retains much of the appearance of a town of the middle ages. The ramparts and bastions constructed by the architect and engineer San Micheli in the early part of the 16th century, were almost entirely destroyed according to one of the conditions of the peace of Luneville in 1801, but the gates were spared, one of which, the Porta del Palio, has been termed a miracle of architecture. There are remains of walls erected round the town by the emperor Gallienus, by Charlemagne, and by the Soligneri. The remains of the last add greatly to the beauty of the city. But all the former fortifications of the place are insignificant when compared to the works erected round Verona within the last few years by the Austrians, who have constructed walls and ramparts in the polygonal or cyclopean style, so that Verona is now one of the strongest fortresses not only in Italy but in Europe.

Among the many remarkable buildings of Verona the most worthy of notice are, the splendid palace of Canossa, built by San Micheli; palace called della Gran Guardia in the Piazza di Bra, the elegant palace Quarta Verza by San Micheli; the palace Bevilacqua; the palace Ridolfi, which has a curious representation of the cavalcade of Pope Clement VII. and Charles V. on the occasion of that emperor's coronation at Bologna; the palace del Consiglio, built after the design of Sansovino, but its spacious hall was constructed by Frá Giocondo the commentator of Vitruvius; the Palazzo Publico, opposite to the amphitheatre; and the palaces in the Piazza dei Signori, from which rises a square Campanile tower 300 feet high, surmounted by an octagonal pyramid, the whole forming a most conspicuous object in the scenery of the city. The custom-house is a noble building raised in the 18th century by Count Alessandro Pompei.

The churches of Verona are numerous, and many of them interesting for their monuments and paintings. The church of San Nazario and San Celso is said to be of the 7th century. The subterranean galleries in its neighbourhood were once used as catacombs. The church of San Zenone dates from the 9th century: its bronze gates, a statue of the saint with his tomb, and its curious emblems, arabesques, and figures, attest the antiquity of the structure. The cathedral of Verona, a gothic building, said to be of the age of Charlemagne, with its facade covered with old sculptures of men and animals, contains the tomb of Pope Lucius III., who died at Verona in 1185; several valuable paintings, among which is an Assumption by Titian; a sepulchral monument of Roman times to Julius Apollonius and his wife Attica Valeria; and other interesting objects. The church of San Fermo has a fine mausoleum of the Turriani family. Several monuments of learned men, and also several very old paintings, one of which, by an unknown artist, is said to be anterior to the time of Cimabue. The churches of Santa Maria della Scala, San Giorgio Maggiore, and San Sebastiano are among the finest churches of Verona, and are also rich in paintings.

The library of the Chapter of Verona is very ancient; it contains above

12,000 volumes and about 540 manuscripts, among which is a palimpsest of the Institutes of Gaius. In this library Petrarch discovered Cicero's Epistles 'ad familiares.' Many private collections of paintings, sculptures, and books which once enriched Verona have been sold.

The Teatro Filarmonico of Verona is a handsome structure; in the court and under the portico is Maffei's collection of Etruscan and other inscriptions, and of ancient bassi-relievi given by him to his native town. The sepulchral monuments of the Della Scala (Scaligeri) family in the shape of pyramids, surmounted by the equestrian statues of the various members of that family who were lords of Verona, are remarkable objects. The pretended tomb of Juliet is still visited by credulous travellers.

The amphitheatre of Verona, one of the best-preserved monuments of its kind, forms one side of the Piazza di Bra. Of the outer circuit, which originally consisted of 72 arches, only 4 are preserved; but the interior is nearly perfect. The arena forms an ellipse, the greater axis of which is 210 feet long. The entire inclosure forms an ellipse, the axes of which measure 506 and 404 feet respectively. The seats afford room for 22,000 spectators. The building resembles in style the Coliseum of Rome; it is constructed of marble and in part of brick. Another classical monument, the Arco de' Gavii, the sepulchre of an ancient family, with its handsome fluted columns, was pulled down in 1805 in order to clear the approaches to the citadel. The gate De' Borsari was one of the entrances into Verona in the wall of Gallienus, erected about A.D. 265. Although now nearly 1800 years old, it stands firm and solid, spanning a crowded street of the city. The Porta di Leone, another of the gates in the emperor's wall, is much mutilated. Remains of a theatre have been discovered on the left bank of the Adige. Four bridges cross the Adige at Verona: that called Di Castelvecchio is remarkable for the width of the central arch.

Verona is a bishop's see: it has a lyceum, a ladies' college, a school of drawing and painting, an academy of agriculture and commerce, and a clerical seminary. Verona is the general head-quarters of the Austrian army in Italy. It is altogether a very interesting city, one of the first among the second class of Italian towns: the population amounts to near 60,000 inhabitants. Many families of the local nobility have their residence at Verona, and in the pleasant country-seats which are scattered among the neighbouring hills.

Verona was a town of the Cenomani. Livy (v. 35) says that the Cenomani Gauls occupied the country previously held by the Libui, in which were Brixia and Verona. Under the empire it produced many distinguished men, such as Catullus, Pliny the elder, Vitruvius, and others. After the fall of the empire it was one of the principal towns of the Longobards. It was afterwards taken by Charlemagne. In the 12th century it was a free municipal town, and joined the Lombard league. In the following century it fell under the power of Ezzelino da Romano, after whose death Mastino della Scala was elected Podestà, about 1259. His descendants usurped the sovereign power, and created the dynasty of Della Scala, or Scaligeri, which lasted above a century, until it was conquered by the Visconti, dukes of Milan, who became masters of Verona. After the death of Giovanni Galeazzo Visconti, Verona was seized by Francis of Carrara, lord of Padua; but in 1409, being besieged by the Venetians, the citizens gave themselves up to Venice, by a convention which secured their municipal liberties, and since then Verona has formed part of the Venetian territory.

VEROVICZ. [CROATIA.]

VERSAILLES, capital of the department of Seine-et-Oise in France, is situated in 48° 47' 56" N. lat., 2° 7' 39" E. long., 11 miles by railway W. from Paris, and had 29,975 inhabitants in the commune at the census of 1851.

Versailles was a mere village in the time of Louis XIII., who in 1627 built here a small hunting seat, which Louis XIV. converted, by his vast and expensive additions (1661-1672), into the most magnificent palace then in Europe. Under this prince and his successors Louis XV. and XVI. Versailles was the ordinary residence of the court, and the village of Versailles grew into a handsome city with above 70,000 inhabitants.

The town is divided into two nearly equal parts by a noble avenue nearly half a mile long and nearly 300 feet broad, running east and west, planted with four rows of elms, forming three alleys. The road from Paris, of which this avenue forms part, enters the town on the east, immediately opposite to the palace. Before the bend at the entrance of the Avenue of Paris, the road passes between the villages of Grand Montreuil on the right and Petit Montreuil on the left: these villages are now regarded as suburbs of Versailles. Versailles itself is divided by the Avenue into the Quarter of St. Louis on the south side, and the Quarter of Notre-Dame on the north side. The quarters are named after the parish churches which they respectively contain: the two parts are equally modern, and consist of straight well-built streets crossing each other at right angles.

Besides the Avenue of Paris, two other avenues (those of St. Cloud and Sceaux) converge to the Place-d'Armes, or parade-ground, which is immediately in front of the court of the palace. These avenues are all planted with fine elms, and lined with pleasant residences. Besides these avenues there are in the Quartier Notre-Dame three boulevards, all planted with fine elms, and bordered with neat houses and other buildings. Of the Places, or squares, the Place-d'Armes is the largest; the Place-Hoche (adorned with a statue of the general

from whom it is named), formerly the Place-Dauphin, is the handsomest. There are two market-places, and a number of fountains.

The town front of the palace consists of a central and two wings, inclosing three sides of a court, which is open on its fourth or east side towards the Place-d'Armes. The central and principal part of the palace of Louis XIV. also forms three sides of a quadrangle, and fronts the gardens. It presents three fronts to the gardens, namely, the principal front and two side-fronts, and is in advance of the rest of the building; the wings, which have the same general direction as the principal front of the central building (namely north and south), are thrown back about 250 or 260 feet, which is the extent of the two side-fronts of the central portion. The whole extent of the garden front is above 1900 feet. This front is in the estimation of many persons one of the grandest and most beautiful in existence. It is adorned with Ionic columns, 86 in number, arranged in 15 colonnades of 4, 6, or 8 columns, each colonnade supporting a cornice crowned with as many statues as there are columns; and if the northern face or extremity of the north wing, and the southern face of the south wing, be included, the number of columns will be augmented to 162. The spaces between the colonnades are adorned with pilasters, or with columns engaged in the wall; and the attic has dwarf pilasters throughout, and is surmounted by a balustrade. Niches immediately behind some of the intercolumns are occupied by statues. This palace was built from the designs of J. H. Mansard.

Immediately in front of the palace, on the west side, is the garden or little park, an irregular polygon about 3 miles long from the palace to its western extremity, and about 2 miles broad. It is included in the limits of the great park, which is estimated to be from 20 to 25 miles in circuit. The garden was laid out by Le Notre in terraces, parterres, and alleys, adorned with a profusion of statues, vases, and other sculptures; with a canal in the shape of a cross, and other pieces of water; and a number of fountains, which are supplied with water from the Seine by the forcing-pump (substituted for the former waterworks), aqueduct, and reservoirs of Marly. The fountains play on the first Sunday in the month during the summer: these exhibitions always attract crowds of spectators from Paris. The orangery is remarkable for the number and beauty of the orange-trees which it contains.

The interior of the palace was fitted up with great cost by Louis XIV. After the first French revolution the building was neglected. Louis Philippe completely restored the palace, and converted it into a national museum, or gallery of paintings and other monuments illustrative of different portions of the history of France, which was opened to the public on the occasion of the marriage of his son, the Duke of Orleans (June 10, 1837). Adjacent to the north wing of the palace, on the town side, is the chapel, which is remarkable for the beauty of its exterior, for its interior decorations, and for its many historical associations. The palace-chapel, the last work of Mansard, was built in the interval of 1699-1710. The theatre of Versailles, called Salle-de-l'Opera, has a beautiful interior. It was commenced in 1763, and opened in 1770, on the occasion of the marriage of Louis XVI. It was used in his reign for court-balls, on which occasion the pit was covered by a floor on a level with the stage. It was fitted up in this way for an entertainment given by the king's body-guard to the officers of the regiment of Flanders when it was surprised by the revolutionists; and in this state it remained till Louis Philippe had it repaired and re-opened for dramatic representations, June 10, 1837. In 1855 it was distinguished by magnificent fêtes in honour of the visit of Queen Victoria to the emperor Napoleon III.

In the park of Versailles are the two royal seats of the Grand Trianon and the Petit Trianon, with their respective gardens. The Grand Trianon was built by Louis XIV.; the Petit Trianon by Louis XV. The 'English garden,' which is the great attraction of the Petit Trianon, was formed by the orders of Marie Antoinette. In the Place-d'Armes, opposite to the town-front of the palace, are the two ranges of stables, buildings of great extent, occupying respectively the spaces between the Avenue of Paris and the converging avenues of St. Cloud and Sceaux. There are near the palace various other buildings, as the Grand Commun, which had a thousand sleeping-rooms, and could lodge two thousand persons. To the south-east and south of the palace are the kitchen-garden and a very large piece of water. The former mansions of the master of the king's household, and of the chief huntsman, are now converted respectively into the town-hall and the courts of law; the former Garde-Meuble is now the prefect's office. The Tennis-court, famous for the oath taken in it by the National Assembly (June 20, 1789), was used as a studio by Horace Vernet, who executed here all of his paintings that adorn the collection in the palace. Besides these and other buildings connected with the court or the government offices, Versailles has two churches, namely, the cathedral of St. Louis and the church of Notre-Dame. There is also a beautiful chapel attached to the royal college, and there is a parish church in the suburb of Montreuil. The general hospital is one of the finest in France. Versailles has also an ecclesiastical school, a primary normal school, a public library of 42,000 volumes, a museum, a free-school for drawing, an agricultural society, a theatre, baths, several barracks, and a prison.

Versailles has a good corn-market, manufactures of fire-arms, files, clocks and watches, jewellery, cotton-yarn, net, pasteboard, hats,

hosiery, wax-candles, earthenware, and glass. There are breweries and tan-yards, and a number of nursery-grounds. A small garrison is kept in Versailles.

Versailles gives title to a bishop, whose diocese is the department of Seine-et-Oise. At Versailles were born Philip V., king of Spain; Louis XVI., Louis XVII., Louis XVIII., and Charles X., kings of France, Marshal Berthier, and General Hoche. Blücher plundered the town in 1815.

VESOUL. [SAONE, HAUTE.]

VESUVIUS (*Vesuvius*), a mountain situated east of the bay and east-south-east of the city of Naples, celebrated for many centuries as one of the principal and most active volcanoes of Europe. Its height above the sea is variable, according to the condition in which eruptions leave the crater; and owing to the same causes the figure of the mountain, though in a general sense always conical, changes from time to time. During the early part of the present century the top of Vesuvius had become a rough and rocky plain, covered with blocks of lava and scoriae, and out by numerous fissures, from which clouds of vapour were evolved. By the violent eruptions of October, 1822, this was all thrown out, and replaced by a vast elliptical gulf or chasm three miles in circumference, three-quarters of a mile in the longest diameter, and perhaps 2000 feet in depth. More than 800 feet of the summit of the ancient cone were carried away by the explosions, and the height of the mountain was thus reduced from 4000 to 3200 feet. One of the greatest eruptions of modern times took place in 1855, when vast floods of lava poured down the mountain for about three weeks, destroying the village and township of Cercolo, covering a great extent of vineyards and sweeping away houses and bridges. For about ten miles the vast lava-stream flowed irresistibly on until it almost reached the sea in the direction of the Ponte Maddaloni. The eruption commenced on the 1st of May. After hurling up stones and flames for a week, the old crater broke up altogether, and in the middle of the cone ten new craters were formed, whence lava poured forth like a river on the side of the Cavallo and as far as the Minatore. Here four other craters were formed, which threw up glowing masses of bitumen pyramidal in form, and resembling gigantic fireworks. About the 20th the lava ceased to flow.

The mountain called Somma, which surrounds for half a circle with a precipitous escarpment the true peak of Vesuvius, is part of the ancient large crateriform cone described by the Roman historians, the summit and part of the side of this ancient cone being destroyed by the explosion of A.D. 79. No record exists of an actual eruption of Vesuvius prior to the Christian era. Diodorus Siculus notices (iv. 21) that it has "many signs of having been burning in ancient times;" and Strabo infers its igneous origin from the nature of the rocks; but the slopes were richly cultivated and proverbially fertile, though the top was a rough, sterile, slightly concave plain, in which Spartacus was besieged by the Roman army. (Florus, iii. 20.)

In A.D. 63 the long-dormant volcano gave the first symptoms of renewed agitation in an earthquake, which occasioned considerable damage to many of the cities in its vicinity, amongst others to Pompeii. In the month of August, A.D. 79, occurred the first and perhaps the greatest of all the recorded eruptions of Mount Vesuvius, described in the letter of Pliny the Younger to Tacitus, which records the death of Pliny the naturalist. The cities of Stabiae, Pompeii, and Herculaneum were overwhelmed by showers of cinders and loose fragments, no lava having been ejected on this occasion. Other eruptions succeeded in A.D. 203, 472, 512, 685, 993, and 1036, which last is said to be the first which was attended by an ejection of lava. Eruptions were renewed in 1049, 1138 (or 1139), 1306, 1600, 1631, 1660, 1682, 1694, and 1698, from which time to the present phenomena of this nature have been repeated very frequently, so as seldom to leave any interval of rest exceeding ten years. Sometimes this mountain has flamed twice within a few months.

The eruption of 1737 gave forth lava currents, which passed through Torre del Greco into the sea, the solid contents being estimated at 33,587,058 cubic feet. In 1794 the lava followed the same course, and amounted to 46,098,766 cubic feet. In the various eruptions of this mountain, currents of melted rock, torrents of heated water, clouds of ashes and scoriae, and great volumes of steam and gases have at different times been observed. The force with which the subterranean agencies operate during their paroxysmal excitement may be judged of by the height (2000 feet) to which stones have been projected, and the distance to which they have been thrown. Stones of 8lbs. in weight fell on Pompeii in the eruption of A.D. 79, while masses of an ounce weight overwhelmed Stabiae; and in a later eruption fine ashes were transported by the winds even to Constantinople.

GEOG. DIV. VOL. IV.

VIÁTKA (Wjatka, or Wiátak), an extensive government of Russia, is situated between 55° 50' and 60° 5' N. lat., 55° 46' and 54° E. long. Its area is 52,900 square miles, and the population in 1846 was 1,662,800. It is bounded N. by Vologda, E. by Perm, S. by Oranburg and Casan, and W. by Kostroma. The country is covered by branches of the Ural Mountains, and by vast morasses and immense forests. The climate is cold and inclement, especially in the northern portion of the country, but salubrious. The soil is in general clay or moor, with no considerable tract of rich mould, except on the banks of the Kama, which rises in the north of the government, but soon enters Perm, through which it flows from north to south. The principal river is the Viátka, which rises near the source of the Kama, and with various windings traverses the government from north to south, and falls into the Kama at the south-western corner of the province. It receives in its course the Tschepza, Metscheda, Malmyschka, Sohomsa, Cholumitza, and several other rivers.

Agriculture is the chief occupation of the inhabitants. The species of grain cultivated are rye, barley, oats, and a little wheat; pulse of different kinds, and flax and hemp are grown. The forests of pines, oaks, elms, limes, and other trees, are a principal source of wealth: they are the resort of abundance of deer and of fur-bearing animals. The breeding of oxen, sheep, swine, and goats is much attended to. The country-people have also great quantities of bees, and the fishing in the rivers is profitable. The minerals are copper and iron. The inhabitants build boats, manufacture coarse cloth and linen, tan leather, and make iron and wooden utensils. The Finnish part of the population, as well as the Russians and Tartars, provide for almost all their own wants. A good deal of brandy is distilled. The exports of the government go to Archangel.

Viátka, the capital of the government, is situated in 58° 22' N. lat., 49° 45' E. long., at the confluence of the Viátka and Chlenopka. There are 23 churches, all of stone, and about one in nine or ten houses are also of stone. The town is the seat of government and the see of a bishop. There are a gymnasium, a seminary, and a convent, founded in 1520.

The second town in the government is *Sarapol*, on the Kama, nearly 400 miles S.W. from Viátka. It is a well-built town, and has 6000 inhabitants. *Slobodskoi*, on the Viátka, has 6000 inhabitants, who manufacture iron and copper. *Volka* has also about 6000 inhabitants who manufacture anchors and crucibles. At *Isch*, on the river Isch, 27 miles S.W. from Volka, there are large establishments, where fire-arms are manufactured for the army: the population is about 8000.

VIC-FEZENSAC. [GÈRE.]

VIC-SUR-ALLIER. [PUY-DE-DÔME.]

VIC-SUR-CÈRE. [CANTAL.]

VICENZA, a province of the crownland of Venice, in Austrian Italy, is bounded N. by the Tyrol, E. by the provinces of Belluno and Treviso, S. by the province of Padua, and W. by that of Verona. It is about 50 miles long from north to south, and 25 miles in its greatest breadth. The area is 1083 square miles, and the population in 1850 numbered 340,694. The river Bacchiglione crosses the province in its length. The Brenta crosses the eastern districts and passes by Bassano. More than half of the area of the province is occupied by mountains and hills; the rest, which is level, is very fertile in corn, maize, pulse, potatoes, and hemp. The pastures are extensive. Fruit-trees are abundant, and the chestnut-trees in the mountains supply food to a part of the population. A large quantity of silk is produced annually. The forests are rather extensive. Some coal-mines are worked. Cattle and sheep are very numerous. The manufactures consist chiefly of woollens and silks. The province is traversed by the railway from Venice to Milan, which passes through the city of Vicenza.

The principal towns are VICENZA and BASSANO. Citadella is an old fortified town, the fortifications of which are now in ruins. *Riccione*, in the mountains north of Vicenza, is celebrated for its mineral baths. *Montebello* is a large village on the road from Vicenza to Verona. *Asiago* is the head town of the district called I Sette Comuni, whose inhabitants speak a very corrupt and old dialect of German, is situated in the mountains north-west of Bassano, has between 3000 and 4000 inhabitants, and a substantial church. The inhabitants of the Sette Comuni are chiefly graziers and breeders of cattle: the principal manufacture of the district consists in the plaiting of straw-hats, which are exported. Timber is also exported from the forests in the mountains. The dialect of the Sette Comuni may be judged by the following extract from a version of Cardinal Bellarmine's Catechism:—"Saitar iart Christian? Ja: ich pins as Gott vorgheltz. Bas ist ein Christian? Ar ist dear, da ist gutofet, un clobet, un professart baz de hatüz galiarnet Jesu Christo."

VICENZA, the capital of the province of Vicenza in Austrian Italy, is situated in a fine and fertile country on the river Bacchiglione, 39 miles by railway W. from Venice, and has about 33,000 inhabitants. The city is about three miles in circumference, and is surrounded by walls. It is adorned with many beautiful architectural mansions or palaces, many of which were built by Palladio, a native of the town. The cathedral and other churches of Vicenza are rich in

paintings by native artists, the two Montagnas, Magansa, Zelotti, Andrea Vicentino, Bassano, and others. The Teatro Olimpico, which was not finished till after Palladio's death, is an imitation of an ancient theatre; it was opened in 1585 for the performance of the 'Oedipus' of Sophocles, translated into Italian.

Vicenza is a bishop's see: it has a lyceum with ten professors, a gymnasium with fourteen professors, a clerical seminary, and a college for boarders, a public library of 36,000 volumes and about 200 manuscripts, an orphan asylum, and several hospitals. There are also several private collections of minerals and fossils, with which the country abounds. In the Piazza de Signori, a remarkably fine square, are two columns, in imitation of those in the Piazza San Marco in Venice, and a beautiful campanile 20 feet square and 300 feet high. The remains of antiquity consist of the ruins of a Roman theatre, and some remains of a palace, and three arches of an aqueduct near the village of Olbia. Vicenza has been long known for its silk manufactures, which are the most important of the kind in the Venetian states. In the neighbourhood of Vicenza is the celebrated Villa Capra, by Palladio, the architecture of which has been imitated for country-seats in England and other countries. The church of La Madonna del Monte, upon a hill called Monte Berico, about a mile out of Vicenza, is a celebrated sanctuary. A long covered portico leads up the hill to the church, whence there is a splendid view of the surrounding country from the Alps to the Adriatic. The church and annexed convent are possessed of some valuable paintings.

Vicentia, or Vicetia, is mentioned by Pliny ('Hist. Nat.' iii. 23) among the towns of the Veneti. In the middle ages it was for a time a free municipal city; it became subject to Ezzelino da Romano, and afterwards to the Della Scala, lords of Verona. It afterwards fell under the dominion of Gian Galeazzo Visconti, duke of Milan; after his death, 1404, the citizens called in the Venetians, who held Vicenza till 1797. [VENICE.] Vicenza had a university in the 13th century, which was frequented chiefly for the study of the canon law. The people of Vicenza are characterised in history as irritable, quarrelsome, and prone to revenge. The town was bombarded and taken by the Austrians in the campaign of 1848.

VICH. [CATALUÑA.]

VICHY. [ALLIER.]

VICKSBURG. [MISSISSIPPI, State of.]

VICO EQUENSE. [NAPLES, Province of.]

VICTORIA, or PORT PHILLIP, a British colony in Australia, situated at the southern extremity of the continent, extends between 34° and 39° S. lat., 141° and 150° E. long.; and is bounded N. and E. by New South Wales, from which it is divided by the river Murray, and a line drawn from the head waters of that river to Cape Howe; S. by Bass's Strait and the Pacific Ocean; and W. by South Australia, from which it is separated by the meridian of 141° E. long. The form of the province is triangular, its greatest length being from east to west about 500 miles; its greatest breadth about 300 miles. The area is 98,000 square miles, or nearly 63,000,000 acres. The population in 1846 was 32,800; on March 2nd 1851 it was 77,345; on December 31st 1852 it was estimated at 151,127. The progress of emigration has since considerably increased the population of the colony. On the 19th of August 1854, it was estimated that the population on the gold-fields of Victoria colony was 111,735, including 77,550 men, 16,555 women, and 17,630 children.

From Cape Howe, at the eastern extremity of the province, a line of coast, called the Long Beach, extends 200 miles in a south-westerly direction to Wilson's Promontory. This part of the coast, which curves slightly inwards, consists for the most part of low and sandy shores backed by hills. Near the centre are several lagoons, and a considerable sheet of water called Lake Wellington. A short distance north of Wilson's Promontory is Corner's Inlet, where a settlement called Alberton has been formed. The inlet is full of shoals, but it forms a harbour for small vessels, and maintains considerable intercourse with Hobart Town, exporting sheep and fat cattle from the adjoining country. Near Cape Wilson are a number of small rocky islands, forming a continuation of the ridge of the Australian Alps. From Wilson's Promontory to the western boundary of the province, the coast-line runs in a north-westerly and westerly direction more than 300 miles. Only three harbours are found on it—Portland Bay, near the western, and Port Phillip and Western Port, near the eastern extremity. Between Portland Bay and Port Phillip, a distance of more than 200 miles, there is no place of safety even for small vessels, with the exception of Warrnambool and Port Fairy, small harbours for coasting vessels. During the summer the south-eastern winds blow on this coast for three months with great force. From Wilson's Promontory to Western Port the coast is mostly high. From Western Port to the western boundary-line it is generally low. The low shores are sandy, except at some places where swamps exist. West of Cape Nelson the coast is bounded by sand-hills.

Western Port affords good anchorage for vessels of considerable size, and is safe, being protected against the southern and south-eastern winds by Phillip Island, which lies across its entrance. Port Phillip, situated at the western entrance of Bass's Strait, is a harbour of great capacity. It is entered by a passage a mile and a half wide, bounded by Cape Nepean on the east, and Cape Lonsdale on the west. The channel is still further narrowed by some shoals which front the

entrance. Within, the basin extends about 40 miles north, and about midway attains the same breadth, sending off an arm to the west, where it forms the harbour of Geelong. Hobson's Bay, at the northern extremity of the basin, affords good anchorage for vessels of all sizes, and forms the port of Melbourne. Lighter vessels ascend the Yarra-Yarra 8 miles to the capital, which is only a mile and a half distant by land. Portland Bay, near the western boundary, extends 26 miles from east to west, and 10 miles from north to south, and has good anchorage on its western shores in from 4 to 6 fathoms; but it is open to the south-east winds, and during the south-west gales a swell sets in, causing a heavy surf on the beach.

Wilson's Promontory, the most southern headland of Australia, is formed by a mountain, which is visible at the distance of 15 leagues. This rocky mass may be considered as the commencement of the Australian Alps, a range of mountains which, for a distance exceeding 70 miles, runs to the west of north, and farther on, for about 100 miles, to the east of north, until it approaches 37° S. lat. From this part of the range, which has a mean elevation of 2500 feet above the level of the sea, several lateral ridges extend to the south-east and west. The acclivities both on the east and west are gentle, and are partially overgrown with forests, containing many timber-trees, mostly blue gum and black butt. Near 37° S. lat. the range rises above the snow-line, and this portion of it is called the Ajuk Mountains. The valleys in this district comprise much land no less fit for cultivation than for pasture. That portion of the province which from the eastern declivity of the southern portion of the Australian Alps and the Ajuk range descends to the Pacific, is called Gippsland. It extends along the coast to 148° E. long., and consists of an inclined plane, which however near the mountains appears to descend with great rapidity, as in the middle of the region the plain is only 210 feet above the sea-level. The northern portion of this country is traversed by several ranges of hills, which are of considerable elevation near the principal range, but grow lower as they proceed southward. The valleys exhibit a considerable degree of fertility, and many cattle stations have been established in them. In the centre of Gippsland are plains of considerable extent, which are covered with open forests, and are capable of maintaining numerous herds of cattle. The most southern portion of Gippsland is traversed by several offsets of the Southern Australian Alps, which are covered with forests of blue, green, and black butt, in which numerous timber-trees are found. The whole of Gippsland is abundantly watered by several streams. The country extending north-east of Gippsland to the boundary of New South Wales has been but partially explored.

On the north of Port Phillip the watershed between the rivers falling into the Southern Sea and the Murray occurs about 45 miles from the northern extremity of the harbour, but farther to the west it is between 80 and 100 miles from the sea-shore. On both sides of the watershed the country is hilly and broken, and between 142° and 148° E. long., it rises into mountains. This hilly tract is in general from 80 to 40 miles across. To the south of it is an extensive plain, which descends gently to the sea-shore. Near the sea it is almost level or slightly undulating; but farther north it contains a rather large number of hills, rising from 500 to 700 feet above their bases; among them is Mount Buninyong, which rises 1570 feet above its base. A great number of lakes are scattered over this plain, one of which, called Carangamite, is about 90 miles in circumference. Its waters are salt, as are those of nearly all the others. The isolated hills which rise on this plain appear, from their formation, to be of volcanic origin. The southern part of this plain contains extensive tracts of the finest land for pasture and tillage. West of the river Hopkins (142° 45' E. long.) the land along the sea-shore, as far as Portland Bay, is generally poor, and that lying west of Portland Bay, though better, is only indifferent. But that portion of the plain which lies north of 38° S. lat. contains a large portion of good land. In some parts it is overgrown with thick forests of Eucalyptus trees, *Banksia*, *Casuarina*, and other trees peculiar to Australia; at other places it is covered with open forests and abundant grass. The numerous hills are thickly wooded, and the best soil is found at their bases.

Of the western division of the province, which, for its beauty and apparent fertility, was called by Sir Thomas Mitchell, who first explored it, Australia Felix, the best portion is that which lies within the hilly tract on both sides of the watershed. Nearly all the ridges by which this tract is overtopped run nearly at right angles to the watershed. The most western of these ridges rises to the elevation of mountains, and has been called the Grampians. Nearly in the centre of the Grampians stands Mount To-ol, or Mount William, which rises to 4500 feet above the sea-level. Mount Abrupt is 1700 feet, and Mount Sturgeon is 1071 feet in height. The Grampians are surrounded by extensive forests of fine tall timber-trees of Eucalypti.

The country which is drained by the rivers originating in the southern and western portion of the Grampians appears to be the most fertile tract of New South Wales. It is abundantly watered by the Nangeela, or Glenelg, and its tributaries. The soil is black and rich, several feet deep, and rests on a subsoil of clay. The surface of the higher portion of this plain is strongly undulating, and on it are found many small sandhills.

The hilly tract of the watershed east of the Grampians has its surface diversified by numerous narrow ridges of rocks, several round hills of moderate elevation, and many rather narrow valleys traversed by clear and beautiful streams. In some parts the hills are covered with wood; at other places free from wood, but overgrown with grass to the top. About 30 miles east of the Grampians, some more elevated ridges traverse the watershed. They have been named Pyrenees, but the natives call them Peerick Hills. They consist wholly of granite, but are all grassy to their summits, and thinly wooded. East of the Pyrenees the country is more broken and the hills are higher. There are forests chiefly composed of box and lofty blue gum. A considerable portion of the hilly country, placed nearly in the centre of it, consists of hills of lava. A very large portion of this hilly country affords excellent pasture.

Between the hilly region of the watershed on the south, the mountain region of the Australian Alps on the south-east, the course of the Murray on the north, and the boundary-line of South Australia on the west, lie the plains of the Murray River. The Murray and its tributary the Bayunga flow in wide bottoms, sometimes 8 or 10 miles across, which bottoms are overgrown by high trees, partly swampy or covered with lakes and ponds, but exhibiting an extraordinary degree of fertility in the vigour of their vegetation. In some places are found salt-lakes in considerable numbers, but in general the plains are open, grassy, and beautifully diversified with serpentine lines or clumps of wood. Even at a considerable distance from the banks of the rivers water is not scarce, as there are numerous hollows in the plains, which generally contain water. The plains of the Murray are fit both for cultivation and rearing of cattle. The river Murray, rising in the Australian Alps, flows in a north-westerly direction along the boundary of the province, entering South Australia at 34° S. lat., after a course of above 600 miles. In the lower part of its course along the border it has a channel 350 yards broad, with a depth of from 12 to 20 feet. Its chief tributaries, which drain the northern division of the colony are the Mitta-Mitta, Ovens, Goulburn, Campaspe, and Loddon, most of which are dried up during summer and converted into chains of ponds. The Mitta-Mitta rises in the Australian Alps, not far from Lake Omeo, the neighbourhood of which forms one of the gold-fields of Victoria. The Loddon rises near Mount Alexander, the principal gold-field, and its feeders, after the rainy season, are employed in the process of gold-washing. The Avoca, Avon, and Wimmera flow northward from the Pyrenees and Grampian chains. The Glenelg, collecting several tributaries from the western slopes of the Grampians, flows southward along the frontier and enters South Australia just before reaching the ocean. The Hopkins, with its several affluents, waters the country south from the Pyrenees, reaching the ocean a little to the eastward of Port Fairy. The Barwon, after flowing in a north-easterly direction to the neighbourhood of Geelong, bends to the south-east, and falls into the sea near the entrance of Port Phillip. The Yarra-Yarra, a considerable stream, which washes the capital, is subject to heavy floods during the rainy season. It comes in from the mountains to the east of Melbourne and continues in a very circuitous course to the head of Port Phillip. It is navigable to the city for small vessels and steamers of light draught. The Latrobe, rising in the Great Swamp, which is divided from Western Port by a belt of land a few miles broad, intersects the southern range of the Alps and flows eastward through Gippsland into Lake Wellington. Lake King collects the waters of the Tambo, the Riley, and the M'Arthur, which drain the northern district of Gippsland.

The predominating rocks in the higher masses of the Australian Alps are granite, sienite, and quartz, intermingled occasionally with mica-schists and various other rocks of a slaty texture. Quartz, ironstone, sandstone, and clay-slate are general throughout the other hilly portions of the colony. Veins of coal have been found on the coast between Port Phillip and Cape Otway, besides traces of lead and manganese. Rich veins of copper ore have been met with on the banks of the Yarra-Yarra. The chief mineral however is gold, the discovery of which in 1851 has led to a remarkable increase in the wealth and population of the colony. The gold is found chiefly at Ballarat, 40 miles N.N.W. from Geelong; at Mount Alexander, 75 miles N.W. from Melbourne; and around Lake Omeo, in the Australian Alps. At Ballarat, where the precious metal is found extensively on the ranges and flats and in the beds of the watercourses, a section of the workings exhibits the following series of strata:—Red ferruginous earth and gravel, streaked yellowish and red-clay, quartz gravels of moderate size, large quartz pebbles and boulders with masses of ironstone set in very compact clay, blue- and white-clay and pipe-clay. The gold is uniformly found in the formations superior in position to the pipe-clay. The richest deposits occur in the blue-clay, where the ore is for the most part quite pure. It is washed from the clay in rounded or flattened grains; sometimes it is found in fused pieces of pure metal, at others incorporated with quartz-pebbles, and occasionally in rolled water-worn lumps called nuggets. The number of miners' licences issued at the colony of Victoria in August 1854 amounted to 15,682; and in July to 14,617. The grand total quantity of gold received at the gold offices of Melbourne and Geelong, from the various gold fields of the colony in July and August 1854 was 276,613 oz., valued at 1,106,454*l.* The amount of fees received on account of licences in the same months was 54,087*l.*, and the amount of fees on private gold

and cash transmitted per escort 10,191*l.* The number of mining licences issued in December 1854 was 8059, and the quantity of gold received at Melbourne and Geelong in November and December 1854 was 277,027 oz., valued at 1,108,108*l.* The amount of fees received for licences in those two months was 48,990*l.*, and the fees on private gold and cash per escort 8141*l.* The quantity of gold exported from Victoria in the months of November and December was 427,921 oz. The quantity exported during the quarter ending the 31st of December was 510,188 oz., valued at 2,084,375*l.* In the early part of 1855 serious riots took place at the gold-diggings of Ballarat, in consequence of the miners resisting the payment of the licence fees. This led to the substitution of a tax on gold exported from the colony, instead of the licence fee for diggers.

The climate of Victoria is comparatively mild. The mean temperature of summer is 65°, of winter 48°, of the whole year 57°. The atmosphere is so dry and elastic that the heat of summer, sometimes very intense, is less oppressively felt. Hot winds occasionally come from the north, and last from 20 to 30 hours, suddenly raising the temperature to an extreme heat, but they do not occasion great inconvenience, and they are generally succeeded by a refreshing breeze from the ocean. During June, July, and August, the winter months, cold and wet days frequently occur, and at rare intervals light snow showers fall. In August, 1852, snow fell at Bendigo to the depth of seven feet. The average fall of rain for the year is 30.7 inches. The rapid changes of temperature, sometimes 80 degrees in 24 hours, are unfavourable to consumptive patients. Dysentery and a species of ophthalmia prevail to some extent in the hottest months. On the whole, the climate is found agreeable and salubrious. The wild animals found in the province are, the dingo, or native dog; the great gray kangaroo, which abounds in some districts; the rock wallaby, or badger; kangaroo rat; opossum; flying squirrel; wild cat; bandicoot; cloth, or Australian bear; and various others. Among its birds are, the bustard, or wild turkey, which on some of the plains appear in considerable flocks; numerous quails; many species of parrots; the lyre-birds, or Australian pheasant, which frequents the mountains of Gippsland; black swans, which abound in the neighbourhood of Western Port; the emu; magpie; pelican; eagle-kingfisher; and plover. Snakes are numerous. Mosquitoes, locusts, and ants appear in great numbers in summer, and also lizards and other reptiles. The bays and rivers abound with fish. Codfish of a large size are found in the rivers of the northern district. Shoals of herrings appear on the coasts in February and March. The most important timber-trees are, the red gum, lightwood, blackwood, pine, tea-tree, she-oak or siak, honey-suckle, and iron-bark. The kangaroo apple-tree, the grass-tree, and the quandong, which forms a fine preserve, are indigenous. The fruits which have been successfully cultivated are, the peach, plum, quince, nectarine, apricot, pear, apple, mulberry, almond, and fig. Several vineyards have been formed. Vegetables are abundant. The potato, turnip, carrot, cabbage, brocoli, and radish grow to an enormous size. Indigo and flax are indigenous. The tobacco and castor-oil plants and Indian corn grow luxuriantly. The common cereals are produced in great perfection; wheat is of the finest quality, with a return of from 40 to 50 bushels an acre.

The country around Melbourne is equal to any part of Australia for the growth of wheat, Indian corn, and potatoes. In all parts of the colony there are tracts of the finest arable land. But sheep-farming is the principal pursuit in this province, apart from the recent mining operations, and the export of wool has for some years very rapidly increased.

The settled part of the province, comprehending principally the eastern and southern portions, is divided into 24 counties. Melbourne, the capital, and Williamstown, its port, are noticed in the article MELBOURNE. In that article the revenue of the city of Melbourne for 1852 is given at 16,161*l.* 19*s.* 5*d.*, instead of 26,161*l.* 19*s.* 5*d.*, which is the correct amount. The second town in the colony is Geelong, now an important shipping port, pleasantly situated on the south-western shore of Port Phillip, at the head of Corio or Geelong Bay. It is regularly built, well supplied with water, and is steadily advancing in population and trade. Smaller vessels ascend to the town, but those of greater burden discharge at Port Henry, 10 miles down the bay. The increase of the town of Geelong consequent on the gold discoveries is shown by the town revenue in 1851 and 1852, which stood thus: 1851—2785*l.* 4*s.* 1*d.*; 1852—10,697*l.* 16*s.* 1*d.* The principal part of the receipts has been laid out in public improvements, to assist which considerable grants of public money were made to the town; more recently a large amount has been borrowed by the corporation of Geelong for the purpose of carrying out extensive improvements. A railway to Melbourne is in course of construction. Near the mouth of the Yarra, on the north-east shore of Port Phillip, are the neat villages of St. Kilda and Brighton, which are resorted to as bathing places by the citizens of Melbourne.

The town of Portland is built near the western extremity of the bay of the same name. It has a small population, but occupies a considerable space, being built in streets crossing each other at right angles. There are some whaling establishments in the place, and the wool and other produce of the neighbouring district are shipped at the harbour, which is inconvenient and exposed. Belfast, an active and thriving town, is situated on Port Fairy, some miles east from Portland

Bay. It is famed for its butter and cheese, and lies amid some of the best tillage-land in the western division of the province. *Warrambool*, near Belfast, is a small seaport, having frequent intercourse by trading vessels with Melbourne and Portland. It is the port of a considerable agricultural district. A Presbyterian church, built of stone, replacing a wooden structure, was opened here in the early part of 1855. *Bal-larat*, the seat of the gold-diggings of that name, is described by Mr. William Howitt, who visited the place, as containing a large population, who are settling down into regular habits, and are constructing a neat, well-laid out, and commodious town.

The principal towns in Victoria colony, in addition to those already mentioned, are:—Alberton, Avoca, Ballan, Beechworth, Benalla, Bendigo, Brunswick, Buninyong, Castlemaine, Chepstow, Colac, Flemington, Kilmore, Kyneton, Mount Alexander, Port Fairy, Prahran, Richmond, Sandhurst, and Wangaratta.

By an act of the Legislative Council of Victoria, ratified by the act of the Imperial Legislature, 18 and 19 Vict., cap. 55, it is provided that there shall be a Legislative Council of 30 members, and a Legislative Assembly of 60 members, for the colony. Members of Council must be 30 years of age, natural born subjects of the Queen, and possessors for at least one year previous to election of lands and tenements in the colony of the value of 5000*l.*, or of the annual value of 500*l.* No judge, minister, traitor, or convicted felon, can be a member. Electors must be 21 years of age, natural born subjects, or naturalised for at least three years, and possessed of freehold property of the clear value of 1000*l.*, or clear annual value of 100*l.*, or leasehold property of 100*l.* yearly. Members of Assembly must be 21 years of age, possessing freehold property to the amount of 2000*l.*, or 200*l.* yearly value. Judges, ministers of religion, and persons who have been attainted for treason, or convicted of felony, are excluded. Electors must be 21 years of age, possessed of freehold property of 50*l.* value, or 5*l.* yearly value, or leasehold property of the clear annual value of 10*l.*, or occupy premises of 10*l.* yearly rent, or have a yearly salary of 100*l.* After the expiration of two years from the passing of the act no person is to be registered as an elector who cannot read and write. The leading feature of the new charters for Victoria and the other Australian colonies is that, with the exception of a few reserved points in reference to imperial rights, the business of each colony will be managed by its own legislature. In particular the management of the waste lands is committed to the colonial legislatures.

The imperial authority is represented by a lieutenant-governor, whose salary is 10,000*l.* per annum, with an allowance of 5000*l.* per annum for salaries of staff, repairs to government-house, travelling, and other expenses. The laws are administered by a chief justice and three puisne judges, who have criminal jurisdiction and exercise the powers of the Queen's Bench, Common Pleas, and Exchequer courts. There is also a master in equity. Under the new act, 50,000*l.* a year is to be reserved for the purposes of religious worship, to be distributed in proportion to the respective numbers of the several religious denominations. This sum is to be laid out in assisting to erect places of worship and in payments to ministers. The sum given in aid of ministers' stipends is not to exceed 25,000*l.* in any one year. The religious bodies in the colony are—the churches of England and Scotland, the Free Church of Scotland, United Presbyterians, Independents, Baptists, Methodists, and Roman Catholics. At the head of the Church of England in the province is the Bishop of Melbourne. At the close of 1852 there were 7841 scholars attending schools in the colony. The colonial revenue in 1851 was 379,824*l.* 12*s.* 4*d.*; in 1852 it was 1,577,181*l.* 8*s.* 1*d.*: the expenditure in 1851 was 409,884*l.* 1*s.* 5*d.*; in 1852 it was 784,961*l.* 18*s.* 2*d.* The estimated income for 1855 is 3,015,683*l.*, and the estimated expenditure is 4,801,292*l.*, showing a deficit of 1,785,609*l.*, to provide for which a considerable amount of difficulty has been experienced by the government.

The number of ships entered at the ports of the colony in 1851 was 712, of 129,426 tons; the number in 1852 was 1657, of 408,216 tons. The number of ships registered as belonging to the colony on December 31st 1854 was 272 of 81,985 tons, and 12 steam-vessels of 29,395 tons. The value of the goods imported into the colony in 1851 amounted to 1,422,909*l.*; in 1852 the amount was 7,451,549*l.* From Great Britain alone there was sent to the colony in 1858 goods to the (declared) value of 7,062,387*l.* of British produce and manufactures, besides upwards of 2,200,000*l.* worth of foreign and colonial produce and manufactures. About 21,000,000*lbs.* of wool was imported into Great Britain from Victoria colony in 1853. The emigration to the colony from Great Britain during 1854 included 35,384 persons, the whole of the other Australian colonies having only 6788 emigrants from Great Britain in the same period.

Port Phillip was discovered and entered by Lieutenant John Murray in January 1802, and was soon after visited by Captain Flinders, who called it Port Phillip, in honour of the first governor of New South Wales. Although occasionally visited in succeeding years, it remained without any settlement till 1835, when the first sales of land took place in the Australian colonies. A settler from Van Diemen's Land having purchased an extensive tract of country from the natives, the government refused to recognise the validity of the purchase, and the entire district adjoining Port Phillip was taken possession of on behalf of the crown. Colonists from Van Diemen's Land, bringing their

flocks with them, arrived in great numbers. The New South Wales squatters, with their flocks and herds, came from the north. The district rapidly advanced in population and wealth, and was placed under the control of a superintendent appointed by the governor of New South Wales, till, after repeated representations on the subject, it was, in 1850, separated from that colony, and constituted a distinct province. The bishopric of Melbourne was founded in 1847; the diocese comprises the colony of Victoria. There is one archdeacon, of Geelong.

VICTORIA. [HONG-KONG; MEXICO; VENEZUELA.]

VICTRI. [BASILICATA.]

VIENNA (*Wien*), the capital of the Austrian empire, of the Arch-duchy of Austria, and of the Crownland of Lower Austria, is situated in 48° 12' 35" N. lat., 16° 22' 58" E. long., at an elevation of between 500 and 600 feet above the sea, on the right bank of the Danube, at its confluence with the little river Wien, which flows through the city. Vienna is full two miles from the main stream of the river, which divides above the city into several branches, forming many islands, so that only a small branch, which serves as a canal, and is generally called the Danube Canal, passes under the walls. The population, exclusive of the military, numbers above 410,000.

Vienna consists of the interior or old city and the suburbs. The old city is nearly circular, and not above three miles round. It is surrounded with a broad fosse, and a wall from 40 to 50 feet high, which has ten regular bastions and forms one of the most favourite promenades of Vienna, commanding a very fine view. Beyond the fosse is the glacis, which varies in breadth from 960 to 1500 feet, formerly reserved as a clear space without the walls, but is now laid out in public walks, and extends all round the city, except towards the north-north-east, in which direction the fortifications flank the right bank of the Danube Canal, between the Chain Bridge and the mouth of the Wien. The Wien, after reaching the glacis on the south side of the city, between the Kärnthner Gate and the Polytechnic school, makes a bend eastward, and runs north by east between the city and its eastern suburbs: between the Stuben Gate and the Invalides Hospital it communicates with the Vienna-Neustadt Canal. The western suburbs are traversed by a small stream called the Alster.

The city is surrounded by 34 suburbs, two of which are to the north-east, on the island of Leopoldstadt in the Danube, and the 32 others beyond the glacis. These 32 suburbs are surrounded by the Lines, that is, a fosse with a wall 12 feet high. From the old city twelve gates lead to the suburbs, the principal of which is the Burg-Thor, or palace gate, which was completed in 1824, and is a splendid piece of architecture, with five equal archways. From these gates there are paved streets and avenues to the principal streets in the suburbs, and these are connected by twelve other gates in the Lines, or outer fortifications, with the adjacent country. The extent of the Lines is 12 miles, and the circumference of the two suburbs situated on the island is above 6 miles. The old city occupies about a tenth part of the whole space.

The inner or old city is very irregularly built; most of the streets are crooked and narrow. The places, or squares, are 20 in number, most of them small and irregular; among the best are—the New Parade, before the imperial palace, the largest square in Vienna, nearly 1000 feet in length and 650 feet in breadth, perfectly regular, surrounded with avenues of trees, and adorned with grass-plots and flower-beds; the Hof, 450 feet long and 300 feet broad; the Hofs Markt, with a beautiful marble temple; the Josephplatz, in which there is a colossal equestrian bronze statue of Joseph II.; and the Graben, which is rather a street than a square, 540 feet long and 100 feet broad: it is nearly in the centre of the city, and is a place of fashionable resort, especially for strangers. The streets are well paved, well lighted at night, and cleansed and well drained by capacious sewers. Differing in this respect from most other European capitals, the old city is the most fashionable; it contains the palaces of the emperor, of many of the principal nobility, the public offices, the finest churches, and most of the museums and public collections, the colleges, the exchange, and the most splendid shops. The houses, which are in general of brick, are six or seven stories, and very large; most of them are inhabited by several families. There is a common staircase, and a porter keeps the street-door.

The public buildings, palaces, churches, &c., are very numerous:—1. The most remarkable is the cathedral, dedicated to St. Stephen, a very majestic edifice, built entirely of freestone, in a beautiful gothic style, in the 12th and 13th centuries: it is one of the finest specimens of ancient German architecture. The interior is 342 feet in length, 222 feet in breadth between the two great towers, and 79 feet in height. The church is surmounted by four towers, one of which is above 450 feet high. In this steeple hangs the great bell, weighing 357 cwt., and cast, in 1711, out of 180 pieces of Turkish cannon, which had been used in the siege of Vienna. The interior of the church contains thirty-eight marble altars and numerous monuments of celebrated men, among which are those of the emperor Frederick IV. and of Prince Eugene of Savoy. The crypt beneath the church consists of thirty large vaults, in which since the time of Ferdinand III. the bowels of all the deceased members of the imperial family are deposited in copper or silver urns, their hearts being deposited in the Augustinian church, and their bodies in the church of the Capuchins in the New Market, where also is the sarcophagus of the Duke of

Reichstadt, son of Napoleon I. 2. St. Peter's, built on the model of St. Peter's at Rome, and adorned with fine fresco and old paintings. 3. The elegant Augustinian church, which contains the celebrated mausoleum of the archduchess Christina, a masterpiece of Canova. 4. The church of the Capuchins, with the imperial family vaults, where the bodies of the imperial family are deposited, beginning with the emperor Mathias and his consort. 5. St. Michael's, a magnificent edifice, containing some capital paintings. 6. St. Ruprecht's is remarkable only as the oldest Christian church in Vienna, having been originally built in 740, for the convenience of the Avari. 7. The church of Maria Stiegen, built in 882, and recently assigned to the Redemptorists, and likewise to the Slavonian nation. 8. The Scotch abbey church (so called from the Scotch Benedictines, who possessed it from 1158 to 1418). Besides these there are the Italian church, the German church, two chapels in the Burg, the church of the United Greeks, and two churches of the schismatic Greeks. The Lutheran and the Calvinist chapels have neither steeples nor bells. The Jews have a synagogue and school.

The principal public buildings are—1. The Burg, the imperial palace, the residence of the emperor, an old irregular edifice, built at different times. It consists of three quadrangles. It contains the imperial jewel-office, one of the richest collections of the kind in Europe, a fine cabinet of works of art, a very extensive collection of natural history, and the cabinet of medals, which far surpasses all other collections of the kind. The Imperial Library, connected with the Burg, is a handsome edifice, with a saloon, and a gallery 250 feet long, and in the centre 100 feet broad, in which is the imperial library, consisting of 320,000 volumes and 16,000 manuscripts, many of which are very ancient and very valuable. The library possesses a collection of 20,000 volumes and 650 manuscripts in Oriental languages, relating to the history of Turkey and other eastern countries, formed by Von Hammer. The collection of engravings is one of the largest and most valuable in Europe: it consists of above 800,000 engravings, from the origin of the art to the present time. 2. The building formerly called the Imperial Chancery, the fine façade of which forms one side of the quadrangle called the Burghof, or Burgplatz, built by Fischer von Erlach, with five colossal groups by Machioli, representing the Labours of Hercules. 3. The Imperial Riding-School, a masterpiece of architecture, by Fischer von Erlach. 4. The splendid palace of the Archduke Charles, formerly belonging to his father-in-law, the Duke of Saxe-Teschchen; containing an extensive library and a collection of 180,000 engravings in 900 portfolios. The collection contains also 15,000 drawings by the old masters. 5. The Mint, formerly the residence of Prince Eugene. 6. The University. 7. The Town-house. 8. The archbishop's palace, near St. Stephen's. 9. The Zeughaus, or Imperial Arsenal. 10. The former City Hospital, a large building four stories high, with 10 court-yards or quadrangles, and divided into 200 residences. 11. The Trattnerhof, a spacious building divided in a similar manner. 12. The Town Arsenal. 13. The Bank in the Singer-street. 14. The Imperial Austrian National Bank. 15. The public offices called Chanceries, such as the Bohemian, Austrian, and the Hungarian and Transylvanian chanceries. 16. The Custom-house. 17. The palaces of the nobility, most of which are remarkable for their architecture, and contain good collections of paintings and other works of art. There are five theatres in Vienna, two in the inner city and three in the suburbs. 1. The Hof or Burg Theatre, attached to the imperial palace, for the performance of the regular drama. 2. The Theatre at the Karntner, or Carinthian gate, for operas and ballets. 3. The Theatre on the Wien, in the suburb Wieden, the largest and handsomest in Vienna, for melodrama. 4. The Theatre of the Leopoldstadt, an Austrian national theatre, the favourite of the middle and lower classes. 5. The Theatre in the Josephstadt.

The hospitals and other charitable institutions are numerous and well endowed. The General Hospital, founded by Joseph II., is a very large building, containing 2000 beds. Connected with it is an admirably-managed lying-in hospital, and a foundling hospital. There is also a lunatic asylum. The institution for deaf-mutes was founded by Joseph II.; the inmates are treated with parental care. The Hospital of the Charitable Brothers is open to the sick of all nations and religions. The Invalids' House, or Hospital, founded by Joseph II., accommodates 800 old soldiers.

The principal establishments for education are the following:—The University, founded by Duke Rudolph IV. and his brothers, with the consent of Pope Urban IV., in 1365. It is famous as the first medical school in Germany, is attended by above 2000 students, and has 80 professors, a library of 120,000 volumes, an observatory (the latitude and longitude of which are given in the previous column), a botanic garden, an anatomical theatre, a veterinary school, and a laboratory. The Josephinum, founded by Joseph II., is a medical institution for the instruction of surgeons for the army, with very rich collections. Other establishments worthy of notice are—the Imperial Oriental Academy; the Academy of Engineers; the Academy of the Fine Arts; the Geographical Institution; the Mineralogical Institute; the Normal School; the Polytechnic Institution; and many others.

Vienna, being the centre of the Austrian dominions, is likewise the principal seat of commerce and manufactures. Steam-vessels ply along the Danube, and to Constantinople, Trebizond, and Smyrna, and other Mediterranean ports. Railways connect Vienna with Trieste

(its great port on the Adriatic), with Pesth and other towns in the crownland of Hungary, with Prague, Dresden, Cracow, Warsaw, Brealau, Berlin, and all the important towns of North and Central Germany; and lines are in course of construction to extend its communication by railroads to Milan, Salzburg, Munich, and South-Western Germany. By electro-telegraphic wires Vienna has instantaneous communication with Constantinople, Paris, London, Milan, Berlin, and all the important towns in Europe. Manufactures of every kind are carried on in Vienna. The principal are—silk, velvet, shawls, gold and silver lace; cottons, woollens, ribands, carpets, leather, porcelain, jewellery, mathematical and musical instruments, cannon and fire-arms, gold and silver plate, watches, fine cutlery, carriages, gloves, lace, straw-hats, paper, &c. The printing of large and accurate maps, and of books in various dialects of human speech, are greatly encouraged by the Austrian government.

The suburbs are not built on a regular plan, but they have broad and straight streets, many of which are of great length. They contain numerous palaces and gardens of the nobility, a great number of handsome private houses, several convents, and above 30 churches, of which we may instance the church of St. Charles Borromeo, perhaps the handsomest ecclesiastical edifice in Vienna. Among the other buildings in the suburbs the following are most worthy of notice:—The Imperial Mews, 600 feet in length, fitted up to receive 400 horses. The Belvedere Palace, which was built by Prince Eugene, and consists of two buildings, the Upper and Lower Belvedere, with a public garden on the space between. The Lower Belvedere, which stands at the foot of a gentle eminence, contains the celebrated Ambras collection of ancient armour, paintings, jewels, &c., removed from the castle of Ambras, in the Tyrol, in 1806, when that province was ceded to Bavaria. The Egyptian Museum is deposited in the same building. The Upper Belvedere, which crowns the eminence, contains the imperial gallery of paintings, consisting of nearly 1300 pictures, arranged according to schools. The palace of Prince Liechtenstein contains a splendid gallery of 1200 pictures, a valuable collection of engravings, and many other works of art: attached to the palace is a fine garden. Prince Esterhazy's summer residence contains his splendid gallery of paintings, some fine sculptures, and a collection of 50,000 engravings. The beautiful palace of the Duke of Modena; that of Count Rasumowsky; the Polytechnic Institution, with a very remarkable collection of many thousand specimens of the national manufactures; the Imperial Porcelain Manufactory, which occupies an entire street. Several of the public institutions already noticed are in the suburbs.

Among other structures in Vienna must be mentioned the bridges over the Danube, of which the Ferdinand Bridge, opening upon the Tabor-Strasse, in the northern suburb, opposite to the Rothethurm Gate, is considered a masterpiece of construction; it consists of ten cast-iron arches supported on stone piers. A chain-bridge was completed in November, 1849. Many additions have been made to the fortifications of Vienna since the troubles of 1848-49. On the left bank of the Danube is the great central railway station where the junction between the northern and southern railways takes place. The custom-house; the church and convent of the Sisters of Mercy; the Standehaus, or house of assembly for the states of Lower Austria; the new post-office; the several barracks; the new gate; the Weillburg and Schönbrunn palaces; the savings bank, Dittmann's-Haus, in the Präter; the music hall, and the exchange, are also to be numbered among the fine structures in or near this illustrious capital.

The public promenades, which are the great places of resort for the citizens of Vienna, are the following:—The Bastei, or ramparts of the old town, and the glacis, or esplanade between the city and the suburbs. That part of the Bastei is the most frequented which is near the imperial palaces, and communicates with the Volksgarten (the people's garden), which was laid out and thrown open to the public by the emperor Francis. There are two handsome coffee-houses in this garden, and an edifice copied after the temple of Theseus at Athens, in which is placed the fine group of Theseus slaying the Minotaur, by Canova, the gardens of the palaces of Liechtenstein, Rasumowsky, Schwarzenberg, and the Belvedere, are also open to the public. The Präter, an immense park, in the Leopoldstadt suburb, was opened to the public by the emperor Joseph II. in 1766. The Präter is a league and a half in length, and is traversed by six noble avenues of chestnut-trees, running in different directions, the principal one being 15,000 feet in length. This is divided into three parts; one for horsemen, one for pedestrians, and the broad road between them for carriages. Beyond the avenues there are fine meadows, with groups of magnificent trees, and large herds of deer. The Präter is always crowded with company every Sunday in the spring; the grand day is Easter Monday, when there may be 20,000 pedestrians, and an uninterrupted line of carriages two leagues in length. There are many coffee-houses along the walks. The most characteristic part of the Präter however is the Würstel Präter, so called from the puppet-shows (Würstel-spiele) there exhibited. It is covered with innumerable liquor-shops, swings, roundabouts, jugglers, and all sorts of diversions for the lower classes. The whole is like a great fair or encampment of sutlers' booths; long rows of tables and benches are constantly supplied with guests. Adjoining the Präter is the Augarten, and next to that the Brigittenau, which are very agreeable walks, but not so frequented as the Präter.

The environs of Vienna are very picturesque. On the north it has the beautiful islands of the Danube; on the west the lofty Kahlenberg Mountain; on the south hills covered with thick forests and rich vineyards, the Noric Alps commencing with the Schneeberg, and towards Modlin and Baden a dark circle of hills, valleys, ruins of castles, antique churches, modern palaces, and handsome country-seats. The imperial palaces of Schönbrunn and Laxemburg are at a short distance from the city.

The climate of Vienna is extremely variable, great heat being often suddenly followed by severe cold. The islands and the parts of the city next the river are subject to inundations, and the atmosphere is frequently foggy.

The inhabitants of Vienna are a gay, friendly, and hospitable people, among whom a stranger quickly finds himself at home. Beggars are not seen in the streets, and one may traverse them at all hours without meeting with any kind of disturbance or annoyance. Breaches of the peace are rare, cases of drunkenness seldom occur, and gaming-houses are unknown. Among the virtues of the Viennese charity is pre-eminent. They are also devoted to pleasure. Literary societies are however very numerous, and the higher classes are very accomplished. French, English, and Italian are currently spoken, as well as the native German. The ladies are extraordinary proficient in music, of which they are excessively fond.

Vienna, called by the Romans *Vindobona*, was long the head-quarters of a Roman legion, and the capital of Pannonia. When the Roman power declined, it was overrun by the Goths and Huns, till, in 791, Charlemagne annexed it to his dominions. It was then and long afterwards of small extent; St. Stephen's cathedral, now in the centre of the city, being when erected in 1114 without the walls. It however increased progressively from the mercantile advantages of its situation, and by being the usual residence of the dukes and emperors. The most remarkable events in its annals are the various sieges which it has sustained. In 1484 it was taken by Mathias, king of Hungary, who resided in it till his death, when it was restored to Austria. In 1529 the Turks, assisted by the Hungarian insurgents, approached the city and destroyed the suburbs. In 1619 the Bohemian insurgents, supported by a party in Austria, succeeded in penetrating into the city, but were almost immediately expelled. In 1625 it was threatened by the Swedish general Torstenson. In 1678 the plague carried off in the city 49,486 persons, and 73,323 in the suburbs. In 1683 the city was besieged by a Turkish army, and reduced to extreme distress, when it was relieved by John Sobieski, king of Poland, who, with 60,000 men, totally defeated the Turkish army of nearly 200,000. In 1797 it was threatened by Napoleon I., and occupied by him in 1805 and 1809. Strict discipline was observed by his troops on both occasions. A Congress was held at Vienna in 1814-15, at which the territorial and political state of Europe was settled after the downfall of Napoleon I. In the troubled period that followed the last French revolution, Vienna was for a time in the hands of insurgents. The city was taken after a bombardment by the Austrian army under Prince Windischgrätz on Nov. 1, 1848. [See SUPPLEMENT.]

VIENNE, a department of France, bounded N. by Indre-et-Loire, E. by the departments of Indre and Haute-Vienne, S. by Charente, W. by Deux-Sèvres and Maine-et-Loire. Its greatest length from north to south is about 80 miles; the greatest breadth is 51 miles. The area of the department is 2692 square miles. The population in 1851 was 317,305.

The department has no mountains. A chain of hills called the heights of Gatine, which extends from the central mountains of Auvergne towards the mouth of the Loire, crosses the south-western side of the department; and a branch from these hills extends towards the north-east, between the Clain and the Thoué. The central part, between the Clain and the Vienne, consists of tolerably high ground; but the part east of the Vienne is low. The north-eastern border of the department is occupied by cretaceous formations; the rest of the department is occupied by the secondary rocks. The department has several iron-works, quarries for millstones, whetstones, lithographic-stone, limestone, and freestone, and a quarry of marble which takes a good polish. There are sulphureous springs at La-Roche-Posay, near the junction of the Creuse and the Gartempe.

The department belongs almost entirely to the basin of the Loire; a very small part in the south-west corner, about Civray, belongs to the basin of the Charente. The *Vienne*, which is one of the principal affluents of the Loire, rises in the department of Corrèze, and after traversing Haute-Vienne and a part of Charente enters this department on the south, just above Availles, and flows northward through the department, which it quits below the junction of the Creuse. About 65 miles of the course of the Vienne are in this department: from the junction of the Clain to its mouth in the Loire, a distance of about 40 miles, it is navigable. Nearly all the other rivers of the department are tributaries of the Vienne: the Grande-Blourde, the Ozon, and the Creuse join it on the right bank; and the Dive and the Clain on the left bank: the Veude, which joins it on the left bank long after it quits this department, and the Mable, a feeder of the Veude, have their source amid the hills on the north of the department. The Creuse has the last 20 miles of its course on the border of this department; its feeder, the Gartempe, rises in the department of Creuse, but has the lower part of its course, for nearly 40 miles, within or

upon the border of this department. The Anglin, a feeder of the Gartempe, and the Sarleron and Benaize, feeders of the Anglin, belong partly to this department. The *Clain* rises in the department of Charente, but has nearly the whole of its course of more than 60 miles in this department. None of the affluents of the Vienne are navigable except the CREUSE. The *Dive*, a tributary of the Thoué (an affluent of the Loire), is navigable for 8 miles. It rises in this department, and has the greater part of its course within or upon the western border. The Charente just crosses the south-western corner of the department.

The department is traversed by 6 imperial, 9 departmental, and a great number of communal or parish roads: the most important is the high road from Paris to Bordeaux. The Paris-Bordeaux railway also traverses the department in its whole length, passing through Châtelleraut, Poitiers, and Civray.

The air is generally mild. The north wind prevails in winter, the north-west wind in spring, and the south wind in summer. The marshes in the west of the department are unhealthy.

The area of the department may be stated in round numbers at 1,680,000 acres, of which more than 1,000,000 acres are under the plough. The most productive soils are on the northern part of the department; those on the south and south-east are generally poor. The principal productions are wheat, rye, oats, hemp, flax, peas, and potatoes. The meadows occupy above 100,000 acres, and the heaths or open pastures nearly 190,000 acres. A great number of horses, mules, horned cattle, sheep, goats, and pigs are bred: poultry is abundant. The vineyards occupy 70,000 acres, and yield ordinary white and red wines. The orchards occupy 14,000 acres, the woods 200,000 acres. A considerable quantity of walnuts, chestnuts, and fruit are grown.

The department is divided into five arrondissements, as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Poitiers	10	82	110,640
2. Châtelleraut . . .	6	50	58,819
3. Civray	5	45	50,093
4. Loudun	4	63	35,805
5. Montmorillon . . .	6	60	61,948
Total	31	300	317,305

1. In the first arrondissement the chief town is POITIERS. Among the other places worth notice are *Lusignan*, on the Vonne: population, 2560. *Newville*, between the Auzance and the Palu: population, 2800. *Mirebeau*, on a feeder of the Dive, which flows into the Thoué: population, 2556, for the whole commune. *Vivonne*, on the Clain, has a manufacture of coarse woollens, a corn-market, and about 2700 inhabitants. *Lusignan* has a manufacture of coarse woollens, and considerable trade in grain and seeds. There was formerly a strong castle at Lusignan, the site of which is now occupied by a pleasure public walk. The house of Lusignan acquired the crowns of Jerusalem and Cyprus. *Mirebeau* was built by Foulques Nera, count of Anjou, who also erected a castle here. In this castle *Eléonore* of Guienne, widow of Henry II. of England, was besieged (1202) by her grandson, Arthur, duke of Bretagne, but was relieved by the approach of her son, King John of England, who took Arthur prisoner. The village of Vouillé, on the Auzance, a feeder of the Clain, 10 miles W. from Poitiers, was the scene of the great battle in which Clovis and the Franks defeated and slew Alaric II., king of the Visigoths, in A.D. 507.

2. In the second arrondissement the chief town, *Châtelleraut*, is situated on the right bank of the Vienne, 20 miles by railway N. from Poitiers, and has 11,959 inhabitants in the commune. It is in general an ill-built town. The site of the old fortifications is occupied by handsome residences and pretty walks. A fine stone bridge connects the town with the suburbs, on the left bank of the Vienne. At the town end of the bridge is a large mansion, flanked with four massive towers, with a lofty arch in the centre of the building, under which the high road enters the town. *Châtelleraut* has important iron-works, a college, tribunals of first instance and commerce, manufactures of cutlery, jewellery, lace, hardware, side-arms, &c.

3. In the third arrondissement the chief town, *Civray*, which stands on the Charente, has a church of great antiquity, the ruins of an ancient castle, a college, and 2210 inhabitants, who trade in corn, chestnuts, and truffles. *Availles*, on the left bank of the Vienne, has mineral waters, and about 2000 inhabitants.

4. In the fourth arrondissement the chief town, *Loudun*, situated on the slope of a hill 34 miles N. by W. from Poitiers, has a tribunal of first instance, a college, and 4457 inhabitants. It is an ancient town, with wide streets of good houses, and surrounded by vineyards which produce some of the best wine in the department: the town has some pleasant walks (formed on the site of the old castle of Loudun), a theatre, and an hospital. Coarse woollen, leather, linen, jewellery, and lace are manufactured; and considerable trade is carried on in corn, wine, brandy, walnuts, and oil. *Moncontour*, a small place on the Dive, gives name to the victory which the Duke of Anjou (afterwards Henri III.) gained over the Huguenots, under Admiral Coligni, in 1569.

5. In the fifth arrondissement the chief town, *Montmorillon*, situated

on the Gartempe, 27 miles S.W. from Poitiers, has a tribunal of first instance, an ecclesiastical college, and 4894 inhabitants. The town is ill-built. Biscuits and highly esteemed macaroons are made; and there are paper-mills, bleach-grounds, and tan-yards. Considerable trade is carried on in cattle fattened in the neighbourhood for the Paris markets. The ecclesiastical college is established in the buildings of the former hospital of Maison-Dieu, founded in the 11th century. These buildings are spacious, of very curious construction, and contain several groups of strange allegorical figures.

This department, and the adjacent one of Deux-Sèvres, constitute the diocese of Poitiers, the bishop of which is a suffragan of the archbishop of Bordeaux. It is in the jurisdiction of the High Court and within the limits of the University-Academy of Poitiers. It is included in the 18th Military Division, of which Tours is head-quarters. The department returns two members to the Legislative Body of the French empire.

VIENNE, HAUTE, a department of France, is bounded N. by the departments of Vienne and Indre, E. by Creuse, S. by Corrèze and Dordogne, and W. by Charente. Its greatest length from north to south is 60 miles; its greatest breadth at right angles to the length is 50 miles. The area is 2130 square miles; and the population in 1851 numbered 319,379.

The Gatine Hills, which extend from the great central mountain group of Auvergne towards the mouth of the Loire, cross the south of the department from east to west. Mont-Jargeau, their most elevated point, is about 3114 feet high. Another chain, nearly parallel to these, crosses the centre of the department, separating the valley of the Vienne from that of its feeder the Gartempe. The most elevated point in this chain is Le-Puy le-Vieux, 3196 feet high. The mountains have generally round tops. The whole department is occupied by the primary and lower secondary formations. Iron, copper, lead, antimony, and coal-mines are worked. There are numerous iron-works. Porcelain-clay and granular felspar are obtained. Good granite and other building-stone and limestone are dug.

The department is chiefly included in the basin of the Loire. The southern slopes of the Gatine Hills belong to the basins of the Charente and the Garonne. On these slopes the Tardoire and the Bandiat, which unite and flow into the Charente—and the Dronne, the Isle, and the Loue, which belong to the system of the Garonne—rise; but only a small portion of the upper course of these rivers belongs to this department. Of the tributaries of the Loire, the Vienne is the only one belonging to this department, which it enters on the east side, a few miles from its source (in the department of Corrèze), and crosses from east to west into the department of Charente, receiving several small feeders on both banks, and passing the city of Limoges. The Gartempe, a feeder of the Creuse, drains the north of the department. None of the rivers named are navigable in this department. Ponds are numerous, but none of them is large.

The department is traversed by 7 imperial, 9 departmental, and 34 parish roads.

From the general elevation of the surface the air is colder than the latitude would lead one to expect. The atmosphere is moist, and the temperature changeable.

The area of the department in round numbers is 1,370,000 acres, of which about 533,000 acres are under the plough. A considerable quantity of rye and buckwheat is grown; the growth of corn is however insufficient for the support of the inhabitants, but the deficiency is made up by the abundance of chestnuts. The meadows and pasture-lands amount to above 320,000 acres, besides 230,000 acres of heath, common, or other open pasture, and grazing forms the most important branch of agricultural industry. Great numbers of mules, horses of the best Limousin breed, and of horned cattle, are reared. Horse-races and a cattle-show are held yearly at Limoges, and prizes are distributed. Pigs are numerous. The vineyards occupy only about 7000 acres, and produce only ordinary red wine. The woodlands occupy above 90,000 acres, chiefly in small clumps or in copses. Chestnuts and walnuts are grown in great abundance, and there is a considerable quantity of oak-timber. Game is plentiful. A great number of bees are kept. Besides iron, which is the most important industrial product of the department, coarse woollens, flannel, blankets, linen, leather, paper, nails, glass, and pottery are manufactured.

The department is divided into four arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Limoges . . .	10	78	138,756
2. St.-Yrieix . . .	4	26	44,610
3. Bellac . . .	8	65	84,082
4. Rochechouart . . .	5	30	61,331
Total . . .	27	199	319,379

1. In the first arrondissement the chief town is *Limoges*, which forms the subject of a separate article. [*LIMOGES.*] *Aize*, a small place 7 miles S.W. from Limoges, has some Roman remains and the ruins of a castle of the middle ages. *St.-Léonard*, on an eminence on the right bank of the Vienne, over which there is a handsome bridge,

is a tolerably well-built town, with about 5600 inhabitants. Its boulevards command a pleasant prospect. The church is of very great antiquity. There are paper-mills and copper works, and the townsmen manufacture wollen-stuffs, common hats, porcelain, and sheepskin and other leather. At Eymoutiers (or Aimoutier), which is on the left bank of the Vienne, in a mountainous district, there are tan-yards; and cotton-yarn is manufactured: population of the commune 3500.

2. In the second arrondissement the chief town is *St.-Yrieix*, which is situated in the south of the department on the Loue, a feeder of the Isle, and has a college and 7403 inhabitants in the commune. The town is ill-built; it has five parish churches, one of which, a collegiate church, is considered an admirable specimen of gothic architecture. The townsmen manufacture porcelain and common earthenware, woollen-cloths and coarse woollen-stuffs, and leather. There are some iron-works. *Chalus*, a small place of about 2000 inhabitants, near the source of the Tardoire, has some historical interest as being the place where Richard I. (Cœur-de-Lion) of England received his death-wound, whilst besieging the castle that formerly defended the town, 1199. It is divided by the Tardoire into the upper and the lower town. *St.-Germain-les-Belles*, N.E. of Yrieix, has 2500 inhabitants in the commune.

3. In the third arrondissement the chief town *Bellac*, is situated on a hill above the Vinçon, a feeder of the Gartempe, 24 miles N. by W. from Limoges, and has 3775 inhabitants, who manufacture paper, broadcloth, linen, leather, blankets, and hats. Near the town there is a large druidical altar. Among the other towns may be mentioned the following—*Beaunes*, on the Gartempe: population, 2640; *Château-Ponsat*, also on the Gartempe: population, 3387; *Le-Dorat*, N. of Bellac on the Sèvre a feeder of the Gartempe, with a fine church, an ecclesiastical college, and 2500 inhabitants; and *Magnac-Laval*, E. of Le-Dorat: population, 3600.

4. In the fourth arrondissement the chief town, *Rochechouart*, is situated on the Grenne, a feeder of the Vienne, 22 miles W. from Limoges, and has 4166 inhabitants, who manufacture glass-bottles, bricks, tiles, and vinegar. On a rocky hill above the town are the remains of an old feudal castle, one of the towers of which serves for a prison. There are iron-works near Rochechouart. *St.-Junien*, is built on the slope of a hill at the junction of the Glane with the Vienne, on the right bank of the latter. It is surrounded by boulevards, which are planted with trees and command a pleasant prospect of the surrounding country. This town is one of the busiest places in the department. The parish church and the chapel of Notre-Dame close to the bridge over the Vienne are the principal buildings. The inhabitants, who number about 5500, manufacture gloves, blankets, hats, woollen-cloths, serge, porcelain and common earthenware, chamois and other leather, and paper. There are monthly fairs for the sale of horses, mules, cattle, hides, corn, hemp, flax, and wine.

This department and the adjoining department of Creuse constitute the diocese of Limoges, the bishop of which is a suffragan of the archbishop of Bourges. It is in the jurisdiction of the High Court of Limoges, within the limits of the University-Academy of Poitiers, and in the 21st Military Division, of which Limoges is head-quarters. It returns 2 members to the Legislative Body of the French empire.

VIJI ISLANDS is the name of an extensive group of islands in the Pacific Ocean, which on our maps are called Fidji, or Feedjee Islands. The group is little known, partly because it is situated out of the common track of vessels and in a dangerous part of the ocean, and partly on account of its great extent. The Viji Islands lie between 15° 5' and 19° S. lat., 177° and 182° E. long., and consist properly of three groups. The most eastern contains a great number of small islands, and one of considerable size, the island of Lakemba. Farther to the west there is a more extensive group, containing several islands of moderate size, and a large one, Viji-levu, or Great Viji. The third group lies to the north of the Viji-levu, and contains the large island of Pau, or Tarkanava, with several smaller ones. Several good harbours have been visited by Europeans; the best are at Rewa, on the southern shores of Viji-levu, and at Libuka, on the island of Ovalan, west of Viji-levu.

These islands seem to be of volcanic origin, though no active volcano has been observed, and they exhibit that irregularity of surface which is peculiar to islands of that formation. Many of them rise to a considerable elevation. The climate is hot, but not so constant as it generally is between the tropics, because this group is situated on the southern limit of the trade-winds, where the changes in the temperature are frequent and sudden. In August and September the thermometer on board ship varied between 72° and 88°. The domestic animals are pigs and dogs, and the wild animals are rats. There are few kinds of birds; the most common are parrots. Cocoa-nut palms, bread-fruit trees, bananas, yams, sugar-cane, sago, maize, and

particularly rice, are cultivated. The forests supply timber for the construction of boats.

The population is stated to amount to 200,000 individuals. In the structure of their bodies the inhabitants resemble those of the Friendly Islands, and there is no great difference in their languages: they evince a considerable degree of inventive power and ingenuity in the construction of their boats and houses, and in making arms, clothes, wicker-work, and earthenware. They have three kinds of boats: the largest, consisting of two boats united, are sometimes 50 feet long, and are used to make voyages which last several days. Many of them are made for sale in the neighbouring islands. In Rewa is a large manufacture of earthenware, which is made with great taste, and is also an article of export to the neighbouring islands. Of late years some Wesleyan missionaries have established themselves on the islands.

These islands are sometimes visited by American vessels. They get there sandal-wood, tortoise-shell, and trepang for the Chinese markets. The Americans bring guns, gunpowder, cochineal, cotton-stuffs, and iron-ware. The inhabitants of the Friendly Islands obtain here the best of their large boats, and pay for them with 'topa,' or stuffs made from the bark of the Chinese mulberry-tree, and the teeth of the *Physeter macrocephalus*.

The Viji Islands were discovered by Tasman in 1643, but from that time were not visited until 1739, when Captain Bligh, after the mutiny of his crew, sailed through the most eastern group, and in 1792 he discovered the islands farther to the west.

VINCENT, ST., one of the islands of the Columbian Archipelago, situated between 13° 10' and 13° 25' N. lat., 61° 10' and 61° 20' W. long., having Barbadoes on the east, Grenada on the south, and St. Lucia on the north. The area of St. Vincent is 131 square miles, or about 84,000 acres, of which about 35,000 acres are under cultivation. It is one of the most beautiful islands of the Caribbee group, of an oval form, 18 miles long by 11 miles broad; and though the surface is irregular, the valleys, some of which are very beautiful, possess a fertile soil, and are well watered. The coast is bold and rocky, and a range of high mountains crosses the island from north to south. The *Grenadines* consist of several small islets off the southern extremity of the coast. Bequia, the largest, has an area of 3700 acres, and there are seven others. Bequia possesses a fine harbour, called Admiralty Bay. The most remarkable physical feature of St. Vincent is the Souffrière, a volcanic mountain 3000 feet high, with a crater half a mile in diameter, from the centre of which rises a conical hill 300 feet high, and 200 feet in diameter at the base. After a repose of nearly a century an eruption of the mountain took place in 1812. St. Vincent has several times suffered severely from hurricanes.

St. Vincent was discovered by Columbus in 1498. In 1672 Charles II. included St. Vincent with Barbadoes and several other islands under one government. In 1714 the French began to form a settlement with the permission of the natives. For many years it was a subject of dispute between the French and the English, but it was at length ceded to the British crown at the peace in 1763. St. Vincent is in the diocese of Barbadoes. The population in 1852 was estimated at 30,128.

The chief productions of the island are, sugar, rum, and molasses, with some arrow-root, coffee, cacao, and cotton. Pozzuolano is exported as an excellent subaqueous cement. The cultivation of cotton and arrow-root is increasing.

The amount of the revenue in 1852 was 14,390%; that of the expen-

diture was 14,932%, besides 7786% for civil and military establishments defrayed by Great Britain. The imports during 1852 amounted in value to 167,059%, the exports to 204,995%. The amount of tonnage entered inwards during 1852 was 30,541; the amount cleared outwards was 31,181 tons. Of places of worship there were 103 in 1852, of which 14 belonged to the Church of England, the others being almost entirely belonging to the Wesleyan Methodists. The number of children attending school was 2154.

Kingstown is the capital of the island, and contains about 5000 inhabitants. It has a harbour, a few public buildings, and a commodious church. A botanic garden of 30 acres was formed more than half a century ago.

VINDELICIA, the ancient name of a part of Southern Germany. It extended from the Lacus Brigantinus (Lake of Constance), as far as the junction of the Inn with the Danube, and from Rhetia to the Danube. Vindelicia at first was a part of Rhetia; from the time of Diocletian it was a separate province, and was called Rhetia Secunda, which name was gradually supplanted by the name Vindelicia, which is first mentioned by Sextus Rufus (c. 8). The name of Vindelicia is derived from the Vindelici, a warlike Celtic tribe in the southern mountainous part of the country; and it is believed that this tribe had its name from the Vindo or Vinda, also called Virdo, now Wertach, and the Licus, now Lech, which were two of the principal rivers of the country. The Romans founded many colonies in Vindelicia. Among them were Augusta Vindelicorum, now Augsburg; Campodunum, now Kempten; Brigantia, now Bregenz; Reginum, or Castra Regina, now Ratisbon, or Regensburg; Pons Oeni or Aeni, now Mühldorf, on the Inn. The municipal rights given to these colonies by the Romans, were the cause of their afterwards becoming free Imperial towns. After the 3rd century Vindelicia was invaded by German tribes (Alemanni and Boiarii), who extirpated the ancient population.

VINDHYA MOUNTAINS. [HINDUSTAN.]

VIRE. [CALVADOS.]

VIRGIN ISLANDS are an extensive group of small islands, which form part of the Columbian Archipelago, commonly called the West Indies. They lie between 18° 5' and 18° 50' N. lat., 64° 10' and 65° 40' W. long., exclusive of the island of Santa Cruz, or Saint Croix, which properly does not belong to the group, but is commonly considered as forming part of it, because it belongs to Denmark, which also is in possession of some islands of the group itself. This island is about 90 miles S. from the centre of the Virgin Islands. The Virgin Islands extend in nearly a straight line from west-south-west to east-north-east, and occupy a space of about 100 miles in length, with an average width of 20 miles. The most western belong to Spain; the most eastern belong to the British; those in the centre to Denmark.

The British islands lie between 64° 10' and 64° 50' W. long., and amount to about 50 in number; but most of them are very small. They are stated to cover a surface not exceeding 60,000 acres, or between 93 and 94 square miles. The largest of these islands are—Anegada, Virgin Gorda, Comance, Beef Island, Guana, Tortola, Jost van Dyke's, and Peter's Island. The population of the whole of these islands in 1850 was estimated at 7000 persons. The colonial income in 1849 was 1675%. Anegada, which is the most north-eastern island of the whole group, contains 31,200 acres, but has only a few inhabitants. [ANEGADA.] Virgin Gorda, also called Spanish Town, which is considered to be a corruption of Penniston, the original name of the island, consists of a rocky mass, and two peninsulas which project from the mountains to the east and south-west. Of the rocky mass in the centre of the island the summit is about 1500 feet high. The island is said to contain 9500 acres. The soil is sandy and dry. The exports consist of sugar, rum, tobacco, indigo, peas, and some cotton. The produce of the island is sent to Tortola for exportation. At St. Thomas Bay, on the southern peninsula, is a group of houses called the Town. In the prolongation of the southern peninsula is a cluster of rocks, exhibiting a great variety of fantastic figures, resembling ruined temples, columns, and arches. They are called the Fallen City, or Broken Jerusalem. Between Virgin Gorda and Tortola, at a short distance from the last-mentioned island, are—Great Comance, which is very rocky and elevated, and thinly inhabited; and Beef Island, which is also rocky, but contains a considerable proportion of pasture-ground. Each of these islands contains an area of about 1500 acres. The small island of Guana lies north of Tortola.

Tortola, the most important of the British Virgin Islands, extends nearly 12 miles from east-north-east to west-south-west, but its width does not exceed 2 miles. Its area is said to be 13,300 acres. It is a mountain-mass, broken up and furrowed by glens and ravines in every direction, so as to present a succession of undulating surfaces and precipitous eminences. The most elevated part runs through the middle of the island from east to west. Sage Hill, the highest summit, which lies west of Road Town, is 1650 feet above the level of the sea. The descent is more precipitous to the north than to the south, and high rocky masses advance to the water's edge on the north-west, but at all other places the country on the shores of the sea is of moderate elevation. The shores are indented with bays, harbours, and creeks, which afford shelter and anchorage for a great quantity of shipping. The soil is dry, and has little depth. The capital of the island is Road Town, or Kingstown. It is built on the southern side of the

island, in the western bight of a deep bay, which is 5 miles long and 3½ miles wide, and constitutes an excellent harbour, being perfectly land-locked on all sides. The town consists of only one long irregular street, which incloses in a curve the base of a projecting point of land, and lies close to the water's edge. The houses are mostly well built. To the north of the western extremity of Tortola is *Jost van Dyke's Island*, which is more than 3 miles long and about 1 mile wide. It resembles Tortola in soil and productions. To the south of Tortola, about 4 miles from the island, extends a row of islands from Broken Jerusalem on the east-north-east to the western extremity of St. John. They are all rocky and elevated, but small. The largest, *St. Peter's*, has an area of 1890 acres. Between this row of islands and Tortola is Sir Francis Drake's Channel, which is of difficult navigation on account of the numerous rocks and shoals, the strong tides, and the heavy swell of the sea.

The Danish Virgin Islands, St. John, St. Thomas, Santa Cruz, and numerous islets, are situated between 64° 40' and 65° 10' W. long. The island of *St. John* lies about a mile distant from Tortola: it is about 8 miles long, and on an average 3 miles wide. The surface is very uneven, the mountains reaching a height equal to that of the Tortola eminences. Sugar, coffee, and cotton are cultivated on level tracts near the sea-shores. In the interior maize and ground provisions are cultivated. There are several good anchorages, the best of which is Coral Bay. St. John, a small town at the western extremity of the island, possesses a good harbour. The island of *St. Thomas*, west of St. John, has an area of about 30 square miles. Its unevenness of surface renders a considerable portion of it unsuitable for agriculture. The soil is mostly a dry loam. Maize, ground provisions, and fruits are cultivated to some extent. Most of the white inhabitants of this island and of St. John are of Dutch origin, and Dutch is the common language. The town of St. Thomas is built on the north shore of a fine bay, which has good anchorage for 200 vessels. Being a free port, open to all nations, it is an important entrepôt for articles of plantation consumption, and is the chief mart of the inhabitants of the Virgin Islands generally. The population is about 3000, of whom about 400 are whites. [ST. THOMAS, in SUP.] The most important of the Danish possessions is *Santa Cruz*, or *St. Croix*, in the Columbian Archipelago. Though it does not properly belong to the group of the Virgin Islands, it is usually reckoned along with them. It lies between 17° 40' and 17° 50' N. lat., 64° 30' and 65° W. long., and is 2½ miles long and nearly 8 miles broad in its widest part, containing an area of about 110 square miles. Along the northern shores there is a chain of hills, of which the eastern extremity spreads over the whole width of the island. The island is comparatively fertile, the sugar-cane, cotton, and provisions being produced. The island is traversed in its whole extent lengthwise by three good roads. The greater number of the whites on the island are of English origin, and English is the language most generally spoken. The population is upwards of 30,000, including about 2500 whites. The capital of Santa Cruz is *Christianstadt*, also called the Basin, which stands on a small bay on the northern shore. This town, one of the best built in the West Indies, stands on the gentle declivity of a hill. The streets, which are parallel to the sea, are wide and straight, and rise like terraces one above the other. *Christianstadt* is the seat of the governor of the Danish possessions in the West Indies. The government-house has the appearance of a palace, and there are several other handsome public buildings. There are four churches (Danish, Dutch, English, and Roman Catholic), and two elementary schools for poor boys and girls. *Frederickstadt*, at the western extremity of the island, has a population of 1500, and a good roadstead.

The Spanish Virgin Islands are a short distance from the eastern coast of Puerto Rico, and consist of two islands of moderate extent, and of several islets. The northern island, called *Culebra* (Snake Island), or *Passage Island*, has an area of about 10 square miles, is rocky, and rises to a moderate elevation. The products are sugar and coffee. The population is only about 300. The southern island, called *Bieque*, or *Crab Island*, extends from east to west about 16 miles, and is between 3 and 4 miles wide. On the northern side is a great lagoon, which usually dries up at the close of the dry season. The western part of the island is rocky and hilly. About two-thirds of the surface of the island is low, level, and overgrown with trees and bushes.

Climate.—These islands have two rainy and two dry seasons. The short rainy season begins in May, and lasts from 15 to 20 days. The heat in this season is equal to that of the summer in Southern Europe. In July and August the heat is considerable, the thermometer in August usually marking 92° at noon. In September the rain comes down like a deluge, and speedily makes the surface of the islands a sheet of water. Between July and October hurricanes occur. The summer or dry season commences generally in December, and from this period till the month of April showers are rare, and the heat is moderate. This is the most healthy and the most agreeable season of the year. Earthquakes occasionally occur, but the shocks are generally slight. On the northern shores of these islands a very heavy swell, called the 'ground-sea,' is experienced between October and May, and sometimes later. This swell has worn away much of the lower parts of the northern shores, leaving the coasts lined in many places with high rocks or cliffs.

VOG. DIV. VOL. IV.

Productions.—The chief articles of export are sugar, rum, a little cotton, and salt from Anegada. Maize and guinea-corn are cultivated. The castor-oil plant and the tamarind grow wild, but are also cultivated. Other wild-growing and useful plants are the *Aloe perfoliata* and the *Agave Americana*. In the forests are many useful trees, among which are mahogany- and fustic-trees. There are no wild quadrupeds, and birds are rare. There are two or three kinds of turtles. Fish is plentiful.

History.—Santa Cruz and the Virgin Islands were discovered by Columbus on his second voyage, 1494. They were then inhabited, and Santa Cruz was the most northern island in which the Caribbees had established themselves; but towards the end of the 16th century no inhabitants were found on them. In the 17th century these islands became the resort of buccaneers; some Dutch buccaneers began to settle Tortola in 1648, but were expelled from the island by the English in 1666, and since that time the island has always been in their possession. The island of St. Thomas was settled by the Danes in 1672; and a few years later the Danes also possessed themselves of St. John. These islands were taken by the British in 1801, but were restored in the following year. They surrendered to the English in 1807, and continued in their hands till 1815, when they were again restored to the Danes. The British islands are under the authority of the governor of St. Kitts, but they have a separate legislative assembly, which meets at Road Town. The Danish islands are under the care of the Danish governor residing at Christianstadt; and the Spanish islands are dependencies of Puerto Rico.

VIRGINIA, one of the United States of North America, extends between 36° 30' and 39° 43' N. lat. (with the exception of a long narrow alip of land which extends between Pennsylvania and the Ohio River as far north as 40° 38' N. lat.), 75° 15' and 83° 30' W. long. It is bounded E. by the Atlantic Ocean and the Potomac River, which separates it from the state of Maryland and the district of Columbia; N.E. by Maryland; N. by Pennsylvania; N.W. by Ohio; W. by Kentucky; S.W. by Tennessee; and S. by North Carolina. The area is 61,352 square miles. The population in 1850 was 1,421,661, of whom 54,353 were free coloured persons, and 472,528 slaves: the density of population was 23.17 to the square mile. The federal representative population in 1850 was 1,232,649, in which number three-fifths of the slaves are included. This, according to the present ratio of representation, entitles the state to send 13 members to Congress. To the Senate, like each of the other states, Virginia sends two members.

Sea-Coast.—From the northern extremity of the Currituck Sound, which is included within the boundary of Virginia, to Cape Henry, about 80 miles, is an unbroken line of low shelving sandy shore. From Cape Henry, which is a low sand-hill, it is about 12 miles to Cape Charles; and between these two capes is the entrance of Chesapeake Bay, which extends inland about 180 miles. Chesapeake Bay is described under MARYLAND, to which state the greater part of it belongs. From Cape Henry to Windmill Point, a distance of about 45 miles, the coast of Virginia presents a succession of projecting headlands, inclosing many bays, some of which extend far inland, and preserve a considerable width and depth to a distance of from 20 to 50 miles from the sea. These larger bays are the estuaries of rivers, and admit large vessels, so as to constitute good harbours. The smaller bays are formed by indentations of the shores, and most of them have safe anchorage for coasting vessels. The headlands between the bays have low and frequently swampy shores, but at some distance from them the country rises from 15 to 20 feet. That part of Virginia which lies east of Chesapeake Bay, and is called the 'Eastern shore of Virginia,' is skirted on the side of the Atlantic by a number of low sandy islands, which towards the north form one row, but towards Cape Charles two or three parallel rows. They are inhabited by a few fishermen, and the straits which separate these islands from one another afford some passages for small coasting vessels. The coast opposite these islands supplies shelter and good anchorage, and that on the side of Chesapeake Bay has some good harbours for small vessels.

Surface, Soil, Climate, Agricultural Productions.—Nearly one-half of the surface of Virginia is mountainous. The Appalachian or Alleghany Mountains run through it obliquely from south-west to north-east, spreading along the southern boundary over the western, and towards the north over the central, districts of the state. From the eastern base of this mountain region there extends to the shores of the Atlantic and of Chesapeake Bay a plain known as the Atlantic Slope, which along the shores of the sea is a low undulating plain, and at the back of it a higher hilly country, which reaches to the Blue Ridge. These two plains constitute the maritime and the higher slope of the Atlantic. That portion of Virginia which lies to the north-west of the mountain region, between it and the rivers Ohio and Big Sandy, is much more hilly than the eastern plain, and may be called the hilly region of the Ohio and of the Kanawha. The following table exhibits a rough estimate in square miles of the respective areas of these four regions:—

1. Maritime or Lower Slope of the Atlantic	8,000
2. Hilly or Upper Slope of the Atlantic	17,000
3. Mountain Region of the Appalachians	26,300
4. Hilly Region of the Ohio and Kanawha	10,000
	61,300

1. *The Maritime Slope of the Atlantic* comprehends also the eastern shore of Virginia, or that part which lies east of Chesapeake Bay. This country consists of a tongue of land about 70 miles long and 10 miles in width, the islands included, but without them only 7 miles across. Along the shore is a sterile tract mostly covered with low sand-hills or swamps, and about half a mile wide; the interior is a level flat country, with a light sandy soil resting on clay. The principal crops are maize and oats, but wheat, cotton, peas, beans, and potatoes are also grown. There are good orchards, in which the fig-trees and pomegranate-trees attain a large size, and yield abundant fruit. The palma-christi, from which the castor-oil is obtained, is cultivated to a considerable extent.

Of the Maritime Region west of Chesapeake Bay, the south-eastern portion is a flat country which rises imperceptibly towards the south. The soil is a mixture of sand and clay, but less fertile than the eastern shore; its productions are the same. On some low tracts near the Dismal Swamp rice is grown, and this is the most northern point where that grain is cultivated on the Atlantic shore of the United States. The Dismal Swamp extends into NORTH CAROLINA. From the forests at the southern part of the Swamp a large quantity of lumber is obtained. Near the centre of the Swamp, in Virginia, is Lake Drummond, which extends about 7 miles in every direction, and varies in depth from 10 to 20 feet. The remainder of the Maritime Region has a somewhat undulating surface, which towards the western limits of the region is diversified with hills. The soil is alluvial, but thin and poor. Some of the higher tracts are nearly destitute of vegetation and barren, and others are covered with forests of stunted pines, from which tar, pitch, and rosin are extracted. The bottoms of the rivers have a deeper and richer soil, and produce good crops. Wheat is not much cultivated, but maize, oats, potatoes, and sweet potatoes are extensively grown; tobacco is also cultivated. The orchards yield apples, pears, cherries, quinces, neotaries, apricots, almonds, plums, pomegranates, figs, peaches, and mulberries.

The climate of this low region, if compared with that of low countries on the east of the Atlantic, is distinguished by great and sudden changes, which occur at all seasons except October and November. The winters are much colder than in any part of Europe south of the Alps, and also more severe than in the low countries north of the Alps. Frosts are frequent, and sometimes very severe, but generally of short duration. During July and August the heat is very great, the thermometer rising almost every year to 90°, and sometimes to 96° and 98°. The mean annual temperature is 56°. Though the number of rainy days is less in this region than in England, the mean annual quantity of rain is much greater. The prevailing wind all the year round is the south-west; but in autumn and winter the wind blows from all quarters except the south, and southerly winds are at all seasons very rare. The change of the wind produces sudden changes in the temperature. Jefferson states that the thermometer has descended 45 degrees in thirteen hours, from 92° to 47°, in consequence of a change of the wind.

2. *The Upper Slope of the Atlantic* extends from the western limit of the Maritime Slope to the Blue Ridge. From the base of the ridge the country descends to the falls of the rivers in an inclined plane. Where the falls occur, a ledge of rocks extends across the state, rising from 100 to 200 feet above their base, which in most places is about 100 feet above the sea-level. The surface of this region presents only a comparatively small number of hills, from 300 to 500 feet high; it generally extends in undulating plains, which in many places have a gentle acclivity, but in others are broken and uneven, and between these plains are the deeper depressions, in which the rivers run. The hills are generally not steep, but the soil is sometimes rocky, and not fit for cultivation. They are mostly overgrown with ash, beech, elm, hickory, chestnut, oak, and hemlock. The soil of the higher grounds between the bottoms of the rivers is sandy, but has in general a moderate degree of fertility. The cultivated tracts yield moderate crops of wheat, maize, tobacco, and oats, and also rye and buckwheat. The orchards are extensive, and all the trees mentioned in the foregoing region succeed, except pomegranates and almonds. The forests, which still cover a considerable part of the surface, are comprised of oak, hickory, gum, maple, logwood, and especially yellow pine. The bottoms along the watercourses are extensive along the large rivers: that of the James River is in general from two to three miles wide, and extends from Richmond to Lynchburg, 125 miles. Their soil is generally excellent, and produces good crops of wheat, maize, and oats, and the best sort of tobacco, which is extensively cultivated. Nearly all the cotton exported from Virginia is from this district. The hills which are dispersed over this region are mostly isolated and irregular; but there extends over the whole width of the state a series of hills and short ranges, nearly in a parallel line with the Blue Ridge, and at a distance of from 15 to 30 miles east of it. North of James River, which for more than 30 miles flows along its eastern base, this hilly tract is called the South-West Mountain; but towards the northern extremity it is called the Bull Run and Kittoctan Mountains. This chain rises from 800 to 1200 feet above the sea-level. The hills are covered with forests of oak, hickory, green maple, white and yellow poplar, black and white walnut, ash, sassafras, dogwood, chestnut, and chestnut-oak. The long valley which extends between these hills and the Blue Range is in general hilly; for several offsets of the Blue

Ridge advance into it from 5 to 10 miles from the range, and it also contains many isolated hills. The soil generally consists of a good mould lying on a substratum of red clay. In the northern district it is lighter, and contains a good proportion of sand or gravel. The principal objects of agriculture are maize, wheat, rye, oats, and potatoes. In the southern districts much tobacco is grown, and hemp in several places. The orchards yield apples, peaches, cherries, plums, quinces, and grapes. The general level of this valley is from 500 to 700 feet above the sea, except towards the north, where it is lower. The mean annual temperature of this region is from three to six degrees lower than in the maritime region.

3. *The Mountain Region of the Appalachians* lies west of the upper region of the Atlantic Slope. It is described generally under ALLEGHANY MOUNTAINS. It extends in a general north-east direction, from the southern boundary of the state along the Cumberland Mountains to the Greenbrier Ridge, and along Laurel Range to Cheat River, which breaks through it near 39° 20' N. lat., and thence to Pennsylvania, where it goes by the name of the Laurel Hills. The extensive region inclosed by this line and the Blue Ridge is widest in the southern part; between the southern boundary of the state and 37° 25' N. lat. it extends 150 miles east and west, but north of that parallel it hardly ever exceeds or falls much short of 90 miles. The most elevated points of this region are the peaks of Otter, which occur in the Blue Ridge near 37° 35' N. lat., and whose highest summit is 4260 feet above the sea, and the White Top Mountains, situated near the place where the three states of Virginia, North Carolina, and Tennessee are contiguous, and whose highest summit is still more elevated. These however are single summits, which are not frequent in this mountain system, as the upper edges of the ridges extend in nearly straight lines, which at certain distances, usually from eight to ten miles, are broken by narrow depressions, through which gaps the roads run. The general elevation of the ridges however seems to vary between 2500 and 3000 feet, except towards the banks of the Potomac, where it sinks to between 1400 and 1000 feet above the sea.

South of 37° N. lat. there are, besides several smaller ones, four large parallel ridges, called, from west to east, the Cumberland Mountains, Clinch Mountains, Iron Mountains, and the Blue Ridge, which are connected by the Great Ass Mountains, and other transverse ridges. This section of the mountain region appears to be more favoured by nature than any other. It is well watered by rivers of gentle current, and free from rapids or other impediments to navigation; the valleys are rather wide, and the soil is black and of the best quality. Cultivation is successfully carried on nearly to the northern extremities of the valleys; the mountains inclosing which are steep, but almost entirely covered with large forest-trees, such as chestnut, beech, walnut, elm, black and white oak, maple, ash, poplar, and buck-eye. The principal articles of cultivation are maize, wheat, rye, oats, hemp, flax, and potatoes. The orchards are generally planted with apple- and peach-trees and vines, this being one of the best grape countries in Virginia. On the mountains are good pastures, and many horses, cattle, and hogs are reared.

North-east of this section lies that which is drained by the Kanawha. It is also traversed by four larger ridges, of which the two most southern preserve the names of the Blue Ridge and Iron Mountains; but the continuation of the Clinch Mountains is called Walker's Mountains west of the Kanawha, and Peter's Mountains east of that river. The most northern ridge is called Great Flat Top, and is connected with the Great Ass Mountains. A transverse ridge running nearly due north and south, near 80° 15' W. long., connects Peter's Mountains with the Iron Mountains, and these with the Blue Ridge. This section is probably the most elevated part of the mountain system south of the Potomac; where the Kanawha is joined by the Greenbrier River its surface is 1833 feet above the sea. The river runs sometimes for many miles between high rocks rising almost perpendicularly from the water's edge. In other places level tracts, hardly ever half a mile wide, but of some extent, are found near the banks; but they do not constitute what is called a river bottom, being many feet elevated above its level in the time of the freshets. These are the only tracts which are fit for cultivation, and on which considerable quantities of maize, potatoes, hemp, and flax are raised. The mountains are generally covered with tall trees.

All the waters collected in the two sections already described run off to the Ohio by the Tennessee and Great Kanawha rivers, but farther north the greater part of the drainage flows into the rivers which fall into the Atlantic. The watershed between these rivers and those which run to the Ohio is formed by a continuous ridge, which on the banks of the Kanawha is called Peter's Mountain, but farther north is known as the Alleghany Mountains. The wide space east of the Alleghany Mountains and west of the Blue Ridge is traversed in all its length by a chain known as the North Mountain, or Great Kittatiny Chain. The western districts of this section are traversed by numerous ridges rising from 1000 to 1200 feet above the sea, but between them along the large rivers are valleys from one to two miles wide, where maize, wheat, rye, oats, barley, buckwheat, potatoes, flax, and hemp are grown. They are however better adapted for pasture; and live stock, with butter and wool, constitute the principal articles for the market. Those parts of this section which are contiguous to the Blue Ridge have wider valleys and an equally good soil, which pre-

duces abundant crops of maize, wheat, and tobacco. There are also extensive orchards, which produce apples and peaches of good quality.

The northern section of this mountain region, or that which lies within the basin of the Potomac in Virginia, is divided by the Kittatinny Chain into two natural divisions, which gradually lower as they proceed from south to north. Nearly the whole of that division of it which is inclosed by the Blue Ridge on the east and the Kittatinny Chain on the west, is drained by the Shenandoah and its affluent. It is comparatively level; and the soil is in most parts stony, but, consisting almost entirely of limestone, it is generally fit for cultivation, and on the river bottoms it exhibits a considerable degree of fertility. The crops of wheat, rye, maize, and oats are tolerably abundant. But as the colder climate of this region favours the growth of grasses, the inhabitants pay more attention to the dairies and rearing of domestic animals. North of the plain of Staunton the true character of the Alleghanies reappears. Between 88° 30' and 39° 10' N. lat. the whole space between the two principal ranges is filled up by several elevated ridges, with their intervening valleys. These ridges rise as high as the Blue Ridge and run parallel to it. The valleys contain the best description of limestone-land, and are from two to three miles wide. They produce the same articles as are grown in the plain of Staunton, and cultivation extends at some places over the lower declivities of the Blue Ridge, but the ridges west of it are unfit for cultivation. The low tracts along the rivers are very fertile, but mostly used as grass-lands, for here too the rearing of cattle is more profitable than the cultivation of grain. The mountains are mostly covered with oak, pine, hickory, and chestnut. The mountain ridges which traverse the central basin of the Shenandoah extend northward to the banks of the Potomac, where they spread over the western districts, which contain only narrow valleys between high ridges, so that this tract is better adapted for pasture than cultivation. But as the space between these ridges and the Blue Ridge widens considerably north of 39° 10' N. lat., a plain occurs here, which extends to the banks of the Potomac. Its surface is uneven and in some parts hilly, but the slopes of the hills are not too steep for cultivation, and the soil is rather fertile, being what is called limestone-land of the best description. Wheat, rye, maize, and tobacco are extensively grown. The cultivation of grasses is also carried on to some extent, and the orchards are numerous. This tract is considered the most fertile in Virginia, and is very populous.

The basin of the Upper Potomac, or the country between the Kittatinny Chain on the west and the Alleghany Mountains on the east, may be considered as a terrace considerably elevated above the basin of the Shenandoah. Its surface is very elevated; and it is traversed longitudinally by several ridges, which leave only narrow valleys between them. The soil of the valleys is either poor or of indifferent quality, except a fine tract of bottom ground on the south branch of the Potomac. As the climate is cold the crops do not always succeed, and therefore the inhabitants have turned their attention more to the rearing and fattening of cattle and keeping of other domestic animals, especially sheep. But in the country which approaches the north branch of the Potomac cultivation is more attended to. The grains, except maize, with flax and hemp, are cultivated. Fruit-trees are scarce, with the exception of apples and cherries. Vegetables are extensively grown. The low lands and the slopes of the mountains are still to a great extent covered with forests. On the top of the mountains and more elevated portions of the slopes are cedars, and pitch, spruce, and white pines; in some places these trees have attained their full growth, but in others they are stunted. The less elevated grounds are overgrown with oak, beech, elm, black walnut, and hickory; and on the low grounds along the banks of the rivers, which are subject to be inundated during the freshets, the woods consist mostly of sycamore-trees, plane-trees, and red or water maple.

The principal articles which are cultivated in the region west of the Alleghany Mountains, are maize, oats, and buckwheat; cattle are rather numerous. The eastern portion is an elevated table-land, whose surface is distinguished by extensive prairies; it is drained by five or six small rivers, which by their union form Cheat River, an upper branch of the Monongahela. Numerous herds of cattle find pasture on these natural meadows. The western district, or that which lies contiguous to the Laurel Ridge, is a valley, called Tygart's Valley. It is about 30 miles long and 2 miles wide, possesses a fertile soil, and is well settled. It produces maize, wheat, rye, oats, and several vegetables in abundance: clover and other grasses are extensively grown, and cattle are numerous. The mountains surrounding the valley are well stocked with fine timber—oak, poplar, cherry, pine, fir, red-cedar, &c.

The climate necessarily varies greatly in a mountain region, which in some parts rises to 3000 feet above the sea, and in others hardly attains an elevation of 300 feet. The winters are more severe than in the countries east of the Blue Ridge, and they generally last three months without interruption. The vegetation on the east side of the Blue Ridge is usually two weeks earlier than on the west side; but the air is never so hot on the west side as to dry up the grass during the summer months; droughts however occasionally occur.

4. *The Hilly Region of the Ohio and Kanawha* comprehends the north-western portion of the state, or that which is inclosed by the

north-west limit of the mountain region, the Sandy River and the Ohio, and the boundary of Pennsylvania. The most southern portion of this region is the most elevated, which is north of it, by a line commencing on the banks of the Big Sandy River, where that stream is cut by 88° N. lat., and running thence to a point on the Great Kanawha River a little above the salt-works, whence it continues in the same direction to the salt-works on the Little Kanawha, where it turns eastward. The whole country consists of high masses of rocks, which generally rise to the elevation of mountain ridges, which are united to the western edge of the Mountain Region at right angles, as they generally extend from south-east to north-west. There are no bottoms along the river-courses, except a few small tracts hardly a quarter of a mile wide. The rocks, which are generally contiguous to the banks, rise to 500 feet and more, and in many places with a nearly perpendicular acclivity. Where the acclivity is not too steep the mountains are covered with soil, and along the watercourses overgrown with bushes; but in many parts the rocks are bare. At some distance from the watercourses the high grounds present a hilly surface, usually covered with low bushes or stunted trees. There are only a few tracts of moderate extent, on which maize, oats, and potatoes are grown; and the pastures which the higher grounds afford are too poor for cattle. The inhabitants obtain their livelihood partly by taking lumber to the lower country.

The remainder of this region is only hilly, with the exception of the north-eastern country, where some short ranges of mountains occur. The hills rise from 300 to 500 feet above the river bottoms, generally with a gentle acclivity, though in many places they are steep. The bottoms differ in width, from a quarter of a mile to upwards of two miles. The least fertile part is the tract which lies between the Big Sandy River and the Great Kanawha, where the hills which form the higher grounds between the rivers consist of sandstone, rise with a steep acclivity, and have flat tops covered with low bushes. They are not cultivated, and not even available as pasture-ground for sheep. In the depressions between the hills the soil is also poor. The bottom of the Great Kanawha has many very fertile tracts, and in general it yields good crops of maize, wheat, rye, oats, and potatoes. The hills which inclose the bottoms of this river and those of its affluents contain large trees, especially lime, hickory, sugar-maple, laurel, hemlock, and sumach: the sumach attains here the height of a stately tree. North of the Great Kanawha the country improves. It is still hilly, but the slopes of the hills are not so steep, and the soil is more fertile. The higher grounds are overgrown with trees or bushes. The best portion of this region is the basin of the Monongahela. Though the river-bottoms are not so wide as those of the Ohio or Great Kanawha, they are very fertile, and produce abundant crops of wheat, maize, rye, oats, potatoes, and vegetables. In some places the higher grounds rise into mountains. In general the hills on the higher ground, though broken, have a good soil, which produces maize, rye, and oats. The higher grounds between the Laurel Chain and Chestnut Ridge are destitute of trees, but in summer they are covered with grass; the cultivated tracts are not very numerous. The most northern part of Virginia, or that narrow tract which lies between the western boundary-line of Pennsylvania and the Ohio, resembles the countries on the banks of the Monongahela, being much broken, but equally fertile.

Hydrography, Communications.—Virginia has numerous navigable rivers. They all originate within the Mountain Region or on the ranges which form the edges of that region. The greater number run east and south-east, and flow into the Atlantic. The others flow north or north-west into the Ohio.

The *Potomac*, from its source to its mouth, forms the boundary between Maryland and Virginia, and will be found described under *MARYLAND*. As there mentioned, ships of the line ascend it to the Washington navy yard, and large boats to Harper's Ferry, where the river breaks through the Blue Ridge. Its principal tributary in Virginia is the *Shenandoah*, which rises near 88° N. lat., and drains nearly the whole of the Mountain Region north of that parallel and between the Kittatinny Chain and the Blue Ridge. It flows 130 miles before it joins the Potomac.

The *Rappahannoc* rises on the eastern declivity of the Blue Ridge, with two branches called the Hedgeman and Rapid Ann, which unite after a course of about 50 miles. After the union of these streams the river becomes navigable, but 10 miles farther down it has some falls, and a short distance below them it meets the tide-water at Fredericksburg, up to which place vessels of 140 tons can ascend. In approaching the sea it widens to a narrow bay, which at its lower extremity is about 2 miles across. Its course is about 160 miles.

York River originates in the south-east mountains, with two branches, the Pamunkey and Mattaponi, each above 100 miles long. By their union the York River is formed, which is an estuary from one to three miles across. After a course of 35 miles it falls into Chesapeake Bay. The largest ships ascend to Yorktown, 12 miles from the sea, where it forms an excellent harbour. Up to the union of its two branches it has a depth of 3 fathoms, and admits coasting-vessels. The Pamunkey and the Mattaponi are navigable by boats for 70 and 50 miles respectively.

The *James River* is the principal river belonging wholly to Virginia. It rises in the Alleghany Mountains with several branches, of which

1. *The Maritime Slope of the Atlantic* comprehends also the eastern shore of Virginia, or that part which lies east of Chesapeake Bay. This country consists of a tongue of land about 70 miles long and 10 miles in width, the islands included, but without them only 7 miles across. Along the shore is a sterile tract mostly covered with low sand-hills or swamps, and about half a mile wide; the interior is a level flat country, with a light sandy soil resting on clay. The principal crops are maize and oats, but wheat, cotton, peas, beans, and potatoes are also grown. There are good orchards, in which the fig-trees and pomegranate-trees attain a large size, and yield abundant fruit. The palma-christi, from which the castor-oil is obtained, is cultivated to a considerable extent.

Of the Maritime Region west of Chesapeake Bay, the south-eastern portion is a flat country which rises imperceptibly towards the south. The soil is a mixture of sand and clay, but less fertile than the eastern shore; its productions are the same. On some low tracts near the Dismal Swamp rice is grown, and this is the most northern point where that grain is cultivated on the Atlantic shore of the United States. The Dismal Swamp extends into NORTH CAROLINA. From the forests at the southern part of the Swamp a large quantity of lumber is obtained. Near the centre of the Swamp, in Virginia, is Lake Drummond, which extends about 7 miles in every direction, and varies in depth from 10 to 20 feet. The remainder of the Maritime Region has a somewhat undulating surface, which towards the western limits of the region is diversified with hills. The soil is alluvial, but thin and poor. Some of the higher tracts are nearly destitute of vegetation and barren, and others are covered with forests of stunted pines, from which tar, pitch, and rosin are extracted. The bottoms of the rivers have a deeper and richer soil, and produce good crops. Wheat is not much cultivated, but maize, oats, potatoes, and sweet potatoes are extensively grown; tobacco is also cultivated. The orchards yield apples, pears, cherries, quinces, nectarines, apricots, almonds, plums, pomegranates, figs, peaches, and mulberries.

The climate of this low region, if compared with that of low countries on the east of the Atlantic, is distinguished by great and sudden changes, which occur at all seasons except October and November. The winters are much colder than in any part of Europe south of the Alps, and also more severe than in the low countries north of the Alps. Frosts are frequent, and sometimes very severe, but generally of short duration. During July and August the heat is very great, the thermometer rising almost every year to 90°, and sometimes to 96° and 98°. The mean annual temperature is 56°. Though the number of rainy days is less in this region than in England, the mean annual quantity of rain is much greater. The prevailing wind all the year round is the south-west; but in autumn and winter the wind blows from all quarters except the south, and southerly winds are at all seasons very rare. The change of the wind produces sudden changes in the temperature. Jefferson states that the thermometer has descended 45 degrees in thirteen hours, from 92° to 47°, in consequence of a change of the wind.

2. *The Upper Slope of the Atlantic* extends from the western limit of the Maritime Slope to the Blue Ridge. From the base of the ridge the country descends to the falls of the rivers in an inclined plane. Where the falls occur, a ledge of rocks extends across the state, rising from 100 to 200 feet above their base, which in most places is about 100 feet above the sea-level. The surface of this region presents only a comparatively small number of hills, from 300 to 500 feet high; it generally extends in undulating plains, which in many places have a gentle acclivity, but in others are broken and uneven, and between these plains are the deeper depressions, in which the rivers run. The hills are generally not steep, but the soil is sometimes rocky, and not fit for cultivation. They are mostly overgrown with ash, beech, elm, hickory, chestnut, oak, and hemlock. The soil of the higher grounds between the bottoms of the rivers is sandy, but has in general a moderate degree of fertility. The cultivated tracts yield moderate crops of wheat, maize, tobacco, and oats, and also rye and buckwheat. The orchards are extensive, and all the trees mentioned in the foregoing region succeed, except pomegranates and almonds. The forests, which still cover a considerable part of the surface, are comprised of oak, hickory, gum, maple, logwood, and especially yellow pine. The bottoms along the watercourses are extensive along the large rivers: that of the James River is in general from two to three miles wide, and extends from Richmond to Lynchburg, 125 miles. Their soil is generally excellent, and produces good crops of wheat, maize, and oats, and the best sort of tobacco, which is extensively cultivated. Nearly all the cotton exported from Virginia is from this district. The hills which are dispersed over this region are mostly isolated and irregular; but there extends over the whole width of the state a series of hills and short ranges, nearly in a parallel line with the Blue Ridge, and at a distance of from 15 to 30 miles east of it. North of James River, which for more than 30 miles flows along its eastern base, this hilly tract is called the South-West Mountain; but towards the northern extremity it is called the Bull Run and Kittoctan Mountains. This chain rises from 800 to 1200 feet above the sea-level. The hills are covered with forests of oak, hickory, green maple, white and yellow poplar, black and white walnut, ash, sassafras, dogwood, chestnut, and chestnut-oak. The long valley which extends between these hills and the Blue Range is in general hilly; for several offsets of the Blue

Ridge advance into it from 5 to 10 miles from the range, and it also contains many isolated hills. The soil generally consists of a good mould lying on a substratum of red clay. In the northern district it is lighter, and contains a good proportion of sand or gravel. The principal objects of agriculture are maize, wheat, rye, oats, and potatoes. In the southern districts much tobacco is grown, and hemp in several places. The orchards yield apples, peaches, cherries, plums, quinces, and grapes. The general level of this valley is from 500 to 700 feet above the sea, except towards the north, where it is lower. The mean annual temperature of this region is from three to six degrees lower than in the maritime region.

3. *The Mountain Region of the Appalachians* lies west of the upper region of the Atlantic Slope. It is described generally under ALLEGHANY MOUNTAINS. It extends in a general north-east direction, from the southern boundary of the state along the Cumberland Mountains to the Greenbrier Ridge, and along Laurel Range to Cheat River, which breaks through it near 39° 30' N. lat., and thence to Pennsylvania, where it goes by the name of the Laurel Hills. The extensive region inclosed by this line and the Blue Ridge is widest in the southern part; between the southern boundary of the state and 37° 25' N. lat. it extends 150 miles east and west, but north of that parallel it hardly ever exceeds or falls much short of 90 miles. The most elevated points of this region are the peaks of Otter, which occur in the Blue Ridge near 37° 35' N. lat., and whose highest summit is 4260 feet above the sea, and the White Top Mountains, situated near the place where the three states of Virginia, North Carolina, and Tennessee are contiguous, and whose highest summit is still more elevated. These however are single summits, which are not frequent in this mountain system, as the upper edges of the ridges extend in nearly straight lines, which at certain distances, usually from eight to ten miles, are broken by narrow depressions, through which gaps the roads run. The general elevation of the ridges however seems to vary between 2500 and 3000 feet, except towards the banks of the Potomac, where it sinks to between 1400 and 1000 feet above the sea.

South of 37° N. lat. there are, besides several smaller ones, four large parallel ridges, called, from west to east, the Cumberland Mountains, Clinch Mountains, Iron Mountains, and the Blue Ridge, which are connected by the Great Aas Mountains, and other transverse ridges. This section of the mountain region appears to be more favoured by nature than any other. It is well watered by rivers of gentle current, and free from rapids or other impediments to navigation; the valleys are rather wide, and the soil is black and of the best quality. Cultivation is successfully carried on nearly to the northern extremities of the valleys; the mountains inclosing which are steep, but almost entirely covered with large forest-trees, such as chestnut, beech, walnut, elm, black and white oak, maple, ash, poplar, and buck-eye. The principal articles of cultivation are maize, wheat, rye, oats, hemp, flax, and potatoes. The orchards are generally planted with apple- and peach-trees and vines, this being one of the best grape countries in Virginia. On the mountains are good pastures, and many horses, cattle, and hogs are reared.

North-east of this section lies that which is drained by the Kanawha. It is also traversed by four larger ridges, of which the two most southern preserve the names of the Blue Ridge and Iron Mountains; but the continuation of the Clinch Mountains is called Walker's Mountains west of the Kanawha, and Peter's Mountains east of that river. The most northern ridge is called Great Flat Top, and is connected with the Great Aas Mountains. A transverse ridge running nearly due north and south, near 80° 15' W. long., connects Peter's Mountains with the Iron Mountains, and these with the Blue Ridge. This section is probably the most elevated part of the mountain system south of the Potomac; where the Kanawha is joined by the Greenbrier River its surface is 1833 feet above the sea. The river runs sometimes for many miles between high rocks rising almost perpendicularly from the water's edge. In other places level tracts, hardly ever half a mile wide, but of some extent, are found near the banks; but they do not constitute what is called a river bottom, being many feet elevated above its level in the time of the freshets. These are the only tracts which are fit for cultivation, and on which considerable quantities of maize, potatoes, hemp, and flax are raised. The mountains are generally covered with tall trees.

All the waters collected in the two sections already described run off to the Ohio by the Tennessee and Great Kanawha rivers, but farther north the greater part of the drainage flows into the rivers which fall into the Atlantic. The watershed between these rivers and those which run to the Ohio is formed by a continuous ridge, which on the banks of the Kanawha is called Peter's Mountain, but farther north is known as the Alleghany Mountains. The wide space east of the Alleghany Mountains and west of the Blue Ridge is traversed in all its length by a chain known as the North Mountain, or Great Kittatinny Chain. The western districts of this section are traversed by numerous ridges rising from 1000 to 1200 feet above the sea, but between them along the large rivers are valleys from one to two miles wide, where maize, wheat, rye, oats, barley, buckwheat, potatoes, flax, and hemp are grown. They are however better adapted for pasture; and live stock, with butter and wool, constitute the principal articles for the market. Those parts of this section which are contiguous to the Blue Ridge have wider valleys and an equally good soil, which pre-

duces abundant crops of maize, wheat, and tobacco. There are also extensive orchards, which produce apples and peaches of good quality.

The northern section of this mountain region, or that which lies within the basin of the Potomac in Virginia, is divided by the Kittatinny Chain into two natural divisions, which gradually lower as they proceed from south to north. Nearly the whole of that division of it which is inclosed by the Blue Ridge on the east and the Kittatinny Chain on the west, is drained by the Shenandoah and its affluents. It is comparatively level; and the soil is in most parts stony, but, consisting almost entirely of limestone, it is generally fit for cultivation, and on the river bottoms it exhibits a considerable degree of fertility. The crops of wheat, rye, maize, and oats are tolerably abundant. But as the colder climate of this region favours the growth of grasses, the inhabitants pay more attention to the dairies and rearing of domestic animals. North of the plain of Staunton the true character of the Alleghanies reappears. Between 88° 30' and 89° 10' N. lat. the whole space between the two principal ranges is filled up by several elevated ridges, with their intervening valleys. These ridges rise as high as the Blue Ridge and run parallel to it. The valleys contain the best description of limestone-land, and are from two to three miles wide. They produce the same articles as are grown in the plain of Staunton, and cultivation extends at some places over the lower declivities of the Blue Ridge, but the ridges west of it are unfit for cultivation. The low tracts along the rivers are very fertile, but mostly used as grass-lands, for here too the rearing of cattle is more profitable than the cultivation of grain. The mountains are mostly covered with oak, pine, hickory, and chestnut. The mountain ridges which traverse the central basin of the Shenandoah extend northward to the banks of the Potomac, where they spread over the western districts, which contain only narrow valleys between high ridges, so that this tract is better adapted for pasture than cultivation. But as the space between these ridges and the Blue Ridge widens considerably north of 89° 10' N. lat., a plain occurs here, which extends to the banks of the Potomac. Its surface is uneven and in some parts hilly, but the slopes of the hills are not too steep for cultivation, and the soil is rather fertile, being what is called limestone-land of the best description. Wheat, rye, maize, and tobacco are extensively grown. The cultivation of grasses is also carried on to some extent, and the orchards are numerous. This tract is considered the most fertile in Virginia, and is very populous.

The basin of the Upper Potomac, or the country between the Kittatinny Chain on the west and the Alleghany Mountains on the east, may be considered as a terrace considerably elevated above the basin of the Shenandoah. Its surface is very elevated; and it is traversed longitudinally by several ridges, which leave only narrow valleys between them. The soil of the valleys is either poor or of indifferent quality, except a fine tract of bottom ground on the south branch of the Potomac. As the climate is cold the crops do not always succeed, and therefore the inhabitants have turned their attention more to the rearing and fattening of cattle and keeping of other domestic animals, especially sheep. But in the country which approaches the north branch of the Potomac cultivation is more attended to. The grains, except maize, with flax and hemp, are cultivated. Fruit-trees are scarce, with the exception of apples and cherries. Vegetables are extensively grown. The low lands and the slopes of the mountains are still to a great extent covered with forests. On the top of the mountains and more elevated portions of the slopes are cedars, and pitch, spruce, and white pines; in some places these trees have attained their full growth, but in others they are stunted. The less elevated grounds are overgrown with oak, beech, elm, black walnut, and hickory; and on the low grounds along the banks of the rivers, which are subject to be inundated during the freshets, the woods consist mostly of sycamore-trees, plane-trees, and red or water maple.

The principal articles which are cultivated in the region west of the Alleghany Mountains, are maize, oats, and buckwheat; cattle are rather numerous. The eastern portion is an elevated table-land, whose surface is distinguished by extensive prairies; it is drained by five or six small rivers, which by their union form Cheat River, an upper branch of the Monongahela. Numerous herds of cattle find pasture on these natural meadows. The western district, or that which lies contiguous to the Laurel Ridge, is a valley, called Tygart's Valley. It is about 30 miles long and 2 miles wide, possesses a fertile soil, and is well settled. It produces maize, wheat, rye, oats, and several vegetables in abundance: clover and other grasses are extensively grown, and cattle are numerous. The mountains surrounding the valley are well stocked with fine timber—oak, poplar, cherry, pine, fir, red cedar, &c.

The climate necessarily varies greatly in a mountain region, which in some parts rises to 3000 feet above the sea, and in others hardly attains an elevation of 300 feet. The winters are more severe than in the countries east of the Blue Ridge, and they generally last three months without interruption. The vegetation on the east side of the Blue Ridge is usually two weeks earlier than on the west side; but the air is never so hot on the west side as to dry up the grass during the summer months; droughts however occasionally occur.

4. *The Hilly Region of the Ohio and Kanawha* comprehends the north-western portion of the state, or that which is inclosed by the

north-west limit of the mountain region, the Sandy River and the Ohio, and the boundary of Pennsylvania. The most southern portion of this region is the most elevated, which is north of it, by a line commencing on the banks of the Big Sandy River, where that stream is cut by 88° N. lat., and running thence to a point on the Great Kanawha River a little above the salt-works, whence it continues in the same direction to the salt-works on the Little Kanawha, where it turns eastward. The whole country consists of high masses of rocks, which generally rise to the elevation of mountain ridges, which are united to the western edge of the Mountain Region at right angles, as they generally extend from south-east to north-west. There are no bottoms along the river-courses, except a few small tracts hardly a quarter of a mile wide. The rocks, which are generally contiguous to the banks, rise to 500 feet and more, and in many places with a nearly perpendicular acclivity. Where the acclivity is not too steep the mountains are covered with soil, and along the watercourses overgrown with bushes; but in many parts the rocks are bare. At some distance from the watercourses the high grounds present a hilly surface, usually covered with low bushes or stunted trees. There are only a few tracts of moderate extent, on which maize, oats, and potatoes are grown; and the pastures which the higher grounds afford are too poor for cattle. The inhabitants obtain their livelihood partly by taking lumber to the lower country.

The remainder of this region is only hilly, with the exception of the north-eastern country, where some short ranges of mountains occur. The hills rise from 300 to 500 feet above the river bottoms, generally with a gentle acclivity, though in many places they are steep. The bottoms differ in width, from a quarter of a mile to upwards of two miles. The least fertile part is the tract which lies between the Big Sandy River and the Great Kanawha, where the hills which form the higher grounds between the rivers consist of sandstone, rise with a steep acclivity, and have flat tops covered with low bushes. They are not cultivated, and not even available as pasture-ground for sheep. In the depressions between the hills the soil is also poor. The bottom of the Great Kanawha has many very fertile tracts, and in general it yields good crops of maize, wheat, rye, oats, and potatoes. The hills which inclose the bottoms of this river and those of its affluents contain large trees, especially lime, hickory, sugar-maple, laurel, hemlock, and sumach: the sumach attains here the height of a stately tree. North of the Great Kanawha the country improves. It is still hilly, but the slopes of the hills are not so steep, and the soil is more fertile. The higher grounds are overgrown with trees or bushes. The best portion of this region is the basin of the Monongahela. Though the river-bottoms are not so wide as those of the Ohio or Great Kanawha, they are very fertile, and produce abundant crops of wheat, maize, rye, oats, potatoes, and vegetables. In some places the higher grounds rise into mountains. In general the hills on the higher ground, though broken, have a good soil, which produces maize, rye, and oats. The higher grounds between the Laurel Chain and Chestnut Ridge are destitute of trees, but in summer they are covered with grass; the cultivated tracts are not very numerous. The most northern part of Virginia, or that narrow tract which lies between the western boundary-line of Pennsylvania and the Ohio, resembles the countries on the banks of the Monongahela, being much broken, but equally fertile.

Hydrography, Communications.—Virginia has numerous navigable rivers. They all originate within the Mountain Region or on the ranges which form the edges of that region. The greater number run east and south-east, and flow into the Atlantic. The others flow north or north-west into the Ohio.

The *Potomac*, from its source to its mouth, forms the boundary between Maryland and Virginia, and will be found described under MARYLAND. As there mentioned, ships of the line ascend it to the Washington navy yard, and large boats to Harper's Ferry, where the river breaks through the Blue Ridge. Its principal tributary in Virginia is the *Shenandoah*, which rises near 88° N. lat., and drains nearly the whole of the Mountain Region north of that parallel and between the Kittatinny Chain and the Blue Ridge. It flows 130 miles before it joins the Potomac.

The *Rappahannoc* rises on the eastern declivity of the Blue Ridge, with two branches called the Hedgeman and Rapid Ann, which unite after a course of about 50 miles. After the union of these streams the river becomes navigable, but 10 miles farther down it has some falls, and a short distance below them it meets the tide-water at Fredericksburg, up to which place vessels of 140 tons can ascend. In approaching the sea it widens to a narrow bay, which at its lower extremity is about 2 miles across. Its course is about 160 miles.

York River originates in the south-east mountains, with two branches, the Pamunkey and Mattaponi, each above 100 miles long. By their union the York River is formed, which is an estuary from one to three miles across. After a course of 35 miles it falls into Chesapeake Bay. The largest ships ascend to Yorktown, 12 miles from the sea, where it forms an excellent harbour. Up to the union of its two branches it has a depth of 3 fathoms, and admits coasting-vessels. The Pamunkey and the Mattaponi are navigable by boats for 70 and 50 miles respectively.

The *James River* is the principal river belonging wholly to Virginia. It rises in the Alleghany Mountains with several branches, of which

Jackson's River and Cow-Pasture River are the chief. The James River thus formed runs with great rapidity southward between high mountains, and turns to the east above Pattonsburg, at which place it is 806 feet above the sea-level, and begins to be navigated. It passes through the Blue Ridge at the Balcony Falls, which are avoided by a canal about six miles long which runs parallel to the river. At Lynchburg the level of the river is 500 feet above the sea. Below Lynchburg it turns to the north-east and runs with great rapidity, but is navigable. Above Scotsville it passes the south-east mountains, and at that place its level is only 255 feet above high water-mark, and at Columbia, at the mouth of the Rivanna, only 178 feet. Lower down the current of the river is gentle until it approaches the falls above Richmond, where it descends 80 feet within 6 miles, and immediately below the falls it meets the tide-water. A canal connects the tide-water below and the navigable water above the falls. Below the falls the river gradually widens and assumes the features of a bay, and after a course of 90 miles farther it merges in Chesapeake Bay. The wide expanse of its mouth, known as the Hampton Roads, affords a harbour for vessels of any size, but it is not safe in winter. Ships of the line can ascend more than 20 miles above Hampton Roads; vessels of 250 tons sail up to Warwick; and of 125 tons to Rocketts, a mile below Richmond. The whole length of James River is about 500 miles. The largest of its affluents is the *Appomattox*, which rises at the base of the South-East Mountains, and runs about 150 miles; vessels drawing 7 feet water can ascend to Petersburg, 20 miles above its confluence with the James, and the navigation is continued above the falls there by the Upper Appomattox Canal. Two others of the affluents of James River are navigable: the *Rivanna*, which joins it from the north, which by a canal is made navigable to Piræus, within one mile and a quarter of Charlottesville; and *Willis River*, which joins the James from the south a few miles below the embouchure of the Rivanna, and is navigable for 20 miles from its mouth.

Nansemond River, which flows only 15 miles and falls into Hampton Roads, is navigable for vessels of 100 tons as far as Suffolk, 10 miles from its mouth.

The *Nottoway* and *Meherrin* rivers drain a large part of the country south of the James River, each of them running about 100 miles, and uniting, after having entered North Carolina, to form the *Chowan River*.

The upper course of the *Roanoke* lies within Virginia. [CAROLINA, NORTH.] It is navigable in Virginia below Monroe. Its largest affluent, the *Dan*, belongs almost entirely to Virginia; it drains the most southern portion of the Atlantic Slope, and is navigable for boats as far as Danville.

The Ohio divides Virginia from the state of Ohio, having between these two states a course of 355 miles. It is navigable all this distance for steamers of light draught. [MISSISSIPPI RIVER.] The *Monongahela*, one of the principal branches of the Ohio, is also noticed under MISSISSIPPI RIVER. It is formed by three rivers, Cheat River, Tygart's Valley River, and West Fork, which rise in the Alleghany Mountains, and though not of much use for navigation, are of great value for the abundant water-power which they furnish. The *Monongahela* affords an easy navigation for steam-boats as far as Morgantown, about 10 miles from the boundary of Pennsylvania. The *Little Kanawha*, which joins the Ohio at Parkersburg, runs more than 100 miles, and with its principal affluent, Hughes River, is much used for bringing down lumber, &c. The *Great Kanawha* rises beyond Virginia, in the valley inclosed by the Blue Ridge and the Iron Mountains; it traverses the mountain region by a course of 120 miles, and is swelled by the confluence of its great branch, the Greenbrier River. After it leaves the mountain region its rapidity is so great that as far down as the mouth of Gauley River the stream flows between high rocks with such force as to render crossing it very hazardous. Two miles below that place are the Great Falls, a fine cataract of 22 feet over a natural dam of rocks which spreads irregularly across its bed. Below this place it becomes navigable, and from Charleston, 60 miles above its confluence with the Ohio, it is navigable for large steam-boats. Its affluents, the Elk River, which joins it at Charleston, and the Coal River, which joins it 12 miles lower down, are navigable during freshets for a considerable distance. The *Guyandotte* and the *Big Sandy River*, both of which flow above 100 miles, are chiefly valuable for their immense water-power.

The most southern portion of the mountain region is drained by several rivers, which by their junction, which takes place in the state of Tennessee, form the Tennessee River. These rivers are called, from east to west, Holston, Clinoh, and Powell's. They are the only rivers that drain the mountain region which are navigable in their natural state.

The canals of Virginia are very important and costly works. They are—the Alexandrian Canal, from Georgetown to Alexandria, $7\frac{1}{2}$ miles; James River and Kanawha Canal, which is completed from Richmond to Balcony Falls, 148 miles, but is eventually to be carried along the valley of the Kanawha to the Ohio; Dismal Swamp Canal, from Deep Creek to Joyce's Creek, 23 miles; and 11 miles of branch canals; total 189 $\frac{1}{2}$ miles.

The railways of this state are also on a very grand scale, being parts of the great lines which extend from the Atlantic to the West, and are connected with all the main lines of the neighbouring states. On the 1st of January 1855 there were in Virginia 23 lines of railways

having 837 miles of road in operation; and 1095 miles additional were in course of construction or projected.

Geology, Mineralogy, &c.—The geology of Virginia has engaged much attention, and been illustrated in the writings of many of the most eminent geologists of Europe and America. By far the larger part of it belongs to the Alleghany system, and is sufficiently described under ALLEGHANY MOUNTAINS. Here it will be enough to say that eruptive and metamorphic rocks traverse the state in a north-east and south-west direction, corresponding with that of the Alleghany range; and consist of granites, syenites, porphyries, gneiss, traps, &c. On the west of these igneous rocks, also traversing the state in the same direction, occur Lower Silurian strata, having a depth of 3000 feet, and consisting of limestones and sandstones. These are skirted by a broader band of Upper Silurian rocks, comprising three or four varieties of gray and blue limestones. Beyond these are beds of Devonian rocks, consisting of limestones crowned by vast beds of very thick old red-sandstones. West of the Devonian rocks we come upon the Carboniferous formation. The lower carboniferous strata occupy only a narrow belt, and are chiefly represented by red schist and siliceous conglomerates. But the upper carboniferous or coal-measures occupy the whole western side of the state, and form a portion of the great coal-basin of Ohio, Pennsylvania, and Virginia. New Red-sandstone occurs in small basins, whose general direction is parallel to the dislocation of the Alleghanies. Strata of lias also occur in a band of from 10 to 12 miles wide, and about 50 miles long, extending from Richmond to the neighbourhood of Washington; they are inclosed in a deep and narrow granitic furrow, and consist "of a coarse-grained sandstone, formed from the decomposition of the surrounding granite, a species of micaceous schist, often very clayey, and passing into black slate; and lastly, beds of coal placed chiefly at the lower part of the formation, 40 or 50 feet in thickness." The whole eastern side of the state consists of Eocene and Post-eocene strata. The post-eocene strata have a profusion of characteristic fossils, and Sir Charles Lyell assimilates them in age to the English crag and the faluns of Touraine.

Virginia is extremely rich in minerals. In the Upper Atlantic Slope, gold, iron, black-lead, copper, and limestone are found. Gold is found in a wide tract south of Fredericksburg, and extending parallel to the Blue Ridge, into North Carolina and Georgia: a considerable quantity has been obtained. Bituminous coal is found and extensively worked in the neighbourhood of Richmond, along the James and Appomattox rivers, at Wheeling on the Ohio, on the Kanawha, on the borders of Pennsylvania, and at several other places. Anthracite is obtained in the valley of the Potomac and elsewhere. In all there have been traced five tiers of coal-seams, with an average thickness of from 30 to 35 feet; and beds not directly connected with these occur elsewhere. Iron-ore is abundant along the base of the Blue Ridge, and in the mountain region iron-ore of very good quality occurs. Lead-mines are worked in the Iron Mountains. This region abounds also in limestone, sandstone, slate, gypsum, and other useful minerals. The country west of the Alleghany Mountains is richer in minerals than the other parts of the state. Besides abundance of bituminous coal and iron-ore, beds of limestone are extensively distributed, and the caverns, which are of frequent occurrence in the limestone rocks, furnish large quantities of nitre. The region west of the Blue Ridge contains several hot-springs and other medicinal springs, which are resorted to by invalids, and the inhabitants of the lower countries on the Atlantic, during the summer heats. Salt-springs are very numerous, and salt is made in sufficient quantities to furnish with this article most of the countries west of the Appalachian Mountains.

The climate, soil, and agricultural productions have been already noticed in describing the several geographical regions of the state. It will be enough to say here, by way of summary, that Virginia is one of the largest wheat-growing states of the Union; raising very large quantities of maize, oats, barley, and rye, and a considerable quantity of buckwheat. Very large crops of common and of sweet potatoes are also grown. Of tobacco, a larger quantity is grown than in any other state, though Kentucky has nearly reached to a level with it. The quantity grown in Virginia in 1850 was 56,803,227 lbs. Cotton is grown pretty largely in those parts which are suited to its culture. A little rice is raised. Of hemp a larger quantity was returned in 1850 than in any other state, but the returns of hemp are known to have been very inaccurate. Of flax, the only state which grows a larger quantity is Kentucky. A considerable quantity of maple-sugar is made. The forests, and the kinds of trees which grow in them, have been already noticed. The timber is of excellent quality in the mountain regions and in great abundance, but the cost of carriage interferes with its extensive export. A large quantity of lumber is however sent down the rivers annually.

Virginia ranks among the principal grazing states of the Union. It possesses a very large number of horses, horned-cattle, sheep, and swine. Increased attention has been paid of late years to the breeds, and the stock has been greatly improved. A large amount of wool of good quality is annually clipped. Butter is made to a great extent, also a good deal of cheese.

Wild animals are now rare on the east side of the mountains, but they are not uncommon in the western districts. The most common

are bears, wolves, deer, the racoon, squirrel, and opossum. The largest of the wild birds is the wild turkey, which is still met with in the western districts and in the Blue Ridge. There are also several kinds of water-fowl, among which are the canvass-back duck of the Potomac, and the sora, or American ortolan. Other remarkable birds are the turkey-buzzard, the mocking-bird, the red-bird, and the humming-bird. Partridges and quails, as they are called, are common. All the rivers abound in fish in the lower part of their course; in the rivers which fall into the Ohio are several kinds which are not found in Europe, as the black perch, the grennel, the blue cat, the buffalo, and the salmon-pike. There is also the soft-shell turtle, which surpasses in flavour the fine green-fat turtle. Oysters, lobsters, and other shell-fish are abundant on the coast. Bees are reared to a considerable extent.

Manufactures, Commerce, &c.—Virginia has considerable manufactures. In 1850 nearly 80,000 persons were employed in manufactures, mining, and mechanic arts, without including slaves, who are extensively employed in the tobacco manufactories, &c. The cotton manufacture employed about 3000 persons; the iron manufacture upwards of 3000; the woollen nearly 700; the salt 1300; and there are very important tobacco manufactories, extensive flour-mills, numerous tanneries, breweries, distilleries, machine shops, manufactories of hardware and cutlery, carriages, harness, &c.

In its foreign commerce Virginia has declined, and now ranks among the less important commercial states; a large proportion of its products is now exported through one or other of the northern ports, and foreign merchandise is received by the same channel; but it carries on a very large coasting trade. In the year ending June 30, 1853, the exports amounted to 3,306,791 dollars; the imports to 399,004 dollars, of which 255,863 dollars were carried in American vessels. There were in the same year 40 vessels built in the state of the aggregate burden of 6599 tons. The total shipping owned by the state in 1850 was 74,071 tons.

Divisions, Towns, &c.—Virginia is divided into 137 counties, 69 in Eastern and 68 in Western Virginia. Richmond is the political capital, and the largest town in the state. This and some of the other more important towns are noticed below; the population is that of 1850:—

Richmond, the capital, is beautifully situated on the ascending slope of the left bank of James River, 130 miles from the entrance of Chesapeake Bay, and 122 miles S.S.W. from Washington, in 37° 32' N. lat., 77° 27' W. long.: population 27,570. The ground on which the city is built is broken into several hills of different heights. The plan of the city is regular, the principal streets running parallel to the river, which are called A Street, B Street, &c., and crossed at right angles by others, which are called First Street, Second Street, &c. The chief public building is the State-House, or Capitol, a copy of the Maison Carrée of Nîmes, which is finely situated on the brow of a hill which overlooks the city. It contains a statue of General Washington by Houdon. The city-hall is a handsome edifice; there are besides a governor's house, court-house, and other state and civic buildings, including a state penitentiary, a poorhouse, and a female orphan asylum. There are 25 churches, some of them costly and handsome structures; 8 colleges; numerous schools; a philosophical institution, &c. The river flows over a channel of granite, of which material there are inexhaustible quarries in the vicinity of the city. Within a few miles of the city are large beds of coal, and the falls of the river, which extend from opposite the city for nearly six miles, afford water-power to any extent. There are several flour-mills, two of them among the largest in the world, and four cotton-mills; about 40 tobacco factories, employing over 2500 blacks; iron rolling-mills; cannon foundries; nail-works; machine shops; paper-mills, &c. The commerce consists chiefly in the exportation of tobacco and flour. Four railways unite here. There are seven daily and several weekly newspapers.

Alexandria, a city and port, on the Potomac, 7 miles S. by W. from Washington: population 8734. The city stands on high ground, contains some good buildings, and has a considerable commerce: ships of the largest size ascend to the town.

Charlottesville, on a branch of Rivanna River, 81 miles W.N.W. from Richmond: population about 2000. The town contains a court-house, several churches, schools, &c., but the place derives its chief importance from its connection with the University of Virginia, which is about a mile and a half distant from the town. The buildings of the University occupy an oblong quadrangle about 500 feet long by 150 feet wide. In the neighbourhood of Charlottesville is Monticello, formerly Jefferson's residence, on the summit of a hill about 500 feet above the Rivanna. It commands a magnificent view of the Blue Ridge and the surrounding country.

Fredericksburg, on the right bank of the Rappahannock, 110 miles from the mouth, and 66 miles N. from Richmond, population 4061, is a flourishing commercial town in a healthy and pleasant situation. It is near the head of the navigation of the Rappahannock, up to which town vessels of 130 tons burden can ascend. There are a court-house, a market-house, churches, banks, several factories, &c. It exports annually a large quantity of corn, flour, tobacco, &c.

Harper's Ferry, at the confluence of the Shenandoah and Potomac rivers, where the united stream forces its way through the Blue Ridge, 135 miles N. by W. from Richmond: population 1747. There are

here several factories, for which the rivers afford ample water-power; but the chief establishment is a national armoury on a very large scale for the manufacture of fire-arms, &c. The Potomac is navigable up to the village, and a canal and railway pass the town. The river and mountain scenery here is famous for its magnificence, and attracts a great number of tourists.

Of **James Town**, where the first colony was settled, and the chief seat of the colonial government from 1607 till 1798, though once a large place, not a single house remains.

Lexington is seated on the right bank of the North River, a tributary of the James River, 156 miles W. by N. from Richmond: population 1743. It is chiefly noteworthy as the seat of Washington College, which was founded and endowed by George Washington. It also contains a military institute, a court, &c.

Lynchburg, on the right bank of James River, 20 miles below the Great Falls where the river passes through the Blue Ridge, and 120 miles W.S.W. from Richmond: population, 8071. Lynchburg is one of the busiest commercial towns in Virginia. It has considerable trade, not only with Western Virginia, but with North Carolina, Tennessee, Kentucky, and Ohio; and its trading facilities will be greatly extended by railways now in course of construction. It contains several costly and substantial public buildings, banks, several very large tobacco warehouses and factories, cotton-mills, iron-foundries, flour-mills, &c.

Mount Vernon, the mansion of Washington, where he died, and near which he was buried, stands on a bold promontory overhanging the Potomac, which is here a mile and a half wide. The tomb is above ground, and his remains are deposited in a white marble sarcophagus, with a flat cover, on which is sculptured an eagle in relief, the American stars and stripes, and the name 'Washington.' A similar sarcophagus near it contains the remains of his wife.

Norfolk, situated on the right bank of Elizabeth River, about 8 miles from Hampton Roads, and 114 miles S.E. from Richmond, population 14,326, is the chief commercial port, and the second town in size, of Virginia. The harbour is easily accessible, sheltered from all winds, has depth of water for the largest vessels, and good anchorage for vessels of all sizes. The town is built on a plain, the streets are broad and well-paved, and the houses chiefly of brick. The public buildings are—a court-house, custom-house, market-house, almshouse, theatre, eight churches, schools, an atheneum, an orphan-house, &c. On the opposite bank of Elizabeth River, but distant nearly a mile, is **Portsmouth** (population, 8122), almost adjoining which is **Gosport** (population, 504), which may be regarded as parts of Norfolk. At Gosport is the United States navy-yard, the largest and finest in the Union. The dry-dock, constructed of granite, cost about 1,000,000 dollars. Opposite to it is the government naval hospital. Steamers ply regularly between Norfolk and New York, and the town has good railway accommodation.

Petersburg is situated on the right bank of the Appomattox, about 12 miles from its junction with James River, and 23 miles S. from Richmond: population, 14,010. The town is regularly laid-out, and the houses are substantial. It contains several public buildings, churches, schools, &c. The falls above the town, as at Richmond, are used for water-power; a canal continues the navigation round the falls, and four lines of railway meet here. There are several tobacco manufactories, cotton-, flour-, saw-mills, &c. The exports of tobacco and flour are very large.

Springs.—The medicinal springs of Western Virginia are in great repute, and have become watering-places which are resorted to from all parts of Virginia and adjoining states; and at most of these springs there are handsome establishments, hotels, &c. for visitors. The **Red Sulphur Springs**, 240 miles W. from Richmond; the **Gray Sulphur Springs**, about 9 miles E. from the Red Sulphur Springs; the **Salt Sulphur Springs**, 18 miles E. from the Red Sulphur Springs; the **White Sulphur Springs**, 38 miles N.E. from the Red Sulphur Springs; and the **Sweet Springs**, 204 miles W. from Richmond, are the most fashionable resorts, but there are besides the Berkeley, the Fauquier, the Shannondale, and several others which are much frequented.

Staunton, on Lewis Creek, 120 miles N.W. by W. from Richmond, population about 2500, is the centre of a fertile district, and contains two court-houses, a market-house, churches, the lunatic asylum for Western Virginia, &c.

Wheeling, on the Ohio, 357 miles N.W. from Richmond, population 11,435. The town is situated on a strip of land so narrow as only to allow of three principal streets between the river, with which they are parallel, and the steep hills at the back of the town. The place has an extensive trade, and there are several large manufactories of cottons and woollens, steam-engines, iron-castings, nails, white- and sheet-lead, glass, paper, silk, extensive flour-mills, &c.; and ship-building is carried on to a small extent. The city contains the usual county buildings, churches, &c. A wire suspension-bridge, of 1010 feet between the supporting towers, crosses the Ohio. The great National Road passes through Wheeling; and the town is becoming an important railway centre.

Winchester, the capital of Frederick county, nearly in the centre of which it is situated, 130 miles N.N.W. from Richmond, population about 4000, is an old town, but has of late risen considerably in manufacturing and commercial importance, and in population. It

contains some good public buildings, a lyceum, masonic-hall, 14 churches, and a medical school.

Government, History, &c.—The original constitution adopted in 1776 was superseded by the present one in 1851. By it the right of voting is vested in all white male citizens 21 years of age, who have resided for two years in the state. The legislature consists of a Senate of 50 members, called the General Assembly, elected for four years, and a House of Delegates, consisting of 152 members elected biennially. All elections are by open voting, and not by ballot. The governor is elected by the people for four years. His salary is 5000 dollars. The judges are also elected by popular vote.

The total net revenue obtained by taxes in the financial year 1853-4 was estimated at 1,281,047 dollars. The ordinary expenditure, exclusive of schools and debt, is about 600,000 dollars. The public debt Oct. 1, 1854, was 22,889,476 dollars; the interest on which was 1,825,000 dollars. The aggregate militia force of Virginia is 125,000 men, of whom 6492 are commissioned officers. The state has a large school fund; the educational returns of the state are however very imperfect. In 1850 there were returned in the state 18 colleges, with 110 professors and 1618 students, and 2980 public schools, with 2997 teachers and 67,853 scholars. Among the colleges is included the University of Virginia, at Charlottesville, a very celebrated institution which in 1854 had 16 professors, 466 students, and a library of 19,500 volumes.

The early history of Virginia is the history of the establishment of British colonies in North America. In 1584 Sir Walter Raleigh obtained a patent to colonise any unappropriated part of North America, and sent out two small vessels, which reached the coast of Florida, and sailed north as far as the island of Roanoke, in which neighbourhood they remained some time in friendly intercourse with the natives. On their return the country was named Virginia by Queen Elizabeth. The first actual settlement was made in NORTH CAROLINA. In 1606 James I. granted patents to two companies. To the one, called the London Company, he granted South Virginia; to the other, called the Plymouth Company, he granted New England. On the 19th of December, 1606, a small expedition of 105 men in three ships, the largest not more than 100 tons burden, having entered a river which was then called Powhatan, now the James River, they planted the first colony in the present state of Virginia, May 13, 1607, on a peninsula connected with the north bank, and named the place James Town, in honour of King James. But the colonists suffered much from sickness and disunion, and the whole would probably have perished if the management had not fallen into the hands of Captain John Smith, whose courage and prudence preserved the little colony from destruction. Smith's history, which is of the most romantic character, he has related in 'The True Travels, Adventures, and Observations of Captain John Smith, in Europe, Asia, Africa, and America, beginning about the year 1598, and continued to this present 1629;' and to one of the most romantic incidents in it the infant colony was indebted for its preservation. On an expedition up the James River and into the interior, in 1607, Smith was taken prisoner by the Indians, and two men who accompanied him were slain. He himself, after being several days in custody, was saved from the tomahawk by the entreaties and interference of Pocahontas, the daughter of Powhatan, the principal chief, and he was ultimately allowed to return to James Town. Two years later, when the Indians had plotted the destruction of the little colony, Pocahontas revealed their designs; and Smith having subsequently succeeded in establishing friendly relations with the natives, the country was gradually cleared, and under his active superintendance James Town began to assume the appearance of a fortified village. The value of his energy and influence was seen a year or two later on his departure from the colony. On finding themselves uncontrolled by any sufficient authority, the settlers abandoned themselves to improvidence and idleness; the store of provisions was rapidly consumed; and in consequence of their marauding habits, attacks were made by the Indians, who murdered many stragglers, and laid plans to destroy the whole colony. Smith had left nearly 500 persons; in six months the number was reduced to 60. These had resolved to abandon the settlement, and had actually embarked for Newfoundland, with a view to disperse themselves among the fishing-vessels there; but before they reached the mouth of the river they met the long-boat of Lord Delaware, who had been appointed governor, and who had arrived in Chesapeake Bay with supplies and emigrants. More colonists with liberal supplies arrived the next year (1611), and from this time the colony advanced in prosperity; their security being especially promoted by the curious circumstance of a marriage solemnised according to the rites of the Church of England between a young Englishman, John Rolfe, and Pocahontas, who had more than once saved the life of Smith. The consequence of this marriage was a confirmed peace with her father Powhatan, and with other Indian tribes under his influence. Pocahontas sailed with her husband to England, and became an object of admiration both at court and in London, which her conduct as a wife and mother afterwards confirmed and continued. There are families still in Virginia who are proud of their descent from that union.

The history of the colony during the next century exhibits it as engaged in frequent hostilities with the Indians; while from the time that it had attained to a certain degree of wealth and stability, the disputes and collisions between the colonists and the home govern-

ment and its representative, the governor of the colony, were almost continual, until the accession of William and Mary, when a more liberal and conciliatory policy was adopted towards the colony. From this time it continued to flourish till 1764, when the Stamp Act was proposed, and the American war, which broke out a few years afterwards, led to a separation of all the North American colonies from the parent state.

VIRIEUX. [AIN.]

VISTULA (Wislá, Weichsel), a large river of Europe, rises at the foot of the Carpathians, in the circle of Teschen in Austrian Silesia. Taking at first partly an eastern course, it enters Poland, passes Cracow, and then turning to the north-east divides Poland from Galicia as far as Sandomir. From Sandomir its course is north and north-west to Warsaw, then westerly and north-westerly till the river enters Prussia a little above Thorn, below which it flows northward to the Baltic. Before it reaches the Baltic however it divides at Montau, below Marienwerder, into two branches, the smaller of which, called the *Nogat*, discharges itself into the *Frisches-Haff*. The larger or western branch, after flowing about 40 miles farther, again divides at Fürstenwerder, 9 miles from Dantzic, into two branches, the smaller of which turns to the east, and empties itself into the *Frisches-Haff*, and the main stream taking the opposite direction falls into the Baltic at Weichselmünde, north of Dantzic. The principal feeder of the Vistula is the Bug which (fed by the *Narew*) joins it near Warsaw on the right bank. Another large feeder on the right bank is the *Sava*. The most important tributary of the Vistula on the left bank is the *Pilica*. [POLAND.] The whole course of the Vistula is about 460 miles, for above 300 miles of which, namely, from Cracow, it is navigable. The Bromberg Canal connects the Vistula with the Oder. The Vistula, being connected with so many navigable rivers, is a great channel for the conveyance of the productions of Poland, especially corn and timber, from the interior to the sea-coast. At the junction of the Bug with the Vistula stands the important fortress of Modlin: at Warsaw the river is commanded by Alexander's citadel.

VITEPSK, or WITEBSK, a government in the north-west of European Russia, which, with the government of Mohilev, forms the part of Poland that fell to Russia at the first partition of that country in 1772. Catherine II. divided it into two governments, which she united in 1796 under the name of White Russia; but in 1802 it was again divided into two, when Vitepsk was organised as at present. It is bounded N.W. by Livonia, N.E. by Pakow, E. by Smolensk, S.E. by Mohilev, S.W. by Minsk, and W. by Wilna and Courland. Its area is 17,145 square miles, and the population in 1846 amounted to 789,600, the great majority of whom are Rusniaks and Catholics.

The surface presents a vast plain diversified only by the banks of the rivers, which rise a little above the general level. The soil is sand mixed with clay, and with a very thin covering of vegetable mould. The principal river is the DUNA or Dwina, which enters the government from Pskow, makes a semicircular bend to Deena, from which place it runs along the western frontier, and is joined in its course by most of the rivers of the province: among these are the *Mesha*, the *Kasplia*, the *Ula*, the *Polota*, the *Drissa*, the *Drujs*, the *Saryja*, the *Feananka*, and the *Ewest*. There are numerous small lakes: the largest is that of Lubahn, on the frontier of Livonia. The climate is damp, but temperate and not very variable.

Though the soil is poor, agriculture is the chief occupation of the inhabitants, and, on account of the facility of exportation, very profitable. They cultivate rye, wheat, barley, oats, some pulse, flax, hemp, and hops. Horticulture is pretty well attended to, but there is no fruit except cherries. The bird-cherry is very common, as well as all sorts of wild berries (bilberries, cranberries, &c.) The immense forests, consisting both of pines and other timber-trees, afford ample employment to the inhabitants in felling and squaring timber. The pasture-lands are very extensive; horned-cattle and horses are bred in great numbers, but the former are small; the horses are partly of the strong Russian race and partly of the light Polish breed. There are large flocks of sheep, the wool of which is coarse. The inhabitants have abundance of goats, swine, poultry, and bees. In the forests there are bears, wolves, foxes, stags, wild boars, flying squirrels, hares, and game. The lakes and rivers produce various kinds of fish, especially smelts, of which immense quantities are dried and exported. The minerals are iron-ore, freestone, limestone, marl, and fuller's-earth.

The commerce of the government is greatly facilitated by the Duna, by which all its surplus produce is conveyed in light boats to Riga and Pernau; hemp is sent in sledges to St. Petersburg. Greater facilities have been given to commerce by the *Berezina Canal*, which connects the Duna and the Dnieper. The principal articles of export are hemp, dried fish, corn, flour, bristles, horses, square timber, masts, linned, flax, oxen, wool, hides, tallow, honey, and wax.

Vitepsk, the capital of the government, to which it gives its name, is situated on the Duna, at its confluence with the *Viteba*, in 55° 6'

N. lat., 30° 5' E. long., and has about 17,000 inhabitants. The town is surrounded with ancient walls and towers. The principal part of it is built on the left bank of the river. On the right bank is the old castle, surrounded with a very lofty rampart, and the handsomest buildings. The streets are on the whole narrow and irregular, and there are only a few stone houses. One of the finest edifices is the convent of Greek monks of the order of St. Basil. There are 14 churches; 8 monasteries, of which 6 are Roman Catholic and 2 Greek; and 2 nunneries. Vitepsk has many charitable institutions, a large bazaar, several woollen-cloth factories, and tanneries.

Welisch, or *Wieliz*, a town with 6800 inhabitants, of whom 1000 are Jews, also situated on the Düna, has a considerable trade in the produce of the country. The public buildings are—nine churches, a synagogue, and a citadel.

Polotsk, mentioned in the ancient Scandinavian traditions anterior to Rurik, is situated near the right bank of the Düna, north-east of Vitepsk, and is slightly fortified. The handsomest building in the town is the former college of the Jesuits, with a beautiful church. The population of Polotsk is about 10,000.

VITERBO, a province of Central Italy, in the States of the Church, is bounded N. by the province of Perugia, E. by those of Spoleto and Rieti, S. by the Comarca di Roma and the province of Civitá-Vecchia, and W. by the Tuscan Sea and Tuscany. The area is 1083 square miles: the population in 1850 numbered 129,074. The surface is hilly in the north. The eastern part of the province lies in the basin of the Tiber; the central part consists of the basin of the Lake of Bolsena, and its outlet the river Marta; and the western part consists of the lower valley of the river Fiora, which, rising in the Tuscan territory, enters the Papal State, and after a course of nearly 50 miles falls into the sea below Montalto. These three basins or valleys slope southward towards the sea, and merge in the unhealthy maritime plain of the Maremma, which extends along the sea coast. There is a good deal of fertile land in the province, which yields wine, oil, and corn. Great numbers of cattle are reared. Alum is very abundant.

The ridge called Cimino, the ancient Ciminus, of volcanic formation, runs from north to south for a length of about 30 miles, from Monte Soriano, north-east of Viterbo, which is its highest summit, being 4000 feet above the sea, to Monte Virginio near the lake of Bracciano, and divides the basin of the Tiber from that of the Lake of Bolsena. The Ciminus and its impervious forest arrested for many years the progress of Roman conquest on the side of Etruria. It is still a well-wooded and picturesque mountain. Between Ronciglione and Viterbo it is crossed by the high road from Rome to Florence. A succession of lower hills incloses the lake of Bolsena on three sides, leaving an opening to the southward, through which flows the river Marta. [BOLSENA.] On the south-east, between the lake and the Ciminian ridge, is a wide plain, at the south-eastern end of which is the town of Viterbo.

Viterbo, the capital of the province, a bishop's see, and the residence of the delegate or governor, is pleasantly situated at the northern base of the Monte Cimino, on the high road from Rome to Florence, 40 miles north-west of Rome, and has about 14,000 inhabitants. It is a large well-built town, inclosed by walls and towers; it has more than fifty churches, several convents, and other considerable buildings; the streets are well paved but narrow, and adorned with handsome fountains. The cathedral of San Lorenzo is adorned with some good paintings, and with the monuments of popes John XXI., Alexander IV., Adrian V., and Clement IV. Villani (vil. 40) says that Prince Henry of England, son of the Earl of Cornwall, was murdered at the high altar of the cathedral of Viterbo by Guy de Montfort, fourth son of Simon de Montfort, who fell at the battle of Evesham. Dante alludes to this tradition in the 12th canto of his 'Inferno.' In the piazza before the cathedral Pope Adrian IV., an Englishman, compelled the emperor Frederick Barbarossa to hold his stirrup while he dismounted from his mule. The episcopal palace annexed to the cathedral dates from the 13th century; it contains the great hall where the conclaves of the sacred college were held for the election of several popes in the 13th century. The other ecclesiastical edifices worthy of notice are—the church of Santa Rosa, where the body of that saint is preserved. The church of Santa Maria della Verità, outside of the walls, which has a very good fresco painting representing the 'Spasazio,' or Marriage of the Virgin Mary, by Lorenzo di Giacomo of Viterbo, a pupil of Masaccio, and the church of San Angelo in Spata, which contains a Roman sarcophagus with a basso-relievo, and an inscription, which says that it was used as a sepulchral urn for the fair Giuliana, a beauty of the 12th century, whose charms are said to have caused a war between Rome and Viterbo, in which the Romans were defeated.

The Palazzo Publico, or town-hall, begun in 1264, has some good paintings and a collection of Etruscan sepulchral monuments and other antiquities. The old palace of the Farnese family is now a founding hospital. Viterbo is celebrated by old Italian writers for the beauty of its women and its fountains.

It is the commonly received opinion that the *Fœderus Volturnæ*, at which the ancient Etruscans held the general meeting of deputies of the different states of their confederation, was on the site of Viterbo. The name indicates that there was a temple on the spot, but the meetings were of a political nature, although originally they may have been of a merely religious character. There was no town in ancient

times on the spot, but a large fair seems to have been held simultaneously with the meetings of the deputies. Viterbo is said to have been built, or inclosed, by Desiderius, the last king of the Longobards, and to have been peopled by the inhabitants of several ruined towns of the neighbourhood. It governed itself for a long time during the middle ages as a free municipality, and was often at war with the people of Rome, to which it was obliged at last to make its submission about the year 1200.

The population of Viterbo and its neighbourhood are supported chiefly by agriculture; wine and oil are the principal produce of the country. There are however some manufactures of woollens. Many of the landed proprietors and local nobility reside at Viterbo.

VITORIA, a town of Spain, in the Basque Provinces, capital of the province of Alava, or Vitoria, is situated on an eminence overlooking an extensive plain, through which, at a short distance to the north, flows the river Zadorra. It is on the main road from France to Madrid, from which city it is distant about 190 miles N.N.E. The population in 1845 was 14,901. The town consists of an old part, with narrow tortuous streets and a curious old plaza, and of a modern part, with wide and regular streets of good houses, and a modern plaza, which is an arcaded square of 220 feet each side, with shops beneath, the town-hall forming the southern side, and the centre being used as the market-place. The town contains a collegiate church and four parish churches, a custom-house, a handsome general hospital, of classical architecture, an orphan asylum, a small theatre, a public library, and a museum of antiquities. The manufactures consist of iron-ware, earthenware, linen-cloths, leather, and candles. The town is also an important centre of trade between Bilbao, San Sebastian, Bayonne, and Castilla la Vieja. The alamedas El Prado and La Florida are delightful public walks. Vitoria is an ancient town, and was probably occupied by the Romans. Sancho el Sabio of Navarra, about 1180, named it Vitoria in commemoration of a victory gained over the Moors. The French occupied it from 1808 till June 21, 1813, when they were defeated by the British under the Duke of Wellington, who soon afterwards followed the retreating army over the Pyrenees into France. (Ford, *Handbook of Spain*.)

VITRÉ. [ILLE-ET-VILAINE.]

VITRY. [MAINE; PAS-DE-CALAIS.]

VIVARAIS, LE, a province of the former government of Languedoc in France, lay chiefly between the Cévennes and the Rhône, from Mont Lozère to a little north of Annonay, and took its name from its chief town, Viviers. It now forms the department of ARDÈCHE. The remaining part of the Vivarais extended west of the Cévennes, and is now included in the southern part of the department of the Haute-Loire.

VIZAGAPATAM. [CIRCARS, Northern.]

VIZCAYA. [BASQUE PROVINCES.]

VIZEU. [BEIRA.]

VIZILLE. [ISÈRE.]

VLAARDINGEN. [HOLLAND.]

VLADIMIR, or WLADIMIR, a government in the centre of European Russia, is bounded N. by Twer, Yaroslav, and Costroma, E. by Nischnei-Novgorod, S. by Riäsan, and W. by Moscow. Its area is 18,240 square miles; the population in 1846 was 1,246,500. The face of the country is an undulating plain, diversified by low hills, by the steep banks of the rivers, and extensive forests; there are also many heaths and morasses.

The principal river is the Oka, which traverses the south-west of the government. It is joined by the Kliazma, which comes from the government of Moscow, crosses this province nearly in the middle, and joins the Oka in Nischnei-Novgorod. Its affluents are the Nerl, Sudogda, Sobitka, Kolokscha, Kamanka, Tessa, and some others. There are 22 large and small rivers, all of which have very pure water, and abound in fish. Among the numerous lakes, the two largest and most remarkable are the Peganowoe, in which floating islands are sometimes seen; and the Fleschtæhejew, which is about 5 miles long and 4½ miles broad, and is celebrated on account of the nautical exercises of Peter the Great.

The rivers freeze in the middle of November, and thaw in March. The winter is very cold; the summer is very hot; the spring and autumn are variable. Night-frosts continue till May, and return at the end of September. The climate on the whole is healthy.

Agriculture is the chief occupation of the inhabitants; but though the soil is in some parts fertile, the heaths, marshes, sandy tracts, and forests cover so great an extent of surface, that the produce of the harvest is not sufficient on an average for the home consumption. Wheat, rye, barley, oats, millet, and peas are cultivated. The gardens produce all kinds of vegetables common in Russia, and most of them are full of apple- and cherry-trees; amongst the former is the beautiful transparent apple called Nakiwni. Some hops, flax, and hemp are also grown. Game, except hares and partridges, is rare; but bears, wolves, and lynxes are still met with. Wild berries of various kinds abound. The breed of horned cattle is merely sufficient for the wants of the province; the breed of horses is excellent. The peasants breed plenty of domestic poultry. The principal fish are sturgeon and shad: what is not consumed in the provinces is sent to Moscow. The minerals are iron, alabaster, good potter's-clay, and freestone.

Besides the manufacture of thread, worsted, linen, and coarse woollens for home use, the government has important manufactures of linen, cotton, leather, iron-ware, glass, and crystal. The exports comprise the products just named, and paper, soap, potashes, fruit, timber, fire-wood, stone for building and millstones, and lime.

Vladimir, the capital, is situated in the centre of the government, in 56° 17' N. lat., 40° 20' E. long., on a group of hills which rise above a fertile plain on the left bank of the Kliazma, which flows under the walls. It is one of the oldest cities in Russia, and from 1157 to 1828 was the residence of the grand-dukes and the capital of Great Russia. With the exception of its numerous churches and stone houses Vladimir has few traces of its former greatness; there are no vestiges of the palace of the princes, and the Golden Gate has nothing magnificent except its name. The city is still large, but ill built, and has 6 gates, terminating the 6 principal streets. Of the 25 churches, the cathedrals of St. Mary and Demetrius are remarkable in the history of Russia. There are 2 convents, an ecclesiastical seminary, and several crown buildings. The bishop of Vladimir and Susdal has a palace here. The inhabitants manufacture silk veils and handkerchiefs, and have some tanneries and soap manufactories.

Pereaslavl-Zaleskoe is situated on the river Trubesch, where it empties itself into Lake Plechtachejew. It is an old town with several churches and convents, which are the only important structures in the place. The population is 4000, who manufacture linen, silks, and woollen-cloths. They have a profitable transit and commission trade.

Murom, with 6500 inhabitants, an ancient town, was once the capital of the Mordwins, and afterwards the residence of Russian princes; it has 3 convents, 18 stone and 7 wooden churches, and several crown buildings. The inhabitants have some manufactures and considerable trade.

VLIELAND. [HOLLAND.]

VLISSINGEN. [FLUSHING.]

VOGHERA, a province of Piedmont, in the administrative division of Alessandria, is bounded N. by the Po, which divides it from the province of Mortara and from the Austrian crownland of Lombardy; E. by the duchy of Parma and Piacenza; S. by the provinces of Tortona and Bobbio; and W. by the provinces of Tortona. Its area is 308 square miles, and its population in 1848 was 101,695. It lies mostly in the plain of the Po, but the southern part of it includes the northern slope of the Ligurian Apennines, from which the Staffora and other torrents descend and cross the plain to join the Po. The country produces much silk. The head town, *Voghera*, originated in a suburb of the ancient town of Iria, and this circumstance seems also to have given origin to the name, which is a corruption of *Vicus Iriae*. *Voghera* has 11,000 inhabitants, who manufacture woollens and silks; the only building in it worthy of notice is the collegiate church, which is of good architecture. *Voghera* is in a plain on the Staffora (which as well as the town was in ancient times called *Iria*), at the intersection of the high roads from Turin to Modena, and from Genoa to Milan by Pavia. The town is begirt with walls.

The other towns of the province are—*Stradella*, with 5000 inhabitants, situated on the high road from *Voghera* to Piacenza, and near the borders of the duchy of Parma; *Broni*, or *Bronsi*, a post-town on the same line of road, with 3000 inhabitants; and *Catoggio*, which has 2500 inhabitants.

VOIGTLAND, or VOGTLAND, is the land formerly possessed by the officers called Voigte (advocates) of the empire, the predecessors of the present princes and counts of Reuss. Their country comprehended the present circle of Voigtland in the kingdom of Saxony, the bailiwick of Weyda in the grand-duchy of Saxe-Weimar, the possessions of the princes and counts of Reuss, the lordship of Hof (now belonging to Bavaria), and the bailiwick of Ronneburg in the duchy of Saxe-Altenburg. The descendants of Henry the Elder, Voigt of Plauen, sold or mortgaged various portions of these possessions; and at length, in consequence of such a mortgage, the Elector Augustus of Saxony, who in 1560 had acquired by purchase the bailiwick of Weyda, Arnschank, and Ziegenrück, purchased in 1569 the lordships of Plauen, Voigtberg, and Pausa. They were formed into two circles: that of Neustadt, which was ceded to Prussia by the treaty between Prussia and Saxony concluded at Presburg, May 18, 1815; and the circle of Voigtland, which remained to Saxony, and forms the most western part of that kingdom. This circle has an area of 556 square miles. According to the nature of the country, it is divided into two portions, the Mountain and Forest Region, and the Land Region. The first is the mountainous and thickly-wooded tract on both sides of the Mulda next the circle of the Erzgebirge, which it greatly resembles. The climate is cold and the soil stony; the only kind of grain produced is oats, and the only vegetables are potatoes. In the other portion, called the Land Region, the surface of the ground is covered with a rich mould, the climate is milder, and the weather and temperature much less variable. The highest mountains are the Schneckenstein and the Rammelsberg, on the frontiers of Bohemia: the principal rivers are the Elster, the Mulda, and the Gölsch. In the valleys most agricultural products are successfully cultivated. Flax is a very important crop. The circle has a very fine breed of horned cattle and sheep. Game and fish abound, and pearls are found in the Elster. One of the chief productions is timber, of which large quantities are exported. The minerals are copper, iron, alum, lime,

and slate. The chief occupation of the inhabitants is the manufacture of linen, cotton, woollen-cloth, and muslin. The chief town of the Voigtland is PLAUEN.

VOIRON. [ISÈRE.]

VOLCHOW, or WOLCHOW, RIVER. [NOVOGOROD.]

VOLGA, called by the Tartars *Etch*, that is, 'the bountiful,' is the longest river, and, with the exception of the Danube, has the largest volume of water of any river in Europe; and its entire course is within the Russian empire. It rises in 57° N. lat., on the frontier of the governments of Twer and Novogorod, near the village of Wochina-Werchowia, issuing from a small lake formed by several springs, and it flows through the lakes of Oselok, Plara, and Volga, which it quits about 90 miles above Twer. Near Ostuschkof it receives the Selicharowka, which issues from Lake Seeliger, and attains the breadth of 150 feet; at Rahew-Vladimirov it becomes navigable for small boats, and at Twer, where it is 700 feet broad, for large barges. Having traversed the government of Twer in an easterly direction, it turns to the north-east to Yaroslav, then south-eastwards to Kostroma and to Nischnei-Novgorod, where it receives the Oka; thence to Casan, where, having been joined by the Kama, it becomes 1000 yards broad, and having passed Simbirak, Saratov, and Astrachan (where in time of floods it is above 10 miles across), it divides into eight branches, which inclose 70 islands, and discharges itself by 65 mouths into the Caspian Sea. The rivers which join it, with the exception of the Oka, before it reaches Casan, are of no great magnitude; but the Kama, which joins it at Casan, after a course of 1000 miles, makes a vast accession to its waters.

The Volga is of the utmost importance for the facility which it affords to the trade of the interior of the empire, and also to its foreign commerce; the Russian government having, by a judicious system of canal navigation, so connected the various navigable rivers, that the Polar Sea communicates with the Caspian by a navigation of 4000 miles on the Dwina, the Volga, and canals. The entire length of the Volga is above 2000 miles, and its total fall is only about 60 feet. It flows with a slow regular current uninterrupted by rapid or cataract. It is stated that the volume of its waters is gradually decreasing: at the beginning of the 18th century it had depth enough for freights of 1600 tons; it does not now bear vessels of more than 1200 tons.

The banks of the Volga are extremely fertile, even the yet uncultivated parts; and there is no other part of Russia where so much oak timber grows as in the vicinity of this river. The navigation of the Volga is much obstructed, in the dry season of the year, by shallows and islands; but in May and June the melting of the snow and ice swells its waters, and often causes extensive inundations. At this season its depth is so increased that large ships can pass over the sand-banks and low islands (which are then completely under water), and descend it in safety from Twer to Astrachan. The Volga, especially from Astrachan to the Caspian, is more abundant in fish than perhaps any other river in the world. Immense numbers penetrate from the Caspian Sea to a considerable distance into the several mouths of the Volga, and many thousand small vessels are employed in the fisheries. The fish taken in the largest quantities are sturgeon, carp, and pike of extraordinary size. Caviar is made of the roe of one species of sturgeon, and isinglass from the skin and entrails of another, which is called by the Russians *Beluga*. Seals also come from the Caspian into the mouths of the Volga, where they are taken. Steam-boats ply on the Volga from the Twer to the Caspian.

VOLHYNIA (Wolynsk), a government of West Russia, is bounded N.W. by Grodno, N. by Minak, E. by Kiew, S. by Podolia, and W. by Galicia and Poland. Its area is 27,434 square miles; the population in 1846 was 1,445,500.

The country is an elevated level extending at the foot of the Carpathian chain. On the northern frontier there are extensive peat moors and morasses, and where there are hills they are clothed with the finest forests, chiefly of pine, though there are some which consist entirely of oaks, beeches, and limes. The southern portion is undulating, and has two ridges of low hills, which enter it from Podolia and decline towards the centre of the province. These chains of hills (generally not more than 300 feet high), are covered with forests, and are to be considered as the extreme offsets of the Carpathians on this side. In the southern district they rise to the plateau of Awratyn, to which some give an elevation of 1000 feet. This plateau extends from Awratyn to Bieloserka (from the north to the south-west) for about one degree; and forms part of the watershed between the Baltic and the Euxine. There is no great river in the government. There are great numbers of large ponds, and several mineral-springs. The climate resembles that of Southern Germany, only that the winter is rather more severe, and the night frosts protracted to a later period, so that the rivers are every year frozen. There are no prevalent endemics except the *Plica Polonica*. Locusts periodically desolate the fields.

Volhynia is one of the most fertile provinces of Russia, and there is perhaps no other in which agriculture is so general and so flourishing. But agriculture is still in a backward state, and farming implements are rude. The rich crops of grain are to be attributed to the fertile soil. In the northern border, where there are many marshes, there are the most luxuriant pastures. Besides rye, barley of several

kinds, oats, millet (which thrives especially in the heavy marsh-lands), the farmers cultivate several species of wheat of the finest quality. A large surplus of corn is annually exported. Flax and hemp are grown in great abundance, and here and there rapeseed, tobacco, and pulse: linseed, hempseed, and oil are exported. All the ordinary vegetables are cultivated in the gardens. Mustard, saffron, capsicum, hops, and tobacco are commonly grown; and chamomile, panic-grass (*Manne de Pologne*), and wild asparagus, are gathered in the fields and meadows.

The forests are very extensive. Great quantities of timber and firewood are conveyed to the Dnieper, partly by rafts, partly by land-carriage; the forests also furnish much pitch, tar, charcoal, and potash. The wild animals found in them are stags, elks, fallow-deer, wild boars, hares, squirrels, martens, polecats, weasels, beavers, and otters, a few bears, lynxes, and wild-cats, and many wolves and foxes. Wild berries of various kinds abound, and truffles and mushrooms are commonly met with.

The rich pastures are very favourable to the breeding of cattle. The Volhynian oxen are fine animals, and great numbers are exported. The management of the dairy is not well understood. The horse, when properly tended, is larger and stronger than the other Polish horses, though of the same breed: the horses of the peasants and poor Jews are in general inferior. The sheep are mostly of the Polish breed. The farmer has fewer goats than swine; poultry is very abundant; great numbers of bees are kept, and the honey is very fine. The rivers furnish abundance of fish, and on all the estates there are regular carp-ponds.

Bog-iron, saltpetre, building-stone, millstones, potter's-clay, porcelain clay, and limestone are found.

The women in the villages knit, spin, and make coarse linen and woollen cloth; the men prepare potash, pitch, tar, and charcoal. Manufactures have greatly extended in Volhynia since the commencement of the present century. The principal products are linen, leather, woollen-cloths, earthenware, porcelain, and paper.

The Dnieper is near enough to afford easy communication with Odessa. The articles exported are the products already enumerated, and some manufactured goods. The cattle, horses, honey, and wax find a ready market in Austria and Poland, whither they are conveyed by the Jews, who have the whole trade of the province in their hands. There are great fairs at Dubno and Ostrog.

The principal towns are—*Schitomir* (in Polish, *Zytomiers*), the capital of the government, situated on the river Teterow. Before it came under the dominion of Russia it was an insignificant place, with less than 2000 inhabitants. It has now a population of about 12,000, who have a considerable trade in woollen-cloths, linen, silks, calicoes, leather, wax and honey, and Moldavian and Hungarian wines. *Berdykiew*, an ugly ill-built town, is one of the most considerable in the country; it has several churches, and a large fortified Carmelite convent. The population is stated to be between 30,000 and 40,000, of whom a great proportion are Jews. There are several respectable Christian merchants, who carry on a considerable trade in the productions of the country. *Iaslau*, with 5000 inhabitants, has four Greek churches, one Roman Catholic church, a monastery, and a synagogue. *Ostrog*, on the Wellija, consists of the old and the new towns; it contains an ancient castle, several Greek and Roman Catholic churches, a Basilian convent and school, and about 5000 inhabitants, of whom many are Jews. *Kremenetz* is situated at the foot of a high mountain, on which there is a castle or citadel. It has several Greek churches, a monastery, and 8000 inhabitants.

VOLOGDA, an extensive government of European Russia, extends from 58° 30' to 64° 40' N. lat., 38° 20' to 59° 40' E. long. It is bounded N. by Archangel, N.E. by Tobolsk, S.E. by Perm and Viatka, S. by Kostroma, S.W. by Yaroslav, W. by Novgorod, and N.W. by Olonetz, and comprises an area of 147,422 square miles.

The surface of this government is an immense plain, which extends on the east to the Ural Mountains, and is only traversed by a lateral branch of that chain, which crosses the north-eastern part: it contains vast forests, extensive morasses, and some lakes. The soil is very various: there are however large tracts in which the surface is covered with a rich mould, and in most parts the soil is susceptible of cultivation. The most fertile part is the south-west.

Besides the Ural and its north-western offset, which runs along the bank of the Petschora, there is here and there a hill, which is called a mountain. The north-eastern chain, here called *Pojas-Kamennoi*, or the Stony Girdle, evidently forms the watershed between the Dwina and the Petschora. It is thickly wooded, about seven miles broad, and continues to rise as it runs to the north.

The principal rivers are—the DWINA, which is formed by the union of the Jug and the Suchona. The *Vaga*, a feeder of the Dwina, which issues from a morass, where it is already above 1200 feet in breadth. The *Petschora*, which rises in the Ural Mountains at the point where the governments of Vologda, Tobolsk, and Perm meet. This province has also a canal, called the North Catherine Canal, begun in 1736 and completed in 1817. It is 12 miles in length. It unites two rivers, both called *Keltma*, one a tributary of the *Wytschegda*, and the other of the *Kama*, a tributary of the *Volga*, by which the *Wytschegda* communicates with the *Kama*, or the Dwina, and the Frozen Ocean with the Caspian Sea.

GEOL. DIV. VOL. IV.

The most considerable lakes are—the Kubenskoe, which receives the Kubana and 20 other small rivers, and from which one branch of the Suchona issues. The island of *Kamennoi* is on this lake. The two lakes called *Piätisorskoi* are very deep. Lake *Sandor*, 10 miles long and 3 miles broad, the waters of which are said to heal wounds and ulcers. Lake *Kondas*. There are numerous morasses in this government, some of which are 25 to 45 miles in circumference.

The climate is cold but very salubrious: it however varies considerably in different parts of the province. The winter is much longer in the north-eastern than in the south-western portion. The rivers generally freeze in November and thaw in May.

Agriculture requires the utmost care, and the ground requires to be well manured. Rye, barley, and oats are grown. Flax and hemp are extensively cultivated; and likewise some hops, peas, and beans. In the south-western circles the produce is sufficient for the home consumption; but towards the north and north-east it gradually diminishes, and a considerable quantity is imported. In the north-east cabbages, turnips, and garlic thrive; in the south-west the gardens produce not only most of the vegetables common in Russia, but also apples and cherries. The forests constitute the wealth of the province. The chase furnishes many valuable articles both for the inland and foreign trade. The wild animals are elks, reindeer, ermines, martens, weasels, squirrels, hares, gluttons, bears, wolves, lynxes, foxes and wild-cats, various kinds of birds and water-fowl, among which are twelve species of ducks. Horses, oxen, sheep, goats, and swine are numerous. The rich pastures east of the Dwina and the many salt-springs are favourable to the rearing of cattle, and the breed both of horses and oxen is in great repute.

The minerals are iron, copper, granite, freestone, quartz, felspar, whetstones, limestone, and salt. The salt-springs are very important, and supply almost the whole consumption of the province.

There are manufactories of woollen cloth, linen, glass, iron-ware, and paper. There are also brandy distilleries, tanneries, and manufactories of candles. Vologda may be regarded as the centre of the trade of Siberia with Archangel, being situated on the great road between them, and a very active trade is carried on in the summer on the rivers, and in the winter on sledges. The principal trading towns are Vologda, Totma, and Ustiug. The several annual fairs are very well attended.

The population of this government, amounting to 822,200 in 1846, consists chiefly of Russians. There are also some Syrians, who are a remnant of the ancient Finnish inhabitants; and Samoiedes, who wander in the inhospitable deserts of the north-east, on the banks of the *Petschora*.

Vologda, the seat of government, and the see of the bishop, is situated in 59° 12' N. lat., 40° 10' E. long., on both sides of the river Vologda. The population is about 14,000. Vologda is an open town, consisting of two principal parts, each of which is divided into four quarters. The town contains about 50 churches, 6 of which are of stone; a monastery; a nunnery; a theological seminary for 600 priests' sons; a gymnasium; a district school; and many buildings and magazines belonging to the crown. The inhabitants manufacture linen, silks, leather, sealing-wax, white-lead, colours, vitriol, and have very extensive tanneries and candle manufactories; they likewise make superior articles in gold, silver, enamel, and lacquered ware. The merchants trade extensively with St. Petersburg and Archangel, with China and the Aleutian Islands. They are also connected with Hanseatic merchants. The city is surrounded with gardens, which produce good vegetables and some fruit.

Totma, on the Suchona, consists of three broad streets, has 17 churches, 3 convents, several magazines, and 3000 inhabitants, among whom are many artisans and intelligent merchants, who have a profitable retail trade, and a considerable commerce with Archangel and Siberia.

VOLONNE. [ALPES, BASSES.]

VOLTAGGIO. [GENOA.]

VOLTERRA, a town of Tuscany, in the province of Pisa, is built on the sight of Volaterræ, one of the most ancient of the Etruscan cities. Volaterræ is first mentioned by Livy (x. 12) under the year B.C. 298, when the people fought bravely against the consul L. Cornelius Scipio. It became eventually a municipium. The people of Volaterræ, having espoused the party of Marius, were besieged by Sulla two whole years. The city suffered severely from the invasion of the Vandals; after them it came under the dominion of the Lombards, who were driven out in the 8th century by Charlemagne, and Volterra became an imperial town, governed by the counts, marquises, or officers of the emperors, who often deputed the bishops of the diocese to administer the government. Like other cities of Italy, Volterra was torn by the contending factions of the Guelphs and Ghibellines. The former having prevailed, the Volterrani were induced to unite themselves to the Pisan republic.

Volterra is 50 miles from Leghorn, about 40 miles from Florence, and 30 miles from Siena. It is situated on a hill, the west sides of which are extremely precipitous, and, owing to the soft nature of the material, a species of marl, are continually wearing away and encroaching on the site of the town. On the north are found the numerous sepulchral chambers, called by the Italians 'Ippogei,' to which Volterra owes its remarkable and unique museum of cinerary urns or sarcophagi.

A most interesting public Etruscan museum, consisting of cinerary sarcophagi, gold ornaments, gems, weights, bronzes, coins, and objects in terra-cotta, has long been formed in Volterra. Some fragments of walls and columns and an arched gateway of Etruscan workmanship are all that now remain of the ancient constructions. The huge blocks of stone in these remains are uncemented. The Etruscan arch is decorated with three sculptured human heads; one adorns the key-stone, and two are carved on the springing stones of the arch above the impost; the impost itself retains its mouldings in excellent preservation.

The modern city is walled, and possesses a fortress partly constructed on the site of the ancient Etruscan walls. Within the fortress is a circular tower called the Mastio, which has served as a state prison. Volterra contains a cathedral, several churches, a theatre, several palaces, a Monte-di-Pieth, and an antiquated town-hall, begun in 1208 and finished in 1257. In this building, on the ground-floor, is the museum of sarcophagi found in the tombs, and above is placed the public library. A gloomy palace, constructed in the 10th century, was the residence of the Capitano di Giustizia, when Volterra was a free and independent city: it afterwards became the residence of the podestà, or mayor. This building has been the theatre of many scenes of violence. The streets are narrow, and, except the main streets, badly paved; the houses are often of great antiquity, consisting in many instances of towers modernised. The population may be about 5000.

The chief business of the Volterrani is the carving of alabaster; they supply vast quantities of carved ware to the markets of Florence, Leghorn, and Pisa.

VOLTRI. [GENOA.]

VOLVIC. [PUY-DE-DÔME.]

VOORN. [BRILL; HOLLAND.]

VOORNE, ISLAND. [MEUSE, RIVER.]

VOREPPE. [ISÈRE.]

VORONETZ, or WORONESCH, a government of Russia in Europe, is situated between 48° 35' and 52° 50' N. lat., 37° 45' and 43° E. long. It is bounded N. by Tambov, N.E. by Saratov, E. and S.E. by the country of the Don Cossaks, S.W. by Ekaterinoslav, and W. by Charkow. Its area is 25,591 square miles, and it is divided into twelve circles.

The face of the country is an undulating plain traversed by low ridges and chalk-hills. The soil consists partly of clay, partly of sand, for the most part covered with a pretty thick layer of vegetable mould, which is so fertile that it requires only a periodical fallow.

The principal river is the DON, which comes from Tambov, and, traversing the government from north to south, receives most of the other rivers, such as the Voronetz, which is navigable by large barges, the Sosna, the Ikoretz, the Donez, and some others. The climate is temperate and healthy. The inhabitants live to a great age, and the productions of temperate climates flourish. Melons are raised in large numbers, and are sent to Moscow and St. Petersburg. The rivers freeze about December, and thaw in the beginning of March.

Voronetz is one of the great corn provinces of the empire. The farmers grow wheat of different kinds, barley, oats, buckwheat, millet, and maize—the last only in gardens; poppies, lentils, peas, flax, and hemp are grown in the fields. Horticulture is very carefully attended to; the gardens produce all the kinds of vegetables that are grown in Germany. Hops are grown in small quantities. The most common fruits are cherries and plums. Vines grow in sheltered situations, and the grape ripens in warm seasons. The forests are very nearly thinned. Pines are rare; but there are remarkably fine oaks. The rich pastures on the banks of the rivers and the extensive commons are favourable to the breeding of cattle, which is a very general occupation of the inhabitants. There are numerous flocks of sheep and herds of swine; oxen suffice only for the home consumption. There are many small studs of horses of the Russian race. The most common domestic poultry are geese and barn-door fowls; bees are very generally kept. The minerals are iron (but no other metal), chalk, limestone, freestone, and saltpetre.

The manufactures of the province are not of great importance. The exports are the natural productions of the country—corn, cattle, hides, timber, bristles, some coarse cloth, saltpetre, honey, and wax. The chief commercial cities are Voronetz and Ostrogobak; but there is great want of good water-carriage, the Don being navigable only in the spring, when the water is high. The Donez merely touches the frontier, and has not one town on its banks.

The population of this government was 1,657,900 in 1846. The inhabitants are in the northern part Great Russians, and in the southern Little Russians. Among the latter are included the Cossaks, or Tscherkassians, as they are here called, after their ancient capital; there are also some gipsies and Germans.

Voronetz, the capital of the government, the residence of the governor and of the Bishop of Voronetz, is situated in 51° 40' N. lat., 39° 23' E. long., on the river Voronetz, which falls into the Don two miles below the city. Voronetz is built on a very steep rock, and possesses strong natural defences. It is one of the oldest cities in the empire, and is mentioned in 1177. Peter the Great had a dockyard here for building ships, with which he intended to descend the Don to the sea. He often resided here, and built himself a palace, no vestige of which now remains. The city consists of three parts, the

upper town, the lower town, and the suburbs. The upper town contains the residence of the governor and the public offices, the bishop's palace, the cathedral, the bazaar, and the town-hall. In the city are 18 stone churches, 2 convents, a poor-house, a gymnasium, an ecclesiastical seminary, an arsenal, and several schools. The population is probably over 20,000. The streets are very broad, but not paved. The manufactures are cloth for the army, leather, soap, and vitriol. There are some breweries and brandy-distilleries. The merchants of Voronetz trade with all parts of the empire.

Ostrogobak, about 60 miles S. from Voronetz, is a small commercial town with several churches. The population is about 4500, who carry on an extensive trade. The three annual fairs are visited by merchants from the most distant parts, and even by Greeks, who bring many Turkish goods. At a distance of about 10 miles there is a small colony of Germans, whose chief occupation is agriculture.

VOSGES, a department in the eastern part of France, is bounded N. by the department of Meurthe, N.E. by that of Bas-Rhin, E. and S.E. by that of Haut-Rhin, S. by Haute-Saône, W. by Haute-Marne, and N.W. by the department of Meuse. Its form is that of an irregular quadrangle, of which the northern side measures 35 miles, the southern 45 miles, the eastern 53 miles, and the western 41 miles. The department is comprehended between 47° 48' and 48° 33' N. lat., 5° 27' and 7° 20' E. long. Its area is 2347 square miles. The population in 1851 was 427,409.

The surface is mountainous in the east, in the other parts (which constitute what is called the Plain) hilly. The Vosges Mountains, from which the department takes its name, extend along the eastern boundary; and the Faucilles traverse the department from west to east, and unite with the branches of the Vosges about Plombières, in the south-eastern part of the department. The Vosges Mountains present a great variety of picturesque and delightful scenery. The Ballon-d'Alsace, one of their highest summits, at the point where the branch which joins the Faucilles diverges from the main chain, is 4124 feet high; Le-Bressoir, a neighbouring summit, is 4049 feet; and Le-Grand-Donnon, farther north, is 3314 feet.

The Vosges, and that part of the Faucilles which is nearest to the Vosges, are composed chiefly of granitic rocks. Upon the granite rests the red and the variegated sandstone; upon these sandstones lie fossiliferous limestone and variegated marl; and above these lies the lower oolitic rocks. [VOSGES MOUNTAINS.] These formations cover the whole of the department; the upper formation, the oolitic, occupying the western side, and the others successively cropping out as we advance eastward. The mineral treasures of the department are considerable. Granite, porphyry, freestone of a black colour, millstones, slates, coal, gypsum, and agates are found. Iron-stone is procured. There is a great number of iron-works for the manufacture of pig-iron, wrought-iron, and steel. Copper, silver, and manganese, are also found among the minerals, but no mines are now worked.

The department belongs chiefly to the basin of the Rhine. A small portion, which extends in the north-eastern corner, across the ridge of the Vosges, is drained by the Bruche, which rises in those mountains and flows down into the Ill near Strasbourg. The central parts are drained by the MOSELLE [vol. iii. col. 874], one of the largest affluents of the Rhine, and its tributaries. It receives the Vologne and Durbion on the right bank. The Meurthe rises in the slopes of the Vosges, on the eastern side of the department, and flows north-west into the adjacent department of Meurthe, where it joins the Moselle. The Mortagne, a feeder of the Meurthe, and the Madon, a feeder of the Moselle, rise in the department of Vosges, but do not join their principal streams till they reach the department of Meurthe. The Plaine and the Rabodot, feeders of the Meurthe, rise in other departments, but join their principal stream in this. The north-west of the department is drained by the Meuse, which crosses it from south to north, and by its feeders. A very small district in the north-west is drained by the Ornain, which belongs to the system of the Seine.

The southern border of the department belongs to the basin of the Rhône, and is drained by the Saône, which rises on the southern slopes of the Faucilles, and by the Coney, the Angronne, and the Combautte, which flow directly or ultimately into the Saône.

None of these rivers is navigable in the department of Vosges. Irrigation is well managed; and the streams of the department are skillfully applied as a moving-power to the purposes of manufacture. There are several chalybeate, and also warm saline mineral-springs. There are also several small lakes in the east of the department. The department is traversed by 6 imperial, 23 departmental, and several communal roads.

The area of the department is about 1,450,000 acres, of which about 600,000 acres are under the plough. The soil of the Plain is tolerably fertile; but the produce in corn is inadequate to the supply of the dense population. The principal crop is of oats; barley, wheat, rye, and maalin (wheat and rye mixed), are also grown, and hemp and hops. The grass-lands amount to 180,000 acres, and the heaths and open pastures to about 90,000 acres. The number of horned cattle is very considerable. The dairy is well attended to, and cheese and butter are made in large quantities. Horned cattle are small. Horses too are of inferior size but numerous. A great number of pigs is reared.

The vineyards cover about 11,000 acres, and the orchards and gardens occupy about the same space. The produce of the vineyards is about 5 million gallons a year of ordinary red wine. The quantity of stone-fruits grown is considerable; among them are the quetch or German plum, and the cherry from which kirschwasser is made.

The woodlands have an area of above 300,000 acres, and the forests and wastes 170,000 acres. More than 300 saw-mills, moved by water, are employed in sawing deals, which are floated down the Meurthe and the Moselle to Metz; and staves, which are floated down the Coney into the Saône. Game and fish are plentiful.

The department of Vosges is one of the principal manufacturing departments in France. In the *arrondissement* of Epinal are iron-works, numerous paper-mills, saw-mills, potteries, and tanneries; in the *arrondissement* of Mirecourt are glass-works and iron-works, and a considerable manufacture of lace and musical instruments; in that of Neufchâteau are oil-mills, paper-mills, saw-mills, iron-works, and manufactures of musical instruments and shoes; in that of Remiremont, potash and other chemical products, kirschwasser, and paper are made; and in that of St.-Dié wooden shoes, wooden wares, cotton-yarn and other cotton goods, paper, and wrought iron. The exportation of cheese and timber from the department is very great.

The department is divided into five *arrondissements*, which, with their population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Epinal . . .	126	6	99,585
2. Mirecourt . . .	142	6	73,951
3. Neufchâteau . . .	132	5	65,276
4. Remiremont . . .	37	4	71,256
5. St.-Dié . . .	109	9	117,341
Total . . .	546	30	427,409

1. In the first *arrondissement* the chief town is *Epinal*, which is also the capital of the whole department. [EPINAL.] *Rambervillers*, a well-built town with 4800 inhabitants, is situated on the right bank of the Mortagne, over which is a stone bridge communicating with a suburb on the opposite bank. The townsmen manufacture coarse woollen-cloth, linen, paper, leather, earthenware, madder, iron, and jewellery. Considerable trade is carried on in corn, hemp, iron, paper, and hops. The town has a hospital and a public library of 10,000 volumes.

2. In the second *arrondissement* the chief town, *Mirecourt*, on the Madon, 17 miles N.W. from Epinal, has tribunals of first instance and of commerce, a public library of 7000 volumes, and 5194 inhabitants. The town is in a pleasant and highly-cultivated district, but is ill built. The townsmen are chiefly engaged in the manufacture of musical instruments; a great number of church organs and bird-organs, and of base-violins, violins, guitars, and other stringed instruments are made. Lace, leather, and wooden wares are also manufactured; and trade is carried on in wine, brandy, and sheep. There are four yearly fairs. *Mirecourt* has several fountains, and a handsome hospital. *Charmes*, on the left bank of the Moselle, over which is a handsome bridge, has a population of about 2900, who trade in corn, wine, wood, hides, gypsum, and lace, and manufacture lace, kirschwasser, and leather. *Pontenois-le-Château*, on the Coney, and *Durney*, on the Saône, were formerly places of strength.

3. In the third *arrondissement* the chief town, *Neufchâteau*, on the Mouzon, near its junction with the Meuse, 37 miles N.W. from Epinal, has a tribunal of first instance, a college, a public library of 8000 volumes, and 3589 inhabitants. It is a well-built town, and stands on a small eminence surrounded by loftier hills. The townsmen manufacture coarse woollen-cloth, swanskin, cotton counterpanes, wicker wares, and nails and brads; and trade in wood, iron, and hardware. *La-Marche*, near the source of the Mouzon, has about 2000 inhabitants, wrought-iron works, and oil-mills. It was the native place of Guillaume de la Marche, who founded the college of La Marche at Paris. The village of *Domremi*, on the left bank of the Meuse, close to the north-west border of the department, possesses historical interest as the birth-place of Jeanne or Joan of Aro (1412): it takes from this circumstance the distinctive epithet of *Domremi-la-Pucelle*. The house in which Jeanne was born is still standing near the church, and is easily recognised by its gothic doorway surmounted by three escutcheons with fleurs-de-lis, and by an ancient statue representing the maid covered with her armour. It has become national property by purchase, and near it a school for the girls of the village has been built, and placed under the direction of the Sisters of Charity. A monument in honour of Jeanne d'Aro was inaugurated in 1820: it consists of a fountain with a quadrangular base, from which rise four isolated pilasters supporting an entablature with two fronts, and surmounted by a bust of the heroine. It stands in the public place of the village, and has this simple inscription: "A la mémoire de Jeanne d'Aro"—"To the memory of Jeanne d'Aro."

4. In the fourth *arrondissement* the chief town is *Remiremont*, which stands on the Moselle, at the foot of the Faucilles Mountains, 17 miles S.E. from Epinal, and has 5191 inhabitants. *Remiremont* takes its name from *Rozmaria*, a noble of the early Frankish period, who had a

castle on an eminence near the town. He founded on the eminence two abbeys (A.D. 820), one for monks, the other for nuns, and endowed them with all his possessions. These abbeys having been destroyed in the 10th century, were rebuilt in the plain. The most important of the two was that for lady-conventresses, who were not bound by a monastic vow, but none were admitted who could not prove the nobility of their family for four generations: the abbess was a princess of the empire, and enjoyed the prerogatives and maintained the state of a sovereign. The abbey was rebuilt in 1752, by Anne Charlotte of Lorraine, then abbess. The abbey church, now the parish church, is a handsome structure in the Italian style. The principal streets of *Remiremont* are watered by a brook which flows into the Moselle: the houses are old and not well built, but there are some pleasant promenades. There are a college, a public library of 5000 volumes, an hospital, and a tribunal of first instance in the town. The manufactures comprise cottons, paper, leather, wrought-iron, potash, and kirschwasser; the trade in wood, iron, hemp, cattle, cheese, and medicinal herbs is important. There are numerous saw-mills driven by water-power in the neighbourhood. *Plombières*, a small village situated in a vale-head of the Faucilles Mountains, is celebrated for its warm mineral springs, and for a beautiful church, built by Stanislas Leszinski, duke of Lorraine.

5. In the fifth *arrondissement* the chief town, *St.-Dié*, is situated on the Meurthe, and has a tribunal of first instance, a public library of 10,000 volumes, an ecclesiastical college, and 8692 inhabitants. The town, which is well-built and surrounded with a wall, gives title to a bishop, whose diocese is the department of Vosges. Cotton fabrics and potash are manufactured, and in the neighbourhood are paper-mills, iron-works, and wire-factories. Among the other towns, all of which are small, may be named *Raon l'Étape*, on the Meurthe, population 3500 for the whole commune; *Senones*, N. of St.-Dié, on the Rabodot, population 2500 for the whole commune; and *Gérardmer* or *Géromé*, on the Valogne, population 5625 for the whole commune. *Raon l'Étape* is an old town, poorly built, at the foot of a hill. *Gérardmer* has considerable trade in cheese, and in wooden wares and wooden shoes made in the neighbourhood. It consists of a number of hamlets and country houses built without regularity, in a valley on the eastern shore of the Lake of Gérardmer, 14 miles S. from St.-Dié. In the middle of a long irregular street stands a handsome parish church. In the commune are many saw-mills driven by water power.

The department constitutes the diocese of St.-Dié, the bishop of which is a suffragan of the archbishop of Besançon: it is in the jurisdiction of the Imperial Court, and within the limits of the University-Academy of Nancy, and is comprehended in the 5th Military Division, of which the head-quarters are at Metz. It returns three members to the Legislative Body of the French empire.

VOGSES MOUNTAINS (*Wassgau, Vogesen*), a chain of mountains bounding the valley of the Rhine on the west from the neighbourhood of Mühlhausen to that of Mayence. The chain is partly in France, and partly in the Rhenish province of Bavaria, and in the territory of Hesse Darmstadt in Germany.

The Vosges unite on the south-west with the Faucilles, and so with the Côte-d'Or, and ultimately with the Cévennes; and on the south they unite with the offsets of the Jura. Cæsar calls the range *Vosegi*, and evidently included the Faucilles under the name, since he places in them the source of the Mosæ, or Meuse, which is far westward of the Vosges in the present more limited acceptation of the name. The Vosges extend more than 170 miles from the depression through which the Rhône-and-Rhine Canal passes, between Bèfort and Aickirch, to the valley of the Rhine, at the elbow formed by that river between Mayence and Bingen. The breadth of the range varies. In the northern part, about Mont-Tonnerre, it is nearly 60 miles; but this breadth comprehends the lower slopes as well as the higher parts of the range. West of Strasbourg, between the valleys of the Rhine and the Saar, or Sarre, the breadth is about 20 miles. Between Colmar and Plombières, where a branch extends westward from the principal range, the breadth is nearly 40 miles. Another branch extends in a south-western direction from the southern extremity of the main chain in the direction of Vesoul.

The loftiest summits of the range are in a tolerably direct line, extending from Mont-Tonnerre, in the Rhenish province of Bavaria, to the Ballon-d'Alsace, near Girothagny, in the department of Haut-Rhin in France; and in a line extending nearly at right angles to the foregoing, from the Ballon-d'Alsace towards Plombières. The following are some of the principal summits, with their respective heights in feet:—Ballon-de-Lure, 8721; Ballon-de-Servance, 3970; Ballon-d'Alsace, 4124—all near the sources and upper waters of the Moselle and Oignon; Ballon-de-Soultz, or De Guebwiller, 4695; Le-Haut-d'Honec, 4391; Les-Chaumes, 4203; Le-Bressoir, 4049, near the source of the Meurthe; Le-Champ-de-Feu, 3537, near Schirmeck; Le-Grand-Donnon, 3314, at the source of the Saar, or Sarre; Mont-Tonnerre, 2924.

The part of the range which is north of the valley of the Bruche is sometimes termed *Les-Basses-Vosges*, or Lower Vosges, and is known to the Germans by the name of *Hardt*. The Rhine slope of the Vosges consists of a succession of steep declivities, and the valleys on this side of the range are deeper than those of the west side, where a slightly undulated surface gradually descends into the plain of Lorraine.

The highest summits of the Vosges are comprehended in a triangular space, of which the apex may be fixed at Schirmeck, in the valley of the Bruche, in the north-eastern corner of the department of Vosges, and the angles of the base at Plombières, in the department of Vosges, and Masvaux, in that of Haut-Rhin. In this triangular space the rocks are crystalline, intermingled with sedimentary formations belonging to the transition series. They comprehend granite, gneiss, mica-slate (but in small quantity), sienite, porphyry, serpentinite, talcose-slate, clay-slate, grauwacké, granular and compact limestone, and the formations of the carboniferous group. They ordinarily present rounded summits, called by the inhabitants of the district 'ballons,' or balls. They abound with springs and with deposits of peat, which are met with at various elevations. The transition rocks appear but rarely beyond the limits of the space defined above.

The three sides of the triangle above defined are skirted by ranges, more or less continuous, of mountains of a character altogether different, of square form and more horizontal outline. These are composed of a reddish quartzose sandstone, known as the sandstone of the Vosges. On the south side of the triangle the sandstone range is narrow and much interrupted. On the east side this sandstone is deeply intersected by valleys opening towards the Rhine. On the north-west of the triangle the sandstone occupies a much larger space and descends more gradually toward the plain of Lorraine. North of Schirmeck, as

far as the parallel of Mannheim, this sandstone forms the mass of the Vosges, and presents a range of heights of tolerably uniform elevation, but of unequal breadth.

The Vosges yield a variety of valuable minerals. Coal is found in various parts. Iron-ore is obtained, and a great number of iron-works are established in the neighbouring country. Other metallic ores found are copper, lead, manganese, and arsenic.

The summits of the Vosges are covered with snow during a part of the year. The greater part of the mountains are wooded to a certain height; their summits are covered with large spaces of green turf, to which, during six months of the year herds of cows are led to graze. The herdsmen dwell in huts, and make cheeses like those of Gruyère. The forests are chiefly composed of firs, pines, oaks, and chestnut-trees. The variety of vegetation which the mountains present renders them interesting to the botanist: and though little visited by the picturesque tourist, they present, in spots remote from the principal roads, scenery which may vie with that of Switzerland. Wine is grown in those parts of the mountains which present a favourable aspect.

WAIGATZ, a large island in the Russian government of Archangel, situated in the Frozen Ocean at the entrance of the Gulf of Kara. It is separated by the Strait of Waigatz from the continent, and by the Strait of Woronowakai from the island of Nova Zembla. It lies between 67° 20' and 68° 5' N. lat., 57° 30' and 59° 25' E. long. It is desolate, rocky, without wood, and almost without vegetation; but abounds in fur-bearing animals, snipes, plovers, and fish, and is inhabited by a few families of Samoides, and frequented by the Russians for the sports of hunting and fishing. The Strait of Waigatz was discovered by the Dutch in 1594.

WAINFLEET. [LINCOLNSHIRE.]

WAITZEN. [HUNGARY.]

WAKEFIELD, the capital of the West Riding of Yorkshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Wakefield, is situated on the left bank of the river Calder, in 53° 41' N. lat., 1° 30' W. long., distant 27 miles S.W. by S. from York, and 182 miles N.N.W. from London by road and by the Great Northern railway. The population of the municipal and the parliamentary boroughs, which are co-extensive, was 22,065 in 1851. The borough is governed by 8 aldermen and 24 councillors, one of whom is mayor; and returns one member to the Imperial Parliament. The living is a vicarage in the archdeaconry of Craven and diocese of Ripon. Wakefield Poor-Law Union contains 18 parishes and townships, with an area of 34,662 acres, and a population in 1851 of 47,355.

Wakefield is a very ancient town. The Romans appear to have had a station in the township of Stanley, where some years since several moulds for coining their money (in some of which the coin was still remaining in the matrix) were found in a field; they are now deposited in the British Museum. A battle was fought at Wakefield in 1460, between the Yorkists and Lancastrians, at which Richard, duke of York, father of Edward IV., was slain. An ancient chapel ('of our Lady') occupies the site of one built by Edward III. The building projects over and partly rests on the starlings of the bridge. The bridge has eight arches, and was built in the reign of Edward III.

The town of Wakefield is paved, lighted with gas, and well supplied with water. The suburb called St. John's, at the northern extremity of the town, consists of handsome houses, with shrubberies, &c. A market-cross of the Doric order was erected early in the last century, with an open colonnade supporting a dome, the interior of which contains a spacious room for public business. The public rooms in Wood-street, built by subscription, comprise a library and news-room, with apartments for lectures, concerts, and assemblies. A corn-exchange was erected in 1823, and another on a larger scale was opened for business in 1837. The Tammy Hall, 210 feet long and 30 feet broad, erected many years ago as a place of sale for light woollen fabrics, has been converted into a power-loom factory for stuffs. The most important public buildings are those belonging to the county and the West Riding. The register-office was established in 1704, for the register of deeds relating to landed property. The court-house was erected in 1806. The house of correction is a very extensive pile. About a mile N.E. from the town is the West Riding Lunatic Asylum, erected in 1817, but since considerably enlarged.

The parish church, of which the oldest part was erected in 1470, is 156 feet long and 69 feet wide, with a tower surmounted with an octagonal spire 228 feet high. St. John's church was erected in 1795, and made parochial in 1815. Trinity church, opened in 1839, and St. Andrew's church, Warrigate Head, are the other churches of the Establishment. The Independents and the Wesleyan Methodists have each two chapels; and the Baptists, Quakers, Unitarians, Roman Catholics, and Primitive Methodists have one each. There are a Grammar school; a Green-Coat Charity school; National, British, and Infant schools; and the West Riding Proprietary school. There are a literary and philosophical society, a subscription library, a theatre, a savings bank, a mechanics institute, almshouses, and a dispensary and house of recovery.

The manufacture of woollen stuffs, which was once extensively pursued at Wakefield, is now almost entirely removed to Bradford and Halifax; but the woollen-cloth manufacture, and the spinning of woollen- and worsted-yarn, are carried on to some extent. The dyeing of woollen-stuffs is important as a branch of industry. There are rope-works, brick-kilns, iron-foundries, breweries, ship-yards, starch-works, and copper-works. The town is connected with a very rich and extensive district by numerous lines of river and canal navigation. [YORKSHIRE.] From the agricultural districts Wakefield receives large quantities of corn and wool; and coal and other commodities are exported to London, and to Lincolnshire, Norfolk, and Suffolk. The corn-market, held on Friday, is of great importance; it has frequently happened that for weeks in succession the quantity sold at Wakefield has exceeded the quantity sold at Mark Lane. Malt is made at Wakefield to a very large extent. The wool-fairs are on a large scale; and on alternate Wednesdays there is a great cattle and sheep fair. There are fairs in July and November for horses, cattle, and pedlery. A county court is held in the town.

WAKERING, GREAT. [ESSEX.]

WAKHAN. [BADAKSHAN.]

WALCHEREN. [ZEALAND.]

WALDAL. [NOVOGOROD.]

WALDECK, a principality in the north of Germany, consists of two parts: 1, the principality of Waldeck, which is situated between 51° 4' and 51° 31' N. lat., 8° 31' and 9° 12' E. long., and bounded W. and N. by Westphalia, E. and S. by Hesse-Darmstadt; 2, the principality of Pyrmont, which is situated on the left bank of the Weser, between the territories of Lippe, Hanover, and Prussia. The area of the whole is 459 square miles, of which 427 belong to Waldeck. It is a mountainous country, consisting of chains or of detached masses, without any wide valleys: it is perhaps the most elevated region of Western Germany. There is no large river, but there are several small streams. The climate is cold, but the air is pure and healthy. The soil is in general stony and sterile, yet corn, potatoes, and flax are raised sufficient for the consumption. There is a great quantity of timber, but there is no opportunity for exporting it. In some parts of the country there are good pastures, in which numerous herds of horned cattle are fed, and considerable quantities of butter and cheese are made. Sheep and swine are kept in great numbers. The minerals are copper, iron, lead, alabaster, marble, slate, freestone, and salt. The inhabitants manufacture some coarse woollen cloths, plush stockings, and sufficient linen for their own use. In Pyrmont there are five villages, the inhabitants of which derive their principal subsistence from the manufacture of thread stockings, which they export in large quantities. The population in 1852 amounted to 59,697, of whom 53,074 belonged to Waldeck. The prince and the great majority of

his subjects are Lutherans; the rest are Roman Catholics, Calvinists, Jews, and Quakers. The budget for the financial interval, 1854-56, estimates the annual revenue at 368,797 thalers, the annual outlay at 373,653 thalers. The revenue of the prince is about 45,000*l.* sterling, and the public debt about 180,000*l.* The prince is a member of the Germanic Confederation, and has in the Diet, with Anhalt, Lippe, Reuss, Schwarzburg, and Lichtenstein, a collective vote (the 16th), and in the general assembly a separate vote. His contingent is 519 men. The prince of Waldeck granted a constitution to his subjects in August 1852.

WALDEN, SAFFRON. [ESSEX.]

WALDOBORO. [MAINE, U.S.]

WALDSTÄDTER, and WALDSTÄDTER SEE. [LUZERN; SWITZERLAND.]

WALES, a principality of Great Britain, lies on the west side of that island, between 51° 20' and 53° 25' N. lat., 2° 41' and 4° 56' W. long. It is bounded W. and N. by St. George's Channel; E. by the English counties of Chester, Salop, Hereford, and Monmouth; and S. and S.E. by the Bristol Channel. Its greatest length from north to south is about 180 miles, and its breadth from east to west varies from 50 to 80 miles. It contains 4,793,975 statute acres, or 7398 square miles. The population of the principality in 1841 was 911,705; in 1851 it was 1,005,721. The general physical features of Wales are given in detail in the article GREAT BRITAIN.

The history of the island of Great Britain previous to and during the period of the Roman domination, is given in the article BRITANNIA; and as there are no materials for a history of Wales during that period distinct from the narrative of events in the island generally, we shall refer to that article and to ENGLAND, and proceed to give briefly the principal events connected with Wales from the time of the establishment of the Saxons, Angles, and other tribes in England, by which the ancient inhabitants of the island were gradually driven to the west.

Down to the Roman conquest the Welsh, under a variety of princes, were engaged in almost constant warfare with the Saxons and Angles. During the 6th and 7th centuries the country appears to have been divided into a number of petty kingdoms or principalities. As many as 14 co-existing kingdoms are mentioned. In the commencement of the 7th century, Ethelfrith, king of Bernicia, and the grandson of Ida, attacked the Welsh, assembled under Brochmael, king of Powys, and gained a decisive victory. About the same time Ceolwulf, from Wessex, penetrated into the province of Glamorgan; but the inhabitants, under Tewdric, their former king, drove the invaders across the Severn. Edwin, sovereign of Deira and Bernicia, subdued Anglesey and a considerable part of North Wales, and drove Cadwallon, the sovereign of North Wales, and whose father had been the protector of Edwin in early life, into Ireland. Cadwallon defeated and slew Edwin in 633, and penetrated into and desolated Northumbria. Successful in 14 great battles and 60 skirmishes, Cadwallon was regarded by the Cymri or Welsh as the deliverer of their country. He was however slain, with the flower of his army, in an engagement with Oswald of Northumbria.

Ethelbald, king of Mercia, in the early part of the 8th century, uniting with the king of Wessex, overpowered the Welsh. Dissensions between Mercia and Wessex led to a successful confederation between Roderic Molwynoc, the Welsh leader, and Cuthred, king of Wessex, against the king of Mercia, whom they defeated at Hereford. Cuthred in turn took up arms against and defeated the Welsh, and in 753 Roderic Molwynoc withdrew into North Wales. Towards the end of the 8th century the Mercians succeeded in driving the Welsh from the border territory, and Offa, king of Mercia, made an artificial boundary from the mouth of the river Dee on the north to the river Wye on the south, known by the name of Clawdd Offa, or Offa's Dyke, traces of which are still to be found along a great part of the line. Roderic, who had acquired the sovereignty of nearly all Wales, in 843 divided his dominions into three principalities, to which his three sons succeeded. One of these principalities was called by the Welsh, Gwynedd, and corresponded nearly to the present North Wales; another, Ceredigion and Dyved, or South Wales; and the third, Powys, comprising parts of Montgomeryshire, Shropshire, and Radnorshire. Early in the 10th century these three subdivisions of Wales became reunited under the sceptre of one king, Howel, who was surnamed Dda, the Good. He appears to have been an excellent king, and he reformed and digested the laws of his country. At a subsequent period Wales was divided into two principalities, North and South Wales, but the former seems to have had some predominance over the latter. During all these changes, however, some districts appear to have had their separate petty princes.

In the 10th century a fine or annual tribute was imposed on the Welsh by Athelstan, king of England, who had obtained the nominal dominion of Wales. On the accession of William the Conqueror, the Welsh refused to pay tribute. The Norman conqueror invaded their country with a considerable army, reduced them to submission, and compelled their princes to do homage and take an oath of allegiance as his vassals, and from this period the English kings preferred a claim to Wales as their dominion. During the reigns of his successors, the Welsh constantly united with the disaffected barons, and committed devastations and outrages on the English borders. William and his son had granted to their Norman followers all lands they

might acquire possession of in Wales, whence originated the Lords Marchers. In 1102 Henry I. bestowed several other lordships and castles in Wales on Englishmen and Normans; and for the purpose of still further repressing the spirit of the Cambrians, he introduced, in the year 1108, into Pembrokeshire, a numerous colony of Flemings. The principality of South Wales was for a time destroyed; Powys-land was also possessed by the English; and North Wales alone retained its independence.

In 1237 Gryffyth, the eldest son of Llewellyn-ap-Iorweth, prince of North Wales, rebelling against his father, that prince applied for the protection of Henry III. of England, which he received upon the terms of yielding vassalage to the English crown. David, the eldest son of Llewellyn, on the death of his father, renewed the homage to England, and taking his brother Gryffyth prisoner, delivered him to Henry, who imprisoned him in the Tower, where he lost his life in an attempt to regain his freedom. After the death of Gryffyth, Henry gave the principality of Wales to his eldest son Edward, afterwards Edward I. Llewellyn, the youngest son of Gryffyth, succeeded to the throne of North Wales on the death of his uncle David, and his brother Owen Goch to that of South Wales. Homage was now enforced by England as an established right. After the accession of Edward I. to the English throne, the Welsh prince was summoned to do homage, which he declined doing without having hostages for his safe conduct, and demanded that his consort, who was Edward's prisoner, should be restored. This Edward refused to comply with, and immediately proceeded to levy war against him, assisted by David and Roderic, brothers of Llewellyn, who had dispossessed them of their inheritance. The Welsh prince defended himself among the inaccessible mountains of Caernarvonshire, but Edward blocked up Llewellyn and his army so effectually, that after sustaining all the horrors of a siege they were obliged to yield to the wary English king. Llewellyn shortly afterwards rose against the English, and was joined by his brother David, but Llewellyn was slain in or immediately after an engagement with the Earl of Mortimer near Builth, in Brecknockshire, in 1284. David, who succeeded him in the principality, was soon after executed at Shrewsbury as a traitor for defending by arms the liberties of his native country and his own hereditary authority. The nobility of Wales submitted to the conqueror, and by the statute of Rhuddlan, passed in the 12th year of Edward's reign, Wales was incorporated and united with England.

Thus ended the existence of the Welsh as an independent nation. The title of Prince of Wales was bestowed by Edward upon his son, afterwards Edward II., and has ever since been the title conferred on the eldest son of the sovereign of England.

In 1295 insurrections broke out in various parts of Wales, but they were everywhere suppressed, and to prevent their recurrence Edward built castles at Rhuddlan, Conway, Beaumaris, Caernarvon, Harlech, and Aberystwith. The last effort by the Welsh to maintain an independent existence was under Owen Glyndwr, in the commencement of the 15th century. His career and brilliant success in opposing the English army are intimately connected with English history.

By the statute of Rhuddlan (12 Edward I., c. 5) a part of Wales was formed into the counties of Anglesey, Caernarvon, Merioneth, and Flint; and by a statute passed in the 27th year of the reign of Henry VIII., the counties of Monmouth, Brecknock, Radnor, Montgomery, and Denbigh were constituted; and by this statute one knight was directed to be chosen for each county in Wales, and a burgess for every borough being a county town, except the county town of Merioneth, and a member was subsequently given to Haverfordwest. By the Reform Act an additional member was given to the counties of Caermarthen, Denbigh, and Glamorgan; a member was given to Merthyr Tydvil, and one to Swansea, and numerous places were made contributory boroughs to each of the ancient boroughs returning members.

The laws and chief features of the constitution of the Britons when masters of the whole island seem to have been preserved in Wales for a considerable time; many of them indeed remained in full force until their abolition or alteration by express statutes at a comparatively recent period. The government from the earliest period appears to have been monarchical, but not following a strict rule of descent. An old code of laws compiled from those of Howel Dda states that no one is an "edling (heir to the throne) except that person to whom the king shall give hope of succession and designation." No power but the regal could either enact or abrogate a law. Traces of a popular representation are to be found in the formation of the digest of the Welsh laws by Howel Dda, in the 10th century. For this purpose six of the most intelligent and powerful persons were summoned out of every cynwd, or hundred, and also the nobles, bishops, and principal clergy, to assist that king in the great work of legislation. By these means the ancient laws were revised, others enacted, and all digested into one regular code, and a declaration made that they should not be altered, except by means of a similar national council. After the English conquest, and in consequence of the subsequent insurrections, several severe laws were passed against the Welsh; but these were gradually repealed or fell into abeyance; and the laws of Wales steadily approximated to those of England, until they became substantially the same. Since the passing of the 11th Geo. IV. and 1st Wm. IV., c. 70, Wales has no jurisdiction in legal matters distinct

from England. It is divided into two circuits, North and South, and one judge travels each.

Wales abounds in memorials of its past history. The cromlechs, earnedds, and barrows; camps, British and Roman; abbeys and castles of later periods; are all to be met with in various parts of the principality. Detailed notices of these will be found in this work in articles treating of each county.

Wales is divided into North and South Wales, each containing six counties. North Wales includes Anglesey, Caernarvonshire, Denbighshire, Flintshire, Merionethshire, and Montgomeryshire. South Wales includes Brecknockshire, Cardiganshire, Caermarthenshire, Glamorganshire, Pembrokeshire, and Radnorshire. To the articles on these several counties we refer for a more particular account of the physical geography, geology, mineralogy, products, manufactures, trade, &c. Over a large part of Wales the Welsh language is still generally spoken, but the use of the English language is steadily increasing. Wales contains four bishoprics—those of Bangor and St. Asaph in North Wales, and of St. David and Llandaff in South Wales.

WALES, NEW SOUTH, extends over the south-eastern portion of Australia. Its western boundary has been fixed by the grant of the colony of Southern Australia, whose eastern boundary extends from the shores of the Southern Sea along 141° E. long. to 26° S. lat. The northern boundary-line of New South Wales has not yet been definitely fixed, but is generally taken as 26° S. lat., the same as Southern Australia, as there are settlements, particularly since the gold discoveries, north of Moreton Bay, which is in 27° S. lat. On the east New South Wales is washed by the Pacific. On the south the Murray forms the boundary between it and the newly-constituted province of Victoria from South Australia to its source, whence the line turns southerly through the Australian Alps west of Mount Wellington, and then takes an arbitrary straight line south-easterly to Cape Howe, which is the most southerly point of the province, in 37° 5' S. lat., 150° E. long. The extreme length is 893 miles, the average breadth about 600 miles, which gives an area of 535,800 square miles. The most north-western portion of the country, extending over perhaps one-third of the whole surface, has scarcely been visited by any European. The population of the colony was estimated in December 1862 at 208,254.

Surface, Soil, and Climate.—The physical constitution of this country is very peculiar. The interior consists of wide plains, interrupted only by comparatively short ranges of high hills or low mountains. The waters collected in these plains are all united into one river, the Murray, which disembogues within the territories of South Australia. On the east and south the plains are surrounded by higher land, which constitutes the watershed between the rivers joining the Murray and those which run into the sea. This watershed is in general about 100 miles from the shores.

The Australian Alps commence at Wilson's Promontory, and extend into New South Wales by Mount Wellington. In this range rise the Murray and the numerous streams which, flowing more or less westward, ultimately fall into it and form it into a river, having abundance of water all the year round, whilst most of the large rivers which run into the interior become dry during the summer months. Farther north, in the Warragong Chain, the Murrumbidgee with its affluents takes its source, and is likewise a perennial river; east and north of this are Yass Plains and the hilly tract inclosing Lake George. The elevated plains extend, under the name of Goulburn and Breadalbane Plains, about 40 miles farther north, to the southern extremity of Cockbandoon Range, which constitutes the southern part of the Blue Mountains, east of which runs the Shoalhaven River to the sea. The Blue Mountains commence in 34° 30' S. lat., and run northward to the Monundilla Range, in 32° 40' S. lat. From the eastern side descend the Nepean, the Colo, the Wollondilly, and the Macdonald rivers, all of which find their way to the sea through the Hawkesbury at Bullen Bay; on the west side descends the Lachlan and its affluents, which join the Murrumbidgee. The mountains are of sandstone; the highest point, King's Table-Land, attains a height of 3400 feet above the flat country. At the distance of from 60 to 70 miles north of the Monundilla Range is the Liverpool Range, running east and west. This range extends to about 32° S. lat. On its northern side are Liverpool Plains, between 150° and 151° E. long. In these parts its southern slope rises with a precipitous acclivity, and in some places nearly perpendicular above the plains which lie south of it. Its elevation is probably 1500 or 2000 feet above the base. Where the slope is not too rapid, it is thinly wooded. On account of the steepness of the ascent, only two places have been found at which it can be traversed with ease: the western, called Pandora Pass, near 150° E. long.; and the eastern, called Hecknaduey, west of 151° E. long. When the summit of the passes is attained, a short descent brings the traveller to the Liverpool Plains. A ridge from the Monundilla Range to these mountains divides the affluents of Goulburn River, a tributary of Hunter River, which falls into the Pacific, from those of the Cudgong and Talbragar, which fall into the Macquarie. A considerable portion of this ridge is without trees, overgrown with bushes, and grassy; but on the rising grounds are forests, composed mostly of apple-trees, iron-bark, stringy-bark, and box.

The coast-line on the east extends in a general direction of north-north-east from Cape Howe to Cape Byron, when it recedes a little to

the west. There are numerous harbours formed by the mouths of the rivers flowing into the Pacific. The chief of these, proceeding from south to north, are—Twofold Bay, at the mouth of the Towamba, immediately north of Cape Green, one of the boldest promontories along the coast; Barmouth, Bateman Bay, Sussex Haven, Jervis Bay, Shoalhaven, Port Hacking, Botany Bay, Sydney, Port Jackson, Broken Bay, Port Hunter, Port Stephens, Farquhar and Harrington Inlets at the mouths of the Manning and Lansdowne rivers, Port Macquarie, Trial Bay, Shoal Bay at the mouth of the Clarence River, in 29° 5' S. lat., whence there is no other till we come to Moreton Bay, with its group of islands extending 70 miles from north to south. In this extent the shore presents every variety of appearance. From Cape Green to Shoalhaven River the cliffs are generally low; from Shoalhaven River, north of 30° S. lat., to Hunter River, north of 35° S. lat., they present a range of bold perpendicular cliffs of sandstone lying in horizontal strata, occasionally interrupted by sandy beaches, the high land retiring to a considerable distance. Numerous sand-hills occur along the remaining part of the coast. Port Stephens is a bar-harbour, so that small vessels only can enter it; those of larger description are compelled to anchor outside. In some parts, especially north of Trial Bay (30° 50' S. lat.) and south of the mouth of Clarence River, are tracts of coast many miles in length, where it is rocky and rises to a considerable elevation. The harbours are only found at the mouths of the numerous rivers.

Rivers.—The larger rivers which drain the country between the Pacific and the watershed have water all the year round. They generally flow in beds which are deeply depressed below the common level of the country, and between banks which rise perpendicularly, or nearly so, from 100 to 200 feet, and frequently higher; so that the streams are inaccessible, except at a few places. They are of little use either for irrigation or for transport. The *Shoalhaven River*, the most southern of the considerable rivers of this region, rises on the tablelands east of the Warragong Mountains, and runs about 90 miles northward, measured in a straight line, and then about 40 miles eastward. About 20 miles from its mouth occurs the last rapid, up to which the tide flows. The mouth of the river is much obstructed by shoals and sand-banks. The *Hawkesbury* falls into Broken Bay. It rises under the name of Wollondilly, on the connecting tablelands, and receives nearly all the waters which are collected on them. It flows in a deep bed, sinking into a deep ravine, when it is no longer accessible. The last rapids occur near Windsor, from which place it is navigable for moderate vessels. Windsor is only 40 miles from the sea in a straight line, but 100 miles at least following the windings of the river, whose waters are fresh for 30 miles below the town. Its estuary, Broken Bay, is surrounded by rocks, and has several good anchorages even for large vessels, the best of which is called Pittwater. The whole course of the river exceeds 250 miles. Sometimes the floods of this river rise to 90 feet above its usual level, and the inundations then lay waste the fertile tracts on its banks. *George's River* falls into Botany Bay. It runs hardly 60 miles, but is navigable for boats from Liverpool downwards, a distance of about 12 miles in a direct line, but 24 miles following the windings of its course. *Hunter River* disembogues into Port Hunter. It has two great branches, one called Hunter and the other Goulburn. The first rises in the Liverpool Range, the other in the connecting ridge, and both have very tortuous courses. The navigation begins at Maitland, about 20 miles from Port Hunter by land, but nearly 40 miles by water, and a steamboat plies regularly between that town and Sydney. This river often rises rapidly after heavy rains, and in some places to the height of 50 feet.

The navigable rivers which drain the countries north of the Hunter are the Manning, Hastings, Apsley, Clarence, and Brisbane. The Manning and the Hastings both fall into Port Macquarie, which is a bar-harbour, admitting only vessels of 100 tons burden; and it is dangerous to enter, except at full tide, on account of the rapid current, which sets the vessels ashore upon the shoals on the northern side of its entrance. Outside the bar is good anchorage for ships of the largest class, except when the wind blows strong upon the shore. Within the bar is secure anchorage for a great number of vessels.

North of Port Macquarie is the valley which is drained by the *Apsley* or *MacLeay River*, which divides about 12 miles from the sea into two branches, inclosing a large island. The main branch at the northern end forms the harbour of Trial Bay, which has a bar across, having from 12 to 17 feet of water upon it. This river is navigable to a distance of more than 50 miles from the sea, when farther progress is impeded by a fall, which occurs where the river issues from a narrow glen, whose sides rise 900 feet above its bed. Below this place the river runs through a wide valley, in which there are some plains destitute of timber, and gently-rising hills covered with open forests and grassy pastures. Farther north is the valley of the *Clarence River*. The mouth of the river is at Shoal Bay, 29° 20' S. lat. The bar across its entrance has 12 feet of water on it at high tides. *Brisbane River* falls into Moreton Bay, and is navigable by ships drawing 16 feet of water 20 miles up, at which point a ridge of rocks crosses the bed, but to a distance of more than 60 miles from the sea it may be navigated by boats. Several of its tributaries are also navigable for some miles from their mouths. The country on both banks of the river presents an alternation of hills and level tracts. The soil, which is very good, is overgrown with high trees, among which are cedars and cypres-

trees of great magnitude. The highest hills lie on the north side of the river, where some rise from 700 to 800 feet. The farthest sources of the Brisbane are in the Coast Range, which here offers an easy passage to the interior by a gap which occurs south of 28° S. lat., north of Mount Mitchell, which is 4120 feet above the sea.

All the rivers draining the interior of New South Wales, as far as it is known, appear to belong to the river basin of the Murray. The rivers composing this extensive system consist of numerous streams that flow westward from the high lands running north and south through New South Wales. The Murray itself we have noticed as dividing the colony from Victoria, and it enters South Australia at Table-Land Cliffs, and after flowing in a westerly direction about 90 miles in a direct line, it turns to the south and enters the sea at Encounter Bay. [SOUTH AUSTRALIA.] The Murrumbidgee, after it has itself received the Lachlan, falls into the Murray in 149° E. long. The Darling, by its upper branches, drains the country extending from 32° to 28° S. lat. Its most northern branch, the Condamine, rises on the Darling Downs, in 28° S. lat., runs northward as far as 26° S. lat., 151° 4' E. long., then turns westward to 149° E. long., and then south-westward till it joins the Darling on its left bank. From the south it receives the Bogan, a considerable stream, rising in the Harvy Range; and it is probable that the Macquarie, at least during the rainy season, discharges into it part of its water from the marsh in which it is lost.

Geology, Mineralogy, &c.—The general account of the geology of the island has been given under AUSTRALIA, in vol. I., cols. 695-699. Sir R. I. Murchison has asserted that gold must exist in the country in certain formations; and the same theory had been promulgated in the colony by the Rev. W. B. Clarke, on the ground that the strata of the Australian mountains running north and south through Victoria and New South Wales, were of the same formation as those of the Sierra Nevada in California, and the Ural Mountains in Russia, namely, granite mixed with quartz and schistose slate; but it was not till 1849 that the actual existence of gold was discovered. In 1851 further discoveries were made, Mr. Hargraves disclosed the places where he had found gold, and when the government officer was sent to examine the places, he found persons already working them. On May 22nd instructions were given by the governor to grant licences to diggers at the rate of 30s. per month. The first discoverers obtained the gold by washing the detritus from the beds of the creeks, and the earth from the shores; but it was soon found that the richest deposits were in the quartz, and means were found to crush the rock and obtain the gold. On August 5th the governor issued a notice that the licences would only apply to the gold-washers, and that on gold obtained by crushing, a royalty must be paid of from 5 to 10 per cent. Policemen were appointed to the various stations, and escorts furnished for bringing the gold from the diggings to the ports of Sydney or Melbourne. In a short time the towns and villages were deserted, all the usual avocations abandoned, the ships in harbour left unmanned, and every one capable of labour repaired to the diggings. An immigration ensued almost without a parallel. In the quarter ending the 30th of September, 1854, the total quantity of gold brought down to Sydney was 28,053 ounces, and the quantity of gold exported 49,893 ounces, valued at 162,153*l.*; 10,712 10s. licences were granted on Crown lands to mine and dig, 704 on Crown lands to erect buildings for trading purposes, and 12,157 5s. licences on private lands to mine and dig, making a grand total of 12,157 licences, for which 5893*l.* was received. Eight leases were granted to work auriferous quartz veins. The total quantity of gold exported up to the 30th of June, 1854, was 150,429 ounces, valued at 488,896*l.*; making a gross total of 1,661,355 ounces of gold exported in 1851, 1852, 1853, and the half of 1854, the value whereof was 5,399,350*l.* The estimated net quantity of gold exported from New South Wales and Victoria, from the 29th of May, 1851, to the 30th of June, 1854, was 7,318,482 ounces, valued at 25,630,232*l.*; and up to the 30th of September, 7,886,509 ounces, valued at 27,975,419*l.*

Respecting other metals we have little to add to what is said under AUSTRALIA.

Iron-ore is known to exist in several places, especially on the west of the Blue Mountains. Several extensive coal-measures have been found, two of which are worked. Those found near the mouth of the Hunter River, near Newcastle, are extensively worked, and their produce is shipped to Sydney. The coal-beds near Western Port are also very large, and have been worked for several years. Limestone is abundant in some places, and some kinds of marble are worked on the banks of the Wollondilly.

An account of the botany of New South Wales is given under AUSTRALIA, vol. I., col. 701-3. Many of the trees are used for domestic purposes, and some of them are exported as timber. The most valuable is the cedar (*Melia acedarack*), which is found especially at Illawarra, and on the banks of the Hunter, Hastings, and Clarence rivers. Several of the gum-trees, as they are called (*Eucalyptus*), are valuable. Timber is farther obtained from a kind of pine belonging to the genus *Callitris*. Most of the eucalypti yield a kind of gum, and therefore they have obtained the name of gum-trees. A summary account of the zoology of New South Wales is given under AUSTRALIA, vol. I., col. 703-9.

The climate is noticed generally under AUSTRALIA vol. I., col. 700

The rains are not, as between the tropics, limited to certain seasons, but fall all the year round; they are, however, most frequent in winter (June to August). The most characteristic peculiarities of the climate of New South Wales are the long droughts which occasionally prevail, and which are generally succeeded by excessively long and heavy rains. The winds are as variable as in England. Westerly winds, especially from the north-west, prevail in winter, and easterly winds are more frequent in summer (December to February). In summer, in the morning, the winds blow, almost every day, from west and south-west, but towards noon they pass to north-east and north. Dews are frequent and heavy. Hailstones are common in December and January, and are of much larger size than in England. Thunderstorms prevail from December to February, and occur also in November and March. On the Table-Lands and in the Plains of Bathurst, which are more than 2000 feet above the sea-level, the winters are much more severe than in the lower country. As in summer the heat is several degrees less on these elevated countries than at Port Jackson, the grass is not so quickly burned up, and thus the flocks of sheep find here, nearly all the year round, sufficient food for their sustenance.

Soil, Agriculture, and Agricultural Productions.—The soil of so extensive a country must necessarily vary greatly. Many parts are distinguished for their fertility, and it is probable that at least one-fourth part is well adapted for cultivation, and that one-half would afford good pasturage for sheep and cattle. In addition to the various species of grain and artificial European fruits and vegetables, that succeed well in various places, the sugar-cane, the vine, and tobacco are raised. Although the growth of grain has been constantly on the increase, New South Wales has always been an importing country, and the influx of population in consequence of the discovery of the gold-fields must render it for a considerable time still more so. In 1852 the total number of acres in crop was 152,057, of which the respective proportions were—wheat, 82,110; maize, 25,017; barley, 6725; oats, 2470; rye, 245; millet, 54; potatoes, 4079; tobacco, 731; wheat, barley, and oats, for hay, 27,598; and sown grasses, 3028. The produce was as follows:—Wheat, 1,407,465 bushels; maize, 717,053 bushels; barley, 133,944 bushels; oats, 49,069 bushels; rye, 4891 bushels; millet, 731 bushels; potatoes, 13,644 tons; tobacco, 12,530 cwt.; wheat, barley, and oats, for hay, 31,894 tons; and sown grasses, for hay, 4711 tons.

The colonists have been at some pains to introduce many kinds of fruit-trees and vegetables, and they have in most cases done it with tolerable success. There are oranges, lemons, citrons, nectarines, apricots, peaches, plums, cherries, figs, quinces, pears, apples, mulberries, pomegranates, grapes, raspberries, strawberries, bananas, guavas, pineapples, gooseberries, currants; almonds, walnuts, chestnuts, and filberts. Gooseberries succeed in the colder and more elevated countries, as near Bathurst. In the kitchen-gardens are raised melons, water-melons, pumpkins, capsicums, cabbages, turnips, and some other vegetables.

The first sheep introduced into the colony were from England, and the wool was of indifferent quality; but as soon as it became evident that wool might become a source of wealth, and yield an important article of export to the mother country, several landed proprietors were at considerable expense to get merino sheep. The quality of the wool has been much improved. The wool imported into Great Britain from New South Wales in 1853 amounted to 16,674,933 lbs.; the tallow received in British ports from the colony was 115,933 cwt.; of sheep skins undressed there were 8496. The breed of cattle is a mixture of the Bengal buffalo variety with humpy shoulders, and various English breeds which have been introduced. They are fine large animals. In some parts, especially on the Plains of Bathurst, the dairies are well attended to, butter being made to a great extent, and also cheese not inferior to the common cheeses of England. Bullocks are mostly used for draught. The horses are remarkably hardy and can undergo great fatigue. Pigs find abundant food in the uncultivated tracts, and are easily fattened with maize. Goats have been introduced, and thrive amazingly in those parts which have a barren soil, and are overgrown with shrubs. The number of untanned hides imported into Great Britain from New South Wales in 1853 was 40,328.

Poultry is in great abundance; geese, ducks, turkeys, guinea-fowls, and common fowls thrive surprisingly, without any particular care being taken of them.

Industry and Manufactures.—The manufacturing industry of the colony has made considerable progress, though the production and export of native commodities form the staple of the occupation of the inhabitants. The most numerous manufacturing establishments are the mills for grinding and dressing corn, turned by wind, water, horses, or steam. There are also manufactories of woollen-cloth, hats, soap and candles, and of articles of furniture; distilleries, breweries, iron- and brass-foundries, rope-yards, and ship-building yards. As sperm-ceti-whales and black whales frequent the sea adjacent to the eastern entrance of Bass's Strait and the strait itself, and a great number of seals are found on the islands in the same part of the sea, the whale and seal fishery became a source of gain to the colonists, and is still carried on, though it has fallen off considerably.

Commerce.—New South Wales, considered as a commercial country,

holds a very high rank among our colonies, if its population is taken into account. Besides the large quantities of wool, tallow, hides, and sheep-skins, already noticed, Great Britain imported from New South Wales, in 1853, the following, and various other articles:—347 tons of bones of animals and fish; 87 tons of copper-ore; 137 cwts. of undressed flax; 993 cwts. rough mother-of-pearl shells; 8331 cwts. cocoa-nut oil; 425 tons sperm-oil; 6933 lbs. quicksilver; 1835 lbs. tortoise-shell, or turtle-shell; 601 gallons wine, the produce of British settlements in Australia; and 1170 loads of wood. The declared value of the exports of British produce and manufactures from Great Britain to New South Wales, amounted to 4,527,776*l.* in 1853, including apparel, slops, and haberdashery to the amount of 1,202,673*l.*; cottons, 447,194*l.*; woollens, 506,178*l.*; linens, 124,825*l.*; silk manufactures, 176,209*l.*; hardware and cutlery, 189,871*l.*; iron, wrought and unwrought, 141,088*l.*; leather, saddlery, and harness, 334,361*l.*; machinery, 23,315*l.*; musical instruments, 29,804*l.*; plate, jewellery, watches, &c., 90,334*l.*; stationery, 75,364*l.*; soap and candles, 33,943*l.*; pickles and sauces, 69,926*l.*; beer and ale, 179,907*l.*; British spirits, 31,782*l.*; printed books, 50,225*l.*; and a variety of other articles, besides a large amount of foreign and colonial produce and manufactures. The number and tonnage of ships registered as belonging to the colony on December 31st, 1854, were as follows:—Of and under 50 tons, 161 vessels of 4107 tons burden; above 50 tons, 180 vessels of 32,082 tons; with 123 steam-vessels of 3050 tons.

Divisions of the Country.—The more closely-settled portion of the colony is divided into 37 districts, 21 of which were added in 1847. Out of these are formed 40 counties, of which the first settled 21 are conterminous with the districts. The other counties do not occupy the whole of the districts, nor do the districts occupy the whole of the territory, but it is a regulation of government that no land can be sold beyond their limits. The extreme boundaries of county lands have come therefore to be called the boundaries of location, and according as lands lie within or beyond these boundaries, a different system is followed in the management and civil government of them.

Within the boundaries the whole country is divided into police districts, each having a bench of petty sessions and a magistrate; and of these districts, which are of unequal size, there are at present about 40. Beyond the boundaries the country is also roughly divided into districts, in each of which there is a commissioner of crown lands, who is the chief magistrate of it, and has under his command a small force of mounted constables, who are called the Border Police. Within the limits of location, land is either sold or let on lease; beyond the limits it is neither sold nor let, but licences are granted, at the discretion of the crown commissioner, for the occupation of such portions of land as may be desired by proprietors of stock, on each of which licences a fee of 10*l.* is payable annually, and an assessment is levied on the stock depastured there. Each allotment of land for which a licence is thus given is called a station, and the stations may vary in extent from 5000 to 30,000 acres. The amount received for licences in 1852 was 36,928*l.*, and land was sold to the amount of 41,273*l.*

New South Wales is divided into two bishoprics, Sydney and Newcastle, the Bishop of Sydney being the metropolitan of Australia; the other bishoprics are those of Melbourne, Adelaide, Tasmania, New Zealand, and Christchurch, which forms a second bishopric in New Zealand. There is an archdeacon in New South Wales who is styled Archdeacon of Cumberland, one of the districts. In 1853 the number of clergymen in the colony was 163, of whom 47 were supported wholly by voluntary contributions. Of the whole number, 78 belonged to the Church of England, 32 were Presbyterians, 32 Roman Catholics, 16 Wesleyans, 4 Independents, and one was of the Jewish persuasion. The amounts paid by government to religious teachers were as follows:—Church of England 18,344*l.*, Roman Catholics 12,837*l.*, Presbyterians 5998*l.*, and Wesleyan Methodists 1013*l.*

There is a considerable number of roads within the boundary of location. Various lines of roads, which have been made at considerable expense, traverse these districts, and various others have been made or are making in consequence of the gold discoveries, to facilitate transport to and from the commercial towns and ports. A regular post is established, and all letters not exceeding half an ounce in weight are delivered at a uniform rate of twopence. In 1852 the income of the post-office was 18,174*l.* 1*s.* 11*d.*; the expenditure was 25,304*l.* 8*s.* Newspapers are exempted from postage.

Education.—Sydney University, incorporated and endowed by the Act of Council, 14 Victoria, No. 31, and inaugurated on October 11th 1852, had 38 students in 1852. Its expenses for that year amounted to 3860*l.* 11*s.* 7*d.* There are three colleges or Grammar schools—two at Sydney, called Sydney College and Australian College, and King's School at Paramatta. These high schools are supported by the payments of the students. The elementary schools are mostly maintained by government. In 1852 there were at school 11,387 male and 9678 female children; of these one half were at Church of England schools.

History.—The history of a colony so recently established may be soon told. New South Wales was discovered by Captain Cook in 1770, though the western and northern coasts of the island had been previously visited by Dutch navigators. In 1787 the British government decided to form a convict establishment in Australia, "to empty the jails and houses of correction" of the mother-country, and eleven

ships were therefore sent, which arrived at Botany Bay, where it was intended to form the settlement, on January 20th 1788. Botany Bay was found inconvenient, and the establishment was removed to Sydney by the governor, Capt. A. Philip, who had been sent out with the fleet. The early progress of the colony, owing to the circumstance that the first settlers were only convicts, was so slow that its population in 1810 did not exceed 10,000 individuals. About that time one of the landed proprietors ascertained that the climate and soil of the colony were favourable to the rearing of sheep, and many persons consequently went to the colony to settle; but they soon found themselves embarrassed for want of room, and it appeared impossible to extend the settlements farther westward, as several attempts to pass over the Blue Mountains had been frustrated by the nature of the range, which consists of sandstone masses, furrowed by numerous ravines, whose sides are so steep that it is impossible to ascend them. In 1813 three enterprising individuals, Blaxland, Wentworth, and Lawson, succeeded in passing over the mountains; and in the same year followed the discovery of that fine pastoral country the Downs of Bathurst. In the following year a practicable line of road was constructed over the mountain ranges by convict labour. Mr. Oxley, in 1817, began the task of exploring the interior. Since this period some portion of the country has been nearly every year discovered and explored. Among the discoverers may be particularly mentioned Allan Cunningham, Lieut. Sturt, Count Stretzki (who first asserted that gold was to be found in the mountains), Mr. Eyre, Mr. Windsor Earle, Messrs. Landor and Lefray, and Dr. Leichardt, who, leaving New South Wales, reached the Gulf of Carpentaria, and who, on a second journey, lost his life in the interior. The results of their discoveries have been given in the geographical notices of Australia and of the several colonies.

The system of transportation has been discontinued of late years.

Towns.—The capital is SYDNEY. Bathurst is a thriving town, 198 miles W.N.W. from Sydney, on the west of the Blue Mountains, situated on the upper part of the Macquarie. It derived its importance at first from being the chief place of trade of the rich pasturage, Bathurst Plains, which surround it. It has since become of still greater importance from its vicinity to the gold diggings of Ophir, which lie from 20 to 28 miles west from it. *Boyd*, or *East Boyd*, as it is sometimes called, is a small but rising port-town, near the southern border of the colony, on the mouth of the river Towamba, which here falls into Twofold Bay. *Brisbane* is at the northern extremity of the colony, situated on the river Brisbane, about 10 miles from its mouth. It is a flourishing town, in an agricultural district. Tobacco and wine are produced. *Campbellton* is on the coast, about 20 miles S. from Sydney, and has considerable trade and manufactures, particularly of leather. *Liverpool* is about 16 miles W. from Sydney, on the left bank of George's River. It is an inland town, surrounded by a rich and well cultivated country, which secures it much retail business. *Macquarie*, or *Port Macquarie*, is a small but increasing town, at the mouth of the river Hastings, which a little higher up receives the Wilson and Maria rivers, and forms a tolerably safe bay. It is about 120 miles N. from Hunter River. *Maitland* is on the right bank and about 40 miles from the junction of Hunter River, at the junction of the Wallis creek. The river here first becomes navigable for sloops. The coal-mines in the neighbourhood have greatly contributed to the prosperity and increase of this place, which is properly two towns, East Maitland and West Maitland. In East Maitland are a court-house and jail, and in West Maitland are numerous stores and some good hotels. A steamer runs regularly from Maitland to Sydney. *Newcastle*, about 70 miles N. by E. from Sydney in a direct line, is built at the mouth of the Hunter River, which forms a harbour deep enough for merchant vessels, but the entrance is narrow and crooked. The town owes its importance chiefly to the collieries in its neighbourhood, which are extensively worked. It gives title to a bishop. *Paramatta* is situated at the mouth of the small river Paramatta, and at the head of the harbour of Port Jackson. It is 18 miles by water and 15 miles by land from Sydney. The principal street is a mile long; at the end farthest from the harbour is the country residence of the governor of the colony. Daily communication is kept up with Sydney by means of stage-coaches and steam-boats. The observatory at Paramatta (founded in 1821) was the private property of Lieut.-General Sir Thomas Brisbane, an active and well-informed astronomer, during his residence in the colony as governor. At his return to England, the government adopted it as a public establishment, and it is now under the superintendence of an observer appointed by the Admiralty. At Paramatta are two lunatic asylums, one of which is for convict lunatics and invalids. *Windsor*, about 30 miles N.W. from Sydney, stands on the right bank of the Hawkesbury, which is navigable for a few miles above the town for coasting vessels. This circumstance and the fertility of the country which extends along both sides of the river above the town have raised it to some commercial importance. There are at Windsor mills for grinding grain, breweries, and tanneries.

The Government.—This consists of a governor-in-chief, with a secretary, treasurer, and auditor-general, with the necessary subordinates, and an executive council, all appointed by the imperial government at home. By the 18 and 19 Vict., cap. 54, passed in August, 1855, there are to be a legislative council, consisting of such number (not

fewer than 21) as the governor and council may determine. There is also to be a legislative assembly of 54 members. For the legislative assembly, the qualifications of electors are, that they must be natural-born or naturalised subjects of her Majesty, of the age of 21, possessing a freehold estate within the district of 100*l.* clear value above all incumbrances or charges on it, for at least six months before the date of the writ or the last registration, or occupying a dwelling-house for six months of the clear annual value of 10*l.*, or a lodging of 10*l.* yearly rent, or having a salary of 100*l.* a year, or holding a licence to depasture lands within the district, or holding a leasehold estate in the district of the yearly value of 10*l.* of which the lease has not less than three years to run, and on which in all cases the rates and taxes due to within three months of such election or registration have been paid, and who is not attainted of treason, or convicted of felony, &c. No minister of religion can be a member. The legislature, when constituted, is to administer, in conjunction with the governor, the affairs of the colony, without reference to the mother country, except in such cases as the governor may think doubtful or important enough to require to be brought under the special consideration of the home government. The amount of the civil list specified in the Act, including the expense of the civil and judicial establishments of the colony, is 64,300*l.*; and a sum of 28,000*l.* a year is likewise to be appropriated for the purposes of public worship. The waste lands in the colony are to be under the management of the colonial legislature.

The governor and council are empowered to levy customs on goods imported, but no duty is to be imposed on any article from one country that is not alike imposed on the same article from other countries. No duties however are to be levied on articles imported for the supply of her Majesty's land or sea forces; nor have they the power allowed them to grant any exemption, or impose any duty, at variance with any treaty concluded by her Majesty with any foreign power.

In the administration of justice there are a chief judge and three puisne judges, with an attorney-general, a solicitor-general, and a crown solicitor. Magistrates are appointed in the various districts by the governor, and quarter sessions and petty sessions are held in various places at frequent intervals.

WALKER. [NORTHUMBERLAND.]

WALLACHIA, or WALACHIA (*Zara Rumuniata*, in Wallachian, in Turkish *Bflak*), a principality and vassal state of Turkey-in-Europe, is bounded N. by the Carpathian Mountains (which divide it from Transylvania) and the principality of Moldavia, E. by that part of the Lower Danube, which, running from south to north, separates it from the Dobruddcha, S. by the Danube, and W. by the Danube and the south-eastern corner of Hungary. Its greatest length from west to east is 276 miles; its greatest breadth from south to north is 127 miles. The area is about 28,000 square miles: the population amounts to 2,324,484, all of the Greek Church, except a few Hungarian settlers, who are Catholics.

The Carpathians are the principal mountains. [CARPATHIANS.] Several ranges of lower mountains and hills stretch from the Carpathians in a parallel direction south and south-east, and contain valleys between them, the upper part of which is narrow, but the lower part becomes wider as the valleys approach the Danube. Along this river there is a broad level tract consisting near the Danube of lowlands and marshes, which are exposed to the inundations of the river. However the most western part of Wallachia is generally mountainous, and the hills reach to the banks of the Danube. A great part of the country, especially the northern part, is covered with forests of firs, oaks, and beeches. The soil, except in the mountainous districts, is a rich mould, and of extraordinary fertility. In the elevated part of the country there are extensive pastures covered with aromatic herbs, which feed a great number of sheep, the flesh of which is much esteemed. In the level and marshy parts there is excellent pasture for cattle, of which great numbers are annually fattened. The principal river is the Danube. [DANUBE.] The other rivers are tributaries of the Danube; their sources are all in the Carpathians, and their direction is south in the western part of the country, south-east in the middle part, and east in the eastern part. The principal are—the *Syll*, or *Schyl*, in the west; its sources are in Transylvania, but it soon leaves this country by a long and narrow defile called the Valkan Pass, where it enters Wallachia; it joins the Danube opposite the small town of Rahova in Bulgaria; its length is nearly 140 miles. The *Alt*, or *Aluta*, east of the *Syll*. [ALUTA; TRANSYLVANIA.] The *Telorman*; its sources are in 45° N. lat., between the Alt and the river Arjish, at the foot of the Carpathians; it joins the Danube opposite the town of Novograd in Bulgaria, after a course of 100 miles. The *Arjish*, *Argis*, or *Arj*, east of the Alt; its sources are in the Carpathians, 20 miles east of the Rothenthurm Pass, and it joins the Danube a little below Oltenitza, and opposite the Bulgarian town of Turtuki, after a south-eastern course of 160 miles. The *Dumbravitza*, a tributary of the Arjish, passes Bukharest, and joins the latter 16 miles north of the junction of the Arjish with the Danube; its course is almost parallel to that of the Arjish, and its length is 110 miles. The *Jalonitza* comes from the Carpathians near the Tomosh Pass; at first it runs south for 80 miles, and afterwards south-east, east, and north-east till it reaches the Danube a little below Hirsova; its whole course is nearly 170 miles. The *Buzeo*, north of the Jalonitza, comes from Transylvania, flows through the Buzeo Pass, GEOG. DIV. VOL. IV.

and joins the Sereth 12 miles above the junction of this river with the Danube, after an easterly course of 120 miles. All these rivers are navigable for barges, but little is done to facilitate the navigation, which is rendered impracticable in many places by rocks, shallows, and other obstacles. Besides the larger rivers, there are many smaller streams which traverse the country. In the marshy districts there are several large lakes formed by branches of the Danube; and in the rainy season, or when the snow on the Carpathians melts, the low tracts along the Danube are inundated for many miles in breadth.

Climate and Productions.—The summers are exceedingly hot and the winters very cold; but the climate is healthy, except in the marshes, where bilious fevers prevail, and mosquitoes swarm during the warmer months. The waters are abundantly supplied with fish. The mineral productions are iron, copper, lead, silver, rock-salt, and bitumen. Gold is found in the sands of several of the feeders of the Danube. Wallachia produces abundantly wheat, barley, rye, hemp, tobacco, maize, &c. The vine grows well, and the produce is excellent, and would be equal to the best Hungarian wines if the inhabitants had more skill. The French berry (*Rhamnus infectorius*) grows in many districts, and is exported chiefly to Transylvania, where it is used for dyeing. Sheep are very numerous in Wallachia, and a great quantity of excellent wool is exported. Cattle also are very numerous. There is abundance of game of every description. There is plenty of timber, but it rots in the forests. Only the third part of the country is cultivated. The navigation of the Danube by steamers puts Wallachia in communication with Vienna and Constantinople. Several foreign merchants reside at Bukharest, the capital, and at Brailow, the principal Wallachian port on the Lower Danube.

Government.—The government is in every respect like that of Moldavia, from which country the political history of Wallachia is inseparable. In the article MOLDAVIA reference was made to the present article with a view to supply some further information respecting the history of the countries, subsequent to their evacuation by the Russians, in the summer of 1854. But, with the exception of the return of the princes Stirbey and Ghika to Wallachia and Moldavia respectively, and the continued military occupation of both principalities by Austria, no events worth noticing have occurred. Wallachia is divided into 18 districts, administered by officers called *Isprovniks*. Ten of these districts are in the mountainous and hilly parts of the country; eight in the plain and low country along the Danube. The following table gives the districts, with the population and chief town of each:—

	Districts.	Population.	Chief Town.
Upper Wallachia.	Romnik Sarat	111,342	Romnik Sarat
	Buzeo	137,645	Buzeo
	Sacinezi	121,230	Bucova
	Fracova	130,434	Ploiesci
	Dambovitza	116,987	Turguviel
	Muscelu	123,438	Campulungo
	Arges	137,753	Pitești
	Romnik Valcea	126,928	Romnik
	Gordji	148,728	Turgudjilu
	Mehedinti	187,850	Cernets
Lower Wallachia.	Doldji	136,819	Krajova
	Romanati	128,432	Caracala
	Oltu	115,917	Slatina
	Tele-orman	116,453	Zimnicea
	Vlasca	102,310	Giurgevo
	Jalomitza	111,612	Calaras
	Ilfov	175,000	Bukharest
	Ibrafla	95,608	Ibrafla

Towns.—*Bukharest*, the capital, is described in a separate article. [BUKHAREST.] *Tergovist*, or more correctly *Turguviel*, N.W. of Bukharest, was the capital of Wallachia till 1698, when the seat of government was transferred to Bukharest. *Tergovist* is situated on the Jalonitza, and contains about 5000 inhabitants; the whole place is covered with ruins of houses and palaces, which were abandoned by the nobility after 1698. The road from Bukharest to Kronstadt in Transylvania, leads through *Tergovist*. *Giurgevo*, on the Danube, is noticed under RUTHENIA. *Arjish*, on the Arjish River, towards its source, lies on the road from Bukharest to the pass of Rothenthurm and Hermannstadt. There is a beautiful church in this thriving little town, which is said to be the finest in Wallachia. *Islas* is a small but busy town, a little west of the junction of the Aluta with the Danube. *Krajova*, a fine town with about 8000 inhabitants, has considerable commerce: it is situated on the Schyl, in the centre of *Little Wallachia*, or the western part of Wallachia, between the Aluta in the east, and Hungary and the Danube on the west. This district was the scene of the early struggle between the Turks and Russians at the commencement of the war in 1854. *Krajova* is the capital of *Little Wallachia*. To the south-west of *Krajova* opposite *Widin* is *Kalafat*, which was occupied and defended by the Turks against the Russians with great bravery. [WIDIN.] Not far from it is *Csitate*, where the Turks defeated the Russians with great loss, January 6, 1854. *Brailow*, or *Ibrafla*, on the Danube, 10 miles S. from the junction of the Sereth with the Danube, in the north-eastern corner of Wallachia, forms the subject of a separate article. [IBRAFLA.] *Romnik*, lies W. of Brailow

In its vicinity is Okna-Mare, where there are rich mines of rock-salt. The great road from Yassy to Bukharest leads through Romnik. *Fokahany*, or *Fokzan*, is partly in Moldavia: population, 25,060. [MOLDAVIA, vol. iii., col. 836.]

Inhabitants.—The majority of the inhabitants are Wallachians, besides whom there is a considerable number of gipsies, and some Jews, Armenians, and Greeks. Besides the Wallachs of Wallachia, there are many of the same people spread over Moldavia, south-western Russia, Transylvania, Hungary, the Bukowina, Thrace, Macedonia, Thessaly, and Epirus. As the Wallachian language is derived from the Latin, it is generally supposed that the Wallachians are descendants of the Roman colonists sent by Trajan into Dacia; and to this day they call themselves no other name than *Rómani*, *Rumani*, or *Romans*. The name Wallacha, which is given to the inhabitants of Wallachia by foreigners, belonged to some people in Thrace, Macedonia, and Thessaly, as we know from the Byzantine historians, who frequently mention the *Vlachi* (*Βλάχοι*), who lived chiefly in the country round Mount Pindus. In the 18th century a part of the *Vlachi*, who were oppressed by the emperor Manuel, concluded an alliance with the Bulgarians and the *Gumani*, who inhabited Bulgaria and Dacia, and, commanded by two brothers, *Aaan* and *Peter*, left Thrace and settled north of the Danube.

Three causes seem to have contributed to induce the *Vlachi* to settle north of the Danube—the oppression of the Greek emperors and nobles, the invasions of the Turks, and the opportunity of acquiring fertile lands and liberty in a country beyond the reach of the emperors and the Turks. Thus the inhabitants of Wallachia, Moldavia, and a great part of Transylvania and Hungary must be considered as descended from the *Vlachi* in Thrace, a Christian nation, belonging to the Greek Church, and who in the 12th century used a kind of Roman language, which the *Kutzo-Wallachians* (or that part of the race which remained in the more southern provinces of Turkey-in-Europe) still do. The name '*Vloch*,' or '*Wloch*,' is said to be Slavonic for '*Italian*,' or '*Roman*;' and thus Wallach is equivalent to the native name *Rómani*. In *Stritter's 'Memoria Populorum*,' vol. i., Thrace is spoken of as, "*Provincia Latinorum qui illo tempore Romani vocabantur, modo vero Morovlachi, hoc est Nigri Latini vocantur.*"

Slavonic tribes spread all over the European provinces of the empire south of the Danube, even to the remotest parts of the Peloponnesus in the 7th century, and no doubt mingled with the races already in possession of the soil. That the Wallachs are principally descended from Romans or a Romanised people is clear from their language, customs, costume, and name. The language shows a considerable admixture of Greek and Slavonic, with some Turkish and Albanian roots; but the auxiliary verbs, the pronouns, the greater part of the prepositions, and the adverbs of place and time, as well as the numerals, the declensions, and the conjugations, are all Latin, and so is generally the groundwork of the language.

The Wallachians use the Cyrillic alphabet, which consists of forty-two letters, and was invented by Bishop Cyrilus about 870, when he first wrote in the old Slavonic language in Servia. They have always had a written language, and the number of their chronicles, annals, and ecclesiastical works is considerable, but only a few of them are printed. Newspapers are published in the Wallachian language at Bukharest and Yassy. [See ROUMANIA, in SUPPLEMENT.]

WALLASEA ISLAND. [ESSEX.]

WALLASEY. [CHESHIRE.]

WALLENSTADT, LAKE. [GALL, ST.; SWITZERLAND.]

WALLINGFORD, Berkshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on the right bank of the Thames, in 51° 36' N. lat., 1° 7' W. long., distant 46 miles W. by N. from London by road, and 50 miles by the Great Western railway. The population of the municipal borough of Wallingford in 1851 was 2819; that of the parliamentary borough was 8064. The borough is governed by 4 aldermen and 12 councillors, of whom one is mayor; and returns one member to the Imperial Parliament. The livings are in the archdeaconry of Berks and diocese of Oxford. Wallingford Poor-Law Union contains 28 parishes and townships, with an area of 40,860 acres, and a population in 1851 of 14,112.

Wallingford was probably a Roman station. [BERKSHIRE.] There was a castle here at the time of the Conquest belonging to Wigod, a Saxon noble. In 1067 Robert D'Oyley, a Norman baron, who had married Wigod's only daughter, built a strong castle at Wallingford. In 1158, Henry, son of the Empress Maud, besieged a fort which Stephen had erected at Crowmarsh, on the opposite side of the Thames, and Stephen coming to its relief, a peace was concluded between the rival parties. In the civil war of Charles I., the castle was regarded as a post of importance: near the close of the war it surrendered to Fairfax, and was afterwards demolished. Scarcely any portion of the buildings remains. In the town are portions of several ancient buildings. A Benedictine priory was founded here in the reign of William I.

Wallingford has a remarkably neat and respectable appearance. The principal streets are paved, and lighted with gas. The stone bridge, which here crosses the Thames, connects the town with Crowmarsh-street. There are three churches, St. Mary's, St. Leonard's, and St. Peter's. St. Mary's, the principal church, is an ancient struc-

ture of early English character. St. Leonard's was rebuilt in great degree after the siege in 1646, in which it had sustained great injury; it has recently been restored and enlarged; this church is a fine specimen of Norman architecture. St. Peter's was also ruined in the siege, and remained in ruins more than a century; it has a spire of very singular form, erected at the expense of Sir William Blackstone, the author of the '*Commentaries*,' when the church was restored about 80 years back. Sir W. Blackstone is buried in the church. There are chapels for Independents, Baptists, and Primitive Methodists, National schools, a mechanics institute, and a savings bank. The chief trade of the place is in corn, flour, malt, and coal. Friday is the market-day; a fair is held yearly on September 29th. A county court is held. Wallingford is a borough by prescription.

WALLIS ISLAND is a small island in the Pacific, the centre of which is in 18° 18' S. lat., 176° 20' W. long. It is 5 miles long and 2 miles wide. The interior of the island is rather high, but along the shore it is low and rocky. The island is surrounded by a reef about two miles from the shore. In a break in the reef on the west side of the island a vessel may anchor in eight fathoms water. The island is covered with trees to the water's edge, and many of them are of large size. In some parts there are plantations of cocoa-nuts. There are several rills of water in the island. The inhabitants go naked.

WALLOOSTOCK, RIVER. [CANADA.]

WALLOP, NETHER. [HAMPSHIRE.]

WALLESD. [NORTHUMBRLAND.]

WALMER. [DEAL.]

WALMERSLEY. [LANCASHIRE.]

WALPOLE ST. PETER. [NORFOLK.]

WALSALL, Staffordshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Walsall, is situated in 52° 35' N. lat., 1° 58' W. long., distant 17 miles S.S.E. from Stafford, 121 miles N.W. from London by road, and 128 miles by the London and North-Western and South Staffordshire railways. The population of the municipal and the parliamentary boroughs, which are co-extensive, was 25,680 in 1851. The borough is governed by 6 aldermen and 18 councillors, of whom one is mayor; and returns one member to the Imperial Parliament. The living is a vicarage, in the archdeaconry of Stafford and diocese of Lichfield. Walsall Poor-Law Union contains eight parishes and townships, with an area of 21,608 acres, and a population in 1851 of 48,044.

The town of Walsall is irregularly laid out, but contains numerous good houses. The parish church of St. Matthew is in the centre and highest part of the town. The tower is of fine proportions, and is surmounted with a lofty spire. St. Paul's chapel, a handsome Grecian building, was erected by the trustees of the grammar school. There are chapels for Wesleyan Methodists, Baptists, Independents, and Roman Catholics, a Free Grammar school, National schools, and an infant school. There are an old town-hall, a small borough jail, and a handsome public library and news-room, with a Doric colonnade.

Walsall is situated on the eastern border of the South Staffordshire coal-field, and of the Warwickshire and Staffordshire iron district. Many of the inhabitants are employed in the manufacture of guns, gas-tubes, chains, locks, keys, spades, shovels, hinges, screws, files, edge-tools, buckles, stirrup-irons, bridle-bits, and machinery. There are brass- and iron-foundries; and in the vicinity are coal-pits and freestone quarries. A market is held on Tuesday. There are three yearly fairs. A county court is held. Races are held about Michaelmas.

WALSHAM. [NORFOLK.]

WALSINGHAM, LITTLE or NEW, Norfolk, a town, and the seat of a Poor-Law Union, in the parish of New Walsingham, is situated on both sides of the river Stiffkey, in 52° 54' N. lat., 0° 54' E. long., distant 28 miles N.W. from Norwich, and 113 miles N.N.E. from London by road. The population of the parish in 1851 was 1207. The living is a perpetual curacy in the archdeaconry and diocese of Norwich. Walsingham Poor-Law Union contains 50 parishes and townships, with an area of 86,503 acres, and a population in 1851 of 21,857.

Great or Old Walsingham, and Little or New Walsingham, adjoin each other. Geoffroy de Favarches, in the reign of William the Conqueror, founded here a monastery for Augustinian or Black Canons. An image of the Virgin, belonging to this foundation, was held in the very highest regard; pilgrimages to the chapel or shrine of '*Our Lady of Walsingham*' were even more frequent than those to the shrine of St. Thomas à Becket, and the possessions of the priory were augmented by large endowments and costly presents. There are some fine remains of the convent:—a richly-ornamented lofty arch, supposed to have formed the east end of the conventual church; the western entrance-gateway to the monastery, having a broad flattened arch; and other interesting portions, yet remain. The principal part of these ruins is included in the pleasure-grounds of Walsingham Abbey, the seat of the lord of the manor. There was a house of Franciscan or Gray Friars at Little Walsingham; there was also a lazaret-house, founded in 1492, for two leprous persons. This lazaret-house has been enlarged, and is used as a bridewell. The parish church contains an ancient font of perpendicular character; its carving is among the richest in England, representing the seven sacraments of the Roman Catholic Church, and the Crucifixion. There are chapels for Wesleyan Methodists, Independents, and Baptists a Free Grammar school, and National schools.

There is a yearly fair. Quarter sessions for the county are held in the town by adjournment twice in the year.

WALSOKEN. [NORFOLK.]

WALTHAM. [ESSEX.]

WALTHAM ABBEY, or WALTHAM HOLY CROSS, Essex, a market-town, in the parish of Waltham Abbey, is situated on the river Lea, which is here separated into several channels, some of which flow through the town, in 51° 41' N. lat., 0° 1' W. long., distant 13 miles N. by E. from London by road, and 15 miles by the Eastern Counties railway. The population of the town in 1851 was 2329.

The first notice of Waltham occurs in the reign of Canute, whose standard-bearer, Tovi, founded here a religious house with two priests. Harold, afterwards king of England, enlarged the foundation of Tovi in 1062, rebuilt the church, and established a school of learning. When Harold fell in the battle of Hastings in 1066, his body was brought to Waltham for interment, and a tomb erected over his burial-place. In the reign of Henry II., in 1177, the dignity of abbot was conferred upon the head of the establishment. Henry III. frequently resided here, and granted to the inhabitants the privilege of a market and a fair. The town is lighted with gas. The nave of the conventual church, with its side-aisles, forms the body of the present church. The extent of the original fabric may be estimated by the fact, that Harold's tomb, which was in the choir or in a chapel beyond it, stood about 120 feet eastward from the termination of the present building. The church is about 90 feet in length, and, including the side-aisles, 48 feet in breadth. It is in the Norman style, with round massive piers dividing the nave from the side-aisles, semicircular arches, and zigzag enrichments. The roof is modern. At the west end of the church is a heavy square embattled stone tower, 86 feet high, bearing the date 1558. From the south side of the church projects a chapel, under which is a fine crypt. The building was repaired and restored a few years back; it is of great architectural and antiquarian interest. An entrance-gateway which remains is in a much later style of architecture than the church. There are chapels for Baptists and Wesleyan Methodists; National and British schools; a school, founded by Mr. Leverton, for the education and clothing of 20 boys and 20 girls; a literary and scientific institute; and a working-men's mental and moral improvement society. The powder-mills belonging to government employ many hands; there are also breweries, flour-mills, malt-kilns, and a manufactory of percussion-caps. A county court is held. The market is on Tuesday. Fairs are held on May 14th, and on September 25th and 26th.

WALTHAM CROSS. [HERTFORDSHIRE, *Cheshunt.*]

WALTHAM-ON-THE-WOLDS. [LEICESTERSHIRE.]

WALTHAMSTOW, Essex, a village in the parish of Walthamstow, is situated near the left bank of the river Lea, in 51° 35' N. lat., 0° 2' W. long., distant 26 miles S.W. from Chelmsford, and 7 miles N.E. from London. The population of the parish in 1851 was 4959. The living is a vicarage in the archdeaconry and diocese of London. Besides the parish church, a brick building with a square tower, there are chapels for Independents; National, British, and Infant schools; Sir G. Monoux's Grammar school; the Forest school, in connection with King's College, London; and a school for the education of the daughters of missionaries, in connection with the London Missionary Society. In the neighbourhood are copper-mills and oil-mills.

WALTON-LE-DALE. [LANCASHIRE.]

WALTON-LE-SOKEN. [ESSEX.]

WALTON-ON-THAMES. [SURREY.]

WALTON-ON-THE-HILL. [LANCASHIRE.]

WANDSWORTH and CLAPHAM, Surrey, adjoining villages and parishes, which jointly give name to a Poor-Law Union. The Union contains 6 parishes and townships, with an area of 11,693 acres, and a population in 1851 of 50,764. The villages of Wandsworth and Clapham are described under SURREY.

WANGARA, a country in Northern Africa, mentioned only by the Arabian geographers Edrisi, Abulfeda, and Leo Africanus. These authors agree in stating that in Wangara the Niger terminates, and Leo Africanus adds that it terminates in the sea. Thus Wangara appears to be the delta of the Quorra, and this supposition is supported by the description which is given of the country. The authors above mentioned describe it as an alluvial tract environed and intersected by the branches of the Niger, and annually overflowed in July, August, and September; they add that several fresh-water lakes are found in it. Leo Africanus says that the low tract is called Genni by the inhabitants, and that it is contiguous to Wangara, which thus would comprehend the mountainous tract about the confluence of the Quorra and the Tshadda. The name of Genni or Ginni appears even at present to be used in Northern Africa for the delta of the Quorra, and from this name appears to be derived that of Guinea, which Europeans have applied to that portion of the coast of Africa which extends from Cape Palmas to the Bight of Biafra. The Arabs arrived in Sudan by way of Nubia and Abyssinia, and as soon as they had advanced as far as 10° E. long. of Greenwich, they found that all the waters ran westward; and they must soon have been informed that they united in a large river, which farther down in Wangara reached the sea. They were therefore right in stating that the Niger runs westward.

WANGFORD, a hundred in the county of Suffolk, which gives name to a Poor-Law Union. Wangford hundred comprises 23 parishes and one hamlet, with an area of 33,187 acres, and a population in 1851 of 9618. Wangford Poor-Law Union contains 27 parishes, with an area of 35,079 acres, and a population in 1851 of 14,014.

WANLOCKHEAD. [DUMFRIESSHIRE.]

WANSDYKE. [SOMERSETSHIRE.]

WANSTEAD. [ESSEX.]

WANTAGE, Berkshire, a market-town and the seat of a Poor-Law Union; in the parish of Wantage, is situated in 51° 35' N. lat.; 1° 26' W. long., distant 10 miles S.W. from Abingdon, and 60 miles W. by N. from London by road. The population of the town in 1851 was 2951. The living is a vicarage in the archdeaconry of Berks and diocese of Oxford. Wantage Poor-Law Union contains 34 parishes and townships, with an area of 76,700 acres, and a population in 1851 of 17,438.

Wantage was a place of importance in the time of the Saxons, when it formed, with the neighbouring lands, part of the patrimony of the West Saxon kings, who had a residence here, in which Alfred the Great was born in 849. A public festival in commemoration of the birth of Alfred was held at Wantage on October 25th 1849.

Wantage had formerly a manufacture of woollen-cloth and sacking, but this having declined, the town was gradually decaying, when, on the opening of the Great Western railway, the leading inhabitants established a new pitched market, on Wednesdays, for the sale of agricultural produce, and the town has in consequence been greatly benefited. Among other improvements may be named the erection of a town-hall, a National school of a superior character, a Grammar or Middle school (the revival of an old and nearly obsolete foundation), a new cemetery and chapel, and two district chapels. The parish church is an ancient cruciform edifice of mixed styles, with a square embattled tower rising from the intersection. In the interior are some monumental brasses of the 14th and 15th centuries. The Wesleyan Methodists and Baptists have chapels; and there are the Alfred literary and scientific institute, the church library, and a savings bank. A county court is held. There is a market-cross, erected in 1580. A branch of the Wilts and Berks Canal comes up to the town. There are a monthly cheese-fair, two yearly fairs for cattle and cheese, one for cherries, and a statute fair.

WAPPING. [LONDON.]

WARASDIN. [CROATIA.]

WARBOYS. [HUNTINGDONSHIRE.]

WARDODJ, RIVER. [BADAKSHAN.]

WARE, Hertfordshire, a market-town and the seat of a Poor-Law Union, in the parish of Ware, is situated on the left bank of the river Lea, in 51° 49' N. lat., 0° 2' W. long., distant about 3 miles E.N.E. from Hertford, 20 miles N. from London by road, and 24 miles by the Eastern Counties railway. The population of the town in 1851 was 4832. The living is a vicarage in the archdeaconry of St. Albans and diocese of Rochester. Ware Poor-Law Union contains 15 parishes and townships, with an area of 35,747 acres, and a population in 1851 of 16,482.

Ware consists of one long street and several smaller streets. The Lea is crossed by a fine iron bridge, constructed in 1845. The parish church, a beautiful cruciform structure, was lately restored. The Wesleyan Methodists, Independents, and Quakers have places of worship. The Free Grammar school, founded in 1563, has been revived as a Middle school. St. Edmund's College, Old Hall Green, is an academy for the education of Roman Catholic clergymen. There are National schools, a British school, and a literary institute. The market on Tuesday is one of the greatest in the county for corn, and there is a yearly fair. Ware is one of the principal towns in England for the manufacture of malt. Brewing, rope-making, brick-making, and sack-making employ some of the inhabitants. The Danes, in the reign of Alfred, brought their vessels up the Lea to Ware, and protected them by a dam or weir across the river.

WAREHAM, Dorsetshire, a market-town, municipal and parliamentary borough, and, conjointly with Purbeck, the seat of a Poor-Law Union, is situated on an eminence between the rivers Frome and Piddle, in 50° 41' N. lat., 2° 6' W. long., distant 19 miles E. by S. from Dorchester, 115 miles S.W. from London by road, and 126 miles by the London and South-Western railway. The population of the parliamentary borough in 1851 was 7218. The municipal borough is governed by 7 aldermen and 21 councillors, one of whom is mayor, who acts as coroner for the whole Isle of Purbeck. The living is a rectory in the archdeaconry of Dorset and diocese of Salisbury. Wareham and Purbeck Poor-Law Union contains 27 parishes and townships, with an area of 96,309 acres, and a population in 1851 of 17,417.

The town of Wareham is within three miles of an arm of the sea, which forms a part of the bay called Poole Harbour. A town existed here in the time of the Britons, and it was subsequently occupied by the Romans. The town is nearly surrounded by an earthwork formed by the Danes in the time of Alfred. A priory was founded at Wareham in the 9th century, and there are some traces of an ancient castle. Much of the original area of the town is now covered with market-gardens. Three parishes, Lady St. Mary's, Trinity, and St. Martin's, now form one parish for ecclesiastical purposes. The church of St.

Trinity parish is used for the National school; and in that of St. Martin the burial service only is read. Lady St. Mary's church is a large and ancient edifice, and belonged to the priory. The nave was rebuilt in 1842. There are chapels for Independents, Wesleyan Methodists, and Unitarians; National, British, and Infant schools; almshouses; a mutual improvement society; a news-room; and a savings bank. Wareham returned two members to Parliament from the reign of Edward I. to the passing of the Reform Act, under which it now returns one member.

Wareham is a member of the port of Poole. The principal trade consists in the export of a peculiar kind of clay found in the parish of Corfe Castle and in the neighbourhood, which is in demand for the manufacture of common earthenware in Staffordshire. The market-day is Tuesday; and there are fairs for cattle, cheese, and hogs on April 7th and September 8th, and six cattle-fairs in the spring.

WAREKAURI. [CHATHAM ISLANDS.]

WARENDORF. [MÜNSTER.]

WARGRAVE. [BERKSHIRE.]

WARK. [NORTHUMBERLAND.]

WARKWORTH. [NORTHUMBERLAND.]

WARMINSTER, Wiltshire, a market-town and the seat of a Poor-Law Union, in the parish of Warminster, is situated in 51° 12' N. lat., 2° 10' W. long., distant 47 miles S.W. by S. from Devizes, 96 miles W. by S. from London by road, and 114 miles by the Great Western railway. The population of the town in 1851 was 4220. The living is a vicarage in the archdeaconry and diocese of Salisbury. Warminster Poor-Law Union contains 21 parishes and townships, with an area of 56,356 acres, and a population in 1851 of 17,067.

The town is in a very healthy situation, close to the western border of Salisbury Plain, in the valley of the Wily. The principal street is well paved. The parish church is a spacious and handsome structure; the tower is of the time of Edward III.; the body of the church was rebuilt early in the last century. Christ church was built a few years ago. An ancient chapel in the centre of the town is now used as a chapel of ease. There are chapels for Baptists, Independents, Wesleyan Methodists, and Unitarians; Lord Weymouth's school; National and Infant schools; and a savings bank. The town-hall, erected by the Marquis of Bath, contains a handsome suite of rooms for assemblies, public meetings, &c. The market for corn is held on Saturday, and there are three yearly fairs. A county court is held.

WARNETON. [FLANDERS, West.]

WARRAGONG MOUNTAINS. [AUSTRALIA.]

WARRENPOINT. [DOWNSHIRE.]

WARRINGTON, Lancashire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Warrington, is situated on the right bank of the river Mersey, in 53° 24' N. lat., 2° 36' W. long., distant 53 miles S. by E. from Lancaster, 184 miles N.W. from London by road, and 182 miles by the London and North-Western railway. The population of the parliamentary borough of Warrington in 1851 was 28,363. The borough is governed by 9 aldermen and 27 councillors, one of whom is mayor; and returns one member to the Imperial Parliament. The living is a rectory in the archdeaconry of Liverpool and diocese of Chester. Warrington Poor-Law Union contains 16 parishes and townships, with an area of 29,984 acres, and a population in 1851 of 36,164.

The town consists of several narrow streets irregularly laid out, which are well paved and lighted with gas. Two or three excellent examples of ancient half-timber houses are in the market-place. The parish church is a large cruciform building of various dates. Under the eastern end of the church is a Norman crypt. St. Paul's church, finished in 1831, is of gothic architecture; Padgate church is of later erection. There are places of worship for Roman Catholics, Wesleyan and Primitive Methodists, Independents, Baptists, the Countess of Huntingdon's Connexion, Quakers, and Unitarians. There are a Free Grammar school; National, British, Orphan, and Infant schools; a Blue-Coat school, a school of the Educational Society, a Diocesan Model school, Wesleyan and Roman Catholic schools, an institution for the education of clergymen's daughters, a mechanics and a church institute, a museum, a town library, a dispensary, a savings bank, and public baths. A town-hall, a market-hall, two cloth-halls, a bridewell, assembly-rooms, and a theatre are in the town.

Warrington was among the earliest seats of manufactures in Lancashire. Coarse linens and checks were the fabrics first made in the town, after which huckaback was manufactured, and then sailcloth and sacking. At present the chief branches of industry are—cotton-spinning and power-loom weaving, the weaving of fustians, the manufacture of flint-glass and glass bottles, machinery and mill-work, wire, pins, files, nails and tools, spades, rope, sail-cloth, soap, glue, size, and hats. There are steam flour-mills, malt-houses, brick-fields, tan-yards, a paper-mill, an iron-foundry where large iron steamers are built, and several breweries. The market is on Wednesday for corn, vegetables, and butcher-meat; a less important market is held on Saturday. There are two yearly fairs for woollen-cloth, Irish linens, Welsh flannels, horses, horned cattle, pigs, sheep, and pedlery. Potatoes and vegetables are cultivated to a considerable extent around the town. The navigation of the river Mersey and its feeder the Irwell is continued upward to Manchester. The Mersey and Irwell Canal joins the river Mersey near Warrington; and the Sankey Canal, the Duke of

Bridgewater's Canal, the London and North-Western railway, and the Lancashire and Cheshire Junction railway pass near the town.

WARSAW, the capital formerly of Poland, now of the province of Warsaw in European Russia, is agreeably situated on an eminence on the left bank of the Vistula, in 52° 10' N. lat., 21° E. long., and had 164,115 inhabitants in 1851. It consists of the city itself, which is divided into the Old and the New Town, and of several suburbs. The city is surrounded with ramparts, and defended by a citadel and other fortifications. The circumference of the city and suburbs (including Praga, a suburb on the right bank of the Vistula) is 10 miles, but there are many gardens and open spaces in this area. The city itself is irregularly built and the streets narrow, but the suburbs are distinguished by their regularity and fine buildings, and entitle Warsaw to rank among the handsomest cities in Europe. These suburbs are adorned with splendid edifices, with broad, well-lighted, and paved streets; the mean wooden houses which formerly stood here have gradually disappeared, and others of stone taken their place. Among the public structures are—the royal (now the imperial) palace, built by King Sigismund III., who transferred his residence from Cracow to Warsaw; the Saxon palace, with a fine garden; the palace, formerly the residence of the primate, since occupied by the commissariat department; the Krasiński palace, a very fine building, now the palace of the government; the palaces formerly belonging to Prince Radzivil and Count Brühl; the buildings of the former university; the arsenal; the mint; the Marieville bazaar, an imitation of the Palais Royal in Paris; the military hospital; and the great barracks. There are besides above a hundred palaces of the Polish nobles, and 18 convents (some of these have been suppressed), each with its own church. Among the other churches of Warsaw the most remarkable are—the Catholic cathedral of St. John, the church of the Holy Cross, that of St. Alexander (built by means of contributions which were collected for the purpose of erecting a triumphal arch in honour of the emperor Alexander's first entry into Warsaw); the church of St. Borromeo, and a beautiful Lutheran church. Warsaw has five theatres; numerous useful and charitable institutions; a National bank, established by order of the emperor Nicholas in 1828; a foundling hospital, six other hospitals, an agricultural academy, a deaf and dumb asylum, and numerous schools. Of the population about 30,000 are Jews. The manufactures of Warsaw comprise broadcloth, cotton-prints, linen, woollen-stuffs, hosiery, hats, gold- and silver-ware, paper, tobacco, saddlery, beer, chemicals, &c.; and the trade of the city is considerable, being favoured by the Vistula, five annual fairs, and by a railway, which joins the Cracow-Vienna line at Granica.

Before the Cracow gate stands the gilt bronze statue of King Sigismund III. on a marble column 26 feet high. The emperor Nicholas caused a splendid monument to be erected in the church of the Capuchins, in honour of King John III. (Sobieski), the conqueror of the Turks. In 1830 the statue of Copernicus was erected before the palace of the Royal Society of Friends of the Sciences, and the statue of Prince Joseph Poniatowski, who lost his life in the battle of Leipzig, was set up in the Cracow suburb. Another statue of Copernicus, by Thorwaldsen, was erected in 1849.

The University of Warsaw, abolished in 1834, has been replaced by two colleges; but its library of 150,000 volumes and all its other valuable collections were transferred to St. Petersburg. Warsaw has also a theological seminary, a rabbinical college, an observatory, a botanic garden, two gymnasia, numerous Russian schools, libraries, and literary associations. Warsaw became the capital of Poland in 1566, of the Grand Duchy of Warsaw in 1807, and of Russian Poland in 1815. The Poles drove the Russians out of it in 1830, but the latter recovered it a few months after; and since this insurrection the most persevering efforts have been made by Russia to abolish the nationality, the religion, and the language of the Poles. [POLAND.]

WARSOP. [NOTTINGHAMSHIRE.]

WARTHA, RIVER. [BRANDENBURG.]

WARWICK, the county town of Warwickshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated chiefly on the right bank of the river Avon, in 52° 17' N. lat., 1° 33' W. long., distant 90 miles from London by road, and 105 miles by the London and North-Western railway. The population of the borough in 1851 was 10,973. The borough is governed by 6 aldermen and 18 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The living is a vicarage in the archdeaconry and diocese of Worcester. Warwick Poor-Law Union contains 34 parishes and townships, with an area of 66,639 acres, and a population in 1851 of 41,934.

Warwick is a place of considerable antiquity. It was ruined in the early wars of the Danes, and restored by the Lady Ethelfleda, daughter of Alfred the Great, and governor of Mercia, who built a fort here in 913. In the time of Philip and Mary the town received its first regular charter of incorporation.

The principal part of the town is separated from the Avon by Warwick Castle and the castle grounds. Its site is a solid rock, in which the cellars are excavated. Above the castle the Avon is crossed by a stone bridge of one arch 100 feet in span. The streets are spacious, well paved, lighted with gas, and in general lined with modern well-built houses. The castle is one of the finest specimens of the ancient residences of our feudal nobles in the kingdom. One of the

towers in the castle, known as Caesar's Tower, which is 147 feet high, is the most ancient part of the whole building, and is of uncertain date; another, known as Guy's Tower, 128 feet high, is of the latter part of the 14th century and is of decorated English character. The length of the entire suite of apartments is 333 feet. The great hall of the castle, a noble room, 62 by 37 feet, retains, in its appearance and furniture, much of its ancient character. The other apartments contain a number of portraits and other paintings by the old masters, and a valuable collection of ancient and modern armour. The grounds are extensive and beautiful, and one of the greenhouses contains the capacious and beautiful ancient vase brought to England by the late Earl of Warwick, known as the 'Warwick Vase.' St. Mary's church is a cruciform edifice, of which the choir and its adjuncts, especially the chapel of St. Mary, usually termed Beauchamp Chapel, are ancient; the nave and transept are modern, and are of barbarous architecture, with a mixture of different styles. The chancel is a beautiful specimen of perpendicular architecture, and the east front is remarkably fine. The tower, which is 130 feet high, is surmounted at the angles with lofty pinnacles. In the centre of the chapel is a very rich altar-tomb, with the figure, in latten, of Richard Beauchamp, Earl of Warwick, who died in 1439. St. Nicholas's church is a small modern building. There are places of worship for Wesleyan Methodists, Independents, Baptists, Quakers, Roman Catholics, and Unitarians. There are the King's school, founded by Henry VIII., National, British, and Infant schools; an Industrial school for girls; an Endowed school for boys and girls; a savings bank, and a dispensary. The public buildings include a spacious and handsome county-hall; a neat court-house; a large modern jail; a county house of correction; a town-hall; and a substantial market-house. 'Leicester Hospital,' or almshouse, is for a master and 20 brethren, impotent or infirm men. An ancient place of worship, called St. Peter's church, over the east gate of the town, is used as a free-school. On the west side of the town is a race-course.

An extensive hat manufactory and some large flour-mills afford considerable employment. There are malt-houses, rope-walks, and lime-, timber-, and coal-wharfs on the bank of the Warwick and Napton Canal. The market is held on Saturday. There are 12 yearly fairs, some of which are considerable cattle-fairs. The assizes and quarter sessions for the county, quarter sessions for the borough, and a county court, are held at Warwick.

WARWICKSHIRE, a midland county of England, is bounded N. for a very small space by Derbyshire; N.E. by Leicestershire, the line of separation being formed in great part by the ancient Watling Street; E. by Northamptonshire; S.E. by Oxfordshire; S. and S.W. by Gloucestershire; W. by Worcestershire; and N.W. by Staffordshire. It lies between 51° 58' and 52° 42' N. lat., 1° 10' and 2° 0' W. long. The greatest length is 50 miles; the greatest breadth is 33 miles. The area of the county is 881 square miles, or 563,946 acres. The population in 1841 was 401,703; in 1851 it was 475,018.

Surface and Geology.—Warwickshire has no lofty hills, but the whole county is occupied by gentle eminences with intervening vales. The south-eastern border is skirted by hills composed of the lower formations of the oolitic series, overlooking the valley of the Stour and the 'Vale of Red Horse,' so called from a colossal figure of a horse carved in the ferruginous sands of the slope of Edge Hill, now obliterated by the progress of inclosures, and replaced by one of much smaller dimensions. Of these oolite hills the chief portion in Warwickshire consists of two ridges separated from each other by a narrow valley drained by a small brook which joins the Cherwell near Banbury in Oxfordshire. The northernmost ridge, comprehending the Burton Hills, Gredenton Hill, Bitham Hill, Compton Hill, Farnborough Hill, Mollington Hill, and others, runs from north-west to south-east, dividing the valley just mentioned from a parallel valley drained by another small feeder of the Cherwell, and through which the Oxford Canal passes. The other ridge consists of two parts or branches, meeting at Knowle Hill: one part runs parallel to that just described, and overlooks the valley between them; the other is nearly at right angles to the former, and runs southward, overlooking the valley of the Stour. This latter part of the ridge, known in one part as Edge Hill, possesses considerable interest as overlooking the scene of the first pitched battle in the civil war of Charles I.: it consists of an elevated platform with a steep escarpment, commanding an extensive prospect over Warwickshire and Worcestershire as far as the Malvern and Abberley Hills west of the Severn. The southern prolongation of Edge Hill consists of detached summits, such as Tysoe Hill, Broom Hill, Mine Hill, and Long Compton Hill. Brailes Hill is detached from the principal chain of hills, and is more advanced into the valley of the Stour; it has two rather lofty summits.

The valley of the Stour and the Vale of Red Horse, which skirt the foot of the oolite hills, are occupied by the beds of the lias formation. The lias forms towards its north-western limit a range of high ground, including Walton or Bath Hill, Morton Hill, Bromston Hill, Harbury-upper-Field, and Dunsmore Heath, at the foot of which range the formations of the red marl and new red-sandstone group crop out, and occupy the valley of the Avon nearly as far as Rugby. The lias forms the cap or summit of several hills, Red Hill, Bardon Hill, Welcome Hill, Rime Hill, Black Hill, and others, north-west of the Avon, between Stratford, Alcester, Warwick, and Henley-in-Arden.

The marlstone of the lias beds is quarried at Binton and Grafton, between Stratford and Alcester, and is used for paving, for stone seats, and as marble for chimney-pieces; it is not variegated in colour, but presents dendritical appearances.

The rest of the county, with one or two exceptions, is occupied by the formations of the red marl and new red-sandstone group; and forms part of the great midland red marl and new red-sandstone district. There is a range of high ground in Feckenham Forest, west of Alcester, along which the Ridge-way runs. Another range of high ground forms a semicircle north of Henley-in-Arden, inclosing the valley drained by the Alne (a small feeder of the Avon), which passes Henley and Alcester. A third range extends across the northern part of the county, forming a crescent, and passing by Solihull, Coleshill, and Dosthill, to the border of the county between Atherstone and Tamworth; and a fourth runs northward from the lias-capped hills near Warwick, by Hatton, Berkswell, Meriden, and Maxtoke to Whitacre, where it unites with the third range. None of these high grounds are of much elevation. A range of hills runs eastward from Warwick, or rather from Leamington Priors, by Dunchurch and Rugby to the border of the county, separating the valleys of the Leam and the Avon.

There is one coal-field in Warwickshire: it extends in length 16 miles from Wicken and Sow, two villages close to Coventry on the east, to the border of Staffordshire east of Tamworth: it has an average breadth of about three miles. The coal district is hilly, and the outcrop of the strata on the east forms a well-defined low escarpment, presenting in some places the coal-measures, in others the subjacent strata of the millstone-grit. At the foot of the escarpment is a level plain, where the lower formations are covered by the red marl and new red-sandstone, which completely encircle the coal-field. The principal coal-works are at Griff and Bedworth, in the southern part of the field, between Nuneaton and Coventry. Greenstone is found at Griff.

Hydrography and Communications.—The greater part of Warwickshire belongs to the basin of the Severn; a considerable portion in the north is included in the basin of the Trent; and a small portion in the south-east in the basin of the Thames. The drainage of the county is conveyed into the Severn by the *Upper Avon*, one of its most important tributaries. The Avon rises at Naseby in Northamptonshire, and enters Warwickshire about 12 miles from its source. Its course in this county is westward, passing Brownover, Rugby, Wolston, and Ryton-on-Dunsmore, below which it turns south-west and flows through Stoneleigh Park by Warwick, through Warwick Castle Park, by Barford, Charlecote, and Stratford-upon-Avon; and thence partly within, partly upon the border of the county, by Weston-upon-Avon and Bidford, till it quits the county just above Harvington mill. Its course through the county is about 57 miles. [AVON.] The navigation commences at Stratford. The feeders of the Avon are the Swift, the Sow, the Leam, the Dene, the Stour, and the Arrow. The *Swift* is a small stream which rises in Leicestershire, 4 miles from Lutterworth, passes that town, and after a course of 10 miles joins the Avon on its right bank near Rugby. The *Sow* rises near Astley, 5 or 6 miles north of Coventry, and flows 18 or 20 miles by Bedworth, Foleshill, Sow, and Stoneleigh, into the Avon, which it joins on the right bank in Stoneleigh Park. The *Leam* rises near Shuckburgh Park, flows in a very winding channel by Wolfhamcote, Leamington, Hastings, Radford, and Leamington Priors, and joins the Avon just above Warwick. Its receives on the left the *Ichene*, or *Ichens*, which rises at the foot of Hardwick Hill, near Prior's Hardwick, and joins the Leam at Marton. The *Dene* rises at the foot of the Burton Hills, and flows west and north-west by Kineton and Wellesbourne Hastings into the Avon, which it joins on the left bank at Charlecote. The *Stour* rises near Tadmarton and Swalcliffe in Oxfordshire, flows west to Burmington, then north and north-west by Shipston-on-Stour and Preston-upon-Stour into the Avon, which it joins on the left bank below Stratford. The *Arrow* rises in the Waste Hills, or West Hill, about 3 miles east of Bromsgrove Lickey in Worcestershire, and flows by Alvechurch, Redditch, Studley, Alcester, where it receives the Alne on its left bank, and Arrow, into the Avon below Bidford. The *Alne* rises near Lapworth, and flows by Preston Bagot and Great Alne into the Arrow at Alcester. None of the feeders of the Avon are navigable.

That part of the county which belongs to the basin of the Trent is drained by the *Tame*, which rises in Kesington Wood, near Bloxwich, flows between Walsall and Wednesbury to Aston, near Birmingham, above which it enters Warwickshire, and below which it receives the Rea from Birmingham on the right bank. It then flows by Castle Bromwich and Water Orton to the junction of the Blyth and the Bourne, both on the right bank, and turns northward, flowing partly within, partly on the border of the county, to the junction of the Anker at Tamworth, where it quits Warwickshire. The *Blyth* rises just within the border of Worcestershire, and has a winding course, by or near Solihull, Hampton-in-Arden, and Coleshill, below which it receives on the left bank the little river Cole. The *Bourne* rises near Arley, and flows first south-west, then west, 10 miles into the Tame. The *Anker* rises in Wolvey Fields, and flows by Nuneaton and Polesworth into the Tame at Tamworth. It receives the Griff Brook on the left bank at Nuneaton, and the Sence, from Market Bosworth in Leicestershire, on the right, below Witherby. Part of the course of the Anker

is on the border of Warwickshire and Leicestershire. Neither the Tame nor any one of its affluents is navigable.

The small portion of the county which belongs to the basin of the Thames is drained by a small stream which rises near Burton Dassett, and flows south-east by Warmington into the Cherwell, below Banbury in Oxfordshire.

The deficiency of river navigation, which in Warwickshire is limited to a small part of the course of the Avon below Stratford, is compensated by the number and importance of its canals. The Coventry Canal commences in the Grand Trunk Canal, on Fradley Heath, near Alrewas, in Staffordshire, and runs southward, nearly parallel to the river Tame, to Fazeley, near Tamworth; afterwards it proceeds by Polesworth, Nuneaton, Bedworth, and Foleshill to Coventry. The whole length of the canal is nearly 38 miles, 27 miles of which are in Warwickshire. The Oxford Canal commences in the Coventry Canal at Longford, and has a winding course past Newbold-upon-Avon and Hill Moreton to Brantton, where the Grand Junction Canal opens into it; then to Napton-on-the-Hill, and into Oxfordshire. It opens into the Thames at Oxford. The whole length of this canal is about 84 miles; of which about half is in Warwickshire, or in Northamptonshire, one or two small projecting parts of which it crosses before finally quitting Warwickshire. The Ashby-de-la-Zouch Canal commences in the Coventry Canal, 3 miles S. from Nuneaton, and quits the county near Hinckley; it is continued to the collieries in the coal-field west of Ashby. The Old Birmingham Canal belongs chiefly to Staffordshire, little more than two miles being in Warwickshire. The Birmingham and Fazeley Canal, 15 miles long, belongs almost entirely to Warwickshire, only two miles being in Staffordshire. There is a junction between this and the Old Birmingham Canal on the west side of the town of Birmingham. The Worcester and Birmingham Canal commences at the junction of the Old Birmingham and Birmingham and Fazeley canals, and runs southward and south-westward into the Severn at Worcester. Of its whole course, 29 miles long, only the three miles nearest to Birmingham are in Warwickshire. The Stratford-upon-Avon Canal commences in the Birmingham and Worcester Canal at King's Norton in Worcestershire, and runs into the Avon at Stratford. Of its whole course, 23½ miles, by far the greater part belongs to Warwickshire. There are three or four short branches. The Warwick and Birmingham Canal commences at Saltisford, on the north-west side of Warwick, and runs north-west by Hatton and Knowle to Birmingham, where it joins a branch of the Birmingham and Fazeley Canal, on the east side of the town of Birmingham. It is 22½ miles long, and belongs almost entirely to Warwickshire. A short branch joins this canal with the Stratford-upon-Avon Canal. The Warwick and Napton Canal commences in the Warwick and Birmingham Canal near Warwick, and runs eastward by Leamington Priors and Long Itchington to the Oxford Canal at Napton-on-the-Hill. It is 14 miles long, and belongs entirely to Warwickshire. The great system of internal navigation which brings the principal ports of England into communication with each other, and with the manufacturing districts, has greatly promoted the manufactures of Warwickshire, especially the silk and ribbon manufactures of Coventry.

Of the coach roads, the most important is the parliamentary road to Shrewsbury and Holyhead, which enters the county between Daventry and Dunchurch, and passes through Coventry and Birmingham. There are two other main lines of road to Birmingham: one by Buckingham, Banbury, and Warwick, and the other by Oxford, Stratford-upon-Avon, and Henley-in-Arden. A road from London to Liverpool crosses the northern part of the county, passing through Atherstone; and the principal road between Bristol and the north of England passes through Birmingham and Sutton Coldfield. Roads lead from Warwick by Southam to Daventry, and by Kenilworth to Coventry, and there are others of less importance.

The county is amply furnished with railways. The main line of the London and North-Western railway enters the county near Rugby, and passes by Rugby and Coventry to Birmingham, a short distance beyond which it quits the county. The Trent Valley branch runs from the main line at Rugby, in a north-westerly direction to Tamworth. Another branch runs from Rugby to Leamington Priors, 15 miles. From Leamington a branch is carried northward to Coventry, and from Coventry it is continued to the Trent Valley line at Nuneaton. The west branch of the Midland railway connects Birmingham with Tamworth, and a branch from it at Whitacre junction joins the main line of the North-Western at Hampton. The Midland South branch runs for a short distance in the county north from Rugby. The Bristol and Birmingham branch of the Midland just enters the county near Birmingham. The Birmingham and Oxford branch of the Great Western railway enters the county by Farnborough a few miles from Banbury, and traverses the county in a north-westerly direction past Warwick to Birmingham. The Rugby and Stamford railway runs for a short distance in the county north-east of Rugby.

Climate, Soil, and Agriculture.—This county, being situated nearly in the centre of England, has a comparatively mild and healthy climate. Except in the higher and more exposed situations, where the soil is cold and heavy, the harvest is as early as in more southern counties. The soil varies extremely, so that two or three different kinds of soil are often found in a field of no great extent. The red loam, which

is found to a considerable extent across the centre of the county, and especially between Warwick and Coventry, and from the borders of Worcestershire to Leicestershire, is mostly of a superior quality; all of it is very fit for white crops, and much of it capable of bearing both beans and turnips. Where the loam inclines to sand, the subsoil is chiefly limestone, marl, or sandstone; and under the colder and heavier loams the substratum is clay. There is also a fertile clay on limestone. There is a great extent of excellent pasture-land in Warwickshire, but there are not many water-meadows. In the neighbourhood of Warwick, Coventry, and especially Birmingham, much land is laid out in gardens, at a high rent, and well cultivated; pieces of meadow-land, likewise, for feeding milk cows, are let at very high rents near these manufacturing towns.

The county of Warwick is extremely well timbered: on every estate of any extent, besides hedgerow timber, there are woods and coppices. At one time the *Forest of Arden* occupied a large portion of the centre of the county. Several places preserve the name, as Henley-in-Arden, Hampton-in-Arden, &c.; and although there is no longer a continuous forest in this district, it is still the best-wooded part of the county, affording plenty of timber, consisting of almost all kinds of forest-trees, but especially oaks.

There is no breed of cattle peculiar to the county. The dairy cows are chiefly long-horns, crossed in every possible way: short-horns have been introduced, and are preferred by many, especially for feeding, although the Herefords are in great repute with the graziers; as well as Scotch, when they can be bought in at a reasonable price. The old Warwickshire sheep is nearly forgotten, having been superseded by the New Leicester and a cross of the two breeds; for feeding the South Downs are preferred.

Divisions, Towns, &c.—The county is divided into four hundred each of which contains several divisions. These hundreds and their respective divisions are as follows:—Barlichway, west—divisions: Alcester, Henley, Snitterfield, and Stratford; Hemlingford, north—Atherstone, Birmingham, Solihull, and Tamworth divisions: Kineton, or Kington, south—Brails, Burton Dassett, Kington, and Warwick divisions: Knightlow, east—Kenilworth, Kirby, Rugby, and Southam divisions. The borough of Warwick is included in Kineton hundred; Birmingham in Hemlingford; and the city of Coventry, formerly a county in itself, is now included in the hundred of Knightlow.

Warwickshire comprehends the city of COVENTRY; the county town and municipal and parliamentary borough of WARWICK; the municipal and parliamentary borough of BIRMINGHAM; the municipal boroughs of STRATFORD-UPON-AVON and Sutton Coldfield; and the market-towns of ALCESTER, ATHERSTONE, Colleshill, Henley-in-Arden, KENILWORTH, Kington, or Kineton, LEAMINGTON PRIORS, NUNEATON, RUGBY, SOLIHULL, and SOUTHAM. Of these the places printed in small capitals are noticed under their respective titles, the others we notice here:—

Colleshill, population of the parish 1980 in 1851, is situated near the river Cole, about 10 miles E. by N. from Birmingham, and 18 miles N.N.W. from Warwick. The town consists principally of one long street, which contains many handsome houses. The church occupies a lofty site, and has a square western tower with buttresses, surmounted by a crocketed octagonal spire of late perpendicular character. There are chapels for Wesleyan Methodists and Independents, a Free Grammar school, a Commercial Free school, and National and Infant schools. The market is on Wednesday; and there are five annual fairs for cattle and horses.

Henley-in-Arden, population of the chapelry 1143 in 1851, about 11 miles W. from Warwick, consists chiefly of one street along the road between Stratford-upon-Avon and Birmingham. The town appears to have been of some importance at an early period. Overlooking the town is the site of an ancient castle, formerly the seat of the Montfort family. In the market-place are the remains of a cross. The parochial chapel is small, but of good perpendicular character. There are a school for boys; a Free school, partly endowed; a school supported by Roman Catholics; a savings bank; and Randal's charity for apprenticing poor children. Brick-making, rope-making, malting, and brewing are carried on, and there are some flour-mills.

Kineton, or Kington, population of the parish 1270 in 1851, about 11 miles S.S.E. from Warwick, formerly had a market, which has been disused. A castle once stood on a hill west of the town; the ruins are popularly termed King John's Castle, and at the foot of the hill there is a well commonly called King John's Well. The church retains some ancient portions; it is cruciform, with a square embattled tower. The western door has a richly-moulded Norman archway. The Wesleyan Methodists and the Independents have chapels. There are National schools. Fairs are held in February and October.

Sutton Coldfield, population 4574 in 1851, is about 7 miles N.N.E. from Birmingham. The church is handsome, and comprehends a modern nave with side aisles and a chancel, which contains the effigy of Bishop Vesey, a benefactor of the town in the time of Henry VIII., who died in 1555, at the age of 103. The Roman Catholics have a chapel. There are a Free Grammar school, a day-school, an Infant school, and a savings bank. On the town-hall, a neat brick building, are the arms of Bishop Vesey emblazoned on a shield, surmounted with a mitre. South-west of the town is 'the Coldfield,' a bleak and cheerless tract of 13,000 acres, extending into Staffordshire; and

north-west and west of the town is Sutton Park, containing about 8500 acres, granted to the poor of the town as pasturage by Bishop Vesey. Branches of the hardware manufacture afford considerable employment. The weekly market is on Monday, and there are fairs for cattle, sheep, and pedlery in March, September, and November.

The following are some of the more important villages, with the parish population in 1851, and a few other particulars:—

Alceston, population 769, stands in a very healthy situation, about 2 miles E. from Stratford, near the right bank of the Avon. A new church has been recently built; of the old church only the chancel remains. There are National schools and an Infant school. Malting, basket-making, and the manufacture of agricultural implements afford some employment. *Aston Cantlows*, or *Cantelups*, population 1111, about 14 miles W.S.W. from Warwick, had once a market and a yearly fair, which have long been discontinued. The parish church is an ancient structure, with an embattled western tower. There are National schools. *Bedworth*, population of the town 3012, is about 4 miles S. by E. from Nuneaton, on the road to Coventry. The church is a modern building, enlarged in 1837. The Independents have a chapel. There are endowed National schools, and almshouses for 20 aged women. A yearly fair for cattle is held. *Bidford*, population 1537, is about 7 miles W.S.W. from Stratford, on the left bank of the Avon. The church has been recently rebuilt in the gothic style. There are National schools. Bidford had formerly a market; fairs are still held on April 9th and September 8th. *Brailes*, population 1808, about 17 miles S.E. by S. from Stratford-on-Avon, has a commodious church, in various styles of gothic, with a lofty tower. The Quakers and Roman Catholics have places of worship; and there are a National school, partly endowed; an Infant school; a school supported by Roman Catholics; and a library and reading-room. The village possesses a manufactory of plush for liveries, a manufactory of agricultural implements, and several flour-mills. *Bulkington*, population 2005, stands on an eminence, about 6 miles N.N.E. from Coventry. The church has been recently enlarged. There are a chapel for Independents, and National schools. Many of the inhabitants are employed in the ribbon manufacture. *Chilvers Coton*, population 2613, about a mile S. from Nuneaton, has a parish church, places of worship for Wesleyan Methodists and Independents, a Free school, and an Infant school. The Coventry Canal passes the village. The ribbon manufacture employs many of the inhabitants. *Compton, Long*, population 845, about 16 miles S.S.E. from Stratford-on-Avon, had a charter from Henry III., for a weekly market and an annual fair. The Common, containing about 2300 acres, has been inclosed. Besides the parish church, there are chapels for Wesleyan Methodists and Independents, and National schools. *Dunchurch*, population 1135, about 11 miles E.S.E. from Coventry, was once a market-town, and still has several yearly fairs. The church is a handsome building. The chancel is early English, with some good decorated windows inserted; the nave is decorated, and the tower is perpendicular in style. There are a Free Grammar school; and several National and Infant schools. In the centre of the village is an obelisk. *Foleshill*, population 7810, about 2 miles N.E. from Coventry, is one of the principal seats of the ribbon manufacture. Besides the parish church, and another Episcopal church, there are places of worship for Wesleyan and Primitive Methodists, Independents, and Baptists; National schools; and an Infant school. There are collieries and an iron-foundry. *Hampton-in-Arden*, population 3094, about 12 miles N.N.W. from Warwick. Besides the parish church, a very ancient edifice, consisting of a chancel, three aisles, and a low tower, there are a chapel for Independents, and Fensham's Charity school. There are four annual fairs. *Hartshill*, population of the hamlet 1108, about 3 miles N.W. from Nuneaton, has a church recently built; chapels for Independents and Quakers; and a Free school. The ribbon manufacture employs many of the inhabitants. In the neighbourhood are the ruins of a Norman castle. *Ipsley*, population 1099, about 16 miles W. by N. from Warwick, near the Worcestershire border, has an ancient church, with a handsome square embattled tower. Many of the inhabitants are engaged in the manufacture of needles and fishhooks. *Polesworth*, population 2104, about 10 miles N.W. from Nuneaton, had a Benedictine nunnery, originally founded early in the 9th century by King Egbert. A few picturesque fragments of the buildings remain. There are here a parish church, an Episcopal chapel, chapels for Baptists and Independents, and Free schools. The making of watches and clocks employs some of the inhabitants. *Sowe*, population 1586, about 4 miles N.E. from Coventry. Many of the inhabitants are engaged in the ribbon manufacture. There are National and Infant schools. *Stoneleigh*, population 1289, is situated on the river Sow, just above its junction with the Avon, about 6 miles N.N.E. from Warwick. There was anciently a Cistercian abbey here. The gateway of the abbey is still standing in Stoneleigh Park, the seat of Lord Leigh. The church of Stoneleigh is a large irregular building, partly of Norman architecture. There are here National schools, and almshouses. Stoneleigh House is a noble mansion, standing in an extensive and well-wooded park. *Studley*, population 2133, is about 16 miles W. from Warwick. There are here some considerable remains of the conventual buildings of an Augustine priory. A considerable manufacture of needles and fish-hooks is carried on. Besides the parish church, there are chapels for Wesleyan Methodists and Baptists; and National schools. Studley Castle is an extensive modern mansion,

erected by Sir F. T. A. Goodrich, Bart. *Wellesbourne Hastings*, population 797, about 6 miles S. from Warwick, had in the reign of Edward I. a charter for a weekly market, and a yearly fair. Besides the parish church, there are a chapel for Wesleyan Methodists, a Free school, and an Infant school. *Willoughby*, population 378, is about 14 miles S.E. from Coventry, close to the Northamptonshire border. To the north of the village is a spa, called the Bath, not now visited. In the vicinity are stone quarries.

Divisions for Ecclesiastical, Legal, and Parliamentary Purposes.—This county is wholly included in the diocese of Worcester. It comprehends the whole of the archdeaconry of Coventry and a part of the archdeaconry of Worcester. The county is included in the midland circuit; the assizes and quarter sessions for the county are held at Warwick; those for the city of Coventry are held at Coventry. County courts are held at Alcester, Atherstone, Birmingham, Coventry, Nuneaton, Rugby, Solihull, Southam, Stratford-on-Avon, and Warwick. There are a county jail and a house of correction at Warwick; a jail and house of correction at Coventry for the city; lock-up houses at Leamington and Birmingham; a debtors or Court of Requests prison at Birmingham; and a county asylum for discharged juvenile prisoners at Stretton.

Before the Reform Act Warwickshire sent only six members to the House of Commons, namely, two for the county, two for the city of Coventry, and two for the borough of Warwick. By the Reform Act the number was increased to ten, namely, four for the county, which was divided into two parts; two each for Warwick and Coventry, as before; and two for Birmingham, which was made a parliamentary borough. By the Poor-Law Commissioners Warwickshire is divided into 13 unions—Alcester, Aston, Atherstone, Birmingham, Coventry, Foleshill, Meriden, Nuneaton, Rugby, Solihull, Southam, Stratford-on-Avon, and Warwick. These unions include 225 parishes and townships, with an area of 529,720 acres, and a population in 1851 of 458,423.

History and Antiquities.—In the Roman division of Britain, Warwickshire appears to have been included in the province of Flavia Cæsariensis. Several Roman or other ancient roads cross the county or pass along its borders. Among these may be named the ancient Watling-street, the Foss Way, and the Ryknield Way. Some Roman towns and stations, in the county or on the border, may be identified. The Tripointum of Antoninus is fixed by Dugdale at Dove Bridge, or Dowbridge, on Watling-street, at the junction of the three counties of Northampton, Leicester, and Warwick; or at Lilbourne in Northamptonshire, close by, where there are some ancient trenches and one or two tumuli. The Venons of the same writer is fixed by Camden and others at or near High Cross, where the Watling-street and the Foss Road intersect. The Manduessedum of the same writer is fixed at Mancetter or Manchester, near Atherstone. Here are evident remains of a Roman station; the ditch and vallum being in many parts very perfect. Alcester may be identified with the Alauna of the 14th Iter of Richard of Cirencester. Near Chesterton, on the Foss Way, is an encampment, evidently Roman. Roman coins or other antiquities have been found near Birmingham, Hampton-in-Arden, Willoughby near the Leam, on the eastern border of the county, and Warwick; and a Roman pavement at Coventry. There are some earthworks at Brinklow, near Monk's Kirby, on the line of the Foss, which appear to be Roman.

In the earlier Saxon period Warwickshire formed part of the kingdom of Mercia. The southern part of the county, which has been all along included in the diocese of Worcester, appears to have formed part of the subordinate kingdom of Hwiccas, or, as it is termed by Bede ('Hist. Eccles.', lib. iv., c. 13, 23), 'provincia Huiccorum,' which was in existence as early as the middle or latter end of the 7th century. Under Alfred Warwickshire came, with the rest of Mercia south-west of Watling-street, into direct subjection to the West Saxon crown (about 886), and during part of the reign of Alfred and his son Edward the Elder it was governed by the alderman Æthered, and after his death by his wife, the lady Æthelflæd, or Ethelfleda, Alfred's daughter. During this and the subsequent reigns it was the scene of war with the Danes or Northmen.

In the civil troubles of Henry III., after the defeat and death of Simon de Montfort, earl of Leicester, the castle of Kenilworth held out for the insurgents for six months (1266); and in the reign of Edward II. the murder of Gaveston, the king's minion, took place at Blacklow Hill, near Warwick. In the war of the Roses the inhabitants of the county were divided between the two parties; the Warwick men, swayed by their earl, the celebrated 'king-maker,' were Yorkists; the men of Coventry were supporters of the house of Lancaster. In the civil war of Charles I. the county generally embraced the cause of the Parliament. The first great battle of the war was fought at Edge Hill, in the southern part of the county, in 1642.

Statistics: Religious Worship and Education.—According to the Returns of the Census in 1851, it appears that there were then in the county 593 places of worship, of which 278 belonged to the Church of England, 133 to six sections of Methodists, 64 to Independents, 50 to four sections of Baptists, 26 to Roman Catholics, 10 to Unitarians, 7 to Quakers, 5 to Mormons, and 3 to Irvingites. The total number of sittings provided was 208,713. The number of Sunday schools

was 418, with 49,411 scholars; of these 224 schools with 24,571 scholars belonged to the Church of England. Of day schools there were 1101, of which 337 were public schools with 34,295 scholars, and 764 were private, with 16,866 scholars. Of evening schools for adults there were 12, with 498 scholars. In the county there were 12 literary and scientific societies, with 1873 members and 11,628 volumes in their libraries.

Savings Banks.—In 1853 the county contained eight savings banks, at Alcester, Atherstone, Birmingham, Coventry, Rugby, Stratford-on-Avon, Sutton Coldfield, and Warwick. The amount owing to depositors on November 20th, 1853, was 754,947*l.* 11*s.* 8*d.*

WASHINGTON, a territory of the United States of North America, lies between 45° 25' and 49° N. lat., 110° 30' and 124° W. long. It is bounded E. by the Rocky Mountains, which separate it from the territory of Nebraska; N. by the parallel of 49° N. lat., which separates it from British North America; W. by the Pacific Ocean; and S. by the territory of Oregon. The area is estimated by the United States authorities at 123,022 square miles. At the Census of 1850 Washington formed a part of the territory of Oregon, which contained 13,294 inhabitants: the country separated from Oregon, in order to form the territory of Washington, then contained less than 2000 inhabitants, exclusive of the native Indians, who probably number about 7000 or 8000.

In its general character Washington has a marked resemblance to OREGON. The surface is greatly broken, it being traversed from south to north by three parallel ranges of mountains, the northern prolongation of the Oregon ranges, while the Rocky Mountains, as in that territory, form its eastern boundary. The coast from the mouth of the Columbia to the entrance of Gray's Harbour, or, as it was named by Vancouver, Whidbey's Bay, a distance of 45 miles, is rocky and almost unbroken. The entrance to Gray's Harbour is about 2½ miles across, but the harbour itself opens to a width of 5 or 6 miles, and is 12 miles deep. It affords well-sheltered anchorage in some places, but it is everywhere encroached on by sand-banks, and its mouth is obstructed by a bar, which only admits the passage of vessels drawing under 10 feet of water. From Gray's Harbour to Cape Flattery, or Cape Classet, a lofty promontory at the southern side of Juan de Fuca Strait, a distance of about 80 miles, the coast is high, rocky, and only broken by two or three unimportant streams. The Strait of Juan de Fuca, which forms the northern boundary of the coast of Washington, is a vast arm of the sea, about 10 miles wide at its mouth and 100 miles deep. [VANCOUVER ISLAND.] The southern coast consists of perpendicular sandy cliffs of moderate elevation, from which the land gradually rises towards the craggy mountains of the interior. About 70 miles from the mouth of the strait is a long low sandy point which forms a good anchoring-ground; and beyond this is a deep bay about 9 miles across, and 3 miles from its eastern point is Protection Island, so named by Vancouver from its position at the entrance to Port Discovery. Immediately beyond Port Discovery is Port Hudson, an equally safe and good though somewhat smaller harbour: Vancouver and Wilkes unite in describing these as among the very finest harbours on the western coast of North America. Beyond this harbour is a deep inlet named Admiralty Inlet, which soon divides into two arms—the smaller one, named Hood's Canal, bearing to the south-west, and stretching far into the interior; while the main arm proceeds due south for about 40 miles, where it terminates in a broad sound named Puget's Sound. Both these branches afford good anchorage, but Puget's Sound is broken by several inlets, and affords the greatest possible security and ample space. Vancouver speaks of these harbours and the contiguous country in such terms as might suggest the suspicion that he had been carried away by the ardent feelings of a discoverer; but Mr. Wilkes, the commander of the U.S. Exploring Expedition, fully corroborates all that Vancouver had asserted: he says, that "nothing can exceed the beauty of these waters and their safety: not a shoal exists within the straits of Juan de Fuca, Admiralty Inlet, Puget's Sound, or Hood's Canal, that can in any way interrupt their navigation by a 74-gun ship. I venture nothing in saying there is no country in the world that possesses waters equal to these." It is around Puget's Sound that the commerce of the territory is chiefly establishing itself. Numerous settlements have been already formed along its shores. The tides rise 18 feet in Puget's Sound. The sound is full of islands, and receives several small rivers.

Like Oregon, this territory is naturally divided into three nearly parallel districts, determined by the course of the mountain ranges: a western, or coast section; the middle section, lying between the Cascade and the Blue Mountains; and the Rocky Mountains region. The western section lies between the Cascade Mountains and the sea, and is much broken in surface, being intersected by spurs from the Cascade Mountains. The greater part of this section is covered with forests of lofty trees; pines often occur from 200 to 300 feet in height, and of corresponding girth, and some of the pines rise to a height of 200 feet without a branch. The most prevalent trees besides pines are fir, oak, ash, spruce, cedars, arbor-vita, &c., with a dense undergrowth of hazels, roses, &c. The hills are generally of basalt, and some, like Mount Olympus, near Juan de Fuca Strait, are of considerable altitude. The soil is in parts a light brown loam, in others a light vegetable mould with a sandy and gravelly subsoil. Generally

it has considerable fertility. The river-bottoms afford good farming land, the prairies and the uplands excellent pasture-ground. The climate is mild and salubrious, though somewhat moist; the winters are short, and snow seldom lies long on the ground. Game abounds.

The Cascade Mountains continue, as in Oregon, in a generally northern direction, and about 150 miles from the coast. The highest cones rise to an altitude of upwards of 13,000 feet, and they form a barrier of very difficult passage between the western and middle sections of the territory. The country between the Cascade and the Rocky Ranges is wider than the corresponding district in Oregon. Between the Snake and the Flathead or Clarke rivers is a plain, or rather rolling prairie, which extends nearly 200 miles in length and 100 miles across in its widest part. The soil is arinaceous, and the country is fitted for tillage; but the plain is covered with a good grass, and affords pasturage for immense flocks and herds. The river-bottoms have an alluvial soil of various quality, but generally productive. The hills are comparatively bare of wood, and infertile. The climate of this middle section is cooler, drier, and more salubrious than in the western section; but the varieties of temperature are much greater. No dew falls here.

The Blue Mountains are considerably broken and interrupted, but generally run north and south. The country east of them to the Rocky Mountains is interrupted throughout by offsets from the Rocky range, and transverse ranges connecting the main chains. Nothing can well exceed the wild magnificence of much of this country, with its vast and snow-clad mountainous tracts, deep valleys, tremendous gorges, lofty cataracts, and rushing torrents. It is of course little suited for agricultural operations, but the basis of the hills are generally covered with timber, and about the lakes, from which flow the head streams of the Columbia, the Spokane, and the Flathead rivers, are spots of remarkable fertility as well as of surpassing beauty. But all this district is left to the native Indians, who are a warlike and implacable race. The chief dependence of these Indian tribes is on hunting, and they barter the furs to the servants of the Hudson's Bay Company: tobacco and articles of European manufacture; but the fur-bearing animals are rapidly decreasing in number. The Rocky Mountains are described elsewhere. [ROCKY MOUNTAINS; NEBRASKA.] There are two or three practicable passes in this range along the territory of Washington, but they are much more difficult than the Great Salt Pass.

The principal river is the Columbia, which belongs equally to Washington and Oregon; it is described under OREGON. Its northern branches rise in the Rocky Mountains within the Hudson's Bay Territories, and unite in Washington; the united stream traversing the territory in a generally southern direction, and receiving numerous tributaries. It forms the Columbia by the junction of the Saphin or Lewis River. The principal tributaries of the northern branch of the Columbia are the Kootanie or Flat Bow, the Flathead or Clarke, and the Spokane rivers: they are all very rapid streams, but navigable by boats for some distance. The chief river north of the Columbia is the Chehalis, which rises in the Cascade Mountains, and pursues a very tortuous course to its outfall in Gray's Harbour. Its course is very rapid, and it is only navigable by canoes; it receives several small streams from the high grounds about Hood's Canal and Puget's Sound. The Nisqually and Tenalquit, or Shute's rivers, fall into Puget's Sound; they are both navigable for some distance, but will probably prove of greater value for their mechanical power. In the interior are numerous lakes, the larger being chiefly expansions of the northern branches of the Columbia, the Spokane, and the Cascade rivers.

At present the rearing of horses and cattle have attracted most attention from the settlers, but agriculture is rapidly extending. The productions are similar to those of OREGON: wheat is the chief grain crop; maize has not been much grown hitherto. The forests will for many years supply an unlimited quantity of fine timber. Coal is found in the neighbourhood of Puget's Sound, and on the Chehalis and Monticello rivers. Iron and other metals have been found; but mining operations have as yet been little heeded. A few manufactures have sprung up. The fisheries will probably become an important part of the industry of Washington. All the rivers abound in fish; salmon being especially abundant. Fish also abound on the coast. Whales frequent the coasts and the mouth of Juan de Fuca Strait. Shell-fish are very abundant. The commerce of Washington is yet in its infancy, but it is steadily increasing; nearly all the commerce centres in the district of Puget's Sound.

Washington has as yet no town of many inhabitants. The political capital, principal commercial town, and port of entry is Olympia, on the right bank of the Tenalquit or Shute's River, at its entrance into Puget's Sound. This town boasts of its hotel, stores, saw- and grist-mills—the first in the territory—newspaper, &c.; and contains 800 inhabitants. The other more important places are:—Columbia City, on the right bank of the Columbia, below Fort Vancouver; Monticello, the capital of Lewis county, and the place where the convention was held which led to the separation of Washington from Oregon; Nisqually, on the east side of Puget's Sound, the property chiefly of the Puget's Sound Agricultural Company, whose farms supply provisions to the servants of the Hudson's Bay Company west of the Rocky Mountains; and Pacific City, on the right bank of the Columbia at its entrance

into the Pacific Ocean, which appears likely to become a place of some trade.

Washington was separated from Oregon, and received a territorial constitution, by Act of Congress, March 2, 1853. By this act the right of voting is vested in every free white male 21 years old then resident in the territory. The Legislative Assembly consists of a council of 9 members, chosen for three years, but one-third to vacate their seats each year; and a House of Representatives of 18 members, elected annually. The governor is appointed by the president and senate for four years. All laws passed by the legislature must be submitted for confirmation to Congress. No law can be passed interfering with the primary disposal of the soil; or taxing the property of non-residents higher than that of residents. Sections 16 and 36 in every township are to be reserved for schools.

(Vanconver; Wilkes; Lewis and Clarke; Fremont, &c.; *Gazetteers of United States; United States Census; American Almanac, &c.*)

WASHINGTON, a city in the district of Columbia, and the capital of the United States, is situated on the left bank of the Potomac, and on the right bank of the Anacostia, or Eastern Branch. The capitol, which occupies the central site of the city, is in 38° 53' 20" N. lat., 77° 0' 15" W. long. The population of the city in 1840 was 23,364, and 40,001 in 1850. By an act of Congress, passed in 1790, it was decreed that the seat of government should be established at some place on the Potomac, and the district around Georgetown was ceded to the United States by Virginia and Maryland for this purpose. The city was founded by laying the corner-stone of the capitol, Sept. 18, 1793. The name of Washington was ultimately bestowed upon 'the federal city,' and the seat of government was transferred to it from Philadelphia in 1800. The president and other chief executive officers of the federal government have since resided at Washington: Congress meets there every year on the first Monday of December, and the Supreme Court of the United States holds its annual sittings, beginning on the second Monday of January.

Washington is separated from Georgetown [COLUMBIA, DISTRICT OF] by Rock Creek, over which there are several bridges, and from Alexandria [VIRGINIA] by the Potomac, over which is a bridge upwards of a mile in length. There are also several bridges over the Anacostia. Frigates ascend the Anacostia above the navy-yard. Vessels drawing 14 feet water can ascend to Potomac Bridge, whence to the mouth of the Tiber, a small stream which flows through the middle of the city, there are 9 feet of water at ordinary high tides. A spacious canal unites the Anacostia with the Potomac. Washington is situated near the head of the tide-water navigation, and is connected with the interior by the Chesapeake and Ohio Canal, as well as by excellent coach-roads and railways. The city is well supplied with water, and has in front (south) the Potomac, nearly a mile in width, and a range of heights in the rear (north), affording many fine sites for villa residences.

The city was regularly laid out, according to the design of Major L'Enfant. It extends from N.E. to S.W. about 4½ miles, and from E. to S. about 2½ miles, but only a comparatively small part of the ground embraced within the plan is built upon. The capitol is the central site: 15 avenues from 120 to 160 feet wide, named after so many states of the Union, extend from it towards the states after which they are named. These avenues intersect diagonally square blocks formed by streets crossing each other at right angles. The streets north and south of the capitol are designated by the letters of the alphabet, A north, A south, &c.: those east and west of it are numbered, 1st street east, 1st street west, &c. The streets are from 70 to 100 feet wide. The effect of the at present very partial filling up of the magnificent plan of the city is generally felt to be cheerless and unimpressive: but every year is doing something towards removing the unfinished and somewhat desolate aspect of this 'city of magnificent distances,' as it has been not inaptly designated.

The most striking and important of the public buildings of Washington is the Capitol. It stands within an inclosed area of 30 acres, on a rising ground at the eastern termination of Pennsylvania avenue, which is 4 miles in length, spacious, and planted with trees. The building is constructed of freestone, and composed of a centre, from which rises a lofty dome to a height of 145 feet, and two wings. The length of the whole is 352 feet, the depth of the wings is 121 feet, but it is to be extended by two new wings, each 238 feet by 140 feet: when these are completed the Capitol will occupy an area of more than four acres. A Corinthian portico extends the length of the centre, which is occupied by the rotunda, 96 feet in diameter and 96 feet in height. The rotunda is ornamented with rilievs, busts, and statues, and contains seven paintings representing subjects connected with American history. Adjoining to this, on the west, is the library of Congress, a hall 92 feet in length by 34 feet in width, and 36 feet high, containing about 50,000 volumes. The Senate Chamber is in the north wing: it is a semicircle of 75 feet long and 45 feet high. Over the president's chair is a portrait of Washington. The Hall of Representatives in the south wing, is also a semicircle: it is 96 feet long and 60 feet high. The dome is supported by twenty-six columns and pilasters of variegated Potomac marble. A colossal statue of Liberty, a statue of History, and portraits of Washington and Lafayette, are the principal ornaments of the hall. Immediately below the senate chamber, and nearly of the same form and dimensions, is the hall in which the sessions of the Supreme Court are held. Below the Hall of Represent-

GEOG. DIV. VOL. IV.

tives are committee-rooms and other places of business. Apartments for the vice-president and other state officers are also included in the building. The grounds of the Capitol command some very fine prospects: they are well laid out, are adorned with statues, and afford a favourite promenade.

The Executive Mansion, or official residence of the president of the United States, occupies the centre of a plot of 20 acres, at the opposite extremity of Pennsylvania avenue from the capitol. It is a handsome building two stories high, with a lofty basement, 170 feet long by 85 feet wide. In convenient proximity to the mansion are four spacious and commodious edifices, known as the State, the Treasury, the Navy, and the War Departments; a fifth building, the Department of the Interior, is as yet unfinished: these, as their names imply, contain the offices of the principal executive departments. The General Post-Office is built of white marble, in the Corinthian order; it is 204 feet long, 102 feet deep, and three stories high. The building is surrounded by an ample lawn. At the home office are shown the autographs of all potentates who are or have been in alliance with the Union, and the presents made by foreign courts to American ambassadors, with several relics of General Washington; Franklin's printing press; various objects of interest obtained by Wilkes in the United States Exploring Expedition, &c. At the office for Indian affairs are the portraits of all chiefs who have from time to time come to negotiate with the president. This quarter of the city contains many elegant private dwellings, most of which are occupied by the foreign ministers.

The Navy Yard, and the Arsenal immediately to the north of it, are situated on the Anacostia, just below the long bridge which spans the Potomac and connects the Columbian and the Virginian shore of the river. To the navy yard are attached the marine barracks, and to the arsenal very extensive public manufactories of arms and military stores. The works at the navy yard are on a very important scale, and in the anchor and chain cable manufactories, machine shops, &c., every approved contrivance for assisting human labour has been introduced. The slips and ship houses are very spacious and well arranged. The river, on arriving at Washington, makes a beautiful sweep, forming a bay, on which the city stands. The navy yard and arsenal follow the curve.

The National Observatory occupies an elevated site on the Potomac, between the president's house and Georgetown. Its exact site is 38° 53' 39.3" N. lat., 77° 2' 48" W. long., and from it is measured the first meridian of American geographers. It contains a very extensive and valuable collection of instruments, and ranks among the first institutions of the kind in existence: it is now under the direction of Lieut. M. F. Maury, U.S.N., so well known by his investigations of oceanic winds and currents. As at Greenwich the observatory announces mean time daily by the fall of a large ball.

One of the most striking of the public buildings of the city is the Washington Monument, which stands on the Mall, between the president's house and the Potomac. It is a vast circular structure 250 feet in diameter, and 100 feet high, surmounted with an obelisk 70 feet at the base, and 500 feet high. The building is surrounded by a colonnade of 30 pillars, each 12 feet in diameter and 45 feet high, and is elevated upon a base 20 feet high, and 300 feet square. The pediment of the front portico has a triumphal car, with a statue of Washington; another statue of Washington stands opposite the principal entrance; and around the building are statues of the 'Fathers of the Revolution,' and of the signers of the Declaration of Independence; with sculptured representations of some of the principal events in Washington's career, emblematical designs, &c. The centre is to be occupied by the tomb of Washington, a sculptural structure of unusual magnitude and very ambitious design, which has been for several years in process of execution, and which will comprise a large number of statues of heroic size. Statues of Jefferson, Jackson, &c., and one or two monumental erections are the only other specimens of the sculptor's art which adorn the public places of the city.

The remaining public buildings in Washington are a city-hall, several market-houses, a penitentiary, nearly 40 churches, some of them very costly edifices; an orphan asylum, almshouses, &c. Columbian College, which was incorporated by Congress in 1821, is a spacious brick building situated a little to the north of the city; it has 10 instructors, 55 students, and a library of 6000 volumes. The National Medical College, previous to 1840, formed the medical department of this college. The public and private schools and academies are very numerous, and bear a high character. Among literary institutions the first place is due to the Smithsonian Institution, which was founded under the will of an Englishman named Smithson, who bequeathed above half a million dollars for the purpose. The building stands on the Mall, in the midst of extensive grounds. It is Romanesque in design, is 450 feet long, 140 feet wide, and has 9 towers, ranging from 75 to 150 feet in height. It contains a spacious library, museum, gallery for works of art, a lecture room, capable of accommodating 1200 persons, a chemical laboratory, &c. The National Institute holds its meetings at the patent-office. There are several other literary and numerous benevolent institutions.

Washington is neither a commercial nor a manufacturing city, and the legislative sessions and the residence of the executive have failed to attract the wealthy to it as a place of permanent abode. The population of Washington consists of members of the legislature and

of the executive departments of state and of foreign diplomatists, with the addition of such professional, trading, mechanical, and menial persons as are required to minister to their comfort. The tone of society, as might be anticipated from this circumstance, differs considerably from that which prevails in other parts of the Union. Owing to the influence of the example of the foreign diplomatists, it approaches more nearly in some respects to that of Europe. In external appearance and the arrangements of domestic and social intercourse, Washington reminds the European of a second-rate Continental capital; in its business habits, political clubs, and government and parliamentary offices, of Westminster. There is nothing scholastic or commercial in its character: that consists rather of a mixture of politics and pleasure. The highest intellects, the best-educated, and most influential gentlemen of America are to be met with in the circles of Washington. The fashionable amusements are as in Europe—balls, soirées, dinner parties, &c., which in costliness are on a level with those of the most courtly cities of the Old World. The city affords every accommodation to the temporary residents. The boarding-houses of Washington form quite a feature of the city; and the hotels are numerous and on a scale of great magnitude and splendour. Some have marble fronts of considerable architectural pretensions.

WASHINGTON. [DURHAM; INDIANA; PENNSYLVANIA.]

WASSELONNE. [RHIN, BAS.]

WASSIGNY. [AISE.]

WATCHETT. [SOMERSETSHIRE.]

WATEOO, the largest of Cook's Isles, a small group situated in the Pacific between the Society Islands on the east and the Friendly Islands on the west. It lies between 18° and 22° S. lat., 157° and 160° W. long. Wateoo, or Atioo, occupies nearly the centre of the group, being traversed by 20° S. lat., 158° 5' W. long.; it is about 18 miles in circumference. The surface is composed of hills and plains, and the soil is light and sandy along the beach, but better farther inland. The shores are lined with reefs or rocks, so that they cannot be approached by vessels. The island has abundance of cocoa-palms, plantains, and sweet potatoes; and of hogs. A great part of it is covered with trees. The number of inhabitants is perhaps about 4000, and that of the whole group is estimated at 16,000.

WATERBEACH. [CAMBRIDGESHIRE.]

WATERBURY. [CONNECTICUT.]

WATERFORD, a maritime county in the province of Munster, Ireland, is bounded N. by the counties of Tipperary and Kilkenny, E. by the county of Wexford, S. by the Atlantic Ocean, and W. by the county of Cork. It lies between 51° 56' and 52° 20' N. lat., 6° 58' and 8° 8' W. long. Its greatest length from east to west is 52 miles, from north to south 28 miles. The area is 721 square miles, or 461,558 acres. The population of the county, exclusive of Waterford city, in 1841 was 172,971; in 1851 it was 188,764.

Coast-line.—From Blackball Head, near the entrance of Youghal Harbour, the western extremity of the coast of Waterford, the general direction of the coast is east for three or four miles, when it trends to the north-east to Helwick Head, the western head of Dungarvan Harbour. This harbour does not afford very good anchorage. From the opposite headland the coast runs more easterly to Tramore Bay, which has a level beach three miles in extent. The coast is flat and very dangerous to shipping. There are beacons on the eastern and western headlands of the bay. Between Tramore and Dungarvan, a distance of 20 miles, the whole coast is rocky, and often unsafe from the want of shelter. About 5 miles east of Tramore is Red Point, the south-western extremity of Waterford Harbour; and a mile farther, within the harbour and about 14 miles below Waterford, is the port of Dunmore. The width of Waterford Harbour is here about 2 miles. There is a lighthouse on Hook Head, at the entrance of the harbour on the eastern side. There are some remarkable caverns on the coast.

Surface, Hydrography, and Communications.—The general character of the county is mountainous. The great mountain-tract which extends from Waterford on the east coast to Dingle Bay on the west, comprehends the whole of the county of Waterford; it is interrupted on a line from Dungarvan to the valley of the Suir, west of Clonmel, by the southern extremity of the great plain which occupies the central part of Ireland. The Cumeragh Mountains, which occupy the part of the county west of Dungarvan, are among the highest and wildest in Ireland. There are four small lakes among the Cumeragh Mountains.

The *Suir*, which rises in the north-east of Tipperary, after being joined by the Nier from the Cumeragh Mountains, forms the boundary-line between Waterford and Tipperary and Kilkenny. The united waters of the Suir and Barrow form the estuary called Waterford Harbour. The Suir is navigable for large vessels up to Waterford city, and to Carrick-on-Suir for those of which the draught does not exceed 11 feet. The *Blackwater*, which rises in the Kerry Mountains, enters the county on the west, and runs due east to Cappoquin, where it turns southward, and discharges itself into Youghal Harbour, after receiving midway the river Bride. The Blackwater is navigable for vessels of 100 tons to its confluence with the Bride, and for vessels of 70 tons as far as Cappoquin. The *Bride*, a sluggish stream, is affected by the tide for the whole of its course within the county, and

is navigable for small craft. From Cappoquin to Lismore there is a canal 3 miles long, made at the expense of the Duke of Devonshire. The Licky, Brickly, Colligein, Mahon, Phinisk, Clodagh, and some other streams, none of them of importance, except for drainage, reach the sea at various points of the southern coast.

The mail-coach road from Dublin to Waterford, 75 miles, enters the county within two or three miles of Waterford city. The mail-coach road from Waterford to Cork, 71½ miles, passes through Kilmacthomas, Cappoquin, and Tallow, between which place and Youghal it leaves the county, but again touches Waterford before it finally leaves the county a short distance before reaching Youghal. The other important roads are—from Dungarvan to Youghal, through Clashmore; also from Dungarvan to Youghal, through Pilltown, both over the mountains; and from Dungarvan to Clonmel by Ballinacult; one from Cappoquin to the mountains; one from Waterford to Tramore. The railways which are wholly or partially in the county are the Waterford and Kilkenny, the Waterford and Limerick, and the Waterford and Tramore railways.

Geology and Mineralogy.—The Waterford Mountains contain two varieties of slate. The first is the old transition-slate, coloured gray, which is quarried at Glenpatrick, and is extensively used for roofing. The second or newer slate rests on the older; the lower portions of its strata consist of alternating beds of brownish-red quartzose conglomerate and coarse red slate. These strata are succeeded by alternations of red and gray quartz rock, red quartzose-slate, red clay-slate, the grain becoming gradually finer as the beds accumulate and recede farther from the conglomerate, till at length the upper beds produce varieties of purple, brownish-red, and reddish-gray clay-slate, which are quarried and used as roofing-slate, particularly in the valley of the river Blackwater near Lismore. The newer series contains abundance of marine and even vegetable organic remains. The limestone in the valleys contains all the fossils of the carboniferous limestone; and the gray-slate, which sometimes alternates with the lower beds of the limestone, also contains fossils similar to those found in the limestone. Slate, iron, and lead are found at various places in the clay-slate district. At Knockmahon and Bonmahon, two adjoining places near the coast, about equidistant from Tramore and Dungarvan, copper-mines have been successfully worked for some years. Good potters'-clay occurs about Dungarvan. A black marble is quarried at Kildrum, about 5 miles from Dungarvan, and marbles of various colours are likewise met with in the county. A good sandstone for buildings, as well as a kind resembling Portland-stone, is found in several places.

Climate, Soil, and Agriculture.—The climate is moist, but is not considered unhealthy. Much of the soil is marshy, and there is a considerable quantity of bog, but a large part of the cultivated districts is what is called good light turnip land. The pastures are excellent, and much butter is exported, the breed of cows yielding rich milk, but not fattening well for the butcher. Bacon is also made and exported largely. In 1853 there were 117,800 acres under crop of which 21,946 acres grew wheat; 33,484 oats; 11,186 barley, bere, rye, beans, and peas; 19,944 potatoes; 11,233 turnips; 3334 other green crops; 103 flax; and 16,070 acres were in meadow and clover. The plantations in 1841 covered 26,536 acres. On 9220 holdings in 1852, there were 12,430 horses, 4520 mules and asses, 66,122 cattle, 31,934 sheep, 45,114 pigs, 5990 goats, and 151,150 poultry, of the total estimated value of 637,423*l.*

The fishery district of Waterford comprises 76 miles of maritime boundary, extending from the east bank of Barrow Bay to Ballyvoola Head. In 1853 it had 401 registered fishing-vessels, employing 1656 men and boys.

The county is in the dioceses of Waterford and Lismore, and, including the city of Waterford, contains 82 parishes. It is divided into eight baronies—Coshmore and Coshbride, Decies within Drum, Decies without Drum, Gualtier, Glenahiry, Middlethird, Uppertthird, and Kilcullibeen. The principal towns are WATERFORD, DUNGARVAN, PORTLAW, LISMORE, Tallow, Carrickbeg, which is part of CARRICK-ON-SUIR, CAPPOQUIN, and part of CLONMEL. The places printed in small capitals are noticed under their respective names. The following are the smaller towns and more important villages, with the population of each in 1851:—

Ardmore, population 836, a village and post-town, about 4 miles N.E. from Youghal, is admirably adapted for a bathing-place. There is some fishing carried on. The remains of an old church are in the village. Ardmore Head and Ramhead are rocky eminences rising to a height of above 200 feet. In the neighbourhood are the Slieve Gran or Drum Mountains, of which one of the heights exceeds 900 feet. *Bonmahon*, a sea-bathing village, about 5 miles S.E. from Kilmacthomas, at the mouth of the river Mahon, is the chief place of the district where copper is procured: population, 1142. Some lead is also found. At Bonmahon are a dispensary and loan-fund office. *Cappoquin*, a small post-town, prettily situated at the southern foot of the Knockmeledown Mountains, on the left bank of the Blackwater, about 3 miles E. from Lismore: population, 2145. There are a new church, a large Roman Catholic chapel, a dispensary, and a loan-fund office. Five fairs are held in the course of the year. The Blackwater is here navigable for barges. Near the town is the large Trappist establishment of Mount Melleray. *Dunmore*, a sea-port and post-

town at the entrance of Waterford Harbour, about 9 miles from the town: population, 313. It is in a sheltered bay, and great efforts have been made to render it effective as the mail-packet harbour, for which purpose a mole has been built 800 feet long, and a quay or pier 900 feet, and the packets ply regularly between it and Milford. It is also a coast-guard station and a bathing-place. Much of the improvement in the place has been effected by the Marquis of Waterford. KILMACTHOMAS, the seat of a Poor-Law Union, is noticed in a separate article. *Passage* is a sea-port and post-town on the right bank of the Suir, or rather of Waterford Haven, about 5 or 6 miles below Waterford, and about the same distance from the mouth of the river: population, 664. The town is irregularly built. There are a church, a Methodist and a Roman Catholic chapel, and a dispensary. A court of petty session is held weekly. A quay was built in 1836, which affords accommodation to steam-vessels, and there is a ferry to Cork. Some ship-building is carried on. *Portlaw*, a small manufacturing and post-town, on the road from Kilmarden to Carrickbeg, stands upon the Clodagh, a small mountain-stream: population, 4351. It is clean, respectable, and flourishing, chiefly in consequence of the establishment of a cotton manufactory by the Messrs. Malcolmson, the machinery of which is worked by the Clodagh. There are a parish church, and chapels for Presbyterians and Roman Catholics. Three fairs are held yearly. *Stradbally*, a village and post-town, about 4 miles S.W. from Bonmahon, on the road to Dungarvan: population, 665. There are a modern church, a Roman Catholic chapel, and a dispensary. *Tallow*, a post- and market-town, and a parliamentary borough prior to the Union, stands near the right bank of the navigable river Bride, an affluent of the Blackwater, on the road from Waterford to Cork, about 5 miles S.W. from Lismore: population 1986, besides 687 in the workhouse. There are a well-built modern church, a large Roman Catholic chapel, a market-house, a sessions-house, a convent, a fever hospital, a dispensary, several schools, and a jail. There are five fairs yearly. *Tallow Bridge*, which has a population of 181, is the port of Tallow lying on the Bride, about half a mile from Tallow. In the neighbourhood are the ruins of Kilmacov Castle and Moygeely Abbey. *Tramore*, an irregularly-built but neat market- and post-town on the Bay of Tramore, is about 9 miles S. from Waterford: population, 1882. It is much resorted to by the inhabitants of Waterford as a bathing-place. The bay is dangerous for shipping. There are beacons on Newtown Head and Brownstown Head, and a lightship is stationed north of the Saltees Islands. The town has a church, a chapel, a market-house, an assembly-room, a dispensary, and a loan-fund office. Races are run in the summer.

The county returns five members to the Imperial Parliament—two for the county, two for Waterford city, and one for the borough of Dungarvan. It is in the Leinster circuit. The assizes are held at Waterford, where is the county jail. Quarter sessions are held at Carrickbeg, and in Dungarvan and Lismore, which two towns have bridewells. Petty sessions are held in 16 places. The lunatic asylum, which admits 73 patients from the county, is in Waterford city. There are fever hospitals in Dungarvan, Lismore, Tallow, and Waterford; and dispensaries in 23 places. There are a savings bank and a loan-fund at Waterford, and loan-funds in Cappoquin, Newtown, and Tallow. The Union workhouses are at Waterford, Dungarvan, Lismore, and Kilmacthomas. The county is in the military district of Kilkenny, and the barracks stations are at Dungarvan and Waterford. The militia staff is stationed at Waterford. The police force, of 264 men and officers, is distributed over 7 districts, comprising 37 stations, of which Dungarvan is head-quarters. The districts are Dungarvan, Cappoquin, Portlaw, Ballinamult, Clashmore, Waterford, and Tramore. In September, 1852, there were in the county 93 National schools, attended by 6486 male and 6890 female children.

History and Antiquities.—According to Ptolemaeus, the Menapii, a Belgic colony, were the ancient inhabitants of Waterford and the adjoining county of Wexford. The Desii, from the county of Meath, were a powerful clan at the period of the English invasion, when their importance was nearly destroyed. In 1171 Henry II. granted the city of Waterford and the adjacent province to Richard le Poer, and by marriage the estates and honours of his descendants came to the Beresford family, who still retain large possessions in the county. The county suffered little during the rebellion in 1798. Waterford city has been the chief scene of most of the historical events of importance.

Many remains of antiquity, both military and ecclesiastical, are found in the county; most of them are noticed in the accounts of the towns and villages where they are situated. A large double trench, called by the Irish 'the trench of St. Patrick's cow,' may be traced for 17 or 18 miles across the Blackwater towards Ardmore; it corresponds with the work called 'Dane's Cast,' in the counties of Armagh and Down. A second trench runs westward from Cappoquin into Cork.

WATERFORD, the capital of the county of Waterford, Ireland, a county of a city, a market- and post-town, a sea-port, a parliamentary borough, an episcopal city, and the seat of a Poor-Law Union, is situated on the river Suir, in 52° 16' N. lat., 7° 8' W. long., distant 94 miles S.S.W. from Dublin. The population of the city in 1851 was 25,297. The city is governed by 10 aldermen and 30 councillors one of whom is mayor; and returns two members to the Imperial

Parliament. Waterford Poor-Law Union contains 30 electoral divisions, with an area of 125,719 acres, and a population in 1841 of 71,223; in 1851 of 69,033.

The city itself is entirely on the right bank of the Suir, and is about a mile long; a suburb lies on the left bank of the river. A noble quay, 120 feet in width, except at each end, where it narrows, extends for nearly a mile along the bank of the river, from which the city rises gradually. Waterford is about 12 miles from the sea, and vessels of 800 tons burden can lie by the side of the quay, but larger ships anchor about 6 miles lower down, opposite the village of Passage. The river is crossed at the upper end of the city by a very long wooden bridge, which opens in one part to allow vessels to pass.

The principal public buildings are—the cathedral, an elegant modern structure; the bishop's palace, which is of hewn stone, with a double front, and commands an extensive view across the river into the county of Wexford; the dean's house; two parish churches; several Roman Catholic chapels, one of which has a handsome Ionic front, and is said to be the largest in Ireland; and places of worship for Quakers and other sects. The other public buildings are—a town-hall, a market-house, an exchange, a custom-house, a theatre, an assembly-room, a jail, and artillery and infantry barracks. Among the charitable institutions are a house of industry, a hospital for the poor, a fever hospital, a dispensary, and a lunatic asylum.

The commerce of Waterford is chiefly with England, and consists for the most part of agricultural produce—butter, pork, bacon, grain, flour, and meal, and, since the introduction of steam-vessels, of livestock. On December 31st 1854, the number and tonnage of vessels registered as belonging to the port were, sailing-vessels under 50 tons 62, tonnage 1602; above 50 tons 98, tonnage 13,663; steam-vessels 19, tonnage 5861. During 1854 there entered and cleared at the port as follows:—Inwards, sailing-vessels 1147, tonnage 99,149; steamers 192, tonnage 55,660; outwards, sailing-vessels 925, tonnage 74,670; steamers 200, tonnage 56,977. There is a packet-station at Waterford for conveyance between Waterford and Milford daily.

Waterford was originally founded by the Danes about 850, and it was their chief possession in Ireland for some centuries. In 1170 it was taken by assault by Strongbow, earl of Pembroke, who afterwards restored and enlarged the town. Waterford received its first charter from King John, who resided there for some time. All its charters were seized and annulled by James I., on the ground of the nonconformity of the chief magistrates, and Waterford remained without a charter from 1617 to 1626, when it received one from Charles I. Waterford was unsuccessfully besieged by Cromwell, but it was afterwards taken by Ireton. Some remains of the old fortifications still exist, and there are a few relics of some of the ancient monasteries. *Cwraghamore*, the magnificent domain of the Marquis of Waterford, is in the neighbourhood of Waterford; it contains 4,600 acres.

WATERTOWN. [NEW YORK.]

WATERVILLE. [KERRY.]

WATFORD, Hertfordshire, a market-town, and the seat of a Poor-Law Union, in the parish of Watford, is situated on the right bank of the river Colne, in 51° 39' N. lat., 0° 24' W. long., distant 18 miles S.W. from Hertford, 15 miles N.W. from London by road, and 17½ miles by the London and North-Western railway. The population of the town of Watford in 1851 was 8300. The living is a vicarage in the archdeaconry of St. Albans and diocese of Rochester. Watford Poor-Law Union contains 6 parishes and townships, with an area of 36,520 acres, and a population in 1851 of 18,800.

Watford consists principally of one main street, about a mile and a half in length. The parish church has at the west end a fine embattled tower, surmounted with a spire 100 feet high. The Wesleyan Methodists, Independents, and Baptists have places of worship. There are National, British, and Infant schools; an old established Free school; a literary institute; and a savings bank. The market-house, a long building resting on wooden pillars, is situated near the church. There is here a bridge over the river Colne. The market is held on Tuesday; fairs are held on Whit-Tuesday and September 9th. There are silk-, paper-, and flour-mills; breweries, tan-works, and a manufactory of agricultural implements. Cashiobury Park, adjoining the town, is the seat of the Earl of Essex.

WATTON. [HERTFORDSHIRE; NORFOLK.]

WAVENEY, RIVER. [NORFOLK.]

WAVRE-ON-THE-DYLE. [BRABANT, SOUTH.]

WAYLAND, a hundred in the county of Norfolk, which gives name to a Poor-Law Union. The hundreds of Wayland and Shropham, the greater part of which is included in the Union, include together 37 parishes, with an area of 80,734 acres, and a population in 1851 of 17,488. Wayland Poor-Law Union contains 25 parishes, with an area of 51,068 acres, and a population in 1851 of 12,141.

WEALD, THE. [KENT; SUSSEX.]

WEALD, NORTH AND SOUTH. [ESSEX.]

WEAR, RIVER. [DURHAM.]

WEARDALE, a district in the vale of the river Wear, in the county of Durham, the parishes in which have been constituted a Poor-Law

Union. The market-town of Stanhope, at which the Union workhouse is situated, and the small market-town of St. John's, Wearside, are described under DURHAM County. Weardal-Poor-Law Union includes two parishes, a township, and a chapelry, with an area of 90,533 acres, and a population in 1851 of 14,567.

WEAVER, RIVER, and WEAVERHAM. [CHESHIRE.]

WEDMORE. [SOMERSETSHIRE.]

WEDNESBURY (commonly pronounced Wedgebury), Staffordshire, a market-town in the parish of Wednesbury, is situated in 52° 33' N. lat., 2° 1' W. long., distant about 21 miles S.S.E. from Stafford, 119 miles N.W. by W. from London, and 124 miles by the London and North-Western and the South Staffordshire railways. The population of the town of Wednesbury in 1851 was 11,914. The living is a vicarage in the archdeaconry of Stafford and diocese of Lichfield.

Wednesbury lies at nearly equal distances from the towns of Birmingham and Wolverhampton, Walsall and Dudley. Ethelfleda, 'Lady of Mercia,' sister of Edward the Elder, built a castle here in 914. The church occupies the summit of the hill where Ethelfleda's castle formerly stood: it is a tolerably spacious building, chiefly perpendicular in style. The Wesleyan and Primitive Methodists, Baptists, and Independents have places of worship. There are National, British, Infant, and Juvenile schools, and a mechanics institute. The market is held on Friday; there are two annual fairs. The inhabitants are employed in the various branches of the iron manufacture. Limestone, clay, and peat are found, besides iron-ore and excellent coal.

WEDNESFIELD. [STAFFORDSHIRE.]

WEEDON-BECK. [NORTHAMPTONSHIRE.]

WEENER. [AUBURN.]

WEIGHTON, MARKET. [YORKSHIRE.]

WEIMAR, the capital of the grand-duchy of Saxe-Weimar-Eisenach, is situated in 51° N. lat., 11° 20' E. long., on the Ilm, and on the railway from Halle to Eisenach, from which towns it is distant 53 and 49 miles respectively, and has about 10,000 inhabitants. It stands in a pleasant valley, with a wooded mountain to the north and low hills to the south and east. The river, over which there are two bridges, winds along the south side of the town. Weimar is illustrious in the annals of German literature by the names of Göthe, Herder, Schiller, Wieland, Kotzebue, and others. It is an open town with irregular streets; there are however many agreeable houses, but the general appearance is plain and rather antique. The palace is beautifully situated, and the interior is fitted up with great elegance and taste. The adjoining park would be an ornament to any city. The chief public buildings are the workhouse, the hospital, the library, the museum, and two churches. The houses of Göthe and Schiller are shown to the public. The Court Theatre was built in 1825, and, under the management of Göthe and Schiller, greatly contributed to improve the public taste. The grand-ducal library contains above 130,000 volumes, besides manuscripts, copper-plates, and drawings. The principal church deserves notice as containing the sepulchres of the grand-ducal family, and being adorned with several fine paintings by Lucas Kranach. A colossal bronze statue of Herder was erected in the cathedral square, August 25, 1850. Weimar has a gymnasium, a training school, a house of correction, an orphan asylum, and a benevolent ladies' institution for the instruction of girls in female work. Falk's establishment for destitute children was converted by the grand-duke, in 1829, into a public school for education by the name of Falk's Institution. The manufactures are of small importance: the inhabitants derive their chief support from the residence of the court. The chief articles of trade are broadcloth, linen, leather, room-paper, books, maps, colonial produce, &c. A fine avenue connects the town with the mansion and park of Belvedere, about two miles and a half from Weimar.

WEISSENFELS. [MERSEBURG.]

WEISSENSEE. [ERFURT.]

WELFORD. [GLOUCESTERSHIRE; NORTHAMPTONSHIRE.]

WELLAND, RIVER AND CANAL. [CANADA.]

WELLINGBOROUGH, Northamptonshire, a market-town and the seat of a Poor-Law Union, in the parish of Wellingborough, is situated in 52° 19' N. lat., 0° 42' W. long., distant 9 miles N.E. from Northampton, 67 miles N.W. by N. from London by road, and 78½ miles by the London and North-Western and Northampton and Peterborough railways. The population of the town of Wellingborough in 1851 was 5061. The living is a vicarage in the archdeaconry of Northampton and diocese of Peterborough. Wellingborough Poor-Law Union contains 26 parishes and townships, with an area of 54,909 acres, and a population in 1851 of 21,356.

Wellingborough is situated on an eminence above a little brook which flows into the river Nene. The town is lighted with gas. The houses are for the most part built of red-sandstone. The church is large and handsome, and of various styles of architecture. The Independents, Wesleyan Methodists, Baptists, Calvinistic Baptists, and Quakers have places of worship. There are Free schools; a Freeman's school; National, British, and Infant schools; a mechanics institute; a parochial reading-room and lending library; a savings bank; and an

agricultural society. The town-hall is a neat building. The principal manufacture of the place is that of boots and shoes. The market is on Wednesday, and is a considerable market for corn; there are two yearly fairs for live stock and cheese. Petty sessions and a county court are held in the town.

WELLINGTON, Shropshire, a market-town, and the seat of a Poor-Law Union, is situated near the base of the Wrekin, in 52° 42' N. lat., 2° 30' W. long., distant 11 miles E. by S. from Shrewsbury, 142 miles N.W. by W. from London, and 146 miles by the London and North-Western and the Shrewsbury and Birmingham railways. The population of the town of Wellington in 1851 was 4601. The living is a vicarage in the archdeaconry of Salop and diocese of Lichfield. Wellington Poor-Law Union contains 11 parishes and townships, with an area of 83,528 acres, and a population in 1851 of 20,729.

Wellington is situated in the populous coal and iron district of Shropshire. The town is neat in its appearance, and is lighted with gas. It possesses a handsome modern church, chapels for Wesleyan and Primitive Methodists, Independents, Baptists, and Roman Catholics. National and Free schools; a dispensary; a mechanics institute; a savings bank; and a neat market-hall. The market is held weekly on Thursday; there are numerous fairs and cattle markets in the course of the year. Petty sessions and a county court are held.

WELLINGTON, Somersetshire, a market-town, and the seat of a Poor-Law Union, is situated on high ground near the right bank of the river Tone, in 50° 58' N. lat., 2° 30' W. long., distant 56 miles S.W. from Bath, 148 miles W.S.W. from London, and 170 miles by the Great Western and Bristol and Exeter railways. The population of the town in 1851 was 3926. The living is a vicarage in the archdeaconry of Taunton and diocese of Bath and Wells. Wellington Poor-Law Union contains 24 parishes and townships, with an area of 60,454 acres, and a population in 1851 of 22,121.

The manor of Wellington was bestowed by Alfred the Great on his friend and biographer Asser, bishop of Sherborne, and on his death was transferred to the bishop of the newly-erected diocese of Wells, by whose successor it was held at the time of the Domesday survey, in which it is written *Walintone*. The church is a fine gothic building; it contains a fine monument of Chief Justice Sir John Popham. There are an Episcopal chapel, places of worship for Baptists, Independents, Wesleyan Methodists, and Quakers; National schools; and several almshouses. The woollen manufacture is carried on. The market is held on Thursday. There are fairs on March 29th, June 22nd, September 29th, and November 17th. A county court is held. The Date of Wellington's title was derived from this town. A lofty pillar in commemoration of the battle of Waterloo, erected by subscription, stands on Blackdown Hill, near the town.

WELLINGTON. [ZEALAND, NEW.]

WELLS, Somersetshire, an ancient city, the seat of a bishopric, a municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated in a valley at the foot of the Mendip Hills, in 51° 12' N. lat., 2° 38' W. long., distant 19 miles S.W. from Bath, and 120 miles W. by S. from London. The population of the borough of Wells in 1851 was 4736. The borough is governed by 4 aldermen and 12 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The living is a vicarage in the archdeaconry of Wells and diocese of Bath and Wells.

The founder of the first church at Wells is said to have been Ina, king of Wessex, in 704. In the reign of Edward the Elder, in the beginning of the 10th century, the town became the seat of a bishopric. About 1091 John de Villula obtained the bishopric, and having removed the episcopal seat to Bath, called himself bishop of Bath only. About 1139 Bishop Roberts, the successor of Villula, determined that the diocesan should be styled Bishop of Bath and Wells. Wells has returned two members to Parliament since the reign of Edward I.

The town is cleansed, lighted with gas, paved, and supplied with water. There is a jail. The town-hall was built in 1780, and stands on one side of an extensive area which communicates by an ancient gateway with the cathedral close. The cathedral is one of the finest structures of the kind in England. It is in the usual form of a cross, the extreme length from east to west being 415 feet and the transept measuring 165 feet. The tower, which rises from the intersection, is 165 feet high, and two other massive towers, each 126 feet in height, crown the extremities of the west front. This western facade is remarkable for its tracery and sculptured figures: there are about 150 statues of the size of life, and above 300 of smaller size; and among many of them are a good deal mutilated, the effect is very striking. The Lady chapel is the most beautiful part of the cathedral, and is one of the best specimens of ecclesiastical architecture in England. There are several ancient monuments. The cathedral has for some time past been undergoing the process of restoration. The cloisters form a quadrangle attached to the south side of the cathedral, the sides severally measuring about 160 feet. The chapter-house is a handsome octangular building, 52 feet diameter in the interior, the roof being supported by a single central pillar. The episcopal palace, which is of the 14th century, stands at a short distance south from the cathedral, and with its lofty and embattled wall, inclosing an area of about seven acres, and surrounded by a broad moat filled with water, resembles an old baronial castle. The parish church of St. Cuthbert is a large and handsome edifice in the later pointed style.

with a fine embattled tower crowned with pinnacles. The Wesleyan Methodists, Independents, and Baptists have places of worship. The Chapter Grammar school is free to choristers. The Diocesan central schools, which are conducted as National schools, are partly supported from endowment; there are also an Endowed Blue-Coat school, Infant schools, several almshouses, and a savings bank.

The corn-market has decayed, but the market for cheese is still important. The market-days are Wednesday and Saturday. Fairs are held on January 6th, May 14th, July 6th, October 25th, and November 30th. The summer assizes for Somersetshire are held alternately in Wells and Bridgewater. A county court is held. Races are run annually in the vicinity of Wells.

The see of Bath and Wells is in the province of Canterbury. The diocese comprises the county of Somerset, except Bedminster, and contains 460 benefices: it is divided into the archdeaconries of Wells, Bath, and Taunton. The chapter consists of the dean, archdeacons, chancellor, precentor, and four canons. The income of the bishop is fixed at 5000*l.* a year.

WELLS. [MAINE, U.S.; NORFOLK.]

WELS. [ENS, Upper.]

WELSHPOOL. [POOL.]

WELWYN, Hertfordshire, a small town, and the seat of a Poor-Law Union, is situated on both sides of the river Maran, a feeder of the Lea, in 51° 50' N. lat., 0° 13' W. long., distant about 8 miles W. by N. from Hertford, 24 miles N. by W. from London by road, and 22 miles by the Great Northern railway. The population of the parish in 1851 was 1557. The living is a rectory, in the archdeaconry of St. Albans and diocese of Rochester. Welwyn Poor-Law Union comprises four parishes, with an area of 6457 acres, and a population in 1851 of 2225. The parish church is situated in the middle of the town; the Independents and Wesleyan Methodists have chapels. Besides an Endowed school for boys, founded by Dr. Young, author of the 'Night Thoughts,' who was rector of the parish, there is a school for girls.

WELZHEIM. [JAXT.]

WEM, Shropshire, a market-town and the seat of a Poor-Law Union, is pleasantly situated near the source of the river Roden, in 52° 51' N. lat., 2° 42' W. long., distant 10 miles N. by E. from Shrewsbury, and 163 miles N.W. by W. from London. The population of Wem parish in 1851 was 3747. The living is a rectory, in the archdeaconry of Salop and diocese of Lichfield. Wem Poor-Law Union contains 11 parishes and townships, with an area of 51,197 acres, and a population in 1851 of 10,625.

The town of Wem consists principally of one spacious street, which is lighted with gas. The church is a handsome structure with a fine chancel and a lofty spire. The Independents, Baptists, Primitive Methodists, and Irvingites have places of worship. There are—a Free school, and National, British, and Infant schools. Malting is carried on, and there are corn-mills, tan-yards, and rope-walks. The market is held on Thursday; cattle fairs are held six times in the year. Petty sessions and a county court are held.

WEMYSS, EAST and WEST. [FIFESHIRE.]

WENDEN. [LIVONIA.]

WENDOVER, Buckinghamshire, a market-town, is situated near the base of the Chiltern Hills, in 51° 45' N. lat., 0° 44' W. long., distant 5 miles S.E. from Aylesbury, and 35 miles N.W. from London. The population of the parish in 1851 was 1937. The living is a vicarage, in the archdeaconry of Buckingham and diocese of Oxford.

Wendover was formerly a parliamentary borough, but it was disfranchised by the Reform Act. Besides the parish church, which stands a short distance from the town, there are places of worship for Baptists and Independents, and National, British, and Infant schools. Lace-making, straw-plat-making, malting, coach-building, and rope-making are carried on. The market is held on Tuesday; and there are fairs on May 13th and October 2nd. The celebrated John Hampden represented Wendover in five parliaments. A branch of the Grand Junction Canal comes to the town.

WENER, LAKE. [SWEDEN.]

WENERSBERG. [SWEDEN.]

WENLOCK, sometimes called GREAT or MUCH WENLOCK, Shropshire, a market-town, and municipal and parliamentary borough, is situated near the north-eastern extremity of the Wenlock Edge Hills, in 52° 35' N. lat., 2° 38' W. long., distant 12 miles S.E. from Shrewsbury, and 148 miles N.W. by W. from London. The population of the parish in 1851 was 2398; of the municipal borough 18,728; of the parliamentary borough 20,588. The living is a vicarage, in the archdeaconry of Salop and diocese of Hereford. The borough is governed by six aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament.

The town of Much Wenlock consists of only two streets. Besides the parish church the town contains National schools, and a savings bank. The market is held on Monday; five fairs are held yearly.

Wenlock Abbey was founded about 680 by Millburga, of the family of one of the kings of Mercia. It was on two occasions destroyed by the Danes, but subsequently restored. The ruins of the abbey are considerable; they are of the 13th century. The whole length from east to west was 401 feet, and the breadth of the nave and aisles 66 feet.

WENSUM, RIVER. [NORFOLK.]

WENTWORTH. [YORKSHIRE.]

WEOBLEY, Herefordshire, the seat of a Poor-Law Union, and formerly a market-town and borough, is situated in 52° 9' N. lat., 2° 51' W. long., distant 11 miles N.W. from Hereford, and 141 miles W.N.W. from London. The population of the parish in 1851 was 908. The living is a vicarage, in the archdeaconry and diocese of Hereford. Weobley Poor-Law Union contains 25 parishes and townships, with an area of 48,959 acres, and a population in 1851 of 8718.

Weobley formerly returned two members to Parliament, but it was disfranchised by the Reform Act. Many of the old wooden houses are extremely picturesque in appearance. The church is a commodious and handsome gothic edifice, with a fine tower and spire. There are a chapel for Primitive Methodists, an old Endowed Grammar school, and a Charity school. A yearly fair is held in October.

WEREJA. [MOSCOW, Government of.]

WERNIGERODE, the capital of a county in Prussian Saxony, the property of Count Stillberg Wernigerode, of which the Brocken is the centre, and which is about 90 square miles in extent. The town is situated on the northern slope of the Harz and on the Zillertal, is a walled town, with four gates, and a suburb called Nesenrode. The mansion of the count is an ancient castle, built on a rock 827 feet above the level of the sea, and 400 feet above the town. It commands a very fine prospect, and contains a library of 30,000 volumes. The town has woollen and linen manufactories, tanneries and brandy distilleries, a paper-mill, several oil-mills, saw-mills, &c.; 4 churches, an orphan asylum, a poorhouse, a gymnasium, and considerable trade in corn. Population 5600.

WERWICK. [FLANDERS, West.]

WESEL (Ober-), a walled town in the government of Coblenz, on the left bank of the Rhine, the bed of which is deep and narrower here than at any other point. There are two churches and three chapels, of which St. Werner's chapel is worthy of notice. The inhabitants, 2600 in number, are engaged in the manufacture of woollen-cloth and the salmon fishery on the Rhine. Wine of superior quality is produced in the adjacent country. On a steep mountain without the town are the ruins of the great and very strong castle of Schönberg, and below the town on the right bank of the Rhine is the perpendicular Lurley rock, celebrated for its echo, which is said to repeat sounds fifteen times.

WESEL. [DÜSSELDORF.]

WESER, the Roman *Vesurgis*, one of the largest rivers of Germany, is formed by the junction of the Werra and the Fulda: the Werra rises in Saxe-Hildburghausen, and the Fulda in the Rhön-gebirge in Bavaria. The course of the Werra is 175 miles, and that of the Fulda 125 miles, to their junction at Münden in Hanover, where their united streams take the name of the Weser. The Weser then passes through the principality of Göttingen, the duchy of Brunswick, the principality of Calenberg, the county of Schaumburg, the Prussian province of Westphalia, the Hanoverian provinces of Hoya, Verden, and Bremen, and the territory of the city of Bremen, from which, to its very broad mouth beyond Bremerlehe, it forms the boundary between Hanover and Oldenburg, and falls into the North Sea 45 miles below the city of Bremen: its entire course from Münden is 225 miles. Its principal affluents are, on the right hand, the Aller, with the Ocker and the Leine; the Wumme; the Lune; and, on the left, the Au; the Delme; the Hunte. The general direction of its course is from south to north, at first through a mountainous country, to the celebrated Porta Westphalica (between four and five miles above Minden), which is a gap in the Sünt-l-gebirge, through which it flows, having Jacobsberg (528 feet high) on the right, and Wittekindenberg (807 feet high) on the left bank. After passing the Porta Westphalica it flows through a wide valley with low banks. The facilities afforded by the navigation of the Weser, the Werra, the Fulda, and some of the other tributary streams, as the Aller and the Hunte, are of the highest importance to the commerce of the countries on their banks. The upper and middle portions of the Weser however are often rendered impassable in summer by sand-banks. Five miles below Bremerlehe a harbour was constructed, in 1818, at the mouth of the river. [BREMEN.]

WESPRIM. [HUNGARY.]

WEST BROMWICH. [BROMWICH, West.]

WEST DERBY, Lancashire, a suburb of LIVERPOOL, and the seat of a Poor-Law Union, is situated in 53° 28' N. lat., 2° 55' W. long., distant 3 miles N.E. from Liverpool, and 204 miles N.W. from London. The population of the ecclesiastical district of West Derby was 32,978 in 1851. West Derby Poor-Law Union contains 23 parishes and townships, with an area of 49,614 acres, and a population in 1851 of 153,238.

WEST FIRLE, Sussex, a village and the seat of a Poor-Law Union, is situated in 50° 50' N. lat., 0° 6' E. long., distant 4 miles S.E. by E. from Lewes, and 54 miles S. by E. from London. The population of the parish in 1851 was 701. The living is a vicarage in the archdeaconry of Lewes and diocese of Chichester. West Firle Poor-Law Union contains eight parishes, with an area of 14,494 acres, and a population in 1851 of 2590. The parish church is a spacious gothic structure. There are National schools.

WEST HAM, Essex, a village and the seat of a Poor-Law Union, is situated near the left bank of the river Lea, to the south of the main road from London to Chelmsford, in 51° 32' N. lat. 0° 1' W.

long, distant 26 miles S.W. from Chelmsford, and 5 miles N.E. from London. The population of the parish of West Ham in 1851 was 18,817. The living is a vicarage, in the archdeaconry and diocese of London. West Ham Poor-Law Union contains seven parishes and townships, with an area of 19,477 acres, and a population in 1851 of 34,395. West Ham had at one time a market. The villages of Plaistow and Stratford, which are in the parish, are noticed under Essex. The works of the Eastern Counties railway at Stratford have led to a great increase of population in that part of West Ham parish. The church of West Ham is an ancient and commodious structure, consisting of nave and chancel, with aisles. The Independents and Baptists have places of worship. There are National, British, Free, and Infant schools. On the river Lea are corn-mills, distilleries, a gutta-percha manufactory, brick-works, and market-gardens.

WEST HAMPNETT, Sussex, an agricultural village, and the seat of a Poor-Law Union, is situated in $50^{\circ} 50' N. \text{ lat.}, 0^{\circ} 46' W. \text{ long.}$, distant one mile and a half N.W. from Chichester, and 60 miles S.S.W. from London. The population of the parish in 1851 was 637, of whom 225 were in the Union workhouse. The living is a vicarage, in the archdeaconry and diocese of Chichester. West Hampnett Union contains 37 parishes and townships, with an area of 72,409 acres, and a population in 1851 of 14,649.

WEST INDIES, a term applied to the archipelago which separates the Atlantic from the Caribbean Sea and the Gulf of Mexico. The name perpetuates the notion of Columbus that by sailing west he should reach India, or Hindustan; it was for some time synonymous with America. Geographers sometimes call these islands the *Columbian Archipelago*, because nearly all the islands were discovered by Columbus. On the continent of Europe the name ANTILLES has been generally retained. Various names are given by seamen of different nations to different portions of the archipelago. The Spaniards introduced the distinction of Windward and Leeward Is. s (Barlovento and Sotavento). By *Windward Isles* English navigators mean the group that lies south of, and includes, Martinique; while the *Leeward Isles* comprise the islands between Martinique and Puerto Rico: these two groups, together with a series of islets along the north coast of Venezuela, constitute the *Lesser Antilles*. The most northerly of the Leeward Isles form the group of the VIRGIN ISLANDS. The larger islands—Puerto Rico, San Domingo, Jamaica, and Cuba—which bound the Caribbean Sea on the north, are called the *Greater Antilles*; and outside these towards the Atlantic, on the north-east, are the great banks on which rest the *Lucayas*, or BAHAMAS.

The archipelago of the West Indies extends from 10° to $27^{\circ} 30' N. \text{ lat.}, 59^{\circ} 30'$ to $85^{\circ} W. \text{ long.}$, and the islands are divided into three groups: the Bahamas, lying between $27^{\circ} 30'$ and $20^{\circ} N. \text{ lat.}, 70^{\circ}$ and $80^{\circ} W. \text{ long.}$; the Greater Antilles, between $23^{\circ} 30'$ and $18^{\circ} N. \text{ lat.}, 65^{\circ}$ and $85^{\circ} W. \text{ long.}$; and the Lesser Antilles, extending from 19° to $10^{\circ} N. \text{ lat.}, 59^{\circ} 30'$ to $66^{\circ} W. \text{ long.}$ The most northern portion of this archipelago, or that part which is north of $20^{\circ} N. \text{ lat.}$, is noticed under BAHAMAS; the Greater Antilles are described under CUBA, HISPANIOLA, JAMAICA, and PUERTO RICO; the British West India Islands are severally noticed under their proper heads, as are also the more important of the islands belonging to France, Denmark, and Holland. Lists of the islands belonging to these different states are given under ANTILLES. The gross area of the West Indies is estimated at 86,023 square miles, that of the British possessions at 13,272 square miles. It remains in this article to take a brief glance at the formation, climate, and products of the archipelago.

The islands dispersed over the Bahama banks are low, with the exception of the islands of Heneagua, or Inagua, and Mayaganga, or Marignana, both situated in a wide opening to the north of the Windward Passage which separates Cuba from Hispaniola. They hardly rise more than six feet above high-water mark, and their shores are formed by madrepores or coral. They are all long, and very narrow. Towards the centre of the islands the soil is composed of sand and calcareous rocks, with an intermixture of shells. It is generally hard, and partially covered with shrubs or with low trees, some of which produce dye-woods. The banks themselves rise nearly perpendicularly from an unfathomable depth. Where their edges are not formed by islands there is a depth of three to ten fathoms of water on them, but this depth decreases gradually towards the interior of the banks, where it is frequently only a few feet. There are also large tracts which are dry at low-water, and in other places there are single rocks or cliffs. The surface of the banks is composed of calcareous sand intermixed with shells.

The extensive banks which surround the greater part of the island of Cuba prove that this island rests on a bank similar to the Great Bahama Bank. These banks surround the island so as to leave only a few places of comparatively small extent, where large vessels have access. [CUBA.] The eastern portion of Cuba however is free from banks, and in these districts alone the mountains rise to a considerable elevation, whilst those parts which are surrounded by banks contain only hills.

The mountainous portion of Cuba evidently belongs to another region, which extends far to the east, comprehending the three other Larger Antilles and the Virgin Islands, so as to terminate near $64^{\circ} W. \text{ long.}$ In the most western parts the mountains rise to a great elevation. The Montañas del Cobre in Cuba rise to 7200 feet; the

Blue Mountains in Jamaica to 7150 feet; and those of Cibao in Hispaniola to about 8000 feet. Farther to the east the mountains decrease in height. In Puerto Rico they do not attain 4000 feet, and in the Virgin Islands probably not 2000 feet. Those of Virgin Gorda perhaps do not much exceed 500 feet. These mountains exhibit the usual formation of most mountains of Europe, but primitive rocks are prevalent in the highest ranges. Between them there are valleys of considerable width, and on their sides smaller ones, all of which are very fertile. There are considerable plains, as in Jamaica and Hispaniola, which however are destitute of trees and less fertile. The mountains, their declivities, and the valleys are thickly wooded in their natural state.

The strait which lies between Virgin Gorda and Anguilla, and is traversed by the meridian of $64^{\circ} W. \text{ long.}$, separates this region from the islands of volcanic origin, which extend from $18^{\circ} 20'$ to $12^{\circ} N. \text{ lat.}$ and between $60^{\circ} 50'$ and $63^{\circ} 10' W. \text{ long.}$ in a curved line. These islands consist either entirely or for the greater part of mountains and rocks of volcanic origin. Anguilla however, which lies at the most northern extremity, and Barbuda and Barbadoes, which lie farther to the east, are not much elevated, and they exhibit no traces of volcanic action, but consist mostly of limestone rocks. The greater number of the others are entirely composed of lava or other rocks of volcanic origin; but in St. Martin, St. Bartholomew, Guadeloupe, Martinique, and Granada are tracts consisting of limestone or sandstone. Two of these islands, Guadeloupe and St. Vincent, have active volcanoes; the others contain extinct craters, or solfatarae, in different degrees of activity. The surface of these islands, like that of all countries consisting of volcanic rocks, presents great and sudden irregularities. The mountains rise from 2500 to more than 5000 feet above the sea. The highest are the Morne Diablotin in Dominica (5316 feet) and the Soufrière in Guadeloupe (5118 feet), both of which lie nearly in the centre of the chain. Proceeding south and north they become lower, but Mount Misery in St. Christopher is still 4454 feet, and Morne Rouge in Grenada 3840 feet high. On the eastern shores of the islands, which are exposed to the strong currents from the Atlantic, the rocks rise with a very steep ascent, and the indentations between them are generally too short and too much exposed to the trade-wind to constitute harbours. On the western shores the mountains are less elevated and their declivities gradual; and here the inlets are of great extent, and form good harbours.

The islands of Tobago and Trinidad chiefly consist of primitive rocks, and resemble in their formation the north-eastern coast of Venezuela. There are no traces of volcanic action on them, except some mud-volcanoes on Trinidad.

All the islands of the Columbian Archipelago, with the exception of the most northern Bahamas, are within the tropic; and their climate, as in other countries thus situated, is regulated by the progress of the sun, and the trade-winds, which depend on that progress. The year is divided into two seasons, the dry and wet. All the islands which are south of $18^{\circ} N. \text{ lat.}$ have two dry and two wet seasons, and this is also the case with the southern shores of the islands of Puerto Rico, Hispaniola, and Jamaica. The long dry season sets in when the equator approaches the southern tropic, about the end of November or the beginning of December. In this season the weather is generally very constant. Showers of rain indeed occur, but not frequently; and the sky is cloudless for several weeks and even months in succession. This weather lasts till the sun approaches the equator. Towards the end of March a change in the atmosphere takes place in the most southern islands, but it occurs about a month later in those near $18^{\circ} N. \text{ lat.}$ The short rainy season begins, which in the southern islands lasts about six weeks, but in the northern only 15 or 20 days. Showers are then frequent, and sometimes several occur in one day; but they hardly ever continue for an hour. When the sun passes over the zenith of the islands, the short dry season begins, and it lasts till the sun has reached the northern tropic. In July the long rainy season sets in, and continues to the month of November. These rains, which are ushered in by violent gusts of wind, and accompanied by terrific thunder-storms, are generally not heavy in July; but they become so in August in the southern, and in September in the northern islands. They then descend in torrents, and sometimes continue for 24 hours without interruption; but they usually fall in showers, several of which occur in one day, and sometimes as many as twenty. In the southern islands they begin to diminish in September, and in the northern in October. In November the showers are moderate and less frequent.

On the island of Cuba and on the northern coasts of the other Greater Antilles and in the Bahamas, the seasons are not so distinctly marked. Though fine weather prevails during the long dry season, it is frequently interrupted by rain. It must however be observed that the heaviest rains fall in those months when the rainy season is at its height in the islands lying farther south. The quantity of rain which annually falls in the Greater Antilles is less than in those islands where the seasons are more regular. In the former it amounts to between 48 and 60 inches, and in the latter to 60 or 70 inches.

The mean annual temperature differs very little in places situated between the tropics. In the West Indies it is about 78° . The greatest heat experienced at Puerto d'España does not exceed 98° , or 15 degrees above the mean annual temperature. At the Havana the thermometer sometimes rises to 92° ; but it sometimes descends as low as 45° , and

in its vicinity ice is occasionally formed, after a long continuance of northerly winds in December or January. With this exception it is stated that no frost is experienced even on the summits of the high mountains of Cuba or Jamaica.

When the sun is in the southern hemisphere the Archipelago enjoys the full benefit of the trade-winds, blowing from north-east and east-north-east, and diffusing over it a refreshing coolness. But when the sun has passed the equator, the trade-winds retire to the northward as far as 15° or 16° N. lat., and are replaced by south-eastern winds, which are warm and usually gentle; they continue to blow with diminishing force till June, when they are frequently interrupted by calms. During the long rains the wind blows from all the points of the compass, and frequently in very violent gusts. This is also the season of the hurricanes, which rarely occur in July, but generally in August or September. They are not experienced in Trinidad and Tobago, and are more frequent and destructive on the Lesser Antilles than in Jamaica or Cuba. In Cuba they usually occur in October. When the trade-winds are not strong, the heat is moderated by the daily alternation of the sea- and land-breezes, the first blowing by day and the land-breeze by night. The calms between the breezes are the hottest part of the day, but they last only from one to two hours.

All the islands are subject to earthquakes; but they are not violent, except on the islands of volcanic formation, where they prove sometimes very destructive. The climate is considered healthy from November to June, but during the great rains various diseases, especially fevers, are prevalent.

The navigation of the Archipelago is much affected by the currents which prevail in the surrounding seas. The principal of these, the Gulf Stream and the Guyana Current, are noticed under ATLANTIC OCEAN. Another current prevails along the north-eastern edge of the Bahama Banks. It sets along the banks to the east-south-east, and varies much in strength according to the seasons. In the sea between this current and the Guyana Current the extraordinary phenomenon occurs which is called the 'Ground-Sea,' or in Jamaica the 'North Sea.' It is a swell of the sea, to which the south-eastern Bahamas, the north-eastern coast of Jamaica and Hispaniola, but chiefly Puerto-Rico and the Virgin Islands, and in a less degree the northern Caribbee Islands, are subject. This heavy swell sets in generally in October and continues, though with some intermission, till April and May. During June, July, and August it appears only occasionally, and for a short time. It takes place when the air is calm, or even after the prevalence of light winds from the southward of east. The sea approaches from the north the shores of the islands in undulating masses, which suddenly rise to large ridges created with foam, and form billows which burst upon the beach with great impetuosity. The sea for many miles assumes a peculiar aspect. Different tints of blue, from the lightest to the darkest, form a strong contrast with the snowy foam of the breaking waves when they strike against the hidden rock, or with the white line which is visible along the whole coast.

The grains, plants, vegetables, and fruit-trees, which are cultivated either for the purpose of obtaining articles of export or as food, are enumerated in the articles on the several islands. The most important products are sugar, coffee, tobacco, indigo, cotton, ginger, cacao, manioc, maize, &c., vast quantities of delicious fruits and vegetables, and hard strong timber. The wild animals which existed on the Archipelago when the Europeans first arrived were—the agouti, peccary, racoon, alou, or native Indian dog, and the wild boar—are now all extinct or nearly so, with the exception of the wild hog, which is still common on most islands. Monkeys are still found on several islands, and in Jamaica there is a smaller kind. Birds are numerous, and nearly all of them are fit for food. There are macaws, parrots, wild guin-a-fowls, quails, several species of wild-pigeons and partridges, snipes, wild-ducks, gray-ducks, teal, plovers, widgeons, mocking-birds, or nightingales, curlews, spoonbills, divers, herons, rails, and sand-pipers. The most remarkable of the birds are the humming-bird and the carrion-crow: without the last-mentioned bird, it is said that these islands would hardly be habitable.

Fish are abundant and excellent. Madden enumerates 24 species in Jamaica, all of which are excellent food. In the sea surrounding Cuba and Jamaica the manatee and the remora, or sucking-fish, are met with, but very rarely. Turtles are abundant on the Bahamas and other low islands. In Jamaica is the mountain-crab, which is one of the delicacies of the island. The cotton-tree worm, or casu, is eaten by the negroes. There are several kinds of large lizards, among which is the guana, which is eaten. Alligators are numerous. There are also several kinds of snakes, and some are large, but they are innoxious. The mosquitoes, cockroaches, and ants are troublesome. Fire-flies are very abundant.

The original inhabitants found by the Spaniards on the Greater Antilles and the Bahamas were a gentle and timid race. They were all exterminated in a few years. The Little Antilles on the other hand were inhabited by a courageous and robust race called Caribs, from whom this part of the West Indies is still sometimes called the Caribbean Islands. But this warlike race is also extinct in the islands, which are now peopled entirely by Europeans, Creoles, and negroes. A few families of Caribs still exist on the islands of St. Vincent and Trinidad. The present population, amounting to between three and four millions, is composed of whites and negroes, and the offspring of

these two races. In the British islands the negroes constitute about three-fourths of the population; in Cuba, about one-half; in Puerto Rico, only one-sixth. The proportion between the two races in the islands which belong to other European nations is nearly the same as in the British islands. In Hispaniola both races are so mixed, that the bulk of the people are considered mulattoes.

History.—The greater number of the islands composing the Columbian Archipelago were discovered by Columbus. On his first voyage he first fell in (12th Oct., 1492) with the island of San Salvador, one of the Bahamas, which the natives called Guanahani. He afterwards visited the Bahama Islands, which lie between San Salvador and Cuba, and sailed along the north-east coast of the last-mentioned island from Punta Maternello to Cape Maysi, whence he passed to Hispaniola, of which he discovered a great part of the northern coast. In his second voyage (1498) he discovered all the Lesser Antilles north of 15° N. lat., and also Puerto Rico, and in the following year the southern coast of Cuba. In his third voyage (1498) he discovered Trinidad and the adjacent part of Venezuela, with the islands of Margarita and Cubagua. In his fourth voyage he discovered the Bay of Honduras, the whole of the coast of Central America from Cape Gracias à Dios to Puerto Bello, and, in returning from this coast to Hispaniola, also the island of Jamaica. The other islands were discovered either at the same time or soon afterwards. Columbus formed the first settlement on his second voyage, and in the beginning of the 16th century the other Greater Antilles were occupied and settled by the Spaniards, who attempted to exclude Europeans from having any commercial intercourse with these islands. But as the Spaniards did not think it worth their while to occupy the smaller islands, they became the resort of the pirates called Buccaneers, who infested the Spanish possessions during the 16th and 17th centuries. With the assistance of the Buccaneers several nations settled permanently in them. Other islands were wrested from the Spaniards by war, as Jamaica by the English; or by treaty, as the western portion of Hispaniola by the French. After the extermination of the Buccaneers the islands began to enjoy peace, and soon rose to great importance, as the demand for their principal produce, sugar and coffee, increased rapidly in Europe, and most of the other countries in which those articles might be obtained were shut out from a free commercial intercourse. Thus the English islands, as also those of other European nations, with the exception of those of Spain, had risen to a high degree of cultivation at the end of the 18th century. Several events which have taken place since 1800 have considerably affected the condition of the English possessions; such as the abolition of the slave-trade, the emancipation of the slaves, and the free intercourse not only of England, but also of other European nations, with countries producing similar articles. Slavery has been abolished, and the slaves made free in the French West India islands since 1848. Slaves now exist only on the islands still belonging to Spain.

(Bryan Edwards, *History of the West Indies*; Humboldt; *London Geographical Journal*; *Parliamentary Papers*.)

WEST KILBRIDE. [AYBSHIRE.]

WEST WARD, Westmorland, is the north-western division of the county, and gives name to a Poor-Law Union. The ward contains an area of 120,523 acres, with a population in 1851 of 8156. It is bounded N.W. by Cumberland, E. by East Ward, and S. by Lancashire and the ward of Kendal. West Ward Union, which contains 22 parishes and townships, is co-extensive with West Ward division of the county.

WESTBOURNE, Sussex, a village and the seat of a Poor-Law Union, is situated on the left bank of a small stream which divides Sussex from Hampshire, in 50° 51' N. lat., 0° 56' W. long., distant 8 miles W. by N. from Chichester, and 70 miles S.W. from London. The population of the parish in 1851 was 2178. The living is a vicarage, in the archdeaconry and diocese of Chichester. Westbourne Poor-Law Union contains 12 parishes and townships, with an area of 32,866 acres, and a population in 1851 of 6944. Besides the parish church, Westbourne has National and Infant schools. Brick-making, rope-making, and mast and block making are carried on.

WESTBURY, Wiltshire, a market-town and parliamentary borough, and the seat of a Poor-Law Union, is situated in 52° 15' N. lat., 2° 9' W. long., distant 12 miles S.W. from Devizes, 100 miles W. by S. from London by road, and 109½ miles by the Wilts and Somerset branch of the Great Western railway. The population of the parliamentary borough of Westbury in 1851 was 7029. The living is a vicarage, in the archdeaconry and diocese of Salisbury. The Poor-Law Union, which is called the Westbury and Whorwelsdown Union, from the two adjoining hundreds so named with which its area is nearly co-terminous, contains 10 parishes and townships, with an area of 30,944 acres, and a population in 1851 of 12,580.

Westbury is a place of considerable antiquity, and numerous Roman coins have been dug up in the neighbourhood. Westbury Leigh forms a street, separated by an interval of open road from the principal street of Westbury. The church is a large ancient building, with a central tower, and a fine west window. There are chapels for Independents and Baptists, and National and Infant schools. The town-hall is a handsome building. The clothing manufacture is carried on. The market is on Friday, and there are four yearly fairs.

WESTBURY-ON-SEVERN, Gloucestershire, a village and the seat of a Poor-Law Union, is situated on the right bank of the river Severn,

in 51° 50' N. lat., 2° 24' W. long., distant 9 miles S.W. from Gloucester, and 111 miles W. by N. from London. The population of the parish of Westbury-on-Severn in 1851 was 2498. The living is a vicarage, in the archdeaconry of Gloucester and diocese of Gloucester and Bristol. Westbury-on-Severn Poor-Law Union contains 14 parishes and townships, with an area of 43,246 acres, and a population in 1851 of 18,124. Westbury stands at the north-eastern corner of the Forest of Dean. Besides the parish church, there is a chapel for Independents. National schools are supported partly from endowment.

WESTBURY-ON-TRYM. [GLOUCESTERSHIRE.]

WESTCHESTER. [PENNSYLVANIA.]

WESTERAAS. [SWEDEN.]

WESTERHAM, Kent, a market-town, in the valley of Holmesdale, near the western border of the county, in 51° 15' N. lat., 0° 4' E. long., distant 21 miles W. from Maidstone, and 21 miles S. by E. from London. The population of the town of Westerham in 1851 was 1247. The living is a vicarage, in the archdeaconry of Maidstone and diocese of Canterbury. The parish church is a handsome edifice, chiefly in the perpendicular style, with a spire. In the interior is a cenotaph to the memory of General Wolfe. The Independents have a chapel, and there are National schools. Wednesday is the market-day. An annual fair is held on May 8rd.

WESTERN AUSTRALIA, in its widest sense, extends over the western portion of the Australian continent, and comprehends all the countries lying west of 132° E. long., the boundary west of South Australia and North Australia; so that the boundary-line between it and the other parts of the continent joins the Indian Ocean east of Cambridge Gulf, and the Southern Sea near the Australian Bight, at Cape Adieu. Thus Western Australia contains about one-fourth of the whole continent, and lies between 35° and 14° S. lat., 115° and 132° E. long. The limits of the British colony, originally established under the name of the Swan River Settlement, are much less, but the boundary has not been definitely settled, and is constantly being extended. It may be said to lie between 30° and 35° S. lat., 115° and 119° E. long., or about 400 miles from south to north, and about 250 miles in breadth.

Coast.—The coast-line presents a much greater variety than most other parts of Australia. In some parts the sea to some distance from the shore is covered with numerous islands, islets, and rocks, which render these countries difficult of access. From this cause an extent of coast-line, about 500 miles in length, has not been surveyed. Tasman Land, between Point Gantheaume and Cambridge Bay, to the northward, has a coast more broken than any other part of Australia, and indented with wide bays, and some narrow inlets, which penetrate a considerable distance into the interior. The coast of Tasman Land has been but slightly examined, so that our information in respect of the natural products of the country is very limited. Within the confines of the colony there are numerous estuaries, each of which receives several rivers. Of the few good harbours along this coast the best are Rockingham in Cockburn Sound, Albany in King George's Sound, Bunbury in Port Leschenhault, and Augusta, near Cape Leeuwin, on the southern side of the south-western promontory of the island. At the mouth of the Swan River, and at the head of the Melville Water, which runs inland for nearly 80 miles, is the port of Perth, the capital of the colony of Western Australia. The entrance is encumbered and rendered dangerous by several rocks. A lighthouse is placed on Rottenest Island at the entrance, and on some of the more dangerous rocks there are beacons.

Mountains, &c.—A range called the Darling Mountains extends along nearly the whole length of the colony. Its distance from the coast varies from 50 to 150 miles, and its height is from 800 to 3000 feet. It is generally sterile; the granite appears in some places in masses. A profusion of coarse herbage appears on the surface, and plants which resemble the English heath grow in considerable numbers. There are forests of large mahogany and blue gum-trees. In the Darling Mountains have been found roofing-slate, limestone, marl, selenite, siliceous and calcareous petrifications, magnetic iron-ore, chromate of lead, galena, and copper. Wide valleys bordered by fertile plains occur where basaltic rocks are developed. Columnar basalt is found around Geographe Bay, and from thence to Shark Bay a band of coal has been traced a distance of 600 miles.

In that part of Western Australia which borders on the south coast, there are three distinct parallel ranges of mountains running from north to south. The highest and most eastern of these has its southern termination near to King George's Sound, in 35° 6' S. lat. The second terminates at Cape Chatham, 35° S. lat.; Cape Leeuwin, which is inferior in altitude, as well as in extent, to the other two; it terminates on the north at Cape Naturaliste, 33° 27' S. lat. The highest point is Tulbanop, which is stated to attain an elevation of 5000 feet. On the mountains and higher hills the surface is rugged and stony; on the lower sides of both the soil is excellent; but in the principal valleys and the lower grounds, where the sandstone formation prevails, it is of a very inferior description, except where the rivers have brought down an alluvial deposit.

Rivers.—The rivers on the west coast of Australia generally rise at no great distance from the sea. Near their sources they are mountain torrents, but in the lowlands they become slow streams. They are

liable to rise suddenly, owing, it is supposed, to the rain which falls near their sources. At other times their channel, in some places may be quite dry, is quite dry. They offer little or no facility for inland navigation. The Swan River rises on the western side of the Darling Range. At its mouth is a bar, after passing which the river is navigable, though with difficulty, for some distance. The other rivers are the Avon, the Murray, the Canning, the Harvey, the Preston, the Collic, the Vasse, the Blackwood, the Donnelly, and the Kalgan. The Canning rises in the Darling Range: it is smaller than the Swan, and only navigable for a few miles. Shoals impede the navigation, and dry weather boats must be pushed over them for fully half a mile. The Murray takes its rise also in the Darling Range, and empties itself into Peel's Inlet. The Preston and the Collic unite about 50 miles south of the Murray, and the united stream runs into an estuary called Leschenhault, and forms a bar, over which the river is very shallow.

For the botany and zoology of Western Australia, see AUSTRALIA. *Climate.*—The climate of Western Australia has the same general character as that of Eastern Australia. [AUSTRALIA.] It has generally been found prejudicial to Europeans, while in the case of some persons it has proved highly favourable. Though variable, the western part of this colony is not so uncertain as New South Wales in the supply of rain and moisture. The average winter temperature is about 58°, that of the summer about 76°.

The wet season begins generally in March and ends in November, the rain being most abundant in August and September. The driest of the dry season is during the harvest, in January, when the nights are distinguished by heavy dews. The seed-time lasts from early in May to the end of August. By December the grain is ripe; hay is cut in November. Tomatoes, pumpkins, gourds, vegetable-marrows, chillies, egg-plants, besides every English vegetable, ripen in the open air; and also the following among other fruits—melons, bananas, almonds, figs, grapes, peaches, and strawberries. The olive, pomegranate, apricot, plum, mango, lemon, and orange; the mulberry, apple, nectarine, pear, and several others are grown. Fig-cutting produce fruit the first year, and vines the second or third.

Population.—The aborigines do not amount to more than 1700. The European population here increases very slowly. In 1852 it amounted to 8711, including 705 enumerated among the military, 1432 bond, and 6574 free. Schools are provided at the government expense for children of all religious denominations, as well as for natives, those who are able paying a small sum; and there are other schools in connection with the Wesleyan Methodists. There are about 70 churches and chapels in the colony, of which 20 belong to the Church of England, 4 to Presbyterians, and 3 to Roman Catholics.

Government.—There is a lieutenant-governor, with his staff of officials. The colony is divided for government purposes into 21 counties. On the first establishment of the colony in 1829, it was decided that no convicts should be sent thither, and a system of colonisation was projected, to be carried forward by means of land-sales, but it did not work well. The labourers sent out became landowners, and hired labour became excessively dear. Convict labour has since been requested by the colonists, and has succeeded well. In November 1854, four years after the formation of a convict department, 2930 convicts had been sent. Of these 553 were then in prison, either as probation prisoners, or as reconvicted ticket-of-leave men; but of the last there were only about a hundred. There were 1523 ticket-of-leave men, 622 employed on public works, 891 in private service, and 10 in hospital. There had been 113 deaths, 723 conditionally pardoned, and 18 either free by servitude, escaped, or missing. The public works had been executed under the superintendence of the Royal Sappers and Miners, and consisted of the permanent prison at Fremantle; commissariat stores and offices at Fremantle, Guildford, York, Toodyay, and Bunbury; jails at York, Toodyay, and Bunbury; 272 miles of road, 50 of which are 30 feet wide, and the remainder 18 feet, 27 miles graded and levelled, 5 miles macadamised, and 50 miles repaired; 28 bridges built, one of which, over the Swan at Guildford, is 480 feet long and 30 feet high, and several others of considerable size; a jetty 216 feet long, built at Fremantle as a landing from the river, and another 455 feet long, as a landing from the harbour, in progress; the lakes at the back of Perth drained, and the swamps in Fremantle filled up; with some minor works. The conduct of the convicts had on the whole been good, and considerable improvement had been developed in their characters.

Commerce.—Though most of the English grains are grown, and the soil is tolerably productive, the exertions of the settlers are chiefly directed to the raising of stock. Wool is one of the chief articles of export; horses, which are sold to supply the cavalry at Madras, are another large article of export; as is sandal-wood, and a species of mahogany, of which there are large forests in the interior. Guano has been found on the islets that lie around Shark's Bay. Attempts have been made to prosecute the whale fishery; and something is done in fishing off the coasts to furnish provisions for the inhabitants. There are many salt-lakes and springs in the colony, and a considerable quantity of salt is manufactured. The amount of tonnage inwards in 1852 was 25,326. The imports in 1852 amounted to 97,804. The colonial revenue for 1852 was 87,022; the expenditure was 34,774. *Towns.*—Perth, the capital, is situated on the right side of the

estuary of the Swan River, near its junction with the Canning. The population is small; the town is however improving, but the houses are scattered over a large area. A bridge has been built across the Canning, another over the Swan, and there is a new jail. *Fremantle* is on the opposite side of the Swan River estuary, a few miles lower down. It is the seat of the convict establishment, and there is a jail. A lighthouse has been erected upon Arthur's Head, a promontory in front of the town. There is a jetty for the convenience of the port. *Albany* is a port-town, in the south-eastern part of the colony, in King George's Sound. It has a jail, and some trade in timber. *Augusta* is a small port on the eastern side of Cape Leeuwin, on the estuary of the Blackwood River. *Bunbury* is the port town of a district formerly called Australind, of which a small village still retains the name. The harbour of Port Leschenault, upon which it stands, is a good and large one, but it has little commerce. *Geraldton* is an inland town on the Murchison River, founded in consequence of the commencement of the working of lead-mines there by a company. *Guildford* is a small inland town, a few miles east of Perth. *Northam* is a small inland town, in an agricultural district, east of the Darling Range, on the river Mortlock, and is about 60 miles in a direct line E.N.E. from Perth. *Rockingham* is on Cockburn Sound, and has a good port, and some trade. *Toodyay* is an inland town, about 20 miles N.W. from Northam, and about 50 miles N.E. from Perth, upon the river Toodyay, which pierces the Darling Range, and falls into the Melville Water, but is not navigable. *Vasse* is a small port on Vasse Inlet, in the centre of Geographe Bay, about 20 miles S.S.W. from Bunbury, about 50 miles S. from Vasse, across a fine country, forming the promontory bounded by Cape Leeuwin and Cape Naturaliste. Other small towns of little importance are named York, Picton, Clarence, and Waterloo.

WESTERVIK. [SWEDEN.]

WESTERWALD. [PRUSSIA.]

WESTMEATH, an inland county in the province of Leinster, Ireland, is bounded N. by the county of Cavan, N.E. and E. by the county of Meath, S. by King's County, W. by the county of Roscommon, and N.W. by the county of Longford. It lies between 53° 8' and 53° 48' N. lat., 6° 54' and 7° 55' W. long. Its greatest length east-north-east and west-south-west is 35 miles, its greatest breadth at right angles to that line 25 miles. The area is 708 square miles, or 453,468 acres, of which 365,218 acres are arable, 56,392 acres uncultivated, 8803 acres in plantations, 628 acres in towns, and 22,427 acres under water. The population in 1841 was 141,300; in 1851 it was 107,510.

Surface, Geology, Hydrography, and Communications.—The county has for the most part a gently-undulating surface, not rising anywhere to a very great height. Knock Eyne, or Ion, on the border of Lough Deveragh, is about 702 feet high; Benfore, or Ben of Fowre, near the village of Fowre, not far from Lough Lane, or Lene, is 710 feet high. These, with the other principal elevations, are in the northern part of the county. The whole belongs to the central carboniferous limestone district of Ireland. There are two small districts, one just round Moate-a-Gronogue, and the other in the same neighbourhood, but rather more to the south-west, which are occupied by the yellow sandstone. These beds are considered to belong to the same period as the carboniferous limestone, of which series of formations they constitute the lowest members.

The western side of the county belongs immediately to the basin of the Shannon, which forms its western boundary, separating it from the county of Roscommon. Lough Ree, the largest of the series of lakes into which the Shannon expands, is also on the western border. This noble sheet of water is 16 miles long from north to south, and of a varying breadth, above 7 miles in one part. Its outline is exceedingly broken and irregular, and its surface is studded with a number of small islands finely wooded. Those adjacent to Westmeath are, Innismore, or Inchmore, containing 104 acres, once the site of a monastery; Hare Island, 57 acres, with the ruins of an abbey; Innisturk, or Inchturk, 24 acres; and Innisboffin, or Inchboffin, 27 acres, formerly the site of an abbey; besides a number of smaller islands. An inlet at the southern extremity of Lough Ree, connected with it by a strait so narrow as properly to constitute it another lake, is almost entirely inclosed within the county. This subordinate lake, which is about 2 miles long from east to west, and in one part above a mile and a half wide, contains a large island called Friar's Island, well wooded at its western extremity. The streams which flow into the Shannon or into Lough Ree are all small. A stream, which rises 3 miles north of Moate, and several other streams in the north-west, flow into the Inny, which joins Lough Ree on the border of the county of Longford. There are several small lakes on this side of the county, some of which communicate by small streams with Lough Ree. Bogs are numerous.

The central part of the county is drained by streams that empty their waters into several inland lakes, which are connected by small streams with each other, and ultimately with the Shannon. The northernmost of these is Lough Sheelin, or Shillin, on the north border of the county, from which lough a small stream communicates with Lough Keinal, also on the border. From Lough Keinal the connecting stream flows southward, first along the border, separating Westmeath from Longford, and then through the county into Lough

GEOG. DIV. VOL. IV.

Deveragh. This sheet of water extends 5 or 6 miles in length from north-west to south-east, and has a breadth varying from 2½ or 3 miles near the north-west end, to little more than a quarter of a mile near the south-east extremity. The banks are hilly, and some of the loftiest elevations in the county are in the surrounding district. There are plantations or other woodlands on some parts of the shore. Lough Deveragh receives some small streams: and others, including the Glore, which is the outlet of a small lake (Lough Glore), north-east of Lough Deveragh, fall into the connecting stream. A small brook forms a communication between Lough Iron and Lough Owhele, or Hoyle, 3½ miles long from north-west to south-east, and about one mile and a half broad. The banks rise gently from the lake, and are fertile and well wooded. On a small islet in the lake is a rude chapel with a burial-ground, once much resorted to by pilgrims. A supply of water is drawn from Lough Hoyle for the Royal Canal. From Lough Hoyle a small stream flows in a winding channel southward past Mullingar into Lough Ennel, 4½ or 5 miles long from north-east to south-west, and above 2 miles broad at the widest part. This lough, sometimes called Belvidere, is studded with small islands. A number of streams flow into the lough. These lakes communicate with the Shannon by two different streams, the Inny and the Brosna.

All that part of the county which we have described is included in the basin of the Shannon, though for convenience the central lake district has been described separately. The eastern side of the county belongs to the basin of the Boyne. A number of small streams rise on that side of the county and flow eastward into the Boyne: the most important is the Deel, one branch of which rises near Mullingar, and another is the outlet of a small system of lakes near the north-east border of the county. The lakes of this system are, Lough Bawn, the White Lake, and some very small ones on the borders; and Lough Lene, Lein, or Lane, and Lough-a-Deel within the border; Lough Lene, the largest of the group, is about 2½ miles long from west-north-west to east-south-east, and nearly a mile broad. Its waters are peculiarly clear, and it contains several islets.

The eastern and south-eastern sides of the county abound with bogs, and some of them are of very considerable extent.

The county of Westmeath is among the most beautiful in Ireland, but its beauty is of a peculiar character, consisting of rich undulating scenery, and not entering into rivalry with the more romantic beauties of Kerry and Wicklow.

The Shannon is navigable for steam-boats throughout that part which borders on this county. The Royal Canal, which connects Dublin and the east coast with the upper part of the Shannon at Tarnonbarry, crosses this county from east to north-west, passing near Killucan, Mullingar, and Ballinacargy. A branch from the Grand Canal between Philipstown and Tullamore in King's County, to Kilbeggan, is partly in this county.

The principal roads are those from Dublin to Longford and Athlone respectively. The Longford road enters this county from that of Meath near Kinnegad, and runs north-west by Mullingar and Rathowen into the county of Longford. A branch from this at Mullingar takes a rather more westerly direction from Ballinacargy to Ballymahon. The Athlone road branches from that to Longford just after it enters the county at Kinnegad, and runs westward by Rochford Bridge, Tyrrell's Pass, Kilbeggan, and Moate to Athlone. The road from Dublin to Granard runs through the northern part of the county by Castle Pollard; and a branch from Kinnegad joins this road near Castletown-Delvin.

The Great Western railway from Dublin to Galway enters the county at Killucan, runs westward to Mullingar, then turns southward to Castletown, Streamstown, and Moate, and then westward to Athlone, where it leaves the county.

Climate, Soil, and Produce.—The climate, which is mild and equable, frosts seldom occurring, resembles that of Dublin, but is perhaps a little drier, having few lofty hills, and lying inland; it is considered very healthy. The soil in the eastern parts is a heavy loam from 7 to 12 inches deep. The more hilly parts in the north afford excellent grazing, and the black cattle of this county are considered among the best in Ireland; sheep are also fed, but not so largely. In the western parts the soil is light, and there is a good deal of bog; it is however well suited to the growth of potatoes and flax. The breed of horses is good, and many are reared for the Dublin market. Pigs also are kept in considerable numbers. The principal grain cultivated is oats, but grazing is the chief agricultural pursuit. Dairy farming is practised to some extent, and a considerable quantity of good butter is made and sold in Dublin. Plantations of wood have been increased of late years, but turf is the chief fuel. The agriculture of the county is still behind that of England or Scotland. The number of acres under crop in 1853 was 127,214, of which 2797 acres grew wheat; 56,064 acres oats; 3621 acres barley, bere, rye, beans, and peas; 16,200 acres potatoes; 7014 acres turnips; 3248 acres other green crops; 280 acres flax; and 38,010 acres were in meadow and clover. In 1841 the plantations covered 11,790 acres, yielding oak, ash, elm, beech, fir, mixed timber, and fruit. In 1852 on 10,157 holdings there were 13,603 horses, 3554 mules and asses, 68,356 cattle, 116,748 sheep, 17,353 pigs, 8616 goats, and 209,559 head of poultry. The total value of the stock here enumerated was estimated at 720,1554.

Divisions and Towns.—The county is in Meath diocese, with a small portion in that of Ardagh, and contains 63 parishes. It is divided into 12 baronies—Brawny, Clonlunan, Corkaree, Delvin, Farbill, Fartulagh, Fore, Kilkenny West, Moyashel and Magheradernan, Moycashel, Moygolsh, and Rathconrath. The principal towns are MULLINGAR, ATHLONE, and Moate, of which the first two are noticed under their respective titles. Moate and some of the smaller towns and principal villages are noticed here; the population being that of 1851.

Ballinacargy is a small post-town on the banks of the Royal Canal, nearly 10 miles W.N.W. from Mullingar: population, 386. In the town is a Roman Catholic chapel. Petty sessions are held here monthly. There are a dispensary and a Free school. *Ballinalack*, is situated on the river Inny, between Lough Iron and Deveragh, nearly 10 miles N.N.W. from Mullingar: population, 222. In the vicinity is Wilson's hospital and school, in which 134 boys are maintained and educated; and there is also a Charter school. *Ballymore* is a market- and post-town on the road from Mullingar to Athlone, about 15 miles S.W. from Mullingar: population, 520. It is an irregular ill-built town, and contains a church and a Roman Catholic chapel. Petty sessions are held monthly. Near the town are remains of a castle. *Castle Pollard* is a market- and post-town on the Dublin and Granard road, about 10 miles N. from Mullingar: population, 1052. The market-house stands in a square in the middle of the town. There are a handsome modern church, a Roman Catholic chapel, a fever hospital, a dispensary, a savings bank, a parochial school, and a bridewell. Quarter sessions and petty sessions are held monthly; and four annual fairs are held. *Castletown* is a very small and poor post-town, about 5 miles N. from Kilbeggan: population, 249. There are a neat church, a Roman Catholic chapel, a National school, and a Roman Catholic school. In it is a station of the Dublin and Galway railway. There are the ruins of an ancient castle and of a monastery in the neighbourhood. *CASTLETOWNDELVIN*, the seat of a Poor-Law Union, is noticed in a separate article, in which by mistake it is stated to be in the county of Meath, instead of Westmeath. *Clonmellon* is a market- and post-town on the border of the county, about 5 miles N. from Castletowndelvin: population, 626. It is a neat little town, with a handsome church, and a dispensary. There are a considerable corn-market on Tuesday and four yearly fairs. Petty sessions are held monthly. *Kilbeggan*, a municipal borough, a market-town and post-town, and prior to the Union a parliamentary borough, stands on the Upper Brosna River, on the road from Dublin to Galway, about 5 miles W. from Tyrrell's Pass: population, 1442. There are an ancient church, a handsome Roman Catholic chapel, a Wesleyan Methodist meeting-house, a neat market-house, and a dispensary. A branch canal runs from the town to the Grand Canal, and a considerable trade is carried on by it in corn and butter. There are a brewery, a distillery, a flour-mill, and a snuff-mill. Petty sessions are held monthly. *Kinnegad* is a market- and post-town at the junction of the roads from Athlone and Galway to Dublin, about 12 miles E. from Mullingar: population, 684. There are a modern built church, a Roman Catholic chapel, a dispensary, and a National school. Kinnegad has some trade, particularly in cheese; and the market and an annual fair are well supplied with agricultural produce. *Moate-a-Grenogue* is a market- and post-town on the road to Athlone, from which it lies 10 miles E.: population, 1979. The town consists almost entirely of one street, and is a neat and clean-looking place. There are a church; a Roman Catholic chapel and convent; places of worship for Wesleyan Methodists, Baptists, and Quakers; a neat court-house; a dispensary; and a bridewell. The trade of the place is considerable. The market is important for oats; there are four yearly fairs. The quarter sessions for one division of the county are held here, and also petty sessions fortnightly for the district. *Multifarnham*, a village and post-town, about 9 miles N.W. from Mullingar: population, 241. Petty sessions are held monthly, and there are four yearly fairs. The picturesque ruins of a Franciscan abbey, founded in 1236, were formerly objects of much interest, but their effect has been marred by a portion having been rudely covered in to form a chapel for some Franciscan friars settled in the vicinity. *Rathowen* is a post-town, 13 miles W. from Mullingar, on the Sligo road: population, 337. It is a decaying place, but it contains a church, a Roman Catholic chapel, a court-house, a school, and a police barrack. Petty sessions are held here monthly, and two fairs yearly. *Tyrrell's Pass* is a market- and post-town on the road to Athlone, about 5 miles E. from Kilbeggan: population, 526. It is a clean and well-built little town, with a handsome modern church, a Wesleyan Methodist chapel, a school-house, a dispensary, and a savings bank; and has two yearly fairs for cattle. Just outside of the village are the remains of an old castle. The town has taken its name from a neighbouring pass, formerly guarded by the castle just mentioned, where the English were defeated during Tyrone's rebellion by a party of Irish, who were commanded by an English partisan of the name of Tyrrell.

Westmeath returns to the Imperial Parliament two members for the county at large and one for the borough of Athlone. It is in the Home circuit. The assizes are held at Mullingar, where are the county jail and the county infirmary. Quarter sessions are held there, and at Moate and Castletowndelvin, in which towns there are bridewells. Petty sessions are held in 16 places. There is a fever hospital at Castle Pollard, and there are 18 dispensaries in the county. The

District Lunatic Asylum, to which the county is entitled to send 48 patients, is at Maryborough, in Queen's County. A savings bank is at Castle Pollard, and loan-funds are at Castletowndelvin, Killucan, Mayne, Moate, Mullingar, Portneshangan, and St. Mary's (Athlone). The union workhouses are at Athlone, Castletowndelvin, and Mullingar. The county is within the military district of Dublin. There is a barrack station at Mullingar. The staff of the county militia is stationed at Moortown. The police force, consisting of 296 men and officers, is distributed over seven districts, comprising 48 stations, of which Mullingar is head-quarters. In September, 1852, there were 105 National schools in operation, attended by 5033 male and 5004 female children.

History and Antiquities.—This county was included in the kingdom of Meath, of which it formed the western division. In common with the rest of that kingdom it suffered severely both from the ravages of the Danes and from civil dissensions, and was included in the county palatine of Meath, granted by Henry II. of England to Hugh de Lacy, one of the Anglo-Norman barons who assisted in the reduction of the county. It was the scene of frequent hostilities for several centuries between the native Irish, who were not entirely expelled or subdued, and the English. Westmeath was separated from Meath or Eastmeath in the 34th of Henry VIII.; at its first separation it included Longford, which was not detached from it and formed into a separate county until the reign of Elizabeth. King's County, which was partly taken from Westmeath, had been formed into a county in 1557, in the 5th of Philip and Mary.

Many vestiges of antiquity are scattered through the county. There are numerous ruins of ancient castles, including some erected by the De Lacys. Sonnagh Castle, one of these, stands on the verge of a small but picturesque lake. Of monastic buildings there are several ruins; and some churches, formerly conventual, are still used for divine worship by Catholics or Protestants.

WESTMORLAND, a northern county of England, bounded N. and N.W. by Cumberland, S. and S.W. by Lancashire, S. S.E., E., and N.E. by Yorkshire, and for a short distance N.E. by the county of Durham. It lies between 54° 10' and 54° 42' N. lat., 2° 9' and 3° 10' W. long. The form of the county is irregular: the greatest dimension or length is from north-north-east to south-south-west, a little more than 41 miles: the greatest breadth, measured at right angles to the length, is about 32 miles. The area of the county is 758 square miles; the population in 1841 was 56,454; in 1851 it was 68,287.

Surface and Geology.—Westmorland is wholly mountainous. The eastern side is traversed by the great Pennine Chain, and the western side and the centre are occupied by the mountains of the Cumbrian group, which are separated from the Pennine Chain by the valley of the Eden.

The principal ridge of the Pennine Chain enters the county across its northern border just to the south of Cross Fell, and extends across Milburn Forest to the border of Yorkshire: it then turns south-south-west, and runs, above Kirby Stephen, to the head of the valley of the Eden. On the west side of this ridge the mountains have a steep and almost precipitous descent into the valley of the Eden; on the east they extend a considerable distance, far beyond the boundaries of Westmorland, subsiding more gradually into the wide valley or plain of the Tees, which occupies the south-east of the county of Durham and the north of Yorkshire. On each side of the ridge numerous transverse valleys are drained by small streams: those on the west side falling into the Eden; those on the east forming the upper waters of the Tees, the Swale, and the Ure or Yore. The principal mountains of the Pennine Chain in Westmorland, from north to south, are Dun Fell, Dufton Fell, Eagles' Chair, Seordale Head, Wareop Fell, Middle Fell, Musgrave Fell, and Helbeck Fell, all north of the depression through which the river Below passes. South of that depression is a number of summits grouped together, and forming the district of Arkengarth Forest, of which the Nine Standards (2136 feet high), Dowphin Seat, Brownber Fell, and Hugh's Seat, the last on the border of Westmorland and Yorkshire, are among the principal.

The principal ridge of the Cumbrian Mountains reaches the border of the county on the west side near Helvellyn (3055 feet high), which is just within the border of Cumberland, and runs south-east to Kirkstone Fell, at the head of the valley drained by the Coldrill, or Goldrill, otherwise the Hartsop Beck, which flows into Ulleswater: from Kirkstone Fell it runs east by south, to the head of the valley of the Eden, on the eastern side of the county; by which valley, here very narrow, it is separated from the Pennine Chain. The ridge about midway between Kirkstone Fell and the valley of the Eden is divided into two parts by a depression through which the Lune passes. Among the principal mountains along the ridge are Grisedale Brow (988 feet high), and Dow Crag, between Helvellyn and Kirkstone Fell; High-street and Harter Fell, near the head of Kentmere; and Birkbeck Fells and Hause Hill, near the head of Borrowdale.

On the north side a principal branch is thrown off from the main ridge at High-street, a short distance east of Kirkstone Fell, of which branch Dod Hill, Place Fell, Alday Pike, Kidsty Pike, the peaks in Martindale Forest, and Swarth Fell are summits. This branch extends nearly to the bank of the Eamont, a principal feeder of the Eden, opposite Penrith. Ulleswater Lake, the upper part of which belongs wholly to Westmorland, while its lower part is on the border of

Cumberland and Westmorland, is about 7 miles long, with an average breadth of half a mile. The upper part of the lake is in the valley of Patterdale, into which open other dales or valleys, including Glen-coin, Glenriddan, Grisedale, and Deepdale, which are formed by the short branches thrown off towards the lake by the semicircle of mountains which here surrounds it. Martindale opens at its northern end upon the south-east side of Ulleswater; it lies between the hills of Martindale Forest on the east, and a detached mountain or hill on the west. These dales are watered by mountain streams flowing into Ulleswater, from the lower extremity of which the Eamont flows.

From the main ridge near Birkbeck Fells an important branch is thrown off in a north-east direction; but between this and the branch ridge, which has been described as parting from the main ridge at High-street, are two shorter branches separated from the High-street branch by the valley of Mardale, from each other by the valley of Swindale, and from the Birkbeck Fells branch by the valley of Wet Sleddale.

The branch from the principal ridge of the mountains at Birkbeck Fells is known in the part nearest the ridge as Shap Fell. It extends northward in several ridges, separated by intervening vales. Knipe Scar, and the hills of Shap Moor, Newby High Moor, Ravensworth and Meaburn Moors, and Colby Common, all belong to this branch. The intervening valleys have a general direction north and south, and the waters which drain them unite to form a stream which joins the Eden between Kirkby Thors and Temple Sowerby.

The branches from the main ridge on the south side extend on the western side of the county a very short distance from the main ridge, subsiding in the valley of Grasmere, by which they are separated from a detached group of the Cumbrian Mountains, which occupies the western extremity of the county. Numerous branch ridges and groups of hills extend in various directions, including many forests, fells, and crags, separated by valleys, drained by numerous streams, and presenting varieties of picturesque scenery.

The western extremity of the county is occupied by part of another group of the Cumbrian Mountains divided into two parts by the valley of Great Langdale. Langdale Pikes, Silver How, and Loughrigg Fell are between Grasmere and Great Langdale; and Bow Fell (2911 feet high), on the border of Westmorland and Cumberland, and Wrey Nose, or Wrynose, form the western termination of the valleys of Great and Little Langdale, which are separated from each other by a ridge called Lingmire. The two lakes of Grasmere and Rydal Water form the Rothay, which flows into the Windermere.

Geologically the county may be regarded as consisting of three parts. The slate rocks of the Cumbrian Mountain group form the first part or division; the formations of the great carboniferous and mountain limestone series of the north of England, of which formations the Pennine Chain forms the western outcrop, constitute the second part or division; and the new red-sandstone of the Valley of the Eden the third.

If a line be drawn in a south-easterly direction from the foot of Ulleswater, passing a little to the south-west of Shap and Orton, and thence to Ravenstonedale, at that place bending to the south till it reaches the border of the county at the point where the road from Sedburgh to Kirkby Stephen enters it; and if another line be drawn nearly at right angles to the former, commencing at Shap Wells, passing by the south side of Wardale Crags, and crossing the Valley of Long Sleddale at the hamlet of Little London, the Valley of Kentmere near the Hall, and the Valley of Troutbeck a little above Town Head, and thence, skirting the southern flank of Wanafell, to Pool Wyke, near the north-west angle of Windermere, the whole county will be divided into three irregular and unequal districts, each marked by peculiar geological features. We shall consider them in the following order:—

1. The green-slate and porphyry of the north-western district.
2. The upper slates of the south-east.

3. The carboniferous rocks of the north-east, and the new red-sandstone of the basin of the Eden.

1. *Green-Slate and Porphyry.*—This, the middle term of the series into which the Cumbrian slates have been divided, and overlying the lowest member of that series in the adjoining county (the Skiddaw slate of Sedgwick), occupies the whole of the north-western portion of the county, and is bounded on the south by the range of a series of overlying beds of calcareous slates (Coniston limestone, &c.), and on the north-east by the carboniferous rocks. It comprehends two distinct classes of rocks, igneous and aqueous, yet so blended and interjected, that they must be considered as the effects of two distinct causes acting together and continued during a lengthened geological period. The igneous rocks include almost every variety of felsone and felsone-porphyry, occasionally passing into greenstone: they more rarely put on a columnar form like that of basalt. The aqueous rocks are composed of quartz in an extremely fine state of comminution, and obtain their typical colour from earthy chlorite derived from the Plutonic silt. All these rocks have in a greater or less degree a slaty structure, and from them the finest roofing-slates are quarried. The rocks of this division rise into the highest and most rugged peaks of the whole lake district, constituting the main ridge of the mountains west of High-street, those between Grasmere and Great Langdale, &c. The prevailing strike of the rocks is north-east, and they dip at a high

angle to the south-east. Garnets are found in some abundance in the brecciated rocks of this division, and agates and other minerals occur in the cellular Plutonic silt. No organic remains have been discovered in any part of the group. Metallic veins occur in some places; amongst others, a lead-mine is worked south-west of Ulleswater.

2. *Upper Slates of the South-Eastern District.*—This formation is divided by Professor Sedgwick into three ill-defined groups: 1, the fossiliferous rocks south of Kendal and of Kirkby Moor; 2, a lower group, like the former in lithological structure, but with a more decided slaty impress and fewer traces of fossils; 3, a complicated group of calcareous slates, alternating with hard coarse siliceous beds, and several bands of fine roofing-slates, all resting on the fossiliferous limestone of Coniston. Mr. D. Sharpe also separates this division of the slate rocks into three groups ('Proceedings of Geological Society,' London, 1848), and seeks to identify them with the three principal groups of Sir R. I. Murchison's Silurian system; and his division has been followed by subsequent writers. Mr. Sharpe's division will be found in the following descending order on making a traverse from the south-east to the north-west; as, for instance, from Kirkby Lonsdale, where the uppermost beds underlie the old red-sandstone, to the Coniston limestone above Low Wood, at the head of Windermere. First, the Upper Ludlow rocks, occupying the greater part of the district between the lower parts of the Kent and Lune, succeeded by a band of Lower Ludlow rocks; next, a series of unfossiliferous beds (of considerable thickness when expanded in the district of Furness), which are provisionally named Windermere rocks, and are the assumed equivalents of the Wenlock formation; and, lastly, a series of slates (Kirkby Ireleth), gray slaty grits, blue flagstones, and Coniston limestone—the four last being the supposed equivalents of the Caradoc sandstone.

The Coniston limestone forms a well-defined though irregular base to this division of the slates on the north-west (this boundary being rudely marked by the line we supposed to be drawn from Shap Wells to Windermere Head). On the south and south-east it is bounded by Morecambe Bay and the carboniferous rocks, and it extends eastward as far as the border of the county, except where it is overlaid by the carboniferous series of Yorkshire. The rocks on the east bank of the Lune are separated from those on the west bank by an enormous fault, which ranges in the direction of that river. Middleton and the other fells on the eastern side of the Lune are composed of the beds of the middle group of this division. The rocks to the east of Kendal, and those which break out beneath the western escarpment of the carboniferous limestone of Underbarrow Scar, abound with Upper Silurian fossils, and the Coniston limestone is charged with Lower Silurian crustacean shells and corals. The middle term is unfortunately without organic remains, and in the absence of separating calcareous bands (Aymestry and Wenlock limestones), Professor Sedgwick's recommendation to separate the whole upper division of the slates of Westmorland into two groups, an upper and a lower, seems to be as yet the safest plan. These uppermost slates are harder than those of the lowest series, and give to the mountains formed of them a more angular and picturesque outline and rugged surface; but they do not in these respects equal the middle series of slate rocks, which form mountains of greater elevation and more picturesque character. The mountains formed by the uppermost slates rarely have a height of 1000 feet, being inferior not only to the middle slate mountains (Helvellyn, Langdale Pikes, &c.), but also to the limestone mountains of the Pennine chain. Valuable flagstones are obtained from these rocks in many places, and copper is found in some parts of them.

3. *Carboniferous Rocks, &c.*—The inspection of any accurate geological map of the lake district will at once point to the fact that a mantle of carboniferous rocks has at one period continuously extended round the whole of the Cumbrian slates. On the north-east of the line we have supposed to be drawn from the foot of Ulleswater to Ravenstonedale, the belt of carboniferous rocks is still unbroken, and resting on the slates.

The mountain limestone occupies all the county north-east of the line of junction except the valley of the Eden, which is chiefly occupied by the new red-sandstone; a small district between Appleby and Shap, where the limestone is covered by the coal-measures; and a portion of the county east of the upper valley of the Eden, where the limestone is covered by the millstone-grit and shale. The mountain limestone forms the mass of the Pennine chain, attaining in Cross Fell, which is in Cumberland, but close upon the border of Westmorland, a height of 2901 feet. The formations of the mountain limestone observed in this county are among the lowest in the series. Among them occurs a stratum of whin, or basalt, 60 feet thick. On the steep western escarpment of the Pennine chain the subjacent beds of old red-sandstone appear, and even the slate rocks beneath the old red-sandstone. There is a remarkable cavern in the mountain limestone at Dunall, five miles from Dufton; and there are several lead-mines near Dufton, where antimoniated lead-ore, lead-ore with such a superabundance of sulphur as to take fire and burn on being held in the flame of a candle, and small quantities of malachite, are obtained. Beautiful specimens of flos-ferri, or arragonite, of snow-white colour and satiny-like lustre, and witherite, of clove-brown colour and striated texture, have been found in Dufton mine. There are copper-mines near Orton and Kirkby Stephen.

The mountain limestone has been said to rest commonly on the slates. On the western escarpment however of the Pennine Chain, from Cross Fell, 15 miles southward, to Highoupe, near Murton, the old red-sandstone or conglomerate intervenes, having a dip conformable to that of the limestone. It is observed also in the valley of the Lune near Orton, and lower down near Kirkby Lonsdale, and in the valley of the Mint and several other places near Kendal. It appears here in its common form of a coarse pudding-stone. The subjacent slate, which is co-extensive with the old red-sandstone, forms a kind of broken under-terrace along the escarpment, and is bounded on its west side by a narrow and irregular but nearly parallel line of greenstone. This small slate and greenstone district is distinguished by three lofty conical summits or pikes; Knock Pike, the most northerly, is chiefly composed of greenstone; Dufton Pike, near Knock Pike, contains both greenstone and slate; and Murton Pike, the southernmost and the loftiest, appears to be almost entirely composed of slate. Imperfect roofing-slate is dug on Langdon Moor, near Murton Pike, and at Middle Rig; and slate-pencils are obtained in several places. Coal is not very abundant, and is seldom worked.

The millstone-grit is found only on the eastern border of the county, covering the mountain limestone, and forming the summit of Browner Fell, Nine Standards, and Hanging Stones, in Arkengarth Forest, in the Pennine Chain, in the east side of the valley of the Eden near its head; and of Wild-Boar Fell, on the west side of the same valley, at the eastern end of the main ridge of the Cumbrian Mountains. In the coal-measures which rest on the mountain limestone between Appleby and Shap there are several coal pits.

On the southern side of the county the carboniferous limestone appears broken up by enormous faults into detached portions with wide valleys between them; one large mass, with several outliers, commences about two miles north of Kendal, and extends as far south as the shores of Morecambe Bay, resting on the Silurian rocks, with the interposition here and there of the old red-sandstone (Plumgarth, Laverock Bridge, &c.); opposite to its long south-western escarpment of Underbarrow Scar is another mass of limestone (Whitbarrow). The limestone at Kendal is extensively quarried for building purposes, and many of the beds polish into beautiful marble, which is in great demand for ornamental purposes. Another mass of limestone of some extent lies to the south-west of Kirkby Lonsdale.

The new red-sandstone is the most recent formation of this county, and fills all the lower part of the basin of the Eden, from near Brough to the shores of the Solway Frith. It usually appears here as a strong thick-bedded sandstone, and is much used as a building-stone. It rests upon the carboniferous rocks on its south-western side, and spreading wide on both sides of the Eden, abuts against the upraised terrace of Cross Fell elevated by the great 'Pennine fault.' Gypsum is obtained in many parts of the saliferous district in Westmorland.

Proofs of igneous action are abundant in many parts of this county, porphyritic dykes being found in various parts; there are five which may be observed not very far distant from the Shap Granite in Wet Steddale, in the valley above High Barrow Bridge, on the crest of the hill from that place to Shap, and in two places farther north and near the roadside. But the well-known Shap Fell red porphyritic granite forms the largest portion of erupted rock in the county. It rises at the base of the upper division of the slates, and appears to have cut off the Conistone limestone for some distance; altering, tilting off at high angles, and indurating all the neighbouring rocks. The boulders from this granite are easily recognised, and are found to have travelled in one direction as far as the Yorkshire coast. They are seen resting at the height of several hundred feet above the level of the plain of Eden, against the steep sides of the great ridge of Cross Fell, and they have travelled down the valley of the Kent to Morecambe Bay. The mode of their transport, whether by water, or by ice, or by ice floating in water, is yet an unsolved problem in geological dynamics; but what is called the glacial theory is that which is now most generally received by the best geologists.

Hydrography and Communications.—The Pennine chain of mountains separates the waters which flow into the Irish Sea from those which flow into the German Ocean. Westmorland is chiefly on the western side, but a small portion is on the eastern side of the ridge, and in this some of the upper waters of the Tees have their source. The Tees itself rises just beyond the northern border at the foot of Cross Fell, but its course as far as the fall at Cauldron Snout is on the border of Westmorland. On the western side of the Pennine Chain the county is divided by the principal ridge of the Cumbrian Chain into two basins—the basin of the Eden on the north, and the basin of Morecambe Bay on the south, drained by the Kent, the Lune, and other streams, which flow into that estuary. The Eden rises on the border of Westmorland and Yorkshire, on the side of Hugh's Seat, one of the mountains of the Pennine Chain. It passes Kirkby Stephen and Appleby, and shortly afterwards quits the county for Cumberland. Its course in Westmorland is 30 miles, no part of which is navigable. It has numerous affluents, among which may be named the Beelah or Belay, the Helbeck, the Troutbeck, and the Crowdundale on the right bank, and the Leeth and the Eamont on the left bank. All the larger affluents of the Eden which join it on the left bank rise on the northern slope of the Cumbrian ridge.

The Lune, the Kent, the Winster, and the Leven drain the basin of

Morecambe Bay. The Lune rises on the northern side of the Cumbrian ridge. It passes Orton and Kirkby Lonsdale, a little below which it passes into Lancashire. No part of its course of 27 miles in Westmorland is navigable. The Kent rises at the foot of High-street in the Cumbrian ridge, and after receiving the Sprint and the Burns-dale, or Mintbeck, it flows into Morecambe Bay, along with the rivers Pool and Beelo, or Betha, which there join it. Its whole course of 23 miles belongs to Westmorland: it is not navigable. The Winster, also called the Pool, rises in Westmorland, and flows some 10 miles, along the border of Westmorland and of Furness in Lancashire, into Morecambe Bay. The Leven, which flows out of Windermere, belongs to Lancashire; but the Rothay, or Rainedale, which drains the valley of Grasmere, the streams which drain the valleys of Great and Little Langdale, and the Troutbeck, which flow into Windermere, and may be regarded as the upper waters of the Leven, belong to Westmorland. Elterwater, Grasmere, Ryk Water, and some other small lakes, or tarns, are connected with the streams which flow into Windermere. Windermere belongs by its position rather to Lancashire, under which county it has been described; but the fisheries (which comprise all the lake) are held under the barony of Kendal by the payment of certain lord's rents, and they are also rated and pay to the relief of the poor in Westmorland.

For economical or commercial purposes the rivers and lakes of Westmorland are of little importance; but in combination with the rugged mountains and the secluded valleys amid which they are found, they give to the county a high degree of picturesque beauty. "The forms of the mountains," says Wordsworth, in his 'Scenery of the Lakes,' "are endlessly diversified, sweeping easily or boldly in simple majesty, abrupt and precipitous, or soft and elegant. In magnitude and grandeur they are individually inferior to the most celebrated of these in some other parts of the island; but in the combinations which they make, towering above each other, or lifting themselves in ridges like the waves of a tumultuous sea, and in the beauty and variety of their surfaces and colours, they are surpassed by none." The mountains are generally covered with turf, rendered rich and green by the moisture of the climate; forming in some places an unbroken extent of pasturage, in others laid partially bare by torrents and burblings of water from the mountains in heavy rains. Wood is not abundant: the want of timber-trees is particularly felt, but coppices are tolerably numerous. The trees are chiefly oak, ash, birch, and a few elm, with underwood of hazel, holly, and white and black thorns. Scotch fir, beeches, larches, and limes have been introduced of late years. Fern is commonly found on the mountains; heath and furze are only occasionally found.

The valleys are for the most part winding, and in many the windings are abrupt and intricate; the bottom of the valleys is most commonly formed by a comparatively spacious gently-declining area, level as the surface of a lake, except where broken by rocks and hills that rise up like so many islands from the plain.

The small size of the lakes is favourable to the production of varied landscapes, and their boundary-lines are either gracefully or boldly indented; in some parts rugged steeps, admitting of no cultivation, descend into the water; in others, gently sloping lawns and rich woods or flat and fertile meadows stretch between the margin of the lake and the mountains. The margin of the lakes is generally lined either with a fine bluish gravel thrown up by the water, or with patches of reeds and bulrushes; while the surface is variegated by plots of water-lilies. The disproportionate length of some of the lakes would, by making their appearance approximate to that of a river, injure their characteristic beauty, were not this effect prevented, especially in Ulleswater and Haweswater, by the winding shape of the lakes, which prevents their whole extent from being seen at once. The islands are neither numerous nor very beautiful. The water is remarkably pure and crystalline. What are locally termed tarns are small lakes, belonging mostly to small valleys or circular recesses, high up among the mountains. Loughrigg Tarn, near the junction of the valleys of Great and Little Langdale, is one of the most beautiful. The mountain tarns are difficult of access, and naked, desolate, and gloomy, but impressive from these very characteristics.

The streams of Westmorland are rather large brooks than rivers, with a very limpid water, allowing their rocky or gravelly beds to be seen to a great depth. The number of torrents and smaller brooks, with their waterfalls and waterbreaks or rapids, is very great. The wide estuary of the Kent presents at low water a vast expanse of sands.

The lakes and tarns abound with various species of fish, as trout, eel, bass, perch, tench, roach, pike, char, and others. Sea-fish are also abundant on the shore of Morecambe Bay.

Westmorland has only one canal, the Lancaster Canal, which commences on the east of Kendal, at a height of 144½ feet above the level of the sea, and runs southward with some bends by Burton-in-Kendal to Lancaster and Preston in Lancashire. About 12 miles of the canal are in Westmorland.

The principal coach-roads in the county are the main road from Lancaster to Carlisle and Glasgow; and the road (formerly a mail-road) through Stamford, Newark, Doncaster, and Greta-bridge, to Carlisle and Glasgow. The Carlisle road enters the county on the north side, at Burton-in-Kendal, 11 miles from Lancaster, and runs north-

ward by Kendal, Shap, and Brougham, to Penrith; before reaching the last-mentioned town it crosses the Eamont into Cumberland. Roads lead from Kendal south-westward to Ulverstone and Dalton-in-Furness; westward to Bowness and across Windermere by the ferry to Hawkshead, and Coniston-Water in Furness, and to Egremont and Whitehaven in Cumberland; north-westward by Ambleside to Keswick, Cockermouth, and Workington in Cumberland; north-eastward by Orton to Appleby, with a branch road to Kirkby Stephen and Brough; eastward to Sedbergh, Hawes, Askrigg, and Richmond, all in Yorkshire, with a branch from Sedbergh to Kirkby Stephen, and south-eastward by Kirkby Lonsdale to Settle, Skipton, Otley, and Leeds.

The Preston, Lancaster, and Carlisle railway enters Westmorland near Burton, and proceeds in a generally northern direction to Kendal, where it turns north-west for a few miles to Bank Mills, whence it again proceeds northward till it quits the county at Penrith. Its length in Westmorland is about 41 miles. The Windermere railway quits the above at Kendal, and runs in a north-westward direction, 10½ miles, to Bowness on Windermere.

Climate, Soil, Agriculture.—Although this county, from its mountainous nature, is more interesting in a picturesque than in an agricultural point of view, it contains some very fertile valleys, in which there are many well-cultivated farms. The climate is mild and moist in the valleys; the high hills condense the clouds which come over the Atlantic, and cause frequent and abundant rains, which keep the pastures green, but are not so favourable to the ripening of the corn. Much snow often accumulates in winter.

The soil in the valleys is mostly a dry gravelly mould, composed of different earths washed down from the hills, and forming a soil well fitted for the cultivation of turnips, of which great crops are raised on some well-managed farms. Towards the east and north of the county the soil is more inclined to clay; and, unless this be well drained, the land is too wet, in spring and autumn, to admit of clean and careful cultivation. Wherever the water has no sufficient outlet, basins of peat are formed.

There were formerly a great many small proprietors in Westmorland who were called 'Statesmen,' that is, 'Estate-men'—men who held land of their own, either as freehold, or by a customary tenure, somewhat resembling copyhold, under some great landlord. With the exception of a fine or heriot on the death of a tenant or on alienation, they were held free. The proprietors of these very small farms were an independent set of men, who worked hard and lived frugally. They often joined the trade of weaver to that of farmer, and thus their whole time was usefully employed. The increase of wealth and consequent luxury gradually led to a greater expense of living than the small farms, imperfectly cultivated, could support; and these small proprietors gradually decreased, their farms being absorbed into the greater estates which surrounded them. The larger farms are now usually let on lease for various terms. Of late years considerable improvement has taken place in the cultivation of the county. Draining the heavy lands has been much attended to; manuring is better understood; more careful rotations of crops have been introduced; and better implements of husbandry employed; but much yet remains to be accomplished.

From Kirkby Stephen to Brough and Appleby and thence to Temple Sowerby the soil is a deep sand, which the moisture of the climate of Westmorland renders more compact on cultivation. Turnips and potatoes grow well here, when plenty of manure is put on. Near Kendal a great breadth of potatoes is planted for the supply not only of the immediate neighbourhood, but also of the adjacent counties, many thousand loads being annually sent into Lancashire and Yorkshire.

Grass-land being abundant and the climate favourable to pastures, a great portion of the soil is devoted to the maintenance of cattle. Good meadows let at a high rent, and are carefully manured. Great crops of hay are made in favourable years, and, as those who keep horses generally hire a meadow to make hay of, it is seldom sold in the dry state. Young cattle are kept on inferior lands in summer, and have hay and straw in winter, with turnips where these are raised: a few are fattened at three years old, but most of them are sold to graziers in Yorkshire and Lancashire. Scotch cattle are purchased in September, at the great fair at Brough-hill, held in that month: they are wintered in coarse pastures and occasionally in straw-yards; the next year they are put on the best grass and are fit for the butcher in October. A few horses are reared, but not to any extent. The sheep are of a hardy kind, fit for the mountain-pastures; they are brought down to the valleys at the approach of winter and kept in the inclosed grounds till April. The fattening of hogs and the curing of bacon and hams are well understood in Westmorland, and many hams are sent to other parts of the country. The breed is not large. The hogs are not made so fat as they are in some places; the hams are more delicate, and are very well cured and smoked. They are often sold as York hams, whereas the latter are much larger and fatter, the Yorkshire breed of hogs being large and fattening very readily.

The plantations are extensive in most parts of the county; they are chiefly of oak, ash, elm, beech, sycamore, Scotch fir and larch, which last thrive best. Many ornamented cottages and villas have been built on the borders of the several lakes; and men of talent, reputation, and wealth, have taken their temporary and some their

permanent abode there. This has tended to improve the immediate neighbourhood more rapidly than would otherwise have been the case.

Divisions, Towns, &c.—The county is divided into two baronies—the barony of Kendal, which appears to have been anciently a part of Lancashire, and comprehended, so late as the time of Henry VIII., several places now in Lancashire; and the barony of Westmorland—sometimes called the barony of Appleby, sometimes the bottom of Westmorland—which now comprehends some places formerly included in the barony of Kendal. There is some diversity in the customs of inheritance in the two baronies of Kendal and Westmorland: in other respects the division into baronies is little used. The usual division is into four wards:—East ward, north-east; Kendal ward, south-west; Lonsdale ward, south-east; West ward, north-west. The town of Kendal is included in Kendal ward. Kendal and Lonsdale wards are in the barony of Kendal; the East and West wards in the barony of Westmorland.

Westmorland has no city; it contains the county-town of APPLEBY, the parliamentary borough of KENDAL, and the market-towns of Ambleside, BROUGH, BURTON-IN-KENDAL, Kirkby Lonsdale, Kirkby Stephen, Milnthorpe, Orton, Ravenstonedale, and Shap. The places printed in small capitals are noticed under their respective titles; the others are noticed here:—

Ambleside is a small market-town, 14 miles N.W. from Kendal: population of the chapelry 1592 in 1851. Ambleside lies in a beautiful valley near the upper end of Windermere, and on the left bank of the little river Rothay. The streets are partially paved. The chapel is a plain but commodious and substantial edifice, rebuilt in 1812. There are an Independent chapel; a Free Grammar school; National, British, and Infant schools; and a savings bank. Ambleside is a place of considerable resort for visitors to the lakes of Cumberland and Westmorland. The market, which is chiefly for provisions, is on Wednesday; fairs are held on the Wednesday in Whitsun week; October 13th, the principal one, called the tip (that is, tup) fair; and October 29th for cattle. Slate quarries are in the vicinity. A county court is held in the town.

Kirkby Lonsdale (that is, a church-town in the dale or valley of Lon or Lune) is on the right bank of the Lune, 15½ miles N.E. from Lancaster, and 11½ miles S.W. from Kendal. The population of the township in 1851 was 1875. The market-place is in the centre of the town; the streets are lighted, but not paved. The houses are well-built of freestone and roofed with slate. The church is 120 feet long and 102 feet broad, and is divided into four aisles or portions by three rows of pillars; it has a square tower 68 feet high, with a peal of six bells. The Wesleyan Methodists, Independents, and Sandemanians have places of worship. There are a Free Grammar school, National and Infant schools, and a savings bank. At Casterton are a Clergy Daughters' school, a Preparatory Clergy Daughters' school, and a Servants' school. Some of the females employ themselves in knitting stockings. The market is on Thursday; and fairs for cattle are held on Holy Thursday, the third Thursday after October 5th, and December 21st. A county court, a court leet, and petty sessions are held in the town.

Kirkby Stephen, 11 miles S.E. from Appleby, on the left bank of the Eden: population of the township 1339 in 1851. The church is a large ancient building with a square tower. The Wesleyan Methodists and Independents have places of worship. An endowment provides for the support of a Grammar school, an hospital for twelve aged and infirm men and as many women, and four preparatory schools. There is a modern market-house. In the vicinity are copper- and lead-mines, slate quarries and coal-pits. Upon the Eden are corn-, woollen-, and saw-mills. The market is on Monday for corn and provisions; fairs or great markets for cattle and sheep are held five times in the year.

Milnthorpe, or Millthorpe, population 1534, is situated near the left bank of the estuary of the Kent, 7 miles S. from Kendal. The principal street runs from east to west, nearly parallel to the little river Beels, over which is a bridge of one arch. In the town are chapels for Episcopalians and Independents, and a National school. Milnthorpe is a member of the port of Lancaster; small vessels by the help of the tide get up the river to the town. There are a corn-mill and a paper-mill; some twine and sacking are made. The market is on Friday, and there are fairs for cattle and sheep on May 11th and October 17th.

Orton (anciently Scar Overton), 14 miles N.N.W. from Kendal: population of the parish 1456. The church is an ancient building with a low embattled tower. There are a Grammar school, and a branch savings-bank. The market is held on Friday; fairs are held four times in the year. The remains of a beacon, and of an old fort or encampment, a large tumulus, and some other antiquities are in the neighbourhood.

Ravenstonedale, 5 miles S.W. from Kirkby Stephen, population of the parish 939, is situated in a mountainous district near the confluence of Scandale-Beck and Cold-Beck. There are a spacious church, places of worship for Wesleyan and Primitive Methodists, Independents, and Quakers; and a Grammar school. A small market is held on Thursday; fairs are held four times in the year. Many of the inhabitants are engaged in knitting. Stone quarries are in the neighbourhood.

Shap (anciently *Hep* or *Heppe*), 15 miles N. by W. from Kendal: population, 1009. There was anciently in this parish a Premonstratensian abbey, founded originally at Preston-in-Kendal (now Preston Patrick), by Thomas, son of Gospatric or Cospatric, in the reign of Henry II.; it was removed in the lifetime of its founder to the secluded valley of Wet Sleddale, in the parish of Shap, watered by one of the streams that form the Lowther. Some picturesque ruins of this abbey still remain on the west bank of the stream. The tower and some fragments of the chancel of the conventual church, which was very spacious, remain, as well as the foundations of the cloisters and the offices. The parish church is on the east side of the town, and retains some ancient parts amid many alterations. Fairs for cattle and pedlery are held on May 4th and September 28th. There are limestone and slate quarries. Near Shap is a prehistoric stone circle.

The following are the more important villages; the population is that of 1851:—

Bowness, population of the township of Undermillbeck, in which Bowness is situated, 1421, is built on the left bank of Windermere, about 5 miles S. by E. from Ambleside. The Windermere railway terminates at Bowness. The village, which is beautifully situated, is much frequented by lake tourists. It is the chief boating station on the lake, and the head-quarters of the annual Windermere regattas. The parish church of Windermere, which stands in the village, has some interesting architectural features. There is a Free Grammar school. A small customary market for meat and vegetables is held on Wednesday. Some boat-building is carried on. *Dufton*, population of the township 488, is situated at the foot of Dufton Fell, 4 miles N. from Appleby. Besides the church, which was rebuilt in 1775, there are places of worship for Wesleyan and Primitive Methodists, and a Free Grammar school. Many of the inhabitants are employed in lead-mines. *Grasmere*, population of the township 445, stands in a picturesque situation at the head of Grasmere Lake, and in the midst of very fine scenery. The church is small. The place is a favourite summer resort. A sheep fair is held on the first Tuesday in September. *Holme*, population of the township 1154, lies between the Preston and Carlisle railway (which has a station here) and the Lancaster and Kendal Canal, 2 miles N. from Burton-in-Kendal. The district church, which is in the early English style, was erected in 1839. There is a National school. A flax- and linen-mill is in the village. *Kirkby Thore*, population of the township 412, is situated at the confluence of the Troutbeck with the Eden, 6 miles N.N.W. from Appleby. Besides the church there are chapels for Wesleyan Methodists and Independents in the village. A great portion of the village has been built out of the ruins of the Roman station known as Whelp Castle. *Langdale*, population of the chapelry 580, is about 5 miles W. from Ambleside. The village of Langdale is of little importance, the houses being scattered in a straggling manner along the picturesque dale from which it receives its name. The dale is very narrow, and the mountains at the head of it, the Langdale Pikes, 2400 feet high, are not only lofty, but of remarkably bold and rugged character. The scenery of Langdale is among the most striking in the Lake district. Two celebrated waterfalls, Skelwith and Colwith forces, are in the vicinity. Besides the chapel there is a parochial school. *Lowther*, population of the parish 494, is about 4 miles S. from Penrith. The place is only note-worthy on account of Lowther Castle, the magnificent seat of the Earl of Lonsdale. The mansion was erected in 1810 from the designs of Robert Smirke. It is a castellated edifice, standing on an eminence; the north front is 420 feet long. It stands in a park of 800 acres, the scenery of which is of the most picturesque character. Brougham Hall, the seat of Lord Brougham, is about 3 miles N. by E. from Lowther. *Long Marton*, population of the township 762, is a neat modern village, on the right bank of the Troutbeck, 4 miles N. by W. from Appleby. Besides the church, which is a spacious edifice standing on the south of the village, there is a Dissenting chapel. *Morland*, population of the township 894, is 5 miles N.W. from Appleby. The church is ancient; the Wesleyan Methodists and Quakers have places of worship, and there is a Grammar school. *Over Staveley*, population of the township 732, is 4½ miles N.W. from Kendal, on the Windermere railway, which has a station here. There are a chapel and a Free school. In the village are turning-mills, and mills for spinning woollen and yarn. *Patterdale*, population of the chapelry 686, is picturesquely situated at the head of Ulleswater, about 9 miles N. from Ambleside. The chapel is a small old building. A sheep fair is held in October. The scenery of Patterdale and its vicinity forms a splendid combination of lakes and mountains, and the place is a favourite station of tourists. *Pooley Bridge*, at the foot of Ulleswater, is another tourists' station. The village is small; the population is not given. *Temple Sowerby*, population of the chapelry 872, is 7 miles N.N.W. from Appleby, near the right bank of the Eden, which is here crossed by a handsome stone bridge erected in 1748. The chapel is modern. There is a tanyard, and a good deal of trade is carried on. Fairs for cattle and sheep are held on the last Thursdays in February, March, and October, and the second Thursday in May. In the neighbourhood are many good residences. *Warcop*, population of the parish 740, is on the right bank of the Eden, 3 miles W. by N. from Brough. The church is ancient; there are a Wesleyan Methodist chapel and a National school. In the village is an ancient manorial cross. Lead-mines are in the parish.

Divisions for Ecclesiastical, Legal, and Parliamentary Purposes.—Westmorland is divided between the dioceses of Carlisle and Chester: the East and West wards, constituting the ancient barony of Westmorland, are in the archdeaconry and diocese of Carlisle; Kendal and Lonsdale wards are in the archdeaconry of Richmond and diocese of Chester. The number of parishes in the county is only 32; but as many of the parishes, from their great extent, which averages more than 15,000 acres, or nearly 24 square miles each, and rises in some instances (Kirkby Stephen and Kirkby Lonsdale) to above 30,000 acres, and in one instance (Kendal) to near 70,000 acres, have been divided into chapelries, the number of ecclesiastical charges is much greater. By the Poor-Law Commissioners the county is divided into three Poor-Law Unions:—East Ward, Kendal, and West Ward. These unions include 110 parishes and townships, with an area of 437,567 acres, and a population in 1851 of 58,337. The county is included in the northern circuit. The assizes are held at Appleby. The quarter sessions for the county are held at Appleby, and by adjournment at Kendal. County courts are held at Ambleside, Appleby, Kendal, and Kirkby Lonsdale. A county jail and house of correction is at Appleby, and a county house of correction at Kendal. Before the passing of the Reform Act four members were returned to parliament from the county of Westmorland, namely, two for the county itself, and two for the borough of Appleby. By the Reform Act Appleby was disfranchised, and Kendal made a parliamentary borough, to return one member.

History and Antiquities.—In the earliest historical period this county appears to have been included in the extensive territory of the Brigantes; and upon the subjugation of South Britain by the Romans, it was comprehended in the province of Maxima Caesariensis.

A Roman road ran through the county nearly in the line of the old mail-road by Greta Bridge to Carlisle. At Brougham it crossed the Eamont into Cumberland. Between Brough and Kirkby Thore it is six yards wide, and on level ground is formed of three layers of stone of the aggregate thickness of a yard, the lowest layer being the largest. In other places it was sometimes made of gravel or of flint. A road called the Maiden Way branched off from this at Kirkby Thore and ran northward over the moors to Caerboron, one of the stations on the Roman Wall in Northumberland. An ancient camp, or fort, an oblong quadrangle of irregular form, stands on the line of the Roman Way (which passes through the camp) east of Stainmoor, and on the border of Yorkshire and Westmorland, part of the camp being in each county. The fragment of Re-Cross, or Rere-Cross, the ancient boundary-mark of the Scottish principality of Cumberland, and now of Westmorland and Yorkshire, stands inside the camp. A square stone fort, called Maiden Castle, defended by two ramparts, an inner one of stone with a small ditch, and an outer one of earth with a ditch, stands on the line of the road, about two miles west of the camp just noticed.

The Antonine station or town *Verteræ* is generally fixed at Brough, and *Brovanacæ* at Kirkby Thore, to the south-east of which village, on Speedy Moor, are the remains of a camp or fort called Whelp Castle, at the place seemingly where the Maiden Way diverged from the principal Roman road. The *Brovacum* of Antoninus is fixed at Brougham. Of several other stations the sites have not been definitely ascertained. A number of Roman inscriptions have been found in Westmorland, several of which are given in Horsley's 'Britannia Romana.'

There are several camps and earthen forts in different places, though it is doubtful to what period some of them are to be referred. Near the south end of Dun Fell, on Milburn Forest, is a round camp or fort surrounded with deep ditches, called Green Castle. An altar, with the inscription 'DEO SILVANO,' was found here. There are several appearances of camps and roads on the waste ground of Milburn Forest. At the end of Yanwathwood, on the west bank of the Lowther, opposite Lowther Hall, is another round fort called Castlesteads; and at the south end of Eamont Bridge is a circular inclosure, formed by a lofty embankment with a ditch inside; it is known as Arthur's Round Table. At Sayle Bottom near Great Asby are a number of barrows, with a deep trench and a breastwork on two sides of the ground which they occupy; and at Sandford, between Warcop and Appleby, near the line of the Roman road, are some more barrows, two small camps, and the ruins of a small round fort, the walls of which are of immense thickness, and built with red stone strongly cemented with lime and sand.

There are some monuments of the prehistoric period. Near Arthur's Round Table was found in 1800, under an artificial hillock, a complete circle of stones inclosing an area nine feet in diameter, and having in the centre a slab of stone supported on blocks or pillars of the same material. Mayborough Castle, in the same neighbourhood, is a circular inclosure of loose stones, having an entrance on the east. On the waste near Helton, between the rivers Lowther and Eamont, is a remarkable upright stone called Helton-Copstone; and about a quarter of a mile to the north of it is a circle of stones, 10 yards in diameter, called the Druids' Cross. Another circle, 21 yards in diameter, called the Cock-Stones, stands at the head of Ellerbeck, in the neighbourhood of Ulleswater; and there is a large cairn on the descent from the moor towards Pooley, at the lower end of Ulleswater. On Lowther Soar is a circle 70 feet in diameter, formed of large stones; and near Shad

are the remains of two converging lines of huge stones of unhewn granite, called Carl Lofte. In Gunnerkild Bottom, near Shap, is a circle of stones called the Druids' Temple, but which was unquestionably used for a burying-place.

Westmorland was probably conquered by the Angles of Northumbria under Egfrid, who took several districts between the Ribble and Cartmel and Carlisle from the Cumbrian Britons, about A.D. 685. It became part of the kingdom of Northumbria, of which it shared the fate. The county is mentioned only once in the Saxon Chronicle, where it is called Westmoringaland. In the later Anglo-Saxon and in the earlier Anglo-Norman period it is said to have been included in the kingdom or principality of Cumbria, held by the heir-presumptive of the crown of Scotland. William the Conqueror erected the baronies of Westmorland and Kendal. Appleby Castle was taken by William of Scotland and the town destroyed in 1173, and the town was again destroyed by the Scots in the reign of Richard II.

The castles of APPLBY, KENDAL, BROUGH, Buley, Howgill, and Brougham, with Shap Abbey, are the principal remains of the buildings of the middle ages. Buley, or Bewley Castle, is on the left bank of the Eden below Appleby, and is a mere ruin, showing little remains of its former strength. Howgill Castle, near Milburn, on the northern border of the county, is occupied as a farm-house; some of the walls are more than 10 feet thick. Of Brougham Castle there are considerable remains. The keep is standing, but all the inner apartments are destroyed, except one vault, the roof of which is formed of groined arches, supported by an octagonal pillar in the centre.

In the civil war of Charles I., Appleby Castle was occupied by a royalist garrison, but was obliged at last to surrender. One of the islands in Windermere was the stronghold of Colonel and Major Philipson, brothers, royalists. In the rebellion of 1745-46 there was some fighting at Kendal (14th December, 1745), between the townspeople and a party of the rebels then on their retreat toward Scotland; and a few days after there was a rather severe skirmish at Clifton, on the road to Penrith, between the rear-guard of the insurgents and the forces of the Duke of Cumberland.

Statistics: Religious Worship and Education.—According to the Returns of the Census for 1851 it appears that there were then in the county 165 places of worship, of which 78 belonged to the Church of England, 29 to Wesleyan Methodists, 18 to Primitive Methodists, 18 to Association Methodists, 9 to Independents, 4 to Baptists, 4 to Quakers, and 2 to Roman Catholics. The total number of sittings provided was 37,138. Of Sunday schools there were 121, of which 74 were in connection with the Church of England. The total number of Sunday scholars was 7516. Of day schools there were 214, of which 119 were public schools with 6594 scholars, and 95 were private schools with 2384 scholars. There were 5 evening schools for adults, with 157 scholars. Of literary and scientific institutes there were 5, with 348 members, and libraries containing 2545 volumes.

Savings Banks.—In 1858 the county possessed two savings banks, at Kirkby Lonsdale and Kirkby Stephen. The amount owing to depositors on November 20th 1858 was 35,511l. 16s. 4d.

WESTON. [BUCKINGHAMSHIRE; CHESHIRE.]

WESTON-SUPER-MARE. [SOMERSETSHIRE.]

WESTPHALIA, erected a kingdom by the emperor Napoleon I. on the 15th of November, 1807, consisted of the territories of Brunswick-Wolfenbüttel and Hesse-Cassel (with the exception of Hanau and Katzenelnbogen), the Prussian provinces of Magdeburg and the Old Mark on the left bank of the Elbe, Halberstadt with Hohnstein, Hildesheim with Goslar, Mansfeld, Quedlinburg, Eichsfeld with Trefurt, Mühlhausen and Nordhausen, Stolberg-Wernigerode, Paderborn, Minden and Ravensberg, the Hanoverian provinces of Göttingen, Grubenhagen, and Osnaburg, the principality of Corvey, belonging to Nassau-Orange, and the county of Rietberg. The area of this new kingdom was 14,500 square miles, with 1,947,000 inhabitants. Napoleon I. appointed his youngest brother, Jerome, king, who made Cassel his capital. After the battle of Leipsig, king Jerome having retired into France, the Prussians returned into Cassel, and in a few days the former governments were restored in almost the whole of the kingdom.

WESTPHALIA, a province of Prussia, constituted in 1815 out of the former duchy of Westphalia and of several small principalities, is situated between 50° 43' and 52° 30' N. lat., 6° 25' and 9° 20' E. long. Its area is 7786 square miles; the population in 1852 numbered 835,841 Catholics, 652,801 Protestants of different sects, 15,499 Jews, 109 Mennonites, and 1 Greek; in all 1,504,251 inhabitants. Westphalia is bounded N.W. by Holland; N. by Hanover; E. by Hanover, Brunswick, and Hesse-Cassel; S.E. by Hesse-Cassel, Waldeck, and Hesse-Darmstadt; and S.W. and W. by Rhenish Prussia.

The northern half of the province, north of the Lippe, belongs to the great plain of Northern Germany, and has no mountains properly speaking, though some low eminences run from the Egge to the Weser and to the Porta Westphalica, and pass through the government of Minden into Osnaburg; the other half, to the south of the Lippe, consists of small chains of mountains and hills, which contain many valleys. In the northern half the soil is in general sandy, with extensive heaths and morasses, and scanty forests; in the southern half the soil is firm and sand is rare: it is not always productive, but the forests are very fine. The mountains in the province are all offsets

of the Harz. To these belong:—1. The Weser chain. 2. The Teutoburgerwald, a remarkable chain which traverses the province like a wall towards the Netherlands, from the Rhine to the middle of the Ems. It has only one opening or break till it comes to Bielefeld. The chain forms the watershed between the Rhine and the Lippe, and is covered with fine forests of oaks, beeches, and other trees. 3. The Suntegebirge, a beautiful picturesque chain, which forms a semicircle of 45 miles in diameter, extending from the neighbourhood of Osnaburg, through the district of Minden, to the Steinhuder Lake in Lippe-Sohaumburg. There is a pass through this chain, exactly in the centre, about 5 miles below Minden, and this is the celebrated Porta Westphalica. [WESER.]

The principal rivers are the Weser, the Ems, the Lippe, the Rôhr, and the Vechta. There are no lakes, but marshes are numerous, especially in the northern part: the principal mineral-waters are those of Driburg and Schwelm.

The climate is temperate and healthy: the air is purer, but colder in the southern than in the northern part, where fogs, caused by the marshes, are frequent. The winter is cold and wet, and the heat in summer is often very great in the flat extensive heaths.

The vegetable products are, corn of all kinds; peas and beans, garden vegetables, fruit, hemp and flax (which are staple articles), some hops, and in the mountainous part timber in great quantities. The minerals are iron, copper, lead, calamine, marble, slate, freestone, salt, and coals: there are extensive turf-moors. The manufactures are of considerable importance, especially those of linen, cotton, woollen-cloth, silk, leather, hosiery, and paper. There are numerous iron, copper, and steel-works, and manufactories of all kinds of cutlery, and copper, brass, and iron goods. There are also many sugar-refineries, brandy-distilleries, and tanneries in the province. Cotton factories have been recently established at a few places in the circle of Hagen. The trade of the province consists in the exportation of its own natural productions and manufactures.

The province is divided into three circles—MÜNSTER, MINDEN, and ARNBERG, which form subjects of separate articles. In these articles or under independent heads all the towns of the province are noticed. Münster is the capital. The province is traversed by the Cologne-Minden railway, which connects the Hanoverian and Prussian lines with the Rhine and Belgian railroads. From Hanover lines run to Münster and to Cassel.

The name *Westphalia* was originally given to the country in the north-west of Germany between the Weser, the Rhine, and the Ems. The country between the Weser and the Elbe was called *Ostphalia*, or *Eastphalia*; but this name has fallen into disuse. The whole was included in the great duchy of Saxony, and was sometimes called *Sauerland*. The archbishops of Cologne held a portion of it, which constituted the duchy of Westphalia from 1179 till 1802, when the duchy was given to Hesse-Darmstadt, which ceded it to Prussia in 1815.

Westphalia gave name also to a large circle of the German empire, with an area of about 27,000 square miles, and comprehending the bishoprics of Münster, Paderbogh, Osnaburg, Liege, and Corvey; the duchies of Jülich, Cleves, Berg, and Oldenburg; the principalities of Minden, Verden, and Friesland; the counties of Ravensburg, Mark, Hoya, Diepholz, Schaumburg, Lippe, Bentheim, Tecklenburg, Lingen, Steinfurt, Rietberg; and many ecclesiastical and temporal lordships.

WESTPORT, county of Mayo, Ireland, a market-town, and the seat of a Poor-Law Union, is situated near the southern extremity of the head of Clew Bay, in 58° 48' N. lat., 9° 28' W. long., distant 10½ miles W.S.W. from Castlebar, 170 miles W. by N. from Dublin. The population of the town in 1851 was 4815, besides 2991 inmates of the workhouse. Westport Poor-Law Union comprises 20 electoral divisions, with an area of 175,508 acres, and a population in 1851 of 36,202. The town, which owes its plan and chief improvements to the first Marquis of Sligo, is well built and regularly laid out. At the foot of the Mall, or principal street, which is lined with large and handsome houses, is the entrance to the beautiful demeane and fine mansion of the Marquis of Sligo, proprietor of the town. Besides the parish church there are chapels for Roman Catholics, Presbyterians, and Methodists, a convent of the Sisters of Mercy, and a Roman Catholic Free school for boys and girls. The court-house is a neat substantial building, having a bridewell connected with it. There are also a market-house, a linen hall, a dispensary built and liberally aided by the Marquis of Sligo, military and constabulary barracks, and the Union workhouse. There are various manufactories in the town, and a weekly market is held on Thursday for linen, corn, and provisions. The harbour, which is at *Westport Quay*, a village about a mile west from the town, has a custom-house and large bonding warehouses. The port has a considerable fishery and an extensive trade. Quarter and petty sessions and a manor court are held in the town. Fairs are held four times in the year.

WETHERAL. [CUMBERLAND.]

WETHERBY. [YORKSHIRE.]

WETHERSFIELD. [ESSEX.]

WETTERN, LAKE. [SWEDEN.]

WETUMPKA. [ALABAMA.]

WETZLAR, the chief town of a circle in the government of Coblenz in Rhenish Prussia, is situated in a romantic country 36 miles E. by N. from Coblenz, on the banks of the Lahn, over which there is a stone

bridge, and which is there joined by the Dill and the Wetzsch. The town is surrounded with walls, has six gates and two suburbs, and is built on the side of a hill. The cathedral of St. Mary is a very spacious and fine edifice, with 28 altars; it is divided between the Catholics and Protestants; the portal entrance is said to date from the 8th century. The Jews have a synagogue. The town has an hospital, a gymnasium, a school of industry, and about 5500 inhabitants. The houses are built in the old-fashioned German style. The inhabitants have some manufactures of stockings, gloves, and tobacco, some tanneries and oil-mills, and a trade in iron. Wetzlar was formerly a free imperial city, and, from 1698 to 1806, the seat of the imperial chamber, or supreme court of appeal of the empire. By the Congress of Vienna it was assigned in 1815 to Prussia. The town derives some celebrity also from being the scene of Göthe's 'Sorrows of Werter.' The circle of Wetzlar lies on both sides of the Lahn, and is inclosed by Nassau and Hesse-Darmstadt.

WEXFORD, a maritime county in the province of Leinster, Ireland, is bounded N. by the county of Wicklow, E. by St. George's Channel, S. by the Atlantic Ocean, and W. by the counties of Waterford, Kilkenny, and Carlow. It lies between 52° 6' and 52° 48' N. lat., 6° 8' and 7° 2' W. long. Its greatest length from north to south is 55 miles; from east to west 34 miles. The area is 900 square miles, or 576,588 acres. The population in 1841 was 202,038; in 1851 it was 180,159.

Coast-line.—Owing to the position of Wexford at the south-east corner of Ireland, more than half of its boundary is formed by the sea. Kilmichael Point is the easternmost point in the county, and the northern extremity of its coast-line. The whole line of coast from Arklow, which lies a little north of the northern boundary of Wexford, to Wexford Harbour, presents no opening which can afford shelter from foul weather, except to small craft; and the danger to shipping is increased by a range of sand-banks which lie parallel to the shore at the distance of a few miles, towards the northern extremity of which the Arklow light-ship is stationed. Wexford Harbour is large, and of very irregular form; but the navigation is dangerous, and the entrance is obstructed by a bar. The entrance is between the extremities of two long narrow sandy peninsulas—the Raven Point on the north and Roselare Point on the south; and though it is less than a mile wide, the harbour almost immediately expands to a width of more than eight miles. The town of Wexford lies opposite to and about four miles from the entrance of the harbour, which contracts so suddenly opposite the town as to be crossed by a bridge 1571 feet long, a portion of the roadway of which is made moveable, to allow the passage of masted vessels into the inner portion of the harbour, which again extends, though only for a short distance, to the width of about two miles. A bank of shifting sand outside the entrance to the harbour leaves so little depth of water as to render the entrance to the harbour inconvenient for any vessel above the burden of 200 tons, and the navigation of the interior is both intricate and shallow. The harbour contains a few small but inhabited islands. In two of these, called Beg Erin (or Little Ireland), and Great Island, there are remains of monastic buildings. From Roselare Point to Greenore Point, nearly 7 miles in a south-easterly direction, the coast forms another bay, called Greenore Bay, and opposite the point, about 3 furlongs from the shore, is a detached rock called Carrick Beacon. From this point, for rather more than 5 miles, the coast again trends a little westward in an irregular line to Carnore Point, which forms the south-eastern angle of the county and of the whole of Ireland. Opposite to this portion of the shore, about 7 miles S.E. from Greenore Point, is the Tuscar rock, the position of which is marked by a revolving light, and by a bell in foggy weather. On the southern coast, from Carnore Point to Crossfarnogue Point, a distance of between 9 and 10 miles in a straight line, is a shallow bay, into which two considerable lakes, called Lady's Island Lake and Taumshin Lake, open, the former by an artificial communication which is cut every three or four years through the sand-bank which separates it from the sea; this lake is remarkable for the circumstance that while it receives several small rivulets it has no natural outlet. South of Crossfarnogue Point are the Great and Little Saltee islands, the nearest of which is rather more than two miles from the shore. From Little Saltee Island, which lies nearest to the mainland, a ridge of rocks called St. Patrick's Bridge, having only from 7 to 10 feet of water at low tide, extends to the adjoining shore, presenting an exceedingly dangerous obstacle to the navigation. Several small rocky islets occur about this part of the coast, and a floating light is stationed a few miles south of Great Saltee Island. Along the remainder of the coast-line occur a succession of bays, headlands, islands, and small harbours and inlets. At Hook Head is a lofty lighthouse with a stationary light, and, as the shore is rugged and dangerous, lights have been placed at various points of the coast. From Templetown Bay, about four miles from Hook Head (within Waterford Harbour), the shore trends towards the west for about five miles, to the estuary of the Suir. The Wexford coast of Waterford Harbour is indented by numerous small bays.

Surface, Hydrography and Communications.—The county of Wexford is in a great measure cut off from the rest of Ireland by natural boundaries. From the extremity of its sea-coast in Waterford Harbour, the estuary of the Suir and the river Barrow, which flows into it, form the boundary of the county for a distance in a straight

line of about 16 miles, to the point of junction of the counties of Carlow, Wexford, and Kilkenny. For 12 or 13 miles farther, in a north-easterly direction, the boundary is pretty distinctly marked by the ridge called Blackstairs Mountain (2409 feet), which rises in seven points along the boundary-line of the counties of Wexford and Carlow to elevations of from 1520 to 2409 feet above the level of the sea; and the Mount Leinster ridge, which attains the elevation of 2610 feet. Three remarkable summits upon this ridge of mountains, between Wexford and Carlow, are distinguished as 'The Leaps of Omeau Grayhounds.' The small river Clody, which rises on the slope of Mount Leinster, forms the boundary of the county to the town of Newtownbarry, where, after a rapidly descending course, it falls into the Slaney. From Newtownbarry the boundary-line runs for a short distance up the course of the Slaney, towards the north-west, at which it turns north-east along the tributary river Derry to a point a little beyond the junction of the counties of Carlow, Wexford, and Wicklow. After leaving the course of the Derry the boundary-line turns abruptly south for a short distance, and then, again turning north-east, runs over an elevated ridge which forms the southern termination of the mountains of Wicklow. The last portion of the boundary-line is formed by a small stream which falls into the sea near Kilmichael Point.

Wexford contains many single hills of considerable elevation, among which are the Forth Mountains, a range which extends in a south-westerly direction for five or six miles from the neighbourhood of the county town. Of the detached hills may be noticed Camaroes Hill, 767 feet high, and Carrickbyrne, 767 feet, in the middle of the county; Tara Hill, near the northern extremity, and not far from the coast, which it forms a striking landmark, 826 feet high; and the Lakin Hill, near New Ross, 629 feet high.

The principal river of the county is the *Slaney*, which enters from the county of Carlow a short distance north of Newtownbarry, and flows in a tolerably direct course past that town and Enniscorthy to Wexford Harbour. It is navigable for large boats as far as Enniscorthy, to which place the tide flows. On the left bank it receives a few miles north of Enniscorthy, the river *Bass*, which rises in the north-eastern part of the county, and two or three minor streams; and on the right bank its principal tributaries are the *Urn* and the *Boro*, both of which descend from the Blackstairs Mountains. Among the other streams in the county are the *Owenavorrage* and its tributary the *Banoge*, the waters of which enter the sea north of Courteenure Harbour; the *Owenduff*, the *Corock* or *Corug*, and some other small streams, which flow into Bannow Bay; and several rivulets which empty themselves into the lakes on the southern coast.

The principal communication between Wexford and the interior of Ireland is by the river Barrow, which communicates with the Grand Canal. The principal roads in the county are—the mail-coach road from Dublin, which enters the county from Arklow, near its northern extremity, and passes by Gorey and Enniscorthy, and thence along the western side of the Slaney to Wexford; a post-road on the eastern side of the Slaney from Wexford by way of Oulart, which joins the preceding at Enniscorthy; a mail road which branches from this road a little north of Enniscorthy, and leaves this county for Carlow a few miles north of Newtownbarry; and the mail road across the county from Wexford to Waterford by New Ross; a road from Enniscorthy to New Ross; and a mail road from New Ross to Fethard by Arthurs-town. The county is however well supplied with roads in every direction; and the harbours of Waterford and Wexford afford ample facilities for communication by sea.

Geology, &c.—The county of Wexford forms part of the clay-slate tract which extends along the eastern portion of Ireland from the northern part of Wicklow to the Atlantic Ocean. Though considerably inflected in some of the southern parts of the county, the strata generally maintain, in the northern parts, a tolerably uniform direction from north-east to south-west, with a dip to the south-east. The clay-slate is found in immediate contact with granite, which forms the chief component of the ranges that separate this county from Carlow. The Forth Mountain consists principally of quartz rock, with occasional laminae of clay-slate, and the strata are in some places broken by fissures and veins of quartz, which occasionally show indications of the presence of lead, copper, and iron. Quartz-rock and clay-slate form also the lower grounds in the vicinity of the Forth; and the former, which is sometimes iron-shot and of a deep-reddish hue, extends under and to the north of the town of Wexford, and also considerably to the south of the Forth Mountains. Granite appears about Carnore Point, in the south-east, and at the Carrickbyrne and Camaroes Hills; and blocks of that substance are found strewn between those mountains and Bannow, on the south-west. Beds of greenstone also occur in a few places among the clay-slate, which, near Enniscorthy and in several other places, is much intermixed with quartz-rock. The principal ranges of elevated land however consist of clay-slate, and good slates are quarried near Newtownbarry, and in other parts adjacent to the granitic chain. A black and slightly carbonated clay is found near Enniscorthy, and has been mistaken for coal. That part of the county which borders on Waterford Harbour consists principally of clay-slate in nearly vertical strata, and is mounted in two or three places with a cap of sandstone. From Templetown Hill, near the Hook promontory, such a cap declines

until it underlies a tongue of stratified limestone, which extends to the extremity of Hook Point, and is arranged in thin strata dipping at an angle of 4° to 8° towards the south. This limestone contains numerous bivalves and corallites. The sandstone rocks form the precipitous coast about Baginbun Point, and appear in several detached spots in the county, among which is the inner haven of Wexford Harbour. The rugged eminence called Tara Hill, alluded to above, consists of porphyry, with a base of compact felspar, occasionally passing into hornstone with inlaid crystals of glassy felspar. Greenstone also appears here occasionally. In addition to the limestone at Hook Point, some is found a little south of Wexford town, and also at Duncormuck, about the middle of the southern coast. The Saltee Islands are clay-slate surmounted by beds of sandstone. Lead has been found and worked at Caim, or Cairne. Silver was formerly raised near Clonmines, where there are the remains of an ancient mine; galena has also been found there. Copper-ore exists at Kerlogue, near Wexford; and plumbago and asbestos have been recently discovered at Greenfield, near Ennisoorthy. Horns and bones of the moose-deer have been discovered in the alluvial districts on the east and south, where marl occurs; and some years ago a perfect fossil specimen of the *Cervus Megaceros*, or gigantic deer of Ireland, of extraordinary dimensions, was found at Ballyhuskard, near the Bog of Itty.

Climate, Soil, and Produce.—In climate, those parts of Wexford which lie open to the sea are milder in temperature than the adjacent counties of Carlow and Kilkenny. Snow seldom remains on the ground in these districts, and agricultural operations may often be carried on without interruption while lands 10 miles inland are covered with snow or locked up with frost. The southern district is exposed to storms in spring and autumn, and to heavy rains in winter; but the climate is peculiarly favourable to the perfection of grain crops.

In 1853 there were in the county under crop 247,510 acres, of which 17,014 acres grew wheat, 88,218 acres oats, 49,730 acres barley, bere, rye, peas, and beans; 25,608 acres potatoes, 15,355 acres turnips, 6247 acres other green crops, 461 acres flax, and 44,882 acres were in meadow in clover. Of plantations, there were 24,343 acres in 1841, yielding oak, ash, elm, beech, fir, mixed timber, and fruit. The stock, on 16,732 holdings in 1852, was 24,465 horses, 7480 mules and asses, 78,172 head of cattle, 81,598 sheep, 63,930 pigs, 9346 goats, and 331,415 head of poultry. The total value of the stock here enumerated was estimated at 900,072*l.*

The manufactures of the county are of little importance. The principal external commerce of the county is in agricultural produce, especially barley, of which great quantities are sent to England, Wexford being the port through which the trade of Ennisoorthy and Castlebridge passes. New Ross also exports the like produce to a considerable extent. Butter is sent through Gorey to Dublin, and through Wexford and Waterford to Bristol, Liverpool, &c.; and cattle, pigs, and poultry are sent to England by steam-boats from the same ports.

The county belongs to the fishery districts of Gorey and Wexford, which together comprise 108 miles of maritime boundary, and in 1853 had 577 registered fishing-vessels, employing 3233 men and boys.

Divisions, Towns, &c.—The county is in the diocese of Ferns, with a very small part in that of Dublin, and contains 144 parishes. It is divided into nine baronies—Ballagh Keen, Bantry, Bargo, Forth, Gorey, Scarawalsh, Shelburne, and Shelmaliave east and west. The principal towns are WEXFORD, ENNISOORTHY, GOREY, and NEW ROSS, which are noticed under their respective names.

Of the following towns and villages the population given is that of 1851:—

Arthurstown, or King's Bay, is a small port and post-town on the left bank of the Nore, where it falls into Waterford Harbour: population, 309. There are a fever hospital, a dispensary, and a convenient pier, at which vessels of 100 tons can unload or load. *Ballycanow* is a post-town about 4 miles S. from Gorey, on the road to Wexford Bridge, near the Awin-Banna River: population, 361. There are an ancient church, a Roman Catholic chapel, and two schools. Five fairs are held annually. *Bannow*, population 104, a small post-town on Bannow Harbour, about 6 miles N.E. from Fethard across the harbour, contains the ruins of an old church, a dispensary, a Roman Catholic chapel, and a school. Two stations of the preventive service are in the neighbourhood. It was formerly the site of an ancient borough, of which scarcely a trace is left. *Bridgetown* is a small post-town near Tacumshin Lake, about 10 miles S. from Wexford: population, 244. In it are a small church and a ruined castle; another ruined castle is about three miles distant. *Camolin* is a post-town on the Bann, about 7 miles S.W. from Gorey, on the road to Ennisoorthy: population, 713. It contains a Roman Catholic chapel and a dispensary. Six yearly fairs are held. Near it is Camolin Park, the seat of the Earl of Mountnorris. *Castlebridge* is a village and post-town at the junction of the Sow with the estuary of Wexford Harbour, about 4 miles N. from Wexford: population, 473. In it are a Roman Catholic chapel and a dispensary. Eight annual fairs are held. *Clonroche* is a small thriving post-town about 9 miles S.W. from Ennisoorthy: population, 420. It has a dispensary and a savings bank, and petty sessions are held here monthly. There are eleven yearly fairs, and the town

ÆGEO. DIV. VOL. IV.

has a considerable trade. *Courtown* is a small sea-port and post-town, at the head of Courtown, or Kilbride Bay, at the mouth of the Awin-Banna River, about 3 miles S.E. from Gorey: population, 259. The hamlet of *Riverchapel* almost joins it however, with a population of 348. The places are neatly built, and together form a rising town. Close to it are the mansion and demesne of the Earl of Courtown, and the church stands in the demesne. *Duncannon* is a fishing village and post-town on the east side of Waterford Harbour, about a mile and a half S. from Arthurstown: population, 460. The shore is here flat and shallow, and consequently dangerous, but it is broken by a small creek, which, at high-water, can be entered by vessels of 100 tons burden, and a pier has been built. Near the village is a fort, placed on a rocky headland, and within the fort is a lighthouse. The fortifications occupy about 3 acres; 30 pieces of cannon are mounted on them, and a garrison is maintained. It was held for James II., and hence he embarked on his final departure for France. *Ferns*. *Fethard* is a small but neat fishing-port and post-town, situated on a small inlet of the sea running up from Bannow Bay, about 16 miles S. from New Ross: population, 326. A branch of the coast-guard department is stationed here, and a small trade is carried on from the port in the importation of coal and timber, and the exportation of corn: there are also four cattle fairs held yearly. The harbour was constructed by government in 1798. The town was incorporated by James I., but the corporation is now extinct. It sent two members to the Irish Parliament. In the principal street is an ancient church, and an Anglo-Norman castle, now adapted as a residence. A Roman Catholic chapel and a dispensary are in the town. *Kilmore* is a fishing village and post-town, having a small harbour on the eastern side of Ballyleigue Lough, which is separated from the sea by a long sand-bank. The fishermen have constructed a pier for the accommodation of their craft, which, in sailing- and rowing-boats, number from 60 to 70. A Roman Catholic chapel is in the village, and there is a coast-guard station. *Newtownbarry*, a market- and post-town, is situated at the confluence of the Clody with the Slaney, about 22 miles N.W. from Wexford: population, 1307. Newtownbarry was formerly called Bunclody, from its situation at the junction of the Clody and Slaney. The town forms an irregular square, and a western suburb extends into the county of Carlow, with which Newtownbarry is connected by a wooden bridge over the Clody. A stone bridge of seven arches crosses the Slaney. The market is well attended, and there are 13 annual fairs. The church is a neat structure, with a square tower surmounted by a spire. In the town is a handsome Roman Catholic chapel, three public schools, a dispensary, a fever hospital, a constabulary police force, and a detachment of the revenue police. Petty sessions are held monthly. Near the town is a strong chalybeate spring, but it has fallen into disuse. Slate of excellent quality, building-stone, and granite, as well as limestone, and marl for manure, are found in the vicinity. *Taghmon*, a market- and post-town, and, until the Union, a parliamentary borough, stands on the road from Wexford to New Ross, about 7 miles W. from Wexford: population, 1082. It contains a church, a Roman Catholic chapel, a fever hospital, a dispensary, a savings bank, and a police barrack, and petty sessions are held monthly, but it is a poor and decaying place, though in a rich and fertile country, and now chiefly owes what trade it has to its market, at which butter is sold to a considerable extent, and to its fairs, of which it has 19 every year. The place derived its name, which was originally *Theagh Munno*, or 'the House of Munno,' from St. Munno, who founded an Augustinian monastery here, in the 6th century, to which the origin of the town is attributed.

The county returns four members to the Imperial Parliament—two for the county at large, and one for each of the boroughs of Wexford and New Ross. It is in the Leinster circuit. The assizes are held in Wexford, where is the county jail; quarter sessions are held there, and at Ennisoorthy, New Ross, and Gorey, in which three towns there are bridewells. Petty sessions are held in eleven places. The District Lunatic Asylum, to which the county is entitled to send 44 patients, is in Carlow. The county infirmary is in Wexford. The fever hospitals are in Wexford, Arthurstown, Ennisoorthy, Gorey, New Ross, Newtownbarry, and Oulart; 28 places have dispensaries. There are savings banks in Wexford and Gorey; and two loan-funds in Wexford, two in New Ross, and one each in Boro, Ennisoorthy, and Gorey. The union workhouses are at Wexford, Ennisoorthy, Gorey, and New Ross. The county is in the military district of Kilkenny; the barrack-stations are at Wexford, Duncannon Fort, and New Ross. The staff of the county militia is stationed at Wexford, which is also the head-quarters of the county police. The police force consists of 256 men and officers, distributed over 43 stations, in 7 districts. In September 1852, there were in the county 117 National schools, attended by 7229 male and 7440 female children.

History and Antiquities.—In the time of Ptolemy the greater part of the present county of Wexford was inhabited by the Menapii, whose chief town, Menapia, is supposed to have occupied the site of the present town of Wexford. The county was anciently styled *Corteigh, Moragh, and Leighion*. The term *Leinster* was chiefly applied to Wexford by Irish, Danish, and Latin writers towards the close of the middle ages. The present name appears to come from *Weisford*, a name given by the Danes to the chief town, when, after predatory incursions in the county, during which they burnt the

previous capital, Ferns, they chose that as the centre of a permanent settlement. Wexford is distinguished as containing the first landing-place used by the English, when, in 1170, or, according to other authorities, 1169, they invaded Ireland under the command of Robert Fitz-Stephen. The English armament landed at Baginbun, near Fethard, and shortly afterwards attacked the Danes at Wexford, of which place, after a contest of four days, they obtained possession. MacMurrough then confirmed a grant which he had previously made of Wexford and some adjoining parts to the English adventurers, whose settlement in the country so alarmed the other native princes, that they formed a confederacy for driving out MacMurrough and his English allies. But the invaders had obtained too firm a footing to be thus got rid of, and their conquests were soon greatly extended by the prowess of Richard de Clare, surnamed Strongbow, who married Eva, the daughter of MacMurrough, after whose death, in 1172, he became Lord of Leinster, a title which was confirmed to him as palatine by Henry II. of England, when he visited Ireland shortly after. Wexford was formed into a county by King John in 1210, and it formed part of the possessions inherited by William le Marshal through his marriage with the daughter of Strongbow. On the extinction of the male line his possessions were divided among his daughters, and subsequently underwent frequent changes of proprietorship.

In 1641 the Royal forces, under Ormond, were defeated in an attempt upon New Ross in the early part of the war, and subsequently Duncannon Fort was taken by the Catholics. In 1649 the whole county was reduced to subjection by Cromwell, who put the garrison of Wexford to the sword. This county was the chief seat of the rebellion of 1798, and the scene of many severe conflicts. The insurgents possessed themselves of Enniscorthy and Wexford. The head-quarters of their army were formed at Vinegar Hill, near Enniscorthy; but in their attack on New Ross they were repulsed with much loss, and the Royal forces having collected their strength from various quarters, made a simultaneous attack upon Vinegar Hill, and forced the insurgents to retreat. Wexford was afterwards retaken; and this complete defeat of the main body of the rebels put an end to the insurrection in this district.

The county of Wexford, especially the southern part, abounds with antiquities of Danish, Saxon, and Norman origin, though comparatively few can be assigned to a period prior to the arrival of the English in the country. Two tumuli, or raths, remain in the neighbourhood of Enniscorthy, at Salville or Montabeg, and Donamore; two others, of considerable size, near Dunbrody; and one near New Ross. There are remains of monasteries at Wexford, Enniscorthy, St. John's (south of Enniscorthy), Ferns, Dunbrody (near the confluence of the Suir and the Barrow), Ross, and Clonmines. Of other ecclesiastical edifices, Tintern Abbey, near the Bannow, has been converted into a dwelling; Ballyback, Carnsore, and Clonmore are turned into parish churches; and the ruins of Glasarrig are partly used as a farm. There are ruins of an ancient chapel, called St. Vaughn's, near Carnsore. Ruins of castellated buildings are numerous; we have mentioned many in our notices of the towns and villages; 130 are said to exist in only four of the baronies. Among other military remains is Strongbow's fort or camp, near Duncormuck Castle, on Baginbun Head, where intrenchments are yet visible. Of more recent objects of interest in the county may be mentioned a great pile of stones at Wicklow Gap, near its northern extremity, marking the burial-place of those who fell in a sanguinary conflict between the insurgents and the Royal troops in 1798.

WEXFORD, the capital of Wexford county, a parliamentary borough, a municipal borough, a port, a market- and post-town, and the seat of a Poor-Law Union, is situated upon the south-western shore of Wexford Harbour, at the embouchure of the river Slaney, in 52° 20' N. lat., 6° 27' W. long., about 74 miles S. from Dublin by road, and 80 miles E.N.E. from Waterford. The population of the borough in 1851 was 12,471. The borough is governed by 8 aldermen and 18 councillors, of whom one is mayor; and returns one member to the Imperial Parliament. Wexford Poor-Law Union comprises 83 electoral divisions, with an area of 128,801 acres, and a population in 1851 of 52,872.

The town consists chiefly of three nearly parallel streets, of which one, called the Quay, is a wide terrace, fronting the harbour, while the other two run in crooked lines behind it; and of two wide and well-built streets on the west and north-west extremities of the town. The town is well provided with water, and is lighted with gas. Towards the centre the Quay is broken by the Crescent, which is indented in a semicircular form. Nearly opposite to the Crescent, at some distance from the quay-line is a kind of breakwater, called the Ballast-Quay, or Bank, formed by the ballast deposited there by ships which frequent the port. The haven contracts abruptly opposite to the northern end of the town; and at the narrowest point is a timber bridge, constructed in 1795 of American oak, at a cost of 17,000*l.* by Lemuel Cox, an engineer from the United States; but it has been reconstructed, and now consists of two causeways, projecting 650 feet and 188 feet from the north-eastern and south-western banks respectively, united by a timber bridge of 733 feet, supported by 23 piers of the same material, and having a drawbridge for the passage of masted vessels into the inner haven, which expands considerably a little above the bridge. To its entrance into the sea between Rosslare Point and Raven Point,

the length of the haven is above six miles, at low water leaving an expanse of mud, through which the stream winds, and at the mouth is a bar which prevents ships of more than 200 tons ascending. The control of the harbour is vested in a body of commissioners.

The town of Wexford was a maritime settlement of the Danes, and was formerly called Weisford. It was besieged for three days by Fitz-Stephen, soon after he landed, and surrendered on condition of recognizing the sovereignty of Dermot MacMurrough, king of Leinster. During the contention between the houses of York and Lancaster it was seized by Sir John Butler, brother to the Earl of Ormond. He was soon afterwards defeated by the Earl of Desmond, who, in the following year, held a parliament in the town. Wexford was one of the first places which fell into the hands of the insurgents in 1641, and formed the port from which they received their principal supplies from other countries. In 1649 Cromwell obtained possession of the place, and nearly destroyed it, levelling six of the parish churches, and mining another. After the battle of the Boyne the town took part with William III., and was garrisoned by his troops. A monument obelisk on the Windmill Hill commemorates the death of a Captain Valloton in 1793, in a conflict between the military and a party of Whiteboys. During the insurrection of 1798 the town was evacuated by the garrison, and the rebels immediately made it their head-quarters. After the defeat of the insurgents at Vinegar Hill the rebels fled precipitately from the town. There are now only two parish churches—St. Iberius and St. Selsker, both modern, the former a plain building with a cupola, the latter in the early English style of architecture, connected by a vestibule with the massive square tower and raised walls of St. Selsker Abbey, founded it is said in 1190, on the site of an earlier church built by the Danes, or Ostmen. Some of the churches still present some interesting ruins, particularly that of St. Mary's. There are three Roman Catholic chapels, one of which, St. Peter's, is a handsome structure in the decorated style, with a large rose window at the east end. The Presbyterians, Wesleyan Methodists, and Independents have each a meeting-house. The public buildings of the town consist of a neat court-house, a jail, a fever hospital, an infirmary, a house of industry; the buildings belonging to the corporation, the offices connected with the revenue; the barracks; the Union workhouse; and St. Peter's College, on Summer Hill, a magnificent building for Roman Catholic students preparatory to their going to Maynooth, and attached to St. Peter's chapel. There are also a Diocesan Protestant school, Erasmus Smith's school, the Parochial school of St. Patrick, the Redmond Female Orphan-house, National schools, a savings bank, a mechanics institute, and a lying-in-hospital.

Wexford has a considerable retail trade; its markets, twice a week, and its nine yearly fairs, are well supplied and well attended. Corn, poultry, butter, and fish, particularly oysters, are furnished in considerable quantities, not only for home consumption, but for the English market. Ship-building is carried on. On December 31st, 1854, the number of vessels registered as belonging to the port was—28 under 50 tons, 71 above 50 tons, of the aggregate burden of 8461 tons. The number and tonnage of vessels entered and cleared at the port during 1854 were as follows:—Sailing-vessels, inwards, 54, tonnage 31,095; outwards, 395, tonnage 22,856; steam-vessels, inwards, 54, tonnage 12,172; outwards, 52, tonnage 11,254.

The assizes for the county are held in this town, as are also the quarter sessions for the district; petty sessions are held every week. The staff of the county militia is stationed in Wexford.

The environs of the town, particularly towards the Forth Mountains, are picturesque. At Carriga-Damon a handsome column was erected in 1841 by General B. Clayton to commemorate the actions of the British army in Egypt under Abercromby.

WEXIO. [SWEDEN.]

WEYBRIDGE. [SURREY.]

WEYHILL. [HAMPSHIRE.]

WEYMOUTH and MELCOMBE REGIS, Dorsetshire, form together a municipal and parliamentary borough, market-town, and sea-port. They together also form a part of the Weymouth Poor-Law Union, which consists of 18 parishes and townships, with an area of 37,282 acres, and a population in 1851 of 22,017. The borough is situated on the shore of Weymouth Bay, in 50° 37' N. lat., 2° 26' W. long., distant 8 miles S. from Dorchester, and 128 miles S.W. from London. The population of the borough in 1851 was 9458. The borough is governed by 6 aldermen and 18 councillors, of whom one is mayor; and returns 2 members to the Imperial Parliament. The living of Weymouth is a perpetual curacy in the parish of Wyke Regis, that of Melcombe Regis is a rectory, in the archdeaconry of Dorset and diocese of Salisbury.

Weymouth and Melcombe Regis were formerly distinct municipal and parliamentary boroughs, but were united in 1571, and Weymouth is now the general name for both places. Weymouth Bay here communicates by an arm of the sea with a small internal bay, about two miles long, called the Backwater, which may be regarded as the estuary of the small river Wey. The harbour is in the arm of the sea, which connects the Backwater with Weymouth Bay. Weymouth is on the south side of the harbour, and Melcombe Regis on the north side; the two towns are connected by a handsome stone bridge.

Weymouth proper is a very ancient place, and was of considerable

commercial importance in the 14th century. It has now the appearance of an old fishing-town. Melcombe is situated on a tongue of land between Weymouth Bay and the Backwater, very narrow on the north-east, but becoming wider towards the harbour, where the width is about a third of a mile. The ground on which it stands is low, a considerable part of it having been reclaimed from the Backwater by embankment. In front of Weymouth Bay a broad terrace, called the Esplanade, extends nearly a mile, with a gradual slope towards the shore; the ranges of houses which face this Esplanade are handsome, and many of them large.

Weymouth was brought into repute as a bathing-place about 1768 by Ralph Allen of Bath. The Duke of Gloucester went there in 1780, and had a house built for his residence. George III. paid his first visit in 1789; he had a royal lodge erected, and went there frequently. The climate is very mild, Weymouth Bay being sheltered to the north by surrounding hills, which have a gradual slope to the south towards the beach. There are two churches, one of which is in Weymouth; places of worship for Wesleyan Methodists, Independents, Baptists, Quakers, and Roman Catholics; National, British, and Infant schools; and a savings bank. Ship-building and rope-making are carried on. The construction of the Portland breakwater, which will afford shelter to vessels entering Weymouth Bay, is being proceeded with, and the works already afford much of the required protection.

The number and tonnage of vessels registered as belonging to the port of Weymouth on December 31st 1854 were:—Sailing-vessels under 50 tons 23, tonnage 705; above 50 tons 57, tonnage 6834; with 2 steam-vessels of 63 tons, and 1 of 61 tons. The number and tonnage of vessels which entered and cleared at the port during 1854 were:—inwards, 441 sailing-vessels, tonnage 81,680; outwards, 118 sailing-vessels, tonnage 6644.

WEYRE. [BUXTON.]

WHAPLODE. [LINGOLNSHIRE.]

WHEATENHURST, or WHITMINSTER, Gloucestershire, a village and the seat of a Poor-Law Union, in the parish of Wheatenhurst, is situated near the left bank of the river Severn, in 51° 47' N. lat., 2° 20' W. long., distant 9 miles S.S.W. from Gloucester, and 110 miles W. by S. from London. The population of the parish in 1851 was 380. The living is a perpetual curacy in the archdeaconry of Gloucester and diocese of Gloucester and Bristol. Wheatenhurst Poor-Law Union contains 14 parishes and townships, with an area of 24,471 acres, and a population in 1851 of 7987. Besides the parish church there is a school supported by subscription.

WHEATHAMSTEAD. [HERTFORDSHIRE.]

WHICKHAM. [DURHAM.]

WHISSENDINE. [RUTLANDSHIRE.]

WHITBURN. [DURHAM.]

WHITBY, North Riding of Yorkshire, a market-town, parliamentary borough and sea-port, and the seat of a Poor-Law Union, in the parish of Whitby, is situated on both sides of the river Esk, where it falls into the German Ocean, in 54° 29' N. lat., 0° 35' W. long., distant 45 miles N.E. from York, 236 miles N.N.W. from London by road, and 246½ miles by the Great Northern and York and North Midland railways. The population of the parliamentary borough in 1851 was 10,989. The borough returns one member to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry of Cleveland and diocese of York. Whitby Poor-Law Union contains 22 parishes and townships, with an area of 90,371 acres, and a population in 1851 of 21,592.

The larger and better part of the town of Whitby stands on the left bank of the Esk. The two parts of the town are connected by a stone bridge of 8 arches, 172 feet long, with a swivel bridge to admit the passage of vessels to the inner harbour. The inner harbour is formed in the river, and is capacious and secure, with dry docks for building and repairing vessels. The harbour has 10 feet of water in ordinary neap-tides, and 15 feet and upwards in spring-tides. The piers which protect the harbour run out into the German Ocean, the western pier for about 1000 feet, forming a fine promenade; and two inner piers break the force of the waves in stormy weather. At the end of the west pier is a lighthouse. The ground on each side of the river rises rapidly, especially on the right or east side, where the town is continued southward in a narrow column of houses along the bank of the river. On the west side the streets have been carried over the crown of the hill. The streets are well paved, and are lighted with gas.

Whitby possesses a town-hall and a custom-house. The bath-house, a spacious and elegant structure on the quay, contains baths, a subscription library, and the museum of the Whitby Literary and Philosophical Society. The parish church stands on the summit of a cliff about 350 feet high, and a flight of 194 steps leads to it from the town below. The original structure, which is of Norman date, has been much altered and repaired at various periods. The other episcopal places of worship are—a chapel of ease, erected in 1788; and the churches of St. Michael and St. John the Evangelist, both of modern erection, and in the early English style. There are chapels for Wesleyan, Primitive, and Association Methodists, Independents, United Presbyterians, Quakers, Roman Catholics, and Unitarians. There are in the town National, British, and Infant schools; a subscription library; a literary and philosophical society, with a museum; the Whitby Institute, with a reading-room; a mechanics institute;

a news-room; a temperance-hall; a savings bank; a dispensary; and a seamen's hospital. The market is held on Saturday. Fairs are held on August 25th and on Martinmas day. A cheese fair is held in October, and a cattle show in August. A county court is held in the town.

Whitby seems to have arisen originally from the foundation of an abbey by Oswy, king of Northumberland, in A.D. 658; but both abbey and town were utterly destroyed by the Danes about 867, and lay in ruins after the Norman conquest, when the abbey was rebuilt, and the town became a considerable fishing town. The ruins of the abbey are near the church, overlooking the sea at the height of 800 feet. The beautiful central tower fell in 1880; the existing remains consist of the choir, the north transept (nearly entire), and part of the west front. The town rose into commercial importance towards the end of the reign of Queen Elizabeth, when the working of the alum-mines in the neighbourhood was greatly extended, the harbour was improved, and ship-building was carried on. The alum formerly exported to the continent is now sent chiefly to London and other British ports. The foreign exports are inconsiderable: the chief imports are timber, and hemp and flax from the Baltic. The manufacture of ornaments from jet found in the cliffs in the neighbourhood of the town affords some employment.

Whitby is still a very considerable sea-port. The number and tonnage of vessels registered as belonging to the port on December 31st, 1854, were:—Sailing-vessels under 50 tons 51, tonnage 1720; above 50 tons 339, tonnage 60,386; steam-vessels under 50 tons 4, tonnage 879. The number and tonnage of sailing-vessels which entered and cleared at the port during 1854 were:—inwards, 725, tonnage 85,375; outwards, 131, tonnage 7862.

Numerous interesting fossil remains have been found in the neighbourhood of Whitby, many of which are in the Whitby Museum. In 1841 an entire specimen of the *Plesiosaurus Grandipinnis*, 15 feet 6 inches long, was found in the lias near Whitby.

WHITCHURCH, Hampshire, a decayed market-town, municipal borough, and the seat of a Poor-Law Union, in the parish of Whitechurch, is situated about 5 miles from the head of the river Anton or Test, in 51° 13' N. lat., 1° 19' W. long., distant 12 miles S. by W. from Winchester, and 87 miles W.S.W. from London. The population of the parish in 1851 was 1911. The living is a vicarage in the archdeaconry and diocese of Winchester. Whitechurch Poor-Law Union contains 8 parishes and townships, with an area of 29,518 acres, and a population in 1851 of 5619. Friday is the market-day; fairs are held on the third Thursday in June and October 19th. Paper- and silk-mills are worked by water-power. The church was enlarged in 1846. Wesleyan and Primitive Methodists, Independents, and Baptists have places of worship. There are National and Infant schools, and a school on the Glasgow system.

WHITCHURCH, Shropshire, a market-town and the seat of a Poor-Law Union, in the parish of Whitechurch, is situated in 52° 58' N. lat., 2° 40' W. long., distant 20 miles N. by E. from Shrewsbury, and 163 miles N.W. by W. from London. The population of the town in 1851 was 3619. The living is a rectory in the archdeaconry of Salop and diocese of Lichfield. Whitechurch Poor-Law Union contains 25 parishes and townships, with an area of 41,003 acres, and a population in 1851 of 11,870.

The town of Whitechurch is situated on an acclivity, on the summit of which is the parish church, a handsome Grecian edifice, erected in 1722. There are also a district church of the Grecian order, erected in 1840; chapels for Wesleyan Methodists, Independents, and Baptists; a Free Grammar school; National, British, and Infant schools; a savings bank; and a reading-room. Friday is the market-day; four fairs are held in the course of the year.

WHITCHURCH. [OXFORDSHIRE.]

WHITE SEA, a large gulf of the Arctic Ocean, which enters deeply into the northern parts of European Russia, between 64° 30' and 68° 30' N. lat. It has nearly the shape of a semicircle, opening towards the north-west, and separated from the open sea by a large peninsula, which takes its ordinary name from the town of Kola, built not far from its northern shore. The entrance to the White Sea is between Kanin Noss, on the peninsula, or rather island, of Kaninskaja Zemlia, which lies to the east, and Swatol Noss, a projecting cape of the peninsula of Kola. These two places are about 100 miles distant from each other. The gulf gradually grows narrower, and where it turns to the south-west it is hardly more than 40 miles wide. That portion of it which lies east and west is nearly twice as wide, and expands towards the south into two large gulfs—the Dwinskaja Guba, or Gulf of the Dwina, on the east; and the Oneskaja Guba, or Gulf of the Onega: both bays have received their names from the rivers which fall into their most south-eastern recesses. West of the Oneskaja Guba the White Sea terminates with an inlet, which is about 100 miles long, but has only a mean width of 25 miles, and runs to the north-west. It is called Kandalaskaja Guba, or the Gulf of Kandalask, from a small place of that name which lies near its innermost recess. The area of this sea is said to be about 44,000 square miles.

The White Sea is so far favourable to navigation that it has a considerable depth of water, with the exception of a sandbank which lies before the mouth of the Dwina, and occupies the greater part of the Dwinskaja Guba. This sandbank approaches the eastern shore

within about a mile, and remains about three miles distant from the southern shore. Large vessels therefore must keep near the shore, which is generally rocky and of moderate height, but may be safely approached, as the depth is seldom less than 20 fathoms. A bar lies across the entrance of the river Dwina, which at low-water has a depth of only 12½ feet, and at high-water from 14½ to 15 feet; at spring-tides it rises to 17 feet. But the sea is frequently covered with fogs, which are thick at a distance from the shore, but much less so as the coast is approached, which circumstance renders them less dangerous to shipping. The navigation is open for five or six months in the year.

Fish is more abundant in the White Sea than in any of the closed seas of Europe. Seals are very frequently met with on the shores. The white fish, as it is called by the whalers of Spitzbergen, or the beluga, or white whale, of authors and navigators, yields a valuable oil, and is met with in large shoals. Cod is taken in great quantities along the coast of the peninsula of Kola. Herrings are as numerous as along the coast of Norway. The *Salmo autumnalis* of Pallas enters, towards the end of the summer, the small lakes along the coast, and is much esteemed for its flavour. But the fishery carried on by the population on the shores of the White Sea is not limited to that sea. From Archangel, Mezen, and Onega many vessels are annually sent to the coasts of the Polar Sea, and especially to Spitzbergen and Nova Zembla, where they take whales of different kinds, seals, and the walrus.

In 1553 Richard Chancellor, with his ship belonging to the squadron of Sir Hugh Willoughby, who had been sent to discover a north-east passage to Cataia or China, arrived at St. Nikolaus, not far from the present town of Archangel, and by this voyage, and the negotiations which followed it, the empire of Russia was first opened to English enterprise, and the White Sea made known to Europeans. The principal trading-place in the White Sea is ARCHANGEL.

WHITEGATE. [CORK.]

WHITEHAVEN, Cumberland, a market-town, sea-port, parliamentary borough, and the seat of a Poor-Law Union, in the parish of St. Bees, is situated on the western coast, on a level inlet between rocky and precipitous cliffs, in 54° 33' N. lat., 3° 35' W. long., distant 38 miles S.W. from Carlisle, 294 miles N.N.W. from London by road, and 340 miles by the North-Western and connected railways *via* Carlisle. The population of the parliamentary borough in 1851 was 18,916. The town is governed by 21 trustees, elected triennially, who have also the management of the harbour. The borough returns one member to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry of Richmond and diocese of Chester. Whitehaven Poor-Law Union contains 23 parishes and townships, with an area of 98,713 acres, and a population in 1851 of 35,579.

In the reign of Elizabeth, Whitehaven was a small fishing village, containing six houses. It is now a well-built town, with considerable commerce, and its shipping business is important. The town is lighted with gas, and is supplied with water from Ennerdale Lake. In the vicinity are extensive collieries, some of which are wrought to the extent of two miles under the sea. Some of the coal-seams are eight feet and others are eleven feet thick. The harbour is commodious; it is tidal, but by means of a pier, constructed by Sir John Rennie, there is a depth of nine feet of water at low tide. There is a patent slip for the repair of large vessels. The port possesses two forts for its protection, and also two batteries of 42-pounders, all of which were repaired after the piratical attack of Paul Jones in 1771. At the entrance of the harbour are two lighthouses. The manufactures are of sail-cloth, linen, check, earthenware, candles, soap, &c. There are large rope-works and extensive ship-building yards. Coal is exported, chiefly to Dublin and other Irish ports. Communication by steam-vessels is maintained with Liverpool, Belfast, Dublin, and the Isle of Man.

There are in Whitehaven three churches of the Establishment; chapels for Wesleyan, Primitive, and Association Methodists, Independents, English Presbyterians, United Presbyterians, Baptists, Quakers, and Roman Catholics; a Marine school; National, British, and Infant schools; a mechanics institute; a news-room and library; and a savings bank. The market-house is a neat building; there are a custom-house, a house of correction, an infirmary and dispensary, salt-water baths, and a theatre. Petty sessions and a county court are held. The market days are Tuesday, Thursday, and Saturday. A fair or great market is held on August 12th. The northern approach to the town is through a gateway of red freestone, above which is a railway for coal-waggons; and at the south-east end of the town is a castellated mansion of the Earl of Lonsdale, called the Castle.

The number and tonnage of vessels registered as belonging to the port of Whitehaven on December 31st 1854 were—Under 50 tons, 13 sailing-vessels, tonnage 335, and one steam-vessel of 37 tons; above 50 tons, 173 sailing-vessels, tonnage 29,540, and 4 steam-vessels, tonnage 879. During 1854 there entered and cleared at the port, inwards, 621 sailing-vessels of 27,969 tons, and 817 steam-vessels of 75,113 tons; outwards, 3223 sailing-vessels of 238,404 tons, and 381 steam-vessels of 73,047 tons.

WHITEHOUSE. [ANTRIM.]

WHITEHORN. [WIGTONSHIRE.]

WHITSTABLE. [KENT.]

WHITTINGTON. [DERBYSHIRE; SHROPSHIRE; STAFFORDSHIRE.]

WHITTLESEA, Cambridgeshire, a decayed market-town and the seat of a Poor-Law Union, is situated in 52° 33' N. lat., 0° 8' W. long., distant 80 miles N.W. by N. from Cambridge, and 78 miles N. by E. from London. The population of the town in 1851 was 5472. The livings are vicarages in the archdeaconry and diocese of Ely. Whittlesea Poor-Law Union comprises the parishes of St. Mary and St. Andrew, with an area of 25,131 acres, and a population in 1851 of 7687.

There are two parish churches in the town, but the respective bounds of the parishes are not known, and there is only one parochial register. St. Andrew's church is the larger of the two; St. Mary's church has a very fine tower surmounted with a spire. The Independents and Baptists have places of worship; and there are National schools, a public library and reading-room, and a literary institution. The market has been discontinued for upwards of 60 years; there are fairs on January 25th, June 13th, and October 26th. Whittlesea Mere, which is about 5 miles S.W. from the town, is noticed under HUNTINGDONSHIRE.

WHITWELL. [DERBYSHIRE.]

WHITWICK. [LEICESTERSHIRE.]

WIASMA. [SMOLENSK.]

WIBORG. [FINLAND; JUTLAND.]

WICK, Caithness-shire, Scotland, a royal and parliamentary burgh, sea-port and market-town, and the chief town of the county, is situated on the Bay of Wick, 140 miles N.N.E. from Inverness by road, in 58° 24' N. lat., 3° 5' W. long. The population of the royal burgh in 1851 was 1514; of the parliamentary burgh, 6722. The town is governed by a provost and 14 councillors, two of whom are bailies; and unites with Cromarty, Dingwall, Dornoch, Kirkwall, and Tain in returning one member to the Imperial Parliament.

The town of Wick has increased considerably of late years. Pulteneytown, which is situated on the opposite side of the harbour, and is connected with Wick by a bridge, has been entirely built within the present century. Wick is the chief seat of the herring-fishery in the north of Scotland. In the harbour there are, during the season, usually from 1500 to 2000 boats. The town is lighted with gas and well drained. It possesses the parish church, two Free churches, and chapels for United Presbyterians, Independents, Baptists, Original Seceders, and Roman Catholics. There is an academy in Pulteneytown; the parochial school is in Wick. There are a Free Church school, a savings bank, and a library. Rope- and sail-making and the dressing of flagstone for pavements are carried on. There are extensive docks at Pulteneytown. The vessels registered as belonging to Wick on December 31st 1854 were:—Under 50 tons 24, of 693 tons; and above 50 tons 21, of 1876 tons. During the year 1854 there entered and cleared at the port as follows:—Inwards, 766 sailing-vessels, tonnage 39,780, and 176 steam-vessels, tonnage 33,622; outwards, 910 sailing-vessels, tonnage 48,763; and 168 steam-vessels, tonnage 32,945.

WICKHAM-MARKET. [SUFFOLK.]

WICKLOW, a maritime county in the province of Leinster, Ireland, is bounded N. by the county of Dublin, N.W. and W. by Kildare, S.W. by the county of Carlow, S. by the county of Wexford, and E. by the Irish Channel. It lies between 52° 40' and 53° 14' N. lat., 6° and 6° 47' W. long.; its greatest length is 38 miles from north to south, and its greatest breadth nearly 33 miles. The area comprises 781 square miles, or 500,178 acres. In 1841 the population was 126,143; in 1851 it was 98,978.

Surface, Hydrography, and Communications.—The county of Wicklow is covered by the mountains which skirt on the south-east the great limestone plain of Central Ireland. The central part of the range consists of a mass of granite, protruding through the slate rocks. The slate rocks occupy the rest of the county on each side of the granite, and form mountains of somewhat less elevation on its flank, extending from the central part of the range on the one hand towards the sea; and on the other, towards the great central limestone plain, no part of which is in the county. Wicklow is altogether occupied by crystalline or schistose rocks.

The eastern flank of the Wicklow Mountains presents a varied aspect, being worn into deep glens and dells, which are lined with abrupt precipices or occupied by lakes, from which begin those narrow transverse valleys whose general course to the south-east is distinguished by the most beautiful and romantic scenery. The western flank, on the other hand, presents less variety, the glens and valleys, which exhibit fewer features of attraction, being more rounded and expanded. The rivers which arise in these have a general tendency towards a north-west direction; but on both sides of the central range the transverse valleys either merge into or cut across more expanded longitudinal vales by which the central range is flanked, and beyond which arise offsets or detached groups and parallel ranges of lower hills.

This mountain range cannot be considered as having a clearly-defined crest or ridge extending longitudinally, but it is intersected by its transverse valleys, so that the mountains which compose it are separated into groups. Their principal summits are as follows:—Kippure, 2478 feet; Seefingan, 2364 feet; Tonduff North, 2043 feet; Tonduff South, 2107 feet; Moan Bane, 2313 feet; Gravale, 2352 feet; Duff Hill, 2364 feet; Mullaghcleevaun, 2783 feet; Tonlagree, 2307 feet; Carrigeenduff, 2105 feet; Little Sugar-Loaf, 1120 feet, and Great

Sugar-Loaf, 1651 feet; Douce, 2384 feet; Table Mountain, 2302 feet; hill south-east of Table Mountain, 2495 feet; Lugnaquilla, the highest mountain in the county, 3039 feet; Croaghan Moira Mountain, 2175 feet, near Lugnaquilla; Keadeen, 2143 feet; and Croghan Kinahela, 1399 feet.

The outline of the coast is tolerably even. Just at the mouth of the Dargle, which separates the county of Wicklow from that of Dublin, is a shelving shore, on which, near Bray, are two Martello towers. About a mile south of the Dargle the coast rises into low cliffs, forming the little promontory of Bray Head. Along the remainder of the coast occur low cliffs, headlands, and sand-hills. The whole length of the coast may be estimated at about 36 miles. The only harbours are formed by the mouths of the rivers Dargle, Vartry, and Ovoca, and they are all unimportant.

The scenery of the county of Wicklow is pre-eminent for picturesque beauty. The Glen of the Dargle, a deep dark cleft or hollow, between two mountains, the sides of which are richly wooded, is a much admired spot, and, owing to its easy distance from Dublin, is much frequented. The Glencoreane, a feeder of the Dargle, forms a beautiful waterfall as it passes through the demesne of Powerscourt. The stream falls over a perpendicular rock at an elevation of 300 feet; it is more striking from its elevation and the rich verdure of the surrounding scenery than from the volume of water. The Glen of the Downs, about 4 miles from Bray, is a romantic opening between two mountains, the sides of which are covered with rich hanging woods, interspersed with rugged cliffs. The view up the glen northward is closed by the picturesque form of the Great Sugar-Loaf Mountain, the summit of which commands a noble view in every direction. The Devil's Glen, near Ashford Bridge, is a narrow pass between two mountains rising precipitously on each side of it, and has little more width than suffices for the passage of the river Vartry, which here flows in an eastward direction. The northern side of the glen is occupied by rich woods, with masses of rocks occasionally breaking through the foliage. The two sides of the glen present in their geological structure and appearance a marked correspondence. The glen, from its depth and narrowness, is dark and sombre in its character. At its upper or western extremity is a noble waterfall; the Vartry throws itself over a ledge of rock 100 feet high in one unbroken sheet into the hollow beneath, and presents, particularly when the stream is swollen by rains, a spectacle of great magnificence. Glenmacanass is a valley amid the mountains, of which Tonelagee is the highest. A curved precipice partly incloses a vast hollow into which the river Avon-More (which waters the valley) falls over the brow of the precipice. Above the waterfall at some distance Tonelagee is broken into many bold granitic precipices. Under one of these precipices, from 400 to 500 feet high, is the small circular lake or tarn Ouler, at an elevation of 1828 or 1830 feet above the level of the sea. The military road made after the insurrection of 1798 runs through this valley. The valley of Glendalough is watered by the Glencole, which joins the river Glendassan, and falls with it into the Avon-More. The valley extends east and west, and is inclosed on the north and south sides by lofty, barren, and inaccessible mountains, which unite and close the western or upper end of the valley, presenting granitic or mica-slate precipices 500 feet high. The river tumbles over the rocks at the west end so as to form a cascade, and then expands into two lakes: the upper lake is about a mile long and nearly a quarter of a mile wide, and about 440 feet above the level of the sea; the lower lake is about 435 feet above the level of the sea, only about a quarter of a mile long, and about half that distance wide. Adjacent to this lake, at its lower end, are the ruins of the seven churches of Glendalough and various other antiquities. Glendassan opens into the valley of Glendalough, or rather the three valleys, Glenmacanass, Glendassan, and Glendalough, all open near the same point into the wider valley of the Avon-More, which may be regarded, with reference to its direction, as a prolongation of Glenmacanass. Glendassan is inclosed on both sides by steep and lofty hills; near its upper end is the lake or tarn Nahanagan, half a mile long, and nearly as wide, about 1380 feet above the level of the sea. Glenmalure is to the south-west of the three glens just noticed. It extends 8 or 10 miles in a south-eastern direction, having the Table Mountain at its upper or north-west end, and on the west the mountains of Croghan Moira. The mountains rise with considerable steepness 600 or 800 feet above the valley, and more than 2000 feet above the level of the sea. Lugnaquilla rises on the south-west of the valley, but not immediately adjacent to it, 2500 feet above the bottom of the valley at the lead-works, or more than 3000 feet above the level of the sea, having at its top a cromlech called 'Pierce's Table.' Near the upper end of the glen is a waterfall formed by the Avon-Beg (or, as it is called in the upper part of its course, the Eas), which waters the valley. The fall is broken by projecting crags, and loses itself in a succession of rapids in the hollow beneath. Glenmalure is characterised by the absence of trees, which imparts to it an air of peculiar sterility and desolation. There are lead-mines in Glenmalure. A bridle road over a gap in Table Mountain leads from Glenmalure to the Glen of Imale, a circular valley, surrounded by lofty heights, Lugnaquilla being the highest, and Baltinglass Hill (1256 feet) the lowest. This valley is about 3 miles in diameter, and is a scene of calm and rich beauty, nearly all the surface being made available, the upper parts of the mountains

for pasturage, the bottom for arable. From a tarn high up the northern side of Lugnaquilla, the Slaney issues and flows through the glen.

The picturesque beauties of the Vale of Ovoca, or Avoca, have been celebrated in Moore's 'Irish Melodies.' In his song 'The Meeting of the Waters' he has commemorated the junction of the Avon-More and Avon-Beg, which unite to form the Ovoca. In a note to the song, Mr. Moore speaks of the junction of 'the rivers Avon and Avoca.' This however is not correct. The name Avoca, or Ovoca, is not given except to the united stream; the constituent waters are both called Avon, one the Avon-More (or Great Avon), and the other the Avon-Beg (or Little Avon). The Avon-Beg is a rapid stream rolling over a rocky bed. The Avon-More has a gentle current. About 3 miles below Newbridge is a second 'meeting of the waters,' equal in beauty to that celebrated by Moore. Indeed there has been some dispute which of the two formed the poet's subject; and in his published 'Diary' he owns that he "wrote the song at neither place, though he believes the scene under Castle Howard [the upper meeting] suggested it." The lower meeting is constituted by the brawling mountain stream the Daragh, Derry, or Aughrim, and the stiller stream of the Ovoca.

The central mountain range divides the county into two slopes, the eastern and the western. The first is drained by the Dargle, the Vartry or Fartrey, the Three Mile Water, the Potter's River, and the Ovoca: the western by the Liffey and the Slaney, with their respective affluents. These two last-mentioned rivers, although draining the western slope, afterwards turn eastward, and passing through openings in the mountain range, fall into the Irish Channel, as well as the rivers which drain the eastern slope. The Dargle rises to the north-west of Douce or Djouce Mountain, and flows first east, then north, then north-east into the Irish Channel below Bray. In its upper part above the junction of the Glencree, it is called the Glencoreane. The Vartry rises on the eastern slope of Douce Mountain, and flows first east, then south, then south-east into the Irish Channel, below the town of Wicklow. It waters the Devil's Glen. It approaches very near to the sea, about two miles north of its present mouth, but being prevented from flowing into it by the ridge of sand or beach which here lines the shore, expands into a narrow lagoon above two miles long, called 'Broad Lough,' at the southern or lower end of which it flows into the sea. The long tongue of land intercepted between this lagoon and the sea is called the Murrrough, or Murragh, and is partly occupied by the Wicklow racecourse. The Three Mile Water has a course of 6 miles, and Potter's River of 7 miles. The Ovoca is formed by the junction of the Avon-More and the Avon-Beg. The Avon-More rises on the south-east slope of Duff Hill, and passes through Lough Dan; it receives on the left bank the Annamoe, which rises in Croghan Pond, a little lake 1770 feet above the level of the sea, passing through Lough Tay, an oval lake, the longer diameter of which is about half a mile, elevated 807 feet above the level of the sea, and surrounded by steep, abrupt, and wooded heights. Lough Dan, through which the Avon-More flows, is nearly two miles long from north-west to south-east, and about three furlongs across at the broad-east part; it is about 630 feet above the level of the sea. From the junction of the Avon-More and the Avon-Beg, the river now called Ovoca flows nine miles into the sea below Arklow, receiving on its right bank the Aughrim, which passes through a pretty glen of the same name, into which the Gold-Mine River and the Ow both fall. The Ow rises on the eastern slope of Lugnaquilla. The Liffey rises in a bog near Croghan Pond, and runs first west-north-west, then south-west (partly within and partly upon the border of the county), to the place where it quits the county altogether to enter that of Dublin, to which it chiefly belongs. It receives the King's River, between Blessington and Ballymore Eustace. The Slaney rises on the northern slope of Lugnaquilla, and flows in a winding channel westward to a little below the junction of the Carrigower: it then turns south, and flows by Baltinglass into the county of Carlow, to which county, and to the county of Wexford, the lower part of its course belongs. It receives on the left bank, above the bend, the Little Slaney, from the western slope of Lugnaquilla, and the Carrigower from the north-west slope of Slieve Gadoe, on the right bank. The Derry River has its source, and a considerable part of its course, within or upon the boundary of this county. It joins the Slaney soon after quitting this county, near Clonegall on the border of the counties of Wexford and Carlow.

Most of the lakes have been noticed in connection either with the scenery or the rivers. Upper Lough Bray and Lower Lough Bray are mountain lakes in which two feeders of the Glencree have their respective sources; the first is 1453 feet above the level of the sea, and has an area of more than 28 acres; the second is 1225 feet above the level of the sea, and has an area of nearly 65 acres.

The chief roads of Wicklow county are, the Dublin and Wexford mail-road, which enters the county at Bray, and runs southward by Delgany, Newtown-Mount-Kennedy, Ashford Bridge, Rathdrum, and Arklow into the county of Wexford; a branch road from this in the neighbourhood of Ashford Bridge to Wicklow; a road from Wicklow to Arklow; a road branching off at Rathdrum, by Talbotstown to Carlow; a road from Dublin to Carlow on the western side, by Blessington, Hollywood, Stratford-on-Slaney, and Baltinglass; a road

from Dublin to Glendalough, by Enniskerry and Annamoe; a road from Blessington to Naas; and the military road from Rathfarnham to Ashavanagh, by Glencree, Glendalough, Laragh, and Drumgoff. The other roads have been considerably improved of late years.

Geology, Mineralogy, &c.—The mass of granite which forms the surface-rock of the central district, occupies a tract of varying breadth, from 7 to 14 miles, and is the fundamental rock on which the other formations rest; it protrudes in isolated portions in the districts occupied by the slates. The granite is in general remarkably pure, and free from minerals not essential to its composition. It varies much in the size of the grain; some of the largest grained and most beautiful occurs in Glencree, in the northern part of the county, amid the mountains north of the Dargle; some of the finest grained, remarkably firm and compact, is found in the Glen of Imale, at the northern side of Keadeen Mountain. The granite is not unfrequently porphyritic, as in Glencree and Glenmacanass. Schorl, tourmaline, garnet, beryl, rock-crystal, epidote, heavy spar, magnetic iron-ore, galena, copper and iron pyrites, and other minerals are found in small portions. Contemporaneous veins of granite, and less frequently of quartz, are found in the granitic mass. Granite of later formation is occasionally found alternating with the rocks which rest on the fundamental granite.

The mica-slate district on the eastern flank of the granite is in general narrow, never exceeding 3 or 4 miles in breadth: it generally passes into clay-slate, by which it is bounded on the east side throughout its course in this county. Hornblende and hornblende-slate, grenatite, emery, andalusite, hollow-spar, talc-slate, which is quarried for chimney-pieces, hearthstones, gravestones, &c., and veins of quartz, occasionally occur in the mica-slate district. The mica-slate on the cap of Kealeen dips 65° to the south-east, and is remarkably full of andalusite. Brissetown Hill consists of mica-slate and trap-rocks, namely, fine granular greenstone, greenstone-slate, and greenstone-porphry. Mica-slate and granite are found alternating near Kilranelagh.

The clay-slate on the eastern flank of the granite occupies nearly the whole of that part of the county which lies east of a line drawn from the junction of the Dargle and Glencree rivers, south-south-west to Tinahely, Shillelagh, and Clonegall in Carlow county. This clay-slate is in different parts associated with granite, mica-slate, quartz-rock, flinty slate, grauwacke-trap, and porphyry. The strata in the northern part of the clay-slate district, near Bray, are much inflected, but in the middle part, and southern part, so far as concerns this county, they are tolerably regular, dipping to the south-east. In some places the granite acquires a sienitic character; in others it passes into a true felspar-porphry; and in others the felspar and mica are so intimately blended as to constitute an apparently homogeneous mineral, in some cases resembling some varieties of the trap-rocks, and in others verging in aspect and texture towards clay-slate. Near Danganstown, south-west of Wicklow, masses of greenstone and quartz rock are found, gradually passing into hornstone and compact felspar. A mass of greenstone, inclosing a bed of roofing-slate, which is quarried, is found near the Avon-More; and quartz-rock in combination with clay-slate, and abounding in contemporaneous veins of pure white quartz; granite, greenstone, and greenstone-slate, alternating with clay-slate, occur in several places. Arklow rock (411 feet high) on the coast, just south of Arklow, consists of trap rocks, as greenstone, felspar, felspar-porphry, and a variety of trap well entitled to the name of basalt, very similar to the basalt of the Giant's Causeway. Quartz-rock forms the masses of the Great and Little Sugar-Loaf, and of the hill above Bray Head. The clay-slate of the western flank of the granite occupies the most of that part of the county which lies west of the Liffey, the King's River, and the Slaney; grauwacke is found in combination with it.

The rocks on the eastern flank of the granite abound in metals, while on the western flank there is a total absence of them. In the granite and mica-slate districts the metallic substances are found in veins; the clay-slate district has metalliferous beds, and contemporaneous veins or alluvial deposits. In the granite and mica-slate, galena, green and white lead-ore, and copper pyrites are found. The ore is smelted in small blast-furnaces, with the aid of turf, lime, and a small portion of the purest blind-coal; the lead is obtained by a single operation, and is fit for all the purposes of the plumber. The principal lead-mines are in Glenmalure.

The metals obtained from the clay-slate tract are gold, silver, copper, iron, lead, zinc, tin, tungsten, manganese, arsenic, and antimony. The metalliferous portion of the clay-slate district is small, extending in length only from the border of the county at Croghan Kinshela, 10 or 11 miles in a north-north-east direction, and having but a small breadth. The discovery of native gold near Croghan Kinshela Mountain took place about 1796, but the quantity found was very small. Some gold has been found in streams near the mountain Croghan Moira. Copper pyrites, iron pyrites, and black copper-ore are found and wrought at Cronbane and Ballymurtagh, near the Avon-More. The mines employ about 1000 men. Native silver, minutely disseminated, sometimes in particles, sometimes in filaments, was found in the middle of the last century in a brown indurated oxide of iron at Cronbane. Lead is found and worked at Ripplagh, or Laganure, near Glenmalure.

Climate, Soil, and Produce.—The climate of Wicklow is nearly similar to that of Wexford; it is said to be somewhat drier than the county of Dublin. The nature of the soil varies considerably; in the mountainous parts it is thin and poor, but dry, and there is a large proportion of bog. In a great part of the lowlands, a rich light black mould rests on a subsoil of gravel or sand, or, sometimes, of yellow clay: this is generally tolerably dry; but a considerable quantity of the valley lands, and the low-lying bog, much require draining. In the north-eastern parts of the county the soil is peculiarly intermixed with small nodules of limestone, imbedded in marl or gravel. Dairy-farming, grazing, and the growing of corn, chiefly oats, are the principal objects of the farmer, and raise potatoes that of the farm-labourer or cottier. The land on the coast is moderately fertile. The county has no peculiar breed of cattle, sheep, or pigs, but all these kinds of stock have been greatly improved of late years. In 1853 there were under crop 118,002 acres, of which 4738 acres grew wheat; 37,947 acres oats; 5465 acres barley, let rye, peas, and beans; 9842 acres potatoes; 5246 acres turnips; 111 acres other green crops; 4 acres flax; and 53,268 acres were meadow and clover. In 1841 the plantations covered 23,945 acres yielding chiefly oak, ash, and fir. On 8015 holdings, in 1852, the aggregate stock was 11,564 horses, 3413 mules and asses, 67,428 head of cattle, 139,235 sheep, 19,972 pigs, 5825 goats, and 141,140 head of poultry.

The fishery along the coast is prosecuted to some extent. Oysters are taken off Arklow Bank, and herrings, cod, mackerel, and other fish, are found within a distance of from 5 to 8 miles from the coast. Arklow and Wicklow are the chief fishing-ports, but neither is good or convenient as a harbour, and the fishery is not very actively prosecuted.

The villas and mansions in Wicklow county are numerous and many of them handsome; and the demesnes are highly cultivated.

Divisions, Towns, &c.—The county is in the dioceses of Dublin and Glendalagh, with small parts in those of Leighlin and Ferns, and contains 59 parishes. It is divided into eight baronies:—ARKLOW, Ballinacor north and south, Newcastle, Rathdown, Shillelagh, and Lower and Upper Talbotstown. The principal towns are WICKLOW and ARKLOW, which with BALTINGLASS, RATHDRUM, and SHILLELAGH are noticed under their respective names. The following are some of the towns and villages, with the population of each in 1851.

Blessington is a neat market- and post-town, on rising ground, near the banks of the Liffey, 14 miles S.S.W. from Dublin: population, 514. In the middle of the town the street expands into a market-place. The church is a handsome small modern building, with a steeple. There are in the town a police barrack, a dispensary, and a loan-fund office. The market is on Thursday, and there are three yearly fairs. Petty sessions are held monthly. Blessington returned two members to the Irish Parliament, but it was disfranchised at the Union. *Bray* is a market- and post-town, standing on both sides of the river Liffey, near its mouth, 12 miles S.E. from Dublin: population, 1554. It is partly in the county of DUBLIN, under which head a notice of the town appears, vol. ii., col. 813. *Carnes* is a neat little market- and post-town on the borders of Wexford county, about 8 miles S. from Tinahely: population, 982. There is a castle which tradition states to have been battered by Cromwell in his march from Dublin to Wexford, but which has since been roofed and repaired. The church is a handsome building, with an embattled tower and spire, and there are chapels for Wesleyan Methodists and Roman Catholics, a dispensary, a loan-fund office, a police station, and a school. Petty sessions are held monthly, and there are eight yearly fairs, four of them considerable horse and cattle fairs. *Dalgany* is a small village and post-town about 2 miles S.E. from Bray: population, 214. It is situated near the elegant mansion and grounds of Bellevue, which form one side of the Glen of the Downs, the seat of the Latouches. The church, a gothic edifice with a steeple 90 feet high, and the school-house, were built by the Latouche family. In the village is a fever hospital. *Donard* is a small post-town on the Slaney, near its source in Slieve Gadoe, about 4 miles N.E. from Stratford-on-Slauey: population, 323. There are a church, a Roman Catholic chapel, many good houses, and the ruins of an old church, burned during the rebellion of 1793. *Dunlavin*, or *Dunlavan*, is a market- and post-town, about 5 miles N.W. from Donard: population, 757. Several of the houses are well built, and there are a neat church of modern erection, a market-house, a Roman Catholic chapel, a school-house, a police station, and a dispensary. Petty sessions are held monthly, and there are six annual fairs. *Enniskerry* is a beautifully-situated village and post-town, on a rapid mountain stream falling into the Dargle River, 12 miles S. from Dublin, on the road to Glendalough: population, 380. There are a school-house, a fever hospital, and a dispensary; also a number of cottages in the old English style erected by Lord Powerscourt. The romantic scenery of the neighbourhood draws many persons from Dublin. Powerscourt demesne, with its spacious and splendid mansion of hewn granite, adjoins the town. Near Enniskerry are the demesne and house of Tinnehinch, which were purchased by the Irish parliament and presented to the late Henry Grattan. *Kilcoole* is a small village on the road from Bray to Wicklow, near the sea, about 2 miles N. from Newtown-Mount-Kennedy: population, 383. There are a church in ruins, a Roman Catholic chapel, and three or four schools. Two fairs

are held yearly on the village green, where is a detached rock, from the summit of which a good view of the surrounding country is obtained. *Newbridge* is a hamlet and post-town on the *Ovoca*, about 5 miles N. from *Arklow*. There are a Roman Catholic chapel and a tourists' hotel; and in its neighbourhood *Castle M'Adam* church, the lead-mines of *Ballymurtagh* and *Cronbane*, a number of mansions and villas, and some of the loveliest scenery of the county. *Newtown-Mount-Kennedy* is a small market- and post-town on the mail-road to *Wexford*, about 10 miles S.W. from *Bray*: population, 717. There are a church, a market-house, a dispensary, a loan-fund office, and a school-house. There are six yearly fairs. Petty sessions are held monthly. The town is chiefly noticeable as being a central station for tourists. *Redcross*, a village and post-town on the road from *Rathdrum* to *Arklow*, about 6 miles N. from the latter town: population, 267. There are a church and the ruins of another church, two schools, a dispensary, and a police station. Petty sessions are held monthly, and there are seven yearly fairs. *Stratford-upon-Slaney* is a small manufacturing, market- and post-town, about 4 miles S.W. from *Donard*: population, 237. This town is of modern origin, having been founded in 1790 by the then Earl of *Aldborough*, after whose family name it was called. The town chiefly consists of one principal street, having in the course of it two large open spaces, one an oval, the other a square, which latter the main street crosses diagonally; there are two or three smaller streets branching from the main street at right angles at the open spaces. It contains a neat church, and chapels for Roman Catholics and Presbyterians. Near the town is a fever hospital. *Tinahely*, about 52 miles S. from *Dublin*, is a market- and post-town on the road from *Rathdrum* to *Carnew*, about 8 miles S.W. from *Aughrim*: population, 562. The town was destroyed in the insurrection of 1798, and has since been neatly rebuilt, partly at the expense of Earl *Fitzwilliam*, the lord of the manor. It consists of three streets meeting in the market-place. There are a market and court-house, a police barrack, a bridewell, and a dispensary. There are also a large flour-mill, a tannery, and a soap manufactory; and 13 yearly fairs are held, chiefly for cattle and pigs. The quarter sessions for the district are held here, and petty sessions are held monthly.

The county returns two members to the Imperial Parliament. It is in the *Leinster* circuit. The assizes are held in the town of *Wicklow*, where are the county jail and an infirmary. Quarter sessions are held there, and at *Arklow*, *Bray*, *Balinglass*, and *Tinahely*, which last two towns have each a bridewell and infirmary. Petty sessions are held in 14 places. The district lunatic asylum, which admits 27 patients from the county, is in *Dublin*. The fever hospitals are at *Arklow*, *Bray*, *Delgany*, *Enniskerry*, *Newtown-Mount-Kennedy*, *Stratford-on-Slaney*, and *Wicklow*. There are 20 dispensaries in the county. *Arklow*, *Balinglass*, and *Bray* have savings banks, and there are loan-funds at *Balinglass*, *Imail*, *Kiltegan*, *Moyno*, and *Wicklow*. The union workhouses are at *Balinglass*, *Rathdrum*, and *Shillelagh*. The county is in the military districts of *Dublin* and *Kilkenny*. The staff of the county militia is stationed at *Arklow*. The police force, numbering 232 men and officers, has its head-quarters at *Wicklow*, and is distributed over six districts, comprising 34 stations. In September, 1852, there were 71 National schools in operation in the county, attended by 3468 male and 3304 female children.

History and Antiquities.—This county appears to have been included in the dominions of the *Cauci* of *Ptolemaeus*. The *Slaney* was perhaps the *Modonus* of *Ptolemaeus*, and the *Ovoca* may be safely identified with the *Ovoca* of the same writer. In the Anglo-Norman invasion (1169) the city of *Glendalough* was taken without resistance, and plundered and burned. In the division of lands among the invaders *Wicklow* was assigned to *Maurice Fitzgerald*. In the division of *Leinster* and *Munster* into shires by *King John*, what is now the county of *Wicklow* was included in that of *Dublin*, and was not formed into a separate county until the government of the lord-deputy *Sir Arthur Chichester*, in the reign of *James I.*, 1605. The native sept appear to have preserved a precarious independence in the mountains; of which the separate continuance of the bishopric of *Glendalough* for nearly 300 years after the attempt of the Anglo-Norman government, with the aid of the Pope's legate, to suppress it, is an indication. Castles were built to restrain them, but with little effect. In the time of *Elizabeth*, *Pheagh*, or *Feagh M'Hugh*, chief of the *O'Byrnes*, was in rebellion against the government, but in 1596 he was defeated, and in 1597 slain. The natives joined in the great insurrection of 1641, and were in the sequel subdued by *Cromwell* in his march toward the south.

In the insurrection of 1798 the *Wexford* insurgents entered the county from the south, but were beaten at *Arklow* by *General Needham* and *Colonel Skerrett*: this was one of the most important actions of the war, as it prevented the insurgents from advancing upon *Dublin*.

The principal antiquities that have not been noticed in the localities where they occur, are those of *Glendalough*, or more properly the *Seven Churches*, as the former name is now applied to the glen, which we have already described.

In this valley *St. Coemgene*, *Kevin*, or *Kevin*, a young man of noble birth, born A.D. 498, took up his abode, and afterwards founded an abbey, under the invocation of *St. Peter* and *St. Paul*, over which he presided as abbot and bishop. *St. Kevin* died in 618, aged 120, and his festival is kept on *June 3rd*. The abbey suffered much in subse-

quent years. It was burned once or twice by accident, and repeatedly soaked or burned by the Danes or others. Notwithstanding these disasters the religious establishments in the glen went on increasing, and the jurisdiction of its bishops extended even to the walls of *Dublin*. About the middle of the 12th century the ecclesiastics began to desert the place, and the see was united in 1214 to that of *Dublin*. The see however continued to exist either by usurpation or papal appointment, and the bishops were supported by the natives. *Denis White*, the last titular bishop, resigned his claims in 1491, and the see has been ever since united to that of *Dublin*. The ruins of many of the ecclesiastical buildings remain. The easternmost are the ruins of the priory of *St. Peter* and *St. Paul*, otherwise the priory of *St. Saviour*, on the south side of the united stream of the *Glencalo* and *Glendassan*: the priory has been a building of more elegant design and richer embellishment than any other building in the valley, but the remains are very imperfect. On the opposite or north side of the stream, a little more to the west, are the ruins of *Trinity* church, sometimes called *Ivy* church, from its being overgrown with *ivy*. A short distance west of *Trinity* church is a small paved area, said to have been the market-place of the city, with a base of masonry on which the market-cross is said to have stood. From this area a paved causeway, the remains of which may be traced in several places, formerly led up the valley of *Glendassan*: traces of a road leading up the valley of *Glendalough* may also be seen in one or two places. To both these roads the name of *St. Kevin's Road* is given. Close to the market-place the river *Glendassan* is crossed by a ford and by stepping-stones; there was anciently a bridge; and opposite to the market-place, on the south side of the *Glendassan*, on the tongue of land between that and the *Glencalo*, are the ruins of the cathedral and of several other churches. The ruins of the cathedral, of what is called the *Priest's Church*, of a 'cloigtheach,' or round tower, and of several crosses, are in an inclosed burial-ground, entered, immediately on crossing the *Glendassan*, by a gateway with a semicircular arch. The remains of the cathedral consist of parts of the nave and choir; the nave was 48 feet long by 30 feet wide, and was united to the choir by a semicircular arch, now fallen down. The semicircular east window of the choir, adorned with a chevron moulding, and having on its impost sculptures of some of the traditional adventures of *St. Kevin*, and three windows on the south side of the nave, remain. The crosses in the graveyard are mutilated; one of them, formed of a single block of granite and neatly sculptured, is supposed to be the market-cross, removed from its base in the market-place. The round tower is in the north-west corner of the graveyard; it is 15 feet in diameter at the base, and tapers very gradually to the summit: it is 110 feet high. Originally it was crowned by a conical roof, but that is gone. Since the publication of *Mr. Petrie's 'Essay on the Round Towers of Ireland,'* there is a growing belief that these remarkable buildings were erected by the Christian ecclesiastics who were settled in Ireland at a very early period. *Mr. Petrie* thinks they were intended to serve at once for keeps, or places of security from marauders, and for belfries. In the inclosures which immediately adjoin the graveyard of the cathedral is a church with a stoue roof, commonly called *St. Kevin's House*, or *St. Kevin's Kitchen*, by far the most perfect of all the ancient buildings in the valley. It is nearly 23 feet long and 15 feet wide inside, and has a semicircular vaulted roof, with an opening into a small round tower or belfry, covered in with a conical cap rising 45 feet from the ground, similar to those of the ancient round towers. The roof of the church is a high-ridged roof externally, rising 30 feet from the ground; at the west end of the church is a small chapel of somewhat later date, with a roof of lower pitch. The sites of two other churches may be traced in this and the adjoining inclosure. A short distance westward from the cathedral are the ruins of *Our Lady's Church*, a small building of more ornamental character than most of the others, and covered with *ivy*, from which circumstance it is sometimes called *Ivy Church*. Scattered in the valley are the remains of stone crosses and two or three small earthen forts. On the bank of the *Lugduff Brook*, which flows into the upper lake, in the midst of a plantation, are the ruins of *Refcart* or *Rhefart Church*. On the south side of the lake are the ruins of another church called *Templenaskellig*, or *Teampall-na-Skellig*, otherwise *Dysart-Kevin*. A small chapel or crypt near the abbey church, discovered in the latter part of the last century, is supposed to have been the tomb of *St. Kevin*. *St. Kevin's Keep* and *St. Kevin's Well*, in the neighbourhood, are connected by tradition with the saint.

WICKLOW, the capital of the county of *Wicklow*, a market- and post-town and seaport, in the parishes of *Kilpoolo*, *Drumkay*, and *Rathnew*, is situated on the right bank of the estuary of the *Vartrey*, which here forms a small port, in 52° 58' N. lat., 6° 3' W. long., about 20 miles S. from *Bray*, 32 miles S.S.E. from *Dublin*. The population in 1851 was 3141.

Wicklow is supposed to have been occupied as a naval station by the *Ostmen* or *Danes* before the Anglo-Norman invasion. *Maurice Fitzgerald*, one of the Anglo-Norman invaders, began to build a castle here. In 1310 the town was burned by the Irish. In 1375 the town was put into a state of defence by one of the *Fitzwilliams*, in whose family the constablership of the castle long continued. In the early part of the 16th century the castle and town were occupied by the native sept of the *Byrnes*, but were soon afterwards surrendered by them to the English government.

The estuary of the Vartrey, which is called Brom Lough, is separated from the sea by a long and narrow slip of land, called the Murrough, which at its southern end bends to the west, and approaches so close to the shore, that a bridge crosses it, and leads to a suburb. At the northern end of this slip is the race-course. The town extends along the estuary for above half a mile. At the eastern end of the town, on a steep rock or cliff projecting into the sea on the south side of the mouth of the river, are some trifling remains of the castle, called Black Castle. In the centre of the town are the ruins of a Franciscan friary, founded in the reign of Henry III. The church of the Wicklow union (which comprehends the three parishes in which the town is situated, and those of Glenealy, Killiskey, and Kilcommon) is on the north-west side of the town, near the river. The south door has a fine Norman arch, the remains of the ancient structure; but nearly all the rest of the building is of modern date: it has a tower and a copper cupola added in 1777. Near the church is a school-house. There are meeting-houses for Wesleyan Methodists and for Quakers, also a Roman Catholic chapel, two school-houses, a fever hospital, an infirmary, a loan-fund office, a county jail and court-house, a post-office, and a police station. Vessels drawing from seven to eight feet water can enter the harbour at ordinary tides. There are two lighthouses on Wicklow Head, a mile and a half south-east of the town. There is a coast-guard station at Wicklow. Corn and some copper- and lead-ore are exported; and coal, culm, limestone, timber, and iron are imported. A few small vessels of from 35 to 100 tons and some small craft belong to the port. Wicklow was incorporated by charter of 11 James I., and sent two members to the Irish parliament before the Union; at which time it was disfranchised. The assizes for the county, and quarter and petty sessions, are held in Wicklow.

WICKWAR. [GLOUCESTERSHIRE.]

WIDIN, a fortified town in Turkey, capital of Upper Bulgaria, is situated on the right bank of the Danube, opposite the straggling village of Calafat on the left bank, about 130 miles E.S.E. from Belgrade, and has a population of about 25,000. The fortifications, which were previously decayed and weak, were repaired and greatly strengthened by the Turks in 1853-54. The town contains pretty wide streets for a Turkish town; many mosques surmounted with graceful minarets; small bazaars, &c. It is the residence of a Greek bishop, and of the pasha of the province of Widin. The trade of the town is in rock-salt, corn, wine, and agricultural produce. The Austrian Danube steamers put into Widin. The inhabitants of Widin consist of Turks, Greeks, and Armenians: the Christians inhabit suburbs outside the line of the fortifications.

WIELICKZKA. [GALICIA, Austrian.]

WIELUN. [POLAND.]

WIERINGEN. [HOLLAND.]

WIESBADEN. [NASSAU.]

WIGAN, Lancashire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Wigan, is situated in 53° 33' N. lat., 2° 38' W. long., distant 40 miles S. by E. from Lancaster, 200 miles N.W. by N. from London by road, and 194½ miles by the London and North-Western railway. The population of the municipal and parliamentary borough, which are coextensive, was 31,941 in 1851. The borough is governed by 10 aldermen and 30 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The living is a rectory, in the archdeaconry of Liverpool and diocese of Chester. Wigan Poor-Law Union contains 20 parishes and townships, with an area of 47,018 acres, and a population in 1851 of 77,539.

Wigan is a place of considerable antiquity. The old part of the town is chiefly on the right bank of the river Douglas; the suburb of Scholes, which is modern, is on the left bank of the river. The town is supplied with water, and is lighted with gas. Besides the parish church, a handsome structure of ancient date, seated on the brow of the hill, there are St. George's church, erected in 1781, and St. Catherine's, built in 1841. There are chapels for Wesleyan Methodists, Independents, Baptists, English Presbyterians, and Roman Catholics; a Free Grammar school; a Blue Coat school; National schools; Infant schools; a mechanics institute, library, and museum; news-rooms; a savings bank; and a dispensary. The town-hall, built in 1720, and the moot-hall, are in the market-place. A large brick edifice, called the Commercial Hall, 102 feet by 66 feet, erected in 1816, is for the use of the manufacturers on market-days. The market-days are Monday and Friday, and there are annual fairs on Holy Thursday, June 27th, and October 28th.

The manufactures of the place comprise linens, calicoes, checks, fustians, the spinning of cotton-yarn, and other branches of the cotton manufacture. Iron- and brass-foundries, chemical works, manufactories of spades and edge tools, and corn- and paper-mills, give considerable employment. There are extensive collieries in the neighbourhood. The Leeds and Liverpool Canal, which passes through the town, gives it the advantage of water communication with Yorkshire and many parts of Lancashire, and, by the Lancaster branch of this canal, with Westmorland. Several lines of railway meet at Wigan, by which communication is afforded with all parts of the country.

Wigan has received nine royal charters, the first of which was granted by Henry III., in 1246. Quarter and petty sessions and a

county court are held. There are several sulphureous springs in the parish.

WIGBOROUGH, GREAT. [Essex.]

WIGHT, ISLE OF, on the south coast of England, is separated from the mainland of Hampshire by a channel called the Solent. The average breadth of this channel is less than four miles. It is narrowest to the west of Yarmouth, where it is contracted to about a mile by a narrow tongue of gravelly beach which runs out nearly three miles from the Hampshire coast, and on the extremity of which is situated Hurst Castle. This narrow part of the channel is extremely deep. From Yarmouth to near West Cowes the width is from three to three miles; it is here contracted to a mile and a half, but opens out opposite to Southampton Water to about five miles; it then becomes narrower as it approaches Spithead, where the entrance to the channel from the east is from two to three miles. The current through the channel, both with the rising and ebbing tide, is extremely strong.

The form of the island is that of an irregular rhomboid or lozenge. The Needles Cliff, at the western extremity of the island, is in 50° 41' N. lat., 1° 34' W. long.; the Foreland, at the eastern extremity, is in 50° 41' N. lat., 1° 5' W. long. West Cowes Castle, north, is in 50° 41' N. lat., 1° 17' W. long.; St. Catherine's Point, south, is in 50° 41' N. lat., 1° 18' W. long. The longer diameter, from the Foreland to the Needles Cliff, is not quite 23 miles; the shorter diameter, from West Cowes on the north to St. Catherine's Point on the south is scarcely 18 miles; the circumference is about 56 miles, and the area is about 1,500 acres, or about 155 square miles. The population in 1851 was 42,000.

Coast and Surface.—The coast of the Isle of Wight consists for the most part of precipitous cliffs or steep slopes. The north coast is more than the south.

The surface of the Isle of Wight is for the most part at a great elevation above the sea. A range of high chalk downs extends with some interruptions and irregularities, from the Culver Cliff east to the Needles west. In this chalk range there are three principal depressions: between Yaverland and Brading, three-quarters of a mile wide through which the eastern Yar flows; between St. George's Down and Carisbrooke, half a mile wide, through which the Medina flows; and at Freshwater Gate, hardly 100 yards wide, through which the Western Yar flows. Besides these principal depressions, several others, from 100 to 200 feet deep, divide the range into a series of long eminences. The highest point of the chalk range is Mottiston Down, 698 feet above the sea. The south side of the island consists of a high range of downs, the upper part of which, on the west, is part of the chalk ridge; on the south, is chalk in horizontal strata; on the east, is green sandstone and iron sand. A broad valley separates the lofty range of south downs from the central chalk ridge. The north side of the island, which is in general less elevated than the south side, consists of a great variety of wooded hills and valleys.

The most extensive of the valleys is that of the Eastern Yar alluded to above, which comprises a large portion of the most fertile land in the island. The basin of the Medina, which is in general very narrow, forms a central valley. The south-western valley is bounded on the east by St. Catherine's Hill, on the west by the sea, on the north by the chalk ridge. On the north-east are a number of small valleys which open separately into the sea; that of the Wootton River is the most extensive. Another series of separate valleys, but more flat and marshy than the north-eastern, forms a north-western valley which is bounded on the west by the high land of Colwell Bay and Totwell Bay. Last and least is the singular valley of Freshwater, in which the Western Yar rises within a few yards of the south coast, and running into the sea at Yarmouth on the north coast, almost makes a distinct peninsula of the western end of the island.

The highest part of the island is St. Catherine's Hill, the summit of which is 830 feet above the sea; the height of Dunnoose is 792 feet.

Rivers.—The Medina rises near the north-eastern foot of St. Catherine's Hill, and runs in a narrow valley till near Gatoombe, where the valley becomes wider; it then passes through the chalk ridge near the centre of the island, and flowing on the east side of Newport, forms immediately below the town a wide estuary, and enters the sea five miles to the north, between East and West Cowes. The Eastern Yar, or Brading River, has its source in the same range of hills as the Medina, not far to the east; it runs in a direction generally north, north-east, and east, and passing through a narrow chasm in the chalk range between Brading and Yaverland, then forms Brading Haven, which at high-water is a beautiful lake of 800 acres, but at low-water is a surface of muddy sand traversed by the Yar. The Western Yar rises near Freshwater Gate, and falls into the sea at Yarmouth; it is an estuary in nearly its whole length, which is less than three miles.

Geology.—The whole of the strata which compose the Isle of Wight are exhibited in its precipitous cliffs in the most distinct and complete manner. Some of the phenomena which these strata present are extremely curious. The north side of the island consists of the strata above the chalk; the centre and the upper part of the south side consist of the chalk; and the lower part of the south and south-east sides consist of the strata below the chalk. The series above the chalk belongs to what has been called the chalk basin of the Isle of Wight, the boundaries of which are—near Winchester to the north, near Carisbrooke to the south, Brighton to the east, and Dorchester to the

west. This basin is circumscribed by chalk-hills, except where it is broken into by the Solent Sea.

The most extraordinary circumstance in the geological structure of the Isle of Wight is the vertical or highly-inclined position of the central chalk ridge, and of the plastic clay and London clay to the north of it. The strata farther to the north and to the south are horizontal, or nearly so, those to the south being the chalk and underlying strata, which remain undisturbed, while those to the north are more recent formations deposited horizontally and unconformably on the broken edges of the vertical strata. Two great sections of these vertical strata are exhibited by the Culver Cliff and the cliffs of Whitecliff Bay on the east, and by the Needles Cliff and the cliffs of Alum Bay on the west. In Whitecliff Bay the plastic clay and sands form two low cliffs perfectly vertical; rounding the cape to the south, the chalk of the Culver Cliff rises to a great height at an angle of about 70°, dipping north-north-east, and gradually diminishing to about 50°. In Alum Bay a section, quite conformable, but more extensive and distinct, is exhibited. On the south are the lower strata of chalk and chalk-marl at an angle of about 50° north-north-east, the upper strata of chalk at an angle of about 70°; farther to the north, the plastic clay and its sands, perfectly vertical; still farther to the north, the London clay, also vertical; and, farthest, a bed of yellow sand inclined at an angle of 60° or 70° north-north-east. The face of the chalk ridge is about one-fourth of a mile wide. The upper strata of chalk have alternating strata of flints in a very extraordinary state, the pieces of flint, though closely invested with the chalk and perfectly retaining their forms, being found, when taken hold of, to be shivered into fragments of every size from three inches to an impalpable powder, and the fractured edges of every particle being quite sharp, as if the effect had been occasioned by a blow of inconceivable force. The plastic clay in Alum Bay consists of clays, marls, and sands in a countless number of layers, some extremely thin, of every variety of colour, and most of them, especially when recently cut, singularly bright, like the stripes of a ribbon or the streaks of a tulip. It contains also eight beds of wood-coal, or rather bituminised wood, each about one foot thick, and vertical, like the other layers. The cross fracture of the coal is earthy; it burns with difficulty, with little flame, and a sulphurous smell. The line along which the disturbing force acted that occasioned the vertical position of the strata may be traced as far as Abbotbury in Dorsetshire.

Another very curious circumstance in the stratification of the Isle of Wight is that of a marine deposit between two fresh-water deposits. This is distinctly shown in a natural section of Headon Hill, on the north side of Alum Bay. Hence it has been concluded that this hill must have been twice the bottom of a fresh-water lake, and at an intermediate period have been covered by the sea. This marine deposit does not seem to be a part of any extensive formation; it only forms a bed of which the actual boundaries are unknown; but the fresh-water formations have been found to correspond very closely with the *calcaire grossier* of the Paris basin. Beneath these formations in Headon Hill, and extending into Alum Bay, Totland's Bay, and Collwell Bay, is a stratum of pure siliceous sand without shells, from 30 to 50 feet thick, which is extensively used for making the best kinds of glass. The whole of the north side of the island is considered to belong to these formations.

The south side of the Isle of Wight, from Dunnose to St. Catherine's, consists in the upper part of chalk and chalk-marl in nearly horizontal strata; the centre is green sandstone, beneath which is dark marl, and then ferruginous sand. Whenever the land-springs act on this marl it is formed into mud, runs out, and leaves the green-sandstone and chalk without support, which then tumble down. In this manner have been formed those picturesque terraces called the Undercliff. The green-sandstone, so called from its being mixed with a considerable quantity of green earth, is here about 70 feet thick, divided in layers by other substances. The green-sandstone and dark-red ferruginous sand extend from Dunnose to Yaverland. The ironsand is very thick, and some of it consolidated into rock, as may be seen in the lofty perpendicular Redcliff, near Yaverland. Cliffs of the ironsand may be traced from Sandown Bay on the east to Freshwater on the west, except where it is concealed by the ruins of the Undercliff. It forms the substratum of all the south side of the island.

Between the central chalk ridge and the south range of downs, the chalk and greensand are entirely wanting; and in this space, which constitutes the valleys of Newchurch and Kingston, the ironsand only is found.

Climate, Soil, and Agriculture.—The climate is very mild, especially in the valleys and sheltered parts of the south side of the island. Laurels, myrtles, geraniums, and various kinds of delicate evergreens, flourish throughout the winter. The Undercliff has been particularly recommended by the most eminent physicians as peculiarly suitable for invalids, especially for persons having a tendency to or afflicted with pulmonary complaints.

North of the chalk ridge the predominating soil is a stiff clay, extremely well suited for the growth of wood, especially oak, which in the neighbourhood of East Cowes and St. Helen's grows down to the water's edge. Elm does not bear the sea air so well as oak, but in sheltered situations it grows to a large size. Ash is not common, and the beech is rare. This north side of the island was formerly covered

GEOL. DIV. VOL. IV.

with forest, and though the demand for ship-building has thinned it greatly, it is still well wooded. All the northern half of the island is much inferior to the southern half as arable land. The soil, whether clay or loam, is generally very full of flints. Much chalk is used for manure, and sea-weed is mixed with the dung in the farmyard. The soil of the whole of the south part of the island is generally a rich red loam, in some parts inclining to sand, in others more stiff and clayey, but everywhere extremely fertile. Timber does not grow so well on the south side of the island as on the north side. A long fleecy gray moss invests many of the trees. Almost all the lower tracts are employed in tillage, and the produce of wheat especially is greater than in almost any other part of the kingdom. Wheat, barley, and oats are exported to a considerable amount annually, and all kinds of pulse and green crops are cultivated. The pastures and meadows are rich, but few oxen are reared. Dairies are attached to most of the larger farms. The Alderney and Devonshire cows are preferred. Large flocks of sheep are fed on the downs, and are in repute for the fineness of their wool; and a considerable number of lambs are sent to the London markets.

Game is abundant, especially pheasants. Fish is not taken in great abundance, except shell-fish. Lobsters and crabs are very large and fine on the south side of the island. Sea-fowl, choughs, puffins, razor-bills, &c., resort to the cliffs in summer in vast numbers: the Main Bench is their chief place of resort.

The Isle of Wight is much visited, as well for the grandeur and extraordinary geological structure of its cliffs, as for the beautiful scenery of the interior, in which, considering the smallness of the space, it is not surpassed by any other part of the kingdom.

Divisions, Towns, &c.—The Isle of Wight is included in, and forms a division of, the county of Southampton. [HAMPSHIRE.] The two nearly equal divisions of the island formed by the Medina constitute the Liberties of East Medina, which contains 14 parishes, and West Medina, which contains 16 parishes. By the Reform Act of 1832 the Isle of Wight was separated from Hampshire for parliamentary purposes, and returns one member to the House of Commons.

The chief towns are NEWPORT, COWES (East and West), and RYDE, which are noticed under their respective titles; and Yarmouth, Brading, and Newtown, which we notice here.

Yarmouth is a small town; the population of the town and parish in 1851 was only 572. It is situated at the mouth of the estuary of the western Yar, 10½ miles W. from Newport. It has an excellent roadstead. There is a pier for steam-boats, a town-hall and market-house, an old but plain church, a Wesleyan Methodist and a Baptist chapel, and National and British schools. The castle is a small fort. The market is held on Friday, and a yearly fair on July 25th. Yarmouth is a corporate town, which was not affected by the Municipal Corporation Act. It was formerly a parliamentary borough, and returned two members.

Brading is a small town picturesquely situated near the head of Brading Haven, on the slopes of two opposite hills on the south-east side of the island, 7 miles E. by S. from Newport: population of the parish 3046 in 1851. The market-house and town-hall is a small structure. The church is large, and has some portions of Norman date. The Independents have a chapel, and there are National and British schools. A sample market for corn is held on Monday. Fairs are held on May 12th and November 2nd.

Newtown, situated on the north-west side of the island, at the top of the estuary of the Newtown River, 5 miles W. by N. from Newport, is a decayed municipal borough, and, until the Reform Act, was a parliamentary borough, which returned two members to the House of Commons. It is now a very small place; it is a chapelry in Calbourne parish, containing in 1851 only 21 houses and 86 inhabitants. At high-water vessels of 500 tons can come up the estuary of the Newtown River, in the creeks of which are several salterns, now little used. The place was burnt by the French in the reign of Richard II. The ruins of a church, and a town-hall now used as a school-room, are the chief relics of the town.

The following are the only villages which require notice; the population, when not otherwise stated, is that of the parish in 1851:—

Arreton, population 1912, is a long straggling agricultural village, situated on the southern slope of Arreton Down, 3 miles S.E. from Newport, and contains an old church, and an endowed parochial school. *Binstead*, population 317, is prettily situated one mile W. from Ryde. It is chiefly occupied by genteel villa-residences, several of which are of quite recent erection, and some of a superior class. The church is a very elegant new building in the early English style. *Bonchurch*, population 523, is on the south side of the island, adjoining Ventnor on the east. The old church, of Norman date, is now disused, a very elegant new gothic church having been lately built. A handsome school-house was erected at the same time. Bonchurch is a favourite residence and resort of bathing visitors, on account of its mild and healthy climate and picturesque situation. *Calbourne*, population 695, is an old-fashioned and secluded agricultural village, 5 miles W. by S. from Newport. The church, of the early English date, has a curious square tower. *Carisbrooke*—population, including Parkhurst Prison, the House of Industry, and the Albany Barracks, 7530—is pleasantly situated on the Medina, one mile S.W. from Newport.

Carisbrooke is said to have been at one time the capital of the island, but to have decayed as Newport rose into consequence. The chief object of interest is Carisbrooke Castle, formerly the residence of the lords of Wight, and subsequently of the governor of the island, but now a mere ruin. It is noticed more particularly at the end of this article. There are also some slight remains of a Cistercian priory. The parish church is a portion of the original priory church. There are a Primitive Methodist meeting-house and an infant school in the village. There are large corn-mills on the river. Parkhurst Prison, or Reformatory for Juvenile Offenders, is in Carisbrooke parish; it is an extensive and well-arranged edifice. Near the Reformatory is the House of Industry, or workhouse for the whole of the Isle of Wight. Near these, and also in Carisbrooke parish, are the Albany infantry barracks. The scenery around Carisbrooke is very beautiful. *Chale*, population 629, is on the south side of the island, at the western extremity of the Undercliff, about 9 miles S. by W. from Newport. It is an agricultural village, but is much resorted to by tourists on account of Black-Gang Chine, one of the most remarkable of the chines, or narrow gorges, through which the streams of the island find their way to the sea, and which form a peculiar natural feature of the Isle of Wight. The cliff over which the stream falls is only about 40 feet high, but the rocks behind it rise to a great altitude, and the cliff scenery generally is here of a very bold and picturesque character. The church is of the reign of Henry I.; there is an Endowed parochial school. *Freshwater*, population 1393, is on the left bank of the Yar, 3 miles S. by W. from Yarmouth. The old village consists of a few houses, situated by the church, near the head of the estuary of the Yar. The church is an ancient cruciform structure, with a rather singular tower. The Wesleyan Methodists have a chapel, and there is a Free school. *Freshwater Gate* is a collection of new villas, lodging-houses, baths, &c., and is much resorted to in summer for sea-bathing. The chalk-cliffs between Freshwater Gate and the Needles are the loftiest in England. The Needles light-house, erected on the summit of the cliff overlooking the Needles rocks, is in Freshwater parish. *Godshill*, population 1316, is an agricultural village built on the sides of an irregular hill, the summit of which is crowned by the church, which is a handsome building, partly of the decorated and partly of the perpendicular period. There is a Free school. In the parish is Appuldurcombe, for a long period the most celebrated mansion in the Isle of Wight. It is a large and stately edifice, standing in the midst of an extensive, well-wooded, and picturesque park. It was the family seat of the Worsleys, and contained the splendid collection of pictures, books, and antiquities collected during many years at a vast expense, and illustrated in a well-known costly work, the 'Museum Worsleyanum.' *Helen's St.*, population 1948, is situated opposite the well-known roadstead, St. Helen's Road, near the mouth of Brading Harbour, 4 miles E.S.E. from Ryde. The old church of St. Helen's stood close by the shore; but having become endangered by the incroachments of the sea, it was pulled down, except the tower, which has been strengthened, and now serves as a sea-mark. A new church was in 1719 erected on a more elevated site; it was almost entirely rebuilt in 1831. A district church is at Oakfield. There are National schools. Many of the inhabitants of St. Helen's are pilots, who mostly reside at Sea View, which place is resorted to for sea-bathing. *Niton*, population 684, is near the south shore of the island, 3 miles S. from Newport. The church is ancient; there are a Baptist chapel and a Free school. A chalybeate spring of some reputation is at Sandrock. At St. Catherine's Point is a handsome lighthouse, erected in 1840; it is 125 feet high to the top of the lantern. *Sandown* is a hamlet in Brading parish; the population is not returned separately. It stands facing Sandown Bay, about a mile and a half S. by W. from Brading. Within the last few years Sandown has been much resorted to by summer visitors. The situation is eminently picturesque, and commands a noble sea view. A new gothic church, a street of good shops, and several excellent villa-residences have been erected. *Shanklin*, population 355, is at the eastern extremity of the Undercliff, 4 miles S. by W. from Brading. The village is chiefly dependent on the numerous visitors who resort here during the summer. The church is very ancient. The Independents have a place of worship. The scenery around Shanklin is very beautiful; but the chief attraction of the place is Shanklin Chine, the most visited and most picturesque of the chines. It is a winding chasm or cleft in the rocks, which terminates in a narrow fissure about half a mile from the shore; at the further end a waterfall being formed by the stream, which has in course of ages worn away the chasm. The sides of the chine are to a great extent overgrown with trees and shrubs. *Ventnor*, population 2569 in 1861, is beautifully situated on the Undercliff, about 9 miles S.S.E. from Newport. Ventnor has within the last 25 years increased from a mere hamlet of a few rude cottages into a well-built watering-place. It was indebted for its rise to having been recommended by some eminent physicians as the most suitable part of the Undercliff for invalids and others requiring a mild climate. It now contains a handsome gothic church with a spire; places of worship for Wesleyan Methodists, Independents, Bible Christians, and Plymouth Brethren; National and British schools; a literary and scientific institution, and a mutual improvement society; handsome baths on the beach; several excellent hotels; numerous villa-residences, some of them of a superior

class; a kind of park called Madeira Vale; some superior shops; a branch bank of the National Provincial Bank of England; and a savings bank. An Improvement Act for Ventnor was obtained in 1844. *Whippingham*, population of the parish, which includes *East Cowes* [noticed under *Cowes*], 3100, is situated on the right bank of the Medina, 3 miles N. by E. from Newport. The church is a neo-crociform building of some antiquity. There is no village property so called; the only reason for noticing it here is that *Osborne*, the seat of her Majesty, is at Whippingham, about three-quarters of a mile from the church. Osborne, since it has become the possession of her Majesty, has been enlarged, and now presents an extended facade in the Italian palazzo style, with a lofty campanile. Standing on a considerable elevation, it commands a magnificent prospect.

History and Antiquities.—The Isle of Wight was conquered by Claudius, A.D. 43. In 495 it was conquered by Cerdic the Saxon, who settled here many of his own countrymen. In 661 Wulfhere, king of Mercia, subdued it. Not long afterwards it was subjected and compelled to embrace Christianity by Ceadwalla. From the 8th until early in the 11th century it was several times plundered by the Danes; and in 1052 Earl Godwin, who had been banished by Edward the Confessor, made a descent on it, and plundered it. William the Conqueror bestowed it on his kinsman William Fitz Osborne, and created him Lord of the Isle of Wight. A succession of Norman lords held it till 1445, when Henry VI. created Beauchamp, earl of Warwick, King of Wight, and crowned him with his own hands. The kingly title however was not continued, and the last of the lords was the Earl Rivers, who was beheaded by Richard III. in 1483. During the period that it was held by these lords it was frequently threatened by the French, and sometimes plundered by them. One of the last of their actual descents was in the reign of Richard II., when they conquered all the island except Carisbrooke Castle, but retired on receiving 1000 marks from the inhabitants. On the succession of Henry VII., Sir Edward Widville, or Woodville, brother to the late Earl Rivers, was made captain of the Isle of Wight, and the title was held by his successors for a considerable period. The last captain was the Earl of Portland, who was displaced by the Parliament, and the Earl of Pembroke was appointed governor in his place. He was succeeded by Colonel Hammond, and during his governorship Charles I. fled to the Isle of Wight after his escape from Hampton Court. He arrived there November 1st, 1647. He was not strictly confined at first, but was so afterwards, when he made several unsuccessful attempts to escape. A conference between Charles and the Parliament was held in the school-room of the Free school of Newport, which lasted some weeks. On the 29th of November, 1649, he was seized and conveyed to Hurst Castle. The title and office of governor of the Isle of Wight is still continued.

The Isle of Wight does not abound in antiquities. Barrows are found on the downs, but there are no traces of Roman forts or camps, or of Saxon warfare. Carisbrooke Castle is the only ancient fortress. During the rule of the lords of Wight, whose power and privileges were almost regal, the present village of Carisbrooke was the capital of the island, and Carisbrooke Castle was the residence of the lords. The castle stands on a lofty eminence, and the keep still higher on an artificial mound. Fitz Osborne the Norman built the castle, and included the keep within the ditch with which he surrounded the whole. The castle was successively enlarged by subsequent lords. Lord Widville, or Woodville, built the main gateway, which is very handsome, in the reign of Edward IV.; the arms of Woodville appear on its front. There were several conventual establishments in the island, but none of large size except Quarr Abbey, which was founded in 1182. It was dissolved by Henry VIII. It was bought by a merchant of Southampton, who swept away everything except some masses of the long walls, which inclosed an area of 30 acres, a building which has been called the Refectory, but on no good authority, and a few fragments of gables, arches, and doorways, which still remain. Carisbrooke Priory is entirely demolished, except the church, which is now parochial. Some of the parochial churches are as old as the Norman conquest. Yaverland church is one of the most ancient. The entrance-door is arched, and has some curious Norman mouldings.

WIGMORE. [HEREFORDSHIRE.]

WIGSTON-MAGNA. [LEICESTERSHIRE.]

WIGTON, Cumberland, a market-town and the seat of a Poor-Law Union, in the parish of Wigton, is situated near the right bank of the river Wisa, in 54° 49' N. lat., 3° 9' W. long., distant 11 miles S.W. from Carlisle, 303 miles N.N.W. from London by road, and 312 miles by the North-Western and Lancaster and Carlisle railways. The population of the town in 1851 was 4244. The living is a vicarage, in the archdeaconry and diocese of Carlisle. Wigton Poor-Law Union contains 31 parishes and townships, with an area of 176,529 acres, and a population in 1851 of 23,661.

Wigton consists chiefly of one long and tolerably wide street, which is lighted with gas and contains many well-built houses. The principal manufactures are checks, gingham, and calicoes. Some linen is made. Tanning, nail-making, brewing, and malting are carried on. The parish church is a handsome edifice, erected in 1738. The Wesleyan Methodists, Independents, Quakers, and Roman Catholics, have places of worship. There are a Grammar school, a British school, and a Roman Catholic school; news-rooms; and parochial, diocesan, and

subscription libraries. The Quakers have an academy at Brookfield House, about a mile west from Wigton. The weekly market on Tuesday is well supplied with grain and provisions; a great market for butchers' meat, apples, and honey is held on St. Thomas's Day. There are several fairs in the course of the year. Petty sessions and a county court are held in Wigton.

WIGTON, Wigtonshire, Scotland, a royal and parliamentary burgh, sea-port, and market-town, and the chief town of the county, is situated at the mouth of the river Bladenoch, where it falls into Wigton Bay, distant 129 miles S.W. from Edinburgh, in 54° 51' N. lat., 4° 24' W. long. The population of the borough in 1851 was 2121. The town is governed by a provost and 17 councillors, two of whom are bailies; and unites with New Galloway, Stranraer, and Whithorn in returning one member to the Imperial Parliament.

The town consists principally of a broad main street, in the centre of which is an inclosed square, containing a bowling-green. Immediately outside the inclosure stands a handsome granite cross. The town-house has a low spire at one end. There is a commodious prison. The old church is a mean-looking fabric. There are a new Church of the Establishment, chapels for Free and United Presbyterians, a Grammar school, a library founded in 1794, and two branch banks. There are several farina mills. Once a fortnight, and sometimes oftener, a steamer calls at Wigton, on the passage between Liverpool and Garieston. The number and tonnage of vessels belonging to the port on December 31st, 1854, was, under 50 tons 36, tonnage 1218; above 50 tons 17, tonnage 1523; with one steam-vessel of 316 tons. During the year 1854 there entered and cleared at the port, inwards, 444 sailing-vessels, tonnage 18,233, and 74 steam-vessels, tonnage 18,018; outwards, 265 sailing-vessels, tonnage 9185, and 78 steam-vessels, tonnage 19,929.

WIGTONSHIRE, a maritime county in the south-west of Scotland, bounded E by Kirkcudbrightshire, N. by Ayrshire, W. by the Irish Channel, and S. by the Irish Sea, lies between 54° 36' and 55° 4' N. lat., 4° 16' and 5° 12' W. long. The county is about 30 miles long and 80 miles broad from the extreme points; its area is 326,736 acres. The population of the county was 89,195 in 1841, and 43,389 in 1851.

Coast-Line.—The sea-coast of Wigtonshire is indented by several spacious bays. Wigton Bay, on the east, diminishes from a width of 8 miles until it terminates in the river Cree. Luce Bay forms an indentation in the southern part of the county, and stretches inwards about 15 miles: the distance between the two headlands of Burrow Head and the Mull of Galloway is about 15 miles, the Mull being about a mile and a half farther south, and the most southern point of Scotland. The point of the Mull, on which there is a lighthouse, is a peninsula of about a mile and a quarter long by a quarter of a mile wide. The small island of Whithorn, about 3 miles N.E. from Burrow Head, affords safe and commodious shelter for shipping. Lochryan Bay, which is also a safe and commodious harbour, on the north-west, extends into the country about 8 miles, to Stranraer, its breadth varying from 2 to 4 miles. No part of the county is above 18 miles from the sea.

Surface, Hydrography, and Communications.—The surface of Wigtonshire, though consisting of eminences and hills of considerable height, is said to be less elevated above the level of the sea than any other county in Scotland. The principal eminences are Mull Hill, Mont-lokown, Bunman, Cairnhill, Cairn of Dolt, and Grennan Hill, which vary from 400 to 900 feet in height. It may be divided into three districts:—the Rhynns (peninsula), lying west of a line drawn between Luce Bay and Lochryan; the Machers (flat country), lying between Wigton and Luce bays; and the Moors, which include the remainder, being more than one-third of the whole county. The freshwater lochs are numerous, but small, and occupy an area of about 7½ square miles. Dowalton, in the Machers, the largest, is about two miles long by a mile and a half broad. The only navigable rivers are the Cree and the Bladenoch. The Cree rises in Ayrshire and separates this county from Kirkcudbright before it falls into Wigton Bay. It is navigable for about 4 miles. The Bladenoch has a circuitous course of about 24 miles in the county before it falls into Wigton Bay. It is navigable for a few miles only. The river Luce, which falls into Luce Bay after a course of 21 miles from the borders of Ayrshire, is easily crossed on foot, except when floods occur. The other streams of the county are comparatively insignificant. Salmon abound in these streams, and on the coast there are several valuable stake-net fisheries.

Geology.—The most prevalent rocks are primary transition and secondary schists. Grauwacke, grauwacke slate, and argillaceous schist are particularly abundant. Beds of grauwacke occur of all thicknesses from a few inches to as many feet, of hard compact grain, and of a blue or grayish brown colour, for the most part breaking irregularly, but often splitting into parallel slices.

Climate, Soil, Agriculture, &c.—The climate of the county is exceedingly mild and salubrious: Wigtonshire is indeed sometimes called the Devonshire of Scotland. Of late years drainage has been scientifically carried out; the most improved implements are in use, and the application of the new manures is general. Towards the coast much of the land is excellent, such as the Baldoon estate, the reclaimed Moss of Cree, and the holms or lowlands around Garieston and Whithorn.

The general soil on the coast-land is either alluvial or sandy loam, and under careful culture is capable of yielding any kind of crop. The soil of the Machers and the Rhynns consists for the most part of a hazelly loam, dry, and adapted for the turnip husbandry. There is a tract of rich alluvial land in the eastern part of the county, which extends from the parish of Kirkcubright to Newton-Stewart. The Moors are bleak and barren, and in many places consist of peat-land partially covered with water. Grazing is much attended to in the county. The land is mostly under entail, and let in farms of moderate size, generally for leases of 19 years.

Divisions, Towns, &c.—Wigtonshire is divided into 17 parishes. The county returns one member to the Imperial Parliament; and one member is returned by the Wigton district of burghs, consisting of Stranraer, Wigton, and Whithorn in Wigton county, and New Galloway in Kirkcudbrightshire. There are three royal burghs in the county, Whithorn, Wigton, and Stranraer. WIGTON we have already described. The others, with the more important villages in the county, we notice here:—

Stranraer, population 5738 in 1851, about 30 miles W. by N. from Wigton, is a considerable sea-port town and royal and parliamentary burgh, situated at the head of Lochryan Bay. Stranraer was made a royal burgh in 1617. The town consists chiefly of three streets, which run parallel to the shore; many of the houses are well built. The town-house is a neat structure. Besides the parish church there are three chapels for United Presbyterians, and one each for the Free Church, Reformed Presbyterians, Original Seceders, and Roman Catholics; a parochial school, two subscription libraries, and a public reading-room. Lochryan Bay forms a spacious and well-sheltered harbour. Tanning is carried on, and hand-loom weaving for Glasgow manufacturers employs some of the inhabitants. The number and tonnage of vessels registered at the port on December 31st, 1854, were as follows:—Under 50 tons 28, tonnage 848; above 50 tons 6, tonnage 638. During 1854 there entered the port 172 sailing-vessels, tonnage 8588, and 251 steam-vessels, tonnage 29,740; and there cleared 134 sailing-vessels of 3996 tons, and 255 steam-vessels of 30,507 tons.

Whithorn, population 1652 in 1851, is a royal and parliamentary burgh and small sea-port, in the parish of Whithorn, 11 miles S. from Wigton. The town consists principally of one long street, intersected by a rivulet. In the main street stands the town-house and jail. In the churchyard are remains of the priory of Whithorn. A Norman arch is nearly entire, and is regarded as a good specimen of its class of architecture. The parish church is a plain building. The Free Church, United, and Reformed Presbyterians have places of worship. The port of Whithorn is subordinate to Wigton. Whithorn is mentioned at an early date in the ecclesiastical annals of Scotland. About the 12th century a priory for monks of the Premonstratensian order was erected by Fergus, lord of Galloway. The relics of St. Ninian collected in the original building attracted for a long period pilgrims from all parts of Scotland and from countries beyond sea. The bishopric of Galloway, or Whithorn, was one of the oldest in Scotland.

Drumore, population about 300 in 1851, in the parish of Kirkmaiden, the most southerly parish of Scotland, is about 5 miles N.W. from the Mull of Galloway. In the bay of Drumore there is good anchorage. In the harbour is a small quay. Drumore Castle is an ancient edifice, belonging to the Earl of Stair. *Garieston*, population about 700, about 8 miles S. by E. from Wigton, has a good harbour, which was improved some years since. At high tide it contains about 20 feet depth of water. Some ship-building is carried on. Garieston is a member of the port of Wigton. There is here a chapel for Independents. *Glenuce*, population about 1000, near the mouth of the river Luce, has a parish church, rebuilt in 1815, a Free and a United Presbyterian church, a Parochial and a Free Church school, a Parochial and a Free Church library, and a savings bank. The oyster fishery employs about 40 boats. At Stairhaven, or the Crow's Nest, there is a harbour for small vessels. Of the Abbey of Luce, founded in 1190, there are some remains. *Kirkcolm*, population about 420, is a small village on the west shore of Lochryan. Many of the females are engaged in embroidering muslin for Glasgow and Ayr manufacturers. There is here a Free church. *Kirkcowan*, population about 660, on the left bank of the Tarf Water, about 10 miles N.W. from Wigton, has some woollen manufactures, and in the vicinity are stone quarries. *Newton-Stewart*, population 2599, is a burgh of barony, on the right bank of the river Cree, about 10 miles N. by W. from Wigton. The town is lighted with gas. The curing of bacon is carried on to a considerable extent. There are a parish church and a Free church, and chapels for United Presbyterians, Reformed Presbyterians, and Roman Catholics. There are a Parochial school, the Douglas academy, an endowed institution, Lady Galloway's Industrial and Infant schools, and the Newton-Stewart and Minigaff young men's mutual improvement society. Lead-mines afford some employment. There is a neat town-hall. *Portpatrick*, population 1038, a sea-port town on the Irish Channel, possesses a convenient and sheltered harbour. Many of the inhabitants are engaged in fishing, or in other maritime pursuits. There are a parish church and a Free church. Since the government mail-packets ceased to have their station here, Portpatrick has declined.

History, Antiquities, &c.—Wigtonshire formed a part of the ancient province of GALLOWAY. Some Saxon remains exist, and relics of the

earlier Celtic inhabitants are occasionally discovered. The remains of an ancient wall or rampart, called the Dail's Dike, which commences at Lochryan, and is believed to have terminated near Bowness in Cumberland, where the great Wall of Hadrian commenced, is supposed by Chalmers to have been the work of the Britons after the departure of the Roman armies. There were monasteries at Whit-horn, WIGTON, Glenluce, and Soulesat. Several ancient castles are scattered over the county, among which may be mentioned Dunakey Castle, singularly placed on the verge of a precipice, above the sea, about a mile S. from Portpatrick; and Castle Kennedy, the ancient seat of the family of Cassilis, in the parish of Inch. The abbey of Glenluce is at the present day a mere remnant of what it once was. Of objects of antiquarian interest the most curious is the stone circle called the Standing Stones of Torrhouse, in the parish of Wigton: the stones are 19 erect blocks of granite, which form a circle, with several stones standing at a little distance to the south and east. Two cairns occur in the same neighbourhood. There are a few other unimportant prehistoric and Roman remains.

Statistics: Religious Worship and Education.—According to the Returns of the Census for 1851 it appears that there were then in the county 52 places of worship, of which 18 belonged to the Established Church, 14 to the Free Church, 10 to the United Presbyterian Church, 4 to the Reformed Presbyterian Church, 4 to Roman Catholics, and 1 each to Episcopalians and Independents. For 50 of the places of worship the number of sittings was estimated at 22,293. The number of Sabbath schools in the county was 51, of which 14 belonged to the Established Church, 14 to the United Presbyterian Church, and 12 to the Free Church. The total number of Sabbath scholars was 3402. Of Day schools there were 101, of which 59 were public schools with 4076 scholars, and 42 were private schools with 1452 scholars.

WILHELMSTADT, or WILLEMSTAD. [BRABANT, North.]

WILKOWYSZKI. [POLAND.]

WILLENHALL. [STAFFORDSHIRE.]

WILLIAM, FORT. [INVERNESS-SHIRE.]

WILLIAM HENRY. [CANADA.]

WILLIAMSBURG. [NEW YORK.]

WILLINGHAM. [CAMBRIDGESHIRE.]

WILLITON, Somersetshire, a village and the seat of a Poor-Law Union, in the parish of St. Decumans, is situated in a valley near the Bristol Channel, in 51° 9' N. lat., 3° 19' W. long., distant 13 miles N.W. from Taunton, 155 miles W. by S. from London. The population of the chapelry of Williton in 1851 was 2783. The living is a perpetual curacy, in the archdeaconry of Taunton and diocese of Bath and Wells. Williton Poor-Law Union contains 36 parishes and townships, with an area of 109,202 acres, and a population in 1851 of 19,895. Besides the district chapel there are places of worship for Wesleyan Methodists and Baptists, and a Diocesan school.

WILMINGTON. [CAROLINA, NORTH; DELAWARE; KENT.]

WILMSLOW. [CHESHIRE.]

WILNA, an extensive government of West Russia, formed out of Samogitia and Lithuania, situated between 53° 35' and 56° 24' N. lat., 21° 5' and 26° 40' E. long., is bounded N. by Courland, N.E. by Vitepsk, E. by Minak, S. by Grodno, S.W. by Poland, W. by Prussia, and N.W. by the Baltic. Its area is 16,251 square miles, and the population in 1846 numbered 868,700.

The country is an extensive and rather elevated plain, diversified by forests and hills, the highest of which however do not rise more than 300 feet above the surface of the sea, and the hollows are filled with marshes and bogs. Some districts are too sandy for vegetation, but on the whole the soil is not unfavourable to cultivation. All kinds of grain and useful plants flourish. Here and there are found blocks of granite, and fossil bones of elephants and other animals. The country appears to have been covered with one vast forest for thousands of years. The progress of cultivation has of course thinned the forests, but there are still woods of great extent. There are many lakes and numerous rivers; most of the rivers are tributaries of the Niemen, which forms the south-western boundary of the province towards the kingdom of Poland. The Duna bounds the province for a short distance on the extreme north-east. The Wilia is the principal river; it rises in Minak, is joined by the Narocs and the Swienta, and falls into the Niemen at Kauen. The Dange and the Beresina both rise in the province; the former passes into Prussia, and the latter into Minak. The course of most of these rivers is slow, and the water is bad in consequence of the many small streams which flow into them from the marshes, which are chiefly in the east and south-east of the province, where likewise the lakes are the most numerous, the principal of which are the Narocs, to the east of Wilna, the Drisirety, and the Lake of Braslau. The winters, though short, are very cold; the spring is long and humid; the autumn and summer are wet and foggy.

Agriculture is the chief occupation of the inhabitants. Rye is the grain most generally cultivated, and considerable quantities are exported. Next to rye are barley and wheat, then oats, buckwheat, peas and beans, and a little millet. Flax, hemp, and hops are grown, and a considerable quantity exported.

Cattle, though numerous, are in general of inferior breed. There is a good breed of small but hardy horses, called the Lithuanian,

which are in great request for the Russian light cavalry. Bees are kept in great numbers. The abundance and remarkably fine quality of the honey are attributed to the great forests of lime-trees, of the flowers of which the bees are very fond.

There are vast forests of oak, fir, ash, beech, lime, willow, maple, and alder, and great abundance and variety of wild-berries are found. Great quantities of charcoal are burned, and pitch, tar, potashes, and lamp-black are made. Large numbers of river-craft are built for the down-navigation of the rivers. There is abundance of game and wild beasts, among which are wolves, bears, gluttons, &c. The urus is said to exist in the woods near Letewik.

The minerals are bog-iron, saltpetre, marble, granite, sandstone, jasper, agates, and chalcidony.

The manufactures are unimportant. The women in the country spin hemp, flax, and wool, weave linen and coarse cloth for their families, and knit stockings. The men work in the forests, and gain their livelihood partly as carriers, and by preparing potashes, pitch, tar, and lamp-black, and partly by assisting in the conveyance of goods on the Niemen, the Duna, and the Wilia. The articles exported are rye, flour, linseed, hops, timber, staves, bark, tar, potashes, hides, wool, hair, horns, feathers, honey and wax, tallow, butter, oxen, Lithuanian horses, and strong coarse linen. There are no great brandy-distilleries, but all the principal farmers have each his own still for himself and his family, and the Jews distil brandy for sale. The inland trade is almost exclusively in the hands of the Jews.

Towns.—Wilna, the capital formerly of Lithuania, now of the government of Wilna, is situated in 54° 43' N. lat., 25° 10' E. long., at the conflux of the navigable river Wilia and the Wileyka, and has about 58,000 inhabitants, of whom more than one-third are Jews. The streets are crooked and narrow. On an eminence called the Castle Hill are ruins of a large palace of the Jagellons. The town-hall, the arsenal, the palace of the government, and some palaces of the nobility, are handsome buildings. Among the churches, which number about 40, the cathedral, dedicated to St. Stanislaus, is the most worthy of notice. It was built in 1367. Besides Catholic convents there are several Jewish synagogues, two Protestant and two Greek churches. The University of Wilna, founded as a college of Jesuits in 1578, was suppressed by a ukase of 1st May 1832, and its library of 200,000 volumes was transferred to St. Petersburg. The town has still a medical academy, a botanic garden, an observatory, and a theological seminary. It has a few manufactures and a considerable trade.

Zvolé, situated on a lake 17 miles to the west of Wilna, has 4000 inhabitants. Kowno, a town of 7000 inhabitants, is situated at the conflux of the Wilia and the Niemen; it was here that the main body of Napoleon's army entered Russia in 1812. Krcidany, with 6000 inhabitants, is a very considerable town; all the houses are of wood.

WILTON. [NORFOLK.]

WILTON, Wiltshire, a market-town, a municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Wilton, is situated near the river Wily, in 51° 4' N. lat., 1° 51' W. long., distant 3 miles W. by N. from Salisbury, and 84 miles W.S.W. from London. The population of the parliamentary borough in 1851 was 8607. The borough is governed by a mayor, aldermen, and burgesses, and returns one member to the Imperial Parliament. The living is a rectory in the archdeaconry and diocese of Salisbury. Wilton Poor-Law Union comprises 23 parishes and townships, with an area of 55,304 acres, and a population in 1851 of 10,742.

Wilton is a place of great antiquity, and its former importance is indicated by the circumstance of its having given name to the county, which is called in the Saxon Chronicle Wiltunscire. It was the scene of one of Alfred's earlier battles with the Danes in 871. Wilton was the occasional residence of the West Saxon kings; and an abbey for nuns existed here at an early period. The town was plundered and burnt by the Danish king Sweyn, in the reign of Ethelred II., 1003, but it appears to have so far recovered as to be a place of importance at the time of the Conquest. It was for a time (909-1045, or later) the seat of a bishopric formed by the dismemberment of the diocese of Sherbourne, and afterwards reunited with it, just before the removal of the see to Sarum.

Wilton stands on the tongue of land formed by the junction of the Nadder and the Wily. The town consists chiefly of one long street, on the road from Salisbury to Hindon and Mera. The old church, formerly the abbey church, is now only used as a place of sepulture. The new church, erected in 1842, at a cost of nearly 30,000*l.* by the Right Hon. Sidney Herbert, M.P., is a very elegant and highly-finished edifice in the Lombardic style, with a detached campanile. There are places of worship for Independents and Methodists; an endowed and a parochial school. Opposite the old church is 'the county cross.' The town-hall is an ancient plain brick building. Wilton was formerly famed for its carpet manufacture: this branch of industry has declined, but is still carried on to some extent, and some beautiful fabrics are produced. The market is not held regularly. There are two yearly fairs; one of them, one of the greatest sheep fairs in England, is held on September 12th, the other on May 4th.

Near the town is Wilton House, the seat of the Earl of Pembroke, a mansion of incongruous architecture but imposing appearance,

standing in a noble park, in which are also extensive gardens. The house contains a fine collection of paintings and antiquities, and a valuable library.

WILTSHIRE, an inland county of England bounded N.W. and N. by Gloucestershire, N.E. by Berkshire, S.E. by Hampshire, S.W. by Dorsetshire, and W. by Somersetshire. The county is of very compact form, approximating to a quadrangle. Wiltshire is situated between 50° 55' and 51° 43' N. lat., 1° 29' and 2° 21' W. long. The greatest length of the county, north and south, is about 54 miles; the greatest breadth, east and west, is 37 miles. The area is estimated at 1352 square miles, or 865,092 statute acres. The population in 1841 was 256,280; in 1851 it was 254,221.

Surface and Geology.—The geological formations of Wiltshire consist chiefly of the cretaceous and oolitic series, with the intermediate beds; in the south-eastern corner the chalk is covered with the tertiary formations of the chalk-basin of the Isle of Wight.

The chalk formation may be considered, from its extent, as the most striking geological feature of the county, forming as it does the extensive downs which overspread the eastern, central, and southern parts. The chalk district of Hampshire and Wiltshire constitutes the centre of the chalk formation in England, from which proceed four great branches. The first great branch is the chalk range of the Chiltern Hills, Dunstable and Royston Downs, &c., extending through Berkshire, Buckinghamshire, Bedfordshire, Hertfordshire, Cambridgeshire, Essex (just the north-western corner), Suffolk, and Norfolk, across the Wash, reappearing in Lincolnshire and Yorkshire, and terminating in Flamborough Head; the second branch is the North Downs of Hampshire, Surrey, and Kent; the third the South Downs of Hampshire and Sussex; and the fourth the North and South Downs of Dorsetshire, inclosing between them the trough of Poole.

The Wiltshire portion of the great central chalk district is divided into two parts by the Vale of Pewsey, where the greensand occupies the bottom of the valley, and is skirted on each side by the chalk hills. This valley extends east and west, and it may be convenient to describe the two portions into which it divides the chalk district as the northern and southern districts: Marlborough Downs belong to the northern district; Salisbury Plain belongs to the southern.

The northern chalk district is bounded by a line entering the county from Berkshire at the village of Bishopston, and passes Avebury, Eddington, or Heddington, its westernmost point, Bishop's-Cannings, Wootton-Rivers, and Great Bedwyn, to the border of Berkshire at Great Shalbourne. The boundary may be traced throughout by a tolerably steep escarpment overlooking the surrounding country. The included chalk district is divided into two parts by the depression or valley, running east and west, through which the Kennet passes from Avebury to Hungerford; and the northernmost of the two parts is again divided by a valley running north and south, and drained by a small feeder of the Kennet. This valley is occupied by the chalk, as well as the higher ground on each side. The principal eminences are on the boundary-line of the district, and are in several instances crowned by ancient intrenchments, or rather earthworks. The following may be enumerated:—Charlbury Hill, above Little Hinton; Beacon Hill, crowned by an ancient intrenchment called Liddington Castle, above Liddington; Barbury Hill, also crowned with an intrenchment; Hackpen Hill, above the Winterbournes; Oldbury Castle, an intrenchment on the summit of the hill above Cherhill, having a white horse carved on the slope beneath; Beacon Down, above Eddington; Roundaway Hill, above Devizes, the scene of a severe action in the civil war of Charles I.; with Easton Hill, St. Ann's Hill, and several other hills, which are parts of the southern escarpment overlooking the Vale of Pewsey. The northern chalk district forms an elevated platform, and is to a considerable extent uncultivated and uninclosed. In the part north of the valley of the Kennet, are Marlborough Downs, Aldbourn Chase, Wanborough Plain, and Bishopston Down. South of the valley of the Kennet are the King's Play Down, Pound Down, Severnake Forest, and Bedwyn and Wilton Commons.

The southern chalk district is bounded by an extremely irregular line, commencing on the north side of Inkpen Beacon, and making a circuit by Westbury, Maiden-Bradley, and Wilton to Shaftesbury in Dorsetshire, its continuity being broken by three deep indentations in the upper part of the valleys of the Avon, Wily, and Nadder, where the subjacent formations have been denuded.

The south-eastern part of the county, inclosed by this boundary, is occupied by the chalk which extends eastward into Hampshire and southward into Dorsetshire, and forms an extensive hilly tract furrowed by the valleys of the Nadder, the Wily, the Avon, and the Bourn, and a valley watered by a stream which passes Broad-Chalk, Bishopston, and Humington, which valleys unite near Salisbury to form the Valley of the Lower Avon. South and east of Salisbury the chalk is covered with the plastic clay formation belonging to the chalk basin of the Isle of Wight, which is also observed in one or two other places in the district.

The principal hills in this southern chalk district, as in the northern, are on the boundary, which is for the most part indicated by a steep escarpment. The principal eminences are Inkpen Beacon, the highest point in the chalk formation in England, 1011 feet high, near the junction of Wiltshire, Hampshire, and Berkshire; Easton Hill and Pewsey Hill, both commanding the Vale of Pewsey, and crowned

with ancient earthworks; Little Cheverill and Great Cheverill Hills; Eddington Hill, Battlesbury Camp, Titherington Hill, Chiselbury Camp, with a circular intrenchment, and White Sheet Hill, between Wilton and Shaftesbury. In the central part of the district are Mizmaze, Ashley, and Harnham hills, Tower Hill, Amesbury Down, Newton Hill, and numerous others.

This chalk district, known as Salisbury Plain, forms an elevated platform, uncultivated and uninclosed, except in the valleys. Wide downs, covered by a scanty herbage, spread in every direction. The population is collected in the valleys, where, along the streams which water them, the villages stand very close to each other. The chalk is generally bare of wood, except in three or four spots, such as Severnake Forest, Grovely Wood, Vernditch Chase, and Cranbourn Chase.

The greensand formation, comprehending the chalk-marl with the greensand, crops out from beneath the escarpment of the two chalk districts occupying the Vale of Pewsey, which separates them, as well as the indentations in the boundary of the southern chalk district. Consequently the outer edge of the greensand is rather more regular than that of the chalk. The greensand rises gradually from the foot of the chalk escarpment towards its outer edge, which is in many parts traceable by a well-defined and steep escarpment.

From Eddington the outer edge of the greensand may be traced in an irregular line by Devizes and Pottern to Market Lavington; then westward by Westbury to the border of Somersetshire. It occupies nearly all the county west of the chalk between Warminster and Mere. About Warminster and Stourhead Park, in the south-western part of the county, the greensand hills nearly equal those of the chalk in height. Alfred's Tower, near Stourhead, is on a greensand hill 800 feet high.

From beneath the outer edge of the greensand formation the Weald clay, or Tetsworth clay, which usually separates the greensand from the ironsand, crops out. It occupies only a narrow tract, surrounding on every side the country occupied by the superior formations, and may be traced through the county with little interruption. In the Vale of Wardour the clay occupies a very narrow strip skirting the greensand. The ironsand does not appear in this county, except in a few places, and is described as being a pudding-stone composed of rounded quartz united by a siliceous cement with a red calx of iron, containing ore formerly in much request for the furnace and the forge.

In the absence of the ironsand, the Weald clay is found to rest along the northern and north-western borders of the county on the Kimmeridge clay, which belongs to the uppermost division of the oolitic group. This Kimmeridge clay occupies a tract rarely exceeding two miles in breadth, but extending in length from the Berkshire border to Seend, west of Devizes, beyond which it is covered by the westward extension of the overlying formations. At Swindon, in the Kimmeridge clay district, beds of oolitic freestone, similar to the Portland beds, intervene between the Weald clay and Kimmeridge clay, and are extensively quarried. In the northern part of the county the upper oolites are confined to low ground: in the Vale of Pewsey they acquire some elevation, as in Lady Down near Tisbury.

The formations already noticed occupy the whole of the county south and east of a line drawn westward from the Berkshire border, three miles south of Highworth, parallel to and a little to the north of the Wilts and Berks Canal, by Stratton to Wootton-Basset and Seend, to the Somersetshire border at Corsley near Frome; the whole line making a circuit convex to the north-west. Beyond this boundary the strata of the middle oolites, comprehending the coral rag and calcareous grit, and the Oxford clay, crop out, occupying all the northern border of the county, and extending westward to a line drawn south by west from Cirencester to Gloucestershire, by Malmesbury, Chippenham, Melkham, Trowbridge, and North Bradley, to Frome in Somersetshire; beyond which line the upper beds of the lowermost division of the oolites appear.

The tract occupied by the middle oolites has a breadth of eight miles along the northern part of the county, where it extends into Gloucestershire: between Wootton-Basset and Cirencester, it is 11 or 12 miles broad; thence diminishing towards the south and south-west, so that near Westbury and Frome it is probably not more than one or two miles broad. The lower or outer edge of the coral-rag and calcareous grit may be traced by a range of low hills of this formation, extending to the north of Highworth, Swindon, and Wootton-Basset, and then westward by Lyneham, Bremhall, Bowood, and Bromham. Near Seend, west of Devizes, there is a depression in these hills, through which the Kennet and Avon Canal passes; but the hills re-appear at Steeple-Ashton, beyond which the coral-rag is covered by the westward extension of the chalk and greensand. The average height of the coral-rag hills seems to be about 400 feet above the level of the sea. The Oxford or clunch clay occupies the lower ground at their foot, including the valley of the Thames, and that of the Avon above Malmesbury. There are some gentle eminences of Oxford clay between Criklade and Malmesbury, and again about Melkham, Semington, and Trowbridge. Mineral waters occur in this formation; those of Melkham, and of Holt, three miles south-west of Melkham, are impregnated with purgative salts; those of Seend near Devizes contain iron and carbonic acid. The formations belonging to the lower oolites in this county are the cornbrash, the forest-marble, then a bed of clay, in some places 80 feet thick, and then the great oolite.

Hydrography and Communications.—The county is comprehended in the three basins of the Thames, the Severn, and the Christchurch or Salisbury Avon; that part of the south-western border about Stourhead and Mere which is drained by the Dorsetshire Stour being included in the basin of the Avon, with which the Stour unites in Christchurch haven. The northern chalk district and the northern part of the county, as far as a line drawn from the neighbourhood of Swindon to near Tetbury in Gloucestershire, are included in the basin of the Thames; the southern chalk district, with the greensand district which begirds it, the Vale of Pewsey east of Devizes and Market Lavington, and the Vale of Wardour, belong to the basin of the Salisbury or Christchurch Avon; and the western side of the county, nearly as far south as Warminster, belongs to the basin of the Severn.

Some of the streams which join the Thames in the upper part of its course rise in this county. One, which has been considered by some persons, but with very little reason, as the true Thames, rises just on the border of the county where the Roman road Akeman or Acman Street crosses the Thames and Severn Canal by 'Thames-head' bridge; it joins the Churn or true Thames [THAMES] from Cirencester, about a mile above Cricklade bridge. This pseudo-Thames has a course of about nine miles before joining the true Thames. From Cricklade bridge, where the true Thames first touches the county, it flows four miles by Castle Eaton to the border of the county; then between three and four miles farther along the border, separating Wiltshire from Gloucestershire; and quits the county altogether a little above Lechlade. The *Key* (otherwise the Ray) rises in the greensand hills near Wroughton; it runs northward, passing to the west of Swindon, and joins the Thames between Cricklade and the border of the county. The *Cole* rises near Chisledon, and flows northward, chiefly on the border of the county, which it separates from Berkshire, and flows into the Thames just beyond the border of the county.

The most important feeder of the Thames in this county is the *Kennet*, which rises in the greensand district near its outer edge, in Cleavancy-fields between Cliffe-Pypard and Yatesbury. It flows south and south-east by Yatesbury and Avebury, to Silbury Hill on the Bath road, near which it turns eastward by East Kennet, Manton, Marlborough, Mildenhall, and Chilton-Foliat, just below which it touches the border of the county, which it separates from Berkshire for about a mile or a mile and a half, and then, at Hungerford, quits it altogether. That part of the course of the Kennet which belongs to Wiltshire is about 20 miles long.

The *Salisbury Avon* rises in the southern slope of the northern chalk district, in the neighbourhood of Devizes, and flows east-south-east along the Vale of Pewsey. At Salisbury it is joined on the right by the *Wily* (united with the *Nadder*): it is joined a little lower down, on the left bank, by the *Bourne*, and afterwards flows southward by Standfinch House to Downton, a little below which it quits the county: its length from the neighbourhood of Devizes to the border of the county is 42 miles. [AVON.]

The *Wily* or *Willely* rises in the downs north of Mere, in the south-west part of the county, and flows first east, then north by the Deverills to Warminster, near which it bends to the east-south-east, and flows past Heytesbury, Wily, Steeple-Langford, Stapleford, Ditchampton, and West Harnham, to Fisherton-Anger, a suburb of Salisbury, where it joins the Avon. Its whole course is about 27 miles. Near Quiddampton it is joined on the right by the *Nadder*, which rises close to the Dorsetshire border near Shaftesbury. The *Bourne* rises just within the northern boundary of the southern chalk district, and flows southward by Collingbourn-Kingston to Shipton, where it crosses a corner of Hampshire, Cholderton, Allington, Idmiston, the Winterbournes, and Laverstook, near Salisbury, below which it joins the Avon: its whole length is about 23 miles.

A very small part of the county about Mere, in the south-western corner, is drained by the upper waters of the Dorsetshire Stour, which rises at Stourhead in this county. The Stour and the Salisbury Avon unite just above their outfall into the English Channel at Christchurch.

That part of the county which belongs to the basin of the Severn is drained by the *Bristol* or *Lower Avon*, the sources of which are in the Cotswold Hills, at Horton near Chipping-Sodbury in Gloucestershire, and in the hilly district in the northern part of Wiltshire. The united stream is joined at Malmesbury by a stream, eight miles long, from Tetbury and Brokenborough. From Malmesbury the Avon flows in a winding channel 15 miles southward to Chippenham, and thence 20 miles in a winding channel south-west by Laycock, Melksham, Bradford, and Limpley-Stoke, to the border of this county and Somersetshire, between Bradford and Bath. The *Marden* rises in the greensand hills (Compton Hill) above Compton-Basset, flows by Calne, and after a course in all of about 9 miles, flows into the Avon. The *Were* and the *Frome* are also feeders of the Avon. The *Were* is formed by the junction of several streams which rise on the escarpment of the chalk downs about Westbury. The *Frome* belongs to Somersetshire, but some part of its course is on the borders of this county.

Of these numerous rivers but few are navigable, and then only for a short distance in this county. This is the consequence of its central position and comparative elevation, from which it results that the principal streams have only their sources or the upper part of their courses in it. The navigation of the Thames, the Kennet, and the

Bristol Avon does not commence until after those rivers have quitted the county.

The want of river navigation in Wiltshire is partially supplied by canals, of which three lines are connected with this county. The northernmost line is that of the Thames and Severn Canal, which in its course from the Thames at Lechlade in Gloucestershire to the Stroudwater Canal at Stroud in the same county, connecting the rivers Thames and Severn, crosses the northern part of this county near Castle Eaton and Cricklade. The second line is that of the Kennet and Avon Canal, which also connects the Thames with the Severn by means of their respective tributaries the Kennet and the Bristol Avon. This canal is 57 miles long: it commences at the head of the navigation of the river Kennet at Newbury in Berkshire, and terminates in the river Avon at Bath. About 41 miles of its course is in Wiltshire, which county it enters near Hungerford. It passes Great Bedwyn, Devizes, and Trowbridge, and quits the county 4 miles from Bradford, at the Dundas aqueduct, by which it is carried over the Avon. The third line of canal navigation is that of the Wilts and Berks Canal: it lies between the two lines already noticed, and connects the Thames near Abingdon with the Kennet and Avon Canal at Semington, between Devizes and Bradford. At Lower Eastcott, near Swindon, is a branch nearly all in Wiltshire 8½ miles long, passing the town of Cricklade to the Thames and Severn Canal at Latton in Gloucestershire, near Cricklade.

The principal coach-roads are the former mail-roads from London to Salisbury and Exeter, and to Bath and Bristol. There are several roads from London to Exeter besides the mail-road. One of these branching from the mail-road at Salisbury passes through Combe-Bisset, and enters Dorsetshire near Woodyates Inn. Another branching from the mail-road at Andover enters the county at Park House, and runs across Salisbury Plain through Amesbury and Winterbourne-Stoke to Mere, beyond which it enters Somersetshire. The road from London to the Old Passage on the Severn, opposite the mouth of the Wye, branches from the Bath road at Chippenham, and runs by Yatton-Keynell, Castle-Combe, and Nettleton into Gloucestershire. There are several roads from Salisbury, the county town: one runs south by west to Cranbourne, Wimbourne-Minster, and Poole in Dorsetshire, branching from the road to Exeter (through Blandford, Dorchester, and Honiton) a little beyond Combe-Bisset; one southward by Downton to Fordingbridge, Lyndhurst, and Christchurch in the New Forest in Hampshire; two south-east to Southampton—one through Bramshaw, the other through Romsey; two eastward to Winchester—one by Romsey, and one (branching from the London and Exeter main-road) through Stockbridge; and two north-east to Bath and Bristol—one through Heytesbury, Warminster, Westbury, and Bradford; the other branching from this at Warminster, and rejoining it at Bath.

The main line of the Great Western railway crosses this county in a direction nearly parallel to that of the Wilts and Berks Canal. It enters Wiltshire between the Shrivenham and Swindon stations, the latter of which is 77 miles from the London terminus, and runs in a south-western direction by Swindon, Chippenham, Corsham, and Box. The Cheltenham branch quits the main line at Swindon station, and runs in a generally north-western direction towards Stroud, a few miles short of which it quits Wiltshire. Just before it leaves Wiltshire the Cirencester branch runs off from it, but only two miles of this branch is in this county. The Wilts and Somerset branch quits the main line near the Chippenham station, south-by-west by Melksham, Trowbridge, and Westbury to Warminster. At the Westbury station a short branch diverges south-west to Frome, of which about three miles are in this county. The Salisbury branch of the South-Western railway enters the county at West Dean, and runs thence west-by-north for seven miles to Salisbury, where it terminates.

Climate, Soil, Agriculture.—In an agricultural point of view the county of Wilts may be divided into two districts—the first or southern district comprehending all the Wiltshire Downs, with their intersecting valleys, and separated from the northern district by an irregular line running round the foot of the chalk-hills from their entrance into the north-east part of Berkshire to their south-west termination at Maiden Bradley.

South, or more properly, South-East Wiltshire, contains in round numbers about 500,000 acres of land. The Downs are an elevated table-land intersected by valleys, which give the surface a broken appearance. These valleys contain rivers and small streams. The soil being generally more fertile there, and the climate milder, cultivation was originally confined to them, and there most of the villages are situated: the higher and more exposed situations remain as natural pastures for sheep and cattle. The air on the Downs is keen, and healthy to robust constitutions. The valleys, although more sheltered from the sweeping winds from the Atlantic, partake of this keen air, which is drawn along their course in currents. The soil on the Downs varies little, being thin, and uniformly resting on the chalk. It produces excellent short herbage very well suited for sheep-pasture. It is comparatively a small proportion which has been converted into arable land, and chiefly on the borders of the valleys. As we descend from the Downs into the valleys the soil generally becomes less mixed with flints and of a more loamy nature, in consequence of the waters washing down portions of the upper soil, of which the finer particles are deposited on the sides of the hills, and form what is called white

land. The level part of the valleys nearest the rivulets consists of flints washed down lower and mixed with fine earth.

Some remarkable veins of sand intersect this district: one of these, of a fertile nature, enters the county at Mere on the borders of Dorsetshire, and takes a north and north-east direction round the outer edge of the Downs, keeping nearly close to their foot, by way of Maiden Bradley, Warminster, Westbury, and Lavington, towards Devizes, where it meets with a much wider and still more fertile vein coming down the Pewsey vale from Barbage. Another vein also enters the county from Dorsetshire, being a continuation of the sand-hills on which Shaftesbury stands, and passes through Donhead, Ansty, Swallowclift, Fovant, &c., under the foot of the Downs, till it is stopped by the high ground in Barcombfield. This vein is also met at or near Fovant by another branch, or rather a ridge of sand-hills, coming from West Knoyle by Stop-Beacon and Ridge.

The system of cultivation was originally such as the situation of the more fertile soils and their connection with the extensive pastures on the Downs naturally suggested. Wool was no doubt the principal produce, and no more corn was grown than the necessity of the inhabitants required. In no part of England was the system of water-meadows introduced so early or carried to such perfection. A farm consisted of certain buildings and homesteads, with meadows, irrigated if possible, or kept in heart by flogging; with some fields to raise corn for the family, and a run on the Downs for a certain number of sheep, which were the chief source of rent and profit. Since the common fields have mostly been inclosed and divided among the proprietors, more land has been cultivated and better systems have been adopted; but this has been done slowly. A great and gradual improvement however has taken place, and new methods of cropping, new manures, and improved instruments, as well as more compact and better-arranged farm-buildings, are continually being introduced. Sheep are still a principal object of the Wiltshire farmer, but his attention is not confined to them, and he makes them subservient to a greater production of corn. All the usual crops are raised.

The water-meadows are extremely well managed. There are two kinds of water-meadows, those irrigated by catch-work and those which are flooded. The flooded meadows are those which lie along the course of the rivers or rivulets, and are flat and level naturally or rendered so by art. The water is let on by sluices and channels from the upper part of the stream, and kept in by banks, if necessary, and let off again into the lower part of the stream, or on lower meadows, by similar sluices and channels. It is computed that there are above 20,000 acres of excellent water-meadows in this district.

As the cows in this district are not such objects of attention as the sheep the breeds are very various, and few of them of superior quality. The chief dairies are on the borders of Dorsetshire, whence comes the butter used in the towns, North Wiltshire producing little butter, except whey-butter—its chief produce being cheese. The Wiltshire sheep are a variety of the Southdown, but not in general so pure. The original breed was horned, but this has been almost entirely superseded by the polled breed, which produces a finer wool, if not so large a carcass. The Southdown breed has almost entirely superseded the old Wiltshire breed. The pigs are much the same as in other counties, the Chinese and the Neapolitan breeds having by their crosses improved the original breeds and altered all their qualities.

The north-western district of Wiltshire differs greatly from the southern district. The sub-soil in this part of the county, instead of being chalk, consists chiefly of flat broken stone, called provincially corn-grate. It is the same as that of the Cotswold Hills in Gloucestershire. These stones serve for building when they are of sufficient thickness, and the thinner layers to cover houses, instead of slate. The top-soil is a reddish calcareous loam mixed with irregular flat stone, and commonly called stone-brash. In some places a stratum of clay is interposed between the rock and the top-soil, which may easily be known by the oaks which thrive there, whilst on other parts the elm thrives best.

There is a very fertile vein of gravel, or rather of small shelly sand with pebbles, covered with a good depth of rich mould, which runs in a broken line from Melksham through Chippenham to Cricklade, but extends wider from Tytherton through Christian Malford and Dauntsey to Somersford. All this vein is very rich land, especially near Dauntsey. A less fertile vein of sand runs from Redburn by Seagry and Sutton Benger to Langley Burnell by Chippenham, and another begins at the opposite corresponding hill at Charlott, and runs through Bremhill to Branham. The greatest part of the residue of the soil of this district lies on a hard close rock of a rough irregular kind of spurious limestone, fit only for mending the roads with: the soil above this rock is mostly retentive of moisture, and consequently cold.

This district is essentially a dairy country, and probably has been so from time immemorial. The buildings are well suited to this purpose, and placed conveniently with respect to the surrounding fields. The cheese-lofts are often on a very extensive scale; and all the buildings are kept in a neat and substantial order. Leases are common for 14 or 21 years, and the tenant is prevented from selling hay or straw, which secures his keeping sufficient stock for manure. The implements are similar to those used in the south-eastern district. The common fields have been mostly inclosed, to the great advantage

of the husbandry. Some of the best land has been laid down in grass, and a better system of cropping has been generally introduced, as well as a cleaner tillage. The grass-land forms the greater portion of North Wiltshire, and the cheese made there is justly celebrated.

The breed of milk-cows is an object of greater attention in this district than in the southern. A great many cows are fattened in the dairies. The sheep in this district are much the same as in the southern portion of the county, and although there are not such extensive sheep-pastures, there is usually a flock attached to every arable farm, and folding is one of the chief modes of manuring the fields. Many porkers are fattened in the dairies on the whey, after it has been skimmed and whey-butter made. The breed of pigs has been much improved. There is nothing peculiar in the breed of horses; those used on the farms are mostly imported young from other counties.

There are very few market-gardens or orchards in this district, and no cider is made. Vegetables are only raised for sale near the towns; every farm having generally as much garden as the family requires, and no more. The woods have diminished greatly all over the county, which was once very well-wooded.

There are many excellent markets in Wiltshire; the principal corn-markets are Warminster, Devizes, and Salisbury. Swindon and Salisbury are excellent cattle-markets. Marlborough is a great market for cheese, although most of it is contracted for by factors, who take the whole produce to London, Bath, and Bristol.

Divisions, Towns, &c.—The county is divided into 28 hundreds, which are situated as follows:—

Alderbury, south-east; Amesbury, east; Bradford, west; Branch and Dole, central; Calne, central; Cawden and Cadworth, south; Chalk, south; Chippenham, north-west; Damerham North, north-west, with Damerham South, south-west; Downton, south and south-west; Dunworth, south-west; Elatub and Everley, east and central; Frustfield, south-east; Heytesbury, south-west and central; Highworth, Cricklade, and Staple, north; Kingsbridge, north-east and central; Kinwardstone, east; Malmesbury, north; Melksham, west and central; Mere, south-west; Potterne and Cannings, central; Ramsbury, north-east; Selkley, east and central; Swanborough, central; Underditch, south-east and central; Warminster, west; Westbury, west; Whorwelsdown, west.

The city of Salisbury is included in Underditch hundred, the borough of Devizes in Potterne and Cannings hundred, and the borough of Marlborough in Selkley hundred.

Wiltshire contains the county town and city of New Sarum, or SALISBURY; the parliamentary boroughs of CALNE, CHIPPENHAM, CRICKLADE, DEVIZES, MALMESBURY, MARLBOROUGH, WESTBURY, and WILTON; the disfranchised boroughs of GREAT BEDWYN, DOWNTON, Heytesbury, Hindon, Ludgershall, Old Sarum, and Wootton-Bassett; and the market-towns of AMESBURY, BRADFORD, CORSHAM, HIGHWORTH, East or Market Lavington, MELKSHAM, MERE, SWINDON, TROWBRIDGE, and WARMINSTER. The places printed in small capitals are described in separate articles. Of the rest we subjoin an account, the population given being that of 1851:—

Heytesbury, population 1210, on the left bank of the Wily, about 17 miles N.W. by W. from Salisbury, had for its Saxon name Hegtredesbiryg, softened in Domesday into Haseberie. The church is a large cruciform edifice, with a square tower at the intersection of the nave and transept. It was anciently collegiate. The Independents have a chapel, and there is a National school. The manufacture of woollen-cloth employs a few of the inhabitants.

Hindon, population 710, about 15 miles W. by N. from Salisbury, is a small market-town and decayed borough. The church or chapel (for East Knoyle is the mother church) is a plain building; it was founded in the 16th century; in 1836 it was repaired and enlarged. The Primitive Methodists and Independents have places of worship, and there are National schools. The market is on Thursday; fairs are held on May 27th and October 29th for horses, cattle, sheep, and poultry.

Ludgershall, colloquially termed Lurhall, population 580, about 17 miles N.N.E. from Salisbury, close to the Hampshire border, is called Litlegarsele in Domesday. There are some remains of a castle erected soon after the Norman Conquest. The church is of irregular form, with nave, chancel, and two transepts of very unequal dimensions. The Primitive Methodists and Baptists have places of worship, and there is a Free school. A mutilated stone cross distinguishes what was formerly the market-place. There is a considerable yearly fair.

Old Sarum, situated about a mile and a half N. from Salisbury, is generally regarded as the Sorbiodanum of the Romans. Its name, derived from the Celtic words sorbio, 'dry,' and 'dun,' 'a city or fortress,' leads to the conclusion that it was a British post. The number of Roman roads which met at Old Sarum, which are noticed at the end of this article, and the mention of the place in the Itinerary of Antoninus, show that it was occupied by the Romans, but the remains present little resemblance to the usual form of their posts. In the Saxon times, Sarum, under the somewhat altered name of Searobyrg, Serabyria, and Sarisberia, is frequently noticed by historians. Kenric, son of Oerdic, defeated the Britons in this neighbourhood, A.D. 552; and in 1008 the place was taken and burned by Sweyn, king of Denmark. Under the Anglo-Saxon and Anglo-Norman princes,

councils ecclesiastical and civil were held here, and the town became the seat of a bishopric. There was a castle or fortress, which is mentioned as early as the time of Alfred, and which may be regarded as the citadel; and the city was defended by a wall, within the inclosure of which the cathedral stood. Early in the 13th century the oppression of the castellans, or captains of the castle, and their disputes with the bishops and clergy, led to the removal of the cathedral to its present site. Many of the citizens also removed, and the rise of New Sarum [SALISBURY] led to the decay of the older place, so that in the time of Leland there was not one inhabited house in it. It returned members to Parliament in 23 Edward I., and again in 34 Edward III., from which period it continued to return them until it was disfranchised by the Reform Act. It was commonly referred to as the most striking instance of a rotten borough, continuing to return members when it had neither house nor inhabitant. It contained one house with four inhabitants in 1851.

Wootton-Basset, population 2123, about 15 miles N. by E. from Devizes, is called in Domesday, *Wodetone*; it passed to the Bassets of W.combe, from whom it obtained its distinguishing epithet. The market-house and the town-hall, as well as the church, which is ancient, are in the centre of the town. The Independents and Primitive Methodists have chapels, and there are National, British, and Infant schools, and an Endowed Free school. The market is on Tuesday, and there are four yearly fairs, with a large market for cattle on the second Tuesday in each month.

East or Market Lavington, population 1189, about 6 miles S. by E. from Devizes, is in the valley between the greensand and chalk hills on the north-west side of Salisbury Plain. The church, which occupies an elevated site a short distance west from the town, is in the perpendicular style. The Independents and Baptists have places of worship, and there are National and British schools. The market is on Wednesday, and there is one yearly fair. An iron-foundry and agricultural implement manufactory gives some employment. Malting, gardening, and basket-making are carried on.

The following are some of the more important villages, with the parish populations in 1851, and a few other particulars:—

Aldbourn, or *Auburn*, population 1622, about 9 miles S.E. from Swindon, is beautifully situated in a fertile valley, and was once a place of importance, possessing a market and fairs, which have however been long disused. The church is of Norman date. The Wesleyan and Primitive Methodists and Independents have places of worship, and there are National schools. *Ashton-Keynes*, population 1365, about 4 miles W. by N. from Cricklade, is on the left bank of the river Thames, near the Gloucestershire border. The church, which is ancient, has some traces of Norman architecture. The Independents and Primitive Methodists have places of worship. There is a Free school. *Steeple-Ashton*, population of the tithing 802, about 4 miles E. from Trowbridge, was formerly a market-town and the seat of a considerable clothing manufacture. The parish church is a lofty and elegant structure, with nave, chancel, side aisles, north and south porches, and a large square tower at the west end. The church was erected about the end of the 15th century. The tower was originally surmounted with a stone spire, which gave the village its specific designation of Steeple-Ashton. The spire was destroyed in two thunder-storms in July and October, 1760. There are here a chapel for Baptists, and a National school. A tessellated pavement, somewhat different in style and material from the usual Roman pavements, was dug up at Steeple-Ashton. *Box*, population 1987, about 4 miles W. by S. from Corham, is situated in a beautiful valley watered by a small feeder of the Avon, sometimes called the Box Brook. The parish church is an ancient edifice with a spire. The Wesleyan Methodists have a chapel, and there are National schools. There are considerable quarries near Box of the freestone usually called Bath stone, and there are two mineral springs. A station of the Great Western railway is at Box, and the longest tunnel on the line is near this place. *Maiden Bradley*, population 704, is on the Somersetshire border, 7 miles S.W. from Warminster. The parish church is a stone edifice with a western tower. It was originally built in the reign of Richard II., but has undergone repairs and alterations at various periods. In the village are a chapel for Independents and National schools. *North Bradley*, population of the tithing 987, is about 2 miles S. from Trowbridge. The parish church is a commodious structure with a fine Norman tower. There are here an Endowed National school and an asylum for six poor parishioners. Broadcloth and kerseymeres are made here. *Bratton*, population of the chapelry 721, is about 2 miles N.E. from Westbury. The parish church is of Norman architecture, and has a tower at one corner surmounted with a spire. Bratton camp is an ancient intrenchment of irregular form, nearly a mile in circuit, and inclosing an area of 23 acres. *Bromham*, or *Brenham*, population 1619, is 4 miles N.W. from Devizes. The village is near the site of the Roman station *Verulcio*, and some Roman antiquities, consisting of a bath and portions of a tessellated pavement, were found here about 90 years since. The church, which is large and ancient, has been restored and repewed. It has a chapel richly carved, which contains some ancient banners and armour, and several monuments of the Baynton family; the tower, with the spire which surmounts it, is 180 feet high. The Wesleyan Methodists and Baptists have places of worship, and there

are National schools. In the vicinity is *Sloperton Cottage*, long the residence of the poet Thomas Moore, and the house in which he died. *Bishop's-Cannings*, population 3925, is about 3 miles N.E. from Devizes. Bishop's-Cannings has a fine cruciform church, with nave and side aisles, transept, south porch, a chantry on the east end of the south transept, another chantry chapel, and a lady chapel, now used as the chancel. The church was repewed in 1829. There are National schools. *Castle Combe*, population 557, about 6 miles N.W. from Chippenham, has an ancient gothic church with a tower, chapel for Independents and Baptists, and National schools. Paper-making and making are carried on, and in the neighbourhood there are saw-mills. *Corsley*, population 1473, is about 5 miles W. by N. from Warminster, on the Somersetshire border. The church is a neat early English edifice, recently rebuilt, with a square tower. The Baptists and Independents have places of worship, and there is a National school. *Crudwell*, population 781, is about 4 miles N. by E. from Malmesbury, near the Gloucestershire border. The church is a very ancient edifice, but has been altered and repaired at different periods; it is chiefly in the early English style. The Baptists have a chapel, and there is a National school. *Longbridge Deverhill* or *Deverhill*, population 1878, about 3 miles S. from Warminster, is so called to distinguish it from four other villages to which the name of Dew hill is common. The church is ancient, and contains the burial-place of the Bath family. There are a chapel for Primitive Methodists, National schools, and some almshouses. *Longleat House*, the splendid mansion of the Marquis of Bath, standing in a well-wooded park about 12 miles in circumference, is on the border of the county, about 5 miles W. from Longbridge Deverhill. The clothing manufacture gives employment to some persons in the parish. *Fonthill Gifford*, population 442, is about 2 miles S.E. from Hindon. The church, built by Adam Beckford, is constructed after the model of a Grecian temple, with a pediment and a tower surmounted with a dome. There are National schools. The extensive park in which is the site of Fonthill Abbey, lies between Hindon and the village of Fonthill Gifford. The magnificent structure raised here by the celebrated William Beckford, author of 'Vathek,' was entirely removed after the fall of the lady central tower in 1825. *Praxfield*, population 571, is chiefly noticed on account of the Duchess of Somerset's Hospital, or almshouse, for 30 widows of laymen and 20 widows of clergymen. The building forms an oblong quadrangle of considerable extent, and the institution is under the charge of a steward, a chaplain, and other officers. The parish church, which is seated on high ground a short distance from the village, is a brick building with a low tiled roof. *Hilperton*, population 996, about a mile N.E. from Trowbridge, shares in the cloth and kerseymeres manufacture of that town. There are here a small parish church, chapels for Wesleyan Methodists and Baptists, and National schools. *East Knoyle*, population 1110, is about 2 miles S. from Hindon. The church, a cruciform stone building with a western embattled and turreted tower, stands on elevated ground. There are National schools, a lending library, and a branch of the Wiltshire Friendly Society. East Knoyle was the birthplace of Sir Christopher Wren, whose father was rector of the parish. *Lacock* or *Laycock*, population 1653, about 3 miles S. from Chippenham, near the right bank of the Avon, was formerly a market-town. The church is an ancient gothic edifice with a spire. The Independents have a chapel, and there are National schools. *Lacock Abbey*, now the seat of the lord of the manor, was formerly a nunnery, founded about 1231. *Potterne*, population 1778, about 2 miles S. from Devizes, is pleasantly situated in a sheltered and picturesque valley. The church, a Norman edifice, has been repaired and internally restored. A large square tower, embattled, with turrets and pinnacles, rises from the intersection of the nave and transepts. There are here a chapel for Wesleyan Methodists, National schools, and some parochial charities. *Parva*, population 2087, about 4 miles S. from Cricklade, is pleasantly situated on elevated ground. The church is a commodious and handsome cruciform gothic structure with two towers; the one which rises from the intersection of the nave and chancel is surmounted with a lofty spire. The Primitive Methodists and Independents have places of worship, and there are National schools. *Ramsbury*, population 2696, on the left bank of the Kennet, about 12 miles S.E. from Swindon. Ramsbury was made the seat of the bishopric erected in the 9th or 10th century by the dismemberment of Wiltshire from the diocese of Sherbourne; the see was removed after an interval to Wilton, and was afterwards reunited to Sherbourne, the cathedral being fixed at Old Sarum, from which it was removed to Salisbury. The church is spacious, and consists of a nave and two aisles, a chancel, and a massive western tower. The Wesleyan and Primitive Methodists and Independents have places of worship, and there are National schools. Ramsbury formerly had a market. *Rosde*, population 1123, is about 2 miles W.N.W. from Devizes. The church, partly rebuilt in 1833, is a gothic edifice with a square embattled tower at the west end. The Wesleyan Methodists have a chapel, and there are National schools. *Sherston Magna*, or *Great Sherston*, population 1589, is situated near the head of the river Avon, about 6 miles W. by S. from Malmesbury. Sherston is supposed to be the Sceorstane of the Saxon Chronicle, the scene of an indecisive battle in 1016 between Edmund II. (Ironside) and Canute, who engaged during the battle in personal conflict. The village is partly within the site of an ancient encampment, part of

which is obliterated. The church at Sherston is a very large cruciform building, comprising a nave, two aisles, transept, and large south porch. It is partly Norman, partly of later date. The Independents and Baptists have chapels, and there are National and British schools.

Divisions for Ecclesiastical and Legal Purposes.—About three-fourths of the county are included in the diocese of Salisbury and archdeaconries of Sarum and Wilts. The other fourth is in the diocese of Gloucester and Bristol, and archdeaconry of Bristol. By the Poor-Law Commissioners the county is divided into 18 Poor-Law Unions:—Aldbury, Amesbury, Bradford, Calne, Chippenham, Cricklade and Wootton-Basset, Devizes, Highworth and Swindon, Malmesbury, Marlborough, Melksham, Mere, Pewsey, Salisbury, Tisbury, Warminster, Westbury and Whorwelsdown, and Wilton. These Unions contain 307 parishes and townships, with an area of 773,713 acres, and a population in 1851 of 240,460. Wiltshire is in the western circuit: the spring assizes are held at Salisbury, the summer assizes at Devizes. The Epiphany quarter sessions for the county are held at Devizes; the Easter sessions at Salisbury; the Midsummer sessions at Warminster; and the Michaelmas sessions at Devizes. County courts are held at Bradford, Calne, Chippenham, Devizes, Malmesbury, Marlborough, Melksham, Swindon, Trowbridge, Warminster, and Westbury. Before the Reform Act 34 members of Parliament were returned from Wiltshire—namely, two for the county, two for the city of Salisbury, and two each for the boroughs of Great Bedwyn, Calne, Chippenham, Cricklade, Devizes, Downton, Heytesbury, Hindon, Ludgershall, Malmesbury, Marlborough, Old Sarum, Westbury, Wilton, and Wootton-Basset. By the Reform Act Great Bedwyn, Downton, Heytesbury, Hindon, Ludgershall, Old Sarum, and Wootton-Basset were altogether disfranchised; and Calne, Malmesbury, Westbury, and Wilton reduced to one member each. The county was formed into two divisions, each returning two members; so that the number of members is now 18.

History and Antiquities.—Wiltshire is probably the richest of all the English counties in memorials of the earliest historic period, and also of the ante-historic period of our country. This pre-eminence it owes to the wide extent of its chalk downs, unbroken by inclosures, and untouched by the plough, on which the earthen or rude stone memorials of the remotest ages have remained uninjured, except by the mouldering touch of time, or by rare and occasional interventions of the caprice and violence of man; exempt in a great degree from the more systematic and complete destruction which the extension of building or cultivation has caused.

It is difficult to determine exactly to which of the ancient British nations the various parts of the county belonged. A large portion, there can be no doubt, belonged to the nation or nations mentioned by Ptolemaeus under the generic name of Belgæ. Ptolemaeus assigns to them the cities of Ischalis and Aquæ Calidæ, now Ilochester and Bath in Somersetshire, on the one hand, and Venta, now Winchester in Hampshire, on the other. We may therefore assign to the Belgæ that part of the county which lies between these places. Other parts of the county may probably have been occupied by the Durotriges, the Atrebatii, the Dobuni, and the Hedui. It is likely that the county was included in the scene of Vespasian's operations in the reign of Claudius. In the Roman division of Britain, Wiltshire was included in the province of Britannia Prima.

After the departure of the Romans Wiltshire was the scene of contest between the Britons and the Saxons. The site of the asserted massacre of the British nobles by Hengist is placed on Salisbury Plain, but the event itself and its locality are alike doubtful. The great victory which Cerdic, founder of the kingdom of Wessex, obtained in 508 over the British king Natan-leod, or Nazaleod, brought the conquerors to the south-eastern border. Chardford, the Cerdic's-ford of the 'Saxon Chronicle,' on the Salisbury Avon, above Fording-bridge, in Hampshire, but close on the Wiltshire border, was the limit of the territory 'Natanleaga,' to which Natan-leod gave name. In 552 we find Cynric, son of Cerdic, in successful conflict with the Britons at Searobyrg, or Old Sarum. The West Saxons, of whose kingdom Hampshire formed the nucleus, appear to have sought to extend their power northward, to and even beyond the Thames, rather than westward. However, before or in 577, they must have overrun Wiltshire, as we find them in that year, under their king Ceawlin, fighting with the Britons in the north of Somersetshire and in Gloucestershire, to reach which they must have crossed Wiltshire. In 591, according to the 'Saxon Chronicle,' "there was a great slaughter of the Britons" at Wodnesbeorge, or Wanborough, near Swindon. In 652 Cenwalh, king of the West Saxons, "fought at Bradan-forda by Afene," obviously Bradford-on-the-Avon. In 715 Ine, or Ina, king of Wessex, and Ceolred, king of Mercia, fought at Wodnesbeorhe, or Wanborough, near Swindon. In 828 the battle which gave to Wessex the permanent superiority among the Anglo-Saxon states was fought at or on Ellendune, probably Allington-on-the-Bourne, near Amesbury, or Ellington Wroughton, now called simply Wroughton, near Swindon.

The first notice of Wiltshire by that name in the 'Saxon Chronicle' occurs under 870, just before the accession of Alfred, when it is recorded that the Bishop of Wiltshire, Ethered, was translated to the metropolitan see of Canterbury. It is obvious that the name, which is written Wiltun-soire, was taken from the town of Wiltun, or Wilton. Alfred's first battle with the Danes, after his accession, was fought at Wilton early in 871, before he had been on the throne a month. His ardour

GEOL. DIV. VOL. IV.

led him to engage the enemy with too small a force, and he was defeated. Just at the beginning of 878, Cyppanhamme, or Chippenham, was surprised by the Danes, and Alfred was driven from his kingdom. When he emerged from his retirement amid the marshes of Athelney, he met the men of Somersetshire and Wiltshire at Egbyrhtes-stane, or Egbert's-stone (probably Brixton Deverhill, near Warminster), on the east side of Seal-wuda, or Sel-wood; whence he marched to Iglea (Iley, or Highley, near Melksham), and from thence to Æthandune, generally supposed to be Eddington, near Westbury, under the escarpment of the southern (or Salisbury Plain) chalk district, where he gave the Danes so complete a defeat as to compel them to surrender their camp and submit to him. He thus recovered his kingdom with little difficulty. The Danish army, which appears to have retired by agreement to Chippenham, marched after some months (879) to Ciren-ceastre, or Cirencester, and next year (880) into East Anglia, where they settled.

When the East-Anglian Danes revolted against Edward the Elder (905), they forced the Thames at Cricklade, and overran and plundered the country as far as Bradon, between Cricklade and Malmesbury, but retired before the king could gather his army to attack them. In the year 978 a council of the chief nobles on ecclesiastical affairs was convened by Dunstan at Calne, which became mournfully celebrated from a fearful disaster which distinguished it. The floor of the room where the council was assembled gave way; some were killed, others dreadfully bruised, but Dunstan was unhurt. In 1003 Wiltshire was ravaged by the Danes, who plundered and burnt Wilton, and occupied Old Sarum; the men of Wiltshire and Hampshire assembled to meet them, but the treachery or cowardice of their commander, Ealderman Elfric, enabled the enemy to withdraw without loss. For several years the Danes continued to harass the district. In 1016, soon after midsummer, a severe but indecisive battle was fought between Edmund Ironside, who had become king of the Anglo-Saxons, and Canute, the Danish king, at Scesorstane, now Great Sherston, about six miles west from Malmesbury.

The Roman road from Calleva (Silchester) to Isca Silurum (Caerleon) probably entered the county at or near Hungerford, but there do not appear to be any traces of it east of Marlborough. It is still to be traced from Fyfield, two miles west of Marlborough, with little interruption, for 22 miles across the downs by West Kennet, Silbury Hill, and Heddington Wick, through Spy Park, almost to the border of the county near Bathford. The remains of baths, tessellated pavements, medals, pottery, glass, &c., have been dug up in Spy Park and in Bowood Park, near the supposed site of the station Verlucio. This road is included in the twelfth Iter of Richard of Cirencester.

A Roman road from Calleva (Silchester) and Venta Belgarum (Winchester) to Isca Dumniorum (Exeter), coincident with the fifteenth Iter of Antoninus, and included in the sixteenth Iter of Richard, enters the county across the Hampshire border, about two miles east of the village of West Winterslow, passes by the hamlet of Middle Winterslow (near which its remains are called the Devil's Causeway), across Winterbourne-Down, and thence to Old Sarum; from which place the road runs south-west by Stratford-Dean, Bemerton, and Vernditch Lodge, and across Vernditch Chase, into Dorsetshire, where it is in one part known as Achling Ditch, or Atchling Street.

The Roman Foss Road touches the boundary of the county on the north side, about two miles from Cirencester; it runs south-west about 23 miles upon or within the boundary of the county, coinciding throughout with existing roads, and showing its Roman origin by the directness of its course. There are traces of a Roman settlement at Easton-Grey on the Foss, where a profusion of medals has been found.

Another Roman road enters the county on the north side, and runs south-east, coinciding with the modern road from Cirencester to Cricklade, near which it crosses the Thames, just however avoiding the town. From near Cricklade, it runs still south-east by or near Water-Katon, Wanborough, and Baydon, into Berkshire, uniting at Spine or Speen with the Roman road from Londinium to Aquæ Sulis, or Bath. It is comprehended in the thirteenth Iter of Antoninus, and is coincident throughout its Wiltshire course with modern roads or lanes. Numerous minor roads evidently of Roman construction have been traced in the county.

Of the station Cunetio traces are found both at Mildenhall on the north side of the Kennet, and Folly Farm on the south side. The hill on which Folly Farm stands is covered with a variety of banks and earthworks, probably belonging to the period before the Roman dominion, and within these more ancient works are traces of the Roman settlement. A portion of the rampart, which was quadrangular with rounded angles, may be seen; and funeral remains, coarse tessellated pavements, medals, and other relics have been dug up.

The earthworks of Sorbiodunum, now Old Sarum, are very conspicuous. They are on the right of the Marlborough road, about a mile and a half from Salisbury, and consist of a circular or rather oval intrenchment; a smaller intrenchment of similar form within the first; and some earthen banks extending from the inner to the outer intrenchment, and subdividing the area between them. Numerous roads met here, of which traces are still distinguishable.

At Stockton Wood Corner, 10½ miles from Sorbiodunum (Old Sarum), on the road which leads into Somersetshire by Kingston Deverhill, are some indications of a Roman settlement, pottery and

medals having been dug up. At Bishopstrow, between Warminster and Heytesbury, on the line of the supposed road from Sorbiodunum (Old Sarum) to Aquæ Sulis (Bath), the remains of a Roman settlement have been found; an earthen vallum incloses an irregular quadrangular area of 50 acres, still called the Bury: large fragments of Roman pottery have been dug up in every part of the inclosure. At Pitmead, close to Bishopstrow; at Rudge, near Froxfield; at Bromham, near the site of the station Verucio; and at Littlecote, near Ramsbury, tessellated pavements have been discovered, but the principal of them were destroyed soon after they were found. At Rudge a brass cup and some medals were found in a well: the cup was inscribed with the names of several of the stations on the Roman wall in Northumberland. An engraving of it is given in Horley's 'Britannia Romana,' and in Hoare's 'Ancient Wiltshire.' Many other Roman remains, but not of great importance, have been found; some of them, such as stuccoed and painted walls, and hypocausts, were found within the inclosures of what were supposed to be British settlements.

Of the antiquities not Roman, the most striking are those of Stonehenge and Avebury. There are some traces of a British road, or tract-way, known as the Ridgway, running across Salisbury Plain, from Heytesbury, by John a'Gore's Cross, Redhorn turnpike (on the road from Salisbury to Devizes), by the village of Charlton-on-the-Avon, across Walker's Hill, by the village of East Kennet, over Hackpen Hill and Shelbarrow Hill into Berkshire; throughout which county it may still be traced.

Wansdyke, or Wansditch, is a vast earthen rampart, with a ditch on the north side, which extends, though not uninterruptedly, through the county. Its length in Wiltshire, from its divergence from the Roman road to the Berkshire border, is about 19 miles, including gaps. The origin of Wansdyke is unknown, but it was probably a boundary between different kingdoms. Aubrey supposed it to have been the ancient boundary of the kingdoms of Wessex and Mercia. Stukeley supposes it to have been made by the Belgæ, to secure their territories from the Celts. Sir R. C. Hoare seems to have regarded it as a Belgic work, repaired or reconstructed by the Saxons. Mr. Guest, in a paper read before the Archaeological Institute, and since published in the *Journal of the Institute* (viii. 143, &c.), has carefully traced the work and ascertained its present condition: he considers it to have been the boundary between the Belgæ and the Dobuni.

There are numerous other banks and ditches to be traced on the downs; some perhaps for boundaries or for defence, like Wansdyke, have one rampart and a ditch; whilst others were no doubt roads, and consist of a broad level way between two banks. Old-ditch may be traced on the downs, north of Warminster and Heytesbury, running eastward by Chittern, or Chiltern-All-Saints, and Tilahead, till it terminates in another ditch running at right angles to it; its length is about 11 miles, including gaps or intervals; the transverse ditch, in which it terminates, can be traced for above two miles.

The most remarkable feature of the topography of Wiltshire is that extraordinary group of stones which has received the name of Stonehenge. It is an assemblage of upright, horizontal, and prostrate stones situated on Salisbury Plain, about 2 miles W. from Amesbury, and 9 miles N. from Salisbury. From its singular character Stonehenge has attracted more attention than any other relic of primeval antiquity in Great Britain. Many of the stones have been squared, or hewn by art, and the horizontal stones of the outer circle are carefully attached by mortices to the uprights, which have tenons; whereas nearly all other examples of pre-historic, or, as they are generally called, Druidical circles, are composed of rough unhewn upright stones, without impost.

The stones are surrounded by a circular vallum, or bank of earth, within a shallow ditch or fosse. Within this bank are three stones, two of which are in an upright position, and the other is prostrate. It has been conjectured, with some probability, that these originally formed part of a circle. In the centre of the inclosed space is what is usually called the temple itself, which comprised originally an outer circle of 30 upright stones, at nearly equal distances apart, sustaining as many stones in a horizontal position, forming a continuous impost. Each of the upright stones had two tenons or projections on the top, which were adapted to fit into and fill up two mortices or hollows in each superincumbent slab. Within this was another, or second circle, consisting of about the same number of perpendicular stones, of much smaller size, and without impost. This circle inclosed an elliptical arrangement of large and small stones; the former, which were divided into groups of three stones each, are called trilithons. There were five trilithons, each of which consisted of two upright stones, and an impost, covering or extending to the extreme edges of the standing stones. Before each trilithon stood three small upright stones; and in the central space, or adytum, of the temple (in front of the principal trilithon) was a large flat stone, known as the altar. The dimensions of the stones, and the space occupied by the structure, as nearly as they have been ascertained, are—diameter of the space inclosed within the vallum or bank, 800 feet; height of the vallum, 15 feet; diameter of the outer circle, 100 feet; diameter of the second circle, 83 feet; height of the stones of outer circle, 14 feet (sides 7 feet by 3 feet); height of trilithons, 16 feet 3 inches, 17 feet 2 inches, 21 feet 6 inches; height of one of the small stones before the same, 7 feet 6 inches.

Viewed at a distance, Stonehenge seems an unimportant object; for

its real magnitude is hardly conceived in the extensive plain or open country on which it stands, and even when seen close at hand it often fails to satisfy expectation. At first sight it appears to be little more than a confused heap of upright and fallen stones; but a steady examination soon renders the nature of the original arrangement of the principal stones pretty clear, and the greatness of the work irresistibly impresses itself on the mind. The stones are mostly much weathered, and covered with moss and lichens. Some of the upright stones have large portions entirely eaten away, and some of the fallen ones are much broken; but many are still square and sharp at the angles, and the tenons and mortices remain in perfect preservation. Six of the impost stones of the outer circle remain in their original position, and two of those of the trilithons of the inner circle. The remaining are fallen.

The surrounding plain is covered with a profusion of tumuli: barrows and earthworks, unparalleled in any spot of similar extent in England. Many of the barrows were opened by Sir Richard C. Hoare and his indefatigable coadjutor Mr. Cunnington, and were found to contain, in some instances, cists or chests, filled with burnt bones, and in others entire skeletons, with various relics of British and in a few cases of Roman art. The avenue by which the work is approached from the north-east, is a narrow strip of raised ground, bounded on each side by a slight bank of earth, and extending in a straight line from the entrance, through the vallum to the distance of 594 yards, which spot it divides into two branches, one of which continues southward, and is seen between two rows of barrows, while the other proceeds northward, and approaches within a few yards of the curus. The curus is a curious and interesting appendage to Stonehenge, if it can be properly so considered. It is a flat tract of land, bounded by two parallel banks and ditches, and is situated about half a mile N.E. from Stonehenge: it measures 1 mile, 5 furlongs, 176 yards in length, and 110 yards in breadth. Its direction is from east to west, and at the eastern extremity is a mound of earth resembling a long barrow, which stretches entirely across it. Hoare, who supposes the curus to be a British circus, thinks this bank was where the principal spectators of the race were seated. The western extremity is destitute of any such mound, but there are two barrows irregularly placed near this end within the area of the curus, a part of which appears also to be cut off by a slight bank. From the near resemblance of the curus to the genuine circus of the Romans, it is reasonable to suppose that, if not formed by the Romans, it was made in imitation of their chariot-course, and by a people familiar with their manners and customs. In Hoare's 'Ancient Wiltshire' is a map showing the surface of the plain around Stonehenge to the extent of about five miles from east to west by three miles from north to south. In this area there are at least 300 barrows or tumuli of various sizes and shapes.

The object for which Stonehenge was constructed, and the date of its erection, have engaged both the research and the imagination of antiquaries, but no definite conclusion has been arrived at. In 1844, the Rev. E. Duke, in his 'Druidical Temples of the County of Wilt,' extending the suggestions of some previous writers, made an elaborate attempt to show that Stonehenge was a temple of Saturn, and a member of a vast planetarium, representing, in conjunction with Avebury and the barrows and other primeval remains on Salisbury Plain, the solar system, and extending over a wide extent of country, "on a meridian 82 miles in length." The stones of the inner circle of Stonehenge, he thinks, were brought from Egypt for the purpose of being erected here! Rickman, the celebrated writer on gothic architecture, published a paper in the 'Archæologia' (vol. xxviii.), in which he argues that Stonehenge was formed in the 4th century of the Christian era, or before the final departure of the Romans from Britain. Mr. A. Herbert has, in a work entitled 'Cyclops Christianus,' developed at great length and supported with much curious learning, a novel theory—that Stonehenge was erected early in the 5th century of the Christian era by a neo-Druidic sect, who sought to preserve or restore the old Druidic faith under Christian forms, and raised Stonehenge as in some measure a substitute for the ancient Druidic groves.

It is perhaps scarcely to be expected that anything better than a very vague conjecture can now be formed as to the time when this work was constructed, or the purpose for which it was raised. That it was erected by a Celtic tribe, and not by Romans or Saxons, is supported by all analogy, and appears to be admitted by most antiquaries. It is evident from the vast number of tumuli which cover the plain, and the traces of primitive villages which Hoare found within a few miles of Stonehenge, that here was the residence and the cemetery of an extensive tribe. The tumuli which have been opened in the neighbourhood are all of an ante-Roman date; but it is remarkable that in the only recorded excavations made within the area of Stonehenge Roman pottery was each time found. Sir R. C. Hoare found, on excavating within the inner circle, "several fragments of Roman as well as of coarse British pottery, parts of the heads and horns of deer and other animals, and a large barbed arrow-head of iron. Dr. Stukeley says that he dug close to the altar, and that at the depth of one foot he came to the solid chalk. Mr. Cunnington also dug about the same place to the depth of nearly six feet, and found the chalk had been moved to that depth; and at about the depth of three feet he found some Roman pottery, and at the depth of six feet some pieces of sarsen stones, three fragments of half-baked pottery, and some

charred wood. Some small pieces of bone, a little charred wood, and some coarse pottery were intermixed with the soil." These excavations seem to prove that this was not a place of sepulture, but rather of sacrifice. The cursus shows that the immediate vicinity of Stonehenge was a place of assemblage for public sports, and public sports were generally in early times associated with religious ceremonies. The great labour, skill, and cost necessary to the erection of such a structure as Stonehenge, lead us to the conclusion that it must have been intended for some great public purpose. On the whole we incline to the opinion, as in the instance of Avebury, that this extraordinary structure was a British temple, or a place of meeting for important deliberations, and probably was appropriated to both purposes, as well as to solemn judicial investigations. But the mechanical skill and art displayed in its construction, lead us to infer that Stonehenge was raised at a time when the tribe had made a considerable advance beyond the state of cultivation existing when Avebury was erected. In a word, we believe that it was erected probably not very long before the Roman conquest of Britain; while the discovery of Roman pottery within its area shows that it continued to be used for some time after that event.

Tumuli are more numerous in Wiltshire than in any other English county; the camps and other earth-works are also very numerous; they are fully described in Sir R. C. Hoare's 'Ancient Wiltshire,' which has been our chief authority for the antiquities of the county.

In the reign of Henry II., 1164, a national council was held at Clarendon, 2 miles S.E. from Salisbury, where the kings had a residence and a forest. At this council the Constitutions of Clarendon were passed, restricting the power of the clergy. In the reign of Henry III., 1267, the statutes for the suppression of tumuli, known as 'The Statutes of Malbridge,' were enacted in an assembly or council held at Marlborough. In the War of the Roses the men of Wiltshire generally embraced the Lancastrian side; but no great event in that war occurred in the county. In the civil war of Charles I., Marlborough was garrisoned by the Parliamentarians, but was taken by the Royalists under Wilmot in 1642. During the Commonwealth, Wiltshire was the scene of the unsuccessful attempt of the Royalists under Sir Joseph Wadstaffe. [SALISBURY.]

Religious Worship and Education.—According to the Returns of the Census in 1851, it appears that there were then in the county 754 places of worship, of which 352 belonged to the Church of England, 196 to four sections of Methodists, 101 to Baptists, and 76 to Independents. The total number of sittings provided was 159,484. Of Sunday schools there were 478, of which 281 were connected with the Church of England. The total number of Sunday scholars was 27,624. Of day schools there were 774, of which 367 were public schools with 27,068 scholars, and 407 private with 7776 scholars. There were 16 evening schools for adults, with 342 scholars; and 12 literary and scientific institutions, with 1956 members, and libraries containing 6424 volumes.

Savings Banks.—In 1853 the county possessed 11 savings banks—at Bradford, Calne, Chippenham, Devizes, Malmesbury, Marlborough, Melkham, Salisbury, Swindon, Trowbridge, and Warminster. The total amount owing to depositors on November 20th 1853 was 461,541*l.* 13*s.* 4*d.*

WIMBLEDON. [SURREY.]

WIMBORNE MINSTER, Dorsetshire, a very ancient market-town, and, conjointly with Cranborne, the seat of a Poor-Law Union, in the parish of Wimborne Minster, is situated in 50° 48' N. lat., 1° 57' W. long., distant 21 miles E.N.E. from Dorchester, and 100 miles S.W. by W. from London by road. The population of the town in 1851 was 2295. Wimborne and Cranborne Poor-Law Union contains 24 parishes and townships, with an area of 79,878 acres, and a population in 1851 of 17,271.

Wimborne is supposed to have been a Roman station called *Vindogladia*; by the Saxons it was called *Vinburnan*. A nunnery was established here in the beginning of the 8th century, upon the site of which the present minster or collegiate church was built; and the word 'Minster' has been added to the name of the town to distinguish it from Wimborne St. Giles, in another part of the county. Wimborne Minster is pleasantly situated on the right bank of the Stour, near its confluence with the Wim or Allen. Parts of the minster were built soon after the Conquest. It is a cruciform structure, 108 feet in length, and consists of a chancel, nave, choir, and side aisles, a transept, and three porches. There are two quadrangular towers, one at the west end, and the other, once surmounted by a very lofty spire, at the intersection of the cross. The minster is a royal free chapel, and a peculiar in the diocese of Salisbury. Several royal and noble persons have been interred here. The Wesleyan Methodists, Baptists, and Independents have places of worship. There are a Free Grammar school, for the support of which some of the lands of the nunnery were set apart by Queen Elizabeth, National schools, two ancient hospitals for poor aged persons, and a savings bank. Friday is the market-day; fairs are held on the Friday before Good Friday and on September 14th. Coach-making is carried on. A county court is held in the town.

WIMPOLE. [CAMBRIDGESHIRE.]

WINCANTON, or WINCHAUNTON, Somersetshire, a market-town and the seat of a Poor-Law Union, in the parish of Wincanton, is

situated on the left bank of the river Cale, in 51° 3' N. lat., 2° 25' W. long., distant 26 miles S. by W. from Bath, and 109 miles W.S.W. from London. The population of the parish of Wincanton in 1851 was 2483. The living is a perpetual curacy in the archdeaconry of Wells and diocese of Bath and Wells. Wincanton Poor-Law Union contains 39 parishes and townships, with an area of 65,960 acres, and a population in 1851 of 21,272.

Wincanton consists chiefly of four principal streets, one of which forms part of the main road from London to Exeter by Ilchester and Honiton. In the Domesday Survey the town is called *Wincalton*, a name which embodies that of the river on which the town stands. Wincanton parish church is a commodious structure, with a tower at the west end. The Independents and Baptists have places of worship, and there are National schools, and a reading-room with a library. Wednesday is the market-day: fairs are held on Easter Tuesday and September 29th. Some dowels and bed-tick are manufactured.

WINCHCOMBE, Gloucestershire, a market-town and the seat of a Poor-Law Union, in the parish of Winchcombe, is situated on the banks of the river Isbourne, a feeder of the Upper Avon, in 51° 57' N. lat., 1° 58' W. long., distant about 19 miles N.E. from Gloucester, and 95 miles W.N.W. from London. The population of the town in 1851 was 2052. The living is a vicarage in the archdeaconry of Gloucester and diocese of Gloucester and Bristol.

Winchcombe is a place of great antiquity, and was once of considerable importance. It was anciently the site of a castle and of a Benedictine abbey, the abbot of which was mitred. No trace of the buildings remain. The parish church is a fine gothic edifice, with an embattled tower at the west end. The Wesleyan Methodists and Baptists have chapels, and there is a Grammar school. Saturday is the market-day: fairs are held on the last Saturday in March, May 6th, and July 28th.

WINCHELSEA. [SUSSEX.]

WINCHESTER, the county town of Hampshire, an ancient episcopal city, a municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated in 51° 4' N. lat., 1° 19' W. long., distant 62 miles S.W. from London by road, and 67 miles by the London and South-Western railway. The population of the city of Winchester in 1851 was 13,704. The livings are in the archdeaconry and diocese of Winchester. The city is governed by 6 aldermen and 18 councillors, of whom one is mayor; and returns 2 members to the Imperial Parliament. Winchester Poor-Law Union contains 34 parishes and townships, with an area of 60,544 acres, and a population in 1851 of 21,164.

Winchester is one of the most ancient towns in England; its origin is lost in the fables of tradition. The Britons are said to have called it 'Caer Gwent,' or the White City; the Romans, by whom it was first subdued, named it *Venta Belgarum*; the Saxons, who were the next possessors, named it *Witancaster*, which has become Winchester: in Latin deeds and by the Latin writers it is called *Wintonia*.

Winchester appears to have flourished under the Romans as long as they remained in the island. The massive walls, composed of flints and mortar, which inclosed the city, are considered to have been originally built by them. In A.D. 519 it was conquered by Cordic the Saxon, who afterwards made it the seat of his government; and it continued to be the capital of the West Saxon kings till Egbert, the first king of the whole heptarchy, was crowned there, and then it may be said to have become the metropolis of England. Though sometimes plundered and in the possession of the Danes, it continued to be the capital of successive Saxon kings till 1013, when Sweyn, the Danish king, obtained possession of England, and Winchester became the seat of his government. After his death a fierce struggle ensued, and England is said to have been ultimately divided into two kingdoms: London became the capital of Canute, and Winchester of Edmund Ironside, till Edmund's death in 1016, when Canute became sole king and Winchester the sole capital.

After the Norman conquest Winchester continued to be the capital, and during the reign of Henry I. attained the summit of its greatness. It was surrounded by strong walls; was defended by a castle built by William the Conqueror on the west, and by another, subsequently erected for the residence of the bishop, on the east; it contained an extensive palace and numerous mansions of the nobility; a cathedral, three monasteries of royal foundation, and a very large number of churches: the suburbs extended a mile from the walls in every direction. In the reign of Stephen, Winchester began to decline. While Stephen was a prisoner in Gloucester Castle a contest commenced between his queen and the Empress Matilda, aided by their respective partisans, which was carried on for several weeks in the streets of Winchester, at the termination of which nearly the whole of the town north of the High-street, the royal palace, the abbey of St. Mary, Hyde Abbey, and about 40 churches, were burnt down or laid in ruins. The death of Stephen in 1154 put a stop to the calamities of civil warfare. Henry II. resided much at Winchester; he rebuilt the palace, and to a considerable extent renewed the city; but London seems to have found more favour in the eyes of subsequent kings, and Winchester lost its dignity as capital of the kingdom.

In the contests between Henry III. and his barons Winchester suffered severely, both parties alternately gaining possession of its castles, and carrying on the work of destruction in the city. From this time Winchester, though partly upheld by the splendour of its

cathedral and other ecclesiastical and scholastic establishments, seems to have declined rapidly. When Henry VIII. suppressed the monasteries, the minor establishments were the first to suffer in Winchester. Subsequently the priory of St. Swithin was suppressed, and the greater part of its revenues were transferred to the dean and chapter of the cathedral; also Hyde Abbey, which had been rebuilt; St. Mary's Abbey; and several hospitals.

The last of the great sufferings of Winchester occurred during the civil war between Charles I. and the Parliament. The city adhered to the king. On the 29th of March, 1644, a battle was fought on Cheriton Down, in which Sir William Waller, the parliamentary general, was victorious; and his soldiers destroyed or defaced the stained-glass windows, the monuments, and relics of the cathedral. After the battle of Naseby, Cromwell was sent to reduce Winchester under the authority of the Parliament. Having taken the city after a week's siege, he undermined and blew up Winchester Castle, and laid Wolvesey Castle and the other fortified places in ruins. St. Mary's College escaped from injury it is said through the firmness of one of the parliamentary officers, who was a Wykehamist. In 1666 very many of the inhabitants of Winchester were destroyed by the plague. An obelisk, with an inscription, commemorates the event. Charles II. took a liking to the place, and employed Sir Christopher Wren to design and erect a palace, which he intended for a summer residence, on the site of Winchester Castle. The king laid the foundation-stone, March 3rd, 1683, and the work was carried on with vigour till the death of Charles in 1685, when a stop was put to it, and it was never completed. The building is now used as a barrack for infantry.

The city is built on the slope of an eminence which rises gently from the right bank of the Itchin. The river is made navigable as a canal from Winchester to the sea. The city is well supplied with water, and the streets are well paved, and are lighted with gas.

The liberty of the Soke encompasses the city on almost every side, and a small part is within the city. The Soke is divided into the East Soke and the West Soke. The ancient city had four principal gates—north, south, east, and west; of these only the West Gate, at the end of the High-street, now remains: it is a massy square tower over a wide gateway. The tower is built in the Norman style: it is now employed as a room in which to preserve the corporation records.

Winchester being the centre of an agricultural district, it has a good corn-market, which is well attended. Wednesday and Saturday are the market-days. Four fairs are held in the course of the year, one of which is a large sheep fair.

Of the public buildings of the city, the first place is due to Winchester Cathedral, which is one of the largest cathedrals in England, and in many respects one of the most interesting. From the west entrance to the choir is 356 feet; the length of the choir is 135 feet; and the Lady Chapel at the east end is 54 feet, which makes the total length 545 feet. As a distinct part, the nave is 250 feet long, 86 feet wide including the aisles, and 78 feet high. The choir is 40 feet wide. The length of the transepts is 186 feet. The square of the tower is 48 feet by 50 feet, and the height is 138½ feet, which is only about 26 feet above the roof; of course it has a low and squat appearance, and was perhaps not intended to contain bells, but only to throw additional light into the choir, and increase the interior effect by additional height. The present bells were suspended in the reign of Charles I.

Viewed from the exterior, the west front is by far the most imposing part of the structure. On entering the building, the view from the west end to the east is magnificent: the vast length of vista formed by the nave and choir, with the splendid ceiling, the columns and arches on each hand and overhead, and the eastern window 'casting its dim religious light' from behind the choir, produce a combined result of solemnity and beauty equalled by few cathedrals in Europe.

The original structure of Winchester Cathedral was destroyed by the pagan Cerdic, and rebuilt by one of his successors, the Christian Kinegils. Some of the most substantial walls and pillars of the present structure were erected by St. Ethelwold, bishop of Winchester, who lived to finish it, and to dedicate it to St. Swithin in 980. In 1079, having been much damaged by the Danes, it was repaired by Bishop Walkelyn, who built the present tower, with part of the nave and transepts, and in 1098 re-dedicated the church to St. Peter, St. Paul, and St. Swithin. The bishops De Lucy, Edyngton, and Wykeham repaired and rebuilt other portions. Bishop Fox in the early part of the 16th century rebuilt some portions. The grandeur of the west front is due to Wykeham. Many restorations and repairs of the cathedral have been recently executed at an expense of upwards of 50,000*l.* Among the monuments in the cathedral may be mentioned the tomb of William Rufus, of plain gray stone, without inscription, in the choir; the six mortuary chests of wood, carved, painted, and gilt, in which Bishop Fox deposited the remains of Saxon kings and other distinguished persons, which he transferred from the decayed lead coffins in which they had been buried; and especially the beautiful chantries or oratories of the bishops Edyngton, Wykeham, Beaufort, Waynflete, and Fox.

Winchester College (St. Mary's College), which is outside the city boundary on the south-east, was founded by William of Wykeham in 1387, on the site of 'the great grammar school of Winchester,' at which he had been educated. The college was founded and endowed

by Wykeham as a preparatory college to New College, Oxford, which he had founded a short time before. The college was opened March 28th, 1393. In 1354 there were in the college 70 scholars on the foundation, and 16 choristers. The number of commoners, boys not on the foundation, was about 80, who are lodged in a spacious quadrangular building contiguous to the college. The buildings of Winchester College are spacious, and comprise a chapel, a hall of gothic architecture, and a library; a school-room, erected by subscription of the Wykehamists in 1687; and a hall in which the commoners dine. Over the entrance to the school-room is a bronze statue of Wykeham.

The ruins of Wolvesey Castle are at a short distance south-east from the college. This castle, once the residence of the bishops of Winchester, was built in 1138 by Henry de Blois, brother of King Stephen and bishop of Winchester, on the site of a former palace of the Saxon kings. It was a place of great strength till it was dismantled in the reign of Henry II. It continued to be the residence of the bishops till it was demolished by Cromwell in 1646. The episcopal palace begun in 1684 was suffered to go to decay, and the greater part of it was taken down about 40 years ago. The present plain but neat episcopal residence was formed out of the west wing of the former building: it is now occupied during pleasure by the Diocesan Training school for masters. The Cross, in the High-street, is a square structure on an octagonal base of five steps. The circumference of the lowest step is 49 feet, and the height is 44 feet. The cross consists of three tiers of gothic archwork, with ornamented niches and canopies. Winchester Castle stood on an eminence outside the city wall on the south-west. It was built by William the Conqueror in 1068, and blown up by Cromwell in 1645. The ruins were entirely removed when Charles II. began his palace. The chapel of Winchester Castle, which was a building detached from the castle, has since been converted into a court for holding the assizes. A curious piece of antiquity, called King Arthur's Round Table, is suspended over the judges' seat. Symonds' College (properly Christ's Hospital) was founded in 1607, by Peter Symonds, a native of Winchester, and afterwards a mercer of the city of London. The endowments are applied to the maintenance of six old men, one matron, and four boys, and also to the assistance of one scholar in each of the two English universities. The Matrons' College, built by Bishop Morley in 1672, and endowed for the support of 10 clergymen's widows, stands on the site of the monastery of St. Grimbald, founded in A.D. 898, by King Alfred.

Most of the churches in Winchester are ancient. One of the most curious for its situation is the parish church of St. Swithin, built by King John over the old postern of St. Michael, or King's Gate. St. Thomas's parish church has been rebuilt. There is a new church in the parish of St. Maurice. The Wesleyan Methodists, Independents, Baptists, and Roman Catholics have places of worship. There is also a convent of Benedictines at Winchester. There are several National schools, a mechanics institute, a Church of England library and reading-room, a Church of England Young Men's Society, a museum, and a savings bank. A county court is held in the town. The guild-hall, or town-hall, in High-street, was built in 1711. Some articles curious for their antiquity are kept in it, especially the ancient standards of measure. The market-house was built in 1772. A new county jail, bridewell, police station, and offices have been erected outside the West Gate. The county hospital was established in 1736, but the present building was not erected till 1759. St. John's House, which is the public banqueting-room and assembly-room, is on the site of the hospital of St. John the Baptist. There are a small theatre, and a public library and reading-rooms.

The hospital of St. Cross, about one mile S. from Winchester, was founded and endowed in 1136, by Henry de Blois, bishop of Winchester, as a permanent retreat for 13 poor men past their strength, and for 100 other poor men, who were to be provided with a dinner. Other charities were added. A glass of ale and a small loaf are still offered to persons who call at the hospital before the day's supply is exhausted. The endowments of this institution have been grossly misappropriated for many years past; but inquiry has recently been made by authority of the government into the manner in which the intentions of the founder have been carried out, with a view to a more appropriate employment of the funds of the charity. The church is a very beautiful cruciform pile; it is chiefly of Norman, but partly of early English date. The other buildings which remain are fine specimens of gothic architecture.

The see of Winchester is in the province of Canterbury. The diocese includes Hampshire, with the islands of Wight, Guernsey, Jersey, Alderney, Sark, and the county of Surrey; and comprises 524 benefices. It is divided into the archdeaconries of Surrey and Winchester. The chapter consists of the dean, the archdeacons, eight canons, four minor canons, and a chancellor. The income of the bishop is fixed at 10,500*l.* a year.

WINDAU. [COURLAND.]

WINDERMERE. [LANCASHIRE; WESTMORLAND.]

WINDSOR, or NEW WINDSOR, Berkshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on the right bank of the river Thames, in 51° 29' N. lat., 0° 37' W. long., distant 18 miles E. by N. from Reading, 22 miles W. by S. from London by road, 21 miles by the Great Western railway, and 26 miles by the South-Western railway. The population of the

borough in 1851 was 9598. The borough is governed by six aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The living is a vicarage, in the archdeaconry of Berks and diocese of Oxford. Windsor Poor-Law Union contains six parishes, with an area of 22,407 acres, and a population in 1851 of 18,449.

Windsor derives its importance, and perhaps its origin, from having been a favourite residence of many of the kings of England since the Conquest. The Saxon kings had a palace at Old Windsor, called Windles-ofra, or Windleshora, from the winding course of the Thames in this part, and Edward the Confessor occasionally kept his court there; but it is a distinct parish, about 2 mile S.E. from New Windsor. In the reigns of William the Conqueror and William Rufus, the castle at Windsor was a military fortress. Henry I. enlarged and improved the castle and held his court there, and from this time it was the frequent residence of the king, in consequence of which New Windsor received many marks of royal favour. From having been a chapelry in the parish of Clewer, it was constituted a separate parish. Edward I. made it a free borough, and in his reign it first returned two members to Parliament; from the 25th Henry VI. (1447) it has regularly returned two members. Though situated on opposite banks of the Thames, Windsor and Eton form in appearance but one town, the line of houses being interrupted only by the bridge, erected in 1824, a neat structure of iron, 200 feet long and 29 feet wide, and consisting of three arches. The town is well lighted with gas, and paved. Among other recent improvements Datchet Bridge has been removed, and two new bridges, both of iron, with stone piers, have been erected: Victoria Bridge, some distance above the old Datchet Bridge, in connection with the new road from the South-Western railway station; and Albert Bridge, below old Datchet Bridge, and about midway between it and Old Windsor, in connection with the new road to Staines.

The public buildings of Windsor (exclusive of those pertaining to the castle) are not in any way remarkable. The church is a spacious and convenient structure, in the perpendicular style, erected in 1822. A neat district church of gothic character was erected in 1842. The Wesleyan Methodists, Independents, and Baptists have places of worship. There are Free, National, British, and Infant schools; a royal dispensary; Brotherton's hospital, founded in 1508, for eight poor persons; Reeves' almshouses, founded in 1676; and a savings bank. The guildhall, or town-hall, erected in 1686, is rather a handsome building. In the hall, or court-room, are a number of portraits of the sovereigns of England and personages of rank. The town-hall was repaired and to a considerable extent remodelled in 1852, under the direction of Mr. Hardwick. The theatre is internally neat and convenient. The Great Western railway station, near the centre of the town, is a plain but convenient building. The South-Western railway station, in Datchet-lane, is a more ambitious edifice of red brick, with stone dressings; it is a somewhat quaint imitation of the Tudor style.

Windsor possesses no manufacture, but there are considerable ale breweries. The inhabitants are chiefly dependent upon the trade created by the residence of the court at Windsor Castle, and by the abode of many persons of rank and wealth in the vicinity, and the numerous visitors who resort to the town. The market is held on Saturday. Fairs are held on Easter Tuesday, July 5th, and October 24th. On the west side of the town is a piece of meadow-land, surrounded with a gravelled walk, which is known as the 'Bachelor's Acre,' and is reserved, under the Inclosure Act, as a place in which to play at 'all sports and pastimes.' 'The Bachelor's Revel' is held here on August 17th, and attracts numerous visitors. On the Acre is an obelisk, erected by the Bachelors to commemorate the visit of Queen Charlotte and the princesses to their festival in honour of the jubilee of George III. There are barracks for infantry and cavalry, the latter in Clewer parish.

Among the royal and palatial edifices of Europe, that of Windsor holds a very high rank, and is in a manner to England what Versailles is to France, and the Escorial to Spain; and while it is infinitely superior to both in point of situation—standing on an elevation which commands a rich extent of country—it far exceeds them, and indeed every other pile of building of its class, in antiquity. From having been the residence of so many of our kings, its history is to a certain extent identified with that of the kingdom itself from the time of the Conquest. In its present state however the antiquity of the castle is little more than nominal, the whole of the habitable part having been remodelled and rebuilt; but if it has thus lost the reality, it has at least recovered the appearance of antiquity, after nearly every trace of it had been obliterated, and the greater part of the whole pile had been rendered a motley assemblage of mongrel architecture.

Relative to the early history of the castle, only a few of the more prominent dates and epochs of the building can here be noticed. The Conqueror's structure on this site was probably a mere hunting-lodge, or a military post; and we have little positive information in regard to what it became when rebuilt by Henry I., who there took up his residence; or as to the extensive additions, including a chapel, afterwards made by Henry III. In fact, it was not until the 14th century that the plan of the whole began to assume its present extent and arrangement, when Edward III. first erected the buildings form-

ing the third or upper ward, to the east of the keep, whose inclosure then became the middle one; and the same king founded the 'College or Free Chapel of St. George,' in the lower ward. These works were carried on from about 1350 to 1374, and were chiefly conducted by William of Wykeham, who was appointed surveyor in 1356, with a salary of one shilling a day. From this period comparatively little was done until a century afterwards, when Edward IV. began to re-erect St. George's Chapel nearly as we now behold it, thereby adding, if not immediately to the castle itself, to the buildings within its precincts, one of extraordinary beauty and interest. Henry VII. added to the castle that singularly fine specimen of palatial architecture in its particular style, which is still called after him, and which is situated near the public entrance to the state apartments, at the western extremity of the range forming the north side of the great quadrangle.

During the three following reigns no additions were made. The reign of Elizabeth, on the contrary, forms almost an epoch in the architectural history of the castle, because, though she did not do much to it in the way of building, except annexing to the portion added by Henry VII. that which is distinguished by the name of Queen Elizabeth's gallery, she first caused the terraces to be formed, thereby giving to the royal abode of Windsor what is not the least striking or least attractive of its characteristics. Under the Stuarts nothing material was done until the Restoration, when the castle began to be modernised, and in such a tasteless and insipid manner as to have no quality of style of any kind, and nothing of grandeur but what was derived from mere size. The principal addition made by Charles II. was the Star-Building (containing the state apartments shown to the public). The first two Georges did nothing for Windsor; George III. restored the interior of St. George's chapel (1787-90), which, little as the execution of gothic was then understood, was done in a judicious manner, by scrupulously following the original details.

Except beauty of situation the castle had nothing whatever to recommend it as a residence. The whole of the east and south sides, the portions actually inhabited, were singularly inconvenient in every respect. Hence it was found indispensably necessary to erect (1778-1782) a separate building for the actual occupation of the royal family. This, which was called the Queen's Lodge, was merely a large plain house on the south side of the castle, near the site occupied by the present stables, and was taken down in 1823. About the same time George IV. announced his intention of taking up his abode within the castle, and converting it into a suitable residence for himself and his successors. Accordingly a grant of 300,000*l.* was readily voted by parliament in April 1824 for the projected improvements. The designs for the intended works, furnished by Jeffrey Wyatt, were adopted, and no time was lost in carrying them into execution. The first stone of 'King George IV.'s Gateway' (forming the principal entrance into the quadrangle on the south side, in a direct line with the Long Walk) was laid by the king himself, August 12th, 1824; on which occasion the architect received the royal authority for altering his name to that of Wyattville; and on the king's taking possession of the private apartments, which were completed by the end of 1828, he received the further distinction of knighthood.

Until renovated and remodelled by Sir Jeffrey, the exterior had very little of either architectural character or dignity, or even of picturesque-ness, except that arising from situation; whereas now it is marked by many bold features and well-defined masses, and presents a series of parts, all varied, yet more or less interesting; but even where the principal masses remain the same, the general outline, before feeble and insipid, has been greatly improved: somewhat greater height than formerly has been given to most of the buildings by deep embattled parapets, and in some of them by machicolations also. Some of the towers have been carried up higher and others added; among these last are the Lancaster and York, flanking George IV.'s Gateway, and distinctly marking that as the principal portal of the castle; also the Brunswick Tower, which, owing to its difference of form and greater mass, adds very much to the architectural effect of the north-east angle. But the most striking improvement of the kind was that of carrying up the Round Tower 30 feet higher, exclusive of the Watch Tower on its summit, which makes the height in that part 25 feet more. Previously to this being done that keep hardly deserved the name of tower, it being of diminutively low proportions; whereas now it renders the castle very much more conspicuous than formerly as a distant object.

After the first grant of 300,000*l.*, others were successively made and the total expenditure down to the end of the reign of William IV. amounted to 771,000*l.* There has since been a grant of 70,000*l.* for new stables, which form an extensive range of buildings, only 400 feet from the castle, on its south side, and to the west of the Long Walk; they extend upwards of 600 feet, and include a riding-house, nearly 200 feet in length by 60 feet in breadth. Some additional expenditure has since been incurred by the removal of the houses along the west side of the castle by Thames-street, and the opening of the approaches, and in other improvements. The state apartments, which contain many fine portraits by Vandyke and Lawrence, as well as many other paintings and works of art and taste, are open to the public every Monday, Tuesday, Thursday, and Friday, by tickets obtainable gratuitously of the leading print-sellers in London.

The beautiful chapel of St. George stands within the castle precincts. A chapel dedicated to St. George, for the service of the Order of the Garter, was erected at Windsor by Edward III. (1327-77); but the present edifice was begun by Edward IV. (1461-83), and was not completed until after the commencement of the 16th century. It is one of the most beautiful specimens of the perpendicular style of architecture in this country. The great east window is painted after the designs of West. During the last few years this chapel has been entirely and very judiciously restored at a great expense. St. George's Chapel is a collegiate establishment. The chapter consists of a dean, eight canons, and six minor canons.

The castle is surrounded on two sides by the Little Park, a very ancient and beautiful domain, which at one time formed part of Windsor Forest. Within its precincts is Frogmore Lodge, now occupied by the Duchess of Kent: the grounds comprise about 18 acres, laid out with great taste. In the reign of Queen Anne that part of Windsor Forest which remained the property of the crown, under the name of the Great Park, was cut off from the castle by the intervening private property; and it was therefore determined to buy as much land as might be required to complete an avenue from the castle to the forest. This is the present Long Walk, generally considered the finest avenue of the kind in Europe. It is a perfectly straight line, above three miles in length, running from the principal entrance to the castle to the top of a commanding hill in the Great Park called Snow Hill. On each side of the road, which is slightly raised, there is a double row of stately elms. The view from Snow Hill is very fine. In 1832 a colossal equestrian statue of George III. was erected on the highest part of this hill. The total elevation of the statue and pedestal exceeds 60 feet, and the statue (man and horse) is 26 feet in height. The walks and drives in the Great Park present scenes of much beauty and variety. At the southern extremity of the park is Virginia Water, the largest artificial lake in the kingdom. The eastern side of the Great Park is chiefly in Surrey.

WINDSOR. [NOVA SCOTIA.]

WINDWARD ISLANDS, THE, are opposed to the Leeward Islands, both of which terms are applied to some islands belonging to the Columbian Archipelago, or to the West Indies. The English however differ from other seafaring nations in the application of the name. They limit both terms to that group of the Archipelago which is commonly called the Lesser Antilles, and call those south of 15° N. lat. Windward, and those north of that parallel Leeward Islands [WEST INDIES.]

WINGFIELD. [DERBYSHIRE.]

WINGHAM. [KENT.]

WINGROW. [POLAND.]

WINKFIELD. [BERKSHIRE.]

WINLATON. [DURHAM.]

WINSLOW, Buckinghamshire, a market-town and the seat of a Poor-Law Union, in the parish of Winslow, is situated in 51° 56' N. lat., 0° 51' W. long., distant 10 miles N. by W. from Aylesbury, 49 miles N.W. by W. from London by road, and 54 miles by the London and North-Western railway and its Oxford branch. The population of the parish in 1851 was 1889. The living is a vicarage in the diocese of Oxford. Winslow Poor-Law Union contains 17 parishes and townships, with an area of 85,895 acres, and a population in 1851 of 9876.

Winslow is a neat town, seated on the brow of a hill commanding fine prospects of the surrounding country. The parish church, a commodious plain building of the perpendicular style, has at the west end a square embattled tower. The Independents and Baptists have places of worship. There are National and Infant schools; and a Girls school, in which lace-working is taught. The market is held on Thursday: a monthly market has been lately established for the sale of cattle, wood, &c. Fairs are held eight times in the year. Statute fairs are held on the first Thursday before, and the second and third Thursday after, Old Michaelmas Day.

WINSTER. [DERBYSHIRE.]

WINSTREE. [LEICESTER.]

WINTERBOURNE. [DORSETSHIRE.]

WINTERINGHAM. [LINCOLNSHIRE.]

WINTERTHUR. [ZURICH.]

WINTERTON. [LINCOLNSHIRE; NORFOLK.]

WINTZENHEIM. [RHIN, HAUT.]

WIRKSWORTH, Derbyshire, an ancient market-town, in the parish of Wirksworth, is situated in 53° 4' N. lat., 1° 33' W. long., distant 18 miles N.N.W. from Derby, and 140 miles N.N.W. from London. The population of the town of Wirksworth in 1851 was 2632. The living is a vicarage in the archdeaconry of Derby and diocese of Lichfield.

Wirksworth is the ancient seat of the lead trade, and is situated near the southern edge of the mining district, in a valley nearly shut in by limestone hills. Roman coins and relics have been found at Wirksworth. The town is lighted with gas. Barmote courts are held in the moot-hall, a handsome stone-building, erected in 1814, at the cost of the duchy of Lancaster. Here is kept the miners' standard dish for lead-ore, made in the reign of Henry VIII. The church is a handsome gothic structure of the 14th century. The Wesleyan Methodists, Baptists, and Independents have places of worship. There

are a Grammar school, National schools, and a savings bank. Poor sessions and a county court are held in the town. Gingham, and small-wares are manufactured. The lead-mines of the vicinity, though not so productive as formerly, are still the chief sources of the prosperity of the town. The market is held on Tuesday; there are six annual fairs. Races are held annually.

WIRRAL, a hundred in the county of Chester, which gives name to a Poor-Law Union. The hundred of Wirral occupies the peninsula lying between the estuaries of the Mersey and the Dee. Wirral Poor-Law Union contains 56 parishes and townships, with an area of 112,110 acres, and a population in 1851 of 87,147.

WIRTEMBERG. [WÜRTTEMBERG.]

WISBEACH, Cambridgeshire, a municipal borough and seat of a Poor-Law Union, is situated in the Fen district, chiefly on the right bank of the river Nene, in 52° 40' N. lat., 0° 7' E. long., distant 49 miles N. from Cambridge, 98 miles N. by R. fr. London by road, and 96½ miles by the Eastern Counties and E. Anglian railways. The borough is governed by 6 aldermen and 10 councillors, of whom one is mayor. The living is a vicarage, in the archdeaconry and diocese of Ely. Wisbeach Poor-Law Union contains 22 parishes and townships, with an area of 131,585 acres, and a population in 1851 of 86,215.

The town of Wisbeach has a neat and uniform appearance; its streets are clean and lighted with gas. A handsome circus, constructed in 1816, occupies the space on which the castle of Wisbeach formerly stood. The corn exchange, built in 1811, was converted in 1831 into a room for lectures, concerts, and similar purposes. At the back of the corn exchange is a large plot of ground used as a cattle-market. The new town-hall was built in 1801 on the site of a building called 'The Firkin Cross,' which was the butter-market at a period when the town had a considerable trade in dairy produce. A public hall was erected in 1852 for the use of the mechanics institute, temperance society, &c. The house of correction was built in 1807. The market-place occupies a large piece of ground in the centre of the town. There are public baths. St. Peter's church is an ancient and very fine building, with a tower detached from the body of the church. St. Mary's church is a short distance from the town, and there is a chapel of ease. The Wesleyan Methodists, Independents, Baptists, Quakers, Roman Catholics, and Unitarians have places of worship. There is a Bethel or Seamen's chapel, a Free Grammar school, National, British and Infant schools, a literary society, a scientific institution, reading-rooms, a public library, and a savings bank. Quarter and petty sessions and a county court are held in the town.

The two parts of the town of Wisbeach are connected by a bridge of stone, consisting of one arch of 72 feet span. A canal between Wisbeach and Outwell, which was completed in 1792, connects the Nene with the Ouse. The navigation of the Nene to Wisbeach had gradually become very difficult and dangerous, from the accumulation of mud and sand; but by cuts and other works it has been much improved. The number and tonnage of vessels registered as belonging to the port of Wisbeach on December 31st, 1854, were—50 tons and under, 22 sailing-vessels, tonnage 816; and 1 steam-vessel, tonnage 18: above 50 tons, 78 sailing-vessels, tonnage 11,932; and 2 steam-vessels of 675 tons. The number and tonnage of vessels entered and cleared at the port during 1854, were:—Inwards, 727 sailing-vessels, tonnage 62,694, and 41 steam-vessels, tonnage 16,996; outwards, 308 sailing-vessels, tonnage 19,658, and 2 steam-vessels, tonnage 104.

The market for fat cattle is held weekly on Thursday; that for corn, which is of considerable importance, is held on Saturday. Three fairs are held yearly. The exports include corn, potatoes, wool, and seeds; coals and timber are the chief imports. Ship- and boat-building, rope-making, iron-founding, brick-making, brewing, malting, and tanning are carried on. Whiting is made to some extent. In the vicinity are extensive market-gardens.

A castle was built at Wisbeach in 1086 by William I. After its destruction by an inundation in 1236 it was rebuilt. It existed in Cromwell's time, but has since been demolished. The Guild of the Holy Trinity of Wysbech was established in 1379, and remained, with eight minor guilds, till the dissolution of the monasteries.

WISBY. [GOTHLAND.]

WISCASSET. [MAINE, U.S.]

WISCHEGRAD. [BOSNIA.]

WISCONSIN, one of the most northern of the United States of North America, extends between 42° 30' and 47° N. lat., 86° and 93° W. long. It is bounded E. by Lake Michigan and the large inlet at its south-western extremity known as Green Bay, which divides it from the state of Michigan; N.E. by the state of Michigan; N. by Lake Superior, which divides it from Upper Canada; N.W. and W. by the territory of Minnesota; S.W. by the state of Iowa; and S. by that of Illinois. The extreme length from north to south is 285 miles, the greatest width 255 miles. The area is 53,924 square miles. The population in 1850 was 805,391, of whom 635 were free-coloured persons: the density of population was 5.66 to the square mile. The inhabitants being all free, the federal representative population is the same as the entire population in 1850. This, according to the present ratio of representation, entitles the state to send three representatives to Congress. To the Senate, like each of the other states, Wisconsin sends two members.

Surface, Hydrography, and Communications.—The surface of this state is for the most part gently undulating. No portion of it is mountainous, but the northern and north-western parts are very much broken, and some of the hills known as the Wisconsin Mountains attain a considerable elevation. The most northern part is a wild rocky country containing immense forests of white pine and other evergreen trees, from which vast quantities of lumber are annually sent down the St. Croix River to the Mississippi. This region is wholly one of primitive rocks, and affords scenes of striking grandeur. It is in this district that the extensive copper deposits of Wisconsin are found. Along Lake Superior the cliffs are very steep and mostly bare, or only covered with low bushes. In the immediate vicinity of the lake forest trees rarely occur, except in the recesses of some of the bays, or along the river bottoms. All the rivers in this northern portion of the state are very rapid, and afford abundant water-power; those which flow into Lake Superior generally have rapids or falls a few miles above their mouths.

That portion of the state which borders on the Mississippi is described under *MISSISSIPPI RIVER*. From the junction of the St. Croix the Mississippi runs along a 'bottom,' which below Lake Pepin widens from 8 to 10 or 12 miles. This bottom is uniformly bounded by limestone cliffs, or 'bluffs,' which are generally abrupt and often precipitous, rising to a height of from 300 to 500 or 600 feet, and occasionally still higher; south of the Wisconsin River they sink much lower. Within the bottom, especially in the vicinity of Lake Pepin, isolated hills and knobs of considerable magnitude, based upon horizontal strata of rock and towering to various heights, are frequently met with. The valley consists of alternate prairie and woodlands. The prairies are usually elevated above the reach of floods, and richly covered with herbage and flowers; while the woodlands sustain a heavy growth of trees, but are inundated in flood-time. The high lands bounding the river are intersected by deep and numerous rivers and watercourses, which give to that part of the country a hilly and broken aspect. At the back of them the country is diversified by hills and valleys: the hills are high and rugged, and partly covered with timber; the valleys often present extensive flats, abounding in lakes, swamps, and ponds. The soil is sandy, and the vegetation not vigorous; the trees do not attain their full growth. This country is bounded on the east, about 90° W. long, by a lofty range of hills called the Ocooch and Smokey Mountains. In this hilly region originate the head-waters of a great number of rivers and numerous lakes. The country east of this ridge, extending by Fox River to Green Bay, is less broken and rugged; the soil is less sandy, the vegetation more luxuriant, and the forest-trees attain a more stately growth. A large part of it consists of wide rolling prairies, and there are several lakes and extensive swamps having an abundant growth of cranberries and wild rice. The forests in these parts consist chiefly of yellow-pine, pitch-pine, and white-pine of excellent quality; but white-birch, white-cedar, spruce, and juniper are also common.

The country between the southern boundary of the state and the Wisconsin, where that river runs from east to west, is an irregular plain, elevated from 250 to 300 feet above the surface of the Mississippi, and consists of limestone which is often rent by deep and nearly perpendicular chasms of considerable depth, but little width. On the upper surface of the plain are numerous single hills rising from 200 to 500 feet above their bases, and from 600 to 1000 feet above the watercourses which run in the chasms. The highest of these hills, called Blue Mound, not far from the left bank of the Wisconsin, is stated to be 1414 feet above the surface of the Mississippi at the mouth of Wisconsin River. The greater part of this region is a prairie destitute of wood, and generally covered with a good turf. There are also many tracts overgrown with stunted oak and some other trees; but these woods have no underwood, and the single trees are generally from 10 to 20 feet from one another. In a few places the forests are more dense. The bottoms of the rivers run at a considerable depth below the general level of the country, especially that of the Wisconsin, which resembles the bottom of the Mississippi, but is only from one mile to two miles wide.

The country along the shores of Lake Michigan has a different aspect. The southern part, as far north as the small bay into which the river Milwaukee falls, is a portion of the great level and low plain which surrounds the southern extremity of the lake, and extends from St. Joseph's River to the Milwaukee. It is an extensive flat embracing woodlands and prairies alternating with each other. Farther north the shores of the lake are skirted by high sand-hills, which sometimes extend inland, and are barren, but protect the more level and fertile country which is traversed by the Milwaukee and Manawakee rivers against the winds blowing from the lake. North of 44° N. lat., and up to Green Bay, the shores of the lake are somewhat rocky, uneven, and partly wooded. The country farther inland along the Fox River, and towards Winnebago Lake, has a considerable degree of fertility.

In the southern part of the state are numerous very remarkable remains of an unknown antiquity, the only records of the ancient inhabitants of the country. They consist of a series of tumuli, and are locally known as the Mounds. They are scattered over a wide area, but are most numerous along Rock, Wisconsin, Fox, and Pishtaka rivers, and in the vicinity of Lake Winnebago and the Four Lakes.

The most numerous of the mounds are of a circular and oblong form, similar to the sepulchral mounds which have been met with all over the globe; but besides these, and often placed without regard to regularity among them, are numerous others wholly unlike what are met with elsewhere. These are described as being of various sizes, and constructed of various materials, but commonly of burnt clay. They all assume definite shapes, and, though rudely fashioned, are evidently intended to represent various quadrupeds, birds, reptiles, and occasionally man. One, near Blue Mound, represents a man lying down, with his head towards the west, his feet to the east, and his legs and arms extended. It is 120 feet long, and about 6 feet high. A figure of a turtle is 56 feet long, and about 5 feet high. Some are said to represent buffaloes, eagles, lizards, &c.; and in a few instances they occur arranged in an irregular line as though the animals were following each other. At one spot, near the Four Lakes, about 100 of these mounds occur; those representing animals being placed among the plain ones without any apparent order. Fragments of ancient pottery are frequently found in the same neighbourhood. ('Silliman's Journal,' vols. xxxiv. and xlv.)

The Mississippi, which forms the western boundary of the state from the junction of the St. Croix, is noticed in a separate article. [*MISSISSIPPI RIVER*.] All the more important rivers of the state fall into the Mississippi. The *Wisconsin*, from which the name of the state is derived, flows from some lakes north of 45° N. lat., and runs above 200 miles in a generally southern direction to Portage, when it turns to the south-west and west, and, after a further course of 114 miles, falls into the Mississippi near Prairie du Chien. When swollen by a freshet it affords an easy navigation for steam-boats of considerable burden up to Portage, and boats of light draft usually find sufficient water. Above Portage are numerous rapids, which afford water-power to a great number of saw-mills. At Portage is a depression, or portage, of one mile and a half, across a flat meadow, which is occasionally subject to inundation, to the Fox River of Green Bay, thus affording a communication between Lake Michigan and the Mississippi, through which boats have been known to pass. The current in the lower part of the river is rapid, and like the Mississippi it contains numerous islands: when the water is low, the navigation is obstructed by shoals and sand-banks. Works have been for some time in progress for the purpose of improving the navigation of the Wisconsin, and of rendering available its communication with Lake Michigan.

The river next to the Wisconsin in importance is the *Fox*, or *Neenah* River, whose head-waters lie to the east of the great bend of the Wisconsin. From the portage above-noticed between the two rivers it runs northward to the Buffalo and Puckawa lakes, which extend from west to east. Issuing from these lakes the Fox River runs north-west, until it is joined from the north by the largest of its affluents, the Wolf River. The united river passes through a small lake, called, from the tumuli which occur in its vicinity, the Grande Buttes des Morts Lake, into Winnebago Lake, which is 32 miles long and nearly 10 miles across in the widest part. It leaves this lake at its north-western extremity and soon afterwards forms a series of rapids, which obstruct navigation. The remainder of its course lies to the north-east, and it falls into the most southern recess of Green Bay. The rendering the rapids below Lake Winnebago passable by steam-boats, is a part of the scheme for connecting the Mississippi with Lake Michigan, noticed above.

Of the other rivers we shall only mention three, which fall into the Mississippi,—the Black River, the Chippeway and St. Croix rivers. *Black River* rises in the Ocooch Mountains near 44° 20' N. lat., and flows first south, and then south-west to its junction with the Mississippi, about 91° 30' W. long. It drains a valley, in which the surrounding hills are covered with fine forest trees; and above 15,000,000 feet of pine lumber are annually sent down the river to the Mississippi. The *Chippeway*, the Ojibway of the Indians, rises near some of the tributary streams of Lake Superior. The main stream is formed by the union of several small streams, which issue from numerous lakes near the Michigan boundary. It flows in a generally south-western direction to the Mississippi, which it enters near the foot of Lake Pepin. It forms in its course numerous rapids, one series of which extends for about 24 miles. Above 28,000,000 feet of pine lumber are sent down this river annually. The *St. Croix* River is noticed under *MISSISSIPPI RIVER*, vol. iii. col. 821. About 20,000,000 feet of pine lumber are annually sent down the St. Croix. The other rivers of the state are very numerous, and though not of much value for navigation, are of the greatest importance for mechanical purposes.

The number of lakes which are dispersed over the state between the Mississippi River and Lake Superior is very great. In some parts north of 45° N. lat., they cover more than half the surface, most of them varying from 2 to 10 miles in circumference; but there are also several larger lakes. The larger are the Flambeau Lake and the Tomahawk Lake, each of which sends its waters to the Chippeway River; in the same district are lakes Courtoreille, Chetac, Red Cedar, &c. The country south of 45° N. lat., contains comparatively few lakes, with the exception of the low tract of country which lies between the great bend of the Wisconsin River and Green Bay, and is drained by Fox River. This tract contains numerous lakes, among

which is the Winnebago Lake, through which Fox River flows, and which is navigable for steam-boats, several of which ply regularly upon it. The lakes Buffalo, Puckawa, and Buttes des Morts, formed by expansions of Fox River, have been already noticed; Fond du Lac is another expansion of Fox River, which opens into Great Buttes des Morts Lake, and is remarkable for its picturesque scenery. South of the Wisconsin are the Four Lakes, through which the Goosekahn River flows; on the isthmus between Third and Fourth lakes, Madison, the capital of the state, is situated. Lake Michigan, which bounds the state on the east, is noticed under CANADA.

Numerous railways have been projected for this state, and several have been wholly or partly constructed. Madison is the centre of the state railway system. One of the chief lines in operation is the Milwaukee and Mississippi railway, which connects Milwaukee with Madison, and will eventually be continued to the Mississippi. Another great line connects Chicago, on Lake Michigan, in Illinois, with Fond du Lac. In all there were, on the 1st of January, 1855, in Wisconsin 11 lines of railway, having 283 miles of road in operation, and 746 miles additional were in course of construction or projected. Plank roads have been laid down from all the chief lake ports to the interior.

Geology, Mineralogy, &c.—The rocks of the north and north-western portions of the state belong entirely to the eruptive and metamorphic series; except in the immediate vicinity of Lake Superior, where are strata of what Mr. Owen describes as Potsdam sandstone, but which Mr. Marcou thinks clearly identical with the New Red-sandstone of European geologists. In this north-western section are valuable dykes of copper-trap. But the prevalent formation of Wisconsin is the Silurian, which is described as extending along the entire course of the Mississippi in this state, from the St. Croix to considerably east of the Chippeway, along Lake Michigan, and to occupy almost the whole of the southern moiety of the state. Of this extensive tract Lower Silurian strata occupy by far the largest portion. The lowest of these strata is the hard crystalline sandstone, known as Potsdam sandstone; in the western part of the state it is of considerable thickness, and is characterised by containing a larger number of *Lingula* and *Orbicula* than is found in any other part of America. Above this occur strata, chiefly of blue-limestone and blue clays, with, in some places, layers of sandstone. The limestones are mostly magnesian, in which are included the Galena limestones, which supply the lead veins that constitute so important a part of the wealth of southern Wisconsin. To this division of the Lower Silurian strata chiefly belong the rocks which border Green Bay. The St. Peter's shell-limestone, or the upper division of the Lower Silurian strata of America, is also said to have been recognised in some parts of Wisconsin. Upper Silurian strata form a comparatively narrow band, extending along Lake Michigan from Green Bay into Illinois: these strata consist entirely of limestone rocks. In the extreme south-eastern angle of the state, south of Milwaukee, they consist chiefly of light gray limestones, and are designated by Mr. Owen the Red Cedar River Formation.

Wisconsin is very rich in minerals, and though so new a state, mining operations are carried on upon an extensive scale. In the north-western portion of the state, or the region of igneous rocks, veins of copper-ore occur of remarkable richness, and which are said to be apparently inexhaustible. The copper-mines are chiefly in the neighbourhood of Lake Superior. The lead-mines of Wisconsin supply however by far the larger proportion of its mineral wealth. The lead occurs in the porous limestone of the southern part of the state, and the mines are worked to great profit. In 1852 about 40,000,000 lbs. of lead were exported from Galena, of which nine-tenths are said to have been raised in Wisconsin, and the quantities shipped at other ports on the Mississippi and Wisconsin are said to be more than equal to the remaining tenth part. Iron-ore occurs along the upper course of the Mississippi and elsewhere, but it has not yet been turned to much account. In the copper-veins zinc and calamine are found. The Silurian sandstone forms an excellent building-stone, for which purpose it is largely quarried. White-marble abounds in the southern and eastern portions of the state. Gypsum, chalcedony, jasper, &c., are met with in various places.

Soil, Climate, Productions, &c.—In the prairie districts the soil generally consists of a dark vegetable mould of considerable depth, resting on a clayey loam. It contains a large proportion of carbonate of lime, is quite free from stones or gravel, and is very fertile. The soil of the timbered land is neither so deep nor so rich as that of the prairies; that of the evergreen district is sandy and far from fertile. There is also a great deal of poor sandy land along the eastern side of the state. In the mining districts there are many very fertile tracts.

The winters are long and very cold, and the summers are very hot. The difference between the two seasons is much greater than in the northern countries of Europe, which are under the same degree of latitude and nearly as elevated as Wisconsin. During the winter months the thermometer frequently descends below zero, which very seldom takes place in southern Sweden. But the temperature rises rapidly in March, and the spring is much warmer than in Europe, in places which have the same mean annual temperature. On the other hand, the decrease of heat in the months of October and November is also greater. The mean annual temperature is about 45°, but it

differs of course somewhat in different parts of the state. Notwithstanding the numerous lakes and swamps, the climate of Wisconsin is said to be very healthy.

The prevailing winds in the countries situated near the shores of Lake Michigan are from the south-west for at least ten months in the year. But on the banks of the Mississippi the north-west is the prevailing wind, except in May and June, when the south-east is the frequent. Thunderstorms are frequent, especially at the beginning of the spring and towards the end of the summer.

Wisconsin is mainly an agricultural country, and its agricultural operations are yearly extending rapidly. The oak openings, the result of the annual fires which have for an indefinite period swept over a large portion of the state, offer great facilities for the operation of immigrant farmers; and Wisconsin has continued to attract for many years past a steadily increasing influx from the south and east, and the returns show a corresponding increase of improved lands. The cereals wheat is the principal crop, and the quantity raised increased from 212,116 bushels in 1840 to 4,286,131 bushels in 1850, an increase of 1920 per cent. in 10 years. Oats is the next largest crop, and then maize; the quantity grown of both of these has increased very largely (though a good deal less than that of wheat between the above dates. Barley, rye, and buckwheat are also grown to a considerable extent. Potatoes are raised in large quantities. Some hops are grown. The cultivation of hemp and flax is increasing. Home manufactures were only valued at 12,567 dollars.

The forests consist chiefly of white and other pines, but they contain various kinds of oak, hickory, walnut, sugar-maple, linden, cotton-wood, white, blue, and black ash, elm, red cedar, maple, willow, elm, white birch, white cedar, spruce, and juniper. About 200,000,000 feet of lumber are annually sawn and sent down the rivers of Wisconsin.

The prairies, especially in the southern districts, are covered with a fine turf, and afford good pastures for cattle and sheep. Horses, cattle, and sheep are becoming numerous. Swine have increased very greatly. The wool sheared in 1850 amounted to 253,963 lbs., butter 3,633,750 lbs., and of cheese 400,283 lbs. were made. There are wild animals of several kinds, though their number is rapidly decreasing. In the northern districts are buffaloes, elk, and deer; in these animals are rare in the southern districts. Bears, wolves, and foxes are not uncommon. The black and silver fox are greatly prized for their skins. The other animals are beavers, otters, minks, muskrats, musk-rats, which are now found only in the northern districts. The lakes, swamps, and rivers abound in water-fowl, such as swans, geese, ducks, and teal. There are also eagles, falcons, snipes, wild turkeys, and partridges. Fish abound in the lakes. The most important kind is the white-fish, which weighs from 4 to 6 lbs., and is very numerous in some of the northern lakes. The rivers abound in sturgeon.

Commerce, Manufactures, &c.—The direct foreign commerce of Wisconsin is chiefly with Canada, and is not of much importance. But the coasting-trade carried on from the lake ports of this state and by the Mississippi is very large. The imports at the ports on Lake Michigan in 1850-1 amounted to above 6,300,000 dollars, and the exports to about 3,000,000 dollars. The exports from the Mississippi ports are chiefly of minerals. The quantity of lumber annually sent down the rivers has been already stated.

The manufactures are chiefly of agricultural implements and the kinds of articles which are required in an agricultural country, the great bulk of what are entered in the state returns under the head of manufacturing establishments, being saw-mills, flour-mills, and tanneries. There are however also several iron-works, woolen factories, breweries, distilleries, &c. A large quantity of maple sugar is made by the farmers.

Divisions, Towns, &c.—Wisconsin is divided into 45 counties. The political capital is Madison, but the commercial centre and by far the largest town in the state is Milwaukee. The following comprise most of the more important towns, but new towns are constantly rising into comparative importance in this as in the other more flourishing of the new states.

Madison, the capital, is situated on the isthmus between the Third and Fourth Lakes, of the series known as the Four Lakes; 85 miles W. from Milwaukee: population 1525 in 1850, and 3500 in 1853. On Wisconsin being organised as a territory this spot was selected as the site of the future capital. The country was then only very partially cleared, and the contractor for laying out and building the future capital was, with his party, 11 days in cutting his way through the wilderness from Milwaukee. The foundation of the city was commenced in June 1837. The situation of the city is a very striking one. The capitol occupies the summit of an elevation 75 feet above the level of the lakes, and the main streets lead from it down to the lakes, with the exception of the western avenue, which is directed to the open country. The capitol, the chief public building, is a spacious and substantial structure. On an elevated spot west of the city stands the University of Wisconsin, founded in 1848: in 1854 it had 5 professors and 23 students. The city has greatly increased in buildings and population since the opening of railway communication; and the great amount of water-power which it possesses has led to the erection of several extensive mills. Three newspapers are published here.

Milwaukee stands on both sides of the Milwaukee River, at its entrance into Lake Michigan; 85 miles E. from Madison, in 43° 3' N. lat., 87° 57' W. long. The rise of this city has been very rapid. It was laid out in 1835 as a village. In 1840 it contained 1712 inhabitants; 20,061 in 1850, and about 25,000 in 1853. It is the chief commercial and manufacturing town in the state, and the largest on Lake Michigan after Chicago, which is about 100 miles S. from it. Milwaukee contains some good county and municipal buildings, churches, schools, stores, hotels, &c. A large portion of the trade is in the export of lumber, but there is an important and rapidly-extending export of wheat, flour, pork, beef, hides, lead, &c. The imports in 1850-51 amounted to 3,828,650 dollars, the exports to 2,098,469 dollars, but they have since greatly increased. In the city and its suburbs are extensive saw-mills, flour-mills, woollen factories, machine shops, iron foundries, cooperages, paper-mills, and tanneries; also manufactories of carriages, cabinet-ware, harness, soap and candles, sails and rigging, &c. Bricks of peculiar colour and quality are made here very largely for exportation. The city possesses several ships, and screw- and paddle-steamers. Milwaukee Bay, which is 6 miles across and 3 miles deep, is well sheltered, except from the east, and affords good anchorage. Six daily newspapers, 5 of them having also tri-weekly and weekly issues, are published here.

Beloit, on both sides of Rock River, at the junction of Turtle Creek, 46 miles S. by E. from Madison; population 2732 in 1850, and 3300 in 1853. The town possesses considerable water-power, which is applied to working several large mills; it also contains machine-shops, and other manufacturing establishments. Beloit College had 6 professors in 1854, and 30 students. A branch of the Galena and Chicago railway is carried to the town. Several of the ancient tumuli before noticed are in the vicinity. *Fond du Lac*, a village on the Fond du Lac River, at its entrance into the lake, 30 miles N.E. by N. from Madison; population 2014 in 1850, and about 4000 in 1840, is a place of considerable and growing trade. Regular steam-boat communication is maintained with the chief ports on Lake Michigan. *Green Bay*, on the right bank of Fox River, at its entrance into Green Bay, 140 miles N.N.E. from Madison; population 1923 in 1850, and 2500 in 1853. It is well situated for trade, the harbour permitting vessels of 200 tons to come up to the town, and the Fox River promising to afford, when the improvements in progress are completed, great facilities for communication with the interior. Some of the buildings are large and showy. *Janesville*, on both sides of Rock River, 35 miles S.S.E. from Madison; population 3419 in 1850, about 5000 in 1853. This is one of the rising business towns of the state. It contains a few good public buildings; has several large mills and stores; and is connected with Chicago and Milwaukee by railway. *Kenosha City*, formerly called Southport, is situated on Lake Michigan, about 100 miles S.E. from Madison; population 3455 in 1850, about 5000 in 1853. The harbour is a good one, and the town is the market and port of one of the finest farming districts in this part of the Union. *Manitowac*, at the entrance of the Manitowac River into Lake Michigan, 120 miles N.E. from Madison; is conveniently situated for trade, has good water-power for mechanical purposes, and is the natural outlet of a fertile district. It appears to be one of the most rising towns in the state; the population, which in 1850 was only 756, had increased in 1853 to 2300. *Mineral Point*, on one of the head streams of the Pecatonica, an affluent of Rock River, 50 miles W.S.W. from Madison; population about 3000 in 1853; is a mining town of considerable local importance. It contains some good public buildings, and large works for smelting lead- and copper-ore. *Prairie du Chien*, on the Mississippi, 3 miles above the confluence of the Wisconsin, about 105 miles W. from Madison; population 2498 in 1850. The town contains several churches and other buildings. It is a place of considerable trade; in its vicinity are very productive lead-mines; and the prairie from which the town derives its name is one of the most fertile regions south of the town. The military post, Fort Crawford, is a short distance south from the town. In the neighbourhood are numerous ancient sepulchral mounds. *Racine City*, at the mouth of Root River, on Lake Michigan, 90 miles E. by S. from Madison; population 5107 in 1850, and about 7500 in 1853, is, after Milwaukee, the most important commercial place in the state. It contains several good public buildings, and is the site of Rowsell Episcopal College. The exports, chiefly of wheat, amounted in 1851 to 650,950 dollars; the imports to 1,452,750 dollars. Five newspapers are published here. The Chicago and Milwaukee railway passes through the city. *Sheboygan*, on Lake Michigan, at the mouth of the Sheboygan River, 115 miles N.E. from Madison, is a place of some trade, and contained 2600 inhabitants in 1850. *Shullsburg*, on a branch of Fever River, 60 miles S.W. from Madison, is the centre of a busy lead-mining district, and contained 1678 inhabitants in 1850, and 2500 in 1853. *Waukesha*, on the Pishtaka River, 65 miles S.E. from Madison, stands on the edge of a rich prairie, and is a place of considerable trade. It had 2313 inhabitants in 1850, and 4000 in 1853.

History, Government, &c.—Wisconsin was first visited by the French about 1660; and it remained nominally a French possession till 1763, when it was ceded to Great Britain. After the declaration of American independence, Wisconsin formed a part of the United States North-West Territory. Wisconsin was erected into a distinct territorial government in 1836; but the territory included a much

larger area than the present state. In 1848 Wisconsin, with its present boundaries, was admitted into the Union as an independent state.

The constitution of the state of Wisconsin was confirmed by a popular convention in April 1848. By it the suffrage is vested in all free white males 21 years of age, who have resided in the state for one year, and in all civilised persons of Indian descent not being members of a tribe. The legislature, elected biennially, consists of an Assembly of not less than 54 nor more than 100 (at present 54) members; and a Senate of not less than one-fourth nor more than one-third of the number of members of the Assembly: at present there are 18 senators. The governor is also elected for two years. The judges are elected by popular vote. By the constitution, the legislature cannot pass a bill for a lottery or a divorce. The total revenue of the state for the year ending December 31, 1853, was 311,633 dollars; the total expenditure was 254,187 dollars. The state militia consisted in 1854 of 39,565 men, of whom 414 were commissioned officers. In 1853, in the counties which furnished returns (39 out of the 45 in the state), there were in all 138,279 "children between the ages of 4 and 20," of whom 95,293 attended school. The capital of the State School Fund amounted on December 31, 1853, to 1,141,804 dollars, of which 1,107,709 dollars were at interest at 7 per cent. There are a state university at Madison, and colleges at Beloit and Racine.

WISHAWTON. [LANARKSHIRE.]

WISMAR. [MECKLENBURG.]

WITCHAMPTON. [DORSETSHIRE.]

WITHAM, Essex, a market-town and the seat of a Poor-Law Union, in the parish of Witham, is situated on the left bank of the river Brain or Podsbrook, just above its junction with the Blackwater, in 51° 48' N. lat., 0° 39' E. long., distant 9 miles N.E. from Chelmsford, 87 miles N.E. from London by road, and 38½ miles by the Eastern Counties railway. The population of the parish of Witham in 1851 was 3803. The living is a vicarage in the archdeaconry of Colchester and diocese of Rochester. Witham Poor-Law Union contains 17 parishes and townships, with an area of 36,938 acres, and a population in 1851 of 16,099.

Witham is generally reputed to have been built by Edward the Elder, but probably that prince only restored the place, as there appears to have been a Roman station here. The town of Witham consists of two portions: the larger comprises one main street along the high road, and four small streets branching from it; while the smaller, about half a mile distant, is on Chipping Hill, and includes the parish church. The town is lighted with gas. The church is a commodious structure. A second church, All Saints, was erected in 1842, at a cost of 5000*l.* The Independents, Baptists, Quakers, and Roman Catholics have places of worship. There are National, British, and Infant schools, a literary institution, and a savings bank. The market is held on Saturday; three fairs are held in the course of the year.

WITNEY, Oxfordshire, a market-town and the seat of a Poor-Law Union, in the parish of Witney, is pleasantly situated on the banks of the river Windrush, in 51° 48' N. lat., 1° 29' W. long., distant 11 miles W.N.W. from Oxford, and 65 miles W.N.W. from London. The population of the town of Witney in 1851 was 3099. The living is a vicarage and rectory, in the archdeaconry and diocese of Oxford. Witney Poor-Law Union contains 42 parishes and townships, with an area of 70,169 acres, and a population in 1851 of 23,530.

The town of Witney is chiefly known by its blanket manufacture, which has been carried on from an early period. Although a manufacturing town, Witney retains a quiet and rural appearance. Situated in the High-street are a staple or blanket hall, a handsome structure, erected in 1721; a town-hall, built of stone, with a piazza underneath for a market-house; and a market-cross, erected in 1683, and repaired in 1811. The church is a commodious and handsome cruciform building, with a tower and a lofty spire at the intersection. The Independents, Wesleyan and Primitive Methodists, and Quakers have places of worship. There are a Grammar school, National, British, and Infant schools, and an Athenæum reading-room. The manufacture of rough coatings, of tilt for barges, of felt for paper-makers, and of gloves, employs some of the inhabitants. The Witney blankets are of superior texture and good colour. Thursday is the market-day; six fairs are held in the course of the year.

WITTENBERG. [MERSBURG.]

WITTERSHAM. [KENT.]

WIVENHOE. [ESSEX.]

WIX. [ESSEX.]

WLODAWA. [POLAND.]

WOOHOO. [SANDWICH ISLANDS.]

WOBURN, Bedfordshire, a market-town and the seat of a Poor-

Law Union, in the parish of Woburn, is situated in 51° 59' N. lat. 0° 37' W. long., distant 16 miles S.S.W. from Bedford, 41 miles N.W. by N. from London by road, and 50 miles by the London and North-Western railway. The population of the parish of Woburn in 1851 was 2049. The living is a perpetual curacy exempt from episcopal jurisdiction. Woburn Poor-Law Union contains 16 parishes and townships, with an area of 29,603 acres, and a population in 1851 of 12,075.

An abbey of Cistercian monks was founded at Woburn by Hugh de Bolebec in 1145. The last abbot, Robert Hobs, was executed for denying the king's supremacy; and the site of the abbey was granted to John, lord Russell, afterwards earl of Bedford. The town of Woburn was destroyed by fire in 1724, after which it was rebuilt in a regular manner. The market-house has been much improved by the present Duke of Bedford, who has also enlarged the parish church and school-house, and added to the church tower an elegant lantern and pinnacles. The Wesleyan Methodists and Independents have chapels, and there are a British school and some almshouses. Lace-making and straw-hat making employ some of the females. Friday is the market-day; fairs are held on January 1st, March 23rd, July 13th, and October 6th.

The park, in which is situated Woburn Abbey, the magnificent seat of the Duke of Bedford, is about three miles long by about a mile and a half wide. Part of the old abbey remains, but has been incorporated with the buildings constituting the present mansion. Woburn Abbey, as it now stands, was erected about the middle and towards the end of the last century; it occupies four sides of a quadrangle, presenting four fronts of above 200 feet each. The principal front, on the west side, is of the Ionic order, with a rustic basement. The offices are at a short distance from the mansion, and the park is finely diversified with wood and water. The tree on which Abbot Hobs was hung is still standing, and is carefully preserved. The abbey is adorned with several interesting historical portraits. In the dining-room is a fine collection of portraits by Vandyke; and in the breakfast-room a numerous series of views in Venice, by Canaletti, painted originally for Bedford House. In the sculpture gallery are the antique vase known as the Lanti vase, brought over to England by Lord Cawdor, and a very large ancient marble sarcophagus (brought from Ephesus) having bassi-relievi on the four sides. In the park is a farm-yard on a very extensive scale, and furnished with every convenience. It originated with Francis, fifth duke of Bedford. The grounds and gardens have obtained great horticultural celebrity. The arboretum is a very fine one; the collection of willows is the finest in England.

WOKING. [SURREY.]

WOKINGHAM, or OAKINGHAM, Berkshire, a market-town and the seat of a Poor-Law Union, in the parish of Wokingham, is situated near the right bank of a feeder of the river Loddon, in 51° 25' N. lat., 0° 50' W. long., distant 7 miles S.E. from Reading, and 32 miles W. by S. from London. By the Great Western railway, and the Reading branch of the South-Eastern railway, the distance from London is 42½ miles. The population of the town of Wokingham in 1851 was 2272. The town is governed by eight capital burghesses, one of whom is alderman. The living is a perpetual curacy, in the archdeaconry of Berks and diocese of Oxford. Wokingham Poor-Law Union contains 16 parishes and townships, with an area of 42,226 acres, and a population in 1851 of 13,663.

Wokingham is within the precincts of Windsor Forest, and on one of the roads from London to Reading. The town consists of several streets, which meet in a spacious area, containing the market-house. The church, which is ancient, is a large and handsome edifice. The Wesleyan Methodists and Baptists have places of worship. There are National and Infant schools, a savings bank, almshouses, and a hospital at Luckley Green for a chaplain and 16 poor men. The malting and meal trades and the shoe manufacture furnish the chief occupations of the inhabitants. The market is held on Tuesday, and is well supplied with poultry, which is purchased largely for the London market. Four fairs are held during the year.

WOLFENBÜTTEL, a town in the duchy of Brunswick, capital of the circle of Wolfenbüttel, is situated in 52° 9' N. lat., 10° 32' E. long., on the Ocker, 13 miles by railway from Brunswick, and has about 10,000 inhabitants. It is divided into three parts, namely the citadel, or formerly fortified part, and two suburbs. The town is well built, and has broad, and for the most part, straight streets, all well paved. Till 1764 it was the residence of the dukes, in whose palace there was a manufactory of tapestry and a theatre. Opposite the palace stands a fine building, erected in 1723, on the model of the Pantheon at Rome, containing on the ground-floor the ducal riding-school, and above it the public library, which contains 10,000 manuscripts and 200,000 printed volumes. The town has four churches, of which that of St. Mary is remarkable for its size; an ancient arsenal, now used as barracks; a large poor-house; an orphan asylum; a gymnasium; and several schools. The inhabitants have a considerable trade in yarn, and they also manufacture linen, leather gloves, japanned-ware, paper-hangings, silk, diaper, tobacco, liqueurs, and vitriol; there are likewise some tanneries and distilleries. Wolfenbüttel is the seat of several public offices, for the whole duchy, of the consistory and of the supreme court of appeal for Waldeck, Lippe, and Brunswick.

WOLGA. [VOLGA.]

WOLLIN. [STETTIN.]

WOLSINGHAM. [DURHAM.]

WOLSTANTON, Staffordshire, a village, and the seat of Wolstanton and Burslem Poor-Law Union, is situated in the pottery district, in 53° 1' N. lat., 2° 11' W. long., distant 2 miles N. by E. from Newcastle-under-Lyme, 150 miles N.W. from London by road, and 147½ miles by the North-Western and North-Staffordshire railways. The population of the township of Wolstanton in 1851 was 1317; that of the entire parish, which includes Tunstall, noticed among the towns in STAFFORDSHIRE, was 22,191. The living of Wolstanton parish is a vicarage, in the archdeaconry of Stafford and diocese of Lichfield. Wolstanton and Burslem Poor-Law Union contains the two parishes so named, with an area of 13,679 acres, and a population in 1851 of 41,916. Wolstanton church is a neat edifice; there are no other buildings of any consequence. The inhabitants are chiefly dependent on the potteries of the district.

WOLVERHAMPTON, Staffordshire, a market and manufacturing town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated in 52° 35' N. lat., 2° 7' W. long., distant 16 miles S. from Stafford, 123 miles N.W. from London by road, and 127 miles by the London and North-Western railway. The population of the municipal borough of Wolverhampton in 1851 was 49,985; of the parliamentary borough, 119,748. The borough is governed by 12 aldermen and 36 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry of Stafford and diocese of Lichfield. Wolverhampton Poor-Law Union contains 4 townships, with an area of 23,998 acres, and a population in 1851 of 132,603.

A monastery was founded at Wolverhampton in 996 by Wulfrana, sister of King Edgar; and the town appears to have been named Wulfrana Hamton, after the foundress of the monastery, which by contraction and corruption has become Wolverhampton. The parish includes a circumference of about 30 miles. The town is situated on rising ground, and consists in general of substantial and well-built houses; the streets are well lighted with gas. The public buildings are—a new exchange, opened in January 1852, containing a hall 100 feet long, 50 feet wide, and 50 feet high; a town-hall; a public subscription library-hall, over which is a suite of rooms used for concerts and assemblies; an hospital; a dispensary; a theatre; and a new market-hall. There are eight churches, four of which are of recent erection; the oldest is that of St. Peter, a spacious structure, erected in the 14th century, and just restored. The pulpit is formed of a single stone elaborately sculptured, and there is a font of great antiquity, with curious bas-relief figures of saints. In the churchyard is a column 20 feet high, with rude antique sculptures. The Wesleyan Methodists, Independents, Baptists, English Presbyterians, and Roman Catholics have places of worship. There are a Free Grammar school; National and Infant schools; an Endowed Blue-Coat school; and a school erected and endowed by Mr. Barker, one of the iron-masters, for the children of his workmen. There is a general cemetery a short distance south-west of the town.

The district in which Wolverhampton is situated abounds in mines of coal, iron, limestone, and other minerals; and the manufactures consist chiefly of fire-irons, tinned and japanned iron-ware, locks and keys, guns, files, screws, edge-tools, and a variety of other articles of hardware. Numerous extensive iron-foundries are situated in the vicinity of the town. There are several large manufactories of japan, papier-mâché, and tin goods; also several brass-foundries, chemical-works, and coach and railway-carriage works. Brick-making, rope-making, malting, and tanning are carried on. The town is regarded as the capital of the Staffordshire iron district. The market is on Wednesday; a fair is held on July 10th. Races are held annually.

WOLVERTON. [BUCKINGHAMSHIRE.]

WOLVISTON. [DURHAM.]

WOMBRIDGE. [SHROPSHIRE.]

WOODBRIDGE, Suffolk, a market-town and port, and the seat of a Poor-Law Union, in the parish of Woodbridge, is situated on the right bank of the river Deben, where it expands into an estuary, in 52° 6' N. lat., 1° 19' E. long., distant 8 miles E.N.E. from Ipswich, and 77 miles N.E. by E. from London. The population of the town of Woodbridge in 1851 was 5161. The living is a vicarage in the archdeaconry of Suffolk and diocese of Norwich. Woodbridge Poor-Law Union contains 46 parishes and townships, with an area of 80,761 acres, and a population in 1851 of 23,660.

The town is lighted with gas and well paved. The market-place is spacious; in the centre of it is an ancient shire or sessions hall, in which quarter-sessions for the division are held. The church is a handsome edifice of early perpendicular character, built chiefly of black flint, and has a large square tower built of flint and stone, 180 feet high. A new church was opened in 1846. There are places of worship for Wesleyan Methodists, Independents, Baptists, and Quakers. There are Free, National, British, and Infant schools, a mechanics institute, and a savings bank. There are extensive almshouses of the Sekford charity, built about 10 years since at the cost of nearly 20,000*l.* Wednesday is the market-day for corn, cattle, and provisions. Fairs are held on April 5th and October 23rd; that held in April is a large horse-fair. There are a custom-house, a lecture and temperance

hall, a small theatre, and barracks; and near the town is a bridewell. The estuary of the Deben is here navigable for small coasting-vessels; the tide flows above the town. Corn, malt, and flour are exported; and coal, timber, and general merchandise imported. The number and tonnage of vessels registered as belonging to the port on December 31st 1854, were:—Of and under 50 tons 30, tonnage 1007; above 50 tons 34, tonnage 2398. The entries at the port during 1854 were:—Inwards, 543 vessels, tonnage 28,298; outwards, 380 vessels, tonnage 19,399.

WOODFORD. [Essex.]

WOODHAM FERRERS. [Essex.]

WOODNESBOROUGH. [Kent.]

WOODSTOCK, NEW, Oxfordshire, a parliamentary and municipal borough, and the seat of a Poor-Law Union, in the parish of Woodstock, is situated on rising ground on the left bank of the Glyme, a stream which is expanded into a lake in Blenheim Park, in 51° 51' N. lat., 1° 21' W. long., distant 8 miles N.N.W. from Oxford, and 62 miles W.N.W. from London by road. The population of the parliamentary borough of Woodstock in 1851 was 7933. The borough returns one member to the Imperial Parliament. The living is a curacy in the archdeaconry and diocese of Oxford. Woodstock Poor-Law Union contains 31 parishes and townships, with an area of 44,973 acres, and a population in 1851 of 14,360.

The hamlet of Old Woodstock, though not included in the municipal borough, may be considered as forming a part of the town of New Woodstock. The town-hall, erected about 1766, is a neat stone building, with a piazza in the lower part, which is used as a market-place. The greater part of the church was rebuilt in 1785 on the site of a chantry founded by King John. A round-arched Norman doorway remains in the south wall, and three massive ancient columns in the interior, with grotesque heads on the capitals, support pointed arches. There are chapels for Wesleyan Methodists and Baptists, a Free Grammar school, two endowed Free schools, and a savings bank. A county court is held in the town. The only manufacture of importance is that of gloves, which is carried on partly in the town of Woodstock, but chiefly in the surrounding villages. Tuesday is the market-day; seven fairs are held in the course of the year. Previous to the Reform Act, Woodstock returned two members to Parliament.

WOODSTOCK. [CANADA; NEW BRUNSWICK.]

WOODVILLE. [MISSISSIPPI, State of.]

WOOLER. [NORTHUMBERLAND.]

WOOLWICH, Kent, a market-town and the seat of the chief government arsenal, in the parish of Woolwich, is situated on the right bank of the river Thames, in 51° 29' N. lat., 0° 4' E. long., distant 8 miles E. from London by road, about 9½ miles by the river, and 9 miles by the North Kent railway. The population of the town and parish of Woolwich in 1851 was 32,867. The parish forms part of the parliamentary borough of GREENWICH. The town is governed by a board of 30 commissioners. The living is a rectory in the archdeaconry of Middlesex and diocese of London.

Woolwich consists chiefly of a street about a mile long, on the bank of the river, with other streets diverging from it chiefly to the south. In the higher and more modern part of the town there are several streets of handsome houses. The streets are lighted with gas. At Woolwich the Thames is three-quarters of a mile wide. A tract of land in Essex, on the left bank of the river, called North Woolwich, is included in the parish of Woolwich. The parish church is a plain brick building with a square tower. Two new churches have been erected within the last few years with the aid of the Church Building Society. There is also a proprietary Episcopal chapel. The Ordnance chapel, on the road to Plumstead, and another chapel in the Royal Artillery Barracks, are both in the appointment of the Board of Ordnance. The Wesleyan and Association Methodists, Independents, English Presbyterians, Baptists, and Roman Catholics have places of worship. There are National, British, Infant, and Roman Catholic schools, a Marine school, reading-rooms, a mechanics institute, a savings bank, baths, and several parochial charities. There is a town-hall. A county court is held in the town. The government establishments are—the Royal Artillery Barracks, the Royal Marine Barracks, the Royal Sappers and Miners' Barracks, the Royal Arsenal, Her Majesty's Dockyard, and the Royal Ordnance Hospital.

The importance of Woolwich has arisen from its dockyard, from the government foundry for cannon having been established there, and from its having been made a great dépôt for naval and military stores. Of the government establishments at Woolwich, the first was—

The Royal Dockyard, which was formed in the reign of Henry VIII. The 'Harry Grace à Dieu,' named after the king, and built at Woolwich in 1515, was the largest vessel which had then been constructed. The dockyard now commences at the village of New Charlton on the west, and extends along the south bank of the river almost a mile to the east, very near to the Royal Arsenal. It contains two large dry docks, a basin 400 feet long by 300 feet wide, capable of receiving the largest vessels; extensive ranges of timber-sheds, store-houses, mast-houses, with steam saw-mills, &c.; and a large building provided with powerful steam-engines, Nasmyth's steam-hammer, and every other needful implement for manufacturing the various articles of iron used in ship-building.

The government foundry for casting cannon was formerly in

Moorfields, and was removed to Woolwich about the year 1716. The foundry for cannon forms one of the principal departments of the Royal Arsenal. It has 4 air-furnaces, the largest of which can melt at once 19 tons of metal. Another department of the Royal Arsenal is the Model Room, which is near the foundry. It contains a pattern or model of every article used in the artillery service; of the machinery for granulating gunpowder, and for trying the strength of powder; of Congreve and other rockets; chain, bar, and other shot; fire-ships, fire-works, &c. Connected with the Model Room is the Laboratory, in which cartridges, rockets, fire-works, and other articles of chemical manufactures are prepared. In other parts of the arsenal are large numbers of cannon-balls and bomb-shells arranged in pyramidal groups. At the east end of the grounds is the 'butt,' a large mound, which is made use of in proving the large guns cast here. There are extensive magazines for gunpowder and rockets, also saw-mills and workshops for the manufacture of gun-carriages, rocket-staffs, lance-poles, and similar articles. The Storehouses of the Royal Artillery are to the north of the Royal Arsenal. The Royal Artillery Barracks are on the north side of Woolwich Common. The principal front, which consists of 6 ranges, is 1200 feet long, with an elegant entrance-tower in the centre. A spacious chapel in the east wing has accommodation for 1000 persons. The other parts of the building consist of the library and reading-rooms, and a splendid suite of apartments, in which balls and other entertainments are given. The interior is divided into two quadrangles, with stabling and barracks for the horse-artillery and a large riding-school.

The Royal Military Academy is at the south-east edge of Woolwich Common, towards which it presents a handsome front: the central tower, with its four domed turrets, is a picturesque object in the distance. The academy was established as early as 1719, but the present building was not erected till 1805. The Master-General of the Ordnance for the time being is the governor. The resident officers are—a lieutenant-governor and inspector, second captains and lieutenants, a professor of mathematics, a professor and instructors of fortification, instructors in practical artillery, masters of geography, surveying, drawing, languages, &c., with lecturers on mechanics, astronomy, geology, and chemistry.

The Repository, south of the town, on the west side of Woolwich Common, is a depository for models of fortified towns, dockyards, &c.; other models of military and naval architecture, with specimens of fire-arms, military machines, and a variety of other things connected with military and naval affairs. The building, called the Rotunda, is of tent-like form, with 24 sides, the diameter being 120 feet. The centre of the cone which forms the top of the building is supported by a pillar, round which are arranged specimens of old English weapons, such as matchlocks, wheel-locks, bills, partizans, old swords, &c.

Besides the buildings above described, there are the Royal Marine Barracks; the barracks of the Royal Sappers and Miners, in which a library and museum have been instituted by the non-commissioned officers and privates of the corps; and the Royal Ordnance Hospital. In the Thames, opposite the dockyards, are the hulks for the reception of convicts sentenced to transportation and to hard labour: the convicts are employed on government works.

At North Woolwich, on the opposite side of the river, a village of neat residences, with an hotel and pleasure-grounds, has sprung up since the construction of the Woolwich branch of the Eastern Counties railway, which has its terminus here. Communication by steam-boat is constantly maintained between Woolwich and North Woolwich. Extensive commercial docks are in course of construction at North Woolwich.

WOOTTON BASSETT. [WILTSHIRE.]

WOOTTON ST. LAWRENCE. [HAMPSHIRE.]

WORBIT. [ERFURT.]

WORCESTER, the capital of Worcestershire, an episcopal city, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated chiefly on the left bank of the river Severn, in 52° 12' N. lat., 2° 12' W. long., distant 111 miles W.S.W. from London by road, and 139 miles by the London and North-Western and Bristol and Birmingham railways. The population of the city of Worcester in 1851 was 27,523. The borough is governed by 12 aldermen and 36 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry and diocese of Worcester. Worcester Poor-Law Union contains 12 parishes, with an area of 6967 acres, and a population in 1851 of 26,237.

The ancient boundary-wall of the city of Worcester may still be traced in some places. There were six gates (besides the tower on the bridge); the last was taken down in 1787. The present extent of the city is about three miles from north to south, and nearly two miles from east to west.

Worcester is built almost entirely of red brick, with the exception of some public buildings, the churches, and the cathedral, which are of a soft and commonly a reddish kind of sandstone. The city is lighted with gas, and well supplied with water. The principal streets are broad, airy, and cheerful; the appearance of the houses and shops is clean and neat. The chief thoroughfares are High-street, Bridge-street, Broad-street, Sidbury, College-street, the Cross, Foregate-street, and the Tything. Besides the cathedral there are 13 churches. St.

John's is the parish church of what may properly be termed a suburb of Worcester, and is on the right bank of the Severn. There are places of worship for Wesleyan and Primitive Methodists, Quakers, Baptists, Independents, Countess of Huntingdon's Connexion, Roman Catholics, and Mormons. A floating chapel is maintained for boatmen and others employed on the river. Besides Queen Elizabeth's Grammar school, there are a Cathedral school, a Diocesan school, a Blue-Coat school, a Roman Catholic Charity school, and the Countess of Huntingdon's Charity school; National, British, and Infant schools; a literary and scientific institution; a natural history society and museum; public news-rooms; a law society and reading-rooms; a savings bank; a dispensary; an infirmary; a female asylum; and several other benevolent institutions.

A cathedral existed here in the time of the Saxons; but it was deemed insufficient for its purpose, and was superseded by a new cathedral, built by Oswald, the bishop, in 983. This building being destroyed by fire, another edifice arose under the auspices of Bishop Wulfstan in 1084. This cathedral likewise twice suffered from fire. After the second conflagration it remained for 16 years in a dilapidated state. Repairs, so great as to render a fresh consecration necessary, were then made, and in January, 1281, the church was re-opened in the presence of the king. Various alterations and additions were made in 1224, and again in 1830. The crypt of Wulfstan's cathedral remains in a tolerably perfect state.

Worcester cathedral is built in the form of a double cross, with double transepts. The tower, which is 193 feet high, rises from the intersection of the western transept with the nave and choir. The nave, which appears to be the oldest part of the present building, except of course the crypt, is divided from the aisles by 10 clustered columns on each side, surmounted with pointed arches. The roof is groined, and ornamented with flowers, heads, and other forms of decoration; some of the windows are admirable examples of the early and decorated English styles. The height of the nave is 67 feet, the length 174 feet, and the width 30 feet. The choir has also a handsome groined roof; the altar-screen and the pulpit are of stone, and both are richly sculptured. The tomb of King John is in the centre of the choir. There is a lady-chapel, which corresponds in date and style with the choir. The total length of the cathedral is 425 feet; the greatest width is 145 feet. The west transept is 128 feet; the east transept is 120 feet. The cloisters form a quadrangle on the south side; on the east side is the chapter-house, which is polygonal outside, and circular in the interior, with a central column supporting the roof: it contains the cathedral library.

The other principal buildings of Worcester are—the guildhall, an elegant structure of brick, with stone quoins and ornaments; the skinkhall, a handsome stone Ionic building; the county courts; the county jail; the city jail; the county infirmary; a new corn-hall; another building, erected for a corn-exchange, but now converted into a music-hall; a new market-house; and Edgar's Tower. In the guildhall is a large room which is used for public entertainments. The present bridge over the Severn was built in 1780; it has of late years been repaired, and the pathway widened. Musical festivals, conducted by the choirs of the dioceses of Worcester, Hereford, and Gloucester, are held in Worcester cathedral triennially. Races take place in July and November near the bank of the river; on the race-ground is a commodious grand stand.

A considerable manufacture of cloth was once carried on here. The glove trade now employs a large number of the female inhabitants. Porcelain of a fine quality is extensively made; in the town are several celebrated porcelain factories. Hops are cultivated in the neighbourhood. A distillery and a rectifying-house are in the city. Trade is carried on in coal, corn, malt, slate, and timber; iron-founding, tanning, and rope-making employ some of the population. On the bank of the canal are large warehouses. Markets are held on Wednesday and Saturday: there are eleven fairs in the course of the year. A county court is held in the town.

A city occupying the site of the present city of Worcester was destroyed by the Danes, and rebuilt about 894 by Ethelred. In 1041 the town was plundered and partly burnt by the troops of Hardicanute. In 1074 a body of troops under Walter de Lacy and the Barons of Hereford was assembled here, to quell a conspiracy against William the Conqueror, and to guard the passes of the Severn against the rebels. In 1088 Bernard Neumarck unsuccessfully besieged the city. On several occasions during the 12th century the city suffered from casual fires, and also from the ravages of civil war. In 1216 the king's troops, commanded by the Earl of Chester, plundered the city, which had revolted. King John was buried here in this year. In 1225 a great tournament was held here. Bishop Blois excommunicated all persons concerned in it. From the year 1263, in the revolt of the barons, till 1651, when Charles II. was besieged in the city by the parliamentary troops under Cromwell, the town experienced on many occasions the disasters accompanying a state of civil warfare.

The site of the castle, which from time to time sustained so many sieges and so frequently changed governors, is on the south side of the cathedral. A small part of an old ecclesiastical house, the nunnery of Whitetane, now called 'The White Ladies,' is still standing; Friar-street takes its name from a house of Franciscans which formerly existed here; the remains of the monastery were demolished in 1823.

The Dominicans, Penitents, Black Friars, and Friars of the Holy Trinity had likewise their establishments.

The see of Worcester is in the province of Canterbury. The diocese includes the counties of Worcester and Warwick, one parish in Gloucestershire, and three in Staffordshire, and comprises 393 benefices. It is divided into the archdeaconries of Worcester and Coventry. The chapter consists of the dean, the archdeacons, 6 canons, 14 honorary canons, 5 minor canons, and a chancellor. The income of the bishop is fixed at 5000*l.* a year.

WORCESTER, U.S. [MASSACHUSETTS.]

WORCESTERSHIRE, an inland county of England, is bounded N. by Staffordshire and Shropshire, E. by Warwickshire, S. by Gloucestershire, and W. by Herefordshire. The county lies between 51° 56' and 52° 31' N. lat., and 1° 46' and 2° 38' W. long. The greatest length of the county is about 29 miles, in a direction from north-east to south-west; its greatest breadth is about 22 miles, in a line running from east to west. The area of Worcestershire is 788 square miles, or 472,165 acres. The population in 1841 was 248,460; in 1851 it was 276,926.

Surface, Geology, &c.—Worcestershire is generally a flat county; on the eastern and western sides are two nearly parallel ranges of hills, which partly bound and partly intersect it: the intermediate space is, for the most part, a fertile plain. The eastern range of hills commences in the north in the Clent Hills, extends to the north-west of Bromsgrove, and forming near Redditch the boundary between this county and Warwickshire, terminates to the north of Evesham. The western chain commences in the neighbourhood of Bewdley, and runs southward by Abberley and Martley to the great chain of Malvern Hills, in which it terminates. The principal hills not comprised in or bordering on these chains are Bredon Hill, situated about three miles south of Pershore, Broadway Hill, near the town of that name, in the south-eastern extremity of the county, and a small line of hills extending from Croome northwards towards Worcester.

Geology, &c.—Worcestershire is composed, for the most part, of new red-sandstone, lias, and oolite; other formations are visible in the chain of the Malvern Hills, in the districts bordering on Tenbury, Bewdley, and Dudley, and in the Lickey and neighbouring hills in the northern part of the county. The new red-sandstone comprehends that district which is watered by the Severn, together with the north-eastern portion of the county: its lower beds being found round Witley, Stourport, Kidderminster, Bromsgrove, and Alvechurch; and the higher, called the Keuper beds, round Droitwich, Worcester, and Upton. The lias formation is found at Pershore and Evesham, and in the vales watered by the Avon; it extends from Foster's Green to the limits of the county near Tewkesbury. The portion of the Malvern Hills within the boundary of Worcestershire consists of trap; while the Silurian rocks, the Caradoc sandstone, Ludlow rock, and Wenlock limestone appear in the northern portion of the chain. The lower coal and ironstone beds are found at its termination, to the north of Abberley Hill, in the forest of Wyre. Here also is found the old red-sandstone formation upon which Tenbury stands, and which is the prevailing stratum throughout the adjoining county of Hereford. Bewdley is situated near the junction of the lower red-sandstone with the coal-field of the Forest of Wyre. The town of Dudley stands on the thicker coal-measures, Wenlock limestone appearing on its north-west, and trap at Rowley Hill on the south-south-east. In the neighbourhood of Droitwich and Stoke Prior are saliferous beds, from which a large quantity of salt is manufactured. A full and interesting account of them is given in a pamphlet by Dr. Hastings. They are likewise described by Sir R. I. Murchison in his 'Silurian System,' to which work we refer our readers for very accurate accounts of the coal-fields and more remarkable geological phenomena of the county. In a paper by Mr. Leonard Horner, in the 'Geological Transactions,' is a full and interesting account of the geology of the Malvern Hills.

Hydrography and Communications.—The principal rivers are the SEVERN, the AVON, the Teme, and the Salwarp.

The Teme, which is a very rapid stream, first comes into contact with Worcestershire at its western extremity; it passes the town of Tenbury, and forms here, as during other parts of its course, the boundary of Worcestershire with Herefordshire. It falls into the Severn near Powick, about three miles south of Worcester: it is not navigable. The stream is good for fishing, and trout and grayling are abundant. The Salwarp, a small river, rises to the north of Bromsgrove, flows through Droitwich, and falls into the Severn near Claines.

The northern part of the county is intersected by several canals, which are of great commercial importance. The chief of these, the Birmingham and Worcester Canal, reaches from the junction of the Birmingham and Fazeley canals at Birmingham, to the Severn, a little below Worcester, passing through the salt-district of Droitwich, and having two branches, one to Dudley by way of Hales Owen, and the other from King's Norton to Stratford-upon-Avon. From Dudley there is a canal, which, under different names, runs to Stourbridge, Kidderminster, and Stourport, at which last place it opens into the Severn.

The principal roads are from Birmingham through Bromsgrove, Droitwich, Worcester, Severnstoke, and Upton to Tewkesbury, Cheltenham, and Gloucester; from Dudley to Stourbridge, Kidderminster

to Stourport; or, leaving Stourport on the left, through Hartlebury and Omberley to Worcester; and from Worcester to Malvern. There are good turnpike-roads which connect the county town with Tenbury and Bromyard, and other towns.

The main line of the Bristol and Birmingham railway intersects this county diagonally from north-east to south-west. The line runs nearly parallel with the turnpike-road leading from Tewkesbury to Worcester and Birmingham on the south-east. The Oxford, Worcester, and Wolverhampton railway enters the county a short distance east of Evesham, and runs west-north-west to Worcester; it then turns northward, and passes by way of Droitwich, Kidderminster, and Stourbridge to Dudley, where it quits the county. A short branch from Droitwich to the Stoke Works station connects it with the Bristol and Birmingham line. A portion of the London and North-Western railway likewise traverses the north-eastern extremity of the county. There are some tram-roads, on which horses are worked, in the coal districts.

Climate, Soil, Agriculture.—The climate of Worcestershire, especially in the middle, south, and west of the county, is remarkably mild and healthy, and the fruits of the earth are brought to early maturity. The vales of Severn and Avon are but little raised above the level of the sea; and it has been observed, that an elevation of 60 yards makes a difference in climate equal to a degree of latitude towards the north, soil and other circumstances remaining the same. The higher parts of the county, between Bromsgrove and Birmingham, have consequently a later harvest. The higher hills, such as the Malvern Hills, are proportionally colder and later. They tend to shelter the vales between them from the cold winds, and add to the mildness of the climate there.

The Vale of Severn, which extends about 30 miles in length from north to south, contains some extremely rich alluvial soils, which from their situation are admirably adapted for rich pastures. The banks of the Avon also, which falls into the Severn near Tewkesbury, are rich, and consist mostly of meadows and pastures.

The *Teme* winds through the county for about 30 miles. Along its banks are many hop-gardens and orchards, a sure proof of a good deep soil, and the lower parts form rich meadows. Several lesser streams run in their own valleys, the soil along their banks being generally good, except in a few instances in which bogs, with their accompanying peat, have been formed by the stagnation of the waters. Except where the higher hills rise in peaks, the surface is in general gently undulating. One-half of the county consists of rich loams and clay soils. Upon the whole, few counties in England contain so much good land, and, as a consequence, fewer wastes.

Many of the farms are small, but the average size is gradually enlarging, by the union of several farms under one tenant. The system of agriculture is steadily approximating to the most improved methods, with only the differences rendered necessary by local peculiarities.

The average produce of wheat in Worcestershire is higher than in many other counties. Potatoes are raised in great abundance in this county, and supply the markets of Birmingham and Staffordshire. Wolverley sands have long been famous for the growth of carrots and for raising carrot-seed. Hop-yards occupy a considerable extent. The cultivation of this plant is a perfect garden culture, chiefly by the spade. Apple orchards are extensive, and a great deal of cider is made. Pear orchards are common in Worcestershire. There is much fine timber growing in the hedgerows: elms predominate, and grow to a large size where they have room. There are also some woods and plantations of oaks and ash, the underwood of which forms valuable coppices.

There is no peculiar breed of cattle in Worcestershire. The cattle are chiefly obtained from Herefordshire and South Wales. The best and most profitable breeds to stock the rich pasture are found to be the Herefords and Devons, which get into excellent condition by a summer's run, and are then finished in the stalls with hay, turnips, and oil-cake in winter: very fat beasts are sent up to Smithfield and to Birmingham every year from this county.

The sheep are mostly of the Leicester breed, which suit the rich pastures. On the Malvern Hills are some small hardy sheep, without horns, with gray faces and legs, which, when fattened at a proper age, make excellent mutton. The horses for farm-work are mostly of the strong black breed.

Divisions, Towns, &c.—Worcestershire is divided into five hundreds:—Blackenhurst, Doddingtree, Halfshire, Oswaldalow, and Pershore, Upper and Lower. It contains the city of WORCESTER, the parliamentary boroughs of BEWLEY, DROITWICH, DUDLEY, EVESHAM, and KIDDERMINSTER, and the market-towns of HALES OWEN (erroneously included in the towns referred to under SHROPSHIRE, to which county it belonged till 1844), PERSHORE, SHILTON-ON-STOUR, STOURBRIDGE, STOURPORT, TENBURY, and UPTON-ON-SEVERN. All these are described in separate articles, except Stourport, which we notice here.

Stourport, a market-town in the hamlet of Lower Mitton and parish of Kidderminster, population of the hamlet 2993 in 1851, is situated on the left bank of the river Stour, at its junction with the Severn, about 10 miles N. by W. from Worcester. The streets are lighted with gas, and paved. The Worcestershire and Staffordshire Canal enters the Severn at Stourport. Across the Severn is thrown a handsome iron bridge of a single arch, of 150 feet span, and 50 feet above the surface of the river. There is a spacious basin, with extensive

wharfs and warehouses. Hops, corn, and apples are largely sold at Stourport market; great quantities of coal, from the Staffordshire and Worcestershire collieries, are conveyed on the canal; and timber is dealt in to a considerable extent. Markets are held on Wednesday and Saturday. There are fairs on March 31st, September 15th, and December 18th for horned cattle, hops, &c. Petty sessions are held in the town. There are in Stourport a chapel of ease, a chapel for Wesleyan Methodists, National schools, and a savings bank.

The following are some of the more important villages, with the parish populations in 1851, and a few other particulars:—

Alvechurch, population 1600, about 23 miles N.E. by N. from Worcester, was at one time a borough, but is now a mere village. Besides the church, there are National schools and some almshouses. *Belbroughton*, population 1839, is about 6 miles N.N.W. from Bromsgrove. The parish church is a commodious and handsome edifice, with a lofty spire. There are National schools. Malting is largely carried on. A manufactory of scythes and hay-knives employs a considerable number of persons. Three fairs are held in the year. *Bengworth*, [EVESHAM.] *Blockley*, population 2587, is about 12 miles S.E. from Evesham. In the village are the parish church, partly of Norman and partly of early English date; a chapel for Baptists; an Endowed Free school; and a mechanics institute. Silk-throwing employs a considerable number of hands. A fair is held on the first Tuesday after Easter for cattle, and a hiring fair on October 10th. Numerous coins and other Roman remains have been found at Blockley. *Bredon*, population 1661, is on the left bank of the river Avon, 8 miles S. by W. from Pershore. The principal manufacture is that of stockings, which are worked on frames here for the Tewkesbury manufacturers. The church is a very ancient and interesting edifice, partly of Norman date. There is an Endowed Blue-Coat school. In the neighbourhood are the remains of an ancient encampment of large size. *Broadway*, population 1629, is about 6 miles S.E. from Evesham. The houses, which are built of stone, extend in a straggling manner for about a mile along both sides of the main road. There are day schools, partly supported by subscription. *Chaddesley-Corbett*, population 1420, about 5 miles S.E. from Kidderminster, possesses a neat church, built of red freestone, of various styles, including Norman; and an endowed Free school. Malting is carried on. There are flour-mills and a worsted-mill. *Feckenham*, population 3254, about 8 miles E. by S. from Droitwich, was formerly surrounded by Feckenham Forest, the wood of which was cut down to supply fuel for the Droitwich salt-works: it was disafforested in the reign of Charles I. There are here a neat parish church, in which are several ancient monuments; a chapel for Independents; and an Endowed school. The manufacture of needles and fish-hooks employs a considerable number of persons. Cattle fairs are held on March 26th and September 30th. *Hagley*, population 935, is about 6 miles N.E. from Kidderminster. The parish church has been recently enlarged. There are National schools. Roman remains have been found at various times in the vicinity. *Hanbury*, population 1009, is about 4 miles E. by N. from Droitwich. The parish church occupies an elevated site. The Worcester and Birmingham Canal and the Bristol and Birmingham railway pass on the west side of the village. *Hanley-Castle*, population 1686, about 9 miles S. from Worcester, is pleasantly situated near the right bank of the Severn. In the village are a parish church, a chapel for Roman Catholics, and National schools. *Hartlebury*, population 2047, is about 11 miles N. by W. from Worcester, and 2 miles S.E. from Stourport. There are here a Free Grammar school and a Free school for 15 girls. Malting is carried on. There are some corn-mills. *Kempsey*, population 1375, about 4 miles S. from Worcester, on the left bank of the Severn, contains the parish church and National schools. Henry II. held his court here. The ruins of an ancient camp are near the church. *KING'S NORTON*. *MARTLEY*. *Old Swinford*, population of the township of Upper Swinford 2728, about a mile S.S.E. from Stourbridge. Brick-making, nail-making, chain- and trace-making, brewing, and malting, are carried on. There are some collieries in the vicinity. The church is a very handsome gothic edifice, with a lofty spire. There is a Blue-Coat hospital for 100 boys, connected with which is an Infant school. The school-house is a neat collegiate building. *Omberley*, population 2364, about 6 miles N. from Worcester, near the left bank of the Severn, has a handsome church, which was lately rebuilt. There are here Endowed National schools, and an Infant school. In the churchyard are the remains of an ancient cross. *Powick*, population 1834, about 3 miles S.S.W. from Worcester, of which city it may be reckoned a suburb, is on the right bank of the river Teme, over which there is here an ancient bridge. The church, which is a handsome gothic edifice, is situated on a lofty hill, from which there is a fine view of the valley of the Severn. In the village are National and Infant schools. *Radditch*, population of the township 4802, is pleasantly situated on an eminence near the Warwickshire border, about 6 miles E.S.E. from Worcester. It is the chief seat of the needle manufacture; fish-hooks are also made in large quantities. There are here a chapel of ease, chapels for Wesleyan and Primitive Methodists, Independents, and Roman Catholics; National schools; and a savings bank. Brickmaking, brewing, and malting are carried on. *Stoke Prior*, population 1613, about 2 miles S. by W. from Bromsgrove, has extensive salt, soap, and chemical works, and a manufactory of railway carriages. There are

a parish church, a chapel of ease, and National and Infant schools. *Strensham*, population 339, is pleasantly situated on the right bank of the Avon, 5 miles S.S.W. from Pershore. The village is chiefly known as the birth-place of the author of *Hudibras*. The house in which Butler was born is still standing, about a quarter of a mile from the church. It is a low rude timber-frame and thatch cottage, and is known as *Butler's Cot*. *Strensham* church is a handsome edifice, containing some fine monuments and brasses. *Strensham* possesses a Free school and some almshouses. *Wolverley*, population 2441, about 2 miles N. from Kidderminster, on the right bank of the river Stour, has a neat parish church, erected in 1722; a well-endowed Free school; and a National school.

Divisions for Ecclesiastical, Legal, and Parliamentary Purposes.—Worcestershire is in the province of Canterbury, and for the most part in the diocese of Worcester; a few parishes are in the diocese of Hereford. The county is in the Oxford circuit: the assizes and quarter sessions for the county and city are held at Worcester. County courts are held at Bromsgrove, Droitwich, Dudley, Evesham, Kidderminster, Pershore, Redditch, Stourbridge, Tenbury, Upton-on-Severn, and Worcester. By the Poor-Law Commissioners the county is divided into 13 Unions:—Bromsgrove, Droitwich, Dudley, Evesham, Kidderminster, King's Norton, Martley, Pershore, Shipston, Stourbridge, Tenbury, Upton-on-Severn, and Worcester. These Unions contain 267 parishes and townships, with an area of 527,797 acres, and a population in 1851 of 384,325. Before the Reform Act Worcestershire sent nine members to the House of Commons; namely, two for the county, two each for the city of Worcester and the boroughs of Droitwich and Evesham, and one for the borough of Bewdley. By the Reform Act the number was increased to 12; namely, two each for the East and West divisions of the county, two for the city of Worcester, two for the borough of Evesham, and one each for Bewdley, Droitwich, Dudley, and Kidderminster.

History and Antiquities, &c.—The etymology of 'Worcester' is with some plausibility adduced from 'Wyre-Cestre,' the Camp or Castle of Wyre, under which name a considerable forest still exists in the neighbourhood of Bewdley. Of the early history of the county little is accurately known: there are however many evidences of its occupation by the Romans. During the Heptarchy, Worcester was the principal Mercian see, and the inhabitants of the district were under ecclesiastical government. After the Conquest the form of government was changed. Earls of Worcester were created, and had the civil power confided to them. During the war between Stephen and the Empress Matilda, and subsequently during the resistance of the barons to King John, the possessions of the Earls of Worcester frequently changed masters. Some of the conspirators in the Gunpowder Plot retreated to and were apprehended at Hendlip, an old house, of a curious construction, well fitted for concealment, situated between Droitwich and Worcester. During the contest between the king and the parliament, Worcestershire was on several occasions overrun by the contending parties. [WORCESTER.]

The antiquities of this county are not remarkable. Three Roman roads have been traced—Icknield-street, which ran from Alocster northward to Staffordshire; a second road, which passed from Tewkesbury to Upton, Worcestershire, and so to Shropshire; and the Ridgeway, which is the boundary of the county for some distance on its eastern frontier. Ancient encampments may be traced at Malvern, at Breton, and on the hills at Woodbury and Witlebury. There are many remains of ecclesiastical houses; the chief are St. Wulstan's at Worcester, and the abbeys of Malvern, Bordesley, and Evesham. The most remarkable churches are the cathedral at Worcester, the churches at Evesham, Malvern, Droitwich, Eastham, Naunton, Beauchamp, Stockton, and Church Leach.

The principal gentlemen's seats are—Croome, belonging to Lord Coventry; Hagley Park, the residence of Lord Lyttleton; Witley, the property of Lord Ward; Hewell Grange, belonging to the Hon. Robert Olive; Hartlebury Castle, the episcopal residence of the bishop of the diocese; Ombersley, belonging to Lord Sandys; Westwood Park, Madresfield, Bordesley Park, Standford Court, Pull Court, Overbury Park, Hanley Court, Kyre, and Hanbury Hall.

Manufactures and Commerce.—Iron is largely manufactured at Dudley, in the neighbourhood of which there are likewise extensive coal-mines. In the northern part of the county a very large quantity of nails is made, and there are likewise factories for fish-hooks and needles; carpets of many descriptions and qualities are made at Kidderminster; glass is manufactured at Stourbridge; a declining glove-trade is carried on at Worcester; and porcelain is manufactured to a considerable extent. The population of the southern and eastern part of the county is wholly occupied with agriculture.

Religious Worship and Education.—According to the Returns of the Census of 1851, it appears that there were then in the county 489 places of worship, of which 244 belonged to the Established Church, 127 to five sections of Methodists, 46 to Baptists, 24 to Independents, and 12 to Roman Catholics. The total number of sittings provided was 141,512. The number of Sunday schools was 341, of which 193 were connected with the Church of England, 82 with Methodists, 27 with Baptists, and 20 with Independents. The total number of Sunday scholars was 35,221. Of day schools there were 701, of which 288 were public schools with 21,279 scholars, and 468 were private

schools with 9278 scholars. There were 19 evening schools for adults, with 379 scholars; and 21 literary and scientific institutes, with 1541 members, and libraries containing 15,776 volumes.

Savings Banks.—In 1853 the county possessed ten savings banks, at Bewdley, Bromsgrove, Droitwich, Evesham, Kidderminster, Shipston-on-Stour, Stourport, Tenbury, Upton-upon-Severn, and Worcester. The total amount owing to depositors on November 20th 1853 was 463,204l. 3s. 5d.

WORKINGTON, Cumberland, a market-town and sea-port, in the parish of Workington, is situated on the left bank of the river Derwent, about a mile from its entrance into the sea in St. George's Channel, in 54° 39' N. lat., 3° 33' W. long., distant 32 miles S.W. from Carlisle, 306 miles N.N.W. from London by road, and 330 miles by the London and North-Western and connected railways via Carlisle. The population of the town of Workington in 1851 was 5837. The living is a rectory in the archdeaconry of Richmond and diocese of Chester.

Workington is indebted for its prosperity chiefly to the collieries in its neighbourhood, which furnish the principal article of export. Timber and flax are imported to a considerable amount. Ship-building, rope and sail-making, and block-making employ some of the inhabitants. The manufacture of straw-plait in imitation of Leghorn is carried on. There are extensive iron-foundries, hat-works, breweries, malt-kilns, dye-works, chemical-works, timber-yards, nail-works, and flour-mills. The river Derwent is here crossed by a stone bridge of three arches, built in 1763. Workington possesses a safe and capacious harbour, with a breakwater and extensive quays. The custom-house and commodious warehouses are situated on the quays. The number of vessels registered as belonging to the port on December 31st 1854, was, under 50 tons 3, tonnage 88; above 50 tons 92, tonnage 18,466; with one steam-vessel of 18 tons. The number and tonnage of vessels entered and cleared at the port during 1854 were:—Inwards, 126, tonnage 8625; outwards, 1210, tonnage 103,116.

St. Michael's, the parish church, was rebuilt about 1780 in a semi-gothic style; St. John's chapel, erected in 1825, is in the Tuscan order of architecture. There are chapels for Wesleyan Methodists, Independents, English Presbyterians, and Roman Catholics; National, British, Infant, and Roman Catholic schools; a School of Industry for girls; a savings bank; a mechanics institute, a subscription library and news-room; a theatre; assembly-rooms; and a dispensary. A lock-up and justice-room has been recently built. The principal market, for corn and provisions, is held on Wednesday, and a less important market on Saturday. Fairs, held in May and October, have lately been revived. Races are held annually. From Workington there is a branch railway to Cockermouth, of which the terminus is situated near the new quay.

WORKSOP, Nottinghamshire, a market-town and the seat of a Poor-Law Union, in the parish of Worksop, is pleasantly situated on the banks of the river Ryton, in 53° 17' N. lat., 1° 7' W. long., distant 26 miles N. by E. from Nottingham, and 146 miles N.N.W. from London by road, and by the Great Northern and Sheffield and Lincolnshire railways. The population of the town in 1851 was 6058. The living is a vicarage in the archdeaconry of Nottingham and diocese of Lincoln. Worksop Poor-Law Union contains 26 parishes and townships, with an area of 78,050 acres, and a population in 1851 of 18,990.

Worksop contains numerous well-built houses, and the streets are well paved and lighted with gas. An ancient building, called the Moot-Hall, is used for public business. A corn-exchange, erected in 1851, contains a large hall fitted up with an orchestra, &c., for assemblies and concerts; the building contains also corn, butchers' meat, fruit, vegetable, and fish markets. The parish church is a large building, originally cruciform, and of Norman architecture; but the exterior shows considerable admixtures of later styles. The Wesleyan and Primitive Methodists, Independents, and Roman Catholics have places of worship. There are National schools, a savings bank, and some parochial charities. Wednesday is the market day. Three cattle-fairs and a statute fair are held in the course of the year. The Chesterfield Canal, which passes the town, is carried over the river Ryton by an aqueduct. Of an Augustinian priory, which formerly existed here, the principal gateway is still standing, and part of the priory church now forms the parish church. Several noblemen's seats are in the vicinity. Many Roman coins and other antiquities have at different times been found near Worksop.

WORMHOUDT. [NORD.]

WORMS, an ancient city, in the province of Rheinessen, in the grand-duchy of Heese-Darmstadt, is situated in 49° 37' N. lat., 8° 22' E. long., near the left bank of the Rhine, in a beautiful country, 23 miles S. from Mayence by railway, and has a population of about 9000 exclusive of the garrison. The city occupies the site of the Roman *Borbetomagus*, which subsequently took the name of *Augusta Vangionum*, from the Vangiones, in whose territory it was. The name *Wormatia* (from which the modern name is taken) was in use in the middle ages, corrupted according to D'Anville from *Borbetomagus*. After its destruction by the Vandals and Huns, it was rebuilt by the Franks about 475, and became the seat of a count, and subsequently of the dukes of Franconia, who styled themselves Counts of Worms. It was for a time the residence of Charlemagne, who held in its vicinity those primitive legislative assemblies which, meeting in May, were

called Mai Lager, or Champs de Mai. Some of the Frankish and Carolingian kings also resided here. Several diets of the German empire were held at Worms, among which was that of 1521, at which Luther appeared before the emperor Charles V. Its industry, its commerce, and its great population (which in the time of the Hohenstaufen amounted to 60,000, and even after the Thirty Years' War was still 80,000) made it rich and powerful; but in the two next centuries its prosperity rapidly declined. In 1689 it was burnt by order of Louis XIV., and only the fine old cathedral resisted the efforts made to destroy it. Since that time it has never recovered; some portions have been indeed rebuilt, but within the ample circuit of its decayed walls are large inclosures, some waste, some converted into vineyards and gardens, which were once covered with populous streets and fine buildings. Since the beginning of the 19th century improvement has set in, and the population is nearly double what it was in 1800. The most remarkable edifice is the venerable cathedral, which was founded in the 8th century, but not completed till 1110. It is a plain gothic building, with two towers at each end. The Leibfrauenkirche, or Church of Our Lady, is also a fine building in the gothic style. Near it formerly stood a Capuchin convent, the garden of which is now a vineyard, famous for its wine called from it Liebfrauenmisch. Worms is the seat of the provincial tribunals and of the consistory: it has a gymnasium and several schools; and manufactories of sugar-of-lead and tobacco, several tanneries, and a good trade in corn, cattle, and wine.

WORONESCH. [VORONETZ.]

WORSLEY. [LANCASHIRE.]

WORSTEAD. [NORFOLK.]

WORTHING, Sussex, a market-town and watering-place, in the parish of Broadwater, is situated on the shore of the English Channel, in 50° 48' N. lat., 0° 22' W. long., distant 12 miles W. from Brighton, and 61 miles S.S.W. from London by road and by the London, Brighton, and South-Coast railways. The population of the town of Worthing in 1851 was 5370. The living is a perpetual curacy, in the archdeaconry and diocese of Chichester.

The situation of Worthing is low and flat, no part of the town being more than 20 feet above the level of the sea, and it is foggy in winter. It was originally an obscure fishing-station, but at the close of the last century, when fashion caused the best points of the southern coast to be resorted to for health and pleasure, this town sprang up, and in consequence of its proximity to the Downs, and the richness of the surrounding country, it has continued to increase. The esplanade extends for three-quarters of a mile along the shore, and the bathing-machines and the baths are of superior character. There are in the town a church, erected in 1843; a chapel of ease; a Wesleyan Methodist and an independent chapel; National and Infant schools; a town-hall; a market-house; a theatre; a dispensary; and a literary institution. The Steyne is an open space, of three acres in area. The market is on Saturday, and a corn-market is held on every alternate Wednesday. There is an annual fair on July 20th, and races are run in September. A county court and petty sessions are held here. In the neighbourhood Roman remains have been found, and at Cissbury is a fortification or earthwork of an irregular oval form, inclosing an area of nearly 60 acres. The parish church of Broadwater, about a mile from the town, is a fine specimen of Norman architecture, though some parts are of a somewhat later date.

WORTLEY, West Riding of Yorkshire, a village and the seat of a Poor-Law Union, in the parish of Leeds, is situated in 53° 48' N. lat., 1° 36' W. long., distant about 3 miles W. by S. from Leeds, and 192 miles N.N.W. from London. The population of the chapelry of Wortley, which forms part of the borough of LEEDS, was 7896 in 1851. The living is a perpetual curacy, in the archdeaconry of Craven and diocese of Ripon. Wortley Poor-Law Union contains four townships, with an area of 51,944 acres, and a population in 1851 of 18,798. Wortley possesses manufactures of woollen-cloth, fire-bricks, pipes, and alum. There are flax-spinning, worsted-spinning, and fulling-mills; iron-foundries, machine-factories, malt-kilns, corn-mills, and dye-works. In the village are a neat modern chapel of ease; chapels for Wesleyan and Primitive Methodists, and Independents; National and Endowed Free schools, and a reading-room.

WOTTON-UNDER-EDGE, Gloucestershire, a market-town, in the parish of Wotton-under-Edge, is situated in 51° 38' N. lat., 2° 21' W. long., distant 18 miles S. by W. from Gloucester, and 107 miles W. by N. from London. The population of the borough in 1851 was 1212. The town has a corporation with merely nominal functions. The living is a vicarage, in the archdeaconry of Gloucester and diocese of Gloucester and Bristol.

The former town of Wotton-under-Edge was burnt down in the reign of John; a place called the Brands is supposed to mark the original site. The present town is well built and lighted with gas. The church, dedicated to St. Mary, is a handsome building of early English style and date. The Wesleyan Methodists, Independents, and Baptists have places of worship. The Tabernacle meeting-house, originally erected by Rowland Hill, has been rebuilt in the early English style, with pinnacles, and a tower at the south-east angle. There are a Free Grammar school, National, British, Infant, and Blue-Coat schools; a literary institution, with a small library and a news-room; a general hospital, a hospital for twelve poor persons, and almshouses for six poor persons. Wotton is one of the clothing

towns, and has many cloth-mills; woollen cloth of a fine quality is manufactured. Dyeing is carried on. Friday is the market-day. Fairs are held on the Tuesday before March 25th and on Sept. 25th.

WRAGBY. [LINCOLNSHIRE.]

WREXHAM, Denbighshire, North Wales, a market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of Wrexham, is situated on the Gwenfry Brook, a feeder of the Clywedog, which is itself an affluent of the river Dee, in 53° 2' N. lat., 2° 59' W. long., distant 23 miles S.E. from Denbigh, 179 miles N.W. by W. from London, and 185 miles by the North-Western and Birmingham, Shrewsbury, and Chester railways. The population of the parliamentary borough in 1851 was 6714. The living is a vicarage, in the archdeaconry and diocese of St. Asaph. Wrexham Poor-Law Union contains 44 parishes and townships, with an area of 78,592 acres, and a population in 1851 of 40,078.

Wrexham is advantageously situated in the mining district of Denbighshire, and is one of the most important towns in North Wales. The church is a handsome and spacious building, in the perpendicular style. The tower, which has a very striking appearance, has an elevation of 135 feet, and has on three sides rows of saints in richly-sculptured niches. The church was formerly collegiate. The English and Welsh Independents, Welsh Calvinistic Methodists, Baptists, and Roman Catholics have places of worship. There are a Grammar school, National schools, and a Roman Catholic school. The town-hall is a plain brick building: there are a county house of correction, an infirmary, a new market, a literary institute, and a savings bank.

Wrexham has a considerable flannel manufacture; and in the parish there are quarries, lead-mines, collieries, and iron-works. Brewing, malting, and tanning are carried on, and there is a factory for making patent flat and round rope. Markets are held on Thursday and Saturday. Fairs are held eight times in the year. The fair held on March 23rd is kept up for many days, and is one of the most important in North Wales: cattle and horses, Welsh flannels and other woollens, Irish linens, Manchester cotton goods, Yorkshire woollens, and especially hardwares from Birmingham and Sheffield, are sold at this fair. By the Reform Act Wrexham was made a contributory borough to Denbigh. A county court and petty sessions for the hundreds of Bromfield and Yale, are held at Wrexham.

WRIETZEN. [BRANDENBURG.]

WRINGTON. [SOMERSETSHIRE.]

WRITTLE. [ESSEX.]

WROCKWARDINE. [SHROPSHIRE.]

WROTHAM. [KENT.]

WU-CHANG-FU. [CHINA.]

WÜRTEMBERG, a kingdom in the south-west of Germany, lies between 47° 35' and 49° 35' N. lat., 8° 15' and 10° 30' E. long. It is bounded N.E. and E. by Bavaria, N.W. and W. by Baden, and S. by Switzerland and the Lake of Constance. Its greatest length from south to north is about 140 miles; and its greatest breadth from east to west nearly 100 miles. The area is 7494 square miles. The population in December 1852 numbered 1,733,263—namely 838,276 males and 894,988 females. The principalities of Hohenzollern, almost wholly surrounded by the kingdom of Würtemberg, now belong to Prussia. [HOHENZOLLERN.]

The area and population of Würtemberg are distributed among the four circles, or provinces, of the kingdom as follows:—

Circles.	Area in Square Miles.	Population in 1852.
Neckar-Kreis . . .	1,279	501,034
Schwarzwald-Kreis . . .	1,835	448,872
Donau-Kreis . . .	2,406	413,444
Jagt-Kreis . . .	1,974	374,913
Total . . .	7,494	1,733,263

The surface is for the most part mountainous; on the east the Swabian Alp enters the country, and the western border is covered by the Schwarzwald (the Black Forest), both of which send out branches in all directions. The Schwarzwald runs from south to north, parallel to the Rhine, and to the Vosges Mountains on the other side of that river. It begins between Eglisau and Basle, and extends to Durlach and Pforzheim; its length is about 83 miles, and its mean breadth 14 miles. On the west side its declivity is steep; on the east it slopes gradually towards the central part of Würtemberg. It consists chiefly of granite and sandstone, and is intersected by many well-watered valleys. The highest points of the Schwarzwald in Würtemberg are the Hornigrunde, 3640 feet high, and the Rossbühl, 2940 feet high: but the most elevated part of the range is in Baden. The Alb, or Alp, is entirely in the kingdom of Würtemberg (excepting a small part of it which is in Hohenzollern), and runs from south-west to north-east. Its length is between 80 and 90 miles, and its breadth varies from 9 to 13 miles, between the Neckar and the Danube. On the north-west side it is steep, but on the south-east side gradually declines into undulating hills. Though not so elevated as the Schwarzwald, it is more bleak and inclement. There are several large caverns in the limestone of the Alp.

There are wide and fertile valleys, the principal of which are those of the Neckar and of the Danube. The diversity of mountain and valley, the fertility of the soil, and the luxuriance of the vegetation combine to produce a great variety of beautiful scenery, and render Würtemberg one of the finest parts of Central Europe.

The chief rivers are the Neckar [NECKAR-KREIS] and the DANUBE, into which almost all the other rivers discharge themselves. The principal affluents of the Neckar are on the right—the Kocher, a considerable river, which has a course of 160 miles; the Rems; the Eyach; and the Jagst; on the left the Enz, which has a course of 98 miles, and at its junction with the Neckar at Berigheim has a volume of water nearly equal to that river. The Danube enters Würtemberg at Tuttlingen, and crosses the kingdom in a generally north-east direction to Ulm, where it enters Bavaria. The chief affluent is the Iller, which joins it on the right bank near Ulm. The Lake of Constanz is the only considerable lake in the kingdom, which however only touches a small portion of Würtemberg on the southern frontier. The small lakes are numerous. The Fidersee is about five miles long and as many broad.

The soil is extremely fertile, except in the higher regions of the Alp and the Schwarzwald, where the substratum is unfavourable to vegetation.

The climate is healthy, temperate, and mild, with differences however arising from elevation. The summits of the Alp and the Schwarzwald are too cold to produce corn, and are covered with forests and pastures. Goitrous affections are very common in the Kocherthal and the Roththal.

Of domestic animals in 1852 there were horned cattle, 811,159; sheep, 458,488; swine, 148,524; horses, 95,038; being in every class a large diminution from the numbers of each in 1850. There are still a few stags and deer in the forests, as well as foxes, badgers, some wild cats, squirrels, martens, and weasels. Poultry of all kinds is abundant, and also game and wild-fowl. There are several species of owls, which are very numerous. The many small lakes and all the rivers yield a great variety of fish. In many parts of the kingdom bees are kept, and silk-worms have been introduced. Leeches are bred in ponds, and edible snails in separate reservoirs.

Agriculture.—The distribution of the soil in 1852 was as follows:—Corn land, 2,050,102 acres; gardens, 94,778 acres; vineyards, 64,678 acres; meadows, 687,653 acres; pastures, 208,206 acres; forests, 1,497,082 acres; roads, 103,648 acres; railways, 2429 acres; buildings, 21,777 acres; heaths and barren lands, 65,844 acres; lakes, rivers, &c., 31,384 acres: total, 4,827,656 acres. The quantity of wine produced in 1852 was 5,822,180 gallons.

Würtemberg is one of the most fruitful countries of Germany, and agriculture is on the whole carried on upon a good system. On the 26th of September there is an annual agricultural fête at Cannstadt, at which prizes are given. A manifest improvement in the breed of cattle and horses is remarked at every new cattle-show.

The kinds of grain cultivated are chiefly spelt, maize, oats, barley, rye, and wheat. There is usually a surplus for exportation. The other agricultural productions are peas, beans, vetches, potatoes, flax, hemp, rape-seed, poppies, hops, and tobacco. Fodder of many kinds is abundant. Of the vineyards more than three-fifths are in the circle of the Neckar. There are the Tauber and Lake (that is, of Constanz) wines, which resemble Rhenish.

The minerals are copper, lead, zinc, and iron, marble, alabaster, millstones, freestone, gypsum, quartz, garnets, tourmaline, amethysts, chrysolites, rock-crystal, agate, chalcedony, carnelian, opal, jasper, porcelain earth, potters'-clay, basalt, fullers'-earth, chalk, marl, coal, and salt. The salt-works are the property of government, which has the monopoly of the salt-trade; the annual produce is 24,000 tons. Most of the Swiss receive their supply of salt from Würtemberg, according to specific conventions.

Manufactures.—There are manufactures of almost every description, and though not on so extensive a scale as in some other parts of Germany, they are of considerable importance. The principal are linen, woollen-cloth, calicoes, silks, lace, hosiery, muslin, carpets, leather, porcelain, earthenware, ironmongery and stealware, gold and silver plate, tobacco, tobacco-pipes, and gunpowder; there are numerous distilleries, breweries, and chemical factories.

Commerce.—Würtemberg has a very considerable trade. The exports consist both of the natural productions and manufactures, horned cattle, horses, sheep, salt, corn, timber, raw hides, wool, garden-seeds, millstones, and saltpetre; gold and silver articles, leather, hats, paper, white-lead, tobacco, oil, chemicals, vinegar, and printed books. The imports consist of raw cotton and cotton manufactures, silks, glass wares, wine, fruit, cheese, china, earthenware, and all kinds of colonial produce. There is likewise a very great transit trade. The inland navigation is important, especially on the Neckar, which becomes navigable at Cannstadt. Steamers ply below Heilbronn. A railroad runs from Stuttgart to the Lake of Constanz through Ulm, where it is joined by the Bavarian line to Augsburg and Munich. Another line runs north from Stuttgart to Heilbronn, with a branch westward from Bretigheim to the Bruchsal station, on the trunk railway along the right bank of the Rhine. Würtemberg is a member of the German Zoll-verein, or commercial union.

Population.—With the exception of about 22,000 Jews and some

foreigners, the population is entirely German. With respect to religion the Protestants are to the Catholics in the ratio of 2 to 1 very nearly. In 1850 the population, including that of Hohenzollern, amounted to 1,802,252; namely, 885,756 males, and 916,496 females. The births were 74,294, of which 9804 were illegitimate. The deaths amounted to 53,233. The average revenue of Würtemberg for the years comprising the interval 1852-55 was 1,218,977*l*. The expenditure in 1854 was 1,216,403*l*. The total amount of the public debt was 4,841,291*l*. Emigration has for several years tended to keep down the population of Würtemberg.

Education.—In regard to education, Würtemberg ranks very high. There is not a parish in the kingdom without its school. The establishments for higher and special instruction are—a university at Tübingen, with about 800 students; 7 gymnasia, 4 lycœums, 78 Grammar schools, a Protestant seminary at Tübingen, a large number of Protestant theological seminaries, 4 seminaries for Roman Catholic priests, Protestant and Catholic training-schools, schools of philology and sciences, schools for the deaf and dumb, for the blind, for drawing, &c. According to law, every child is to attend school from the age of six to that of fourteen. The private literary societies are numerous.

The Army.—Every subject of Würtemberg is liable to serve as soon as he has completed his twentieth year, and he has to serve six years. The army numbers in all 19,017 men in time of war, and 8107 in time of peace; it consists of eight regiments of infantry, four regiments of cavalry, two battalions of artillery, two garrison companies, and a squadron of jägers.

Constitution.—Würtemberg is an hereditary monarchy. According to the constitution, which was completed in 1819, Würtemberg is a constitutional representative kingdom, with a diet or parliament consisting of two chambers. The crown is hereditary in the direct male line, according to the order of primogeniture; and if the male line becomes extinct, in the female line. The constitution secures to the subject every reasonable degree of civil and religious liberty, Christians of the Lutheran, Calvinistic, and Roman Catholic faiths being placed on a footing of perfect equality. The liberty of the press, which had been shackled by a decree of the German diet in 1819, was established by a decree abolishing the censorship, March 1, 1848. In the troubled period that followed the French revolution of 1848, attempts were made to alter the constitution of Würtemberg; national assemblies were convoked for this purpose in 1849 and 1860, but in consequence of their wild democratic tendencies they were both dissolved. Würtemberg has the sixth place in the German diet, and has four votes in the full council. Its contingent to the army of the Confederation is 13,955, forming the first division of the 8th army corps of the Confederation.

History.—At the beginning of the 4th century the Alemanni appeared in the country, afterwards called Suabia, now partly included in Würtemberg. In A.D. 496 the Alemanni were overcome by the Franks under Clovis. This country, as a part of Austrasia, subsequently belonged to the kingdom of the Franks, and was governed by dukes, under whom Christianity was introduced. When Germany was governed by kings of its own nation, Suabia was under dukes, who were often changed; and, according to the policy of those times, the emperor's own sons were often put in their place. When the princes of the house of Hohenstaufen, who had become dukes of Suabia, had acquired the imperial crown, they caused Suabia to be governed by members of their family. Philip of Hohenstaufen sold and gave away a great part of the hereditary estates, and thus created a great number of petty principalities, which after the death of Conradin in 1268 asserted their independence. Ulrich, count of Würtemberg, who reigned from 1246 to 1265, is the acknowledged founder of the family now on the throne of Würtemberg. From his death Würtemberg was governed by counts of his family till the latter end of the 15th century, when Eberhard V. was created Duke of Würtemberg by the emperor Maximilian at the diet at Worms, on the 21st of July, 1494. The reformation was established in Würtemberg by Duke Christopher about 1540. In the Thirty Years' War, which began in 1618, the duchy of Würtemberg was frequently ravaged. After the first French revolution, Würtemberg was repeatedly traversed by hostile armies, and a revolutionary spirit spread among the youth. The French crossed the Rhine on the 24th of June, 1796, and on the 18th of July entered Stuttgart; and the Austrians being obliged to retreat, the duke was compelled to purchase peace with eight millions of francs and the cession of Mömpelgard. The then reigning duke Frederick Eugene died in 1797, and was succeeded by his son Frederick William Charles.

The territories of Würtemberg had been greatly curtailed during the war with France, but the German diet in 1803 amply indemnified the duke for this loss, and at the same time made him elector of the empire. His adherence to Napoleon brought him a further extension of territory at the peace of Presburg. On new year's day, 1806, he assumed the title of King of Würtemberg, and proclaimed a uniform administration for all his dominions, and equal rights to all his Christian subjects. After the battle of Leipzig, Würtemberg joined the allies. King Frederick died in 1816, and was succeeded by the present king William I., to whom Würtemberg is indebted for its excellent constitution.

WURZBURG, a city in Bavaria, capital of the circle of Lower

Franconia, is situated in 49° 45' N. lat., 9° 56' E. long., in a beautiful valley on the Mayn (over which there is a bridge 200 yards long, adorned with twelve colossal statues of saints), and on the railway from Bamberg to Frankfurt, from which towns respectively it is distant 63 and 70 miles, and has 25,000 inhabitants. As Würzburg has been the see of a bishop since A.D. 741, and for many centuries the capital of an ecclesiastical principality, governed by a succession of above 80 bishops, who were princes of the empire, it contains a great number of handsome churches and other handsome public buildings. Of the churches the principal are, the cathedral, originally founded in the 8th century, but rebuilt subsequently to 1042, which contains many fine paintings, and a long series of monuments of the bishops, each bearing the sword in one hand and the crozier in the other; the church of St. John im Haug, built on the model of St. Peter's at Rome; the New Minster, containing the relics of St. Kilian, an Irish missionary, and the apostle of Franconia; the Marienkirche, an elegant edifice, built in the years 1377 to 1479, in the German pointed style, with lofty lancet windows; and the University church, with an observatory on its lofty tower. The most remarkable of the secular buildings are, the royal, formerly the episcopal, palace; it was built by two bishops of the name of Schönborn, 1720-1744, in imitation of the palace of Versailles, is 270 feet long, 60 feet high, and forms a parallelogram with two projecting wings: the Julian hospital, a very large, wealthy, and admirably arranged institution: the town-hall: the university, which has a clinical establishment, an anatomical museum, a library of 100,000 volumes and 1000 manuscripts, &c.: and the citadel, situated on the Frauenberg, or Marienberg, a hill 400 feet high above the left bank of the Mayn. Besides the university, Würzburg has a gymnasium, a seminary for priests and schoolmasters, a veterinary school, a polytechnic institution, a school of industry, a school of music, schools for the blind, for midwifery, &c.: it has also four hospitals, besides the Julian hospital already mentioned; and a synagogue. The manufactures comprise woollen-cloth, tobacco, pipes, leather, paper, surgical and mathematical instruments, &c. Boats are built, and there is an active river trade in wine and other agricultural produce. Steamers ply daily on the Mayn to Frankfurt. Würzburg is the residence of a bishop and chapter, and the seat of the law courts and public offices connected with the administration of the province. The territory of the prince-bishops was secularised in 1803 and given to the archduke of Tuscany. In 1815 it was united to Bavaria.

WURZEN. [LEIPZIG.]

WYCOMBE, CHIPPING, or HIGH WYCOMBE, Buckinghamshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Chipping Wycombe, is situated in 51° 37' N. lat., 0° 45' W. long., distant 18 miles S. by E. from Aylesbury, and 29 miles W. by N. from London. The population of the municipal borough in 1851 was 3588, of the parliamentary borough 7179. The borough is governed by four aldermen and 12 councillors, of whom one is mayor; and returns two members to the

Imperial Parliament. The living is a vicarage, in the archdeaconry of Buckingham and diocese of Oxford. Wycombe Poor-Law Union contains 80 parishes and townships, with an area of 81,308 acres, and a population in 1851 of 33,562.

High Wycombe, as the town is commonly designated, probably occupies the site of a Roman settlement: a Roman tessellated pavement and Roman coins and other antiquities have been discovered here. The town had a market in the time of the Saxons. It was incorporated in the reign of Henry VI. (1422-1461). The borough has returned two members to Parliament since the reign of Edward I. The river Wick passes through the town, and falls into the Thames at Great Marlow, about 6 miles south from Wycombe. There are numerous paper-mills and corn-mills on the Wick and on the Rye, a feeder of the Wick. The church is a fine old building of the 13th century, with a highly-ornamental tower, 108 feet high, of later date. The length of the church, including the chancel, is 180 feet; the height of the nave is 48 feet. In the course of extensive repairs in the church in 1827, a fine gothic window over the great south door was discovered and opened. The Wesleyan Methodists, Independents, and Baptists, have each two places of worship; the Quakers and Primitive Methodists have one each. There are a Free Grammar, a Diocesan, National, and British schools, a literary institution, and a savings bank. The town-hall and market-house, erected in 1757, is supported on 34 stone pillars. The making of chairs from beech-wood is carried on to a considerable extent in Wycombe. Rope-making, basket-making, coach-building, the parchment manufacture, brewing, and malting, furnish employment. Lace-making and straw-plaiting employ many of the female inhabitants. A county court is held in the town. Friday is the market-day. Fairs for cattle are held on the third Monday of April and on October 28th; a statute fair is held on the Monday before Michaelmas day. Wycombe market is important for corn and agricultural produce generally. Adjoining the town is Wycombe Abbey, a very large and handsome modern mansion, the seat of Lord Carrington. *West Wycombe*, 2 miles W.N.W. from High Wycombe, is noteworthy on account of the church, a somewhat singular structure, erected in 1763 by the notorious Francis Dashwood, Lord le Despencer. The tower is surmounted by a globe, in which is a room capable of containing several persons. *West Wycombe House*, a spacious modern mansion, the Dashwood family seat, stands in an extensive park adjoining the village. The park is picturesque, well-wooded, and contains some fine sheets of water.

YANG-TSE-KIANG, one of the largest rivers in the world, drains the north-eastern districts of Tibet and the central provinces of China proper. Its source is in the interior of Asia, about 1850 miles from its mouth in a straight line; but the whole course of the river probably exceeds 3000 miles. The country watered by the Yang-tse-kiang and its numerous tributaries is estimated to have an area of 740,000 square miles.

Upper Course.—According to Chinese statements translated and published by Klaproth in his 'Mémoires relatives à l'Asie,' the Yang-tse-kiang rises between 34° and 35° N. lat., 89° and 90° E. long., in the Bayan Khara Mountains, in three branches, all of which bear the Mongol name of Oolan muren; but to the most northern the name of *Nam-tai-tu* is prefixed; that in the middle is distinguished as *Toktonas*, and the southern river is called *Kat-si*. These three rivers run from west to east. The *Kat-si*-oolan-muren is joined from the south by a small river called *Murus-ussu*, which comes from the south-east. The united stream preserves the name of the last-mentioned river, which indeed seems to be the denomination by which the Yang-tse-kiang, in its upper course, is known. The *Murus-ussu* runs northward, and

GEOG. DIV. VOL. IV.

is joined by the *Toktonai-oolan-muren* from the west; it then turns eastward and receives the waters of the *Nam-tai-tu-oolan-muren*, which enters it from the north. The *Murus-ussu*, after being joined by the *Nam-tai-tu-oolan-muren*, turns southward, being opposed in its eastern course by a branch of the Bayan Khara Mountains, but soon afterwards it enters by a south-eastern course that extensive mountain region which divides the table-lands of Central Asia from the lowlands of China. As the ranges composing this mountain region run mostly from north to south, the river soon takes a southern direction, and flows in a narrow valley inclosed by mountains, whose summits rise far above the snow-line. In these parts the river is called *Pho-lat-tshu*, which passes the town of Batang (29° N. lat.), and forms the boundary-line between Tibet on the west and China proper on the east. After passing 28° N. lat., the river begins to break through the several ranges of snow-covered mountains which oppose its eastern course. The valleys which its waters have scooped out across these chains is rather wide in the western ranges, so as to extend in some places into moderate plains; but in the eastern ranges it is a mere chasm, which is entirely filled up by the great volume of water brought down by the river. In these parts the river is called *Kin-cha-kiang*, or the river of the golden sand, because small particles of gold are found in it. In its course through the mountain region the *Kin-cha-*

kiang is joined by several tributaries, among which the largest is the *Ya-teng-kiang*, which rises in the Bayan Khara Mountains, south of the sources of the Hoang-ho, and runs parallel to the course of the principal river, preserving a distance of about 180 or 140 miles from its banks. The course of this tributary of the Kin-cha-kiang exceeds 600 miles, and the whole of it lies in a narrow longitudinal valley between snow-covered ranges. Near 102° E. long. the Kin-cha-kiang attains its most southern point (26° N. lat.), and near 108° E. long. it turns northward. In the vicinity of the town of Tung-tshuan-foo (26° 30' N. lat.) it enters a wider and more open valley, and here it begins its middle course. The upper course of the river is about 1280 miles long. It runs about 460 miles eastward as far as the Muru-usu, about the same distance southward as the Pho-lai-tshu, and about 860 miles eastward as the Kin-cha-kiang. It does not appear that the river is navigated in any part of its upper course, where in its passage through the mountains it forms many rapids and falls. But great quantities of timber are floated down. The large rafts of timber which are found in the middle parts of the course floating down to the provinces near the Pacific prove that this supply must be derived from a country covered with forests, and such a country is only found on the upper part of its course.

Middle Course.—The middle course of the river lies through a hilly country, and extends from Tung-tshuan-foo to King-tsheou-foo, at which place it enters the great Chinese plain. From Tung-tshuan-foo the Kin-cha-kiang flows northward about 180 miles, and then turns to the east, in which direction it runs about 100 miles, when it is joined from the north by the Min-kiang or Ta-kiang, and from this place it is called *Kiang* (the river), or *Ta-kiang* (the great river). The Kiang runs in a north-eastern direction about 860 miles, when it passes north of 31° N. lat., where its course is directed to the east by some offsets of the Tapa-ling range, and, flowing in that direction, it reaches King-tsheou-foo, after a course of about 240 miles. Thus the middle course of the river amounts to 860 miles. Though the Kin-cha-kiang below Tung-tshuan-foo runs in a wide valley, it is still within the mountain region, and its course is interrupted by cataracts. It is ascended by large barges to the mouth of the Yan-min-kiang, or Ta-kiang. This tributary rises in the mountains of Sifan, a branch of the Bayan Khara range, and traverses in its southern course a rugged mountain tract, until it enters the plain of Tching-too-foo (so named from the capital of Te-tchu-an), which is surrounded by high mountains, and which the river waters and fertilises by dividing into a great number of arms. These arms unite some distance south of the city, and flow through a depression of the mountains to Kia-ting-foo, where the river runs through a plain to its junction with the Kiang near Siu-tshou. The Ta-kiang is navigable to Tohing-too-foo, to which place it was ascended by the Portuguese missionary Magallans, in the middle of the 17th century. This author gives an account of the great number and extent of the rafts of timber which he daily met with on the Kiang. They were only 10 feet wide, and of different lengths, the longest about a mile and a half in length: but their number was so great, that if all of them had been put together, they would have covered a space of several days' journey. On the rafts were placed other articles, drugs, parrots, monkeys, rhubarb, musk, and chowry-tails. The hilly country, through which this part of the Great River lies, improves lower down. The country near the mouth of the Ta-kiang is mostly covered with high hills, which at some distances rise into mountains, which are covered with extensive forests of pine, fir, cedar, and juniper; a part is overgrown with bamboo. The remainder is well cultivated, and the fields are interspersed with large plantations of fruit-trees, among which orange, lemon, and citron are mentioned. The *Kia-ling-kiang*, which joins the river near the town of Tung-king-foo, drains a rich agricultural valley and joins its principal stream, near which the country yields rice, cotton, sugar, silk, and fruits of every kind in abundance. Cultivation increases lower down the river to the still more important town of Kuei-tsheou-foo, which stands on the northern banks of the Ta-kiang, in one of the richest parts of China, where hardly a spot is to be found which is not applied to some useful purpose, with the exception of the crest of the Tapa-ling range, which is about 35 or 40 miles distant from the town, and inhabited by some mountaineers. But this range supplies great quantities of salt, which is sent from Kuei-tsheou-foo to the lower country.

Lower Course.—From King-tsheou-foo the river runs about 100 miles south-east to the outlet of Lake Tung-ting, from that place north-east to the mouth of the Han-kiang about 160 miles, then again south-east about the same distance to Kieu-kiang, which is on the channel that unites Lake Poyang with the Ta-kiang. At this place the name of the Ta-kiang is changed into that of *Yang-tse-kiang*, which it preserves to its embouchure. From Kieu-kiang the river runs north-east about 220 miles to Nan-king, the ancient capital of the empire. From Nan-king it flows mostly eastward, and after about 50 miles it reaches the Great Canal, and flowing about 180 miles more, it falls into the Pacific. In all this extent the river does not offer any impediment to navigation: its current is as gentle as the large volume of water permits. The width varies from one to three miles. The number of islands is small, and most of them are rocky. The tides are perceptible as far as Kieu-kiang, 400 miles from its mouth; and so far upward several kinds of sea-fish ascend it in great numbers, as sturgeons, porpoises, dorades or gold-fish, &c.; and some, which seem peculiar

to this river, as that called hongyu, or yellow fish. The river barges used in this part of the river are as large as coasting-vessels; but the river is navigated also by the largest junks, and the largest men-of-war might ride in safety on its surface.

Between King-tsheou-foo and Poyang Lake the Ta-kiang passes through an extensive depression, which is filled with a deep alluvial soil, and distinguished by a great number of lakes. This depression lies nearly in the centre of China proper, and extends over the greater part of the province of Hupe and the northern districts of Ho-nan, and is considered the most fertile portion of the whole empire. This plain may be about 200 miles every way, and is called *Yumichiti*. Nearly all the productions of China are here raised in the greatest abundance; no spot is uncultivated, towns and villages cover the country on all sides, and several large towns are found on the banks of the Ta-kiang. Besides several smaller rivers, the Kiang receives from the south a great volume of water by the outlet of Lake Tung-ting, which falls into it east of 130° E. long. This lake is more than 200 miles long, and surrounded by an extremely fertile country, which even in the driest seasons yields abundant crops, the means of irrigation derived from the lake never failing. Two large rivers, originating on the northern declivity of the Nan-ling Mountains, and draining a country as extensive as the island of Great Britain, fall into this lake, the Tshing-shui-kiang and the Heng-kiang, each running more than 400 miles. The largest river which from the north joins the Ta-kiang is the *Han-kiang*, which rises on the southern declivities of the Pe-ling, drains the wide and fertile valley inclosed by the Pe-ling and Tapa-ling ranges, runs nearly parallel with the Ta-kiang, and falls into it after a course of about 500 miles at the town of Han-yang. There are several large towns on its banks, and the river seems navigable nearly to its source. By means of the easy water-communication afforded by these rivers and several large lakes, the country contiguous to the banks of this portion of the Ta-kiang has become the centre of an immense traffic, and the towns built on them are very populous and industrious. King-tsheou-foo, situated where the river enters the plain of Yumichiti, is large, rich, and well fortified. Where the Han-kiang joins the Ta-kiang there are two large towns, Han-yang on the northern, and Wan-tshang on the southern shores. Wan-tshang is compared by the Jesuits to Paris in extent, and Han-yang to the second town of France. The navigation in the neighbourhood of these two places is so active, that from 8000 to 10,000 large river-barges, equal in size to small coasting-vessels, may always be seen either at anchor or plying between the two towns. About 30 miles farther down is the large commercial town of Hoang-tsheou-foo, surrounded by a beautiful and fertile country.

The plain of Yumichiti is separated from Lake Poyang by a rocky mountain tract called Li-shan. The lake extends nearly 90 miles from north to south, with an average width of 20 miles. It contains many islands, most of which are cultivated and populous. Both on the west and east it is inclosed by high hills where it approaches the Yang-tse-kiang, but a large low plain surrounds its southern shores, and this plain is traversed by numerous arms of the river Kan-kiang, which is the largest of the rivers that fall into the lake. This river and the country surrounding it are crossed by the great road from Canton to Peking. The course of the river is about 300 miles in a straight line, but with its bends it probably exceeds 400 miles. It rises near the Meiling Pass, through which the great road leads to Canton, and becomes navigable at the foot of the pass, where the town of Nan-gan is built, though at this place its width does not exceed 15 yards. Small river-barges ply between this place and Kan-tsheou-foo, where the river receives a large supply of water by several tributaries which join it near this place. Hence it has sufficient water for large river-boats, but about 10 miles below the last-mentioned place are the Shepotan, or rocks with the 18 rapids, which however do not interrupt the navigation. South of the rapids begins a wide, fertile, and very populous valley, which extends to the town of Nan-shang-foo, the capital of the province Kiangsi, which is large, well-built, and contains many edifices as large as palaces. Below this town the country extends in a low and level plain, which is traversed by the different arms into which the Kan-kiang branches out before it enters the lake. In the hills contiguous to the low plain of Lake Poyang, on the east, the best porcelain clay is found, and the china-ware made in the vicinity of lao-tsheou-foo is considered the best in the empire. There is the village *King-te-shing*, which is said to have a million of inhabitants and 500 large manufactories of china-ware. It is called shing (village) because it is not inclosed by walls.

After uniting with the channel which issues from Lake Poyang, the Yang-tse-kiang is always from 2 to 4 miles wide, and contains a great number of islands, most of which are low and formed by alluvium, but a few are rocky and elevated. The country on both sides consists of low hills, composed of sandstone or clay, which terminate on the river in steep declivities. It is of indifferent fertility, but well cultivated. In a depression of this hilly country, forming a considerable basin, is the town of Ngan-king-foo, or Gan-king-foo, a place of great commerce and manufacturing industry. The hilly country ceases where the river Tshao-ho-kiang falls into the Yang-tse-kiang. This river brings down the waters of the large lake Tshao-ho, and a little lower down the Yang-tse-kiang is joined, near the large town of Tai-ping-foo, by several small rivers. These, as well as the Tshao-ho-kiang,

are navigable to a considerable extent. Farther down the Yang-tse-kiang flows through a rather level country and between high banks, so as not to have a bottom along its bed. This country is of considerable fertility, and extends below the town of Nan-king to the vicinity of Tshing-kiang-foo, or the Great Canal.

About 45 miles below Nan-king the Yang-tse-kiang is joined on the north by the western branch of the Great Canal, and about 10 miles farther down, at the town of Kua-tsheou, by the eastern branch. Both branches unite near the town of Yang-tsheou-foo, one of the largest and most commercial towns in China, whose population is stated to be two millions by the Jesuits. From Yang-tsheou-foo the canal runs directly northward along the borders of Lake Kao-yeou to the Hoang-ho. Opposite the island which is formed by the two above-mentioned branches of the Great Canal, north of the Yang-tse-kiang, is the entrance to the southern portion of the Great Canal, at the town of Tshing-kiang-foo. By these two canals the navigation of the Yang-tse-kiang is continued over the eastern and northern provinces of China proper.

At the junction of the canals the width of the river is about two miles, but farther down it increases considerably. Junks of the largest kind find no difficulty in sailing up the river to Tong-tsheou-foo, a large town on the northern shores of the estuary, and even to Tshing-kiang-foo. According to the maps the mouth of the river seems to form an opening more than sixty miles wide.

In this opening, but much nearer to the southern shores of the estuary, is the alluvial island of Tsung-ming, which is traversed by numerous canals and dikes for the purpose of irrigation. The island is 60 miles long, 15 to 18 miles wide, and has a population of half a million. It is very fertile, and produces abundance of rice, millet, cotton, and vegetables.

The depth of the Yang-tse-kiang, as far up as the tides ascend, that is, to Lake Poyang, is very great, and is expressed in the Chinese proverb, "The sea has no boundary, and the Ta-kiang no bottom." Such a depth is not found in any other river, except in the Amazonas, below the Strait of Obydoa. The tide of course affects only the surface-water of the river, and below it the natural current carries the river-water to the sea. This river-water however is pressed to the bottom by the superincumbent tide-stream, and thus confined it scoops out a much deeper bed than it does in other circumstances where such a pressure does not exist.

YANNINA. [JOANNINA.]

YAORI. [SOODAN.]

YARDLEY HASTINGS. [NORTHAMPTONSHIRE.]

YARE RIVER. [NORFOLK.]

YARKIAN, or YARKAND. [THIAN-SHAN-NANLU.]

YARM. [YORKSHIRE.]

YARMOUTH, or GREAT YARMOUTH, Norfolk, a market-town, sea-port, and the seat of a Poor-Law Union, in the parish of Great Yarmouth, is situated near the confluence of the rivers Yare, Waveney, and Bure, in 52° 36' N. lat., 1° 45' E. long., distant 23 miles E. by S. from Norwich, 124 miles N.E. from London by road, and 136 miles by the Eastern Counties and Norfolk railways. The population of the borough in 1851 was 30,879. The borough is governed by 12 aldermen and 36 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The living of St. Nicholas is a perpetual curacy in the archdeaconry and diocese of Norwich. Great Yarmouth Poor-Law Union comprises the parish of Great Yarmouth, with an area of 1510 acres, and a population in 1851 of 26,880.

Great Yarmouth is situated chiefly on the left bank of the Yare, but it extends also along the left bank of the Bure. Over the Bure is a suspension-bridge. The rivers Yare and Waveney unite their waters about four miles south-west from Yarmouth, forming an estuary called Braydon Water; and the stream issuing from the east end of this lake, being joined by the river Bure, retains in its passage to the sea the name of the Yare. The hamlet of South Town, sometimes called Little Yarmouth, on the right bank of the Yare, may be considered as a part of Yarmouth. The town extends beyond the limits of the old walls, to the north towards Caistor, and to the south towards Nelson's monument, and east of the walls, between the old town and the sea. The village of Gorleston, to the south, near the mouth of the river, is now connected with South Town.

The town of Yarmouth, within the boundary of the old walls, consists of four principal lines of streets, nearly parallel with the river, and of about 150 narrow lanes, called rows, which form the communications between the streets. The rows are extremely narrow, most of them being not more than from five to eight feet wide, and impassable for ordinary wheel-carriages; the greater part of the traffic of the town is therefore carried on in 'Yarmouth carts,' which are peculiarly constructed, with low wheels, and adapted to the width of the rows; they are drawn by one horse, and look like sledges, but are well suited for conveying heavy goods. Some of the rows have been enlarged, particularly one near the middle of the town, to which the name of Regent-street has been given. The principal streets are wide, and the houses are mostly well built, but the most substantial

and handsome houses are situated along the quays. The provision-market is spacious. Near it is the fish-market. The corn-exchange is in Regent-street. Many visitors resort to Yarmouth as a bathing-place, for which purpose it is the best on the coast of Norfolk. The town within the walls is well paved and lighted with gas. The harbour is in the river Yare. There are two quays, South Quay and North Quay. South Quay is the larger; it is about a mile and a quarter long, well constructed, and improved by Sir J. Rennie. There is a bar at the entrance of the river: but vessels drawing 12 feet water, or about 200 tons burden, can pass it at high water, and sail up to the town. The quay is in some parts 150 yards wide, and there is a beautiful promenade planted with trees along the centre. Opposite the southern part of Yarmouth a jetty, supported on piles, extends about 450 feet into the sea; it is 24 feet wide, and in fine weather affords a pleasant promenade.

The guildhall is a building of considerable extent, with a spacious assembly-room. The town-hall, a handsome building, with a portico supported by Tuscan columns, stands on the quay. There are a large custom-house, a jail, a house of correction, the Royal hospital, the Fisherman's hospital, a commercial club-house, a theatre, a ball- and concert-room, and two bath-houses. The oldest church is that of St. Nicholas; it is a handsome cruciform building, of pointed architecture, with turrets at the west end, and a tower and spire, 168 feet high, in the centre. It was founded in the beginning of the 12th century. St. George's church was built in 1716, and St. Peter's in 1833. At Gorleston is an ancient church, and there is a small church in South Town, called St. Mary's church. The Wesleyan, Primitive and New Connexion Methodists, Baptists, Independents, Unitarians, Jews, Roman Catholics, and Countess of Huntingdon's Connexion have places of worship. There is also a Mariners' church. There are in Yarmouth a Proprietary Grammar school, British schools, Endowed Hospital schools, Church Charity schools, a Factory evening school for girls, and Infant schools; a public library, a savings bank, and 70 almshouses. On the beach, about half a mile from the town towards the mouth of the river, is the Nelson column, which was erected in 1817: it is a fluted pillar 140 feet high, surmounted by a statue of Britannia. Not far from the column are barracks, which were built at an expense of 120,000*l.* The building was used as a hospital after the battle of Waterloo: it is now occupied as a government asylum for officers of the army and navy afflicted with lunacy.

The chief business of Yarmouth is in the fishing, curing, and exporting of herrings. The Yarmouth bloater is a well-known article of commerce. Railway communication with London is of considerable importance to the herring fishery, the produce of the deep-sea fishing being forwarded to the metropolis daily by railway. There are manufactures of crape and silk goods. Ship-building, rope- and sail-making, and other trades dependent on shipping, are carried on. Salt-works, corn-mills, soap-works, breweries, malt-houses, tanneries, and iron-foundries afford considerable employment. Yarmouth is the chief port for the exports and imports of Norfolk, Suffolk, and part of Essex. It has also an extensive inland trade by the rivers Yare, Waveney, and Bure. The Yare is navigable to Norwich, the Waveney to Bungay, and the Bure to Aylsham. Coals are largely imported, also timber, salt, wines, and colonial produce; barley is the principal article of export: other grains and peas are also shipped in large quantities. The market-days are Wednesday and Saturday; the chief sales of corn are on Saturday. Fairs are held on the Friday and Saturday in Easter week, and on Monday and Tuesday at Shrovetide. A county court is held in the town.

The number of vessels registered as belonging to the port of Yarmouth on December 31st 1854 was:—Sailing vessels under 50 tons 831, tonnage 9401; above 50 tons 264, tonnage 30,082; steam-vessels under 50 tons 4, tonnage 71; above 50 tons 2, tonnage 197. The number and tonnage of vessels entered and cleared at the port during 1854 were:—Inwards, sailing-vessels 1927, tonnage 158,915; steam-vessels 208, tonnage 27,343; outwards, sailing-vessels 774, tonnage 48,617; steam-vessels 208, tonnage 27,343.

From Domesday Book it appears that Yarmouth was a royal demesne, to which belonged 70 burgesses. Henry III. granted a charter, with permission to fortify the town with a wall and moat. The wall had 10 gates, and was strengthened with 16 towers. In Ket's, or the 'Norfolk,' rebellion, in the reign of Edward VI., Yarmouth was attacked by the insurgents, who were repulsed by the townsmen. In 1588, on the alarm of the Spanish Armada, a fortress with four towers, whence beacons might be displayed, was erected in the middle of the town. As the navigation off the coast is dangerous, floating lights are kept in Yarmouth Roads. A regatta is held annually at Yarmouth. The Dens are used by the inhabitants for cricket and other amusements; annual racing meetings are held on them. On the beach are the South Star, North Star, and Town batteries. There is a station of the coast-guard at Yarmouth.

YARMOUTH. [WIGHT, ISLE OF; NOVA SCOTIA.]

YAROSLAV, or JAROSLAW, an extensive government of European Russia, is situated between 56° 42' and 59° N. lat., 37° 45' and 41° 20' E. long. It is bounded N. by Novogorod and Vologda, E. by Kostroma, S. by Vladimir, and W. by Tver. The area is 18,965 square miles. The population in 1846 was 1,008,100.

The country is a pretty high table-land, the level surface of which

is diversified only by some ridges of low hills and the high banks of the rivers. The soil is a mixture of sand and gray clay, and there are extensive morasses, and some small tracts which are wholly incapable of cultivation. The hills and the banks of the rivers consist of strata of clay, marl, and limestone. Of the 19 rivers, the principal is the Volga, which enters the government from Twer, runs at first to the north to Mologa, where it is joined by the river of the same name, then turns to the south-east, to the city of Yaroslav, where it makes a small bend towards the north, and then flows eastward to Kostroma. At Rybinsk, between Mologa and Yaroslav, it is joined by the Scheksna. All the rivers of the government flow into the Volga. The Mologa and the Scheksna are by far the most considerable. The lakes are 38 in number: the largest is that of Nero, near Rostow, which covers an area of 23 square miles. The climate is rather severe; the winter, spring, and autumn are long; the summer is short. The purity of the air is very favourable to vegetation and to the health of the inhabitants.

Agriculture is the chief occupation of the inhabitants. The soil is only moderately fertile, and the corn produced is far from sufficient for the consumption of the inhabitants. The chief corn crops are rye, barley, wheat, buckwheat, and oats. Peas are grown in large quantities; flax and hemp only for domestic use. Horticulture is well understood. Apples and cherries thrive in the southern circles. The forests chiefly consist of birch, alder, aspen, and underwood; but timber for building is scarce, there being hardly any oaks, and very few pines and firs. The beasts of prey are bears, wolves, lynxes, and foxes; the fur-bearing animals are squirrels, martens, badgers, and weasels; hares are pretty numerous. The fisheries in the rivers are very productive. Very little attention is paid to the breeding of cattle.

Spinning and weaving, both of flax and wool, are universally practised; in the country, gloves, shoes, and cloaks for the peasantry, caps, stockings, harness, and agricultural implements, are manufactured for home use. The manufactures, properly so called, are confined to the towns, and consist of leather, linen, cotton, silk, tobacco, paper, soap, and candles. The principal articles of export are Russia leather, sail-cloth, duck, linen, cordage, some linseed and linseed-oil, salt meat in large quantities, and horsehair; the imports are corn, brandy, salt, iron, and all kinds of colonial produce, drugs, and manufactures.

The inhabitants are almost all Russians. They are of the Greek Church, under the Archbishop of Yaroslav and Rostow, whose diocese contains 833 parishes.

Yaroslav, the capital of the government, is situated near to the eastern frontier, at the junction of the Volga with the Kotorosla, the outlet of Lake Nero. The town is surrounded with palisades and defended by a citadel, which is in the angle formed by the two rivers, and is surrounded by a rampart. The city stands on an elevated plateau, and its many stone houses, its 44 churches and three monasteries, give it a striking appearance. It is however ill built, with generally narrow streets; the principal street by which the town is entered on coming from St. Petersburg is broad, and consists of handsome stone houses. Yaroslav has a theological seminary, a gymnasium, a district school, and a school for the higher branches of learning, called the Demidoff Lyceum, from its founder, Prince Paul Demidoff, who in 1803 endowed it with a capital of 300,000 silver rubles and 3600 peasants. The lyceum has a very good library. The linen and Russian leather of Yaroslav are highly esteemed. Its trade is very considerable, and the merchants have a very large bazaar. The population is 28,500.

Rostow, situated on Lake Nero, is one of the most ancient towns in Russia. It is six miles in circuit, has several times suffered by war and fire, and now consists of the city and an extensive suburb. The city is surrounded by a rampart and a moat. The site is low and surrounded by marshes. The Archbishop of Yaroslav resides here, where he has his principal cathedral, an ancient richly-adorned edifice, and a vast palace with a seminary. There are 24 churches and 3 convents in the city. Besides the bazaar, the city contains 200 shops and above 1000 houses, with 6500 inhabitants. The great fair of Rostow, which begins at the end of February and continues for a month, is attended by at least 40,000 Russians, Armenians, Greeks, and Tartars, who bring goods to the value of 14,000,000 rubles.

Uglitsch, on the right bank of the Volga, is likewise an ancient town. Before it was burnt by the Lithuanians in 1607, it contained, it is said, 150 churches, 12 convents, and 30,000 houses. At present it has two convents, 23 churches, and a fortress built of wood. The streets are narrow and crooked. There are 7000 inhabitants, who have a considerable trade and some manufactures.

Rybinsk, at the confluence of the Rybinska with the Volga, 50 miles N.W. from Yaroslav, is an important commercial town, though the population hardly amounts to 4000. Goods are here transferred from the large vessels that ply on the Volga to smaller craft, which convey them to St. Petersburg and other Baltic ports. As many as 20,000 barges arrive annually with goods to the amount of 250,000,000 rubles. Rybinsk has a fine exchange, several churches, an arsenal, a theatre, large bazaars and corn-stores, a house of correction, and several schools. Beer, spirits, salt, oil, soap, candles, and earthenware are among the manufactures. Corn is the chief article of commerce. Two large annual fairs are held.

YEOVIL, Somersetshire, a market-town and the seat of a Poor-Law Union, in the parish of Stone, is situated near the left bank of the river Yeo, in 50° 56' N. lat., 2° 37' W. long., distant 36 miles S.S.W. from Bath, and 123 miles S.W. by W. from London. The population of the town in 1851 was 5985. The town is governed by a portreeve. The management of the paving, lighting, watching, &c., is under a body of commissioners. The living is a vicarage in the archdeaconry of Wells, and diocese of Bath and Wells. Yeovil Poor-Law Union contains 35 parishes and townships, with an area of 51,271 acres, and a population in 1851 of 28,446.

Yeovil was probably a Roman station, as Roman coins and tessellated pavements have been found at the place; the town was called *Gevele* by the Saxons, and *Ivle* and *Givele* in Domesday Book, which names may be identified with that of the river Yeo or Ivel. The streets are lighted with gas and paved. The church is a handsome cruciform edifice, of perpendicular character, 146 feet long and 50 feet wide; the length of the transept is 80 feet. The church stands in a large churchyard surrounded with lime-trees. There are also a new church called Trinity church; places of worship for Wesleyan Methodists, Independents, Baptists, Quakers, and Unitarians; a Grammar school; National schools; a savings bank; Wobourne's almshouses, for 12 poor persons; Portreeve's almshouses; and several parochial charities. A new town-hall has been recently erected. Yeovil was formerly the seat of a woollen manufacture, but the manufacture of leather gloves is now the chief source of employment. The wages paid yearly by the manufacturers of Yeovil and its neighbourhood are estimated at about 100,000*l.*, of which about two-thirds are paid by the Yeovil manufacturers. A considerable number of women and girls are employed in sewing the gloves at their homes. The market is held on Friday, every alternate Friday being regarded as the great market. Large quantities of corn, butter, cheese, hemp, and flax are sold; and considerable trade is carried on in the sale of cattle. Fairs for horses are held on June 28th and November 17th. In the vicinity of Yeovil are many dairy farms, from which butter in considerable quantities is obtained for the London market. A county court is held in the town.

YETMINSTER. [DORSETSHIRE.]

YONNE, a department of central France, is bounded N.E. by the department of Aube, E. by Côte-d'Or, S. by the department of Nièvre, W. by that of Loiret, and N.W. by Seine-et-Marne. It lies between 47° 20' and 48° 24' N. lat., 2° 55' and 4° 20' E. long. Its greatest length is 82 miles; the greatest breadth is 53 miles. The area is 2368 square miles; and the population in 1851 amounted to 381,133.

The surface is in many parts undulating; the highest ground is toward the south-western corner, where the low hills which separate the basin of the Loire from that of the Seine cross the department. The country about Avallon is comprehended in the granitic district of Morvan; the rest of the department is occupied by the oolitic formations, except the north-west of the department, which is occupied by the chalk formations. Iron-ore is obtained; freestone, sandstone, and stone suitable for lithography are quarried; and gun-flints, and red and yellow ochre, are procured. A mine of lead and silver was formerly worked near Avallon.

The department belongs almost entirely to the basin of the Seine. Some parts along the western border are drained by the Loing and its affluents; the central and eastern parts are drained by the Yonne and its tributaries the Cure, the Serein, the Armançon, the Tholon, the Vrin, and the Vanne. The Loing and its feeder the Ouanne rise in the south-west part of the department, and have a north-western course into the adjacent department of LOIRET, in which their junction takes place. The other feeders of the Loing have only their sources and the upper part of their course in this department. The Yonne rises in the department of Nièvre, near Château-Chinon; and flows north-west into the department of Yonne, where it passes Coulanges, Auxerre, Joigny (between these towns it receives the Serein and the Armançon, both on the right bank); and just below Joigny it receives the Tholon and Vrin, both on the left bank, St. Julien, Sens (near which it receives the Vanne on the right bank, and Villeneuve-la-Guiard. Below Villeneuve-la-Guiard it quits the department and enters Seine-et-Marne, through which it flows a short distance west-north-west to Montreault-Yonne, where it unites with the Seine. Its whole course is about 150 miles. The river is employed for floating timber from near its

source: at Clamécy the timber is formed into trains or rafts, and floated down to Auxerre. At Auxerre the navigation commences, and extends for about 64 miles, the greater part of it in this department. The *Cure* rises in the department of Nièvre, and flows north-north-west into the department of Yonne, and by Vermanton into the river Yonne on the right: its whole course is above 50 miles. The *Voisin*, which joins the *Cure*, and its feeder the *Cousin*, both rise in the department of Côte-d'Or, and flow north-west. The *Serein* rises in the department of Côte-d'Or, and flows north-north-west into the department of Yonne, where its course bends more towards the west. The *Armançon* rises in the department of Côte-d'Or, and flows north-north-west by Semur into the department of Yonne, through which it flows north-west by Nuits, Tonnerre, and Dannemoine; then westward by St-Florentin and Briénon into the Yonne. Its whole course is about 92 miles. Both the *Armançon* and its feeders, including the *Armance* (which flows into it from the department of Aube), are used for floating timber, and vast quantities of firewood down to Paris.

The Canal de Bourgogne, which connects the Seine with the Rhône, commences in the Yonne, and passes up the valley of the *Armançon*, then up the valley of the *Brenne*, a feeder of the *Armançon*, and, crossing the hills which separate the basin of the Seine from that of the Rhône, follows the valley of the *Ouche* till it terminates in the *Saône* at St-Jean-de-Losne. The summit-level is at Pouilly in the department of Côte-d'Or, so that all the part of the canal which is in this department (of Yonne), officially stated at 91,638 mètres (about 57 miles), is on the side of the descent from the summit-level to the Yonne: this descent is of 311 mètres (about 1020 feet), and is effected by 115 locks. This canal was projected by Henri IV., but was not commenced till 1775; and if finished (of which we have no certain information) has been completed only within a very few years. The department is traversed by the Canal de Bourgogne, which connects the navigation of the Seine with that of the Rhône, commencing in the Yonne at the mouth of the *Armançon*, and terminating in the *Saône* at St-Jean-de-Losne [Côte-d'Or]; and by the *Nivernais Canal*, which commences in the *Loire* at Decize, in the department of Nièvre, passes up the valley of the *Aron*, is carried by a tunnel under the mountain of *Coloncele*, and descends from the summit-level to the Yonne at Auxerre, thus connecting the navigation of the *Loire* with that of the *Seine*. The department is traversed by 6 imperial, 19 departmental, and a great number of communal or parish roads; and also by the Paris-Lyon railway, which passes Sens, Joigny, and Tonnerre, and sends off a branch from Joigny to Auxerre.

The area of the department comprehends in round numbers about 1,800,000 acres, of which about 1,150,000 acres are under the plough. More corn is produced than suffices for the consumption of the inhabitants. The produce in wheat is below the average of the French departments; but in other kinds of grain, oats, rye, maslin, and especially in barley, the department far exceeds the average. Other products are—hemp, chestnuts, truffles, pulse, and fruits. The grasslands amount to nearly 80,000 acres; the commons and other open pastures to 45,000 acres. Horned cattle, sheep, and horses are kept, but in no great numbers. Wine is the staple produce of the department. The vineyards comprehend above 90,000 acres, yielding about 19,000,000 gallons of wine annually, of which two-thirds are exported. The wines are known as 'Lower Burgundy wines.' Some of them are in high repute. The orchards and gardens occupy nearly 15,000 acres, and the woodlands above 360,000 acres. The exportation of timber and firewood, and the manufacture and exportation of charcoal, are important branches of industry. The department has some important iron-works and glass-houses. In the manufactures of the department are comprised also coarse woollens, blankets, serges, caeks, leather, conserve of grapes, tiles, pottery, &c.

The department is divided into five arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Auxerre . . .	12	181	121,539
2. Avallon . . .	5	71	47,524
3. Joigny . . .	9	108	99,446
4. Sens . . .	6	90	66,855
5. Tonnerre . . .	5	82	45,769
Total . . .	37	482	381,133

1. Of the first arrondissement, and of the whole department, the chief town is AUXERRE. *Vermanton*, on the right bank of the *Cure*, has a population of 2816, who carry on a considerable trade in wood and wine. The loose timber and firewood floated down from the *Morvan Hills* are collected at *Vermanton*, and formed into trains or rafts, which descend by the Yonne and the *Seine* to Paris. *Chablis*, 12 miles E. from Auxerre, on the left bank of the *Serein*, has a population of about 2800, who trade in the excellent white wine produced in the vineyards of the canton: there are seven fairs in the year. At *St-Florentin*, an ill-laid out but on the whole a handsome town, prettily situated on the Canal-de-Bourgogne, at the junction of the *Armance* and the *Armançon*, and on the Paris-Lyon railway, are several tan-yards; trade is carried on in corn, hemp, firewood, and charcoal:

there are seven yearly fairs. The town stands on a hill; the fine lofty gothic church, built in 1376, has some stained-glass windows of great beauty, and some handsome sculptures. From the four principal gates of the town the four leading streets run to a handsome central square, in the middle of which is a public fountain of gothic design. The Canal-de-Bourgogne is carried over the *Armance*, near the town, by a beautiful aqueduct bridge. The town is on an ancient site. A strong castle which stood on the site now partly occupied by the parish church, is connected with the history of Queen *Brunebaut*, who took refuge here in A.D. 597 from the pursuit of her grandson, *Theodebert II.*, king of *Austrasia*. *Pepin* demolished the fortress as soon as he mounted the throne in 752. The Normans were defeated near *St-Florentin* in 888 by *Richard*, duke of *Bourgogne*. The town capitulated to the Count of *Champagne* in 936. On the banks of the *Cure*, near the south-eastern border of this arrondissement, are the extensive grottoes of *ARCY*.

2. In the second arrondissement the chief town, *Avallon*, on the right bank of the *Cousin*, a feeder of the *Aire*, has a college and 5740 inhabitants in the commune. The town is regularly built, with clean wide streets, and has some handsome public buildings. Coarse woollen-stuffs, woollen-yarn, staves, paper, and casks are the chief industrial products. *Vézelay*, an old and ill-built town, anciently fortified, stands on a hill not far from the left bank of the *Cure*, and is surrounded by vineyards. The church of *Vézelay*, which is classed among the historical monuments of France, and has been recently restored, consists of two parts: the first part, into which the three outer doors open, is 80 feet long, and is called the *Catechumen's church*; the second part, with which the first part communicates by three other doors, is called the *Great church*, and is 213 feet long. The choir of the church is very fine; the lofty roof, 75 feet high, is supported by 10 beautiful columns. The nave and choir are surrounded by aisles. The three portals of the façade are adorned with sculptures; those over the central door represent the apostles. *Vézelay* is rich in historical recollections. At a council held here in 1145 the second crusade was preached by *St. Bernard*, and *Louis VII.* of France and many of his nobles took the cross. In the third crusade, *Philippe Auguste* of France, and *Richard Cœur-de-Lion* of England, united their forces at *Vézelay*, to the number of 100,000 warriors. It is now a small place with about 1200 inhabitants.

3. In the third arrondissement the chief town, *Joigny*, stands on the Paris-Lyon railway, and is built on the slope of a hill above the right bank of the Yonne, over which there is a handsome stone bridge. Along the river on each side of the bridge extends a broad and elevated quay, fronting which is a handsome cavalry barracks. The town is surrounded by an ancient wall, and is entered by six gates; the streets are very steep, narrow, and winding, and are lined for the most part with wretched houses, among which are mingled a few of better construction. In the upper part of the town is a fine château, the windows and terraces of which command a beautiful prospect. Near it is the church, the fine vaulted roof of which, although mutilated, is worthy of notice. The town has two hospitals, a college, a theatre, and 6056 inhabitants, who trade in oak-bark, wood, charcoal, caeks, hoops, wine, brandy, and vinegar; there are brandy-distilleries, tan-yards, and tile-yards; whiting is made. *St-Julien*, a small place on the left bank of the Yonne, 10 miles by railway from *Joigny*, gives name to a favourite French wine. *Villeneuve-le-Roy*, or *Villeneuve-sur-Yonne*, on the right bank of the Yonne (over which there is an old stone bridge), is the first railway station between Sens and *Joigny*: population about 4500. The principal street of the town is straight and handsome, with a gate and an avenue of trees at each end; the church is near the centre of the main street, and has an elegant front, with a handsome door on each side. Coarse woollen-cloth and leather, and conserve of grapes are the chief industrial products; trade is carried on in wine, wood, and charcoal. *Briénon*, or *Briénon-l'Archevêque*, is a well laid out, well-built, handsome town, situated on the Canal-de-Bourgogne, and the right bank of the *Armançon*: population, 2650. The manufactures are woollen-yarn, coarse woollen-cloths, and leather. There is also considerable trade in firewood (which is floated down to Paris), charcoal, corn, and linen. *St-Fargeau*, prettily situated on the *Loing*, is an ancient town with about 2400 inhabitants, who manufacture leather, iron, glass, and earthenware; they also trade in firewood to Paris. The territory and castle of *St-Fargeau* passed by purchase from the house of *Montferrat* to *Jacques Cœur*, on whose spoliation it was sold by *Charles VII.* to *Antoine de Chabannes*. They came by marriage into the house of *Anjou*, and afterwards into that of the *Bourbons*. *Mademoiselle de Montpensier*, who built the beautiful château still standing, left the estates to her husband, the Duke of *Lanzun*, who sold them soon after her death to an ancestor of the present possessor, the *Marquis de Boisgelin*.

4. In the fourth arrondissement the chief town is SENS. *Pont-sur-Yonne*, a station on the railway to Paris, 7 miles from Sens, is on the left bank of the Yonne, over which there is a handsome bridge. The population, which numbers about 2000, manufactures tiles, leather, and coarse woollen-cloth, and carries on trade in the wine of the district, corn, and cattle. *Villeneuve-la-Guyard*, in the north-west of the department on the left bank of the Yonne, 14 miles by railway from Sens, on the road to *Montereau* and Paris, has a population of about

2000. *Villeneuve-l'Archevêque*, situated in a fertile plain, 14 miles from Sens, on the Vanne, has four yearly fairs; a considerable trade in wool, hemp, and woollen-stuffs; manufactories of coarse woollen cloth, tan-yards, and tan- and fulling-mills.

5. In the fifth arrondissement the chief town is *Tonnerre*, which is a station on the Paris-Lyon railway, and is built on the slope of a hill on the left bank of the Armançon, over which there is a stone bridge: population, 4510. The Canal de Bourgogne passes near the town, which is well laid out and well built with houses of stone. The parish church of St. Pierre and the magnificent hospital, founded and endowed by Marguerite de Bourgogne, sister-in-law of St. Louis, are built on a rock above the town, and are remarkable structures. The church of the hospital is of large dimensions and remarkable for the bold architecture of its vaulted roof, which is not supported by pillars. The town has a college, a theatre, a fine public walk, saw-mills, tan-yards, curriers'-shops, and corn-mills; paper-hangings and agricultural implements are manufactured; and trade is carried on in corn, wine, wood, and earthenware. There are seven yearly fairs. At *Tanlay*, the first station on the railway S.E. from Tonnerre, some trade is carried on in iron goods and other articles, and there are three yearly fairs. *Ancy-le-Franc*, which is 9 miles farther along the same railway, has considerable iron-works, a glass-house, a pottery, and a saw-mill. *Noyers*, in the valley of the Serein, which is inclosed by hills covered with vineyards, has an hospital, and about 1800 inhabitants, who manufacture serge, coarse linen, striped linens, cottons, and woollens, horsecloths, hosiery, bleached wax, wax and tallow candles, leather, and combs; and trade in corn, wine, and wool. The town which was taken by Edward III. in 1359, and suffered much in the religious wars of the 15th century, is surrounded by walls flanked with well-built towers of cut-stone.

The department forms the archiepiscopal diocese of Sens-et-Auxerre. The department is in the jurisdiction of the Imperial Court and within the limits of the University-Academy of Dijon, and is included in the 1st Military Division, the head-quarters of which are at Paris. It returns 3 members to the Legislative Chamber of the French empire.

(Malte Brun; Vaysse de Villiers; *Dictionnaire de la France*; D'Anville. *Statistique de la France*; *Official Papers*.)

YOONASKA. [ALEUTIAN ISLANDS.]

YORK, the capital of Yorkshire, an archiepiscopal city, a municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on the banks of the river Ouse, or Ure, which flows through the midst of it, in 53° 37' N. lat., 1° 4' W. long., distant 199 miles N. by W. from London by road, and 191 miles by the Great Northern railway. The population of the municipal borough in 1851 was 86,303; that of the parliamentary borough was 40,359. The borough is governed by 12 aldermen and 86 councillors, of whom one is lord mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry and diocese of York. York Poor-Law Union contains 82 parishes and townships, with an area of 80,519 acres, and a population in 1851 of 53,932.

York was originally a town of the Brigantes, a people of Celtic origin, described by Tacitus as the most numerous of the British tribes. It was converted into a Roman station during the second campaign of Agricola in Britain, about A.D. 78. By the Romans it was called Eboracum, or Eboracum. It appears to have very soon become the principal Roman station of the north, and even of the whole province of Britain. It was the head-quarters of the sixth legion from the time of its arrival in Britain in the reign of Hadrian, till the departure of the Romans from the island. The ninth legion, which came over with the emperor Claudius, had previously been stationed here, and of course continued here after its incorporation with the sixth. From the time of Septimius Severus, if not earlier, it was the residence of the emperors when they visited the province, and, in their absence, of the imperial legates.

One of the angle towers, and a portion of the wall of Eboracum attached to it, are to this day remaining in an extraordinary state of preservation. Excavations made at various times, and in different parts of the city, have discovered many remains of the fortifications of Eboracum, on three of its sides. It is inferred that this important station was of a rectangular form, occupying a space of about 650 yards by about 550 yards, inclosed by a wall and a rampart mound on the inner side of the wall, and a fosse without; with four angle towers, and a series of minor towers, or turrets, and having four gates or principal entrances, from which proceeded military roads to the neighbouring stations mentioned in the 'Itinerary' of Antoninus. Indications of extensive suburbs, especially on the south-west and north-west, exist in the numerous and interesting remains of funeral monuments, coffins, urns, tombs, baths, temples, and villas, which from time to time, and especially in late years, have been brought to light.

For more than a century after the departure of the Romans we have no authentic account of the state of York. Though it lost the pre-eminence it had so long maintained as the different Anglo-Saxon kingdoms rose and flourished, yet it was unquestionably the chief city of the north, and an important bulwark against the incursions of the Picts, from which there is reason to believe that it suffered greatly. When the kingdom of Northumbria was constituted, York became the capital.

The historical notices of York from the foundation of the kingdom of Northumbria to the Norman Conquest are sufficient to show that it continued to be a place of considerable importance. It was the principal royal residence. Here, 'under the lofty walls of York,' says Alouin, Edwin, king of Northumbria, and fifth Bretwalda, was baptised by Paulinus; and here he erected the first metropolitan church. The first Danish invader found it necessary to employ a considerable force in order to make himself master of this bulwark of the north. Edgar, the first sole monarch of England, held, in the year 966, the Witanagemot in this city. Siward the Dane, who was earl of Northumbria in the reign of Edward the Confessor, built a church at York, dedicated to the royal Danish saint Olaf, or Olave, preparatory to his intended foundation of a monastery, and, dying at York, was buried in that church.

Very few Saxon or Danish relics have been discovered at York. An interesting portion of the Saxon church erected by Paulinus, or by Albert, has been brought to light beneath the choir of the present cathedral; and fragments of crosses, or commemorative pillars, and some coffins, both of stone and wood, belonging to the Saxon period, have occasionally been found. The dean and chapter are in possession of a large and beautifully-carved ivory horn, a Danish relic, presented to the church by Ulphus, a Danish chief and friend of Canute, when he endowed it with all his lands.

Although William was crowned in London by Aldred, archbishop of York, the claims of the Conqueror were for a long while strenuously resisted in the north. As soon as the affairs in the south would permit, William took possession of York, built or repaired two castles in it, and strongly garrisoned them with Norman soldiers. Notwithstanding this, Edgar Atheling appeared at York, and was acknowledged king. The citizens, supported by a powerful body of English and Scotch, and a considerable number of Danish auxiliaries, besieged the castles, entered them, and put the garrisons to the sword. During the siege a great part of the city was destroyed by fire. York soon felt the destructive vengeance of the Conqueror, who reduced the whole country of Northumbria to a vast wilderness. In the reign of Stephen, David, king of Scotland, formed the design of seizing York, and for this purpose appeared before it with a powerful army. But this design was frustrated by the great battle of the Standard, in the year 1138. His grandson, Malcolm IV., was summoned to York by Henry II., where he did homage to the English king for Lothian; and according to Kuyghton, in 1171 William, the successor of Malcolm, did homage at York to Henry for 'broad Scotland'; and in token of submission, offered and deposited upon the altar of St. Peter, in the cathedral church, his breastplate, spear, and saddle. The reign of Richard was ushered in by a general massacre of the Jews. It began in London, apparently by accident, but was soon followed in other places, and especially in York, where, it has been computed, not less than 1000 or 1500 of this unhappy race perished. In the last year of King John the northern barons laid siege to York, but retired on receiving from the citizens 1000 marks. In the year 1230 Henry III. kept his Christmas magnificently at York, with Alexander II. of Scotland, the cardinal legate, and a large concourse of nobility. Henry III. with great magnificence observed the festival of Christmas in 1251, when he gave his daughter Margaret in marriage to Alexander III. in the presence of all the peers of the realm, and a great assembly of the nobility of Scotland and of France. In the year 1298 a parliament was summoned to meet at York, and in the following spring the whole English army was mustered there, preparatory to their march into Scotland. The Courts of King's Bench and Exchequer were on this occasion removed to York, where they appear to have remained seven years. Edward II. made York his head-quarters. In 1327 Edward III. kept his Christmas at York, and on the 24th of January was married in the cathedral church to Philippa of Hainault. Three months after he had defeated the French on the plains of Crécy, his queen took the field with forces she had collected together at York against the Scotch, who had invaded England under the conduct of David Bruce. At the battle of Nevill's Cross the Scotch king was taken prisoner, and was afterwards brought to York, whence he was conveyed to the Tower of London.

Richard II. held a parliament at York, and removed thither for a few months the courts of Chancery and King's Bench. The city, having received from him several immunities and privileges, gratefully adhered to him in his adversity, and consequently suffered severely from the vengeance of his successor, Henry IV. The neighbourhood of York was the scene of some of the sanguinary conflicts in the War of the Roses, and the lofty gates of the city exhibited the barbarous spectacle of the heads of Lancasterians and Yorkists alternately. Richard III., while duke of Gloucester, resided much at his favourite castle of Middleham, and soon after his coronation at Westminster visited the city with his queen. Henry VII. came twice to York for the purpose of suppressing insurrections in the north.

The dissolution of the monasteries by Henry VIII. occasioned many insurrections in the north; the most formidable of which was that styled 'the Pilgrimage of Grace.' The insurgents made themselves masters of York, and compelled the archbishop to take the oath and join their party. The first visit of Charles I. to York was on his peaceable progress to Scotland in 1633; his second, six years afterwards, on his hostile expedition against the Scotch. The year 1642

opened with the civil war, and in March the king fixed his headquarters at York, where he was joined by many of the Yorkshire gentry, and several of the peers from London. After a stay of five months he removed to Nottingham. In the beginning of the next year the queen, having landed at Bridlington, proceeded to York, and continued there some time 'with great advantage to the king's cause.' In the month of April, 1644, Sir Thomas Fairfax, commanding the parliamentary forces, joined by the Scotch, invested York, which had been strongly fortified and held out for the king. Several batteries were erected against the city; the suburbs, then very extensive, were set on fire; one of the gates was nearly demolished, and a tower of the abbey of St. Mary, in which the chartularies of many of the northern monasteries had been deposited, was blown up, and many important records were destroyed. After the battle of Marston Moor the city was compelled to open its gates to the Parliamentarians. Many who took part in the rebellion of 1745 were tried and executed at York; and the noble gates were again defiled by a spectacle worthy only of an age of the grossest barbarism.

Among the interesting relics of Eboracum, or of York, under the Romans, are remains or memorials of Roman temples. About the end of the 6th century, Ethelbert, the Saxon king of Kent, was converted to the Christian faith by the preaching of the monk Augustine. Edwin, the fifth Saxon king of Northumbria, and a native, it is said, of York, had married Ethelburga, the daughter of Ethelbert, and, through her influence and the seal of Paulinus, a companion of Augustine, became a convert, and with Coiffi, the heathen priest, and a considerable number of the nobles of his kingdom, was baptized by Paulinus on Easter-day, in the year 627, at York, in the church of St. Peter, which, says Bede, he had hastily constructed of wood while he was a catechumen, and preparing to receive baptism. Soon afterwards, by the advice and with the aid of Paulinus, to whom he had given York as his episcopal see, the king made preparations for building a larger and a nobler church, in the midst of which the oratory that he had previously constructed, and in which he had been baptized, might be included. He laid the foundation and began to raise the edifice; but before the walls were completed he was slain. The work was finished by his successor Oswald; but when he also had fallen, and Paulinus (who during the life of Edwin had received the pallium from Rome, and been elevated to the rank of archbishop of York) had been compelled to retire with Ethelburga into Kent, the church was wholly neglected, and fell into ruins. In the episcopate of the celebrated Albert, who was elected to the see of York in the year 767, a new church was begun, finished, and dedicated; this edifice appears to have been one of the most magnificent of the Anglo-Saxon churches. A small but very interesting portion of this church, comprising a part of the earlier church built by Edwin, was brought to light during the excavation of the present choir, after the calamitous fire in February, 1829.

Archbishop Thomas, who was appointed to the see by William the Conqueror in the year 1070, rebuilt the church, which had been in great part destroyed by fire. From remains of the crypt, discovered in the recent excavation and preserved beneath the floor of the present choir, a good idea may be formed of the grandeur and beauty by which the entire edifice must have been distinguished. Archbishops Roger, Grey, and Thoresby, with other dignitaries, at various periods repaired, altered, and added to the buildings of the cathedral.

York Minster, although wanting the uniformity of a building constructed from a well-arranged plan, is a magnificent structure. Its situation is low and confined; yet its mass, and the grand scale on which every part is constructed, render it an imposing object from whatever point it is viewed. The west front is very grand; the immensity of the structure here appears very striking. The window is an unrivalled specimen of the rich tracery that marks the style of the middle of the 14th century. The lofty towers arising from the western aisles are uniform and very graceful; they are terminated by pinnacles and supported by buttresses, in every part highly enriched. Almost the whole of this front is adorned with a profusion of tracery and sculpture. The south transept is a noble piece of workmanship. Attached to it is a fine porch. The central tower is very fine, but appears hardly high enough compared with the towers at the western end, which are a few feet loftier; it has been supposed that it was intended to be crowned with a lofty spire. The cathedral consists internally of a nave, choir, and Lady chapel, each with its two aisles; north and south transepts, with two aisles, and a lantern in the centre; and a chapter-room, with a vestibule on the north side. The elevation of the north transept presents five tall and very beautiful windows, commonly known as 'the five sisters;' above these are five other lancet windows of varied heights. The south transept is neither so regular nor so finished as the other, though rather richer in the details. The nave is remarkably beautiful, and the aisles are unequalled for grandeur in this kingdom; they are as lofty as those at Westminster, but not so narrow. The east window is about 78 feet high and 30 feet wide. It is divided into compartments, each containing the representation of an historical event: in all about 200 subjects are represented. The singularly elaborate and very interesting screen contains statues of the kings of England from William I. to Henry VI. That of Henry VI. is a modern statue, the original having been removed in the reign of Edward IV. Its place was supplied until

recently by a statue of James I., which was placed in the vacant niche when he visited the minster. Upon this screen now stands the organ, perhaps the finest in the kingdom.

This magnificent cathedral is cruciform, measuring in length from base to base of buttresses east and west about 519 feet, and from base to base of the transepts 249 feet. The internal length east and west is 483 feet, of the transepts 222 feet 6 inches. The internal height of the nave is 93 feet, of the choir 101 feet, of the central tower externally about 198 feet, internally 182 feet 6 inches. The height of the western towers is about 201 feet to the top of the pinnacles, 178 feet 3 inches to the top of the battlement.

The chapter-house is a noble room of an octagonal form, the angular diameter being 60 feet 6 inches, and the height of the central boss from the floor 62 feet 2 inches. The roof is unsupported by any pillar. It has an elegant window in each of seven of its sides, the eighth having corresponding tracery. Under the windows are fifty-four stalls for the canons, the stalls being surmounted with rich crocketed canopies. It has a handsome wooden roof, which was brilliantly painted and gilt by Willemont. The floor is laid with a tessellated pavement.

During the Commonwealth period the interior of the cathedral suffered much injury, and several of the ancient monuments were demolished or mutilated. There are however still many ancient monuments of great beauty and interest. The most important is that of Archbishop Walter Grey, who built the south transept, in which it is placed. This splendid relic of the 13th century consists of two tiers of trefoil arches, supported by eight slender columns, with capitals of luxuriant foliage, sustaining a canopy divided into eight niches, with angular pediments and elaborate finials. On a flat tomb under this canopy is a recumbent effigy of the archbishop in his pontificals.

The earlier cathedrals were successively destroyed by fire: the present Minster has twice within the last thirty years narrowly escaped a similar fate. The first time was on February 2nd, 1829. It was the work of a maniac, Jonathan Martin, who had concealed himself in the Minster the preceding day, Sunday, after prayers. He was soon apprehended and tried, but acquitted on the ground of insanity. He was of course sent to a lunatic asylum, where he died in October, 1838. By this fire the whole of the roof of the choir, 222 feet long, was destroyed, with the woodwork on each side; and the walls above the arches of the choir were so much damaged that it was found necessary to rebuild them; the organ was burnt, and the altar-screen so much injured as to render a new one necessary; the communion plate too was melted. No time was lost in repairing the parts injured; but the restorations were scarcely completed, when another fire occurred, hardly less destructive in its results. A workman who had been employed to repair the clock, with most culpable negligence left his candle burning when he quitted his work. This was on the evening of May 20th, 1840, and by nine o'clock the south-western tower, in which he had been employed, was discovered to be in flames. By twelve o'clock the south-western tower, with its fine peal of bells, was destroyed, and the whole of the roof of the nave had fallen in. The progress of the flames was on both occasions checked by the great central tower. The parts destroyed were reconstructed under the direction of Sir Robert Smirke, at a cost of above 100,000*l.*, and the opportunity was taken to remove many irregularities and incongruities which in the course of time had to a certain extent been allowed to deface the noble edifice. The whole is now undoubtedly in a far more perfect state than it has been for centuries.

In replacing the various fittings of the Minster a new peal of 12 bells of large size and fine tone, presented to the Minster by the late Dr. Beckwith, was substituted for the old peal of 10 bells. A new great bell was also cast for the cathedral by Mr. Mears, of London, at whose foundry the peal was cast, and paid for by subscription. This is the largest bell in the kingdom, weighing 11½ tons, and exceeding by four tons Great Tom of Oxford, previously the largest.

The palace of the archbishop was anciently on the north side of the cathedral. Archbishop Roger is said to have rebuilt it towards the end of the 12th century, and a small portion of his work is still remaining, as is the chapel of the palace, of a later date. This elegant building, having been long an unsightly ruin, was repaired in the time of Dean Markham, and is now used as the library of the dean and chapter. Near it is the new deanery.

No establishment of regular monks is known to have existed at York prior to the Norman conquest. Shortly before that event Siward, the Danish earl of Northumberland, laid the foundation of a monastery near the walls of York; but the building did not advance beyond the erection of the church; and the foundation was laid anew, and a great part of the monastery completed, by William Rufus. It was dedicated to 'The Blessed Virgin Mary.' About the end of the 13th century the church and a great part of the monastery were rebuilt; but several portions of the original structure still remain. During the government of the third abbot, Gaufridus, in 1131, thirteen of the monks, desirous of adopting the Cistercian rule, seceded, and founded the abbey of Fountains near Ripon. William Thornton, the last abbot, surrendered to the king, November 29th, 1540, when there were in the monastery fifty monks, including the abbot, prior, and sub-prior, and one novice. The clear annual value was reckoned to be 1650*l.* 0*s.* 7*d.* The abbot enjoyed the dignity of the mitre, and was

south-south-east, and forming the northern slope of the most extensive valley in England, that of the Ouse and Trent. The high land on the eastern boundary of this valley, extending from the Tees to the Humber, forms, as has been previously stated, a bold coast-line, from which, in the northern part of the county, the surface rises, in some parts very suddenly, to a great elevation. In the description of this valley and its boundaries in the 'Physical and Political Geography of Great Britain,' in the 'Library of Useful Knowledge,' it is observed that south of the estuary of the Tees we find the commencement of the high lands which in some places stretch inwards to a distance of from 20 to 30 miles from the coast—in Barnaby Moor, which has an elevation of 784 feet; in the trigonometrical station of Burleigh Moor; and, a little farther south, in the Guisborough Hills. These high lands run down to the sea-coast at Huntcliff, and also by the Easington Heights, about midway between the Tees and Whitby, where is a trigonometrical station at an elevation of 681 feet, to Rodcliff, or Rockliff, a little farther south. A small depression in the high moors, opening to the sea at Whitby, carries off the drainage of the small valley of the Esk, which runs between the Guisborough Hills and the elevated Egton Moors, which lie south of it. These form part of a series of barren elevations which extend from the bold and lofty coast south of Whitby to within about 5 miles of Northallerton, a distance of about 30 miles from the coast. The whole tract of the Eastern Moorlands, extending about 30 miles from east to west, and 15 miles from north to south, is a wild and mountainous district, intersected by numerous picturesque and fertile valleys. North of Northallerton, where the scarped extremity of the high lands turns eastward, it overlooks the vale of Cleveland, which slopes down to the Tees. On the various roads which intersect the district extensive and dreary wastes present themselves, with no boundary but the horizon; but towards the northern and western escarpments of the moorlands there are some very beautiful prospects. Among the most elevated points of this mountainous region are the trigonometrical stations of Botton Head (1435 feet), Loosehoe Hill (1404 feet), and Black Hambleton, on the western escarpment (1246 feet). Another remarkable summit, which is celebrated as a landmark, and as commanding a most extensive and beautiful view, is the mountain called Roseberry Topping, the height of which is given by Greenough as 1102 feet, near the road from Guisborough to Stokesley, on the northern escarpment of the high lands.

The valley of the Derwent, which descends from near the sea-coast in the neighbourhood of Scarborough, and, inclining towards the south-west, falls into the valley of the Ouse, separates the Eastern Moorlands from the Yorkshire Wolds, which form the continuation of the high lands on the east side of the valley of the Ouse. The ascent of the Wolds, except on their eastern side, is generally steep, but they seldom rise to an elevation exceeding 600 feet, and they are broken and divided by many deep winding valleys. Although their southern extremity presents the finest prospects, there are many points on the range from which beautiful views may be obtained of the Vale of York, the low grounds between the Wolds and Spurn Head, and the Valley of the Derwent, beyond which the Eastern Moorlands rise in the back ground. The peninsular district of Holderness is agreeably diversified in surface, especially towards the sea-coast, within a short distance of which, close to the town of Hornsea, is the largest lake of the county, called Hornsea Mere, about a mile and three quarters long, and three quarters of a mile broad at the widest part. The western side of Holderness is distinguished by a fenny district known by the provincial name of 'The Cars,' which extends nearly 20 miles from north to south, with an average breadth of about four miles. As noticed in a previous column, considerable portions of land have been reclaimed from the Humber, and among them may be named the Holderness drainage, comprising upwards of 11,000 acres, the Beverley and Barstow drainage, and the Keyingham drainage, comprising about 5500 acres. In addition to the great extent of fertile land added to the county by these and several other extensive drainages, the high prices of agricultural produce in this country have led to a great extension of cultivation on the Wolds, which, until about the close of the 18th century, were little better than a large rabbit-warren.

On the western side of the great valley of the Ouse lie the Western Moorlands of Yorkshire, the general elevation of which is much greater than that of the Eastern Moorlands. These form part of the irregular tract of high land called the Pennine Chain, which, extending southward to the Derbyshire and Staffordshire hills, forms the great moorland district of England. The highest point of the Pennine Chain is at Cross Fell, a few miles north-west of the north-western angle of the county, where it joins Westmorland and Durham, and approaches within 3 or 4 miles of Cumberland; and from a little south of this point, which has an elevation of 2901 feet, is a ridge nearly coincident with the county boundary, with a steep escarpment towards the eastern side of the valley of the Eden. South of this point the Cumbrian Mountains join the western side of the great Pennine range, the high lands of which, in its further progress towards the south, sometimes spread out into extensive moors, sometimes present rounded mountain-tops, and in other places consist of a confused heap of rocky mountains, interspersed with numerous narrow valleys, which afford scenery of the most romantic and

picturesque character. This portion of the range, which occupies the north-western extremity of the West Riding, forms the western portion of the wild district of Craven, and comprises, among its more elevated summits, those of Wharfedale, or Wharfedale, near the junction of the counties of York, Westmorland, and Lancashire, with an elevation of 2384 feet, according to the Ordnance Survey; Ingleborough, a little farther south, 2361 feet; Penyghent, or Pennigant, rather more to the east, about 2270 feet; a second mountain, distinguished as the Great Wharfedale, near Kettlewell, and still more to the east, 2263 feet; Bow Fell, near Sedburgh, a few miles north of the first-mentioned Wharfedale, 2911 feet high, an elevation considerably greater than that of any other mountain in this part of the county; and Cam Fell, between the two Wharfedales, 2245 feet high. The valleys of this district, the most extensive of which are Netherdale, or Netherdale, the valley of the river Nidd, Wharfedale, and Airedale, are so well wooded, cultivated, and studded with villages, as to present a beautiful appearance from the adjacent heights; and the picturesque character of the district, the roads of which afford some of the finest scenery in the country, is heightened by numerous small lakes, one of the principal of which is Malham Water, or Malham Tarn, 6 or 7 miles east by north of the town of Settle, which is about a mile in diameter, and is situated upon the summit of an elevated moor. Though the general direction of the great range of mountains which occupies the western side of the county, and which is sometimes styled 'the back-bone of England,' is from north to south, it does not consist of a single ridge, but rather of several ranges, which, though very irregular in their disposition, mostly form small angles with the main direction of the mountain-range, thereby forming numerous long and narrow valleys, with a general direction from north to south. This hilly district forms a kind of natural boundary between Yorkshire and Lancashire, and presents great difficulties in the construction of canals or railways, rendering necessary the execution of some extraordinary and costly works.

The Valley of the Ouse, or the Vale of York, commences very near the river Tees, on the northern boundary of the county, the basin of that river being separated from that of the Wiske, one of the affluents of the Ouse, by a narrow ridge of small elevation; and, occupying the centre of the county, it extends southward to its opposite boundary. With the tributary valley of the Aire, which stretches westward about as far as Halifax, the breadth of this valley is about 50 miles; while the Don, which joins the Aire near Snaith, drains a continuation of the valley towards the south-west to the very extremity of the county, between 30 and 40 miles from the confluence of the Ouse and Trent, and about 45 miles in a direct line from York. The northern part of this valley has a gentle slope towards the south, with the level surface broken by several bold swells; but south of the city of York the surface sinks into a perfect flat, and is in several parts marshy, especially along the course of the Ouse. The monotony of the level is only broken by low sandy hills, seldom rising to an elevation of more than 50 feet above the level of the sea, and which are found principally near the course of the Don, in the vicinity of Snaith, Thorne, and Doncaster; and, owing to the extraordinary flatness of the country, the rivers Ouse, Aire, and Don have frequently altered their course. That portion of the valley which lies immediately about the lower part of the Ouse, and between it and the Wolds which separate the valley from the Holderness district, is called 'The Levels;' and though fertile and pretty thickly inhabited, it is entirely flat. Farther south, towards Sheffield, and on the western side of the valley, the surface is diversified by the hills which gradually rise towards the mountainous district.

Hydrography and Communications.—The description of the great valley of the Ouse and its principal tributaries will give a general idea of the position of the rivers of this county. The drainage of the extensive tract which supplies the waters of the Ouse tends towards the point where the Aire unites with the Ouse at Armin, about 20 miles S.S.E. in a straight line from the city of York, and to this point converge a great number of small rivers, commencing in the south-west with the Rother, which flows from the border of the county near Rotherham, and embracing the numerous rivers which descend along the valleys of the high lands on the west of the county, and those which flow through almost the whole of the western and northern districts, as well as the drainage of the totally distinct high lands on the north-east, which finds its way into the course of the Derwent. In the article TRENT AND HUMBER the leading features of the great basin, of which this forms a part, are more fully described. It is computed that the drainage of about seven-ninths of the total area of Yorkshire, or about 4500 square miles, runs into the basin of the Humber; and, with the exception of the district between the Wolds and the sea, the whole of this district pours its waters into the Ouse.

The Ouse, which is sometimes called, to distinguish it from other rivers of the same name, the Northern Ouse, is formed mainly by the union of the Ure or Yore and the Swale. The total length of this stream may be estimated at from 130 to 135 miles, whether we reckon from the source of the Swale or from that of the Ure.

The Ure rises in the high mountains at the western extremity of the North Riding, near the border of Westmorland, and flows first towards the south-east, and then eastward, near Hawes and Askrigg, along Yoredale and Wensleydale to Middleham, receiving in its course

several small tributaries on each side. A little below Askrigg the Ure falls over a succession of limestone rocks, forming what is called the Aysgarth Force. Below Middleham it is joined on the south by the Cover, a stream which rises at the head of the long narrow valley of Coverdale; and shortly afterwards it flows past Masham, a few miles below which place it reaches the boundary-line between the North and West Ridings, and receives on the right side the small river Binn. It then pursues a very irregular course by Tanfield to Ripon, where it receives on the right the united streams of the Skell and the Laver. At Ripon the Ure quits the boundary-line and enters the West Riding, but it rejoins the boundary near Boroughbridge, and passes by that place and Aldborough to the junction of the Swale. The united stream—which, according to different authorities, may at this part be called either the Ure, the Swale, or the Ouse—continues in an irregular course to the south-east, forming the boundary of the North Riding as far as York, receiving the Linton with its tributaries on the left, and the much more important river Nidd on the right side. At York the Ouse receives the river Foss on the left side, and from that city to near Cawood its course runs southward, a little inclining to the west. Near Nun-Appleton, a little above Cawood, it receives on the right side the Wharfe, and in the remaining part of its course the Ouse constitutes the boundary between the East and West Ridings. Inclining now to the south-east, it pursues a very irregular course by Cawood and Selby, and, after receiving successively the Derwent on the left, and the Aire with its tributaries on the right side, it pursues a very tortuous course near Howden; and by the newly-formed port of Goole, where it is joined by the Dutch River, or River Dunn Navigation, to the confluence with the Trent at Faxfleet, whence the united stream, under the name of the Humber, pursues an eastern course to the ocean. [TRENT AND HUMBER.] The Ouse and its principal northern tributaries have been the subject of several Acts for the improvement of the navigation.

The *Swale* is formed principally of two streams, which, rising respectively near two hills called the Lady's Pillar and Shunnon Fell, flow in an easterly direction along the opposite sides of the high ground called the Water Crag, which has an elevation of 2180 feet, until, the first-mentioned and principal branch having turned to the south, after flowing through the valley called Swale-Dale, they unite at Muker. From Muker the river has an irregular course towards the east past Reeth to Richmond, below which its course inclines somewhat to the south, and it receives, together with several minor streams, the river Gilling on the left side. Not far from Northallerton it receives on the right the Bedalebeck, or Bedale River; and farther south, in the latitude of Thirsk, it is joined on the left by the Wike, a stream which rises near Osmotherley, on the west escarpment of the Eastern Moorlands. From this point the course of the Swale, though very tortuous, continues in a south-south-east direction to its junction with the Ure, receiving in its course on the left side two considerable streams which descend from the Hambleton Hills, on the escarpment of the Eastern Moorlands, the northern and most important of which flows by Thirsk, and is called the Codbeck.

The *Nidd* rises about 3 miles N.E. from Kettlewell, on the adjacent mountains called the Great Wharfedale and Black Fell, and after flowing eastward to Bleasfield Scar, it enters the earth by a wide and rocky cavern called Goydon-Pot-Hole. It reappears about two miles south of that point by two issues, the streams of which shortly unite, and then, after receiving the Stone, a little river which rises in Netherdale Forest, very near the source of the Nidd itself, the river takes a tolerably direct course towards the south-east to Pateley Bridge. It then inclines more to the east, and descends along the slope of the Western Moorlands, by Ripley and Knaresborough to Colthorpe, whence its general direction is north-east to the Ouse at Nun Monkton.

The *Wharfe*, the next tributary on the same side of the river Ouse, and which is one of the most beautiful streams in the island, rises also in the Western Moorlands, very near the source of the Ribbles. The main stream, rising about three miles north of the Pennine Mountain, flows eastward through Langstrath-dale or Langstrath-dale to Buckden, very near the border of the North Riding, where it turns nearly due south along Kettle-dale, passing Kettlewell, near which place it receives a considerable tributary. After pursuing the same direction to Grassington the river becomes very tortuous, but inclines generally to the south-east, by Barden Tower and Bolton Abbey, where it forms the main feature of several miles of scenery of surpassing beauty. A short distance below Barden Tower the stream rushes with great impetuosity through a narrow passage in the rocks, and forms a remarkably picturesque object. This chasm, known as the 'Strid,' is only about six feet wide. It is the scene of a legend which forms the subject of poems by Wordsworth and Rogers. One of the small tributaries of the Wharfe forms a picturesque waterfall in Bolton Park, not far from the Strid. From Bolton Abbey the Wharfe flows south-east to Ilkley, near Rommell's Moor, whence it turns east by Otley and Harewood to Wetherby. From Wetherby the Wharfe inclines more to the south-east, and passing by Tadcaster, up to which place it is navigable, joins the Ouse at Nun-Appleton, a little above Cawood.

The source of the *Aire*, Air, or Are, is in Malham Tarn or Water, 5 or 6 miles E. by N. from the town of Settle, in the district of Craven,

among the Western Moorlands; but for about a mile south from this lake the stream runs underground, and reappears at the base of a perpendicular rock 286 feet high, which forms the centre of a romantic amphitheatre of limestone rocks called 'Malham Cove.' The course of the Aire, and of those subsidiary streams which unite with it in the upper part of its course, is generally towards the south for a few miles, until near Gargrave it is crossed by the Leeds and Liverpool Canal, which passes over it by a large aqueduct at an elevation of about 414 feet from the sea at low water, and which from that point follows the valley of the Aire to Leeds, and the levels of which, hereafter noticed, will give some idea of the descent of the valley. From Gargrave the general course of the river is south-east, passing to the south-west of Skipton, Rumbold's or Rommell's Moor, and Bingley, east of Keighley, and north of Bradford, along the picturesque valley of Alredale, to Leeds, passing in its course the ruins of Kirkstall Abbey. At Leeds the canal terminates, the river itself being made navigable below that town. It proceeds in the same direction from that town to Castleford, where it receives the Calder from the west, and from which point it pursues a very irregular course, the main direction of which is nearly due east, but inclining a little to the south, by Knottingley, Ferrybridge, and Kellington, to Snaith, a little below which town it receives the Don from the south, and from this junction it runs east by north for 5 or 6 miles (direct distance) to its junction with the Ouse at Aspley Island, near Armin, or Airmin, a little to the south-west of Howden. The improvement of the Aire, with its important tributary the Calder, for the purposes of navigation, forms an important feature in the history of this class of improvements, these rivers having been made navigable under the powers of an Act passed in 1699 (10 and 11 Will. III., c. 19), upwards of half a century prior to the date of any enactment for a canal navigation. As before intimated, the Aire is not navigable above Leeds; but under the powers of the Act referred to, the navigation was formed from that town to the junction with the Calder, a distance of 11½ miles, in which there is a fall of 43½ feet, effected by six locks, and also from the junction of the two rivers to Weeland, a farther distance of 18½ miles, with a fall of 34½ feet, by four locks, making a total navigable length of about 30 miles, with which several short connections have been formed by private canals and railroads extending to quarries and collieries in the vicinity. [CALDER RIVER.]

The *Don*, or *Dun*, rises near Salterbrook, upon the high ground called Snealsden or Snailsden Pike, near the border of Cheshire, and pursues an easterly course to Penistone, then turns south-east towards Sheffield, receiving on its way the Little Don, the Ewden Brook, and the Loxley River. At Sheffield the Don is joined by the Sheaf or Sheaf, which rises in the Derbyshire Mountains, and runs north-north-east, skirting the boundary of the county for a short distance, and receiving another small stream from the highlands to the west. From Sheffield the Don runs north-east by Rotherham and Doncaster to Thorne, when it turns north, and runs to the Aire just below Snaith. The principal tributaries received along this part of its course are the Rother, which rises in Derbyshire [DERBYSHIRE], enters Yorkshire a few miles south of Rotherham, and joins the Don at that town; the Dearn, or Darn, the longest branch of which rises at the hill called Denby Moor, to the north of Penistone; a stream of considerable length which descends from Hemsworth, Kirkby, and Clayton in the Clay, and flows westward to the Don at Barsley; and the Went, which originates in the last slope of the high lands on the west of the Ouse Valley, and flows by Wentbridge and Kirk-Smeaton to the Don about midway between Thorne and its junction with the Aire. The navigation of the Don or Dun commences at Tinsley, south-west of Rotherham, at which point the river is joined by the Sheffield Canal, a separate undertaking, though forming part of the same extended line of communication; but in many parts below that point a navigation is effected by artificial cuts to avoid bends and difficulties in the bed of the river. The first Act for this navigation was passed in 1726, and there have since been several others, of which that of 1826 empowered the company of proprietors to make very extensive improvements by new cuts and other works. The portion of navigation from Tinsley to Doncaster, which by the old course was 21 miles long, is thus reduced to 18 miles, with a fall of 67½ feet by 11 locks. Similar improvements have been effected in other parts of the navigation, and the total length of the improved Don navigation is about 39 miles, with a total rise from the low-water mark in the Dutch River of 92½ feet, effected by 16 locks. This navigation is of very great importance for exporting the produce of the extensive coal- and iron-works which abound at its western extremity, as well as the vast quantity of manufactured iron goods and cutlery produced in Sheffield and its neighbourhood. The trade of Rotherham, the limestone and plaster at Sprotborough and other places on the line, and the agricultural produce of the neighbourhood of Doncaster, also constitute considerable branches of traffic; while the imports embrace every article required for the supply of an extensive and populous manufacturing district.

The rivers which join the Ouse on the north-eastern side are far less numerous and important than those on the south-west. The *Linton*, which joins it near Newton-upon-Ouse, and which is the first of any consequence below the junction of the Ure and the Swale, rises on the Howardian Hills, a little north of Easingwold, and flows

south-west to near Alna, where it receives another small stream from the south of Easingwold, and one on the opposite side from the lower ground of the Vale of York. Its principal tributary rises a few miles north of York, near the river Foss, and runs first north and then west through the tract called Galtres Forest.

The *Foss* rises near Newbergh Hall, about 4 miles N. from Easingwold, then crosses Oulstone Moor, where is a reservoir for supplying the navigation in dry seasons, and passing towards the south-east, reaches Sheriff Hutton Bridge, from which point it has been made navigable by the aid of a cut of about 2 miles, to avoid a considerable bend, for a distance of 12½ miles, with a fall of 47 feet 8 inches to the level of the Ouse in its ordinary summer state. The lower part of its course is to the south, with a slight inclination westward, and after passing through the eastern quarter of the city of York, it falls into the Ouse on the south side of the castle.

The *Derwent*, which is the only important stream descending from the highlands on the eastern side of the county, rises near the Flaak Inn, about 3 miles S.W. from Robin Hood's Bay, in the Eastern Moorlands. From this point it runs nearly parallel with the coast in a southern direction, with a very tortuous course, to the Vale of Pickering, receiving several tributaries from the west, from Harwood-Dale, Long-Dale, Deep-Dale, and Trout's-Dale. Near Ganton it is joined by the Hertford or Hartford, which rises very near the coast at Filey Point, and the Derwent then runs westward along the valley which separates the Eastern Moorlands from the Yorkshire Wolds, to Yedingham Bridge, below which it is navigable for barges, and its course becomes south-west, and at length nearly due south. Below Yedingham or Yeddingham, the Derwent is greatly augmented by the waters of the Rye. From the junction of the Rye, which gives name to the wapentake of Ryedale, the Derwent flows by New Malton through a beautifully diversified district, past the ruins of Kirkham Abbey, by Stamford Bridge, to East Cottingham, where it receives the Pocklington Canal from the north-east, by Bubwith and Wreath, to its junction with the Ouse at Barnby, about 7 miles below Selby. The navigation is the property of Earl Fitzwilliam, and extended originally to New Malton, about 38 miles. The additional length of nearly 11½ miles to Yedingham Bridge was made navigable in 1805.

The *Hull* rises at the eastern foot of the Wolds, in the East Riding, about 3 miles W. by N. from Great Driffield, and flows south-east to near Frodingham, where it receives the Old How Drain, which rises near the sea-coast, a little north of Hornsea. From the junction the Hull runs southward to the Humber at Kington-upon-Hull, to which town it gives the name by which it is most familiarly known. The Hull is navigable from the junction of its two principal feeders, the upper part of the navigation being effected by an artificial channel, and it communicates with the Driffield, Leven, and Beverley canals. This river drains the greater part of the country which is cut off from the valley of the Ouse by the Wolds: but the northern portion of that district drains into a small stream which rises near Wharram-le-Street, and follows the course of the northern range of the Wolds, partly by a subterranean channel, to the sea near Bridlington; and a part of the southern extremity of Holderness drains into an independent stream which flows by Hedon into the Humber.

The *Est*, with its numerous tributaries, drains the northern portion of the Eastern Moorlands. It rises about 20 miles in a straight line west from Whitby, and, collecting the streams from several dales which run at right angles or nearly so to its course, flows eastward through the narrow but beautiful valley of Eskdale to the sea at Whitby.

The *Torne* rises in the neighbourhood of Tickhill, near the south-east boundary of the county, and flows in a very irregular course to the north-east, being separated from the valley of the Don by the intervention of some comparatively high ground. After meandering through the low levels in the vicinity of Hatfield Chace, it joins the county boundary near the Stainforth and Keadby Canal, and for the remainder of its course to the Trent, which it joins just before its confluence with the Ouse, this stream forms the boundary between Yorkshire and Lincolnshire.

The *Ribble* rises in the north-western extremity of the West Riding, and flows first to the west past Cam Hill, and then to the south by Horton, Settle, and near Long Preston and Gisburn, to the county boundary at Grindlston. It turns towards the south-west above Gisburn, and continues in that direction along the border of the county for a few miles, past Clitheroe, until the boundary turns northward, while the Ribble pursues its former direction through Lancashire. [LANCASHIRE.]

The *Tees* joins the county boundary at its north-western extremity, at the junction of Yorkshire, Westmorland, and Durham, in the Lune Forest, and it continues to form the boundary between Yorkshire and Durham for the whole of its course from that point to the sea. This river being fully described under DURHAM, it is sufficient here to notice its principal tributaries on the Yorkshire side, which are as follows:—The *Lune*, which rises near the border of Westmorland, and flows north-east through Lune Forest to the Tees, a little below Middleton. The *Bander*, which flows in the same direction, and enters the Tees about midway between the junction of the Lune and Barnard Castle, passing in its course those hills in Stainmoor Forest which, in common with the heights near Robin Hood's Bay, bear the name of Robin

Hood's Butta. The *Greta* River or Beck, sometimes called the Barney, the longest branch of which rises in Westmorland, but which, though very winding, pursues the same general course towards the north-east, the river being the centre of the beautiful scenery about Greta Bridge to the Tees: the junction of the two rivers forms a remarkably picturesque scene. The *Leaven*, which collects the waters of numerous rivulets from the north-western escarpment of the Eastern Moorlands, and of the Tame from the Vale of Cleveland, and, flowing westward by Stokesley to Rudby, thence turns north by a winding course to the Tees below Yarm.

Other streams which rise in this county, but soon cross the boundary into the adjacent counties, are of little importance; the chief are:—the *Blythe*, which rises to the east of Rotherham, flows westward into Lincolnshire, and there joins the Idle; the *Tame*, a tributary of the Mersey, which leaves Yorkshire at its junction with Cheshire and Lancashire; the *Wenning*, a tributary of the Lune of Westmorland and Lancashire, which rises north-west of Settle, and flows westward into Lancashire; the *Greta*, being a second rivulet of that name, which rises at two points near Wharfedale, the streams from the two sources flowing southward toward Ingleton, where they unite, and turn westward across the county boundary to the Lune, a short distance north of the Wenning; the *Dee*, which rises north-east of Wharfedale, flows west-by-north along Dentdale to Sedburgh, beyond which place it turns west-by-south, and, after forming the county boundary for a short distance, enters the Lune in Westmorland; and the *Rother*, the second river in the county of that name, which rises on the north-west boundary, near the sources of the Eden, flows first north-west along the boundary of Westmorland, and then turns southward by the Calf and Cautley Crag and the hill called Serker to Sedburgh, where it receives a stream which flows westward through Garsdale, and below which place it joins the Dee.

Canals.—The North Riding of Yorkshire is almost entirely destitute of either artificial canals or navigable rivers, and the canals of the East Riding are few and unimportant; but the West Riding is peculiarly rich in this species of communication, while the exceedingly difficult character of the country through which the principal canals are conducted has rendered necessary the construction of engineering works of astonishing boldness and magnitude, in order to effect navigable communications between the eastern and western sides of the island, across the central mountain chain on the Lancashire side of this county. Of the formidable nature of the difficulties to be overcome some idea may be formed from an examination of the section given by Priestley of the inland navigation between the ports of Liverpool, Goole, and Hull, by the river Mersey, the Duke of Bridgewater's and Rochdale canals, the Calder and Hebble and Aire and Calder navigations, and the rivers Ouse and Humber, a distance of 158½ miles by that route. Commencing along the tideway of the Mersey, the level is suddenly raised by locks at Runcorn to an elevation of about 90 feet above the level of the Mersey at Liverpool. The next material rise takes place beyond Manchester, on the Rochdale Canal, which, in a distance of 17 or 18 miles, rises to the summit-level near Stansfield, at an elevation of 600 feet above low-water mark on the Mersey at Liverpool, or 610½ feet above the sea at low water. From this point, which is about 60 miles by the navigation from Liverpool, and a very short distance west of the western boundary of Yorkshire, the level of the canal falls very suddenly to Todmorden, and after entering Yorkshire continues to descend, until, at the junction with the Calder and Hebble Navigation, about 73 miles from Liverpool, the elevation is only about 250 feet. From this point the descent, though far less rapid, continues considerable until arriving at the junction of the Calder and Hebble and Aire and Calder navigations at Wakefield, while the total fall in the remaining distance of about 62 miles to Hull is only about 70 feet. Other lines of water-communication from the Irish Sea to the German Ocean are formed by the more circuitous route of the Leeds and Liverpool Canal with the Aire and Calder Navigation, and by the more direct cut of the Ashton-under-Lyne and Huddersfield canals, which communicate with the Calder and Hebble Navigation through Sir John Ramsden's Canal. For convenience of reference, we notice the principal canals of Yorkshire in alphabetical order.

The Aire and Calder Navigation has been sufficiently noticed in the article CALDER, and in a previous part of this article. The Barnsley Canal commences in the Calder, a little below Wakefield Bridge and the junction of the Calder and Hebble Navigation, and proceeds southward for about 10 miles. It then turns westward, and after crossing the river Dearne by a stone aqueduct and forming a junction with the Dearne and Dove Canal, passes Barnsley and extends to Barnby Basin, in the township of Cawthorne, where it communicates with a railway from the Silkstone collieries. Its total length is 15½ miles. Beverley Beck is a short canal, or creek, connecting Beverley with the river Hull. The Bradford Canal is a cut of about 3 miles from the Leeds and Liverpool Canal southward to the town of Bradford. It is very useful for exporting paving-stone, coal, and iron.

The Calder and Hebble Navigation, a considerable portion of which consists of artificial cuts, is noticed under the river CALDER. The Chesterfield Canal, which belongs chiefly to NOTTINGHAMSHIRE and DERBYSHIRE, crosses the southern extremity of Yorkshire between Shire Oaks and the village of Wales, near which there is a tunnel of

2850 yards upon the summit level of the canal. The Dearne and Dove Canal commences at Swinton, in a side-cut which forms part of the Don or Dun Navigation, and proceeds north-west to the aqueduct for conducting the Barnsley Canal across the river Dearne, near Barnsley, a distance of $9\frac{1}{2}$ miles. It has a branch of 2 miles to Worsborough, which communicates by a railway with extensive collieries near Stainborough Hall; and there is also a branch canal of $2\frac{1}{2}$ miles, belonging to Earl Fitzwilliam, to the Elsecar iron-works. The Derwent River Navigation is sufficiently noticed in the account of the river in a previous column. The Driffeld Navigation commences in the river Hull, at Aike Beck Mouth, about $4\frac{1}{2}$ miles N. from Beverley, and half a mile N. from the junction of the Leven Canal. For a distance of $5\frac{1}{2}$ miles northward the navigation is chiefly in the natural bed of the river, and it extends a short distance up Frodingham Beck, the chief feeder of the Hull, which has a short private cut to Foston Mills; but a little north of the junction of Frodingham Beck with the Hull the canal proceeds by an artificial cut of nearly $5\frac{1}{2}$ miles, partly parallel with the Hull, to Driffeld on the north-west. The Don or Dun River Navigation is described already under the river *Don*; so likewise is the Foss Navigation under the river *Foss*. The Hedon Haven Navigation, from the Humber to Hedon, in the promontory of Holderness, is simply a natural creek or stream improved for the purpose of navigation. The Huddersfield Canal is one of the most stupendous works of the kind, considering its limited extent, ever executed. This canal, which is fitted for small craft 7 feet wide, and is capable of admitting boats of 24 tons burden, commences on the south of the town of Huddersfield, and takes a south-west direction by Slaithwaite, being nearly parallel to one of the branches of the river Colne, a tributary of the Calder, which it crosses by aqueducts in three places. Approaching Marsden in the same direction, it rises 436 feet by 42 locks, and thereby attains its summit level, which is rather more than 656 feet above the level of the sea at low water, and higher than any other canal in the kingdom. This level it maintains for a distance of 4 miles, of which a distance of 5451 yards, or more than 3 miles, is in a tunnel under the mountain ridge generally called Standedge. As there is no towing-path, the boats are hauled through this tunnel by manual labour in about 1 hour and 20 minutes. Emerging from the tunnel at Diggles, the canal pursues the same direction by Saddleworth along the valley of the Tame, which river it crosses several times, and after running parallel with the boundary of Lancashire for some miles, it turns westward near Dukinfield, and passes for a very short distance through that county to its junction with the Ashton Canal. Its total length is $19\frac{1}{2}$ miles. By this means a water-communication is obtained between the eastern and western shores of the island. The Hull and Leven Canal extends about three miles eastward from the river Hull to Leven, for the conveyance of lime, manure, corn, and other produce. The Knottingley and Goole Canal, forming part of the Aire and Calder Navigation, has been already described.

The Leeds and Liverpool Canal, which is partly described under *LANCASHIRE*, commences at the north-western termination of the Aire and Calder Navigation at Leeds Bridge, proceeds a short distance along the river Aire, and then enters an artificial channel, which pursues a north-western course to Shipley, where it receives the Bradford Canal. From Shipley it proceeds westward to New Mill, where it crosses the Aire by an extensive aqueduct; after which, to the neighbourhood of Gargrave, it continues a winding course to the north-west along the northern bank of the river. At Bingley, a short distance beyond the New Mill aqueduct, the canal rises suddenly by a series of locks a height of 88 feet 8 inches, and thereby attains a level which extends for 18 miles without a lock. Beyond Gargrave the canal turns south-west, crosses the Aire again by a large aqueduct, and runs southward across the Craven Moors, attaining at the summit-level at Greenberfield an elevation of 411 feet 4 inches above the Aire at Leeds, and about 500 feet above the level of the sea at low water. On the summit-level it receives a branch from limestone-quarries at Rainhill Rock; and this level continues beyond the point where the canal enters Lancashire at Foulridge, near Colne. The length from Leeds to the summit-lock at Greenberfield is 41 miles. This great undertaking was 46 years in progress, and was not completed so as to allow vessels to pass from Leeds to Liverpool until 1816. The Market Weighton Canal is important both for the purposes of navigation and the drainage of the low levels through which it is conducted. It commences at a point called New River Head, near Market Weighton, in the East Riding, and pursues a nearly straight course to the south, joining the Humber by a sea-lock very near the confluence of the Ouse and Trent, passing through Walling Fen, which contains 20,000 acres of land. The Ouse River Navigation is described among the rivers in a previous page. The Pocklington Canal was formed for the conveyance of coal and lime to, and agricultural produce from, the neighbourhood of Pocklington, in the East Riding, near the Wolds. It commences in the river Derwent, at East Cottingwith, and runs nearly parallel with one of its feeders in a circuitous north-eastern course, to near Pocklington. Its length is about $8\frac{1}{2}$ miles. Sir John Ramsden's Canal commences at the river Calder, at Cooper's Bridge, and runs south-west for about $3\frac{1}{2}$ miles to Huddersfield. In addition to its importance as a link in the communication across the island by the Huddersfield Canal, this navigation has been the chief means of raising the

town of Huddersfield, the greater part of which was built on Sir John Ramsden's property, to its position as one of the principal markets for woollen goods in the county. The Ripon Canal is a short cut parallel with the river Ure, for connecting Ripon with the navigable part of that stream. The Rochdale Canal commences in the Calder and Hebble Navigation, at Sowerby Bridge wharf, near Halifax, and runs west-by-north along the valley of the Calder to Hebden Bridge, where it turns with the river west-by-south, leaving the county near Todmorden, where it enters *LANCASHIRE*. This canal is made of sufficient size to receive vessels capable of navigating the tideways of the Humber and the Mersey. The Selby Canal is a short cut connecting Selby, on the Ouse, with the Aire at West Haddlesey. The Sheffield Canal commences in a cut communicating with the river Don or Dun at Tinsley, and pursues a course of little more than four miles, nearly parallel with the Don, to Sheffield, crossing by an aqueduct over the road from Worksop to Attercliffe. The Stainforth and Keadby Canal commences in the River Don Navigation, near Stainforth, and proceeds eastward by Thorne into Lincolnshire, where it joins the Trent at Keadby, crossing the county boundary near Crowle. Its total length is 15 miles, of which about half is in Yorkshire, and passing through a very flat country, it has no lock, except at its junction with the Trent. The Thanet Canal is a short branch from the Leeds and Liverpool Canal to limestone-quarries near Skipton, formed by the Earl of Thanet under an Act of 1773. The River Ure Navigation is noticed under the river itself, and a part of it also under the title of the Ripon Canal. Nearly all the canals of Yorkshire have been either leased or purchased by the several railway companies.

Roads and Railways.—The great north road from London to Edinburgh, by Goldstream or Berwick, enters Yorkshire from Nottinghamshire at Bawtry, and proceeds in a tolerably direct course to the north, inclining a little westward, by Doncaster, Boroughbridge, and Northallerton, to the border of Durham, near Darlington. A branch leading also to Edinburgh, by Carlisle, leaves this line at Boroughbridge, proceeds nearly parallel with it by Leeming and Catterick, and afterwards turns westward by Greta Bridge, and enters Westmorland near Brough; while another route from London to Edinburgh leaves the first-mentioned road at Ferrybridge, proceeds north to Sherburn and Tadcaster, and then inclines north-west to York, from which city it proceeds north-north-west by Easingwold and Thirsk, and rejoins the direct road a little south of Northallerton. The road to Whitby branches off at York, and runs pretty direct north-north-east through New Malton and Pickering; and from the latter town is a branch to Scarborough. Another branch from the great north road enters Durham at Yarm, near Stockton; and there are numerous other connections with towns in Yorkshire and Durham. The road from London to Hull and Scarborough, through Lincolnshire, enters the county by a ferry across the Humber near Barton, to the west of Hull, and proceeds northward through Beverley and Driffeld, with collateral branches to Bridlington and New Malton. The road from London to Leeds and Ripon enters Yorkshire from Chesterfield a little to the south of Sheffield, and passes through that town, Barnsley, Wakefield, Leeds, Harrogate, and Ripley, to Ripon, in a course nearly due north, and beyond the latter place it inclines north-east, and crosses the great north road to Thirsk. Skipton is approached by a road which extends from Manchester to Clitheroe, and then enters Yorkshire with a north-eastern course, and also by a road from London, through Bedford and Nottingham, which enters the county near the eastern boundary of Derbyshire, and passing by Rotherham, Barnsley, Huddersfield, Halifax, Skipton, and Settle, crosses the northern extremity of Lancashire, and enters Westmorland by Kirkby Lonsdale, whence it is continued to Kendal. Notwithstanding the difficult nature of the country, abundant lines of road have been formed in every direction between the several towns of the woollen district in the West Riding, and also between the West Riding and Lancashire.

Of the railways of Yorkshire it is unnecessary to particularise such as have been formed merely for communication with mines and quarries, for the most part by private individuals, and without parliamentary powers; but one railway of this class is worthy of mention because of the peculiar interest attached to it as one of the first, if not absolutely the first, formed under the powers of an Act of Parliament, as well as being probably the first upon which locomotive engines were regularly employed. This is called Brandling's railway, from the name of its constructor and proprietor, and sometimes, from the collieries with which it communicates, the Middleton railway, and it was formed under an Act granted to Charles Brandling, Esq., and other persons, in the year 1758. It connects the Middleton collieries, about 3 miles to the south of Leeds, with that town; and on this road, about the year 1811, was introduced a kind of locomotive engine patented by Mr. Blenkinsop, which was propelled by a toothed wheel working into a rack-rail.

The Yorkshire passenger railways may be noticed in connection with the companies to which they severally belong:—

1. *London and North-Western.*—This company has taken at a rental dependent on the dividend of the parent line, the Huddersfield and Manchester and the Leeds and Dewsbury railways. The former joins the Sheffield line near Ashton, and terminates at Huddersfield, passing through the 'Back-bone of England' by a tunnel three miles long, close and parallel to the tunnel of the Huddersfield and Manchester

Canal. The Dewsbury railway joins the Lancashire and Yorkshire line near Mirfield.

2. *Midland*.—The Midland line enters Yorkshire a little south-east of Sheffield, and proceeds by way of Normanton and Leeds to Bradford and Skipton, having one or two short branches within the county.

3. *Lancashire and Yorkshire*.—This railway affords remarkable accommodation to the clothing district of the West Riding. The original Manchester and Leeds line entered the county at Todmorden, and proceeded nearly east till it joined the Midland at Normanton; but great additions have since been made to it within this county. Three branches spring out northward from the main line to accommodate Halifax, Bradford, Bowling, Low Moor, and Heckmondwike; another extends south to Huddersfield and Holmfirth; another prolongs the original line east to Pontefract and Goole; and there are several others of minor importance.

4. *Manchester and Sheffield*.—This railway passes through Yorkshire from the Woodhead tunnel, through Penistone and Sheffield to the Nottinghamshire boundary of the county; there is a branch from Penistone to Huddersfield.

5. *Great Northern*.—This company's railway was originally intended to extend to the city of York; but other companies have offered facilities which have stopped it short of that limit. The railway enters Yorkshire between Bawtry and Doncaster, and soon afterwards links itself to several other lines within the county.

6. *York and North Midland*.—This company occupies a wide area in the south-east part of the county. The original line extended from Normanton to York; but there have since been constructed branches from York to Scarborough, from Pickering to Whitby, from Leeds to Hull and Selby, from York to Market Weighton, from Selby to Market Weighton, from Hull to Beverley and Scarborough, from Church Fenton to Harrogate, from York to Knaresborough, and a few small connecting lines with the railways of other companies, all within this county.

7. *York, Newcastle, and Berwick*.—The main line of this company passes through Yorkshire from York to the Tees near Darlington, with branches in Yorkshire to Boroughbridge, to Bedale, to Richmond, and to one or two other places.

8. *Stockton and Darlington*.—A small portion of this company's railway extends along the Tees-mouth shore of Yorkshire, from Middlesbrough to Redcar; partly for passenger traffic, but much more largely for coals.

9. *Leeds Northern*.—This railway extends from Leeds through Harrogate and Ripon to the Tees at Stockton, with a branch from Ripon to Thirsk.

10. *North-Western*.—This railway (which is often called the 'Little' North-Western, to distinguish it from the greater undertaking known by the same name) extends from Skipton north-west to the neighbourhood of Ingleton, and then south-west to Lancaster, thereby completing a line of railway communication from Hull on the east coast to Lancaster on the west.

These railways, from the nature of the country which they traverse, have necessitated the construction of works of extraordinary magnitude and cost. Some of the longest and most difficult tunnels in the country, and very expensive and heavy cuttings and embankments, as well as viaducts and bridges, have called into exercise some of the greatest efforts of engineering skill and constructive ingenuity.

Owing to the abundant railway communication provided between Hull and Liverpool, the traffic of Yorkshire has remarkably increased. Goods from the Baltic and goods for Ireland or for America can be forwarded to Liverpool, and goods for Germany can be forwarded to Hull, with a facility which has made the south of Yorkshire a great highway of traffic.

Geology.—In this great county, which stretches from the eastern to nearly the western coast of England, a great proportion of the stratified rocks of the British series may be advantageously observed: the exhibitions of igneous rocks and mineral veins are of an interesting character; the superficial deposits are extensive and remarkable; the series of ancient organic life is extremely large. The leading physical features of the county are very obviously dependent on its geological structure, and the modifications to which they are subject by the action of the sea and modern atmospheric agencies are various and instructive.

If through the city of York a line be drawn to the north-north-west and south-south-east, it will pass along the centre of a wide continuous vale, rarely elevated more than 100 feet above the sea. Were the general level of the land altered by a depression quite within the limits of well-known instances, this vale would be a sea-channel, bordered by the cliffs of an island on the east, and more slowly rising lands on the west. The district on the west rises to assume a mountainous character along nearly all the western border of Yorkshire; the eastern region is somewhat mountainous in its northern portion, and in the southern rises into a curved range of hills, 'the Wolds,' between the flat district of Holderness and the vale of Pickering.

The elevated western district is based on Palaeozoic rocks; the central vale and the larger part of the eastern districts are formed on the Mesozoic strata; while in Holderness and in other limited tracts are tertiary and diluvial deposits which may be referred to the Cainozoic period.

In the condensed descriptions which follow, the deposits are ranged in the order of their relative position in the earth.

CAINOZOIC DEPOSITS.

Alluvial.

Silt Lands.—The great rivers of Yorkshire which concentrate in the Humber, flow in all their lower parts through vast breadths of fine sediments, left by the rivers or inundations of the sea, and a great portion of this surface is still below the level of spring-tides, and only defended from floods by banks. In the valley of the Aire, at Ferrybridge, hazel-branches partly petrified, and nuts with the kernels changed to calcareous stone, were found in considerable numbers ('Phil. Mag.,' 1828.)

Peat or Turf Moors, at no higher level than the silt lands just noted, occupy extensive areas (Thorne Waste and Hatfield Chase), and in some situations deposits of like nature occur under 20 or more feet of silt. Trees in considerable abundance lie in these deposits, and have been stated to show traces of the axe and marks of fire. (De la Pryme, in 'Phil. Trans.'). In such peat, on Thorne Waste, skeletons of the fallow deer occur, and in one remarkable case the bones were found to have lost their earthy phosphates and carbonates, and by the action of sulphuric acid to have been subsequently converted to leather by the action of tannin on the remaining gelatine. ('Reports of the British Association,' 1831.)

Shelly Marls.—Under the peaty tracts of Holderness, which are of remarkably small extent, lie marls often filled with lacustrine shells; and amongst them rarely the remains of the Irish elk (*Cervus giganteus*) have been found.

Raised Beaches.

The shelly gravels and sands of some tracts near Ridgmont, in Holderness, may possibly deserve this name, but it is more certainly applicable to some shelly sand-beds on the cliffs near Filey, from which several marine shells of existing species have been extracted.

Diluvial Deposits.

Accumulations of local gravel are common in the valleys of most parts of Yorkshire, but over great breadths of the district of Holderness, in some of the oolitic and chalk hills, and in many of the valleys in these formations—over great part of the area of the central Vale of York—in the elevated country between the Swale and the Tees, and in a very few situations in the valley of the Calder, occur abundance of stones of various sizes and qualities, which have been drifted from great distances, even from beyond the limits of the county, especially from the north or north-west. Of these stones some are of a size to arrest attention, and of such a peculiar nature as to be easily referred to the original situation from which they were drifted. Such in particular are the 'erratic blocks' of porphyritic granite, which lie near the surface in many situations in the northern and eastern parts of Yorkshire, on areas which converge to the north-west, and finally terminate in the porphyritic granite fells of Shap, in Westmorland. From that point they were certainly removed across ridges of hills, and great breadths and valleys, as far as Flamborough Head and Scarborough; but whether by force of water when the land was at a lower level or was rising out of the sea, or by icebergs floating on water, or by glaciers moving across the land, or by a combination of these, is perhaps still a problem for discussion. A considerable proportion of small drifted stones lies in a great body of clay which is not stratified, and incloses stones of all sizes, without any arrangement of size, gravity, or mineral quality. Bones of the elephant, hippopotamus, horse, ox, &c., occur in these gravelly and argillaceous deposits, but not frequently, except in valleys where the materials may have been displaced and subjected to fluvial action. (Vale of York; Middleton, On the Wolds, &c.)

Osiferous Deposits.—At Hesale Cliff, flinty gravel, stratified under diluvial clay, contains elephantoid and other remains; at Beilbecks, near Market Weighton, marls which have some drifted gravel below and other gravel above, contain bones of the elephant, rhinoceros, feline, urus, and many other animals, with 13 species of land and fresh-water shells of existing species. Few of the numerous caverns in Yorkshire, which occur in the great limestone districts of the North Riding, have been explored for bones. The Cave of Kirkdale has been rendered famous by Dr. Buckland's descriptions ('Reliquiæ Diluvianæ'), which enumerates more than 20 vertebrated animals among the reliques.

Tertiary.

On the sea-coast, immediately north of Bridlington Quay, green and ferruginous sands enter into the composition of the cliff, and, under favourable conditions of the tide, have been explored with success, and have yielded a considerable number of shells of tertiary date, perhaps of the age of the crag of Suffolk, in which some of the species certainly occur.

MESOZOIC STRATA.

Cretaceous System.

Chalk (500 feet thick).—It constitutes the Wold Hills. This is usually a harder rock than that of the south of England, and the nodular flints which it contains are scattered through a great part of its thickness. The lower part assumes in places a grayer and softer aspect. Fossils occur in the upper part, especially sponges, maras,

rites, and *Behinodermata*, but *Mollusca* and *Conchifera* are less plentiful than in the south of England. The lowest band of the chalk is red, as in Lincolnshire. The chalk is unconformed to all the strata below, resting on each of them in succession in different parts of the Wold edge, as far as the lower beds of the lias.

Speeton Clay (150 feet thick).—This blue argillaceous deposit lies under the chalk, but does not graduate into it. It appears on the coast at Speeton, and inland at Knaption and other points. The organic remains are numerous, different from those in the chalk, and also different from those in the strata below. They appear to have analogies to the gault of the south of England, and also to the Kimmeridge clay; the former analogies perhaps predominate. Some of the shells occur in the 'Neocomian' formations of France, which are supposed to be nearly equivalent to our lower greensand.

Oolitic System.

Kimmeridge Clay.—This occurs along the north side of the Vale of Pickering, and under the escarpment of the Wolds, near Cave. It is not clearly seen in contact with the Speeton clay above, into which it gradually passes. It contains *Ostrea deltoidea*.

Upper Calcareous Grit (60 feet thick).—This is seen on the hills above Wass Bank, and near Pickering. It contains a few fossils.

Coralline Oolite (60 feet thick).—This rock forms generally the uppermost stratum of the ranges of tabular hills which extend from Scarborough to the Hambleton Hills, and then turns southward to Walton and Aoklam. Its oolitic grains are of various sizes, some beds being coarse pisolite. A few bands of chert nodules occur in it, and crystallisations of calc-spar and quartz, and deposits of chalcedony, lie in the cavities left by the decomposition of organic remains. It is not generally durable in buildings. In this rock is situated Kirkdale Cave. Several rivers sink into it, and reappear after long subterranean passages. The organic remains are extremely numerous; the coral bands being local, but characteristic.

Lower Calcareous Grit (80 feet thick).—It forms the edges of the tabular hills above mentioned, and occasionally broad and very poor heath surfaces. Though called calcareous, it has little of carbonate of lime in its composition, and some of the shells which it contains are silicified. Locally it is a good building-stone. The fossils are very numerous, and almost exactly like those of the same rocks in Oxfordshire. *Ammonites vertebralis* is common.

Oxford Clay, or Gray Earth of Scarborough Castle Hill (150 feet thick).—It appears in the steep slope of the escarpments of the tabular hills, under the 'Nab Ends,' and on the breast of the sea-cliffs south of Scarborough. The fossils which it yields are more like those of the calcareous grit than those of the Oxford clay of the south of England.

Kelloways Rock, or Hackness Rock (90 feet thick).—It lies at the base of the tabular hills, and at the foot of the sea-cliffs south of Scarborough. It is more ferruginous than the calcareous grit; is in places somewhat oolitic, and everywhere rich in fossils, such as *Ammonites calloviensis*, *A. sublavie*, *Gryphaea dilatata*, and other shells characteristic of the same rock in Wiltshire, where it is much thinner and of less importance. The Hackness rock has proved a fair building-stone in the museums at York and Scarborough.

Cornbrash (10 feet thick).—This impure calcareous rock is separated from the sandy Kelloways stone by a thin band of clay containing *Crustacea*. It is very rich in fossils, and is nearly continuous from Scarborough to the vicinity of Malton.

Below the cornbrash, the oolitic series of Yorkshire is very much unlike that of the south of England. In that is little sandstone, in this little limestone; the clays of the south are shales in the north; and with the shales and sandstones are fossil plants, coal-beds, and ironstone layers, very much like those of the older coal-fields. To these strata it is not desirable to apply always the same names as those which belong to (perhaps) contemporaneous beds in the south, but we shall indicate the probable analogies.

Upper Sandstone, Shale, and Coal (nearly the equivalent of the Hinton sands and Forest marble of Somersetshire), 200 feet thick.—This series of sandstones (conglomeritic, or fine-grained, or laminated), shales, coal, and ironstone courses, may be studied about Scarborough and in the cliffs to the northward. The coal is thin, and of small value.

Gray Limestone (equivalent of part of the oolite of Lincolnshire), 30 feet thick.—It occurs at the White Nab, south of Scarborough, at Cloughton, Staintondale, and other points north of Scarborough and west of Whitby, always in an impure, rarely at all oolitic, state. But as we turn south along the foot of the Hambleton Hills, it becomes oolitic; and as the upper and lower sandstones diminish, it thickens and acquires more of the usual oolitic aspect. It is in places very ferruginous. The organic remains are numerous. They agree partly with those of the cornbrash, and partly with those of a lower zone, to be mentioned below.

Lower Sandstone, Shale, and Coal (500 feet thick).—The coal in this great mass of arenaceous and argillaceous deposits is thick enough to be worked on the moors west of Whitby and north of Helmsley, and on the sea-coast at Haiburn Wyke. Over it is a bed of sandstone, in which stems of *Equisetia* stand erect, and below is a bed of shale. This series of rocks ascends to the highest parts of the Cleveland Hills, 1300 to near 1500 feet above the sea.

Ferruginous Beds (inferior oolite and sand of Somersetshire), 60 feet thick.—These appear in the Peak Hill at Robin Hood's Bay, at Kettle-ness north of Whitby, and in various places round the base of the Cleveland and Hambleton Hills, as Osmotherley and Craike Castle. In the Peak Hill the slightly calcareous and ironous beds are very fossiliferous, and the species of fossils generally resemble those of Dundry Hill near Bristol. The transition from these beds to the lias formation below is very easy and gradual, the base of the one and the top of the other being softened by intervening pale micaceous sands.

Upper Lias Shale (called also *Alum Shale*, from its being the principal seat of the manufacture near Whitby, Lofthouse, and Guisborough), 200 feet thick in the cliffs near Whitby, and in the Cleveland Hills it gradually loses this thickness in going to the south of England, till near Bath and at Lyme Regis it can hardly be said to exist at all. In these strata lie most of the Saurian remains and many of the fishes, and in general a large proportion of the ammonites, belemnites, and other shells for which the Whitby coast is famous. It yields coniferous wood, often changed to jet.

Marlstone.—A series of sandy, ferruginous, and slightly calcareous beds, which divides the lias shales into two parts, and is very rich in fossils, receives this name. At Robin Hood's Bay, Staithes, and the head of Bilsdale, it is very conspicuous. Thickness 150 feet. These are the strata which contain *Ophiura* rather frequently about Staithes.

Lower Lias Shale (500 feet thick).—It forms the base of the lofty cliffs to the west of Staithes, and supports the high moorlands of the carbonaceous sandstones and shales, and continues to the south under the Wolds. In its lower parts are bands of gryphites, especially where its course approaches the Humber. Hardly any true lias limestone-rock occurs in Yorkshire farther north than about Cave and Market Weighton. The ammonites and other fossils of this series much resemble those of the Lyme Regis and Somersetshire lias, and it contains coniferous wood, sometimes changed to jet.

New Red Formation.

Red Marls with Gypsum.—These marly clays, with local occurrences of gypsum (Pocklington, Holme), form a broad band on the eastern side of the Vale of York, at the western foot of the oolitic and chalky hills, but, being much covered by gravel drifted against these hills, are less known as to thickness and properties than any other of the Yorkshire strata. They may be several hundred feet thick. They contain no fossils.

Red Sandstone.—This is found on the western side of the Vale of York, in an irregularly undulating tract of dry land, especially about Ripon and Boroughbridge. It has mixed with it a considerable mass of white or yellow sandstones, dug near Boroughbridge. Its thickness is unknown. It contains no fossils.

PALÆOZOIC STRATA.

Magnesian Limestone Formation.

Brotherton Limestone (45 feet thick).—This is a pale gray limestone, much laminated with clay, and nearly devoid of magnesia: a few shells occur in the lower beds. It is of vast importance in agriculture, the stone from hundreds of acres having been excavated and burnt to lime, which is of especial value on the peat and silt lands in the levels of Yorkshire. It ranges from the valley of the Wharfe near Tadcaster in a nearly straight course of rising ground to near Tickhill.

Red Clay and Gypsum (50 feet thick).—This is well known in the vicinity of Fairburn and Brotherton, and has been cut through on the York and North Midland railway. It separates the nearly pure limestone of Brotherton from the magnesian limestone of Weldon, and makes a continuous belt of rather wet land. It has no organic remains.

Magnesian Limestone (150 or 200 feet thick).—The composition of this important rock is usually a mixture of carbonate of magnesia and carbonate of lime. Sometimes the mixture is atomic. It is generally granular, and the grains are often crystalline. Colour usually yellowish, and the quality excellent for the mason, but of uncertain durability. Huddleston and Roche Abbey stone are the most in request. Tadcaster yields abundance of stone, some good. Spar veins and cavities are common. Small veins of carbonate and sulphate of copper, oxide of iron, sulphate of barytes, and sulphate of strontian occur in the rock. In the vicinity of Garforth the lower portion is laminated somewhat like the marl-slate of the county of Durham, and yields *Productæ* and other fossils. *Axini*, *Mytili*, *Nautili*, spiral shells, and a few corals occur in the limestone near Ferrybridge. The springs which issue from the magnesian limestone often contain carbonate of lime, but seldom much magnesia. The course of the magnesian limestone is in a range of low tabular hills from near Masham, by Knaresborough, Pontefract, Broadsworth, and Roche Abbey. These hills are finely escarped to the west and slope gently to the east. The soil is not in general good, especially for grass, but it is applicable to various cultivation.

Lower Red Sandstone, or Pontefract Rock.—In places this is 100 feet thick, and consists of red, purplish, and yellowish sands and clays, with stems and other parts of plants. Near Pontefract it is usually a mass of yellowish sands, of the greatest excellence for the use of the metal-founder in the construction of his moulds. This is a property which accompanies it along a great part of its course which is

a narrow belt, on the west side of the magnesian terrace. Between this and the strata beneath a great unconformity is observed, in the direction of the edges of the strata, the magnesian formation resting on coal, millstone-grit, or mountain-limestone indifferently.

Carboniferous System.

Coal Formation.—From beneath the southern part of the nearly straight edge of the magnesian deposits rise the sandstones, shales, ironstones, and coal of the West Riding of Yorkshire, and fill an enormous area in the valleys of the Aire, Calder, Went, Dearn, Dove, and Dun. Leeds, Bradford, Halifax, Huddersfield, Penistone, and Sheffield are all situated near the curved lower edge of the coal strata, while Aberford, Kippax, Pontefract, Elmsall, Conisborough, and Laughton le Morthen are near its straighter eastern boundary. The whole of this large area (600 square miles) yields coal; the whole series of strata is about or above 4000 feet thick; and of the coal which lies in this series there are about 20 workable beds, yielding about 40 feet of coal, generally of good quality. Ironstones of excellent quality accompany the lower parts of this coal deposit, and the circumstances of the country permit the full attainment of these advantages.

In this great coal-field the most useful classifications are founded on the nature and accompaniments of the beds of coal. The most complete general view yet made public is that given by Dr. Wm. Smith, in his valuable 'Geological Map' of the county founded on the succession of grit-rocks and shales containing coal and ironstones.

The following is the classification of Dr. Smith, proposed in 1821:—

Coal Measures.	a. Pontefract rock.	The upper part of the coal series contains thin beds of swift-burning coal, which leaves white ashes.
	b. Shales and coal beds.	
	c. Ackworth rock.	
	d. Shales and coal.	The midway part thick beds of hard coal, good for furnaces.
	e. Chevet rock.	
	f. Shales and coal.	
	g. Red rock.	
	h. Shales and coal.	The lower part, excellent bituminous coal, as at Silkstone, Flockton, &c., accompanied with cannel coal and ironstone.
	i. Bradgate rock.	
	k. Shales and coal (the shell ironstone).	
l. Wortley rock.		
m. Shales and coal.		
n. Flagstone and other rock.	On the extremity of the coal-field a thin coal extends north-west to some of the moors.	
o. Shales and coal.		

The Pontefract rock is here ranked by Dr. Smith among the coal-measures.

Below is the millstone-grit series.

The Ackworth rock yields soft freestone, and grindstone occurs at Ackworth, Kirkby, Mexborough, and Denaby.

The Chevet rock is of limited range and little value.

The red rock, often a coarse gritstone, occurs at Woolley Edge, Newniller Dam, &c.

The Bradgate rock yields freestone and grindstone.

The Wortley rock is in thin beds.

The flagstone is evenly laminated, micaceous, and yields fine paving and roofing flags.

Beds of coal are worked in the west of Yorkshire as thin as 18 inches (near Halifax and Penistone), and one as thick as 8, 9, or 10 feet (Barnsley), but the average is from 3 to 6 feet. The finest coal of Bradford (called the 'better bed'), and some of the finest Silkstone coal may vie with all but the very choicest Newcastle and Durham coal; the furnace coals of the middle series are excellent; the upper swifter-burning coal is in general of less value. There is no anthracite bed in the district, and very little cannel coal. The dip is generally to the east-south-east, and very moderate. There are some very great and many small dislocations, sometimes accompanied by pyritous and sparry veins, and even by galena. Over several beds the large stems of *Lepidodendra* and *Sigillaria* stand vertical; under some coals the *Stigmaria* spreads in much abundance, especially in the beds below the flagstone, which have a rock floor called 'ganister,' or 'galliard.' The shelly ironstones of Tankersley Park, &c., are much esteemed in the furnaces, from the lime which the shells yield.

A valuable deposit of iron-ore in the Cleveland district, between Guisborough and Stokesley, has been recently discovered. It is said that the ironstone contains between 30 and 40 per cent. of metal; that it lies at a very small depth below the surface; that the bed or seam varies from 12 to 20 feet in thickness; and that the yield is of considerable value. The ironstone is combined with calcareous matter in rather a peculiar way. Some thousands of tons have been smelted in Northumberland, affording an average yield of 33 per cent. of iron. The proprietors of the seam have contracted to supply an iron-work with 200,000 tons per annum for seven years. It is regarded as very probable, from iron being on the spot, and coal not far distant, that iron-works may be profitably constructed, and iron smelted at a cost which will successfully compete with that produced elsewhere.

There is a small detached coal-field in the line of a fault south of Ingleton.

The organic remains of the Yorkshire coal-field consist of fishes

(*Coilacanthus*, *Holoptychius*, *Megalichthys*, *Palæoniscus*, &c.), and many shells, the most numerous and diffused being *Unionide* of various species, such as are common in coal-fields; but the most remarkable group of fossils is that which lies in a very thin band in the part of the series below the flagstone rock, and consists of *Goniatites*, *Orthoceratites*, *Avicula*, and other marine genera, such as occur in the mountain limestone strata far below. The fish remains form thin beds (as in Lancashire) over the Middleton coal, near Leeds. The plants are variously distributed in the shales, sandstones, and ironstones.

The **Millstone Grit**, a series of coarse and fine and laminated sandstones and shales, with poor ironstones and coals, generally thin and bad in quality, surrounds the true coal-field on all the west and north, from Sheffield, by Huddersfield, Keighley, and Otley, to Harwood. It spreads to the boundary of the county, constituting the mountainous border against Lancashire, and occupies along the confines of Westmorland and Cumberland the summits of all the great ridges about the sources, between the dales of the Ribble, Rother, Wharfe, Nidd, Swale, Greta, and Tees. Where these rivers pass away from the highest ground to the south and east, they enter a connected area of millstone-grit, which thus appears to occupy a very large space in the West and North Ridings. It in fact constitutes most of the high healthy moors of these districts, and contributes much both to their barrenness and their picturesque effect. The most characteristic rock is the quartzose conglomerate, still used in making millstones; and where, as in Bramham Crags, the atmosphere has produced unusual waste, the appearance of the huge blocks is most singular and impressive. The whole series is about 1000 feet thick, and contains, besides the beds already named, a few thin limestones and cherty bands. Its fossils are like the shells of the mountain limestone, and like the plants of the coal series.

Mountain Limestone.—Yoredale Series.—This is about 1000 feet thick, and consists of five principal bands of limestone, alternating with gritstones, shales, thin coals, and some ironstone nodules. This is the character presented along all the northern dales; but in Nidderdale and towards Craven the limestones lose their importance, and almost vanish as we proceed south; the coal also vanishes, and the gritstones become less frequent, till the whole assumes an argillaceous type, and is called in Derbyshire the limestone shale.

Many of the magnificent mural precipices ('scars') which surround the great mountains of Ingleborough, Penyghent, Pen Hill, and Mickelfell, and range along the sides of the romantic dales of the Swale and the Yore, are formed of the limestones of this series; and many of the finest waterfalls (Hardrow, Millgill, &c.) happen where they cross the rivers. Swallow-holes abound on the edge of the limestones, and receive the water of rains and small streams. Some of the limestones (especially the upper thick belt, called the main, or twelve-fathom limestone) are very rich in lead-ore. The flagstone and some of the building-stones are of excellent quality, and the farther north we go the better is the quality of the coal. The lowest limestones yield black marble, and the upper ones encrinal marble.

Mountain Limestone.—The Lower Series.—This is in the south of Yorkshire, almost wholly calcareous, and makes in the vicinity of Clitheroe and Settle, round Pendle Hill, Ingleborough, and Penyghent, mighty ranges of rock 400 or 500 feet thick, and nearly perpendicular. Farther north and west, near Kirkby Stephen and Brough, it begins to admit shales, sandstones, and beds of coal; and as we advance into Northumberland these interpolations grow more and more important, the limestones grow thinner and less pure, and the whole group resembles closely the Yoredale rocks as they are seen in Yorkshire. The grandest exhibitions of these rocks are at Greenhow Hill in Nidderdale, in Wharfedale, in Ribblesdale, about Settle, Clapham, Ingleton, and Kirkby Lonsdale. In these parts they are full of caverns of great size and beauty, sometimes giving subterranean passages to the rivers, and forming enormous breadths of bare weather-worn rock. Lead and copper are found in veins in this limestone, but not very frequently. Culamine occurs in it, in the district of Bowland Forest, and oxides of zinc on Malham Moor. The organic remains of the mountain limestone in Yorkshire are extremely numerous and interesting.

Old Red-Sandstone.

This rock hardly occurs in Yorkshire except as a conglomerate, locally accumulated in the valley of the Rother, near Sedburgh, and not in connection with the mountain limestone which rests on the slaty Silurian rocks, and in its lowest beds contains pebbles of these rocks and lumps of quartz.

Silurian System.

This class of strata appears to be unconformed to the limestone series above. It is found in two separate districts: one near Sedburgh, west of the summit of drainage, and naturally associated with Westmorland, rising into a characteristic group of hills called Howgill Fells; the other a narrow band exposed along the line of an enormous dislocation on the south side of the mountains of Graygarth, Ingleborough, and Penyghent. In both localities slaty cleavage disguises the original stratification of the Silurian sediments. Fine blue flags are dug at the Crooks of Lune, near Sedburgh, and about Horton in Ribblesdale, and at Ingleton a greener rock is cleft into tolerable slates.

It is a most singular geological scene which is presented in the vicinity of Ingleton and Horton, for there slaty rocks of extremely various qualities, with vertical cleavage and inclined beds, are covered for many miles by a horizontal cap of mountain limestone 500 feet thick. *Orthoceras* and other fossils occur in the dark thin flags of Horton in Ribblesdale.

Disturbances of Strata.

Such is the series of Yorkshire strata, much thicker, more complete, and more varied than belongs to any other county of the empire. It will be found that three cases of general conformity have been noted: the oldest is between the Silurians and the mountain limestone; the next between the Coal and the Magnesian series; the last between the Oolitic series and the Chalk. The prevailing dip of the strata is eastward; indeed, except in the western parts of Craven and in the line of great faults, this general dip is very little modified. In the district of Craven several anticlinal axes of limited extent, mostly ranging north-east, make elliptical elevations about Greenhaw Hill, Skipton, Lothersdale, and in Bowland Forest. These are often connected with the production of metallic veins. A slight broad anticlinal axis affects the oolitic strata beneath the chalk.

Some of the dislocations, which occasion great vertical movement of the strata, are very striking. The Great Craven Fault, which ranges nearly east and west from Wharfedale to near Kirkby Lonsdale, and is in part of this course double, causes a downthrow to the south of from 1000 feet to more than 1000 yards, and is accompanied by a grand and characteristic change of physical geography. North of this line the country rises to the height of 2400 feet, and south of it sinks to a few hundreds of feet. Where this fault turns to the north from near Kirkby Lonsdale, and receives the name of the Pennine Fault, its effects are equally extraordinary, and the western border of Yorkshire derives its peculiar bold escarpment from Wharfedale to Mickie Fell from the operation of this fault.

There are several curious faults visible in the oolitic and lias strata of the coast near Whitby and Scarborough, and the coal-field is full of them. The magnesian limestone is dislocated near Robin Hood's Well and in a few other places. These and many other fractures of the earth's crust are wholly or principally unconnected with great masses of igneous rock, and devoid of such rocks along the line of fissure. Under Ingleborough however a curious red felspathic dyke is seen to coincide with the Craven Fault, and a very large and remarkable greenstone dyke, accompanied by a dislocation of strata, traverses the northern parts of this county, and the southern part of Durham, from near Middleton in Teesdale to near the High Peak, south of Whitby. Along the line of this great 'whindyke' the argillaceous strata are bleached and the sandstones indurated. It is geographically related to the east end of the great 'whin sill,' as it has been called, which fills a considerable space on the Yorkshire side of the Tees, and causes the great waterfalls of Caldron Snout and the High Force. This mass is in places 200 feet thick, and in others only 24 feet thick. It is a sort of 'interposed bed,' which was formed from lava poured out on the sea-bed with some local violence and rending of the strata. It is in a few places subcolumnar, and varies in crystallisation. The limestones have been altered by its heat to white crystalline masses, the sandstones hardened, and the shales locally changed, so as to yield in one spot garnets. No particular dislocations appear to mark its course, and its relation to the local richness in lead of the mining district of Teesdale and Alston Moor is obscure. Lead-veins traverse it in the mines about Hilton and Dufton, and yield ore, a circumstance in which it appears to differ from the toadstone of Derbyshire, which is also interposed in the limestone series.

Climate, Soil, and Agriculture.—The great extent of the county of Yorkshire, and the variety of surface, occasion considerable differences in the climate in various districts. Tuke, in his 'General View of the Agriculture of the North Riding of Yorkshire,' published in the year 1800, observes, that the climate of the coast is, from its situation, cold and bleak, but that in some of the vales near it, which are sheltered from the westerly winds and from the sea-air, the climate is such as to favour the ripening of corn. The Vale of Cleveland, near the Tees, is very cold, being open to the sea on the north and east, and to the cold winds from the central mountains on the west. The Eastern Moorlands, from their great altitude, have a climate so severe as to present a serious impediment to agricultural improvements. The Howardian Hills partake, though in a less degree, of the coldness and severity of the Eastern Moorlands; and the Wolds of the East Riding are subject to cold winds from the sea, though their diminished elevation and the different character of the soil make them more favourable to cultivation. Ryedale has a mild climate, which greatly promotes the perfection of crops. The districts between the Wolds and the coast are liable to cold winds and fogs from the sea and the Humber. In the Vale of York the climate is generally mild and temperate, but the northern part is subject to cold winds from the adjacent moorlands, while the extensive levels in the southern parts of the county, though comparatively mild in consequence of being sheltered from easterly winds by the Wolds, are very liable to a damp and foggy atmosphere. The climate of the West Riding generally appears to be tolerably healthy. The Western Moorlands are more liable to rain than the Eastern, and, owing to

their greater altitude and not being exposed to sea-air, the snow remains longer upon them. That part of the high lands which lies in the West Riding, though tempestuous and very rainy, is considered salubrious for strong constitutions, perhaps in consequence of the frequent purification of the atmosphere by high winds. The quantity of rain which falls annually in the vicinity of Ingleborough Hill is about 48 inches; and, though the lower tracts are very much milder and less rainy, the average annual fall of rain at Sheffield is 33 inches, which is 5 inches more than the general average of England. Tuke attributes the almost unceasing rains which fall upon the mountain district to the arresting of the clouds brought from the Atlantic by the westerly winds by the mountains themselves, and still more by the violent conflict which frequently takes place between the currents from opposite sides of the island. During March, April, and May, the east winds are usually accompanied by a bright sun in the day-time and sharp frosts at night, with frequent showers of snow and sleet, the united effect of which is to parch the surface and greatly to arrest the process of vegetation.

Yorkshire is one of the most important counties in an agricultural point of view; but from its great extent, and the varieties of soil and differences of climate which are found there, it is absolutely necessary to treat of its subdivisions or Ridings separately, and consider them as though they were separate counties.

In the North Riding the soil on the coast is mostly a brownish clay, or a loam incumbent on a clay or on freestone; and in some valleys west of Whitby the soil is a rich deep loam. The soil of Cleveland is mostly a fertile clay or fine red sand. In the neighbourhood of Kildale there is a good deal of deep rich loam. The surface is diversified with hills, and there are very few level fields. Near the Tees, in the valley of York, there is generally a rich gravelly loam. On the whole, it may be asserted that in all the valleys and on the lower hills the soil is fertile and mostly fit to bear good crops with proper management. The extensive tract of high hills called the Eastern Moorlands, occupying a space of about 30 miles by 15 miles, is penetrated by many cultivated valleys more or less fertile. The Western Moorlands are covered with green pastures; and even where it is brown with ling there are sweet grasses interspersed with it, which the cattle and sheep soon find out. The farmhouses are not in general conveniently situated for the occupation of the land, but are often crowded in villages at a distance from the fields. Where new buildings have been erected on the inclosures of common lands, they are however much better situated. The cottages for labourers are small and mean, and generally consist of two small rooms on the ground-floor, which is often damp, and consequently unhealthy. The farms in the North Riding of Yorkshire, as in the rest of the county, are of every imaginable size, from 50 to 1000 acres and more. Most Yorkshire farms have extensive pastures attached to them, where horses and cattle are bred, for which the county is celebrated. The Cleveland horses are very strong and active, and many good carriage-horses are bred from Cleveland mares. Threshing-machines were very early introduced from Scotland, and there is scarcely a farm of any extent which has not one. More modern and complicated implements, such as scarifiers, drills, horse-hoes, &c., are used by gentlemen and the wealthier farmers; and every new improvement is soon introduced and tried. On an average of farms, the grass-land is two-thirds of the whole farm, and the arable one-third; in the drier portions of the Riding, as in Cleveland, the proportion of arable is greater; towards the west it is less, the climate being there better adapted for grass. Clean fallows were once universal on all the heavy soils, but on the lighter loams turnips have entirely superseded clean fallows; and even on the heaviest, fallows do not recur so frequently as they did formerly, seldom sooner than after an interval of six years. Lime and guano, and the various other natural and artificial manures, are in general use.

The corn, when not mown, is reaped with the sickle, generally by women; the men seldom reap, but they often tie up the sheaves. The best wheat is grown in Cleveland, but the crops are not so abundant as those in Ryedale. Much wheat is exported from the ports of the North Riding, chiefly to the manufacturing districts, besides what supplies its own population; but till of late years oat and rye-meal were the chief food of the labourers, as well as mealin, that is, wheat and rye sown together, which makes good wholesome bread. On the good light soils as much as six quarters of rye per acre has been grown. Ryedale is remarkable for its fine oats. The kind used is generally the Friesland oat, and the farmers are particular in getting a change of seed from Holland every four or five years. Oats are sown in March and April. Eight quarters per acre is an average crop in Ryedale.

Rape is sown extensively for seed on the best lands, and the preparation is often by paring and burning grass-lands, which is sure to secure a crop. The seed is sown in July or August, and the plants are thinned out or transplanted in October. Where there is a great breadth of rape the plants are raised in seed-beds, and transplanted with the plough. Rape is usually ripe in July, and threshed out on a cloth in the field, by which much shedding of the seed is saved. These threshings are a kind of festival, like hop-picking in hop countries, and draw together many labourers and more idlers; but the work must be finished rapidly in so precarious a climate, for a wet day would spoil all. The straw and refuse of the rape is excellent

fodder for the cattle in winter. The crop usually averages the same as wheat, but the price fluctuates greatly. Turnips used to be sown on grass-land pared and burnt, or ploughed two or three times after having been fed off late in spring; but now the usual cultivation of this root on the Northumberland plan is generally adopted, with a very careful preparation and manuring.

Potatoes are a very essential crop on many farms, and are mostly shipped to London, where they fetch a good price. The Yorkshire reds are a favourite sort in the market. The produce is from 200 to 300 bushels per acre. Flax is still sown, but to a much smaller extent than formerly. A considerable quantity of mustard is sown in the neighbourhood of York, which is ground and sold as Durham mustard.

The principal part of the North Riding consists of grass-lands, and is appropriated to the dairy. There was once a fair proportion of timber-trees both in the woods and hedge-rows of this Riding, but they have been much thinned. Ash still abounds in the dairy districts, being useful for butter firkins and other dairy implements which require a white wood.

The short-horned breed of cattle is the prevailing sort all over Yorkshire, and of this there are some varieties. Those of Cleveland and the Vale of York are known by the name of the Tees-water breed, and in England are called the Holderness breed. Oxen are fatted to a great size, and seldom used for draught. In the West Moorlands the cattle are smaller, and on the borders of the West Riding and Westmorland the long-horned breed is very common. Many heifers and cows of the Tees-water breed are sent to the dairymen in London.

The old Tees-water breed of sheep is large and coarse, but the breed has been much improved by crosses from the Dishley breed. The sheep on the Western Moorlands are horned, with gray faces and legs; and many of them have a black spot on the back of the neck: their wool is coarse.

The breed of horses all over Yorkshire is well known and highly appreciated. For carriage-horses, Cleveland bays are in high repute when they have some blood. In the dales of the Eastern Moorlands and on the coast many useful horses are bred, of a moderate size and very compact, which suit the manufacturing districts. Mares are used very generally for farm work, and are made to give foals every year.

Many of the observations made on the agriculture of the North Riding of Yorkshire are equally applicable to the whole county, and consequently need not be repeated: we shall only notice those points which are peculiar to each Riding, and begin with the East Riding. This riding extends along the German Ocean, from the river Hartford, southward to the Humber. The length of this riding from the south-east to north-west is 52 miles, and from south-west to north-east 42 miles, containing above 750,000 acres, mostly cultivated. The high hills called the Wolds are cold and bleak, from their exposure and want of shelter; but they are healthy, and form strong robust constitutions; and although the winters and springs are cold the soil is fertile, and the crops are generally abundant, especially in very dry seasons. There is a moisture arising from the chalky subsoil which is very favourable to vegetation. The Wolds, however suited to pastures and spring corn, produce no good wheat. In Holderness, where the land is sheltered and the soil fertile, abundant crops of excellent wheat are raised, and the flat rich pastures along the Humber are equally remarkable for good grass. The climate on a level with the sea is much milder.

Howdenshire, with Ouse and Derwent, being situated inland, and sheltered by the Wolds from the north-east, have a milder climate than the districts nearer the sea, although the frost and snow are of longer continuance in winter.

The soil of the Wolds is a light friable calcareous loam over a chalk rubble, which covers the solid mass of chalk. There are flints in the soil, but not of such a size and in such quantities as in other chalk districts in the south. On the banks of the Humber there are above 14,000 acres of warp-land, a stiff clay rendered by the process of warping of extraordinary fertility. A certain proportion of fine sand in the warp is essential to its greatest fertility. Sunk Island, now a most fertile spot, forming part of the coast, was once a mere sand-bank in the Humber.

A large tract of poor sandy land extends in a north-west direction from South Cave nearly to York. Parallel to this, and along the Ouse, lies a tract of a very fertile alluvial soil, fit for any kind of agricultural produce. In the Vale of Derwent the soil varies greatly. The East Riding is very well watered; the Derwent, being navigable from its junction with the Ouse to Malton, greatly facilitates its communications.

The farms and estates in the East Riding are of considerable extent. The farmhouses and labourers' cottages are generally comfortable. There is a peculiarity in the harvesting of oats in this Riding, which is worthy of notice. The oats are cut by the sickle, as wheat is elsewhere: the sheaves are tied loosely very near to the corn, and the butts are spread out and set singly and upright; so that the wind readily finds access to dry them. Some time after a fresh band is made, and the first sheaf is tied round the middle, while the upper band is loosened; this serves to bind the next sheaf, and so on. There is a little extra labour in this mode of tying, but it is well repaid in a moist climate by the condition in which the oats thus

treated are stacked, and by the goodness of the straw, which otherwise often acquires a musty taste in the stack, even if the oats are not injured.

Beans are a profitable crop in the heavy soils of this Riding. Rape is extensively grown in Holderness both for sheep feed and for seed. About Hedon, Patrington, Sunk Island, and other rich warp-lands, much cole-seed and rape-seed are raised, which are sent to the oil-mills at Hull. On breaking up the sheep-walks on the Wolds rape is often successfully grown. Sainfoin has been introduced wherever the subsoil is chalk, where it is an invaluable plant. Potatoes are very extensively cultivated in Holderness and Howdenshire. The best sorts have been long known by the names of Red-nose kidney, Flat white, Purple kidney, and Cape kidney; the Green top and Ox noble are very productive, but better suited to feed cattle with than for the table. Swedish turnips, cabbages, and carrots are extensively grown.

In the East Riding the proportion of grass-land on the farm is much less than in the other Ridings. Most of the pastures have been ploughed up, even on the Wolds; and those only which lie low along the rivers have been left as permanent meadows. The salt-marshes along the sea are very useful, especially to recover horses which have been overworked; sheep likewise get fat on them after a time. There is but little timber in this Riding, either in woods or hedge-rows. The Wolds are naturally quite bare of trees. Some plantations have been formed on them, but they contain little useful timber. Draining, on a very extensive scale, has been done in Holderness and other flat and low parts of the Riding, by which low and marshy grounds have been rendered fertile. Works have been erected at great expense under the authority of several Acts of parliament, from 1762 to the present day. Near the sea-coast 'wreck' or sea-weed is very extensively used for manure; and after a storm the farmers' carts may be seen busily employed at low water collecting it. It is laid in heaps, where it soon ferments, and, as soon as is convenient, is carried on the land; if left to rot, it would waste away and be of little use. Bones and various other manures are now extensively used on the lighter soils.

Holderness cattle have been mentioned before, and scarcely any other breed is found in the East Riding.

On the rich pastures the improved Leicester breed of sheep is found the most profitable; on the Wolds the Southdowns have been introduced with great success.

No part of England produces such fine and valuable horses as the East and North Ridings of Yorkshire. We have mentioned the Cleveland bays. The introduction of full blood into this breed has produced some clever hunters, which have been sold at high prices; but for the carriage many still prefer the pure Cleveland bays.

The West Riding of Yorkshire is situated nearly in the centre of the kingdom, but, from its numerous rivers and canals, has a free intercourse with the east and west coasts. In an area of more than 1,700,000 acres, the soil and climate naturally vary. It is in general dry and healthy. The eastern and northern portions are similar to the Ridings so situated, while the west partakes of the moist and hilly nature of the counties bordering on the Atlantic. We need only observe on the agriculture of the West Riding, that a great part of the Riding is in pasture, the arable land being chiefly found on the northern and eastern portion, where it is cultivated much in the same manner as in the adjoining Ridings.

As grazing is well understood in this Riding, much cattle is purchased to be fatted here, but not many are bred; consequently a much greater variety may be observed in the stock than in the other Ridings. The grass will nearly fatten an ox in summer. With the addition of turnips and hay in autumn, oxen are made very fat, especially with the help of linseed-cakes, which is sometimes succeeded by oatmeal and hay for the last 10 days, in order to avoid the flavour so readily discoverable in beef fed with oily food. Many hogs are fatted in this Riding, the hams being cured for the London market, while the fitches are readily disposed of among the manufacturers, who never find bacon too fat.

This Riding was formerly better wooded than the rest of Yorkshire, but the forests have been destroyed, and the land divided and cultivated. There is a considerable demand for oak and ash of small size for the use of the mines and collieries. Much land in the Riding is fit for little else than planting firs and larch, and where the latter wood has thriven considerable profit has been made in a few years by well-managed plantations.

The properties and farms in the West Riding are generally smaller than in other Ridings.

Manufactures.—In its industry, as well as in other respects, Yorkshire is an exceedingly varied and interesting portion of the kingdom; and the West Riding forms one of the most important manufacturing districts in England, comprising important seats of the woollen, cotton, linen, iron, and hardware and cutlery manufactures, as well as considerable quarries and mines. Of these the woollen manufacture may be considered the great staple of the district. Cotton factories have been established at various places in the West Riding. Flax-spinning is carried on to a greater extent at Leeds than anywhere else in England. The flax manufacture arose in Yorkshire, probably from the extensive growth of flax in the county; and when the culture of flax declined the manufacture still continued. Leeds and Barnsley

are the centres of the manufacture: the one for the spinning and the other for the weaving. At Leeds the flax-mills are on a very large scale: especially so is the remarkable building of the Messrs. Marshall. The flax is heckled and spun in these large mills, chiefly into yarn for weaving, but partly also into thread for sewing. Scarcely any linen-weaving is practised at Leeds; this is done (far more than in any other town in England) at Barnsley. The Barnsley manufacturers buy the flax-yarn from Leeds, and either give it out to hand-loom weavers, to work-up at their own houses, or weave it by power-loom in large factories; but Barnsley has hitherto been known rather for hand-loom than power-loom productions. Extensive iron-works are seated at Rotherham, Low Moor, and Bowling, in the neighbourhood of Bradford. The manufactures of hardware and cutlery at Sheffield, and in the district surrounding that town, are very extensive, and in some departments excel those of Birmingham. In cutlery and plated goods Sheffield stands pre-eminent, and it maintains a high reputation in other branches of manufactures, which are noticed under SHEFFIELD. The manufactures of the North and East Ridings are of comparatively small importance, and even the mineral productions of the county, consisting of freestone, limestone, coal, iron, copper, and lead, are most extensively found in the West Riding. At Wickersley, 4 miles E. from Rotherham, several thousands of grindstones, some of them as much as 6 feet in diameter, and suitable for the finer descriptions of cutlery, are made annually for the use of the Sheffield manufacturers. The coal, which forms an important source of the manufacturing prosperity of the district, is found chiefly in the vicinity of Leeds, Sheffield, Bradford, and Wakefield. The coal of the Silkatone and Barnsley district has been, since the opening of the Great Northern railway, brought to London in large quantities. There has also been a great increase in the shipment of coals from the Yorkshire side of Teessmouth, where Redcar and Middlesborough are becoming important places. Alum-works have been carried on in the county, ever since the time of Queen Elizabeth, first at Guisborough, and more recently at Whitby.

The manufacturing district of the West Riding extends from north to south about 40 miles, has a mean width of about 20 miles, and includes an area of about 800 square miles, comprising the hardware as well as the clothing district. The clothing district commences below the part of the county which bears the name of Craven, and extends over the tract which comprises the towns of Leeds, Bradford, Halifax, Huddersfield, and Wakefield. In the several articles on those towns will be found particulars of the respective branches of which they may be considered the centres. The principal varieties of woollen broadcloth are classed under the coloured or 'mixed-cloths,' which are wholly made of dyed wool, and the white broadcloths. Halifax produces the finest kinds of stuff goods as well as a fair proportion of all other kinds. Bradford is now the great centre of wools, stuffs, and merinos. The chief district for blankets and flushings lies between Leeds and Huddersfield. Worsted-spinning is largely practised at Bradford. In and near Huddersfield are made narrow cloths; and Saddleworth produces kerseymers and broadcloths nearly equal to those of the west of England. Wakefield is chiefly celebrated for its wool-fairs and the skill of its cloth dyers. From the nature of its manufactures, consisting of baizes, flannels, kerseys, and broadcloths, Rochdale may, though situated in Lancashire, be considered to belong to the woollen district of Yorkshire.

The business connected with the cloth-trade is chiefly transacted in the great cloth-halls in the respective towns, but much cloth is produced and sold without passing through the halls.

Formerly the greater proportion of the woollen goods produced in Yorkshire consisted of the coarser kinds of cloth: but the manufacture has been so greatly improved that Yorkshire cloths are no longer looked upon as inferior to those of other districts, while the finer qualities of cloth made in the West Riding are excellent. The introduction of llama and alpaca wools has opened new and important sources of industry in the manufacture. At about a mile from Shipley, on the road to Bingley, is Saltaire, the largest spinning and weaving establishment perhaps in the world, employing about 4000 workmen. It belongs to Mr. Titus Salt, who carries on at Bradford a very extensive manufacture of stuff and alpaca goods. The Saltaire mill affords all the advantages of concentration. On the same estate a complete town has been built to accommodate the workpeople and their families. There are a road, a river, a canal, and a railway, all passing through the estate; and five bridges over the Aire.

Divisions, Towns, &c.—Yorkshire is divided into three Ridings—a division now peculiar to this county, but which at the Domesday Survey obtained also in Lincolnshire. In its present form the term Riding is a corruption of the Anglo-Saxon name of the divisions 'trithing' or 'thriding,' and the division of the county into thirds or trithings is generally ascribed to the Saxons; but Worsaae, perhaps fancifully, attributes it to the Danes, suggesting that the term completely answers both in sound and meaning to the Scandinavian division of a county or district into thirds or 'Tredinger.' Several of the old feudal divisions of Yorkshire, though no longer possessed of a legally recognised boundary, are still popularly known and their names used for many purposes. Cleveland, Craven, Holderness, and Richmond, either give, or have given, titles to some of our noble families. Holderness has given its name to a valuable breed of cattle; and the Cleveland

bay is the origin of our best kind of coach-horses; and while no such districts as Cleveland or Craven appear on our maps, they are used as distinguishing appellations in Shipton in Craven, Kirkby in Cleveland, &c. It may be worth while therefore to describe briefly the localities indicated by these names. *Cleveland* is in the North Riding, and forms now the two wapentakes of the east and west division of Langbaugh, extending along the coast from the mouth of the Tees to near Whitby, and inland to the moors of the wapentake of Ryedale, including 37 parishes. *Craven* occupies somewhat more than what now forms the wapentake of Staincliff, and with the wapentake of Ewcross, a former member of Craven, forms the north-west portion of the West Riding. The Ribble, the Wharfe, the Aire, and the Nidd, all rise within it. Craven contains 26 parishes. *Hallamshire*, in the West Riding, appears to have been a large manor at the time of the Conquest. The Domesday Book states that "Hallum, one manor, with its 16 hamlets," was held by Earl Waltheof; but Sheffield, which is now part of Hallamshire, is not mentioned. It is wholly in the West Riding, but the boundaries are not very well defined. *Holderness* is yet a seignior, a liberty, a manor, and a wapentake, in three divisions of the East Riding. It occupies the coast east of the river Hull and of the Humber, after the Hull falls into it, from Bridlington Bay to Spurn Head. *Richmondshire* occupies the whole western portion of the North Riding, from a line running nearly straight from Yarm to Boroughbridge. It was erected into an earldom by the Conqueror in favour of a follower and kinsman, Alan, a son of the Duke of Brittany. It contains the wapentakes of East and West Gilling, Hang, and East and West Hallikeld.

The legal division of Yorkshire is into the East Riding, North Riding, and West Riding. The East Riding is divided into the wapentakes of Buckrose, Dickering, Harthill, Holderness, Howdenshire, and Ouse and Derwent. The North Riding is divided into the wapentakes of Allertonshire, Birdforth, Bulmer, East Gilling, West Gilling, Hallikeld, East Hang, West Hang, Pickering Lythe, Ryedale, Yarm, and the liberties of Langbaugh and Whitby Strand. The West Riding is divided into the wapentakes of Agbrigg, Ainsty, Barkstone Ash, Claro, Morley, Oagoldcross, Skyrack, Staincliff and Ewcross, Staincross, Strafforth and Tickhill, and the liberty of Ripon. The Ainsty of the city of York has been annexed to the West Riding as a wapentake; though for electoral purposes it is joined with the North Riding.

The following places are described in separate articles:—ALDBOROUGH, ALMONDBURY, BAINBRIDGE, BARNLEY, BARWICK, BAWTRY, BEDALE, BEVERLEY, NORTH BIERLEY, BINGLEY, BOROUGHBIDGE, BRADFORD, BRIDLINGTON, CARLTON, DEWSBURY, DONCASTER, GREAT DRIFFIELD, EASINGWOLD, GOOLE, GURBOROUGH, HALIFAX, HARBOROUGH, HELMSLEY, HEMSWORTH, HOWDEN, HUDDERSFIELD, HULL, KEIGHLEY, KIRKBY MOORSIDE, KNARESBOROUGH, LEEDS, LEYSBURN, NEW MALTON, NORTHALLERTON, OTLEY, GREAT OUSEBURN, PATELEY BRIDGE, PATRINGTON, PENISTONE, PICKERING, POCKLINGTON, PONTEFRAC, GREAT PRESTON, REETH, RICHMOND, RIPON, ROTTERHAM, SADDLEWORTH, SCARBOROUGH, SEDBERGH, SELBY, SETFLE, SHEFFIELD, SKIPTON, SKIRLAUGH, STOKESLEY, TADCASTER, THIRSK, THORNE, WAKEFIELD, WHITBY, WORTLEY, and YORK.

Of the other towns of importance we give a notice here:—

In the *East Riding*:—

Cave, South, a small market-town, population of the township 927 in 1851, about 10 miles S.W. from Beverley, near the western foot of the Wolds. The town contains a neat church, built in 1601, and dedicated to All Saints, places of worship for Wesleyan and Primitive Methodists and Independents, and a National school. A corn-market is held weekly on Monday; and there is a fair on Trinity Monday. The imports include coal, lime, freestone, flags, and general commodities. *Flamborough*, population of the parish 1297 in 1851, about 28 miles N.E. from Beverley, is now a mere fishing-village, occupying the centre of the promontory called Flamborough Head. It was frequently used as a principal station by the Danes during their predatory inroads. The church consists of a nave and chancel, with aisles. The Wesleyan and Primitive Methodists have chapels, and there are National schools. *Hedon, Headon, or Heydon*, population of the parish 1029 in 1851, about 6 miles E. from Hull, is a borough and market-town, about 2 miles from the left bank of the river Humber, with which it is connected by Hedon Haven, a creek formerly navigable. It is now chiefly dependent on the agriculture of the rich district in the midst of which it stands. A charter was granted to the burgesses of Hedon by Athelstan, and it received several other charters at later periods down to the first year of James II. It first sent members to Parliament in the 23rd Edward I, but was disfranchised by the Reform Act. A great part of the town was destroyed by fire in 1656; it was afterwards rebuilt in a superior manner. The parish church is an elegant and spacious edifice. The Wesleyan Methodists, Baptists, and Roman Catholics have places of worship. There are National schools, a mechanics institute, and a library and reading-room of the Holderness Agricultural Society. A county court is held. There are cattle-markets on alternate Mondays, and fairs on August 2nd, September 22nd, November 17th, and December 6th. Grain is the chief article of export. Rope-making, tanning, nail-making, brewing and malting, and market-gardening are carried on to some extent. *Hornsea*, population 945 in 1851, about 15 miles E.N.E. from Beverley, at one time a market-town, is situated

on the sea-coast. The town is said to have been formerly 10 miles inland, but the encroachments of the sea have brought the coast within about half a mile. The church is a spacious building, and had formerly a spire, which formed a noted landmark, but it was long since blown down, and has not been restored. The Wesleyan and Primitive Methodists and Independents have places of worship, and there are National and Infant schools. Fairs for horses and cattle are held on August 13th and December 18th. Races are run annually about the end of July. The town has a fine chalybeate-spring, and good accommodation for sea-bathing. In the neighbourhood is the lake called Hornsea Mere. *Husmanby*, population of the township 1291 in 1851, formerly a market-town, is pleasantly situated near the sea-coast, about 30 miles N. by E. from Beverley. The church contains a handsome monument of the Osbaldeston family, to whom most of the township belongs. The Wesleyan and Primitive Methodists and Baptists have places of worship, and there are National schools and two public libraries. *Market Weighton*, population of the town 2001 in 1851, about 10 miles W. by N. from Beverley, is a market-town, situated at the western foot of the Wolds, on the little river Foulness. It has a good water-communication with the Humber by the Market Weighton Canal, and is connected by railway with the city of York. The church is an ancient edifice, with a comparatively modern spire; and the town contains chapels for Wesleyan and Primitive Methodists and Independents. There are National schools, and a temperance-hall. The market for corn, held on Wednesday, is well attended. Fairs for horses, cattle, and sheep are held on May 14th and September 25th.

In the *North Riding* :—

Akrigg, population of the township 633 in 1851, is a market-town, situated in Wesley-Dale, about 17 miles S.W. from Richmond. The church is an ancient edifice dedicated to St. Oswald; the Wesleyan Methodists have a chapel, and there are National schools. Dyeing, the manufacture of knitted hosiery and of carpets, and worsted spinning are carried on. There is a market on Thursday, and fairs are held in May, June, July, and October. The neighbouring moorland country is exceedingly picturesque, and contains some fine waterfalls, of which may be mentioned Millgill Force and Whitfield's Force. *Egton*, population of the parish 1129 in 1851, is a small market-town, about 7 miles W. by S. from Whitby, on the edge of the Egton Moors. The church was consecrated in 1349 by the Bishop of Damascus. Egton also contains a Roman Catholic chapel and a public school. A fine spring, called Cold Keld Well, is much resorted to for strengthening weakly children. *Hawes*, population of the chapelry 1708 in 1851, is a market-town, situated at the head of Wesley-Dale, about 23 miles S.W. by W. from Richmond. The houses are generally built of stone. The chapel of ease is a plain edifice; there are places of worship for Wesleyan Methodists, Quakers, and Sandemanians; National schools, and a subscription library. Nail-making, clog-making, and dyeing are carried on. Cattle fairs are held on alternate Tuesdays, from the last Tuesday in February till Whitsuntide. At a short distance from the town is a magnificent cascade, called Hardraw Scar, or Force, with a perpendicular fall of 102 feet. *Masham*, population of the township 1139 in 1851, is a market town, about 14 miles S. by E. from Richmond. The church is small, but handsome, with a lofty spire; there are places of worship for Wesleyan Methodists, Baptists, and Quakers, a Grammar school, a Charity school, and an Infant school. The town has a considerable manufacture of woollen-yarn, and a flax-mill. Rope-making, brewing, and dyeing are carried on. Fairs for cattle and sheep are held during spring on alternate Wednesdays. *Middleham*, population of the parish 966 in 1851, is a small market-town about 10 miles S. by W. from Richmond. The church was made collegiate by Richard III., when duke of Gloucester. The town contains chapels for Primitive and Wesleyan Methodists, and a school of industry. Middleham is built, chiefly in the form of a square, upon a gentle acclivity on the right bank of the Ure. Fairs are held on Easter-Monday and Whit-Monday; and on the 5th of November is held on Middleham Moor one of the largest fairs in England for horned cattle and sheep. Middleham castle was built about 1190, by Robert Fitz-Ranulph, and has been the scene of some important historical events. It is said to have been reduced to ruins by Cromwell. The ruins of the castle stand on a rocky eminence near the town. The Duke of Leeds is hereditary constable of Middleham Castle. *Middlesborough*, or *Middlesburgh*, population 7431 in 1851, is about 28 miles N.E. from Richmond, on the right bank of the Tees, close to its mouth. The town is lighted with gas. The church of St. Hilda, erected in 1840, is an elegant gothic structure. The Wesleyan and Primitive Methodists, Independents, Quakers, and Roman Catholics, have places of worship. There are a British and an Independent school, a savings bank, a mechanics institute, and a subscription news-room. Middlesborough is now a considerable sea-port and market-town, with several foundries, ship-building yards, rope-walks, a sail-cloth manufactory, an anchor, chain-cable, and railway rail manufactory, brick- and tile-works, a pottery, and other manufactories. *Musker*, population 1321 in 1851, a customary market-town, about 17 miles W. by S. from Richmond, stands in an angle formed by two streams which contribute to form the river Swale. The chapel of ease was erected in 1580. There are a National school and a subscription library. The market is held on Wednesday, and there is an annual fair. *Yarm*, popula-

tion of the parish 1647 in 1851, occupies a low peninsula nearly surrounded by the river Tees, about 22 miles N.E. from Richmond. It has several times suffered greatly from inundations. In 1753, and again in 1822, the water covered the town to the depth of 7 feet, and in 1771 it rose still higher, being as much as 20 feet in some parts. The Tees is here crossed by a bridge of five arches, built in 1400 by Walter Skirlaugh, bishop of Durham, and since much improved. The church, which stands to the west of the town, was rebuilt in 1730. The Primitive and Wesleyan Methodists, Quakers, Independents, and Roman Catholics, have places of worship. There are a Free Grammar school, and a National school. There is a salmon fishery in the Tees. In the neighbourhood are extensive flour-mills and a paper-mill. The market is on Thursday, and there are several fairs, including a great cheese fair on the 19th of October.

In the *West Riding* :—

Aberford, population of the township 737 in 1851, is a small market-town about 15 miles S.W. from York. The parish church is an ancient edifice. The Wesleyan Methodists and Roman Catholics have chapels, and there are National schools. Rope-making, wire-working, malting, and basket-making employ a few persons. *Cawood*, population of the parish 1195 in 1851, is a small town about 10 miles S. from York. There is here a ferry over the Ouse. Besides the church, which is small, there are a chapel for Wesleyan Methodists, and Duffield's Charity school. The archbishops of York had a castle at Cawood as early as the 10th century. The castle was demolished by order of the Parliament. *Dent*, population of the chapelry 1630, about 5 miles S.S.E. from Sedburgh, is a small market-town near the Westmorland border. Considerable quantities of black and gray marble are quarried, polished, and exported, chiefly to the metropolis. Besides a chapel of ease, there are chapels for Wesleyan and Primitive Methodists, Independents, and Quakers, a Grammar school, and National and Infant schools. The making of chairs, shoes, and clogs employs some of the inhabitants. *Giggleswick*, population of the township 855 in 1851, is on the right bank of the river Ribbles, about one mile N.W. from Settle. There are a large and handsome parish church and a Free Grammar school. About a mile north-west from the village is a curious ebbing and flowing well; the water is clear, cold, and wholesome. *Gisburn*, population of the township 518 in 1851, is about 11 miles W. by S. from Skipton. Cattle fairs are held on alternate Mondays, and cattle and pedlery fairs on Easter Monday and September 19th. *Harewood*, population of the township 895 in 1851, about 8 miles N. from Leeds, is pleasantly situated near the right bank of the river Wharfe. Harewood House, the magnificent seat of the Earl of Harewood, stands in a park a short distance west from the town. On an eminence are the remains of a Norman castle. Besides the parish church there are a chapel for Wesleyan Methodists, and a Free school. *Ripley*, population of the township 233 in 1851, is about 25 miles N.N.W. from York. The church is ancient. There is a Free school. The chief distinction of the place is the castle of the family of Ingilby, which was built in 1555, and is still the family residence. Monday is the market-day: fairs are held on Easter Monday and Tuesday, and on the 25th, 26th, and 27th of August, chiefly for cattle, horses, and sheep. *Sherburn*, population of the township 1440 in 1851, is about 16 miles S.S.W. from York. In the neighbourhood are stone-quarries, flour-mills, and orchards. Teasel is extensively grown in the vicinity. The parish church, which is ancient, is a handsome and commodious edifice; there are also the Hospital school, a Charity school, and a National school. *Snashall*, population of the township 840 in 1851, is about 23 miles S. by E. from York. The church is of the later English style, with a low square tower surmounted with pinnacles. There is a Free Grammar school. Flax is grown in the vicinity. An extensive steam flour-mill and several windmills are near the town. Basket-making and rope-making employ some of the inhabitants. *Sowerby Bridge*, population 4365, about 3 miles S.W. from Halifax, is of modern origin and growth. The woollen-cloth manufacture employs many of the population. There are several large iron-works, malting-houses, and corn-mills. There are two Episcopal chapels, and one each for Wesleyan and Primitive Methodists and Independents; also a Church school, a National school, a school supported by Wesleyan Methodists, and a mechanics institute. *Tickhill*, population of the township 2087 in 1851, is situated in a fertile valley, about 7 miles S. from Doncaster. The market-cross is a plain circular stone building erected in 1776. Rope-making, paper-making, nail-making, and malting are carried on. There is a fair in August for cattle and merchandise. Tickhill was a place of importance in the middle ages. The castle is said to have been erected by Roger de Bual, one of the Norman followers of William the Conqueror, but it several times reverted to the crown. On a pleasant situation at the west end of the town are the remains of an Augustine priory, founded in the reign of Henry III. The parish church, erected in the 13th century, is a very handsome edifice with a noble tower. There are several interesting monuments: an altar-tomb in the church is of the date of 1386. The Independents and Wesleyan Methodists have large chapels. There is a National school. *Wetherby*, population of the township 1494 in 1851, is a market-town situated on the left bank of the river Wharfe, about 15 miles W. by S. from York. There is a neat town-hall, built of stone, and containing the public news- and reading-rooms. Over the Wharfe there is a handsome stone bridge.

A little above the bridge is a very fine stone weir, by means of which some extensive flour-mills are worked. There are also several oil- and logwood-mills. St. James' church is a handsome edifice, built in 1839. The Wesleyan Methodists and Independents have chapels, and there are National schools and a savings bank. The market, held on Thursday, is of importance for corn. Fairs are held on Holy Thursday, August 5th, and October 10th: there are also fortnightly stock fairs, which are well attended. A little below the town is St. Helen's Ford, where the Roman military way crossed the river. The scenery in the vicinity of the town is diversified and beautiful. A county court is held.

The following are some of the more important villages in the county: the population is that of 1861; the letters E, N., and W. after the several places indicate that they are respectively in the East, North, or West Riding:—

Ackworth, W., population 1835, about 8 miles E. by S. from Wakefield, is chiefly noticeable for the Free school maintained here by the Quakers, for children of members of their society. There are also the Lowther Endowed school and an Infant school. **Addingham, W.**, population of the township 1553, about 6 miles E. by S. from Skipton, has an ancient parish church; places of worship for Wesleyan Methodists and Quakers; and a National school. Worsted spinning, the making of worsted goods, the cotton manufacture, malting, tanning, and nail-making are carried on. **Armsley, W.**, population of the chapelry, which forms part of the borough of Leeds, 6190, is on the right bank of the river Aire, about 2 miles N. by W. from Leeds. It has an extensive woollen manufacture. There are a chapel of ease; chapels for Wesleyan and New Connexion Methodists and Baptists; endowed Town's schools; National schools; and schools connected with the Baptist and Wesleyan Methodist congregations. Tanning, malting, and brewing are carried on. There are flour-mills, and scribbling- and fulling-mills. Flax spinning, and the manufacture of thread and of linen goods, employ some of the inhabitants. The jail and house of correction was erected in 1847, at an expense of 45,500*l.* **Askern, W.**, a village of some celebrity for its sulphureous waters, is 7 miles N. from Doncaster: population of the township 382. The earliest notice of the Askern waters occurs in a work by Dr. Short, published in 1734. There are several wells, and Dr. Lankester analysed the waters of six of them. The water contains sulphate and carbonate of lime, and traces of sulphur. A bath charity was established in 1825 for enabling poor persons to avail themselves of the benefit of the wells. The Wesleyan Methodists have a chapel, and there are National schools, partially endowed. **Attercliffe** forms part of the borough of Sheffield. [SHEFFIELD.] **Aysgarth, N.**, population of the township, 253, of the parish, which has an area of 77,308 acres, 5635, about 13 miles S.W. from Richmond, is situated in Wensleydale, on the right bank of the river Ure, which has here a remarkable fall over an irregular ridge of rocks, called *Aysgarth Force*. A bridge of one arch, 71 feet in span, crosses the river above the Force. Besides the parish church, there is a National school. **Ayton, N.**, population of the parish 1804, about 16 miles N.E. from Northallerton, has a plain old church; places of worship for Wesleyan and Primitive Methodists, Independents, and Quakers; a British school; a Free school; and an Agricultural school, supported by the Quakers. Tanning, shoe-making, the linen manufacture, and nail-making afford employment. **Barnoldswick, W.**, population of the township 1938, is about 8 miles S.E. from Gisburn. Besides the parish church, which is ancient, there are a chapel of ease, chapels for Wesleyan and Primitive Methodists, and Baptists, and a National school. The cotton manufacture is carried on. An abbey was founded here in the 12th century. **Bailey, W.**, population of the township 9308, is about 6 miles N.W. from Wakefield. The parish church is an ancient building, of the perpendicular style. There are places of worship for Wesleyan and Primitive Methodists, a Free Grammar school; a National school; and a literary institution. The inhabitants are chiefly employed in various branches of the woollen manufacture. **Beeston, W.**, population of the township, which forms part of Leeds borough, 1973, about 2 miles S. by W. from Leeds, has an ancient chapel. The neighbouring collieries, and several branches of the woollen manufacture, give employment to many of the inhabitants. **Bentham, W.**, population of the township 2143, is on the right bank of the river Wenning, close to the Lancashire border. Besides the parish church, there is a Grammar school. The inhabitants are engaged in the flax manufacture. **Birstall, W.**, population of the parish, which is very extensive and contains eight populous townships, 36,222; the village is about midway between Leeds and Huddersfield. The church is of the perpendicular style; there are chapels for Wesleyan and Primitive Methodists, and a National school. **Bishopthorpe, W.**, population 406, about 3 miles S. by W. from York, has a handsome parish church, which was repaired in 1842 by the late Archbishop Harcourt; the windows are of fine stained glass. The carved chair, for the use of the Archbishop, was constructed from wood saved from York Cathedral when it was partially burned in 1829. There are a chapel for Wesleyan Methodists, and National schools. The palace of the Archbishop of York is a fine gothic structure, much enlarged and somewhat modernised by Archbishop Drummond. The tea-gardens at Bishopthorpe attract numerous visitors from York. **Bolton Abbey, W.**, is a small township in the parish of Skipton, population of the township 109, beautifully situ-

ated on the right bank of the Wharfe, 6 miles E.N.E. from Skipton. The place is only noteworthy on account of the beautiful scenery of its immediate neighbourhood, and the picturesque ruins of the abbey, for which it is much visited. A priory is said to have been founded at Embsay in 1124, by William de Meschines and Cicilia, his wife, but removed three years later to Bolton, on the death of their son Romilly, who was drowned in leaping across the Strid in Bolton Park: the story has been celebrated by Wordsworth, Rogers, and some minor poets. Bolton Priory is now the property of the Duke of Devonshire. The ruins are chiefly of the priory church; they are partly of Norman date. The remains of Barden Tower are on the heights, about 8 miles N.W. from Bolton Abbey. **Boston, or Boston Spa, W.**, about 4 miles N.W. from Tadcaster, on the right bank of the river Wharfe, is visited by invalids, for its chalybeate spring. Commodious baths have been erected, and there are good lodging-houses. Several boarding-schools are in the village and its vicinity. **Bowes, N.**, population of the township 725, is on the left bank of the Greta, 4 miles S.W. from Barnard Castle. Besides the church there is a Free school. There are here remains of an extensive castle of Norman date. **Bradfield, W.**, population of the chapelry 6865, about 7 miles N.W. from Sheffield, in the midst of barren moors, has a chapel of ease, a chapel for Wesleyan Methodists, and Endowed schools. Some of the inhabitants find occupation in preparing cutlery articles for the Sheffield manufacturers. **Bramham, W.**, population of the township 1818, about 3 miles W. from Tadcaster, is pleasantly situated. The church is an ancient gothic structure, with a western tower; the Wesleyan Methodists have a chapel, and there are National schools, and a superior school or college. Lime and freestone are abundant in the district. On the south side of the town is Bramham Moor, a great part of which is still a rabbit warren. **Bramley, W.**, population of the chapelry 8949, near the right bank of the river Aire, about 4 miles N.W. by W. from Leeds, has a chapel of ease; chapels for Wesleyan and Primitive Methodists, and Baptists; National schools, and schools supported by Wesleyan and Primitive Methodists. The woollen-manufacture is largely carried on; also rope-making, tanning, iron-founding, and malting. **Brampton-Bierlow, W.**, population of the township 1741, about 6 miles N. by W. from Rotherham, has a National school, originally founded as a Free school, in 1711. Earl Fitzwilliam has here extensive coal-mines and iron-foundries. **Brighouse, W.**, population of the township 6091, on the left bank of the river Calder, about 4 miles E.S.E. from Halifax, is favourably situated for trade, from its excellent roads to neighbouring towns, the railway, and the Calder navigation. There are here a district church, chapels for Wesleyan and New Connexion Methodists, and a Free school. Worsted spinning, the manufacture of fancy woollen goods and worsted stuffs, the making of carding machinery for the manufactories, currying, tanning, and malting are carried on. **Brompton, N.**, population of the chapelry 1491, about a mile and a half N. by E. from Northallerton, has an ancient church of Norman character, and a British school. The linen manufacture is the chief occupation. Here was fought the battle of the Standard between the English and the Scotch armies in 1138; the site of the battle-field is still called Standard Hill. **Brotherton, W.**, population of the township 1454, about 3 miles N.E. from Pontefract, has a parish church, which has recently undergone a complete repair; chapels for Wesleyan and Primitive Methodists, and Independents; and National and Infant schools. Basket-making, boat-building, the manufacture of glass bottles, lime-burning, malting, and rope, sail, and twine-making, give some employment. **Burley, W.**, population of the township 1894, about 2 miles W. by N. from Otley, has a chapel of ease, and chapels for Wesleyan Methodists and Independents. Some of the inhabitants are employed in the cotton-manufacture, and in worsted-spinning. Considerable attention is given by the neighbouring farmers to the rearing of sheep, cattle, and horses. **Calverley, W.**, population of the township of Calverley with Farsley 4392, is on the right bank of the river Aire, about 8 miles N.W. from Leeds. There are here a parish church, a new district church opened in 1843, chapels for Wesleyan and Primitive Methodists, and National, British, and Town's schools. There are fulling-mills and flour-mills. **Carleton, W.**, population of the chapelry 214, about 2 miles N. by E. from Snaith, is pleasantly situated near the left bank of the river Aire. Besides the parish church, there are chapels for Wesleyan and Primitive Methodists, and Roman Catholics. **Castleford, W.**, population of the township 2150, about 3 miles N.W. from Pontefract, is on the right bank of the river Aire. There are a church, chapels for Wesleyan and Primitive Methodists, and an Infant school. Coal-mines, glass-manufactories, and pottery-works employ a considerable number of workpeople. Over the river Aire is a handsome stone bridge. **Catterick, N.**, population of the township 640, is about 5 miles S.E. by E. from Richmond, near the right bank of the river Swale. The parish church was erected in the reign of Henry V. There are a Free school founded in 1645, and an hospital for six poor widows. **North Cave, E.**, population of the township 899, about 10 miles W. by S. from Beverley, contains a parish church, places of worship for Wesleyan and Primitive Methodists and Quakers, and Endowed and Free schools. Agricultural implements are manufactured. **Cawthorne, W.**, population of the parish 1254, is about 4 miles W. by N. from Barneley; it has a parish church, a chapel for Wesleyan Methodists, a Grammar school, and Mrs. Stanhope's Charity school.

Chapel Allerton, W., population of the township 2312, about 2½ miles N. by W. from Leeds, is pleasantly situated, and contains many handsome dwellings, the residences of respectable families. The chapel of ease has been enlarged and improved; the Wesleyan Methodists have a chapel, and there are National subscription schools. Paper-making, tanning, and dyeing afford some employment. *Cleckheaton, W.*, population of the chapelry 5173, about 7 miles E. from Halifax, is pleasantly situated in a rich valley. There are two Episcopal chapels; chapels for Wesleyan Methodists, Independents, and the Christian Brethren; also National and British schools. The manufacture of carding and spinning machinery is the principal occupation. The manufacture of worsted goods, and of woollen-cloth of a low quality, blankets, and flannels is carried on. *Conisbrough, W.*, population of the parish 1551, about 6 miles S.W. from Doncaster, now an insignificant village, appears to have been a royal town both in British and in Saxon times; the ruins of an ancient castle are on the top of a steep hill at the east end of the village overlooking the river Don. The circular keep is in a state of good preservation. The parish church is of Norman character, with some portions of decorated and perpendicular. There are a chapel for Wesleyan Methodists, and an Endowed school. Basket-making, malting, and nail-making are carried on. *Cottingham, E.*, population of the parish 2854, about 5 miles S. by E. from Beverley, had formerly a market. Of Baynard Castle, erected in the beginning of the 13th century, and destroyed by fire in 1541, only the ramparts and ditches are now traceable. Besides the parish church, there are chapels for Wesleyan and Primitive Methodists, and Independents, and National, Free, and Infant schools. In the vicinity are market-gardens. Coach-making, brewing, and the manufacture of oil-press bagging, are carried on. *Coxwold, N.*, population of the township 330, is a small village, 5 miles N. from Easingwold. Besides the chapel, there are a Free school, and hospitals for 10 poor men and 8 poor women. Laurence Sterne for a while held the curacy of Coxwold. *Darley, W.*, population of the township of Menwith with Darley 718, about 5 miles W. from Ripley, on the right bank of the river Nidd, the waters of which work the machinery of several mills for spinning flax, and for grinding corn. Grazing is much attended to in the neighbourhood. *Deighton, W.*, population returned with the parish of Huddersfield, about 2 miles N.E. by E. from Huddersfield, is distinguished by the manufacture of velveteens and woollen cords. Christ church, a new district church in the style of the 13th century, was erected in 1829 at the cost of John Whitacre, Esq. The Wesleyan Methodists have places of worship, and there are National and Infant schools. *Drighlington, W.*, population of the chapelry 2740, about 6 miles S.W. from Leeds, has a chapel of ease, a chapel for Wesleyan Methodists, and a Grammar school. Malting, boot- and shoe-making, and the manufacture of woollen goods are the chief occupations. *Dunnington, E.*, population of the parish 779, about 4½ miles E. by N. from York, has a neat parish church and a National school. There are here a very extensive establishment for the manufacture of chicory; agricultural machines are also made. *Ecclesfield, W.*, population of the township 10,005, is about 5 miles N. from Sheffield. The inhabitants are chiefly engaged in various branches of the Sheffield cutlery trade. There are here a parish church and chapels for Wesleyan Methodists and Independents; in the parish are several schools and almshouses. Rope- and twine-making, flax-dressing, linen-weaving, nail-making, and malting are carried on, and there are flour-mills. *Elland, W.*, population of the joint township of Elland with Greetland 7225, about 4 miles S. by E. from Halifax, on the right bank of the river Calder, which is here crossed by a bridge of three arches; the coach-road is carried across the valley of the Calder by an extensive viaduct. The chief manufacture of the place is coarse woollen-cloth. Some branches of the cotton manufacture are also carried on. Wool-carding and other machines are made. There are chemical-works, flour-mills, dye-works, fulling-mills, collieries, and an iron-foundry. An ancient chapel, a Grammar school, and National and Charity schools are in the village. *Emley, W.*, population of the township 1706, is about 6 miles E. by S. from Huddersfield. Besides the parish church, there are chapels for Wesleyan and Primitive Methodists and a British school. The inhabitants are employed in the neighbouring collieries, and in wool-combing and weaving. Fairs are held on Lady-day and Michaelmas-day. *Farnley, W.*, population of the chapelry 1722, stands on elevated ground about 4 miles S.S.E. from Leeds. It has a chapel of ease, a chapel for Wesleyan Methodists, and National schools. Woollen cloth of fine quality is made. There are corn-mills, malt-houses, iron-foundries, and boiler-making factories. *Filey, E.*, population of the township 1511, is situated on the coast, at the northern extremity of Filey Bay. The church was repaired and enlarged a few years back; there are chapels for Wesleyan and Primitive Methodists, National and Infant schools, and a Wesleyan school. Filey is resorted to as a bathing-place. Fishing is carried on to a considerable extent. *Flockton, W.*, population of the chapelry 1040, about 5 miles E. by S. from Huddersfield, contains a chapel of ease and an Independent chapel. The inhabitants are chiefly dependent on the neighbouring collieries. *North Frodingham, E.*, population of the parish 846, near the Hull River, about 5 miles S.E. from Great Driffield, was once a market-town. It contains, besides the parish church, chapels for Wesleyan and Primitive Methodists and Independents, and National and British schools. *Fulford Gate, E.* population of the township 1939, is a

pleasant village on the left bank of the Ouse, a mile and a half S. from York. Fulford contains the parish church, National and Infant schools, York barracks, and the excellent lunatic asylum of the Society of Friends, called the Retreat. *Gargrave, W.*, population of the township 1214, stands on the right bank of the Aire, 3 miles W. by N. from Skipton. Besides the parish church, there are chapels for Wesleyan and Primitive Methodists, and National and Infant schools. Factories for spinning worsted and cotton give employment to many of the inhabitants. On the Leeds and Liverpool Canal, which passes through the parish, are extensive warehouses. Petty sessions are held here. A large cattle-fair is held on December 11th. *Gildersome, W.*, population of the chapelry 2126, is about 4 miles S.W. from Leeds. Besides the ancient parochial chapel, there are places of worship for Wesleyan Methodists, Baptists, and Quakers. The inhabitants are chiefly employed in the woollen manufacture, and in the neighbouring coal-mines and quarries. *Glusburn, W.*, population of the township 1320, on the Aire, is 5 miles S. from Skipton. In the village are a Wesleyan and a Primitive Methodist meeting-house. The stuff manufacture is carried on. *Golcar, W.*, population of the chapelry 4212, is about 3 miles W. by S. from Huddersfield. The church was erected in 1829. There are two Free schools and a National school. At Golcar are several extensive factories of coarse woollen-cloths for the Huddersfield houses; fine cloth is also made. *Gomersal, W.*, population of the township 9926, is situated about 7 miles S.W. from Leeds. The Wesleyan Methodists, Independents, and Moravians have chapels. There are National and Infant schools, and a Moravian school for girls. The manufacture of woollen-cloths and worsted-yarns is carried on. *Hatfield, W.*, population of the township 1840, about 2 miles S.S.W. from Thorne, is a large and handsome village. The church, which is ancient, has a lofty tower. There are an Independent chapel and a National school. Nails, tiles, and bricks are made here. A fair is held on November 16th. Petty sessions are held in the village. William de Hatfield, second son of Edward III., was born here. Hatfield Chase, a level waste of 180,000 acres, was granted by Charles I. to Cornelius Vermuyden, who drained it at a vast and to himself ruinous expense. [A. HOLME, ISLE OF.] *Haworth, W.*, population of the chapelry 6848, is on the edge of the Morro, 10 miles W. by N. from Bradford. The village contains the district chapel, rebuilt in 1757; two chapels for Baptists, and one each for Wesleyan and Primitive Methodists; and National and Wesleyan schools. The manufacture of stuffs and worsted spinning are the chief occupations. *Headingley, W.*, about 2 miles N.W. from Leeds, population 6105, is chiefly dependent on the woollen manufacture. Several good villa residences are occupied by Leeds merchants. *Hebden Bridge, W.*, population of the ecclesiastical district 3763, about 8 miles E. by N. from Halifax town, is pleasantly situated near the junction of the rivers Calder and Hebden. An aqueduct of four arches, strongly built of stone, carries the Leeds and Liverpool Canal over the united streams. In the village are a district church, and chapels for Wesleyan and Association Methodists, and Baptists. The cotton and worsted manufactures, with spinning and dyeing, are carried on extensively. *Heckmondwike, W.*, population of the township 4540, about 8 miles E. by S. from Halifax, contains a chapel of ease, built in 1831, chapels for Wesleyan and Primitive Methodists and Independents, and National and Subscription schools. The blanket, carpet, woollen-cloth, and woollen-yarn manufactures are the chief sources of employment. Cattle-fairs are held in May and November. *Hesley, W.*, population of the ecclesiastical district 2662, is about 2 miles S. from Sheffield, of which it may be regarded as a suburb. The church is a neat cruciform gothic edifice, erected in 1848; there are a Wesleyan Methodist chapel and a National school. *Heptonstall, W.*, population of the township 4177, about 8½ miles W.N.W. from Halifax, has extensive cotton manufactures, with some mills for worsted spinning and the worsted manufacture. There are a chapel of ease, chapels for Wesleyan Methodists and Baptists, a Grammar school, and an Infant school. *Hessle, E.*, population of the parish 1576, on the left bank of the Humber, about 5 miles W. by S. from Hull, has a parish church, chapels for Wesleyan and Primitive Methodists, Free schools, and a small Endowed hospital. Hessle House is a lunatic asylum for female patients. Over the Humber is an ancient ferry. *Hipperholme, W.*, population of the township 6091, is about 2½ miles E. from Halifax; it is a place of residence for many persons engaged in business in Halifax. In the township are two Episcopal chapels and an Independent chapel, a Free Grammar school, and a National school. *Holme, E.*, population of the parish 1713, about 4 miles W.S.W. from Market Weighton, has an ancient parish church, chapels for Wesleyan and Primitive Methodists and Roman Catholics; National schools; a school supported by Wesleyan Methodists; and a Roman Catholic Free school. *Holme-ferth, W.*, population included with the parishes of Almondbury and Kirk Burton, is situated near the union of the Holme and Ribblesden streams, about 7 miles S. from Huddersfield. On both these streams there are mills for the woollen manufacture. There are also flour-mills, fulling-mills, hat manufactories, dye-works, machine-factories, &c. Holmeferth is lighted with gas. There is a town-hall, erected in 1842. Petty sessions and a county court are held here. Besides the Episcopal chapel, there are chapels for Wesleyan Methodists and Independents; a National school; and a mechanics institute, with a library, museum, and reading-room. Three annual fairs are held

On the night of the 4th of February, 1852, the Bilberry Dam reservoir, a short distance above Holmefrith, burst its embankments, carrying away many mills and dwelling-houses, and causing a great loss of life and destruction of property. Public sympathy was much excited, and a subscription was entered into, which reached so large an amount, that after alleviating as much as possible the distresses of survivors, more than a third of the sums subscribed was returned to the subscribers to the fund. The embankments of the reservoir have since been repaired and strengthened. *Honley, W.*, population of the township 5595, about 3½ miles S. from Huddersfield, has extensive manufactories of fancy and other woollen goods, dye-works, scribbling and fulling-mills, machine-factories, collieries, tan-works, &c. There are a chapel of ease, chapels for Wesleyan Methodists and Independents, National and Infant schools, and a mechanics institute. *Horbury, W.*, population of the chapelry 2803, is about 3 miles W.S.W. from Wakefield. The inhabitants are dependent on the woollen manufacture. It contains a handsome chapel of the establishment, erected by Mr. John Carr, architect, at his own cost; two Methodist chapels; a Free school, and National and Infant schools. *Horsforth, W.*, population of the chapelry 4584, about 5 miles N.N.W. from Leeds, has large manufactories for woollen-cloth, fulling-mills, paper-mills, flour-mills, stone-quarries, and malting-works. There are here a neat chapel, erected in 1775; a district church, and chapels for Wesleyan Methodists and Baptists. *Hovingham, N.*, population of the township 622, about 7 miles S.S.E. from Helmsley, has a parish church, a chapel for Wesleyan Methodists, and a Free school. In 1745, a Roman hypocaust and bath were found in the garden attached to Hovingham hall. *Hoyland, Nether, W.*, population of the chapelry 2912, is about 9 miles N. from Sheffield. The church was erected in 1831; there are a Wesleyan Methodist and an Independent chapel, a National school, and a mechanics institute. Lime-burning, tanning, nail-making, and malting are carried on. At Elsecar, in the chapelry, is a new church, erected in 1843, by Earl Fitzwilliam, who is proprietor of the Elsecar iron- and steel-works. At Milton iron-works, near Hoyland village, very extensive operations are conducted in iron manufactures, including steam-engines, bridges, and works of similar magnitude. *Idle, W.*, population of the chapelry 7118, about 3 miles N. by E. from Bradford, is pleasantly situated on elevated ground. Worsted spinning, several branches of the woollen manufacture, stone and slate quarries, malting, and basket-making furnish employment to many of the inhabitants. There are here a neat gothic church, chapels for Wesleyan and Primitive Methodists, Independents, and Baptists, and National and Infant schools. *Ilkley, W.*, population of the township 811, stands in a very picturesque situation on the right bank of the Wharfe, about 6 miles N.W. from Otley. Ilkley is resorted to in summer on account of a cold bath, the waters constituting which flow from the side of a high hill which overlooks the village. The Wharfedale Hydropathic establishment and hotel are at Ben Rhydding near Ilkley. There are here an ancient parish church, an old Free school, and a mechanics institute. *Kivham, E.*, population of the parish 1247, about 5 miles N.N.E. from Great Driffield, is pleasantly situated on a declivity of the Wolds. There are here an ancient and commodious parish church, chapels for Baptists, and Wesleyan and Primitive Methodists, a Free Grammar school, and National and Infant schools. Fairs are held on August 21st and November 12th. *Kirk Burton, W.*, population 3560, about 5 miles S.E. from Huddersfield, has a parish church, erected in the time of Edward III., chapels for Wesleyan and Primitive Methodists and Independents, and National and Free schools. The manufacture of fancy goods and of woollen-cloth is carried on. Fairs are held in April and October. *Kirk Heaton, W.*, population 3086, about 3 miles E.N.E. from Huddersfield, has an ancient parish church, three chapels for Methodists, and a free school. There are collieries, chemical-works, and dye-works. *Kirk Leatham, N.*, population of the township 789, is about 14 miles N.N.E. from Stokesley. Turner's hospital has an income of about 1600*l.* a year. *Kirkstall, W.*, population of the ecclesiastical district 2934, about 3 miles N.W. from Leeds, is chiefly known on account of its celebrated abbey, but has a considerable manufacture of woollens. There are also extensive iron-foundries, manufactories of machinery and steam-engine boilers, railway-wheels, agricultural instruments, and mechanical tools; and on the Aire are extensive corn-mills. A large and handsome gothic church, with a lofty spire, was erected here in 1831; the Wesleyan Methodists have a chapel, and there are National and Wesleyan schools. Kirkstall Abbey was founded for monks of the Cistercian order by Henry de Lucy in 1147. The remains consist of portions of the refectory, dormitory, chapter-house, and cloisters. *Knottingley, W.*, population of the chapelry 4540, is a large and busy village on the right bank of the Aire, at its junction with the Knottingley and Goole Canal, 2½ miles N.E. from Pontefract. Christ church is a handsome edifice erected in 1848; there is also a chapel dedicated to St. Botolph. The Wesleyan Methodists and Independents have places of worship, and there are National, British, and Infant schools, and Banks's Free school for girls. There is a marine insurance society. The village is lighted with gas. There are large brick- and tile-works, lime-works, and potteries; also corn-mills of great power. Brewing is carried on, and there are yards for building of boats and vessels of light burden. *Lepton, W.*, population of the township 8592, is about 3½ miles E. by

S. from Huddersfield. The manufacture of woollen-cloth and of fancy woollen goods, the making of cards for jacquard looms, scribbling and fulling-mills, and chemical works, furnish employment to the working population. *Linthwaite, W.*, population of the township 3802, about 4½ miles S.W. from Huddersfield, has a district church, two chapels for Baptists, two for Wesleyan Methodists, and a National school. The manufactures are those of woollen-cloth and small wares. *Lytke, N.*, population of the township 1094, is on the coast, 4 miles N.W. from Whitby. The church was restored a few years back; there is a Dissenting chapel. Many of the inhabitants are employed in alum-works. *Marsden, W.*, population of the chapelry 2665, about 7 miles S.W. from Huddersfield, is situated on the banks of the rivers Wessenden and Colne. The woollen-cloth manufacture is extensively carried on. There are also a mill for the spinning of silk and a very extensive iron-foundry, in which water-wheels, steam-engines, steam-engine boilers, and other large pieces of machinery are made. There are in Marsden a chapel of ease, chapels for Wesleyan Methodists and Independents, a National school, a Town school, and a school conducted by Independents. Fairs are held at Marsden in April, July, and September; that in September is a great cattle fair. *Medham, W.*, population of the chapelry 3758, about 5 miles S.S.W. from Huddersfield, contains numerous mills for the manufacture of woollen-cloth; for cotton-spinning; for the manufacture of sewing-cotton; and for silk-throwing. There are also collieries, an iron-foundry, dye-works, and fulling-mills. In 1835 the parish church was enlarged, and the present tower erected. There are chapels for Baptists and Wesleyan Methodists, and a Church school. *Meorborough, W.*, population of the township 1506, is about 6 miles N.N.E. from Rotherham. Besides the parish church, a spacious ancient edifice with a tower and spire, there are chapels for Wesleyan, Primitive and New Connexion Methodists; and National and British schools. Here are an extensive iron-foundry, engineering and railway wheel-works; the Don bottle- and glass-works; an extensive pottery; and stone-quarries and collieries. *Mirfield, W.*, population of the parish 6966, about 3 miles W. by S. from Dewsbury, has a large share of the woollen-cloth manufacture; malting is carried on, and there are several corn-mills. There are here an ancient parish church; chapels for Wesleyan, Primitive, and New Connexion Methodists, Baptists, and Moravians; a Moravian school, and a National school. *Monk Bretton, W.*, population of the township 1810, is 2 miles N.E. from Barnsley. Besides the church there are Wesleyan and Primitive Methodist chapels, National schools, and Talbot's hospital for six poor widows. The inhabitants are chiefly employed in linen-weaving and bleaching. *Morley, W.*, population of the township 4821, about 4 miles W. from Leeds, has manufactories of woollen-cloth. In the village are a parochial chapel; chapels for Wesleyan and Primitive Methodists, and Independents; National schools, and schools supported by Independents and Wesleyan Methodists. *Newport Walfingen, or New Village, known also as Riverbridge, E.*, population of the township 873, about 7 miles E. by N. from Howden, is a village of recent origin. The place was a fen, or uncultivated morass, but towards the close of last century, the manufacture of bricks, tiles, and coarse earthenware was commenced, and has continued to increase. There are chapels for Wesleyan and Primitive Methodists. *Norton [NEW MALTON]. Osmotherley, N.*, population of the township 985, is about 7 miles E.N.E. from Northallerton. There are here a parish church, places of worship for Wesleyan Methodists, Quakers, and Roman Catholics; and a National school. Linen-weaving and bleaching are carried on. *Osett, W.*, population of the joint township of Osett with Gawthorpe 6266, about 4 miles W. from Wakefield, is important for its extensive woollen manufactures; worsted-spinning also employs many of the inhabitants. There are here a district church, chapels for Wesleyan and Primitive Methodists and Independents; National, Free, Wesleyan Methodist, and Infant schools; and two subscription libraries. *Oulton, or Oulton, W.*, population of the township 1771, about 5 miles S.E. from Leeds, is a neat village, containing a fine gothic church, with a lofty spire, a chapel for Wesleyan Methodists, and National and Infant schools. Tanning, paper-making, nail-making, malting and brewing are carried on. *North Owsam, W.*, population of the township 15,285, about 2 miles N.N.E. from Halifax, has extensive stuff manufactories, and stone-quarries. There are a chapel for Independents, and an Infant school. *South Owsam, W.*, population of the township 7880, about 2 miles S.E. from Halifax, possesses important stone-quarries; and many of the inhabitants are engaged in the worsted manufacture. There are here a chapel of ease, a chapel for Wesleyan Methodists, and a National school. *Paddock [HUDDERSFIELD]. Paul, or Paghil, E.*, population of the township 606, about 2 miles S.W. from Hedon, on the left bank of the Humber, possesses an extensive shrimp fishery. Several line-of-battle ships were built here during the French war. Paul's church is a small cruciform church of the decorated style. A lighthouse was erected at Paul in 1886. *Pudsey, W.*, population of the ecclesiastical district 1948; of the township 11,603, about 4 miles E. by N. from Bradford, possesses extensive manufactories of woollen-cloth. There are here a handsome gothic church, chapels for Wesleyan and New Connexion Methodists, and Independents, and National schools. Rope-making, tanning, hat-making, and brewing are carried on. *Rastrick, W.*, population of the chapelry 3917, is about 6 miles S.E. from Halifax. Machine-making, card-making, and the manufacture of stuff and fancy

goods, employ some of the population. The village possesses a neat church, places of worship for Independents and Quakers, an Endowed Free school, and a British school. *Rawmarsh, W.*, population of the parish 2583, about 2 miles N. by E. from Rotherham. In the vicinity are extensive steel-works, a manufactory of sheet-iron and rails for railways, and considerable pottery establishments. There are here a parish church, two chapels for Dissenters, a Grammar school, and an Infant school. *Redcar, N.*, population of the township 1032, about 6 miles N. from Guisborough, is situated on the shore of the North Sea, near the mouth of the river Tees. The coast at this point is extremely dangerous, in consequence of which a life-boat is maintained at the place. The town is much resorted to by visitors for sea-bathing. *Ripponden, W.*, is about 6 miles S. from Halifax, finely situated on the river Ryburn, in a fertile vale. There are here cotton-spinning establishments, and manufactures of fustians and other cotton goods. In the village are a district church and a National school. Cattle fairs are held on the Wednesday in Easter week, and the Thursday after Michaelmas day. *Rishworth, W.*, population of the township 1540, is about 7 miles S.S.W. from Halifax. Wheelwright's School, established in 1725, has an income from endowment of about 2000*l.* a year. The inhabitants are largely engaged in cotton-spinning. *Rothwell, W.*, population of the township 3052, about 6 miles N. by E. from Wakefield, has a parish church, a chapel for Wesleyan Methodists, and National, Wesleyan, and Infant schools. Near the church are remains of a castle or castellated mansion. Rope- and twine-making, basket-making, malting, hat-making, and paper-making, are carried on in the village. *Ruswarp, N.*, population of the township, 2163, is about 2 miles S. from Whitby. Across the Eak here the Whitby and Pickering railway is carried by a wooden bridge of excellent construction. At a short distance is an elegant suspension-bridge. *Saltwaite, W.*; the village of this name will be found under *Manufactures*, ante, col. 1205. *Great Sandall, W.*, population of the township 1586, about 2 miles S.E. from Wakefield, possesses a neat parish church, a Free school, a School of Industry, and an Infant school. *Shipley, W.*, population of the township 3272, is about 3 miles N. by W. from Bradford, on the right bank of the river Aire. The woollen manufacture employs many persons in the village. The making of machines, railway-carriage wheels, whiting, and paper is carried on. There are here a district church, chapels for Wesleyan Methodists and Baptists, a Church school, and a British school. *Silkestone, W.*, population of the township 1037, is about 3 miles W. from Barnsley. The church is of the early English style. There are chapels for Wesleyan and Primitive Methodists, and a National school. The collieries of the neighbourhood are very extensive. *Siladen, or Sighelden, W.*, population of the hamlet 2508, is about 4 miles N. from Keighley. Considerable quantities of nails are made here. There is a handsome gothic church, rebuilt in 1815, with a fine square tower. In the village is a National school. *Skelmanthorpe, W.*, about 8 miles N.W. by W. from Barnsley. A handsome new church and school-house have been recently erected. The Wesleyan and Primitive Methodists have places of worship, and there is a National school. Fancy woollens are manufactured here. *Staithe, W.*, population of the chapelry 2852, about 5 miles S.W. from Huddersfield, possesses extensive manufactories of woollen-cloth and small wares. Cotton-spinning, machine-making and brewing are carried on; and there are fulling- and scribbling-mills. There are here a large chapel of the Establishment, a National school, and a Classical and Commercial academy. *Sowerby, or, as it is commonly called, Sowerby Town, W.*, population of the township 7908, about 3½ miles S.W. from Halifax, stands on an elevated site. In the chapel of ease is a statue of Archbishop Tillotson, who was born at Sowerby. A district church was erected in 1840 in the Norman style, and dedicated to St. George. The Wesleyan Methodists, Independents, and Baptists have chapels, and there is a National school. Weaving and wool-combing are carried on to a large extent. *Spafforth, W.*, population 1118, about 15 miles W. from York, has a parish church and a chapel for Wesleyan Methodists. This place was in ancient times the chief seat of the Percy family. Of the castle, there are ruins of the grand hall, upwards of 70 feet long, with large pointed gothic windows. *Stainland, W.*, population of the township 4173, is about 4 miles S. from Halifax. The woollen manufacture and cotton spinning employ a considerable number of the inhabitants. There are here a church, erected in 1840, and chapels for Wesleyan Methodists and Independents. *Staithe, N.*, population included in the chapelry of Roxby, is situated on the coast, about 11 miles N.W. by W. from Whitby. The inhabitants cure a considerable portion of their take of herrings for exportation. A short distance along the coast westward are extensive alum-works. *Stanningley, W.*, population included with the parishes of Leeds and Calverley, is about 3½ miles N.E. from Bradford, on the road between Bradford and Leeds. There are in the village a district church, chapels for Wesleyan and Primitive Methodists and Baptists, and a Town's school. Besides woollen and worsted manufactories there are extensive iron-foundries; and factories for steam-engines and railway wheels, and for machines used in the woollen manufacture. *Stannington, W.*, is 4 miles W. by N. from Sheffield: population of the ecclesiastical district 2856. The church was erected in 1830; there are a Wesleyan Methodist and a Unitarian chapel, and a National school. *Swinfleet, W.*, population of the township 1162,

on the right bank of the river Ouse, about 2 miles E. by S. from Goole, has a chapel of ease, an ancient brick building; chapels for Wesleyan and Primitive Methodists; a National school; and a school supported by Wesleyan Methodists. *Swinston, W.*, population of the chapelry 1817, about 5 miles N. by E. from Rotherham, is the chief seat of the china and earthenware manufacture in this part of the country. The principal works are the well-known Rockingham Works and the Don Pottery. There are also iron-works, stone-quarries, and collieries. St. Mary's church was rebuilt in 1816; there are chapels for Wesleyan Methodists and Independents; a National and an Infant school. *Thornhill, W.*, population of the township 2791, is about 2 miles S. from Dewsbury, on the right bank of the river Calder. The parish church is an early English structure. There are chapels for Wesleyan Methodists and Baptists, a Free Grammar school, and a Free school. Tanning, lime-burning, malting, and boat-building are carried on. In the vicinity are chemical-works, glass-bottle-works, iron-works, and coal-mines. *Thornton, W.*, population of the township 8051, about 4 miles W. from Bradford, is largely engaged in the worsted manufacture; there are here a chapel of ease, chapels for Wesleyan Methodists and Independents, and National and Free schools. The manufacture of Heald yarn, shuttle-making, and clog-making, give some employment. *Thornton Dale, N.*, population of the parish 927, about 2½ miles E. by S. from Pickering, contains, in addition to the parish church, chapels for Wesleyan and Primitive Methodists, Lady Lumley's Free Grammar school, almshouses, and a British school. *Thurstone, W.*, population of the township 2018, is one mile and a half W. from Penistone, in the midst of a wild moorland tract. The Wesleyan Methodists and Independents have places of worship. The woollen-cloth manufacture is carried on; in the vicinity are numerous gritstone-quarries. *Thurstonland, W.*, population 1320, is about 7 miles S. from Huddersfield, in the Holme-firth valley. The inhabitants are engaged in the woollen manufactures, and in the coal-mines of the vicinity. There are here a chapel of ease, a chapel for Wesleyan Methodists, and a Free school. *Topcliffe, N.*, population of the township 710, about 4 miles S.S.W. from Thirsk, occupies a romantic situation on the left bank of the river Swale. The parish church is of considerable antiquity: the Wesleyan Methodists have a chapel, and there is a Grammar school. Fairs for sheep, horned cattle, and horses are held on July 17th and 18th. In the parish are some remains of Maiden Bower, a seat of the Percys. *Wadley, W.*, population of the ecclesiastical district 4333, occupies a pleasant situation on an eminence above the right bank of the Don, 4 miles N.W. from Sheffield. There are here a neat gothic church, and Free, National, and Infant schools. The inhabitants are engaged in the manufacture of the coarser kinds of pocket-knives. At Wadley Bridge are extensive steel-works. *Wath-upon-Dearne, W.*, population of the township 1495, is situated on a slope near the Dearne and Dove Canal, 5 miles N. by E. from Rotherham. Besides the parish church there are a Wesleyan Methodist chapel, an Endowed Free school, a Girls and an Infant school. Many of the inhabitants are employed in extensive potteries, iron-works, and collieries. *Wellton, E.*, population of the township 682, about 10½ miles E. from Hull, has a very ancient parish church, a Wesleyan Methodist chapel, and a National school. *Wentworth, W.*, population of the township 1556, is pleasantly situated about 4 miles N.W. from Rotherham. Besides the parish church there are Free, National, and Infant schools, a mechanics institute, and an hospital for six poor men and six poor women. Wentworth is the property of Earl Fitzwilliam, whose splendid seat, Wentworth House, stands in a fine park, a little to the south-east of the village. The mansion has a facade 300 feet long; the gallery, 130 feet long, contains a fine collection of paintings by the great Italian masters. In the park is a mausoleum erected in honour of the celebrated Marquis of Rockingham. *Whitely, W.*, population of the township 636, about 11 miles N.W. by W. from York, has a parish church, a Wesleyan Methodist chapel, and Tancred's hospital for 12 decayed gentlemen. Tanning is carried on, and in the vicinity are market-gardens and nurseries. *Widens, W.*, population 3454, about 5 miles N.W. from Bradford, has extensive manufactories of worsted-yarn and worsted-cloth. There are a district church, chapels for Wesleyan Methodists and Independents, National schools, and a mechanics institute. *Witton, East, N.*, population of the parish 610, is pleasantly situated about 2 miles S.E. from Middleham. The church is a neat building, erected about 1810 by the Marquis of Ailesbury. The village is the property of the Marquis of Ailesbury, whose mansion is at a short distance from the ruins of Jervaulx Abbey. This abbey was founded about the middle of the 12th century. The ruins are much visited. *Wooddale, W.*, population of the township 5600, about 5½ miles S. from Huddersfield. The woollen-cloth manufacture and the collieries are the chief sources of employment. The Wesleyan Methodists and Quakers have places of worship, and there is a Wesleyan school. *Worsborough, W.*, population of the township 4250, is situated in Worsborough Dale, 3 miles S. from Barnsley. Besides the parochial chapel, which is ancient, the Wesleyan Methodists have a chapel, and there is a Free school. In the village and its immediate neighbourhood are iron- and glass-works, paper-mills, and collieries. *Yeadon, W.*, population of the ecclesiastical district 4109, about 3½ miles S. by E. from Otley, is a busy manufacturing village, with a new church, and chapels for Wesleyan and Primitive Methodists.

Divisions for Ecclesiastical and Legal Purposes.—Yorkshire is in the archiepiscopal province of York. The county is divided between the dioceses of York and Ripon, which are subdivided as follows:—The diocese of York consists of the archdeaconry of York, or the West Riding, containing the deaneries of the city of York and Ainsty, and of Doncaster; the archdeaconry of the East Riding, containing the deaneries of Buckrose, Dickering, Harthill and Hull, of South Holderness, and of North Holderness; and the archdeaconry of Cleveland, containing the deaneries of Bulmer, Cleveland, and Ridall. The diocese of Ripon consists of the archdeaconry of Craven, containing the deaneries of Craven and of Pontefract; and the archdeaconry of Richmond, containing the deaneries of Boroughbridge, Richmond, Ripon, Catterick, and Clapham.

Yorkshire is in the northern circuit, and the assizes are held at York. The quarter sessions for the city are held at York, those for the East Riding at Beverley, those for the North Riding at Northallerton, and those for the West Riding at Pontefract, Skipton, Bradford, Rotherham, Knareborough, Leeds, Doncaster, Wakefield, and Sheffield. County courts are held at Barnsley, Beverley, Boston, Bradford, Bridlington, Dewsbury, Doncaster, Great Driffield, Easingwold, Goole, Halifax, Hedon, Helmsley, Holmfirth, Howden, Huddersfield, Keighley, Kingston-upon-Hull, Knareborough, Leeds, Leyburn, New Malton, Northallerton, Otley, Pocklington, Pontefract, Richmond, Ripon, Rotherham, Saddleworth, Scarborough, Selby, Settle, Sheffield, Skipton, Stokesley, Thirsk, Thorne, Wakefield, Whitby, and York. In our notice of PICKERING it is erroneously stated that a county court is held in that town. The county jail is at York, the house of correction for the North Riding at Northallerton, that for the East Riding at Beverley, and that for the West Riding at Wakefield; and there are other prisons at York, Richmond, Beverley, Hull, Leeds, Bradford, Knareborough, Ripon, Pontefract, Rotherham, Doncaster, Halifax, Sheffield, and Rothwell. A new lunatic asylum for the East and North Ridings, capable of containing 320 patients, has been recently erected at Clifton near York, at a cost of about 50,000*l.* The lunatic asylum for the West Riding is at Wakefield. For poor-law purposes the three Ridings are treated as distinct counties. By the Poor-Law Commissioners the East Riding is divided into 10 Poor-Law Unions:—Beverley, Bridlington, Driffield, Howden, Kingston-upon-Hull, Patrington, Pocklington, Seuloates, Skirlaugh, and York. These unions include 370 parishes and townships, with an area of 714,661 acres, and a population in 1851 of 250,463. The North Riding is divided into 16 unions:—Bainbridge, Bedale, Easingwold, Guisborough, Helmsley Blackmoor, Kirkby Moorside, Leyburn, Malton, Northallerton, Pickering, Reeth, Richmond, Scarborough, Stokesley, Thirsk, and Whitby. These unions include 485 parishes and townships, with an area of 1,218,180 acres, and a population in 1851 of 195,735. The West Riding is divided into 30 unions:—Barnsley, Barwick, North Bierley, Bradford, Carlton, Dewsbury, Doncaster, Ecclesall Bierlow, Goole, Halifax, Hemsworth, Huddersfield, Keighley, Knareborough, Leeds, Ouseburn, Pateley Bridge, Penistone, Great Preston, Ripon, Rotherham, Saddleworth, Sedburgh, Selby, Settle, Sheffield, Skipton, Thorne, Wakefield, and Wortley. These unions include 642 parishes and townships, with an area of 1,602,584 acres, and a population in 1851 of 1,237,675.

Each of the three Ridings of Yorkshire has a distinct lord-lieutenant. The county of York anciently sent two members to parliament, but this number was increased to four before the passing of the Reform Act, by the addition of two members taken from the disfranchised borough of Grampound, in Cornwall. Under the Reform Act each of the three Ridings has the right of electing two members, those for the North Riding being elected at York, those for the West Riding at Wakefield, and those for the East Riding at Beverley. The same Act disfranchised the boroughs of Aldborough, Boroughbridge, and Hedon; reduced Thirsk and Northallerton from two members each to one each; gave one member each to Huddersfield, Wakefield, and Whitby; and two each to Bradford, Halifax, Leeds, and Sheffield. The places which formerly sent members, and retained two each under the Reform Bill, are Beverley, Hull, Knareborough, New Malton, Pontefract, Richmond, Ripon, Scarborough, and York. The total number of members returned from the county prior to the Reform Act was 32; the number abolished by that Act was 8, and the number added 13; thus making the present number of representatives 37.

History and Antiquities.—At the time of the invasion of Britain by C. Julius Cæsar, this part of the island, together with the neighbouring counties, was inhabited by the Brigantes. The Roman power was not established in this district until the reign of the Emperor Vespasian, when, about the year A.D. 71, the Brigantes were subdued by Petilius Cerialis. Nearly half a century later, about the year 120, the Emperor Hadrian formed a wall or rampart of earth across the island from Solway Frith to the German Ocean, and subsequently took up his residence for a time at Eboracum, now the city of York. After Hadrian left, the Brigantes attempted to throw off the Roman yoke; but the next remarkable event in the history of Yorkshire is the visit of the Emperor Septimius Severus, who, about the year 206 or 207, came over in person, and after proceedings of which a brief account is given under BRITANNIA, died about the year 210 or 211, at York. The Emperor Constantius Chlorus resided for a considerable

time at York, and died there in 306 or 307; and his son Constantinus, commonly called Constantine the Great, was proclaimed emperor at that city by the soldiery.

Being chosen by the Romans as an occasional residence and a centre of government, York and the surrounding country were supplied with many marks of their power and skill. They bestowed great attention upon the public roads. The Watling-street entered the county from Nottinghamshire near Bawtry, and, according to Baines, "it has been traced by Doncaster, over Scausby and Pigburn Leas to Barnsdale, through Pontefract to Castleford, a little below the junction of the Aire and Calder, from which point the road was conducted by Tadcaster to York." Another military road led from Mancunium, now Manchester, to York, and passing by Stainland, about 5 miles S. from Halifax, and Almondbury, about 2 miles S.E. from Huddersfield, crossed the Calder about a mile below Dewsbury, and proceeded along the line of the present turnpike-road to Wakefield, whence it continued in the direction of the present road about half way to Pontefract, and then, turning to the left, joined the military way from Doncaster to York. The Romans had numerous other roads of minor importance in the county. Traces of Roman encampments, as well as of Saxon and Danish encampments, may be found in several parts of the county; and Roman antiquities have been discovered in many places, especially in York and its vicinity. The Wolds contain many tumuli; and of the other prehistoric antiquities may be mentioned a curious assemblage of rocks called Bramham Crags, about 9 miles N.W. from Ripon, which from indications of rude sculpture have been by many supposed to have been a Druidical temple; and three gigantic obelisks or single stones, called the Devil's Arrows, noticed under BOROUGHBRIDGE. The principal Roman stations were at Eboracum, now York; Cataracton, or Cataractonium, now Catterick; Cambodunum, at Slack; Laurium, at Aldborough; Legiolium, a little below the junction of the Aire and Calder; Danum, at Doncaster; Olicana, or Alicana, at Ilkley; Calcaria, at Tadcaster; Derwentio, near Stamford Bridge; Delgovitia, near Londesborough; and Prætorium, at Flamborough.

Yorkshire formed part of the British kingdom of Deifyr, or Deira. The boundaries of the Saxon and subsequently the Danish kingdom of Northumbria, in which Deira was included, varied frequently with the fortunes of war, but it generally included the greater part of Yorkshire. Of the history of the kingdom of Northumbria, and the varying governments of its principal divisions, Bryneich, or Bernicia, in the north, and Deifyr, or Deira, the southern or Yorkshire division of the kingdom, an account is given under NORTHUMBERLAND. Christianity appears to have been introduced into Yorkshire about the year 628, during the reign of Edwin, king of Northumbria. The history of this district down to the time of Harold, the last of the Anglo-Saxon kings, is noticed in the article NORTHUMBERLAND. Of the events which followed Harold's victory at Hastings, so far as they relate to this county, some particulars are stated under YORK. In the Domesday Survey, Yorkshire is called Ewrewickscire, and appears then to have comprehended very nearly its present limits.

In the year 1138, during the reign of Stephen, the north of England, as far as York, was invaded and ravaged by David, king of Scotland, who was defeated near Northallerton, at the famous battle of the Standard. Piers Gaveston, the favourite of Edward II., was taken prisoner in Scarborough Castle, by the earls of Pembroke and Warren. In 1318 the northern part of the county was ravaged by the Scotch under Douglas. In the following year another invasion of the Scotch, under the Earl of Murray, advanced as far as York, and set fire to the suburbs, an indignity which so roused the Archbishop of York, that he, accompanied by the Bishop of Ely and a great number of clergymen, collected an army of about 10,000 men, and pursued Murray as far as Myton on the river Swale, about 12 miles from York, where a battle was fought, in which the English were routed. Shortly after, in 1321, Thomas, earl of Lancaster, leader of the barons, was defeated and taken prisoner at Boroughbridge; and he, with several of his party, was shortly afterwards beheaded at Pontefract. In 1347, David Bruce devastated the country as far as York, but was defeated by the English under Queen Philippa, at Neville's Cross, near Durham. Yorkshire formed the scene of many interesting events during the struggle between Richard II. and Bolingbroke, afterwards Henry IV. Richard II., after his deposition, was confined, successively, in the castles of Leeds, Knareborough, and Pontefract. In 1405 one of the conspiracies formed for the purpose of deposing Henry IV., by Percy, earl of Northumberland, Mowbray, earl marshal, and several other northern barons, and headed by Soroop, archbishop of York, was defeated by some of the leaders being drawn into a conference, and taken prisoners, and beheaded. Percy escaped on this occasion, but in February, 1408, being again in arms, he was defeated and slain at the battle of Bramham Moor, near Tadcaster, by Sir Thomas Rokesby, then sheriff of Yorkshire. During the long war between the houses of York and Lancaster this county was the scene of several remarkable events, among which was the defeat of Richard, duke of York, by the army of Queen Margaret, in 1460, at the battle of Wakefield, in which he lost his life. In the battle of Towton, when Richard's son, Edward IV., defeated the forces of Henry VI., the total number slain is reported to have been 38,776, including many leaders of distinction. Events having turned in favour of Henry, Edward fled to Holland in 1470; but in March of the following year he returned to England, landed at

Ravenspur with 2000 men, and, being well received, proceeded to York, where he planted a garrison, and thence marched towards London, and won the battle of Barnet, which established him on the throne.

During the reign of Henry VII. an insurrection of the northern counties against a new land-tax took place, but was eventually put down by the Earl of Surrey. In the following reign an insurrection was raised by Robert Aske, Lord D'Arcy, Sir Robert Constable, Sir Thomas Percy (brother to the Earl of Northumberland), and other powerful persons, to oppose the sweeping changes involved in the suppression of monasteries and other religious establishments; and, in consequence of the sacred character of the objects for which, professedly, they took up arms, they styled their march 'The Pilgrimage of Grace.' A similar but less important insurrection was raised in 1587 near Scarborough and Malton; the rebels obtained possession of Hull, and held it for about a month. A third insurrection, raised in the same neighbourhood in 1548, was dispersed with less difficulty.

Some of the earliest movements in the civil war by which Charles I. was dethroned took place in this county, Charles having, early in the year 1642, left London for York, where his adherents flocked to him. The sieges of HULL are noticed under that town, and many of the other proceedings under YORK. In 1643 Leeds was taken for the Parliament by Sir Thomas Fairfax, who subsequently took possession of Bradford, where he was besieged by the Earl of Newcastle, who failed in his attempts to carry the place by storm, but subsequently obtained possession owing to the exhaustion of the ammunition of the garrison, Fairfax escaping with a party of horse by cutting his way through the ranks of the besieging army. In the same year Queen Henrietta Maria landed at Bridlington with a supply of arms, which were safely conveyed to York, where she remained three months. The Earl of Newcastle subsequently defeated Fairfax at Beverley. In 1644 Fairfax gained a battle against the Royal forces near Selby, and afterwards, with the Scottish forces of the Earl of Leven, laid siege to York; but receiving intelligence of the approach of Prince Rupert, they raised the siege after it had been continued from April 19th to June 30th, and went to Marston Moor with a view of meeting the Royal army, which however having taken a different route arrived at York. Contrary to the advice of the Marquis of Newcastle, Prince Rupert left York on the 2nd of July to give battle to the Parliamentary army, by which he was completely routed in the destructive battle of Marston Moor. The Parliament soon afterwards obtained possession of York, after it had sustained in the whole siege 22 assaults; and they also took Tickhill Castle, Sheffield Castle, Knarborough town and castle, Helmsley Castle, and the town of Pontefract. At Scarborough the Royalists made a vigorous and protracted defence, but both town and castle at length fell into the hands of the Parliament. An insurrection was raised in the West Riding in 1663 by a body of misguided people, led by old parliamentary soldiers and others disaffected to the restored government; but it was quickly suppressed.

Among the more remarkable antiquities of Yorkshire, excepting those of the city of York itself, are the remains of the following fortresses:—Conisborough or Conisborough Castle, about 6 miles W. from Doncaster, is one of the earliest and most interesting ruins of the kind in England; in its immediate vicinity is a tumulus; Knarborough Castle, which was in a great measure destroyed during the civil wars, and about a mile from which, on the summit of a hill, are the remains of an ancient camp; Pontefract Castle, the walls of which were of enormous thickness, and which formerly covered seven acres; Skipton Castle, which, as well as that of Pontefract, was erected shortly after the Norman conquest; and the castles of Cawood, Harewood, Great Sandall, Sheffield, and Tickhill: these are all in the West Riding. The principal buildings of this character in the North Riding were the castles of Helmsley, Malton, Mulgrave, Pickering, Richmond, Scarborough, Sheriff-Hutton, and Skelton; while the more important castle in the East Riding was that of Wressle, an ancient seat of the Percys. There are a few ancient mansions in the county which remain tenable, among which are Temple Newsome, near Leeds, and Gilling Castle, near Helmsley.

The county of Yorkshire contained, according to Burton's 'Monasticon Eboracense, or Ecclesiastical History of Yorkshire,' about 106 religious houses, of which 14 were abbeys, 44 priories, 7 alien priories, 18 cells, and 28 houses of priors of various orders. There were also three preceptories, and three commanderies in the county. Of the above ecclesiastical establishments many ruins yet exist, some of which are exceedingly beautiful. The principal ruins of abbeys are those of St. Mary's, at York; of Fountains, Kirkstall, Roche, and Selby, in the West Riding; and of Byland, Rievaulx, and Whitby, in the North Riding. The chief priories are Bolton and Knarborough, in the West Riding; Guisborough, Mountgrace, and Wikeham, in the North Riding; and Bridlington, Kirkham, and Walton, in the East Riding. Many of the churches present striking specimens of ecclesiastical architecture, and some of them contain curiously sculptured ancient fonts.

Statistics, Religious Worship, and Education.—According to the Returns of the Census in 1851, it appears that there were then in Yorkshire 3609 places of worship, of which 1855 belonged to Methodists, as follows:—Original Connexion of Wesleyan Methodists, 1177;

Primitive Methodists, 476; Reformers, 77; New Connexion, 73; Wesleyan Association, 52. The Church of England had 1143 places of worship, Independents 242, Baptists 126, Roman Catholics 65, Quakers 58, Unitarians 23, Plymouth Brethren 17, Mormons 11, Swedenborgians 6, Presbyterians 4, and Jews 4. The total number of sittings provided was 1,006,156. Of Day schools there were 4684, of which 1595 were public schools with 141,735 scholars, and 3089 were private schools with 84,897 scholars. The number of Sunday schools was 2486, of which 1031 belonged to the Established Church. The total number of Sunday scholars was 277,669. There were 258 Evening schools for adults, with 8019 scholars, of which 237, with 7785 scholars, were in the West Riding. The literary and scientific institutes were returned as follows:—

Divisions.	Institutes.	No. of Members.	Volumes in Libraries.
East Riding, with York city	17	3,099	15,467
North Riding	17	2,082	13,734
West Riding	154	19,953	123,926
Total	188	25,134	152,127

Savings Banks.—In 1853 Yorkshire possessed in all 36 savings banks—at Barnsley, Bedale, Beverley, Birstal and Batley, Bradford, Doncaster, Goole, Guisborough, Halifax, Harewood, Howden, Huddersfield, Keighley, Kingston-upon-Hull, Knarborough, Leeds, Leyburn, Malton, Middlesborough-on-Tees, Northallerton, Otley, Pickering, Pontefract, Richmond, Rotherham, Saddleworth, Scarborough, Settle, Sheffield, Skipton, Stokesley, Thirsk, Wakefield, Wentworth, Whitby, and York. The total amount owing to depositors on November 20th, 1853, was 2,625,057*l.* 1*s.* 2*d.*

YOUGHAL, county of Cork, and province of Munster, Ireland; a sea-port, borough, market- and post-town, and the seat of a Poor-Law Union, about 31 miles E. from Cork, in 51° 57' N. lat., 7° 52' W. long.; population 7410 in 1851, besides 1801 in the Union workahire. The borough is governed by commissioners elected under the Act 9 Geo. IV. cap. 82; and returns one member to the Imperial Parliament. Youghal Poor-Law Union comprises 14 electoral divisions, with an area of 70,624 acres, and a population in 1851 of 32,588.

Youghal stands at the mouth of the Blackwater, which here separates the eastern extremity of the county of Cork from the adjacent county of Waterford. The town is built along the western shore of Youghal harbour, which is capable of receiving vessels of 400 or 500 tons at spring-tides. The harbour is safe and commodious; but though vessels drawing 12 feet water may float off the town, the entrance is obstructed by a bar, on which there are only 5 feet of water at low tides, and 13 feet at high-water of neap tides. A harbour lighthouse has been lately erected at the southern end of the town. The streets are paved, lighted with gas, and cleansed under the superintendence of the town commissioners. Youghal is much frequented for sea-bathing during the summer season, having a fine, smooth, and level strand extending nearly three miles along the bay.

The old church formerly belonged to a collegiate establishment founded in 1464 by one of the earls of Desmond. It was a magnificent structure, in the decorated style, of which the nave and aisles have been converted into a parish church. There is a small chapel of ease in a pseudo-gothic style, near the south end of the town, on the cemetery of the ancient Dominican friary. The town also contains a handsome Roman Catholic chapel with a spire; a convent for nuns of the Presentation order, attached to which are a small chapel, and girls National schools; places of worship for Independents, and Wesleyan and Primitive Methodists; two or three Endowed and several other schools. The Clock Gate, a curious old structure, a remnant of the old fortifications, which stands across the principal street and divides the town into north and south, consists of an archway, above which is a square tower of four stories, surmounted by a clock turret. There are besides a town-hall, a court-house, a savings bank, a fish-market, the Union workhouse, a prison, an infirmary, a fever hospital, a dispensary, a lying-in hospital, and other benevolent institutions.

Although a dependency to Cork, the port of Youghal has a considerable trade, for the accommodation of which there are extensive and commodious quays, and a custom-house. The exportations consist chiefly of agricultural produce, and the importation of coal, culm, timber, Staffordshire ware, porter, and groceries. An extensive fishery is carried on along the coast. The salmon fishery of the Blackwater is important, and employs numerous hands.

The chief manufactures are of bricks, coarse pottery, ropes, and malt liquors. There are also establishments for the purchase and exportation of salmon in ice; and near the town is a quarry of good building-stone. In the town are police barracks, infantry barracks, and a coast-guard station. Quarter and petty sessions are held. The market is held twice a week, and there are fairs on the first Thursday of every month, and on Ascension day.

About a mile and a half north-east of the town, the Blackwater is crossed by a light and elegant timber bridge. The bridge is approached by a raised causeway 1500 feet in length, and is itself 1787 feet long,

including a drawbridge of 40 feet; it is 22 feet wide between the railings; and is supported by 57 sets of piers or pillars. Among the interesting objects in the town is the house called Myrtle Grove, which some say was erected, and which doubtless was for a considerable time inhabited, by Sir Walter Raleigh, in 1586. Raleigh was mayor of the town in 1588, and here, according to tradition, the first potatoes brought by him from America were planted. There are some ruins of the old Dominican priory; considerable remains of the old wall, especially on the western side of the town; and there are several ancient houses in the town and neighbourhood.

ZANGUEBAR, a name given by the Portuguese and after them by other European nations, to a country of eastern Africa, probably from Zanzibar, the largest of the islands belonging to it. It extends from the Mozimba (11° 50' S. lat.), which separates it from Mozambique on the south, to Ras Assoad (4° 10' N. lat.), on the north, where it joins the coast of Ajan. The extent of the coast-line exceeds 1500 miles.

But little is known of Zanguebar except the sea-coast. The interior is entirely unknown, and occupied by native tribes, which are always at war with the inhabitants of the coast, who are mostly foreign settlers. The most northern portion from Ras Assoad to the mouth of the river Juba (a few miles south of the equator) is called Barra Somali, or the country of the Somali, because occupied by that nation. The country north of Mukdeesha, or Magadoxo, as seen from the sea, exhibits a very small degree of fertility, but in the interior of the country there seems to be a fertile populous basin traversed by the HAINES RIVER. To the south of Mukdeesha the country improves considerably; it is far more fertile and more populous. There are several towns on the coast, as Mukdeesha [MAGADOXO]; Geserat and Denana; Havaly and Goondarsha; Marka; Mongooya and Torra; and Brava. All these towns are built on rocky promontories, either entirely or nearly insulated. Along the coast there are in most places dangerous reefs. The river, called Juba or Jubb by the Arabs, and by the Africans Wow-weenda, is stated to be of considerable length, rising in Abyssinia, and being navigable by boats for three months from its mouth. Across the mouth, which is not wide, there is a bar, but the bar is narrow and has plenty of water.

The country south of the river Juba is much more indented, and contains numerous fine harbours. The shore as well as the islands are formed of madrepore. Between the mouth of the river Juba and the Bay of Kwyhoo, a distance of 150 miles, is a labyrinth of small islands and rocks. The country opposite this labyrinth of islands is a succession of hills covered with verdure and of well-wooded lowlands. These parts contain many antiquities, consisting of tombs, obelisks, and other ruins. Though the soil of this tract is apparently fertile and the climate healthy, it is very thinly peopled, having been laid waste by the Galla, who have extirpated the former inhabitants, or obliged them to take refuge in the islands.

At the southern extremity of this region (near 2° S. lat.) begins a low coast-line, which however contains many excellent harbours, as those of Kwyhoo, Patta, Lamoo, Formosa, Melinda, and Mombas. There are only a few coral islands along it. The shores of the bays and harbours are low and mostly swampy; they are overgrown with mangroves, but at a short distance inland the country rises into low hills, between which are wooded levels of moderate extent. The surface presents a soil varying from red to a dark black, which appears to possess a considerable degree of fertility. In Formosa Bay is the mouth of the river Ozy, which is one mile wide at its entrance, and, although deep inside and a large river, it is difficult of access on account of a dangerous quicksand-bar, over which at low tide there is only four feet of water. According to the statement of the natives, this river rises greatly during the rainy season, and inundates the surrounding country for many miles, destroying innumerable wild animals, among the rest many elephants. At the distance of fifteen

days' journey in a canoe there is said to be a large town, Zoobakey, beyond which the current is too strong for farther progress. There seems little doubt that this large river and the numerous other streams that fall in on this coast, have their sources in the recently discovered Kilimadgaro Mountains, which rise above the line of perpetual snow and reach their culminating point in a lofty dome-shaped summit towering high above several lower snow-crowned peaks that surround it, near 3° 40' S. lat. This high mountain range, which (it is asserted by some) stands at the head of the Nile River, runs nearly due north and south at a distance of about 200 miles from the coast, to which it presents its steepest slope.

South of Mombas the general appearance of the coast is low, but not swampy, and well defined, having a sandy shore, and in some places a small intervening cliff of coral. But at some distance appear various insulated mountains of curious shapes. The bay of Lindy has a flat shore, which is formed by the alluvial deposit brought down by the river Lindy, which appears to be large, and at a distance of about eight miles from its mouth branches into several small channels, forming a complete archipelago of low swampy islets covered with mangroves. A few miles farther south is the river Rowoona, which discharges a vast volume of water.

Opposite this country are the largest islands along the eastern coast of Africa, the islands Pemba, Zanzibar, and Monfeea. The most northern Pemba, or *Al Huikera*, extends from north to south thirty miles, and from east to west ten miles. It is not in any part more than 200 miles above the sea, and rests on a coral foundation. It is one of the most fertile spots in the world, being covered with a very productive soil, and it abounds in excellent ship-timber: but the largest part of the surface is cultivated, and produces, besides other plants, rice of the finest quality. Zanzibar is nearly twice the size of Pemba, and resembles this island in soil and fertility. Besides every kind of grain which grows between the tropics, it produces great quantities of sugar. There are numerous harbours between Zanzibar and the main, formed by the islands and reefs which are dispersed over the channel which separates it from the continent, and which is about fifteen miles wide. These harbours are safe, and not difficult of access; but within the shores of Zanzibar there is not one land-locked port. The inhabitants manufacture from rhinoceros hides great numbers of round shields, about one foot and a half in diameter, for the soldiers of the Imam of Muskat, who exercises the sovereignty along the greater part of this coast. Monfeea is little known, being surrounded with a labyrinth of shoals and several islets, which render access to it difficult. It seems to be somewhat smaller than Pemba. It rises abruptly from an unfathomable depth, and is based upon a coral foundation. The surface is covered with trees, and it appears to be tolerably well peopled. The channel between the island and the main is about twelve miles across, but so thickly studded with coral shoals as to be impassable for vessels of any size without considerable danger. Nearly opposite the mouth of the Mozamba River are the Querimba Islands, a numerous archipelago, low, and formed of coral, with excellent harbours between them.

The year is divided between the dry and the rainy season. The rains are very abundant, and the rivers swell so as to inundate the adjacent countries for miles. The heat in summer is very great.

The productions known along the coast are rice, millet, peas, beans, melons, pumpkins, the sugar-cane, coconuts, bananas, plantains, &c. The forests contain the India-rubber-tree and many large timber-trees. Cattle, mostly of the humped kind, abound. The sheep are of the Tartar breed; they are very small, but their flesh is delicate and sweet. Fowls are very abundant. The larger wild animals in the interior are the elephant, rhinoceros, lion, leopard, and several kinds of antelopes. The rivers contain hippopotami and crocodiles. Fish are abundant; there are several kinds of shell-fish. Cowries are collected in great quantities for export.

Zanguebar is partly subject to native princes and partly to the Imam of Muskat. North of the river Juba the inhabitants are Somali, and their chiefs appear to be independent. From the river Juba to the Bay of Kwyhoo the Galla have advanced to the shores of the sea, and keep possession of that tract. The country between

Kwyhoo and Melinda is subject to the Imaum of Muscat. From Melinda to the river Pangany extend the territories of the Shaik or Sultan of Mombas. The remainder of the coast, as far south as Cape Delgado, is again subject to the Imaum of Muscat.

The inhabitants are either tribes of African origin or settlers from other parts of the world. The African tribes are the Somauli, Galla, Dowla, Wanyekas, and Sowhyless. The Somauli are a mild people, living on the produce of their herds and flocks, or the profits of the commerce which they carry on with Arabia and the Red Sea. Along the Indian Sea they inhabit the coast as far as Magadoxa; but they are entirely confined to the coast, the whole of the interior being occupied by the Galla, who occupy the southern portions of Abyssinia, and extend southward to the Bay of Kwyhoo. The Galla are a nomadic people, who ramble about over a great extent of country, and terrify all their neighbours by their warlike disposition, ferocity, and cruelty. They are black, of large stature and athletic make, and wear no dress except a small piece of cloth wrapped round their loins. The Dowlas occupy the country at the back of Lamoo. They are far more tractable than the Galla, and the Arabs have uninterrupted commercial intercourse with them. The Wanyekas inhabit the country surrounding the Bay of Mombas. They seem to have attained a considerable degree of civilisation: some of their towns are large and populous, and strongly defended by a double hedge of thorn-bush and by gates. The Sowhyless occupy nearly all the villages and towns of the coast south of Kwyhoo Bay, and at some places tracts extending to a great distance into the interior. They are not so black as the other tribes, but approach in colour and features to the Moors of North Africa. They differ in language, person, and character from the Arabs and the other native Africans. Their language is still spoken from Kwyhoo to Mozambique. They are Mohammedans, and therefore more closely united to the Arabs than the other tribes. They are mostly engaged in agriculture.

The Portuguese had numerous settlements on this coast in the 16th and 17th centuries. Before their arrival the Arabs had not settled there, except in small numbers and as merchants. But after the Portuguese had been obliged to abandon the country the Arabs appeared as conquerors, and there are a considerable number of them at present in the large towns. Several Banyans from Hindustan are settled at Mombas as merchants.

The towns of MAGADOKO, MELINDA, MOMBAS, and QUILOA are noticed under separate heads. *Patta* is built on an island, which lies between the bays of Kwyhoo and Patta, and is divided from the mainland by a narrow sandy creek, through which boats only can pass. A good deal of commerce is carried on here. The Portuguese had a castle here, the ruins of which still remain. *Lamoo* is at present the most considerable town on the east coast of Africa, next to Mozambique, and has a population of more than 5000. It is built on the southern shore of the Bay of Lamoo, at the foot of a sandy ridge of hills which constitute the southern boundary of the harbour, which is formed by a small river and some creeks. The houses are of an oblong form, and are made of reeds and stakes plastered with mud; the roof is supported by rafters, which project far beyond the walls. Their mosques are built with a flat roof, supported by low clumsy arches. The houses are crammed together as close as space will allow, so as to leave only narrow alleys between them. *Lindy* (near 10° S. lat.) is situated at the bottom of a deep bay formed between reefs, which in some parts extend two or three miles from the land. The river Lindy falls into this bay, and on its northern banks the town is situated. It is built on low ground, and consists of a great number of straggling huts interspersed with groves of cocoa-nut and other trees. It formerly carried on a considerable trade in slaves.

The exports of Zanguebar to Arabia are rice, sugar, molasses, dried and salted fish, ivory, gums, and shields. The chief imports are dates, arms, and some Indian manufactures. The commerce with Hindustan is limited to the harbour of Mombas, from which the Banyans, who are settled there, send ivory, gold, cowries, and a few minor articles to Bombay, whence they receive Indian and English manufactures. Many vessels are employed in the coasting-trade, carrying chiefly dhol (small peas), rice, and salted and dried fish from one place to another.

ZANTE. [IONIAN ISLANDS.]

ZAPOROGH COSSAKS. [COSSAKS.]

ZARA. [DALMATIA.]

ZARAFSHAN, RIVER. [BOKHARA.]

ZARAGOZA (in English generally written *Saragossa*), a city of Spain, capital of the ancient kingdom and former province of Aragon and of the modern province of Zaragoza, is situated in 41° 47' N. lat., 0° 53' W. long., 180 miles N.E. from Madrid. It is the see of an archbishop and the residence of a captain-general. The population in 1845 was 40,482.

The city of Zaragoza stands on the south bank of the Ebro, and is connected with a suburb on the north bank by a good stone bridge 600 feet in length, which was constructed in 1437. The small river Huerba flows from the south towards the central part of the city-wall, and then, sweeping round the outside of the wall, falls into the Ebro on the east side of the city. The Gallego falls into the Ebro on the north bank a short distance below the city. The wall is low, built of brick, and is entered by eight gates. The adjacent plain is fertile, and is well irrigated from the canal of the Ebro. [ARAGON.] The houses

are solidly built, some of stone, but mostly of brick; the streets are narrow, tortuous, ill paved, and ill lighted.

Zaragoza possesses two cathedrals, in each of which the chapter resides alternately six months. The older of the two, called *La Seu* (the See, or Seat, 'cathedra') is a gothic structure, with one octagonal belfry-tower, the other being yet to build. The second cathedral, dedicated to *Nuestra Señora del Pilar*, is a quadrangular building about 500 feet in length, and with three naves. In the centre of the church, in a small chapel under the central dome, is the sacred pillar, surmounted by a small wooden figure of the Virgin Mary. The legend is, that the Virgin stood on this very pillar, and thence directed St. James (Santiago) to build a chapel on the spot. This pillar is held in great veneration by the Aragonese, who resort to it from all parts of the province. Several of the other churches, and most of the conventual buildings, were either destroyed or greatly injured during the two sieges of 1808-9.

An octagonal clock-tower, built in 1504, and called *La Torre Nueva*, is as much out of the perpendicular as the leaning tower of Pisa. It is of brick-work, much ornamented. The university, with its valuable library, was destroyed by the French, but has since been partially reconstructed. The students amount to about 1000. The General Hospital is also a new structure, the former having been burnt during the siege. The *Aljaferia* (so named from *Abu-Jafar*, the Moorish sovereign who built it), the palace-citadel, or *alcasar*, is outside the north-western gate. It was much damaged by the bombs of the French, and is now in a ruinous condition. The *Poor-House* and *Orphan Asylum* (*Casa de Misericordia*), has accommodation for 600 or 700 individuals. Near to this building is the *Plaza de Toros* (bull-arena), where grand fights are occasionally exhibited in honour of the Virgin, on which occasions the profits are applied to the support of the hospitals. The *Lonja*, or Exchange, is a fine stone edifice, round which marble busts of most of the kings of Aragon are placed in niches. Nearly opposite is *La Casa de la Diputacion*, a noble building erected by *Alfonso V.*, in the principal hall of which are portraits of the kings of Aragon. The other principal buildings consist of a theatre, a museum, or academy of fine arts, and a public library. The *alamadas* extend on the outside of the city-wall as far as the *Casa Blanca* on the canal; they are lined with poplar-trees, and much frequented by the inhabitants.

The principal manufactures are silks, woollens, and leather, and there is a considerable trade in agricultural produce by the canal of the Ebro.

By the Celt-Iberians Zaragoza was called *Salduba* or *Saldyva* (Plin. lib. iii.). It was colonised by the Romans, and the Emperor Augustus named it *Cesar Augusta*, which the Moors corrupted into *Saracosta*, anciently written *Çaragoça*, whence the present name Zaragoza. It was taken by the Goths about A.D. 470, by the Moors in 713, and by Alfonso I. of Aragon in 1118. Zaragoza was twice besieged by the French in the early part of the Peninsular War. It was first invested June 15, 1808. The French carried some of the exterior works, and forced their way into the city; but the garrison and inhabitants attacked the enemy with irresistible fury, and after 49 days of open trenches and 21 days of bombardment, the siege was raised on the 4th of August. Being a military position of great importance, where several roads meet, the siege was recommenced on the 20th of December. It was bombarded till the 27th of January 1809, when a general assault was made, and the French forced their way through the breaches into the city. The city itself however was defended with desperate valour by the inhabitants as well as by the garrison, house by house as well as street by street, and was not conquered till the 22nd of February 1809.

ZARIA, or ZEGZEG. [SOODAN.]

ZARITZIN. [SARATOV.]

ZARKI. [POLAND.]

ZARUMA. [ECUADOR.]

ZBARACZ. [GALICIA, AUSTRIAN.]

ZEA (*Kées, Cea*), an island in the *Ægean*, about 18 miles S.E. from Cape Colonna; the island of *Makronisi* is nearly in the mid-channel. The capital, *Zea*, is situated in about 37° 38' N. lat., 24° 20' E. long., on the northern declivity of Mount St. Elias. The island is 14 miles long and 10 miles broad. It is one broad-based hill rising from the low shore-line to the central peak of Mount St. Elias. The capital is situated on the brink of a ravine between 2 and 3 miles inland from its port *Raphitlimani* (which has a sufficient draught of water for vessels of the largest size), and contains about 3000 inhabitants; and the whole island about 5000. The climate is healthy. The products are barley, fruits, wine, cotton, sheep, and silk-worms. *Zea* has no relics of antiquity except the ruins of a temple and the ancient walls of the capital.

ZEALAND, a province of the kingdom of the Netherlands, situated between 51° 14' and 51° 45' N. lat., 3° 13' and 4° 7' E. long., is formed of the ancient province of that name, of Dutch Flanders, and of a group of islands formed by the several arms of the Schelde. It is bounded N. by two branches of the West Schelde; E. by North Brabant and Antwerp; S. by Flanders; and W. by the North Sea. Its area is 670 square miles. The population at the end of 1853 was 165,075. The surface is only a few feet above the sea, and the monotonous plain is only broken here and there by artificial mounds,

The province is protected from the sea by numerous dykes, which run along the coasts and the sides of the rivers. The soil is a rich black mould, and very fertile. The climate is damp, and unfavourable to foreigners, though the natives enjoy good health. The inhabitants are steady, industrious, and wealthy people, devoted chiefly to agriculture, cattle-breeding, and the sea fisheries. Zealand wheat, especially that of the island of Schouwen, is very highly esteemed. The province produces likewise fine rye and malting barley. Kidney-beans and peas, rape-seed and flax, are important articles of exportation, and the island of Schouwen alone produces 20,000 cwt. of fine madder annually. The sheep are small, and the wool of indifferent quality. The horses are large, heavy, and strong. Poultry, rabbits, ducks, wild-fowl, and fish abound. Besides grain and pulse, the people cultivate potatoes, melons, fruit, and teazels. The inhabitants have a considerable export trade, and some manufactures of linen, woollen, and fine yarn; distilleries, breweries, salt-works, and dockyards for ship-building. The following are the islands:—

1. *Walcheren*, in which are the following towns:—*Middelburg*, the capital of the province, a fortified town, connected with the West Schelde by a navigable canal half a league in length. It is a seaport, and has 15,000 inhabitants. *FLUSHING*. *Veer*, or *Terveere*, a fortified town at the mouth of the East Schelde. 2. and 3. *BEVELAND*, North and South. 4. *Wolferdyk*, with the village of Oosterland, separated by the Zuyd Vliet from North Beveland. 5. *SCHOUWEN*, separated by the East Schelde from North Beveland. In this island are the towns of—*Zierickzee*, with 7000 inhabitants, who derive their subsistence from the fishery, salt-works, trade in madder, &c. *Brouwershafen*, mostly inhabited by seamen and fishermen. 6. *Duiveland*, separated from Schouwen by the Dyl. 7. *Tholen*. This island produces the finest flax, and it manufactures the finest thread, of which one pound costs 300 florins (nearly 25*l.* sterling). The town of *Tholen* has 2000 inhabitants, and is partly fortified.

In Dutch Flanders are the following towns:—*Sas de Gand*, a well-fortified town, with 1200 inhabitants, situated on a canal which leads from Ghent to the West Schelde. *Sluys*, or *l'Écluse*, a well-fortified place, situated on a bay of the North Sea, at the mouth of the Schelde, and on a canal to Bruges. The population is 1200. *Aardenburg*, on a canal which joins the Zwin, has 1400 inhabitants. *Cadsand*, on the island of Cadsand (which is 5 leagues long and 4 broad; it has rich pastures, and is famous for its cheese), is a mere village. *Azel*, on an island in the Schelde, on a canal from the West Schelde, has 2300 inhabitants. *Hulst*, a fortified town, with 2000 inhabitants, with a harbour communicating with the Helle Gat, a creek of the West Schelde.

ZEALAND, or SIZELAND. [DENMARK.]

ZEALAND, NEW, one of the British colonies, consists of a group of islands situated in the Pacific Ocean and in the southern hemisphere. This group includes two large islands and a small island at the southern end of them. Many other islands still smaller are scattered along the shores. The northern of the two large islands is called by the natives *Eaheimomauwe*, and the southern *Tavai-Poenammoo*; they are separated by a wide strait, called from its discoverer, Cook Strait. The northern island is called by the colonists *New Ulster*; the central large island is called *New Munster*, and the small island is *New Leinster*, or *Stewart Island*. The islands lie between 166° and 178° 35' E. long., 34° 25' and 47° 20' S. lat. The entire length of the two large islands is about 1200 miles, and the mean breadth about 140 miles. The area is about 95,000 square miles. *Stewart Island* is about 60 miles long and 60 miles wide. The native population in 1850 was estimated at 120,000. In 1851 the census taken in the settled districts gave a population of 26,656, of whom 14,996 were males and 11,660 females.

Coast-line, Harbours, &c.—*New Ulster*, the most northerly of the islands, is of a very irregular shape, extending north-east and then north-west, with a large promontorial projection near the middle on the east. It lies between 34° 25' and 41° 40' S. lat., 172° 30' and 178° 49' E. long. The most northern portion is a narrow tongue of land about 40 miles in length, but hardly anywhere more than 8 miles across, except at the most northern extremity, where it expands in the form of a dovetail, and where it is more than 20 miles from west to east. This is chiefly occupied by a ridge of hills of moderate elevation, which extends from the western cape, called *Cape Maria Van Diemen*, by *Tasman*, to the North Cape, or *Cape Otou*. About 4 miles from *Cape Maria Van Diemen*, on the western coast, begins a cliff which rises almost perpendicularly from the sea, and continues for 6 miles. From this place the ridge of hills recedes from the shore, and runs inland towards the harbour of *Pa-reinga* on the eastern coast; but it sends short offsets to the north and south, so that it is intersected by several small valleys. North Cape is high and bold, presenting steep sides to the northern and eastern coast, but a flat and swampy tract about 3 square miles in extent runs from the northern to the eastern shores, separating the promontory from the hilly tract, which terminates on the eastern coast in perpendicular cliffs of volcanic conglomerate. A narrow isthmus 30 miles in length, consisting of low hills and swamps, connects this promontory with the broken part of the peninsula. On the western shore of the isthmus is *Pa-reinga Bay*, which has always two fathoms of water, and a rise of 10 feet at high tide. On the eastern shore is an isolated hill, called

Mount Camel, or *Houhours*, which rises 500 feet above the sea. On its southern side is a harbour capable of receiving the largest vessels, with anchorage close to the eastern shore; but the entrance is not more than 40 or 50 yards wide. Where the isthmus terminates on the south there is an extensive alluvial district, which stretches from the western to the eastern coast, and follows the serpentine course of the *Awaroa*, a river which empties itself into the estuary of *Ranganui*. The *Awaroa*, though a small river, is navigable for boats at high water to the distance of about 10 miles; the tides rise 10 feet, and the river has little fall in its lower course. There are several European settlements in this district, and the natives have made roads to the shores of the sea and for internal communication.

On the south of the Valley of the *Awaroa* extends a hilly region from sea to sea. The coast on both sides of this region is indented by several inlets, and some of them contain good harbours. On the eastern coast are *Doubtless Bay* and *Wangaroa Harbour*, and on the western coast *Whangapi* and *Hokianga*.

The Bay of Islands, called *Kororarika* by the natives, lies on the eastern coast: it is open to the north and north-east, and the entrance between *Cape Pooooke* and *Cape Brett* is 11 miles wide. It extends south-west about 12 miles, and is studded with several islands, whence it has received its name. There is deep water close to the shore, and there are several good anchorages, even with northerly and north-easterly winds, behind the rocky and elevated islands. It is one of the best harbours in *New Zealand*. Between the Bay of Islands and *Hauraki Gulf*, the shores of the sea are bounded by high precipitous cliffs, in which several small indentations occur; but none of them will receive ships above the size of coasting-vessels, except *Wangari Bay*, which is formed by the mouth of the *Wangari River*. The harbour is about half a mile wide and 4 miles long, and has good anchorage in from 6 to 10 fathoms, and is completely sheltered from all winds. *Hauraki Gulf*, now called the *Frith of the Thames*, from its most northern point, *Cape Rodney*, to its most southern inlet, which terminates at the mouth of the river *Thames*, is about 70 miles long. The entrance is from the north, where it is 40 miles wide, between *Cape Rodney* and *Cape Colville*. It preserves this width to half its extent, but farther south it grows rapidly narrower, and terminates with the estuaries of the *Thames*, or *Waiho*, and the *Piako*, which empty themselves into it within a few miles of each other. *Great Barrier Island*, opposite *Cape Colville*, is nearly 80 miles in circumference, and has an excellent harbour, called *Great Barrier Harbour*, at its most north-western extremity. There are several islands in the wider portion of the gulf, of which those of *Rangitoto* and *Waiheke* require notice. *Rangitoto* is a cone, rising gradually from the sea, and terminating in three peaks, the middle one being the highest. This cone contains a very perfect crater, about 150 feet deep: the highest point of it rises 920 feet above the sea-level. Between *Rangitoto* and the mainland is the best channel into *Waitemata Harbour*, which leads to *Auckland*. *Waiheke* is about 30 miles in circumference, and has a harbour for small vessels, with anchorage for larger vessels in the channel which separates the island from the mainland.

The peninsula which terminates with *Cape Colville* contains two harbours, called *Coromandel* or *Waiho Harbour*, and *Mercury Bay* and *harbour*. From *Mercury Bay* there is no good harbour till we reach that of *Tauranga* in the spacious Bay of *Plenty*. There is here a native village, whence a great number of pigs are exported; they are mostly brought from the valley of the river *Waiho*, to be shipped here. Between *Tauranga* and *Katikati* which lies about 20 miles north from it, the coast-line is formed by several large islands, which in structure and configuration exactly resemble the mainland, but are separated from it by narrow channels.

In the Bay of *Plenty* is the island of *Tuhua*, or *Mayor's Island*, which is of considerable extent, and consists of rugged basaltic rocks, with narrow but fertile valleys. The natives cultivate the land, and occasionally provide passing whalers with provisions. *White Island*, or *Puhia-i-Wakari*, is small and low; it contains an active volcano, similar to *Stromboli*, and produces sulphur. Near *Highland Bay*, one of the indentations in the Bay of *Plenty*, is *Mount Edgecombe*, or *Putawaki*, which reaches a height of 10,000 feet. Other bays on this coast are *Hicks Bay*; *Poverty Bay*, where *Captain Cook* first landed in 1769; and *Wairoa*. *Cape Kawakawa* constitutes, with *Cape Campbell*, the southern entrance of *Cook Strait*. West of the cape is a wide bay, which on the west is sheltered by the high lands terminating with *Baring Head*, or *Cape Tourakira*. It is open to all winds except those from the north and east, and affords no safety nor good anchorage. It is appropriately called *Useless Bay*, also *Palliser Bay*, and by the natives *Wairapara*. At the innermost recess of the bay is the mouth of a river, the *Wairapara*. West of this bay a headland projects into *Cook Strait* in a direction from south-west to north-east. It is traversed by two chains of mountains, which terminate at *Baring Head* and *Cape Terawiti*. Between these rocky capes *Port Nicholson* extends northward. It is surrounded by high and steep rocky hills, generally covered with wood, except opposite the entrance of the harbour, where a sandy beach occurs about 2½ miles in length. This leads to the alluvial valley of the river *Hutt*, or *Eritonga*, which is surrounded by steep mountains, and extends 7 miles inland, where the hills approach each other and form the gorge of the river. This tract has great fertility. The bay extends about 8 miles, and that

portion of it which is adjacent to the eastern hills is exposed to a heavy swell during southern winds. At its extremity Cape Terawiti bends eastward in the form of a hook, and thus it protects the western portion of the bay against the swell and winds. Here is Lambton Harbour, on which the town of Wellington is built.

After rounding Cape Terawiti the coast turns nearly northward, and at the upper end of Cape Terawiti is the harbour of Porirua, not far from the head of the Hutt Valley. At Porirua is a barrack station. Proceeding north there are several harbours, formed by the mouths of the numerous short streams that descend from the western sides of the neighbouring hills, and several settlements have been established on them. The most important is Petre, at the mouth of the Wanganui, which is also the most important river coming from the north, for a considerable distance. The coast then stretches away to the north-west to Cape Egmont, near which is Mount Egmont or Taranaki, 8500 feet high. It then turns north-east, and about 80 miles from the cape is New Plymouth, at the mouth of the Hua. Part of the coast further north is cliffy, part has a low sandy beach, and part is lined by sand-hills, but on it are the following harbours—Mokau, near which coal is stated to have been found. Kawia, a large and safe harbour (near 38° S. lat.), one of the most important on the western coast of the island. It has a clear entrance about a mile and a quarter wide, with two fathoms at low water of spring-tides. The tide rises 12 feet. Aotia, a long and shallow estuary, with a bar at its mouth, admitting only vessels under 20 tons burden. Wangaroa, a long inlet, with a bar at the entrance, in which however there is a channel with 12 feet at low water. Smaller vessels find good anchorage and shelter in several coves on the north shore. From Wangaroa the coast trends to the north-west, and at a distance of about 20 miles is the harbour of Waikato, at the mouth of the river of the same name, the largest in the island, up which vessels of 30 tons burden can ascend for a distance of 100 miles in a south-easterly direction. The next harbour is that of Manukao, which forms part of the Auckland district, and its shores are colonised. It is, as already observed, separated from an inlet of Waitemata Harbour by a portage of less than 2 miles, and from that of Tamaki by another not exceeding a quarter of a mile. It is a fine basin, about 15 miles long, and 8 miles broad in the widest part. Several other harbours occur on the west coast. Some of them are commodious, but deficient in shelter.

Surface and Hydrography.—The mountain system is not yet thoroughly known. The northern headland and the long and narrow isthmus have been already noticed. Where the island widens, it is flat, with a few hills, till we reach 35° 5' S. lat., where commences a ridge of elevated hills, lying nearly north and south, in which are the upper sources of the Wairoa River, the basin of which lies between it and a parallel ridge along the western coast. Another small ridge lies in the same direction north of Auckland, throwing off numerous streams on their western slope into the harbour of Kaipara. The country extending along the western coast south of Manukao, as far as the river Mokau, appears to rise to a higher level than the northern districts of the island. The shores have in many places a low sandy beach; in others they are lined by sandhills, but there are also large tracts where the sea washes the base of steep cliffs composed of sandstone and conglomerate. A few miles from the sea the country rises higher, and contains numerous hills, whose declivities are gradual. Some miles north of Waitemata Harbour the hills sink down, and the narrowest part of the island, which is between this harbour and Manukao Harbour on the western coast, has a slightly undulating surface, on which several isolated hills rise to some height. Where the Gulf of Hauraki grows narrow, opposite the island of Waibeke, the country rises to a higher level, and presents towards the gulf a hilly ridge, in which several narrow valleys open to the estuary of the Waiho. This hilly ridge continues southward, where it separates the valley of the Thames or Waiho and of the Piako from the basin of the Waikato River; but it sinks lower as it proceeds towards the source of the Thames, or rather the general level of the country rises higher. This chain of hills is mostly composed of basalt, and wood is only found in some small valleys and ravines. The valley of the river Thames, which lies to the east of this hilly range, and begins at the most southern branch of the Gulf of Hauraki, is the largest known plain in New Zealand. It extends about 60 miles south, terminating in the low hills of Horohoro, where the river Thames originates. At its northern extremity it is about 20 miles wide, but grows narrower as it runs southward, though probably in no part does it fall short of 10 miles in width. The plain of the Thames is separated from the Bay of Plenty by a ridge of rocky hills, which begins at Cape Colville, at the entrance of the Gulf of Hauraki, and continues without interruption for more than 100 miles to the Horohoro Hills at the source of the Waiho. They are called the Ahora (Love) Mountains, and rise about 1500 feet above the sea. North of the mouth of the Thames they fill up the whole extent of the peninsula terminating with Cape Colville, but farther south they are a few miles distant from the banks of the river. Their western declivity is very steep, and rises like a wall over the plain of the Thames, but towards the Bay of Plenty they descend with a gradual slope. They are almost entirely covered with wood. North of 38° S. lat., the highest portion of this tract does not appear to rise more than 1500 or 2000 feet above the sea-level, and the hills do not run in any determinate direction.

South of the parallel just mentioned they take the shape of a continuous ridge, running parallel to the western coast, and rise much higher. This chain is called, in its northern portion, Rangitoto; in the centre, Rua Wahine; and towards its southern extremity, Tararua, which last terminates at Cook Strait. Mount Taranaki or Egmont occupies the centre of a projecting headland, and is about 20 miles from the shore, in 39° 3' S. lat., 174° 1' E. long. It is an extinct volcano, which rises 8839 feet above the sea-level, and is above the snow-line. It is a perfect cone, from the base of which the country slopes slowly towards the sea on the north, west, and south; and on the east it is surrounded by a hilly region, which extends to the Rangitoto Chain and the volcano of Tongariro. Taranki is the western extremity of a volcanic region, which traverses the island from south-west to north-east, and terminates on the southern shores of the Bay of Plenty. The Rangitoto Mountains contain the active volcano of Tongariro and the extinct volcano of Ruapahu. North of the first-named peak is the Lake of Taupo, which is surrounded by hills of volcanic formation, from the rents of which numerous hot-springs rise, and which are interspersed with mud volcanoes. Towards the shores of the Bay of Plenty is a large cluster of lakes, some of them filled with hot-water, and others surrounded by hot-springs and volcanic rocks, the most remarkable of the lakes being that of Rotorua. The Rangitoto range extends from 38°, after throwing off the branch to Taranaki south by east, to the peak of Tongariro, and then south to that of Ruapahu, about 70 miles. Their general elevation probably does not exceed 2000 feet above the sea, at least not north of Tongariro. This summit rises to 6200 feet, and that of Ruapahu reaches far above the snow-line, and is supposed to be at least 9000 feet high. Between these two summits and in their neighbourhood the range appears to attain its greatest elevation. But these mountains occupy a comparatively small width, hardly more than 4 or 5 miles. On the west of them extends a hilly region, whose general level is probably less than 1000 feet above the sea, but the hills upon it rise about 500 feet higher. On the east of the Rangitoto Range is the basin of the Waikato River. Beyond the valley of the Waikato to the east, in the tract forming the great promontory ending at East Cape, the country is broken and mountainous, but with few remarkable heights, though there are several which rise to a considerable height at its northern extremity, and Mount Edgcombe to the east of Rotorua. The two mountain ridges which inclose Port Nicholson and the valley of the Eritonga unite at the source of the river, and are there called the Tararua Range. This chain, consisting of several ridges, runs south and north, and extends to the elevated peak of Ruapahu, where the Rangitoto Mountains begin, which are to be considered as their northern continuation. The geological structure of the Tararua Mountains is argillaceous schist, interrupted, especially on the western side, by bulky and irregular dykes of red, black, and greenish Lydian stone. Sometimes the clay is more quartzose and granular, and forms a good stone for building purposes. These mountains apparently do not rise more than 3000 feet above the sea-level. They extend in longitudinal ridges, with narrow crsts here and there rising to a somewhat higher summit. In many places they are overgrown with forest, in others the woody region does not quite reach to the top. In the country extending from the Tararua Mountains to Cook Strait the southern portion, as far as Paripari, is filled up with the offsets of the mountains. At the last-mentioned place the chain begins to recede from the sea-shore, increasing its distance from the coast-line as it runs north. The mountains are now succeeded by a belt of low sandy hills, commencing at high-water mark and widening as the mountains fall back, till, at the Manawatu River, the sandy belt is 9 miles broad. From the south-eastern extremity of the island a range of mountains extends to near Cape Matau, known as the Mamigaraki and Pakatoai Mountains.

Though possessing almost innumerable streams, New Ulster, in consequence of the mountain ridges running in general in a north and south direction through the length of the island, has but few considerable rivers. They are chiefly mountain streams, which, falling from the eastern or western slopes, enter the sea, and are seldom capable of being used for navigation. Of the larger ones we proceed to give a short notice. The first, beginning at the northern end, is the *Hokianga*, which, rising near Ngate, about 20 miles from the junction of the isthmus, proceeds in a north-easterly course to the head of the estuary of the Hokianga on the west coast, its course not exceeding 10 miles. The *Wairoa* is one of the largest of the rivers. The remotest branches rise in the country between Hokianga and the Bay of Islands; it flows in a south-easterly direction; its whole course is perhaps not less than 200 miles, measured along the windings, and it falls into the Kaipara Harbour at its northern end. It is navigable for large vessels for about 70 miles above the head of the harbour. Canoes can ascend about 70 miles farther, beyond which their advance is prevented by rapids. The valley through which the river flows is generally two miles wide, and of great fertility. The *Otamatea* rises in the hills in the neighbourhood of Wangari Harbour, and runs probably less than 100 miles. The valley is also fertile, but of smaller extent than that of the Wairoa. It falls into Kaipara Harbour nearly opposite its entrance: it is navigable for many miles from its mouth. The *Kaipara River*, which falls into the most southern inlet of the basin, flows north-westerly, has a very winding course in a moderate-

sized valley bounded by the hills which extend along the sea-coast between Kaipara and Manukao Harbour, and is separated from an inlet of the harbour of Auckland in the Gulf of Hauraki by a neck of land about three miles wide, consisting of low hills, across which the natives frequently dragged their canoes in time of war. The tide ascends the Kaipara for several miles from its mouth, and so far it is navigable for large vessels. The *Waikato* is the largest river in New Ulster. Its source is in the Rangitoto Mountains, or rather in a continuation south of them, called the Kai Munatoa Range. It is a combination of numerous streams which fall into Lake Taupo, the *Waikato* being the outlet of that lake. Lake Taupo is 1337 feet above the sea-level, or higher than the Lake of Geneva. The *Waikato* leaves the lake at its north-eastern extremity, and is there about 300 yards wide and very deep. It runs first north-east, but afterwards in a general north-north-west direction, until it reaches 37° 30' S. lat., when it is joined by its great tributary the *Waipa*. In approaching Manukao Bay it turns south-west, and falls into the sea. The whole course of the *Waikato* probably exceeds 250 miles. In the middle part of its course the navigation, if not entirely interrupted, is rendered difficult by numerous rapids. The mouth of this river does not form a bay, but is a narrow channel, which at low water only vessels of about 30 tons can enter; but inside the headlands it is a full river, and when the tide is in it is navigable for large vessels for about 40 or 50 miles to the place where it is joined by the river *Waipa*. This river rises in the Rangitoto Mountains north-west of Lake Taupo, and runs above 100 miles, of which about 60 miles are navigable for large boats. To the east is a plain drained by three rivers, the *Waiho*, the *Waitou*, and the *Piako*, which receives the *Waitou* before it and the *Waiho* fall into the Gulf of Hauraki, at the east and west corners of its southern end. The *Waiho*, which is also called the *Thames*, drains the plain in its whole extent, rising in the Horohoro Hills, on the border of the table-land of Roturua. Its course is about 100 miles, of which 90 miles are navigable for large boats. The *Piako*, which rises on the hills bordering the western side of the plain, is much smaller, and runs only about 30 miles. The *Mokau* rises on the western side of the Rangitoto Mountains, and after a course of about 20 miles falls into the sea in 38° 30' S. lat. Somewhat south-east of the upper sources of the *Waiho* lies the table-land of Roturua, so called from the largest of the numerous lakes which are dispersed over its surface. The *Lake of Roturua* is about 24 miles in circumference, and nearly circular. Near it there are many hot-springs, and some of them close to its banks. From some of the openings in the ground every five minutes a column of steam and water, two feet in diameter, is thrown up to the height of three or four feet. Other lakes are filled with warm water, and in some of them the thermometer rises to 95°, or 30 degrees higher than the air. There are several cones of pure sulphur, and mud volcanoes. The soil consists of a black mould a few inches thick, resting on a substratum of pumice gravel. It is in general light, but possesses a considerable degree of fertility. The *Wanganui* rises on the north-western declivity of the volcanic peaks of Puki Onaki, and runs with numerous windings to Petre, on Cook Strait. The mouth is more than half a mile wide, and has on the bar 8 feet of water. Vessels of 230 tons have passed over it, but at low water the sea breaks across the bar. Inside the bar the river grows deeper, and is about 300 yards wide. The banks are here low and sandy, and covered with drift-wood and pumice-stone, which the river brings down from the volcanic region surrounding its source. At the distance of some miles an extensive flat extends along the banks, which is bare of timber and even of bushes, and in its natural state is covered with flax and fern: it is considered well adapted for grazing. About 30 miles from the mouth the river flows between hills, which are well wooded, and extend to the base of Mount Tongariro. But in approaching that summit the country is again more open and flat, though much broken. The *Wangaiti* rises from the same source on Ruapahu as the *Waikato*, and falls into the sea 9 miles south from the *Wanganui*. The *Manawatu* takes its rise on the southern declivity of Mount Ruapahu, and runs along the eastern side of the Rua-Wahine Range, southward, in a valley between mountain ridges, about 70 or 80 miles, when it pierces the range through a cleft by turning westward, and enters the lower country along Cook Strait, about 40 miles south from Petre. As, with all the rivers in Cook Strait, the force of the current is not strong enough to remove the sand which is thrown up at its mouth by the south-westerly and north-westerly winds, and the depth over the bar is only 6 feet at low water: the tide rises 8 feet. The breadth at the mouth is about 300 yards at half tide.

Cook Strait, which separates New Ulster from New Munster, is about 150 miles long, and lies from south-by-east to north-by-west. At its southern entrance, between Cape Kawakawa in New Ulster and Cape Campbell in New Munster, it is about 50 miles wide; but the promontories which form its northern entrance, Cape Farewell in New Munster and Cape Egmont in New Ulster, are more than 100 miles distant from each other. At the narrowest part, opposite Cape Terawiti, the strait is not quite 30 miles across. The tide runs from the south at the rate of five knots an hour during spring-tides. The prevailing winds near the southern entrance, for the greater part of the year, are from the south and south-east, and often increase to heavy gales, augmenting the rush of water through the straits, and making considerable inroads on the coast. In the northern and wide

portions of the strait the prevailing winds all the year round blow from the north-west and south-west, and cause a heavy swell to set against the shores of New Ulster, between the island of Kapiti and Cape Egmont. This coast has no harbours, and as the sea to a great distance from the shore is shallow, vessels are obliged to keep a good offing. The island of Kapiti, called by Cook the Island of Entry, is the most remarkable of the islands of the strait. It is about 25 miles in circumference, and consists of a ridge of hills rising in some places to the height of 600 feet. These hills descend abruptly to the westward and eastward, but at the southern extremity they are low and undulating. At the north-eastern point is an extensive alluvium, with a lagoon in the middle. To the east of the southern extremity of Kapiti are three small islands, which, together with Kapiti, form a roadstead, which is sheltered from the prevailing north-west winds by Kapiti, and from the south-east winds by the three islets, and affords a safe anchorage.

Tavai-Poenammoo, now called New Munster, is separated from New Ulster by Cook Strait. It extends from 40° 25' to 46° 40' S. lat., and lies between 166° 20' and 174° 30' E. long. It contains, according to a rough estimate, about 50,000 square miles. The interior of this large island is not so well known as New Ulster. Seen from the sea, a chain of apparently uninterrupted mountains is observed at some distance from the shore on the western side; on the eastern side are other ranges at a greater distance from the shore; and at the northern end, which terminates on Cook Strait, are three extensive masses of high mountain rock, with valleys between them, which, considering the wide masses of rocks that inclose them, must be called narrow. The mountains, even at a small distance from the shores, rise to 3000 feet, and farther inland they attain a much greater elevation. The highest of these ranges seems to be the western, which fills up the whole country west of Tasman Bay, and falls off with a steep declivity to Massacre Bay. In the centre of it stands Mount Arthur, which is always covered with snow, and probably rises 8000 feet above the sea-level. It is divided from the central mass by a narrow depression, extending, as it appears, far inland. This depression is not a plain, but is traversed by several ridges of high and steep hills running in the direction of the island from south-west to north-east. The lower tracts between these hills are in some places extensive, and drained by several rivers, of which the *Waimea* is the largest. The central mass of mountains is called Pelorus Ridge, and occupies the whole country between Tasman Bay and Cloudy Bay. It terminates on the shores of the strait in three projecting peninsulas, which inclose two very long inlets, Admiralty Bay and Queen Charlotte Sound, in which several safe anchorages are found, well protected against all winds, as the surrounding mountains rise to an elevation of from 2000 to 3000 feet. As the mountains generally rise from the water's edge with a steep ascent, only a few places of small extent occur near the shores, on the slopes or in the ravines, which are fit for cultivation. On the east side of this mass is an indentation, which constitutes the harbour of Underwood. This port is a deep inlet formed by hills, from which numerous buttresses run out towards the sea, and form as many small coves, in which vessels find good shelter. Port Underwood opens to the south-west into Cook Strait, and is frequently resorted to by whaling vessels. South of Port Underwood the mountains run inland, and give way to a wide depression, which extends along the shores of Cloudy Bay to the vicinity of Cape Campbell. This elevated cape is the termination of the range of mountains which is called Kaikora, or the Southern Alps, and is covered with snow nearly all the year round. The country between Port Underwood and Cape Campbell is comparatively level, and drained by several small rivers, among which the largest is the *Wairao*, which has a bar at its entrance. From Cape Campbell, on the eastern coast, the mountains stretch inland in a south-west direction; Mount Kaikora being 9300 feet high, and other peaks ranging from 4000 to 5000 feet in height. It joins a mountain group near 43° S. lat., from which all the other ranges in the island appear to diverge. From Mount Grey, in 43° 5' S. lat., a crescent-shaped ridge runs at the back of the Canterbury settlement, and ends on the left bank of the Kakaunui River; near the sea, in 45° 10' S. lat., a great part of the range is above the snow-level, but there are passes through it into the central plain. Rowley Point is 5000 feet high, and Mount Peel, Mount Somers, Mount Richards, and Mount Torless, are probably about the same height. Of the western coast Captain Cook says:—"From Cape Farewell to 41° 30' S. lat. there is a narrow ridge of hills that rises directly from the sea and is covered with wood: close behind these hills are the mountains, extending in a ridge of stupendous height, and consisting of rocks that are totally barren and naked, except where they are covered with snow, which is to be seen in large patches upon many parts of them, and has probably lain there ever since the creation of the world. A prospect more rude, craggy, and desolate than this country affords from a distance at sea cannot possibly be conceived; for, as far inland as the eye can reach, nothing appears but the summits of rocks, which stand so near together, that instead of valleys there are only fissures between them." From 41° 30' to 45° S. lat. the country presents a better aspect. Well-wooded hills and some extensive valleys occur. All the indentations of this coast, which are numerous, are open to the westerly winds and the swell of the sea, except Milford Haven (44° 30' S. lat.). The south-western extremity of New Munster is

bounded by elevated chalky cliffs, which are intersected by numerous narrow arms of the sea. These inlets afford safe anchorage to shipping from every wind. The principal of these ports are called Dusky Bay, Preservation Harbour, and Chalky Bay. The most southern part of New Munster is the widest part, and in Favourite Strait, which separates it from New Leinster, are a few good bays, the principal being Bluff Harbour. There are no mountains to be seen here from the sea. This comparatively level tract, which is moderately elevated, continues north-eastward to Port Otago, where a settlement has been effected. Port Otago is an inlet of the sea, running in a west-south-west direction about 13 miles: it is well sheltered by highlands. The entrance has a bar across, with $3\frac{1}{2}$ fathoms of water. Within the harbour it deepens to 9 fathoms. The navigable river Clutha, formerly called the Molyneux, falls into the most western corner of the bay. North of Otago high land and a bold coast extends to Banks Peninsula, around and upon which the settlement of Canterbury has been formed.

Banks Peninsula has an oval form, and is nearly 70 miles in circumference. The surface is very irregular and hilly, and some of the hills are visible at sea from a distance of 40 miles. The higher parts are barren, but the lower slopes of the hills are well wooded and the soil is favourable to vegetation. It has harbours on each side. The most capacious, called Akaroa, is near the eastern extremity of the peninsula; it has sufficient depth for large vessels, is easy of access, and well sheltered. On the northern side of the peninsula are Port Victoria and Port Ashley, which are little inferior to that of Akaroa. Pegasus Bay, extending between the peninsula and the mainland, is shallow and not safe. The country in the vicinity of the bay is in general level, and rises gradually from the shore. The shores north of Banks Peninsula are very high and rocky, and generally there is no beach between the high grounds and the sea. At a few places inlets occur, but they are open, and not well sheltered from the prevailing south-east winds. The best harbour is in Lookers-on Bay, a small estuary, into which two rivers fall, both of them navigable some miles from their mouth.

Opposite the southern extremity of New Munster lies New Leinster, or Stewart Island. The strait which separates it from the mainland was discovered in 1816 by Stewart, the captain of a sealing vessel, and called 'Foveaux Strait,' but it is now called Favourite Strait. This strait is about 40 miles long and 12 miles wide on an average. It is very dangerous on account of numerous rocks which are dispersed over it, especially at the eastern entrance of the strait. New Leinster has nearly the form of an equilateral triangle, and measures in its greatest length and width about 40 miles. The coast is generally rocky and high. Along the western coast it has only anchorage under the lee of some small islands, but on the northern shores there are some small bays which afford good anchorage. The south-eastern shore has one of the finest harbours on the globe, called Pegasus, or Southern Port. At its entrance are two islands, which divide it into three channels, and each of them is deep enough to admit large vessels. The island is rather mountainous than hilly, and is almost covered with forests, which contain abundance of ship timber. Between the hills are many fine valleys and some plains of moderate extent.

Climate, Soil, and Productions.—The climate of New Zealand is frequently compared with that of Great Britain, and certainly there is a great similarity between the two countries, so far as respects the frequent changes of the weather, the moderate heat and cold, and the limited annual range of the thermometer, the limited daily range of the thermometer, and the slow passage from heat to cold, and *vice versa*, at the change of the seasons. The following is the mean temperature at Auckland, Wellington, Nelson, and London, from the observations of one year only at each place, but not the same year:—

Months.	At Auckland.	At Wellington.	At Nelson.	At London.	Months.
January . .	69.5°	66.4°	65.5°	62.97°	July
April . . .	59.0	63.5	53.3	50.79	October
July . . .	49.5	48.7	46.0	36.34	January
October . .	58.6	59.2	54.0	47.61	April
Summer . .	67.2	65.3	65.2	61.7	Summer
Autumn . .	60.1	59.3	55.0	50.3	Autumn
Winter . .	51.9	50.4	47.5	38.2	Winter
Spring . .	57.4	57.7	53.7	48.3	Spring
Annual Mean } .	59.2°	58.4°	55.4°	49.6°	{ Annual Mean

The temperature of the air thus appears more equable at Auckland than at London; as at Auckland the difference between the hottest and coldest months is not more than 19.8°, and at London it is 26.6°. At Nelson the temperature is lower than at Auckland, and the daily range of the thermometer is greater. The daily range of the thermometer on the coast frequently does not amount to more than 4°, and probably it never exceeds 8°; but on the table-land surrounding Lake Taupo, which may be considered as 1500 feet above the sea-level, it sometimes amounts to 25°, and in these parts the ponds

and swamps are sometimes covered with ice about half an inch thick. On the table-land the trees shed their leaves in winter; but along the whole coast the natives plant their potatoes at all seasons of the year, and the forest is always green.

The climate of New Zealand is very humid. In ten months (from April, 1841, to February, 1842), there fell 34.49 inches of rain in Wellington, and in 1846 there fell 28.78 inches at Nelson. In London the mean annual quantity of rain is 24.10 inches, but in some districts in the west of England double that quantity falls. Dews are frequent and particularly heavy during the winter months. Fogs are rare on the sea-coast, owing to the brisk winds, which hardly ever cease to blow; but in the interior they rest upon the lakes and watercourses until they are dispelled by the sun or driven away by the winds. This abundant moisture renders vegetation so vigorous, that it covers even the rocks where only a thin layer of vegetable mould is found: it is not injurious to health, as the country is generally so well drained that swamps are comparatively rare and of small extent; besides, it feeds the numerous streams and rivulets, which render the island one of the best-watered countries on the globe. Rain falls in New Zealand in all the months of the year, but the largest quantity falls in winter and spring.

Every part of New Zealand seems to be subject to frequent winds and heavy gales. The winds at Wellington blow either from north and north-west or from south and south-west. In 1841 it blew from north and north-west for 213 days, and from south and south-west for 119 days. During the winter the north-west wind prevails; but when the sun has a southern declination southerly winds are most general. But in Cook Strait, which is nearly inclosed by high mountains, the direction of the wind changes so frequently and suddenly that no two puffs follow each other from the same quarter, and the nearer the shore the more this is felt. At Nelson the prevailing winds are north-east and south-west: in 1846 it blew from the north-east on 219 days, and from the south-west on 71 days. At Auckland, and in general on the northern narrow peninsula, south-west and west winds prevail. They generally commence about 10 o'clock in the morning, and increase gradually almost to a smart gale, but subside at sunset into a calm. Easterly gales generally occur at the full and change of the moon, and continue for two or sometimes for three days. In the winter months they sweep with great violence over the more exposed part of the country. These winds nearly always bring heavy rains. Northerly winds are of rare occurrence.

The seasons are not very distinctly marked. At Wellington the fair season commences in the middle of December, and continues to the middle of April. After the middle of April the weather is more variable, the winds increase in force, and the showers are heavier and last longer. The air becomes chilly. This weather continues to the beginning of July, when the bad or tempestuous season begins. Heavy rains occur almost daily, and sometimes they continue for many days together: the wind is almost a constant gale, and often blows with the strength of a hurricane. At Auckland the fair season lasts from October to April and even May. It is regularly interrupted by the heavy rains which occur at the full and change of the moon, attended by gales, and irregularly by squalls and showers. During the remainder of the year showers are frequent, and the westerly winds blow with considerable force. In December and January regular land and sea breezes are experienced. The sea-breeze sets in from the north-east in the forenoon, and veers to the south in the evening. Thunderstorms are frequent in August, and are sometimes heavy. Earthquakes have been experienced at several places, but the shocks have always been slight, and have caused no damage.

Two plants were cultivated by the natives at the time of the arrival of the Europeans, the taro (*Caladium esculentum*) and the kumera, or sweet potato (*Convolvulus batata*). Among the fruit-trees the most remarkable is the *Areca sapida*, of which the undeveloped plaited leaves or the heart are eaten, and the leaves are used in roofing the houses. The leaves of the *Piper excelsum* are used as tea. Some shrubs bear berries, which are much liked by the natives, especially the *Solanum laciniatum* and the elderberry-tree (*Cornaria sarmentosa*), whose leaves however contain an acrid poison, which produces violent symptoms if eaten by cattle.

The greater portion of the island is still covered with forests. There is a great variety of trees, and perhaps in no part of the globe do they attain a larger size and exhibit a more luxuriant vegetation, which is to be attributed to the humidity of the atmosphere. There are various kinds of *Conifera*, and they produce the most valuable timber. One, peculiar to New Zealand, is the kauri (*Agathis Australis*), whose timber is so highly prized that it was one of the greatest inducements to Europeans to visit the island. It is however only found on the northern peninsula. There are numerous other useful timber-trees, but the quantity of timber exported from New Zealand is not large.

The other kinds of plants requiring notice are—the ferns, the *Phormium tenax*, and the raupe. There are ninety-four species of ferns in the island, and some attain the size of trees. The *Cyathea dealbata*, the highest, is sometimes forty feet in length. One species, the *Pteris esculenta*, has a root which was formerly much used as food by the natives; but since the cultivation of several other plants has been introduced by Europeans, it is only used to feed pigs, which

quickly fatten on it. The *Phormium tenax*, or flax, covers many extensive plains; it grows on mountains and in swamps. It was formerly used by the natives to make clothing, and considerable quantities of flax obtained from it were exported; but since the demand for provisions by the vessels which visit the island has increased the value of labour, the natives have produced much less of this article for the market. Many swamps are overgrown with a kind of bulrush called raupu (*Typha angustifolia*), which is a useful building material for the natives, who make the walls and roofs of their houses of them, tying them together in bundles with a climbing fern.

The most important of the plants introduced by Europeans is the potato, which is extensively used by the natives, partly for food and partly for exportation: most vessels that touch at the island take large quantities of them. Maize, or Indian corn, was introduced early, and in the northern district forms a considerable article of export. Wheat was introduced by the missionaries more than twenty years ago, and its cultivation has spread rapidly. Turnips are very extensively cultivated: they are dried in the oven, wind, or sun, and they keep for a long time. The other vegetables are pumpkins, shallots, onions, garlic, beet-root, endive, celery, leeks, purslain, radishes, Spanish radish, Spanish onions, cabbages, brocoli, artichokes, cucumbers, capsicums, Chili pepper, and mustard. The fruit-trees of Europe have also been planted, and most of them succeed very well, especially in the northern districts, as pomegranates, figs, quinces, nectarines, peaches, apples, pears, vines, olives, raspberries, strawberries, and Cape gooseberries. Some attempts have been made to introduce the fruits of India, but without success. The bananas and mango-trees do not flower. Tobacco is cultivated at several places by the natives for their own consumption, and the sugar-cane succeeds very well at Hokianga.

The dog, a smaller variety of the Australian dingo, existed here at the arrival of the Europeans, and is still, though rarely, met with, as almost the whole race of the island has become a mongrel breed. This was the only domestic animal at that time. The white settlers have introduced the horse, cow, ass, sheep, and pig. Pigs are very numerous; they are easily fed and fattened on the fern-root. The other animals, though not yet numerous, succeed well, particularly sheep. A considerable amount of wool (about 700,000 lbs. in 1858) is exported to Great Britain. No wild animals are found, with the exception of a kind of bat, called *Mystacina tuberculata* by Gray. Formerly a native rat, which was eaten by the aborigines, was very common, but it has been nearly exterminated by the European rat, and is now only found on the table-land of Roturua.

Seals and whales of various kinds are found in the neighbouring seas, but not so plentifully as formerly; and many sorts of fish, several of which are edible. Fish and eels are also found in the rivers. There are numerous species of birds, the most remarkable of which is the kiwi of the natives (*Apteryx australis*), a struthious bird, unable to fly on account of its want of wings, instead of which it is provided with flappers. Among other birds are a rail, found in the swamps, as large as an English pheasant, and of splendid colours: some small and gaily-coloured parrots; a sort of mocking bird, called tui by the natives, which makes a variety of fanciful noises, coughing, whistling, and chattering; and a small owl, called by the settlers 'More Pork,' from the sound which it is said it distinctly pronounces towards day-break for half an hour continuously.

Very little is known of the mineralogy of New Zealand. In October 1852 gold was discovered at Coromandel, about 40 miles E. from Auckland, on the peninsula forming the eastern side of Hauraki Gulf, between the harbours of Waihou on the western side and Mercury Bay on the eastern side. Neither lead nor silver have been traced, but Dieffenbach states that from the island of Otea, or Great Barrier Island, which is north of Cape Colville before the entrance of Hauraki Gulf, he obtained specimens of a copper-ore, some of which contained nearly 25 per cent. of copper. Iron-ore is said to exist at several places; coal has been found and worked at Maasacre Bay, on the Waikato River; at Motunao; at Mokau, in New Ulster; and at Saddle Hill, near Otago; and also at various places in the neighbourhood of Tasman Bay, in the island of New Munster. Thick layers of lignite are observed in the cliffs which skirt the western and eastern coasts, but especially in the former. Limestone is found on the west coast, especially on the deeper inlets, and some limestone-rocks would yield marble. Indurated scoriae and some kind of sandstone are fit for building materials. Slates are met with in many places. Immense quantities of sulphur could be collected in the volcanic region.

Population and Inhabitants.—The population is composed of European settlers and of the native tribes. The natives call themselves Maori (aborigines), in contradistinction to the foreigners, or Pakehah. They are generally tall, muscular, and well-proportioned, and do not vary in size as much as Europeans do. The form of the cranium approaches that of the European. Their language is derived from the same stock with the Malay language, but that of the Malays has been greatly enriched by foreign words from the Sanscrit, Arabic, &c., whilst that of New Zealand preserved its originality until the missionaries and Europeans introduced new ideas and new signs for them.

When the voyages of Cook first made us acquainted with New Zealand, the inhabitants derived their food from plants which they cultivated, lived in houses constructed so as to protect them against rain and the weather, were possessed of large war-canoes, and wore

more clothing than the people in the other islands; but they were divided into many tribes, which were frequently at war with one another. On the hills which are so numerous they built villages, which were fortified with palisades and ditches, and to these small fortresses they retired when attacked by an enemy. These fortresses were called 'paha.' Their wars were carried on with great cruelty; they ate their enemies who fell in battle, and frequently killed and ate their prisoners. Women and children were carried off as slaves. These wars greatly impeded their progress in civilisation.

The intercourse of the natives with Europeans effected a great change. The New Zealander became acquainted with the use of fire-arms and adopted them. The tribes that first became possessed of fire-arms immediately acquired a superiority over their neighbours; and this circumstance led to the annihilation of several tribes which had formerly been numerous and powerful, and it is probable that the whole race would have been extirpated if the missionaries had not arrived.

The most singular custom among the New Zealanders, as well as among the inhabitants of many other islands dispersed over the Pacific, is what is called 'tapu,' which signifies that a thing must not be used or touched, and heavy penalties are attached to the violation of the tapu. Many things are always tapu, as the plantations of the sweet potato, property contained in a house left uninhabited by its proprietor, a house containing seeds, a canoe left unprotected on the beach, or a tree selected for being worked into a canoe at a future period. A married woman and a girl promised in marriage are invariably tapu. A burying-place and the utensils and clothes used in interments are strictly tapu. It is evident that this tapu supplies the want of prohibitory laws. But a thing may also be declared tapu by the priests, and it cannot be used until the tapu is taken off. Even men or women may be pronounced tapu, and then they are not allowed to touch their food or drink, but are fed by others until the tapu is taken off, which is done by the priest or priestesses by some simple ceremonies and prayers.

The natives have considerable talent for the mechanical arts, and a great inclination to cultivate their minds. Cook found among them war canoes, which were 80 feet long, and constructed with considerable ingenuity. They have applied themselves successfully to the acquisition of the various trades introduced by Europeans, are good farmers, and bold and skilful seamen. There are now few natives who have not learned to read and write; and even those who live in parts of the country which have only occasionally been visited by missionaries, have acquired these elements of civilisation by mutual instruction.

The governor, Sir George Grey, writes of the natives in 1850, in his Report to the British Secretary of State, in terms of high commendation, in reference to their industrial capabilities, their desire for mental improvement, their agreeable manners, their moral character, and their material prosperity.

History and Colonisation.—There is reason for supposing that some Spanish navigators discovered New Zealand in the 16th century, but nothing is on record which can prove it. We must therefore consider that the islands were discovered by the Dutch navigator Abel Tasman, who, in December, 1642, reached the west coast of Tawai-Poenammoo, near 42° 10' S. lat. He sailed along the coast northward, and entered the western entrance of Cook Strait in the wide open bay called on our maps Blind Bay, but by the Frenchman D'Urville, Tasman Bay. Here he anchored in a harbour, which he called Massacre Bay, as four of his seamen were killed there by the natives. From that time New Zealand was considered a part of the Australian continent by the geographers of the period. No European seems to have visited it till the time of Cook, who in his first voyage spent nearly six months on the coasts, in 1769 and 1770, during which he circumnavigated the islands and surveyed the coasts. In December 1769, a French ship commanded by Surville anchored for some time in Doubtless Bay, as it is called by Cook, but which Surville named Lauriston Bay; and in 1772 two French vessels, under the command of Marion and Crozet, sailed along the west coast of New Ulster, and remained for some time in the Bay of Islands, where Marion and 27 Frenchmen were killed by the natives. Cook visited New Zealand in his second voyage three times, and in his third voyage for the fifth time. Vancouver also visited it in 1791, but merchant-vessels came to it only towards the close of the last century. In fact, these remote seas were hardly visited by trading-vessels before the foundation of the British colony at Port Jackson in Australia.

When the colony at Port Jackson had gone through its first trial and began to rise, it became the centre of a new branch of commercial industry. Before the end of the last century a few vessels, English and American, departing from Port Jackson, began to prosecute the whale-fishery in the sea east of New Zealand. As the number of whales was immense their success was very great, and they soon learned that provisions and other necessaries of life were to be got much cheaper and with less labour in New Zealand than at Sydney, and thus New Zealand began to be the resort of the whalers, who visited the Bay of Islands in preference to all other parts on account of its geographical position and the excellence of its harbour. To facilitate the intercourse between the natives and the crews of these vessels, a few English settled in that harbour and in some others on the east coast. About the same period the New Zealand flax began

to be considered a useful article both in England and in New South Wales, and many vessels visited the islands to procure it. The tracts where the *Phormium tenax* grows in greatest abundance are situated on the west shores of New Ulster; and settlements were made there in order to get cargoes for the vessels whose arrival was expected. During the first twenty years of the present century the coasts of New Munster and of Cook Strait were overrun by sealers in every direction, who caught many thousand seals every season; the skins were sent to China, where they fetched a high price. When the seals began to fail the whale-fishery in Cook Strait was established. This led to the settlement of several Englishmen on the shores of the strait, and thus a considerable number of Englishmen had become domiciled in New Zealand at an early period. Most of them married native females, and finding that the country possessed a considerable degree of fertility, and that immense tracts were not cultivated, they began to acquire landed property before a regular colony had been established. Meanwhile the Church Missionary Society had directed its attention to the natives of New Zealand, and sent several missionaries in 1814. They were soon followed by some Wesleyan and Roman Catholic missionaries, and though their labours were not attended with immediate success, they ultimately succeeded, and at present the natives are nearly all at least nominally Christians.

The English government having been informed that every foot of ground in New Zealand was the property of somebody did not think it expedient to send a colony there, and made a declaration to that effect; but the English who were settled in the island wished to have some protection, and they complained that many runaway convicts from New South Wales had entered the country, where they exercised a pernicious influence over the natives, who were excited by them to acts of violence against their neighbours and the settlers. The use of fire-arms began to be introduced among them, and the conflicts became more numerous and deadly than ever. This induced the English government in 1833 to send there a consul or agent to decide disputes between the English according to the law of their country, and to remove vagabonds.

In 1835 a French adventurer, Baron de Thierry, announcing himself as sovereign chief of New Zealand and king of Nuhuhwa (one of the Marquesas Islands), published a formal declaration that he was about to go to New Zealand and to establish an independent sovereignty. He went in 1837 to Hokianga with a few settlers, but being soon abandoned by his companions he left the country. The British settlers now addressed a petition to William IV., praying for the establishment of a regular government in the form of a British colony. In 1838 an Englishman arrived in London who had been residing for some time in New Ulster, and had bought an immense tract of country, which he wished to dispose of. This gave rise to the New Zealand Company, which sent there the first regular colony in 1839. Several settlements were made in New Ulster, and on the shores of Tasman Bay in New Munster. In 1840 the English government made a regular settlement on the shores of Port Waitemata in the Bay of Hauraki, where the town of Auckland was built. Subsequently settlements were made at Canterbury and Otago, both in New Munster, the former by members of the Church of England, the latter by Free Church Presbyterians; but both have ceased to be exclusive.

Neither the settlements nor the conduct of the New Zealand Company gave satisfaction to the colonists. The Company had endeavoured to act equitably by the natives in founding their colonies, purchasing all the lands required, and reserving certain portions, mingled with the others, as inalienably appertaining to the original owners. Difficulties had however arisen. The native wars had in many instances transferred districts from the conquered to the conquerors. The latter had sold the lands; the former, on something like peace being restored, claimed them, and showed no disinclination to refer the arbitrement to force. In addition, there were the claims of private individuals, who asserted that they had purchased tracts of land varying from two acres to 500 square miles, for merchandises, tobacco-pipes, and blankets, often from the same chiefs who had sold the land to the New Zealand Company, and in frequent cases produced their signatures. Captain Hobson, who was at first only consul, but was afterwards named lieutenant-governor, concluded the treaty of Waitangi with the native chieftains, by which the sovereignty of the islands was transferred to Queen Victoria; but all the proprietary rights, "the lands, estates, forests, fisheries," &c., were secured to the chieftains, while the right to purchase any part thereof which they might feel disposed to alienate was restricted to the crown; it was declared that any future sale by the natives, except to the crown, would be null and void; and the title of the New Zealand Company to their lands was left unsettled. Numerous disputes arose between the natives, the Company, and the governor. In September, 1842, Captain Hobson died, and his chief adviser, Mr. Shortland, carried on the government till the arrival of Captain Fitzroy, in January 1844. In the meantime an event had occurred which produced a long and disastrous war with the natives. A dispute had arisen respecting the lands in the valley of the Wairau, near Cloudy Bay, on the opposite side of Cook Strait, in New Munster. Two of the most powerful chiefs, Rauperaha and Rangihæta, had used force to prevent a survey of the district being taken, and had burned some of the dwellings,

and a magistrate's warrant was issued to arrest them on a charge of arson. On June 17th, 1843, Captain A. Wakefield, one of the magistrates, and a party of the settlers, amounting in the whole to 49, attempted to execute this warrant, but the Maori chiefs, as might have been expected, laughed at the notion of submission to the authority of the law; and, when told they would be compelled, Rauperaha replied that he "did not want to fight, but if the white people fought he would fight too." An attempt was made to arrest the chiefs. A conflict took place; and though the natives did not number more than 80 or 90, only half of whom were armed with muskets, Captain Wakefield and 21 others were killed, several after they had laid down their arms and offered to surrender; many more were wounded, and all who escaped did so with difficulty. This affair inspired the natives with yet greater boldness, which was not lessened by Captain Fitzroy's declaring, after an interview with Rauperaha, whom he visited to hear his statement, that the settlers were in the wrong, and ought not to have continued the survey at Wairau. In June, 1844, Heki, another chief, and previously a missionary student, proceeded to cut down the British flag-staff at Russell, in the Bay of Islands, at the northern end of New Ulster, and plundered and burned the town. This gave rise to hostile proceedings, which continued for more than a year. In November, 1845, Captain Fitzroy was succeeded by Captain (now Sir George) Grey, who came as governor-in-chief, with a force augmented to 2500 men. Within a month he succeeded in tranquillising the north. He then turned his attention to the south. Rauperaha was suddenly seized in his pah, or fortified village, and kept for a considerable time as a prisoner at large. He cleared the valley of the Hutt, near Wellington, of the intrusive natives, and he pursued Rangihæta and his people till they were subdued and forced to submit. During these dissensions a great portion of the native population adhered faithfully to the British side, and were of the greatest service, particularly in the latter part of the war, when tracking Rangihæta through the pathless and almost impenetrable forests. An attack on Wanganui in the spring of 1847, which was easily repulsed, was the last hostile conflict of the European and native races. The governor employed the military in laying out and completing a number of roads. The natives now mix on the best terms with the British; they live amongst them, they found towns, build churches, and have projected newspapers of their own; they have elevated themselves to an equality, perhaps more—for it is stated, that so eager are they for knowledge that there is scarcely a Maori who cannot read and write.

The New Zealand Company have given up their efforts at colonisation. They resigned in 1852 their claims to the government, upon receiving a compensation for their outlay to the amount of 268,370*l.*, to be paid out of the sale of waste lands in New Zealand; an arrangement which excited much dissatisfaction in the colony.

Government.—The government of New Zealand has hitherto been intrusted to a governor (till 1845 he was only lieutenant-governor, subordinate to the governor-in-chief at Sydney), with an executive council, consisting of the colonial secretary, the treasurer, and the attorney-general; and a legislative council consisting of four colonists, nominated by the governor. The seat of the government is at Auckland. In 1852, by the act 15 and 16 Vict., cap. 72, a new constitution was provided for New Zealand. By this act the following provinces are established in New Zealand, namely, Auckland, New Plymouth, Wellington, Nelson, Canterbury, and Otago, the limits of the same to be fixed by the governor of New Zealand; each province has a superintendent and a provincial council, and the colony at large has a legislative council and a house of representatives. The waste lands are under the superintendence of the General Assembly, but arrangements with respect to lands held in common by the natives cannot be entered into except with the crown.

New Zealand was created a bishopric in 1841, as suffragan to Sydney, when the Rev. G. A. Selwyn was appointed, whose residence is at Auckland, and who has been indefatigable in the discharge of his duties. A second bishopric, that of Christchurch, was founded in 1854.

The government revenue in 1849 was 43,589*l.*, in 1850 it was 57,743*l.*; of the increase 4000*l.* arose from the customs, and 5000*l.* from the land. There has been always a deficiency in the revenue as against the expenditure, which has been made up by a parliamentary vote by England. In 1850 this vote was for 20,000*l.*; but in 1849 there was a decrease in the expenditure in New Ulster of 5075*l.*, and in New Munster of 11,587*l.*, a total decrease of 16,662*l.*

Towns and Villages.—The chief towns and villages in the colony are the following:—

Auckland, the seat of the government of the colony, is built on the southern shores of the harbour of Waitemata, which opens into the Gulf of Hauraki. The harbour has sufficient depth for vessels of considerable burden. The town stands on cliffs of sandstone of moderate elevation, backed by rising ground. Several volcanic cones rise in its immediate neighbourhood, at the base of which are hard scorise, fit for buildings and roads, and easily worked; the sandstone of the cliffs, though soft, hardens by exposure to the air, and is also a good building material. Some of the caves that occur in the cliffs have been used by the natives as places of sepulture, and the bottoms are covered with human bones. The houses in the town are mostly of wood. The town is situated in a part of the island where the soil, though light,

is fertile and easily cultivated, and it has an easy communication with all the countries both to the north and to the south. Many of the English, who settled on the island before the foundation of the colony, reside in the harbours north of Auckland, and a great number of small coasting-vessels visit Auckland. Around Auckland are four pensioner-villages for discharged soldiers. Auckland was incorporated as a borough on July 29th, 1851, the district by which it is formed extending 16 miles in length, and from 5 to 7 miles in width. It is divided into 14 wards, of which three are in the town itself. The Tamaki Creek intersects the borough, is navigable for boats, and is made available for the commerce of the district. The borough is governed by a mayor, aldermen, and burgesses. The principal buildings in the town are—St. Paul's church, a handsome building; two sets of barracks built of scoria; a public hospital; a market-house; a native hostelry; public washing, bathing, and drying grounds; several chapels; and a bank. There are also several bridges, wharfs, and landing-places. The governor's residence and the bishop's are closely adjacent, and four miles from the town, on the banks of the Tamaki, is St. John's College. There is a church at each of the pensioner-villages mentioned above. The population of the town is about 4000; in the district in 1851 there were 8840, of whom 4921 were males and 3919 females. The flag-staff of the barracks is in 31° 51' 27" S. lat., 174° 45' 20" E. long.

Wellington, the principal settlement of the New Zealand Company, founded in 1840, is on the shores of Port Nicholson, in the island of New Ulster, but for government purposes the town and the whole of the district are comprised in the province of New Munster. Port Nicholson lies in 41° 15' S. lat., 174° 47' E. long.; it is surrounded by mountains, except at the alluvial tract through which the river Hutt, or Eritonga, reaches the sea. These mountains rise abruptly from the water's edge, except in the most south-western corner of the harbour, where a strip of flat land extends at their base, about one-third of a mile broad and two miles long, the soil of which is composed of sand, shells, shingle, and vegetable earth. On this flat ground, which surrounds that portion of Port Nicholson called Lambton Harbour, the town of Wellington has been built. It extends about three miles in the form of a semicircle round the harbour. The flat ground not being considered sufficient for the town, the hills south of it were included. As these hills are generally too steep to build on, only the more convenient parts were selected for that purpose, and thus the most distant points of the town are nearly four miles from the harbour. In 1848 there were 525 houses, of which 45 were of brick or stone, 308 of wood, and 177 of clay and wood, or other materials. Other houses, and large warehouses of brick, have been constructed since, near the wharfs and jetties, which have been built so that vessels of 70 tons can unload alongside of them. There are two churches, and an Episcopal chapel, a Presbyterian chapel, five Wesleyan chapels, three other Dissenting chapels, and one Roman Catholic chapel, with a Roman Catholic bishop; there are also a hospital, a bank, a savings bank, a mechanics institute, a horticultural society, a custom-house, an exchange, a jail, two sets of barracks, and the residence of the lieutenant-governor. There are also 38 schools of various kinds. Most of the public buildings are of wood only. The population of the district in 1851 was 5722, of whom 3135 were males and 2587 females. The town is well supplied with water by streams which run through it; it is lighted at night by lamps, which every public-house is compelled by the terms of its licence to keep burning; the streets are not paved, but excellent roads have been made in several directions along the coast to the valley of the Hutt, and towards that of Wairarapa. Two newspapers are published in the town. Three cemeteries have been provided, all of them at some distance outside the town, one for the Jews, one for Roman Catholics, and the other, a large one, picturesquely situated, is used by all the Protestant sects, European and native. The harbour is safe, and has good holding-ground.

Akaroa is a small settlement formed, in 1840, by the French, who had attempted to land in the Bay of Islands, but were prevented by Governor Hobson; and under his direction, and accompanied by an English magistrate under the British flag, they were settled at Akaroa. Akaroa is near the south-east point of Banks Peninsula in New Munster, in 43° 52' S. lat., 173° E. long. The harbour is an inlet 7 miles in depth, with steep shores, and has a bar at the entrance, but it is perfectly landlocked within, though exposed to furious gusts from the highlands around it, and there is 14 fathoms water inside the harbour. The town contains a church, the residence of the magistrate, a jail, and the cottages of the inhabitants, who are chiefly agriculturists. *Bay of Islands*, at the northern end and east coast of New Ulster, was originally the seat of a whaling station, and was at first selected by Governor Hobson for the site of the capital, but was abandoned in favour of Auckland. Two towns however sprung up, Russell and Kororarika; the first was burnt down and the inhabitants expelled by Heki, and from the other they withdrew to Auckland. Still some Europeans have kept their position here, and the government returns state the population as 400. *Canterbury* is the name of a settlement in New Munster, first founded in 1849, upon strictly Church of England principles, and with a large ecclesiastical establishment. It comprises the whole of Banks Peninsula, and a large district running back westward to the range of mountains, and extending along the eastern coast for a direct length of about 100 miles. The population

in 1850 was estimated in the government returns at 1600; but Mr. Fox, in his 'Six Colonies of New Zealand' (1852), gives the number at 3784; and two towns had been formed, Lyttelton, at Port Victoria, and Christchurch, on the plains, where temporary churches had been built, and a college and schools founded. *Kaitiaki* is a native village, and a missionary settlement in New Ulster, in the valley of the Awaroa, a few miles S.W. from Doubtless Bay, and 8 miles from the western coast. The natives in the valley are estimated at 8000. The village is extremely picturesque, and much resembles an English one. There is a large church, with a wooden steeple, the work almost entirely of native builders; the houses are adorned with gardens in front, where roses and other flowers are cultivated; as are also various fruit-trees, the vine, vegetables, and some tobacco; they grow wheat and hops, and they have cut a road 32 miles long through the forest to Waimate on the Bay of Islands. *Mongamoi* is a small settlement on an excellent harbour within Doubtless Bay, on the eastern coast, towards the northern end of New Ulster. *Motueka* is a native village, with a slight admixture of Europeans, about 50 miles E.N.E. from Nelson. In this village, of which the population is about 1400, agriculture seems to be the chief pursuit, though lying close on the shore of Queen Charlotte Sound in Cook Strait. *Nelson*, situated on Nelson Harbour, in Blind Bay, New Munster, on the southern side of Cook Strait, in 41° 15' S. lat., 173° 16' E. long., was the second settlement of the New Zealand Company, and was made in 1843. The port is a good one, but the district is chiefly agricultural. The population of the whole district, which is extensive, amounted in 1851 to 4287, of whom 2317 were males and 1970 females. There are in the town one church, one Wesleyan chapel, two other chapels for Dissenters, and one Roman Catholic chapel. There are three other churches and six chapels at various villages. We have noticed the great extent of sheep farming in this district, and as the pastures lie wide it has led to the construction of a great length of road; from 60 to 70 miles have been already formed, and a communication by land has been opened with Canterbury, a direct distance of about 170 miles, to Lyttelton. Coal exists in great abundance in the vicinity; one seam at Nelson and one at Waikati have been worked for some years, and in the latter end of 1852 a new seam of superior quality was discovered by a landslip at South Wanganui, at the north-west corner of the island, about 60 miles from Nelson in a direct line by land, but easily accessible by sea. Copper is also found near the Dun Mountain, about 8 miles from Nelson. *New Plymouth*, in New Ulster, is situated between two small streams, the Huatoki and the Henui, near their entrance into the sea, on the northern side of the peninsula of which Cape Egmont is the western termination, and in the midst of which stands the extinct volcano of Mount Egmont. There is no harbour properly so called, as the rivers are not navigable, and the mouths are small, nor is the roadstead a secure one. But this is the only drawback for the country around has been called the garden of New Zealand. The land is so dry and so level that good roads are made with but little trouble, and the soil is the most fertile of any yet cultivated in New Zealand. The settlement was founded in 1841. In 1851 the population was 1532, of whom 845 were males and 687 females. The town fronts the sea, about half a mile from the beach, lying scattered on the slope of a hill, and contains two churches, one of them of stone, a Wesleyan chapel also of stone, two Dissenting chapels; a jail, schools, and some other buildings, all constructed of wood; and there are a brewery and three flour-mills. Several bridges have been formed over the various small streams that descend from the sides of Mount Egmont and traverse the country. Iron and coal exist in the neighbourhood. Coal is found in abundance near the Mokau River, about 50 miles N. from New Plymouth. *Otago*, in New Munster, is the district in which a settlement has been made by members of the Free Church of Scotland. It is toward the southern end of the island, on the eastern coast. The town named *Dunedin* is on the Molyneux River, which has been re-named the Clutha. The harbour formed by the mouth of the river is an excellent one; it is 13 miles long, and averages 2 miles in width; but the channel had difficulties which have been guarded against by laying down guiding buoys. The settlement was made early in 1848; in 1851 the population was 1740, of whom 994 were males and 746 females. The chief town, Dunedin, stands at the head of the harbour, and another has been formed nearer the mouth, named *Port Chalmers*, which lies in 45° 46' S. lat., 170° 43' E. long. There was in 1848 only one place of worship, a Free Church chapel; but in 1850 the number of adherents to that doctrine barely reached a majority. The Clutha is a fine river, and, though difficult of entrance from a bar and consequent surf at its mouth, is said to be navigable for 60 miles for vessels of considerable burden. Coal is found at Coal Point, about 10 miles N. from the mouth of the Clutha, and at a spot within a quarter of a mile of the left bank of the Clutha, about 4 miles inland; traces have also been found in other places. A kind of green serpentine or jade is found here. *Otaki* is an exclusively native village on the western shore of Cook Strait, about 50 miles N.N.E. from Wellington, and was the village where the celebrated Rauperaha lived, and where he died. The church missionaries have taken much interest in this village, and not without success. Mr. Tyrone Power ('Sketches in New Zealand') describes it in 1848 as consisting of "houses neatly built, in the midst of well-fenced gardens; and there is abundant

proof of prosperity in the number of pigs, cattle, and horses feeding about." The houses are of Maori architecture, with English doors, windows, &c. Mr. Power adds, that several of the chiefs kept a banking account at Wellington, and relates a story of one of them asking an English officer to cash a cheque for him, having immediate occasion for money, which was done, and the cheque duly honoured. Rauperaha, after peace was restored, exerted himself greatly in forwarding the building of a church, which was done entirely by the Maories. It is only of timber, but it is the largest building they have ever yet erected, being 300 feet long, and in the churchyard attached to it Rauperaha was buried in 1849 with due Christian rites. His son is still the acknowledged chief, and is described as dressing in black, and looking like a clergyman. The population in 1850 was 664. *Petre* is a small but flourishing little place on the west coast of New Ulster, and on the right bank of the Wanganui River, 4 miles from its mouth, and about 100 miles N. from Wellington. The population in 1850 was 452, of whom 276 were males and 176 females. It consists of about 40 houses, a church, a school, a post-office, and a small jail, all of wood. It was founded in 1842, soon distinguished itself by its agriculture, and acquired a great local reputation for its hams and bacon. In 1847 however an unfortunate quarrel with the natives of the valley led to the destruction of the place. On peace being restored the colonists returned, and have resumed their occupations successfully. A small detachment of military is stationed at *Petre*. *Putikiwarans* is a native village on the Wanganui, opposite to the town of *Petre*. It has about 2000 inhabitants, but the whole number in the district probably amounts to 5000. The inhabitants have now applied themselves sedulously to industrial pursuits, bringing their produce down the Wanganui in canoes, which they manage with great dexterity down the rapids, with a cargo sometimes weighing a ton, and contrive even to ascend them with their canoes light. *Waikenas* is a native village about 20 miles S. from Otaki, at the mouth of a small river of the same name. It is in the same style as Otaki, but smaller. In this village one of the natives set up an ordinary—an unlimited dinner for a shilling; but as his fellow-citizens prepared themselves for it by fasting the whole of the previous day he found it unprofitable, and restricted the meal to two pounds of pork, two pounds of potatoes, and a pint of coffee. It has a timber church—like a huge barn, says Colonel Mundy ('Our Antipodes')—and the military coast-road from Wellington passes through it. *Wangaroa Bay* (celebrated as being the scene of the massacre of the crew of the *Boyd* in 1809) is about 25 miles N. from the Bay of Islands in New Ulster. The entrance to the harbour is narrow, between steep rocks of great height; but the water is deep, and the inner harbour is very spacious, and sheltered from all winds. The country around is mountainous, and not adapted for cultivation; but the hills are covered with timber, among which the *Kauri* pine was particularly abundant, but has been much thinned. A few Europeans are settled here, and there is a native village of about 2000 persons, with Protestant and Roman Catholic missions, both persuasions having chapels. Timber is still occasionally exported, and some small craft have been built here.

Trade, Commerce, and Manufactures.—The shipping returns show the following results for the year 1851:—Inwards, 253 vessels, 67,856 tons; outwards, 236 vessels, 64,734 tons. The total imports in 1851 amounted to 349,540*l.*, of which 122,733*l.* went to New Ulster, and 226,807*l.* to New Munster, which, as we have before noticed, includes for such purposes Wellington and its district. The exports in the same year amounted to 34,160*l.*, of which 47,707*l.* were from New Ulster, and 36,453*l.* from New Munster. The chief articles of export were cordage, flax, and hemp; leather and skins; whale and sperm oil; whalebone; and wool. In 1853 the declared value of articles produced or manufactured in the United Kingdom sent from Britain to New Zealand was 230,809*l.* Of trades and manufactures, there are breweries, brick-kilns, candle-manufactories, stocking-loom, cooperages, flax-mills, rope-walks, sacking-loom, wind, water, and steam flour-mills, lime-quarries, lime-kilns, coal-mines, salt-pits, ship- and boat-building yards, tanneries, and saw-mills. In all the towns, and particularly in Wellington, the usual trades and professions have their practitioners.

ZEGZEG. [SOODAN.]

ZEILA (*Zeilah*), a town and harbour in Africa, on the western shore of the Gulf of Aden, near the Strait of Bab-el-Mandeb, is situated in 17° 45' N. lat., 43° E. long. The harbour is small and shallow; small vessels anchor at a distance of nearly half a mile from the beach. The town is inclosed by walls, now in ruins. The inhabitants are engaged in trade. Three kafilas arrive annually from the interior, especially from Hurrar, with slaves, gum, myrrh, coffee, jowari, ghee, ostrich feathers, millet, wheat, and beans. Most of these articles are sent to Mocha and Aden. In return they take back blue and white coarse cloths, piece-goods, prints, silks, silk thread, shawls, red cotton yarn, beads, zinc, copper-wire, frankincense, and Austrian dollars. Zeila is subject to the Pasha of Egypt.

ZERBST, formerly the capital of Anhalt-Zerbst, but now belonging to Anhalt-Dessau, is situated in 51° 58' N. lat., 12° 10' E. long., on a level sandy spot on the river Nuthe, about 5 miles from the river Elbe and 90 miles from Berlin: population about 9000. A little without the town is the ducal palace, the birthplace of the empress Catherine II. of Russia. The church of St. Nicholas is a handsome building in the ancient gothic style. The town has two other churches, two hospitals, an orphan asylum, a house of correction, a workhouse, and a high school called the Franciscœum. The chief industrial products are bear, articles of gold and silver, tobacco, stone-ware, and woollen cloths. A saline mineral spring was recently discovered here, and handsome baths have been erected.

ZERINL. [CYPRUS.]

ZETLAND, the ancient name of the SHETLAND ISLANDS, and still occasionally applied to them. Shetland was called by the Norwegian colonists Hjalmland and Healtland, which became changed into Yetland and Zetland. From this name the late Lord Dundas, one of the principal proprietors of Shetland, took the title of Earl of Zetland when elevated to that rank in the peerage in 1838. The name is also retained in the title of the lord-lieutenant and sheriff of Orkney and Zetland.

ZUG, one of the Swiss cantons, is situated nearly in the centre of Switzerland, and is bounded N. by the canton of Zürich, E. and S. by Schwyz, and W. by Luzern and Aargau. It is about 14 miles long from east to west, and about 10 miles in its greatest width. The area is 85 square miles, and the population at the end of 1850 was 17,461, all Catholics except 125, who were Calvinists. It lies in the basin of the Reusa. The northern part of the lake of Zug occupies the centre of the canton; the southern part is in the territory of Schwyz. The lake is a fine piece of water, about eight miles long, and between one and two miles wide, surrounded by a delightful country. The small lake of *Aegeri* lies in the south-east part of the canton of Zug, near the borders of Schwyz, from which it is separated by the ridge of Morgarten. The river *Lorse* is the outlet of the lake of *Aegeri*, and after a very tortuous course it enters the lake of Zug below *Baar*, and issues out of it again near the village of *Cham*, and flows northward into the Reusa. The canton of Zug is entirely agricultural; the soil is fertile. Fruit-trees are in great abundance; some districts appear like a continuous orchard. There are also fine meadows, and the horned cattle are remarkably large and fine. Wine is made in several localities. The principal articles of exportation are dried fruit, *kirschwasser*, cattle, butter, cheese, and honey. The lakes abound with fish. Offsets of the mountains of Schwyz enter the canton of Zug from the east and south, and slope towards the banks of the lake.

The head town, *Zug*, is built on the east bank of the lake, and at the foot of the *Zugerberg*, which is covered with vineyards and orchards: population 3302. The principal church is dedicated to St. Oswald, a Saxon king and saint. The adjoining cemetery is planted with flowers. The arsenal of Zug contains, among other curiosities, the banner of the canton, stained with the blood of the landamman, Peter Kollin, who fell with his sons at the battle of *Belinzona*, fighting against the Milanese, in 1422. Zug has a gymnasium with four professors.

The other towns of the canton are:—*Baar*, about 3 miles N. from Zug, on the road to Zürich, which has 2000 inhabitants; and *Mes-singen*, which has about 2200 inhabitants.

The constitution of the canton of Zug is a representative democracy. The landrath, or legislative body, consists of 162 members, who sit for one year, but are re-eligible. There is also a general assembly of the whole canton, which meets once a year, and appoints the landamman and other officers of the state. The canton returns one member to the National Council of Switzerland. [SWITZERLAND.]

ZUIDER ZEE, or SOUTH SEA, is so called by the Dutch in contradistinction from the North Sea, though it is only a wide bay of the North Sea, from which it is separated by a series of islands which extend in the form of a segment of a circle along the north-west border of the Zuider Zee. These islands are called *Texel*, *Vlieland*, *Ter Schelling*, and *Ameland*.

The Zuider Zee lies between 52° 15' and 53° 30' N. lat., 4° 15' and 6° E. long., and covers about 12,000 square miles. Near the middle it is narrowed by a projecting peninsula, on the east point of which the town of *Enkhuizen* is built. South of this the sea is generally from 25 to 36 miles wide. At its south-western extremity an inlet branches off to the west, which extends about 15 miles into the province of Holland. It is from one to two miles wide, and called *Hot Y*. This inlet is deep enough for vessels of considerable size, and constitutes the harbour of *Amsterdam*, which is built on its southern shore. The entrance to this inlet is between shoals, and is called the *Pampus*.

The shores of the Zuider Zee are generally low. On its eastern side they are well defined, and on the south-east, in the province of *Gulder-*

land, they rise several feet above the level of the sea. But the western shores are very low, so that a great portion of the adjacent countries is defended from the encroachments of the sea by dykes. Along the eastern shores the sea has sufficient depth for vessels of moderate size, and in general also for large vessels. But along the western shores several shoals occur, the most extensive of which are near the Texel and at the entrance of the Y; and at low tides there is so little water in them that the larger merchantmen were formerly obliged to discharge a portion of their cargo at the Texel before they could sail to Amsterdam. It was to obviate this disadvantage that the Helder Canal was cut. [HOLLAND, North.]

In ancient times the site of the Zuider Zee was a low swampy marsh drained by the Yssel, which was not then, as now, an arm of the Rhine. But after the Roman general Claudius Drusus, about B.C. 12, had caused a canal to be made from the Rhine to the Yssel, a portion of the water brought down by the Rhine was discharged by this canal into the Yssel. In A.D. 1219 a great portion of the low country was inundated by the sea, after continued north-western gales, which broke down the dykes that protected it against the water. The last great inundation took place in 1282, and gave to the Zuider Zee the form and depth which it still preserves. Since the completion of the drainage of the sea of Haarlem it has been recently proposed to attempt the drainage of the Zuider Zee by means of steam-engines.

ZULLA. [ADULE.]

ZÜRICH, one of the Swiss cantons, is bounded N. by Schaffhausen and Baden, E. by Thurgau and St. Gall, S. by Schwyz and Zug, and W. by Aargau. The territory of Zürich lies in the basin of the Rhine, all its watercourses flowing northward into that river. The area is 684 square miles. The population in 1850 was 250,698, of whom 6690 were Catholics and the rest were Protestants of different sects, the great majority being Calvinists. There are no high mountains in the canton; but several ridges of hills, some of which attain a height of 2700 feet, run from south-east to north-west, screening valleys through which flow the principal rivers of the canton, the Thur, the Toas, the Glatt, and the Limmat. The Lake of Zürich, the eastern extremity of which belongs to the cantons of Schwyz and St. Gall, is long and narrow; it runs through the middle of the canton, extending for about 25 miles from south-east to north-west, with a breadth of one to two miles. The banks are strewn with thriving small towns and villages, and country-houses. The surrounding country, rising in gentle slopes on both sides, is planted with vineyards and orchards, intermixed with fields. The Limmat, a rapid clear stream, issues out of the lake at its north-west extremity, intersects the town of Zürich, and is joined by the Sihl, a river coming from the south, which has its source in the canton of Schwyz.

Agriculture is diligently attended to. The principal products are, corn, bad wine, fruit, and pulse. Horned cattle are numerous; sheep and goats are kept in small numbers. Considerable tracts of ground are covered with forests.

More than one-eighth of the population of the canton is occupied in manufactures. The cotton and silk manufactures are by far the most important. [SWITZERLAND.] The canton of Zürich carries on an active trade, especially with Italy. The Swiss-German is commonly spoken; but the written language is the high German, which is also spoken by educated persons. The canton of Zürich is a representative democracy; all citizens who have attained 20 years of age enjoy the elective franchise, except bankrupts, paupers, and criminals. The Great Council or Legislature consists of 242 members, who must be

at least 30 years of age, and of whom 83 are chosen by the Great Council itself to complete its number. The Council appoints the executive council, which consists of 19 members for six years, and is presided over by the burgmeister. The Great Council appoints also the members of the court of appeals, of the criminal court, and those of the ecclesiastical council. The canton returns 13 members to the National Council of Switzerland. [SWITZERLAND.]

Zürich, the head town of the canton, is situated at the north-west extremity of the lake, and is divided by the river Limmat into two nearly equal parts; of which the one on the right bank is called the Grosse Stadt, and the other the Kleine Stadt. The Grosse Stadt is built on the slope of a hill; the Kleine Stadt lies on more even ground between the Limmat and the Sihl, just above the confluence of the two rivers. Both towns are surrounded by ramparts and ditches, with bastions and ravelins. The streets are mostly narrow and irregular, the houses high, massive, and ancient looking, and the general appearance is that of a town of the middle ages. There are however several modern and handsome constructions, especially in the Kleine Stadt. The münsterhof, or cathedral, is a fine old building of the 11th century. The other remarkable buildings of Zürich are—the frauenmünster, once a nunnery, built in the 13th century; the Prediger church; the church of St. Peter, with its handsome tower and clock; the town-house; the orphan asylum; the Wasserkirche, with the town library annexed to it; the new university; the Casino, or assembly-rooms; the Wellenberg tower and dungeon, in a small island in the middle of the river, where state prisoners were formerly confined; the arsenal; and the new police- and guard-house. The principal promenades are the Lindenhof, in the Grosse Stadt; the Katsbastion, from which there is a splendid panoramic view; Gessner's avenue, at the confluence of the Sihl and the Limmat; and the Hohe promenade on the ramparts of the Grosse Stadt. Zürich is the seat of a University, which has four faculties: divinity, medicine, law, and philosophy, with eight ordinary professors, besides supernumeraries; and is attended by about 200 students. There is a botanical garden, a zoological cabinet, and several collections of mineralogy. Zürich has also a gymnasium, a school of industry, and a veterinary school, besides several private institutions for education. The town library contains 45,000 volumes.

Zürich is a thriving busy town, and one of the most commercial and industrious in all Switzerland. The population amounts to 17,040. Zürich was formerly one of the three cities in which the Swiss Diet assembled. Zürich lies 63 miles E.N.E. from Bern, 42 miles W. from St. Gall, and about 60 miles N. from St. Gothard, which is the most direct road from Zürich to Italy. A railway forming part of a line to Basel runs from Zürich to Baden in Aargau. Winterthur, the only other town of importance in the canton, is situated in a plain 12 miles N.E. from Zürich, and is one of the handsomest and neatest towns in all Switzerland. The population is 5341, who are occupied chiefly in manufactures and trade. In the town are several handsome buildings, a public library, and cabinets of medals and ornithology. The site of the ancient *Vitodurum*, where the Romans had a fortified encampment, is at Ober Winterthur, on the road to Frauenfeld in Thurgau. Many remains of antiquity have been found on the spot.
