The roads in Roxburghshire are very good. Several roads from London to Edinburgh pass through this county. One through Wooler just crosses the north-eastern part through Kelso; another, branching from this at Morpeth, passes through Jedburgh and St. Boswell's; and a third, through Penrith and Carlisle, crosses the western side of the county through Dryden and Hawick to Selkirk. A road from Hawick follows the valley of the Teviot, and then of the Tweed, through Kelso to Berwick. The Edinburgh and Hawick railway traverses part of the county. A branch from the York, Newcastle, and Berwick line joins the Edinburgh and Hawick line near St. Boswell's Green.

Geology, &c.—The eastern side of the county is chiefly occupied by the formations of the red-marl or new red-sandstone group, the western side by the grauwacke rocks; the Cheviot or border hills are chiefly of trap formations, and with Liddesdale, form an extension of the Northumberland coal-measures. The predominant rock of the red-marl formation is a sandstone, commonly red but sometimes white. It frequently occurs in strata of considerable thickness, and is employed in building, for which purpose both the red and white varieties are quarried. It more commonly however occurs in thin horizontal beds, which are soft, brittle, and easily decomposed. No coal is dug in the county. The trap formations of the border hills comprehend greenstone, basalt, trap tuff, amygdaloid, and especially a felspar porphyry of reddish-brown colour. In the red-sandstone districts, trap rocks are frequent. Limestone is procured in some parts of the county, but it is neither good nor abundant.

Soil and Agriculture.—The soil in the western parts of the county, where the predominant rock is grauwacke, is generally thin, cold, and clayey, but capable of improvements by underdraining, and of producing good though late white crops. The red-sandstone district, where the sandstone is finer grained, and more clayey and adhesive, is marked by a deep rich red soil producing its harvest rather early; but where the sandstone is more siliceous and loose, the surface is covered with a barren sand. The trap and porphyry district is usually covered by a loose, light, warm, and dry soil, except in the bottoms, where there is commonly a deposit of rich strong clay loam. The highest parts of the trap district afford fine sheep-pasture. The arable land, from the great improvements which have taken place of late years by the introduction of the drill turnip husbandry, the use of manures, better draining, and the intermixture of the feeding and grazing of live stock with tillage, is exceedingly fertile. On the larger farms the inclosures contain from twenty to forty acres. The number of sheep annually raised has greatly increased since the beginning of the century, considerable attention having been shown both to the breeding and the feeding of them. The Cheviots are put on the hill-pastures, and the Leicester, or long-wooled, on the lower grounds. The Teesdale, or short-horned, is the common stock of cattle; but the

Ayrshire and the Highland breeds are also kept, the breeding of cattle being much attended to.

Divisions, Towns, &c.—This county is divided into 30 parishes, of which 5 are partly in other counties. There are 4 divisions of the county, namely, the districts of Melrose, Hawick, Jedburgh, and Kelso. Its popular division into Teviotdale, Liddesdale, &c., has been mentioned above. It contains 5 market-towns:—JEDBURGH, the county town; HAWICK and KELSO, described under their respective heads; Castletown and Melrose, which we notice here.

Castletown, or Newcastle, a market-town in the southern part of the county, had a population in 1851 of about 1030. The castle is a massive border tower, or fortress, nearly 100 feet square. The town consists of two long parallel streets, which are lined with neat new houses, on the right bank of the Liddel. The old village of Castletown (so called from a border fortress now demolished) was situated higher up the vale.

Melrose, a burgh of barony, is situated on the right bank of the Tweed, 36 miles S. from Edinburgh, and 13 miles N.W. from Jedburgh. The population of the town in 1851 was 966. It appears to have been the seat of a religious community in the time of the Saxon heptarchy. In 1138 David I. of Scotland founded here a Cistercian abbey, the ruins of which yet remain. They are chiefly of the abbey church, which was cruciform; the length of the nave and choir was 258 feet, the breadth 79 feet; the length of the choir alone about 50 feet; the length of the transept was 130 feet, the breadth 44 feet. The walls of the nave, choir, and transept are standing, and part of the central tower. The shaft of an ancient cross in the centre of the village is surmounted by the crest of the earls of Haddington. The town of Melrose consists of a central triangular space, with streets diverging from it. The place has an air of antiquity, and some of the houses have in their walls stones with inscriptions derived from mediæval times. The parish church is on an eminence west of the town. There are a Free church, and United Presbyterian and Episcopal chapels; several schools, a library, and a savings bank. A suspension-bridge crosses the Tweed for foot-passengers and single horses. The only manufacture is that of woollens, in connection with the manufactures of Galashiels.

The following villages may be noticed: the populations are those of the parishes in 1851:—

Ancrum, population 1554, is on the right bank of the Ale Water, 4 miles N.N.W. from Jedburgh. The battle of Ancrum Moor was fought in 1645 on a field about a mile and a half north from the village. Near Ancrum are several caves hewn out of the rock on the bank of the river. The remains of a British fort are near the village. In the centre of the village green is an ancient cross. *Denholm,* population of the parish of Cavers 1496, on the right bank of the Teviot, 5 miles N.E. from Hawick, is a thriving village, dependent chiefly on the stocking manufacture carried on at Hawick. There are a Free church, a chapel for Independents, a subscription library, a free library which contains about 1000 volumes, and a parochial school. Of the old baronial castle of the Douglasses, the former sheriffs of Teviotdale, which was of considerable strength and importance, there are now no remains. The town of Cavers was destroyed by the English in 1596. *Leseddes,* population of St. Boswell's parish 884, is pleasantly situated on the right bank of the Tweed, 5 miles S.E. from Melrose. Of the ancient village of St. Boswell's there are now no remains. Besides the parish church there is a Free church. An extensive fair for sheep, cattle, horses, linen, pedlery, &c., is held on St. Boswell's Green on July 18th. *Lillicleaf,* population 798, about 9 miles W. by N. from Jedburgh, possesses a parish church, a chapel for United Presbyterians, a parochial school, and a library. In the times of border warfare there were in the village and vicinity several forts or peels; of these the remains of 14 existed till within the last century. There still remain small portions of one or two of the towers. *Morbattle,* population 997, about 10 miles S. by E. from Kelso, on the Kail or Kail Water, a feeder of the Teviot, contains some good houses. Besides the parish church there are a Free church, a chapel for United Presbyterians, a parochial school, and a parish library. *Roxburgh,* population 1141, is on the left bank of the Teviot, 4 miles S.S.W. from Kelso. The ancient town of Roxburgh, formerly the county town, was at one time the fourth in point of importance of the towns of Scotland; but scarcely any remains of it now exist. The houses were mostly of wood. The ruins of the celebrated castle of Roxburgh are a short distance west from the site of the old town. *Kirk Yetholm* and *Town Yetholm* are burghs of barony in the parish of Yetholm, which had a population in 1851 of 1362. The villages are situated near the border of the county and of Scotland, about 8 miles S.E. from Kelso. Two annual fairs are held in each of the villages. Besides the parish church there are chapels in Town Yetholm for the United Presbyterians and United Original Seceders. Kirk Yetholm is remarkable as the head-quarters of a community of gipsies which has been settled here for about 160 years.

History and Antiquities.—Of prehistoric nations, cairns, barrows, tumuli, and other sepulchral memorials, have been found in different parts of the county. Standing stones, some of them arranged in circles, are found; and the Eildon Hills and other eminences are crowned with forts. On the conquest of this part of the island by the Romans the county was comprehended in the province of Valentia,

and Roman roads were carried across it. Some stations were formed by occupying the ancient forts or hill-camps of the natives, and strengthening and adapting them by Roman skill and labour. The camp on the Eildon Hills was thus occupied. A chain of Roman posts may be traced by their existing remains. One of the roads, a continuation of Watling-street, may be traced from the Northumbrian border across the county near Jedburgh and Melrose, in the direction of Lauder. Coins, vessels of copper and brass, and other Roman antiquities, have been discovered.

On the departure of the Romans this county was attacked by the Angles. The construction of the Catrail, or line of defence, formed of a ditch 26 feet broad, with a rampart 10 feet high on each side of it, extending from near Galashiels in Selkirkshire to Peel Fell on the border of Northumberland, and stretching 18 miles through this county, is attributed to this period. Jedburgh Castle was erected in the time of David I. Roxburgh Castle was of as early a date, and at one time of greater importance. Hermitage Castle, near the village of Castletown, was built during the reign of Alexander II. (1214-49); and in following years, but especially after the aggressions of Edward I., arose various castles, towers, and peels, of which many ruins now exist. The ecclesiastical ruins, Kelso, Jedburgh, and Melrose abbeys, have been noticed already. There are remarkable caves at Jedburgh, Roxburgh, and Ancrum, which appear to have been used as habitations, possibly as temporary retreats during the border wars. There are some remarkable remains of walls in Ancrum parish, forming a quadrangle, inclosing an eminence above which they rose; they are called the Malton Wall, and are supposed to be the remains of a building belonging to the Knights of Malta. Smallholm Tower is so conspicuous as to form a landmark for seamen entering Berwick harbour.

Roxburghshire appears to have been early established as a county. The Sheriff of Roxburgh is mentioned in the reign of Alexander I. and David I. When Edward I. seized Scotland he placed this county under military administration. Robert Bruce and Douglas took Roxburgh Castle in 1313, and restored the former administration by a sheriff. The office of sheriff afterwards became hereditary in the Douglas family, and continued so until the abolition of hereditary jurisdictions. Roxburgh Castle was taken from the English in 1460 by Mary of Gueldres, widow of King James II., who had fallen during the siege. The calamities of war ruined the town of Roxburgh, which had in the reign of David I. been a royal residence and the county town. On its downfall Jedburgh became, and has continued to be, the county town.

Statistics: Religious Worship and Education.—According to the Returns of the Census in 1851 there were 87 places of worship in the county, of which 35 belonged to the Established Church, 17 to the United Presbyterian Church, 16 to the Free Church, 9 to Independents, 4 to Episcopalians, 3 to Baptists, 2 to Original Seceders, and 1 to Roman Catholics. In 67 of these places of worship the number of sittings provided was 28,259. There were 74 public day schools with 6130 scholars, and 32 private day schools with 1574 scholars. Of Sabbath schools there were 77, with 4473 scholars. Of evening schools for adults there were 3, with 136 scholars. There were 2 literary institutions in the county, with 188 members, and possessing 1080 volumes in their libraries.

Savings Banks.—In 1853 the county possessed two savings banks at Jedburgh and Kelso. The amount owing to depositors on November 20th 1853 was 31,525*l.* 19*s.* 10*d.*

ROXBURY. [MASSACHUSETTS.]

ROYBON. [ISÈRE.]

ROYDON. [ESSEX.]

ROYE. [SOMME.]

ROYÈRE. [CRUZE.]

ROYSTON, Hertfordshire, a market-town, and the seat of a Poor-Law Union, chiefly in the parish of Royston (a part of the parish and town being in Cambridgeshire), is situated in 52° 3' N. lat., 0° 2' W. long., distant 20 miles N. by E. from Hertford, 38 miles N. from London by road, and 45 miles by the Great Northern and Eastern Counties railways. The population of the entire parish of Royston in 1851 was 2061. The living is a vicarage in the archdeaconry of St. Albans and diocese of Rochester. Royston Poor-Law Union contains 29 parishes and townships, with an area of 60,440 acres, and a population in 1851 of 19,764.

Royston is situated in a bottom surrounded by chalk downs. The market-house is a modern building. The church was formerly the conventual church of a priory of the regular canons of St. Augustine. There are two chapels for Independents and one for Unitarians; National, British, and Infant schools; a girls working school; and a mechanics institute, with a library. A county court is held. The principal business is malting; a large corn trade is also carried on. There are a brewery and some lime-burning works. The market is on Wednesday. Five fairs are held in the course of the year.

In the town was discovered in 1742 a curious bell-shaped subterranean cavern, supposed to have been a hermitage, 80 feet high and nearly 20 feet in diameter, cut out in the solid chalk, and ornamented with rude carvings of sacred subjects.

RUABON. [DENBIGHSHIRE.]

RUDOLSTÄDT. [SCHWARZBURG.]

RUGBY, Warwickshire, a market-town and the seat of a Poor-Law

Union, in the parish of Rugby, is situated on an eminence near the left bank of the river Avon, in 52° 22' N. lat., 1° 15' W. long., distant 16 miles N.E. by E. from Warwick, 83 miles N.W. from London by road, and by the North-Western railway. The population of the town of Rugby in 1851 was 6317. The living is a rectory in the archdeaconry of Coventry and diocese of Worcester. The parish is under the management of a Local Board of Health. Rugby Poor-Law Union contains 41 parishes and townships, with an area of 80,755 acres, and a population in 1851 of 23,477.

Rugby had a castle in the middle ages, of which only the earth-works remain. The town is lighted with gas and paved. The importance of Rugby is chiefly derived from its grammar-school, founded in 1567 by Lawrence Sheriff, a shopkeeper in London, who was a native of the locality. The school buildings include a quadrangle, inclosing a court 90 feet long by 75 feet wide, bounded on three sides by open cloisters. The buildings are in the Elizabethan style, of white brick, with the angles, cornices, and dressings to the openings and windows, of Attleborough stone. The chapel contains the monuments of Dr. James, formerly head-master, under whom the school first rose to great eminence; of Dr. Wool, one of his successors in office; and of the late Dr. Arnold, under whose mastership, in more recent times, the celebrity of the school was considerably augmented. The school, which was attended in 1854 by 400 boys, is under the care of a head-master and 12 assistant-masters, and has 21 exhibitions of 60*l.* per annum, each tenable for seven years. The endowment is estimated to produce 5000*l.* per annum. Attached to the school is a fine play-ground of eight acres. Rugby parish church possesses little architectural interest; it has a square western tower. St. Matthew's church was built and endowed in 1841; a new church dedicated to the Holy Trinity, has just been erected. The Wesleyan Methodists, Baptists, and Roman Catholics have places of worship. There are also the Elborow school, founded in the 18th century by Richard Elborow, Esq.; the Parochial schools, built in 1830; an Infant school; a literary institute, founded in 1847; a savings bank; a college for the instruction of the deaf and dumb belonging to the higher ranks of life; and two ranges of almshouses.

Rugby holds an important place in the system of railway communication, being the point of junction of several lines of railway. The London and North-Western, the North-Midland, the Leamington and Warwick, the Trent Valley, and the Rugby and Stamford lines meet here. The North-Western station is very extensive, and has recently been enlarged by additional buildings. An iron-foundry gives employment to some of the inhabitants. Saturday is the ordinary market-day; a corn-market is held on Tuesday. There are 18 horse and cattle fairs in the course of the year, one of which, held in November, lasts for eight days. There are two cheese and wool fairs. A county court is held in Rugby. The Oxford canal passes near the town.

RUGELEY. [STAFFORDSHIRE.]

RUGEN, an island in the Baltic belonging to Prussia, is included in the government of Stralsund and province of Pomerania. It has an area of 388 square miles and a population of about 35,000. It is separated from the continent by a strait a mile broad. Its sides are deeply indented by the sea in various directions, so that the island resembles a number of peninsulas united by a comparatively small nucleus in the centre. On the east side the peninsula of *Jasmund* is connected with the nucleus by a steep ridge called *Prora*, and by a long, narrow, and high wall of flint, granite, and porphyry boulders. In this peninsula is the *Stubbenitz*, a considerable beech-forest, containing the *Berg*, or *Black Lake*, an oval spot surrounded with a high wall, which is believed to be the place where the goddess *Hertha* (Earth) was worshipped. (Tacitus, 'Germ.,' c. 40.) The whole island abounds in grotesque and romantic scenery. On the west it is level, but rises in the interior, and the northern coasts consist in general of rugged steep chalk cliffs. One of the most considerable eminences in the island is *Mount Rugard*, on which the residence of the princes formerly stood. On the north point of *Jasmund* is the *Stubbenkammer*, a lofty chalk cliff, which rises perpendicularly (565 feet) from the sea in the most irregular forms: a flight of 600 steps cut in the rock leads down from the highest part of it to the strand. *Jasmund* is connected by a narrow strip of alluvial soil with the peninsula of *Wollow*, a level tract with a rich soil, terminating in the promontory of *Arkona*, the most northern point of Germany. Large tumuli (called *Hünengräber*) are seen in several parts. The island is tolerably fertile, and produces much corn. The number of cattle is considerable, and the fisheries productive. *Bergen*, the capital of the island, has about 3000 inhabitants. Rugen is much visited for its beautiful scenery, and for sea-bathing. This island was ceded to Prussia by Sweden in 1815.

RÜGENWALDE. [CÖSLIN.]

RUGLES. [EURR.]

RUHBORT. [DÜSSELDORF.]

RUM CAY. [BAHAMAS.]

RUM, Island of. [ARGYLESHIRE.]

RUM-ILL, or ROUMILI ('Country of the Romans'), a name originally given by the Turks to the territories which they wrested from the eastern emperors. Hence Asia Minor is known in all eastern countries by the name of Rum, or Roum. In the course of time the term

Roumili was specially applied to the whole country that lies south of the Danube and the Save, to the north of Greece, and between the Adriatic and the Black and Ægean seas; so that it comprised Macedonia, Thrace, Albania, Bosnia, Servia and Bulgaria. Bulgaria is now divided into the Eyalets of Silistré, or Silistria, Widin, and Nich (Niassa); Thrace, or the greater part of it, forms the Eyalet of Edirné, or Adrianople; Syrp, or Serbia, is nearly independent of Turkey; the Eyalet of Bosna includes Bosnia and Turkish Croatia; the southern part of Macedonia forms with Thessaly the Eyalet of Selanik, or Saloniki; the north-eastern part of Albania, with some adjacent districts, form the Eyalet of Uskub, whilst the south part belongs to the Eyalet of Yania, or Joannina; and the remainder of the territory as above indicated, and consisting of eastern Albania and the western part of Macedonia, forms the present Eyalet of *Roum-ili*.

The face of the country, which is described in the articles on ALBANIA and MACEDONIA, is traversed by ramifications of the Balkan Mountains, which inclose many fertile plains and valleys. The climate is in general mild and salubrious. Cotton, wine, oil, and tobacco are the chief products. There are extensive pastures on which large numbers of sheep are bred. The principal rivers are the AXIUS, the MARITZA, and the *Haliacmon*, now the *Vistritza*, and in its lower course *Inje-Kara*, which flows partly from the Lake Kastoria, so named from the fortress of *Kastoria*, which is built on a peninsula in the lake on the site of the ancient *Celstrum*. Its course is winding, but generally to the south of east, and it enters the Thermaic Gulf. In ancient times the *Haliacmon* was joined by the *Lydias* (the modern *Karasamak*), which is the outlet of the Lake of Pella, but now the *Lydias* is a feeder of the *Axius*. The banks of the *Haliacmon* are lined with dykes to save the adjacent country from inundations. Both the river and the lake of *Kastoria* (which is six miles long and four miles wide) are famous for a fish named *Guliani*, which grows to enormous dimensions.

The present Eyalet of *Roum-ili* comprises the livas of *Monastir* and *Ghiustendil*. *Monastir* includes the south-west of Macedonia. The capital *Monastir*, called also *Bitolia*, near the site of the ancient *Heraclæa*, not far from the banks of the river *Erigonus*, an affluent of the *Axius*, and on the borders of Albania, is a considerable town, with about 15,000 inhabitants. *Ghiustendil*, embraces the northern part of Macedonia and the east of Albania. It has some rich copper- and iron-mines. The head town *Ghiustendil* is situated on the slope of a hill at a short distance from the right bank of the *Kara-su*, or *Struma*, in 42° 18' N. lat., 22° 5' E. long., and has about 10,000 inhabitants. The town, which is surrounded by an old wall flanked with towers, contains a bazaar and sulphurous baths. A Greek bishop resides in it. [TURKEY; ALBANIA; MACEDONIA; THESSALY.]

RUNCORN, Cheshire, a market-town, and the seat of a Poor-Law Union, in the parish of Runcorn, is situated on the left bank of the river *Mersey*, near its junction with the *Weaver*, in 53° 20' N. lat., 2° 44' W. long., distant 17 miles N.N.E. from *Chester*, 187 miles N.W. from London by road, and 182 miles by the London and North-Western railway. The population of the town of Runcorn in 1851 was 8049. The living is a vicarage in the archdeaconry and diocese of *Chester*. Runcorn Poor-Law Union contains 37 parishes and townships, with an area of 45,776 acres, and a population in 1851 of 25,797.

Runcorn is a place of considerable antiquity. The town was of little consequence in modern times, previous to the formation of the Duke of Bridgewater's Canal. It now possesses some manufactures and a considerable amount of trade. Iron-foundries, corn-mills, collieries, slate- and stone-quarries, shipbuilding-yards, soap-works, and works for distilling turpentine, employ many of the inhabitants. The Duke of Bridgewater's Canal, the *Mersey* and *Irwell* Canal, and the North-Western railway, which has stations on both sides of the river, afford facilities for the conveyance of passengers and traffic. Runcorn is a favourite resort of sea-bathing visitors in summer. The town is lighted with gas. The town-hall, a neat structure of recent erection, contains a subscription news-room. There is also a bride-well. A county court is held. The parish church is a handsome new building. Holy Trinity church, built in 1838 of red-sandstone, has a low tower. The Wesleyan Methodists, Independents, Baptists, the Countess of Huntingdon's Connexion, and Roman Catholics, have places of worship. There are National, British, and Infant schools, and a savings bank. Friday is the market-day; fairs are held on the last Friday in April and the last Friday in October.

RUNN. [COTCH; HINDUSTAN.]

RUNNIMEDE. [SURREY.]

RUPPIN, NEW. [BRANDENBURG.]

RÛREMONDE. [LIMBURG.]

RUSH. [DUBLIN, County of.]

RUSHDEN. [NORTHAMPTONSHIRE.]

RUSHVILLE. [INDIANA.]

RUSSIA. *The Russian Empire* extends over the north-eastern part of Europe, over the whole of Northern Asia, and the north-western coast of North America. It consists of Russia-in-Europe, properly so called, in which term Poland and Finland also are comprised; the Caucasian Territories, which comprise the countries between the Black Sea and the Caspian; Asiatic Russia, in which are included the four governments of *Tobolsk*, *Tomsk*, *Jeniseisk*, and *Irkutak*, and some

other districts of eastern and western Siberia; and some settlements on the north-west coast of North America. The area and population of the whole empire, according to official statements made in 1846, are as follows:—

	Area in Square Miles.	Population in 1846.
European Russia . . .	2,091,891	60,604,702
Asiatic Russia . . .	4,723,185	2,937,000
American Russia . . .	370,300	61,000
Caucasian Provinces . . .	66,083	2,648,000
Total . . .	7,362,959	66,250,702

Baron Haxthausen, in his recent work upon Russia, states the population in 1852 to be 69,660,146. In respect of religion about 50,000,000 belong to the Greek Church, 7,000,000, chiefly Poles, are Catholics, and about 3,000,000 are Protestants; the rest are Mahomedans, Buddhists, and heathens.

The present article, while in some points of view it relates to the whole of the vast empire, comprises briefly the physical geography of European Russia only; under the heads of SIBERIA, GEORGIA, ALTAI MOUNTAINS, KAMTOHATKA, AMUR, and BAIKAL, the surface of the rest of the empire is described; while under the names of the great administrative divisions of the empire, the physical features, products, towns, &c. of all the provinces, are noticed in detail in the present work.

European Russia comprehends the north-eastern portion of Europe, extending from 43° to 71° N. lat., 20° to 63° E. long. It is divided from Asia by the Ural Mountains, which begin on the peninsula that lies opposite the island of *Nova Zembla*, east of the Strait of *Waigatz*, and extend in a southern direction to 54° N. lat., where they divide into three ranges. From this point, the river *Ural*, which rises between the two most eastern ranges, forms the boundary-line until it falls into the *Caspian Sea*. From the mouth of the river *Ural* the boundary runs along the north-western shore of the *Caspian Sea* to the embouchure of the river *Kuma*. At this point begins the southern boundary-line, which runs along the course of that river to 45° E. long., and then nearly north to the river *Manytch*, whose course it follows to 41° 30' E. long., whence it continues nearly due west to the *Sea of Azof*, and chiefly along the course of the river *Ieia*. The sovereignty of Russia has been acknowledged by most of the countries on each side of the *Caucasus*, between the *Black Sea* and the *Caspian*, as far south as the *Kur* and the *Araxes* [CAUCASUS, GEORGIA, &c.], and though the territories west of the *Caucasus* are considered to belong to Europe, yet they have not as yet been included in European Russia. The remainder of the southern boundary is formed by the *Sea of Azof*, the Strait of *Yenikalé*, and the *Black Sea*. Near its western boundary Russia extends to the banks of the *Danube*, which forms the boundary between it and Turkey as far as the mouth of the river *Pruth* (near 28° E. long.). The *Pruth* divides Russia from *Moldavia* nearly to its source in the *Carpathian Mountains*; further north between *Austrian Galicia*, *Silesia*, and *Prussia*, there is no natural boundary. On reaching the Baltic the boundary-line of the empire towards the west runs round the Gulfs of *Riga* and *Finland*, and up the Gulf of *Bothnia* to its northern extremity (66° N. lat.). Farther north it touches *Sweden* and *Norway*. From *Sweden* Russia is partly separated by the lower course of the river *Tornea*, and farther north by its affluent the *Munio*. The boundary between Russia and *Norway* is partly formed by the watershed between the Gulf of *Bothnia*, and partly by the course of the river *Tana*. A small part of *Norway* extends east of the river *Tana*. On the north Russia is washed by the *Arctic Ocean*, which here forms the extensive gulf called the *White Sea*.

Surface.—The whole surface of Russia may with propriety be considered one extensive plain. If the Ural Mountains, which extend along its eastern border, and a mountain tract in the *Crimea* [CRIMEA] be excepted, there is not in this immense extent of country an eminence which rises more than 500 feet above its base, or more than 1100 feet above the sea-level. The watershed which divides the rivers that flow to the *Arctic Ocean*, the *Baltic*, the *Black Sea*, and the *Caspian Sea*, is not formed by mountains, but by tracts of elevated ground, the summits of which extend in wide and nearly level plains, and whose declivities form long and generally imperceptible slopes. The plains themselves are covered either with bogs and swamps or with forests, and in other parts they are dry and woodless tracts called steppes.

Almost on the banks of the river *Bug*, which used partly to separate *Poland* from *Russia*, between 51° 30' and 53° N. lat., there is a flat plain, the watercourses on which have too little fall to carry off the accumulated water. The whole plain is nearly a continuous swamp, and covered with fir-trees. It contains the sources of several affluents of the *Dnieper* and *Vistula*. On both sides of 52° N. lat. it extends from 24° to 30° E. long., a distance of 240 miles, and renders the country on both sides of the river *Pripecz* almost impassable. This portion of the watershed is called the *Swamps of Pinak* and *Ratnor*. The swampy ground extends farther north, between the affluents of the *Niemen* and *Dnieper*, to 55° 30' N. lat., and terminates on the banks of the *Düna* between *Polotak* and *Drooya*. In these parts how-

ever the swamps are only from 100 to 50 miles in width, and are frequently interrupted by tracts of drier and more elevated land. East of the northern extremity of these swamps, between 54° 30' and 55° 30' N. lat., there is a more elevated country with a very broken surface, and containing numerous rocky hills, between which many lakes occur. From this elevated tract, which separates the upper courses of the rivers Dnieper and Düna, the watershed extends northward over the eastern portions of the governments of Vitepsk and Pskow, where it descends in low ridges to the lakes of Peipus and Ilmen. The most elevated part of it probably attains 1000 feet above the sea, as the town of Mojaik on the Moskwa is more than 700 feet above it. The watershed hitherto noticed divides the rivers that flow into the Baltic from those which run into the Black Sea. At this point however it divides, and forms two watersheds, of which one runs north-east between the watercourses that fall into the White Sea and those which run into the Caspian Sea, and the other runs south-east between the rivers which flow to the Caspian and those which fall into the Black Sea.

The north-eastern watershed begins in the hilly region of Valdai, which contains the source of the Volga, the largest river of Europe. It lies contiguous to the region just described, beginning on the west between the sources of the river Pola, which falls into Lake Ilmen, and extending north-east to the river Msta. In this direction it occupies hardly more than 90 miles, but extends from north-west to south-east, between Novgorod and Vichnei-Volotshok, more than 120 miles. The country rises from the north-west and south-east with a gradual slope, and at the town of Valdai attains an elevation of about 870 feet. On the most elevated portion of it there are steep and rocky hills, but of little elevation above their base; the highest of them, the Popova Gora, according to Humboldt, does not exceed 984 feet above the sea-level. As this region was formerly covered with a continuous forest, it is also known by the name of the forest of Volkhonak. From the banks of the river Msta the watershed extends northward towards the isthmus which divides the great lakes of Ladoga and Onega, but it does not reach it, as it turns again to the north-east, and remains about 20 or 25 miles from the southern extremity of Lake Onega, running between its banks and the Lake of Bielo Osero. Having passed between these lakes, it suddenly turns to the south, and approaches the banks of the Volga (40° E. long.) within about 60 miles. Between the river Msta and 40° E. long. the watershed seems to be much lower than on the hilly region of Valdai, as is proved by the facility with which canals have been made across it to unite the rivers which fall into the Lake of Onega or into the Dwina with the affluents of the Volga. The more elevated tract, with its very gradual slopes, does not seem to exceed 20 miles in width, and is entirely covered with forests. From 40° E. long. the watershed extends eastward near 59° N. lat., between the affluents of the Dwina and those of the Volga, to 50° E. long., whence it declines to the north-east and reaches the Ural Mountains in 61° 30' N. lat., 59° E. long., between the sources of the rivers Petschora and Kolva; the latter is a branch of the Kama, an affluent of the Volga. The whole region east of 40° E. long. is covered with interminable forests of pines and firs, and nearly uninhabited. This large tract of country is called by some geographers 'uwalli.'

The south-eastern watershed begins likewise in the elevated hilly region which separates the upper courses of the Düna and Dnieper, and runs for some distance close to the banks of the last-mentioned river, so that the river Moskwa, which originates in these parts, runs eastward to the Oka, an affluent of the Volga. It continues in a nearly southern course from 55° to 52° 30', and up to 53° 30' N. lat., seems to consist of a broad-backed swell, which is covered with forests. Between 53° 30' and 52° 30' N. lat. it expands in wide and nearly level plains, which occupy perhaps 100 miles in breadth, and extend over the central provinces of Russia eastward up to the banks of the Volga, between 52° and 53° 30' N. lat. These plains do not probably rise more than 800 feet above the sea-level, and are chiefly woodless, though in some of the numerous depressions trees of stunted growth are frequent. Where the watershed approaches the banks of the Volga, in the southern districts of the government of Simbirsk, it forms an elevated ridge, but small in width, which runs eastward, and compels the river to make a bend at Samara (near 53° N. lat.). On the eastern bank of the river a similar ridge rises, which incloses the river Sock, and continues in an easterly direction until it joins the Obstahei Sirt, or western branch of the Ural Mountains, near 56° E. long. That portion of the ridge which lies east of the Volga consists of sandy hills almost without vegetation, and partakes largely of the nature of the steppes which lie south of it. This watershed incloses the wide basin of the upper course of the Volga on the south, and divides it from the rivers which run southward and unite with the Dnieper and the Don.

Besides these two lines of watershed which cross Russia from west to east, there is in the southern provinces an elevated tract, the base of which is granite, and which traverses it in the same direction, but does not form a watershed, being broken through by several large rivers. At its western extremity it is connected with the eastern offsets of the Carpathian Mountains, which extend over the north-western portion of the government of Kisheneff, or Bessarabia, and advance as far south as the town of Kisheneff. From these ridges

the elevated tract extends eastward, occupying on the banks of the river Dniester the whole space between Yampol and Dubossary, and rendering this part of the river unfit for navigation by forming rapids and falls. Farther east, on the banks of the Bug, it occurs near Olviopol, and on those of the Ingool, an affluent of the Bug, between Yelisavetgrad and Bobrinetz. It continues eastward to the Dnieper, which is compelled by it to make the great bend eastward between 47° and 49° N. lat., and in which it produces the Poroges, or twelve waterfalls of Ekaterinoslav. From this place it declines more to the south, and extending along the banks of the Konakaya, an affluent of the Dnieper, it approaches the Sea of Asof, where it terminates on the banks of the river Berda.

Soil.—Russia has a much greater variety of soil than any other country of Europe. Some very extensive tracts are hardly more adapted for agriculture than the great African desert; while others in fertility may be compared with those countries without the tropics which are most favoured by nature. In taking this survey of Russia, we begin from the north-east.

Between the northern portion of the Ural Mountains on the east and the river Mezen on the west, is the region of the 'tundras,' which extends from the coast of the Arctic Ocean to 64° N. lat. It is mostly a plain covered with moss, which for eight or nine months is frozen, and the remainder of the year is so saturated with water as to be impassable. In some places bushes occur, which bear berries. The few inhabitants live on fish, which is very plentiful in the rivers, and clothe themselves with the skins of wild animals. For furred skins, their only article of traffic, they obtain small quantities of corn, which is brought from the countries south of the 'uwalli' down the river Petschora.

To the south and west of the tundras extends the largest forest in Europe, if not on the whole globe. This region occupies the country on both sides of the upper course of the Petschora, and all those which lie within the basin of the Dwina and its great branches the Sukhona and Vychedga. According to official statements, it covers 150,000 square miles. It consists chiefly of different kinds of pines, with some firs, larch, and birch. A few cultivated spots produce rye, barley, oats, peas, hemp, and flax. But as the summer is very short, and, during this season the weather very unsettled, fogs and rain being very frequent, the crops frequently fail. Hard frost continues from the end of October to the end of April. The scanty population is mostly occupied in bringing the produce of the forests to Archangel. This region extends westward to the river Onega, and southward to the uwalli, the northern declivity of which, chiefly occupied by swamps, but well wooded, belongs to it. It comprehends the western portion of the government of Archangel and the whole of Vologda.

West of the river Onega begins the region of rocks and lakes. It extends over the immense tract which lies between the gulfs of Finland and of Bothnia on the west and south and the White Sea on the north-east. This region extends from east to west about 500 miles, and from south to north more than 400 miles. It has a much more broken surface than any other portion of Russia of equal extent. The northern portion, as far as 65° 30' N. lat., is level; at least it does not contain any continuous ridges of hills; and here the watershed is found to rise gradually, but not to a great elevation. Near 65° 30' N. lat., 30° E. long., a ridge of hills (Masielka Mountains) rises, which runs south to 64° N. lat., where it divides into two ridges, of which that which runs east divides the waters that fall into the White Sea from those that run to the lakes of Ladoga and Onega. After having passed the last-mentioned lake at a short distance, it approaches the banks of the Onega River, and then turns to the south-west, and terminates in that direction not far from the south-eastern shore of the Lake of Onega. It consists chiefly of sand-hills; but in some parts granite appears, and in such places the declivity is steep. The ridge which runs westward is mainly composed of granite, but it is of considerable elevation, and grows lower as it approaches the Gulf of Bothnia, sinking down to the level ground at a considerable distance from the shores. The country surrounded by these two ridges, by the gulfs of Bothnia and Finland, the river Neva, the Lake of Ladoga, the river Swir, and the Lake of Onega, has a rocky sub-soil, and in many places the rocks rise above the surface and constitute hills. They never form an extensive mass, but only low and narrow ridges, which alternate with wide and deep depressions, the greater part of which are filled up with lakes. It is supposed that one-fourth of the surface is covered with water. The general surface of the country appears to be lowest towards the east, north of the Lake of Ladoga, where it probably does not attain 200 feet above the sea-level, and is less interspersed with rocks and lakes; but in approaching 30° E. long. it rises considerably. The country west of this meridian is described under FINLAND.

That portion of Russia which lies north of a line drawn from Uleaborg to the extremity of the Gulf of Kandalaskaya comprehends Russian Lapland, which is described under LAPLAND. According to meteorological observations taken at Enontekis, in Russian Lapland (68° 30' N. lat.), the mean annual temperature does not exceed 27° Fahr.; that of the winter is 0°, of the spring 25°, of the summer 55°, and of the autumn 26½° Fahr.

On the southern coast of the Gulf of Finland, the shores are composed of limestone, and rise abruptly from the sea like a wall to an

elevation of 60 to 180 feet. From this elevated coast, the country extends in a level plain from 30 to 40 miles southward, and then descends to the plain of Livonia by a gradual slope. The surface of the plain is covered with a layer of mould of indifferent fertility, producing moderate crops of rye and barley. A part of the plain is covered with woods, consisting commonly of birch, but frequently intermixed with poplar and lime-trees; the last-mentioned trees constitute, in some places, extensive forests. The plain is furrowed by watercourses, which lie many yards below the surface, and the rivers which flow in them have a very rapid course, so as to be unfit for navigation, at least in several places. There are no swamps in this region, but farther west there are many. [COURLAND; ESTHONIA.]

Though both the northern and southern shores of the Gulf of Finland are elevated and rocky, the country that surrounds its innermost recess on both sides of the river Neva forms a depression which extends round the southern shores of the Lake of Ladoga, and continues to the southern extremity of that of Onega. Towards the south it reaches, near 59° N. lat., the hilly tracts that branch off from the table-land of Valdai. A moderately thin layer of mould covers a subsoil of rock. The surface is level and very swampy, and though the soil is not devoid of fertility, great labour is required for its successful cultivation. Though situated in the immediate vicinity of one of the largest and most populous towns of Europe, only a very small proportion of the surface of this region is under cultivation, and about 20 miles from St. Petersburg the forests commence, which occupy nearly the whole of the country. The forests consist almost solely of fir and birch. Immense boulders of granite are dispersed through these forests. The mean annual temperature of St. Petersburg is only 37°; the mean of the winter is 16°, of the spring 32½°, of the summer 50°, and of the autumn 37½°. The mean annual quantity of rain which falls in that city is between 17 and 18 inches; but it must be remembered that vast quantities of snow fall in the winter.

The table-land of Valdai and the elevated tract which extends from the river Msta to the lake Bjelo-Osero (both these countries surround the plain above noticed on the south and south-east) were formerly covered with extensive forests of elm, birch, and poplar, the greater part of which have been cleared. The surface is undulating, and the rocky eminences which rise on it only attain a height of 100 to 200 feet above their base. Grain succeeds very well, and crops are abundant; but a great part of the produce is used for the maintenance of horses, which are in great request, as several well-frequented roads and three lines of canal traverse this region. The elevated and broken region which is contiguous to the table-land of Valdai on the west, and occupies the greater part of the governments of Pakow and Vitepsk, is similar in its natural features, but the surface exhibits greater variety, lakes being very numerous.

A ridge of elevated ground of considerable width commences on the banks of the Düna near Düna, not far from which town the last rapids in the river occur. It extends northward on both sides of 27° E. long., and terminates on the shore of Lake Peipus south of Dorpat. Its average elevation is about 600 feet above the sea, but in some places there are hills which are from 300 to 500 feet higher. This sandy and sterile ridge separates the elevated table-land of Vitepsk and Pakow from the low plain of Livonia, which extends westward from it to the shores of the Gulf of Riga. The eastern portion of this plain, east of 26° E. long., is in general undulating, but in many places contains hills 400 or 500 feet high. In this tract the soil is chiefly loamy, and has a considerable degree of fertility. In the forests the birch prevails. To the west of 26° E. long., the country is nearly a level, with the exception of the southern districts between the Düna and the river Aa, where there are some hills. The soil of the level portion of the plain is much less fertile, it yields however grain, hemp, and flax. The forests consist mostly of pine, and occupy a considerable portion of the level ground. It terminates on the sea with a low, flat, and sandy shore.

The large tract of country which extends from the Düna southward, having the swampy region on the east, and terminating in the great swamps of Pinak and Ratnor, is traversed from north to south by a series of table-lands, which occupy extensive tracts between the Düna and Vilia (an affluent of the Niemen), the Vilia and the Niemen, and the last-mentioned rivers and the Bug, and extend eastward to the swamps. The more elevated portions of these table-lands are from 400 to 800 feet above the sea-level; the soil is sandy and dry, covered with pine-forests, which supply the best pine-timber in Europe. This timber is floated down the affluents of the Niemen, and shipped from Memel. On the southern table-land, between the Niemen and the Bug, near the sources of the river Narew, and contiguous to the swamps of Pinak and Ratnor (between 52° 29' and 52° 51' N. lat., 23° 40' and 24° 30' E. long.), is the forest of Bialovisa, which occupies more than 700 square miles, and contains oak, fir, and pines of immense size. It is the only place where the *Urus* is still found in Europe. The lower countries along the banks of the rivers have a tolerably fertile soil, consisting of loam and sand, intermixed with alluvial mould, the deposit of the inundations of the rivers. They produce wheat, rye, barley, oats, buckwheat, and millet. Cattle are not abundant, owing to the want of meadows. Horses are numerous, but of small size. The climate of this region is much colder than that of the countries along the Baltic under the same parallel. Even in the southern districts the

mean annual temperature does not exceed 42°. The winter is long and severe; the spring short and late. The summer is extremely variable; the difference between two days frequently amounting to 20 degrees and more. The heat is sometimes insupportable, but is soon followed by a cold wind. Fogs are very frequent in this season. Autumn is the most agreeable season, when the days are dry and warm; but the nights are chilly. West of the region just noticed lies the territory of Poland, which is described in a separate article. [POLAND.]

The basin of the Volga occupies about 650,000 square miles, and is equal in extent to three times the area of France. It constitutes the most important, and, generally speaking, the most fertile portion of the empire. The upper basin of the Volga comprehends the governments of Twer, Yaroslav, and Kostroma. The source of the river is 910 feet, the town of Twer 390 feet, and the town of Nishnei-Novgorod, at the lower extremity of this part of the basin, 230 feet above the level of the sea. [VOLGA.] To this region belongs a great part of the southern declivity of the uwalli. Between Yaroslav and Kostroma, the declivity of the uwalli terminates about ten or twelve miles from the Volga, but farther east at a greater distance. Between it and the river there is a level plain. The forests, which consist mostly of pines, occupy less than half the surface of this slope. The remainder is partly covered with morasses and moors, and partly with heaths, here and there interspersed with tracts of sand. It is only along the watercourses that cultivable tracts of moderate extent and fertility occur. The plains along the Volga above and below Twer yield wheat, rye, barley, oats, hemp, and flax: and on their borders are forests of oak, birch, ash, alder, poplar, fir, and pine. Farther down the land is less fertile, and as the climate seems to be more severe, hemp and flax, rye and barley, constitute the principal objects of agriculture. Forests, chiefly of pine, are rather numerous. West of Kostroma however, where the plains increase in width, the soil is almost exclusively covered with sand, which produces few trees, and is only partially cultivated. In a few depressions there are meadows, but it is in general a very poor tract.

South of this portion of the basin of the Volga lies that of its affluent the Oka, which in some places extends to 52° N. lat., and is on an average 260 miles from north to south. Not far from the banks of the Volga, the country south of it rises to an elevation of from 50 to 100 feet, generally with a steep ascent, but in several places with a long gentle slope. The country which hence extends southward is an undulating plain interspersed with a few hills of moderate elevation and gradual declivities. The general level of the surface rises very slowly, as the town of Moscow is only 416 feet above the sea, or only 26 feet higher than Twer, and no part of the intervening country much exceeds 600 feet; but towards the west it rises higher. The soil, which near the Volga is of indifferent quality, improves towards the south and east. In the government of Moscow it is fertile, but still more so in those of Kaluga and Tula, and a part of Orel. But on approaching the watershed in Orel, the soil, though clayey, is very dry, and partakes of the nature of the steppes which lie towards the Black Sea. The country to the west of Moscow has also a less fertile soil, but east of Moscow, in the governments of Vladimir, Riasan, and the northern districts of Tambow, the soil improves still more than it does towards the south. The rivers which intersect this extensive region run in narrow valleys from 50 to 100 feet below the surface of the plain. The river bottoms are chiefly covered with sand, and sterile; in a few places only there are meadows. The heights which inclose these valleys are steep. Forests are rare in the countries south of Moscow, but in the eastern districts they occur at certain intervals between the well-cultivated fields, and consist of birch and fir, among which there are many tall oaks. The climate of Moscow may be considered as representing the climate of all this region, as the districts farther south are more elevated. The mean annual temperature is 39°, that of the winter 13°, that of the spring 39½°, that of the summer 62°, and that of the autumn 40°. The number of rainy days is 205 in the year, but the quantity of rain is small. A great depth of snow however falls during the winter.

The middle basin of the Volga extends from the mouth of the Oka downwards to the ridge of Samara, and comprehends the four governments of Nishnei-Novgorod, Pensa, Casan, and Simbirsk. It contains the most fertile part of the basin of the Volga, and perhaps of all Russia. The most fertile portion of it lies on the west of the river. Along its banks there is an acclivity from 300 to 600 feet above its lowest level; and the country at the back of this acclivity does not descend, but stretches out on an undulating level, here and there rising into hills covered with excellent soil. It produces abundance of wheat, rye, spelt, barley, buckwheat, and millet. Horses and cattle are numerous, but of small size. Sheep are very abundant, especially the broad-tailed kind. Oak is the most common kind of wood; birch and lime-trees are also numerous; fir is of stunted growth and unfit for timber. The region east of the river is not quite so fertile, but still it supplies rich crops, and is remarkable for the extensive forests of oak which occupy the higher grounds. These higher grounds are divided from the banks of the river by a low tract of from 4 to 6 miles or even 8 miles in width, which is partly covered with swamps, but partly supplies good pasture. The mean annual temperature of Casan is 37½°. The mean temperature of the autumn is 33°, of the winter 10°, of the summer 65°, and of the spring 42°.

To the north and east of this portion of the basin of the Volga extends that of its largest affluent, the Kama, which comprehends an area of about 200,000 square miles. As this basin lies contiguous to the Ural Mountains, the country adjacent to the range is traversed by a few offsets of that chain. But the country lowers rapidly to the westward. The town of Perm, hardly seventy miles distant from the great range in a straight line, is only 576 feet above the sea-level. Along the rivers there are valleys, or rather depressions, from 10 to 20 miles wide, and between these depressions there is a swell of elevated ground from 200 to 400 feet above the valleys, the highest part of which is a level or undulating plain, equal in width to the adjacent depressions. The higher portions of the country are entirely covered with forests of pine, oak, and lime-trees. A great part of the lower country is also wooded, but extensive tracts have been cleared, and yield rye, barley, and oats. In a few places wheat is cultivated. The basin of the Kama contains the richest mines of iron and copper in Russia, and immense quantities of salt are extracted from salt-springs. In this region platinum has been found.

The lower course of the Volga traverses an immense steppe or desert, which not only extends over the whole of the lower basin of the river, but stretches out eastward to the banks of the river Ural, along the course of which it extends from its mouth to the place where it issues from the valleys of the Ural Mountains. On the shores of the Caspian Sea the steppe extends from the mouth of the Ural to that of the Kuma. But the greater part of the country between the Kuma and the upper course of the Manytch on the north, and the base of the Caucasus on the south, is a steppe of the same kind. The western border of this immense desert lies close to the right bank of the Volga. About 52° 30' N. lat., or where the ridge of the hills of Samara is broken through by the Volga, there begins on its right bank an elevated tract, running at an elevation of 300 to 500 feet above the lowest level to the point where the Volga turns to the south-east (48° 30' N.). The elevated ground does not cease at the bend of the Volga, but continues to advance southward along the left bank of the river Sarpa, an affluent of the Volga, which runs from south to north. Near the place where the Sarpa originates, the elevated ground, which has the form of a low mountain ridge, between 51° and 46° N., is gradually lost in the plain which extends north of the river Manytch. The steppe thus confined, as far as it belongs to Russia, contains an area of about 336,000 square miles. The whole of this region is unfit for cultivation, and supplies only scanty pasture for the herds of the wandering tribes which inhabit it. That part of it which lies west of the Volga is called the Kumanian steppe. This portion is not level; the surface consists of gentle swells of a roundish form, so that the view seldom extends over many miles. The soil consists almost entirely of a yellow clay, and rarely of sand: it is impregnated with salt; and pits, or small salt-lakes, are common. Vegetation is confined to a few plants, such as wormwood, saisoia, and a coarse grass which grows in tufts several feet apart; between these the yellow soil is without any vegetation. The shore of the Caspian Sea between the mouths of the Volga and those of the Kuma is very low to a distance varying between 20 and 40 miles from the sea. It is inundated when a strong south-easterly wind happens to blow for some time, and vessels are sometimes driven on the sand-hills which rise on the west of this level tract. [CASPIAN.] At the back of these hills there are extensive salt-lakes, which once evidently formed part of the Caspian before the sand-hills existed. Among these salt-lakes those called Solenóé Khaki are very remarkable. They occupy a depression from 12 to 15 miles in width, with a very swampy surface, over which the salt-lakes are dispersed. In this tract the river Manytch originates: it runs nearly due west for about 60 or 70 miles, and then enters an arid plain of moderate width, which extends westward to the mouth of the Don and Sea of Azof, and is inclosed on the south and north by more elevated land. There are strong grounds for supposing that this level tract was once covered by a strait which connected the Black Sea with the Caspian. The number of Kalmuks who find on the Kumanian steppe pasture for their numerous herds, consisting of camels, black cattle, horses, sheep, and goats, is estimated at 20,000 tents or families, besides a considerable number of Cossaks, who possess portions of it. The wild animals, which abound in the steppes, are horses, antelopes, foxes, wolves, and the jerboa. The Kirghis steppe, east of the river Ural, presents similar features to the great Russian steppe just noticed; and it is highly probable that the whole region, as far as the Lake of Aral, was once covered by a salt sea. The Obetshei Sirt, which forms part of the northern boundary of the steppe, is connected at its eastern extremity with the most western ranges of the Ural Mountains, near 52° N. lat., whence it extends westward to the point where the river Ural turns southward. The elevated ground continues westward until it reaches the Volga opposite Kamyshin, between 51° and 52° N. lat. The Obetshei Sirt rises with a gentle declivity about 500 feet above the steppe, which extends along its southern side, and is considered by Pallas to be the ancient coast-line of the sea, when the waters of the Caspian covered the whole plain south of it. It differs considerably from the steppe itself, the soil containing a considerable portion of black mould and being covered with grass.

Near the western extremity of the Obetshei Sirt, not far from the town of Kamyshin, begins the Naryn, an elevated tract of sand, which

runs in a south-east direction through the great steppe, south of the Obetshei Sirt, and terminates not far from the shores of the Caspian Sea. Its length is above 800 miles, and it varies in width from 30 to 100 miles. The surface is covered with hills varying from 12 to 30 feet in height; they lie generally in groups close together, and consist of fine white sand intermixed with broken shells and decomposed lime, and are quite destitute of vegetation; but it is remarkable that a few feet below the surface spring-water is always found among these hills, and in some of the depressions many rare plants grow. On the west of the Naryn extends the worst part of the steppe. It appears that a great depression occurs here containing numerous salt lakes, which begin on the north with the lake of Elton, about 70 miles south-west of Kamyshin, and extend parallel to the Naryn, south-eastward to the shores of the Caspian. In some parts there are hills covered with gypsum, and consisting of great masses of rock-salt. Salt however can be obtained with less expense from the lakes. Immense quantities of salt are obtained from the lake of Elton, which, near 49° N. lat., 46° 40' E. long, is 12 miles long, with a width of nearly 10 miles. The surface of the lake is covered with a thick layer of salt, like ice. The salt is transported to Saratov, where many millions of cwts. of salt are usually stored. Between the series of salt lakes which have been already noticed, and the banks of the Volga, is a tract of sandy hills similar to the Naryn, but of less extent. The vegetation of this tract is very scanty, but there are some spots which supply pasture. It has no permanent watercourses.

That part of the steppe which lies east of the Naryn appears to be less sterile than the country just described. Here the yellow clay is more intermixed with sand, and more fit for supporting vegetation. But the soil is also impregnated with salt; and saline plants, with short wormwood, are the vegetation most frequently met with. Three rivers traverse it from north-west to south-east; two of them, the Lesser and Greater Usen, fall into the salt lake Kamysh Samara. The third river, called Kuahum, falls into the lake of Zagan, or Zagan-Nor. The bottoms in which the Usen run are one or two miles wide. They are covered with poplars, willows, wild olive-trees, and tamarisk shrubs, and constitute the only wooded tracts in the whole extent of the steppe.

Though the Ural River is considered as the boundary-line between Russia and the Kirghiz country, the Russians consider two localities on the Asiatic side of the river as belonging to them, the rock-salt mines of Ilek and the salt lake of Inderkoe. The first are about 80 miles west-by-south from the town of Orenburg. The salt lake of Inderkoe, which is near 49° N. lat., about 8 miles from the eastern bank of the Lower Ural, is about 55 miles in circumference. Its surface is covered with such a thick layer of salt that, according to Pallas, it may be crossed by a man like a sheet of ice.

No country on the globe is subject to a greater diversity of heat and cold than this steppe, especially the eastern part. The Ural, notwithstanding its rapid current in its upper course, is covered with ice at the end of October or the beginning of November, and it does not break up before the middle of April. During this season the frost is continuous and intense. The thermometer generally sinks 15° below zero, and continues so for several weeks together, and sometimes it descends to -30° and -35°. During this time a considerable quantity of snow falls, but it does not cover the ground, being carried over the plain by violent whirlwinds, which cause it to accumulate in certain places. The spring is very short. In the middle of May the heat begins to be oppressive in the daytimes. In June and July the thermometer rises to 100°, and at Orenburg it sometimes attains 110°. The heat is generally attended with a total want of rain, and a southern wind which dries up the water of the lakes, and converts them into swamps. The nights however are cool. In September the heat decreases rapidly, and soon afterwards night-frosts become frequent. In this season rain is rather common.

That portion of Southern Russia which lies west of the lower basin of the river Volga extends along the coast of the Black Sea as far west as the Danube and Pruth. It terminates southward with the peninsula of the Crimea, which contains a mountainous and very fertile and also a level region; the latter exactly resembles the great steppe lying west of the lower course of the Volga. [CRIMEA.] The country which extends from the shores of the Putrid Sea northward between the Dnieper on the west and the river Moloshnya on the east, as far north as 47° N. lat., is likewise a salt steppe; the waters of the lakes as well as those of the small rivers being slightly impregnated with salt. It is not however level, but the surface consists of an alternate succession of elevations and depressions. The higher land has a soil consisting of reddish clay, which is very barren. In the lower tracts the soil is an intermixture of black mould and sand, and mostly covered with grass, which supplies tolerable pasture. The most western portion, extending between the Gulf of Perekop and the estuary of the Dnieper, is a sandy waste, which is entirely barren and uninhabited.

North of this country there is a steppe of somewhat different character. It comprehends the whole country south of the granite tract that traverses Russia from east to west, from the banks of the Don and the Erwla (its confluent, which joins it at its most eastern bend) to the Pruth, with a width varying between 80 and 120 miles. This tract also may be included within the steppe, being similar in soil

and climate, and only differing from it in the form of its surface, which is more hilly. Towards its eastern extremity, near 40° E. long., between the town of Voronez and the Manytch River, the width of this region is near 300 miles; but towards the west it grows narrower, and from 33° E. long. westward it does not exceed 150 miles. Its length from east to west is 900 miles, and the area is about 180,000 square miles. Want of wood and of water are its characteristic features. It is considerably more elevated than the low steppes near the Caspian Sea, and not impregnated with salt except between the mouths of the Dniester and the Danube, where a low marshy tract extends some distance from the sea. Towards the south and east the surface is mostly a dead level, with the exception of narrow tracts along the water-courses, which are inclosed by steep acclivities. These bottoms have a fertile soil consisting of black mould, and yield good crops. The higher and level grounds have an extremely hard clayey soil unfit for cultivation. In spring they are covered with a fine turf, and supply good pasture for cattle and horses. Much grass is also cut for fodder. A weed called 'burin,' and dried dung, are used for fuel. Within the granitic tract the surface is more broken, and contains many tracts fit for agricultural purposes. The summer is dry and hot; rain is rare; the thermometer rises from 90° to 100°. In autumn and winter whirlwinds are frequent; a considerable quantity of snow falls, but it is swept by the winds from the plains, so that the country derives very little advantage from it. From December to February the thermometer frequently sinks to 25° and 30° below zero. The spring and autumn are of short duration.

The country north of this extensive steppe may be divided into two regions. The western lies on both sides of the middle course of the Dnieper. On the west of the river it extends from the northern border of the steppe (between 48° and 49° N. lat.) to the great swamps of Pinak and Ratnor (near 52° N. lat.), and comprehends the governments of Podolia, Volhynia, and Kiev. On the east of the Dnieper it comprehends the government of Pultava, the greater part of that of Tchernigow, and the western parts of Charkow and Kurak. It is designated by the general name of the *Ukraine*. The surface of this region is chiefly undulating, but in many places it extends in level plains. The soil mostly consists of a black mould, here and there interspersed with sandy tracts. The fertility in general is considerable, and in some parts, where loam is mixed with the mould, it is very great. Here the forests principally consist of oak. The eastern portion of the region lies within the basin of the Don, between its upper affluents, and comprehends the eastern portions of Charkow, Kurak, and Orel, the whole of Voronez, and portions of Tambow and Saratov. It appears to be more elevated than the western region; wood and water in many parts are scarce. The soil consists of a mixture of clay and sand, and is not without a certain degree of fertility, though on the higher parts there are considerable tracts of sterile land. On the lower ground however cultivation is general, and the wheat which is grown here is of excellent quality. Though the difference of temperature in summer and winter is considerable, it is much less than in the steppe farther south. Here also the rains are much more abundant in the western region. The scarcity of rain in summer in the eastern region is one of the causes to which its smaller degree of fertility is ascribed.

Rivers and Lakes.—The principal rivers are noticed in the articles DWINA, VOLGA, DUNA, NIEMEN, DNEPER, DNIESTER, DANUBE, DON, VISTULA, and URAL. As Russia is a level country, the rivers present a greater line of inland navigation than those of most other countries. But all the rivers are not equally fit for navigation. Those which fall into the Gulf of Finland, or into the lakes of Ladoga and Onega, from the north, though they bring down a great volume of water, are unfit for navigation, owing to the numerous rapids and cataracts. The rivers which join the gulf and the lakes from the south generally present some impediments to navigation in their upper course; this is also the case with the Duna, which falls into the Baltic, while the Niemen is navigable in all its extent, nearly to its source. In the Dwina there is no impediment to navigation; and the principal river and all its branches may be ascended to a short distance from the places where they originate. The Volga has the longest line of navigation, as it flows more than 2000 miles, and in this course has no cataracts, rapids, nor whirlpools. It becomes navigable about 20 miles from its source in Lake Seliger. Its northern affluents are navigable to an equal extent, but the southern much less so, on account of the small quantity of water which they bring down. The rivers which fall into the Black Sea are much less adapted for the transport of merchandise. Besides their comparatively small volume of water, owing to the scarcity of rain and snow, and the shallowness of their beds, their course is interrupted by rapids and cataracts, where they break through the granitic tract which traverses Southern Russia. The Volga and its feeders, the Danube and the Caspian, are navigated by Russian steamers. Steamers ply on the Volga between Twer and the Caspian.

Lakes are very numerous in certain parts of the empire, especially in the north-west and south-east. Almost all the lakes which occur in the salt steppes that surround the Caspian on the north, as well as in those of the Crimea and the Nogay steppe, which lies north of the peninsula, are salt lakes, and salt might be obtained from all of them. There are very few lakes in the interior of Russia, and they are all small; but those of the countries surrounding the Gulf of Finland

are very numerous. [FINLAND.] To the south of that gulf a very great number of lakes is dispersed over the country. The largest is the lake of Peipus, or Pskow [LIVONIA]; its outlet, the river Narowa, though deep, has a very rapid course, and forms a short distance above the town of Narva, a cataract 18 feet high, by which the navigation is entirely interrupted.

The country which extends between the innermost recess of the Gulf of Finland, and that bay of the White Sea which is called the Gulf of Onega, contains the largest lakes in Russia and in all Europe, the Ladoga and the Onega: the Lake of *Ladoga* is the largest. In length from north-west to south-east it is nearly 120 miles, and its greatest width is 70 miles. It covers an area of more than 6500 square miles. A few rocky islands occur along its north-western shores, but none in the main body of the lake. The depth varies greatly. In some places it is stated to amount to nearly 150 fathoms, which considerably exceeds the greatest depth of the Baltic, but in others it is shallow, and not deep enough for large vessels. The waters of a very extensive country unite in this lake. The Lake of *Onega*, which is nearly at an equal distance from the Lake of Ladoga and the Gulf of Onega, is more than 120 miles long, with an average width of nearly 40 miles. The area is about 4895 square miles, including the island of Klimez Koj, which contains an area of 42 square miles. Its depth is generally 80 to 100 fathoms. Along the shores there are numerous rocky islands, but the main body of the lake is free from them. The waters of this lake are discharged into that of Ladoga by the *Svir* River, which is about 120 miles long, and flows through a low and swampy country overgrown with thick forests. This river is navigated by large river boats. The surplus of the waters collected in the Lake of Ladoga is carried to the Gulf of Finland by the *Neva*, which flows more than 40 miles measured along the windings of the river, and after dividing near and in St. Petersburg into four arms, reaches the Bay of Cronstadt. Its width varies between 100 and 200 fathoms, and its depth is commonly 3 fathoms or more, so that large river-vessels and steamers can navigate it. A shoal about the middle of its course near Pella is avoided by a short canal. The river is covered with ice from the end of October to the end of April. The lakes Bjelo-Ozero, and Ilmen, which lie in the same depression, are noticed under NOVGOROD.

Canals.—The navigability of nearly all the Russian rivers to a very short distance from their sources, and the very moderate height of the elevated tracts, which divide the river systems from one another, above the level of the rivers that originate in them, facilitate more than in any other country the making of canals and the establishment of a continuous water-communication in the interior of the empire. Peter the Great perceived the advantages of such a water-communication, and he planned nearly all the canals which have been executed since his time, and some of them were even finished in his reign.

It has been already observed that those rivers which originate south of 55° N. lat., are much less adapted for navigation in their upper courses than those which have their sources farther north, owing to the dryness of the climate. When attempts were formerly made to unite the southern rivers (the Don, the Volga, the Dnieper, &c.) by canals, this circumstance does not appear to have been known, or at least not to have been considered as an obstacle to the enterprise. All the canals which were undertaken in these districts however have failed because there is no water to feed them.

On the contrary, all the canals which have been made in the northern provinces have succeeded completely. The three most important constitute a water communication between the Volga and the lakes of Onega and Ladoga, and consequently with the Neva and St. Petersburg. The most famous and most frequented of them is the canal of *Viahnei Volotshok*, near 57° 40' N. lat., 34° 30' E. long., by which a direct water communication is opened between St. Petersburg and Astrakhan, a distance of 3200 miles; yet the canal does not exceed 3 miles in length. It unites the Twerza, a feeder of the Volga, with the Lake of *Matino*, which is about 8 miles long, but hardly a mile wide, and from which the river *Msta* flows into the Lake of *Ilmen*. To obviate the danger incurred by vessels exposed to the storms so prevalent on Lake *Ilmen*, a canal has been made from a point about a mile above the embouchure of the *Msta* to the *Volchow*, along the northern shore of the lake. This canal, which is nearly 6 miles long and from 12 to 14 fathoms wide at its upper level, is called the Canal of *Novgorod*, as it terminates in the vicinity of that town in the *Volchow*. Though the actual extent of the canals on this line of water communication amounts only to 9 miles, the works executed in rendering the connecting rivers navigable are very extensive, and have cost large sums. With the exception of the canals in the interior of China, there is probably no canal in the world which is more navigated than that of *Viahnei Volotshok*. The produce of the mines of *Perm* and *Ekatarinburg*, of the rich country and the oak-forests between *Nishnei-Novgorod* and *Sibirsk*, and of the whole basin of the *Oka*, reaches St. Petersburg and the Baltic by the Volga and this line of navigation. The canals and rivers on this line are free from ice from the middle of April to the end of October.

The second line of water communication is formed by the *Tikhvina Canal*, near 59° 25' N. lat., 34° 20' E. long. This line of navigation begins in the Volga at the mouth of the *Maloga*, north of 58° N. lat., and near 38° 30' E. long. It ascends the last-mentioned river

to its most northern bend, where it is joined by its large affluent the Chagoda or Chagodocha: it then follows the last-mentioned river to its junction with the Somino, which rises in the lakes of Somino and Eglino. The Lake of Eglino is united by the Tikhvina Canal with the small Lake of Lebidini, which is the source of the river Tikhvinka. The Tikhvinka runs westward into the Sias, which falls into the Lake of Ladoga a few miles east of the embouchure of the Volchow. The canal itself is only 5 miles long and 36 feet wide at its upper level. A few cuts have been made in the Somino and Tikhvinka, but their length does not exceed 4 miles.

The third line of water communication traverses the two lakes of Onega and Bjelöš Ozero. The Kowsha, a navigable river which rises in Lake Kowshö Ozero, falls into the Lake Bjelöš Ozero from the north-west. Some miles west of the Lake Kowshö are the sources of the river Vytegra, a feeder of Lake Onega. Between these two rivers is the Lake of Matko, whose waters, with those of the Kowshö, are used to feed the locks of three short canals, whose length, taken together, does not exceed 8 miles. These canals are named the Mary Canals, in honour of the empress Mary (wife of Paul), who paid the expense of the undertaking. The river Chekana, which issues from the Bjelöš Ozero and falls into the Volga above Rybinak, contains some rapids, which are avoided by a cut 12 miles long near the town of Tchereponetz. The Tikhvina and Mary Canals can only be navigated from the end of April to the middle of October.

As these three systems of inland navigation traverse the lakes of Ladoga and Onega, and the barges were originally obliged to pass over them, heavy losses of property were frequently incurred by the barges being swamped during the gales to which the lakes are subject. To avoid this dangerous navigation, canals have been made along the southern shores of the lakes. The most western canal, called the Ladoga Canal, unites the river Volchow with the Neva; it is nearly 70 miles long, from 10 to 14 fathoms wide, from 4 to 7 feet deep in summer, and from 7 to 10 feet in spring. Steam-engines are used in some of the locks in this canal, which was finished in 1733. When the Tikhvina Canal was made, this line of navigation was extended farther east by the Sias Canal, which runs along the southern banks of Lake Ladoga to the mouth of the river Sias, and is nearly 7 miles long, 8 fathoms wide, and 5 feet deep. To obviate the danger which the barges passing through the Mary Canals might encounter in navigating Lake Onega, the Onega Canal was undertaken, which begins in the river Vytegra, about 10 miles from its mouth, and runs westward to the lake. It is about 14 miles long, 12 fathoms wide, and in general 7 feet deep. From the embouchure of the Swir to that of the Sias, where the Sias Canal begins, a canal was completed in 1810, which is about 28 miles long and from 13 to 22 fathoms wide; its lowest level is 7 feet below the surface of the Ladoga. It is called the Swir Canal, and has no locks. Thus a line of canals surrounds the southern extremity of the Lake of Ladoga, from the mouth of the Swir to the place where the Neva issues from the lake. The whole line is somewhat more than 100 miles long.

The Lake of Bjelöš and its outlet the river Chekana have recently afforded the means of uniting by one system of canals (Alexander Canal) the river Dwina and Archangel with the river Volga and with the city of St. Petersburg. This line of canals begins in the Chekana, about 20 miles below its efflux from the lake, near the town of Kirilow, whence it runs eastward through several small lakes to the river Porosowina, which falls into the Lake of Kubinskoš. The last-mentioned lake is the source of the river Sukhona, the principal branch of the Dwina, which is navigable for large barges from the place where it leaves the lake. The whole line between Kirilow and the Lake of Kubinskoš does not much exceed 40 miles. This navigation, which was completed in 1828, is of great importance for the transport of timber, the produce of the extensive pine-forests on both sides of the Sukhona.

In the year 1825 was commenced the Moskwa and Volga Canal, which begins on the Volga, at the mouth of the river Dubna, about 40 miles below Twer, ascends the Dubna to its confluence with the Sestria, and then the latter river to the vicinity of the town of Klin. At Klin the canal begins which leads to the Lake of Gulzino, which constitutes the summit level, and where a reservoir is formed which covers about four square miles. From this lake the vessels pass by another canal to the river Istra, which passes near Voakresenk, and falls into the river Moskwa about 26 miles above the city of Moscow. Near 61° N. lat. a canal (Catherine Canal) unites the Vycheгда, one of the principal branches of the Dwina, with the Kama, which is the largest affluent of the Volga, by forming a water communication between two rivers called the Northern and Southern Keltma. The river Düna is united to the Dnieper by the Bereainakof Canal, which joins the Oola, an affluent of the Düna, to the Berezina, a tributary of the Dnieper. The river Niemen is united to the river Dnieper by the Oginsky Canal, which forms a communication between the river Szczara, a tributary of the Niemen, and the Yasolda, an affluent of the Pripeck, or Pripetz: the last-mentioned river traverses the swamps of Pinsk and Retnor, and falls into the Dnieper. A communication between the Vistula and the Dnieper exists by means of the Pins Canal, which unites the river Mookhavoie (which joins the Vistula at Brzecz Litewski) and the Pripeck.

Climate.—The fact that the intensity of cold in Europe increases

from west to east, is illustrated by the climate of Russia. While the mean annual temperature of the western coast of Norway as far north as North Cape is always above 32° Fahr., or the freezing-point, in a considerable portion of the most northern part of Russia the mean annual temperature is below 32°. This is the case with the whole of Russian Lapland as far south as 66° N. lat., and also the whole country drained by the rivers Pechora and Mезen. But this severity of climate does not prevent the growth of trees; along the upper courses of both rivers forests of considerable extent occur. But where the mean annual temperature does not exceed 25° or 26°, which is the case near the mouths of both rivers, a shrub a few inches high is rarely met with. Yet on the peninsula of Kola, where the mean annual temperature is certainly below 32°, barley is cultivated, and generally comes to maturity. This part of Russia may be called the Arctic Region.

South of this lies the Cold Region, in which the mean annual temperature varies between 32° and 40°. The southern limit of this region begins on the shores of the Baltic, on the Gulf of Riga, about 58° N. lat., and runs hence east-south-east to the confluence of the Moskwa and Oka, near 55° N. lat., whence it continues in the same direction towards the southern extremity of the Ural Mountains, terminating south of Uralak on the river Ural, near 51° N. lat. The winter in the northern districts lasts from seven to eight months, and in the southern districts from five to six months. The Neva is generally covered with ice from the 27th of November to the 19th of April. The quicksilver sometimes freezes at Ploetow, in the interior. Both spring and autumn are short, and the passage from cold to heat, and vice versa, is rather rapid. But in summer the heat is for two or three weeks very great. The thermometer then rises to 86°, and even 90°. In the interior both the heat and the cold are greater than on the coast. At Casan the thermometer in winter generally descends to 28° below zero, and in summer it rises to 95° and 96°. The aurora borealis is frequently seen, especially in March, June, July, and September.

The Temperate Region extends over the southern provinces as far north as the line above mentioned. Its mean annual temperature varies between 40° and 50°, but in the Crimea and in the country between the Dniester and Danube it rises to 54° and 56°. This region is distinguished by severe though short winters, and by long and very hot summers. Night-frosts are frequent in October and November, but continual frost does not set in before the middle of December, and it lasts to the middle or end of February. West of the Don the frost is often interrupted by a few days' thaw. The frost is intense while it lasts, the thermometer generally sinking in the western districts to 12° below zero, and in the eastern districts to -20°. From the end of February the cold becomes more moderate, but the weather continues to be raw; and there are night-frosts during the north-east winds, which at that season are the most frequent. In the middle of May however a sudden change takes place. In a few days the heat increases to such a degree as to become oppressive. In June and July it still continues increasing until the thermometer rises to between 90° and 100°. From the middle of August however the heat rapidly decreases, and in September night-frosts sometimes occur. In the hot season south-east and east winds are prevalent. The countries which border on the Baltic and on the White Sea have a wet climate, and rain is frequent all the year round: in winter a vast quantity of snow falls.

Productions.—Russia produces a considerable surplus of grain for exportation. Rye is the great corn crop, which, except in the steppes and the Arctic Region, may be grown in all parts of the empire. The greatest quantity is produced between the cataracts of the Dnieper on the south and the river Volga on the north, but the cultivation extends to the mouth of the Dwina, 65° N. lat. It does not always ripen north of the Volga, owing to the shortness of the summer and the moisture of the atmosphere; and it is generally necessary to dry the grain in buildings constructed for that purpose. The cultivation of barley extends to 67° N. lat. Oats do not succeed north of 62° N. lat. In some provinces which have a poor soil, and in the districts through which the great roads and lines of inland water-communication run, the cultivation of oats is very extensive. Wheat is the principal object of agriculture in the fertile tracts along the rivers in the southern districts, but especially in the Ukraine; farther north it is less grown, though it succeeds as far north as 58° or 59° N. lat. Millet is extensively grown in the elevated country which surrounds the upper course of the Oka, Don, and Desna, and in some other districts south of 55° N. lat. In Southern Russia maize is cultivated south of 48° N. lat.

Flax and hemp are more extensively grown than in any other country in Europe. Along the river Don, and even on the steppes of the Volga near Sarepta, flax and hemp are found in a wild state. They succeed as far north as 65° N. lat., and both, together with hemp-seed and flax-seed, constitute important articles of export from Archangel, St. Petersburg, Riga, and the Sea of Azof. Tobacco is much cultivated in the Ukraine.

The climate of Russia is not favourable to the cultivation of fruit-trees. With the exception of wild cherries and some bad apples, no fruits grow north of 56° N. lat. Other fruits are imported from foreign countries. Pears and plums are only grown to any extent south of 53° N. lat. In the most southern districts there are peaches, apricots, quinces, mulberries, and walnuts; and in the extensive

orchards of the Crimea there are also almonds and pomegranates. Grapes are chiefly cultivated in the districts along the lower course of the Don, on the Volga above Sarepta, and in the Crimea. The wine is generally ill made and of inferior quality, but the produce of the vineyards on the Don, called Donish wine, is said to be hardly inferior to French champagne.

Kitchen-gardens are not much attended to. Potatoes, several kinds of cabbages, turnips, and carrots however are extensively grown; and in some places cucumbers, pumpkins, and radishes. Melons, and especially water-melons, are very abundant in the hot and dry countries near the steppes. Asparagus grows wild in the southern districts. Hops are found wild, but they are also cultivated. Liquorice thrives luxuriantly on the banks of the Volga in the government of Astrakhan; it is taken to Astrakhan, where the juice is expressed, and considerable quantities of it are exported. Soda is obtained from different kinds of *Salsola* that grow in the steppes.

The forests constitute one of the principal sources of wealth to Russia, and their produce, consisting of timber, fire-wood, tar, pitch, ashes, pearl-ash, and potash, is exported to a large amount. About three-fourths of the countries between 65° N. lat. and the course of the Volga as far east as its great bend near Casan, are covered with forests. In all these countries only pine, fir, larch, alder, and birch are found, with a few lime-trees; ash-trees are rare. From these countries is derived the greatest part of the produce of the forests which goes to foreign markets. The central provinces have hardly as much wood as is required for fuel and for manufacturing purposes. In some parts even fire-wood is dear and scarce. West of the Dnieper extensive forests occur on the banks of the Niemen and in the swamps of Pinsk and Ratnor. They chiefly consist of pine- and fir-trees, but birch- and lime-trees are also common, and in some parts these are the prevalent kinds. South of the swamps of Pinsk and Ratnor there are some forests of beech, and this is the only part of Russia where that tree is abundant. The great forests to the east of the central provinces occupy a large part of the governments of Perm, Viatka, Casan, Nischnei-Novgorod, Pensa, and Saratov. They consist mostly of pine, fir, larch, alder, and birch in Perm and Viatka; but in the other governments, of oaks, lime-trees, elms, and ash. The southern provinces of Russia are quite without trees. The oak-tree is most common between 53° and 56° N. lat. Near the Ural Mountains it is not found north of 57° N. lat., but farther west it extends to 59° N. lat., and a few trees are even found in Finland north of 60° N. lat.

The domestic animals of England are found in Russia, with the exception of rabbits. Horses are very numerous, and of various breeds. Those in the northern provinces are rather small, but the central and southern districts have large breeds. Those of the Cossaks, Kalmucks, and Kirghiz, which pasture in the steppes, and become almost wild, are distinguished by their power of sustaining the greatest fatigue with very scanty food. There are also a few wild horses in the steppes. Black cattle is abundant, as is evident from the immense quantities of tallow and hides which are exported, though the domestic consumption of both articles is very great. Sheep are still more numerous; and the breed has been improved by crossing with the Merino and Saxon sheep. In general however the wool is of an indifferent quality. During the winter sheep-skins form the common dress of the peasantry. In the southern steppes there are some peculiar breeds of sheep, among which the Kirghiz breed with the large bushy tail is the most remarkable. Their wool, when full grown, is short and coarse, but the lambs have a fine and beautiful fleece. Goats are more numerous in Russia than in other countries of Europe: the skins are used for making morocco leather. Hogs are generally reared, except in the steppes: they are most numerous in the countries where there are oak-forests, and in the western provinces, from which a great number of hams and much bacon is sent to other parts of the empire. The nomadic tribes which wander about in the steppes keep a great number of camels: some rich proprietors have more than 1000 head. In the government of Astrakhan buffaloes are kept. Fowl, geese, and ducks are abundant. Reindeer are only kept north of 66° N. lat.

Among the wild animals of Russia are the bison (*Urus*), which still exists in the forest of Bialoviza, near the source of the Naraw; and in the northern forests elk, deer, hares, and wild hogs, bears, gluttons, badgers, wolves, foxes, martens, polecats, weasels, ermines, otters, squirrels, and marmots. In the steppes there are wolves, foxes, and wild hogs; also wild asses, saiga antelopes, konsaks, and the dipus jerboa.

Nearly all kinds of birds which are met with in England occur in Russia, and also the capercaillie and pelican: the last however lives only on the shores of the Black Sea and the Caspian.

Fish is very plentiful in the rivers as well as in the White Sea and along the coasts of the Arctic Sea, but it is less abundant in the Baltic. The fish which are chiefly taken in the White Sea are had-dock, cod, herrings, and the omul, a kind of salmon. In the Polar Sea, especially along the coasts of Nova Zembla, the whale, the walrus, narwhal, seal, dolphin, white fish, and some other kinds are caught. The most important fisheries in Russia are those of the Volga, the Ural, and the Sea of Azof. [ASTRAKHAN; AZOF.] The fish is sent to all parts of the empire, but is not exported to any large amount. Isinglass and caviare are sent to foreign markets.

Serpents and lizards are common only in the steppes. Swarms of locusts occasionally infest the countries that border on the steppes. Among the noxious insects are scorpions, millipedes, tarantulas, and the scorpion-spider. Bees are found wild in most of those provinces which have large forests, but they are also reared in other parts of the empire, especially by the Mordwi. Though the consumption of wax is very great in the churches, Russia still exports some wax. The honey collected in the districts where forests of lime-trees exist is highly valued, and fetches a good price. The mulberry-tree thrives well in the southern provinces, and the silk-worm also succeeds, but the manufacturers of Moscow and other parts of the empire obtain their chief supply of raw silk from Persia.

Geology and Mineralogy.—The successive primæval deposits extend over European Russia in regular sequence, and in an unaltered state. Hence, though the surface presents only a monotonous and undulating surface, chiefly occupied by accumulations of mud, sand, and erratic blocks, the framework of the country wherever it can be detected exhibits a clear ascending series belonging to the Silurian period. The oldest deposits have been only partially hardened since they were accumulated at the bottom of the sea, and have been elevated in low plateaus that have undergone no change or disruption. The general order of the older strata has been singularly exempted from all intrusion of every description of plutonic or volcanic rocks. The old deposits consist of slightly coherent mud, marl, and sand, in strata deviating but little from horizontality, and are proved to belong to the same geological period as some of the hard slaty mountains of North Wales. In the Ural chain where there are numerous eruptive rocks (porphyry, greenstone, sienite, granite, and serpentine), the soft primæval strata so prevalent in other parts of European Russia have been converted into metamorphous rocks, crystalline schists, limestone, and quartz.

In a large portion of the country, however, west of the Ural chain, comprising the greater part of the governments of Perm, Orenburg, Casan, Nischnei-Novgorod, Yaroslav, Kostroma, Viatka, and Vologda, constituting an area twice the size of France, the older sedimentary strata are overlaid by widely diffused masses of Permian rocks which contain fauna and flora essentially palæozoic (the genera being the same as those of the coal period, but the species with a few exceptions different), and constitute the true termination to the long palæozoic period. These Permian deposits are of varied mineral aspect; they consist of grits, sandstones, marls, conglomerates, limestones, sometimes inclosing great masses of gypsum and salt, and are also much impregnated with copper, and occasionally with sulphur. They are flanked on the west, east, and north by the upper members of the carboniferous rocks, but with little or no coal. Limestones interstratified with much gypsum prevail towards the base. In some parts of the region salt springs occur rising, it is supposed, from masses of rock-salt in older palæozoic rocks; but in the steppes south of Orenburg, the mineral is subordinate to the true red Permian deposits. Salt-beds range up to the foot of the older palæozoic and crystalline rocks of the South Ural Mountains to the east of Orenburg.

These Permian strata as above hinted at contain many varieties in their contents and relations. Along certain portions of the west flank of the Ural chain they occur in almost apparent conformity to the carboniferous rocks; all the strata, whether carboniferous or Permian, have been raised up and thrown off sharply towards the west. At Sergiefsk and on the banks of the Sok in the basin of the lower Volga, magnesian limestone and marl are surmounted by gypsum, copper ore, and native sulphur, with sulphureous and asphaltic springs in the middle masses, whilst other marlstones and white limestones form the summit. Near Kazan huge masses of gypsum, rising high above the level of the Volga, are surmounted by limestone cliffs, and the latter by red, green, and white marls. In the central tracts, between the Ural Mountains and the Volga, the limestone in some tracts assumes a definite horizon, and is underlaid by coarse grits; it is repeated also at various levels in a succession of beds interlaminated with sandstones, and yellow, white, and greenish marls, occasionally containing plants and small seams of impure coal—the whole being surmounted by red grits and conglomerates with copper-ore.

In some of the Polish governments the younger secondary and tertiary deposits are so widely spread that the palæozoic rocks rise only in small patches to the surface. Around Kielce a nucleus of Devonian rocks with much limestone, and charged with characteristic fossils, is followed by carboniferous limestones and by thick-bedded coal-seams, over a small district that extends into the coal tracts of Silesia. In consequence of the high antiquity of the Silurian strata, which prevails so widely in Russia, there is little or no coal. What seams are known to exist are mere streaks, and of bad quality. The only coal deposits of any importance are those of Kielce and the Donetz coal-field, which lies between the Dnieper and the Don, about 100 miles from the Sea of Azof, in a rugged dislocated tract, where the seams mostly of anthracite are thrown up at different high angles, so as to be difficult to work.

In southern Siberia there is a great extension of the younger palæozoic deposits, which extend also to the Altai Mountains, whilst in north-eastern Siberia such rocks have been traced even to the Sea

of Okhotsk. [SIBERIA.] The geology of the Ural Chain is given under URAL MOUNTAINS. (Murchison, 'Siluria')

Russia is rich in minerals. Gold occurs near the Gulf of Onega, and also on the western declivity of the Ural Mountains [URAL MOUNTAINS]; but the chief gold-mines of Russia are on the eastern or Siberian side of the Ural Mountains. Platinum was discovered on the western declivity of the Ural in 1823, and six mines are successfully worked near 57° 40' N. lat. No silver is found in European Russia, though it occurs in Siberia. But the greatest mineral wealth of Russia consists in its mines of copper and iron. Both these metals frequently occur on the western declivity of the Ural Mountains, from 55° to 60° N. lat., and they are worked in many places. The government of Perm, where the mines are most extensively worked, has 200 mines of different kinds in operation, more than 7300 furnaces, and above 180,000 men directly or indirectly employed in different branches of metallurgy. The mines belong, some to the crown, some to private persons. The governments of Viatka and Orenburg are also important mining districts. Iron-ore occurs also on the southern declivity of the Uwalli, and on the table-land which extends about the sources of the rivers Oka, Don, and Desna. It is there found in the clay in layers, and sometimes only in lumps. Frequently it occurs in bogs and morasses. The extensive manufactures of Tula hardly use any other iron. Quicksilver, arsenic, nickel, cobalt, antimony, and bismuth exist in several places.

Salt is an important article. Besides the vast sources for the supply of this article before mentioned, the salt-formation extends along the western declivity of the Ural Mountains, to the source of the Kama, and thence westward on both sides of the Uwalli. In all these districts salt is made from numerous salt-springs. The greater number of these salt-manufactures are contained in the governments of Perm and Viatka; but several of them occur farther west. Salt is imported into the Baltic provinces from foreign countries cheaper than the native article, owing to the heavy expenses of transport.

Marble and granite are quarried near the village of Tivdia, at the northern extremity of the Lake of Onega, and at Serdobol, on the northern shores of Lake Ladoga. The marble is of good grain; some is white, and some has a reddish colour with white stripes or spots. The granite is worked with great activity; all the public edifices and private mansions in St. Petersburg are built of it.

Inhabitants.—Russia is inhabited by a greater number of nations, differing in language, character, and civilisation, than any other country of Europe. The inhabitants belong either to the Caucasian or to the Mongol race. The Caucasian however is by far the most numerous, as the nations of Mongol origin do not form one-hundredth part of the whole population.

The Caucasian race in Russia consists of individuals belonging to Slavonians, Tshudes or Fins, Turks or Tartars, Germans, Jews, and Greeks. Nine-tenths of the population are of the Slavonic race. They are divided into Russians, Poles, Lithuanians and Lettes, and Wallachians and Servians. The Russians constitute more than two-thirds of the whole population, and their number is estimated by Haxthausen at about 50 millions. They inhabit, to the exclusion of all other nations, the central provinces of the empire between the Dnieper and the Volga. They likewise constitute the mass of the inhabitants in the northern provinces between the Ural Mountains and the White Sea, and in the southern between the Don and the Dniester. They are divided into Great and Little Russians. The latter inhabit the country called the Ukraine. The Cossaks are properly descendants of the Little Russians, and are intermixed with Poles, Tartars, and Kalmucks. [COSSAKS] The Great Russians, with the exception of a comparatively small number who have obtained their freedom, are bondsmen to the numerous body of rich nobles which exists among them. Among the Little Russians a considerable number of families are not subject to any master; and the Cossaks are all free.

The Poles, together with the Russians, inhabit the governments described under POLAND, those of Volhynia and Podolia, and almost exclusively that of Grodno. Their numbers amount to about six or seven millions. The Poles are said to be of more refined manners than the Russians; but in the arts of civilised life, especially in manufactures, and all branches of industry, they are behind the Russians.

The Lithuanians inhabit the governments of Vilna and Minsk. Their number does not exceed one million and a half. Their language is very different from the common Slavonic dialects in its material and forms, but is intermixed with many Russian terms. They are agriculturists, but otherwise they have not made much progress in civilisation. North of the Lithuanians, in Courland and Livonia, are the Lettes, whose number probably does not much exceed half a million. They speak a language different from that of the Russians and the Lithuanians. They are exclusively occupied with the cultivation of the ground. Those who live in Courland are frequently distinguished by the name of Koora. Both nations, the Lithuanians and Lettes, were bondsmen to the German nobility established in their country, till the reign of the emperor Alexander, who partially effected their emancipation.

The Vlaches, or Wallachians, live in the government of Bessarabia, between the rivers Dniester and Pruth. Their number does not exceed half a million. They speak a language which is mainly composed of Latin, Greek, Italian, and Turkish. They are industrious cultivators of the land. They were formerly slaves to the boyars, or

nobility, but they ceased to be so nearly 100 years ago. Among the Vlaches there are a few families of Servians or Razes, and a few more are settled in the government of Ekatarinofslaf.

The Tshudes, or Fins, were formerly considered to belong to the Mongol race; but their light hair and their blue eyes have of late procured them a place among the Caucasian race, in spite of their flat noses and flattened countenances. They inhabit two separate portions of Russia. The majority of them are settled on both sides of the Gulf of Finland. Two of these nations, the Fins and the Laplanders, occupy the country north of the gulf. The Fins, who inhabit FINLAND, are agriculturists and breeders of cattle. The Laplanders live north of 65° N. lat., and are mostly occupied with their reindeer. Their number does not exceed a few thousands. On the south of the Gulf of Finland are the Esthes or Esthonians, whose number is above half a million. Their language is similar to that of the Fins. They are almost exclusively occupied with the cultivation of the ground, and were serfs to the nobles until 1818, when the emperor Alexander effected their emancipation. South of the Esthonians, in the country lying on both sides of the small river Salis (near 58° N. lat.), is the small tribe of the Livis or Livonians, who have given their name to Livonia. They speak a dialect of the Finnish language, and are exclusively agriculturists.

The eastern members of the Tshudic family are separated from the western by an immense tract of country upwards of 500 miles in width, which is now inhabited by Russians. When and how the separation took place is not on record. The eastern Tshudic tribes live on the western declivity of the Ural Mountains, and on the banks of the middle Volga, and are eight in number:—Syrians, Permians, Vogules, Votiakes, Chuvashes, Cheremisses, Mordvines or Mordwi, and Teptiars.

The Syrians, the most northern of these tribes, inhabit the woody country between the upper course of the Kama and the Vychege, an affluent of the Dwina, and particularly both banks of the Vychege, as far west as the mouth of the Syasola. Their principal occupation is the chase of the wild animals with which their country abounds. Their language differs very little from that of the Permians, which has a great affinity to the Finnish.

The Permians occupy the country south of the Syrians, between the rivers Kama and Viatka. Though agriculture has made more progress among them than among the Syrians, they derive their principal subsistence from the chase, and more especially from the fisheries in the Kama and Viatka. Both of these tribes generally speak also the Russian language.

The Vogules (who resemble the Kalmucks) occupy both declivities of the Ural Mountains between 58° and 60° N. lat. They are short in stature, have round faces with projecting cheek-bones, and very little beard. Their language shows that they belong to the Tshudes; it exhibits also a great affinity to the Magyar. The Vogules live entirely on the produce of the chase. They live in small societies, consisting only of five or six huts, and lead a wandering life. A small number have been converted to the Greek Church; the remainder are heathens.

The Votiakes are settled west of the Permians, on both sides of the upper course of the river Viatka, and in the country about the source of the Kama. In language and bodily formation they resemble the proper Fins more than any other of these eastern Tshudic tribes. They are diligent agriculturists, and also rear cattle and bees. They are allowed to choose their own magistrates. They pay only a capitation-tax. Most of them have embraced Christianity.

The Chuvashes and Cheremisses live in the neighbourhood of Casan, on both sides of the Volga. The Chuvashes who dwell chiefly west of the river have become members of the Greek Church. In their personal appearance they resemble the Turkish or Tartar tribes, to whom they are said to be akin in language, though this has been also pronounced to be a dialect of the Finnish. The Chuvashes cultivate the ground, and rear cattle and bees. The Cheremisses speak a language which contains a large number of Finnish roots intermixed with a large number of Turkish origin. The conformation of their body likewise shows some mixture with the Turkish race. They are very diligent and intelligent agriculturists, and have large herds of cattle. The majority have adopted the religion of the Greek Church; they observe the festivals both of the Greeks and the Mohammedans.

The Mordwi, or Mordvines, are settled west of the Chuvashes, in the country on both sides of the river Sura, which falls into the Volga from the south, between Nischnei-Novgorod and Casan. On the west they extend to the Oka. They live intermixed with the Russians, whom they resemble in feature and form, but their language is Finnish. They are all Christians. They cultivate their lands with great care, and their fields are not inferior to the best-cultivated grounds in Russia. They pay great attention to bees, and as they live in a country abounding in forests of lime-trees, their honey is preferred to that of any other part of Russia.

The Teptiars, the most eastern of the Finnish tribes, are settled on the banks of the Bialaya, an affluent of the Kama from the east. Though the Finnish element prevails in their language, it contains also a large number of Turkish words. They rear cattle and bees, and pass a great part of their time in hunting wild animals. They are partly heathens and partly Mohammedans.

The third great branch of the Caucasian family which inhabit

Russia is the Turkish, or Tartar. They came into Russia between the 9th and 13th century with the Mongols and other conquerors. The Turkish tribes at present existing in Russia are four, the Tartars of Casan, the Bashkirs, the Metscheriaks, and the Nogai Tartars. The Tartars of Casan are the most civilised nation in Russia. Their language is a pure and cultivated Turkish idiom. About seven-eighths of them are still Mohammedans. They have schools both for the lower and higher classes of the people. In the elementary schools instruction is given in reading and writing, and the Korán and some other religious books are explained. The objects of instruction in the higher schools are the Turkish, Persian, and Arabian languages, and arithmetic. The priests are educated in an institution established for that purpose in a village called Gargali, which is about nine miles from the town of Orenburg. Those who are established in the towns are either merchants or manufacturers. The inhabitants of the villages are careful cultivators of the soil, and also occupy themselves with rearing cattle and bees. Their villages are well provided with the most common mechanics, as tanners, shoemakers, tailors, dyers, blacksmiths, and carpenters. They have embraced Christianity.

The Bashkirs inhabit both declivities of the Ural Mountains, from 56° N. lat. to near 64° N. lat. They resemble in language and manners the Tartars of Casan, though in the form of their body they approach the type of the Mongols. The Bashkirs still adhere to a wandering life. In winter they inhabit villages, but in summer they ramble about in the country. They cultivate some patches of land near the houses before they begin their wanderings, but the produce of these fields is not adequate to their consumption. Their riches consist in horses, of which the poorest peasant has from 30 to 50, and many have 500, and the richest from 1000 to 2000. Their horses are of a good breed. They keep only a small number of black cattle, sheep, and goats. They have also a great number of bee-hives, and they collect an immense quantity of wax and honey from the wild bees, which are nowhere more common than in the countries adjacent to the base of the Ural Mountains. They train the falcon for the chase of hares, foxes, and wolves. The small tribes of the Metscheriaks live dispersed among the Bashkirs, and subsist on the produce of their herds of cattle and of their bee-hives. They also cultivate the ground, but not to a great extent. They are considered to be more civilised than their neighbours. Both tribes are Mohammedans.

The Nogai Tartars inhabit the Crimea and the steppe which extends north of that peninsula; they are also dispersed over the country east of the Sea of Azof, and along the northern base of the Caucasus. In the Crimea they are agriculturists, and have extensive orchards. They also manufacture leather, and make cutlery, saddles, and shoes. This portion of the Nogai has attained a considerable degree of civilisation. The remainder of the Nogais lead a half-wandering, half-settled life in the steppes north of the Sea of Azof. Their herds consist of cattle and small hardy horses, but of a rather small breed. They have also numerous flocks of the large-tailed sheep.

The number of individuals belonging to the Teutonic family is probably larger than that of the Turks. They are Germans and Swedes, with whom a few Danes are mixed. Numerous families of Germans are dispersed through the provinces along the Baltic, south of the Gulf of Finland, among the Lettes and Esthonians, and in those parts they constitute the nobility of the country. Most of these families settled there when the Order of the Knights Swordbearers was the acknowledged sovereign of these countries (from 1300 to 1530). Great numbers of German families are settled in the two capitals and in the chief towns of the empire, in the southern provinces, and in the Crimea. The Swedes are numerous along the northern coast of the Gulf of Finland, and the eastern coast of the Gulf of Bothnia.

There are few Jews in the central and northern provinces; but they are numerous in those parts which formerly belonged to Poland. They are smiths, tailors, shoemakers, brewers, distillers, &c.

The Greeks are dispersed all over the southern provinces of the empire as merchants. In the Crimea a few villages are entirely inhabited by them. They occupy themselves with agriculture and gardening.

The Kalmucks show their Mongol origin by the form of their body, as well as by their language. The tribes of this nation which still exist in the south-eastern steppes of Russia are the remnant of those which left Russia in 1770 and 1772, at the invitation of the Chinese government, and settled in the plains of Songaria. They are divided into five tribes. In a country which has hardly a few patches of cultivable land, the Kalmucks by able management have succeeded in maintaining horses, cattle, camels, sheep, and goats to the number of three millions. They export to other parts of Russia wool, hair, tallow, lamb- and sheep-skins, hides, and fur to a large amount. The Kalmucks are Buddhists and have their own Great Lama. They have also their own political administration, of which the khan of the Derbet tribe is the head. He is assisted by eight counsellors and judges, and a person sent from St. Petersburg.

After the emigration of the larger number of Kalmucks in 1771 and 1772, by which the whole steppe between the rivers Volga and Ural south of the Obstaihi Sirt was at once deprived of its inhabitants, a numerous tribe of Kirghiz Cossaks, belonging to the Little Horde of that nation, was settled in the tract which the Kalmucks had abandoned. They are known under the name of the Bukei horde, from the name

of their chief, called Bukei, who introduced them into Russia. In personal appearance, they greatly resemble the Kalmucks and other Mongol tribes, but their language is Turkish. Like the Kalmucks, they are nomadic herdsmen, but they have only a small number of camels. They also keep some cattle and goats. Their wealth mainly consists in horses and sheep. Some rich proprietors are said to have 4000 or 5000 horses and 20,000 sheep. The sheep supply the principal articles of traffic, and numerous flocks are annually sold to the Russians at Orenburg, Troizk, and Astrakhan. Their agriculture is limited to the raising of some barley, and a small quantity of wheat and millet. They hunt the fur-bearing animals, with which their country abounds, and in summer the saiga-antelope. The Kirghiz Cossaks are not very strict Mohammedans.

Agriculture.—Notwithstanding the variety and great abundance of the natural productions of the Russian empire, agriculture may be said to be even now (with the exceptions to be noticed presently) in its first stage, since there is certainly no province which yields even half of what it is capable of producing. Hence in the greater part of the empire it is not so much the ground itself that has any value, as the labouring population, and accordingly it is not the number of acres in an estate that is considered, but that of the male serfs attached to it. The old three-field system of husbandry, by which one-third of the land is always in fallow, is generally adopted in Russia. This system is unfavourable to cattle breeding and to the making of manure for supplying the exhaustion of the soil: it has also led to the extirpation of the forests in many parts; but it is too deeply rooted in the habits of the people to be easily changed. In the Baltic provinces however agriculture is in an advanced condition, and many improved methods have been introduced by the wealthy proprietors. The governments nearest to Moscow also, and the Polish governments, have a comparatively large proportion of cultivated land and a tolerably good system of cultivation; yet even in these provinces there are extensive tracts in which not one-fifteenth part of the surface is cultivated. The thinness of the population, the want of roads and markets in the interior of the empire, and obstinate adherence to old routine, contribute to prolong this state of things. On account of the comparatively small value of land, and the want of manure, the fields in Great and Little Russia are often suffered to be fallow for two or three years. The usual kinds of corn grown are rye, wheat, barley, and oats; maize is grown chiefly in the countries about the Black Sea. Other products are pulse, especially peas; millet, hemp, and flax in the west and north-western governments; and hops in Little Russia. The cultivation of grasses is neglected. According to Tengoborski, who in his 'Productive Forces of Russia,' estimates the population of the empire at 68 millions, the total cereal produce annually amounts to 260 million *chetverts*, or 186,875,000 imperial quarters. Of this about 9 million quarters, chiefly wheat, are exported, leaving 177,875,000 quarters to supply seed corn, and the grain used in breweries and distilleries, for feeding cattle, and for the support of the population; which last, according to a careful estimate by Schubert some years ago, amounts to about 15 bushels per head. The average annual exportation of hemp and flax between 1847 and 1850 was not quite seven and a half million poods (36 lbs. each). Timber, hides, tallow, and wool are the other chief exports. The export of wool, formerly very considerable, has fallen off as the supply from Australia has increased; the carelessness of the flockmasters (who labour rather to increase the number of their flocks than to improve their breeds), in matters relating to the cleansing and sorting of the wool, has tended considerably to check export of this article. In some years the harvests fail, and instead of exporting corn it is necessary to allow the importation of corn free of duty. The government makes great efforts to favour agriculture. It endeavours to extend useful knowledge on the subject to all parts of the empire; many agricultural societies have been formed, and schools established, in which everything bearing on the subject is taught in the most simple manner. In European Russia less than 2-10ths of the surface is under corn-culture; in France the ratio is nearly 5-10ths.

Manufactures.—The manufactures of Russia have been chiefly indebted for their encouragement and progress to the efforts of the government. The czars Ivan I. and II. invited artisans and workmen from Germany, the Netherlands, and Italy, and established at Moscow, Yaroslav, Smolensk, and Kiev manufactures of woollen cloth, linen, arms, &c. But the civil wars before the accession of the house of Romanoff, and the interference of Sweden and Poland, which led to the desolation of the country, checked the infant manufactures, so that in fact nothing was done till the reign of Peter the Great, who in this, as in many other respects, was the founder of the prosperity of Russia. He gave great encouragement to foreign manufacturers, and founded in the first instance great manufactories of arms at Tula, Petrosawodak, and at Sestrabeck, near St. Petersburg; and the great imperial manufactories of woollen and linen at Moscow. At St. Petersburg he established manufactories of articles of luxury, such as mirrors, expensive glass-ware, rich carpets, silks, cotton, &c. In all the larger cities he established at least one manufactory of woollen, linen, and metal, so that at his death there were twenty-one great imperial manufactories, and many smaller ones, partly supported at the public expense. The chief seat of manufactures is Moscow and its government; and next the governments of Wladimir, Nischni-Novgorod,

Saratov, and St. Petersburg. In Poland the woollen, linen, and leather manufactures attained great prosperity under Alexander I, and the cotton manufacture, with steam machinery, has been since introduced. [POLAND.] The Russian workman is very clever, and imitates with wonderful facility; but as he attends mainly to external appearance, his works are deficient in quality and durability.

Among the most important branches of national industry are—manufactories of woollen cloths and other woollen goods, silk, cotton, linen of all kinds; tanneries, tallow melting-houses, candle manufactories, soap manufactories, and metal-wares. The central part of the empire is the chief theatre of manufacturing industry. Tula alone used to be mentioned for its manufactories of all kinds of metal articles; it still maintains its manufacturing activity, but no longer holds the first place. The government of Perm has recently become very distinguished for its manufacture of metal-ware and leather. The manufacture of tobacco and snuff, and beet-root sugar, have greatly increased in recent years. The cultivation of beet-root for the manufacture of sugar has taken a great extension within the last twenty years. In the governments of Kiew, Czernigow, Charkow, Kursk, Podolia, and Volhynia, there were 307 factories in 1848 yielding 12,800 tons of sugar, or about one-fourth of the consumption of the empire. This manufacture, like most other Russian manufactures, is 'protected' by heavy import duties upon colonial sugar, the quantity of which consumed in Russia amounts annually to only about 85,000 tons. Besides the workmen employed in these great establishments, there are above two millions of hands employed in handicraft trades, and in coarse woollen and linen manufactures, iron and other metal wares, or in preparing bast-mats, caviar, hogs'-bristles, in dressing furs, &c. Many articles such as tables, vases, library furniture, &c., have been recently manufactured in Russia from malachite, or green carbonate of copper, which is capable of a high polish.

Commerce.—The inland trade is carried on in a very great measure by means of annual fairs, the most remarkable of which is that of NISCHNEI-NOVGOROD. The principal fairs are those of Nischnei-Novgorod, Irbit, Romna, Charkow, Kursk, Korsun, Rostoff, Sumy, Saratov, Simbirsk, Tambow, Taganrog, Jakutzk, Lebedjan, Penza, Nischnei-Lomoff. Several new fairs and weekly markets have been established within the last twenty years. The inland trade is greatly promoted by the extensive system of inland navigation, by which, as above shown, the interior of the empire is able to send its products to the White Sea, the Baltic, the Black Sea, and the Caspian. With the exception of the road from St. Petersburg to Moscow, which is one of the broadest and best in Europe, and the port-roads, which are kept in tolerable repair, the highways and cross-roads in Russia are in a very broken condition. The great bulk of Russian produce however is conveyed to the ports or to the depôts on the navigable rivers and canals on sledges during the long winter. A railway, 400 miles long and straight as an arrow, connects St. Petersburg with Moscow. Another railroad runs south from Warsaw to the Vienna-Krakow line, which connects the west of the empire with the Austrian and Prussian railway system. These are the only railways completed in the empire. A railroad is projected between St. Petersburg and Warsaw; and a line was authorised in 1852 to be made from Riga to Dunaburg, to join the St. Petersburg-Warsaw line.

The principal trading-ports in Russia are—Riga, Cronstadt, and St. Petersburg on the Baltic; Odessa on the Black Sea; Archangel on the White Sea; and Astrakhan on the Caspian. By these chiefly the corn, flax, hemp, tallow, hides, timber, and other raw products of Russia are exported and foreign produce imported. There are however many smaller ports of considerable importance in the Baltic and the Black Sea. Since war was declared between Russia and the Western Powers in 1854, vast quantities of Russian produce have been forwarded for export by the Vistula, from the Prussian harbours of Memel and Danzig, on account of the blockade of the Russian coasts by the French and English fleets. In 1852 the total exports were valued at 114,773,829 silver rubles (about 3s. 4d. each), and the imports at 100,864,052 silver rubles. Of the imports, goods to the value of only 16,649,447 silver rubles entered the empire by the Asiatic frontier, which was crossed by exports to the value of only 12,423,885 silver rubles. All the rest of the trade was with European states. The total customs-receipts of the empire in 1852 amounted to 31,102,789 silver rubles, of which 7 per cent. was absorbed by the maintenance of the frontier guard.

The total number of ships of all nations that entered Russian ports in 1852 amounted to 8655, carrying 790,300 lasts, and the departures to 8507, carrying 768,900 lasts. Of the arrivals 3627 entered Baltic ports; 827 the White Sea; 8929 the Black Sea; and 272 the Caspian: 2020 of them were British ships; 1125 Russian; 1072 Turkish; 660 Greek; 513 Dutch; 470 Swedish; 453 Sardinian; 383 Austrian; 380 Prussian; 361 Danish; 291 Mecklenburg; 258 Hanoverian; 186 French; and 483 belonged to other nations.

The principal articles of export are—Wheat, flour, cattle, furs, feathers, mats, flax, hemp, linseed, hempseed, oil, tallow, hides, wool, bristles, timber, metals, &c.; linen, cordage, woollens and cotton, candles, soap, coarse woollen cloth, exported to China, &c.; spirits, dried- and salt-fish, fruits, honey, &c. The principal imports are—rice, refined sugar, coffee, tea, wine, fruits, raw-sugar, pearls and precious stones, books, engravings, furs, &c.; cattle and horses from Asia,

&c.; foreign manufactures of silk, wool, cotton, &c.; raw cotton, cotton yarn, indigo, cochineal, madder, and dye-woods.

Revenue.—The revenues of Russia, of which we have no recent return, amount to about 400,000,000 silver rubles, of which 45,800,097 silver rubles were derived from the domains of the crown. The debt was, in 1853, 788,573,112 silver rubles.

Army.—The Russian army is composed of regular troops and Cossaks, or irregular troops, which perform the service of light cavalry. In the regular troops of the grand army the soldier engages to serve for 25 years; but in general after 10 to 15 years' service he is put upon the reserve, of which there are two divisions. Before the outbreak of the present war, the active troops of the grand army consisted of 96 regiments of infantry and 64 regiments of cavalry, 33 brigades of horse and foot artillery, 8 battalions of sappers, and 4 squadrons of mounted engineers. On a war footing, the grand army numbers 486,000 men, with 996 guns; the first and second divisions of reserve number respectively 98,000 men with 192 guns, and 115,000 men with 280 guns, giving a total force of 699,000 men and 1468 guns. Besides this force, the regular troops actively employed for local purposes in the Caucasus, in Finland, Orenburg, and Siberia, number about 198,000 men with 180 guns, over and above a reserve of 100,000 men, consisting of veterans and invalided soldiers of the infantry and cavalry. The Cossaks afford irregular troops to the number of 127,200 men, formed into 33 battalions, with 224 guns. Since the war with France and England broke out, the Russian army has received large additions from new levies.

The Navy is divided into the Black Sea division and the Baltic division, and consists, according to recent statements of 60 vessels carrying 70 to 120 guns; 37 frigates, with 40 to 60 guns each; 70 corvettes, brigs, and brigantines; and 40 steamers. The fleet is manned by 42,000 sailors and 20,000 marines. There are some small-armed vessels in the Caspian and the Sea of Okhotak, not included in the numbers just given.

Education.—The institutions for public education are—I. The public schools of all classes under the minister of public instruction. These are—1, the parish schools; 2, district schools; 3, gymnasia; and 4, the universities. II. The military schools. III. The Ecclesiastical schools. IV. Special schools depending on different branches of the administration. Each university has three faculties—philosophy, jurisprudence, and medicine; and includes within its limits several governments of the empire. The universities are those of St. Petersburg, Moscow, Dorpat, Charkow, Casan, and Kiew. At Odessa there are three lyceums. White Russia has 13 gymnasia. Many schools have been founded in the Trans-Caucasian provinces. The military schools contain about 18,000 scholars. The ecclesiastical schools of the Greek Church are above 400 in number, and contain 60,000 scholars. The schools of the Roman Catholics, Protestants, &c., are about 800, with 8800 scholars. The special schools, under the several ministers, are above 1600 in number, and contain about 128,000 pupils. The government contributes about 10,000,000 rubles annually to their support.

The following table, giving the popular divisions, area, and population of the empire, is taken from the Baron de Haxthausen's recent work on Russia:—

Divisions.	Area in Square Miles.	Population.	
		1846.	1852.
Great Russia	328,781	19,220,900	20,403,371
Little Russia	150,141	11,093,400	11,775,865
New Russia	96,636	3,070,700	3,259,613
White Russia	70,399	2,767,300	2,937,436
Western Provinces	47,076	2,704,300	2,870,667
Baltic Provinces	36,616	1,659,800	1,761,907
Northern Provinces	536,226	1,338,300	1,420,629
Ural Provinces	447,788	10,146,000	10,770,181
Cossak Districts	123,776	1,089,700	1,156,736
Poland	49,230	4,857,700	5,156,543
Finland	133,808	1,412,315	1,499,199
Total in Europe	2,022,477	59,360,315	63,012,146
Caucasian Provinces	86,578	2,850,000	
Western Siberia	2,681,147	3,500,000	
Eastern Siberia	2,122,000	237,000	
American Russia	371,350	61,000	
Total out of Europe	5,261,075	6,648,000	6,648,000
Totals	7,283,552	66,008,315	69,660,146

In respect to race, the Baron gives the following approximations in round numbers:—

1. Slavonic races.—Russians, 49,000,000; Poles, 6,500,000; Lithuanians and Lettes, 2,000,000; Bulgarians and Illyrians, 500,000: total, 58,000,000.

2. Other races.—Germans, 650,000; Dacian Romans (Wallachs), 750,000; Tschudes, 3,400,000; Tartars, 2,150,000; Mongols, 250,000;

Munabur, 100,000; Hyperboreans, 200,000; Caucasian tribes, 2,750,000; Greeks, 70,000; Jews, 1,600,000; Gipsies, 30,800; Miscellaneous, 50,000; total, 12,060,000.

The following list exhibits the popular divisions of Russia, with the governments contained in them:—

Baltic Provinces.—St. Petersburg, Finland, Esthonia, Livonia, and Courland.

Great Russia.—Moscow, Smolensk, Pskow, Tver, Novgorod, Olonetz, Archangel, Vologda, Yaroslav, Costroma, Vladimir, Nischnei-Novgorod, Tambow, Riasan, Tula, Kaluga, Orel, Kursk, and Voronetz.

Little Russia.—Kiew, Czernigov, Poltava, and Charkow.

South Russia.—Ekaterinoslaf, Cherson, Taurida or the Crimea with the Nogai Steppe, Bessarabia, Don Cossaks, and Saratov.

Eastern Russia.—Astrakhan, Samara, Saratov, Orenburg, Penza, Simbirsk, Perm, and Viatka.

Western Russia.—Wilna, Grodno, Kowno, Vitpeak, Mohilev, Minsk, Volhynia, Podolia, and the governments of POLAND.

Caucasian Provinces.—Circassia or Hither Caucasus, Tiflis, Kutais, Schemakha, Derbent. [GEORGIA; CIRCASSIA; CAUCASUS; BAKU; DERBENT; DAGHESTAN; &c.]

Siberia.—Tobolsk, Tomsk, Jenisseisk, Irkutsk, Jakutsk, Okhotsk, Kamtschatka, &c. [SIBERIA; KAMTOHATKA; &c.]

Islands.—In the Arctic seas Nova Zembla. Numerous islands opposite the mouth of the Lena; the Liakhov Islands, or New Siberia, north of 75° N. lat.; St. Lawrence, south of Bhering Strait; the Kurile Islands; the Aleutian Islands.

It is said that the Asiatic territories of Russia have been recently increased by the basin of the AMUR, which it is alleged was ceded to the late emperor Nicholas by the Chinese.

I. Murchison, *Siberia*, 1854; *Russia in Europe and the Ural Mountains*.)

History.—The history of Russia cannot properly be said to commence before the middle of the 9th century of the Christian era: though we obtain occasional glimpses of the various Scythian and Slavonian tribes which roamed over its vast territory, little more can be ascertained than that it was divided into numerous small independent states, the two principal of which were Kiew and Novgorod. About A.D. 850 however a Varagian (probably Danish) freebooter of the Baltic, named Rurik, who had been called in by the people of Novgorod to defend them against their neighbours, made himself master of great part of the country, and founded a dynasty which continued to rule uninterruptedly till A.D. 1598. The reign of St. Vladimir the Great (980-1015) was the era of the conversion of Russia. Vladimir himself, who had married Anna, sister of the emperor Basil II., became a Christian according to the Greek Church in 988, and his example was speedily followed by his boyars, or nobles, and his subjects. At the death of Vladimir, his dominions were divided and disputed by his numerous sons; and though Yaroslaf, whose reign was signalized by an unsuccessful attack on Constantinople in 1043, reunited them for a short time, a second partition took place at his death (1055); and Russia was devastated for half a century by constant civil wars and Polish invasions. The authority of the grand-prince of Kiew had been curtailed by the erection of petty sovereignties under the different branches of the house of Rurik, till Andrew I., prince of Vladimir, or White Russia (1057-75), arrogated to himself the title of grand-prince of Russia, while the elder line reigning at Kiew sunk into a subordinate rank; and Novgorod, though still retaining the forms of princely government, had become in effect a free republic, and was the centre of an extensive traffic with both Europe and Asia. The annals of this period present only an unceasing succession of destructive struggles between the different principalities, and wars with Poland. The invasion of the Tartars (1223) produced a momentary unanimity from the sense of common danger. A host of 500,000 men under Touthi, the son of Genghis Khan, encountered and overthrew the combined forces of the Russian princes on the river Kalka, near the Sea of Azof: but though the death of Touthi diverted the victors from the immediate completion of their conquest, they returned in 1236 under his son Batu, laid waste the whole country with fire and sword, and took complete possession of its government.

For more than two centuries and a half after this conquest Russia continued to be held in abject vassalage by the Tartars of Kapchak, whose hordes overspread the eastern and southern provinces, and the plains between the Caspian and the Volga, on the banks of which river the Golden Horde, or imperial residence of the khans of the race of Batu, was fixed; but the interior of the country was still left under the government of the native princes. The grand-prince of Vladimir continued to be considered as the head of the Russian nation, though this dignity was disputed both by arms and by intrigues at the court of the khans, who fomented these dissensions as favourable to the stability of their own supremacy. In 1320 the seat of government was removed from Vladimir to Moscow. The principality of Kiew was finally extinguished (1321) by the Duke of Lithuania, who conquered and annexed it to his own dominions. In the meantime

Novgorod (which in 1276 had joined the Hanseatic league) had acquired very great commercial importance. But the remainder of Russia continued to be held in hopeless bondage, till the termination of the direct line of Batu (1361) by the death of Berdi-Bek Khan, gave rise to disputes for the throne of Kapchak, and the discord of their oppressors encouraged the Russians to endeavour to throw off the yoke. The struggle continued for about a century, till at last Ivan or John III. (1462-1505) succeeded in obliterating the last vestiges of dependence.

With the reign of this prince, who married Sophia, the niece of the last Greek emperor, a new epoch commences in the history of Russia. He defeated the Poles and Lithuanians, reduced the Tartars of Casan to tribute, and re-united under his authority most of the minor Russian principalities; but his capture of Novgorod (1475), and the exactions which he levied on the merchants and citizens, gave a death-blow to the commerce of that famous emporium. The embassies of the European powers, Germany, Poland, Venice, the Holy See, &c., were now first seen at Moscow; and though the character of Ivan is sullied by the cruel despotism of his internal administration, he is justly entitled to rank as the founder of the Russian empire, the power and splendour of which date from him. In the reign of his son, Basil IV., the Tartars of the Crimea, incited by the Poles, committed fearful ravages throughout Russia in 1510; and in 1520 their khan advanced to Moscow, which he spared only on promise of tribute. His successor Ivan IV., Vasilovitch, surnamed the Terrible (1533-84), was crowned (1545) by the title of Czar, which he substituted for that of Veliki-Knez. The first acts of his reign were the institution of the corps of Strelitzes (archers), the first regular army of Russia; and the reform of jurisprudence by the publication of a regular code of laws named Youdebnik; but he was unsuccessful in his efforts to procure (by an embassy to Charles V. in 1547) artisans and engineers from Germany for the instruction of his subjects. The voluntary adhesion of the Don Cossaks (1549) secured to Russia the services of those active and warlike auxiliaries. In 1553 the English trade through Archangel was first opened. Siberia was acquired in 1581. About this period the art of printing, and also several branches of manufacture, were introduced into Russia. The cruelty and ferocity of Ivan increased with his years: his eldest son perished in 1584 by a blow from the hand of his father, and Ivan himself died the same year. Though a remorseless and sanguinary tyrant, he had raised the country by his energetic policy to a hitherto unexampled pitch of prosperity. With his son Feodor, or Theodore, in 1598, the male line of the house of Rurik, which had ruled under 66 sovereigns for 736 years, became finally extinct.

Boris Godoonoff, the brother-in-law and minister of Feodor, was placed on the throne, and commenced his reign (1598-1605) by the emancipation of the serfs and other salutary measures; but he soon degenerated into an arbitrary and cruel tyrant, and at length lost his throne and life in a contest with an adventurer who declared himself to be the lost Demetrius, brother of Feodor, whose pretensions were supported by Poland. The real history of this person has never been satisfactorily ascertained, and many writers consider his claims to have been well founded; but after ruling scarcely a year he perished (1606) in a popular revolt headed by a boyar named Basil Schuiski, who thereupon became Czar. But a second false Demetrius speedily started up. The Poles and Swedes, who each aspired to seat a prince of their own nation on the throne, invaded the country, and were supported by various factions among the nobles; and for seven years (1606-13) Russia became the prey of desolating anarchy and civil war. The Swedes occupied Kexholm and Novgorod, and the Polish prince Ladislas, after taking Smolensk, advanced to Moscow, and sent Schuiski prisoner to Warsaw (1610). But the prospect of the dismemberment of their country roused the national spirit of the Russians; the Poles were driven from Moscow (1613), after a sanguinary battle; and in the following year Michael Romanoff, a descendant by females from the house of Rurik, was called to the throne with a unanimity among all orders in the state, which the sense of imminent danger alone could produce.

The accession of the line of Romanoff gives a new character to the history of Russia, which henceforward, from being regarded as a barbarous and semi-Asiatic power, begins to assume an important place among European states. The long reign of Michael (1613-45), afforded him time for the consolidation of his own power, and the restoration of his dominions from the depression caused by the late calamities. Though compelled by the boyars to re-establish the slavery of the peasants, he partially succeeded in redressing the abuses which the preceding anarchy had occasioned; and he gave a fresh impulse to trade by the conclusion of commercial treaties with England (1623) and with France (1628). In the reign of his son Alexis in 1687, after a long contest with Poland, the truce of Andrusow (converted into a permanent peace in 1686) gave to Russia the Tchernigov, Kiew, and the Ukraine, with the protectorate of the Dnieper Cossaks. About the same period internal commotions, and a revolt of the Don Cossaks, occasioned considerable trouble to Alexis. The last years of his reign were devoted to internal improvements and the advancement of civilisation. Numerous foreigners, particularly Scotch and Germans, were attracted to Russia, where they introduced the arts and manufactures of their own countries; and the publication of a revised code of laws gave a settled character to

the national jurisprudence. Alexis died in 1726, at the age of 47, leaving several children by his two wives. The short reign of his eldest son Feodor (1726-32), was remarkable only for the first war between Russia and the Porte (1738-32), which ended in the final cession of Ukraine to Russia; and for the destruction at Moscow of all the charters and muniments of the nobility, who thenceforward took precedence according to military rank. Feodor left no issue, and at his death, Ivan and Peter, both sons of Alexis, but by different wives, were placed jointly on the throne, under the guardianship of Sophia, the sister of Ivan, an ambitious princess, who aspired to the sole exercise of authority in her own person. The attempts of Sophia to exclude Peter from all share in the government brought on a revolution (1689) in favour of Peter, who ascended the throne as sole sovereign.

The genius of this future regenerator of Russia had been cultivated by the instruction of a Genevese named Le Fort, who had been his tutor since 1684, and the energy of his mind speedily developed itself in action. His first care was the reform of the army, and having succeeded in disciplining some regiments in the European manner, he attacked and took Azof from the Turks in 1694, being aided by a flotilla which he built on the Don, and which was the first Russian navy. In 1697 he quitted his dominions, and travelled for nearly two years in England, Holland, &c., in order to acquaint himself with mechanics and ship-building, and to engage artisans and engineers for his service. A sanguinary revolt of the strelitza, in favour of Sophia, having occurred during his absence, the corps was abolished at his return, and replaced by regular troops. The same year (1698) he founded the first Russian order of knighthood, that of St. Andrew; and the cession of Azof by the Porte at the peace of Carlowitz (1699) at length gave him a port on the Black Sea. His next aim was to acquire a territory on the Baltic, and with this view he joined the Northern League with Denmark and Poland against Sweden; and though his raw levies were defeated at Narva (1700) by Charles XII., he succeeded during the next two years in occupying Ingria and Carelia, while the Swedes were engaged in the Polish war; and his new capital city of Petersburg was founded on this territory (1703) at the mouth of the Neva. While these warlike operations were going on, schools, printing-presses, manufactories, and hospitals were everywhere established; the university of Moscow was founded in 1705; and the overgrown power of the clergy was curtailed by the abolition of the patriarchate, the Czar declaring himself head of the church. In the course of the war with Charles XII., Wiborg, Revel, Riga, with all Esthonia and Livonia, fell into the hands of the Russians; and Frederick Augustus, who had been dethroned by Charles XII., remounted the throne of Poland, in which kingdom Russian influence continued from that time paramount. But a war (1710) with Turkey, arising from the shelter afforded by that power to Charles, had a disastrous result; the Russians were surrounded on the Pruth, and Peter was compelled to purchase the peace of Falczay (1711) by the restoration of Azof and other humiliating concessions. In 1716-17 Peter again travelled through Holland and Denmark, and visited France, where he concluded an alliance with Louis XV. On his return, his son Alexis, who had previously offended him by his weak and vicious course of life, was tried on pretence of conspiracy, and condemned, but died, perhaps from natural causes, in prison. The Swedish war, which had languished after the death of Charles XII. in 1718, was at length terminated (1721) by the peace of Nystadt. Russia became thenceforward the great Northern power in place of Sweden; and Peter exchanged the title of Czar for that of Emperor and Autocrat of all the Russias, which his successors have ever since borne. In 1723 he availed himself of the distracted state of Persia to seize a part of their territory on the western shores of the Caspian, which Shah Tahmasp consented to cede to him; but this was his last exploit. He died January 28, 1725, aged 58. In 36 years he had raised Russia from a semi-barbarous state to a pitch of military strength and political importance, which placed her on a level with the first powers of Europe.

In obedience to the last commands of Peter, his widow, Catherine, formerly a Livonian peasant-girl, was proclaimed empress; but her short reign (1725-7), and that of her successor Peter II. (1727-30), were almost barren of events, and remarkable only for the ascendancy, under Catherine, of Prince Mensikoff, and under Peter II. of the Dolgoruki family. On the death of Peter II., Anne, daughter of Ivan, the elder brother of Peter the Great, was called to the throne (1730-40) by the influence of the Dolgoruki faction, on signing an agreement which limited the imperial power in favour of the nobility; but this compulsory act was cancelled under the advice of the chancellor Ostermann, and the Dolgorukis were disgraced and exiled to Siberia. Another revolution placed on the throne, in 1740, Elizabeth, daughter of Peter the Great by Catherine. In the early part of Elizabeth's reign a war with Sweden commenced (1741), which ended (1743) in the acquisition of part of Finland by Russia. The alliance concluded with Maria Theresa (1747), in the war of the Austrian Succession, and the consequent appearance on the Rhine of 36,000 Russian auxiliaries under Repnin, gave Russia, for the first time, a direct participation in the politics of Western Europe; and in the Seven Years' War a large Russian force, acting as allies of Austria, invaded Prussia. The victories of Gross Jagersdorff (1757), and of

Kunnersdorff (1759) over Frederick the Great, established the renown of Russian arms, and Berlin was taken by them in 1760; while an army of observation was maintained from 1758 in Poland, then a prey to anarchy and confusion. Elizabeth died Jan. 1762, regretted by her subjects, to whom she had endeared herself by the mildness of her domestic administration; and was succeeded by her nephew, Peter III., duke of Holstein-Gottorp. This prince, after a reign of six months, was dethroned (July 1762) by a conspiracy, and died in prison a week afterwards, as is generally supposed by violence. His consort, Catherine II., was then called to the throne.

The accession of this ambitious and unscrupulous princess (1762-96) gave a fresh impulse to Russian policy, which from this time assumed the steadily aggressive character which it has ever since maintained. On the vacancy of the Polish throne, in 1764, a Russian army dictated the election of Stanislaus Poniatowski; and the complaints of the Porte, at the continued occupation of the country by Russian troops, led to a Turkish war (1768-74), in which the Russian arms were triumphant. A Russian fleet appeared for the first time (1770) in the Mediterranean, and destroyed the Turkish navy at Tchesmé; the land forces subdued Crim-Tartary, Moldavia, and Wallachia. The Danube was crossed for the first time in 1773; and the losses of the Porte compelled her, by the treaty of Kutchuk-Kainardji (1774), to acknowledge the Crim-Tartars independent, and to cede to Russia an extensive tract of territory. In the meantime the first partition of Poland (1772) had taken place, which gave Polotsk and Mohilew to Russia; and the dangerous revolt of the Cossak Pugatchef, who personated Peter III., was quelled by his capture and death in 1775. The internal administration was placed on a new footing by the division of the empire (1776) into 43 governments (there are now 49) with separate jurisdictions, and by the gradual promulgation (1775-83) of a new code of laws. In the meantime the chains of Poland were daily rivetted tighter; and the opposition of England to the avowed project of erecting a new Greek empire at Constantinople, on the ruins of the Turkish power, is generally supposed to have given rise to the famous Armed Neutrality (1780), in which all the northern powers combined with Russia to resist the right of maritime search claimed by Great Britain. Crim-Tartary was seized (1783) and incorporated with Russia; but this encroachment, though the Porte was compelled at the time to acquiesce, led eventually to the second Turkish war (1787-92), memorable for the sanguinary triumphs of Potemkin and Suwarow. Choczim, Oczakow, Bender, and Ismail were successively taken with fearful slaughter; and the peace of Jassy (1792) established the Dniester as the boundary of Turkey and Russia. The outbreak of the French revolution produced a change in the disposition of Russia towards England, with whom an alliance and a commercial treaty were concluded in 1793; but no active part was taken against France, as the attention of the empress was directed towards Poland, by the second partition of which (1793) Russia gained Podolia and the Ukraine, with half of Lithuania and Volhynia. Warsaw was garrisoned by the Russians, but a fierce struggle ensued (1794) on the general revolt of the Poles under Kosciusko and Madalinaki; till the storm of Praga by Suwarow, in which 20,000 Poles were slaughtered, finally crushed all resistance; and the third and last partition of the kingdom took place the next year, by which the nationality of Poland was extinguished, while Russia gained Courland with the rest of Lithuania and Volhynia, in addition to her former acquisitions.

Catherine II. died the year after the accomplishment of this favourite object of her policy, and was succeeded by her son Paul (1796-1801). He joined (1798) the second grand coalition against France; in pursuance of which the Russian auxiliaries, under Suwarow and Korsakow, were engaged in Italy and Switzerland in the memorable campaign of 1799; but Paul soon abandoned his allies, concluded peace with Bonaparte (then first consul), and, in 1800, put himself at the head of the Convention of the North, a union of the northern states, on the principle of the armed neutrality, against the British maritime supremacy. A war with England was impending, when Paul was murdered in his palace (1801) by a band of conspirators.

His son and successor Alexander (1801-25) immediately effected a pacification with England, and disbanded a force which his father had assembled at Orenberg, with the wild design of marching overland to India. The relations with France continued peaceful till 1805; but Alexander refused to acknowledge Napoleon as emperor, and, joining the Austrian alliance against him, was personally present at the defeat of Austerlitz. In 1806 the renewed alliance of the Porte with France was made the pretext of a new Turkish war (1806-12), and Moldavia and Wallachia were occupied; but the successive victories of Eylau and Friedland gained by the French (1807), led to the famous conferences between Alexander and Napoleon, the result of which was the peace of Tilsit. Russia joined the 'Continental System' of Napoleon, and became an ally of France; declaring war (1808) against England and Sweden, the latter of whom was forced to cede, by the peace of Frederiksham (1809), all Finland, East Bothnia, and Aland. The war with the Porte was resumed with fresh vigour in 1810-11-12; but the injury which the 'Continental System' inflicted on Russian commerce was becoming insupportable, and the refusal of Alexander to enforce it led to a rupture with France (1812). Alliances were now formed with England and Sweden, and the peace of Bucharest with the Porte extended the Russian frontier to the Pruth. In the autumn

of 1812, Napoleon invaded Russia with 500,000 men, defeated Kutusoff at Borodino, and advanced to Moscow; but the country was everywhere laid waste, and the conflagration of the capital itself by the governor Rostopchin compelled the French to retreat in the midst of a winter of unexampled rigour, pursued by the Russians: nine-tenths of their vast host either perished or were taken prisoners. A powerful Russian force continued to take part in the campaigns of 1813-14 against France, and Alexander entered Paris in triumph. By the congress of Vienna (1815), Warsaw and a large territory, under the name of the kingdom of Poland, were annexed to the crown of Russia, but with a separate administration and free press. A desultory war with Persia (1804-13) had been concluded by the peace of Goolistan, Persia ceding most of her Caucasian provinces, and giving up her claims on Georgia.

The military power and political influence of Russia were now almost paramount on the continent; and after the final downfall of Napoleon, in 1815, she became the head of the 'Holy Alliance,' entered into by herself, Austria, Prussia, and France, for the suppression of revolutionary principles. The remainder of the reign of Alexander was peaceful, and occupied chiefly in reforms of the internal government. In one of these tours of inspection Alexander died at Taganrog, on the Don, aged 48 (Dec. 1825); and was succeeded by his brother Nicholas, the third son of Paul, the second brother, Constantine, having previously renounced the succession. This change in the succession occasioned some military tumults, which were not quelled without bloodshed. In 1826 a dispute respecting boundaries led to a fresh war with Persia, which continued till 1828, when the progress of the Russians compelled Persia to give up Erivan and the country as far as the Araxes, as the price of the peace of Turkmanchai. The Greek revolutionary war was now raging, and the treaty of London was signed (July 1827) by Russia, France, and England, for the settlement of the question; but the refusal of the Porte to accede to the terms dictated to her produced the destruction of the Turkish fleet by the allied squadrons at Navarino; and in 1828 a Russian army invaded Turkey, and though repulsed from before Shumla in the first campaign, succeeded in crossing the Balkan (1829), and occupied Adrianople, where a treaty was concluded, by which Russia acquired numerous frontier fortresses on the Black Sea, and the protectorate of Moldavia and Wallachia. A general insurrection of the Poles (Nov. 1830), who were goaded by the tyranny of their viceroy the grand-duke Constantine, and by repeated infractions of their constitution, was crushed, after a campaign of frightful devastation and bloodshed, by the capture of Warsaw, Sept. 1831: many thousand Poles of all ranks were sent to Siberia; the kingdom was incorporated with Russia, and has ever since been governed as a conquered province. The relations with the Porte assumed a new form in 1833, from the application of the sultan for aid to check the advance of the rebel pasha of Egypt: an auxiliary force was sent to Constantinople, and terms imposed on the pasha; but this service was repaid by the treaty of Unkiar-Skelessi, binding the Porte to have recourse to no other power for assistance, and to close the Dardanelles against all foreign ships of war. These proceedings excited in England a strong popular feeling of hostility towards Russia, which was further augmented by the seizure in 1836 of a British merchantman on the coast of Circassia, where a fierce guerilla warfare with the natives had been for some years carried on, the Russians claiming the country as ceded to them by the peace of Adrianople. The march against Herat (1838) of a Persian army, directed by Russian officers, viewed as preliminary to the invasion of the Anglo-Indian empire, brought the conflicting relations apparently to the verge of a rupture: but the apprehensions of the English cabinet were tranquillised by the repulse of the Persians, and the subsequent conquest of Afghanistan by an army from India; and the Russian schemes of aggrandisement in this quarter received a further check from the failure of a formidable expedition directed (1840) against the predatory Uzbek state of Khiva.

Russia was now actively but secretly employed in consolidating her power, fortifying her ports, and strengthening her frontier fortresses. She became also the protectress of the continental monarchies against the efforts for constitutional governments made by their subjects. In 1846 a slight attempt at revolution in favour of the independence of Poland was made at Cracow, which had been formed into a free republic in the treaties of 1815, under the sanction of all the allied powers. On February 22nd a Russian army took possession of Cracow, and in November a joint decree of Russia, Austria, and Prussia revoked and annulled the articles of the treaty, and Cracow was made over to Austria. Soon afterwards the Russian portion of Poland, to which a sort of nationality had been promised, was incorporated with the Russian empire, and formed into a Russian province. In 1847 Russia, in conjunction with Austria and Prussia, addressed a note to Switzerland, stating that they abstained from intervention only on condition of the Swiss adhering to the compact of 1815; that is, not altering or in any way liberalising their domestic institutions; the vorort protested against any foreign interference, proceeded in their own course, and the only measures taken were by Austria in some vexatious restrictions on commerce and intercourse.

In 1848 the German revolutionary struggle was going on, and the insurrection against Austria commenced in Hungary. Unsuccessful in repressing this great national movement, Austria called in the

assistance of Russia, which was readily granted. Early in 1849 an army was marched into Hungary; on June 23 the battle of Eperies was fought, on July 23 that of Miskolcz, and on July 31 that of Segesvar, and in all the Russians were the conquerors; on August 31 the Hungarian army under Görgey, 25,000 strong, surrendered themselves to the Russians at Vilagos, near Groswarden. In the meantime the Turks had been protesting against the violation of their territory by the marching of Russian troops through Turkish Transylvania. On the loss of the Hungarian cause many of the leaders had fled to Turkey, and their expulsion was demanded by Austria, seconded by Russia; and on compliance being refused, the Russian minister suspended all diplomatic intercourse with the Porte. Upon this the British fleet entered the Dardanelles and diplomatic relations were resumed on the refugees being located at Kutayah.

In 1851 considerable progress was made in the construction of railroads, and that between St. Petersburg and Moscow was opened for traffic. In 1852 the emperor Nicholas visited Vienna and Potsdam; and entered into an agreement as to the succession to the Danish crown.

The possession of the Holy Places at Jerusalem, which were the temple, the sepulchre, and perhaps some others, had long been matters of contention between the monks of the Latin and Greek Churches in that city. A recent dispute had sprung up relative to the right of repairing the temple. The Turkish government had endeavoured to settle it by repairing it themselves, but this gave satisfaction to neither party. The defence of the Latins was undertaken by France, who obtained a firman from the Porte which was thought objectionable by Russia, who of course protected the Greeks. On February 28, 1853, Prince Mensikoff arrived on a special mission at Constantinople; on March 16, in an interview with the Sultan, he announced the dissatisfaction of the emperor with the measures taken as to the Holy Places, demanded an arrangement that should remove these causes of complaint, and that a guarantee should be given for the future. In a second note (of April 19) such a guarantee was demanded as would best secure the integrity of the Greek faith throughout the Turkish empire. The Porte endeavoured to satisfy these demands by proposing to issue firmans securing the religious rights of the Greek Christians; but on May 5 Prince Mensikoff informed the ministers that the firmans would not satisfy him, and demanded an immediate decision. The Turkish ministry asked for time to consider of so important a matter; but Mensikoff on May 18 replied that he saw, from the desire of postponement, that his efforts to secure a pacific decision were vain, and therefore considered his mission terminated; that, as the Porte refused to give the required guarantee for the support of the orthodox Greek-Russian faith, nothing remained but for Russia to take the necessary guarantees by force. The next day the Turkish ministry replied to this note. They stated that their government had made no change; that with regard to the Holy Places, the dispute was not with it, but between France and Russia only; that however they would grant permission to Russia to build a church and an hospital in Jerusalem, and that a solemn decree should be issued confirming the privileges of the Greek clergy. These compliances were ineffectual. On May 21 Mensikoff rejected them, and quitted Constantinople. On the 26th the Porte addressed a memorandum to the ministers of Great Britain, France, Austria, and Prussia, detailing the state of the affairs. On the 31st a note from the Emperor of Russia granted a delay of eight days to the Porte for re-consideration of his demands, but approved of the conduct of his ambassador, as he considered the conduct of the Porte to be a personal offence. The reply to this was, that the demands were wholly inconsistent with the independence of the state, and would not be complied with. On the 26th the Russian manifesto against Turkey was issued, and on July 2 Russian troops entered Wallachia.

In the meantime the English and French ambassadors at Constantinople had protested and remonstrated against the claims of Russia; the resolution of England having been much strengthened by an invidious proposition made by the emperor Nicholas to the ambassador at St. Petersburg for apportioning Turkey—he taking Constantinople provisionally only, and England taking Egypt. On the appearance of a commencement of hostilities, the British fleet was summoned to the Dardanelles, and that of the French quickly followed.

In September 1853 war was formally declared by the Porte against Russia, and on the 1st of October an appeal for material support was made by Turkey to France and England. On the 27th of October the Turks crossed the Danube opposite Widdin, and with greater force on the 3rd of November. Whenever the Russians attacked them, the Turks maintained their position with obstinate courage.

On the 30th of November the Turkish fleet was destroyed in the harbour of Sinope by the Russian fleet from Sebastopol. The narrative of that destruction was so full of horrible circumstances, presenting the character of rather a cruel massacre than an equal battle, that the indignation of England was fairly roused. The combined fleets of Great Britain and France entered the Black Sea on the 3rd of December, on the demand of the Porte to the ambassadors. The Russian fleet retired to the shelter of Sebastopol, from which it never again stirred.

We cannot go into the details of the war with the minuteness of a history: it will be sufficient to mention the more striking events. On the 22nd of April the allied fleets bombarded Odessa; the Russians laid

siege to Silistria, were most signally repulsed, and in June they retreated across the Danube; the Aland islands in the Baltic were taken in August, all the Russian ports in that sea blockaded, and Cronstadt, the port of St. Petersburg, watched and threatened. On the 14th, 15th, and 16th of September the allied armies landed in the Crimea near Eupatoria. On the 20th was fought the battle of the Alma, in which the passage of the river was forced against great advantages of position and numerical superiority, and the Russians were forced to retreat; Sebastopol was then passed, and the siege begun from the southern side; repeated conflicts have taken place, the most brilliant was that called the battle of Inkermann on November 5, 1854, which ended in the repulse of the Russians.

Government, &c.—The emperor is an absolute monarch. Several classes of the inhabitants enjoy certain privileges and immunities, under no other guarantee however than the pleasure of the monarch, who may abolish them just as he granted them. No one has of right any rank unless such as he obtains by filling a civil or military office. The inhabitants of Russia are divided into the following classes:—the clergy, the nobility, the merchants and burghers, and peasants.

The clergy is composed of the monastic or regular clergy, and the secular clergy. All the higher preferments of the church are held exclusively by the first; the secular clergy (the members of which must be married) have no higher preferment than the superintendence of a certain number of parishes. The children of the clergy generally follow the vocation of their parents; some of them enter the civil service.

The nobility is the privileged class. They may enter the service of foreign powers not at war with Russia. A noble cannot be judged except by a judge belonging to his condition, and sentence passed against him cannot be carried into execution without having been previously examined by the senate and confirmed by the emperor himself. A noble is exempt from corporal punishment. The nobility may establish any kind of manufacture and engage in commerce, but in the latter case they must inscribe themselves in one of the merchants' guilds, and pay the taxes attached to it. All the minerals found on their estates are their property, and they are the almost exclusive landholders of the country. All Russian subjects, except those employed on diplomatic service, are prohibited from educating their children from ten to eighteen years of age abroad. All children educated in contravention to the ukase are incapable of holding office in Russia.

The nobles have meetings for the election of certain magistrates, and they may send deputations to the emperor after permission obtained. They may also deliberate at those meetings on several local affairs. Those nobles only who enjoy a grade in the military or civil service are capable of voting. There are two classes of nobles, hereditary and personal. To the first class belong all nobles who have inherited their rank or risen in service to the eighth grade, that of major in the army, captain-lieutenant in the navy, or assessor of a college. The personal nobles are those who have acquired by their services a grade inferior to the eighth. These latter enjoy the privileges of the order without transmitting them to their children, and they cannot be elected to certain offices. The titled nobility, or princes, counts, and barons, have no privileges beyond those of the other nobles. The titles are derived from Russian and foreign grants. The princes are chiefly descendants of the ancient petty princes of Russia, and some of the Lithuanian dynasty; many are of Tartar, some of Georgian or Iberian descent.

The second order of the inhabitants of Russia is composed of the citizens or townsmen, who are subdivided into many classes. Honorary citizens, who are exempt from the capitation-tax, military conscription, and corporal punishment, and have the right of being elected to municipal offices, consist of free non-nobles who have obtained academical honours, distinguished artists, and heads of manufacturing establishments. Academical honours entitle the individual who has obtained them to receive a corresponding grade on entering the civil service. The children of the personal nobles are hereditary honorary citizens. The privileges of that order are forfeited either in consequence of a criminal sentence, or by engaging in some mean trade, and entering into domestic service.

The merchants are divided into three classes or guilds. The first guild which pays annual taxes of 100*l.*, has a right to engage in any commercial or manufacturing enterprise without any limitation as to the amount of capital employed in it. The members of the second guild pay an annual tax of 40*l.*, and cannot enter into any contract for more than 2000*l.*, nor can they keep a banking or insurance office. Both the first and second classes enjoy an exemption from the capitation-tax, military conscription, and corporal punishment. They may possess estates with serfs employed in manufactories. The merchants of the third guild pay an annual tax of 10*l.*, and are retail dealers and small manufacturers. Nobles may enter one of these three guilds.

Foreign merchants trading in Russia must pay the same taxes as the Russian merchants. They may acquire real property in places where they are settled.

The burghers by paying an annual licence of 1*l.* to 3*l.*, may engage in several kinds of retail trade, and have workshops with eight workmen, and by doubling the price of their licence 16 workmen. If they wish

GEOR. DIV. VOL. IV.

to increase that number they must pass into the third guild of merchants. The burghers are not exempted from the capitation-tax, military conscription, or corporal punishment.

The peasants constitute the lowest class of the inhabitants of Russia. They pay the capitation-tax and are subject to military conscription. Beside their agricultural pursuits, they are allowed to engage in handicrafts and some minor trades. By purchasing licences they may engage in any kind of commerce, even that which is carried on by merchants of the first guild, but they do not enjoy the personal privileges of the merchants. They are divided into crown peasants, those of appanage estates, serfs of landowners, and free cultivators of land; the number of these last is however very small.

The crown peasants are those who live on the estates belonging to the crown. They pay, besides the capitation-tax, a rent for their grounds. Many villages are obliged to maintain post-horses for the government couriers and private travellers. The crown peasants elect some of their authorities. Each commune (500 male individuals constitute a commune), elects every two years its chief, called head. Each commune also sends a deputy for the election of assessors who judge in causes arising among themselves, or between them and other classes. These assessors may be chosen from among the peasants themselves or other classes. Causes between crown peasants themselves are decided by the judge of the district with the above-mentioned assessors; but when other parties are concerned, the causes are decided by the same judge with an assessor of the peasants and another of the nobles. The crown peasants may pass into the class of burghers and merchants.

Recent official statements quoted in the 'Gothic Almanac' for 1855, give the area of the crown domains of Russia at the end of 1850 at 80,393,601 desjatines or 340,000 square miles, or 140,000 square miles more than the area of France. The population of the crown domain in 1851 amounted to 18,975,416, of whom 16,005,294 (7,825,154 males, 8,180,140 females) were crown peasants. The capitation, excise, and administrative taxes, together with contributions of various kinds, and rent and forest produce, raised the receipts from the imperial crown-lands throughout the empire to 45,300,097 silver rubles in 1852.

Many estates peopled with crown peasants have been ceded to particular individuals on condition of establishing manufactories. These peasants work in manufactories on certain fixed terms. The owners of the manufactories pay all taxes due from these peasants, who are likewise exempted from military conscription.

The landowner's peasants, or serfs, are complete slaves. Their master can inflict on them such punishment as he chooses, but he is not permitted to kill, to starve to death, or to maim his serf. A serf cannot contract marriage without the permission of the master. The predial serf cannot be sold without the ground to which he is attached, but the domestic serf may be sold like any other chattel. A ukase of 1808 however prohibits the sale of serfs at fairs or by auction, or as substitutes for recruits. An accusation of a serf against his master, except in cases of high treason, is not admitted, and he who proffers such a charge is liable to punishment.

The free peasants, a class whose existence began under the emperor Alexander, are subject to the capitation-tax and military conscription, but they are free in all other respects.

A great number of German colonists have settled in Russia at different times. They are exempt from all taxes for ten years after their settling, and from military conscription entirely.

Administration.—The principal authority is the council of the empire, presided over either by the emperor or by a member specially appointed. It is divided into four departments: legislative, military (which comprises also the navy), civil and ecclesiastical, and financial. Each of these departments has a secretary of state, and they deliberate either separately, or together, which is called the general assembly of the council. The affairs which are decided by a majority of votes, are submitted to the approbation of the emperor.

The Directing Senate, established by Peter the Great, is the supreme tribunal for all judicial cases. Its authority is limited only by that of the monarch. It is presided over by the emperor in person. The ukases of the senate are binding like those of the emperor, who alone can prevent their execution. The senate is divided into eight departments, of which the first superintends the general affairs of the country; the second, third, and fourth try civil cases; and the fifth, criminal cases: these are all at St. Petersburg. The sixth, which also tries criminal cases, and the seventh and eighth, which try civil cases, are at Moscow. Each of these departments has a number of governments or provinces, from the courts of which it hears appeals. Judgment is given by a majority of votes, which must consist of two-thirds of the whole number, or of the number present. In case the required majority cannot be obtained, the cause is decided in the general assembly of the senate, where all the departments vote together. Causes are not publicly argued before the senate or before any other Russian tribunal. A statement of the case of each party is made by the secretary, and communicated to the party, who signs it as correct. These statements are then read to the court, which pronounces judgment. In the Polish provinces causes were publicly argued by advocates, but these laws have been abolished and those of Russia introduced.

The synod, or, as it is officially called, the most holy directing synod, is the supreme administrative and judicial court for all ecclesiastical affairs of the Greek religion. Its decisions are subject to the control of the emperor as head of the Church.

The administration of the country is conducted by the following ministries:—Ministry of the imperial household; foreign affairs; interior affairs; war; marine; national education, to which is attached the administration of the ecclesiastical affairs of those sects which do not belong to the Russian Church; finance; justice; board of control, which audits the accounts of all moneys expended for the public service; post office; and direction of land and water communications.

The governments or provinces are organised in the following manner:—The head of the administration of a province is the civil governor, to whose department belong all the affairs of the province except judicial cases. There is also a military governor, who frequently has more than one province under his jurisdiction, to whom all civil and administrative affairs are referred.

The tribunals or courts of appeal try civil and criminal cases, and the members of them are elected by the nobles. The conscientious tribunal is composed of a chairman and two assessors elected from the nobles, two assessors from the merchants, and two from the peasants. This court hears those criminal cases where the crime was committed more from a concurrence of unfortunate circumstances than from malice. The jurisdiction of the court does not however apply to cases of offence against the imperial person, high treason, murder, theft, and robbery. There are a medical board, a board of public charities, and a council called the tutelage of the nobles (which is trustee of all minors of that class) in each government.

The towns have their separate jurisdiction, composed of the burgo-master and ratmans, councilmen, who are elected from the merchants and burghers of the town. One of the most mischievous defects in the Russian administration of justice and police is the insufficient pay of magistrates, of whom the highest, namely, a senator, receives 160*l.* a-year. Bribery is the universal plague of the Russian administration.

Laws.—In 1497, Ivan III. made an order for collecting into one body the existing customs and ordinances, and rendering the collection complete by the necessary additions. By order of Ivan the Terrible, this code was (1550) revised and completed under the name of Sudebnik, or judgment-book. The Czar Alexey Michaelovich gave orders (1640) for composing a general code of laws under the name of Ulogenis (Regulation). It consists of 25 chapters, and still forms the basis of the Russian law. Since that time the Russian legislation has been continued by Ukases, that is, ordinances issued either in the name of the monarch himself, or of the senate; and their number from the 25th January, 1649, to the demise of the emperor Alexander I. was 30,920.

Immediately after his accession, the late emperor Nicholas declared that a systematically arranged collection of the existing laws and ordinances should become the basis of legislation. A collection of all the laws and ordinances from 1649 till the death of the emperor Alexander I. (December 1, 1825), was published in 48 volumes, 4*to.*, 1827-30. It was followed in 1832-33 by a collection of the ordinances of the emperor Nicholas, from his accession to 1832, in 8 vols. 4*to.*, and is still continued. From the collections just named was extracted the Svod Zakonov (corpus juris), which was published 1826-33, 15 vols., and is the general law of the empire.

RUSTSCHUK, a fortified town in Bulgaria, capital of an eyalet in European Turkey, is situated near the right bank of the Danube, about 40 feet above the level of the river, 40 miles S. from Bukharest, and has a population variously estimated at from 20,000 to 40,000. The Danube opposite Rustschuk is nearly two miles wide, but its surface is broken by a number of islets and shallows, and the banks are low. From a distance Rustschuk has an agreeable appearance, with its white chimneys and graceful minarets rising up from among the foliage of extensive orchards. This impression however is removed by a view of the interior, which presents dirty ill-paved streets, flanked by low wooden houses, most of which stand in little courts or gardens. The Pasha's konak, or palace, and the mosques, are the only buildings worth notice. The town has baths, a bazaar, and about 3000 houses; it has also some trade with Vienna in cloth, indigo, corn, wine, &c. A harbour for river craft is formed below the town by a small recess of the river, which is sheltered towards the north-east by a cape crowned by a bastioned citadel. Rustschuk is commanded by heights to the south-west, on which five detached bastioned earth-works have been recently thrown up. The town itself is surrounded by an earthen rampart, which presents eight bastioned fronts, revetted half-way up with masonry, and surrounded by a moat and counterscarp. The front towards the river is irregularly fortified. The Russians took Rustschuk after enormous losses of men in 1811; it opened its gates to them in the invasion of 1828. The fortified enceinte of Rustschuk measures four miles. On the left or Wallachian bank of the Danube, opposite to Rustschuk, is *Giurgevo*, which was originally the fortified tête-de-pont to Rustschuk. Its defences were razed in carrying out the treaty of Adrianople, but have been recently repaired. A ferry connects the two places. A tall clock-tower stands in the principal square. One of the islands in the Danube is fortified. A pentagonal fort built with stone defends the harbour. Beyond this fort the town of Giurgevo is built; its

enceinte presents a semicircle towards Wallachia. Giurgevo trades with Austria in the produce of the country, and has about 7000 inhabitants. In the wars between Russia and Turkey, Giurgevo has been frequently the scene of hard fighting between the two nations. The Russians took it in 1711, and completely defeated the Turks in the vicinity the same year; they took it again in 1810. The Russians occupied Giurgevo in 1854, and were defeated by the Turks under its walls on July 7 of that year.

RUTHERGLEN. [LANARKSHIRE.]

RUTHIN, Denbighshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated in 53° 7' N. lat., 3° 18' W. long., distant 8 miles S.E. from Denbigh, and 195 miles N.W. by W. from London. The population of the parliamentary borough of Ruthin in 1851 was 3373. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and is contributory to the borough of Denbigh in returning one member to the Imperial Parliament. The living is a wardenship, with a rectory annexed, in the archdeaconry of Merioneth and diocese of Bangor. Ruthin Poor-Law Union contains 21 parishes and townships, with an area of 92,853 acres, and a population in 1851 of 16,853.

Ruthin is situated on the summit and slope of a considerable hill, at the foot of which flows the Clwyd. The town appears to have grown up gradually around the castle, which was built by Roger Gray, to whom Edward I. granted nearly the whole of the vale of Clwyd. The castle stood on the western slope of the hill towards the river. General Mytton took the castle for the parliamentarians, after which it was dismantled. It appears to have been a capacious and lofty building. A new gothic castellated edifice, presenting a very fine appearance, has been erected on the site of the ancient castle, by Frederick R. West, Esq., M.P. for the Denbighshire boroughs. The round towers of the ancient castle remain. The town is lighted with gas. The summit of the hill is occupied by the market-place, to which the principal streets lead. The county-hall or court-house is the finest building for judicial purposes in North Wales. The county prison is well built. The church is the choir of the conventual church of a community of Bonhommes (suppressed in 1310), and afterwards rendered collegiate. The roof of the present church is admired for its curious workmanship. Part of the cloisters have been converted into a residence for the warden of Christ's Hospital. The Wesleyan Methodists, Welsh Independents, Baptists, and other Dissenters, have places of worship. Dr. Gabriel Goodman, whose monument is in the church, founded, in 1592, Christ's Hospital for a warden and 12 decayed housekeepers. The warden has the government of the Free school, which was also founded and endowed by Dr. Goodman. It is under the care of a head-master and two other masters, and is accounted one of the best schools in North Wales. In 1854 the number of scholars was 30. A lending library is attached to it; and there are also connected with the school several exhibitions. The school and hospital constitute the 'Wardenship of Christ's Hospital in Ruthin.' In the town are National and British schools, a young men's library, and a savings bank. A soda-water manufactory has been carried on successfully for several years. The market for corn is held on Monday, that for meat on Saturday; six fairs are held in the year. The assizes for the county are held at Ruthin: the quarter sessions are held alternately at Ruthin and Denbigh. A county court is held.

RUTLANDSHIRE, an inland county of England, is bounded N. and N.E. by Lincolnshire, S.E. and S. by Northamptonshire, and W. by Leicestershire; and lies between 51° 31' and 52° 46' N. lat., 0° 23' and 0° 49' W. long. Its greatest length from north-east to south-west is nearly 20 miles; its greatest breadth at right angles to the length is 16 miles. The area is 150 square miles, or 95,805 statute acres: the population in 1841 was 21,802; in 1851 it was 22,983. In area and amount of population, it is far below the rest of the English counties.

Surface, Geology, Hydrography, and Communications.—The north-eastern part of the county consists of a somewhat elevated plain or table-land, skirted on the southern side by the valley of the Wash, which opens on the west into the more expanded vale of Catmoss. The rest of the county consists of valleys whose general direction is east and west, divided from each other by narrow ranges of low hills. There are no very elevated points in the county; Manton, between Oakham and Uppingham, is said to be the highest.

The county is included in the district occupied by the lower formations of the oolitic series. The great oolite forms the north-eastern table-land above mentioned, and occupies also the higher ground on the southern side of the county from Stamford to within two miles of Uppingham: the prevailing rock is a close-grained buff limestone clouded with blue. The remainder of the county is occupied by the red or reddish-brown ferruginous sands which separate the great oolite from the subjacent lias. These are covered in many places, especially near their junction with the lias, which takes place just on the north-western border of the county, by vast accumulations of transported blocks of gravel. There are quarries of good building-stone at Ketton, between Stamford and Uppingham, just on the border of the district occupied by the great oolite.

Rutlandshire belongs chiefly to the basin of the Wash. The *Welland*, one of the rivers flowing into the estuary of the Wash, skirts the county between Rockingham and Stamford, separating it throughout

from Northamptonshire. This river is not navigable above Stamford, where it quits the county altogether. The *Wash* rises just within the border of Leicestershire, and flows eastward through this county into Lincolnshire, where it joins the Welland below Stamford. The *Chater* also rises in Leicestershire, and flows parallel to the *Wash*: it joins the Welland just above Stamford. The *Eye* brook bounds the county on the south-west, and joins the Welland below Rockingham. The *Wreak*, which joins the Soar, a feeder of the Trent, rises in Rutlandshire near Oakham, and flows northward into Leicestershire, draining a small district in the north-west of the county, which is thus included in the basin of the Humber.

The Oakham Canal is a prolongation of the Melton Mowbray navigation, from Melton Mowbray in Leicestershire to Oakham. It follows a circuitous course, passing through the vale of Catmoss, and has a total length of 15 miles, of which about six and a half miles are in Rutlandshire.

The principal roads are, the coach road from London to Melton Mowbray, and the Great North road. The former enters the county on the south side just beyond Rockingham in Northamptonshire, and runs northward through Uppingham and Oakham into Leicestershire. The Great North road crosses the eastern side of the county between Stamford and Grantham. A road from Leicester to Stamford crosses the county from west to east, passing through Uppingham, and following the valley of the Welland; and two roads run from Oakham into the Great North road—one at Stamford, the other at Stretton between Stamford and Grantham.

The Syston and Peterborough railway on leaving Stamford passes through Ketton, Luffenham, Manton, Oakham, and Ashwell in this county. The section of the Great Northern railway between Peterborough and Newark crosses the eastern angle of Rutlandshire between Ryhall and Essendine.

Climate, Soil, and Agriculture.—The climate differs in no perceptible degree from that of the surrounding counties of Leicester, Northampton, and Lincoln. Of the land in the county there is hardly an acre waste. Rutlandshire is a grazing county. Much attention is paid to rearing choice animals, both oxen and sheep. The face of the country is agreeably diversified, affording good sites for country-seats, parks, and pleasure-grounds. The best pastures are on the lias clay, which, with a portion of oolite, red sand, and magnesian limestone, forms the principal soil of the county. Some low meadows subject to be flooded lie along the rivers Welland, Wash, and Chater. Short-horns are the general favourites with those who pay particular attention to their stock. Other breeds are frequently met with, such as North Devon, Hereford, and Scotch. The milk-cows are chiefly short-horns. A good deal of Stilton cheese is made in the west of the county, especially in the districts of Leighfield Forest and the plain of Catmoss. The sheep are generally of the improved Leicester breed. The farm-horses are large; strong dray-horses are bred in the county for the London market. The hogs which are fattened are mostly of the Berkshire or Suffolk breed.

Among the mansions of this county, three are remarkable for their spaciousness and architecture, and also for the extensive grounds in which they stand. Normanton Hall, the residence of Sir G. J. Heathcote, is situated two miles north from the Luffenham station of the Syston and Peterborough station. It consists of a centre, flanked by wings, each front presenting a majestic simplicity united to great architectural beauty. Burley House, the seat of G. Finch, Esq., is about a mile east from Oakham. It was the residence of the noble family of Harrington in the reign of Elizabeth, and was purchased afterwards by the Duke of Buckingham, who enlarged the mansion, and entertained here, on several occasions, James I. and Charles I. Daniel Finch, Earl of Nottingham, having purchased the estates, erected the present magnificent residence. The building is in the Doric order. The centre of the north front is 196 feet long, and connected, by a colonnade of 32 columns on each side, with the offices. Exton Hall and park, the residence of the Earl of Gainsborough, is about two miles east of Burley Park. The mansion is built in the Tudor style. Exton Park abounds in the finest specimens of oak, ash, beech, and elm trees.

Divisions, Towns, &c.—The divisions of the county are as follows:—Alstoe Hundred, north; East Hundred, east; Martinsley Hundred, central; Oakham Soke, west; Wrandyke Hundred, south and south-east. There are only two market towns, OAKHAM and UPPINGHAM.

The following are the more important villages, with the parish populations in 1851, and a few other particulars:—

Barrowden, population 718, is 10 miles S.E. from Oakham, on the left bank of the Welland, which here bounds the county. An establishment for the manufacture of carpet-rugs, white leather, parchment, and glue, employs some of the inhabitants. *Belton*, population 408, about 4 miles W. by N. from Uppingham, near the left bank of the Eye Brook, contains several well-built houses. Besides the parish church there are a chapel for Baptists and a Free school. Malting is carried on. *Braunston*, population 411, about 2 miles S.W. from Oakham, in a retired valley near Leighfield Forest, has a venerable gothic church, with a tower and spire; a chapel for Baptists; and a National school. *Cottesmore*, population 735, about 4½ miles N.E. from Oakham, occupies an elevated site, and has a respectable appearance. The church is a fine gothic edifice. There are National schools. R. W.

Baker, Esq., introduced here the system of allotments of land for cultivation in small patches; founded the County Friendly Society; instituted prize-ploughing matches; and in other modes promoted the general welfare. The 'Cottesmore Hunt' has a pack of about 70 fox-hounds, and a stud of horses of considerable value. *Empingham*, population 988, about 6½ miles E. from Oakham, contains a handsome cruciform church, of Norman and early English character; in it is a fine window filled with ancient painted glass, exhibiting numerous armorial bearings. The Wesleyan Methodists have a chapel, and there is an Endowed National school. *Exton*, population 832, about 5 miles E.N.E. from Oakham, has a handsome gothic church, with a tower and spire. Schools for girls and infants are supported by the Countess of Gainsborough; there is also a Free school for boys. *Greetham*, population 718, about 6 miles E.N.E. from Oakham, a long straggling village, possesses an ancient parish church with a tower and spire; also National and Infant schools. Forster's charity, founded in 1692, for the instruction of children in Greetham and several neighbouring parishes, produces above 400*l.* a year. *Ketton*, population 1138, a well-built village, 9 miles E. by N. from Uppingham, stands in a valley on the left bank of the river Welland. The church is cruciform, with a tower rising from the intersection, surmounted with a spire 180 feet high. Parts of the west front are Norman. Quarries of good freestone for building are in the vicinity. *Lampham*, population 629, about 2 miles N.W. from Oakham, has an ancient church, with a tower and spire, erected about 1235; chapels for Wesleyan Methodists and Baptists; a British school and a Free school. *Liddington*, or *Lyd-dington*, population 604, a long straggling village, once a market-town, 2½ miles S. from Uppingham, has a parish church, a chapel for Wesleyan Methodists, a Free school, and an hospital, called Jesus Hospital, founded in 1600 by Lord Burghley for a warden, 12 brethren, and 2 nurses. *Luffenham, North*, population 442, about 7 miles E.N.E. from Uppingham, has a handsome gothic church, with a tower and spire; and a Free school. *Luffenham, South*, population 487, about 6 miles E. by N. from Uppingham, possesses an ancient gothic church, with parts of Norman character. In the village are National schools. *Market Overton*, population 498, near the north border of the county, 6 miles N. from Oakham, formerly possessed a market. The parish church is a neat early English structure, with a tower. *Ryhall*, population 1075, including 285 labourers on the works of the Great Northern railway, situated 8 miles N. by E. from Stamford, is a village of considerable size. It contains a handsome church, with a tower and spire; National schools; a large corn-mill; and an establishment for the manufacture of agricultural implements. *Whissendine*, population 795, about 4 miles N.N.W. from Oakham, possesses a handsome church, with a square tower; chapels for Wesleyan and Primitive Methodists; and a Free school. Malting is carried on.

Divisions for Ecclesiastical and Legal Purposes.—The county is in the archdeaconry of Northampton and diocese of Peterborough. It is included in the Midland Circuit; the assizes and quarter-sessions are held at Oakham, where is the county jail. County courts are held at Oakham and Uppingham; which are also the seats of Poor-Law Unions. The county returns two members to the Imperial Parliament.

History and Antiquities.—This county appears to have been included in the country of the Coritani; and upon the Roman conquest of Britain it was included in the province of Flavia Caesariensis. A Roman road (Ermine-street) crossed the eastern side of the county in the line of the present North road. Some remains of a Roman station are near Great Casterton.

Under the Saxons this county was included in the kingdom of Mercia. In the reign of John, Rutland, then first mentioned as a county, was assigned to his queen Isabel as part of her dower. An Earl of Rutland is mentioned in a charter of Henry I. The first earl known to history was Edward, eldest son of Edmund of Langley, who was the fifth son of Edward III. The title was inherited by Richard, duke of York, and by his son, a boy of 12 years of age, who was stabbed by Lord Clifford after the battle of Wakefield in 1460. The earldom was revived by Henry VIII., and conferred on the family of Roos: it afterwards came to the Manners family, in whose favour it was raised to a dukedom, which still exists.

In 1381 Henry le Spencer, bishop of Norwich, assembled a force at Burley in this county to suppress the insurrection of the commons in Norfolk, under John the Litester, or Dyer. In 1468 the Lincolnshire insurgents under Sir Robert Wells were defeated with great loss by Edward IV., at Hornfield in Empingham parish. The battle is commonly known as the battle of Lose-coat-field, from the fugitives throwing off their coats in order to escape more swiftly.

The antiquities of the county are chiefly ecclesiastical. Tickencote, Little Casterton, Empingham, Essendine, and Ketton churches, all on the east side of the county, date from the Norman period. Tickencote was rebuilt in 1792, and only the elaborately-ornamented arch between the nave and chancel, and part of the groining of the chancel, with the font, remain. Essendine is a small church, with nave and chancel, and a gable for two bells at the western end: the architecture is partly Norman, partly early English: the south doorway is Norman, with sculpture in the tympanum and elsewhere.

Statistics: Religious Worship and Education.—According to the Returns of the Census in 1851, it appears that there were then in the

county 91 places of worship, of which 53 belonged to the Church of England, 18 to Methodists, 12 to Baptists, 6 to Independents, 1 to Quakers, and 1 to Mormons. The total number of sittings provided was 17,399. The number of day-schools was 113, of which 39 were public schools, with 2175 scholars, and 74 were private, with 1230 scholars. Of Sunday-schools there were 58, with 3038 scholars. The Rutland Farmers' and Grasers' Club had 40 members, with 80 volumes in its library.

RUVO. [BARI, TERRA DL.]

RYAN, LOCH. [WIGTONSHIRE.]

RYBINSK. [YABOSLAV.]

RYDE, Isle of Wight, Hampshire, a watering place in the parish of Newchurch, is situated on the north-east shore of the Isle of Wight, opposite Spithead, in 50° 43' N. lat., 1° 10' W. long., distant 7 miles N.E. by E. from Newport, and 75 miles S.W. by S. from London. The population of the town of Ryde in 1851 was 7147. The living of Newchurch is a vicarage, with the chapelry of Ryde annexed, in the archdeaconry and diocese of Winchester.

The town is modern; the streets are wide and tolerably regular, well paved, and lighted with gas; and there is a good supply of water. The houses being generally stuccoed, and of various forms and sizes, and intermingled with the foliage of trees in the numerous gardens, the appearance of the town is very picturesque. The market-house and town-hall form a handsome building of the Doric order, 198 feet by 56 feet. St. Thomas's, Holy Trinity, and St. James's chapels are subordinate to the parish church, which is 7 miles distant. The Independents, Baptists, Wesleyan and Primitive Methodists, and Roman Catholics have places of worship. National, British, and Infant schools, a literary and scientific institute, and a dispensary are in the town. There are commodious baths near the pier; a neat theatre, libraries, and reading and assembly-rooms, a handsome town-hall, and an arcade of superior architectural character. There are also the Royal Victoria hospital, a dispensary, a literary institute, a philosophical society, founded in 1851, especially for the prosecution of meteorological studies. One of the finest buildings in the town is the recently-erected mansion of the Royal Victoria Yacht Club. The town exports corn, flour, sheep, calves, lambs, &c., and East and West India ships frequently call here for supplies of provisions. Tuesday and Friday are the market-days: a pleasure fair is held on July 6th. Boat- and yacht-building are carried on, and occasionally larger vessels are built. The pier extends 1740 feet into the sea, and forms an excellent promenade. The vicinity of Ryde is very beautiful, and contains many handsome mansions. A landing may be made in calm weather at all times of the tide. Communication by steam-boat with Portsmouth is kept up hourly in summer and from four to six times a day in winter.

RYE, Sussex, a market-town, a municipal and parliamentary borough, a seaport, a member of the Cinque Ports, and the seat of a Poor-Law Union, is situated upon an eminence at the south-eastern corner of the county of Sussex, about 38 miles E.N.E. from Lewes, 63 miles S.E. from London by road, and 74 miles by the South-Eastern railway. The population of the town of Rye in 1851 was 8541. The borough is governed by 4 aldermen (or jurats) and 12 councillors, one of whom is mayor; and, in conjunction with Winchelsea and six rural parishes, returns one member to the Imperial Parliament. The living is a vicarage in the archdeaconry of Lewes and diocese of Chichester. Rye Poor-Law Union contains 12 parishes and townships, with an area of 39,369 acres, and a population in 1851 of 12,349.

Rye is bounded E. by the river Rother, the channel of which was suddenly diverted from Romney by the tempest that overwhelmed Old Winchelsea in 1287, and S. and W. by the river Tillingham, which, having received the waters of the Brede immediately above the town,

joins the Rother at Rye; the united stream enters the sea nearly two miles below the town, and there forms Old Rye harbour. Rye is supposed to be the Novus Portus of Ptolemy. The earliest authentic record of Rye is of the year 893, when the Danes, under the pirate Hastings, effected a landing near this town, and afterwards took Appuldore. In the reign of Stephen, William d'Ipres, earl of Kent, erected on an eminence which commands the rivers at their junction, a small castle, which is still standing. It is now used as a jail; immediately below it is a modern battery for 18 guns. In 1194 a charter was granted by Richard I., enabling the inhabitants to wall and fortify the town. Edward III. caused the town to be walled on the north and west sides. The steep cliffs which were at that time washed by the sea were considered a sufficient protection on the south. There were originally three gates, besides a small postern-gate. The eastern or land-gate, the only one still preserved, has a handsome gothic arch, flanked on each side by a round tower. In 1572 Rye became an asylum for the Huguenots, who were driven from their homes by Catherine de Medici. They remained at Rye till the latter part of the reign of James I., when they or their descendants re-embarked for France.

The condition of Rye has mainly depended upon its harbour, which in the 16th century was nearly choked up. The sea continued to recede during the 17th century. In 1750, all hopes of improving the old harbour being abandoned, it was determined to form a new mouth by a canal running directly south into the sea. This work was prosecuted at a great expense till 1778, when the new harbour was found to be a complete failure, and was abandoned. The old harbour was once more resorted to, and was much improved. A wooden pier of piles was constructed on the eastern side, and embankments were thrown up on the western side, leaving an intermediate entrance 160 feet in width. Many alterations have since been made in it by narrowing the channel, and otherwise, but the works have been far from successful. The harbour only admits vessels of 200 tons burden. The average rise of spring-tides is about 17 feet, and of neap-tides from 9 to 12 feet at the pier-head. At low water the harbour is dry. The approach from the bay to the entrance of the harbour is intricate and difficult, especially for sailing-vessels, owing to the sand-banks and the tortuous course of the channel. The chief trade consists in the export of hops, bark, and wool, and in the import of coals, corn, timber, and Dutch produce. Lime is also burnt near the town from chalk brought from Beachy Head, and shipbuilding is carried on.

The town is pleasantly situated on the northern and eastern slopes of a hill. The houses are irregularly built. The town is lighted with gas. The town-hall is a neat brick building supported on arches, with a market-place beneath. The fishery is somewhat productive, and a large proportion of the fish taken is sent to the London market. The market-days are Wednesdays for corn, vegetables, fish, &c., and Saturdays for vegetables, fish, and meat. Every alternate Wednesday there is a market for fat stock, well supplied. An annual fair is held in August. The church, dedicated to St. Mary, is partly Norman, and partly in the early English style. The Wesleyan Methodists, Independents, and Baptists have places of worship. The chapel of the monastery of the friars eremites of St. Augustine is used as a warehouse. There are two Endowed schools which have been united; one a Free Grammar school, founded in 1638 by Thomas Pescock, one of the jurats, which has an income from endowment of 341. 10s. a year, and had 50 scholars in 1854, and the other for poor children, founded and endowed by James Saunders, Esq., in 1702, with a rent-charge now producing 116l. 10s. per annum. There are National schools and a savings bank.

SABA, a small island in the West Indies, belonging to the Dutch, is situated in 17° 40' N. lat., 63° 20' W. long. The coast rises in perpendicular masses to a considerable elevation, and at a distance the island appears like a steep round rock. Landing is effected only on the south side, where an artificial path has been made, which however is intricate, and admits only one person at a time. By this path a small place is reached which is built in a secluded valley. The area of the island is about 15 square miles. The small portion of it which is cultivable is appropriated to the growth of cotton, which the inhabitants work into stockings, for sale as well as for their own use. The common vegetables of the West Indies come to perfection. The population is about 1600.

SACO. [MAINE, U.S.]

SACRAMENTO CITY, the capital of Sacramento County, State of California, United States of North America, is situated on the left bank of Sacramento River, at the confluence of American Fork, in 38° 34' N. lat., 121° 40' W. long., about 150 miles N.E. from San Francisco. The city was founded in the spring of 1849; in 1850 it contained 6820 inhabitants, of whom only 474 were females; and at the State Census in 1852 the population was above 10,000.

Sacramento City owes its origin to the discovery of gold, which gave so remarkable an impetus to California generally. It was on the south branch of American Fork, about 50 miles from Sacramento City, that gold was first discovered. The growth of the city was, from its foundation, remarkably rapid. In April 1849 there were only four houses on the site; in the following year it was a large and regularly laid-out town of nearly 7000 inhabitants. The city stands in the midst of a fine farming country, and about 30 miles from the commencement of the gold diggings. Occupying a low site, it has

been found necessary, in order to protect it from inundations, to which it is liable in the rainy season, to construct a bevee along the bank of the river. The streets of the city cross each other at right angles; those running east and west are designated by the letters of the alphabet, and those running north and south by the numerals. Many of the streets are lined with old oak and sycamore trees of large size, imparting a considerable degree of picturesqueness to their general appearance. The city contains Episcopalian, Presbyterian, Methodist, Baptist, Roman Catholic, and other churches, schools, numerous stores, above 150 eating saloons and hotels (some of which are of a very costly and splendid character), several steam-mills, and a few manufactories. Like San Francisco, Sacramento City has suffered severely from several very destructive fires; but the parts of the city which were destroyed have always been quickly rebuilt, and generally in an improved style. Several daily and weekly newspapers are published here. Regular daily communication is maintained with San Francisco by steam-boats. [See CALIFORNIA, in SUPPLEMENT.]

SADDLEWORTH, West Riding of Yorkshire, a village and the seat of a Poor-Law Union, in the parish of Rochdale, and upper division of Agbrigg wapentake, is situated in 53° 33' N. lat., 2° 1' W. long., 10 miles S.E. from Rochdale, and 192 miles N.W. by N. from London. The population of the township of Saddleworth-with-Quick in 1851 was 17,799. The living is a perpetual curacy in the archdeaconry and diocese of Manchester. Saddleworth-with-Quick Poor-Law Union consists of the township, which has an area of 18,280 acres. The village gives name to a district in which the woollen and cotton manufactures have advanced with amazing rapidity and to a very great extent. The district includes nearly 100 villages and hamlets, although it is only about 7 miles long by 5 miles wide. Broadcloth of a superior quality is manufactured. Several coal-mines and extensive free-stone-quarries are wrought. The Huddersfield Canal and the Manchester and Huddersfield railway afford facilities for communication with the metropolis and with other towns. The canal passes at this place through a tunnel about three miles long. A county court is held at Saddleworth.

SAFFL. [MAROCCO.]

SAFFRON WALDEN, Essex, a market-town, municipal borough, and the seat of a Poor-Law Union, is situated near the right bank of the river Cam, in 52° 1' N. lat., 0° 14' E. long., distant 22 miles N.N.W. from Chelmsford, and 42 miles N.N.E. from London by road. The population of the municipal borough, which is co-extensive with the parish of Saffron Walden, was 5911 in 1851. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor. The living is a vicarage in the archdeaconry of Colchester and diocese of Rochester. Saffron Walden Poor-Law Union contains 24 parishes and townships, with an area of 62,630 acres, and a population in 1851 of 20,716.

A castle was erected here by Geoffrey de Magnville, one of the companions of the Conqueror. The remains consist of some parts of the walls and towers, built with flint bound together by a very hard cement. Geoffrey, the grandson of the founder of the castle, having deserted the party of Stephen for that of the empress Maud, obtained of her permission to remove the market from the neighbouring town of Newport (now a village) to Walden. Having been however seized by Stephen, he could only obtain his freedom by the delivery of his castles, Walden being one of them, to the king. The same nobleman founded here in 1136 a Benedictine priory, which was some years later raised to the rank of an abbey. The site was granted to Sir Thomas Audley, lord chancellor, and the title of Lord Audley of Walden was conferred upon him.

The town is irregularly laid out, and some of the houses are of considerable antiquity. The streets are lighted with gas and paved. The church, which is of the reign of Henry VII., is a large and very elegant specimen of the late perpendicular style. It has a nave and aisles, large south porch, and chancel and aisles. The interior of the church is very elegant. There are two places of worship for Particular Baptists, one for General Baptists, and one each for Independents, Quakers, and Wesleyan and Primitive Methodists. The Free Grammar school, founded in 1525, has an income from endowment of 60*l.* a-year, and had 25 scholars in 1854. There are also National, British, and Infant schools, and a savings bank. The town-hall, a neat building, stands in the market-place. In the town are a new post-office, a corn exchange in the Italian style, a museum, a literary institution, a cattle-market, and a handsome range of almshouses. The chief trade is in barley and malt; there are an iron-foundry and a brewery. The market is on Saturday. Three annual fairs are held: one, chiefly for horses, on the Saturday before Mid-Lent Sunday; one at Audley End, on August 3rd; and another at Saffron Walden, on November 1st. A county court is held.

Audley House, or, as it is usually termed, Audley End, the seat of Lord Braybrooke, is a noble mansion, erected on the site and grounds of the ancient monastery by the Earl of Suffolk, who in the time of James I. had inherited the estate of the Lord Chancellor Audley. The grounds are beautiful, and the Cam, which flows through them, expands so as to form a considerable sheet of water in front of the house.

SAHA'RA, SAHRA, or the Great Desert, is a country of immense extent, which occupies the central parts of Northern Africa. Its western extremity is washed by the Atlantic, along which it extends from Cape Nun, 28° 46' N. lat., to the mouth of the river Senegal, 17° N. lat. From the shores of the Atlantic it extends eastward nearly across the continent of Africa, being separated from the Red Sea only by the valley of the Nile and the rocky country which lies between that river and the Red Sea. The valley of the Nile constitutes the eastern boundary of the Sahara. The western edge of that valley occurs between 30° and 32° E. long., and as the African shore along the western boundary of the Desert is between 11° and 17° W. long., the Sahara extends from east to west, on an average, through 44 degrees of longitude, or about 2000 miles. The northern and southern boundaries are very imperfectly known. The Atlas constitutes the northern boundary of the Sahara from Cape Nun on the west to 10° E. long. on the east. From this meridian as far east as the valley of the Nile (30° E. long.), a stony and broken country extends between the Sahara and the Mediterranean, comprehending the countries belonging to Tripoli, including Barca and the stony desert which lies between Barca and Egypt. This rocky region terminates in the desert near 20° E. long., and on the east of it the Sahara appears to extend to the shores of the Mediterranean. This northern branch of the Sahara has probably an average width of about 100 miles. On the shores of the Gulf of Sidra in the Mediterranean it occupies the space between Geria and Haen-Agan.

The southern boundary of the Sahara is best known towards the Atlantic, where it extends to the vicinity of the Senegal River, and between 15° and 4° W. long. approaches the parallel of 15° N. lat. Farther east the river Joliba, or Quorra [NIGER], constitutes the dividing line between the Desert and Soodan as far as the meridian of Greenwich, so that Soodan advances to 17° N. lat., near Timbuctoo. Between that place and the Lake Tchad the boundary line probably lies near 14° N. lat., and this parallel may also be considered as dividing the Sahara from Eastern Soodan as far as the frontier of Dar-Fur, near 23° E. long. Farther east it lies between 16° and 17° N. lat. We may therefore suppose that on an average the Sahara extends from north to south over 14 degrees of latitude, or 960 miles. The area of the Sahara, within these limits, occupies more than 2,500,000 square miles.

The Sahara is a desert, but it is not, as is commonly supposed, covered in its whole extent by a fine and loose sand. There are tracts of considerable extent, the surface of which is covered with a thick layer of fine and loose sand, and with low sandy hills; but it would seem that the greater part of this immense country consists of a firm soil, in many parts composed of indurated sand, in others of sandstone. The surface of other tracts consists of rocks, especially granite, frequently mixed with quartz. A very few tracts of small extent are found covered with bushes and coarse grass. This general sterility is chiefly owing to the dryness of the atmosphere. The Sahara is situated in that part of the globe which separates the region of the winter rains from those of the summer rains, and it does not participate in either of them. In the greatest part of this extensive region a drop of rain never falls to refresh the arid soil; and in those districts which approach the countries which have abundant rains, only a few showers occur in August and September, and even these not every year. This want of rain renders the whole region unfit for any kind of cultivation, but not uninhabitable, as the lower depressions contain a few wells, in the vicinity of which the soil is covered with grass and bushes, that afford pasture to camels, goats, and sheep. These animals supply subsistence to the nomadic tribes, who wander about in this boundless waste. Travellers who cross this region are exposed to many dangers, both from the nature of the country and from the character of its inhabitants. Though the camels occasionally find some shrubs or grass to satisfy their hunger, no provisions can be got along the whole route, which exceeds 1000 miles in length. The traveller must carry everything with him. The wells of drinkable water occur only at a distance of ten days' journey from one another, and sometimes the distance is still greater. The traveller in the desert must therefore provide himself with as much water as is required for his consumption until he reaches the next well; and if the season is drier and hotter than usual, the well is dried up, and he runs imminent risk of perishing of thirst. If he loses his way in the wilderness certain death awaits him from hunger and thirst. In those tracts which are covered with fine loose sand the whirlwinds often blow with great force, and raise a large portion of the sand to a considerable height, and deposit it again at some distance. Such pillars of sand have buried many caravans. The inhabitants of the desert lead a wandering life, and, like all nomadic tribes, are always ready to attack the traveller, to deprive him of his goods, and to reduce him to slavery. In spite of all these dangers the Sahara is annually traversed by several caravans, which carry on the commerce between Soodan and the countries on the shores of the Mediterranean.

There is however a tract across the desert, in which these dangers are comparatively small. It lies between 13° and 16° E. long., and owes its advantages partly to its climate and partly to its soil. It is remarkable that this tract occurs where no elevated country lies between the Mediterranean and the Sahara, but only the low range of the Harutsh, which joins that arm of the Sahara that reaches the shores of the Mediterranean. The country along the shores of the Gulf of Sidra, between 12° and 19° E. long., and between the Gulf and the Sahara, does not appear to rise in any part more than 1000 feet, and in most parts it is much lower. Through this wide gap the northern winds, which frequently blow a gale, and bring moisture from the countries north of the Mediterranean, which at that season are drenched with rain, find access to the Sahara, and produce a considerable degree of cold even as far south as Mourzuk. To these winds also we may probably ascribe the rain which falls in this season in the kingdom of Fezzan, and renders it the most fertile tract of the Sahara. These rains appear to extend to 21° N. lat., and as the northern limit of the tropical rains occurs near 16° N. lat., the tract between the two limits of rain does not exceed 5 degrees of latitude, whilst in other places it occupies more than double that extent. The advantages of this tract as a thoroughfare for caravans consist in the smaller extent of the sandy tracts and of the continuous or broken ridges of rocks. Though the rocky parts within the rainless region resemble the sandy tracts in being without vegetation, the wells which occur between them are more numerous, and rarely more than a few days' journey from one another. The road through this country gives the easiest access to the interior of Africa from the north. This road, after leaving the town of Tripoli, runs south-east to the northern boundary of Fezzan, over a country which partakes in some degree of the nature of the Sahara, presenting a succession of plains and ridges of hills. The hills are of inconsiderable height, generally not exceeding 400 feet, and never rising above 600 feet. Many of them consist of limestone overtopped by lava; others are only sand-hills. They are without vegetation, but contain between them many fertile valleys. This country, which extends to the town of Sokna in Fezzan, has abundance of wells and water. South of this place extends the Harutsh Assouat, or Mons Niger, occupying a width of about 35 miles in a straight line. Fezzan, which extends from this mountain tract to the northern tropic, consists of numerous small oases separated from each other by comparatively narrow tracts of sand. [FEZZAN.] Water is abundant, except towards the southern boundary, where a level desert occurs, which can only be traversed in four days; but in the middle of it there is a small place called Gatrone, surrounded by sandy hills and mounds covered with small trees. At Kasrowa and Tegerhy there are extensive plantations of date-trees and abundance of water. From the southern boundary of Fezzan to the town of Bilma, or from 23° to 18° 30' N. lat., a continuous ridge of steep rocky hills, elevated from 300 to 500 feet above the plain, runs almost due north and south; and from 5 to 20 miles east of this ridge there are isolated hills, mostly composed of sand, but in some places of rock. Between these rocks the road runs over a stony plain without the least vegetation, but Denham says that after the rains a grass quickly springs up, which is several feet high, and that the rains fall in torrents as far as the Tiggerindumma Hills. It would therefore appear that in this tract the northern rains extend to 21° N. lat. No part of this country is inhabited, but wells of drinkable water occur at distances of three or four days' journey. Near 19° N. lat. however there are several small towns or villages, which owe their existence not so much to a certain degree of fertility in the soil, as to numerous small lakes which lie along the foot of the rocky range, and in which trona crystallises. In the vicinity of some of these lakes there are groves of date-trees and pasture-ground for cattle. In some parts the soil is covered with incrustations of pure trona, which extend for several miles in every direction. In a few places mimosa-trees are found. Bilma is noted for its extensive salt-pits [BILMA], and in its vicinity there are a few spots covered with vegetation. South of Bilma the road runs over loose hills of fine sand, in which the camels sink nearly knee-deep. The hills sometimes disappear in a single night by the drifting of the sand, and all traces of the passage, even of a large caravan, vanish in a few hours. Wells are rare. After four days' travelling from Bilma the wells of Dibra are met with; and after four days more those of Agbadem. The last-mentioned wells are abundant, and situated in a wooded valley, which however is not inhabited. After three days more the country is reached which enjoys a small portion of the tropical rains, and the soil improves. At first the sandy soil is interspersed with clumps of grass, and here and there with low bushes; trees soon appear, and then increase in number. Thus the desert ceases near 16° N. lat., but no permanent habitations are met with until the vicinity of Lari is reached, a town which is situated a short distance from Lake Tchad (14° 20' N. lat.). The desert between Bilma and Lari is called the Desert of Tintuma.

The tract just noticed as traversing the desert from north to south, divides the Sahara into two unequal portions, of which the western and larger is known among the natives by the name of Sahel, and the eastern and smaller among geographers by that of the Libyan Desert.

Coast.—Until lately many misconceptions prevailed respecting this coast, which extends perhaps more than 1200 miles along the Atlantic.

Modern surveys of the shore have shown that nearly the whole of the coast is elevated, and consists of sandstone, which in most parts rises to the height of 100 feet and more, but in some does not exceed 60 or 80 feet. A low coast only occurs between Cape Mirik (19° N. lat.) and the mouth of the river Senegal, but here, as at some other parts of the coast, dunes, or sand-hills, are found at no great distance from the shore, and behind these the flat country seems to have a considerable elevation above the sea. The whole coast, as far south as Cape Blanco, is free from sand-banks and shoals, and has regular soundings. The depth gradually increases from the beach, and at the distance of 4 miles there are from 30 to 34 fathoms; at 12 miles from 50 to 60 fathoms; and at the distance of 30 miles about 100 fathoms. The water then deepens very suddenly. A large sand-bank however extends from Greyhound Bay (21° N. lat.) to Cape Mirik; it is known by the name of the Bank of Arguin, and on it the French frigate *Medusa* was lost in 1816. The currents generally follow the direction of the coast. East of Cape Juby is a sudden bend of the coast, which is the most dangerous place in the whole coast-line, as the swell is almost invariably from the north-west, and consequently almost directly on the coast; besides this, the fine particles of sand which cover the desert being blown into the sea and mingling with the haze occasioned by the heavy surf, render this coast very indistinct. The greatest strength of the current is usually at the distance of 3 to 6 miles from the land, and it gradually decreases as it recedes from it. The wind generally blows from the north-west or west, and frequently in hard gales, especially in the night. It is supposed that the rarefaction of the air produced by the arid soil of the Sahara being heated to an extraordinary degree by the almost perpendicular rays of the sun, gives rise to the westerly winds along the coast of the Sahara.

Soil.—The Sahel, or western part of the desert, is by far the worst part of the Sahara. It does not appear that in all this vast extent a single oasis occurs the soil of which is fit for agriculture or for the growth of date-trees. The soil however varies greatly, passing from a fine to a coarse sand and gravel, and then gradually to a bare layer of broken stones and rocks. In many places hills of moderate elevation occur. Some of them consist of sand, and are subject to be changed in size and form by the winds; others consist of rocks, frequently of granite and quartz. All these soils are destitute of vegetation, which only appears in the depressions between the hills and sometimes at the base of the rocky elevations, but it consists only of a few grasses and shrubs. There appear to be numerous tracts, though of small extent, which are fit for pasture; for, according to all accounts, the number of individuals who find subsistence in this part of the Sahara is considerable, and they subsist altogether on the produce of their herds. It is stated, and with some degree of probability, that the caravan-road has been purposely formed through the worst part of the desert, the merchants being less afraid of the dangers of the country than those which they would have to encounter if they traversed a tract which is inhabited by numerous independent tribes, each of which is eager to enrich itself by plundering the caravans or subjecting them to a heavy tax for a free passage through their territories. It would appear that at no great distance from the sea the country contains extensive pasture-grounds, though of very inferior quality, and frequently interrupted by tracts which are completely sterile. Farther inland desert tracts entirely destitute of vegetation and inhabitants are scattered over a much greater portion of the country, but it is perfectly sterile and uninhabited only along the caravan-road, so that the caravans generally terminate their long journey without meeting with a single person. The different tracts covered with sand, gravel, and rocks, as well as the ridges of low hills which occur along the caravan-road, run east and west, a fact which may perhaps be accounted for by the circumstance of the wind almost without exception blowing from the east. The country between this road and the above-mentioned country between Tripoli and Lari is inhabited by numerous tribes of Tuaricks.

The Libyan Desert, or eastern part of the Sahara, contains a considerable number of oases or fertile tracts, which support a moderate population. Nearly all of them contain extensive groves of date-trees and fields in which dhourra is grown. [EGYPT; AUGILA.]

Climate.—It has been ascertained that no rain falls along the coast south of Cape Juby. Some showers fall annually in the countries south of Mount Atlas, but it is not known how far inland they extend. These showers fall between August and November. Along the coast heavy dews occur in the summer months. In the interior the wind blows almost without interruption from the east, and in the day-time frequently with the violence of a gale, which however is generally followed by a dead calm after sunset. The strong wind moderates the heat of the burning sun, and hence the nights are usually more insupportable than the noon-day heat. The violent gales frequently raise the loose sand in such quantities that a layer of nearly equal portions of sand and air, and rising about 20 feet above the surface of the ground, seems to divide the purer atmosphere from the solid earth. This sand, when agitated by whirlwinds, sometimes buries caravans, and often puts them into the greatest confusion. The degree of heat to which these countries are subject is variously stated. On the southern border of the Sahara the thermometer at noon in summer rises to 107°; in some other places to 120° and 140°. The greatest degree of heat which is experienced in the interior of the Sahara seems to occur in August

and September, at which time caravans do not travel, though it is the season in which the northern parts of the desert are refreshed by showers of rain.

Productions.—The most useful domestic animal is the camel, without which these extensive deserts could not be traversed. The camels which are reared by the tribes that inhabit the desert are distinguished by their extraordinary speed and abstinence, and known in northern Africa by the name of 'heiries,' or 'maharbies.' Next to the camel the most useful animal is the goat, which is very abundant in the Sahel, as the dry pastures are more adapted to it than to sheep. Sheep are also common. There are some black cattle of a small breed, but only in those places which have good pasture. Horses are rare in the Sahel, but more numerous farther east. There are lions and panthers, and some other smaller wild animals. Gazelles are frequent in all places where bushes and shrubs occur, and in a few places antelopes are met with. In the deserts bordering on Egypt the *Dipus jerboa* abounds. In the Sahel ostriches are very numerous, and they are hunted by the natives for their feathers from May to July. Vultures and ravens are the only birds that inhabit the deserts, except on some of the lakes along the rocky hills between Fezzan and Bilma, where there are snipes and wild-ducks. In some parts the Guinea-fowl occurs. There are also serpents in the desert.

The vegetable productions are few in number. Date-trees are only found in the oases of the eastern districts and at the foot of Mount Atlas. The Tibboos, a native tribe of the Libyan Desert, cultivate 'gufsub,' a species of millet, and a little cotton. Among the wild plants there are some species of mimosas, of acacias, and the *Hedy-sarum alhaji*, a thorny plant about 18 inches high, which remains green all the year round, grows in many parts of the desert in the sand, and is eagerly eaten by the camels: it is nearly the only plant that supplies them with food while they are traversing the desert. Near the most south-western corner of the Sahel are extensive woods consisting of acacia-trees, from which by far the greatest part of the gum is obtained which in Europe is consumed under the name of gum-arabic.

The minerals are limited to iron-ore and salt. Iron-ore occurs between Fezzan and Bilma. Salt is obtained from springs and lakes, and it occurs also in extensive beds in the Sahel. It is of great importance to the inhabitants, as it furnishes them with the most abundant article of commerce. The countries south of the Sahara, comprehended under the name of Soodan, or Sûdan, appear to have no salt, and all the salt which is consumed in them is brought from the Sahara. The only places permanently inhabited in the Sahel are those in the neighbourhood of which salt is found.

Inhabitants.—A great number of independent tribes are dispersed over the Sahara. They belong to four nations, the Moors, the Tuareks, Tibboos, and Arabs. The Moors seem to be in possession of the whole country west of the road leading from Timbuctoo to Drah. They are a branch of the Moors who inhabit Morocco, but have a greater mixture of negro blood in them. Their complexion is in general nearly black, but the red colour under it is perceptible: their hair is straight; they have a spare body and rather slender legs; the spine is slightly curved, the face long, the cheeks hollow, the eyes sunk but lively. They speak the Moghrebin dialect of the Arabic language, and though they live on the produce of their herds, and consequently lead a nomadic life, they take care of the education of their children, all of whom are taught reading and some part of the Korán. They are very expert in tanning and preparing leather, and in manufacturing bracelets, earrings, and necklaces of gold, in making knives and daggers and other arms, and they are even expert in weaving. Many of them are merchants, and a still greater number are employed in accompanying the caravans on the route between Drah and Timbuctoo. The numerous tribes of the Tuareks occupy the centre of the Sahara, or that country which lies between the two great caravan routes that traverse it from north to south. The form of their body and their language prove that they belong to the aboriginal inhabitants of Northern Africa, who are known by the name of Berbers, and in Morocco are called the Amazirghis. [BERBERS.] The Tibboos occupy the tract between Fezzan and Lake Tchad, and an extensive country extending east of this line towards the boundary of Egypt. In features they strongly resemble the negroes. Most of them are quite black, though some have copper-coloured faces. A brief general notice of the tribes of the Sahara will be found in the article AFRICA.

Commerce.—Though the Sahara only supplies three commercial products, salt, gum-arabic, and ostrich-feathers, a considerable traffic is carried on between the countries north and south of the desert, which is frequently traversed by caravans, consisting of from 200 to 500 persons, and of from 500 to 2000 camels. A camel's load is 500 lbs. The caravans export from the countries situated on the Mediterranean chiefly goods of European manufacture, such as fire-arms, gunpowder, and some cotton stuffs, to which are added some articles manufactured at Fez, and tobacco, dates, &c. Their returns include gold, ostrich-feathers, and ivory. In traversing the desert they usually buy large quantities of salt, which they sell in Soodan at a great profit. Several routes across the Sahara are traversed by the caravans. A caravan route traverses the Libyan Desert, beginning in Soodan at Wara, the capital of the country of Dar-Zaleh, or Wadai, and traversing Borgou and Tibesti in a north-western direction. From

the last-mentioned place it runs westward to the great road that leads from Bornou to Tripoli. The most eastern caravan road that traverses the Sahara connects Dar-Fur with Egypt. [DAR-FUR.]

Salt is got in great abundance at three places in the Sahel: at Toudeney, which is situated near 21° 30' N. lat., 4° W. long.; at Hoden, or Waden, near 20° N. lat., 13° W. long.; and at Shingarín, near 17° 30' N. lat., 4° W. long. The town of El Arawan sends the abundant produce of the rock-salt mines of Toudeney to the countries on the banks of the Joliba, especially to Sansanding and Yamina, and receives in return ivory, gold, slaves, wax, honey, cloths of Soodan, and cured provisions. The salt obtained from the rock-salt mines of Hoden and Shingarín is carried to the same places and to Sego by the caravans of the merchants of Walet, a town which is said not to be inferior in extent and population to Timbuctoo. The caravan route from Timbuctoo to Benown in Ludamar passes through Walet.

An extensive fishery is carried on along the coast of the Sahara by the inhabitants of the Canary Islands. This fishery commences on the north at Cape Nun; the fishermen seldom venturing to go farther north, although fish are equally abundant there, from fear of the Moors on that part of the coast, who possess boats. The fish taken are porgy, mullet of several kinds, rock-cod, and red snapper. The fish are very abundant, and weigh from 8 lbs. to 60 lbs. each. This fishery gives employment to between 400 and 500 men from the island of Lanzarote, to about 250 from Fuerteventura, and to a considerable number from the other islands. Fish constitutes the principal food of the poorer inhabitants of the Canaries. The fishermen frequently land, not only to procure water, but to barter their fish with the inhabitants of the desert for wool and orchilla.

Discoveries.—The nature of the Sahara opposes insuperable obstacles to the progress of a conqueror. The Greeks and Romans were only well acquainted with the oases of the Libyan Desert, which are at no great distance from the western edge of the valley of the Nile, and with those which are contiguous to the rocky region that divides the desert from the Mediterranean, as the Ammonium (now Siwah), Augila, and Cydamum (now Gadames). The coast of the Sahara was discovered by the Portuguese between 1412 and 1443 [AFRICA, vol. I, cols. 106-107], but the interior of that country was unknown up to the end of the 18th century, with the exception of what knowledge might be derived from a few notices in the writings of Leo Africanus. The first impulse to discovery in the interior of Africa was given by the establishment of the African Association in 1783; but before their labours produced any important result, Browne had succeeded (in 1793) in penetrating to Dar-Fur, with the Soodan caravan, through the oases which lie west of the valley of the Nile. Before he published his 'Travels' (1800), Mungo Park had returned from the banks of the Joliba, where he had collected some information respecting the south-western districts of the Sahara, though he had only been on the borders of the desert. Two years afterwards the travels of Hornemann were published, who had penetrated from Egypt to Fezzan by the way of Siwah and Augila. In 1819 Captain Lyon entered Africa from Tripoli, and although he did not add much to our knowledge of the Sahara, he collected much interesting information, which was published in 1821. Denham, Clapperton, and Oudney (1822-1824), following the same route, not only traversed the desert in all its width from Tripoli to Bornou, but discovered a considerable extent of Soodan. These important discoveries were to be enlarged by the travels of Major Laing, who in 1825 likewise departed from Tripoli, and passing through the oasis of Gadames, traversed the whole width of the Sahara, and reached Timbuctoo; but on attempting to return to Morocco by the way of El Arawan, he was murdered by the natives before he reached El Arawan. Two years afterwards Caillié, a Frenchman, who in 1827 had traversed the southern portion of Senegambia between 10° and 12° N. lat., and then passed through the western countries of Soodan to Timbuctoo, departed from the last-mentioned place, and reached Fez by the route which is frequented by the caravans that carry on the trade between Soodan and Morocco. A statement respecting recent explorations in the interior of Africa, including a journey across the Great Desert, is given in the article AFRICA, vol. I, cols. 115-117.

All the nomadic tribes which inhabit the Sahara are independent; but Fezzan and Gadames are subject to Tripoli, and the oases along the western edge of the valley of the Nile, as well as Siwah, depend on the Pasha of Egypt.

* Many other names of places beginning with 'Saint' will be found arranged according to the following part of the name.]

SAINTES. [CHARENTE-INFÉRIEURE.]

SAINTONGE, a province of France, lying on the coast of the Atlantic. It was bounded N.W. by the little province of Aunis, from which it was in one part separated by the Charente; N.E. by Poitou; E. by Angoumois, or Angoumois; S. and S.W. by Le Bordelais, or Guyenne Proper, from which it was separated by the Gironde; and W. by the ocean. It was united with Angoumois into one military government; and the district of Brouageais, which extended along the sea-coast between the Charente and Gironde, was detached from it, and annexed to the government of Aunis, so as to deprive Saintonge of its maritime character. Saintonge was divided into Haute and Basse, or Upper and Lower, separated from each other by the Charente. Saintonge is now comprehended in the department of Charente-Inférieure, except a very small part which is included in the department of Charente. [CHARENTE; CHARENTE-INFÉRIEURE.]

The province obtained its name from the Celtic people, the Santones or Santoni, by whom in Cæsar's time it was inhabited. It formed part of the Roman province of Aquitania, and afterwards fell into the hands successively of the Visigoths and the Franks, and was included in the duchy of Aquitaine, afterwards Guienne.

SAISSAC. [AUDE.]
 SAKARIYEH, RIVER. [ANATOLIA.]
 SALA. [SWEDEN.]
 SALAGNAC. [CREUZE.]

SALAMANCA, a city of Spain, capital of the modern province of Salamanca, which is included in the ancient province of Leon. It is situated in 41° 5' N. lat., 5° 43' W. long., on the north bank of the Tormes, which is here crossed by a stone bridge resting on 27 arches solidly built on Roman foundations. Salamanca is about 180 miles W.N.W. from Madrid, and 120 miles S. by E. from the city of Leon. It is the see of a bishop. The population in 1845 was 12,870.

The city is built on rocky and elevated ground, in the form of a horse-shoe, with the curve sweeping round to the north. It is surrounded by a wall, and entered by 13 gates. That portion of the wall which overlooks the river is very ancient. The streets are steep, narrow, crooked, and dark, mostly consisting of old stone houses, among which are some large and stately residences of the old nobility.

The western portion is mostly in ruins, as it was left by the French on their retreat from the city in 1812. The whole place has an antique and venerable look, but is dull and cheerless. There are several public squares and a few fountains, but the main supply of water is from the river. The Plaza Mayor is a vast square, the largest in Spain, with an arcade, or piazza, of 90 arches supported on columns. It was constructed in 1700-1738. This Plaza contains the town-hall (casa del ayuntamiento) and the post-office. It is occasionally fitted up as a bull-arena (plaza de toros), when it can accommodate 16,000 to 20,000 spectators.

Salamanca contains two cathedrals. The old cathedral is a building of the 12th century, simple and massive. The new cathedral, which is close to the old one, is a splendid specimen of the florid gothic. It was begun in 1513, and was not completed till 1734. The grand entrance-portal is covered with statues and ornamental carving, and is exceedingly beautiful. The two towers are of later date, and of inferior architecture. The interior is divided into a nave and side-aisles, the nave being 130 feet high, and the aisles 80 feet. The length of the cathedral is 378 feet, and the width 181 feet. Besides the two cathedrals Salamanca contains 24 parish churches, which exhibit various styles of architecture, mostly gothic. In 1791, when Mr. Townsend was at Salamanca ('Journey through Spain'), there were 27 parish churches, with 15 chapels; 39 convents, of which 16 were nunneries; and 25 colleges. In the course of the three years during which the French held possession of the city, they destroyed about 20 of the convents, and about the same number of the colleges, partly in order to construct fortifications for the defence of the city, and partly to use the timber for fire-wood.

During the middle ages Salamanca acquired great celebrity by its university, one of the first in Europe. It was founded in 1200 by Alfonso IX. of Leon, and afterwards in 1239 extended by Alfonso X., who incorporated with it that of Palencia. It soon rose into importance, and its professors became eminent in Europe by their acquaintance with the Arabian writers on medicine and philosophy, and through them with the writings of the Greeks. It remained however stationary during the 15th century; and whilst sound science was spreading throughout the rest of Europe, very little was taught here except medicine and dogmatic theology. The number of students in the 14th century amounted to 14,000. In the 16th century the number had diminished to 7000. It continued to languish till the French invasion, since which it has been comparatively deserted. The students are now about 600. The university buildings consisted of 4 superior colleges (colegios mayores) and a library, which still remain; and 21 smaller colleges, which are all or nearly all destroyed. The college of San Bartolomé is the oldest of the collegios mayores, and is thence called El Colegio Viejo (the Old College). It was modernised about 1767. The Colegio de Cuenca was an exquisite specimen of the cinquecento style, but only a small part of it remains. The Colegio do Santiago, usually called El Colegio del Arzobispo, was begun in 1521, and is also of the best period of the cinquecento style. The Colegio del Rey (King's College) was commenced in 1625. The quadrangle is Doric. The Jesuits had also a college, which was built by them in 1614. It consists of two wings each 200 feet long, and three stories high. When the Jesuits were expelled from Spain, one wing was appropriated to the students of the Bishop's Seminary, and the other to the Irish Catholic clergy, who were then educated here. One wing is still used as a clerical seminary, and the other as an Irish mission-school. The façade of the Library of the University is of the period of Ferdinand and Isabella, and is a rich specimen of the decorative and heraldic style. The Library contains about 25,000 volumes. The Dominican convent of San Esteban, which still remains, was one of the finest structures of enriched gothic in Spain. The façade and portal are full of elaborate details of great beauty, and the church belonging to the convent is also a noble building. The French made a magazine of the church, and converted the cloisters into stables.

The manufactures of Salamanca consist of common cloth, hats, leather, earthenware, and a few other articles.

The battle of Salamanca took place on July 22, 1812, between the British under Wellington and the French under Marmont. The French had abandoned the place on the first attack by the allies; but Marmont, having received reinforcements, advanced against the British line, and after various movements the battle took place near the heights of Arapiles, a short distance from the city. The French commander having imprudently extended his left wing too far, Wellington took advantage of his error, and the enemy was defeated with great loss.

Under the Romans, Salamanca was a municipium of the province of Lusitania. The Roman name was Salmantica. It does not seem to have been of much importance during the Roman domination in the peninsula.

(Ford, *Handbook of Spain*; Madox, *Diccionario Geografico de España*; Townsend, *Travels in Spain*.)

SALAMANCA. [MEXICO.]

SALAMIS, now Kolúri, is a small island adjacent to the coast of Attica. It forms the southern boundary of the beautiful Bay of Eleusis, and is only separated from the mainland, at the eastern and western extremities respectively, by a narrow winding channel. The bay is surrounded on the west, north, and east by the high land of

Attica, of which the northern shore of Salamis seems like a continuation, and thus the bay has the appearance of a large lake. The two channels have deep water, and a vessel may enter the Bay of Eleusis through them with any wind.

The form of the island is very irregular. Its greatest length from north to south is about ten miles, and the longest line that can be drawn in the island, from about east to west, is a little more; but the area is probably not above fifty square miles. It produces good honey. There is only one stream in the island, which enters the sea on the south-west coast, and is probably the Bocaros, or Bocalias, of Strabo. The village of Koluri, which is situated on the shore of the deep Bay of Koluri, on the west side of the island, with two other villages called Mulki and Ambelákia (vineyards), and a convent, are the inhabited places on the island.

The old city of Salamis, which was deserted in the time of Strabo, stood on the south coast opposite to Ægina; but the city Salamis of Strabo's time was on the small Bay of Ambelákia, and near the peninsula which projects from the eastern part of the island to the shores of Attica, and terminates in Cape Cynosura. (Herod., viii. 76.) About midway between this peninsula and the Piræus, but not exactly in the strait leading to the Bay of Eleusis, is the small island of Payttaleia, now Lipsokutáli, which makes a conspicuous figure in the battle of Salamis. (Herod., viii. 95.)

The ancient names of Salamis were Sciras and Cychreia, derived from ancient heroes. It was also called Pityuasa, from the pines that grew in it. In Homer the island is only called Salamis, a name said to be derived from Salamis, the mother of Asopus. About the time of Solon and Pisistratus there was a dispute about the island between Megaris and Attica, which terminated in favour of Attica, and from that time the island became one of the Attic demí. In the time of Pausanias the city was in a ruined state, but he could trace the remains of the agora, and there was a temple of Ajax with a statue of ebony.

The great event in the history of Salamis is the naval battle fought B.C. 480, between the combined Grecian fleet and the Persian fleet under Xerxes. The battle took place chiefly in the eastern strait, which, being a contracted space, was very unfavourable to the enormous fleet of the Persians. The Persian king saw the battle from the Attic coast, where he had his seat at the foot of Mount Ægaleos, with his secretaries by his side to register the events of the action. (Herod., viii. 90.) The result was the complete defeat of the Persian armament.

(Herodotus, viii.; Æschylus, *Persæ*; Strabo, p. 393; Pausanias, i. 85; Leake, *On the Demí of Attica*.)

SALAYER ISLANDS are a small group in the Indian Archipelago, situated between 5° 40' and 6° 20' S. lat., 120° and 121° E. long. The group consists of an island about 30 miles long, with an average width of 8 miles, and several smaller islands. The smaller islands are uninhabited, with the exception of two called Bonaratta and Calauwe. The principal island is divided from Cape Lassoa in Celebes by a strait about 8 miles wide. In the strait there are three small rocky islands, called the Budjeroons, which are uninhabited.

A ridge of high hills traverses the island from north to south, and descends to the east and west with a rapid slope. These hills are entirely covered with wood, and abound in deer. Along the base of the hills there are tracts of low land, which are carefully cultivated. They produce several roots and grains common in the archipelago, but especially botta, a kind of millet, which constitutes the chief article of food of the inhabitants. Cotton is also grown to a great extent. Among the trees there are several kinds of palms, and also the tallow-tree, the substance obtained from which is used for burning, as it is in China. The inhabitants, who are stated to amount to about 60,000, are Malays, and apply themselves to agriculture, and the manufacture of coarse cotton stuffs. The island is divided among several petty princes, who are dependent on the Dutch at Macassar.

SALCOMBE. [DEVONSHIRE.]

SALEM. [HINDUSTAN; MASSACHUSETTS; NEW JERSEY; OREGON.]

SALERNO, an archiepiscopal city in the kingdom of the Two Sicilies, capital of the province of Principato Citra, is finely situated on the sea-coast, at the head of the Gulf of Salerno, and surrounded by a beautiful tract of country at the southern foot of the chain of the Apennines, in 40° 44' N. lat., 14° 46' E. long., 30 miles S.E. from Naples, and has about 12,000 inhabitants. The city is old and irregularly built, with narrow and dirty streets, but contains a few good buildings, such as the cathedral and the governor's palace. The Marina, or quay, which was constructed by the French, is a mile in length, and forms a fine promenade. The harbour, which was commenced by John of Procida for Manfred in 1260, and enlarged and completed under Robert the Wise, is now almost useless in consequence of the accumulation of sand: only small craft can enter it. The ruins of the old Greek or Lombard citadel, which was taken by Robert Guiscard after a siege of eight months, crowns a lofty hill above the city. Salerno has a lyceum which grants academical degrees, a court of justice for the province, a theatre, and many churches and convents. The cathedral, the most remarkable structure in Salerno, rebuilt by Robert Guiscard in 1084 on the site of a former cathedral destroyed by the Saracens, is dedicated to St. Matthew. It is adorned with columns of porphyry and verde-antique, mosaics, bas-reliefs, and other ancient works of art, brought by its founder from the temple of

Pæstum. Round the inclosure of the quadrangle are fourteen ancient sarcophagi. The bronze doors were erected in 1099. The interior, which is modernised, contains many of the works of art just alluded to, and also many pieces of excellent sculpture, besides two pulpits and an archiepiscopal throne of rich mosaic work. But it is more celebrated for the tombs which it contains than for its works of art. Among these are the tombs of several descendants of the Norman dukes of Apulia, and the monument of Pope Gregory VII., who died in Salerno the guest of Robert Guiscard in 1085: this monument was restored in 1578. The crypt beneath the cathedral is celebrated for containing the body of St. Matthew, which is said to have been brought here from the east in 930. It also contains the tomb of Margaret of Anjou; and three ancient sarcophagi, which inclose the remains of archbishops, and are adorned with bas-reliefs. An annual fair for native and foreign goods and for cattle is held at Salerno in the month of September, and is resorted to by the merchants from Naples, and by vast numbers of the peasantry.

Salerno (ancient Salernum) seems to have been founded by the Phœnicians. It early came into the hands of the Greeks. Under the Romans it was an important city, and was much frequented for the beauty of its environs during the empire, when it became a Roman colony. The Goths took it in the 6th century; soon after the Lombards made themselves masters of the city, which became the residence of the dukes of Benevento. It was taken from the Lombards by the Saracens A.D. 905. In A.D. 920 the Greek emperor dispossessed the Saracens, but the city seems to have been recovered by the Lombard princes, from the last of whom (Gisulph) the city was wrested by Robert Guiscard in the 11th century. From this time it became the chief seat of the Norman power south of the Apennines. Roger II., duke of Apulia, was elected king of Naples and Sicily by an assembly of barons held in Salerno A.D. 1130. In 1193 the city was sacked and destroyed by the emperor Henry VI. The town had recovered in the following century. Ever since the foundation of the monarchy it has been annexed to the crown of Naples, and it confers the title of prince upon the heir-apparent to the throne of the Two Sicilies. The city of Salerno was famous from very early times for its university and school of medicine, which was protected and flourished most under the Norman princes. The university, probably the most ancient in Europe, existed till 1817, when it was replaced by the lyceum.

SALINS. [JURA, Department of.]

SALISBURY, or NEW SARUM, the capital of Wiltshire, an episcopal city, a municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on the Great Exeter road, at the junction of the rivers Avon, Wily, and Bourne, in 51° 5' N. lat., 1° 48' W. long., distant 82 miles W.S.W. from London by road, and 94 miles by the Salisbury branch of the South-Western railway. The municipal borough is co-extensive with the parliamentary: the population in 1851 was 11,657. It is governed by 6 aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The city comprises three parishes, the livings of which are in the archdeaconry and diocese of Salisbury. For Poor-Law purposes Salisbury is managed under a local act; that part of the borough which is affected by the act comprises an area of 480 acres, with a population in 1851 of 8930.

This city had its origin in the 13th century, when the bishop and canons of the cathedral of Old Sarum [WILTSHIRE], in consequence of a feud with the captains of the fortress, commenced a new church on lands belonging to the see. The inhabitants of Old Sarum followed their clergy, and New Sarum, or Salisbury, rose into existence. Henry III., made it 'a free city,' and gave to the inhabitants a fair and a market; in the succeeding reigns several parliaments were held in it. The city was fortified by a wall and ditch; and the erection of a bridge over the Avon at Harnham brought to it the great western road which had previously passed through Old Sarum. The borough has returned members to Parliament from the 23rd year of the reign of Edward I.

The city occupies part of a peninsula formed by the river Avon on the west and south, and by the river Bourne on the east. The suburb of Fisherton Anger, which forms part of the borough, is on the left bank of the Avon, at the confluence of the Wily. At the suburban village of Harnham, the Dorchester and Exeter road crosses the Avon by a bridge of 10 arches. There are two other bridges over the Avon. The principal part of the city lies immediately to the north of the cathedral close, and consists of several regular streets, forming a series of squares called chequers, the interior of which is laid out in courts and gardens. Most of the houses are of brick, of comparatively modern erection. The streets are well paved, lighted with gas, and drained by brooks let in by floodgates from the Avon through the principal streets. The cathedral close, a meadow of half a square mile in area, is entered by three ancient gates, and the open space around the cathedral adds much to the imposing beauty of the edifice, which for size and for uniformity and purity of style is one of the finest ecclesiastical structures in England.

It is of the early English style, in the form of a double cross, and consists of a nave and choir with two side aisles, a space on the east of the choir, and a lady-chapel at the east end; a large transept with an aisle on its east side; a smaller transept east of the former, with an aisle on its east side; a central tower and spire; a north porch, a monument-room, or vestry, at the south end of the eastern transept; cloisters, and a chapter-house. The tower and spire were built a century later than the church. The church is 474 feet in extreme length, the great transept is 230 feet, the nave from the western door to the organ-screen is 229 feet. The height within the vaulting of the nave, choir, and transepts is 81 feet; the external height, to the ridge of the roof is 115 feet; the height of the spire, which is the highest in England, is 404 feet. The cloisters and the cemetery of the close form a square of 181 feet, inclosed by a beautiful arcade corresponding in style with the church, and connected with the chapter-house, which is a remarkably elegant octagonal chamber with a vaulted roof, supported by a clustered pillar in the centre, and adorned with some curious sculptures. There is some excellent stained glass. The episcopal palace in the south-eastern angle of the close is a large building of various dates and styles, with an extensive garden. At the north gate, adjoining the city, is the Matrons' college, founded by Bishop Ward for ten clergymen's widows of the diocese. There are two parish churches and a chapel of ease; two chapels for Independents, two for Wesleyan Methodists, and one each for Primitive Methodists, Baptists, and Roman Catholics. In the close is a Normal school for female teachers, under the superintendence of the bishop and clergy of the diocese. This institution had 60 students in residence in 1854. The Cathedral Grammar school had 37 scholars in 1854. There are also a school for preparing indigent girls of respectable families for superior service; two National schools; and one Roman Catholic school. In the centre of the city is the market-place, a spacious and handsome square. At its south-east corner stands the council-house, a fine building of brick with a stone portico, erected at the expense of the Earl of Radnor. At the south-west corner of the square is the poultry-market, which contains a very handsome hexagonal cross of the age of Edward III. Among the public buildings are the county jail and bridewell; a spacious and well conducted infirmary; the Salisbury and Wiltshire library and reading-rooms, with a museum attached; the assembly- and concert-rooms; the savings bank; the Wilts and Dorset female penitentiary; a small theatre; and the Union workhouse, which is part of an ancient monastic establishment. The charities of the city produce a yearly revenue of 5000*l*. Salisbury contains many examples of ancient domestic architecture. The Lent assizes for Wiltshire are held in the city, also quarter and petty sessions, and a manor court-leet. The manufacture of hardware and fine cutlery, particularly scissors, is carried on to some extent; but the principal traffic consists in the sale of agricultural produce. There are markets, on Tuesday for corn, Saturday for cheese and provisions, and once a fortnight for cattle. Fairs are held on the Monday before April 5th, and on October 22nd. Salisbury is the place of election for the southern division of Wiltshire.

The see of Salisbury is in the province of Canterbury. The diocese includes Dorsetshire and the larger part of Wiltshire, and comprises 444 benefices; it is divided into the archdeaconries of Wilts, Dorset, and Salisbury. The chapter consists of the dean, archdeacon, chancellor, precentor, and five canons. The income of the bishop is fixed at 5000*l*.

SALLE, LA. [GARD.]

SALLEE, or SALE. [MAROCCO.]

SALLES. [AUDE.]

SALLES-COMTAUX. [AVEYRON.]

SALM. As far back as the 10th century, there have been in Germany two counties bearing the name of Salm; the county of Ober-Salm (with the rank of a principality) in the Vosges Mountains, between Alsace and Lorraine, in the circle of the Upper Rhine; and the county of Nieder-Salm, in the Ardennes, between the duchy of Luxemburg and the bishopric of Liège, which subsequently made part of the circle of Burgundy. Of the family of the counts of Salm, the two principal lines, sub-divided into several branches, subsisted till the French revolution, during which their territories were annexed to France, and in the sequel other possessions were assigned them from the secularisations on the east of the Rhine. At present, the elder line is divided into three branches:—Salm-Salm, Salm-Kyrberg, and Salm-Horstmar. The second line is that of Salm-Reifferscheid, divided into the two branches of Salm-Reifferscheidt-Kraatheim and Salm-Reifferscheidt-Dyck. The sovereign rights held by these princes have been transferred to Austria, or to other members of the German confederation, in whose dominions their possessions are situated.

SALO. [BRESCIA.]

SALON. [BOUCHES-DU-RHÔNE.]

SALONIKI. [THESSALONICA.]

SALOP, County of. [SHROPSHIRE.]

SALSETTE, an island in the Indian Ocean, close to the west coast of Hindustan, and included in the British presidency of Bombay. It is a little to the north of the island of Bombay, with which it is united by a causeway which was constructed in 1805, but which is so

narrow as to be rarely used by carriages. Salsette extends from 19° 4' to 19° 17' N. lat., 72° 50' to 73° 2' E. long., with an average length of about 16 miles, and an average breadth of about 10 miles; its area is therefore about 160 square miles.

The island consists for the most part of rocky hills, in some parts of considerable elevation, but covered with underwood to their tops; in the valleys there are groves of mangoes and palms, and some fine timber-trees. There are tigers in the jungle, and great numbers of monkeys and jungle-fowl. The soil is said to be fertile, but little care is bestowed on its cultivation. An excellent road has been formed round the island by the Bombay government. Tannah and Gorabunder are the only towns. Gorabunder is little better than a poor village, but Tannah is a neat and flourishing town on the eastern coast of the island, chiefly inhabited by descendants of Portuguese and by Hindoos. There is a small but regular fortress, with a considerable cantonment of British troops at Tannah. The hills are inhabited by a wild race of people, who are charcoal-burners, and have little or no intercourse with the Hindoos, who inhabit the lower grounds.

The chief objects of curiosity in Salsette are the temple caves of Kennery, which resemble those of Elora and Elephanta. They are for the most part small, and are cut in two of the sides of a hill, at different heights and of various forms. The largest cave is a Buddhist temple, a rectangle about 50 feet long by 20 feet wide, terminated by a semicircle. The entrance is formed by a lofty portico, over which, but detached and a little to the left, is a high octagonal column, with three lions sculptured on the top, seated back to back. A colossal statue of Buddha, with his hands raised in supplication, is on the east side of the portico. The temple is entered by a large door, above which are three windows contained in a semicircular arch. A colonnade of octagonal pillars surrounds the temple on every side except the entrance. The ceiling of the cave is a semicircular arch, curiously ornamented with slender ribs of teak-wood, of the same curve as the ceiling, which they seem to support; this however is not the case.

Salsette is supposed to contain about 50,000 inhabitants, who are chiefly occupied in fishing, of whom about 10,000 are of Portuguese origin. The Portuguese obtained possession of the island in the 16th century, but it was taken from them by the Mahrattas in 1750, and conquered from the Mahrattas by the British in 1774.

SALT-RANGE. [AFGHANISTAN.]

SALTA, the most northern of the provinces of the Argentine Confederation, South America, extends between 22° and 26° 30' S. lat., 61° and 68° W. long. It is bounded S. by the province of Tucuman, E. by the Gran Chaco, N. and W. by the republic of Bolivia. The area is about 56,000 square miles; the population is about 60,000.

The surface, hydrography, &c. of the country are described under ARGENTINE CONFEDERATION.

It has a great diversity of surface and almost every variety of soil and climate. On the west it includes the eastern sides of the Andes with the lower offsets of that system. On the north, where it borders on the republic of Bolivia, it includes a portion of the desert table-land of Yavi and the range called Abra de Cortaderas. It comprehends likewise a portion of the Gran Chaco; the Desapoblado, whose climate resembles that of Siberia; the valley of the Guachipas, which in climate and productions represents Europe; and the Plain of Salta and the valley of the Rio de Jujuy, which in both climate and productions resembles the West Indies.

The principal rivers are the Vermejo and the Salado—described under ARGENTINE CONFEDERATION. The Vermejo forms the eastern boundary of Salta; it is formed by the junction of the Tarija, and the Jujuy (a stream which belongs wholly to this province), and is navigable for large boats from their confluence about 35 miles below Oran. The head-streams of the Salado rise on the eastern slopes of the Andes in the south-western part of this province. In its upper course the main stream is called the Sileta, and subsequently El Pasaje, but it is known as the Salado for some distance before it passes out of Salta. The Salado drains the southern and western half of the province. During the summer season the water is low and the river is easily fordable, but when the rains set in it becomes so much swelled that all the ordinary traffic between Salta and the lower provinces of the Confederation is suspended. The road connecting Salta with Buenos Ayres is noticed under ARGENTINE CONFEDERATION (vol. i, col. 473), and the inconveniences which this as well as the other provinces of the interior, suffers from the limited means of transit, and the advantages to be derived from the establishment of steam communication on the Paraná, are indicated.

As already mentioned, the country possesses a remarkable variety of soil, and a climate ranging from extreme heat to the most intense cold, permitting the cultivation of almost every kind of natural production. But the country is too thinly peopled, the difficulties of transit are too great, and the inhabitants have too little energy and industry to allow the resources of the country to be other than most imperfectly developed, if even the country itself were in a less disturbed state. The inhabitants are now chiefly settled in the larger towns, and in the valleys of the lesser affluents of the Vermejo and Salado. The cereals grown are wheat and maize, which are raised in considerable quantities in the valleys of the south, for the supply of

the other parts of the province. The vine is extensively cultivated in the same district, and a good deal of common wine made and exported to the neighbouring provinces. The cocoa plant is cultivated in the department of Oran. In the valleys of the Jujuy and its tributaries tobacco and the sugar-cane are grown in sufficient quantities to supply the whole of Salta, and to furnish exports to the rest of the upper provinces, and also to Chili. Cotton and indigo are also cultivated to some extent; and the cochineal insect furnishes a source of profit. Along the valley of the Vermejo there are very extensive forests of valuable timber-trees, as well as the palm, the carob, and other trees which furnish the natives with fruit and a substitute for bread, the maté plant, &c. The cochineal cactus and the aloe are found in every direction. One of the chief sources of wealth to the province has always been the rearing of mules, which are bought in the southern provinces in a very lean state, acquire strength in the rich pastures of Salta, and are sent to Peru and Bolivia in large numbers. Before the revolution from 50,000 to 60,000 mules were annually exported from Salta to Peru alone, but the trade with Peru has greatly declined. In the colder parts of the province alpacas, vicuñas, chinchillas, and guanacos are indigenous. The mountains contain gold, silver, copper, and other metals. The mines have not proved very successful; but the inhabitants of the valleys obtain considerable quantities of gold after the rains from the rivers, and in the alluvial soil which has been left by the receding waters. In the desolate country known as the Desplabado are extensive saline plains, from which the inhabitants of the adjacent districts obtain large quantities of salt, which they carry for sale to the towns of Salta and Jujuy.

Like the other provinces of the Argentine Confederation, Salta is a federal state, owning however little more than nominal dependence upon the central government. The executive power is vested in a governor elected by the junta or provincial assembly.

Salta, the capital of the province, is situated on the left bank of the Sileta, in the valley of Chicuaña, in 24° 51' S. lat., 64° 48' W. long.; population about 8000. The streets are regular, but narrow. In the central square are the government-house, the cathedral, and other public buildings. Jujuy is built in an extensive basin, surrounded by high mountains, on the banks of the Rio de Jujuy; population about 3000. It has some traffic, as the carriage-road leading to Bolivia terminates here, and the goods must be transported farther north on mules. At Jujuy begins one of the most extraordinary mountain-passes in the world. A narrow valley extends from the town to the summit of the range called Abra de Cortaderas, a distance of 90 miles by the road. The highest summit of this road appears to have an elevation of between 11,000 and 12,000 feet. Oran is a small town, founded in 1793, on the Rio de Tarija, about 80 miles above its junction with the Rio de Jujuy. As the centre of a very fertile district, Oran is a place of considerable trade.

SALTASH. [CORNWALL.]

SALTCOATS, Ayrshire, Scotland, a burgh of barony, and a small port on the coast of the Frith of Clyde, 31 miles S.W. from Glasgow by road, and 30½ miles by the Glasgow and South-Western railway. The population in 1851 was 4338. A large portion of the population is employed in weaving for the Glasgow and Paisley manufacturers: they produce gauzes, shawls, &c. Many women are employed in sewing and flowering muslin. Magnesia is extensively manufactured. The harbour admits vessels of 200 tons burden. Some ship-building is carried on. Saltcoats possesses a handsome chapel of ease and a Free church, in both of which the services are frequently conducted in the Gaelic language; two chapels for United Presbyterians, a parochial school, a subscription library, and a public reading-room. The town is frequented in summer by sea-bathers. In the vicinity are several collieries.

SALVETAT. [HÉRAULT.]

SALZBURG, a crownland of Austria, formerly the duchy of Salzburg, is bounded W. by the Tyrol and Bavaria; N. by Bavaria and the crownland of Upper Austria; E. by the same crownland and Styria; and S. by Illyria. The area is 2639 square miles; and the population in 1850 was 146,007. It is a mountainous country, covered by the Noric Alps, which on its southern frontier branch out from the Rhetian Alps. High mountains screen the valley of the Salzach for the greater part of its length, and numerous lateral valleys open into it, divided from each other by branches of the principal chains, and traversed by rapid torrents. The principal valley, one of the most lovely that has been formed by nature, and adorned by the industry of man, begins in the western corner of the country, runs first to the east, then to the north, and is inclosed on the right side, along the southern frontier, by lofty mountains, the continuation of the central Alpine chain, which passing through the Tyrol, to the eastern frontier of Salzburg, forms an almost uninterrupted chain of glaciers, here called Kees, with all the varieties of Swiss scenery, defiles, avalanches, cascades, lakes, &c. Some of these mountains are covered with per-

petal snow. The chain of calcareous rocks which accompanies the central Alps to the north forms the frontier on the other sides, and its highest points are 8382 feet above the level of the sea. The country is open to the north only where the Salzach issues from the mountains, and forms a fruitful plain, which however is marshy in some parts. The Salzach, the principal river, is a feeder of the Inn. The lakes are numerous; that called the Zellersee is ten miles long and above two miles broad. Of the many mineral waters, the hot springs of Gastain are the most celebrated. The cascade of the Krimmler Ache, about 5 miles above the village of Wald in the south-western angle of the province, is the most striking in Austria; the torrent falls in five breaks from the height of above two thousand feet, forming at last a magnificent arch. There are other very fine cascades. The climate is severe. Even in the neighbourhood of the city of Salzburg the hills, which are much lower than those of the south, are covered with snow by the end of September, though it does not lie permanently till November. In the south the winter lasts, with little intermission, from the beginning of November till April, and storms and frosts do not cease till the end of June. The heat in summer is very great in the valleys, and vegetation is rapid. Most of the valleys are very fruitful, and produce corn, flax, and fruit, which thrives even at the foot of the mountains. The middle mountain region is covered with forests of fir, larch, and pine, and the upper with fine Alpine pastures, which afford subsistence to numerous herds of cattle, and to a breed of remarkably strong and large horses. There are chamois goats, marmots, bustards, and heath-cocks. The corn produced is in general of excellent quality, but not sufficient for the home consumption. The products of the mineral kingdom are gold, silver, copper, iron, lead, cobalt, arsenic, rock crystal, marble, saltpetre, salt, sulphur, asbestos, and serpentine. The once celebrated mines of gold and silver now yield little; those of copper, iron, lead, and arsenic are very productive, and the salt-works and marble-quarries are very important. The country people make their own clothing. The inhabitants are a robust race.

In ancient times Salzburg was inhabited by the Celts, who, as dwellers on the Tauern (which is the name they still give to their language to the mountains), were called by the Romans Taurisci. Salzburg was in the province of Noricum, the capital of the province. Hadrian planted a colony in Juvavium, or Juvavia, the old capital of Noricum, which occupied the site on which the city of Salzburg now stands. The decline of the Roman power led to the ruin of Juvavia, which was plundered and destroyed by the Heruli. The country was nearly a desert when the pious Scotchman, Hrodbert (Ruprecht or Rupert), arrived there towards the end of the 7th century, and converted the natives to Christianity. A monastery and church were built for him in Salzburg, and richly endowed. Arno, the seventh successor of St. Rupert, was raised in 798, by Pope Leo III., to the archiepiscopal dignity.

SALZBURG, the capital of the crownland of Salzburg in Austria, is situated in 47° 48' 10" N. lat., 13° 1' 32" E. long., on the banks of the Salza or Salzach, over which there is a bridge 370 feet long and 40 feet wide. The situation is one of the most picturesque in Germany. The city is surrounded with an amphitheatre of lofty mountains, which form a noble background to the view. The river runs between two isolated mountains of breccia, the Mönchsberg on the left and the Capucinerberg on the right, leaving in many places only a narrow space on the banks, on which the city is built. The streets are narrow and crooked, and the squares small, but regular. The houses are built of red marble from the neighbouring quarries, with flat roofs. The archbishops adorned the city with so many splendid buildings, chiefly in the Italian style, that Salzburg was called Little Rome. It is surrounded with walls and bastions, and has eight gates, one of which, called the new gate, is a tunnel cut through the Mönchsberg, 415 feet long, 39 feet high, and 22 feet broad. Salzburg gives title to an archbishop since A.D. 798. The university, founded in 1620, was abolished in 1800, and a lyceum or academy established in its stead, which has a library of 38,000 volumes, 20 professors, and 310 pupils (in 1850), a botanical garden, and a geological museum. The monastery of St. Peter has a library of 40,000 volumes. The city has a theatre, four hospitals, a lunatic asylum, and many other charitable and useful public institutions. The cathedral is built (1614-63) in the Roman style, with a façade of white marble. It is a building of great architectural merit, adorned with many statues of white marble, and good paintings. St. Peter's church contains the tombs of Haydn and St. Rupert. In the cemetery at the back of this church is shown the original cell occupied by St. Rupert, who introduced Christianity into this part of Europe: he died A.D. 623. The cell is now inclosed in the chapel of St. Egidius. The university church, built in 1696-1707, is in a mixed Greek and Roman style. St. Margaret's, a handsome edifice, was built in 1485. The Benedictine church has some beautiful painted-glass windows executed in 1480. The palace called the Winter Residence is a very extensive building ornamented with columns: it is now used for public offices. The square in front of it is adorned with the finest fountain in Germany, 45 feet high, made entirely of white marble. On the opposite side of the square is a magnificent palace called the Neubau, now belonging to the emperor. The town-house and the palace of Count Kerenburg are also splendid buildings. The stables for 180 horses are accounted

the handsomest in Europe. A stream called the Alberbach flows through them; the racks are of white marble. Two fine riding schools, one for the summer, and one for the winter, are attached to the stables. There are many other buildings that deserve notice, for instance some of the 26 churches, the palace of Mirabell, and the church of St. Sebastian, both rebuilt since the fire of 1818, which destroyed part of the city. In the churchyard of St. Sebastian is the grave of Paracelsus, who died here A.D. 1541. A bronze statue of Mozart (a native of Salzburg) by Schwanthaler is erected in the centre of the Michaels-Platz. Salzburg is rich in Roman antiquities, including baths and fine mosaics. The fortress of Hohensalza, commanding the town, from which there is a most interesting prospect, is now used as a barrack. There are in the town one military and three civil hospitals, an hospital for incurable patients, several schools, and many other useful and charitable institutions. The inhabitants, about 18,000 in number, manufacture calicoes, leather, and hardware. Two large fairs are held annually in the town, which has an important transit trade between the eastern Austrian provinces and Bavaria, and between Bavaria and Italy. The environs of Salzburg embrace a great variety of grand and picturesque scenery.

SAMFORD, a hundred in the county of Suffolk, which has been constituted a Poor-Law Union. The hundred of Samford is bounded N. by Bosmere and Claydon hundred, E. by the river Orwell, S. by the river Stour, and W. by the hundred of Cosford. The hundred and union comprise 28 parishes, with an area of 50,230 acres, and a population in 1851 of 12,498.

SAMNIUM, or territory of the Samnites, an ancient nation of central Italy, comprised an extensive tract of country on both sides of the central ridge of the Apennines, including the valleys of the Vulturinus, Tamarus, and Calor, towards the Tyrrhenian Sea, and those of the Sarus, Tifernus, Trinius, and Frento, towards the Adriatic, and corresponding to the present provinces of Sannio and Principato Ultra, and parts of Terra di Lavoro, and of Abruzzo Citra, in the kingdom of Naples. It was bounded N. by the Peligni and Marrucini, and by the Adriatic, for the Frentani, who extended along the coast of that sea, formed part of the Samnite confederation, and were also of Sabine origin; E. by Apulia and Lucania; S. by the Campanians, being divided from the latter by the ridges of Tifata and Taburnus; and W. by Latium and the country of the Marsi. The Samnites were originally a colony of the Sabini, which migrated in remote times, probably before the building of Rome, to the banks of the Vulturinus and the Tamarus, and thence spread on one side as far as the plains of Apulia, and on the other to those of Campania. They were an agricultural and pastoral people, and as their numbers increased beyond the means of subsistence, they followed the custom of their Sabine ancestors, and sent forth colonies, which were the origin of the Lucanians, who gradually extended as far as the southern extremity of the peninsula. The Samnites were divided into several nations or tribes, known by the names of Pentri, Caudini, Caraceni, Hirpini, and Frentani, the three first of which inhabited the country designated by the name of Sabinium Proper, having the Frentani on the north, and the Hirpini to the south-east. Their principal towns were:—*Bovianum*, the head town of the Pentri (Livy, ix. 31), near the modern Bojano, at the foot of the lofty Mount Matese, near the source of the Tifernus; part of the walls, formed of irregular polygonal stones, still remains. *Bovianum* was entirely destroyed by an earthquake in the 9th century; its site is covered with a marshy alluvial soil, in which ancient remains have been found. The modern Bojano stands on a rocky hill, one of the lowest offshoots of Mount Matese. *Esernia*, now *Isernia*, on the opposite or western side of the Matese ridge. *Allifia*, south of *Esernia*, in the valley of the Vulturinus. The modern Alife, which occupies the ancient site, still gives title to a bishop. The ancient walls, gates, and many other vestiges of antiquity, including ruins of a theatre, amphitheatre, and baths, still remain. *Maluentum*, afterwards called Beneventum. [BENEVENTO.] *Caudium*, long since destroyed, stood on the Appian Way, near the little river Isclero, 21 Roman miles from Capua, and 11 miles from Beneventum. It gave name to the pass or passes called *Furculæ Caudinæ*, where the Samnites compelled the Roman army to pass under the yoke, B.C. 321. *Blacium*, in the country of the Hirpini; its remains are within a mile of Mirabella, at a place called *Le Grotte*, on the high road from Naples to Puglia. Near this place are the celebrated *Amsaneti Lakes*, of which Virgil gives a fine description ('*Æn.*' vii. 568). *Telesia*, now *Teles*, near the banks of the river Calore. *Aufidena*, or *Alfidena*, the chief town of the Caraceni, on a hill above the left bank of the Sagrus or Sangro, 5 miles above Castel de Sangro. The remains of its massive walls prove it to have been a fortress of great strength. A village called *Alfidena* perpetuates the name, but does not stand on the ancient

site. *Taurasium*, on the river Calore, where there are considerable remains, and several sepulchral inscriptions near the modern village of Taurasi. Pyrrhus was here defeated by Curius Dentatus. *Compsa*, now *Conza*, in a strong position near one of the sources of the Aufidus or Ofanto. Hannibal occupied it immediately after the battle of Cannæ (B.C. 216) and deposited in it his baggage and plunder. It was a municipal town under the empire, and continued to be a place of strength and importance in the middle ages. In the 10th century it became the seat of an archbishop, which it still is, although the modern town of Conza has no more than 1200 inhabitants. *Seppinum*, in the mountains east of Bovianum. *Abellinum*, now *AVELLINO*. *Larinum*, commonly placed in the country of the Frentani, seems to have had an independent territory, comprising the country between the Tifernus (Biferno) and the Frento (Fortore). It continued to exist till A.D. 842, when it was ravaged by the Saracens, and the site abandoned for one about a mile to the westward, where the modern city of Larino stands. The ruins of the ancient town cover the summit of a hill called *Monterone*, and comprise portions of the walls, one of the gates, an amphitheatre, and a large building supposed to have been the senate house. *Histonium*, near the site of the present town of Il Vasto. *Anxanum*, the remains of which are on a hill near the town of Lanciano. *Ortona*, which has retained its name, and was the chief fortified town of the Frentani. [ABRUZZO.]

The Samnites brought at various times as many as 80,000 armed men into the field. Their chief strength consisted in their infantry. Their government appears to have been a kind of aristocracy, in which the priests exercised a great influence. Livy (ix. 40) describes the army of the Samnites as splendidly accoutred; and (x. 46) he speaks of two millions of pounds weight of coined copper taken from them by the younger Papirius; all which shows that the Samnites were no longer a rustic people. But they never became effeminate and corrupt like the Campanians, and they retained to the last their character for hardness, perseverance, and devotedness to their country. Each of the nations of Samnite race had its own independent government, its magistrates, and its comitia. The chief magistrate of each nation was styled *Meddix Tuticus*, an Oscan denomination, as the Samnites appear to have spoken a dialect of the Oscan, and to have used Oscan characters. It was only in cases of urgent necessity, such as resistance to a common invader, that the various Samnite states acted in concert, and then only for a time.

Between the years 440 and 423 B.C., the Samnites attacked the Etruscans, who had settled in the plains of the Osci or Opici about half a century before, and who had founded or colonized Vulturinum. This town the Samnites took and named Capua. (Livy, iv. 37.) [CAPUA.] About B.C. 340 the first war broke out between the Samnites and the Romans. After defeating the Sidicini, who were aided by the Campanians of Capua, the Samnites overran the Campanian Ager, and laid siege to Capua. The Campanians then sent ambassadors to the Roman senate to ask for aid against their formidable enemies, to which the senate objected, that there existed a previous alliance between the Samnites and Rome. The Campanian ambassadors in despair made a solemn surrender, in the name of their countrymen, of all they were possessed of to the Roman people. Upon this the senate sent messengers to the Samnites to request them to abstain from molesting the Campanians. The supreme council of the Samnites resolutely refused compliance. The senate then sent the *feciales* to declare war against the Samnites. Two armies were ordered out—one, under the consul M. Valerius Corvus, into Campania, and the other, under A. Cornelius Cossus, into Samnium. Valerius, after an obstinate fight, routed the Samnites, who abandoned their camp in the night. The Romans acknowledged that they never before met such stubborn enemies. The other consul having entered the confines of Samnium by the valley of Saticula, at the foot of Mount Tifata, found himself surrounded by the Samnites, who were posted on the heights. A legionary tribune named Decius Mus, by his intrepidity and quickness in marching up to a height yet unoccupied by the enemy, was the means of extricating the Roman army, which attacked and defeated the Samnites. A third battle took place near *Suessola*, in the plain of Campania, in which the Samnites were again defeated. The two consuls re-entered Rome in triumph. Two years afterwards the consul L. Emilius Mamertinus entered the country of the Samnites, who sued for peace, and obtained it.

In the year B.C. 323 a new war broke out with the Samnites, on the occasion of the Romans besieging the Greek town of *Palæopolis*, which was garrisoned by a party of Samnites, but which the Romans took by a secret understanding with the inhabitants. The Samnites were joined by the Lucanians. L. Papirius Cursor, being appointed dictator to carry on the war, his master of the horse, Q. Fabius Maximus Rullianus, attacked the Samnites in his absence and against his orders, and defeated them; but for this breach of discipline he was condemned to death by the dictator, and only saved by the interference of the soldiers and of the people of Rome. Papirius himself defeated the Samnites, who asked for and obtained one year's truce; but before the expiration of the truce, the Samnites having again attacked the Roman territory, the dictator, A. Cornelius Arvina, with M. Fabius Ambustus, his master of the horse, was sent against them. The Roman army, being surprised by the enemy in an unfavourable position, after five hours' desperate fighting was in danger of being

totally defeated, when the Samnite cavalry, seeing the baggage of the Romans moving away in the rear without protection, rushed forward in disorder for the sake of plunder. The dictator, who expected this, allowed them to begin plundering, and then ordered his own cavalry, which he had kept in reserve, to fall upon the enemy's horse, which were cut to pieces. The Roman cavalry then returning, attacked the Samnite infantry in the rear, while the Roman legions pressed them in front with renewed ardour. At last the Samnites gave way, and the defeat was complete. (Livy, viii. 23, 39.)

In the following year, B.C. 321, the Samnites having made great preparations for war, gave the command of their forces to Caius Pontius, son of Herennius, an experienced officer, who had already served against the Romans. He placed his troops in ambuscade in a defile between Mount Taburnus and an offset of the Tifata ridge, through which flows the small river Isclerus, an affluent of the Vulturinus. This was the direct road for the Roman army, which was posted at Calatia, north of the Vulturinus, to proceed by to Maluentum. [BENEVENTO.] Pontius sent emissaries disguised as shepherds towards the Roman outposts, who, being seized and questioned, said that the Samnite forces were then engaged in besieging Luceria, a town of Apulia, which was in alliance with Rome. The consuls, T. Veturius Calvinus and Sp. Posthumius, after some consultation, resolved to march to the assistance of Luceria by the most direct way, which was across the Vulturinus, at the confluence of the Isclerus, and then through the defile towards Maluentum. Advancing through a narrow gorge, they came to a little valley between the mountains, and farther on to another narrow defile, which they found barricaded with trunks of trees and pieces of rock; and looking up they saw the Samnites posted on the hills. The Romans thought of retracing their steps, and recrossing the little valley; but they found the other narrow pass, leading to the banks of the Vulturinus, also barricaded and defended. The consuls then ordered the army to encamp in the plain and to fortify themselves. The Romans, after attempting to break through the surrounding enemy, and, feeling the want of provisions, sent messengers to ask for honourable conditions. Pontius told them that they must consider themselves his prisoners, and as such give up their arms and file off, under a yoke, in presence of the whole Samnite army, after which they would be allowed to return home; and this, the greatest disgrace that ever befell the armies of Rome, they submitted to. The spot on which this transaction occurred became known by the name of the Furculæ Caudinæ (Caudine Forks), from its being in the neighbourhood of Caudium. The war was continued with varying success, but, on the whole, in favour of the Romans, till B.C. 303, when, after the submission of most of their fortified towns and the defeat of the Samnite army by the consul Postumius Megillus, who lost his colleague Minucius Augurinus in the battle, the Samnites sued for peace, which was granted.

In the year B.C. 298, the Roman senate obtained information from the Lucanians and the Picentes, that the Samnites had urged them to join in a new war against Rome, and a new war ensued. The Etruscans having joined the Samnites with a large force, in which were auxiliaries from Cisalpine Gaul, the Romans chose for their new consuls Q. Fabius Maximus, notwithstanding his great age, and P. Decius Mus (B.C. 297). After ravaging a large tract of country, Fabius met the Samnite army on the banks of the Tifernus, and for a long time the Romans could make no impression on the enemy's ranks; but at last Fabius, having sent the hastati of the first legion round a mountain to attack the Samnites in the rear, the latter, thinking that the other consul with his army had arrived, made a precipitate retreat, leaving 3040 killed on the field and 330 prisoners. Decius, who had marched through Campania, also entered Samnium, and the two consular armies spread themselves over the country, which they ravaged for five months. At last those Samnites who were still in arms, being unable any longer to defend their country, migrated in a body under their leader Gellius Egnatius into Etruria. For several years afterwards the war with Samnium however gave the Roman armies occupation, without any decisive success on either side. The Samnite host which had migrated into Etruria fought bravely in conjunction with the Etruscans and Gauls; and on one occasion, near Sentinum, the Gallo-Samnite army spread disorder into the Roman ranks, when the consul P. Decius, perceiving the critical moment, devoted himself to the infernal gods, and, rushing into the thickest of the fight, fell covered with wounds. This act restored confidence to the Romans, and they finally routed the enemy after a severe loss on both sides. In the year B.C. 293, the consul L. Papirius, son of the former conqueror of the Samnites, marched into Samnium, and laid siege to Aquilonia, near the Apulian borders, whilst his colleague Carvilius besieged Cominium. An army of 40,000 Samnites, 16,000 of whom were picked men and bound by solemn oaths to fight to the last, moved to the relief of Aquilonia. Papirius, having attacked them, met with a desperate resistance; but ultimately the Samnites were routed, after losing a great number of men. The remainder of the Samnite infantry took refuge within Aquilonia, whilst the cavalry rode off towards Bovianum. Both Aquilonia and Cominium were taken by the Romans and burnt. Papirius next besieged Sepinum, which he entered after a brave resistance; and his colleague, Carvilius, took Volano, Palumbinum, and Heroulanum. The snow, which fell deep in the mountains, obliged the Romans to evacuate Samnium.

In the following year, B.C. 292, one of the new consuls, Fabius Gurgus, son of Fabius Maximus, marched against the Samnites, and was defeated by them with a severe loss. The senate proposed to deprive him of his command; but his veteran father, deprecating this humiliation, offered to serve under his son as his legatus. A new battle was fought, in which the Samnites were finally routed. Pontius, the conqueror at the Furculæ Caudinæ, was taken prisoner. After taking Venusia, to which the Romans sent a colony, the two Fabii, father and son, returned to Rome, and the senate granted to Fabius Gurgus the honour of a triumph, in which Pontius appeared with his hands tied behind his back: after the ceremony he was beheaded.

In the year B.C. 290, the Samnites, worn out by their repeated defeats, sued for peace, which the Romans, likewise exhausted by their dearly-bought victories, felt disposed to grant. The consul M. Curius Dentatus, being charged with the negotiation, concluded a peace, the conditions of which are not known. (Livy, 'Epitome,' xi.) In the war of Pyrrhus, the Samnites joined that prince, after whose second retreat from Italy and subsequent death they found themselves attacked by two Roman armies, under their old antagonists L. Papirius Cursor the younger and S. Carvilius, who utterly defeated them (B.C. 272). It was then that Samnium became a conquered country, and the Romans sent colonies to Maluentum and other places. In the war of Hannibal the Hirpini joined the Carthaginians after the battle of Cannæ, but the Pentri did not. At last, in the Social War, the Samnites having joined the Marsi, Vestini, Peligni, and others in the common league against Rome, remained last in the field, and were defeated and slaughtered without mercy by Sulla. The devastation of Samnium by Sulla was most effectual; the towns were burnt and razed to the ground; Beneventum alone was spared. During the war of Sulla against the younger Marius, Pontius Telesinus, who had joined the latter at the head of 40,000 Samnites and Lucanians, stole a march upon Sulla, who was besieging Prænestæ, and advanced within ten stadia of Rome, which was without any adequate defence. Sulla however came in time to save the city. A desperate battle ensued: the Samnites defeated the left wing of the Romans, commanded by Sulla himself; but Crassus, who commanded the right wing, having defeated Carina, a Roman officer of the party of Marius, who was opposed to him, fell upon the flank of the Samnites, who were obliged to retire to Antemna, where Telesinus was killed. Between 7000 and 8000 Samnites surrendered to Sulla, who marched them to Rome; and, having shut them up in the Circus Maximus, had them all butchered in cold blood, while he was haranguing the senate in the neighbouring temple of Bellona. The remainder of the Samnites were slaughtered in the same manner at the taking of Prænestæ.

SAMOGITIA, an extensive tract of the ancient duchy of Lithuania, was bounded N. by Courland and the Baltic, W. by the Baltic and Prussia, and S. and E. by Lithuania Proper. It now forms part of the Russian government of Wilna. The inhabitants have retained the peculiar customs and language of the Lithuanians.

SAMOS, an island in the Archipelago, situated near the coast of Asia Minor, between 37° 35' and 37° 48' N. lat., 26° 36' and 27° 8' E. long., at the distance of about a mile from the promontory of Troglitium, or Cape Santa Maria, which lies between the Gulf of Scala Nova and that of Balat. Its early history is mixed with fable. The earliest inhabitants according to ancient tradition were Carians and Leleges, with whom some Lesbians and Ionians were incorporated in the 10th century B.C. Very soon after the year B.C. 776, the Samians became remarkable for maritime enterprise and commerce. They traded with Egypt under the protection of Psammetichus, who gave them a settlement there: about B.C. 630, a Samian merchant, Colonus, made a successful voyage to Tartessus (Herod. iv., 152). During this period they founded several colonies, Samothrace, Anoea, Perinthus, Bisanthe, Amorgus, and joined the confederacy on the Asiatic continent, called the Panionium, consisting of twelve cities.

In the time of Cyrus and Pisistratus, the government of the island was in the hands of Polyocrates, the most remarkable of the tyrants of his day. He extended his sway over the neighbouring states, Lesbos, Miletus, &c., and had a larger navy than any other Grecian prince or state of his time; he was also strengthened by his alliance with Amasis, king of Egypt. Shortly after the invasion of Egypt by Cambyses, Polyocrates became engaged in a war with Lacedæmon, in which the Spartans were finally repulsed from the island. His increasing power at length provoked the jealousy of the Persian monarch Darius, whose Satrap, Oroetes, allured him by treacherous promises to trust himself in his power, and then murdered him. (Herod. iii. 125; Athenæus, lib. xii., 540, Cas.) After the death of Polyocrates, the island fell into the hands of Darius, who appointed Syloson, the brother of Polyocrates, as governor. The resistance of the inhabitants to this measure led Otanes, the Persian general in command, to order a general massacre, and Samos was delivered up to Syloson almost unpeopled. Shortly after the Samians joined the revolt of Ionia. At the battle of Lade, however, they treacherously withdrew from the engagement, to obtain favour with Darius, to whose empire they were again made subject, but were released from it after the battle of Mycale.

The maritime strength of Samos was broken, and their government made democratical by Pericles, B.C. 440. After the battle of Ægosp-

potami, the Samians sustained a siege from Lysander, and were compelled to submit to Spartan principles of government. After this time the Athenians, Lacedæmonians, and Persians became successively possessors of Samos. After forming part of the Egyptian, Macedonian, and Syrian empires, it was finally made subject to Rome, B.C. 84. Samos was afterwards the residence of Marcus Antonius and Cleopatra, A.C. 32, and of Augustus, who gave its inhabitants a titular freedom. It was reduced by Vespasian to the form of a province.

The Samians made great progress in the arts after their commercial connection with Egypt. In sculpture, casting in bronze, architecture, painting, and ship-building, they were eminent. The coins of Samos are very numerous and worthy of attention. The earliest autonomous coins bear the head of a lion or of a bull; a winged wild boar or a prow of a ship are common reverses. Juno, with her attributes, and Neptune, Vulcan, and Minerva, are deities represented upon the imperial coins; the usual reverse is the archaic figure of Juno, which resembles very much that of Diana on the coins of Ephesus. Pythagoras, who was a native of Samos, is also represented in a sitting attitude on the imperial coins, touching a globe placed on a column with his hand. Other types are Meleager attacking the boar, the river Parthenius personified, Nemesis, &c.

Samos was taken and plundered by the Arabs in the 8th century, and recovered by the emperor Leo in the 13th. It subsequently fell into the hands of the Venetians, and afterwards of the Genoese; and upon the taking of Constantinople (1453), was ravaged by Mahomet II. Selim granted permission to colonise the island, as the population had been much reduced by frequent piratical invasions. It has continued ever since under the dominion of the Turks. In recent times the Samians joined the Greek revolution, but were unable to free themselves from the Turkish yoke.

The greatest length of the island is from west to east, and the circumference is about 80 miles. It is separated from the continent of Asia by a strait called the Little Bosphorus, about six miles long, nowhere more than three miles in breadth, and full of small islands. Through the island in a direction from east to west runs a high limestone mountain called Ampelus by Strabo, which is a continuation of the promontory of Trogium, and terminates at its western extremity with the height of Kerkia, the Mons Cercestius of the ancients, the loftiest point in the island. The mountain sides are covered with pine woods, vineyards, or olive-grounds. The valleys of the island are fertile, and yield abundance of wheat. Marble, iron, silver, lead, and emery are among the mineral products.

Immediately opposite to Cape Santa Maria, between the rivers Metelenous and Imbrasius, is the port of Tigani, the ancient harbour of the city of Samos, which has an artificial mole built across it from north to south. Herodotus speaks of an immense mole in this harbour, which he considers one of the three works most worthy of mention in the island. A little inland at the distance of about five miles from Cape Santa Maria is the site of the ancient town of Samos. It was situated partly on flat ground, and partly on the south side of Mount Ampelus; the walls, of which there are still remains, are cased with white marble, and have square towers. At about 60 paces interval they inclose a quadrangular space; within them are the ruins of a theatre with the seats, built on the side of a hill. To the west of the city, towards the Imbrasius, are the remains of an aqueduct, which does not seem to be the one mentioned by Herodotus (iii. 60), which was carried through a mountain, and was one of the three works which he considered most worthy of admiration at Samos. Of the great temple of Juno, said by Herodotus to have been the largest he had seen, and famous for its archaic statues of Juno, which is represented on the coins of the island, hardly anything remains except a capital and base. (Tournefort; Leake, 'Asia Minor'). Opposite the old city, about a mile to the west of it, is the modern town of Cora or Khora (*Χώρα*), the largest in the island, containing, in Pococke's time, about 12 small churches and 250 houses. On the south side of the city is a large plain called Megalocampus, which has become a stagnant marsh. To the west of Cora is the river Imbrasius, on which is the small village of Mily. At the mouth of this river the land juts out to the south, terminating in Cape Colonna, opposite to the small island of Samopoula. To the west of this promontory is the village of Marathrocampus, about 40 miles distant from Patmos. Three miles from this village, opposite to the island of Nicaria, and distant from it about 12 miles, is a hermitage called St. George's, with a grotto near it, on the top of Mount Kerkia, called Panagia Phaneromena. The summit of this mountain is covered with snow all the year round, and has a lake at the top.

Five miles from Marathrocampus towards the north is the village of Castany. Proceeding along the coast in a north-east direction we come to Carlovassi, the most considerable town in the island after Cora. The port is a bad one, being much exposed to the north wind. Three miles to the east of this town is Farni, a village, 10 miles from which, in a deep bay, is Vathi, a town with a good harbour capable of holding a large fleet. There is a small harbour 4 miles to the north-east, the mouth of which is well protected by little islands. On the east side of the island is another port.

The soil of Samos is very fertile, and produces very good wine, though this was not the case formerly, according to the testimony of the ancients. The muscat grape is much cultivated. There is good

timber on the hills, which have quarries of white marble in abundance. Samos was formerly celebrated for its pottery. Game abounds in the island. The inhabitants, about 30,000 in number, are nearly all Greeks. Samos is the see of an archbishop, who is also bishop of Icaria.

SAMOTHRACE (*Samendreck*), a small island in the Ægean Sea, opposite the mouth of the Hebrus in Thrace. According to Herodotus (ii. 51) Samothrace was originally inhabited by the Pelasgians, from whom the inhabitants learnt the religious mysteries of the Cabiri, or Corybantes, for the celebration of which they were famous.

In Homer the island is usually called Samos ('IL,' xxiv. 78, 753), or the Thracian Samos ('IL,' xiii. 12), and was said, according to some accounts, to have derived its name from a colony from the island of Samos on the coast of Asia Minor, who settled there (Paus., vii. 4, s. 3; Strabo, x., p. 457); but Strabo, who did not believe this account, derived its name from *samos*, which meant a height, or from the Sarii, whom he supposed to be the ancient inhabitants of the country. Other accounts state that it was originally called Dardania, and that Dardanus, the founder of Troy, passed over from this island to Asia Minor. (Strabo, vii., p. 331.)

The Samothracians joined the army of Xerxes when he invaded Greece, and one of their ships distinguished itself at the battle of Salamina. (Herodotus, viii. 90.) In the time of Pliny it was a free state.

Samothrace, according to Pliny, was 32 miles in circumference. It contains a very high mountain, called Saocce by Pliny, from which Homer says that Troy could be seen. It is above 5000 feet high. The island has an area of about 30 square miles, with a population of about 2000. ('IL,' xiii. 12.)

SAN FRANCISCO, a city, port of entry, and the capital of San Francisco county, State of California, United States of North America; is situated on a narrow neck of land forming the southern side of the entrance to San Francisco Bay, and between that bay and the Pacific Ocean, in 37° 47' N. lat., 122° 26' W. long. The population, which was only 150 in 1845, was omitted from the Census of the United States in 1850; but in 1852 it was, according to the State Census, 34,776, of whom only 5245 were females. The government of the city is vested in a mayor, recorder, aldermen, county assessors, street commissioners, &c.

The sudden rise of the present city of San Francisco, is perhaps the most remarkable on record. But the place is not devoid of interest in other respects, being one of the earliest settlements of the old Spaniards for the charitable purpose of converting the Indians to Christianity. Their fort, or stronghold, called the Presidio, was fixed near the entrance of the bay, on the southern shore, about half a mile inland. It was a square inclosure, the sides of which were about 300 yards in length, surrounded by a mud wall about 15 feet high, pierced for munitary. Against the inner sides of the walls were the dwellings of the settlers, the centre being left clear for exercise and military evolutions. The walls are now in ruins. From this primary settlement, which was termed the Mission Dolores, emanated the five following missions, which were established in various parts of the adjacent country under the protection of the Presidio:—San Francisco, founded in 1776; Santa Clara, 1777; San José, 1797; San Francisco Solano, 1823; San Rafael, 1827.

The town, which arose in connection with the mission of San Francisco, was called Yerba Buena, or Good Herb, from a plant used as a beverage, and also as a medicine, which grew abundantly in the vicinity. From its foundation the mission continued in a very flourishing condition till about 1831, when in the political disturbances which distracted Mexico, the Indians were driven away from Yerba Buena, and the settlement soon fell to ruin. In 1839 the site was regularly laid out as a town, which however, six years later, as already mentioned, only contained 150 inhabitants. But about this time it began to attract the attention of adventurers from the United States, and soon became in effect an American settlement, though still nominally belonging to Mexico: it was not formally ceded to the United States till 1848. A local government was established, similar to that which prevails in the towns of the United States; an American school was founded, and in January, 1847, an 'ordinance' was issued by the town council directing that the name of the town should henceforth be San Francisco, instead of Yerba Buena. Towards the end of 1847 the first discovery of gold was made, and soon after San Francisco, the port of California, experienced the most extraordinary influx of adventurers ever heard of, accompanied by an unparalleled rise in the cost of provisions and the value of property. The remarkable scenes which were subsequently witnessed in the town, or city as it had now

come to be designated, its rapid extension in every direction, the reckless habits and almost extravagant energy of the strangely diversified population, are too familiar to need more than a word of reference. Nor less well known are the terrible conflagrations which have so often laid large portions of the city in ruins, to be however restored with surprising rapidity to far more than its previous condition, the opportunity afforded by every fire being seized upon to rebuild the destroyed places on a larger, more costly, and substantial scale.

The magnificent bay of San Francisco, on which the city stands is described under CALIFORNIA. The city is built on the western side of the bay, at the extremity of the peninsula, which forms the southern side of the entrance to the bay. It occupies an inclined plane of about half a mile in extent from the hills in the rear of the city. The houses have been carried far up these hills, and a shallow portion of the bay lying between two projecting points of land in front of the city, has been filled up and built upon. The city is regularly laid out, with broad streets intersecting at right angles, and squares at convenient distances. The streets are now tolerably well paved, and many of them are laid with planks; well lighted, and watched; and arrangements have been made for their sanitary supervision. Several of the public buildings and churches are comparable with those in most of the cities of the United States, but the city is still so entirely in a transition state, that the most accurate account of to-day would be inapplicable a few months hence. Besides the churches there are several schools, general and marine hospitals, and numerous benevolent institutions. The warehouses, stores, and shops are on a capacious scale, and abound with every variety of articles of necessity and luxury. The hotels are among the most noticeable features of the place as it now is, and some of them are carried on in a very costly manner. There are also numerous eating and drinking saloons, theatres, concert-rooms, lycæums, and other places of amusement or dissipation, including not a few gaming-houses of various grades. The manufactures of the city are comparatively inconsiderable.

The commercial facilities of San Francisco are very great. The bay, which is 8 miles wide, affords excellent anchorage, and is the natural outlet, not only for the almost unparalleled mineral riches of California, but of a district the extreme fertility of which has as yet hardly begun to be developed. The city fronting the bay is now lined with wharfs and quays, and vessels of great burden can lie alongside to land and take in their cargoes. Steamers are in regular and constant communication with New York and the Atlantic ports, and with the ports of Central America. The character and extent of the commerce of San Francisco have been given pretty fully under CALIFORNIA, and it is needless to repeat the details here. In the years subsequent to that there given, there has been a considerable, though fluctuating, increase in the number and tonnage of vessels arriving and departing at San Francisco, but the returns are informal and incomplete. The annual clearances of shipping from the port at present, average about 500,000 tons; the entrances somewhat less. The amount of gold dust annually shipped from San Francisco exceeds in value 50,000,000 dollars. Up to the close of 1853 there had been deposited at the United States mint and branches, gold from California amounting to 207,316,177 dollars, nearly all of which had passed through San Francisco; besides which a very large quantity has been received in this country and elsewhere direct from San Francisco. Coal is found near the city; and there are quarries of good limestone. Eight or ten daily and several weekly newspapers are published in the city. [See CALIFORNIA, in SUPPLEMENT.]

SAN JOAQUIN, RIVER. [CALIFORNIA.]

SAN JOSE. [CALIFORNIA; COSTA RICA.]

SAN JUAN DE LA FRONTERA, one of the provinces of the Argentine Confederation, South America, extends between 30° 30' and 32° S. lat.; 67° 30' and 70° 20' W. long. It is bounded S. by the province of Mendoza; E. by that of San Luis; N. by La Rioja; and W. by the republic of Chili. The area is about 40,000 square miles: the population is estimated at from 22,000 to 25,000.

The province lies to the north of MENDOZA, which it resembles in its general character and productions. The surface of the country is described generally under ARGENTINE CONFEDERATION. Extending along the eastern declivity of the Andes, San Juan comprehends the northern part of the Vale of Uspallata and a large portion of the plain which separates the Paramilla range from the mountains of Cordova, and contains the Lakes of Guanacache. The Vale of Uspallata is barren and nearly uncultivated. The soil of the plain consists of sand, and is without grass, but covered with stunted prickly trees of the mimosa kind. It is quite barren, and produces no kind of grain or vegetables, except where it is irrigated by the sweet water of the Rio de San Juan and some of its minor affluents. This irrigation renders the land exceedingly fertile; without any other manure, they produce most plentiful crops of wheat and maize. The ordinary crops of wheat are fifty for one, in better lands eighty or a hundred for one, and at Augaco, about 5 leagues north of the city of San Juan, they have been two hundred and even two hundred and forty. The distance from a market and the difficulties attendant on the transport of heavy goods through desert plains, greatly diminish the value of

this fertility. But as fruit-trees, especially vines, succeed very well in this soil, wines and brandies are exported to a considerable amount. In the northern district, called Jachal, there are some gold-mines, whose produce is however not very great. Like the other provinces of the Argentine Confederation San Juan is a federal state, owning little dependence on the central government. The executive power is vested in a governor, elected by the junta, or provincial assembly.

San Juan, the capital of the province, is situated on the Rio de San Juan, in 31° 4' S. lat., 68° 57' W. long.: population about 7000. It contains the government house and other public buildings, and has considerable commerce, being the mart whence the wines and brandies of the province are exported, and from which foreign goods are distributed to the interior. In 1833 the city was nearly destroyed by an inundation of the Rio de San Juan, by which three churches and several other public buildings, with numerous private houses, were thrown down, and many of the inhabitants lost their lives.

SAN JUAN DE LOS REMEDIOS. [CUBA.]

SAN JUAN DEL RIO. [MEXICO.]

SAN JUAN DEL SUR. [NICARAGUA.]

SAN LORENZO DE LA FRONTERA. [BOLIVIA.]

SAN LUCIA. [JAMAICA.]

SAN LUIS DE LA PUNTA, one of the provinces of the Argentine Confederation, South America, extends between 31° and 35° S. lat., 64° and 67° 30' W. long. It is bounded S. by the province of Buenos Ayres, E. by Cordova, N. by La Rioja, N.W. by San Juan, and S.W. by Mendoza. The area is about 36,000 square miles. The population is about 20,000.

The country included within this province is described under ARGENTINE CONFEDERATION. It comprehends that immense tract of country which extends between the provinces of Mendoza on the west and Cordova on the east. Its north-western part runs northward to the border of the Great Salina, and it reaches southward to the country of the Ranqueles Indians, but now claimed by the province of Buenos Ayres. No part of it possesses any considerable degree of fertility. The greatest number of the widely-separated and isolated settlements, consisting mostly of estancias, or cattle-farms, occur along the road leading from Buenos Ayres to Mendoza, in the hilly country, where tracts of grassy land alternate with ridges of hills and sandy deserts overgrown with mimosas. As the grass is coarse and long, the pastures are indifferent; still cattle, horses, mules, and sheep are abundant, and are exported to a small amount, together with some wool. The corn and maize which are raised are not sufficient for the consumption of the scanty and widely-scattered population. The country between the Sierra de Cordova on one side, and Mendoza and San Juan on the other, is still worse. As no fresh-water stream runs through it, it cannot be irrigated; and, with the exception of a few spots, is a complete desert. The climate is dry and hot; rain seldom falls. The gold-mines of La Carolina, about 60 miles N. from the city of San Luis, have ceased to be worked; but the people of the village sift the alluvial soil at certain places in the neighbourhood, and collect annually a small quantity of gold in dust and small lumps (pepitaa). Like the other provinces of the Argentine Confederation, San Luis is a federal state; the executive power being vested in a governor elected by the junta, or provincial assembly, but for many years there has been no really effective government.

San Luis de la Punta, the capital of the province, is pleasantly situated on the western slope of a hill, 2417 feet above the level of the sea, in 33° 17' S. lat., 65° 46' W. long.; but it is merely a straggling village-like collection of mud-huts, and does not contain more than 1500 inhabitants. There is no other place in the province above the rank of a hamlet.

SAN-MARINO, or SAMMARINO, is a small republic in Italy, consisting chiefly of a steep mountain with its offsets and valleys, covering an area of about 21 square miles. It is situated within the papal province of Urbino, and about 10 miles from the Adriatic. The population amounts to about 7600. The town of San Marino stands on the upper part of the mountain, the summit of which is crowned by an old castle with three towers, on which the standard of the republic waves. The town is ill built and ill paved; the streets are steep, and only practicable for mules and donkeys. The square before the town-house is large, and commands a fine view of the neighbouring Apennines. The church of the Capuchins contains a fine painting representing the Descent from the Cross. Outside of the town is Il Borgo, a suburb. The other towns, or rather villages, which give names to communes are—Serravalle, Montegiardino, and Faetano. The inhabitants have cultivated every slip of ground that can be made productive; they make some very good wine, some oil, and rear silk-worms, the produce of which constitutes an article of trade. They have also some good cattle. They import corn from the neighbouring Papal State.

Marinus, a holy hermit from Dalmatia, is said to have retired to this mountain in the 4th century; after his death a church was raised to his memory, and a village grew up round the spot. In the 10th century it became a walled town by the name of 'Plebs Santi Marini cum Castello.' It seems to have governed itself as an independent municipality. During the wars of the Guelphs and Ghibelines, the people of San Marino took the part of the latter. About the year 1291, the commune of San Marino being summoned to pay certain

dues to the Pope's vicar, refused; and the matter being referred to a learned judge of Rimini called Palamede, he decided that the community and men of San Marino were exempt from payment, having been of old independent of all foreign dominion. From that time San Marino has been acknowledged as an independent state by the popes. When Napoleon I. overthrew the papal government he respected the independence of San Marino; and in 1814, when the Pope was reinstated in his dominions, the freedom of the republic was confirmed. The legislative power is in the hands of a great council, formerly composed of 300 anziani, or elders, but now of 60 members—nobles, townsmen, and small proprietors in equal numbers, named for life by the council itself. A committee or council of 12 is appointed from among the members of the great council, 8 for the town and 4 for the country parts. The great council also appoints two Capitani Reggenti, or regents, who are the chief magistrates of the republic, and hold office for six months each. Formerly the chief representative of the republic was styled a Gonfaloniere, and changed every three months. There are secretaries of state for the interior, for foreign affairs, and for the finances. The administration of justice is lodged in the hands of a lawyer not a native of the state, who is elected for three years; after the expiration of which term he may be re-elected once more for the same period.

SAN-MINIATO. [FIRENZE.]

SAN NICOLAO. [CAPE VERD ISLANDS.]

SAN NICOLAS DE LOS ARROYOS. [BUENOS AYRES.]

SAN PAULO, the capital of the province of San Paulo, Brazil, South America, is situated on two of the head streams of the river Tiete, in the plain of Piratininga, at an elevation of 2464 feet above the level of the sea, in 23° 33' S. lat., 46° 45' W. long. The population is about 22,000, exclusive of the suburbs. San Paulo is one of the oldest towns in Brazil, having been founded by a colony of Portuguese in 1560. The streets are wide, and lined with houses of two stories, built of 'taipa,' which is a frame-work of wood filled in with earth. The public buildings are—the palaces of the governor of the province, formerly a Jesuit college, and of the bishop; a spacious cathedral, 12 churches, and a convent of the Carmelites; a college, schools, &c. The only manufactory is a government establishment for making fire-arms. Some coarse woollen cloths and hats are made. San Paulo is the general emporium of the commerce of the plain in which it stands. The exports are—maize, tobacco, cotton, coffee, sugar, rum, jerked beef, hides, horns, and tallow; the manufactured goods of Europe and North America are imported. Santos, the port of San Paulo, is 42 miles S.W. from the city; and the descent to it is so steep that nearly all goods are carried on the backs of mules.

SAN PEDRO, Province of. [BRAZIL.]

SAN REMO. [NICE.]

SAN SALVADOR, Republic of, Central America, extends along the Pacific Ocean from the Bay or Gulf of Conchagua to the Rio de Paz. It lies between 13° 10' and 14° 15' N. lat., 86° 45' and 89° 45' W. long.; and is bounded E. by Nicaragua, N. by Honduras, W. by Guatemala, and S. by the Pacific Ocean. The area is about 6380 square miles. The population is about 300,000.

San Salvador is the smallest, but, in proportion to its size, much the most populous, of the republics of Central America. The surface is very unequal. The main portion of the coast extends along the Pacific in a generally west-north-west and east-south-east direction for about 140 miles; while on the east a smaller portion of it forms the western half of the Bay of Conchagua. There are four harbours—Acajutla or Sonsonate, Libertad, and La Union, which are ports of entry, and Jiquilisco or Triunfo de los Libres. Except La Union, which is on the west shore of the Bay of Conchagua, and is extensive and safe, these harbours are, properly speaking, only open roadsteads, hardly accessible during the rainy season and the prevalence of the south-west winds. As far northward as Libertad the shore is bordered by a narrow tract of low and generally level land from 10 to 12 miles wide; but farther north, up to Sonsonate, the coast is more elevated and broken. The interior is very rugged, being broken by several short ranges of mountains of moderate height, but separated into distinct groups. About 12 to 15 miles from the coast, and nearly parallel to it, are the five volcanoes of Apaneca, Yzalco, San Salvador, San Vicente, and San Miguel. San Salvador and San Vicente are the loftiest, being upwards of 8000 feet above the level of the sea. The eruptions of San Salvador have at times been very destructive; but Yzalco is by far the most remarkable, from its unceasingly active condition, surpassing, it is said, in this respect, and in the impetuosity of its eruptions, any other volcano in America. Neither of the other volcanoes has exhibited other than very slight eruptions of late years.

The rivers of San Salvador have only a short course, and are in their natural state of little importance; though it is asserted that they might easily be rendered of great service for irrigation, and some of them be made navigable for barges and other small craft. The chief river is the *Lempa*, which rising in *Equipulas*, in Guatemala, forms for a short distance the boundary between Honduras and San Salvador, receives the outflow from Lake Guixar, thence crosses San Salvador in a southern direction, and falls into the Pacific a little to the westward of the Bay of Jiquilisco. It is a deep but rapid stream, and the bar

at its mouth prevents vessels of even moderate burden from entering it. The other larger streams are the Rio de Paz, at the western extremity of the republic; the Jiboa, which falls into the sea between the Lempa and Port Libertad; and the Sirama, or San Miguel, all of which have their mouths obstructed by sand-bars. There are two lakes of some size in the state. The Lake of Guixar, near the north-western boundary of the state, has a circuit of about 80 miles, and is one of the principal feeders of the Rio Lempa. It is said to communicate by a subterranean channel with the much smaller Lake of Metapa. Lake Ylopango, about 6 miles E. from the city of San Salvador, is about 9 miles long and 3 miles wide: its only outlet is a small tributary of the Jiboa. Mineral and thermal-springs occur very numerously in various parts of the country.

Owing to the great inequality of surface, there is considerable variety of climate: as a whole, it is warmer than in Guatemala; but it is generally regarded as healthy. The hottest and least healthy part is the low tract along the coast. San Salvador has great agricultural capabilities. The soil is generally good, and in some parts remarkably rich, and the climate permits a considerable variety of crops to be profitably cultivated. The inhabitants are an industrious race, and more skilful agriculturists than the natives of other parts of Central America. Nearly all the available land in the country is appropriated to individuals, and much attention has been paid to its cultivation, though now, from the long continuance of civil dissension, agriculture is in a very neglected condition. Maize is cultivated to a considerable extent; wheat succeeds well only in a few places; several varieties of fricoles, and most of the usual vegetables, are raised for the ordinary food of the people. Oranges, lemons, pine-apples, plantains, and various fruits are extensively grown; sugar, cacao, coffee, tobacco, and cotton succeed very well, and might, were the country in a more settled state, be raised largely for exportation. Since the gold discoveries in California, a very large quantity of sugar has been grown in the neighbourhood of Sonsonate, chiefly for the purpose of distilling rum for the Californian market. Indigo has however always been the chief source of wealth to San Salvador. During the Spanish supremacy, upwards of 1,800,000 lbs. are said to have been annually exported, and though the quantity raised has greatly fallen off, it is still considerable. The coast west of Point Libertad is commonly known as the Balsam Coast, it being the only place where the article known as the Balsam of Peru is collected. This part of the coast is in the possession of the Indians, who live in five villages, have their own chiefs, with a kind of municipal government, and subsist chiefly on the produce of the balsam, which they collect to the amount of about 15,000 to 20,000 lbs. annually and dispose of in Sonsonate. They also cut and carry to Sonsonate a considerable quantity of cedar-trees. There are large forests on the slopes of the mountains of the interior.

Cattle are numerous, and of a good breed; sheep do not succeed very well; hogs are everywhere abundant. Turkeys and fowls are plentiful; but there are few ducks and geese. An inferior kind of cheese is made in large quantities; butter is seldom made.

The mineral wealth of the state appears to be considerable, but it has been very imperfectly developed. Gold has been obtained in several places. Some rich silver-mines were formerly worked, but, owing to the general insecurity of life and property, they have been for many years almost entirely neglected. Excellent iron-ore is obtained near Metapa. Lead and copper have also been found.

The only manufactures are of the common articles of domestic consumption. They consist chiefly of coarse cotton goods, cutlery, and iron ware, and some of them used to be in considerable request throughout Central America. The foreign trade is of comparatively little importance. The exports in 1852 amounted in value to 700,000 dollars; the imports to 1,360,000 dollars.

San Salvador is divided into four departments, which are named after their respective capitals—San Salvador, San Vicente, San Miguel, and Santa Anna. In all, the republic contains 6 principal towns, 142 smaller towns, and 62 villages. The following are the more important places; the populations are merely a loose approximation:—

San Salvador, the capital of the republic, is situated on the Rio de Aselhuate, a small affluent of the Lempa, in 13° 44' N. lat., 89° 8' W. long. The site of the city is more than 2000 feet above the level of the sea, on undulating ground, in a kind of valley, surrounded by high hills covered with wood, among which, in a north-eastern direction, and at a distance of about nine or ten miles, is the volcano of San Salvador, which at different periods has caused great devastation by its eruptions. The city itself was laid out with considerable regularity, and had in the centre a plaza, or square, three sides of which were lined with shops, with porticoes before them, supported by a colonnade; while on the fourth side was the cathedral, an edifice which had no great claims to architectural beauty. The population was about 20,000. But on the night of the 16th of April, 1854, the city was entirely destroyed by an earthquake, and a very large number of the unfortunate inhabitants killed. For several days previous to the sad catastrophe there had been slight tremblings of the earth, but as they caused no mischief, little heed was given to their premonition. On the evening of the night named however the shocks became more frequent and severe, and, being unattended with noise, the inhabitants became seriously alarmed, and many of them assembled in the great square. At length, at about ten minutes to 11 o'clock, a violent heaving

motion of the earth occurred, which in a few seconds levelled the cathedral, churches, university, and every other public building in the place. Of the private houses a few were left standing, but these were rendered uninhabitable; and the wells and fountains were either filled or dried up. Many of the inhabitants, as we have said, perished, and of the survivors many fled to other towns. The movements of the earth continued for some time after the fatal night; and the president of the republic, in his address to the departments calling on them to assist the destitute citizens, intimated that measures were to be immediately taken for the selection of a better site on which to rebuild the city; but we have not heard whether this intention has been carried into effect. Some manufactures of iron, especially of cutlery and coarse cotton stuffs, were carried on here; and some sugar and indigo used to be exported. Sugar-plantations are numerous in the neighbourhood, as are also extensive orchards. Mestizoes, or ladinos, as they are called here, constituted the bulk of the population. Near the city there are some warm and some cold rivulets, which afterwards unite, affording the inhabitants the advantage of having natural baths of every degree of temperature.

San Miguel, some distance east of the Rio Lempa, population about 7000, is noted for its fairs, of which the most important is held in November after the indigo crop.

San Vicente, on the right bank of the Lempa, contains about 8000 inhabitants in the town and its suburbs. In its neighbourhood are extensive plantations of indigo, and near the village of Istepeque excellent tobacco is grown, which is known under that name all over Central America.

Santa Anna, situated in the western part of the state, at a considerable elevation above the sea, population about 9000, has in its neighbourhood extensive plantations of indigo and sugar; in the mountains near the town are iron-mines, which were formerly profitably worked.

Sonsonate, near the western extremity of the state, population about 8000, carries on at present considerable commerce by means of the port of Acajutla, exporting sugar to Peru and Chili, and rum, &c., to California. The Indians inhabiting the country about the town make very beautiful mats, which are also exported. In the neighbourhood of Sonsonate is the Yzalco, a very active volcano.

The other more populous towns are—Aguachapa, Apastepeque, Cojutepeco, Metapa, Sacatecoluca, &c.; but none of them requires further notice.

San Salvador is a republic with a legislative chamber of 25 deputies, but the government is really vested in the president. The history of San Salvador is similar to that of the other republics of Central America. [COSTA RICA; GUATEMALA; HONDURAS; NICARAGUA.] On the formation of the republic of the United States of Central America, San Salvador became one of the federal states, and its capital was made the seat of the federal government; but the union was speedily dissolved, and San Salvador, like the other states, became an independent republic, and like them its progress has hitherto been arrested by constant internal discord.

[Juarros, *History of Guatemala*; Haefkens, *Reise naar Guatemala*; and *Central Amerika*; Baily, *Central America*, &c.)

SAN SALVADOR. [ALESSANDRIA; BAHIA; BAYAMO.]

SAN SEBASTIAN, a city and sea-port of Spain, and capital of Guipuzcoa, one of the Basque Provinces, is situated in 43° 19' N. lat., 2° W. long., on the coast of the Bay of Biscay. The town is built on a low peninsula, or tongue of land, which is terminated by a rocky conical hill 400 feet high, and is flanked on the east side by the estuary of the small river Urumea, and on the west side by a bay which forms the harbour. The hill is named Monte Urgull or Orgullo, and its summit is crowned by a fortified castle called La Mota, whence the hill is commonly called El Monte del Castillo. There are other defences on the slope of the hill, and the town lies at its southern base. The land-front, 350 yards wide, stretches quite across the peninsula, and is defended by a solid rampart, strengthened by a lofty casemated bastion in the centre, and by a half-moon at each end. In front of the bastion is a horn-work. The narrowest part of the peninsula is still farther inland, between the horn-work and the rocky ridge of San Bartolomeo, at the foot of which is the suburb of San Martin. The flanks of the town are protected by ramparts, one of which is washed by the sea in the harbour, and the other is 27 feet above the bed of the Urumea, in which the tide rises about four feet. A long wooden bridge crosses the estuary of the Urumea.

The town has been mostly rebuilt since the two sieges of 1813. The streets are wide and clean, and the houses generally good. Besides the Plaza Nueva, which is a handsome square surrounded by elegant houses, there are other squares, several churches, and three or four civil and military hospitals. The population is about 18,000.

The harbour is small, but secure, and is defended by a mole, and by the small rocky island of Santa Clara at the entrance. There is a good import trade in English and French goods, and an export trade in corn and other produce.

After the battle of Vitoria Wellington despatched Sir Thomas Graham to San Sebastian, which was then defended by General Rey, and which had been held by the French from the year 1808. General Graham commenced the siege on the 10th of July, 1813, and assaulted

GEOG. DIV. VOL. IV.

the town on the night of the 24th, without success, and with the loss of more than 500 killed and wounded. The siege was then suspended for want of ammunition; but after the defeat of Soult at the foot of the Pyrenees on the 31st of July, the siege was renewed, and continued till the 31st of August, when the place was stormed, and all the defences of the town were carried, but with the enormous loss of upwards of 2500 killed and wounded. The castle of La Mota held out till the 9th of September. In 1823, when the French invaded Spain, to put down the constitutional government, they succeeded, after several assaults, in getting possession of San Sebastian by capitulation. Afterwards, during the Carlist insurrection in the northern provinces of Spain, it became the head-quarters of the British auxiliary legion, under General Sir De Lacy Evans, who, in the summer of 1836, resisted several attacks of the Carlists, who occupied the neighbouring heights.

In the article *BASQUE PROVINCES*, Tolosa is stated to be the capital of Guipuzcoa, but since that article was written a decree of the Spanish government, dated August 24, 1854, announced that the city of San Sebastian was in future to be the capital of Guipuzcoa, as it had been from 1822 to 1844, when it was deprived of its title of capital, which was then conferred on Tolosa.

SAN SEBASTIÃO. [BRAZIL.]

SAN-SEVERINO. [MACERATA-E-CAMERINO.]

SAN-SEVERO. [CAPITANATA.]

SAN TADEO, RIVER. [PATAGONIA.]

SAN VINCENTE. [CAPE VERD ISLANDS.]

SANA is the capital town of the province of Yemen in Arabia, situated in 15° 5' N. lat., 44° 5' E. long. Sana, though the chief town of Yemen, is the seat of an independent chief, the Imam of Sana, who exercises authority over a wide district around, and is often opposed to the Egyptian government, which has advanced its frontiers to Beit-el-Fakih, a town in the Jehameh, about midway between Sana and the port of Mokha, on the Red Sea. Sana is pleasantly situated on an elevated table-land, surrounded on three sides by higher mountains. The valley thus formed is about nine miles broad, but extending uninterruptedly to the north. The country round about supplies a considerable quantity of coffee, which at present is transmitted to Mokha on camels; but the exactions of the Egyptian government are so great, that it has been considered likely that the traffic may be turned to Aden, to which port Sana is as near as to Mokha. Coffee forms almost the only export; the imports are piece-goods, thread, and twist, Persian tobacco, glass, silks, spices, and sugar. The town is walled and indifferently fortified. It is about 5½ miles in circumference, with narrow streets, but with many good houses; those of the more opulent having windows of stained-glass. The imam has two handsome palaces, both built of hewn-stone and fortified, in the town, and there are about twenty mosques, some very handsome, and many baths and public fountains. Across the principal street a handsome bridge has been thrown, as in rainy seasons a torrent runs down the street, but occasionally the town is seven years without rain, and is much too dry in general to be healthy. The population is estimated at 40,000; and of three neighbouring towns in the same valley, Rodah, Wady-Dhar, and Jeraf, the population is at least 30,000 more. In Sana, and probably in the other towns, the principal part of the artisans are Jews, who pay a capitation-tax for permission to reside in the town: they live in a quarter by themselves, and their number is about 3000. (*Geog. Journal*, vol. viii.; *Journey of Mr. J. C. Crutenden to Sana*, 1836.)

SANCERRE. [CHER.]

SANDBACH, Cheshire, a market-town in the parish of Sandbach, is pleasantly situated on an eminence near the right bank of the river Wheelock, in 53° 8' N. lat., 2° 21' W. long., distant 26 miles E. by S. from Chester, 162 miles N.W. from London by road and by the North-Western railway. The population of the town in 1851 was 2752. The living is a vicarage in the archdeaconry and diocese of Chester. The manufacture of shoes is extensively carried on, and there are several silk-throwing mills. The worsted trade has declined. The town is lighted with gas. The parish church, a handsome structure in the perpendicular style, erected about 1400, has been in great measure rebuilt. There are two new district churches, chapels for Wesleyan, Primitive, and Warrentite Methodists, and Baptists; National and Infant schools, and a British school. The Grammar school, founded in 1577, has an income from endowment of about 200*l.* a year, and had 74 scholars in 1854. Thursday is the market-day: fairs are held three times a year. In the market-place are two ancient crosses.

SANDEK. [GALICIA, Austrian.]

SANDGATE. [KENT.]

SANDIACRE. [DERBYSHIRE.]

SANDOMIR. [POLAND.]

SANDOWAY. [ARACAN.]

SANDUSKY. [OHIO.]

SANDWICH, Kent, a cinque-port, market-town, and municipal and parliamentary borough, is situated on the right bank of the river Stour, in 51° 16' N. lat., 1° 20' E. long., distant 12 miles E. from Canterbury, 67½ miles E. by S. from London, and 98 miles by the South-Eastern railway. It is governed by 4 aldermen and 12 councillors, one of whom is mayor; and, in conjunction with Deal and Walmer, returns two members to the Imperial Parliament. The

population of the borough in 1851 was 2966. The livings are in the archdeaconry and diocese of Canterbury.

Sandwich was early a place of importance, and is an original member of the Cinque Ports. It probably arose out of the decay of the Roman Ritupa. [KENT.] The name Sondwic occurs as early as 665. Canute landed here in 1016 and in 1029. In the time of Henry III. the town was burnt by the French. In the reign of Henry VI. the French took and plundered the town three times. In course of time the harbour became choked up with sand, and the town declined. In the reign of Elizabeth it revived by the settlement of Flemish refugees, who introduced the manufacture of baize and other woollens, and cultivated the neighbouring lands for vegetables, flax, and canary-seed. Sandwich has returned two members to Parliament since the 42nd Edward III.

The town stands in the marsh lands which border on the Isle of Thanet, about two miles from Pegwell Bay, into which the Stour discharges itself. It is paved, lighted with gas, and supplied with water. A part of the town wall, and one of the gates, called Fishergate, on the north side of the town are still standing. The Stour is here crossed by a stone-bridge, which has in the middle a swing-bridge to allow the passage of vessels. St. Clement's church is a massive building, consisting of a nave and two aisles, a chancel, and a tower rising above the centre of the church. The tower is of Norman architecture, supported by four semicircular arches with massive piers, and is built of Caen stone. There are two other churches of the establishment, and chapels for Independents, Wesleyan Methodists, and Baptists. A Grammar school, founded in Elizabeth's reign, has two exhibitions at Lincoln college, Oxford, which however are not claimed, and the school is at present without scholars. There are National schools for boys and girls. The hospital of St. Bartholomew is an ancient almshouse, with an income of 800*l.* for 16 inmates, who must be decayed tradesmen of the town, or the widows of such. It has a small chapel of early English date, with lancet windows. There are two other almshouses, or hospitals. The Guildhall was built in the time of Elizabeth. The jail is a well built and commodious modern building. There are assembly-rooms and a custom-house. The port extends from the North Foreland southward to Sandown Castle, and seaward as far as the line of Goodwin Sands, having jurisdiction as a Cinque Port over Fordwich, Sarre, Ramsgate, Deal, Walmer, and Stonar. Only small vessels can come up to the town. There is a considerable import of timber, iron, and coal; and corn, flour, malt, seeds, hops, fruit, bark, leather, ashes, and wood, are exported, chiefly to London. Ship-building, tanning, and wool-sorting are carried on. A corn-market is held every Wednesday, a cattle-market on alternate Mondays, a pleasure fair on December 4th. A county court is held. Near Sandwich are the remains of a Roman amphitheatre, 210 feet in diameter.

SANDWICH. [CANADA.]

SANDWICH ISLANDS are a group of islands situated in the northern part of the Pacific, between 18° 55' and 22° 20' N. lat., 154° 50' and 160° 40' W. long. They extend within these limits in a slightly curved line from south-east to north-west, and are thirteen in number; eight of them are of moderate size, and the other five small. The larger islands are Hawaii, Maui, Tahaurawe, Ranai, Morokai, Oahu, Tauai, and Nihau.

Hawaii, formerly called *Owhyhee*, the most south-eastern island, is the largest of the whole group, and indeed twice as large as all the rest together. In form it approaches to a triangle, and is nearly 100 miles long from south to north, and about 80 miles wide in the broadest part. The surface is probably about 5000 square miles. The interior is occupied by a table-land 8000 feet above the sea-level, and almost entirely unknown, there being no road over it from one side of the island to the other. According to the scanty information collected from the natives by Ellis, it is chiefly covered with lava and ashes, but in some places overgrown with wanti-trees, or paper-mulberry-trees. The edge of this table-land toward the east is about 25 miles from the sea, but on the west and south it approaches somewhat nearer the shore. Near these edges are situated three volcanoes, of which the highest, Mouna Kea, is near the eastern declivity of the table-land. Its summit attains an elevation of 18,587 feet above the sea-level, but it is extinct. Near the south-western corner of the table-land is the Mouna Roa, whose summit is 13,175 feet above the sea. No eruption of this mountain is recorded, but it does not appear to be extinct. The present crater has a circumference of about six miles and a quarter, and the ancient orifice is not less than 24 miles round. On the western edge of the table-land is the volcano called Mouna Huararai, whose elevation is estimated at 10,000 feet. It is still active, the last eruption having taken place in 1800. On the table-land there are many other conical peaks, which are evidently extinct volcanoes. But the most remarkable volcano is that of Kirauea, which is at no great distance from the eastern declivity of Mouna Roa, but properly on the southern declivity of the table-land. This volcano is not, like other volcanoes, a conical mountain, but a depression below the general surface of the slope, of somewhat irregular shape, with almost perpendicular sides. The elevation of the slope where this vast pit occurs, is 3873 feet above the sea-level. The surface of the volcanic lakes is about 850 feet below the upper surface. The crater contains two lakes, the smaller of which is nearly of a

circular form, and 319 yards across; the larger is 1190 yards long, and in one part about 700 yards wide. These lakes are vast caldrons of lava in a state of furious ebullition, sometimes spouting up to the height of 20 and even 70 feet. The fiery waves run with a steady current at the rate of nearly three miles and a quarter per hour southward, enter a wide abyss, and fall into the sea in 19° 11' 51" N. lat. All the country round this volcano is covered with lava. The volcano of Kirauea has from time immemorial been prodigiously active. In 1787 it overflowed, when a dreadful eruption took place, and lasted seven days.

From the edges of the table-land, which are about 8000 or 9000 feet high, the country has a gradual slope to the sea. The higher part of this slope, from the table-land to the distance of about four miles from the shore, where it sinks down to 1500 feet, is covered with dense forests, consisting chiefly of several species of acacia, which attain a great size, and of which the canoes of the natives are made. The underwood is tree-fern, from four to forty feet high, and clothed to the top with an almost endless variety of climbing plants. The soil on which these woods grow lies on lava, which frequently rises above it. The tract which lies west of Byron's Bay, or Waiakea, and extends towards the base of the volcano of Mouna Kea, is thickly inhabited and well cultivated; but nearly contiguous to it on the south, and adjacent to the volcano of Kirauea, is a desert of rugged lava, extending 40 miles along the shores, where no cultivation occurs, and which is only inhabited by fishermen. The north-eastern coast is bold and steep; on the western side the land rises with a gentle slope from the shore.

Byron Bay, on the eastern shore, is a spacious harbour, which lies south and north: it is protected from the north-east wind by a coral reef, half a mile wide, which leaves a channel three-quarters of a mile wide, and from ten to eleven fathoms deep. It is the best harbour belonging to the island, and the only one on the eastern shore. On the western coast are the harbours of Towaihe and Karakakoa. In Karakakoa harbour Captain Cook was killed, in 1779.

Maui, or *Mowee*, is situated north-west of Hawaii, and separated from it by a strait 24 miles wide. Its length is 48 miles, and its breadth, in the widest part, 29 miles. It is composed of two masses of rock, surrounded by a narrow tract of low land, and united by a low and sandy isthmus which is nine miles in width. The larger mountain mass, which occupies the eastern portion of the island, is supposed to rise nearly 10,000 feet above the sea, but it contains only a small portion of low and cultivable land. The smaller mountain mass or peninsula has a fine tract of level land along the south-western coast. At the back of it there are well-wooded slopes, with broad valleys, which terminate, towards the summit of the mountains, in deep ravines. The mountains, which rise to about 5000 feet, are also well wooded. The harbour of Lahaina nearly in the centre of the plain, is formed by two low projecting rocks, two miles distant from each other.

Tahaurawee lies south-west of the larger peninsula of Maui. It is about 11 miles long from east to west, and 8 miles wide in the broadest part. The surface hardly exceeds 60 square miles. Like the other islands, it is composed of lava, which however rises only to a moderate elevation. The soil is thin, and covered with a species of coarse grass.

Ranai, which lies west of the smaller peninsula of Maui, is separated from that island by a strait nine or ten miles wide. It is 17 miles long and about nine miles wide. It is a mass of volcanic rocks, but does not rise to a great elevation. A great part of it is barren, and the remainder is only of moderate fertility.

Morokai, or *Morotot*, lies north-west of Maui and north of Ranai; it extends 40 miles from east to west, and 7 miles from south to north. It consists of one mass of rocks, the most elevated portion of which rises about 5000 feet above the sea, and the sides are furrowed by deep ravines full of trees. Level tracts of small extent occur along the shores, and many of them are fertile.

Oahu, or *Woahoo*, lies north-west from Morokai, and extends 46 miles from south-east to north-west, and is 23 miles across in the widest part. It is the seat of government for the islands, and the place in which the foreign commerce is concentrated. It contains a larger proportion of cultivated land than the other islands of the Sandwich group.

A mountain range traverses the island: it begins at the north-eastern point, called Mocupu, and runs first southward and afterwards inclines to the south-west, terminating, at Diamond Point, the south-western cape of the island, in a hill about 400 feet high. This range is more than 3000 feet above the sea-level, and, with the valleys by which it is intersected, covers about half the surface of the island. Another mountain mass occupies the north-western part, but it is not connected with the chain, being separated from it by a plain extending from the mouth of Pearl River to Waiarus on the northern coast, a distance of nearly 20 miles. It is called the Plain of Eva, and is fertile and well wooded, but not much cultivated. The soil consists of a deep mould resting on lava. The plain of Honolulu, on the south side of the island, extends about ten miles along the shore, with a width varying from two to three miles, has a very rich alluvial soil, and is carefully cultivated. Several wide valleys, which extend northward into the mountain range, open into this plain, and are also cultivated to the distance of six or seven miles from the shore, where

they begin to be narrow, and to be inclosed by steep mountains on each side.

Honolulu is the capital of the Sandwich Islands, and the residence of the king. It consists of a considerable number of stone houses built by foreign merchants, and numerous huts of the natives not arranged in regular streets. The harbour is small, being not more than half a mile long and a quarter of a mile broad; but it is tolerably deep, and perfectly safe. It is formed by a coral reef, which extends along the shore at the distance of some hundred yards, and against which the swell of the sea breaks. These reefs have a considerable width, and are dry at low-water. A narrow opening in them opposite to Honolulu forms the entrance to the port, which however is not deep enough for large vessels, and they remain in the roadstead, which is capacious, but has a rocky and uneven bottom.

Tauai, or Atoot, west-north-west of Oahu, is about forty miles long, and more than twenty-four miles broad in the widest place. It is a mountain mass sloping on all sides towards the sea, where it terminates with a rather high coast. Wide valleys run from the shores towards the centre of the island, and they are well cultivated and fertile. On the southern coast, at Waimea, there is a roadstead, but there is no other anchorage round the island.

Nihau, or Oneehou, the most western of the Sandwich Islands, is about twenty miles long from north to south, and seven miles across where widest. The most southern point rises abruptly to a considerable height; but about five miles north, the rocky mass sinks down to a moderate elevation, and afterwards rises again, but not so high as before. The inhabitants make a great number of painted and variegated mats, which are extensively used in all the other islands, and the island produces abundance of yams, which also go to the other islands. On the western side of Nihau there is a very good harbour.

Climate.—The climate is principally regulated by the trade-winds, which during the summer, or from March to October, are strong and regular, but in winter light, and frequently interrupted by calms and south-westerly winds. The rainy season occurs in winter. In summer the atmosphere is usually clear and bright, and in many places on the western or leeward side of the islands not a drop of rain falls. On the eastern or windward parts however, even in this season, seldom a day or night passes without a smart shower, and occasionally heavy rains fall. From September to April the atmosphere is more or less hazy, obscure, and cloudy, with frequent light rains in some places, and in other parts heavy rains of two or three days' continuance.

The heat is considerable in the lower tracts, but perhaps less than might be supposed from the latitude. This is partly owing to the vast expanse of water by which the islands are surrounded, but principally to the prevalence of the north-east trade-wind, which during the greater part of the year sweeps over and about the islands with great velocity, and, having passed a great expanse of sea, is far from being hot. In the eastern districts the thermometer in summer seldom rises higher than 80° or 82°, and during the winter not higher than 72° or 74°; but the lower tracts on the western side of the mountains are exposed to greater heat, and in those parts the thermometer frequently rises to 88° or 90°. According to observations made at Honolulu, the mean annual temperature of that place does not exceed 75° Fahr. In general the thermometer ranges between 70° and 83°. The greatest heat experienced was 88°, and the least 61° Fahr. The elevated tableland in the interior of Hawaii is of course much colder, and snow frequently falls there. In the lower districts on the western side of the islands the sea and land breezes are generally regular, especially during the summer. The sea-breeze sets in at 10 o'clock in the morning, and continues till sunset, when it is immediately followed by the land-breeze, which lasts till sunrise. From sunrise till 10 o'clock a calm prevails.

Productions.—The quadrupeds found on these islands at the time of their discovery were the hog, dog, and rat, to which have been added the cow, horse, sheep, goat, and mouse, all of which thrive very well except the sheep. Fowls were found at the discovery; but turkeys, geese, ducks, and pigeons were introduced afterwards. Fish abound, but there is no great variety; the most common are sharks, bonetos, flying-fishes, and red and white mullets. Many families live on the produce of the fishery. Pearls are found in Pearl River; they are small, but fine.

It does not appear that the European grains are cultivated to any great extent, with the exception of maize. The principal objects of cultivation are roots, especially the taro-root (*Arum macrorhizon*). Potatoes and camotes, or sweet potatoes, are also generally grown. The fruit-trees which were cultivated before the arrival of Europeans were the cocoa-nut, the bread-fruit tree, the ohia- or jumbo-tree of the East Indies, and the kou; several kinds of bananas were also grown. Strawberries and raspberries are also indigenous. The Europeans have introduced oranges, lemons, citrons, grapes, pine-apples, papaw-apples, pomegranates, and figs, all of which come to perfection except pine-apples. The sugar-cane is indigenous, and much cultivated, but only for eating. Melons and water-melons are excellent. The most cultivated vegetables are cucumbers, pumpkins, French beans, onions, and red pepper. The wauti, or paper-mulberry tree, is grown for its interior bark, which is used here, as in China, for making cloth. The forests do not contain many trees fit for ship-building. In several parts the mountains were formerly covered with sandal-wood; but as

the exportation of this wood to China has been very great it begins to be rare.

Salt is the only mineral which is obtained in abundance. A large quantity is got from a salt-lake in the island of Oahu, west of Honolulu, which is between two and three miles in circumference, but has only a few feet of water in the deepest parts. The bottom and shores are incrustated with salt, the water being strongly impregnated, and the crystallisation very rapid. This salt is exported to Kamtohatka. Large quantities of salt are also obtained from sea-water by evaporation, for which purpose there is along the shore a succession of artificial vats of clay, into which the salt-water is let at high tide.

Inhabitants.—The population consists of natives, with the exception of a small number of whites, Englishmen and Americans, who have settled among them as merchants or as missionaries. The population in 1853 amounted to 71,019, being 37,079 males, and 33,940 females. The natives, who call themselves Kanaka, belong to the family of Malay nations. Their colour is a kind of olive, and sometimes reddish-brown. They are of middle stature, and well formed, with muscular limbs and open countenances. The roots of their language have a great affinity to those of the other Malay nations who inhabit the islands of the Pacific. When these islands were discovered by Cook, it was observed that the natives of this group had made further progress in civilisation than those of the other islands and groups. This was evident from the care with which the taro-fields were cultivated, but still more from their manufacturing cloth from the bark of the paper-mulberry and other trees, their beautiful mats, and the art with which they united, and as it were wove together, many beautiful feathers, so as to be used as articles of dress. They also made several utensils of stone, wood, and shells, without the use of iron tools. At that time they wore only a wrapper, called tapa, about their loins; but many of them now dress in the European fashion. They have also improved in other respects, especially in ship-building and navigation. Vessels built at Honolulu, and manned by natives, traverse the Pacific to Canton. Many of the chiefs have built houses in the European style.

Commerce.—Agriculture has not yet supplied articles for exportation, but by selling their produce to the vessels which visit the islands, the natives procure the foreign articles that they are in want of. The arrivals of merchant vessels at the port of Honolulu were as follows:—In 1850, 469; 1851, 446; 1852, 235; and 1853, 194. Salt and sandal-wood are exported. The imports of 1853 amounted to 1,281,951 dollars; the exports to 281,599 dollars. There is some commercial intercourse with San Francisco, Vancouver Island, Australia, China, and the East Indies. Ships of war of England, France, the United States of America, and other countries, visit the islands for supplies.

History and Government.—These islands were discovered by Captain James Cook in 1778, and again visited by him on his return from Behring's Strait, when he was killed by the natives. Within the first twenty years after their discovery they were only visited by Portlock and Dixon, La Perouse, and Vancouver; but towards the end of the last century whaling-ships from America began to visit these seas, and they were soon followed by fur-traders; all these vessels put into some of the ports for provisions. At that time each island had its sovereign and several other chiefs. One of the latter, Tamehameha, succeeded in subduing all the islands except Tauai and Nihau, whose sovereign after the death of Tamehameha, acknowledged the successor of that prince as his king. As Tamehameha had succeeded in his enterprise by the aid of Europeans, he favoured their settlement in the islands, and in 1817 he placed his kingdom under the protection of England. His successor, Rho-Rho, came to London, where he died in 1824. Soon after the death of his father he had succeeded in abolishing idolatry, and in persuading the natives to accept the Christian religion (1819). Since that time many English and American missionaries have visited the islands, and have obtained considerable success. Several books have been printed in the native language at Honolulu and Laheina, and a map of the island has been engraved at Laheina.

Within the last few years, chiefly under the advice of American residents, a regular constitution, in imitation of the parliamentary constitutions of England and the United States of America, has been adopted by the king of the Sandwich Islands. The House of Nobles is composed of 25 members, including the king, queen, and four ministers, of whom three are foreigners—all the rest are natives. In the Lower House are 27 members, of whom eight are foreigners. The revenue of the government for the year 1850-51 was 315,735 dollars, being nearly seven-fold the revenue in 1842-43. The number of public free schools in 1853 was 423, with 12,205 scholars: of these schools, 344 were Protestant and 79 were Roman Catholic. Strenuous efforts have been recently made by Americans in the United States and in the islands to procure the annexation of the Sandwich Islands to the American Union.

(Cook, *Third Voyage to the Pacific*; Lord Byron, *Voyage of H.M.S. Blonde to the Sandwich Islands*; Ellis, *Tour through Hawaii*; Stewart, *Journal of a Residence in the Sandwich Islands*; *London Geographical Journal*, vols. iv. and vii.)

SANDWICH LAND is the name given by Cook to a number of islands in the Southern Atlantic, between 57° 10' and 59° 40' S. lat.

24° and 27° 42' W. long. The most northern group is called Candelmas Islands, and the most southern is named the Southern Thule. They are of volcanic origin. Some of them are very high, and covered with perpetual snow. Others are bare rocky masses, slightly elevated above the sea-level. The surrounding seas contain sea-elephants and octaceous animals.

SANNIO, or *Molise*, a third-class province of the kingdom of the Two Sicilies, lies chiefly on the east side of the central ridge of the Apennines, and extends as far as the Adriatic coast. The district of Isernia however, which belongs to the administrative province of Sannio, lies on the west slope of the Apennines, and belongs to the basin of the Volturno. Sannio is bounded N. by Abruzzo Citra and the Adriatic, S. by Capitanata, Principato Ultra, and Terra-di-Lavoro. The area is 2857 square miles; the population in 1851 amounted to 360,549. The province is crossed in its length by the river Biferno, the ancient Tifernus, which rises from two sources in the high Apennines near Bojano, and flowing north-east enters the Adriatic near the town of Termoli, after a tortuous course of about 60 miles. The other principal river of the province is the Trigno, which flows nearly parallel to, but to the north of the Biferno. In the lower part of its course the Trigno marks the boundary between Sannio and the province of Abruzzo Citra. South of the Biferno, the Fortore constitutes, for a small part of its course, the boundary between Sannio and Capitanata. The central ridge of the Apennines, which runs in a general direction from north-west to south-east, sends out several offsets, which run in a north-east direction to the Adriatic coast. Between these offsets there are valleys through which the rivers flow with a rapid course. The valleys and the lower hills are very fertile, and produce corn, maize, pulse, oil, wine, and fruits. Agriculture is however in a very low condition. The highlands are chiefly used for summer pasture. The forests are of small extent. The chief manufacturing industry in the province is that of cutlery and fire-arms, which is established at Campobasso, Frossolone, Lucito, and Agnone. Agnone has also copper-works. At Calletorto there is a profitable trade in hats, dressed skins, wax ornaments, and candles. Isernia has manufactures of woollen-stuffs, paper, and earthenware.

The province comprises the ancient territories of Larinum, of the Caraceni, and the Pentri. [SAMNIUM.] It has a civil and criminal court at Campobasso, from which there is an appeal to the High Court of Naples. The ecclesiastical administration is under the five bishops of Larino, Termoli, Isernia, Bojano, and Trivento. There are a royal college, and an institution for female boarders at Campobasso, and three grammar-schools at Cascalenda, Montenero-di-Bisaccia, and Morcone. There are elementary schools in many communes. The province is connected with Naples, and the towns on the Adriatic by excellent roads. [NAPLES.]

The following are the principal towns of the province:—*Campobasso*, a town indifferently built, situated on the slope of a hill above the valley of the Biferno, has an important corn-market, manufactories of cutlery, which supply the whole kingdom, and 9000 inhabitants. *Trivento*, in the valley of the Trigno, is a bishop's see, with 3000 inhabitants; it contains some ancient remains. *Sepino*, the ancient Sepinum, formerly a town of the Samnites, is situated in the Apennines, which here divide the valley of the Tiferno from that of the Tamaro, an affluent of the Volturno; it has several churches and convents, a classical seminary, a paper manufactory, and 4000 inhabitants. *Termoli*, the ancient Interamna, a small town of 2000 inhabitants on the sea-coast, between the mouth of the Trigno and that of the Biferno, has a castle on a promontory, and a neglected harbour. *Larino*, a small town of 4000 inhabitants, in the valley of the Biferno, not far from the sea, is the head of a district. [SAMNIUM.] *Agnone* is a thriving modern town, with iron- and copper-works, and about 7000 inhabitants. *Bojano* is an old decayed town in the Apennines, near the sources of the Biferno. *Isernia*, on the site of the ancient *Æsernia*, is an old-looking town, situated in a valley on the west side of the Apennines, near the Volturno, on the high road from Naples to Abruzzo. It contains several remains of antiquity, and has flourishing manufactories of pottery and paper, woollens, and a population of 5500. An ancient aqueduct carried through a tunnel a mile in length, supplies the fountains and manufactories of the town. Native sulphur is found in the hills round Isernia in the form of crystals. From Isernia a carriage-road branches off to the eastward, crosses the central ridge to Bojano, and leads to Campobasso and Larino. The province of Sannio comprises only a part of the ancient Samnium, which also included the whole of the Principato Ultra and part of Terra-di-Lavoro.

SANQUHAR, Dumfriesshire, Scotland, a royal and parliamentary burgh, is seated on the river Nith, in 55° 23' N. lat., 3° 57' W. long., 27 miles N.W. from Dumfries, 56 miles S.E. from Glasgow by road, and 65 miles by railway. The population of the royal burgh in 1851

was 1884; that of the parliamentary burgh was 2381. The town is governed by a provost and 16 councillors, three of whom are bailies. It unites with Annan, Dumfries, Kirkcudbright, and Lochmaben, in the return of one member to the Imperial Parliament. The town possesses a handsome parish church, a Free church, two chapels for United Presbyterians, and one for Reformed Presbyterians; a town-hall of some architectural pretensions; and a small prison. Some of the inhabitants are employed in weaving and sewing of muslin, and in carpet-making. The castle of Sanquhar is a very picturesque ruin.

SANSANDING, a town in Africa, in the kingdom of Bambarra, on the banks of the river Joliba, or Quorra, situated about 13° N. lat., 5° W. long. It is a place of considerable extent, containing about 10,000 inhabitants. It carries on an active trade with Timbuctoo by means of the river, which is navigable for large river-boats all the way between the two towns. All the salt which is consumed in the western countries of Súdán is brought from the Sahara, and passes through this town. By the cañals from El-Arawan it receives coral and beads from the Mediterranean. These articles are sent to the countries south and west of Sansanding, and exchanged for gold, ivory, slaves, wax, honey, and cloth of Súdán, which are afterwards sent to Walet and El-Arawan. The trade of this place is in the hands of the Moors.

SANTA CRUZ, RIVER. [PATAGONIA.]

SANTA ESPIRITU. [CUBA.]

SANTA FÉ, one of the riverine provinces of the Argentine Confederation, South America, extends along the right bank of the Rio Paraná, from about 29° to 33° S. lat., and between 59° 30' and 62° W. long., but the boundaries are not very distinctly defined. It is bounded S. by the province of Buenos Ayres; E. by Entre Rios; N.E. by Corrientes; N. by the Indian country called the Gran Chaco; and W. by the provinces of Cordova. The area is about 41,000 square miles; the population is under 20,000.

The country is low and much of it very infertile; in its natural state it is mostly covered with coarse grass, thistles, and low mimosa-trees. The surface is described generally under ARGENTINE CONFEDERATION. The southern, where it adjoins Buenos Ayres, is the only boundary which is not formed by a desert. A large portion of the country along the Paraná is a barren swamp, while the southern part is subject to very destructive periodical droughts. On the eastern side, where it abuts on Cordova, is the low uncultivated tract in which is situated the Laguna de los Porongos, and in which the rivers Primero and Segundo are lost. The northern boundary is the desert known as the Gran Chaco. But a large portion of the interior of the province is also unfit for agriculture, though it supplies indifferent pasture for cattle, which, with horses and mules, constitute the commercial wealth of the province. Formerly Santa Fé was the centre of communication between Buenos Ayres and the western provinces, with Paraguay, whose enormous supply of maté to those provinces, Chili, and Peru, mostly passed through Santa Fé. But the closure of Paraguay to external commerce, the disturbed state of Santa Fé, owing to domestic dissensions, and the frequent encroachments of the Indians from the Gran Chaco, almost entirely destroyed its trade, and reduced the inhabitants to poverty. Santa Fé is however so admirably situated for commerce that it cannot be doubted that, if the tranquillity of the country could be secured, the partial revival of trade, which has taken place since the opening of the navigation of the Rio Paraná, will be more than maintained; indeed it might be almost indefinitely extended with a larger, more wealthy, industrious, peaceable, and energetic people. The major part of the inhabitants are of Guarini origin, who settled here after the expulsion of the Jesuits in 1790. There are also many Indians, who reside in villages (of which Sauce, 7 miles west of the city of Santa Fé, is the chief), and spin the cloth and make the ponchos usually worn in the country; they are however generally wretchedly poor and degraded. Santa Fé, like the other provinces of the Argentine Confederation, owns a nominal dependence on the central government; the executive power is vested in a governor elected by the provincial assembly.

Santa Fé, the capital of the province, is a meanly-built place on the Rio Salado, a few miles above its confluence with the Paraná, in 31° 38' S. lat., 60° 49' W. long.: population about 3500. The town consists of a central square, and eight streets branching off from it at right angles, and contains the government buildings and four large churches, one of which is of considerable splendour. The port has convenient quays, but at certain seasons there are not more than 3 or 4 feet of water on the bar at the mouth of the river. The town was formerly the entrepôt of the goods which were exchanged between the western states and Paraguay, but that branch of commerce entirely failed when Paraguay broke off all connection with the adjacent countries, and at present the little trade it has is all in the hands of Italians, who navigate the Paraná and Plata by vessels of from 20 to 100 tons burden. It has some overland trade with Monte Video, from which it receives foreign goods.

Rosario, situated on the high and precipitous bank of the Paraná, a considerable distance below Santa Fé, appears likely to become the commercial emporium of the province, being situated in a fertile district, conveniently placed for the steamers navigating the Paraná; and much the most convenient port for the foreign commerce of the western and north-western provinces. It wears already a far more commercial appearance than the capital; has a larger population; and the inhabitants are said to be industrious and diligent. Mr. McCabe, whose visits were made for commercial purposes, says, in his 'Two Thousand Miles Ride through the Argentine Provinces,' that "next to Monte Video, Rosario is the most rising port in this part of South America."

SANTAREM. [BRAZIL; ESTREMADURA, Portuguese.]

SANTIA'GO, the capital of the republic of Chili, South America, is situated on the Mapocho, a feeder of the Maypú, in the plain of Santiago [CHILI], at an elevation of 1690 feet above the level of the sea, in 33° 25' S. lat., 70° 38' W. long., population about 50,000. The plain of Santiago, in which the city stands, from its great elevation above the level of the sea, is unfit for agricultural purposes, except where it is irrigated along the banks of some small rivers, and by a canal which brings water from the river Maypú to the vicinity of the town, and fertilises a tract more than twenty miles in length, and several miles in width.

Santiago is one of the finest cities in America in respect to buildings, convenience, and healthiness. It stands on a very gentle slope towards the west; and it is regularly laid out, being divided, like other Spanish towns, into rectangular and equal squares, called *quadras*. The principal streets are about forty-five feet wide; the houses are usually only one story high, on account of the earthquakes; but they are very large, and contain many rooms, arranged round three quadrangular squares, called *patios*. The Plaza, or great square, stands nearly in the middle of the city; it occupies the space of a whole *quadra*. It has a handsome bronze fountain in the centre, surrounded by a basin of hewn stone, from which the inhabitants are supplied with water by water-carriers. The buildings on the north-west side are—the government palace, the prison, and the chamber of justice; on the south-west side stand the cathedral, the only stone building in the city, and the palace of the bishop, an extensive building in the Moorish style; on the south-east side are a number of little shops; and on the north-east there are private residences. There is also a university. The only other important public building is the Casa de Moneda, or Mint, which is very large, but has ceased for several years to be used as a mint. There are several handsome churches and convents in Santiago, especially those of San Domingo, San Francisco, and San Augustin.

At the eastern extremity of the town is a small rocky eminence, on which the fort of Santa Lucia is built, which is much visited by foreigners on account of the beautiful view which it affords of the Andes. Adjacent to the hill on the north is the Tajamar, or break-water, raised to protect the city from the overflow of the Mapocho during the melting of the snow on the mountains. At the western extremity of the Tajamar is a handsome bridge over the Mapocho of eight arches, which leads to the suburb of Chimba. Along the south-western side of the city is the Cañada, which serves as the public walk, and is a large open place planted with four magnificent rows of poplars, which are watered by small canals constantly full of clear running water. The Cañada separates the city from the large suburb called La Cañadilla. At the western extremity of the city is the small suburb of Chuchunco.

Coarse ponchos and saddlery are made to some extent in Santiago, and sent to the other parts of Chili. Santiago exports the produce of its mines, and jerked beef, hides, and fruits to Valparaiso, from which place it receives the manufactures of Europe, China, and the East Indies, with sugar, cacao, and some other colonial productions from Peru and Central America. The road from Santiago to Valparaiso, a distance of 90 miles, is the best artificial road in South America; and practicable for carriages, though it crosses three ranges of steep hills. Santiago has some commercial intercourse with Mendoza, on the eastern side of the Andes, with which it is connected by two roads, the northern of which traverses the Andes by the mountain pass of Uspallata, which at its highest elevation, called the Cumbre, attains 12,454 feet above the sea-level, and may be passed on mules from the beginning of November to the end of May; while the southern road leads over the mountain pass of Portillo, south of Mount Tupungato, which attains an elevation of 14,865 feet above the sea-level, and is seldom open longer than from the beginning of January to the end of April. By these roads Santiago receives mules, hides, soap, tallow, dried fruits, and wine from Mendoza.

SANTIAGO DEL ESTERO, one of the provinces of the Argentine Confederation, South America, lies between 27° and 30° S. lat., 61°

and 65° W. long. It is bounded S. by the province of Cordova; S.E. by that of Santa Fé, from which it is separated by the Laguna Salados de los Porongos; E. by the desert tract known as El Gran Chaco; N. by the province of Tucuman; and W. by that of Catamarca, from which it is separated in part by the desert tract called the Gran Salinas. The area is about 70,000 square miles; the population is under 50,000.

The province of Santiago comprehends the western part of the Gran Salinas, the country between the Rio Dulce and the Rio Salado, south of 27° S. lat., and also a large tract of the Gran Chaco, to the east of the Rio Salado. The surface of the country and its hydrography are described generally under ARGENTINE CONFEDERATION. It is for the greater part a level country, but it extends on the south-west towards the hilly region surrounding the Sierra de Cordova. The climate is considered to be the hottest in South America. By far the larger part of the country is very infertile. The good land is of comparatively small extent, and almost entirely limited to a narrow tract along both sides of the river Dulce, and a still smaller tract on the banks of the Salado. Though the soil is sandy, it has great fertility in the neighbourhood of the river, producing plentiful crops of maize and wheat, and some good grass. Where it is not cultivated, it is mostly covered with large trees. In the deserts which surround the cultivated tract that species of cactus on which the cochineal insect lives (*Cactus opuntia*) grows to an extraordinary size, and is very abundant. Formerly a considerable quantity of cochineal (from 8000 to 10,000 lbs. annually) was sent to Peru and Chili. A large quantity of wild bees' wax and honey was also collected in the woods; but since the occurrence of the civil dissensions these pursuits have been almost entirely abandoned. Some districts have good pasturage. Among the inhabitants are many Indians who speak the Quichua language, and manufacture ponchos (cloaks) and coarse saddle-cloths or blankets. Some soda is extracted on the borders of the Gran Salinas from the *salsola*. Like the other provinces of the Argentine Confederation, Santiago is a federal state, owning a qualified dependence on the central government. The executive power is vested in a governor elected by the junta, or provincial assembly.

Santiago del Estero, the capital of the province, is situated on the right bank of the Rio Dulce, in 27° 47' S. lat., 64° 3' W. long., population about 4000. It is a straggling ill-built place, but is the emporium of the little internal and foreign trade which the province now possesses. *Matará* is a small place on the Rio Salado, where it begins to be navigable.

SAÔNE, HAUTE, a department in the east of France, is bounded N. by the department of Vosges, E. by that of Haut-Rhin, S. by that of Doubs and Jura, and W. by that of Côte-d'Or, and Haute-Marne. The greatest length is from east-north-east to west-south-west, 72 miles; the greatest breadth, at right angles to the length, is 38 miles. The area of the department is 2064½ square miles. The population in 1841 was 347,627; in 1851, 347,469, giving 168·3 inhabitants to a square mile, or 6·2 below the average of the French departments.

The eastern side of the department is occupied by the branches of the Vosges, the main ridge of which is just upon the border. The principal elevations are Le Ballon de Servance, 3967 feet; and Le Ballon de Lure, 3718 feet. A range of heights branching from the Vosges skirts the right bank of the Oignon, as far as the road between Vesoul and Besançon, and indeed rather farther; and some of the branches of the Faucilles overspread the northern portion of the department.

The east of the department is occupied by the primary rocks which form the nucleus of the Vosges. The country on the west and south of this primary district is occupied by the sandstone of the Vosges and other of the lower secondary formations, but the greater part of the department is occupied by the secondary formations which intervene between the cretaceous group and the sandstone of the Vosges. The minerals are granite, porphyry, freestone, stone for lithography, and excellent grindstones, gypsum, and a white sand valuable for the manufacture of glass, coals, and iron. Numerous coal- and iron-mines are worked. There is a large number of furnaces and forges for the manufacture of pig- and bar-iron and steel. Peat is also procured. There are several mineral-springs, of which those of Luxeuil, a town at the foot of the Vosges, are the most frequented.

The department belongs to the basin of the Saône. The Saône, the ancient *Arar*, rises in the department of Vosges, and enters Haute-Saône near Jonvelle. Hence it runs in a general southern direction through this department past Gray and across an angle of Côte-d'Or. It then enters the department of Saône-et-Loire, passing Châlon, and

reaches the department of Ain below Tournus. From this point to its junction with the Rhône at Lyon, it flows nearly due south. The whole length of the Saône is 280 miles, of which 162 below Gray are navigated by steamers and large barges. During the freshes of the river many large rafts of square timber, loaded with staves, iron, and other heavy produce are floated down to Gray and the towns above it. Near St.-Jean-de-Loane it is joined by two canals, which connect it with the Rhine and the Seine. The stream is proverbially gentle. The principal tributaries which it receives are the Coney, the Superbe, the Lanterne, the Drejon, the Romain, the Morte, and the Oignon, on the left bank; and the Amance, the Gourgeon, and the Saulon on the right bank. Of these the Oignon is the most important: it rises near the eastern extremity of the department amid the Vosges, and flows south-west, partly within, partly upon the border, 90 miles into the Saône. The department is crossed by 5 state and 14 departmental roads. The department has no canals nor railroads. A railway however is authorised to be made from St.-Dizier, in Haute-Marne, to Gray, which will connect the basin of the Upper Saône with the Strasburg-Paris line.

The heat of summer and the cold of winter are less intense than in the adjacent departments, the autumn is usually fine; but the spring is variable. The soil is on the whole fertile. About half the area of the department is under the plough. The chief crops are wheat, rye, maalin (wheat and rye mixed), maize, barley, oats, and potatoes. A surplus of wheat is grown for export to the southern departments from Gray, which is one of the greatest corn-markets in France. Millet, beet-root, pulse, and seeds for oil are also grown. The grass-lands occupy an area of nearly 150,000 acres; they are chiefly along the banks of the Saône and Oignon, and afford abundance of good pasture. The heaths and commons occupy nearly 55,000 acres. The number of horned cattle is above the average; but the number of horses, and still more of sheep, is below the average. Pigs, goats, and asses are reared, but the mule is rare. The vineyards occupy nearly 30,000 acres; the wine is of very ordinary quality. The woods occupy nearly 400,000 acres, and contain abundance of oak, beech, and hornbeam; on the slopes of the Vosges there is abundance of fir-timber. The wolf, the fox, the squirrel, and the otter are common. Game is tolerably plentiful. The rivers abound with fish, including trout, carp, pike, barbel, eels, and grayfish.

The manufactures comprise iron and ironmongery of all kinds, carried on in 60 furnaces, forges, and foundries; glass, pottery, bricks, leather, spirits, cotton-stuffs, paper, hats, druggat, hosiery, canvass, seed-oil, &c. There is a good trade in agricultural produce, timber, staves, deals, cheese, salt, and cattle.

The department is divided into three arrondissements as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Vesoul	10	215	113,862
2. Gray	10	203	144,372
3. Lure	8	166	89,235
Total	28	583	347,469

1. In the first arrondissement the chief town is *Vesoul*, which is also the capital of the whole department. It is situated at the base of a conical hill at the junction of two small streams that form a feeder of the Saône, 200 miles S.E. from Paris, and has 6061 inhabitants in the commune. It is well built, and is adorned with public walks. There are a church, with a handsome high altar in marble, a town-hall, a court-house, a covered market, and handsome cavalry barracks; there are also a theatre, an hospital, and public baths. The manufactures are calicoes and other cottons, braid, hats, nails, hosiery, and olock and watch works. There are dye-houses, tan-yards, and wax bleaching-works. Trade is carried on in corn, hay, wine, cattle, iron, and hides; there are twelve yearly fairs. The town has a college, a public library of 21,000 volumes, an agricultural society, an ecclesiastical school, a normal school, a scientific society, and a departmental nursery-ground. The other towns of the arrondissement are small: they are *Jussy*, 18 miles N.W. from Vesoul, population 2800; *Pont-sur-Saône*, 8 miles W. from Vesoul, population 2200; *Scy*, on the Saône, which is here crossed by a fine bridge of 14 arches: population, 2150. *Scy-sur-Saône* has iron-works and tanyards; the neighbouring country is beautiful and fertile.

2. In the second arrondissement the chief town, *Gray* (population 6703), is built on the slope of a hill above the Saône, 80 miles S.W. from Vesoul, and is commanded by the ruins of an ancient castle formerly inhabited by the dukes of Bourgogne. The streets are crooked and steep, but the houses are built with tolerable regularity. There are cavalry barracks, a theatre, a fountain, a public walk, an exchange, two hospitals, and several parish churches. Some woollen cloth and other articles are manufactured; but the chief business of the town arises from its situation on the Saône, on which river goods are here embarked from different parts of Lorraine, Champagne, Bourgogne, and Franche Comté, in order to be sent to the south of France; and goods from the south are landed. There are immense mills of different kinds on the Saône. One of them, the great flour-mill of M. Tramoy, contains 11 hydraulic wheels, worked by water-

power derived from the Saône, and driving 11 pairs of millstones. The flour is sent down the river chiefly to Lyon and Marseille. The chief articles of trade are corn, hay, timber, deals, wine, iron, and colonial produce. Gray has a tribunal of first instance, an agricultural society, a college, and a public library. At *Champlitte*, which stands 14 miles N.W. from Gray in the valley of the Saône and has 3100 inhabitants, linens, druggats, brandy, and hats are manufactured. The hills around Champlitte are covered with vineyards. At *Gy*, 11 miles E. from Gray (population 2700), druggats, cotton goods, and vinegar are made, and considerable trade is carried on in wine.

3. In the third arrondissement the chief town is *Lure*, which is situated in a marshy plain 16 miles N.E. from Vesoul, and has 3346 inhabitants in the commune. Lure was formerly celebrated for its Benedictine abbey. The sub-prefect occupies the former residence of the abbot. The town consists principally of one long and very wide street, into which some smaller streets or lanes open; the houses are low, but tolerably well built. The inhabitants have tan-yards and dye-houses, and carry on trade in leather, iron, corn, timber and cheese. Straw-hats are made in the district. The town has a tribunal of first instance and a college. Among the other towns are *Champagny*, 8 miles N.E. from Lure, population 3000, mostly employed in the neighbouring coal-mines; *Héricourt*, a well-built town, 15 miles E. from Lure, with above 3500 inhabitants, several cotton-mills, some of which are driven by water and some by steam, tan-yards, breweries, and tile-works; *St.-Loup*, at the foot of the Vosges, population 2600; and *Luxeuil*, a well-built town on the Breuchin, 12 miles N.W. from Lure, population 4000, engaged chiefly in trade and in large iron-works near the town. Luxeuil is frequented for its hot mineral-springs, which were known to the Romans. It was in former ages still more celebrated for its abbey and school, founded by St. Columbanus A.D. 590.

This department, with that of Doubs, constitutes the archiepiscopal diocese of Besançon; it is included in the jurisdiction of the High Court and within the limits of the University Academy of Besançon. The department returns three members to the Legislative Chamber of the empire. It is included in the 7th Military Division, the headquarters of which are at Besançon. The Lutherans have a consistory at Héricourt, and churches at four other places in the department. The Lutheran service is performed in the nave, while mass is celebrated in the choir of the parish church of Héricourt.

(*Dictionnaire de la France.*)

SAÔNE-ET-LOIRE, a department of France, bounded N. by Côte-d'Or, E. by Jura, S. by those of Ain, Rhône, and Loire, and W. by those of Allier and Nièvre. Its greatest length from north to south is 68 miles, from east to west 85 miles. The area is 3306.7 square miles. The population in 1841 was 551,548; in 1851 it had fallen to 534,720, which gives 161,708 inhabitants to a square mile, being 12.876 below the average per square mile for the whole of France.

The department is traversed from south to north through its centre by the Charolais and Mâconnais heights, which form the prolongation northward of the Cévennes, and unite them with the Côte-d'Or, the heights of Langres, the Faucilles, and the Vosges. [CÉVENNES.] These heights in the southern part consist of short parallel ranges of hills, which are separated by longitudinal valleys drained by the feeders of the Saône or the Loire. In the northern part of the department they do not occupy so much space as in the southern, and consist of two ranges of low hills separated by the valley of the Dheune, through which the Canal-du-Centre passes. On the eastern and western sides of these heights the surface of the department is tolerably level.

The nucleus of the mountain chain is granite, which prevails also in the country westward. The eastern slopes and the plain at their base nearly to the Saône, are occupied by the oolitic formations. A considerable extent of country also around Charolles, on the west side of the heights, and extending northward almost to the Arroux, is occupied by the same formations. The immediate banks of the Loire (above the junction of the Arroux) and of the Saône, and that portion of the department which lies east of the Saône, are occupied by the tertiary formations.

In minerals this is one of the richest departments in France. The hungry ungrateful soil of the basin of the Arroux covers one of the richest coal-fields in France. Iron-ore is found also in this district, and numerous important iron-works are established near the coal-mines. At Creuzot, where both coal- and iron-mines are worked, there are some of the most important iron-works in France, and great foundries which turn out cannon, anchors, steam-machinery, mill-castings, &c. The produce of these coal-fields is distributed by means of a railroad 17 miles long, which conveys the coal to the Canal-du-Centre. The richest manganese-mine in France is at Romanèche, near the Saône, in the south of the department. Marble, alabaster, lithographic stones, and abundance of freestone are quarried.

The department is partly in the basin of the Loire, partly in that of the Saône. The line of separation between the two basins is formed by the Charolais heights, the country on the east of them being drained by the Saône, and the country on the west by the Loire. The Saône itself enters the department on the north-east side from Côte-d'Or, between Seurre and Verdun: it pursues a winding course south-south-west past Verdun and Châlon, from which town its course is more directly south, to the junction of the Reyssouce, whence it

separates the department from that of Ain. Its length within or upon the border is about 70 miles, navigable throughout. Its principal affluents are the DOUBS and the Seille, on the left bank; and the Dheune, the Gaye, and the Grône, on the right bank. The Doubs receives the Guiotte on its left bank, and the Seille receives the Solman and the Sane on its left bank. The Seille is navigable from Louhans.

The Loire enters the department on the south-west side, crosses the south-west corner, and for the remainder of its course, until it quits the department altogether, forms the western boundary; about 53 miles of its course, all navigable, belong to this department. It receives the Arconce, or Reconce; the Arroux, which has 12 miles of navigation; the Somme and the Tannay, all on its right or east bank. There are a number of small lakes, some of them on the watershed of the two river-basins.

The Canal du Centre, formerly the Charolais Canal, unites the Loire and the Saône. It commences in the Loire at Digoin, and follows the valley of the Arroux for a very short distance, then that of the Bourbinois, a feeder of the Arroux; at the head of which valley is its summit-level, about two miles long, where the canal crosses a depression in the Charolais heights; it then descends by the valley of the Dheune to the neighbourhood of Chagny, where it turns off, and joins the Saône at Châlon. Its length may be estimated at 75 miles, all in this department. The lateral canal to the Loire consists of two parts, one extending from Roanne, in the department of Loire, to Digoin, in this department; the other from Digoin to Briare, in the department of Loir-et-Cher. The total river and canal navigation of the department amounts to about 270 miles.

The climate is changeable in the Charolais heights; it is too cold in this part to allow the culture of the vine. In the rich plain extending from these heights to the Saône the climate is delightful. Of the total area of the department, more than half is under the plough. The chief crops are wheat, rye, maalin, maize, barley, buckwheat, and potatoes. That part of the department which lies to the east of the Saône is chiefly a corn-growing district; the parts immediately adjacent to the river are productive in wine and pasturage, as well as in corn; and the plain between the heights and the Loire abounds in pasture. The meadows and grass-lands have an extent of nearly 320,000 acres, besides 64,000 to 65,000 acres of heath and common. The number of horned-cattle is above the average. The beef of the district is very good; the principal supply of Lyon is from this department. The number of horses and sheep is small. A considerable number of pigs is bred. Oxen are very generally employed in the labours of agriculture, and a considerable number is sent from the neighbourhood of Charolles for the supply of the markets of Paris. The vineyards occupy about 95,000 acres, and some of the wines, especially those grown in the neighbourhood of Mâcon, are in very high repute. The great bulk of the vintage however ranks only as common table-wine. The woodlands occupy above 400,000 acres; the timber is chiefly oak, beech, ash, pine, fir, and chestnut. The wolf and the wild boar are met with in the Cévennes.

Besides the industrial products already mentioned, the inhabitants manufacture steel, glass bottles, paper, copper ware, beet-root sugar, cotton stuffs, leather, pottery, druggot, felt hats, wine casks, oil, flour, bricks, &c.

The department is divided into five arrondissements, as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Mâcon	9	133	122,401
2. Autun	8	85	100,286
3. Charolles	13	138	133,304
4. Châlon	10	155	130,173
5. Louhans	8	81	88,556
Total	48	592	574,720

1. The first arrondissement is named from its chief town, MÂCON, and among the other places worth naming is *Cluny*, situated in the valley of the Grône, 12 miles N.W. from Mâcon, and famous for its ancient Benedictine abbey, which was founded by William I. of Aquitaine, A.D. 910, and destroyed at the time of the first French revolution. The town has a college and 4260 inhabitants, who manufacture druggot, steel-ware, paper, vinegar, leather, &c. The abbot's house is the only part of the buildings of the Cluniac monks now still standing. *Tournus* is pleasantly situated at the foot of a little hill on the right bank of the Saône, over which there is a good wooden bridge: the houses are indifferently built; there are two public walks and a quay along the river. The townsmen manufacture hats, blankets, calicoes, cotton-counterpanes, beet-root sugar, and potash; they send a great quantity of good building-stone to Lyon by the river, and carry on trade in corn and wine. There are twelve yearly fairs. There is a tribunal of commerce at Tournus. The population of the town is 5300.

2. In the second arrondissement the chief town is AUTUN. The other towns are—*Couches*, 13 miles S.E. from Autun: population, 3050. *Épinac*, in a rich coal-field, 10 miles E. from Autun: population, 2800. *Luy-l'Évêque*, 22 miles S. by W. from Autun: population, 2000; and *Montcenis*, 15 miles S. by E. from Autun: population, 1500. Mont-

cenis formerly gave name to a county belonging to the dukes of Bourgogne, the ruins of whose castle still cover a hill above the town. Near Montcenis is the village of *Cressot*: population, 6100. From 1500 to 2000 workmen are employed in the coal- and iron-mines, iron-works, glass-works, &c.

3. In the third arrondissement the chief town, *Charolles*, is situated at the junction of the Semence and Arconce, 28 miles W. by N. from Mâcon, and has about 3000 inhabitants. Charolles has tribunals of first instance and of commerce, an agricultural society, and a college. The townsmen are engaged in the iron-works and potteries of the neighbourhood. Among the other towns are—*Bourbon Lancy*, famous for its hot-springs, 27 miles N.W. from Charolles: population 2900. *Chaussailles*, a busy modern little town of 3600 inhabitants, who manufacture linen and cotton stuffs, is 17 miles S. from Charolles. *Digoin*, at the junction of the Canal du Centre with the Loire, population 3100. *Marcigny*, 18 miles S. by W. from Charolles, has 2500 inhabitants, who manufacture leather and table-linen, and carry on trade in corn and wine. *Paray-le-Monial*, near the Canal du Centre, has a fine gothic church (which dates from A.D. 1004), and 3400 inhabitants; and *Toulon-sur-Arroux*, 20 miles N.N.W. from Charolles: population, 2340.

4. In the fourth arrondissement the chief town is CHÂLON, or Châlon-sur-Saône. *Chagny*, 10 miles N.W. from Châlon (population 3000), is rather a pretty town in the midst of a country of vineyards; *Givry*, a well-built town of 3000 inhabitants, is situated 6 miles W. from Châlon, in a country which produces excellent wines; *Sennecey-le-Grand*, 9 miles S. from Châlon, is a handsome well-built town, with 2600 inhabitants, who carry on trade in corn and wine; *Verdun*, at the junction of the Doubs and Saône, situated partly on a hill, partly on a plain (which is protected by dykes from the floods of the two rivers), was formerly a strongly fortified place. Its defences were demolished by Henri IV. and Louis XIV.: population, 2000.

5. In the fifth arrondissement the chief town, *Louhans*, an ill-built place on the Seille, 19 miles S.E. from Châlon, is an old town, with the upper stories of the houses projecting over the causeway. It has an hospital, an agricultural society, a college, tribunals of first instance and of commerce, and 3700 inhabitants, who manufacture flour, leather, and trade in cattle, poultry, &c. It stands on the left bank of the river Seille, the navigation of which commences here. The other cantons are named from mere villages.

The department is well provided with the means of communication both by land and water. It is traversed by 7 government, 21 departmental, and several parish roads; and also by the Paris-Marseille railway, which runs down the right bank of the Saône from Châlon to Lyon, and passes through Mâcon. From Châlon, lines are authorised to be constructed to Dôle, in the department of Jura, whence one branch is to run to Besançon, another to Gray, and a third to Lons-le-Saulnier.

The department constitutes the diocese of Autun, in the ecclesiastical province of Lyon-et-Vienne. It is in the jurisdiction of the High Court of Dijon, and within the limits of the University-Academy of Lyon. It is in the 8th Military Division, the headquarters of which are at Lyon. It sends four members to the Legislative Chamber of the empire.

SARATOV, a government of Asiatic Russia, lies between 48° and 53° N. lat., 42° 20' and 51° 20' E. long. It is bounded N. by Pensa, Simbirsk, and Orenburg; E. and S. by Astrakhan; and W. by Tambow, Voronets, and the country of the Don Cossaks. The northern frontier is 375 miles in extent, but the southern only 75 miles. The area is about 74,590 square miles; and the population in 1846 was 1,718,600. The soil of this government is very unequal: to the east of the Volga, which traverses it from north to south, and divides it into two nearly equal portions, it forms a barren steppe of great extent; on the west of the Volga the surface is undulating and varied with hills, very fruitful in the northern part, but poor and stony towards the south. In the western portion there are hills of slate and limestone, which are pretty elevated in the south, and accompany the right bank of the Volga as far as Zaritayn. These hills separate the Volga from the Don. The Volga traverses the government in its whole length from north to south, as far as Sarepta below Zaritayn, where it forms an elbow, and running to the east, divides this government from that of Astrakhan. To the west of the Volga there are some tributaries of the Don, which run from south to north. In the eastern part there are many lakes, the most remarkable of which is the salt-lake of Elton, on the south-east, towards the frontier of Astrakhan. On the north side the banks rise rapidly; on the south access to it is easy. The lake is of an oval form, the longest diameter being about 11 miles

and the shortest nearly 9 miles. The superficial extent is 45,500 English acres. There are some other less considerable salt lakes. The climate is temperate, the air dry and healthy. The mean summer heat is 64°, and the mean winter cold 23°; the greatest cold is -17° and the greatest heat +97° of Fahrenheit's thermometer. Violent whirlwinds are frequent. The steppe beyond the Volga serves only for pasturage, and it is only along the banks that there is a little cultivation. To the west of the Volga agriculture is the chief occupation of the inhabitants; and in the north-west part the soil is so rich as to need no manure. Rye, wheat, oats, millet, peas, flax, and hemp are cultivated. The foreign colonists have introduced the cultivation of tobacco, hops, and madder. The inhabitants cultivate melons (especially water-melons), fruit-trees, and even vines about Sarepta, and mulberry-trees at Saratov. The forests, which are chiefly to the north-west, consist of oaks, pines, maples, and poplars, but though pretty extensive, they do not suffice for the general consumption. The breeding of cattle is, next to agriculture, the chief occupation of the inhabitants; the breed of sheep, which yield coarse wool, has been improved by the importation of merinos. The Tartars keep a great quantity of bees. The fisheries on the Volga are productive. The minerals are salt, millstones, and a little iron.

The government is divided into 10 circles, and comprises a mixed population composed of Russians, Tartars, Cossaks, and other tribes, besides a great number of foreign colonists, who were originally introduced by Catherine II., chiefly from Switzerland and Germany. Most of the colonies are on the right bank of the Volga between Volkug and Kamyschinst, and on the banks of the Medweditz and of the Ilawliß, which fall into the Don. The names of Soleure, Schaffhausen, Zürich, Glaris, Lucerne, Unterwalden, &c., which are given to these villages, indicate the original country of the founders. The little town of Sarepta was founded by the Moravian brethren, and is still occupied by members of that society.

Saratov, the capital of the government, population about 45,000, is situated on the right bank of the Volga, in 51° 31' N. lat., 46° E. long., in an arid and barren valley, between the river and a range of rather high calcareous mountains. The town, which is neither handsome nor regular, is divided into the upper and lower towns; it was built on its present site in 1685, and has been frequently ravaged by fire. The greater part of the city is built of wood. There are seven stone and several wooden churches, two convents, a very large market-place or bazaar, a gymnasium, and a botanic garden. Saratov is the seat of a consistory for the Protestant communities (except the Moravians at Sarepta) in the governments of Saratov, Astrakhan, and eight other governments, and is also the centre of a very extensive and advantageous trade. Three large annual fairs are held here. *Volgak*, with 8500 inhabitants, is a very pretty town, built at the foot of a high mountain on the right bank of the Volga, above 90 miles above Saratov: it is inhabited by wealthy merchants, who carry on a considerable trade. The neat town of *Sarepta* was founded in 1765. It is situated on the right bank of the Volga, near the junction of the Sarpa, and has about 3000 inhabitants. All the streets, which are planted with poplars, terminate in a very large market-place, with a fountain in the centre, which supplies every house with water. The Moravians intended at first to follow agriculture, but in the midst of an arid steppe they could not execute this project; they now have manufactures of linen-cloth, tobacco, liqueurs, &c., with which they carry on considerable trade with the Kalmucks. The brethren cultivate their gardens around the town with much care. *Kamishin*, population about 7000, is situated on the Volga, at the junction of the Kamishirka. It has a considerable trade in agricultural produce. There are several salt-stores, tallow factories, and water-mills. The town is protected by a wall. *Kuensk*, population 4500, about 110 miles N. by E. from Saratov, has a good trade in timber. There are some iron-works, and tan-works. *Petrowsk*, population 7000, on the river Medweditz, carries on some trade in corn. The town possesses a citadel. *Zaritsyn*, or *Tzaritsin*, population 4600, is situated on the right bank of the Volga, about 230 miles S.S.W. from Saratov. This place is celebrated for its mineral waters.

SARAWAK, a province on the north-western coast of the island of Borneo, of which Sir James Brooke is the Raja, or governor, under the appointment of the Sultan of Borneo. The province of Sarawak extends between 1° and 2° N. lat., 109° 40' and 111° 40' E. long. It is watered by the river Sarawak and its tributaries. [BORNEO.] The capital, Sarawak, formerly Kuchin, contains a population of 12,000.

SARDEGNA, SARDINIA, a large island in the Mediterranean Sea, situated between 38° 52' and 41° 17' N. lat., from Cape Spartivento, the most southern point, to Cape Longosardo on the north, and between 8° 4' and 9° 50' E. long., from Cape Caccia near Alghero, the most western point, to Cape Comino on the eastern coast. It is 160 miles in length, the average breadth is 69 miles, leaving out the projections. The area is variously stated, some estimates making it 9300 square miles, which is considerably more than the area of Sicily, others make it only 8021 square miles, being a little less than that of Sicily. The north-eastern point of the island, near Terranova, is about 150 miles W. by S. from the mouths of the Tiber, and Cape Carbonaro, at the south-eastern extremity, is about 300 miles W. from the coast of Calabria. Cape Spartivento, the most southern point of Sardinia, is about 120 miles north of Cape Serrat on the coast

of Tunis; and Cape Carbonaro, the south-east point, is 170 miles from Trapani on the north-west coast of Sicily. Towards the north, the narrowest part of the Strait of Bonifacio, which divides Sardinia from Corsica, is about 9 miles across. The situation of Sardinia is central with regard to Italy, Sicily, Barbary, France, and Spain. The island contains excellent harbours; San Pietro and Porto-Conte on the western coast, the roadsteads of Maddalena on the northern and Terranova on the eastern coast, besides the spacious bays of Cagliari, Palmas, Oristano, and Alghero, and the roadsteads of Vignola, Tortoli, and Porto Torres.

A chain of primitive mountains runs from north to south along the whole eastern side of the island, occupying about one-third of its surface, and forming the wild districts of Gallura, Ogliastra, Barbagia, Sarabus, and Badui: this range consists of granite and schistus, with large masses of quartz, mica, and felspar. Few of the summits exceed 3000 feet, except the Peak of Limbarra in the Gallura, which is 3686 feet high, and the Genargentu range, which is near the centre of the island, and attains an elevation of 5276 feet. West of this highland region, and along the central length of the island, there is a succession of fine plains intersected by ranges of smaller hills, and stretching in some places as far as the western coast, such as at Oristano and Alghero. The remaining part of the western coast is occupied by several unconnected mountain groups, some primitive, some secondary, and others of volcanic formation, jutting out in numerous and picturesque headlands, and giving to that part of the island a more varied and pleasing aspect than the abrupt and iron-bound eastern coast. At the south-western extremity of the island are the mountains of Sulcis, consisting of granite and primitive limestone, separated from the eastern chain by the Campidano, or wide plain, which spreads north of Cagliari towards Oristano. North of the Sulcis, and separated from it by the romantic valley of Iglesias, are the mountains of Murgiani and Arcuentu, which rise along the western coast, and the latter of which attains the height of 2316 feet. North of these lies the deep Gulf of Oristano, and east of it is a great plain, through which flows the Tirsì, the principal river of Sardinia. North of this plain, and near the western coast, is the group of Monte Ferru, which rises 2796 feet above the sea; and farther north, towards Alghero, is Monte Minerva, 2400 feet high. A succession of highlands, partly of volcanic formation, extends north of the basin of the Tirsì, and quite across the breadth of the island, through the district of Goceano, and joins the mountains of Gallura on the eastern coast. This range divides the north-west part of the island from the remainder. At the northern base of it is the extensive plain called Campo d'Ozieri, and Campo di Giavesu, through which the river Coguinus flows to the northward. This plain is bounded on the north-west by a hilly tract mostly of volcanic formation, one point of which, whereupon stands the town of Osilo, is 2009 feet high. West of this hilly tract is the plain of Sassari, extending from the northern coast at Porto Torres to the western sea towards Alghero.

North-west of the plain of Sassari is the mountainous peninsula of Nurra, which stretches out into the sea, terminating in three abrupt headlands: Cape Caccia to the south, above 500 feet high; Cape Argentaro to the west; and Cape Falcon, the Gorditanum Promontorium of Ptolemy, to the north. A narrow and shallow strait, lined with sharp rocks, runs between this cape and the island of Asinara, the ancient Herculis Insula, a mountainous island of a long irregular shape, indented by several gulfs and coves, and having nearly 30 miles of coast-line to a comparatively small surface. It is inhabited by a few shepherds and farmers. The north and west coasts of Asinara are very steep, Mont Scommunica, the principal elevation, being 1500 feet above the sea. The whole peninsula of Nurra is covered with mountains, the northern parts of which consist of great masses of granite with schistose rocks, and the southern part is compact limestone with gypsum and quartz. The principal summits in this range are from 1400 to 2000 feet high.

An ancient volcanic district extends along the centre of the island, beginning at Monastir, north of Cagliari, and running northward between Nurri and Sardara: it comprehends the towns of Ales, Milis, and San Lussurgiu, which last is built in the crater of an extinct volcano. It then extends to Bonorra and Queremula, on the border of the great northern plain of Giavesu, where a crater is clearly distinguishable, which from its unbroken conical shape and fine red ashes bears the appearance of comparatively recent action; and the whole surrounding country consists of slaggy lava, rugged scoriae, obsidian, and indurated pozzolana, with large hills of porphyritic tufa towards Bonorra, lying over calcareous rocks. The volcanic beds extend farther north, through Codrongianus and Osilo in the hilly region east of Sassari, where remains of craters occur, to Castel Sardo, on the northern coast, where they form abrupt cliffs 300 feet above the sea. The town-wall and most of the houses of Castel Sardo are built of lava. The river Coguinus forms on this side the geological boundary between the primitive formations of the eastern country, and the trap and volcanic products to the westward. At Nurri, in the southern part of the island, on the borders of the eastern highlands overlooking the Campidano, or great plain of Cagliari, are two hills called 'Pizz'e Ogheddu' and 'Pizz'e Ogu Mannu,' meaning peaks of the little and great eye, which appear to have been ignivomous mouths. A lava stream has run from them over a calcareous tract, which forms an

elevated plain or table-land nearly 1600 feet above the sea, called Sa Giara a Serri, from the neighbouring village of Serri. This plain is covered with oak, ilex, and cork-trees, while its northern declivity contains rich pasture. North-west of this plain is the Giara, or lava-bed of Gestori, of similar formation, which has proceeded from a crater near the town of Ales: it is strewn with masses of obsidian and trachytic and cellular lava, so as to resemble a city in ruins. At Monastir, in the plain north of Cagliari, there is a distinct double crater, now well wooded, and a bridge has been constructed there of fine red trap over a feeder of the Ulla.

The principal rivers of Sardinia are:—1. The *Tirsi*, the *Thyrus* of Ptolemy, which drains the central part of the island. It rises near Buduso, on the west side of the Gallura Mountains, flows first south and then south-west, along the base of the Goceano ridge, passes through the fine valley of Ottana, receiving several tributary streams from the mountains of Genargentu; then flowing by Fordonianus it enters the plain of Oristano, passing north of that town, below which it turns abruptly to the south, and enters the sea after a tortuous course of between 70 and 80 miles. In very dry summers it is fordable near its mouth, but in winter it contains a vast mass of water, and inundates considerable tracts. 2. The *Coguinis*, in the northern part of the island, rises in the volcanic region of Bonorva, flows northward through the plains of Giavesu and Osieri, receives several streams from the highlands of Goceano and of Gallura, passes between Mount Sassu and the Limbara ridge, when it assumes the name of Rio di Partidas, and flowing through a romantic ravine below the cliffs of Castel Doria, enters a fine plain adjoining the sea. It forms a small lake near its mouth, a few miles east of Castel Sardo. The course of the *Coguinis* is between 50 and 60 miles, and it is fordable near its mouth, except in rainy seasons. 3. The *Flumendoso*, the *Saprus* of Ptolemy, the principal stream of the eastern part of the island, rises in the mountains of Corno di Bue, and runs southward through a high valley between the ridge of Genargentu on the west and the Ogliastra Mountains to the east, passing through many solitary glens. It then turns eastward between the mountains of Sarrabus on one side and the hills of Parte Olla, which divide it from the Campidano, or plain of Cagliari, and afterwards winding through the fertile grounds of Villa Puzzu, San Vito, and Muravera, enters the sea between two low rocky points on which stand the towers of Kalinas and Corallo, after a course of between 50 and 60 miles. As it runs between two mountain ridges, the basin of the *Flumendoso* is very narrow; in the winter it is swelled with the drainage of the surrounding mountain region, and it then assumes a very imposing appearance. 4. The *Manna*, or *Ulla*, rises in a fountain in the table-land of Sarcidanu on the south slope of the Genargentu ridge, and, flowing southward through the plain of the Campidano, is joined by the Calarita from the mountains of Gergei on the east, and the Sixerris, which comes near Iglesias, from the west. The united stream enters the *Lake of Cagliari*, which lies west of that city, and is 6 or 7 miles long by 3 or 4 miles broad, and communicates with the sea by seven cuts through a narrow strip of sand. This lake is navigated by flat-bottomed boats, and contains abundance of eels, mullets, and other fishes; it is also frequented by flamingoes and pelicans in the winter. Between the lower course of the *Flumendoso* and Cape Carbonara is a remarkable seven-peaked ridge (2310 feet high), called *Sette-Fratelli* (Seven Brothers), which fills up the south-eastern angle of the island. Besides these four rivers there are many smaller streams, such as the *Turrucano*, which flows through the plain of Sassari, and is crossed near its mouth by a substantial Roman bridge in excellent preservation; the *Terma*, or River of Bosa, on the western coast; and the *Cedreno*, or River of Orosel, which is navigable by boats for about a mile and a quarter inland on the eastern coast; it is an abundant and impetuous stream from its source, which is on the eastern slope of the Barbagia Mountains.

The climate varies greatly according to the seasons and localities. Along the coast the thermometer ranges in the course of the year from 34° to 90°; but it falls at times considerably lower in the highlands. The summits of Genargentu are often capped with snow in the course of the winter. Hail and thunder-storms are rare, but rain falls copiously in the autumn. In the summer the country is subject to long droughts, but the heavy dews of the night partly compensate for the want of rain. Earthquakes are very rare and slight. The plains and some of the lower valleys are very unhealthy in consequence of malaria fever, called by the natives 'intemperie.' Most people remove from the plains to the higher grounds on St. John's Day, the 24th of June, when the air begins to be unhealthy, though it does not become dangerous till August, from which time it continues so to the end of November. The inhabitants of the plains are viewed by those of the highlands with marked contempt as weak and degenerate.

The lands of Sardinia are divided into feudal and non-feudal. The feudal lands either belong to the respective nobles, several of whom are of Spanish families and non-resident, who entrust their domains to indolent 'podatarii,' or stewards, or have been sold to private individuals, who still recognise the feudal lord by paying him a trifling fee, and are under some restrictions, such as not planting vineyards or trees without his consent. The lands not feudal belong either to communities or individuals, and can be let or sold, or given away at the will of the owners. Small portions of these lands are inclosed and well

GEOL. DIV. VOL. IV.

cultivated, and are called 'tanche'; but the larger proportion consists of 'vidassoni,' that is, lands belonging to communities; they are mostly divided into three parts, each of which is cultivated in its turn, and while under culture is inclosed with a line of hurdles, and the rest, being fallow, is generally open to the wandering flocks. The government however has for several years encouraged the inclosure of fields, and trees and hedges have been planted in many places. Leases are short, and rent is generally paid in kind. In some parts farms are let on the metayer system. One-third of the surface of the island consists of macchie, bush or waste, consisting of sandy or stony districts, and lakes and marshes; another third is occupied by forests or natural pastures; and the remainder, which is estimated at 5,500,000 starelli (a measure about four-fifths of an acre), consists of corn-fields, vineyards, olive-grounds, orchards, and gardens. About a million of these starelli are allotted to the growth of corn. The Sardinian plough resembles the aratrum of the Romans; it is light, and penetrates only two or three inches into the ground, and has no coulter. Most of the garden-grounds are worked with the hoe, the spade and mattock being generally unknown. Corn is left in the fields until it is threshed, which operation is performed by the treading of mares or colts on an area prepared by paring off the sward and beating the soil with a mallet to the requisite hardness. Wind-mills are unknown, and water-mills are found only in the northern part of the island. Corn is winnowed, and it is generally ground in a corner of the house by means of the domestic mill, turned by an ass. There is no regular system of manuring the ground; it is done however sometimes when urgently required. Paring and burning are the common processes. The only artificial fodder for cattle is the 'mischiale,' a mixture of barley, lucerne, basil, and vetches, well known to the ancients.

Cattle, sheep, goats, and swine are divided into two classes: the 'manso,' or tame, being those which work or yield milk, wool, &c., are carefully tended and kept in the best pastures; and the 'rude,' which are for slaughter or for breeding, and which are allowed to ramble over hills and wastes almost in a wild state. All the labour of the field is done by oxen. The breed of horses reared in the tanche, or inclosed grounds, is carefully attended to: horse-races are frequent. For the improvement of the breed there is a government establishment in the plain of Ghilarza, called Regia Tanca, where Arabian and Spanish stallions are kept, and also Swiss bulls and rams. Sardinian horses are in general free from vice, patient of fatigue, and require but moderate food, and the Sards are generally very good horsemen. The mule is unknown. Oxen are used for drawing the carts, the wheels of which are made of a solid piece of wood, strengthened and protected by large-headed nails, the only iron used in the whole machine. The axle-tree is fixed into the wheels, and turns round with them.

The best forests are in the mountainous districts of Gallura, Barbagia, Goceano, Marghine, and Planargia. On the south-west side of the ridge of Genargentu is an extensive elevated plain, called Su Sarcidanu, covered with fine oak, beech, chestnut, and cork-trees; and on the Menomemi range, between San Lussurgiu and Maocmer, is another elevated plain, called Su Littu de St. Antoni, about nine miles wide and eleven or twelve miles long, covered with a rich forest. Fine woods are also found in the Giara de Serri, and on the hills of Trebina and Arcuosa, and they abound with wild hogs and game. Pine-trees are not common except near Terranova. The cork-tree grows very fine and in great quantity in the northern part of the island. Timber is very scarce in the plains, and the want of roads prevents the people from making use of that of the mountain forests. Dwarf mulberry-trees grow in abundance.

Among fruit-trees, the fig, the vine, the apple, apricot, peach, almond, and prickly pear, are the most common. Walnuts and chestnuts are only met with in some places. Oranges, lemons, and citrons are cultivated chiefly in the southern districts of Iglesias and Villa Cidro, and near Sassari, but are not held in great esteem. Date-trees grow on the Campidano, and some of the produce is gathered and sold, but it is not of a good quality.

Vegetables are fine and plentiful; peas and cabbage grow wild in the greatest luxuriance, and the asparagus of the hedges is abundant in the markets in March and April. Celery and tomatoes are large and well flavoured. The 'torzo,' a kind of turnip-cabbage, grows to a gigantic size, weighing without the leaves 8 lbs. or 10 lbs. Saffron is cultivated, and is much used in cookery.

The vine is extensively cultivated, both soil and climate being highly favourable to it; and though the process of making wine is still very imperfect, Sardinia produces some excellent wines. The 'Malvasia,' or malmsey wine of Quarto, Cagliari, Bosa, and Sorso, the muscat wine of Alghero, the red wine of Alghero and Oristano, and the wines of the Campidano, are much esteemed. The natives in general make considerable use of wine. Common white wines are made near Sassari and Terralba, and also in the Campidano.

There are several extensive olive-grounds. The best olives are those of Sassari. Inferior oil is produced from the *Ogliastra*, or wild olive, which, with that made from the *Lentiscus*, serves the peasants for burning.

Corn is the principal article of export. The greater part of the wheat raised in Sardinia is of a superior though soft kind called trigue; it will keep good only eighteen or twenty months; it is sowed in November and December, and reaped in June. In seasons of abundant

harvest about 400,000 starelli (1½ bushels each) are exported. The barley is inferior in quality as compared with the wheat; about 200,000 starelli are exported. Maize, though it thrives well, is not very extensively grown. One hundred thousand starelli of beans, 200,000 starelli of peas, and 1000 starelli of lentils, are also exported annually.

Cheese is a great object of rural economy; it is made chiefly from sheep and goats' milk, and being steeped in brine, it has a salt bitter taste. A great quantity is shipped for Naples, where it is in great demand, being much used when grated to season maccheroni. Little butter is made, as the treatment of cows is not well understood, and fodder is scarce.

Salt is a monopoly of the government, and a profitable branch of the royal revenue, the continental states of the house of Savoy being supplied entirely from Sardinia. Sweden and other states take many cargoes of salt from Sardinia. The salterns, both natural and artificial, are round the Gulf of Cagliari, at Oristano, Terranova, and on the northern coast west of Porto Torres. The salterns are worked by convicts sentenced to the galleys. Tobacco is also a royal monopoly. This plant, which was introduced in 1714, thrives well.

Flax is cultivated, and used in the linen manufactories of the country. The finer sort of linen is made at Busachi. Wool is coarse; it is manufactured into coarse cloth for the peasantry. Cotton grows very well in the Campidano. Madder grows wild, and is used by the peasants for dyeing their coarse cloth. Some rock-mosses are also gathered for dyeing. Bullocks' hides, sheep and goat skins, and kid or lamb skins, are exported in great quantities. Leather is imported from Marseille and other places. Among the exports are—fox skins, martin skins, rabbit and hare skins. The forests abound with stags, small deer, wild boars, and mufoni, or murvoni, a species of large sheep, clothed with hair instead of wool.

The tunny fisheries on the north and west coasts are very productive. They are mostly in the hands of foreigners. The tunnies generally weigh from 100 lbs. to 300 lbs. each, but some of them are above 300 lbs. All the parts of the fish are turned to account; most of them are salted and shipped to various parts of the Mediterranean, and a comparatively small proportion is used in the island. The fishery of anchovies and sardines, which once used to be very productive, is much fallen off. Coral is taken off the west and south coasts. This branch of industry is carried on by the Neapolitans and Genoese. Pearls of an inferior quality are obtained from the *Pinna nobilis*, which abounds in the shallow bays. The shell measures from 15 to 27 inches in length, and is sought chiefly for the tuft of silky hair, the *Byesus* of the ancients, which is attached to it. The filaments are of a glossy brown colour, about 8 inches in length, and are easily spun into gloves, stockings, &c.

Sardinia was noted in ancient times for its mines, which were worked to a great extent, as is attested by vast excavations and remains of foundries. South-west of Iglesias is Monte d'Oru, which appears to have derived its name from the gold formerly extracted from it; the mountain has been reduced by excavation to a mere shell. Iron and lead-ore are found in abundance in many places, as well as copper, silver, and quicksilver. In the eastern mountains are found porphyry, basalt, alabaster, and marble. Chalcedonies, jaspers, carnelians, sardonyx, turquoises, and rock-crystal are found in the districts of Sulci and other mountains of the west. Other mineral products are fossil-wood, lignite, and inferior coal; alum, nitre, amianthus, asbestos, and a mixture of carbonate of lime and alumina, which is used by the natives in washing. There are numerous mineral springs. They are however unprovided with buildings or any sort of accommodation for invalids. Vestiges of ancient terraces exist at the sulphureous springs of Fordongianus.

The population of Sardinia amounted in 1838 to 491,973; in 1848 to 547,112. The island is divided into 8 administrative districts: Cagliari, which comprises the south and south-west parts of the island; Nuoro the east; and Sassari the north and north-west. The administrative division of Cagliari contains the following provinces:—Cagliari, population 106,388; Iglesias, 42,598; Isili, 48,958; and Oristano, 78,189. The administrative division of Nuoro contains the provinces of Nuoro, population 53,882; Cuglieri, 37,522; Lanusci, 27,530. In the administrative division of Sassari are the provinces of Sassari, population 65,821; Alghero, 34,108; Ozieri, 24,456; and Tempio, 22,660. For ecclesiastical purposes the island is divided into eleven dioceses:—Cagliari, Oristano, Sassari, Galtelli-Nuovo, Iglesias, Ales, Alghero, Ampurias Civita, Bosa, Biarcio, and Ogliastra. Cagliari, Sassari, and Oristano are archbishops' sees. The Roman Catholic is the only religion of the country. Over each of the administrative divisions there is an intendant-general, appointed by the king.

The earliest inhabitants of the island were Celts, among whom the Phœnicians formed settlements; to these Iberians and Ligurians, Greeks and Etruscans were successively joined; and afterwards an infusion of Carthaginian and of Roman blood was added. In later times Pisans and Spaniards settled in the towns and lower country, but in the highlands the population has remained almost purely Celtic, and may be considered as the real descendants of the old Sards, who struggled hard against both Carthage and Rome. The Sards are of a middle stature, and well formed, with dark eyes and coarse black hair, though fresh complexions and blue eyes are also seen in the mountains. In the Campidano they are more swarthy than

in the north part of the island, and have generally a large mouth and thick lips. They have strong intellectual faculties, though mostly uncultivated, and an enthusiastic attachment to their country and their native district, in consequence of which families seldom remove or disperse. They are kind and hospitable, but easily offended and excited to revenge. If the family of the sufferer in a blood feud has influence enough to stir justice into active measures against the offender, the latter flies to the mountains, where he joins others of a similar description, and becomes a robber.

Italian is the language of the government, and is also spoken by all educated persons in the large towns. The native tongue is derived from the Latin, with an admixture of words of Greek and Arabic origin. The natives of the Barbagia district pride themselves on the number of Greek words which they retain, and their distinct but harsh and guttural enunciation, which is with difficulty attained by the rest of the Sards. At Alghero the Catalanian is generally spoken.

The villages are generally large and well situated, but with unpaved narrow streets, mean houses, and a general want of comfort. Large dunghills disfigure the principal avenues. The villages in the Gallura are built of granite blocks, and in the other northern districts of freestone; but in the southern division of the island most houses in the country are built of sun-dried bricks. The dwellings of the peasants have generally only one story, without windows, or if they have windows, they are not glazed. A whole family often dwells in a single room, with their chickens, dogs, and kids, whilst the patient ass turns the mill in a corner. Throughout the island the *cittadini*, or inhabitants of walled towns, hold the *contadini*, or villagers, in utter contempt, a feeling which is cordially returned by the rustics, besides which the people of Cagliari and those of Sassari mutually hate each other. Kissing on meeting is an indispensable custom among men of all ranks.

The Sards are fond of feasting; they drink wines and cordials, rarely to excess. Fine wheaten bread is in general use, except among the shepherds of the eastern highlands, who eat a coarse kind of bread, and sometimes acorns. The Sards eat more butcher's meat than the Sicilians or South Italians. Poultry is rather scarce, but game is plentiful. The only mode of travelling for both sexes is on horseback. There are few coaches, and those only in the large towns, and the country people regard them as articles of effeminate luxury. A high road, 125 miles in length, runs from Cagliari to Sassari, passing through Oristano, and keeping as much as possible along the western plains. There are branch roads to the most important towns in the interior. The eastern highlands still remain difficult of access.

The law is the chief profession for young men of respectable connections. The highest legal rank is that of a member of the Real Consiglio for the affairs of Sardinia, which consists of seven members, and sits at Turin. It is a supreme court, and decides finally upon all important matters, appeals, &c. The high court, called Reale Udienza, sits at Cagliari for civil and criminal cases. There is an appeal from it to the Real Consiglio at Turin. In every town or considerable district of the island there is a magistrate called Vicar, in some places Podestà, or Consul in others, who, with an assessor and secretary, judges in the first instance for the town and surrounding territory. The prefects in each of the eleven provinces are also judges in civil matters. There is a commercial court at Cagliari, which decides all commercial suits. Sardinia furnishes by voluntary enlistment one regiment to the royal army, besides which it has a militia, an irregular force of about 6000 cavalry and 1200 infantry, the officers of which wear a uniform, but receive no pay. There are only three regularly fortified towns: Cagliari, Alghero, and Castel Sardo. The coasts are defended by a line of stout towers, garrisoned by a body of coast-guards called *Torrari*, under the superintendence of a council of three members, chosen for three years.

Scientific education is given by the universities of Cagliari and Sassari. The university of Cagliari has faculties of theology, medicine and surgery, law, and philosophy, with a full list of professors in each. Among the accessories are a library of above 15,000 volumes and a cabinet of natural history and antiquities. The university of Sassari has likewise five faculties. The accessory establishments consist of a cabinet of natural history, and a library. In the head town of every province there is a Latin school, and most villages have an elementary school for boys, in which reading, writing, and arithmetic are taught, besides the doctrines of religion and the elementary principles of agriculture. In almost every town there is an hospital for the sick, the insane, and foundlings.

The mechanical arts are in a very low state; the guns of Tempio are in some repute, but the cutlery is of the commonest sort; the potteries are very coarse, and wooden platters are used by the country people; builders and carpenters are very indifferent workmen, besides which all artisans are extremely indolent. Superior workmen come from Piedmont or Genoa.

The principal towns of Sardinia are the following:—CAGLIARI: Sassari, the head town of the north part of the island, situated on a gentle declivity, in a pleasant and fertile country, about 9 miles from the coast. It has a good main street, which is the only one paved; fine public walks, shaded by trees, outside of the walls; twenty-four churches, ten convents, three nunneries, a clerical seminary, a uni-

versity, an ecclesiastical college, several palaces, a public hospital, and about 20,000 inhabitants. The cathedral is a large structure, with a very elaborate façade. Good water is brought to the houses by water-carriers. Sassari was built in the 7th century of our era, by emigrants from the ancient town of Turris, which had been ruined by the Longobards. A fine road leads to Porte Torres, the nearest harbour, where the mail packet puts in from Genoa: ALGHERO: *Oristano*, a town of about 4500 inhabitants, in a low unhealthy plain, near the mouth of the Tirsi, has several churches and convents, a clerical seminary, a college, and a spacious cathedral, with a detached octagonal belfry, which is the most striking object in the town. A spiral staircase of 150 steps leads to the top, whence there is a splendid view. Oristano is a busy lively place in the winter and spring, but in summer all those who can, leave it for a healthier residence. Several noble families inhabit the town: *Nuoro*, the chief town of the eastern province, is situated on the eastern slope of the Barbagia Mountains, near their junction with the Genargentu range, and has about 4000 inhabitants. It gives title to a bishop. On its territory are excellent pastures: *Bosa*, a town of about 3500 inhabitants, finely situated in a valley, between two flat-topped hills, on the north bank of the river Termo, a short distance from the sea. Bosa has nine churches, some convents, a clerical seminary, several paved streets, and a long bridge over the river. The country around is very productive of oil, wine, fruit, flax, cheese, &c., and the inhabitants are very active; most of the travelling pedlars about the island are from Bosa. The town is extremely unhealthy in summer: *Iglesias*, a pleasant town, in a healthy spot, on an elevated and fertile plain, amidst limestone hills, is abundantly supplied with good water, conducted by an aqueduct to a fountain in the centre of the town. The streets are dirty and ill-paved, but they contain some good houses. The cathedral and bishop's palace are remarkable structures. The town is surrounded by a dilapidated Pisan wall, and the remains of a castle are seen on a hill to the north. *Iglesias* reckons about 9000 inhabitants: *Tempio*, the head town of the mountainous district of Gallura, in the north-eastern highlands, stands in a very healthy situation; it has several large houses three stories high, built of granite, with wooden balconies, a collegiate church, a nunnery, a college, and about 6000 inhabitants: *Quartu* [CAGLIARI]: *Villacidro*, at the foot of the mountains north-west of Cagliari, in a healthy situation, has 5500 inhabitants: *Oriolo*, on a mountain 2000 feet above the sea, east of Sassari, has 5400 inhabitants: *Sorso*, in the same district, between Sassari and Castel Sardo, has 4000 inhabitants: *Castel-Sardo*, a strong place on the coast between Sorso and the mouth of the Coguinis: population, 2000. *Bonorva*, at the northern foot of the Marghine Mountains, has 4000 inhabitants.

History.—The island was inhabited by some ancient race before the Greeks became acquainted with it. Iolaus, the mythic charioteer of Hercules, is said to have led a Greek colony into Sardinia, and to have founded Olbia on the north-east coast, afterwards a considerable town in the Roman period, and of which vestiges are found near Terranova. Strabo (p. 225) says that the colonists of Iolaus inhabited the island jointly with the barbarians, who were Tyrrheni. From an inscription found at Stampace, it appears that Caralis, or Cagliari, assumed at one time the name of 'Civitas Iolæ.' The island became well known to the Greeks, who called it Sardo. (Herodotus, v. 106.)

The first Carthaginian expedition to Sardinia, of which the epoch however is not ascertained, was defeated by the natives. About B.C. 490, Hasdrubal and Hamilcar, sons of Mago, led another expedition to Sardinia, which gained a footing in the southern part of the island, and built or colonised Caralis and Sulcis. Hasdrubal however lost his life in fighting against the natives, who appear to have struggled bravely against the invaders. The Carthaginians never reduced the island entirely, as the natives took refuge in the mountains. The lower country however was permanently in their possession until the first Punic war. Sulcis was one of their chief colonies, but the site of that once wealthy town is now a subject of controversy, some placing it on the southern coast, where a district still retains the name; whilst others, with more plausibility, place it in the small island of *San Antioco* opposite, where considerable ancient remains are seen. In the neighbouring island of *San Pietro*, an amphora full of Carthaginian brass coins, was some years ago found by a farmer in ploughing the ground.

During the first Punic war the Romans attacked and defeated the Carthaginian fleet at Olbia, where Hanno, the commander, fell; and again they gained another naval victory over the Carthaginians at Caralis, but at the conclusion of the war the island still belonged to Carthage. The Romans however soon after subjugated the principal part of the island, which was incorporated, with Corsica, into a Roman province, under a prætor, about B.C. 228. After the breaking out of the second Punic war, the Sardis rebelled against the Romans, and having received aid from Carthage, fought a general battle near Caralis, in which they were utterly defeated, and Cornus, the stronghold of the insurgents, surrendered to the Romans. (Liv. xxiii., c. 40, &c.) After this Sardinia remained quiet during the rest of the Punic war. From this time the island, though often disturbed by insurrection, remained subject to Rome. During the period of the empire it was considered by the Romans as one of their granaries, and a penal colony for their criminals. Pliny (iii. 7) mentions Caralis,

Sulcis, Nora, and other places as towns that had the Roman civitas, and Turris Libysonis as a colonia.

Nura, afterwards one of the chief towns of the island, is particularly noticed in the Roman period on account of the inhabitants having accused the prætor Scæurus of malversation, on which occasion Scæurus was defended by Cicero. But the ante-Roman origin of Nura is proved by one of those singular structures called Nuraggi, which is a large cone constructed of coarse blocks without mortar, and flanked by four small ones, upon which rests the foundation of a Roman aqueduct that supplied Nura with water. There are also at Nura other Roman remains, such as a small theatre, baths, &c., all very much defaced. Nura is said to have been destroyed in the wars of the Vandals. The Nuraggi are attributed by some to Iberian colonists and their leader Norax. They are a kind of tower in the form of a truncated cone, constructed of large blocks of stone, lava, porphyry, or freestone, without cement, and forming two concentric walls, between which are stairs leading to the summit. The inner part has generally two vaulted rooms, one above the other. The entrance at the base is very low, and leads through both walls to the lower chamber. The stairs give access to the upper chamber. The Nuraggi are of two sorts; the most common, and probably the most ancient, bear no marks of the chisel, and are constructed of massive blocks, with irregular faces, and smaller stones in the interstices. The exterior materials of the others are evidently worked by tools; and though the stones are not exactly square, they are placed in horizontal layers, and gradually diminish in size towards the summit. The Nuraggi stand generally on the summit of hills commanding a view of the plains. Some rest upon a solid and spacious substructure or platform walled round in the same manner, and in which are constructed hidden chambers, which communicate with the central one by a covered gallery. One of the loftiest Nuraggi is between Samagheu and Fordonianus, in the district of Busachi, east of Oristano: it is nearly 60 feet high, and is called by the natives 'Su Nuraggi longu.' Nuraggi are scattered all over Sardinia, to the number of several hundred, and are seen in every state, some nearly perfect, others a heap of rubbish. They are very numerous in the district of Sulcis, or the south-west part of the island, and also in the hilly region of Le Marghine, north of Oristano. There are also fine specimens of them in the Campo d'Ozieri, and at Isili and Gennuri in the Campidano. The original purpose of these buildings was probably for watch and defence, though in after-ages some of them may have been used as monuments for the dead, fragments of Roman terra-cotta and coins of the Empire having been found in them. Neither literal nor symbolical characters are discovered in these singular structures.

Genesio, the Vandal, invaded Sardinia from Africa, and attached it to his kingdom. After the overthrow of the Vandal kingdom by Belisarius, Sardinia was annexed to the prefecture of Africa, and was governed by an officer styled duke. The Saracens began, about A.D. 720, to ravage the coasts of Sardinia; and as the Byzantine emperors were unable to protect them, the natives applied for assistance first to the Longobards, and afterwards to Louis le Debonnaire, Charlemagne's son, to whom they tendered their allegiance. About the year 1000, Musait, a Moorish chieftain, sailed from Africa to Cagliari with a large force, took it, and conquered the greater part of the island, and assumed the title of king of Sardinia. Musait sent from thence armed vessels to ravage the coasts of Italy. The Pisans sent an armament which took possession of Cagliari; but Musait (1015) obliged the Pisan garrison to capitulate, and then sailing for the coast of Luna in Italy, surprised and sacked that town. He was however attacked in his retreat, and lost most of his men, and even his wife, who was taken prisoner and beheaded. Musait escaped to Sardinia. The combined forces of the Pisans and Genoese now attacked the Moors, and drove them away from both Sardinia and Corsica (1016-1017). After this "the Genoese kept for themselves Corsica and Capraja, and the Pisans had Sardinia." The island being finally cleared of the Moors, the Pisans divided it into four provinces, called Giudicature, and appointed Pisan noblemen over each, styled 'Giudice,' each independent of the others, but all feudatory to Pisa. Cagliari in the south, Torres in the north, Gallura in the east, and Arborea or Oristano in the west, were the names of the four giudicature. Some places along the northern coast were however assigned to the Genoese, among others Castel Sardo, which was for a long time in the possession of the Doria family, who built a castle near it, still called Castel Doria.

The dominion of the island remained long after a constant subject of contention between Pisa and Genoa, whilst the lords of the various provinces made themselves independent in reality. The emperor Frederick II. took advantage of this to make his natural son Hentzius king of Sardinia. Hentzius distinguished himself for his bravery and determination both in Sardinia and Sicily, where he fought for many years for his father against the Pope and the Guelphs, until he was taken prisoner by the Bolognese in 1249, who kept him in confinement for the rest of his life, during which he bore the title of King of Sardinia. His title was however a mere name, and the various judges of the island ruled as independent princes, whilst Pisa and Genoa continued to fight for their respective claims to the nominal sovereignty. After the defeat off Meloria (1284), by which the Pisan naval power was annihilated [LIVORNO; PISA], proposals were made by the Genoese to release their numerous prisoners, provided Pisa would

make a cession of Sardinia, and give up the castle of Cagliari into the hands of the Genoese; but the prisoners themselves, it is reported, protested against recovering their liberty at such a price.

In 1323 Jaime, king of Aragon, who had been invested with the sovereignty of the island by Popes Boniface VIII and Clement V., sent the Infante Don Alonso to make a descent upon the island. The Infante being joined by Hugo, judge of Arborea (whose plot for massacring the Pisans throughout the island had been successfully executed) and some of the native leaders, besieged Iglesias, and after several months' resistance compelled the Pisan garrison to capitulate. He then proceeded to blockade Cagliari by sea and land. A Pisan fleet of 52 galleys arrived in the spring of 1324, and landed a body of troops, which were joined by some of the natives, but being defeated by the Aragonese, a treaty was concluded by which Sardinia was given up by the republic to the crown of Aragon, on condition that the Pisan inhabitants and their property should be respected, and that the castle and suburbs of Cagliari, with the port, and the adjoining lakes should remain in possession of Pisa, on payment of an annual tribute as a sign of homage to the king of Aragon. This arrangement did not last long. In the following year, the Pisan squadron being entirely defeated by the Aragonese in the Bay of Cagliari, the town was evacuated, and Sardinia was entirely lost to Pisa. But the judges were no more inclined to submit to their new masters than to the Pisans, and for many years they carried on a destructive warfare against the Aragonese. At last Peter the Ceremonious, king of Aragon, landed in 1354 with a strong force at Porto Conte, and having traversed and pacified the principal part of the island, made his public entry into Cagliari, where in April of the following year, with a view of checking the influence of the factious chiefs, he convoked a general parliament, after the model of the Cortes of Spain, consisting of prelates, peers, and commons, which was called 'Stamenti,' or Estates. He thus laid the foundation of a representative government in Sardinia, which still subsists. Brancalione Doria, head of the Genoese faction, who had married Eleanor, daughter of Mariano, judge of Arborea, offered his services to the king of Aragon to bring the whole of Sardinia into subjection; but his wife put herself at the head of a strong party of natives, who named her son judge of Arborea. Brancalione, who had gone to Spain, was detained there as a hostage, and after fruitless negotiations Eleanor took the field, being joined by the people of Gallura, and drove the Aragonese from almost the whole northern division of the island. She ruled for several years by the name of 'Giudicessa,' but in fact as queen of Sardinia, and she compiled for her subjects the 'Carta de Logu,' or Code of Laws, which remains in force with few modifications to the present day. This remarkable woman died of the plague in 1403, and her only son dying in 1407, without issue, the Sards invited over the viscount of Narbonne, husband of Beatrice, Eleanor's sister. But the viscount found an opponent in Brancalione Doria, who after his wife's death had taken possession of Arborea, and was supported by the Genoese in the north. In the spring of 1409 an Aragonese army, under Martin, son of Martin of Aragon, landed and entered Cagliari, and from thence, with 8000 foot and 3000 horse, he marched against the forces of both Doria and the viscount, who had united against him. A battle took place at San Luri, in June 1409, in which the Aragonese obtained a complete victory; Doria was taken prisoner, and the Viscount fled precipitately. Martin however died shortly after of the malaria fever, and the Viscount continued to carry on the war. At last Alfonso V. of Aragon obtained the formal cession of the province of Arborea in 1428, by paying 100,000 gold florins to the heir of the late viscount of Narbonne, and the whole island became subject to the crown of Aragon. In 1492 Ferdinand the Catholic established the Inquisition in Sardinia, and ordered the expulsion of all Jews who refused to be baptised, and their synagogues to be converted into churches. From that time the Jews have not been tolerated in Sardinia.

By the union of the crowns of Aragon and Castile, Sardinia became an appendage of the vast Spanish monarchy, and was ruled for two centuries by triennial viceroys sent from Spain. In the war of the Spanish succession, the mountaineers of Gallura having declared themselves for Charles of Austria, an English fleet under Sir John Leake appeared before Cagliari, and the viceroy capitulated, and the island acknowledged Charles; but by the peace of Utrecht in 1713, Charles having resigned his claims to Spain, Sardinia was given to him as emperor. In 1717 Alberoni, the minister of Philip V., sent a large force in the midst of peace, under the Marquis de Lede, which took possession of Sardinia in less than two months. By the treaty of London of 1720 Philip was obliged to restore Sardinia, which was finally given to Victor Amadeus, duke of Savoy, who then assumed the kingly title. From that time the history of Sardinia becomes closely connected with that of the house of Savoy.

In December, 1792, the National Convention, having declared war in the name of the French republic against the king of Sardinia, sent a large fleet under Admiral Truguet to attack the island. The French, who attempted a landing at Cagliari and Quartu, were repulsed by the natives, who are generally good marksmen, and accustomed to the use of fire-arms. The admiral, after uselessly bombarding the town for several days, re-embarked the soldiers and sailed away.

The king of Sardinia, pleased with his insular subjects, invited them to ask for anything that they might think useful for the island. The

Sards demanded, 1, the convocation of the stamenti; 2, the confirmation of their laws, customs, and privileges; 3, that all offices in the island, except that of viceroy, should be held by natives; 4, the establishment of a council to advise the viceroy; 5, permission to send a minister to reside at Turin and watch over their interests. The Piedmontese ministers however dissuaded the king from listening to the petition; situations continued to be filled with Piedmontese; and the consequence was that insurrections broke out in 1794 and 1795, and the commander-in-chief and the intendant-general were killed by the people of Cagliari. By the mediation of the archbishop of Cagliari however, and of the Pope, a general amnesty was proclaimed in 1796, and some of the demands of the islanders were granted. Charles Emmanuel IV., driven away by the French from his continental states, landed at Cagliari in March 1799, and was received with enthusiasm. The king however returned soon after to the continent, and in 1802 abdicated in favour of his brother Victor Emmanuel, who, having lost all hopes of recovering his continental dominions, repaired to his island kingdom in February 1806, and continued to reside in Sardinia till the fall of Napoleon in 1814.

SARDINIAN STATES, the dominions of the House of Savoy, constitute a monarchy, the head of which derives his title of king from the island of Sardinia. These states consist of—1, the duchy of SAVOY; 2, the principality of PIEDMONT; 3, the duchy of GENOA; 4, the county of NIZZA; 5, the island of SARDEGNA. The continental territories have an area of 19,775 square miles. The population in 1848 amounted to 4,368,972. The total area of the kingdom, including the island of Sardinia, is 29,075 square miles (about one-seventh of the area of France), and the total population in 1848 amounted to 4,916,084 (less than one-seventh of the population of France at the census of 1851). The continental territories are divided into 11 administrative divisions and 89 provinces; the area and population of which are given in the following table:—

Divisions.	Provinces.	Area in Square Miles.	Population in 1848.
Torino . . .	Torino . . .	1,117	411,959
	Pignerol . . .	593	153,233
	Susa . . .	539	81,834
Genoa . . .	Genoa . . .	358	285,330
	Chiavari . . .	354	116,077
	Novi . . .	289	65,013
	Levante . . .	261	78,859
	Savona . . .	311	78,906
Savona . . .	Aequi . . .	445	101,102
	Albenga . . .	263	59,993
	Nizza . . .	1,180	118,377
Nizza . . .	Onegilo . . .	175	60,072
	San Remo . . .	265	64,541
	Coni . . .	1,003	179,638
Coni . . .	Mondovi . . .	679	148,450
	Alba . . .	408	118,844
	Saluzzo . . .	632	153,942
	Alessandria . . .	332	117,870
Alessandria . . .	Asti . . .	351	136,065
	Voghera . . .	308	101,695
	Tortona . . .	257	58,853
	Bobbio . . .	269	37,833
	Novara . . .	533	178,069
	Lomellina . . .	480	139,649
Novara . . .	Pallanza . . .	312	64,030
	Osola . . .	521	36,331
	Valsesia . . .	292	35,879
	Ivrea . . .	562	168,561
Ivrea . . .	Aosta . . .	1,233	81,232
	Vercelli . . .	473	121,806
Vercelli . . .	Biella . . .	377	180,691
	Casale . . .	335	420,428
	Chambéry . . .	634	152,468
Chambéry . . .	Alta Savoia . . .	377	50,873
	Moriana . . .	798	64,239
	Tarantasia . . .	706	48,723
	Annecy . . .	620	107,474
Annecy . . .	Faisaigny . . .	786	105,474
	Chablais . . .	356	57,563
Total . . .		19,774	4,368,972

An account of these divisions and their chief towns is given under their respective heads.

Each province is administered by a governor called Intendente, appointed by the king. The province is an aggregate of communes; each commune has a sindaco, or mayor, who is subordinate to the intendente. For judicial purposes each province has a court, called Tribunale di Prefettura, which sits in the chief town. The provinces are divided into districts called Mandamenti, in each of which there is a justice of the peace, who has a secretary. There are in all 412 of these mandamenti. There are four supreme courts, which are also courts of appeal. The supreme court of Turin has jurisdiction over

all the provinces on the Italian side of the Alps and north of the Ligurian Apennines. The jurisdiction of the High Court of Genoa extends to all the provinces of the duchy of Genoa, with the exception of San Remo. The High Court of Nizza has jurisdiction over the provinces of Nizza, Oneglia, and San Remo. The High Court of Savoy, which sits at Chambéry, decides all suits within the limits of the duchy of Savoy. Each court has two chambers, one for civil and the other for criminal matters. The judges are irremovable. There is an Admiralty Court which sits at Genoa; and tribunals of commerce are established in all the leading towns. The tribunals of commerce of Nice, Genoa, Chiavari, Savona, Novi, and San Remo, Turin, Chambéry, and Nice are called *Consolati*. The towns and other communes have a communal council composed of notables of the place, at the head of which is the *syndic*. The council superintends the local and economical administration of the commune, but its acts are subject to the sanction of the intendents of the province.

The government until lately was an absolute monarchy. The late king, Carlo Alberto, published a constitution for his subjects, dated February 8, 1848, which has been since faithfully acted upon. It declares the Catholic religion to be the dominant religion, but gives perfect freedom of conscience to dissenters. The executive is vested in the king, who acts by responsible ministers; the command of the army, the right to make peace or war, to make appointments to office, to sanction laws, also rest in the king. The legislative power is exercised by the king and two chambers—a Senate and Chamber of Deputies—which must be convoked every year by the king; or if dissolved, the king must convoke a new chamber within four months. All financial laws must first be introduced into the second chamber. The freedom of the press and of the person is guaranteed. The judges are irremovable.

The army is recruited yearly by means of a conscription. Every conscript, unless he provides a substitute, is bound to serve eight years in the regular army, after which he is enrolled for eight years more in the provincial battalion of his respective district. In time of war the provincial battalions are called into active service, and the army becomes thereby increased to about 150,000 men. The regular army in 1854 numbered 47,524 men and 7602 horses. The corps of carabinieri, in number about 4000 (of whom 885 are in the island of Sardinia, which is free from the conscription), are charged with the police of the country, being scattered in detachments over the various provinces. In 1855 the army was increased in consequence of the king sending 15,000 men to aid the French and English against Russia in the Crimea.

The naval force consists of 4 sailing and 4 steam frigates, 4 corvettes, 3 brigantines, 1 brig, 6 war steamers, and several smaller vessels, carrying in all 900 guns, and manned by 2860 men, besides officers. The stations of the royal navy are at Genoa, Villafranca, and in the island of Sardinia. The mercantile navy numbers 3419 vessels, carrying an aggregate of 154,852 tons, and 24,539 men, including captains, sailors, and workmen.

The public revenues of the state, as estimated in the budget of 1855, amounted to 128,182,561 francs; and the expenses to 187,668,242 francs. The national debt on the 1st of January 1854 amounted to 571,826,164 francs (22,873,000*l.*), which has been increased during the present year (1855) by a loan of 3,000,000*l.* sterling, guaranteed by the British government. The revenue is derived chiefly from land-tax, customs and excise duties, post-office, public works, &c.

The ecclesiastical administration of the continental states is under the 4 archbishops of Turin, Chambéry, Genoa, and Vercelli; and 26 bishops, of Maurienne, Tarantaise, Annecy, Aosta, Susa, Pinerolo, Acoqui, Alba, Asti, Cuneo, Fossano, Ivrea, Mondovì, Saluzzo, Alessandria, Biella, Casale, Novara, Vigevano, Albenga, Nizza, Bobbio, Sarzana, Savona, Tortona, and Ventimiglia. The number of parishes is 3756; that of collegiate churches, besides cathedrals, is 74; and that of clerical seminaries, 54. There is an ecclesiastical academy for the higher theological studies at Superga, near Turin. There are in all the continental states about 240 convents of monks and 82 convents of nuns; by a law passed by the Sardinian Chambers in May 1855, all religious orders are suppressed, with the exception of those employed in "preaching, teaching, or tending the sick." The Valdenses are the most numerous Protestant sect as yet in the Sardinian states. They dwell chiefly in the valleys of Pignerol. Their clergy study at Geneva or Lausanne in Switzerland. They have churches in Genoa and Turin.

Public instruction is afforded by the royal and communal colleges. In every province there are one or more royal colleges, in which grammar, rhetoric, and philosophy are taught; and in some of them there are chairs of law, medicine, and divinity. In most towns there is a communal college, besides grammar schools. Female education is afforded almost exclusively in convents of nuns, of which there are forty-two thus engaged. Scientific instruction is given in the two universities of Turin and Genoa, in which cities there are academies of sciences and of the fine arts. [GENOA; TORINO.] There are a veterinary school at La Veneria near Turin, a school of mineralogy at the mines of Moutiers in Tarantasia, and a naval school at Genoa. Most communes have schools for boys.

The continental states of the king of Sardinia have several fine carriage-roads across the Alps and Apennines, which intersect their territory. The most remarkable are:—1, the great road of Mont

Cenis, leading from Chambéry to Turin, constructed by Napoleon; 2, that of the Simplon, leading into Switzerland, likewise constructed under Napoleon; 3, the road from Genoa to Sarzana and Luoca along the Eastern Riviera; 4, the road from Genoa to Novi by Serravalle; 5, the road Della Cornice, from Genoa to Nizza, along the Western Riviera, begun under Napoleon, and finished under king Charles Felix. There is a well-regulated and cheap post-office system throughout the Sardinian dominions, as well as diligences for travellers on all the high roads; and public conveyances, called 'velociferi,' on the provincial or cross roads. Under the late king, Carlo Alberto, railroads were begun to be constructed in the continental states. Lines now extend from Turin to Genoa through Alessandria; from Turin to Cuneo, to Pignerolo, and to Susa; from Alessandria a line runs up to Novara. Along these roads electro-telegraphic wires are laid down; and the city of Turin has electric communication through Chambéry with Paris, and by the Gulf of Spezia with the island of Sardinia, from the south-western point of which it is contemplated to carry electro-telegraphic cables to Bonah in French Africa. A railway is projected from Annecy to Chambéry, thence to Montmelian on the Isère, up the left bank of that river to the confluence of the Arc, and up the valley of the Arc to Modane. This line in all probability will be extended from Annecy to Geneva, from Montmelian to Grenoble, so as to form a junction with the French railway system; and the project of cutting a tunnel through the Alps under Mont Cenis, so as to unite the Savoy railroad at Modane with an extension of the Turin-Susa line to Grande-Croix, has been long entertained with great favour by the people and government of the Sardinian States.

The plains of Piedmont are well supplied with canals, chiefly for the purpose of irrigation, the principal of which are in the provinces of Alessandria, Vercelli, Biella, Casale, Ivrea, Alba, and Turin. The river system of Piedmont is described under Po.

The staple products of the continental Sardinian territories for exportation are—silk, rice, hemp, wine, and oil. Most of the wine is consumed in the country. The principal manufactures consist of paper, silks, woollens, linen, glass, and cotton-yarn. The importation of colonial articles and foreign manufactures takes place chiefly through the port of Genoa. A considerable trade is carried on with Switzerland and Germany by the Lago Maggiore, and the Bernardin road leading to the Grisons.

The Sardinian States have Switzerland on the north, France on the west, the Mediterranean on the south, Austrian Italy, Parma, and Tuscany on the east. They comprise the countries between the Var and the Magra, the Rhône and the Ticino. The Sardinian portion of the Lunigiana lies east of the Magra. The surface is covered on the west and north by the Alps, on the south by the Apennines, and between these two great mountain systems lies the most extensive and valuable portion of the country, comprising the slopes, valleys, and plains that form the basin of the Po to the junction of the Ticino. The face of the country is described in the articles ALPS, APENNINES, GENOA, PIEDMONT, SAVOY, and under the names of the several administrative divisions or provinces.

History.—The origin of the house of Savoy is involved in the greatest obscurity. The first historical ancestor of the house of Savoy is Humbert, count of Maurienne and great vassal of Rudolf III., the last king of the second kingdom of Burgundy. As a reward of his services to Conrad the Salic, Humbert was confirmed in his extensive fief of Maurienne, and obtained military jurisdiction over other parts of Savoy, the lower Valais, and also the valley of Aosta, on the Italian side of the Alps, which was part of the kingdom of Burgundy. Count Humbert died about A.D. 1048, and was buried in the cathedral of St. Jean de Maurienne. His eldest son Amadeus I. succeeded him, but, dying shortly after, was succeeded by his brother Oddo, who, by his marriage (A.D. 1045) with Adelaide of Susa, daughter and heiress of Odelric Manfred, count of Turin and marquis of Italy, extended the dominion of his house to the banks of the Po. Oddo by his marriage became marquis of Italy and count of Turin, and master of the principal passes of the Western Alps; for, in addition to that of Great St. Bernard and Little St. Bernard, which were already within his ancestral territory, which extended over the valley of Aosta, he became possessed of those of Mont Cenis and Mont Genève. Oddo died about A.D. 1060. He left by Adelaide three sons, Peter, who is styled marquis, Amadeus, who is called count, and Oddo, who became a bishop; besides two daughters, Bertha, who married Henry, afterwards Henry IV. of Germany, and Adelaide, who married Rudolf, duke of Suabia. Adelaide, the mother, appears to have governed, after the death of her husband, as regent or colleague of her sons, the extensive territories belonging to them on both sides of the Alps. After the death of Peter about 1078, his brother, count Amadeus or Amadeus II., succeeded, who at his death (1080) left by his wife Joan, daughter of the count of Geneva, an infant son, who is styled Humbert II. The Marchioness Adelaide continued to administer her dominions, as guardian to her grandson, eleven years longer, till she died at a very advanced age in 1091.

Humbert II., count of Maurienne, succeeded to his father's Burgundian estates in Savoy, and even increased them by the acquisition of Tarantasia, but those on the Italian side of the Alps had been seized upon during his minority by several claimants. At the same time the great towns, Turin, Asti, and others, availed themselves of the

confusion occasioned by the long struggle between the pope and the emperor to assert their independence of all vassalage except the nominal one to the empire. Humbert crossed the Alps in 1097; and not being strong enough to attack all his opponents, he made a treaty of alliance with the town or commune of Asti and its bishop, by confirming the newly acquired liberties of the citizens of Asti, and by ceding to them several villages and territories, and ensuring to them free passage and protection throughout his Burgundian or Transalpine territories. Humbert died in Savoy in 1103, and was buried in the cathedral of Moutiers in Tarantasia. By his wife Gisla of Burgundy he had a son, who succeeded him by the name of Amadeus III., and a daughter Adela or Adelaide, who married Louis VI., king of France.

Amadeus III. received from Henry V. of Germany the investiture of all Savoy as an Imperial county. Amadeus recovered also in part his ancestral Italian dominions, and, above all, the city of Turin, of which he was acknowledged lord in the year 1181. Count Amadeus III. proceeded with the crusade to Syria, and died of disease at Nicosia in the island of Cyprus, in the year 1148. He was the founder of the magnificent abbey of Hautecombe in Savoy, which was for ages after the burial-place of his descendants. His daughter Matilda married Alfonso I., the founder of the Portuguese monarchy.

1149-88. Humbert III., called 'the Saint,' son of Amadeus III., succeeded him as count of Savoy and marquis of Italy. He compelled Manfred, marquis of Saluzzo, to acknowledge himself his vassal. But the emperor Frederick I. deprived him of part of his dominions, among the rest of Turin, creating the bishop of that city prince of the empire. Frederick also burnt the town and castle of Susa in 1174, when the archives of the house of Savoy are said to have perished in the flames. Humbert was fond of religious retirement, and spent much of his time in the abbey of Hautecombe. He died in 1188.

1188-1238. Thomas I. succeeded his father Humbert III. Philip of Suabia restored to him all the titles and prerogatives of which his father had been deprived by Frederick I. Thomas purchased the seignory of Chambéry, and enlarged the town and built the castle. Until this time Aiguebelle had been the capital and residence of the counts of Savoy. Count Thomas died in January, 1238.

1238-58. Amadeus IV., son of Thomas, recovered the dominion over Turin, and he was created by Frederick II. duke of the Chablais and of Aosta. He died in 1258, and was buried at Hautecombe. Amadeus gave up to his brother Thomas, count of Flanders, the 'utile dominium' of his Italian states with the title of count of Piedmont, retaining however the suzerainty for himself.

1258-63. Boniface, the infant son of Amadeus, was placed under the guardianship of his uncle Thomas, count of Flanders. The people of Turin having revolted again and being supported by the free city of Asti, took Thomas prisoner. When Boniface became of age, he crossed the Alps, and laid siege to Turin, but the Marquis of Montferrato, and Charles, count of Anjou, marched against him and took him prisoner. Boniface died in prison at Turin, and left no issue.

1263-68. Peter, son of Count Thomas I. and uncle of Boniface, born in 1208, succeeded to his nephew. By affinity, he was uncle of Henry III. of England, who had married Eleanor of Provence, daughter of Beatrix of Savoy, Peter's sister. In 1241 Peter had repaired to England, and had been received with great honours by Henry and his consort. Henry made him earl of Richmond, and gave him for his residence a palace near London on the banks of the Thames, which was from that circumstance called Savoy House. Peter's first care on his accession was to reduce the city of Turin, in which he succeeded after a long siege. Peter afterwards obtained the inheritance of Hartmann, count of Kyburg, who had married Peter's sister, and who died without issue in 1264. This inheritance extended along the northern banks of the Lake of Geneva, and through this and the grants of former emperors to Peter's ancestors the house of Savoy became possessed of the whole of the Barony, now the Canton of Vaud in Switzerland. Peter died in the castle of Chillon on the shore of the Lake of Geneva, in 1268, and was buried at Hautecombe. He left only one daughter by his wife Agnes, heiress of the barony of Faucigny. This daughter, Beatrix, made subsequently a donation of that barony to Amadeus V.

1268-84. Philip I., Peter's brother, succeeded him as count of Savoy in his old age. He died at the castle of Rouseillon in the Bugey, leaving no issue.

1285-1323. Amadeus V., styled the Great, son of Thomas, count of Flanders, succeeded his uncle Philip. He made frequent wars with the dauphin of Vienne and with the counts of Geneva, whom he repeatedly defeated. He gave Piedmont in fief to his nephew Philip, who, having married, in 1304, Isabella of Villehardouin, heiress of the principalities of Achaia and Morea, received the investiture of the same from Charles II. of Anjou, king of Naples and count of Provence. In 1323 he went to Avignon, to induce Pope John XXII. to preach a crusade in order to save the Byzantine empire, and whose emperor, Andronicus the Younger, married Anna of Savoy, daughter of Amadeus. Amadeus fell ill and died at Avignon, 1328.

1323-29. Edward, son of Amadeus, succeeded him. He had to repel the repeated attacks of the dauphin of Vienne, the count of Geneva, and the baron of Faucigny, who were leagued against him. At last, through the mediation of Philip of Valois, king of France,

peace was made. The count of Savoy, in 1328, led a body of men to join king Phillip against the Flemish, and contributed to the defeat of the latter by the French at Mont Cassel. After the termination of that war Count Edward went to Paris, where he fell ill and died, in November 1329, leaving no male issue.

1330-43. Aymon, Edward's brother, was proclaimed his successor by the states of Savoy, in preference to Edward's daughter, who was married to the Duke of Brittany. His reign was peaceful. He applied himself to improve the administration. He created the office of chancellor as the head of the judicial order; and he also established a supreme council of justice at Chambéry, to hear appeals from the local courts. Aymon married Yolande, daughter of Theodore Paleologus, marquis of Montferrato, and son of Andronicus the Elder, emperor of Constantinople. He died at Montmélian in 1343.

1343-83. Amadeus VI., son of Aymon, succeeded. His long reign was eminently successful. He drove away the Anjous from Southern Piedmont; he defeated the Marquis of Montferrato, who was leagued against him with the Visconti of Milan; he received the voluntary allegiance of Chieri, Mondovi, and other towns; and he consolidated and greatly extended the dominion of the house of Savoy on the Italian side of the Alps.

1383-91. Amadeus VII. succeeded his father Amadeus VI. He soon after proceeded to the assistance of Charles VI. of France against the united Flemish and English, and distinguished himself in several actions. On his return home, he made the important acquisition of the county of Nios, the people of which chose him for their sovereign in 1388. Amadeus VII. died in 1391 of a fall from his horse, while hunting the bear in the forest of Lornes in the Chablais.

1391-1440. Amadeus VIII., son of the preceding, succeeded his father. By the extinction of the line of the counts of Geneva, he inherited the county of Genevois, and the suzerainty over the imperial city of Geneva. He purchased the valley of Ossola from the Grisons. He obliged the marquises of Saluzzo and of Ceva to swear allegiance to him; and he obtained of Filippo Maria Visconti, duke of Milan, the cession of the town of Vercelli and its territory west of the Sesia. In 1418, Louis of Savoy, prince of Morea and Achaia, and prince of Piedmont, dying without issue, Amadeus, his next heir, reunited the principality of Piedmont to his other dominions, which thus extended without interruption from the shores of the Lake of Geneva to those of the Mediterranean Sea, and from the Rhônes to the Sesia. The emperor Sigismund, on passing through Chambéry, formally created Amadeus duke of Savoy, in 1416, confirming all former investitures granted by his predecessors, and moreover debaring all subjects of the house of Savoy from appealing to the imperial chamber from judgments pronounced by the duke or his successors. Amadeus VIII. collected the edicts and statutes of his ancestors, and from them compiled a code of laws for all Savoy, under the title of 'Statuta Sabaudia,' which he published in 1430. After the death of his wife, Maria Beatrix of Burgundy, in 1434, he retired to the hermitage of Ripaille, leaving the administration of his state to his son Ludovic. In 1439, the council assembled at Basle called him to the Papal chair, which he filled with the title of Felix V. till 1449, when he resigned the tiara to Pope Nicholas V., and retired again to Ripaille. He died in January 1451, at Geneva.

1440-65. Ludovic, son of Amadeus VIII., assumed the ducal crown in consequence of his father's abdication in 1440. He married Anna de Lusignan, of the royal dynasty of Cyprus. His second son, likewise named Ludovic, married Charlotte, heiress of that kingdom, and he was crowned King of Cyprus in 1558; but he and his wife were soon after driven away by Charlotte's illegitimate brother, and the island ultimately fell into the hands of the Venetians. The title of King of Cyprus and Jerusalem is still assumed by the representative of the dynasty of Savoy. Ludovic established the university of Turin; he created a supreme court of justice for Piedmont, called a Senate; and he admitted the barons of Piedmont to the first offices of the state, which had been till then monopolised by the Savoyards. Ludovic died at Lyon, in January 1466, whilst proceeding to the court of his son-in-law Louis XI. of France.

1466-72. Amadeus IX., son of Ludovic, succeeded him. He was of a pious turn of mind, and remarkable for his charities. He died at Vercelli in 1472.

1472-82. Philibert, son of Amadeus IX., succeeded him while yet a minor, under the guardianship of his mother Yolande, sister of Louis XI. The duchess sent a body of troops to join the army with which Charles le Teméraire, duke of Burgundy, invaded Switzerland in 1476. These troops however almost all perished in the battles of Grandson and Morat; and Charles, fearing that the duchess might turn against him in his adversity, caused her to be seized and shut up in the castle of Rouvre. A Piedmontese concealed the young duke Philibert, whom he carried to France to his uncle Louis XI., who soon after sent an armed party to deliver the duchess from the castle of Rouvre, and he restored both her and her son to their dominions. In 1478 Yolande died; and in 1482 Duke Philibert, being now of age, went to Lyon on a visit to King Louis, but died soon after in that city, leaving no issue.

1482-89. Charles I., Philibert's brother, assumed the ducal crown, and in November 1483 made his public entry into Turin. He died at Pignerol in March 1489, being only 21 years of age.

1489-96. Charles John Amadens, styled Charles II., son of the preceding, was a mere child when his father died. His mother, Bianca of Montferrato, was proclaimed regent, with the assistance of a council. Turin was definitively chosen for the residence of the court. From that time the house of Savoy became really Italian. In April 1496, the duke died of a fall at the villa of Moncalieri, near Turin.

1496-97. Philip II., count of Bresse, and a son of Duke Ludovic, succeeded as duke of Savoy and prince of Piedmont. He died in November 1497. He left by Margaret of Bourbon, his first wife, a son, Philibert, who reigned after him, and a daughter, Louisa, who married the Duke of Angoulême, and was the mother of Francis I. of France; and by a second wife, Charles, who was duke of Savoy after Philibert.

1497-1504. Philibert II. married Margaret of Austria, daughter of the emperor Maximilian I. The Duke of Savoy had the title of Imperial Vicar in Italy, and was by interest as well as duty attached to the imperial cause. Philibert however allowed Louis XII. of France to pass through his dominions on his way to invade the duchy of Milan in 1499. In 1504 Philibert II. died without issue, and was buried in the convent of Brou at Bourgen-Bresse, where his monument is still seen.

1504-53. Charles III., brother of Philibert II., although fond of peace, found himself for the greater part of his reign in the midst of the most destructive wars; first between Louis XII. of France and the Holy League, headed by Pope Julius II. against the French; afterwards between Francis I. on one side and the Swiss and Duke Sforza of Milan on the other; and lastly, between Francis I. and his powerful rival the emperor Charles V.: in all of which the territories of Savoy and Piedmont, though the duke professed neutrality, were devastated without mercy by French, Swiss, and Imperialists. In 1530 Duke Charles attended the coronation of Charles V., who treated him with marked attention, giving to his wife Beatrix of Portugal, and her heirs, the county of Asti. Francis I. pretended to be offended at this, and having in 1535 declared war against the duke, his troops occupied the whole of Savoy and Piedmont, except a few fortresses which held out for the duke, who took refuge in Nice. The troops of Charles V. entered Piedmont, and that unfortunate county was for many years the theatre of war between the two great rivals. In 1543 Nice was attacked by a combined French and Turkish fleet; the town was sacked, but the castle was saved by the timely arrival of Andrea Doria. In 1547 Henry II., having succeeded Francis I., came to Turin to take formal possession of Piedmont. In 1551 war broke out between France and the emperor, and Piedmont was again the field of battle between the two armies. In the midst of this confusion, Duke Charles died in 1553, at Vercelli, where he had taken refuge under the protection of the Imperial troops. Vercelli, Nice, Aosta, and Cuneo were the only places that still held out for the house of Savoy.

1553-80. Emmanuel Philibert, son of Duke Charles, had acquired great military reputation in the armies of Charles V., and he continued in the service of Philip II., for whom he won the great battle of St. Quentin from the French in 1557, and in the following year he gained the battle of Gravelines. By the peace of Cambresis, it was stipulated that the hereditary dominions of the house of Savoy should be restored to Emmanuel Philibert, who married Margaret of France, sister of Henri II. The duke, having thus recovered Savoy and Piedmont, which had been estranged from his house for nearly half a century, fixed his residence at Turin, and applied himself to restore order in every branch of the administration. He purchased the county of Tenda and the principality of Oneglia, and created a small naval force for the protection of the coasts. But Geneva had established its independence, and the Pays-de-Vaud had been occupied by the Bernese, so that the Lake of Geneva became the northern boundary of the dominions of Savoy. Emmanuel Philibert died at Turin in 1580.

1580-1630. Charles Emmanuel I., son of Emmanuel Philibert, married Catherine of Austria, daughter of Philip II. He wrested the marquisate of Saluzzo from the French, and made the Alps the boundary between France and Piedmont. When Henri IV. was acknowledged king of France, he claimed the marquisate of Saluzzo, and the claim being refused, he invaded Savoy in 1600. By the peace of Lyon in the following year, Saluzzo was definitively given to the house of Savoy, in exchange for Bresse, Bugy, and the county of Gex, which were ceded to France. In December 1602 Charles Emmanuel unsuccessfully attempted to seize Geneva. In the following year he formally acknowledged the independence of that city and its territory. He was afterwards engaged in wars for the possession of the marquisate of Montferrato. He joined Spain and the emperor against France. The French invaded Savoy and overran Piedmont, and in the midst of this the duke died at Savigliano in July 1630.

1630-37. Victor Amadeus I., son of Charles Emmanuel, obtained possession of the greater part of Montferrato by the peace of Cherasco in 1631. He died in October 1637, in the midst of the war between the Spaniards and the French in Italy, leaving two infant sons, the first of whom, Francesco Giacinto, reigned nominally only for one year, as he died in 1636.

1638-75. Charles Emmanuel II., second son of Victor Amadeus, was proclaimed duke under the regency of his mother Christina of France. French troops, in their quality of allies, were in possession

of the greater part of the country. In the meantime Thomas of Savoy, prince of Carignano, and Cardinal Maurice of Savoy, uncles of the infant duke, being supported by Spain, demanded for themselves the regency and guardianship of their nephew, in order to free the territories of their house from the baneful influence of France. A Spanish army from the Milanese entered Piedmont, led by the two princes, and most of the towns opened their gates to them. In 1640 Turin, being in possession of Prince Thomas and the Spaniards, was besieged by a French army, which had possession of the citadel, and the French were in their turn surrounded in their entrenchments by a Spanish army commanded by Count Leganes. At last Turin capitulated and Leganes withdrew. Piedmont was freed of foreign troops and Charles Emmanuel, being of age, assumed the government. The peace of the Pyrenees in 1659 terminated the Italian wars between France and Spain, which had lasted with little interruption for nearly eighty years. Duke Charles Emmanuel enjoyed peace during the remainder of his reign. He applied himself to the improvement of his dominions. He died in 1675.

1675-1730. Victor Amadeus II. succeeded his father Charles Emmanuel. He found himself harassed between Louis XIV. of France on one side and the house of Austria on the other. Louis ordered him, among other imperious commands, to give up to him the citadel of Turin. Victor Amadeus summoned round him the nobles of Piedmont and declared war against France. Being joined by an Austrian force, he disputed every inch of ground against the French. The war lasted till 1695. The peace of Ryswyck restored peace to Italy, and the French evacuated all the territories of the duke, including Pignerolo, which they had possessed for about a century. In the war of the Spanish succession Victor Amadeus sided first with the French, but afterwards with the emperor. French armies again overran and devastated Piedmont, and in 1706 besieged Turin, which made a noble defence. Victor Amadeus, being joined by the Austrian army under his relative Prince Eugene of Savoy, defeated the French besieging army on the 7th September 1706, and delivered Turin. By the peace of Utrecht (1713) he obtained the Valsesia, the territory of Lomellina, the remainder of Montferrato, and other districts, and above all the island of Sicily with the title of king, and he was crowned at Palermo in December 1713. By the subsequent treaty of London, Victor Amadeus gave up Sicily to the emperor, and received in exchange the island of Sardinia with the title of a kingdom. Thus through his gallantry and perseverance the house of Savoy became numbered among the royal houses of Europe. Victor Amadeus employed the peaceful period which followed to improve the administration and to encourage agriculture and industry. Through his care the cultivation of the mulberry-tree and the rearing of silkworms attained in Piedmont that perfection which they still maintain. He abdicated in 1730 in favour of his son Charles Emmanuel, and retired to the villa of Moncalieri, where he died in 1732. He was the first king of his dynasty.

1730-73. Charles Emmanuel III., King of Sardinia, Duke of Savoy, Prince of Piedmont, &c., assumed the crown in times of peace. But the ambition of the court of Spain, excited by Elizabeth Farnese, wife of Philip V., aimed at recovering its lost preponderance in Italy, and Spain was supported by France in consequence of the family alliance. The contested election for the crown of Poland became the pretext for a new war in 1733. The French cabinet, in order to obtain the alliance of the king of Sardinia, promised him the duchy of Milan, which was to be taken from Austria. Charles Emmanuel united his forces to the French army under Villars, and the Milanese was conquered in a few weeks. Don Carlos, infante of Spain, on his part conquered Naples. In September 1734 the battle of Guastalla took place between the Austrians on one side, and the French and Sardinian troops, commanded by King Charles Emmanuel, on the other. The Austrians lost 8000 men, and were obliged to retreat. In 1735 the preliminaries of peace were signed, and Charles Emmanuel, instead of the duchy of Milan, obtained only the Novarese and Tortona.

In the war of the Austrian succession King Charles Emmanuel took the part of Maria Theresa. In 1748 he signed a treaty with Maria Theresa and England, engaging himself to defend Lombardy with 45,000 men. The French and Spanish combined forces invaded Piedmont and laid siege to Cuneo, which they could not take. In 1745 another French and Spanish army, passing the Riviera of Genoa, entered Lombardy and took Milan. In the following year the king of Sardinia, united with the Austrians, drove them away. In 1747 a French force of 50 battalions attacked the entrenched camp of the Piedmontese near the pass of the Col de l'Assiette on the 19th of July; but after the most strenuous efforts they were completely repulsed, having lost their general (the Chevalier de Belleisle), between 400 and 500 officers, and 6000 men. This defeat put an end to all attempts at invading Piedmont for half a century. By the peace of Aix-la-Chapelle the king of Sardinia obtained the Upper Novarese, or Valli di Novara, and the districts of Voghera and Vigerano near the Po.

The remaining 25 years of the reign of Charles Emmanuel III. were spent in peace, and in the cares of administration. He published a code of laws; effected a general survey of the land; he opened new roads, excavated canals, encouraged commerce; and in 1771 he published an edict, empowering all individuals and communes to

commute feudal services for a money equivalent, to be fixed by a court created for the purpose. He took off all the extraordinary imposts which had been put on during the long preceding wars. Charles Emmanuel died at Turin, in February, 1773, at 72 years of age.

1773-96. Victor Amadeus III., son of Charles Emmanuel, succeeded. The storms of the French revolution rendered his reign calamitous; he lost Savoy and Nice in 1792, Oneglia in 1794, and after two years more of a desultory but sanguinary warfare, the line of defence formed by the Alps was turned by the French passing through the Ligurian Apennines, and the revolutionary torrent poured down into the plains of the Po. King Victor was induced to conclude a hasty peace, which left his dominions at the mercy of the French. He died soon after, in October, 1796.

1796-1802. Charles Emmanuel IV., son of king Victor, succeeded his father on a slippery throne. Savoy and Nice were united to France, and Piedmont was overrun by French troops, who held the principal fortresses in their hands. At last the king was obliged to retire to Sardinia in 1799. In June, 1802, Charles Emmanuel, who was then at Rome, abdicated in favour of his brother, Victor Emmanuel.

1802-21. Victor Emmanuel, seeing no chance of being restored to his continental states, repaired to the island of Sardinia. In the year 1814 he returned to Turin, and took possession of the dominions of his ancestors, to which the Congress of Vienna added the Genoese territory. A conspiracy which broke out in Piedmont (in March 1821), headed by some of the military and the nobles (who wished for either a representative constitution with two chambers, or the Spanish constitution of 1812 with only one chamber), induced the king to abdicate in favour of his brother Charles Felix (he himself having had no male offspring), who was then at Modena. In the meanwhile Charles Albert of Savoy Carignano, who had joined the insurrection, was appointed regent, and proclaimed the adoption of the Spanish constitution of 1812, toleration of all religions, and some other important changes, all however on condition of the royal assent.

1821-31. Charles Felix, the new king, as soon as he was made aware of the proceedings of the regent, issued a proclamation from Modena (March 16, 1821), declaring all that had been done since his brother's abdication null and void. The regent fled to Novara, and thence to the Austrian head-quarters. Charles Felix, supported by Austria, put down the insurrection in Piedmont, and restored the former system of monarchy. He occupied himself with the business of administration, and also in making new roads and other improvements both in his continental dominions and in the island of Sardinia, where he appears to have been very popular. He died at the beginning of 1831, leaving no male issue, and was succeeded on the throne by his collateral relative, Charles Albert of Carignano, a descendant of Prince Thomas, brother of Victor Amadeus I.

1831-49. Charles Albert, after his flight from Turin in 1821, settled for some time in Florence. In 1823 he served as a volunteer in the army of the Duke of Angoulême in Spain, and assisted to crush the constitution in that country which he had endeavoured to set up in his own. He ascended the throne on April 27, 1831. For many years he seemed to oscillate between a desire to retain arbitrary power on the one hand, and a desire to grant political privileges to his subjects on the other. In 1836 he issued an edict for the suppression of the feudal system in the island of Sardinia, and in February 1842 an amnesty to his accomplices in the conspiracy of 1821. The interference of Austria in Italy inclined him to liberal institutions as a means of defence against external aggression. Accordingly when the Austrians, fearing the consequences of the liberal measures of Pope Pius IX., occupied Ferrara in 1847, the king of Sardinia protested, and offered to defend the independence of the States of the Church with all his forces. In the same year he made a commercial league with the Pope, with Tuscany, and Lucca; and followed this up in November by establishing municipalities and provincial councils throughout his states. In February 1848 he granted a representative constitution, the heads of which have been enumerated above. After the Milanese had driven the Austrians out of Milan, he marched at the head of his army to aid the insurgents in the cause of 'Italian regeneration,' as it was called, but his real motive was most likely to extend his dominions. After two days' hard fighting he defeated the Austrians at Goito, May 29. Peschiera then surrendered to him. Verona was attacked, and Mantua threatened. Soon after the Sardinian fleet entered the Adriatic, and blockaded Trieste. Hitherto he had been on the whole successful; but the Austrians, who were led by a master of warfare, were not beaten—they had retreated from Lombardy only to gain strength. On the 27th of July the Sardinian army was compelled to retreat, and Mantua was relieved. Marshal Radetsky pursued the retreating Sardinians to Milan, and forced them to surrender (August 4). [MILAN.] An armistice was agreed upon in September. In the spring of 1849 Charles Albert, influenced by the clamour of his subjects or by sinister advice, renewed the war. He was defeated at all points, and Marshal Radetsky by his great victory at Novara crushed the designs of Charles Albert, who abdicated in favour of his son (the present king Victor Emmanuel II.) on the 24th of March. The Austrians took military possession of the fortress and half the town of Alessandria, and also of the country between the Po and the Sesia, until the conclusion of peace. The Sardinian fleet was withdrawn from the Adriatic, and the army reduced to a peace-footing. Charles Albert retired to Portugal,

where he died at Oporto on the 23th of July. His remains were brought from Portugal and buried in the catacombs of the basilica of Superga. He married in 1817 Teresa, archduchess of Austria, by whom he left two sons, the present king, and Ferdinand, duke of Genoa, since dead.

SARDIS. [LYDIA.]

SAREE. [PERSIA.]

SAREPTA. [SARATOV.]

SARLAT. [DORDOGNE.]

SARMA'TIA was the name given by the Romans to all the country in Europe and Asia between the Vistula and the Caspian. It was bounded S. by the Euxine and Mount Caucasus, and was divided by the Tanais into Sarmatia Europæa and Sarmatia Asiatica. The people inhabiting this country were usually called Sauromatæ by the Greeks and Sarmatæ by the Romans.

Neither Herodotus nor Strabo makes mention of the European Sarmatians. The Sauromatæ of Herodotus dwelt to the east of the Tanais, by which they were separated from the Scythians of Europe, and inhabited a tract of country extending northward from the Palus Mæotis equal to fifteen days' journey in length. (Herod., iv. 21, 58.) Herodotus also says that the Sauromatæ sprung from the intercourse of a body of Scythians with some Amazons who came from the river Thermodon in Asia Minor, and that their language was a corrupted form of the Scythian (iv. 110-117). Strabo likewise places the Sauromatæ between the Tanais and the Caspian (ix. p. 492, 507), and speaks of the people west of the Tanais as Scythians.

The principal nations in European Sarmatia were—1, the Venedæ or Venedi, on the Baltic. 2, the Peucini, or Bastarnæ, in the neighbourhood of the Carpathian Mountains, who, as well as the Venedi, appear to have been of German origin. (Tac., 'Germ.,' 46.) 3, the Iazyges, Roxolani, and Hamaxobii, in the southern part of modern Russia. 4, the Alauri or Alani Scythæ, in the central part of Russia, in the neighbourhood of Moscow. The knowledge which the ancients possessed of these people was very small; they are universally represented as a nomad people with filthy habits. The people with whom the Romans were brought most in contact were the Iazyges, generally called Iazyges Sarmatæ, and sometimes Iazyges Metanastæ, because they were driven out of their original seats on the Euxine and the Palus Mæotis about the year A.D. 51. They settled in the country between the Danube and the Tibisis or Tibisus (Theiss), after driving out the Daci, and carried on for a short time war with the Romans. (Plin. iv. 25; Tac. 'Ann.,' xii. 29, 30.) They are frequently mentioned by subsequent writers as dangerous neighbours to the provinces of Pannonia and Mæssia.

SARNO. [PRINCIPATO CITRA.]

SAROS PATAK. [HUNGARY.]

SARSINA. [FORLÌ.]

SARTHE, a department in France, taking its name from one of the streams by which it is watered, the Sarthe, an affluent of the Mayenne, is bounded N. by Orne; E. by the departments of Eure-et-Loir and Loir-et-Cher; S. by Indre-et-Loire and Maine-et-Loire; and W. by Mayenne. Its length from north to south is about 62 miles; from east to west about 58 miles. The area is 2396 square miles. The population in 1841 was 470,535; in 1851 it amounted to 473,071, which gives 197'44 inhabitants to a square mile, being 22'86 above the average per square mile for the whole of France. The department is formed out of a portion of Anjou.

The surface is generally level. The highest hills are on the north-western border, about Sillé-le-Guillaume. The south-east side of the department is occupied by the formations of the cretaceous group. From beneath the cretaceous group, the formations between the chalk and the new red-sandstone crop out, and occupy the remainder of the department, except along the north-western boundary, where the granite rocks of the great primitive district of Bretagne make their appearance. Anthracite coal-mines are worked in the west of the department. Iron-mines also are worked; and there are several furnaces, and forges for manufacturing the metal. Freestone for building, black marble, sandstone, alates, millstones, granite, fullers' earth, ochre, and potters' clay are found. There is a salt-spring at La-Suze.

The department belongs wholly to the basin of the Loire. The principal river is the Sarthe, which touches the border of the department on the north side near Alençon, and flowing south-west separates it from the department of Orne, except near Alençon, where its course is beyond the boundary, to which however it soon returns. Several miles above Fréney it quits the border and flows in a winding channel south-east to Le-Mans, just below which it receives the Huisme on the left bank from the north-east. From this point the navigation commences, and the river flows south-west into the department of Maine-et-Loire. Its whole course on or within the border of this department is about 110 miles, for about 50 miles of which it is navigable. The Loir, a tributary of the Sarthe, crosses the department just within the south-eastern border: it joins the Sarthe in the department of Maine-et-Loire. Its course in this department is about 55 miles, for 35 or 40 miles of which, namely, from Château-du-Loir, it is navigable. Besides the Huisme and the Loir, the Sarthe receives the Bièvre and the Orne on the left bank; and the Geay, the Vègre, the Erve, and the Vaige on the right. The Loir receives the

Braye, the Elangort, and the One on the right bank; the Huisme receives several small streams. The rivers abound in fish; the Huisme and its affluents yield excellent trout. By the Sarthe and the Loir the department has about 100 miles of internal navigation.

Roadway communication is afforded by 7 imperial, 12 departmental, and 26 communal roads. The railway from Paris to Brest through Chartres is open to Le-Mans in the centre of the department, whence the line is in course of construction nearly due west to Rennes: lines are authorised to be laid down—one northward through Alençon, Argentan, and Falaise to the Paris-Cherbourg line between Lisieux and Caen; the other southward through Château-du-Loir to Tours, where the lines from Nantes and Bordeaux converge for Paris.

The climate is mild and healthy. The soil varies much. The part occupied by the formations of the cretaceous group presents little else than a succession of sands. Part of this tract is made to yield good crops of grain, and other parts are planted with pines (*Pinus maritima*). The rest of the department has a tolerably productive soil. About two-thirds of the area of the department are under the plough. The principal grain crop is of wheat; but oats, buckwheat, and maize are also grown, and rye in the sandy districts. A considerable quantity of hemp and flax is raised, and a great quantity of trefoil seed for exportation. The meadows and grass-lands occupy nearly 150,000 acres, and there are above 110,000 acres of heath or open pasture. The number of horned cattle is considerable. Sheep are numerous. Poultry and game abound; the former are sent in great numbers to the Paris markets. Bees are generally kept. The vineyards occupy about 25,000 acres: the wine is bad. The orchards and gardens occupy as great an extent as the vineyards. Cider is the common drink of the people; about 5,000,000 of gallons are made annually. Considerable quantities of fruit, chestnuts, and walnuts are grown. There are several druidical remains near Connerre, a small place near the Huisme.

The department is divided into four arrondissements as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Le Mans . . .	10	128	173,102
2. Mamers . . .	10	145	128,531
3. Saint-Calais . . .	6	60	68,269
4. La-Flèche . . .	7	80	103,160
Total . . .	33	413	473,071

1. In the first arrondissement the chief town is *Le-Mans*. [MANS, LE.] Among the other towns are—*Ballon*, population 2200, near the Orne; *Écomoy*, population 3700, near the Orne, an affluent of the Loir; *Sillé-le-Guillaume*, population 3000 for the whole commune; and *La Saze*, on the left bank of the Sarthe, over which there is a handsome bridge, population 2200. At Sillé-le-Guillaume linens are manufactured, and trade in corn, hemp, wool, seeds, poultry, cattle, &c., is carried on: Sillé-le-Guillaume has a well-preserved feudal castle built in the 14th century.

2. In the second arrondissement the chief town, *Mamers*, population 5960, between the Bienne and the Orne, was anciently fortified, and was taken in the 11th century by the Count of Belême, and afterwards by the Normans; but there are now scarcely any traces of fortifications. The town consists of two large squares, with a number of streets adjacent to or terminating in them. The houses are tolerably well built, chiefly of stone. The smaller of the two squares is occupied by a handsome covered market; the other by a large building, formerly a convent, now containing the offices of the sub-prefect and the mayor, the college, the public library, the theatre, the prison, and the barrack of the gendarmes. The manufactures are coarse linens, calico, hosiery, beer, leather, &c. Trade is carried on also in corn, wine, brandy, wax, cattle, and sheep. Near the town is an ancient camp. *Frémay-le-Vicomte*, or *Frénay*, population 3160, has a linen-hall, and a museum of natural history. The town is famous for the manufacture of fine linen. *Beaumont*, population 2320, on the Sarthe, an ill-built place 15 miles S.W. from Mamers, owes its origin and its distinctive epithet to the viscounts of Le Mans, who had a castle here, of which the remains serve as a prison. The townsmen manufacture druggot, serge, and prunella. There are two bridges over the Sarthe here. *La-Ferte-Bernard*, population 2583, on the Huisme, was the scene of a conference in 1189, between Henry II. of England and Philippe-Auguste of France. It was shortly after taken by Philippe: it was taken in 1424 by the English, under the Earl of Salisbury; and in the reign of Henri IV., in 1590, by the Prince of Conti. The town has a handsome gothic church, and an hospital. The old walls of the town remain; and there is a castle with keep and towers in pretty good preservation. The principal manufacture is of coarse checked linens for the colonies; linen-bleaching is also carried on; there are tile-works, and tan, flour, and fulling-mills. *Bonnétable*, population 5163 in the commune, is between the Orne and the Huisme.

3. In the third arrondissement the chief town is *St.-Calais*, anciently called Anille, from the brook on which it stands, not far from the right bank of the Braye; it received its present name from St.-Calais, who founded a monastery here in the 6th century. The town lies in a hollow, amid hills covered with scanty crops of corn, 29 miles E. GEOG. DIV. VOL. IV.

by S. from Le-Mans. It has an interesting gothic church and manufactures of serge and other woollens, cottons, linens, leather, and glass. The town has a tribunal of first instance and a college: population of the commune, 3804. *Vibraye*, population 3094, has iron-works, tan-yards, and an hospital. *Besse-sur-Braye*, population 2000, where cotton-goods, wax-candles, and paper are made. *Château-du-Loire*, situated on the Loire, built on the slope of a hill 22 miles S.W. from St.-Calais, population 3029, gets its name from an ancient castle of the counts of Anjou, erected in the 11th and demolished in the 18th century. The older part of the town is badly laid out, and is composed of steep, narrow, and ill-built streets; but the street, along which the road from Le-Mans to Tours passes, is straight and composed of neat stone houses with gardens; it traverses a handsome and regular square, planted with trees and serving as a public walk, on the site of the ancient castle. The rocks in the neighbourhood of the town are excavated so as to form cellars, and in many instances dwelling places inhabited by linen weavers, vine-dressers, and labourers. There are at Château-du-Loir an hospital, a theatre, public baths, and a college. Linens, leather, and cotton yarn are manufactured; cattle, wood, corn, and wine are sold. *Grand-Luce* (13 miles W. by S. from St.-Calais), on the Veuve, which flows into the Elangort, population 2354, was rebuilt after a fire in 1786. It consists of four regularly built streets which abut on a central square. Much trade in corn and cattle is carried on. *Bouloire*, on the Tortue, which joins a feeder of the Huisme: population, 2100.

4. In the fourth arrondissement the chief town is *La-Flèche*: population, 6543 in the commune. It is agreeably situated in the pleasant valley of the Loir, 25 miles S. by W. from Le-Mans. It consists of three principal streets, two of them parallel to each other running through the town for the distance of about half a mile, and the third at right angles to them; together with a few smaller streets or lanes. The two parallel streets are straight, wide, well-built, and well paved; one of them is partly lined by the extensive buildings of the military school. The principal public buildings are the town-hall, the parish church, and the military school just named. This school occupies a royal palace built by Henri IV., and afterwards bestowed by him on the Jesuits for a college. On the suppression of the Jesuits, in 1762, it was converted by Louis XV. into a military school; and after being suppressed at the revolution, was revived by Louis XVIII. Prince Eugene, Descartes, and the astronomer Picard were educated here while the Jesuits had the place. The buildings are arranged round five courts; the principal of which, with its adjacent garden, is very handsome. The principal gateway is adorned with sculptured ornaments and a bust of Henri IV. There is also a large park, which is embellished by the running water brought from a distance of two or three miles for the supply of the building. There is a handsome chapel in the institution, a library of 25,000 volumes, and a gallery of paintings. The town has a theatre and two public bathing establishments. The trade of La-Flèche consists chiefly of corn, hay, wine, poultry, and game. Linen, hosiery, gloves, leather, and glue are manufactured. *Le-Lude*, population 3295, on the left bank of the Loir, 12 miles S.E. from La-Flèche, consists of well-built houses, but the streets are very irregularly laid out. It is commanded by an ancient castle, whose massive quadrangular walls, situated on an eminence overlooking the Loir, and flanked by enormous round towers, one of them in ruins, present a striking appearance. The inhabitants trade in leather, and cattle. *Pontvallain*, population 2019, 14 miles E. from La-Flèche, near the Lons, has some trade in cattle and swine. An obelisk marks the spot near the town on which Bernard Duguesclin defeated the English in 1369. *Sablé*, population 4848, on the Sarthe, 16 miles N.W. from La-Flèche, was anciently a place of strength, but its fortifications have been entirely demolished. The streets are narrow and crooked; there is a small but pleasant boulevard raised like a terrace along the bank of the Sarthe, which forms a semi-circular bend round the town. There is a bridge over the river, built of marble quarried near the town, which, though in its rough state of a slate colour, becomes of a deep black with veins of white when polished. There is a handsome mansion on a hill above the town, built in the beginning of the last century, by Mansard, for the brother of Colbert, on the site of an ancient castle of the dukes of Maine. A considerable manufacture of gloves is carried on; and there is a good trade in corn, fruit, and the marble quarried near the town.

This department, with that of Mayenne, constitutes the diocese of Le-Mans, the bishop of which is a suffragan of the archbishop of Tours. It is in the jurisdiction of the Imperial Court Royale of Angers, and within the limits of the University-Academy of Caen, and in the 18th Military Division, the head-quarters of which are at Tours. It sends four members to the Legislative Chamber of the empire.

SAVONA, an administrative division, province, and town of the Sardinian States. The administrative division contains the provinces of Acqui, Albenga, and Savona. The province of Acqui, which lies north of the Ligurian Apennines, was formerly included in the administrative division of Alessandria. It is described in a separate article. [ACQUI.] The rest of the administrative division lies between the Apennines and the Gulf of Genoa; it was formerly included in the duchy of Genoa, and now forms the provinces of Albenga and Savona. The province of Albenga, the most western part, lies between the province of Savona and the administrative division of Nizza; it forms the subject of a separate article. [ALBENGA.]

The area and population of the administrative division and its three provinces are as follows:—

Provinces.	Area in Square Miles.	Population in 1848.
Acqui	445	101,802
Albenga	263	59,993
Savona	811	78,906
Total	1519	240,701

The province of Savona is bounded N.E. by the province of Genoa, S.W. by that of Albenga, S.E. by the Mediterranean, and N.W. by the Apennines. The soil partakes of the general character of the western Riviera of Genoa, and produces abundance of fruit, oil, and wine. The climate is somewhat cold in winter. The Apennines near Savona are lower than the rest of the Ligurian Apennines, being only 1500 feet above the sea.

The province of Savona is divided into 38 communes. The capital is Savona, a walled town of 15,500 inhabitants, situated on the sea coast, about 30 miles S.W. from Genoa. It is the largest town along the western Riviera between Genoa and Nice. The narrow well-paved streets are frequented by an active busy people. The town carries on a considerable trade; the harbour, which was once good, was partly filled up by the Genoese in 1525-28, through commercial jealousy; it is still very safe, but only fit for vessels of 200 tons. Savona was made a bonding port for foreign goods and merchandise of all kinds except tobacco, in 1850. Savona is the residence of many noble and other substantial proprietors of the surrounding country; it contains some good palaces and several fine churches, among others a cathedral built in 1604, the former cathedral, which had been raised by Pope Julius II., when bishop of Savona, having been destroyed to make room for the citadel. The present cathedral is adorned with valuable paintings and sculptures. Near the cathedral is the Sistine chapel, founded by Pope Sixtus IV., uncle of Julius II., as a burial place for his family. In the Dominican church are an 'Adoration of the Magi,' and another painting by Albert Durer; and a magnificent 'Nativity' by Antonio Semini. The sanctuary of La-Madonna di Savona, situated 5 miles north-west of the town, among the Apennines on the road to Mondovi in Piedmont, has also some good paintings. Savona is the birth-place of Chiabrera, one of the best Italian lyric poets. His tomb is seen in the church of San-Giacomo.

Albissola, a pretty town on the sea-shore, between Savona and Genoa, has 3500 inhabitants, and several handsome villas of the Genoese nobility. Pope Julius II. was born at Albissola. *Noli*, a small town in a picturesque situation near the sea. *Cairo*, in the Apennines, has 3400 inhabitants. Near Cairo is the village of Milleseimo, famous in the history of Bonaparte's first Italian campaign, in 1796.

SAVOY (*Savoia* in Italian, *Savoie* in French), a country with the title of duchy, which belongs to the Sardinian monarchy. It forms part of the highlands of the Alps, and is geographically united to south-western Switzerland, being included in the basin of the Rhône. Savoy extends from 45° 4' to 46° 24' N. lat., 5° 37' to 7° E. long. The boundaries of Savoy are:—on the E. the great chain of the Graian and Pennine Alps, which divide it from Piedmont and the Valais; N. the Lemnan Lake; W. the Rhône, which divides it from France; and S.

an offset of the Cottian Alps, which, running westward from the group of Mont Cenis, divides the valley of Maurienne, the southern-most part of Savoy, from Dauphiné.

Savoy consists of several valleys formed by offsets of the Alps. It is divided into three basins: the northern basin, the waters of which flow northwards into the Lemnan Lake; the central basin, the waters of which flow by means of the Arve, the Fier, and the Lake Bourget westward into the Rhône; and the southern basin, which is drained by the Isère and its affluents. The Isère runs southward into France.

Savoy is divided into seven provinces:—1, Chablais, which comprises the southern coast of the Lemnan Lake and the numerous valleys which slope towards it. The Dranse, which rises in the mountains near the borders of the Valais, is the principal river of Chablais. 2, Faissigny, south of Chablais, consists chiefly of the long valley of the Arve, from its source in the Col-de-Balmes to a few miles below Bonneville, where the river enters the province of Carouge. The well-known valley of Chamouny and the romantic valley of the Giffre, belong to Faissigny. 3, Genevese, or Annecy, west of Faissigny, consists of the valley of the river Fier, an affluent of the Rhône, and the basin of the Lake of Annecy, the waters of which have their outlet in the Fier, and is bounded north by the canton of Geneva. 4, Alta Savoia, south of Faissigny, consists of the valley of the Arli, an affluent of the Isère, which flows from north to south. 5, Tarantasia or Tarentaise, south of Alta Savoia, consists of the long valley of the Isère, running from east to west, from its sources at the foot of Mont Iseran to the confluence of the Arli. Tarantasia is, next to Faissigny, the most Alpine part of Savoy, and the most interesting to mountain tourists. 6, Moriana, south of Tarantasia, consists of the valley of the Arc. The high road to Italy leads through the whole length of Moriana. 7, Chambéry, or Savoy proper, the most level and the most fertile part of Savoy, lies west of Moriana and Tarentaise, and south of Genevese. It is divided on the west from France by the Rhône and its affluent the Guier. The waters of Savoy proper find an outlet partly southward by the Isère, and partly by the Leisse and other streams which run westward into the Lake of Bourget, which lake enters the Rhône by a canal called that of Saviere. The Lake of Bourget lies 3 miles north-west of Chambéry; it is 10 miles long and 3 miles wide, and the surface is 700 feet above the sea.

The principal towns of Savoy are:—1, CHAMBÉRY, the capital of Savoy proper, and of the whole duchy. 2, ANNECY, the head town of the province of Genevese. 3, *Thonon*, which is noticed under CHABLAIS. 4, *Aix-les-Bains*, in Savoy proper, much frequented for its baths. [AIX.] 5, *Rumilly*, in the province of Genevese, has 4000 inhabitants. 6, *Moutiers*, the capital of Tarentaise, a small town with 2330 inhabitants, and a bishop's see, is situated on the Isère. Moutiers has salt-works for purifying the salt which is derived from the neighbouring springs of Salins, and also a school of mineralogy and metallurgy, with three professors, a cabinet of minerals, a library, and a chemical laboratory. The lead-mines of Pesel and Macot, in the mountains near Moutiers, are worked for the government. The mine of Pesel is situated at an elevation of 4500 feet above the sea, and that of Macot at the height of 6000 feet. The ore is sent to Confans, where it is smelted and purified. The mineral springs of La-Perrière, situated in the valley of the Doron, about three miles from Moutiers, are much frequented by invalids from Switzerland and France. The province of Tarentaise has numerous mines of anthracite, which are worked by the country people, and it is rich in marble of various colours. 7, *Bourg-St-Maurice* in Upper Tarentaise, on the road leading to Italy by the Little St-Bernard, is a town of 3300 inhabitants, and carries on considerable trade in cattle. Several large fairs are held here annually. From the village of Scez above Bourg-St-Maurice, the narrow valley of Tignes leads south-east to the sources of the Isère, at the foot of Mont Iseran, a noble pyramid 13,300 feet high, covered with perpetual snow and surrounded by glaciers. From Scez a road leads in an easterly direction to the pass of the Little St-Bernard, 7192 feet above the sea, and thence into the valley of Aosta. The pass is practicable nearly all the year round, but only for horses and mules. A Roman road constructed by Augustus led formerly from Aosta, or Augusta Prætoria, over the Little St-Bernard, and down the valley of the Isère to Vienne on the Rhône. Traces of this road are still visible in the valley of Aosta, but all vestiges of it have disappeared on the Savoy side. On the summit of the pass is an ancient column of cipoline marble, 15 feet high, which is called 'Colonne de Jove,' or of Jove, and near it is a circle of stones probably druidical. Tarentaise was the country of the ancient Centrones, who, with their neighbours the Salassi, long resisted the Roman arms, and were only subjugated in the time of Augustus. A village on the banks of the Isère, above Moutiers, bears the name of Centrone, and a little higher up, in the valley of Aixme, are several ancient Roman inscriptions. 8, the town of *St-Jean*, the chief place in the province of Moriana, has 3000 inhabitants, and a very old cathedral, in which lie buried some of the earlier counts of the house of Savoy. Moriana has mines of iron, copper, and lead.

The late king Charles Felix began the embankment of the three principal rivers of Savoy, the Arve, the Isère, and the Arc, by which means large tracts of fertile land have been reclaimed.

The population of the duchy of Savoy in 1848 was 583,812, of whom 152,468 inhabit the province of Savoy proper. The population

of the other provinces in 1848 is thus stated:—Alta-Savoia, 50,872; Moriana, 64,239; Tarentaise, 45,723; Annecy, 107,474; Faissigny, 105,474; Chablais, 57,562. A great part of the country is rocky and barren, and the male inhabitants are obliged to leave their homes in order to get a subsistence. Many of them when young resort to Paris for employment, and return to Savoy after a few years with the fruits of their industry. Cattle and sheep constitute the chief wealth of the Alpine districts. Savoy does not produce corn enough for its consumption. Wine is made in most parts, and some of it is very good. Silkworms are reared in Savoy proper, and fruit-trees are abundant.

The popular language of Savoy is a Romance dialect, like those of Western Switzerland, but the people of the towns speak good French.

[SARDINIAN STATES.]

SAWBRIDGEWORTH. [HERTFORDSHIRE.]

SAWLEY. [DERBYSHIRE.]

SAWSTON. [CAMBRIDGESHIRE.]

SAWTRY. [HUNTINGDONSHIRE.]

SAXE-ALTENBURG, a small duchy on the northern frontiers of the Thuringian Forest, consists of two principal divisions; the eastern along the banks of the Pleisse, and the western, which is traversed by the Saale. The two parts are separated by the principality of Gera, which forms part of the territory of Reuss. The eastern is bounded N.E. and S.E. by the kingdom of Saxony, S.W. by Weimar, W. by Reuss, and N.W. by Prussian Saxony; the western division is bounded N. by Prussian Saxony, E. by Reuss, S.E. and W. by Weimar, and S.W. by Coburg and Schwarzburg. The duchy lies between 51° and 53° N. lat., 11° and 18° E. long. The duchy is divided into two circles, of which the area and population are thus given:—Altenburg, area 243 square miles, population 86,010 in 1850; Saal-Eisenberg, area 264 square miles, population 46,728 in 1850; total area, 507 square miles; total population, 132,738. The climate is mild and salubrious. The country is hilly, richly wooded, and fertile. The highest points, the Dolenstein near Kahla, and the Buchberg, are however not above 1000 feet high. The rivers, which are small, and are tributaries of the Elbe, are the Saale, with the Orla and Roda, and the Pleisse, which is properly the river of the country, with its small tributary streams the Sprotta and Gerstenberg. There are several large lakes, and also mineral springs, the most celebrated of which is that at Ronneburg. The agricultural products are corn (particularly rye and wheat), pulse, potatoes, rape-seed, flax, and hemp. Much attention is given to the rearing of cattle; the sheep are of a superior breed, and the horses of a remarkably strong make; swine are abundant. Wild boars and deer are in considerable numbers. Fruit is plentiful. There are few minerals. A very fine porcelain earth is found in the neighbourhood of Altenburg, which supplies the famous porcelain manufactory at Gotha. Woollen cloths, stockings, and wooden-ware, are manufactured. There are considerable tanneries at Altenburg, Kahla, Eisenberg, and Lucka. The articles of export are corn, cattle, wool, butter, and timber.

The Duke of Saxe-Altenburg has one vote in the Germanic Confederation. Altenburg forms part of the ancient Osterland, and appears from a very early period to have been under the margraves of Meissen. It was formed into a separate principality in 1603. On the extinction of the house of Altenburg in 1672, the larger portion reverted to Ernest the Pious, duke of Gotha. From this period the principality of Altenburg was governed by the family of Saxe-Gotha, till it expired in the person of Frederick IV., in February, 1825. By the territorial compact among the three junior branches of the house of Gotha, namely, Meiningen, Hildburghausen, and Coburg, the duke of Hildburghausen, on the 15th November, 1826, resigned his own territories to Meiningen, and received in lieu the duchy of Altenburg, with the exception of the districts of Eisenberg and Kamburg. The principal towns in this duchy are:—1, *ALTENBURG*, which had 16,184 inhabitants in 1850. It is noticed in a separate article. 2, *Ronneburg*, a walled town, containing a ducal palace, two churches, and above 5000 inhabitants, who subsist by agriculture, mechanical trades, and manufactures of woollen cloths, pottery, porcelain, and leather. Near the town is a mineral spring. Black chalk for drawing is found in the neighbourhood. 3, *Eisenberg* is situated on a considerable eminence, about 24 miles W.S.W. from Altenburg. It is surrounded by walls, in which are four gates; and possesses a palace, three churches, an observatory, a town-hall, and a poorhouse. The number of inhabitants is about 5000, who manufacture woollens, ribands, leather, porcelain, household furniture, and carriages, with which they carry on a considerable trade.

SAXE-COBURG-GOTHA, a duchy in the southern part of Thuringia, is composed of two large and various smaller detached portions, which are surrounded by the territories of Prussia, Schwarzburg, Sonderhausen, Weimar, Electoral Hesse, Meiningen, and Bavaria. The principality of Coburg lies between 50° 8' and 50° 23' N. lat., 10° 49' and 11° 14' E. long., and that of Gotha between 50° 38' and 51° 20' N. lat., 10° 15' and 11° 2' E. long. The area and population are given under COBURG. The south part of Gotha is traversed by a large portion of the Thuringian Mountains, of which the loftiest points are, the Schneekopf, 3118 feet, the Inselberg, 2947 feet, with others of nearly equal elevation. This chain, extending in a south-easterly direction from Eisenach through Gotha to the frontiers of Reuss, where it receives the name of Frankenwald, is on the whole

nearly 70 miles in length, and from 4 to 6 miles in breadth. The rivers of Coburg are the Itz, Steinach, Rodach, and Nasslach; those of Gotha are the Hörsel, with the Emse, Ruhl, and Nema, the Unstrut, Gera, and Apfelstedt.

Agriculture is the principal occupation of the inhabitants, especially in the low lands, which yield abundance of corn, hops, vegetables, carrots for the making of sugar, flax, anise, caraway, poppy, and canary seed, and excellent fruit. The forests yield timber, potash, and pitch. The rearing of cattle is prosecuted with much activity; the sheep are generally of the Marino breed, and the horses strong and of a good make; swine and poultry, particularly geese, are plentiful. Iron is found near Friederichstadt; there are also coals, sandstone, millstones, marble, alabasters, gypsum, lime, potters'-clay, porcelain-earth, and salt. There is considerable manufacturing industry in Gotha; the chief articles are linen-yarn, ticking, twills, woollens, and cottons; tar and lamp-black; there are also manufactories of iron, steel, starch, tobacco, whitelead, soap, paper, porcelain, copper and iron utensils, and glass.

The exports from Gotha are timber, pine and other wood seeds, wool, coriander and anise seed, and oil, pitch, lampblack, peat, linen and cotton goods, metal and wooden wares. In addition to the exports, the duchy has a considerable transit trade, as the high road from Leipzig to Frankfurt passes through it.

Saxe-Coburg participates in the joint proprietorship of the University of Jena, and has several gymnasia, and numerous town, village, Sunday, training, commercial, and mechanics schools. The principality of Coburg has had a representative constitution since 1821, composed of 17 delegates; Gotha has had its chamber of representatives from an early period, which differs in its nature and arrangement from that of Coburg.

Coburg formerly belonged to the counts of Henneberg, but came by marriage into the Ernestine branch of the house of Saxony. The house of Gotha, properly so called, commenced in 1640, on the extinction of the Coburg and Eisenach houses of the Albertine branch of Saxony. Ernest the Pious received that portion in which Gotha was situated; he considerably augmented it by inheritance, and caused it to be erected into an independent principality by the German Diet. Ernest's eldest son, Frederick I., had Gotha and other neighbouring districts as his portion, and to preserve it from subdivision he established the law of primogeniture. His successors were great promoters of the arts and sciences, and laid the foundation of many noble collections. On the death of the last lineal descendant, in February, 1825, the duchy of Gotha was divided among the dukes of Saxe-Meiningen, Hildburghausen, and Coburg, the last named receiving the principality of Gotha, but it still retains its ancient and peculiar constitutional and political laws and customs. The town and duchy of Coburg are noticed under the article COBURG, and the town of GOTHA is described in a separate article.

SAXE-MEININGEN-HILDBURGHAUSEN, is a duchy composed of the ancient duchy of Meiningen, the principalities of Hildburghausen and Saalfeld, and some smaller districts, forming a compact territory, extending in a semicircle along the banks of the Werra, and skirted by the chain of the Thuringian Forest. It lies between 50° 13' and 50° 58' N. lat., 9° 57' and 11° 54' E. long., and has an area of 963 square miles: the population in January 1853 was 166,364. The duchy is inclosed by the territories of Bavaria, Coburg, Reuss, Weimar, Schwarzburg, Electoral Hesse, Gotha, and Eisenach. Being situated between the Thuringian and Fichtel chains, the character of the surface is mountainous: the loftiest points are the Bletsberg, 2760 feet high; the Klafarle, 2598 feet; the Gerberstein, 2184 feet; and other mountains of nearly equal elevation. Their valleys supply rich pasturage to numerous flocks and herds; they also contain many curious caverns, of which the most remarkable are the Zinselloch, the Grisch, and the Altensteinerhöhe.

The principal rivers are—the Werra, which, with many tributaries, traverses the whole duchy; the Saale, Itz, Rodach, Mils, and Steinach; the vales of some of these rivers are very picturesque. There are mineral springs near Liebenstein and Salzungen, and salt-springs near Friedrichshall and Neusulza. The productions are those of central Germany—grain of all kinds, fruits, vegetables, rapeseed, tobacco, timber, which is the staple of the country, game, fish, poultry, and honey. Among its mineral products are freestone and sandstone, slate, marble, porcelain and potters'-clay, copper, lead, iron, salt, coals, pitch, alum, and basalt.

Agriculture is the most important branch of industry. Fruit is cultivated to a great extent; cattle and sheep of the improved breeds are reared in all the districts; there are also large flocks of goats.

There is considerable manufacturing industry, particularly in the highlands and in the principality of Saalfeld, where there are many furnaces, works, mills, and glasshouses. The ordinary manufactures are coarse linens, sail-cloth, woollens, and cottons; there are also distilleries, breweries, and tan-yards. The exports are wood, sheep, horned cattle, tobacco, wool, leather, Sonnenburg toys, in which a large trade is carried on, woollens, glass, porcelain, and paints.

The University of Jena, being founded for the use of the states of the Ernestine line, is open to Meiningen, which also possesses several gymnasia and numerous schools.

The principal towns in the duchy are as follows:—*Meiningen*, on the

right bank of the river Werra, about 43 miles from Coburg, population about 6500, is the capital of the duchy, and contains the palace, in which are collections of art and natural history. The town has some fortifications, a house of assembly for the duchy of Saxe-Meiningen, gymnasium, and a normal school. Woollen- and linen-cloth are manufactured. *Saalfeld*, about 40 miles E. from Meiningen, population 5000, stands in the midst of the Thuringian Forest. The town is walled, and possesses the ruins of an old castle, erected in the 8th century. A modern residence, formerly occupied by the dukes of the Saxe-Saalfeld family, stands outside the walls. *Hildburghausen*, population about 4200, the former residence of the dukes of Hildburghausen, possesses a gymnasium, a burgher school, a Jews' school, an orphan asylum, and an asylum for lunatics. Cloth and papier-maché are manufactured. *Pörsch*, 11 miles E.N.E. from Saalfeld, population about 3800, has manufactures of woollen-cloth, leather, and porcelain. *Sonnenberg*, 12 miles N.E. from Coburg, has a population of about 4000, who manufacture wooden wares, musical instruments, and toys, which are exported to a large amount. In the vicinity is a quarry, from which slate-pencils are produced. *Bisfeld*, on the river Werra, 8 miles E. from Hildburghausen, population about 3000, possesses an ancient castle. The cotton manufacture is carried on.

The duchy of Saxe-Meiningen formerly constituted a part of the domains of the counts of Henneberg, and having passed by marriage to the house of Saxony, it came, after various territorial divisions, into the possession of Ernest the Pious, duke of Gotha. Ernest's third son, Bernhard, became the founder of the line of Meiningen in 1680. On the extinction of the house of Saxe-Gotha-Altenburg, in 1825, Meiningen received a considerable accession of territory, including the principalities of Hildburghausen and Saalfeld. Hildburghausen was founded by Ernest, sixth son of Ernest the Pious, in whose family it continued till 1826, when, by a family compact among the junior ducal houses, the reigning duke Frederick exchanged it for the duchy of Altenburg; since this period it has merged into the duchy of Meiningen, with the exception of a few districts which were ceded to Coburg.

SAXE-WEIMAR-EISENACH, a grand-duchy on the northern frontiers of the Thuringian Forest, consists of the principalities of Weimar and Eisenach, which are separated by Saxe-Gotha, and of the insulated district of Neustadt, besides various detached portions. Weimar lies along the banks of the Saale, and Eisenach on those of the Werra near the Thuringian and Rhön mountains. It extends from 50° 25' to 51° 27' N. lat., 9° 53' to 12° 18' E. long., over an area of about 1396 square miles (of which Weimar occupies about 690 miles, Eisenach 465 miles, and Neustadt 241 miles), and is bounded N. and N.E. by Prussian Saxony, E. and S.E. by Altenburg and Reuss, and S. and W. by portions of Schwarzburg, Coburg-Gotha, Meiningen, Bavaria, and Electoral Hesse.

Except in the district of Neustadt the soil is rich and well adapted to agriculture, wherever the gently undulating hills do not rise into mountain ridges, but the most elevated point, the Gikkelhahn near Ilmenau, does not attain a height of more than 2700 feet.

The principal rivers are—the Saale, Ilm, Elster Orla, Unstrut, and Gera, in Weimar, and the Werra, Hösels, Nessa, Ulster, and Felda in Eisenach, which are all tributaries of the Elbe and Weser. There are mineral springs near Berka and Ruhla.

The chief productions are wool, which is the staple article of commerce, grain of all kinds, vegetables, fruit, flax, hemp, rapeseed, hops, a small quantity of wine, pitch, tar, and lampblack. The mineral productions include manganese, alabaster, porcelain and potters'-clay, sandstone and freestone, iron, and salt. The rearing of cattle forms an important branch of industry; the horned cattle are mostly reared in Neustadt; and sheep of an improved breed in Weimar.

The population of Saxe-Weimar-Eisenach in 1853 was 262,524, in the following proportions:—Weimar, 132,424; Eisenach, 82,321; Neustadt, 47,779. Of the whole population of the duchy about 250,000 belong to the established Lutheran and the Reformed Protestant churches; about 10,000 are Roman Catholics, and about 1500 are Jews. Eisenach principality, with its capital, Eisenach, and its other principal towns, are noticed in the article EISENACH. The university is described under JENA. Of the other towns in the duchy the following may be named:—*Weimar*, capital of the principality of Weimar, and of the grand-duchy, is situated on the left bank of the river Ilm, about 13 miles E. from Erfurt. It stands in a pleasant valley, surrounded by hills, and contains a population of about 12,000. The town of Weimar is illustrious in the annals of German literature by the names of Göthe, Herder, Schiller, Wieland, Kotzebue, and others. The palace is finely situated in a beautiful park, and is fitted up with great elegance and taste. The grand-ducal library, founded in 1691, contains about 140,000 volumes, and is open to the public. The principal church contains the sepulchres of the reigning family. In this church are several fine paintings by Lucas Kranach. In the town are numerous educational institutions. A private company in Weimar publishes numerous maps, charts, and important geographical works. Besides the palace and the two churches, the chief public buildings are—the court theatre, the workhouse, the hospital, the library, and the new mews. The manufactures carried on are of small extent. The railway from Gotha to Halle passes Weimar.

Apolda, population 4000, about 9 miles N.E. from Weimar, possesses mineral springs, and manufactories of hosiery, woollen-cloth, kerseymeres, and linen. There are also bell foundries. *Geyssa*, population about 1800, is situated on the Ulster River, about 24 miles S.S.W. from Eisenach. *Neustadt*, 24 miles S.E. from Weimar, population 4250, is situated on the river Orla, which flows into the Saale. There is here a ducal residence. Woollen-cloth, linen, and leather are manufactured by the inhabitants. *Weida*, population about 4000, is situated on the rivers Auma and Weida, about 14 miles E. from Neustadt. In the duchy of Saxe-Weimar-Eisenach there are several gymnasia and lyceums, and numerous town and village schools; training schools for teachers; asylums for the blind and the deaf and dumb; a school for forest economy, free schools of industry, &c., besides many literary and scientific institutions. The court of Weimar has long been celebrated for its liberal encouragement of the fine arts.

The line of Weimar boasts its descent from the illustrious John Frederick of Saxony, who, on being deprived by Charles V. of his electoral dignity and dominions, had certain territories assigned to him in Thuringia. The founder of the house of Weimar is John, who was born in 1570, and whose original patrimony has been considerably augmented by purchase and the extinction of some of the collateral branches. At the Congress of Vienna Charles Augustus, the then duke, received an accession of territory with 77,000 subjects, and the dignity of grand-duke, which confers the title of royal highness.

SAXELBY. [LINCOLNSHIRE.]

SAXMUNDHAM. [SUFFOLK.]

SAXONY, a province in the kingdom of Prussia, situated between 50° 30' and 53° N. lat., 9° 50' and 13° 50' E. long., is bounded N. and N.E. by the province of Brandenburg; S.W. by the kingdom of Saxony; S. by Gotha, Reuss, Weimar, and Hesse Cassel; and W. by Hanover and Brunswick. It is divided into three governments, which, with their area and population, are as follows:—

Governments.	Area in Square Miles.	Population in 1846.
Erfurt	1,273	343,617
Magdeburg	4,466	674,149
Merseburg	3,994	724,686
Total	9,733	1,742,452

In 1852 the total population had increased to 1,828,732.

The province is composed of almost the whole of the portion of Saxony ceded to Prussia at the Congress of Vienna, to which the principalities lying to the north of the duchy of Anhalt and to the west of the Elbe and the Havel have been added. The three duchies of Anhalt, a great part of Schwarzburg, the bailiwick of Alstadt belonging to Weimar, and that of Kalvörde belonging to Brunswick, lie entirely within the territory of this province.

The principal river is the Elbe, which traverses the province from south to north, and is joined in the north at Werben by the Havel, and in the south by the Saale. The greater portion of the province, namely, the whole district of Magdeburg to its extreme south-western border, and the larger (or eastern) part of the district of Merseburg on the other side of the Saale, belong to the plains of Northern Germany, and contain gentle eminences, but no mountains. The western or smaller part of the district of Merseburg and that of Erfurt are more mountainous than level, for on the one side branches of the Harz Mountains and on the other side those of the Thüringer Wald run into it; yet this part likewise contains extensive and fruitful plains, and the mountains and hills which traverse it are nowhere of considerable elevation, except in the detached circle of Henneberg; on the south-west border of the province is the highest mountain of Northern Germany, the Brocken, which is 3500 feet above the sea.

The soil, which is generally fertile, supplies the numerous population with the most important articles of food. The province is unquestionably the most equally and the best cultivated in Prussia. Potatoes are very generally cultivated; pulse, oleaginous plants, culinary vegetables of all kinds, are amply sufficient for the consumption of the inhabitants; a considerable quantity of wine is made, and with beer and brandy, the usual beverages manufactured in the province, is mostly used for home consumption. In many parts of the government of Magdeburg wood is scarce, and there is barely sufficient anywhere except in the government of Erfurt. The breed of horned cattle is numerous, and Berlin is in part supplied from this province. The fine wool of the improved breed of sheep supplies not only the extensive woollen manufactures of the province, but furnishes a large overplus for exportation. The mineral products are—antimony, cobalt, iron, and copper; there are also lime, gypsum, alabaster, freestone, alum, and vitriol. The porcelain clay obtained near Halle is of very superior quality, and the salt from the saline springs furnishes a large supply. The manufactures are—woollens, leather, calico, and linen. There are several sugar-refineries in the province, tobacco-factories, and numerous brandy-distilleries. The exports are—wool, corn, woollen and cotton manufactures, brandy, copper, iron and steel wares, and salt. The government is traversed by several railways which connect it with Berlin, the Baltic, the Elbe, Belgium, and Central and Southern Germany. The provinces are described in separate articles, which

contain also notices of the towns. [ERFURT; MAGDEBURG; MERSEBURG; ASCHERSLEBEN; BURG; HALLE; HALBERSTADT, &c.]

SAXONY, KINGDOM OF. Taken in its most extensive sense, the name of Saxony formerly designated a very large tract in Northern Germany, extending from the Weser to the frontiers of Poland. At the peace of 1495 the emperor Maximilian I. divided Germany into ten circles, of which the extensive tract of country hitherto called Saxony formed three, namely, Westphalia, Lower Saxony, and Upper Saxony. The last of these comprised the electorates of Brandenburg and Saxony, the duchy of Pomerania, and several small principalities.

The kingdom of Saxony was formed out of the electorate of the same name. The duchy of Saxony, to which the electoral dignity and the office of hereditary marshal of the empire were attached, was however not part of the ancient German duchy of that name (which was composed of Lauenburg and a tract on the other side of the Elbe), but a Wend or Vandal province which Albert the Bear, margrave of Salzwedel, of the house of Ascania, had conquered and left to his son Bernhard. This Bernhard received from the emperor Frederick Barbarossa (after Henry the Lion had been declared under the ban of the empire) the dignity of duke of Saxony, to which were attached a part of Engern and Westphalia, extending from the Weser, which separated it from Eastphalia, westward to the Rhine. But Bernhard not being powerful enough to maintain the rights attached to his dignity, and to take possession of the duchy assigned to him in Westphalia, most of the Saxon allodial proprietors became immediate estates of the empire, by which the duchy was dissolved, and its name transferred to the country inherited by Bernhard from his father, to which from that time the ducal dignity was attached. The house of Ascania becoming extinct on the death of Albert III., in 1422, the emperor Sigismund invested Frederick the Warlike, margrave of Meissen, with the electoral title and the duchy of Saxony. He was succeeded in the electoral dominions by his son, Frederick the Mild, who reigned from 1428 to 1464. On his death his dominions were divided between his two sons, Albert and Ernest, who were the founders of the Albertine and Ernestine lines, the former of which still reigns in the kingdom of Saxony, and the latter is divided into the four branches of Saxe-Altenburg, Coburg-Gotha, Meiningen, and Weimar.

In the war with France, in 1793, Saxony furnished only a small contingent, and took no decided part; but in 1806 the elector sent all his troops to support the king of Prussia. The ruin of the Prussian power by the battle of Jena enabled Napoleon to gain the Saxons to his cause. Prussian Poland was added to the dominions of Saxony under the title of the grand-duchy of Warsaw, and the title of elector was changed to that of king. Further cessions from Austria in 1809 nearly doubled the territory of Saxony; but the adherence of the king to the cause of Bonaparte proved fatal to him in 1813, when the Russians occupied Poland, and with the Prussians made Saxony the theatre of the great struggle with the French emperor. In that year the battles of Lützen and Bautzen were fought, and were succeeded by the attacks on Dresden, the great battles of Leipzig, and the retreat of Bonaparte to the Rhine. The people of Saxony had hoped that their attachment to the cause of Germany, as proved by the desertion of their troops from the French army in the battle of the 18th of October, would secure the integrity of their territory. The fate of Saxony was to be decided in the Congress of Vienna, and it was at first proposed that the whole kingdom should be united with Prussia, for which a territory in Westphalia, with 300,000 inhabitants, was offered to the king as an indemnity, which was refused. At length it was decided that the kingdom should be divided, and on the 18th of May 1815 the king signed a treaty of peace with Prussia, by which he gave up more than half his dominions in point of extent, and nearly the half of the population, or a territory of 7880 square miles, with 845,218 inhabitants.

The present kingdom of Saxony lies between 50° 10' and 51° 28' N. lat., 11° 54' and 15° 5' E. long. It is bounded N.W., N., and N.E. by Prussia; E. and S. by Bohemia; S.W. by Bavaria; and W. by Reuss and Saxe-Altenburg. Its form is triangular, the base resting on the Riesengebirge and the Erzgebirge from the Neisse, on the border of Silesia, to the Frankenwald, on the north boundary of Bavaria; and the vertex extending a little to the north of the city of Leipzig. The length of the base is about 150 miles, and the height of the triangle, from a little north of Leipzig to the point where the meridian of 13° E. long. crosses the Erzgebirge, is about 75 miles. The area is 5752 square miles, and the population in 1852 amounted to 1,987,832. The inhabitants are chiefly of German descent; about 40,000 are of the Slavonic race. All except about 30,000 Catholics and 1000 Jews are of the Lutheran religion. The Slavonians were the original inhabitants, and their subjection was effected in the 10th century. They are now known under the name of Wends, and live apart from the Germans; they do not intermarry with them, though they inhabit the same towns or villages. Thus they have preserved their language and several peculiar customs. They are only found in that part of Saxony which is east of the Elbe, especially in Bautzen and in the vicinity of that town.

Surface and Soil.—The river Elbe, traversing the kingdom from south-east to north-west, divides it into two unequal portions, between which a considerable difference exists also in wealth and productive powers.

The eastern and smaller portion, which comprehends the south-western part of the country, formerly called Lusatia, is less favoured by nature. The most elevated part of the country lies contiguous to the boundary of Bohemia, and is known by the name of the Mountains of Lusatia. It does not however present a chain of mountains, but is an elevated flat, which towards the south descends into Bohemia with a rather rapid slope, but towards the north forms extensive plains, which are nearly level, lowering with an almost imperceptible slope. On these plains rise several masses of rocks in the form of small tablelands, and in some places there are numerous small conical hills. The base of the rocks is granite or gneiss, but the more elevated parts consist of basalt. The most elevated summits, proceeding from east to west, are—Mount Oybin and the Hochwald near Zittau, which rise respectively to 1680 and 2520 feet; Mount Lausche, which attains 2637 feet; the Schlossberg, near Stolpen, which is 1146 feet high; the Great Winterberg, on the right bank of the river Elbe, which is 1836 feet; the Lilienstein, on the right bank of the Elbe, opposite Königstein, which is 1338 feet high; Mount Catta, near Pirna, which attains 1176 feet; and the Porschberg, near Pillnitz, which has an elevation of 1182 feet above the sea-level. The western declivity of this region is intersected by numerous depressions, ravines, and valleys, and on account of its picturesque beauties is frequently resorted to by travellers. It is known by the name of the Saxon Switzerland, and extends along the Elbe from Pirna to the Winterberg, and from six to eight miles from the river. The northern boundary-line of this region may be indicated with tolerable exactness by a line drawn from Dresden eastward to Bautzen. It is in general a poor country, partly covered with forests of rather indifferent growth, and partly with heath, but there are tracts which make good sheep-walks. The sheep are noted for the quality of their fine wool. Agriculture is very limited; potatoes and oats succeed best, and in some parts flax. There is however a large tract of superior fertility, which occupies the most eastern part of the kingdom, on both sides of the Neisse, and constitutes a wide depression in the elevated region. The surface here is hilly, but in general it produces all kinds of grain, and nearly as much as is required for the consumption of the large and populous manufacturing villages which surround the town of Zittau on the east, north, and west. The plain of Bautzen, which lies along the northern base of the elevated region, is still more fertile, and supplies corn for the consumption of the manufacturing districts. Some coal and iron are found, especially in the neighbourhood of Zittau; and along the river Elbe there are some quarries of sandstone, the produce of which is exported.

The country which extends from the base of this region northward to the boundary-line of Prussia is a plain, on which there are a few isolated hills, among which the Keulenberg, near the town of Königbrück, attains the height of 1362 feet above the sea. The soil of this plain is sandy, or gravelly, and mostly unfit for cultivation: about half the surface is covered with woods, consisting almost entirely of coniferous trees, from which tar and pitch are made. In the cultivable tracts potatoes, oats, buckwheat, and millet, with some rye, are grown. The sheep-walks are extensive, but of inferior quality. Cattle, goats, and pigs are numerous.

The western or larger portion of Saxony, which is situated west of the river Elbe, is naturally divided into three regions, the mountainous, the hilly, and the plain. The mountain region lies within the Erzgebirge, extends over the northern slope of that range, and is bounded on the south by Bohemia. It is occupied with mountain masses, with rather steep declivities, which are furrowed in a direction from south to north by wide and open valleys, and in other directions by smaller valleys. The most elevated summit is the Fichtelberg, near 12° 50' E. long., 3966 feet above the sea-level. Nearly north of it stand the Pöhlberg, 2706 feet high; and farther east the Lugstein, 2934 feet. West of the Fichtelberg are the Cluversberg, which attains 3345 feet; and near Schöneck, the Rammelsberg and the Schneckenstein, respectively 3165 and 2886 feet high. A large portion of this region is covered with forests of beech and pine, which supply fuel for the numerous mines of this district. [ERZGEBIRGE.] In the valleys of this region, which are rather thickly inhabited, cultivation is limited to flax, potatoes, and oats; the population is chiefly supplied with grain from the regions lying farther north.

The region which extends northward along the northern base of the mountains as far as Meissen, exhibits an agreeable alternation of hills, vales, and plains of moderate extent. Its fertility in general is not great, though there are some productive tracts, among which the plains near Chemnitz and Zwickau are distinguished. But the whole region is cultivated with great care, as its agricultural produce finds a ready sale in the populous towns and villages of the mountain region. The winters are not severe enough to prevent the cultivation of the common kinds of grain. Some of the lower grounds, especially those along the Elbe, are noted for their orchards; and in the vicinity of the town of Meissen a considerable quantity of wine is made. Coals are found in extensive beds not far from Dresden, and in the vicinity of Zwickau. Sheep, cattle, and horses are abundant in these parts.

The northern portion of Saxony west of the Elbe is a plain, and constitutes the most southern part of the great plain which extends to the shores of the Baltic. It contains however more hills than occur farther north. The hills are isolated, and generally low, except the

Colmberg, west of Oschatz, which attains an elevation of 1134 feet above the sea-level. The general level of this district near the hilly region is about 600 feet, and where it borders on Prussia it varies between 290 and 860 feet. It is the most fertile portion of Saxony, and though it contains several tracts covered with heath, some extensive districts are distinguished by fertility. The most fruitful parts are the plains of Lommatsch, Meissen, and Leisnig on the Freyberger Mulda; the country surrounding the town of Leipzig, and the valley of the Elster. Agriculture is the principal occupation of the inhabitants, but it is united to the rearing of cattle and horses. Sheep abound in the less fertile tracts. The forests are here of small extent.

Climate.—The temperature of the northern plain does not differ much from that of the hilly region. The mean annual temperature in both regions is 47.5°. The winter is rather severe, the mean temperature being 30° or a little less. The mean temperature of spring is 49°, of summer is 62°, of autumn between 49° and 50°. The banks of the Elbe are the lowest parts of the region, and accordingly the temperature of Dresden and Meissen is from two to three degrees higher than those given in the above statement. The climate of the towns near the mountain region, as that of Freyberg and Chemnitz, does not materially differ from that of the countries farther north, but in the valleys the temperature is considerably lower. At Altenburg in the mountain region, 2475 feet above the sea-level, the mean annual temperature does not exceed 40°, that of the winter is 25°, of the spring 41°, of the summer 54°, of the autumn about 41°. The prevailing winds are from the west and south-west; those from north-west and from south and south-east are also common; northern, north-eastern, and eastern winds are rare. The annual rainfall is from 20 to 24 inches.

Rivers.—The principal river is the ELBE, which is navigable for large river boats through the whole of its course, as far as it lies within the boundaries of Saxony. It is joined, within Saxony, by a few small rivers, which are used to float down timber and fire-wood. The rivers which fall into the Elbe are the Black Elster, with its tributary the Röder, from the east, and from the west the Freyberger and the Zwickauer Mulda, which unite within Saxony, and the White Elster, with its tributary the Pleisse.

Productions.—The chief crops are corn, potatoes, rape-seed, hops, flax, hemp, chicory, tobacco, madder, woad, saffron, medicinal herbs, anise, coriander, poppy, &c. The meadows are most carefully cultivated, and yield several crops in the year. Spanish clover is much cultivated. Culinary vegetables are abundant, and large quantities are exported. With the exception of the mountainous district, Saxony resembles a vast orchard, the produce of which is a never-failing source of wealth to the inhabitants. The culture of the vine was introduced in the 11th century. The annual produce is about 2,400,000 gallons. Almost a fourth part of the country is covered with forests, consisting chiefly of pine and fir. Of other timber-trees the most common are the beech and the birch; the maple, the elm, and the ash are less common, and the oak very rare.

The breed of cattle has been very much improved within the last century. The horses are good. There are swine and goats in most parts of the country, and domestic poultry abounds. Among wild animals are boars, foxes, badgers, hares, lynxes, and wild cats; birds of prey, with the exception of eagles, which are seldom seen, are everywhere met with. There are also bustards, storks, heathcocks, pheasants, partridges, wild geese, ducks, and swans. The breeding of bees has declined. The breed of sheep has been gradually and greatly improved since 1765, by successive importations of merinos from Spain, so that there are above 2,000,000 sheep of the improved breed, and Saxony wool is preferred even to the Spanish.

The minerals are some gold, copper, iron, lead, tin, cobalt, arsenic, vitriol, bismuth, nickel, zinc, antimony, quicksilver, calamine, rock crystal, amethyst, carnelian, garnets, diamonds, jasper, chalcidony, Labrador stone, potters'-earth, fine porcelain clay, basalt, serpentine, granite, marble, alabaster, fluor-spar, sandstone, limestone, slate, porphyry, black amber, brimstone, alum, saltpetre, and coals. All the salt is imported from Prussian Saxony.

The manufactures are very important. The most important branch of linen manufacture is that of damask table-linen at Gross-Schönau (1000 looms). Thread-lace of extraordinary beauty is manufactured in the Obererzgebirge and the Voigtland. The annual value of the linen manufactures is 3,000,000 dollars. Woollen manufactures are very extensive, and those of cotton stuffs and cotton hosiery have rapidly increased in recent times. There are silk-manufactures on a small scale; numerous paper-manufactories; and tanneries, breweries, and distilleries in almost all the towns. The manufactures connected with the mines are of great importance, especially at Freiberg, where are also cannon and shot foundries, and smelting-works. Cobalt is made into smalts, and some places are noted for the manufacture of verdigris. The manufacture of straw bonnets, mats, &c., employs 10,000 hands. Meissen has become universally famous for the manufacture of porcelain and glass. Steam-engines, mill-machinery, tools, and toys are also manufactured in Saxony.

Commerce.—The centre of the commerce of the country is Leipzig. The whole foreign and domestic trade of Leipzig at three fairs amounts to from 20 to 22 million dollars. The book trade is likewise to the amount of some millions. The principal exports are fine woollen-

manufactures, linen, lace, &c.; thread, wool, worsted, hosiery, smalts, porcelain, straw-manufactures, woodenwares, glass, fruit, timber, toys, and mineral products. The imports are salt, cotton, silk, flax, hemp, colonial produce, salt and dried fish, fancy goods, &c. The value of the exports is said to exceed that of the imports by 3,000,000 dollars. The chief towns are all connected with each other and with the great cities of Germany by railroads.

Religion.—There is no state religion; the great majority of the inhabitants are Lutherans, but the royal family is of the Roman Catholic faith, and both religions are placed on an equal footing.

Education.—Saxony holds a very high rank with regard to the number and the excellence of its institutions for education. The lower classes are generally able to read and write. The number of printing-offices and booksellers greatly exceeds that in any other country of equal extent. In addition to the particulars on this score given under DRESDEN and LEIPZIG, we here mention the chief educational institutions of the kingdom:—University of Leipzig, 1; high schools at Grimma and Meissen, 2; gymnasia, 11; seminaries for schoolmasters, 4; mining academy, 1; institution for teaching the management of forests, 1; military schools, 2; deaf and dumb school, 1; agricultural school, 1; Academy of Arts at Dresden, 1; besides free schools for the poor in all the principal towns.

Revenue.—The revenue arising from the public estates, the regalia, and direct and indirect taxes for each of the three years of the financial period, 1852-1854, was estimated at 8,281,728 thalers, and the expenditure at the same amount. The public debt at the end of 1853 amounted to 42,781,528 thalers. The military establishment numbers about 26,500 men and officers, the greater part generally absent on furlough, except at the time of the annual exercises.

The constitution is a monarchy, with a representation divided into two chambers, without the consent of which no law can pass. The executive power is in the king and a responsible ministry. Some attempts were made to compel the king in 1849 to receive the constitution drawn up by the Frankfurt assembly. This the king refused, and the republicans of Dresden broke out into insurrection (May 3), which was crushed with the assistance of Prussia. [DRESDEN.] The crown is hereditary in the male line of the Albertine house of Saxony. Saxony is a member of the German Confederation, and as such furnishes a contingent of 12,000 men and a contribution of between 4000 and 5000 florins. It has the fourth place in the German Diet, between Bavaria and Hanover, and has four votes in the full council.

Divisions of the Kingdom.—The kingdom is divided into four provinces or circles, the area and population of which are as follows:—

Circles.	Area in Square Miles.	Population in 1852.
Dresden	1,607	507,705
Leipzig	1,336	446,826
Zwickau	1,782	735,557
Bautzen	967	297,744
Total	5,752	1,987,832

No country in Europe is more densely populated. On an average there are 345½ inhabitants to an English square mile, and in some parts of the country there are nearly 500 to the square mile. The principal towns are described under DRESDEN, LEIPZIG, LAUSITZ, CHEMNITZ, FREIBERG, PLAUEN, ZITTAU, BAUTZEN, MEISSEN, SCHNEEBERG, ANNABERG, PIRNA, &c.

SCAER. [FINISTÈRE.]

SCAMANDER. [TROY.]

SCANDERON, or ISKENDEROON, or ALEXANDRETTA, a sea-port town in the north of Syria, on the east shore of the Gulf of Scanderoon. It was founded by Alexander the Great, and called Alexandria ad Isum. It is a very unhealthy place during the summer months, being surrounded on three sides by large marshes, which cause intermittent fevers. One of the marshes has been recently drained, and the place is consequently less unhealthy than formerly; but still during summer the harbour is deserted for Latakia, a less convenient port considerably to the southward. It owes its importance to its being the seaport of Aleppo and of all northern Syria. Goods are conveyed to and from Aleppo by caravans of camels. The imports are corn, rice, salt, sugar, coffee, dye-stuffs, spices, and European manufactures; the exports consist chiefly of gall-nuts, silk, cotton, drugs, &c.

SCANDINAVIA, the ancient name of the large peninsula which forms the north-western portion of the continent of Europe, and comprehends the present Norway and Sweden. The small sovereignties which existed in this peninsula when it first began to be noticed in history (Pliny, 'Nat. Hist.' iv. 13), became united into the two monarchies of Sweden and Norway in the 12th and 13th centuries. When Denmark had acquired a more regular government, the famous Margaret, queen of Denmark, succeeded in uniting the crowns of Denmark, Sweden, and Norway in her own person. Norway was acquired by inheritance, and Sweden by conquest. By the union of Calmar (1397) these countries were never to be disjoined. Norway indeed remained united with Denmark up to 1814, but Sweden, was

separated from it in the middle of the 15th century. From that time the two countries of Scandinavia constituted separate states, until the year 1814, when Denmark was obliged to cede Norway to Sweden, and Norway submitted to the new order of things. Since that time the whole peninsula has been under the same king, but the two countries of Norway and Sweden have preserved their constitutions, which differ in every respect. [NORWAY; SWEDEN.]

SCANIA. [SWEDEN.]

SCARBOROUGH, North Riding of Yorkshire, a market-town and sea-port, a municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on the shore of the German Ocean, in 54° 17' N. lat., 0° 22' W. long., distant 40 miles N.E. from York, 217 miles N. from London by road, and 253½ miles by the Great Northern and York and North-Midland railways. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor, and returns two members to the Imperial Parliament. The population of the borough in 1851 was 12,915. The livings are in the archdeaconry of the East Riding and the diocese of York. Scarborough Poor-Law Union comprises 33 parishes, with an area of 81,460 acres, and a population in 1851 of 24,615.

From its name, which signifies a fortified rock, the town appears to have been of Saxon origin, and there is reason to suppose that it was also a Roman settlement. It was incorporated by Henry II. The town was in ancient times defended by strong walls, a moat, and earthen mounds. The castle, which before the application of artillery must have been impregnable, was built in the reign of Stephen. Here Piers de Gaveston, the favourite of Edward I., sought refuge from the exasperated barons, but was obliged to surrender for want of supplies, and was beheaded. During the civil wars the castle underwent two sieges by the parliamentary forces, the first of which lasted twelve months. It was afterwards dismantled by order of the Parliament; but on the breaking out of the rebellion in 1745 received a temporary repair. Barracks for 120 soldiers, and three batteries to protect the town and harbour, have since been erected.

The town is situated in a semicircular bay open towards the south and south-east, and protected towards the north and north-east by a high and steep promontory, with the old castle on its summit. It has risen gradually from the sands up the acclivity in successive tiers of streets; the upper and more modern part of the town being well built and handsome, and the streets wide and well paved. It is lighted with gas, and is supplied with water from a recently-constructed reservoir, capable of containing a million of gallons. St. Mary's church forms part of a much larger edifice, of which portions of a crypt and other remains appear in the churchyard. Christ church is of modern gothic architecture, with a tower and pinnacles. There are a neat chapel of ease, and chapels for Independents, Wesleyan, Primitive, and Association Methodists, Baptists, Christian Brethren, Quakers, and Roman Catholics. There are a Grammar school (which had 80 scholars in 1854), a Lancasterian school, National schools, a school of Industry, Denison's Charity schools, the Amicable Society's school for clothing and educating from 70 to 80 boys and girls, two infant schools, and a Roman Catholic school. The town possesses two public libraries, a mechanics institute, and a philosophical society, with a museum illustrative of the geology and natural history of the North Riding. The Oddfellows' Hall is a handsome structure of recent erection. Trinity House Hospital, the Merchant Seamen's Hospital, and Wilson's Marine Asylum are spacious and ornamental buildings; besides which there are Sedman's, Taylor's, and St. Thomas's hospitals, the Spinners' Asylum, and the Sea-Bathing Infirmary, supported by subscription, for the benefit of poor invalids. The other public buildings are the town-hall, an assembly-room, theatre, and custom-house, the borough jail, and the Union workhouse. One of the most remarkable objects at Scarborough is the Cliff Bridge, erected upon piers 75 feet high, over a chasm 400 feet wide, which separates the town from the Spa, between which places the bridge now forms a delightful promenade.

The town owes its prosperity to its mineral baths, and its advantageous position for sea-bathing. It has a beach of smooth sand, sloping gently to the sea, and the water, free from the influence of any large river, is of the greatest purity and strength. There are several excellent baths, and complete accommodation for marine bathing. The two mineral springs are on the margin of the sea, beneath the cliff, and are protected by a massive sea-wall, on which a spacious castellated saloon is erected; and there are various walks and ornamental grounds. The springs comprise carbonate and sulphate of lime, magnesia, and oxide of iron; they have a cooling and tranquillising influence, and are found beneficial in stomach complaints.

Scarborough Harbour is narrow at the entrance, but is easy of access, and commodious within. It has two piers, each 1200 feet long; at the end of one of the piers is a lighthouse. Scarborough is a bonding port, and has large bonding warehouses. It has a considerable foreign trade, principally with the Baltic, Holland, and Portugal: the imports being timber deals, hemp, flax, iron, brandy, and wine. There is an active coasting trade in coal, corn, butter, bacon, and salt-fish. Nearly 200 boats are employed here in the herring fishery in the season. Ship-building is carried on. Cordage and sail-cloth are manufactured. There are several coal-mines in the neighbourhood.

The ships registered as belonging to the port on December 31st 1853 were—Under 50 tons 62, tonnage 1767; above 50 tons 134, tonnage 32,079. During the year 1853 there entered at the port 274 sailing-vessels of 16,705 tons; and there cleared 27 sailing-vessels of 1657 tons, and 2 steam-vessels of 37 tons aggregate burden. A county court and quarter sessions are held in the town, and weekly petty sessions for the borough and the North Riding. Thursday is the market-day. Fairs, principally for cattle, are held on Holy Thursday and on Old Martinmas Day. The castle-hill, with an area of 19 acres, is more than 300 feet above the level of the sea, and terminates on three sides in a perpendicular rock, the fourth side towards the town being a steep rocky slope. The approach is defended by a wall, with a deep fosse. The keep of the castle is a square tower, nearly 100 feet high, with walls 12 feet thick.

SCARIFF, or SCARRIFF, County Clare, Ireland, a market-town and the seat of a Poor-Law Union, is situated on the river Scariff, about a mile from its entrance into Lough Derg, and on the road from Killaloe to Galway, in 52° 54' N. lat., 8° 32' W. long., 24 miles E. by N. from Ennis, and 120 miles W.S.W. from Dublin by road. The population in 1851 was 954. Scariff Poor-Law Union comprises 17 electoral divisions, with an area of 86,320 acres, and a population in 1851 of 21,947. The town consists of one street, which occupies the sloping bank of the river. It contains a Roman Catholic chapel. Petty sessions are held monthly in the town. There are 11 yearly fairs.

SCARPANTO, the ancient *Carpathus*, an island in the Mediterranean, about 30 miles long and 5 miles broad, lies between Rhodes and Crete. This island consists for the most part of bare and lofty mountains scored by hollows and ravines. The highest point, Mount Lartos, near the centre of the island, is 4000 feet high. The mountains contain iron and marble. It is mentioned by Homer (*Il.* ii. 676) under the name of *Kopwatos*, and is spoken of by Pliny (v. 36) as one of the Rhodian Islands. Strabo (x. 489, Casaub.) describes it as lofty, and 200 stadia in circumference; and says that it contained four towns, one of which was called *Nisyru*. The sea between Rhodes and Crete was called the Carpathian Sea, from the name of the island.

SCARPE, RIVER. [BELGIUM.]

SCHAFFHAUSEN, one of the Swiss cantons, is bounded N., E., and W. by the grand-duchy of Baden, and S. by the cantons of Thurgau and Zürich, from which it is separated by the Rhine. It is one of the smallest cantons of Switzerland. The area is only 115 square miles; and the population, by the census of 1850, was 35,300, of whom 1362 were foreigners and 21 vagrants, and all professed some form of Protestantism, except 1411, who were Catholics, and 9 Jews. The language of the country is a dialect of the German. The surface of the canton is hilly, and the soil is mostly calcareous. The general slope of the valleys is southward towards the Rhine, which drains the whole country. Agriculture constitutes the chief occupation of the people; the country produces corn, wine, flax, hemp, and fruits, especially cherries. The climate is mild, compared with other parts of Switzerland. The manufactures consist of leather, steel, cotton-spinning, and distilling of kirschwasser. The canton has iron-mines; most of the ore is smelted in the furnaces of Laufen, near the fall of the Rhine.

The canton is divided into six districts—Schaffhausen, Stein, Thayngen, Neunkirch, Unterhallau, and Schleithelm. The only towns of the canton are Schaffhausen, Stein, and Neunkirch, but there are many villages and hamlets. The government, since 1831, is democratic. All citizens of the canton who are 20 years of age are electors. Paupers, bankrupts, and criminals are deprived of the franchise. Foreigners who purchase the bourgeoisie, or freedom of one of the communes of the canton, become entitled to the elective franchise after five years. The Great Council consists of 78 members. The Little Council, or executive, consists of nine members chosen by the great council: the members must be at least 30 years of age. The president of the little council is styled burgomaster. Both the great and little council are renewed every four years. The revenues of the canton are derived from an income tax, a house tax, patents, cantonal forests, &c. There were 6222 land- and house-holders in the canton in 1850.

The chief town, *Schaffhausen*, is built on the side of a hill sloping to the bank of the Rhine, and about 1200 feet above the sea. The summit of the hill is crowned with a feudal castle in perfect preservation. It is surrounded by walls flanked with towers, and has a fort, the vaults of which are bomb-proof. The streets are irregular, and most of the houses are old-looking, but many are modern and handsome. The most remarkable buildings are the cathedral, the church of St. John, the town-house, and the arsenal. Schaffhausen has a college, a public library, a gymnasium, several elementary schools, an orphan asylum, and a savings bank. The population is about 7700. The Rhine is crossed by a common wooden bridge. Steamers ply between Schaffhausen and Constanz. Schaffhausen ('skiff-houses') was originally a hamlet of boatmen, and a place for unloading the goods which came down from the Lake of Constanz, the boats being obliged to stop here on account of the falls in the river below the town. In the 11th century, a large monastery being built in the neighbourhood, a town afterwards grew around it, which in the 13th century was walled, and obtained the rank of an imperial town. In

1330 it came into the possession of the house of Austria, but in the 15th century it recovered its independence, and allied itself to the Swiss cantons; in 1501 it was received as a member of the Confederation. *Stewa*, situated at the outlet of the Rhine from the Untersee, or Lower Lake of Constance, has a handsome bridge over the Rhine, about 1800 inhabitants, and some remarkable old buildings. It carries on a considerable trade in wine. *Neunkirch* is a small walled town with 1200 inhabitants, 5 miles W. from Schaffhausen.

SCHLESWIG (*Sleswig*), sometimes called South Jutland, is a duchy belonging to Denmark, situated between 54° 20' and 55° 20' N. lat., 8° 40' and 10° 5' E. long. It is bounded N. by Jutland, E. by the Little Belt, S. by Holstein, from which it is divided by the river Eider and the Kiel Canal, and W. by the German Ocean. The population in 1850 numbered 363,000. The area is 3534 square miles. It is in general a level country. A range of low hills enters it from Holstein, and, traversing it from south to north, passes into Jutland. The length, from north to south, is about 70 miles, and the breadth, from east to west, varies from 30 to 56 miles, not including the islands on the east and west coasts. On the west coast there are low and rich marsh lands, which are protected by dykes, 20 feet high, against the spring tides, which often rise to the height of 13 feet. As the sea in many places deposits alluvium, new dykes are erected from time to time, to secure these additions. The principal rivers are the Eider, the Widau, and the Aue. The east coast is not so low as the west coast, but is equally fertile. The climate is on the whole temperate and healthy, but damper and less salubrious on the west than on the east coast. The country produces corn, pulse, flax, hemp, rape-seed, hay, clover, garden vegetables, and potatoes. The breeds of horned cattle and horses are excellent. The country exports annually corn, great numbers of oxen and horses, and large quantities of butter and cheese. Fish too are an important article of exportation. Wood is scarce, both for building and fuel. There are limestone, chalk, slate, and turf, but no metallic minerals. The chief occupations of the inhabitants are agriculture, the breeding of cattle, and the fisheries. There are no manufactories except in the large towns, and these are of little importance. The most considerable are those of lace and stockings, in Tondern, Hüsum, Friederichstadt, and some other places. The inhabitants, who profess the Lutheran religion, are partly of German, partly of Danish, and partly of Frisian descent. According to the 'Royal Almanac' of 1854, 29,000 of the inhabitants speak Frisian; 122,000 Danish; 125,000 Low German; 36,000 a dialect half Danish half German; and 51,000, who though they ordinarily speak Danish, have adopted German as the language of the schools and churches.

The islands on the east coast are Arröe, ALSEN, FÖHR, and Femern. *Arröe* lies off the eastern coast, due south of the island of Funen, and at the south entrance to the Little Belt. It has an area of 32 square miles, and a population of about 7000. Its level surface is broken only by a lake, called *Wilt-see*. The soil is very fertile; but there are no trees on the island. *Arroekiöping*, on the eastern side of the island is the capital; it has a convenient harbour, formed by the opposite shore of the island of Deyerbe, with which Arröe is united by a bridge. The population of Arroekiöping is only about 1500. *Marstall*, a market-village, and fishing station, on the west coast, has also about 1500 inhabitants. *Femern* is separated from the north-east point of Holstein by a narrow channel, the Femersund; it is about 16 miles long and 12 miles broad, the area 63 square miles, and the population 9000. This island produces abundance of wheat, barley, and peas. The inhabitants manufacture large quantities of barley-groats and peeled barley for exportation; they likewise export annually 20,000 pairs of worsted stockings to Mecklenburg. The fisheries are very productive. There is a lighthouse, 100 feet high, on the island. The chief town is *Burg*, or *Borg*, which has 1700 inhabitants. On the west coast are *Römbe*, or *Röm*, 7 miles long by 3 miles wide; *Sylt*, 20 miles long, 15 miles broad, has 4000 inhabitants; most of the men are sailors and fishermen; the business of agriculture is chiefly performed by the women, who also manufacture worsted stockings. *Nordstrand* was a large island, which was visited by a dreadful inundation, October 11, 1634, when 6408 persons and 50,000 head of cattle perished, and the island was broken into fragments, of which only two, Nordstrand and Pellworm, have been secured by dykes. These islands are the resort of seals and water-fowl. Many thousands of these water-fowl are annually taken, boiled in vinegar, and packed in barrels for exportation. Between these larger islands there are many small ones, without dykes, the construction of which would be too expensive. They are inhabited by descendants of the Frislanders, who, during the inundations, have their abode on the Tumuli called Warfen, which were thrown up in remote ages, and on which the churches are built.

Sleswig, the chief town of the duchy, is situated in 54° 30' N. lat., 9° 35' E. long., in a pleasant country at the mouth of the river Sley, which forms a small shallow bay (Slie Fiord) obstructed by sandbanks. It is a long irregularly built town; the houses are mostly of brick, and resemble in neatness those of a Dutch town. The principal public buildings are the churches, of which the cathedral deserves notice on account of a carved wooden screen before the altar; the town-house, the orphan asylum, the poor-house, and the nunnery of St. John. Among the numerous public institutions are a cathedral school, and a deaf and dumb asylum. The population is about 12,000. There are manufactures of china, earthenware, lace, cambrics, thread, leather, sailcloth, woollens, starch, and refined sugar. On an island in the bay is the castle of Gottorp, formerly the residence of the dukes of Schleswig-Holstein. A little south of the town are remains of the famous fortified Danish wall, erected in the 9th century. The Sley has been rendered navigable, and the navigation by means of small vessels of 200 tons and under is considerable.

Besides APENRADE and FLENSBURG the following are the most considerable towns in the duchy:—*Eckernförde*, with 3500 inhabitants, has a good harbour on the east coast, and trades in corn. *Friedrichstadt*, on the Eider, a well-built town, founded by Dutch settlers, has 3000 inhabitants, who have manufactures of silk, cotton, hosiery, starch, and lackered wares. *Hüsum*, on the west coast, with 4500 inhabitants, has a grammar-school, distilleries of spirits from potatoes, breweries, manufactures of leather and tobacco, and a considerable trade in corn and cattle. *Tondern*, or *Tundern*, on the river Widau, has 3600 inhabitants. It has a good port, with trade in corn and cattle, an oyster-fishery, and manufactures of cotton and lace. *Tönning*, a seaport and trading town at the mouth of the Eider, has 2200 inhabitants.

The railway from Altona to Rendsborg is continued to Schleswig and Flensburg, whence a line through Hüsum runs to Tönning at the mouth of the Eider. From Hüsum a branch line runs direct to Rendsborg.

SCHLEUSINGEN. [ERFURT.]

SCHLUSSELBURG. [PETERSBURG, Government of.]

SCHMALKALDEN. [FULDA.]

SCHNEEBERG is a mining town in the circle of Zwickau, in the kingdom of Saxony, situated in 50° 38' N. lat., 12° 35' E. long., on a mountain called the Schneeberg, about a league from the western Mulde, from which there is a canal, on which timber is floated to Schneeberg. The town is said to have been built in 1471, when some new and very rich veins were discovered in the silver-mines that had been worked for a long period. On the partial exhaustion of the silver-mines, the attention of the people was devoted to cobalt and the manufacture of smalt. At present cobalt and silver are the chief products of these mines. Bismuth, lead, tin, and iron are likewise found in the neighbourhood. Schneeberg is a very well built town; the principal church, the handsomest in the province, and the largest in Saxony, is adorned with paintings by Lucas Kranach. Among the public institutions are a gymnasium, several schools, an orphan asylum, and an hospital. The inhabitants, about 8000 in number, manufacture bone-lace, blond, gold and silver lace, morocco paper, and lackered wares. There are also manufactures of chemicals, and beer breweries. Schneeberg is the seat of a mining-court, and the depository of the produce of the royal smalt-works at Oberschlema.

SCHÖNEBECK. [MAGDEBURG.]

SCHONEN. [SWEDEN.]

SCHOONHOVEN. [HOLLAND.]

SCHORNDORF. [JAXT.]

SCHWABACH, a thriving manufacturing town of Bavaria, in the circle of Middle Franconia, is built on the banks of the Schwabach, a feeder of the Regnitz. It is a well built town surrounded with walls, with four gates, and has one French Protestant and two Lutheran churches, two chapels, a synagogue, an hospital, a lunatic asylum, a house of correction, and a poorhouse. There are manufactures of cotton and of needles. The latter produces every week 4,000,000 common needles, 100,000 English darned, packing, and other needles, and employs about 500 workmen. There are also manufactures of gold and silver lace, plate, stockings, tobacco, paper, hats, sealing-wax, soap, and beer. The number of inhabitants is about 8000. The confession of faith of his party, drawn up by Luther for the German reformers at Schwabach, in October, 1529, is called the Schwabach Articles. The south German reformers refused to subscribe to them, on account of the strongly expressed opinion of the real presence in the Lord's Supper. These articles, which were adopted by the confederates at Schmalkalden, were a chief obstacle to the union of the parties of Luther and Zwingli.

SCHWARZBURG is a German principality consisting of two considerable portions detached from each other, of which the southernmost is called the Upper County (Ober-herrschaft), and the northernmost the Lower County (Unter-herrschaft). The Upper County (which has an area of 423 square miles) lies on the north side of the Thüringer-Wald, between 50° 34' and 50° 55' N. lat., 10° 50' and 11° 20' E. long. It is bounded by the Prussian territory and the Saxon duchies, and is traversed by the rivers Gera, Saale, Ilm, and Schwarza. The Lower County (area 274 square miles) lies between 51° 13' and 51° 25' N. lat., 10° 30' and 10° 17' E. long. It is almost surrounded by the Prussian

territories. It is watered by the rivers Wipper and Helbe. The total area of the two counties is 697 square miles, and the total population at the end of 1852 amounted to 129,885. The surface of the country is diversified with mountains, valleys, and plains, and is on the whole fertile. The Lower County is however more productive than the Upper, which is traversed by a part of the Thüringer-Wald. In the Lower County is the Kyffhäuser, 1458 feet high, and the Hainleite, a wooded mountain chain which begins at the river Unstrutt and extends 8 leagues to the west. The natural productions are corn, fruit, potatoes, flax, and pulse. The forests furnish timber for every purpose, and abound in game. The mineral productions are silver, copper, iron, lead, vitriol, sulphur, alum, saltpetre, salt, marble, alabaster, freestone, slate, potters'-clay, porcelain-clay, and lime. Oxen and swine are numerous; the breed of sheep has been much improved.

The family of the princes of Schwarzburg is very ancient, and is mentioned in the earliest period of the middle ages. It is now divided into two branches, Rudolstadt and Sondershausen, between which the two counties are thus divided:—

	Square miles.	Population in 1852.
Rudolstadt in { Upper County	285	54,228
{ Lower County	85	14,810
Total	370	69,038
Sondershausen in { Upper County	138	26,385
{ Lower County	189	34,462
Total	327	60,847

Schwarzburg-Rudolstadt had a revenue of 720,698 florins in 1854. The portion of the Upper County possessed by the prince is called the lordship of *Rudolstadt*, from its capital, a well-built town in a valley on the Saale. Within the walls is Ludwigsburg, the prince's palace, which contains some considerable scientific collections. There are in Rudolstadt two churches, a gymnasium, a theological seminary, and about 5000 inhabitants. In the Lower County the prince of Rudolstadt possesses the lordship of *Frankenhausen*, so named from its capital, which is situated on an arm of the Wipper, has two churches within the walls and two without, a palace, a Latin school, and 4700 inhabitants.

Schwarzburg-Sondershausen has a revenue of 501,000 thalers. The distinctive title of this branch is taken from the lordship of *Sondershausen*, which comprises the prince's portion of the Lower County, and is named from its chief town, which is situated in a pleasant valley on the Wipper. The palace, situated on an eminence, contains a good cabinet of natural history. The town has a theatre, a gymnasium, an orphan asylum, an hospital, and other public institutions. The population is 4000. In the Upper County the prince has the lordship of *Arnstadt*. This town has also a palace, a gymnasium, four churches, two hospitals, and 5000 inhabitants, who have some trade in timber and corn, and considerable breweries.

Both these little states have their courts and their ministries; and Austria, Prussia, and Switzerland have accredited envoys to Rudolstadt. They belong to the German Confederation; and have, with Oldenburg and Anhalt, the fifteenth place in the select council, and in the full council one vote each. The contingent of Sondershausen to the federal army is 451 men, and that of Rudolstadt 539 men. Rudolstadt has had ever since 1816 a representative constitution with an assembly of states, consisting of 18 deputies.

SCHWARZENBERG is a lordship in Middle Franconia, in the kingdom of Bavaria, from which the princes of Schwarzberg take their title. This illustrious family is one of the most ancient of the noble houses of Franconia. By an imperial diploma of December 8, 1740, the princely dignity was extended to all the male and female descendants of the family. The present possessions of the family in Bavaria, including the county or principality of Schwarzberg, are 130 square miles, with 10,000 inhabitants; in Bohemia 1655 square miles, with a population of 230,412; and in Styria 413 square miles, with a population of 16,113. All these possessions belong to the elder branch of the family. The second branch has also extensive possessions in Bohemia and in Hungary: in the latter country its estates extend over 440 square miles, with a population of 65,000.

SCHWARZWALD. [BADEN; WÜRTENBURG.]

SCHWATZ. [TROL.]

SCHWEDT. [BRANDENBURG.]

SCHWEIDNITZ, a fortified town of Prussian Silesia, is situated in 50° 47' N. lat., 16° 30' E. long., on the left bank of the Weistritz, in one of the most beautiful parts of Silesia, 35 miles by railway S.W. from Breslau, and has about 13,000 inhabitants, including the garrison. It sustained several sieges during the Thirty Years' War; was taken in 1757 by the Austrians, in 1759 by the Prussians, in 1781 by the Austrians. The Prussians afterwards recovered the town and held it till February 1807, when it was taken after a month's siege by the French, who blew up the greater part of its defences. Among the public buildings are two Roman Catholic churches, one of which has a spire 327 feet high; two Lutheran churches, a convent of Ursuline nuns,

GEOG. DIV. VOL. IV.

large barracks, an hospital, a poor-house (which was formerly a castle), and an orphan asylum. The town has a Protestant gymnasium, and manufactures of woollens, linen, leather, starch, gloves, hats, silk, ribands, paper, beer, spirits, and vinegar. The corn, cattle, and wool are much frequented. Not far from the town are copper-works.

SCHWEITZ. [SWITZERLAND.]

SCHWERIN. [MECKLENBURG.]

SCHWYZ, a Swiss canton, which has given its name to all Switzerland. It is the wealthiest and most populous of the forest cantons (Schwyz, Uri, and Unterwalden), which were the first to assert their independence in January 1308, and to form a confederacy, which repulsed the force of the house of Austria at Morgarten; the men of those cantons became known by the name of Schwyzern, or Schweizer, which name continued to be applied to the Confederation in general after it was enlarged by the successive junction of other cantons; and lastly, the whole country formerly known in the Roman times by the name of Helvetia has been called Schweiz, or Schweizerland. [SWITZERLAND.]

The canton of Schwyz lies on the west side of the high Alps of Glarus, of which the Glärnisch, 9000 feet high, is the loftiest summit. It consists of several long valleys between lower offsets of the Alps, the summits of which are from 4000 to 6000 feet high, and of a plateau or table-land in the centre of the canton. The principal valleys are the Wäggi Thal in the north, the Sihl Thal in the middle, and the Muota Thal in the south. The waters of the northern part of the canton of Schwyz run in a north direction into the Lake of Zürich; those of the central part flow north-west by the river Sihl into the Limmat; and those of the southern part run southward into the Lake of Luzern. Besides bordering on those two lakes, the canton embraces within its territory the southern part of the Lake of Zug, and it also entirely incloses the small Lake of Lowerz, which is about two miles long and one mile wide, and the waters of which have an outlet southward into the Lake of Luzern. North-west of the Lake of Lowerz, and between it and the Lake of Zug, is the valley of Goldau, between Mount Rigi and the Rossberg. On the 2nd of September 1806 an enormous fragment of the Rossberg detached itself from the mountain, and rolled down into the valley, which still exhibits marks of this catastrophe.

The canton of Schwyz is bounded E. by Glarus; N.E. by St. Gall, from which it is separated by the river Linth; N. by the Lake of Zürich; W. by Zug, from which it is separated by the ridge of Morgarten and by the Rossberg; S.W. by Luzern, the group of the Rigi lying on the borders of the two cantons; and S., partly by the Waldstätter Lake, or Lake of Luzern, which separates it from Unterwalden, and partly by the canton of Uri, an offset of the Alps called the Rosstock, from 6000 to 7000 feet high, forming the boundary. Its area is 338 square miles. The population numbers 44,168, all Catholics but 155, who are Calvinists, and all native Swiss except 198. None of the mountains of Schwyz are covered with perpetual snow, the cold is therefore not so severe as in the other Alpine valleys, and cattle, which number about 20,000, are able to feed in summer as far as the summits. There are also a few sheep, and large herds of swine and flocks of goats. In the district of Einsiedeln the breeding of horses is attended to. A considerable quantity of cheese and butter is made. Corn is only partially cultivated; potatoes are a common article of food; flax and hemp are produced in several districts; artificial grass is sown in some places. There are vineyards near the borders of the Lake of Zürich, but cider is the common drink of the people. Kirschwasser is distilled. The forests form a considerable source of wealth. The canton exports butter, cheese, timber, firewood, cattle, horses, sheep, and pigs. It imports corn, wine, brandy, salt, coffee, sugar, and manufactures of various sorts. The manufactures of the canton consist chiefly of linens, potash, soap, walnut-oil, wax-candles, tobacco, and gunpowder. There are also some breweries, and many saw-mills and lime- and brick-kilns.

The people of Schwyz are remarkable for their square athletic forms and muscular strength. Most of the houses are built of wood, covered with tiles, and warmed by stoves. The total number of land- and house-owners in the canton, at the census of March 1850, amounted to 5994. There are elementary schools in the various communes. There is a college or gymnasium in the town of Schwyz, and a clerical seminary at Einsiedeln. There is also at Einsiedeln a deaf and dumb school. The language of the people is Swiss-German.

Schwyz, the capital of the canton, is situated at the junction of the valley of Muota with two other valleys, not quite 3 miles distant from the Waldstätter Lake. The curiously-shaped mountain called Mythen, nearly 6000 feet high, rises immediately north-east of the town, and seems to threaten to overwhelm it by its fall. The country around Schwyz is beautiful and very fertile, and the scenery is splendid. Schwyz is an open town: it has two good streets, a large square, a church dedicated to St. Martin (which is one of the finest in Switzerland), two or three convents, a college, a town-house, an hospital, a library which is rich in works relative to the history of the country, a cabinet of medals, and 2414 inhabitants. In the burying-ground annexed to the parish church is the monument of Aloys Reding, who fought bravely for the independence of his country against the French in 1798-99. The parish church contains the rich banner given by Pope

Julius II. to the Swiss troops which he had taken into his pay in the war of the Holy League.

Einsiedeln, situated about 10 miles N. from Schwyz, is a thriving place, with a good paved street, numerous shops, inns, and 2397 inhabitants. The Benedictine abbey of Einsiedeln was founded in the 10th century; it stands outside of the town, is a square building three stories high, and 476 feet long and 414 feet wide, with spacious gardens and numerous offices and outhouses. The church has several fine altars. The library of the monastery contains 26,000 volumes.

Gersau, a small town on the shore of the Waldstätter-See, was formerly a distinct republic, the smallest in Europe, with a population of about 1300, but it is now united to the canton of Schwyz. It manufactures silks, leather, and potash.

Lachen, the head town of the district of the March, on the south shore of the Lake of Zürich, 18 miles N.E. from Schwyz, has a handsome church, a town-house, some iron-forges, several mills, and about 1500 inhabitants. *Arth*, a pretty little town at the south extremity of the Lake of Zug, has a good parish church, a library in the Capuchin convent, and about 1300 inhabitants.

The cantonal government is democratic. All citizens who have completed their 18th year, and who are neither bankrupts nor under a sentence of degradation, are members of the Landgemeinde, or General Assembly, which meets in the valley of Rothenthurm, in the month of May, every other year, or oftener if required. The landgemeinde appoints the landamman, or president of the canton, the statthalter, or lieutenant, and the treasurer; it sanctions or rejects the projects of law or bills which are laid before it by the great council, and examines the financial accounts of the canton. The votes are taken by show of hands, and a simple majority decides. The Great Council consists of 108 members, who are elected by the various districts in proportion to their respective population for the term of six years. The Cantonal Council consists of 36 members, including those of the executive commission. It meets four times a year under the presidency of the landamman. The Cantonal Tribunal, or Supreme Court of Justice, consists of 14 members, besides supplementary ones, named by the various districts for the term of six years. In every district there are district councils, with their respective landamman, statthalter, treasurer, and other officers for the district, besides district tribunals. Every citizen from 19 to 50 years of age belongs to the militia. Every commune has a society of riflemen, and meetings for firing at the target. The canton returns two members to the National Council or Diet of Switzerland. [SWITZERLAND.]

SCIGLIANO. [CALABRIA.]

SCILLY ISLANDS, a group of islands about 30 miles W. by S. from the Land's End in Cornwall, lying between 49° 51' and 50° N. lat., 6° 11' and 6° 30' W. long. The aggregate area is 8560 acres. The population in 1851 was 2627. The group forms one parish, in the archdeaconry of Cornwall and diocese of Exeter.

The ancient condition of these islands has been the subject of much discussion. That at some remote period, antecedent to authentic history, they may have been united to the main, and have been separated from it by the incroachment of the sea, is not improbable. The space between them and the mainland is occupied by softer rocks, if we may judge from an insulated limestone rock, called the 'Wolf,' and hard as they are, they are themselves diminishing in size. At present there are more than 140 islands, but only six of them are inhabited. These are—St. Mary's, on the east side of the group; Treseo, north-west; St. Martin's, north-east; St. Agnes, south; Bryher, north-west; and Sampson, west.

The islands form a compact group, of about 30 miles in circumference, surrounded by a deep sea, from which they rise for the most part abruptly, with rugged sides. Between the islands the depth of the sea is much less; and in several parts extensive flats, some of them dry at low water, extend from island to island. The islands and rocks consist almost entirely of granite, but there are in St. Mary's Island some beds of porphyry and some of chlorite containing pyrites. Detached stones of gypsum and alabaster are found in Treseo, St. Martin's, and St. Mary's. The granite is very liable to decomposition, and presents some interesting geological phenomena. The shores are covered in some parts by a coarse sand, the detritus of granite, occasionally agglutinated into a kind of sandstone; in other parts by a fine shining white sand. The climate is milder and more equable than that of Cornwall, but the islands are subject to dense fogs and to sudden and violent storms. Few days of perfect calm occur in the course of the year, and during the greater part of it the wind blows from various points between north-west and south-west.

St. Mary's, population 1668 in 1851, is the most important island. It consists of two portions, the smaller of which, called 'the Hugh,' is united to the other part by a low, sandy isthmus, on which stands *Hugh Town*, the capital of the group. The shore is generally steep, and there are some small inlets or coves, besides St. Mary's Pool, on the north side, and Port Cressa on the south side of the isthmus of Hugh Town. The island is about 8 miles in circumference. The soil is generally good, and produces excellent crops of corn and potatoes. Hugh Town consists of a principal street, very crooked, and of several lanes, alleys, and courts. A handsome church in the gothic style, with a tower, was completed in 1838, at a cost of 1500*l.* The

Wesleyan Methodists have a place of worship. Most kinds of handicraft are exercised in the island. A pier 430 feet long and 20 feet broad, extends into St. Mary's Pool. A small building, called the court-house, is used by the council appointed by the proprietor of the islands; beneath it are a small prison and a butcher's stall, which receives the name of the market-house. The other principal buildings are the steward's house and the post-office. About a mile from Hugh Town, eastward, is the hamlet of Old Town, once the principal place in the island, and still containing about 200 inhabitants, chiefly fishermen. Small cottages are dispersed over the island, occasionally grouped three or four together; one little group is called London, another Bristol. The old church, with the graveyard, is near Old Town. The Hugh is a steep hill rising about 110 feet above the level of the sea; it is fortified by lines having a circuit of more than a mile, with 18 bastions or batteries, and inclosing a small fort and barracks for the officers and troops. There are two schools, supported by the Christian Knowledge Society, and another school with a small endowment.

Treseo, population 416 in 1851, the island next in importance, is inhabited chiefly by pilots and fishermen. Most of the houses are on the north-east side, near the beach, opposite a harbour called Old Grinsey harbour, and form a village called Dolphin Town. In the south part of the island is a fine sheet of fresh water, half a mile long and a furlong broad. Near this lake are the remains of a religious house. The Abbey, a mansion recently erected by Augustus Smith, Esq., the lessee of the islands, stands also near the lake. Treseo has a small church, a Wesleyan meeting-house, a mission-house of the Society for the Promotion of Christian Knowledge, and a small unoccupied fort or block-house. There are a stone tower called Oliver's Castle, now deserted, and the ruins of a fortress called King Charles's Castle. On the north side of the island is a remarkable subterranean passage called Piper's Hole. The Society for the Promotion of Christian Knowledge supports here a clergyman and a day-school.

St. Martin's, population 211 in 1851, is about 6 miles in circumference. It is chiefly inhabited by pilots and fishermen. The houses form three groups: Higher Town, on a hill rising from a bay on the south shore; Middle Town, in the centre of the island; and Lower Town, near the south-west point of the island. *Higher Town* consists of nearly 50 small houses, built of stone and thatched, with a small church. About the middle of the 17th century, the island was uninhabited; but there are indications that at an earlier period it was fully peopled. The soil is chiefly waste land, or common pasturage. On St. Martin's Head, at the eastern end of the island, is a tower 20 feet high, with a conical top, built on an earthen mound, and designed as a landmark for seamen. A day school is maintained by the Society for the Promotion of Christian Knowledge, and an infant school by the Society of Friends.

St. Agnes, population 204 in 1851, has a very irregular outline; it is surrounded by rocks, and the shore is rocky and almost inaccessible, but the soil is the best cultivated and most productive in the whole group. It consists of two parts—St. Agnes proper and the Gugh, separated from each other at high water, but connected, when the tide is out, by a narrow isthmus of sand. The houses in St. Agnes are scattered about without regard to order or general convenience. There is a small church. The Society for the Promotion of Christian Knowledge has a day school on the island, and there are two infant schools. A lighthouse stands on the highest point of the island, about 50 feet above the level of the sea: it is 52 feet high, surmounted with a lantern of 20 feet additional height, with a revolving light.

Bryher, population 118 in 1851, extends about a mile and a half from north to south, with an average breadth of scarcely half a mile: it consists of several steep hills connected by tracts of low land, a considerable part of which is in cultivation. On the east side of the island, between it and Treseo, is New Grinsey harbour, formed by the shores of the two islands and by the flats, fordable at low water, which in one part connect them. Some of the houses are grouped in what is called the town of Bryher; and there is a church. *Sampson*, population 29 in 1841, and 10 in 1851, lies south of Bryher, with which, as well as with Treseo, it is united by flats fordable at low water. The few inhabitants support themselves by fishing, making kelp, and occasionally acting as pilots. In *St. Helens* are the remains of a church, supposed to have been the first ecclesiastical building in Scilly.

The natural produce of the Scilly Islands consists of a thin short grass intermixed with chamomile, heath, and dwarf furze; fern and moss are found near the shore. The soil is commonly a black peat, mingled with granitic particles; though sandy, it bears in many places good crops of potatoes and barley. Wheat and rye are also grown. The produce of the islands, which might easily be increased, is barely sufficient for the inhabitants. There are no timber-trees, and no fruit-trees, except in a few sheltered spots in St. Mary's. Garlic is much cultivated, and most kinds of vegetables and flowers which grow in England succeed here. The cattle and horses are small and poor: their food consists partly of sea-weed for cattle, and furze for horses. The sheep are of a peculiar breed and small size; hogs are numerous; poultry scarce and poor; and rabbits not so numerous as formerly. Wild birds, especially sea-birds, are numerous; but the puffin, once very plentiful, is now seldom seen. Fish are less numerous in the

surrounding sea than formerly; small sharks are sometimes observed in the summer months, and porpoises are frequently seen.

The Scilly Islands belong to the duchy of Cornwall, and were long held on lease by the lords Godolphin, and after them by the Duke of Leeds; the present lessee is Augustus Smith, Esq. The lessee has usually appointed a council of twelve to exercise a civil jurisdiction, but persons charged with capital offences are taken to Penzance to the justices of the county of Cornwall. The council holds a monthly court at Hugh Town. A military commandant at St. Mary's, and a collector of the customs, are appointed by the authorities in London. Two clergymen, employed by the Society for the Promotion of Christian Knowledge, are stationed here; they reside at St. Mary's and Treaco respectively: when they cannot visit the churches on the other islands, the service is performed by the clerks. The society also supports schools on the principal islands; and distributes bibles, prayer-books, and other religious books. The Baptists have some preaching stations in the islands.

The islanders are generally able to read and write; their pronunciation, though not unmarked by provincialism, is more correct than from their remote situation would be expected. Their general condition is poor; their employments are agriculture, kelp-making, fishing, and pilotage. Sailing packets ply regularly twice a week between Hugh Town and Penzance. Besides the Wolf, other dangerous rocks, as the Bucks, Rennel, and Leven Stones, lie in the course. Near Leven Stones, a floating light has lately been stationed by the Trinity House. A light-house has been erected on Bishop Rock, in the south-west part of the group.

The Scilly Islands are generally considered to have been the Cassiterides of the Greeks. But it seems probable that the western extremity of Cornwall must be included in the term Cassiterides, and that the chief supply of tin was derived from it, for there are no traces of workings in the islands sufficient to countenance the opinion that much tin was ever obtained from them.

From the time of the Romans, who used them occasionally as a place of banishment, there is no notice of the islands in history until their conquest by Athelstan, king of England, who expelled the Danes about the year 938. Of their ancient importance these islands retain little trace. There are some primeval monuments; but the early inhabitants appear to have been replaced by others of Saxon origin, as indicated by their names, language, and customs. The Scilly Islands are not enumerated as part of the duchy of Cornwall, in the original grant of that duchy to the eldest son of the king of England. (12 Edward III.) Part of the islands, and the churches in all of them, belonged to the abbey of Tavistock; but it was not until the Spanish wars in the time of Elizabeth that the islands attracted much notice. In the great civil war they were long held for the king by Sir John Greenville, or Granville, who fitted out armed vessels, which made several captures. At length, in 1651, a formidable armament, under Admiral Blake and Sir George Ayscue, effected the reduction of the islands. Sir Cloudesley Shovel was lost on the rocks which form the south-western portion of the group, with his own ship and some others, on their return from Toulon, in 1707.

SCOTIA, NOVA. [NOVA SCOTIA.]

SCOTLAND. The general description of this part of the kingdom will be found under the head of GREAT BRITAIN. Under the different counties are mentioned the more remarkable historical events of which each has been the theatre, with occasional notices of, or references to, the early settlers. We propose here briefly to recapitulate the leading facts in reference to the settlement of Scotland, and the prominent points in its history till its establishment as a kingdom.

We first hear of the Scots as a people inhabiting Ireland, which island they in the 5th century divided with the Hiberni, the previous inhabitants, over whom however they acquired so decided a superiority as to be enabled to give their name to the country, which was exclusively called Scotia from the 5th to the 10th century. In the beginning of the 6th century a colony of Scots from the north of Ireland emigrated to North Britain, and effected a settlement in the district now constituting Argyleshire, to which they gave the name of Dalriada, it is said, from their leader Riada. Here the Dalriadic Scots—the 'Scoti qui Britanniam incolunt,' as they are called by Bede, remained for more than 300 years, during which the rest of the island to the north of the friths of Forth and Clyde formed the kingdom of the Picts, which, while governed by one king, was divided into two populations, the Northern or Highland Picts, and the Lowland or Southern Picts—the Septentrionales and Australes Picti of Bede.

The Pictish king, Angus MacFergus, in 736, effected a conquest of Dalriada; and a line of Pictish princes reigned there till 819, when the Dalriadic family recovered their ancestral dominions. A victory obtained by Constantine MacFergus, a descendant of Angus, in 789, established the superiority of the southern Picts, and, being followed

by a reign of 30 years, enabled Constantine to introduce the principle of succession by descent, and to make the monarchy hereditary in his family, instead of its being as formerly to some extent elective.

In 843 the whole of North Britain was united under the sceptre of Kenneth MacAlpin, originally king of the Scots of Dalriada, but thenceforth styled king of the Picts. Throughout the 10th century, North Britain, ruled as one kingdom by the successors of Kenneth MacAlpin, was known by the name of Albania, undoubtedly the same with Albion, or Albin, which is the most ancient name attributed to the island, and that by which the Gael of Scotland distinguish it to this day. About the middle of this century however, we find the name Scotland began to be applied to North Britain; and from the commencement of the 11th century the people are designated the Scots simply, and not the Scots of Britain, or of Albania, by way of distinction from the main body of the nation, which had been till now considered as settled in Ireland.

Scotland proper at this date comprised only that part of the island to the north of the Forth and Clyde. But the south of modern Scotland, in whole or in part, was also occasionally comprised under the same name. It may be divided into three districts:—1, Lodonia, comprehending the Lothians and other counties to the south, formed, from the middle of the 5th century, a part of the Anglo-Saxon kingdom of Bernicia, and the people appear to have been mainly Angles from that date. The Northumbrian king Egfrid transferred it to the Picts, and it was formally surrendered by Edgar to the Scottish king Kenneth IV., in 971. 2, Strathclyde, comprehending, besides Lanark, Renfrew, and the northern half of Ayrshire, at least the town and rock of Dumbarton, then called Alcluyd, which was its capital. This was a Cymric or Welsh kingdom, and remained independent of the Scottish crown till the defeat of its last king, Dunwallon, by Kenneth III., in 973. 3, Galloway, which comprised the modern counties of Kirkcudbright and Wigton, together with the southern portion of Ayrshire. Its history is very obscure; but it is spoken of as having been a Pictish country so early as the 6th century, and the English historians notice the Picts of Galloway as appearing in the Scottish array at the battle of the Standard, fought in 1138. The district of Cumbria, lying within what is now called England, was made over to Malcolm I., king of the Scots, by the Saxon king Edmund I., in 946, and being held as an English fief, constituted an appanage of the Scottish crown from that date down to the year 1072.

The Orkney and Western Islands had been taken possession of by the Norwegians in the end of the 9th century. Sigurd, the earl of Orkney, and Thorstein the Red, who claimed the sovereignty of the Western Isles, leaguely together, made a descent upon the mainland in Scotland in 894, and, quickly overrunning the greater part of the districts of Caithness, Sutherland, Ross, and Moray, established there a Norwegian principality, which was maintained, though with much contention, till the expulsion of the Norwegians in 993. This expulsion was effected by Malcolm, Maormor of Moray, who a few years after, by the defeat and death of Kenneth V., obtained possession of the throne under the title of Malcolm II. On his death a faction raised to the throne another Malcolm, the son of Kenneth. This Malcolm MacKenneth, immediately after his accession, proceeded to dispossess Sigurd's son Thorfinn of Caithness, with which he had been invested by his maternal grandfather; and a long war followed between the Scottish king and the Norwegian earl, which terminated, in 1034, in the defeat and death of the former: events which were forthwith followed by the complete subjugation of Scotland, as far north as the Frith of Tay, by Thorfinn, whose kingdom thus founded lasted for 30 years.

On the death of Malcolm MacKenneth, the part of the country that remained unsubdued acknowledged as his successor Duncan, son of his daughter Bethoc, whose father Crinan, commonly designated Abbot of Dunkeld, is believed to have been one of the chiefs of the Northern Picts. Duncan, in 1040, during a temporary absence of Thorfinn, marched upon the dominions of that prince, and made his way as far north as Moray without encountering resistance. At this point he was opposed, not by the Norwegians, but by the Gaelic inhabitants, who were commanded by Macbeth, the Maormor of Moray, who, attacking Duncan near Elgin, defeated and slew him, and assumed the title of King of Scotland. Macbeth in the south, and Thorfinn in the north, reigned till the year 1054, when Macbeth was attacked by a Saxon force, under Siward, earl of Northumberland, which had been obtained from Edward the Confessor by Duncan's eldest son Malcolm, who after his father's death had taken refuge at the English court. This invasion terminated in the expulsion of Macbeth from the country south of the friths of Forth and Clyde, and the establishment of Malcolm (surnamed Canmore, or Great Head), as king of that part of Scotland. The authority of Malcolm continued to be confined to the Lothians till 1058, when a second Saxon invasion drove Macbeth as far north as Lumphnan in Aberdeenshire, where he was overtaken and slain in battle. Thorfinn held his ground till his death in 1064, and it was not till 1085 that the whole of Scotland (except perhaps Caithness) was brought under subjection to Malcolm.

The reign of Malcolm Canmore terminated in 1093, and his death immediately gave rise to a new conflict between two opposite prin-

ciples of succession to the throne—the population of the Lowlands, now to a great extent Saxon, supporting the claim of Duncan, the son of Canmore; the Celtic tribes of the north asserting the right of Malcolm's brother, Donald Bane, in conformity with what is called the system of tanistry, which, brought by the Dalriads from their former country, Ireland, had probably till now regulated the succession in the royal family, both in their first seat and since they had succeeded to the Pictish crown. In entering upon his contest with Duncan, Donald Bane was assisted by Magnus Barefoot, king of Norway, to whom at this time belonged the Western Islands. This alliance enabled Donald in the first instance to carry everything before him, and the establishment of his authority is said to have been immediately followed by the expulsion of all the Saxons who had settled in the Lowlands of Scotland during the late reign; but after a few months Duncan came against him with a numerous army from England, permission to raise which he had probably obtained from William Rufus, and Donald was obliged to give way. It appears however that even Duncan was not able to protect the Saxon settlers who had thus returned with him; he found it necessary to drive them all out of the country, a concession to the popular cry however by which he gained nothing, for as soon as his subjects found him thus deprived of foreign protection they put him to death, and replaced his uncle on the throne. Two years afterwards another English army, conducted by Edgar Atheling, again overpowered Donald, and set the crown on the head of Edgar, a brother of Duncan. That result finally decided the contest between the two principles of succession, and also the struggle for supremacy between Celtic and Saxon Scotland. Edgar, whose accession took place in 1097, was succeeded by his brother Alexander I., and he by his brother David I., whose reign extended to the year 1153. On the accession of Malcolm the Maiden, a child only in his 11th year, attempts were made by the Highlanders to maintain, in opposition to the feudal heir, the claim of William, a grandson of Malcolm Canmore's eldest son Duncan; but this new pretender was wholly unsuccessful.

It was not however till fully two centuries later that the rule of the king of the Scots was completely established over the whole of Scotland. The native chiefs appear for some time to have retained possession of those districts which had formed part of Thorfinn's kingdom; the rest of the country, and the whole of it south of the friths, acknowledged the king of Scotland. The Saxon inhabitants perfected their Saxon institutions; the country was divided into earldoms, and sheriffs and county courts were established over the entire kingdom, except the extreme north. From the reign of Alexander's successor, David I., we are to date the introduction of Norman institutions into Scotland. Of the great Highland chiefs, the earls of Moray continued to be the most formidable till the year 1161, when that ancient line was stripped of its power and its possessions by Malcolm the Maiden, and the title it had enjoyed was transferred to the earls of Mar. From the cession of the Hebrides by the Norwegians in the year 1266, the most powerful family of the north came to be that of the Macdonalds, the Celtic chiefs of these islands, who styled themselves Lords of the Isles; but their strength, which had been broken by the defeat of Donald, lord of the Isles, at the battle of Harlaw, fought in 1411, was destroyed by the effective measures taken to curb the Highland chiefs by James I. From this epoch may be dated the complete reduction of Celtic Scotland under the sceptre of the Saxon king of the Lowlands. The lordship of the Isles was finally extinguished by the forfeiture of the last lord in 1493.

SCOTTER. [LINCOLNSHIRE.]

SCULCOATES, East Riding of Yorkshire, a suburb of Kingston-upon-Hull [HULL], which has been made the seat of a Poor-Law Union. Sculcoates Poor-Law Union contains 18 parishes and townships, with an area of 45,004 acres, and a population in 1851 of 44,059.

SCUTARI, a town on the Asiatic shore of the Bosphorus, facing Constantinople, of which it may be considered as a suburb. It is built on the slope of a hill, and has eight fine mosques and magnificent burying-grounds planted with cypresses. Many of the wealthier Turks of Constantinople choose to be buried at Scutari, from an old tradition that their race will one day be driven out of Europe. There are also fine country-houses and kiosks in the neighbourhood. The late sultan Mahmud built handsome barracks at Scutari for his regular troops. One of the best views of Constantinople is from the hill just above Scutari. The population is estimated at from 35,000 to 60,000 inhabitants. The place is one of considerable traffic, being the great thoroughfare between the capital and the Asiatic provinces of the empire. The town occupies the site of the ancient *Chrysopolis*. Its present name is a corruption of its Persian name *Uskudar*, which means 'courier,' as the place has been from remote ages a post-station for Asiatic couriers, and a rendezvous for caravans and travellers proceeding from Constantinople eastward. One of the greatest attractions of Scutari is the convent of the howling and dancing dervishes. The sultan Mahmud's barracks were occupied by the British troops on their advance to the Crimea in 1854, and have since been converted into an hospital for the British army.

SCUTARI (*Skodré* in Albanian, and *Iskander* in Turkish), a considerable town of Northern Albania, and the capital of a pashalik, is situated at the southern extremity of the Lake Zenta or Lake of Scutari, where the Boyana issues from it, and about 18 miles from the coast of

the Adriatic. It is a fortified town, and has two castles. The population of Scutari is variously reckoned at from 16,000 to 40,000, more than one-half of whom are Catholics. Scutari has manufactures of arms and of woollen and cotton goods, an arsenal, a large bazaar, barracks, several mosques, and Catholic and Greek churches. The fishery on the lake constitutes a valuable branch of industry. The Lake of Scutari is about 16 miles in length from north-west to south-east, and from 3 to 5 miles in breadth, and it contains several small islands. The lake lies in the high land of Albania, and is surrounded by offsets of the chain of Mount Scardus; on the north it borders on Montenegro.

SCYLLA. [CALABRIA.]

SCYTHIA was a name originally given to a part of Europe, and was for a long time restricted to that country. This Scythia, which is described as a square of 4000 stadia by Herodotus (iv. 101), extending from the Ister to the Palus Mæotis, and from the sea (the Pontus) to the Melanchlæni. There is considerable difficulty in determining the boundaries of the Scythia of Herodotus; but it may be said in general terms to have comprised the south-eastern part of Europe, between the Carpathian Mountains and the Tanais or Don. According to the account of Herodotus the Scythians were an Asiatic, perhaps a Mongol people, who were driven from their settlements to the north of the Araxes by the Massagetae, and after crossing that river descended into Europe, and drove out the Cimmerians from the country, which was afterwards called Scythia. The date of their migration into Europe may be determined with tolerable accuracy, if the irruption of the Cimmerians into Lydia in the reign of Ardyas (about B.C. 640) was the immediate consequence of their defeat by the Scythians. (Herod., i. 15.) The general and genuine name of the Scythians is said to have been Scoloti; the name of Scythæ or Scythians was given to them by the Greeks. (Herod., iv. 6.)

The only two important events in the history of Scythia mentioned by Herodotus are, 1st, the invasion of Media by the Scythians in the reign of Cyaxares (B.C. 635-595), and their conquest of Asia as far as the confines of Egypt, which they held for 28 years; and, 2ndly, the invasion of Scythia by Darius, the son of Hystaspes, in which the Persians were unsuccessful.

In subsequent times the Scythians lost all their power. The Getæ conquered a great part of the west of their country, and the Sarmatæ pressed upon them from the east; the latter people eventually obtained possession of the greater part of Scythia, and gave their name to the whole country. [SARMATIA.] In the time of Pliny ('Hist. Nat.,' iv. 25) the Scythians had become extinct as a people: their place was occupied by the Germans and Sarmatians, and the Scythian name was confined to the most remote and unknown tribes to the north.

The name of Scythia began to be applied to the northern parts of Asia in the Macedonian period. When the Macedonians found on the Jaxartes nations resembling the Scythians, they gave the name of Scythia to this part of Asia, and thus an Asiatic Scythia was supposed lying to the east of the true one.

In the time of Ptolemy the name of Scythia was given to the country between Asiatic Scythia and Serica or China: it was bounded on the south by India. Its limits to the north were undefined. It was divided into two parts by the Imaus, Hindu-Koosh, or Bolor-Tagh. The western part was called Scythia intra Imaum, and the eastern Scythia extra Imaum.

SEAFORD. [SUSSEX.]

SEAFORTH. [LANCASHIRE.]

SEAHAM, a small sea-port in the county of Durham, is situated in 54° 50' N. lat., 1° 20' W. long., distant 16 miles E.N.E. from Durham, and 290 miles from London by the Great Northern and North-Eastern railways. The population of the township in 1851 was 729, that of the ecclesiastical district of Seaham Harbour was 3538. The living of Seaham is a vicarage; that of St. John's, Seaham Harbour, is a perpetual curacy, in the archdeaconry and diocese of Durham. The town has been very much improved of late years, chiefly in consequence of the well-directed efforts of its proprietor, the Marquis of Londonderry. Several public buildings have been erected, including a district church, a literary and scientific institute, and schools. Much coal is shipped from the quay.

SEARA, or CEARA. [BRAZIL.]

SEATON. [CUMBERLAND.]

SEATON CAREW. [DURHAM.]

SEATON SLUCE, or SEATON DELÁVAL. [NORTHUMBERLAND.]

SEBASTOPOL, or SEVASTOPOL. In the article CRIMEA we have given an account of this town as it was. Recent events have raised it in interest, but must have greatly altered its appearance, and our account would hardly apply to its present state. In October, 1854, the bombardment of it was commenced by the allied French and English; the defence has been certainly vigorous and skilful; the allied armies, particularly the English, suffered dreadfully from disease during the winter, but in June, 1855, the assaults became more successful, and several of the Russian outworks were taken by the allied forces. We may add that the little promontory upon a part of which Sebastopol stands, is a spot of classical and historical interest. Here stood the temple of Diana, in which Iphigenia, the daughter of Agamemnon, was a priestess; here also was the Eupatoria, founded by a general of Mithridates the Great, king of Pontus, and the able opponent of the Romans; while Balaklava (*Bella Chiave*, the 'beautiful quay')

was the seat of the commerce of the Genoese, who for a time exercised great authority throughout the whole Chersonesus.

SEBENICO. [DALMATIA.]

SEBERGHAM. [CUMBERLAND.]

SEBRAO. [SUNDA ISLANDS, *Timor Group*.]

SEBSEWAR, or SUBZAWAR. [PERSIA.]

SECCHIA. [Po.]

SECLIN. [NORD.]

SEDAN. [ARDENNES.]

SEDBERGH, West Riding of Yorkshire, a market-town, and the seat of a Gilbert's Poor-Law Incorporation, in the parish of Sedbergh, is situated in a sheltered and fertile vale, in 54° 20' N. lat., 2° 30' W. long., distant 78 miles W.N.W. from York, and 263 miles N.N.W. from London. The population of the township of Sedbergh in 1851 was 2235. The living is a vicarage in the archdeaconry of Richmond and diocese of Ripon. Sedbergh Poor-Law Incorporation contains the three townships of Sedbergh parish, with an area of 52,882 acres, and a population in 1851 of 4574.

Besides the church there are in Sedbergh places of worship belonging to Wesleyan Methodists, Quakers, and Independents. The Free Grammar school was founded by Dr. Roger Lupton, provost of Eton. The endowment amounts to about 600*l.* a year; and there are 3 fellowships and 10 scholarships in St. John's College, Cambridge, for students from this school. In 1854 the school had 90 scholars. There are also National and British schools, and several parochial charities.

SEDFIELD, Durham, a market-town, and the seat of a Poor-Law Union, in the parish of Sedfield, is situated on an eminence in 54° 39' N. lat., 1° 26' W. long., distant 11 miles S.S.E. from Durham, and 252 miles N.N.E. from London. The population of the township of Sedfield in 1851 was 1362. The living is a rectory in the archdeaconry and diocese of Durham. Sedfield Poor-Law Union contains 23 parishes and townships, with an area of 43,953 acres, and a population in 1851 of 8501. The parish church, dedicated to St. Edmund, is one of the handsomest in this part of the county: it has parts in early English, decorated, and perpendicular styles. The Wesleyan Methodists and Roman Catholics have chapels. The Grammar school is free to 14 boys; in 1854 it had 70 scholars. The market is held on the first Friday in each month for hogs. Fairs are held on the first Fridays in April and October.

SEDGLEY. [STAFFORDSHIRE.]

SEDLITZ. [BOHEMIA.]

SEEZ. [ORNE.]

SEGEBERG. [HOLSTEIN.]

SEGESTAN. [SEISTAN.]

SEGNÉ. [FROSINONE.]

SEGO is the capital of Bambarra, a country situated in that part of Africa which is called the Sédan. The town stands on both sides of the river Joliba, near 13° N. lat. and 5° W. long. Mungo Park states that the Sego properly consists of four distinct towns, two on the northern bank of the river, called Sego Korro and Sego Boo, and two on the southern bank, called Sego Soo Korro and Sego See Korro. They are all surrounded with high mud walls; the houses are built of clay, of a square form with flat roofs; some of them have two stories, and many of them are whitewashed. Besides these buildings there are many Moorish mosques. The streets are narrow. Park estimated the number of inhabitants at about 30,000. The king of Bambarra resides at Sego See Korro. At several places there are canoes belonging to the king for conveying people over the river. Sego carries on a considerable commerce. The surrounding country is well cultivated. [BAMBARRA; NIGER.]

SEGORBE. [VALENCIA.]

SEGOVIA. [CASTILLA LA VIEJA; NICARAGUA.]

SEGRE, RIVER. [CATALUÑA.]

SEGRÉ. [MAINE-ET-LOIRE.]

SEGURA. [MURCIA.]

SEHWUN. [HINDUSTAN.]

SEINE, the Roman *Sequana*, a river in France, rises in the heights of Langres, near the town of Chauceaux in the department of Côte d'Or, and flows north-west past Chatillon-sur-Seine, Bar-sur-Seine, Troyes, Romilly, Montereau, Melun, Corbeil, Paris, Mantes, Elbeuf, Rouen, and Havre, just below which it falls into the sea: its whole course is about 470 miles. Its source is 1426 feet above the level of the sea; at Troyes it is 331 feet above the same level; at the junction of the Loing between Montereau and Melun, 184 feet; at Corbeil, 147 feet; and at Rouen, 111 feet. Its principal affluents on the right bank, in the order in which they join, are the Aube, the Marne, the Oise, and the Epte; and on the left bank the Yonne, the Loing, the Eure, and the Rille. The Seine and its tributaries abound in fish; the sturgeon, the salmon, the sole, the shad, the eel, the smelt, and other fish are caught in it.

By means of a lateral canal between Marilly and Troyes, and locks to avoid the fall at Nogent-sur-Seine, the river is navigable from its mouth to Troyes, a distance of 370 miles. Large river barges and small steamers ply on the Lower Seine and as high as Paris; and recently a vessel has sailed direct to Paris from Rio Janeiro without breaking bulk. The tide ascends the Seine as far as Rouen, to which city ordinary sea-going vessels of 300 tons and under ascend. The navigation of the Seine and its tributaries is facilitated by the canals

of Oureq, St.-Denis, and St.-Martin, which connect the Oureq with the Seine at Paris and at St.-Denis, and by some short cuts; it is connected with that of the Saône and Rhône by the Canal-de-Bourgogne, which connects the Yonne, between Auxerre and Joigny, with the Saône at St.-Jean-de-Loosne; and with that of the Loire by the Loing Canal, which connects the Seine with the two canals of Orléans and Briare, of which the former joins the Loire just above Orléans, the latter at Briare. The canal of St.-Quentin and the Oise connects the Seine with the Schelde. The total navigation of the Seine and its tributaries is about 900 miles in length.

The Seine has a generally slow current; and its sinuities, especially below Paris, are very great, and tend to render the navigation tedious. The lowest bridge over the river is at Rouen. The shifting sands at the mouth of the river, and the shoals in its bed, formerly impeded the ascent of larger vessels than from 250 to 300 tons. Recently great works have been constructed between Villequier and Quillebeuf, to confine the current in the estuary of the river to a narrower bed; thus a greater depth of water has been obtained, and the increased force of the stream has swept the passage clear of sands. The facilities afforded by this river for the supply of various articles for the markets at Paris are of great importance: corn, flour, wine, hay, wool, hemp, hides, fire-wood, timber for building, coal, sandstone, millstones, and iron are brought down from the districts above the capital; while corn, flour, wine, cider, butter, fish-oil, flax, hemp, wool, pitch, resin, drugs, colonial produce, and manufactured goods are carried up from places below the city. Between 4000 and 5000 sea-going ships, besides coasters, enter and leave the harbours of Rouen and Havre annually.

The scenery in the upper part of the river is tame and monotonous; but from Paris to Rouen, and still more from Rouen to the sea, it presents a more interesting appearance. The Seine is not subject to great overflows.

SEINE, the metropolitan department of France, is surrounded by the department of Seine-et-Oise. It lies between 48° 43' and 48° 58' N. lat., 2° 30' and 2° 33' E. long., and is nearly circular in form. Its greatest length is 18 miles, its breadth 16 miles; its area is 184 square miles. The population in 1841 was 1,194,603; in 1851 it amounted to 1,422,065, giving 7728.61 to a square mile. Although the smallest of the French departments, it exceeds them all in amount and density of population. Of the area, 103.3 square miles are inclosed by the great bastioned wall lately erected around Paris. [PARIS.]

The surface of the department is tolerably level; some heights, as those of Montmartre and Chaumont on the north side of Paris, rise to the height of 270 or 300 feet above the valley of the Seine. Mont-Valerien in the west of the department, the highest hill in the neighbourhood, is not more than 448 feet above the sea-level. The department is occupied by the tertiary formations inclosed within the chalk basin of Paris. These formations include limestone, gypsum, and marl. They yield excellent building-stone, of which there are immense quarries in the plain of Montrouge, and excellent plaster. Fine clays for porcelain and pottery are raised at Sèvres and various other points of the department; also sand for glass-foundries. There are mineral waters at Auteuil and Passy; the latter, which are chalybeate, and valued for their astringent and tonic qualities, are the only ones which are frequented.

The department belongs altogether to the basin of the Seine. That river traverses it from south-east to north-east in a very winding course. The Marne enters the department on the east side, and has a winding course of fifteen miles before it joins the Seine. Both these rivers are navigable throughout. The Oureq Canal enters the department on the north-east side, and runs about six miles to the basin of La-Villette, from which the canals of St.-Denis and St.-Martin communicate with the Seine. The St.-Maur Canal shortens the navigation of the Marne, above Charenton, by avoiding one of its longest reaches. All the great French railways cross the department converging on Paris, where they are connected by a circular railroad. [FRANCE, vol. ii., col. 1077.] Fifteen imperial highways concentrate on the metropolis; many of them, planted near the city with double rows of lofty trees, form noble avenues to Paris. The department is traversed also by 81 departmental and several communal roads.

The department contains about 120,000 acres, a large portion of which is laid out in gardens for the growth of vegetables, fruits, and flowers for the supply of the capital. The quantity of corn produced in the department, when its limited area is taken into account, is very far above the average of the departments in every species of grain which is cultivated in it; and in potatoes it exceeds the average of the departments, even without taking its limited area into the account. But little wine is made, and that little is bad. A great number of horses, asses, and dairy cows are kept. Montreuil, two or three miles east of Paris, is celebrated for its peaches; Grand-Charonne, close to Paris on the east, for its grapes; and Fontenay, four miles south-west of Paris, for its strawberries and roses, which latter are grown for the apothecary and the perfumer, and give to the place its designation of Fontenay-aux-Roses. Nanterre, in the north-west of the department, is also celebrated for the growth of roses. Vitry-sur-Seine, on the left bank of the Seine, above Paris, is surrounded with nursery-grounds for rearing fruit-trees and ornamental trees.

The park of Vincennes, east of Paris; the forest of Bondy, on the north-east; and the Bois-de-Boulogne, on the west of the city, are

crossed by fine drives in various directions, and afford agreeable and much-frequented walks to the Parisians. The Bois-de-Boulogne especially has been greatly embellished by the emperor Napoleon III. with fountains, jets-d'eau, &c.

For the manufactures and commerce of the department the reader is referred to the article on PARIS.

The department is divided into 3 arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Paris		1	1,052,262
2. St.-Denis	4	37	233,792
3. Sceaux	4	43	135,011
Total	8	81	1,422,065

1. The first arrondissement is coterminous with the city of PARIS. The largest suburbs of Paris, Batignolles, Belleville, Passy, La-Villette, &c., are technically in the second arrondissement.

2. In the second arrondissement the chief town, *St.-Denis*, is the subject of a separate article. [DENIS, Str.] *Aubervilliers*, formerly *Notre-Dame-des-Vertus*, a short distance S.E. from St.-Denis, has a handsome church, and about 2500 inhabitants. It was the headquarters of Henri IV., during the siege of Paris; and was the scene of some hard fighting in 1815. *Auteuil*, a pretty village of about 4000 inhabitants, is situated on the eastern edge of the Bois-de-Boulogne on a hill above the right bank of the Seine, and within the great bastioned wall of Paris. *Batignolles*, a rapidly extending suburb adjoining Paris on the north-west, has a population of about 20,000. It stands on high ground part of the plateau of Monceaux. *Belleville*, the great resort of the working population of Paris on holidays, stands on high ground to the north-east of the city, and has a population of above 20,000. In this suburb are numerous schools and industrial establishments, and public gardens and wine-shops without number. *Boulogne*, on the western side of the Bois-de-Boulogne and near the right bank of the Seine, has a handsome parish church, and about 6000 inhabitants. *Chapelle-St.-Denis*, between Montmartre and La-Villette, and within the bastioned wall of Paris, is a large manufacturing suburb, with about 16,000 inhabitants. Markets for the sale of milk-cows, pigs, calves, and fat cattle are held here. *Charonne*, a suburb of Paris, lies to the south-east of the cemetery of Père-Lachaise, and has about 5000 inhabitants. *Clichy-la-Garenne*, south-west of St.-Denis, on the right bank of the Seine, near the Versailles railway; has several establishments for the manufacture of white-lead, sal-ammoniac, glue, catgut, printing and other paper, cardboard, small shot, lead-pipe, and sheet-lead, and about 4000 inhabitants. *Courbevoie*, on the left bank of the Seine, and on the Versailles railway, is a well built place with about 6000 inhabitants. *Montmartre*, immediately north of Paris, is built on a high hill of gypsum, has a church which dates from the 12th century, and a manufacturing population of about 7000. *Nanterre*, a small place of about 3000 inhabitants, and the birthplace of *Sainte-Genève*, is situated west of Courbevoie, on the railway to St.-Germain. *Neuilly*, about 5 miles S.W. from St.-Denis, stands on the Seine, which is here crossed by a beautiful stone bridge of five arches. The houses of the town are generally modern and well built. The population of the commune is about 10,000. The château of Neuilly, the usual residence of the late king Louis Philippe, was destroyed during the revolution of 1848. *Pantin*, on the Ourcq Canal, E. of La-Villette, stands in a plain, and comprises a number of well-built country-houses. There are manufactories for cotton and woollen yarn, in which steam-power is employed; gypsum is quarried, and there are lime-kilns. The chief trade is in corn, flour, wine, brandy, vinegar, and plaster of Paris. Population 2300. *Passy*, a fashionable suburb of Paris, above the right bank of the Seine, between Auteuil and Chaillot, has mineral springs, and 6800 inhabitants. *Romainville*, south-east of Pantin, has 5000 inhabitants. *Surmeux*, between the left bank of the Seine and Mont Valerien, is situated near the Versailles railway, and has a population of 2200. *La-Villette*, between the Ourcq Canal and Chapelle-St.-Denis, and near the north-eastern angle of the great bastioned wall of Paris, is a large suburb, with about 12,000 inhabitants, who manufacture soap, paper, spirits, beer, chemicals, oil, sugar, &c.

3. In the third arrondissement the chief town is *Sceaux*, situated on a hill a few miles S. of Paris, in 48° 46' 39" N. lat., 2° 18' E. long., and has a tribunal of first instance and about 2000 inhabitants. *Sceaux* formerly had a noble mansion and park belonging to the Duke of Maine, and after him to the Duke of Penthièvre. During the Revolution it was sold, and demolished by the purchaser; and the extensive park, of more than 800 acres, broken up for agricultural purposes, with the exception of the garden of the menagerie, which was purchased by some private individuals, and thrown open as a pleasure-ground for the public, still remains. The town is pleasantly situated, and has a number of good houses, and a handsome church. At some distance east of the town, and near the left bank of the Bièvre, the cattle-market of *Sceaux* is held. *Arcueil*, a village between Sceaux and Paris, has 2800 inhabitants, and an aque-

duct which supplies the fountains in the south part of Paris with water. *Bercy*, N.E. of Sceaux, and within the bastioned wall of Paris, is a large suburb on the right bank of the Seine, and has about 8000 inhabitants. It is the great entrepôt for wine, brandy, and oil for the supply of Paris, and contains large sugar-refineries, vinegar-works, timber-yards, and tan-yards. *Bourg-la-Reine*, a well-built village, situated in a hollow about a mile E. from Sceaux, near the left bank of Bièvre, has 1500 inhabitants. *Condorcet*, who committed suicide here in 1794, is buried in the churchyard. *Charenton-le-Pont*, along the east banks of the Seine and Marne, has 3500 inhabitants, a lunatic asylum, and foundries for the manufacture of steam machinery. The bridge across the Marne connects Charenton with *Maisons-Alfort*, situated in the fork between the Seine and the Marne, and famous for its veterinary college. *Choisy-le-Roi*, a well-built village of 3200 inhabitants, stands on the left bank of the Seine and on the Orleans railway, about 5 miles S. from Paris. *Fontenay-aux-Roses*, a village N. of Sceaux, is famous for the culture of rose-trees, strawberries, and other fruits: population about 1100. *Fontenay-sous-Bois*, at the north-east angle of the park of Vincennes, has a handsome church, and above 3200 inhabitants. *Gentilly*, an ancient village consisting of two parts, Petit-Gentilly and Grand-Gentilly, which are now separated by the great bastioned wall of Paris: population of the commune about 10,000. In Grand-Gentilly is the vast lunatic asylum (formerly prison) of Bicêtre, which is outside the wall. *Grenelle*, a suburb of Paris on the left bank of the Seine, has a theatre, a handsome church, and about 4000 inhabitants. *Issy*, S. of Grenelle, and outside the bastioned wall, has a population of 2700. Near it is *Vanves*, which is a station on the Versailles railway, and has 2500 inhabitants. *Jery*, near the left bank of the Seine, between Grand-Gentilly and Charenton, has a manufacturing population of 6900. *Montreuil-sous-Bois*, is about a mile N.N.E. from Vincennes, on a fertile hill. There is a mansion with a fine park, and there are a number of country-houses. Leather, porcelain, and beehives are manufactured. The gardens of this place are unrivalled in the department for the growth of peaches, strawberries, cherries, flowers, and vegetables of all kinds. Large gypsum quarries are worked: population, 5400. *Montrouge*, a southern suburb of Paris, has about 8000 inhabitants. *Vaugirard*, W. of Montrouge, has a botanical garden, and about 13,000 inhabitants. It lies within the bastioned wall, and contiguous to the inner enceinte of Paris. *Vincennes*, on the northern edge of the Park of Vincennes, is about 2 miles E. from Paris, and has about 6000 inhabitants. It is a well-built town. The castle of Vincennes is an ancient fortress; the walls form a large and regular parallelogram surrounded with ditches and strengthened by eight square towers besides the donjon. The donjon, also square and very lofty, with towers at the angles, stands in the middle of the west side of the fortress. The castle of Vincennes has undergone great alterations, and its ancient features have been intermingled with modern structures. The *Sainte-Chapelle* is a fine Gothic building commenced by Charles V., and restored after the return of the Bourbons. It contains the monument of the Duke d'Enghien, who was shot at Vincennes, in the ditch of the castle, by order of Napoleon. This fortress is used as a military post, an artillery-school, an arsenal depot of artillery, and a state prison. The castle was saved from the allies in 1815, by the firmness of the governor, General Daumenil, who threatened, if reduced to extremity, to blow it up. *Vitry*, near the left bank of the Seine, and N. of Choisy-le-Roi, has numerous country-houses and nursery-grounds, and 2500 inhabitants. A little west of it is *Villejuif*, a pretty place situated on a hill, in which building-stone, millstone, and gypsum are quarried: population 1500.

The department constitutes the diocese of the archbishop of Paris. It is in the jurisdiction of the High Court, and within the limits of the University-Academy of Paris; and in the first Military Division, of which the head-quarters are at Paris. It returns 9 members to the Legislative Chamber of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Annuaire du Commerce; Official Papers.*)

SEINE-ET-MARNE, a department of France, bounded N. by the department of the Oise, N.E. by that of Aisne, E. by those of Marne and Aube, S.E. by those of Yonne and Loiret, and W. by Seine-et-Oise. Its greatest length from north-north-east to south-south-west is 74 miles; its greatest breadth 45 miles. The area is 2281.7 square miles. The population in 1841 was 333,311; in 1851 it amounted to 345,078, giving 151.23 inhabitants to a square mile, or 23.35 below the average per square mile for the whole of France. The department is named from its two chief rivers, and formed out of portions of Brie and Gâtinais, divisions of Champagne and Ile-de-France.

There are no mountains in the department, nor any hills of considerable elevation; the highest are in the southern part. The surface is generally undulating. The south-east part is occupied by the formations of the cretaceous group; the rest by the tertiary formations of the Paris basin. Good building-stone is quarried at Château-Landon and Nemours, and sandstone fitted for pavement in the neighbourhood of Fontainebleau. The best millstones in Europe are dug at La Ferté-sous-Jouarre, on the Marne, and good alabaster is quarried. Peat is dug in some parts; and sand, which is valuable for making flint glass, is procured near Fontainebleau. There are mineral waters at Provins.

The department is included in the basin of the Seine, which river crosses it from east to west, forming a crescent, convex towards the south, and passing by Bray, Montereau, and Melun; it is navigable throughout. The Marne also crosses the department from east to west, not far from the northern boundary; its channel is very winding, and navigable throughout; it passes La Ferté-sous-Jouarre, Meaux, and Lagny. The Yonne has a small part of its course in this department, just above its junction with the Seine, which takes place on the left bank of the latter river, at Montereau: it is navigable in all that part which belongs to the department. The Loing crosses the southern boundary near Château-Landon, and flows northward past Nemours and Moret, into the Seine, which it joins on the left bank; it is not navigable, except in those places where it forms part of the line of the Loing Canal. The Suzain, the Bez, and the Lunain, feeders of the Loing, have part of their course in this department. The Yères rises in the department, and flows westward past Rosoy and Châlaines into the adjacent department of Seine-et-Oise, where it joins the Seine: it receives the Yvron. The Essonne, another feeder of the Seine, just touches the south-west border. The Marne receives the Petit Morin and the Grand Morin on the left bank, and the Ourcq on the right bank; only a part of the course of these rivers belongs to this department. The Ourcq and the Grand Morin are navigable; the former throughout that part of its course which belongs to this department, and the latter from above Crécy. The Grand Morin receives the Aubetin. In the central and eastern districts of the department are a number of pools, in which vast numbers of fish are bred.

There are two canals in the department, that of Loing, which follows the valley of the Loing, and unites the Loire with the Seine; and that of Ourcq, which follows the valleys, first of the Ourcq and then of the Marne, to the village of Annet, between Meaux and Lagny, and then leaves the valley of the Marne to take another direction to Paris. It opens a communication between the Ourcq and Paris, and is especially designed to supply the capital with water. The total inland navigation of the department amounts to about 225 miles.

Common roadway accommodation is afforded by 10 state roads, 88 departmental, and 25 communal roads. The department is traversed by the Paris-Strasbourg railway, which passes through Meaux and La Ferté-sous-Jouarre by the Paris-Dijon line, which passes Melun, Fontainebleau, and Montereau; and by the branch from Montereau to Troyes. A line has been recently authorised to be laid down from Paris across the department, through Rosoy and Provins to join the Troyes line at Nogent-sur-Seine, just beyond the eastern border, in the department of Aube.

About two-thirds of the surface of the department are under the plough. The quantity of wheat grown is more than twice the average quantity produced in the other departments. The produce in barley also is double the average of the whole kingdom. Rye, oats, and potatoes are grown in comparatively small quantities. So great however is the preponderance of the wheat crop, that the department is enabled to export from one-fourth to one-third of its harvests; the greater part of what is exported is sent to Paris. Hemp and flax, peas, beans, beetroot, and all kinds of pot herbs are also cultivated.

The quantity of meadow and grass land is above 80,000 acres; and there are about 23,000 acres of heath or common, or other uninclosed pasturage. A great number of horses are kept. The number of horned cattle is considerable; but it is a dairy rather than a grazing country, though a great number of cattle, veal calves, and sheep are fed for the Paris markets. In the number of cows it far exceeds the average of the departments. The cheese known as the Brie cheese is made in large quantities, and is in high repute. The number of sheep is very great, nearly a million consisting of merinos, cross-breeds, native-sheep, and English long-woolled breeds. Poultry is very abundant and excellent.

The vineyards occupy 46,000 acres; the quantity of wine produced is very great, but the quality very inferior; yet some of the best table grapes in France are grown at Fontainebleau, and other places in this department. The gardens and orchards occupy above 18,000 acres. Some cider is made in the arrondissement of Melun. The woods occupy about 256,000 acres, of which 40,000 acres are included in the forest of Fontainebleau. The oak timber of this forest is very good, and it abounds in game.

The industrial products comprise paper, pottery, porcelain, printed calicoes, cotton yarn, leather, window-glass, &c. The glass factory of Bagneaux near Nemours turns out glass cylinders and globes of the largest size, also optical and common glass. The commerce of the department is confined chiefly to agricultural produce, wool, cattle, charcoal, and wood.

The department is divided into five arrondissements, as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Melun	6	97	62,205
2. Fontainebleau	7	100	78,917
3. Meaux	7	151	94,038
4. Coulommiers	4	77	54,984
5. Provins	5	99	54,932
Total	29	527	345,076

1. Of the first arrondissement and of the whole department the chief town is MELUN. Among the other towns, which are small, are Chaumes, near the Yères, a few miles N. by E. from Melun, population 1685; Brie-Comte-Robert, also near the Yères, population 2700; and Tournaï (population 1765), between the Yères and the Marne. Brie-Comte-Robert derives its distinctive epithet from Robert, Count of Dreux, brother of Louis VII., and lord of the town. Robert, son of this count, built the castle of Brie, of which the ruins remain. This castle was in the middle ages the object of frequent attack. There is an elegant church of Gothic architecture, which dates from the 13th century, and contains several remarkable tombs. There is also an hospital, almost as ancient as the church. The town is pleasantly situated, and has a considerable weekly market. There are brick-yards and tile-yards, tan-yards and curriers' shops. Considerable trade is carried on in corn, quills, and Brie cheese. Brie-Comte-Robert was the capital of Brie-Française. Tournaï is a pleasant town, with two fine mansions and parks, and several country-houses in the environs.

2. In the second arrondissement the chief town is FONTAINEBLEAU. Among the other towns is Château-Landon, population 2236, situated on a hill above the Suzain, a feeder of the Loing, 17 miles S. from Fontainebleau. There are quarries in the neighbourhood of hard stone susceptible of a polish like marble. The triumphal arch de l'Étoile in Paris is built of this stone. Spanish white is made in the town, and trade is carried on in corn and wine. The town is ancient; Childebert founded here the abbey of St-Séverin, and Louis le Gros, A.D. 1119, resided in a castle from which the town takes its name. The church of Notre-Dame, consecrated in 1548, contains some remarkable wood carving. Montereau, or Montereau-Fault-Yonne, population 4450, is on the site of the Roman Condatis. It afterwards obtained the name of Monasteriolum, from a religious establishment which formed the nucleus of the modern town. Montereau has acquired historical celebrity from being the scene (A.D. 1419) of the assassination of Jean sans Peur, duke of Bourgogne or Burgundy. The town and a strong castle which had been built here, were taken, A.D. 1420, by Henry V., and the duke of Bourgogne; it was retaken by the French, A.D. 1438. In the civil wars of the 16th century it was repeatedly taken and retaken. On February 18, 1814, a body of allied troops were defeated here by Napoleon. The town is situated at the junction of the Troyes railroad, 12 miles E. from Fontainebleau, at the junction of the Seine and Yonne, both of which are navigable, and crossed by good stone bridges. There are a collegiate church of considerable antiquity, a modern town-hall, and an hospital. The houses are tolerably well built, and there is a pleasant public walk along the Yonne. Earthenware, tiles and other pottery, and leather are manufactured; and trade is carried on in corn, flour, and firewood, for the supply of Paris. Moret, population 1672, 6 miles by rail from Fontainebleau, is surrounded by a dilapidated wall with three gates: there is one suburb. It has a ruined castle, which belonged to the great Sully, and a tolerably handsome Gothic church, at the dedication of which St. Thomas-a-Becket officiated. The streets are straight and clean, and the houses well built. There are several flour-mills and some tan-mills; and trade is carried on in horses, cattle, wine of middling quality, corn, flour, potatoes, wood, and paving-stones. The Loing Canal passes close by the town. Nemours, population 3547, stands 9 miles S. from Fontainebleau, in a pleasant valley on the river Loing, which is crossed by a fine bridge. It is walled, and has four suburbs; the streets are well laid out, and the houses well built. The ancient castle of the dukes of Nemours is yet standing, flanked by four towers, and surrounded by a ditch. In front of the castle is a square of some extent. The banks of the Loing Canal, which passes near the town, and of the river, afford some pleasant walks. There is a bridge over the canal. The parish church, formerly the conventual church of the Augustinian friary of St-Jean, is a large and handsome building, with a fine steeple; but it yields in antiquity to the church of St-Pierre in one of the suburbs. The hospital is attended, like most of the hospitals of France, by the Sisters of Charity. There are several tan-yards and hat manufactories, tan-mills, flour-mills, a brick and tile-yard, lime-kilns, marble-works, and a brewery. Vinegar is made, and trade is carried on in corn, flour, wine, cheese, wood, iron, coal, &c. There are two considerable weekly markets and five yearly fairs. There is a public library of 10,000 volumes deposited in the castle.

3. In the third arrondissement the chief town is Meaux, which occupies the site of the ancient *Latinum*, capital of the Meldi, whose name it afterwards took. It is situated in 48° 57' 40" N. lat., 2° 52' 54" E. long., 25 miles by railroad E.N.E. from Paris, and has tribunals of first instance and of commerce, ecclesiastical and communal colleges, and 8356 inhabitants in the commune. It is built on the Marne, and near the Ourcq Canal. The town is well but irregularly built. The cathedral of St-Etienne, founded in the 11th century, although uncompleted, is considered a masterpiece. It consists of nave, transept, aisles, choir, and sanctuary. Only one of the towers of the façade is finished. In the choir is a white marble monument of Bossuet, who was bishop of Meaux, and of whom some memorials are still preserved in the episcopal residence. In 1854 his tomb was opened, and the body of the great orator was found almost in a perfect state of preservation; his face was still recognisable from his portrait. Meaux

has a public library of 13,000 volumes, a town-hall, cavalry barracks, two hospitals, and a theatre. Cotton fabrics, pottery, flour, leather, saltpetre, and glue are the chief industrial products. There are important markets for corn and cheese, wool, cattle, and poultry. The ramparts of the town are planted with trees, and form agreeable public walks. Among the other towns are—*La Ferté-sous-Jouarre*: population 4 105 in the commune. It is pleasantly situated on the Marne, in which river there is a small island close to the town, 12 miles by railroad E. from Meaux. Round the town are a number of country seats and houses, and near it, on the right bank of the Marne, is the castle of Barre, flanked with towers, and commanding a beautiful prospect. There is an hospital. The chief trade is in the excellent millstones which are quarried near the town, and which are deemed the best in Europe. About 1200 pairs of these millstones are exported yearly, some of them to England and America. Woolecombers' cards, leather, iron, woollen-yarn, tiles, and pottery are manufactured; and boats are built for the navigation of the river. There are lime- and plaster-kilns and nursery-grounds near the town. Trade is carried on in corn, wood, and charcoal for the supply of Paris; and in cattle, sheep, and wool. On a hill above the town is the village of *Jouarre*, with a population of 2722. *Lagny*, population 2212, on the Marne, is pleasantly situated on the left bank of the Marne, over which there is a bridge, amid vine-covered hills and green pastures, 10 miles S.W. from Meaux, on the Paris-Strasbourg railway. There are a handsome fountain, an hospital, and several flour-mills. Considerable trade is carried on in corn, flour, wood, hemp, cattle, and cheese. *Dammartin*, population about 1800, a pretty little town on the road from Paris to Soissons, 12 miles N.W. from Meaux, stands on the slope of a hill which commands an extensive prospect. There are some pleasant shady walks, occupying the site of the former castle of the counts of Dammartin. There is a gothic church, built by Antoine de Chabannes, lord of Dammartin and minister of Charles VII. He is buried in the choir. There is an hospital. Lace is made here, and trade is carried on in corn, wine, and cattle. Dammartin has a good corn-market and important sheep fairs.

4. In the fourth arrondissement the chief town, *Coulommiers*, an ill-built place, is situated in a pretty country, on the Grand-Morin, 27 miles N.N.E. from Melun, and has 4151 inhabitants in the commune. It has a tribunal of first instance, flour- and tan-mills, tan-yards, and some commerce in corn, wool, hides, cattle, and cheese. Among the other towns are—*La Ferté-Gaucher*, which is agreeably situated on the Grand Morin, 10 miles E. from Coulommiers, and has an hospital, tan-yards, a tan-mill, and manufactures of serge and paper. In the neighbourhood are tile-yards and lime-kilns: population 2100. *Rebais*, a small place north of Coulommiers, which was formerly famous for its Benedictine abbey, founded by St. Ouen A.D. 634, and demolished at the time of the first French revolution: population, 1100. *Rosoy*, 11 miles S. by W. from Coulommiers, is a walled town, with about 1600 inhabitants. The walls are flanked with towers, and planted with fine trees. It has a parish church remarkable for the rich and delicate architecture of the interior, and an hospital.

5. In the fifth arrondissement the chief town, *Provins*, is 29 miles E. from Melun, and has tribunals of first instance and of commerce, a college, and 5958 inhabitants. It is a town of considerable antiquity. In the middle ages this was one of the principal manufacturing and trading towns in France; the chief manufactures were woollen-cloth and leather. Provins occupies an extensive area, part of which consists of gardens, vineyards, and fields, and is divided into two parts, the Upper Town on the west side, surrounded by walls, of which the greater part are standing; and the Lower Town, which is also surrounded by walls, except where it is contiguous to the Upper Town. Two small streams, the Vouzie and the Durtein (which unite to form a feeder of the Seine), pass through the town. The Upper Town has streets narrow and winding, and houses ill-built and decayed from age. There are several remarkable ruins, among which are those of the old fort, the citadel, the old castle, the chapel of St. Thibaut, the palace of the counts of Brie-Champagnaise, now occupied by the college, and the tower and church of St. Quiriace. The church of St. Quiriace, now the parish church of the Upper Town, is remarkable for its size and the beauty of its architecture: the choir has the same dimensions as that of the cathedral of Notre-Dame at Paris. It was begun in the 12th century, but has never been completed. The Lower Town, which is well laid out and well built, contains two churches, a general hospital, and cavalry barracks. Besides these buildings Provins has a civil and military hospital, a school of mutual instruction, a large corn-market, and several fountains. The manufactures are druggets and linsey-woolsey, earthenware, and conserve of roses. The Provins roses, from which the conserve is made, were brought from the East in the 13th century by Thibaut, count of Champagne, on his return from the crusade. There are chalybeate springs, which are well frequented in the season. Among the other towns, all of which are small, are *Bray-sur-Seine*, 11 miles S. from Provins, on the left bank of the Seine, which is here crossed by a stone bridge of 22 arches; population, 1800; and *Nangis*, a well-built market-town of 2200 inhabitants, 14 miles W. from Provins, with a gothic church of solid architecture; and two towers, the remains of the ancient castle of the marquises of Nangis: the park attached to the castle still remains.

This department constitutes the diocese of Meaux. It is included

in the jurisdiction of the High Court, and within the limits of the University-Academy of Paris; and is in the 1st Military Division, the head-quarters of which are in Paris. It returns three members to the Legislative Chamber of the French empire.

SEINE-ET-OISE, a department in France, bounded N. by the department of Oise, E. by Seine-et-Marne, S. by Loiret, W. by Eure-et-Loir, and N.W. by the department of Eure. The department of Seine is entirely inclosed by this department. The greatest length of Seine-et-Oise, from north-west to south-east, is about 70 miles; the greatest breadth, at right angles to the length, 52 miles. The area of the department is 2163.5 square miles. The population in 1841 was 470,948; in 1851 it increased to only 471,882, which gives 218.11 inhabitants to a square mile, being 43.53 above the average per square mile for the whole of France. The department is formed out of portions of the province of Île-de-France, and is named from its two chief rivers.

The surface is undulating; the hills, which are of only moderate height, being of gentle slope, and admitting of cultivation to the summits. A narrow strip along the western border is occupied by the cretaceous formations, and the rest of the department by the tertiary formations of the chalk basin of Paris. Excellent freestone for building, lithographic stones, gypsum, chalk, marl, potters'-clay, and peat are dug. There are mineral waters at Enghien-les-Bains; in the valley of Montmorency, 12 or 13 miles north of Paris; and at Montlignon, in the same neighbourhood.

The whole department belongs to the basin of the Seine, which river enters the department on the east side, not far from Corbeil, and flows through it in a north-western direction, but with many remarkable bends, until it finally quits it below the junction of the Epte. All the course of the river between these points does not however belong to this department, but part of it belongs to that of Seine, which, as already observed, is inclosed by this. The Marne has a small part of its course in the eastern part of this department; and the Oise flows for some miles through the northern part, from above Beaumont-sur-Oise to its junction with the Seine. These are the principal rivers, and all three of them are navigable throughout this department. Of smaller streams, the Yères and the Epte flow into the Seine on the right bank, and the Essonne and the Orge on the left: in the west of the department is the Yeagre, a feeder of the Eure. The Ourcq Canal crosses the east side of the department, from the department of Seine-et-Marne to that of Seine. The department is crossed by all the great lines of railroad which converge on Paris [FRANCE, vol. ii., col. 1077], and by the lines that connect the capital with Versailles, St. Germain, and Corbeil. The department is also traversed by the 26 great lines of high roads which lead to Paris from all parts of France; by 52 departmental roads; and by a great number of communal roads.

The climate is temperate and healthy. The soil, generally speaking sandy and by no means fertile by nature, is rendered productive by manure. About 906,000 acres, or about two-thirds of the area of the department, are under the plough. The principal crops are—wheat, barley, rye, mixed grain, oats, vetches, lentils, potatoes, and all kinds of pot-herbs. Pulse of every kind and hemp are cultivated.

The meadow and grass lands amount to 50,000 acres. The number of horses is very considerable. The ass is common. The number of milk-cows is very great; they are chiefly house-fed; their milk contributes to supply Paris and Versailles. The number of oxen and of bulls is small. Veal-calves are fed. Sheep are very numerous, and of good breeds.

The vineyards occupy about 41,000 acres: the wine is of inferior quality. Market-gardening is a profitable occupation; the gardens and orchards occupy above 22,000 acres. Filberts, walnuts, figs, peaches, apricots, cherries, strawberries, grapes, apples, pears, and other common fruits are grown abundantly and in great perfection. The apple and pear are cultivated in the north-west of the department, where the vine does not thrive, for making cider and perry which form the common drink of the inhabitants.

Poultry and fish are abundant; game has become rare. Bees are kept in some places. The streams and pools abound with fish, especially the trout, eel, carp, pike, and perch; the tench, barbel, roach, gudgeon, and bleak are taken, the last for its scales, which are used in the manufacture of imitation pearls. Leeches are obtained in some places.

The department is divided into six arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Versailles . . .	10	114	149,846
2. Mantes . . .	5	127	58,483
3. Rambouillet . . .	6	119	67,509
4. Corbeil . . .	4	93	60,638
5. Fontainebleau . . .	7	161	94,077
6. Étampes . . .	4	69	41,329
Total . . .	36	683	471,882

1. Of the first arrondissement, and of the whole department, the chief town is VERSAILLES, which is united to Paris by two railways.

Among the other towns are—*Argenteuil*, on a hill above the Seine, 12 miles N.N.E. from Versailles: population, 4377. *St-Germain-en-Laye*. [GERMAIN-EN-LAYE.] *Meulan*, a station on the Paris-Rouen railway, 19 miles N. by W. from Versailles: population, 2000. *Poissy*, a station on the Paris-Rouen railway, 10 miles N. from Versailles, on the left bank of the Seine, with a large cattle and sheep market and 4000 inhabitants. *Rueil*, or *Rueil*, a pretty town, 5 miles N.N.E. from Versailles, with a population of 7284 in the commune, and a handsome church, which contains the tomb of the empress Josephine, whose residence, Malmaison, stands between the town and the Seine. *St-Cyr*, a small place of 1800 inhabitants, 3 miles W. from Versailles, and on the railway to Chartres, is famous for its special military school. [CYR, ST.] *Sèvres*, built at the foot of a hill, above the left bank of the Seine, 5 miles E. from Versailles by railway, is celebrated for its porcelain manufactures: population about 5000. *St-Cloud*. [CLOUD, ST.] *Meudon*, on the high ground above Sèvres, and a station on the Paris-Versailles railway; population of the commune, 3174. Besides the imperial palaces of St-Cloud and Versailles, there are many châteaux, parks and beautiful country residences in this arrondissement. At *Marly*, near Rueil, are the aqueduct and immense forcing machinery for raising the water that supplies the magnificent water-works of the park of Versailles.

2. In the second arrondissement the chief town is *Mantes*, which stands on the left bank of the Seine, 34 miles by railway W.N.W. from Paris, and has an ecclesiastical school, three hospitals, several tan-yards, breweries, and flour-mills, and a population of about 6000, including the suburb of Limay, on the right bank of the river. Among the other towns are *Houdan*, 16 miles S. from *Mantes*, on the road from Versailles to Dreux, population 2000; and *Rosny*, a village on the left bank of the Seine, 4 miles N.W. from *Mantes*, on the Paris-Rouen railway, population about 700. The Seine opposite *Rosny* contains several islands, in one of which is the château in which Sully was born, and to which he and Henri IV. retired after the battle of Ivry. At *Rosny* is the junction of the Cherbourg railway with the Paris-Rouen line. On the right bank of the Seine, below *Rosny*, are the ruins of the castle of Roche-Guyon, from which there are beautiful views of the valley of the Seine.

3. In the third arrondissement the chief town, *Rambouillet*, is situated on the railway to Chartres, 30 miles W. from Paris, 18 miles S.W. from Versailles, and has a tribunal of first instance and 3257 inhabitants. It is a clean well-built town. In the palace of *Rambouillet*, which stands in a fine park and gardens laid out by Le Nôtre, Francis I. died in 1547. The Forest of *Rambouillet* is traversed in all directions by fine roads. Charles X., in his flight from Paris in 1830, took refuge for a short space at *Rambouillet*. Among the other towns are *Dourdan*, 12 miles S. by E. from *Rambouillet*, in the valley of the Orge, and near the forest of *Dourdan*, population 2400; and *Montfort-l'Amaury*, an ancient place with only 1800 inhabitants, 9 miles N. from *Rambouillet*, remarkable for the ruins of its ancient castle, the seat of the ancestors and descendants of Simon de Montfort. The ruins have been cleared of rubbish and planted with trees, so as to form shady promenades. Of the castle of *Dourdan*, which, with its domain, formerly belonged to the Bourbons, there remain the keep and eight other towers, united by a curtain flanked with bastions and girt by wide deep ditches.

4. In the fourth arrondissement the chief town, *Corbeil*, is situated 18 miles by railway S. from Paris, on the left bank of the Seine, at the mouth of the Essonne, and has a corn-market, large flour-mills, and manufactures of Cashmere shawls, cotton stuffs, pottery, &c.: population of the commune, 4645. A bridge across the Seine connects the town with *Corbeil-Vieux*, on the right bank. Among the other places of note are *Arpajon*, formerly called *Châtres*, a pretty town of 2234 inhabitants, surrounded by fine shady walks, 10 miles W. from *Corbeil*: *Essonne*, one mile W. from *Corbeil*, population 3600; *Longjumeau*, a pretty village on the Orléans road, population 2000; and *Mont-l'Héry*, an ancient well-built walled village, between *Longjumeau* and *Châtres*, population 1700. There was formerly a very strong castle at *Mont-l'Héry*, of which the keep, 108 feet high, still remains. Louis XI. was defeated by Charles of Burgundy in a bloody battle fought near *Mont-l'Héry* in 1465.

5. In the fifth arrondissement the chief town *Pontoise* is situated on the right bank of the Oise, 18 miles from Paris by the railway to Amiens, and has 5370 inhabitants in the commune. It is a well-built old town, with narrow streets, and remains of an old castle, and inclosing walls. The town, which is named from the 'bridge over the Oise,' has a tribunal of first instance, a college, a public library, an agricultural society, a theatre, a school of mutual instruction, and several private schools. Steel ornaments, clocks and watches, mineral acids and other chemical preparations, starch, cotton-yarn, and leather are manufactured; and trade is carried on in corn and flour for the supply of Paris, gypsum, and cattle. There is a great number of corn-mills on the Oise, or on the Viosne, a small stream which here joins the Oise. Among the other towns are *Beaumont*, on a high hill above the Oise, 12 miles N.E. from *Pontoise*, population 2000; *Gonesse*, the birthplace of Philippe Auguste, in a rich wheat district, in the east of the department, population 2000; *Isle-Adam*, a station on the Paris-Amiens railroad, 7 miles N.E. from *Pontoise*, population 1700; and *Montmorency*, or *Enghien*, 10 miles by railway S.E. from *Pontoise*, GEOG. DIV. VOL. IV.

population 2100, is on a hill commanding the picturesque and beautiful valley of *Montmorency*. The streets are steep, but there are some good houses. The market-place is large but irregular, with a market-house in the middle. The parish church is a gothic building of the 16th century. Near the town is the *Hermitage*, a small house, celebrated as the retreat of Jean Jacques Rousseau, and of the musical composer Grétry, who died here in 1813, and is buried in a tomb in the garden. In the valley near the Lake of *Montmorency*, or pond of *St-Gratien*, are mineral springs and baths.

6. In the sixth arrondissement the chief town is *Étampes*. *Milly*, E. of *Étampes*, on the south-eastern border of the department, has a good corn-market, and above 2000 inhabitants.

The department constitutes the diocese of Versailles, and is under the jurisdiction of the High Court, and within the limits of the University-Academy of Paris. It is in the 1st Military Division, of which Paris is head-quarters. It sends 4 members to the Legislative Chamber of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Annuaire du Commerce; Official Papers.*)

SEINE-INFÉRIEURE, a department of France, is bounded N. and N.W. by the British Channel; S.W. by the department of Calvados, from which it is separated by the Seine; S. by the department of Eure, from which also it is in some places separated by the Seine; S.E. by the department of Oise; and N.E. by that of Somme. It lies between 49° 17' and 50° 4' N. lat.; 0° 5' and 1° 45' E. long. Its greatest length is 76 miles; its greatest breadth from north to south is about 45 miles. The area is 2332.7 square miles. The population in 1841 was 737,206; in 1851 it amounted to 762,039, giving 326.676 to the square mile, or 152.092 above the average per square mile for the whole of France. The department is formed out of several districts of Normandy, and named from its comprising a portion of the basin of the Lower Seine.

The department is almost entirely included in the district occupied by the cretaceous formations. The coast has a rounded outline, presenting no remarkable headland except Cape la-Hève; it is lined nearly throughout by chalk cliffs, broken at intervals by the openings through which the rivers fall into the sea: the only harbours along the coast are formed by these openings. The cliffs vary in height from 150 to 700 feet, which elevation they attain near *Fécamp*. None of the hills are very lofty: the principal are a remote branch from the Ardennes, which cross the department from the east side to Cape la-Hève, which forms their termination, and separate the waters which flow into the Seine from those which flow into the English Channel; they consist of chalk. Marl abounds in several places, and sand, which is used in the manufacture of glass. Brick-clay, pipe-clay, and clay suited for sugar-refiners, for making crucibles, earthenware, and fine porcelain, are procured; limestone and sandstone are also obtained, and there is marble of various kinds, but in small quantity. A small quantity of peat is obtained, and iron-stone is said to have been formerly procured near *Forges-les-Eaux*, on the east side of the department, between *Neufchâtel* and *Gournay*. There are mineral waters at *Forges-les-Eaux*, *Aumale*, *Gournay*, and *Rouen*.

The department, south of the range of hills mentioned above, belongs to the basin of the Seine, which first touches the department on the south side, and has the remainder of its winding course (97 miles by the river, and only 48 miles in a direct course) navigable throughout, upon or within the boundary of the department. The principal feeders of the Seine are the Epte and the Andelle, of which two only the sources and the upper part of their course belong to this department, the Cailly, the Austreberte, the Bolbec, and the Lézarde, all small streams which fall in on the right bank. Of the streams which flow into the Channel the principal are, proceeding from east to west, the Bresle, which bounds the department on the east side, the Yères, the Arques, which receives the Béthune and the Eaulne, the Seye, or Scie, the Saanne, and the Durdan. The length of the Bresle, which is the most considerable of them, may be estimated at 35 miles.

The department is traversed by the railroad from Paris to Rouen, where there are lines to Havre and Dieppe. A new line has been recently authorized from Rouen to Bernay, where it joins the Paris-Cherbourg line. Common roadway accommodation is afforded by 13 state roads, 28 departmental roads, and a great number of communal roads.

The climate is moist, especially along the coast and on the eastern side of the department. The soil is varied, but generally fertile. Two-thirds of the department are under the plough. Agriculture is on the whole flourishing. The mode of cultivation in the peninsula of Caux, formed by the Seine and the English Channel, which constitutes the arrondissement of Havre, is much like that of French Flanders. The farmer is distinguished by his neatness, by the comfortable furniture of his house, the plantations of oaks, elms, beeches, and pines round his homestead, and the neatness and productivity of his garden, inclosed by a quickset hedge. The rotation of crops is usually triennial, and the fallow of the third year has been generally superseded by a crop of trefoil, flax, peas, vetches, rape, &c. The manures employed are dung, marl, and gypsum. Thrashing-machines have been introduced.

The produce of the department in corn is very considerable. In wheat it considerably exceeds the average produce of the departments

of France; in barley, oats, rye, maslin, and in potatoes, the produce falls short of the average. Peas, beans, vetches, lentils, turnips, rape, cole, hemp, and flax are cultivated. The principal corn districts are in the centre of the department. The eastern side has a greater proportion of pasture; the cultivation of the oleaginous seeds, rape, cole, &c., characterises the coast, and the banks of the Seine are altogether less productive than the other parts, although possessed of much picturesque beauty. The corn produce does not suffice for the large population of the department.

The meadows and grass-lands occupy about 70,000 acres, and the heaths and open pastures about 45,000 acres. The grass-lands are chiefly in the valleys and along the banks of the rivers. The number of horses is very great; they are the only animals employed in agriculture. They are good for draught and other labour. Horned cattle also are very numerous, but of inferior breed to those of the departments of Calvados and of La-Manche. The number of sheep is considerable. The native sheep have been replaced by mixed breeds, which give a tolerably fine wool. But as may be expected the fleece is of less consideration with sheep-farmers than the carcasses, where the population is so dense. The sheep-pasture on the downs along the coast, especially in the neighbourhood of Dieppe, supply excellent mutton. Goats are not common, but those of Tibet have been tried with success. Swine and poultry are abundant; the pullets of the district of Caux and the ducks of Rouen are in high repute. The Seine abounds in salmon, sturgeon, soles, eels, &c. Large flats of barks, between 30 and 90 tons, with crews of from 15 to 30 in number, are employed in the mackerel, oyster, and herring fisheries.

There are no vineyards in the department, but the quantity of orchard and garden ground is 150,000 acres. The apple and pear are the fruits chiefly cultivated; the cider and perry made from these constitute the principal drink of the common people. Walnuts are grown in the east of the department.

The woodlands occupy about 170,000 acres. There are few extensive woods, but innumerable small plantations round the farm-houses and in the hedge-rows, which serve to supply the wants of the farmer. Turf is the fuel used by many, but pit-coal is largely imported by manufacturers and others. The oak, the beech, and the hornbeam are the trees chiefly grown; but the ash, the elm, the birch, the fir, the aspen, the maple, the chestnut, the wild cherry, and the lime-tree are also common.

The department is distinguished for its numerous and valuable industrial products, comprising all articles of cotton manufactures, broadcloths, flannel-erge, linen, and mixed cloths, lace, watch and clock movements, pottery, window-glass, bricks, sugar, silks, chemical products, leather, &c. There are numerous and extensive bleach-works, cotton printing-works, metal-foundries, steam machine-mills, and shipbuilding-yards. Rouen is the great centre of the cotton manufacture, the different processes of which are carried on in extensive factories worked by steam-machinery; hand-loom weaving is also carried on in almost every hamlet and house. The linen of Fécamp is in high repute. The commerce with the interior of France and with foreign countries is very extensive and important. [ROUEN; HAVRE; DIEPPE.]

The department is divided into five arrondissements, as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Rouen	15	186	256,329
2. Dieppe	8	168	113,357
3. Le-Havre	9	122	166,261
4. Neufchâtel	8	144	84,204
5. Yvetot	10	169	139,988
Total	50	759	762,039

1. In the first arrondissement are—**ROUEN**. *Caudec-le-Elbauf*, 12 miles S. from Rouen: population, 6000. *Darnetal*, 24 miles E. from Rouen: population, 6000. [ELBAUF.] *Barentin*, population 2500, and *Pavilly*, population 2700, both N.W. of Rouen, in the Aустreberta. Pavilly has manufactures of soft-soap, linen, paper, and cotton-yarn; and the townsmen carry on trade in grain, linen, flax, and cattle and poultry. There are several large villages: as *Denville*, population 4100; *Maromme*, population 3000; and *Malanay*, all on the Cailly; *St. Martin du Vivier* and others near Rouen, the inhabitants of which are engaged in the cotton manufacture, of which Rouen is the centre.

2. In the second arrondissement are—**DIEPPE**; **EU**; and **Tréport**, a small sea-port, with a tide-harbour, connected by a canal with Eu, from which it is about two miles distant. The town has about 3100 inhabitants, chiefly engaged in the fisheries and the coasting trade. Vessels of 800 tons can enter Tréport. There are wet docks and baths in the town. Tréport, Eu, and some adjoining hamlets have been recently incorporated, so as to form one town, to be called Tréport, the total population of which is above 10,000.

3. In the third arrondissement are—**HAVRE**. *Bolbec*, a well-built manufacturing town, 18 miles by railroad N.E. from Havre, is situated on the slope and at the foot of a hill above the river Bolbec, and has 10,000 inhabitants, who manufacture cotton and woollen stuffs of various kinds, and leather, and trade in corn, horses, and cattle.

Étretat, a coast village and bathing-place, situated in a hollow between the cliffs, about 12 miles from Havre, has a handsome church and about 1800 inhabitants, engaged chiefly in the oyster and herring fisheries. The oysters of Étretat are in high repute; they are brought from the Bay of Cancale, and fed in what is called an oyster-park, cut in the rock, and flooded by a mixture of fresh and salt water. A ruined chapel near the sea is supposed to date from the 8th century. The roadstead of Étretat is deep, well sheltered from all winds that blow from west to north-west through south, and has a good bottom. It has been more than once in contemplation to form a great naval harbour here. *Fécamp*, situated in a long narrow valley screened by steep cliffs several hundred feet high, at the mouth of the river Fécamp, is a sea-port town, 22 miles N.N.E. from Havre, and has 10,000 inhabitants. The harbour, formed by jetties, is frequented by fishing-craft, Baltic timber-vessels, and colliers. The principal structure is the handsome church of Notre-Dame, which dates from the 13th century. The town has a tribunal of commerce, a school of hydrography, cotton-mills, sugar-refineries, tan-yards, ship-building yards, &c. Vessels are fitted out for the herring, cod, and mackerel fisheries. There is also an active coasting trade. *Harfleur*, a small village of about 1700 inhabitants, near the mouth of the Lézarde, on the right bank of the Seine, was in the middle ages an important harbour and fortress, enriched by industry and commerce. In its prosperity Harfleur was attacked, and, after a vigorous defence, taken by the English under Henry V. (1415), who expelled the inhabitants and re-peopled the town with English. It was gallantly retaken (1433) by the surrounding peasantry; taken again by the English in 1440; and finally wrested from them about ten years afterwards by Charles VII. of France. The former harbour is now dry, and above a mile of unhealthy marsh separates the town from the Seine; but small boats come up the Lézarde to the town when the tide is in. There is a beautiful gothic church, the elegant tower of which is crowned by pinnacles at the angles, and by an octagonal spire connected with the pinnacles by flying buttresses. This church was built by the English as a memorial of the victory of Agincourt. *Lillebonne*, situated at the foot of a hill in a wooded valley watered by the Bolbec, 19 miles E. from Havre, was the *Julsobona* of the Romans, the chief town of the Caleti. Five Roman roads met here. A great number of Roman antiquities have been found at Lillebonne, and new researches are continually increasing the number; among the most important are the remains of a theatre, an aqueduct, and several tombs, besides medals, statues, and other antiquities. The dukes of Normandy had a castle here, the ruins of which are worthy of notice from their extent. An old circular tower, probably the keep, is said to have been built by William the Conqueror; its wall is full 10 feet thick. The town has 5100 inhabitants, who manufacture cotton-yarn, calico, and leather, and trade in cloth, groceries, hardware, and cattle. There are two yearly fairs. The valley of the Bolbec, between Lillebonne and the town of Bolbec, is studded with cotton-factories and tan-yards. *Montivilliers*, in the valley of the Lézarde, 6 miles N.N.E. from Havre, with above 4000 inhabitants, had in the middle ages a wealthy abbey, of which the church remains. The tower is of Norman architecture of the 11th century; the rest of the building is of various dates, but handsome as a whole. The town is neat and beautifully situated. There are, besides the above-mentioned church, a Calvinist chapel. The townsmen, who were eminent in the 14th century for the manufacture of woollen cloth, carry on the same manufacture now, and they also make lace, cotton-yarn, leather, and paper. There are linen bleach-grounds and a sugar-refinery.

4. In the fourth arrondissement are—*Neufchâtel*, population 3486 in the whole commune, distinguished as Neufchâtel-en-bry, is on the slope of a hill near the right bank of the Bethune, in a hilly and woodland country affording good pasturage, 26 miles N.E. from Rouen, and has tribunals of first instance and of commerce, and manufactures of woollen cloth, hosiery, leather, beer, and glass. The town is not well built; it has an hospital and a prison. It was formerly capital of the district of Bray, and was repeatedly taken by the English or by the contending parties in the civil strifes of France. There was a castle built by Henry I. of England, which gave name to the town. Previously it had been a mere village named Drien Court. Trade is carried on in flour, butter, and in the little cream-cheeses of the district, called Neufchâtel cheeses. *Aumale*, population 1793, on the Bréle, 12 miles E. from Neufchâtel, on the slope of a hill above the Bréle. It is famous for the battle between the forces of the League, under the Duke of Parma, and the army of Henri IV., who was wounded in the action, and had a narrow escape for his life. *Forges-les-Eaux*, population 1700, on a hill near the forest of Bray, 12 miles S. by E. from Neufchâtel, has mineral springs. Crucible earth of the best kind is found here. *Gournay*, population 3200, 24 miles S.E. from Neufchâtel, is situated on the Epte, and has a tribunal of commerce, a good butter market, and manufactures of linen, leather, porcelain, and glass. It is thought to have originated prior to the settlement of the Normans. During the existence of the duchy of Normandy, it was of importance as a frontier town towards the domains of the French king. It is a small clean well-built town, surrounded with a pleasant boulevard. The church of St. Hildevert was built between the end of the 11th and the 13th centuries, and the

architecture varies with the date of erection; the interior is of Norman architecture, but in the west front the pointed arch is used. The heart of Blanche of Castille, St. Louis's mother, was deposited in this church. *St-Saens*, on the Arque, 9 miles N.W. from Neufchâtel, population 2500, has manufactures of linen, glass, leather of various kinds, and glue; there are twelve yearly fairs; trade is carried on in corn, wood, cattle, and hides.

5. In the fifth arrondissement the chief town, *Yvetot*, is situated in a fertile plain, 23 miles by railway N.W. from Rouen, and has tribunals of first instance and of commerce, and about 10,000 inhabitants. The town is old; the principal street is nearly $2\frac{1}{2}$ miles long, and lined with timber-framed houses roofed with slates. It was formerly a place of great trade. The sires of Yvetot are styled kings in old chronicles, and an edict of the exchequer of Normandie qualifies them with this title. Yvetot has linen and cotton factories, and a considerable trade in cattle, sheep, and agricultural produce. *Allouville*, about 4 miles from Yvetot on the road to Havre, though only a village of 1300 inhabitants deserves mention on account of its oak, which is about 900 years old, 15 yards 3 feet in girth near the ground, and nearly 9 yards at the height of a man's head. Branches from two to three yards in circumference spring out from the trunk, and cover a vast space. The trunk of this enormous tree is hollow; the interior wainscotted and painted in marble colours, was fitted up as a chapel, and dedicated to Notre-Dame de-la-Paix in 1696. The top of the oak is formed into a bell-tower, and is surmounted by an iron cross. *Caudebec*, 6 miles S. from Yvetot, on the right bank of the Seine, has a population of 2700. It was formerly the capital of Caux, and was often taken by the English in the wars of the 15th century. The old fortifications that baffled for six months the skill of the great Talbot, have entirely disappeared. *Caudebec* has a harbour lined with quays, but it is little frequented by shipping. *Doudeville*, 8 miles N.W. from Yvetot: population, 3700. *St-Valery-en-Caux*, a small sea-port with a tribunal of commerce, and about 6000 inhabitants, is pleasantly situated 18 miles N. from Yvetot. The mackerel, herring, and cod fisheries are carried on with great activity. There is a good deal of business done in linens and cotton goods: and Baltic and Norway timber for shipping, wine, brandy, &c., are imported.

The department constitutes the diocese of Rouen: it is under the jurisdiction of the High Court of Rouen, and within the limits of the University-Academy of Caen. It is included in the 2nd Military Division, of which the head-quarters are at Rouen. It sends 6 members to the Legislative Chamber of the French empire. There are several fine ruins in this department, among which we can only mention the abbey of Jumieges on the banks of the Seine below Rouen, and the remains of the castles of Rouen, Dieppe, and Arques.

SEINE-MARITIME, a department in France, recently constituted with Havre for its chief town, extends along the coast of the English channel from the Seine to the Bresle. It is formed out of the coast portion of Seine-Inférieure, which bounds it on the south. The Bresle separates it from the department of Somme. It is divided into five arrondissements, Havre, Fecamp, Yvetot, Dieppe, and Tréport. Étretat and Criel, a small coast village, west of Tréport, are made chief towns of cantons. The tribunal of commerce of St-Valery is suppressed, and that of Yvetot transferred to the more important town of Bolbec.

A change has also been made in the limits of Seine-Inférieure, to which that portion of the territory of the department of Eure that lies east of the Seine to the Epte is added. Seine-Inférieure, by this arrangement, has Seine-et-Oise to the south-east; and out of the new territory two new arrondissements, Elbouf and Gournay, are chiefly formed. At Gournay, the railways authorised to be made from Amiens to Rouen, and from Beauvais to Tréport through Aumale, are to meet. In the absence of any official return, it is useless to offer any conjecture as to the area or the population of the new department; though these may be very nearly ascertained by consulting the articles EURE and SEINE-INFÉRIEURE, which have been described as they stood previous to the recent alterations.

SEISDON, a hundred in Staffordshire, which has given name to a Poor-Law Union composed of several parishes in the south division of the hundred. Seisdon Poor-Law Union contains 12 parishes and townships, with an area of 43,574 acres, and a population in 1851 of 13,857. The Union workhouse is at Tettenhall, about two miles north-west from Wolverhampton, and about eight miles north-east from the village of Seisdon.

SEISTAN, called also *Segestan*, is a province, or rather a country, situated in the eastern part of the table-land of Iran, and inclosed within the boundaries of the kingdom of Afghanistan. Taken in the larger signification which is sometimes given to it, Seistan comprehends the countries between 30° and $32^{\circ} 30'$ N. lat., 61° and 65° E. long., a space the area of which considerably exceeds 36,000 square miles.

On the north of Seistan is the extensive mountain-region known to the ancients under the name of Paropamisus, and called by modern geographers the Mountains of Hazareh and Eimack, from the name of two tribes which occupy the most elevated part of it. On the east is the Plain of Kandahar, which may be considered as the eastern prolongation of that of Seistan, though it constitutes a different political division, and is excluded from this notice. On the south is the Desert

of Beloochistan. [BELOOCHISTAN.] The western boundary is formed by a chain of lofty hills, which appears to extend across the table-land of Iran nearly south and north.

Surface.—The Plain of Seistan, with the adjacent valleys, and the Plain of Kandahar and its dependencies, constitute a closed basin. No water which descends on it ever reaches the sea. The southern part of the plain is a desert, large tracts of which are level and without vegetation. In a few places the soil is impregnated with salt. The country is inhabited by some tribes of Beloochees, who wander about with their herds.

The country on the north of the Helmund slopes to the south, not regularly, but in a series of terraces. The basin of the Lake of Seistan is the lowest terrace, in which consequently all the waters that descend into the plain and the surrounding mountains are collected. The whole of this tract approaches to the nature of a desert. The surface generally consists of a hard earth, mixed with rocks and low hills: the soil, except in the bottoms of the rivers, is of a very indifferent quality. These plains supply herbage and water during great part of the year to the numerous herds of camels and sheep of some tribes of the Dóranees. There are permanent villages among the cultivated lands, but by far the greater part of the inhabitants are scattered over the face of the country in tents. As the mountains of Hazareh are covered with snow for several months, they give origin to many rivers, which in the season when the snow melts become deep and rapid streams, and run southward either to the Helmund, or fall into the Lake of Seistan. The water of these rivers is used to irrigate the bottoms of the river valleys, and thus a portion of this region is fitted for cultivation, and produces abundant crops.

The Lake of Seistan is called by the natives *Hamoon*, a name which designates a plain covered by a sheet of water. It bears also the distinctive name of the Lake of Koh-i-Khwajeh, from a hill which is surrounded by the lake, and which is not far from its eastern bank. It is the *Aria Palus* of the ancients, to which another name it bears, *Zarab*, has some resemblance. The lake extends (between 61° and 62° E. long., and 31° and 32° N. lat.) about 70 miles from south-south-west to north-north-east, and has an average breadth of 18 miles, except towards its northern extremity, where it widens to more than 30 miles. In these wider parts of the lake there formerly existed a separate lake, called *Dúk-i-Teer*, which was divided from the Hamoon by an isthmus of moderate width, but not many years ago the Helmund changed its course, and instead of carrying its waters to the great lake, it sent them to the *Dúk-i-Teer*, and the isthmus was carried away by the waters, so that the two lakes are now only one. The *Dúk-i-Teer* is a large sheet of water thickly studded with reed-topped islands, its depth averaging about 4 feet, and having a very muddy bottom. Along its northern banks the water is not so deep, and the reeds are not in patches, but cover the whole surface. Here and there patches of blue water appear between the reeds, but it is only towards the south-west that there is a large sheet of water clear of rushes and reeds. The water of the Hamoon, although salt, is generally used.

The level country which surrounds the Hamoon may be called the Plain of Seistan Proper. On the west it extends to no great distance from the banks of the lake, and seems to be sterile. On the north and east it stretches to the distance of 20 or 30 miles, and to the south-east and south 50 miles and more. It is entirely composed of flats, with the exception of one hill, and in its whole extent not a stone is found, except a few rounded pebbles in the beds of the rivers. The soil is either the light earth of the desert, or the still lighter alluvial deposit of the rivers. Ruins of ancient towns are traceable in several parts.

Rivers.—All the rivers which originate on the southern and western slope of the mountains that surround the Plain of Seistan on the north and east, fall into the Hamoon. They partake of the nature of mountain torrents, at one time of the year rushing down with great violence, almost black with mud, and at others being either quite dry, or flowing in a clear, languid, and shallow stream. The largest of these rivers are the Helmund, the Khash-rood, the Furrak-rood, and the Adrascond. The *Helmund* is noticed in the article AFGHANISTAN (vol. i. col. 89). When about 15 miles from the lake it divides into several arms near Khwajeh Ahmed. The Helmund, in the dry season, is never without a plentiful supply of water; during the swell it comes down with astonishing rapidity, and is said to be equal in size to the Jumna. Its course probably exceeds 400 miles. The *Khash-rood* falls into the *Dúk-i-Teer* at no great distance from the new mouth of the Helmund. This river rises in the lower declivity of the mountains of Hazareh, and flows within their range south-east. It enters the plain near Dilaram, and then runs south-west to its embouchure. The course of the Khash-rood exceeds 100 miles, but in summer it is nearly dry. The *Furrak-rood*, which falls into the north-eastern extremity of the old Hamoon, rises likewise in the lower declivities of the mountains of Hazareh, towards the western extremity of the mountain region, and its course is mostly to the south-west and south. It enters the lake about 20 miles south of Laush. Its course exceeds 100 miles. This river is nearly dry for the greater part of the year; water is however confined in many places by bunds or natural hollows, and is always to be found by digging a few feet into the bed, which is the case with most of the rivers of this part of Asia. During the spring it is a broad and rapid river. The *Adrascond*, or *Heri-rud*,

falls into the Hamoon, about 12 miles west of the Furrâh-rod, and is about the same size. This river waters the Plain of Herat, through which it runs from east to west, rising a considerable distance east of that town. It afterwards turns to the south-east, and crosses the high-road from Kandahar to Herat, about 50 miles south of the latter. After flowing east by south through the Plain of Subzawer it sweeps round to the west, but gradually turns to the south, in which direction it enters the Hamoon. The *Ibrahim-loom* drains a part of the country between the Khash-rod and the Furrâh-rod, and terminates in a marsh.

The Vale of the Helmund contains a fertile strip of ground, called the Gurmair, or hot country, of about two miles average width. It stretches along the bank of the river, and is a rich tract, well cultivated, and full of orchards, in which the mulberry-tree is very plentiful. The vales of the Khash-rod and Furrâh-rod contain numerous inhabited places. Their vales are traversed by the wild hordes of the Beloochees. The Vale of the Adrasound is only to a small extent capable of cultivation.

Climate.—Our information respecting the climate of Seistan is very scanty. The heat in summer is oppressive. For nearly half the year a strong steady wind blows from the snowy mountains which lie to the north. This wind is confined to a breadth of about 80 miles, between the range of hills west of the Hamoon and the town of Khash. During the prevalence of this wind the days are very hot, but the nights are generally cold. It affects the eyes of the inhabitants, particularly by the dust which it raises, and which is mixed with particles of salt. During the three months of the winter the weather is very pleasant, and similar to that in the north-west part of Hindustan. Snow rarely falls in Seistan. The climate however is generally unfavourable to human life, which is mainly to be attributed to the immense quantity of stagnant water, especially in the vicinity of the Hamoon.

Productions.—Wheat, rice, and some coarser grains, are cultivated. Cotton is extensively raised: the plant is not half the height of the Indian one, but it bears a large pod. Large water-melons are raised in enormous quantities on the margin of the Hamoon. The largest tree in the Plain of Seistan Proper is a prickly pomegranate. The Gurmair is well stocked with mulberry-trees.

There is hardly a horse in the country. The mortality which prevails among them is generally attributed to the irritation produced by the flies, with which the country swarms at certain seasons. The few horses which are kept for state are tended with the greatest care in dark stables, from which they only come out on important occasions, except during the winter. Camels are numerous in the Gurmair, and in the desert to the south-east of Seistan proper. Sheep and goats constitute the principal wealth of the pastoral tribes which inhabit the deserts. The sheep are of the broad-tailed kind. Mules and asses are numerous, and thrive well. The cattle are of good size, and much valued in the neighbouring countries. The more common wild animals are wolves, jackals, hyenas, porcupines, hedgehogs, and kangaroo-rats. The skins of the otters are exported to Bokhara. The marshy and rocky parts of the Hamoon shelter innumerable wild hogs, which are very destructive to the fields. They are hunted with trained dogs, which are large, strong, bold animals. Wild asses and deer abound in the desert which lies between the Hamoon and the hills west of it. In these hills leopards are met with, and in the desert north of the Helmund there are antelopes. Water-fowl in incredible numbers appear during the time of the inundation. Geese, ducks, and teal are domesticated. Fish are plentiful in the rivers as well as in the Hamoon. Mosquitoes are very troublesome during the hot season.

Common salt is the only mineral which abounds in Seistan. It is found in patches in various parts of the desert. Saltpetre may be obtained in numerous places. The plain of Furrâh is a saltpetre marsh.

Inhabitants.—The country north of the Helmund and the Gurmair is inhabited by tribes of the Dóranees [AFGHANISTAN], but in some parts of the desert it seems that the Beloochees have settled. Of Seistan proper the original inhabitants appear to have been Tajiks. Two considerable tribes called Shekrukes and Surbundes, from Persian Irak, subsequently settled in the delta of the Helmund. The tribes of the Beloochees, which are settled on both sides of the Helmund as far as Seistan proper, and also occupy the southern banks of the Dák-i-Teer, formerly lived in tents, and subsisted by pasturage and pillage; but they have now applied themselves with industry and success to husbandry, and have adopted the dress and manners of the other tribes of Seistan.

Towns.—*Dooshak*, which by Captain Conolly is called *Dushtuck*, in Seistan proper, contains about 2000 houses, and is built on the ruins of a much larger place, which is called Jellalabad. Other important towns noticed by travellers are *Boorji*, *Chuling*, and *Sekoha*, which appear to be large and well-built towns. In the vale of the Furrâh-rod two considerable places are named, *Laush* and *Furrâh*. Furrâh is stated to be a very large walled town, with some commerce. The most important places in the vale of the Khash-rod seem to be *Kuddeh* and *Khash*.

Government.—Seistan, as a province of the kingdom of Afghanistan, is governed by a *haukim*, who collects the revenue and commands the

militia, and a *sirdar*, who commands the regular troops. Their authority is considerable in the populous districts, where the power of the heads of the tribes is not great; but among the Beloochees and other nomadic tribes their influence is small.

Seistan constituted a great part of the province Aria of the Persian empire; but as none of the great thoroughfares of Asia traverse this part, we are very little acquainted with the state in which it was at that time. No European traveller visited this country before 1788, when George Forster, in his 'Journey from Bengal to England,' in passing along the road leading from Kandahar to Herat, travelled along its northern boundary. In 1810 Captain Christie traversed it from south to north, departing from Nooshky in Beloochistan, and passing through the lower vale of the Helmund to Furrâh and Herat. Events in Afghanistan in 1839 and subsequent years have somewhat added to the information we possess in reference to these countries.

SELBORNE. [HAMPSHIRE.]

SELBY, West-Riding of Yorkshire, a market-town, and the seat of a Poor-Law Union, in the parish of Selby, is situated on the right bank of the river Ouse, in 53° 47' N. lat., 1° 6' W. long., distant 14 miles S. by E. from York, 181 miles N.N.W. from London by road, and 175 miles by the Great Northern railway. The population of the town in 1851 was 5109. The living is a perpetual curacy in the arch-deaconry and diocese of York. Selby Poor-Law Union contains 24 parishes and townships, with an area of 47,830 acres, and a population in 1851 of 14,365.

The town is tolerably well built, paved, lighted with gas, and supplied with water. The Ouse is navigable to Selby for vessels of about 200 tons burden. An excellent timber bridge crosses the Ouse, and opens to permit vessels to pass. The town possesses a town-hall, built in 1825, and a neat building for public meetings, assemblies, &c., erected in 1841. There is a fine old gothic market-cross. The church is part of an abbey of Benedictine monks, which was founded by William the Conqueror in 1068, and was the only mitred abbey, except St. Mary of York, north of the Trent. The church is a magnificent cruciform structure, about 300 feet long, and 60 feet wide. The south transept was destroyed near the close of the 17th century by the fall of the upper part of the central tower. The nave is a fine specimen of Norman architecture; the choir is decorated; beyond it is a very beautiful lady chapel. There are places of worship belonging to the Wesleyan and Primitive Methodists, Independents, Baptists, Quakers, Unitarians, and Roman Catholics; a Free Grammar school, Free schools, the Feoffee's school, and schools supported by the Wesleyan Methodists and Roman Catholics; also a mechanics institute and a news-room. A canal from Selby joins the Aire and Calder navigation, and thus communicates with Leeds. There is a branch custom-house at Selby, so that vessels can proceed direct to any part of the kingdom. Iron- and brass-founding, boat- and barge-building, sail-making, the manufacture of rope- and shoe-thread, brewing, and tanning are carried on. The market on Monday is a considerable one for agricultural produce. Fairs, chiefly for cattle, are held on Easter Monday, the Monday after June 21st, and October 11th; and a wool fair on the first three Fridays in June. Petty sessions and a county court are held in the town. Henry I. was born at Selby in 1068.

SELEUCEIA, a town of Assyria, on the right bank of the Tigris, and a few miles to the south of the modern Baghdad, was built by Seleucus Nicator, in the form of an eagle with extended wings. (Plin., vi. 30.) It became, at the expense of Babylon, the most important city in the east; but declined in population after the foundation of Ctesiphon by the Parthians, on the eastern bank of the Tigris. It contained, in the time of Pliny, 600,000 inhabitants. A republican institution was given to it by Seleucus, which it retained under the Parthians. (Tacit., 'Ann.,' vi. 42.) It was burnt by the Romans in the expedition of Trajan into the east, (Dion Cass., lxxviii. 30), and again by Lucius Verus, the colleague of Aurelius, at which time it contained 500,000 inhabitants. (Dion Cass., lxxi. 2; Eutrop., viii. 5.) It was also taken by Severus (Dion Cass., lxxv. 9), from which time it seems to have been almost abandoned by its inhabitants. Julian found it completely deserted. (Amm. Marcell., xxiv. 5.) The ruins, which are described in Rich's 'Residence in Koordistan,' are very extensive. The northern and the southern walls still remain. In the area are some heaps of ruins, but the greatest quantity are outside the limits of the inclosure to the westward.

SELGE. [PYSIDIA.]

SELKIRK. [SELKIRKSHIRE.]

SELKIRKSHIRE, an inland county in the south of Scotland, is bounded N. by Edinburghshire, E. and S.E. by Roxburghshire, S. and S.W. by Dumfriesshire, and W. and N.W. by Peeblesshire. A small detached part of the county lies just beyond the eastern boundary, entirely surrounded by Roxburghshire. The county lies between 55° 20' and 55° 42' N. lat., 2° 48' and 3° 18' W. long. In form the county is very irregular; the greatest length is from south-south-west to north-north-east, 28 miles; its greatest breadth, at right angles to the length, is 16 miles. The area is 266 square miles, or 170,303 acres. The population in 1841 was 7990; in 1851 it was 9809. The county returns one member to the Imperial Parliament.

Surface, Hydrography, Communications.—The whole county is hilly, but especially the southern and western parts, which are the

highest, the direction of the principal streams being from south-west to north-east. The hills vary in height from a few hundred feet to 2000 feet. Windlestraw Law (2295 feet), at the northern extremity; Blackhouse (2370 feet); Minchmoor (2280 feet), on the borders of Peeblesshire; and Ettrick Pen (2200 feet), on the south-west boundary, are the only hills which exceed 2000 feet in height.

The county is comprehended in the basin of the Tweed, which crosses it in the north from west to east, quitting it at its junction with the Gala. About 10 or 12 miles of its course belong to Selkirkshire. The *Ettrick* is the county river; it gave to the district its former name of Ettrick Forest. It rises in the south-west corner, and flows in a north-east course till it joins the Tweed on its right bank, on the east border of the county; its course is about 30 miles. The *Yarrow* rises on the western border, and has its course nearly parallel to the Ettrick, until it reaches Yarrow Ford, where it turns to the south-east and joins the Ettrick a little above Selkirk; its course is about 20 miles, including the lochs of the Lows and St. Mary, through which it flows. The *Gala*, which has the greater part of its course in Edinburghshire, and the *Cawdor*, belong to the northern part of the county; they flow south-east, and join the Tweed on the left bank: the Gala on the border of the county, the Cawdor a little above it.

The principal lochs are those of the Lows and St. Mary, separated from each other by a very narrow neck of land. They are both expansions of the Yarrow, which enters the loch of the Lows at its upper end and quits that of St. Mary at its lower end. The Lows is a mile long, a quarter of a mile broad, and about 70 feet deep; St. Mary's is 3 miles long, half a mile broad, and from 80 to 90 feet deep. They are at an elevation of 560 feet above the level of the sea. The lochs are stored with pike, perch, and trout. The rivers abound with good salmon and trout, and contain barbel and other fish.

The principal road is the great road from Carlisle to Edinburgh, which passes through Selkirk and Galashiels. A branch parts from it at Selkirk, and passing by Yair Bridge, reunites with the main road at Crosslee, 9 miles N. from Selkirk. A road from Glasgow to Kelso and Berwick crosses the county, following the valley of the Tweed. The Edinburgh and Hawick railway passes the border of the county and has a station at Galashiels.

Geology, Mineralogy, &c.—The mountains have been described as "one large high bed of grauwacke and clay-slate, now cut by the larger streams into long-shaped divisions, and cross-cut by the smaller streams to a less depth, and into smaller and rounded divisions." The hills are generally ridge-shaped and rounded on the tops, having acclivities of from 10° to 30°. The projecting ridges on one side of a valley usually have a corresponding recess on the opposite side. The west and south-west sides of the transverse or smaller valleys are generally the steeper. The strata for the most part dip to the north-east, but with various degrees of inclination. At New House Lynna, 7 miles above Selkirk, the rocks which form the bank of the Ettrick rise to a surprising height perpendicularly; both here and at Newark on the Yarrow the strata are remarkably curved. On the western side of the county, towards Peeblesshire, extensive strata of porphyry are found alternating with thin strata of slate and granite. Shell-marl occurs abundantly near Galashiels, and was extensively used for manure, until superseded by the introduction of lime. Granite and whinstone are abundant.

Soil, Agriculture, &c.—The arable land of the county lies on an elevation of from 280 to 800 feet: none of it therefore is the best as to climate. Wheat abounds in the lower districts, and has been raised, at the height of 700 feet, to what would be called a good crop in the Lothians; and considerably higher, near to the head of Ettrick, oats, turnips, barley, and clover hay thrive in regular rotation. ('New Statistical Account of Scotland.') The soil is light and dry, and the harvest comparatively early. The quantity of land constantly under tillage is small, the dampness of the climate rendering the county more appropriate for pasturage.

The cattle are chiefly of the Teeswater breed. Highland cattle are also grazed on the hills. Black-faced sheep are reared on the high pasturages, where they are found to thrive best. Cheviots and Leicester have been introduced. Considerable attention is paid to breeding. The most improved modes of culture and the best implements have been introduced. The houses of the tenants have generally been rebuilt in better situations and in better style than before. The food and clothing of the people have been both considerably improved. The banks of the streams are generally well-wooded, and often picturesque. Planting has been considerably extended. The indigenous wood is chiefly oak (cut down periodically for the bark), ash, elder, birch, elm, hazel, hawthorn, mountain-ash, &c.

Divisions, Towns, &c.—The county contains nine parishes or parts of parishes. Of these only two, Ettrick and Yarrow, are wholly included in the county. The only towns are Selkirk and Galashiels.

Selkirk, a royal burgh and market-town, and the county town, lies on the right bank of the Ettrick, 36 miles S.S.E. from Edinburgh. The population in 1851 was 3314. In the middle ages Selkirk was a town of some importance. The town was burnt by the English soon after the battle of Flodden, and in the civil war of Charles I. Montrose was here surprised and routed by the Covenanters under David Lealy in 1645. Selkirk has one principal street, expanding in one part into a triangular market-place, with a conspicuous public well in the centre.

The town contains many good houses. The parish church is in the town; and there are two chapels for United Presbyterians, and one each for the Free church, the Independents, and the Episcopalians. The town-hall has a spire 110 feet high. Close to the town are flour-mills, some stocking-loom, a fulling-mill, and a small tan-yard. There is a small-prison for the burgh and county. In the town are the parochial school, the Burgh school, two endowed schools, a savings bank, a parochial library, two subscription libraries, and a reading-room.

Galashiels, a considerable manufacturing town, is situated on the right bank of the Gala, just above its junction with the Tweed, about 6 miles N.E. from Selkirk, and 33 miles S. from Edinburgh by the Hawick railway. The population in 1851 was 9918. A bridge over the Gala connects the town with the village of Buckholmside in Roxburghshire. The church is a gothic building of considerable size; and there are two chapels for United Presbyterians, and one each for the Free Church and the Independents. Part of the town is included in the burgh of barony of Galashiels. There are the parochial school; a subscription school; two libraries, a reading-room, and a savings bank. Galashiels has long been distinguished for its woollen manufactures, the most considerable of the kind in the south of Scotland. For a considerable period coarse cloths were chiefly made, such as are worn by shepherds and mechanics, popularly known as 'Galashiels grays'; fine broad-cloths are now produced; and a hall has been established for the sale of the various fabrics.

History and Antiquities.—This part of Scotland appears to have belonged originally to the Gadeni. On the retreat of the Romans it was overrun by the Anglo-Saxons of Northumbria. At this time it was a forest, and had few settled inhabitants. With the exception of the Catrail [ROXBURGHSHIRE], there are very few British or Roman remains. Near the south-eastern border are a few hill-forts, with a square Roman camp in the midst of them; and there are traces of two camps and of a Roman road in Galashiels parish. After the cession of the southern part of Scotland by the Anglo-Saxon princes, the Scottish kings had a residence at Selkirk. It was probably established as a county before the death of Alexander II. It belonged in the 16th century to the Douglasses. In 1503 the hereditary sheriffdom was granted to Murray of Falahill, whose descendants held it till the abolition of hereditary jurisdictions. Several castles were erected in this county: there was one at Selkirk early in the 12th century, which was occasionally used as a royal residence; and near it was another castle, called Oldwark; but of neither of them is there now any remains. The ruins of Oakwood and Newark (that is, New-work, as distinguished from Old-work), both near Selkirk, are yet standing.

Statistics: Religious Worship and Education.—According to the Returns of the Census in 1851 there were then in the county 15 places of worship, of which 5 belonged to the Established Church, 5 to the Free Church, 2 to United Presbyterians, and 1 each to Independents, Glasites, and the Evangelical Union. The number of sittings provided in 10 of these places of worship was 8413. Of day schools there were 24, of which 15 were public schools with 946 scholars, and 9 private schools with 392 scholars. There were eleven Sabbath schools with 711 scholars.

Savings Bank.—In 1853 the county possessed one savings bank, at Selkirk. The amount owing to depositors on November 20th 1853 was £200,112. 6d.

SELLES-SUR-CHEV. [LOIR-ET-CHEV.]

SELMÁS. [PERUA.]

SELSEY. [SUSSEX.]

SEMENDRIA. [SERVIA.]

SEMISOPOTSHNY. [ALEUTIAN ISLANDS.]

SEMLIN (Zemlin, Zimonig), a fortified town in the Austrian Military Frontier, is situated in 44° 50' N. lat., 20° 25' E. long., on the right bank of the Danube at its confluence with the Save, on the declivity of a mountain opposite to the Turkish fortress of Belgrade, from which it is separated by the Save. It consists of the inner town and the suburb Fransensthal, and has about 10,000 inhabitants, who are chiefly Serbs and Greeks, with a few Germans, Jews, and gipsies. In the inner town there are some good streets with stone houses, but on the whole it is by no means a well-built place. The gipsies live in a wretched quarter. There are five Catholic and two Greek churches, a synagogue, an hospital, and a theatre. Semlin is the seat of a Greek protopapas, and the residence of the Austrian commander of the district. It is the chief point of communication between the Austrian and Turkish dominions, and contains the greatest quarantine establishment on the Austrian frontier. At the east end of the town is the great market-place, where two rows of palisades used to separate the dealers, to prevent any hazardous communication; but the strictness of the quarantine regulations have been in recent years greatly relaxed. There are many shops in the town. The transit trade is very important. The exports to Turkey, Bohemia, and Moravia are woollen-cloths, porcelain, and glass; the imports from Turkey are cotton-yarn, Morocco leather, hare-skins, lamb-skins, honey, and meerschaum pipes.

SEMUR. [CÔTE-D'OR.]

SENECA FALLS and LAKE. [NEW YORK, State of.]

SENEGAL is the name of a large river in Western Africa, which enters the Atlantic by two embouchures between 15° 50' and 16° 30' N. lat. It is the largest river of Senegambia, and with its tributaries

drains nearly half the surface of that country. The largest of its branches are the Ba Woolima and the Ba Fing. The last-mentioned river, which is considered the principal branch, rises, according to the statement of Mollien, near 10° 30' N. lat., 10° 45' W. long., in the mountain range which incloses the elevated table-land of Foota Jallon on the south. The Ba Fing flows first from north to south, but it soon turns eastward, and passes at a little distance to the south of Timbo, the capital of Foota Jallon. Soon afterwards it runs north, and in that direction it traverses the south-eastern portion of the plain of Foota Jallon. After a course of hardly more than 80 miles it enters the mountains which divide Foota Jallon from the Wilderness of Jallon Kadoo. The Ba Fing is joined by some large tributaries, of which the Furkooma runs more than 150 miles. The course of the Ba Fing to its junction with the Woolima exceeds 400 miles. The other great branch of the Senegal, the Ba Woolima, rises above 350 miles from the source of the Ba Fing, to the north-east, at the eastern extremity of the mountain range which separates Senegambia from Súdán, and at no great distance from the banks of the Joliba, or Quorra, near 13° N. lat., 6° 40' W. long. Its course is first to the north-west, and then nearly west, at a short distance from the mountains, until it joins the Ba Fing, after having run more than 300 miles. From the south it is joined by the Kokorro, which exceeds 200 miles in length. The union of the Ba Fing with the Ba Woolima takes place near 14° 10' N. lat., 10° 30' W. long., and from this place the river is called Senegal. About 15 miles below the union of its branches, the Senegal contains a cataract, called the Feloo Falls, which, according to the statement of Golberry, is 80 feet high. In this part the river runs north-west, but it soon turns to the west, and, at the distance of about 100 miles below Feloo Falls, it is joined from the south by the Ba Faleme, which flows more than 100 miles, and is navigable for a considerable distance from its mouth during the rainy season. On leaving the mountainous and hilly country of Senegambia, the Senegal enters a plain which extends to its very embouchures. In this plain its course is first to the north-west and afterwards to the west. In this part its course is extremely tortuous, the windings of the river being so numerous as to make its course double the length which it would have if it ran in a straight line. In that part of its course which lies to the west, the Senegal divides into two large arms, which reunite after having been separated for a distance exceeding 100 miles. These two arms inclose two islands, called Bilbos and Morfil, which have an average width of six miles, and are separated from one another by a narrow arm of the river. The northern or principal arm preserves the name of Senegal, and the southern is called Morfil, or the River of Elephants' Teeth, on account of the great number of elephants which are said to live on its banks. After the two arms of the Senegal have reunited, it flows chiefly in one channel for more than 60 miles, but in approaching the sea it divides, near Fasf, into two arms, which afterwards reunite. The smaller of these two arms is called the Sagueraí. The principal arm divides again within six miles of the sea. The larger branch, or the proper Senegal, turns south by west, and, flowing nearly parallel to the beach, gradually approaches the sea. Between the river and the Atlantic there is a strip of low land, nearly level, and covered with sand: it is called the Point of Barbary, and gradually diminishes in width, so that opposite the island and town of St. Louis it is less than 300 yards across. About five miles farther south it terminates at the mouth of the river. The tract of land inclosed by the Senegal and Sagueraí consists of many islands, two of which are of considerable extent, and separated from one another by an arm which branches off from the Sagueraí and joins the Senegal. The northern island is called Bequio, and the southern Bifeche. These islands are entirely covered with wood, and in the wet season a great portion of them is laid under water. The course of the Senegal, as far as it runs southward, is nearly 40 miles long; but its waters in few places run in one channel, the middle of the river being occupied by a string of islands, some of which are several miles in length, and in some places more than half a mile in width. A bar has been formed across the mouth of the river, on which there is very little water, except at one place, where the currents have forced a passage through the sands: this is called the Pass of the Bar: it is generally about 250 yards wide and 15 feet deep, but these dimensions are subject to change. Only vessels drawing 12 feet of water can pass through this entrance of the river, as the surplus is necessary for the pitching of the vessels which is produced by the strong swell of the sea. The mouth of the river was formerly two miles farther south than it is at present. In 1812 an unusually extensive inundation opened the present mouth through the narrow sands of the Point of Barbary; and the old mouth was almost entirely filled up with sand.

As a navigable river the Senegal is far inferior to the Gambia; for the Gambia has no such obstacles at its mouth, and the Senegal is much inferior to it in depth, and so full of shoals that it cannot be navigated by large river-barges in the dry season. The ascent of the Senegal is only practicable in the wet season, and even then the voyage is slow and tedious, partly on account of the rapidity of the current, and partly because of the numerous windings. The river begins to rise some weeks after the rains have set in, generally in the first week of June; sometimes it attains the height of 40 feet above its lowest level at Bakel, but lower down it does not rise so high. It attains its

highest level in the month of August, and begins to fall about the middle of September. In November or the beginning of December it again enters its bed. The inundations produced by the rise appear to be most extensive along the lower part of its course, especially where the islands of Bilbos and Morfil occur.

SENEGAMBIA is a term adopted by geographers to indicate a part of the western coast of Northern Africa, but it has not always been applied to the same extent of country. Originally it was only used to indicate the countries which lie between the Senegal and Gambia, from the names of which two rivers the term has been composed, or rather, only the tract between the European establishments on the banks of these rivers, for the country itself was almost entirely unknown in Europe nearly to the end of the last century. It is true that this part of the African coast was visited by Hanno, the Carthaginian admiral, and that it was again discovered by the Portuguese in the 15th century, between 1444 and 1469. [AFRICA, vol. i., cols. 105, 107.] The Portuguese also formed several commercial establishments near the mouths of the principal rivers, but they were neglected after the route to the East Indies had been discovered by Vasco de Gama (1497). The French and the English next tried to get a footing there, and the French acquired the Senegal about 1675, and the English the Gambia in 1688. They formed settlements at the mouths of these rivers, and their merchants began to trade on the banks, forming depôts for their goods at certain places. The remotest French commercial establishment was at St. Joseph, or Makannah, not very far below the Feloo Falls, and the English advanced by degrees to Baraconda, some miles below the last rapids of the Gambia. In the year 1788, an association was formed in London for promoting the discovery of the interior parts of Africa. The year before, the settlement of Sierra Leone had been made for the negro slaves who had obtained their freedom in the West Indies. Since that period the interior of Western Africa has been explored by several travellers, among whom may be named Houghton in 1790-91, Winterbottom in 1794, and Mungo Park in 1795-97 and in 1805. After the peace of 1814, the British government sent out an expedition for the purpose of opening a trade between the countries on the Joliba and the settlements on the Gambia. Though this expedition did not accomplish its object, it traversed a great part of Senegambia in different directions (between 1817 and 1820), and collected much interesting information. Denham and Clapperton succeeded in penetrating from Tripoli, through the Great Desert, to Bornou in Súdán, whence they advanced as far westward as Sackatu (near 5° E. long.). Before these journeys were accomplished, Laing set out (1822) from Sierra Leone, and reached the town of Timbo. The French also commenced to explore these countries. Mollien, departing (1818) from St. Louis, traversed the whole country between the mouth of the river Senegal and the sources of the Gambia, crossing the routes of the British travellers. He went as far as Timbo. Caillié, in his great journey, traversed the country between the river Nuñez and Sierra Leone in 1827, and after having passed the Ba Fing, or Senegal, not far from its source, reached Timbuctoo, and returned to Europe by the Great Desert, and through the empire of Marocco.

By these numerous journeys, a tolerably exact notion has been obtained of the natural features and productive powers of the countries of Western Africa which are drained by the rivers whose mouths are found between the embouchure of the Senegal (16° 30' N. lat.) and the island of Sherboro (7° 30' N. lat.). These countries may be regarded as separated into two unequal parts, the northern and larger of which may be called Senegambia, and the southern and smaller part Sierra Leone. The dividing-line between these two countries begins at Cape Verga, whence it extends in an east-north-east direction to the sources of the river Nuñez, and thence eastward to those of the rivers Rio Grande and Gambia. Towards the east Senegambia is supposed to comprehend all the countries drained by the numerous upper branches of the Senegal, and to extend to the high land which separates them from the countries on the banks of the Upper Joliba. A continuous ridge of high land extends along the northern side, and close to the banks of the Ba Woolima, or eastern branch of the Senegal, from its source to its junction with the Ba Fing, or western branch; and this ridge constitutes the north-eastern boundary of Senegambia. Farther west the valley of the river Senegal, which is bordered on the north by the great desert of the Sahara, is considered to be the most northern country belonging to Senegambia. The Atlantic Ocean washes its western shores, constituting a coast-line which probably exceeds a thousand miles in length. The countries inclosed within these boundaries cover an area exceeding 200,000 square miles.

Surface.—Senegambia comprehends a lower and a higher country. The lower country lies along the shores of the sea, and the higher extends over the interior. Though the higher region is generally the more fertile and more populous, the several parts of both regions differ greatly in fertility.

The Country between the Senegal and Gambia.—The valley of the Lower Senegal consists properly of the bottom which extends along its course on both sides of the river from its mouth to Bakel. It is subject to inundations during the rainy season, during which the river in some places rises 40 feet above its lowest level. In some places this bottom is perhaps not more than 5 or 6 miles wide, but in

others it spreads out to 15 or even 20 miles. As the subsoil consists of a light sand, which is covered with alluvial matter, it opposes little resistance to the rapid current of the river, and hence the Senegal frequently divides its waters, and forms arms which again reunite. These arms of the river, called 'marigots,' are almost countless on the southern banks of the river west of 13° W. long. The whole bottom is of great fertility. In its natural state it is covered with forests, mainly consisting of trees of immense size, which occupy the greatest part of it, the cultivated places being neither numerous nor extensive, though they yield rich crops of rice, millet, maize, cotton, and tobacco. The population is small in number.

Between the mouth of the Senegal and that of the Gambia, and nearly at an equal distance from each, lies Cape Verd (14° 40' N. lat.), a wide projecting promontory. Its western extremity is a mass of rocks of moderate elevation and volcanic origin. In its character it greatly resembles the Cape Verd Islands, which are nearly 500 miles from it in the Atlantic Ocean. The northern descent of this isolated mass is rather steep, and at its eastern extremity are two hills rising about 600 feet above the sea: they are called 'mamelles,' or papa, and serve as a beacon to mariners. The central parts of this tract have a moderately fertile soil, which is well cultivated, and produces cotton, millet, and French beans. The uncultivated districts are used as pasture-grounds for cattle, or are covered with briars. This small tract contains about 10,000 inhabitants.

The country between Cape Verd and the mouth of the Senegal greatly resembles that part of the Sahara which extends from that river northward to the Bay of Arguin. Along the sea there is a low sandy beach, lined with sandbanks, on which there is so little water that it cannot be approached by the smallest boat. The country adjacent to the shores is a dead level, covered with a fine loose sand, which it is quite impossible to travel across, except where it has been covered and consolidated by the sea during the flood. It is destitute of vegetation. During the rainy season the soil is drenched with water, and during the dry season is subject to dense fogs and heavy dews, which fall at sunset, and moisten and penetrate like the drizzling rains of Europe. But no stream of running water is formed by this abundant moisture. This flat sterile tract occupies the whole coast to the distance of about two miles from the sea. At the back of it rises an unbroken ridge of sandy downs, which are likewise destitute of vegetation. The low grounds farther east are almost entirely covered with water during the rainy season, but in the dry season a great portion of the swamps is dried up, and as the alluvial soil is of great fertility, it produces rice and indigo, with large quantities of manioc and yams.

The country contiguous to the shores of the Atlantic, between Cape Verd and the mouth of the river Gambia, has a coast-line which is well defined, but does not extend in a straight line. It is also broken by several watercourses. The low beach is covered with mangrove-trees. The country rises gradually from the beach to the distance of 30 or 40 miles. The whole tract, in its natural state, is covered with tall forest-trees, but a considerable portion of it is under cultivation, producing rice, maize, and millet in abundance. The cattle which pasture on the cleared grounds are of great size. All these products, together with pigs and poultry, are taken from these parts to the French and English settlements, especially to Goree. There are several small harbours on this coast. This part of Senegambia probably contains from 300,000 to 400,000 inhabitants.

To the east of the countries hitherto noticed lies the table-land of the Jaloofs, which is of great extent, occupying the whole country between the valleys of the Senegal and Gambia from 13° to 16° W. long. The interior of this vast region has not been visited by travellers, and appears to be only inhabited by some wandering tribes during the rainy season, on account of the pastures which are found there at that time. Towards the mouth of the Senegal the declivities of the elevated ground approach very near to the river. Travellers have observed that the surface of these declivities is almost entirely covered with a reddish sand, which absorbs abundance of moisture without acquiring the least degree of fertility. Still there occur some tracts of moderate extent which are inclosed by higher grounds, in which the waters of the rainy season collect, and give to the sand a mixture of mould which so far fertilises these tracts that millet can be cultivated on them. In these depressions villages are situated, but only at great distances from each other. Water is obtained from wells, which vary from 20 to 80 yards in depth. In some places large forests of acacias are found. The most fertile portion of this inhospitable region is the north-eastern declivity, where the surface is much less level, and in many places interspersed with high hills and short ridges, between which there are many tracts of considerable extent, on which millet, cotton, and indigo are cultivated. On the pastures which occur in these tracts large herds of cattle are fed. Near the only two rivers by which this region is drained, the Saldi and Guiloom, large tracts are covered by ferruginous rocks, but the inhabitants have turned them to account, having in many places furnaces to smelt them for the purpose of extracting the iron. This part of the table-land, though much less fertile than the adjacent valley of the Senegal, appears to be no less populous.

South-east of the table-land of the Jaloofs begins the higher country, which does not however immediately rise into mountains, but the

western districts consist of numerous hills and short ridges, rising to a moderate elevation. A range of mountains which runs along the western banks of the Ba Faleme may be considered as the boundary-line between the hilly and mountainous country. The hills, consisting mostly of ferruginous rocks, from which iron is extracted, are for the most part thinly covered with low stunted wood, little of which is fit for anything but fuel. The valleys and level grounds which are inclosed by these hills are mostly cleared for cultivation. The beds of numerous torrents intersect the valleys in every direction: they are dry in the dry season, but during the rains they conduct the water which is collected on the high grounds to the Faleme and Gambia. Towards the source of the Faleme the country, though more elevated, is much less broken, and there occur some extensive plains, which are partly covered with woods and partly with jungles of bamboo. A very small part of them is cultivated, and they are the haunts of wild beasts, especially of elephants and lions. Millet, maize, rice, cotton, and indigo are cultivated. Numerous tamarinds, boobabs, and other fruit-trees are scattered over the valleys, and many parts of the country are very picturesque. The inhabitants are tolerably rich, which is partly owing to the circumstance that the most frequented commercial road between Súdán and the European establishments on the coast passes through this region.

The mountain region extends over the western portion of Senegambia, including all the countries situated on and between the numerous rivers which, by their confluence, form the Senegal. This region appears to be surrounded on the south, east, and north by a continued range of mountains. The inclosed region seems to be occupied by rocky ridges, which consist almost entirely of iron-stone and slate, with a very thin covering. In the valleys, which in some parts are extensive, a good deal of alluvial soil is found; and in these places millet, maize, and other grains are cultivated. On the southern district is a wilderness, which extends upwards of 100 miles from east to west, and is inhabited by wild beasts. This region is rich in metals. Excellent iron is obtained by the negroes from the iron-stone; and there are several places where gold in considerable quantities is collected.

The Valley of the Gambia and the Country south of it.—The country situated immediately on the banks of the Gambia, as far as Pisania, consists of a level alluvial tract extending about two miles from the river. It is subject to annual inundations during the rains. A great part of it is swampy, or covered with mangrove-trees; in other places the ground has been cleared, and is cultivated with rice. At the back of this low tract the country rises to a moderate elevation above the level of the river when swollen by the rains. The soil is very various. Though often sandy, it is rather fertile; but sometimes it consists of a hard yellow clay, mixed with small quartz pebbles, and is of indifferent quality. Boobabs, tamarinds, and rhamnus lotus, and other fruit-trees are grown in several places; but the principal objects of cultivation in the cleared grounds are manioc, maize, cotton, indigo, and French beans.

The coast-line between Cape St. Mary, situated at the mouth of the Gambia, and Cape Verga, is extremely low, and is intersected by numerous channels, which form many islands. It is said that the space between the Gambia and Nuñez is occupied by an archipelago of low islands, but the mud banks which surround these islands towards the open sea are so dangerous to large vessels that a part of the coast between the river Compoonee and the Rio Grande has never been surveyed, and is laid down on our maps at random. Though these islands do not contain fresh water, they are not only inhabited but populous. It seems that the inhabitants use the palm-wine as a substitute for water. They cultivate some roots and rice, but chiefly occupy themselves with making salt, an important article of commerce in these parts of Africa, as all the salt consumed in Súdán is either obtained from the Sahara or from this coast. This low archipelago constitutes the outer edge of a level and low country, which extends to a great distance inland. It seems for the most part to be composed of alluvial soil, and the large rivers which traverse it divide into many arms, several of which reach the sea, whilst others reunite. The whole country to a great distance from the shore is of great fertility, but in general is very little cultivated. In some places there are forests from which supplies of timber are obtained, and savannas which serve as pasture-ground for large herds of cattle.

At the back of this low plain, between 14° 30' and 13° W. long., lies a more elevated country, constituting a kind of second terrace. Its surface is slightly undulating. The soil of this country, so far as it is known, has a considerable degree of fertility. The inhabitants cultivate rice, millet, and maize, with cotton, indigo, and several roots and fruit-trees. Large herds of cattle, sheep, goats, and pigs are kept, and poultry and bees are extensively reared. Honey and wax are great objects of trade.

The mountain range south of the Gambia begins a little west of 13° W. long. The valleys in this district have a fertile soil, but cultivation is not much attended to. Between the Gambia and Rio Grande the mountain ridges appear to approach 13° W. long., but south of the last-mentioned river they do not pass much to the west of 14° W. long., except that a ridge approaches the river not far from Kade. These mountains, which are called the Tangui and the Badet mountains, are very little known. Their elevation seems to

considerable, but they do not appear to rise above the line of trees. The mountains are mostly bare, their surface consisting of iron-stone, grayish ashes, and yellow sand; in some places they exhibit traces of volcanic action. The valleys are covered with large trees. The inhabitants are mostly herdsmen.

The table-land of Fouta Jallon consists properly of a plain of considerable extent, surrounded by higher grounds, and chiefly by lofty mountains. From north to south it extends about 80 miles, and perhaps still more from east to west. The surface is diversified by gentle hills. The elevation of this plain can hardly be less than 2000 feet above the sea. In the mountains which inclose it on the south, and which appear to be connected with the Kong Mountains, are the sources of the Ba Fing, the principal branch of the Senegal, and the waters issuing from them run above a thousand miles before they reach the sea. This river forms many rapids in its course. The greatest part of the plain is converted into a temporary lake at the end of the rainy season, but this is very favourable to the growth of rice, which is extensively cultivated. Indian corn is also grown, but millet, to the growth of which humidity is not favourable, is seldom seen. Oranges, papaw-trees, and bananas are abundant, and there are many large forest-trees. Cattle are numerous. This is the best cultivated and the most populous part of Senegambia. The inhabitants derive considerable advantages from the commercial road through their country, which connects the countries south of the Joliba with Sierra Leone.

Rivers.—Besides the Senegal and Gambia [GAMBIA COLONY; SENEGAL], which are the largest rivers of Senegambia, the country south of the Gambia is drained by two rivers, which are navigated to a considerable distance from their mouth: these are the Rio Grande and the Nuñez, or Kakoondea. The *Rio Grande* is stated to originate on the western declivity of a range of mountains, the waters from the eastern slope of which form the most remote branch of the Gambia, near 10° N. lat., 11° W. long. As far as its course lies within the mountain region it is joined by numerous tributaries, among which however the Coomba only is a considerable stream, and its course is rapid. At a distance exceeding a hundred miles from the sea the river divides into several branches. That branch which continues to flow in a western direction is commonly called on our maps Rio Grande, but the native name is Butolah. Its mouth is opposite to Bulama Island, which belongs to the group of the Bissagos, or Bijooga Islands. [BISSAGOS.] That arm which runs northward from the point where the bifurcation takes place is called Jeba River. Having continued in that direction about 50 miles, it turns westward and divides again at the Portuguese settlement of the same name. This branch is navigable for small vessels from Jeba to the sea, and for larger vessels from a point about 5 miles above Bissao. The most northern arm, which is called the Cacheo River, is navigable for small vessels to the settlements of Cacheo. The river *Nuñez*, or, as it is called by the natives, *Kakoondea*, is much inferior in size: its whole course probably does not exceed 250 miles, while the Rio Grande runs more than 400 miles; but it offers a safe navigation to a great distance from the sea. It rises in that chain of hills which separates Senegambia from Sierra Leone near 13° W. long. In the upper part of its course it is full of rapids and falls. It becomes navigable for vessels of moderate size above the settlement of Debuco, or Rebuco, and up to this place the tide ascends. The river has three channels at its mouth, two of which are navigated by vessels. They are separated from one another by an island called Sandy Island.

Climate.—The commencement of the rainy season varies between the 1st of April and 1st of June, and its termination is between the 1st and 31st of December. The rains in July and August are heavy, and are frequently accompanied by violent gusts of wind, called tornadoes, attended with thunder. In September the rains are generally slight, and tornadoes with heavy rains are comparatively rare. Tornadoes occur at the beginning and termination of the rainy season. The prevailing winds during this season are from the south-west to the west and north-west; towards the end of November from the north-east and east, and they immediately produce a great change in the face of the country. The grass soon becomes dry and withered; the rivers subside rapidly, and many of the trees shed their leaves. About this period the 'hamattan' is generally felt, a dry and parching wind which blows from the north-east, and is accompanied by a thick smoky haze, through which the sun appears of a dull-red colour. This wind passes over the sandy plains of the Sahara, where it acquires an extraordinary degree of dryness, parching up everything which is exposed to it. It is however considered healthy, especially by Europeans. During the long rainy season the air is loaded with moisture. The hamattan quickly changes this state of things, and many persons who have fallen ill during the rains recover in a short time. But it produces chaps in the lips, and afflicts many of the natives with sore eyes. The easterly winds of the dry season extend to the shores of the sea as far south as Cape Verd. But south of it westerly and north-westerly winds prevail, except in some places where there is a regular alternation of land- and sea-breezes.

Senegambia has long been noted for the great degree of heat to which it is subject all the year round. But it does not appear to be subject to a greater degree of heat than other countries situated in the same latitude, except those tracts which lie along the banks of the

river Senegal, and consequently in the vicinity of the Sahara. At the French settlement of Bakel, on the river Senegal, about 300 miles from the sea in a straight line, the thermometer occasionally rises to 110° in April and May, which are the hottest months of the year, and sinks in December to 56.25°. In the parts of Senegambia which are remote from the coast, the hottest part of the year is during the last months of the dry season and at the beginning of the rains; but on the coast the rains immediately depress the temperature several degrees. On the coast the range of the thermometer generally varies between 65° and 95°, and rarely attains 100°. The mean annual temperature is 79.7°.

Productions.—A country with such a climate and extensive tracts of great fertility must be capable of producing all kinds of tropical vegetable products. Hemp is cultivated to a considerable extent, and made into ropes and cords, in which state it is brought to the European settlements. The grains which are chiefly cultivated are rice, maize, and millet. Besides these grains there are cultivated for food the ground-nut, mandioc, yams, bananas, and a variety of vegetables. Cotton and indigo are grown in many places; the latter grows wild. The forests, which are very extensive, contain several trees, the fruits of which are used as food. The most remarkable is the butter-tree. Among trees used for commercial purposes are the African teak, the mahogany-tree, the mangrove, and others. The mimosa from which the gum is obtained is common on the table-land of the Jaloofs, though less so than north of the Senegal. There are some trees which yield caoutchouc. Cassia, cardamoms, and orchil are obtained from the interior. Along the sea-coast, and also on the islands, and in the low flat country between the Rio Nuñez and the Gambia, different kinds of palms are found in great abundance; palm-oil and palm-wine are important articles of domestic economy.

The domestic animals do not differ from those of Europe, except that a few camels are kept in the desert of the Jaloofs and in the countries near the Sahara. Horses are numerous and the breed is good. Black cattle are numerous and of great size. Butter in a melted state is a considerable article of inland trade, and hides and horns are largely exported. Sheep and goats are confined to some tracts, but pigs and fowls are reared everywhere, the negroes being generally fond of pork. Among the wild animals the elephant occupies the first place, and supplies nearly all the ivory which is exported from the English and Portuguese settlements on the Gambia, Rio Grande, and Nuñez. The hippopotamus abounds in all the rivers, especially in the Senegal. There are lions, leopards, and panthers. The striped hyena is very common. The wild animals which are used for food are the buffalo, the wild boar, which is of prodigious size, deer of different kinds, antelopes, the hare of the Cape, and porcupines. Alligators frequent all the rivers, and the boa is found in the lower marshy country. Among the birds the white heron is one of the most beautiful. Guinea-fowls, turtle-doves, and wood-pigeons are abundant. Turtles are numerous on some of the islands. There are several kinds of large ants; their hills resemble the huts of the negroes.

Little is known of the mineral wealth of Senegambia; but it would seem that the greater part of the mountains are mainly composed of ironstone, and that iron exists there in inexhaustible quantity. The natives are also acquainted with the art of extracting the metal, and there are furnaces in some parts. Gold is found in those parts which lie between the affluents of the Upper Senegal, as in Bambook, Fooladoo, Manding, &c. It occurs mostly in the form of small grains in an alluvial soil.

Inhabitants.—The inhabitants of Senegambia belong properly to the negro race. But the Moors have entered Senegambia in considerable numbers, and mixed with the most populous tribes of the negro race. These tribes are known under the names of Foulahs, or Foolahs, Jaloofs, or Jaloofs, Mandingoes, and Serrawollies; and they occupy the more elevated part of Senegambia, leaving to the other minor tribes only the low country which extends along the sea from the mouth of the Gambia to Cape Verga.

The nations among which the Moors have settled have partly embraced the Mohammedan religion. The structure of their body differs also more or less from that of the true negro race. The inhabitants of Bondoo, who are a mixture of Foolahs, Mandingoes, Serrawollies, and Jaloofs, are described as of middle size, well-made, and very active; their skin of a light copper-colour, and their faces of a form approaching nearer to the European type than any of the other tribes of Western Africa, the Moors excepted. The women vie in point of form with the handsomest women in Europe, and they have very delicate features. The different tribes speak different languages; but that of the Foolahs and Mandingoes is generally understood by all of them. In respect of commerce and civilisation they are far more advanced than the other black tribes. There are schools in almost every town for the instruction of youths who intend to make the Mohammedan religion their profession, in which they are instructed in reading and writing Arabic from the Korán. Their habitations are rather small, but they are kept clean and neat. Both sexes are dressed in a very decent manner.

The smaller nations, who exhibit in their bodily structure the true negro type of the Ethiopian race [AFRICA, vol. i, col. 124], have remained in a low state of civilisation. They cultivate some rice, but

in a very unskilful and slovenly way. They have plenty of pigs and fowls, but few cattle, and no other domestic animals. They generally wear only a piece of cloth about their loins. Their huts are extremely dirty. They are ferocious in their manners, treacherous, cruel, and oppressive; and a tribe of the Bagoes are complete pirates.

Political State of Society.—It appears that little authority has been introduced among the smaller tribes. They do not keep slaves, and have adopted the practice of selling their prisoners of war to the slave-traders. The larger tribes have established regular government, with a king and a hereditary nobility. Each town or district is under a chief. It would also seem that certain revenues—as, for instance, the presents received from the merchants who traverse the country with goods—are divided among these petty chiefs. But the king has the power of making war and peace. All these nations keep a considerable number of slaves. The government of Footatoro is a kind of theocratical republic.

Political Divisions and Places.—The whole country along the sea, from the mouth of the Senegal to Cape Verd, and as far inland as the western declivity of the table-land of the Jaloofs, is subject to the king, or Dámel of Kayor, who resides in the town of Macaya. The inhabitants are Jaloofs. Within the boundary of this state is the town of Cogue, which is a commercial place, as two roads unite here, one leading southward to the Gambia, and the other eastward to Footatoro. It has 5000 inhabitants, and many Moors are settled there. The numerous villages on the rocky peninsula of Cape Verd constitute an aristocratical republic, governed by a senate, which is composed of the chiefs of these villages.

Between Cape Verd and the mouth of the Gambia are the small states of Baol, Sin, and Barra. The French have a commercial establishment at the town of Albrada, the residence of the king of Barra. East of Barra is the small state of Badiboo.

North of Barra and Badiboo is the state of Salum, which extends westward to the sea, where it occupies both sides of the river Joombas. The capital Cahore is built on its banks, and small vessels can ascend as far as the town. It has some commerce with the French settlement of Goree. Among other small states situated in the lower region, between the Senegal and Gambia, are those of Yanimaroo, Katoba, Wooli, Walo, Burba, Jaloof, and Footatoro. The last named state, which is more extensive than most of the others, is divided among seven chiefs, who form a council, and elect a marabout, or priest, for their king, who however can do nothing without the consent of the council, and reigns only during its pleasure. It frequently happens that this chief of the federative aristocracy is changed two or three times in a year. The capital of Footatoro is Chuloigna. Sedo and Canel are rather large towns. The inhabitants are chiefly Foolaas.

In the mountain region and contiguous to the western and southern banks of the Senegal is Galam, which comprehends the country from the Falls of Feeloo (10° 30' W. long.) westward, but does not extend to a great distance from the river. It is densely inhabited, a string of towns occurring along the banks of the river, among which Tuabo, Makanna, and Mussala are considerable places. The inhabitants are mostly Serrawollies; they are distinguished by their manufacture of cotton stuffs, to which they give a fine and permanent blue colour. Between Galam and Wooli on the Gambia is Bondoo, the most powerful state in these parts of Senegambia, which is probably owing to the king, whose title is Alamy, being less dependent on the chiefs of the villages and towns. The inhabitants, who are a mixture of Jaloofs, Foolaas, Serrawollies, and Mandingoes, are much occupied in trade and manufactures. The most important places are Boolibany and Fattecoonda. East of Bondoo and south of Kajaaga is Bambouk, which is noted for its gold-mines. [BAMBOUK.]

The other states which lie farther east and south in the most elevated part of the mountain region and between the numerous tributaries of the Senegal, are much less known than those hitherto described. The most extensive are Foolado, the ancient country of the Foolaas, who however were expelled from it by the Mandingoes, with the towns of Koeena, Keminoom, and Bangassi; Manding, the native country of the Mandingoes, which comprehends the most eastern portion of the mountain region, and has several mines of gold, with the towns of Sibidooloo and Kamalia; Jallon Kadoo, the uninhabited wilderness which extends between the sources of several branches of the river Senegal; Konkodoo on the Ba Fing, or principal branch of the Senegal, which has some rich mines of gold, with the town of Konkroma; Satadoo, with the capital of the same name; and Dentilla, with the towns of Baniserile and Kirwani, which is inhabited by very intelligent agriculturists, and where there are several smelting-furnaces. On the river Gambia are the small states of Neola, with the town of Tambacunda, and Tenda, with the town of Jallacotta.

It does not appear that there is any large kingdom or state south of the Gambia, with the exception of that of Foota Jallon. Indeed as this state has subjected the tribe of the Landamas, who inhabit the country between that river and the Nuñez, and rendered it tributary, it may be said that its dominions extend to the very shores of the sea. The principal seat of its power is the well cultivated and populous plains of the elevated table-land of Foota Jallon, where the capital, Timbo, not far from the sources of the Senegal, contains 7000

OGEOG. DIV. VOL. IV.

inhabitants, and several other towns contain from 3000 to 5000 inhabitants. Most of the inhabitants are Foolaas, but in the fastnesses of the mountains there are still some small native tribes of negroes. In the country which extends between Foota Jallon and the coast, each village appears to have a chief, but no political connection subsists among the villages.

European Settlements and their Trade.—The European settlements in Senegambia are strictly commercial. The settlers have not acquired the property of any land, except the place on which they have settled, and no cultivation is carried on by them or their people, except at a few spots which are rather gardens than plantations. Each of the three European nations which have formed settlements has taken possession as it were of one of the three large rivers, the French of the Senegal, the English of the Gambia, and the Portuguese of the Rio Grande. Each has built a fortress on an island not far from the mouth of the river, which serves as a safe place of deposit for goods which are imported, and from which the productions of the country are shipped. The merchants set out from these places in large river boats with their goods at certain seasons of the year, and ascend the rivers as far as they are navigable. They stop at certain points to which the natives bring their productions to exchange for European manufactures.

The principal French settlement is St. Louis, a town containing about 15,000 inhabitants, of whom about 800 are whites. It is built on a sandy island, about two miles long and a quarter of a mile wide on an average, which is about five miles from the mouth of the river. Only vessels drawing less than 12 feet of water can sail up to the town, as there is a bar across the mouth of the river. [SENEGAL.] The French have also two small fortresses on the banks of the Senegal, one at Podhor, at the western extremity of the island of Morfil, and the other at Bakel, or Baquelle, in the kingdom of Lower Galam, not far from the junction of the Faleme with the Senegal. Between Podhor and St. Louis there are several places to which the Moors of the tribes of the Traza and Braknas bring at certain seasons the gum which they collect in the mimosa forests of the south-western districts of the Sahara. Such places are called markets, and are only inhabited during the stay of the Moors. The most frequented are the Escaladu-Désert and the Escaladu-Coq, or Braknas. The French have also a fortress on the island of Goree, near Cape Verd [GOREE], and an establishment at the mouth of the river Casamanza, which enters the sea between the Gambia and the Rio Grande.

The English settlements are principally on the Gambia. [GAMBIA COLONY.]

The Portuguese settlements are dispersed along the banks of the different arms of the Rio Grande and on the Casamanza. The principal settlement is Bissao, a well-built fort and town on a large and fertile island of the Jeba branch of the Rio Grande. It has about 3000 inhabitants, and an excellent and spacious port: the population consists chiefly of mulattoes and blacks. Higher up the same branch of the Rio Grande is Jeba, with a population short of 1000 inhabitants, which likewise consists of blacks and mulattoes. On the southern branch of the Rio Grande is Bolula, a mercantile establishment, and on the northern or Cacheo branch the town of Cacheo, a considerable place with a harbour, which however is only accessible to vessels drawing 10 feet of water, as a bar runs across the mouth of the river. In the country of the Feloops, between the Cacheo branch of the Rio Grande and the Gambia, the Portuguese have several settlements, as at Zinghinchor and Mahia Kakonda on the Casamanza River, and at Vintang on a small river which falls into the Gambia. To all these places the natives bring ivory, wax, hides, horns, and some gold, the greater part of which is shipped to England from Bissao and Cacheo. Many Portuguese have settled in this country as agriculturists, and have married black women. The number of mulattoes in these parts is considerable.

Nearly all the articles of commerce which are exported from the European settlements in Senegambia are brought from the interior by small caravans or cañas, which sometimes proceed to the coast, but generally stop at certain places where commercial establishments are found, and take in exchange for their goods, fire-arms, powder, India goods, coral, amber, glass beads, iron, tobacco, rum, and cutlery. Though a great part of Senegambia is rich in iron-ore, the process of obtaining the metal from it is so rude and requires so much labour, that many of the natives prefer buying it from Europeans.

Commerce with Sudan and Timbuctoo.—A considerable commerce is carried on between Senegambia and the countries farther east. The principal articles of trade are salt, slaves, and gold. A large portion of gold collected in the countries situated on the banks of the upper branches of the Senegal goes to Timbuctoo, and thence to the countries on the south of the Mediterranean. The cañas by which this commerce is carried on follow two routes. The most northern departs from the Senegal in the kingdom of Kajaaga, or Upper Galam, to which country the traders go from all parts of Senegambia. Hence the road runs east-north-east to Yarra, and then east to Benown in Ludamar. From Benown it continues east through countries which are little inhabited on account of their sterility, to Walet in Beroo. From Walet it again passes through deserts, until it approaches the Joliba near Baracanga, whence it continues at a short distance from the banks of the river to Timbuctoo. The southern caravan-route

leads from the banks of the Gambia through Neola, Dentila, and Konkodoo, to the great wilderness of Jallon Kadoo, which, having traversed from west to east, it passes over the mountain range between Kamalia and Bammakoo. At Bammakoo the goods are embarked on the Joliba, and descend to Yamina, Sego, Sansanding, Jenneh, and Timbuctoo.

(Mungo Park, *Travels in the Interior Districts of Africa*; Mollien, *Travels in Africa to the Sources of the Senegal and Gambia*; Gray and Dachard, *Travels in Western Africa*; Caillié, *Travels through Central Africa to Timbuctoo*; *London Geographical Journal*.)

SENEZ. [ALPES, BASSES.]

SENLIS. [OISE.]

SENNNA is a country on the eastern coast of Africa, and a portion of that region which on our maps is called Monomotapa, and has acquired some fame on account of the rich mines of gold which it contains. It is situated between 16° and 20° S. lat., 30° and 37° E. long., and is stated to cover a surface of 43,200 square miles. It forms the capitaney of the Rios de Senna, the only territory that the Portuguese really possess on the east coast of Africa; their other possessions, as Mozambique, Pemba, &c., consisting only of fortified towns, to which no territory, or only a very small territory, is annexed. This capitaney is bounded E. by the sea, S. by the mountains of Sofala, and it extends to the kingdoms of Quiteve and Barne, which inclose it on the west. To the north of it is the independent kingdom of Moraves, from which it is chiefly separated by the course of the river Zambesi.

The shores of Senna are low, and continue so for some distance inland, but the country gradually rises as we proceed westward. At the distance of 150 to 180 miles from the sea there are some low mountain ranges, separated into two portions by the plain through which the river Zambesi runs. A great part of the country west of these ranges appears also to be a plain, the surface of which is hilly. Towards the western boundary, near 30° E. long., the country is covered with mountains.

Senna is well watered; numerous small rivers descend from the adjacent mountains, all of which join the Zambesi. This river, whose course probably exceeds 800 miles, originates in the countries west of Senna, of which we have no account. Its upper course within Senna is from south-south-west to north-north-east, but it gradually turns more to the east. It is in many places upwards of three miles in breadth. From the town of Teté downwards it is navigated, though the navigation is very tedious in the wet season, owing to the rapidity of the current, and in the dry season on account of the numerous shoals and the deficiency of water. Above Teté the Zambesi enters the flat country, but it runs between high rocky banks until it enters the low country at the distance of about 50 miles from the sea in a straight line. In the low country it divides into two branches at Maroero, of which the northern is called the river Quillimane, and the southern Luabo, and both branches are navigable. A large branch separates from the Luabo not far from the place of division, and bisects the delta of the Zambesi, falling into the sea at nearly an equal distance from the mouths of the Quillimane and Luabo. It is called the Melambey, from a place near its mouth. The embouchures of the Luabo and Quillimane are about 60 miles from one another. Where these rivers flow through the level tract, they form numerous islands, occasioning a very rapid current in many of the narrow intervening channels.

The delta of the Zambesi and the low country near the sea consist of a flat, which is marshy, and covered with mangroves to low-water mark. Higher up the ground is cleared to a considerable extent, and the country abounds in villages; but towards the place where the river divides into arms, nearly the whole surface of the country is covered with rushes and bamboos, interspersed with extensive swamps. A few isolated trees, a species of palm, are scattered over this unwholesome waste. The more elevated part of the country, about the town of Senna and higher up the river, is an extensive plain, which descends towards the banks of the river with a gentle slope.

The rainy season commences in the beginning of November, and continues to the end of March. When the rain fully sets in, the river soon rises above its banks, and inundates the contiguous country to the distance of several miles inland. During this period the heat is very oppressive, but not unwholesome in the higher parts of the country, except in the vicinity of lakes.

The cultivated grains are rice, maize, millet, and wheat. The sugar-cane seems to succeed well. Coffee is grown in the more elevated country. Indigo grows wild. The cotton-ahrub is cultivated by the negroes, but only for home consumption. Vegetables are grown in considerable quantities. A kind of grass is cultivated as food: before it is quite ripe, it is plucked, dried, and haked in a large wooden mortar, and then ground between two rough stones. The meal thus obtained is made into a porridge, which is generally eaten with fish. The fruit-trees are tamarinda, oranges, cocoa-nuts, palms, and mango-trees. Among the forest-trees is a species of cotton-tree of a gigantic size, frequently measuring 60 feet in circumference. The wood is used for canoes in preference to any other, as not being subject to the attack of worms. Large boats 50 feet long are made of a single tree hollowed out.

The wild animals are elephants, rhinoceroses, lions, hippopotami, alligators, monkeys, and deer; but there are probably many others, which have been overlooked by the few persons who have visited this country. There are the common domestic animals. Fish is very plentiful in the river, and constitutes one of the principal articles of food of the negro population. Bees are very common, and wax is an article of export.

Gold and iron are the only metals which are known to exist in abundance. Gold is chiefly found in the mountains of Sofala, and in those which surround the colony on the west; and it does not appear that this article is brought from the kingdom of Moraves, but it is obtained in those of Quiteve and Barne. Iron is obtained in abundance from the southern districts of the colony, and also from the kingdom of Moraves; the hoes with which the slaves till the ground are made of it. Marble is got in the hills which run parallel to the coast. The population consists of a few Portuguese and mulattoes, and a great number of blacks. According to the statement of the governor of Rios de Senna, the number of the whites and mulattoes in 1810 did not exceed 500. The negroes are partly free and partly slaves of the whites and mulattoes. The colony is divided into several districts, each under a Portuguese governor, who collects from the free negroes the taxes in kind, consisting of bees-wax, fowls, meat, vegetables, and rice.

The only harbour in the colony which is visited by vessels is that of Quillimane, about 8 miles from the sea, on the northern arm of the Zambesi. This town, with the other Portuguese settlements, Senna, and Teté, are described in the article MOZAMBIQUE COAST.

SENNAAR is a country situated in the north-eastern parts of Africa, on the banks of the Nile, and at the junction of its two great branches, the Bahr-el-Azrek (Blue River) and the Bahr-el-Abiad (White River). It was formerly an independent state, and one of the most powerful in that part of Africa; but it now constitutes a part of the Egyptian province called Beléd-es-Súdan (or country of the blacks). This province comprehends all the countries which lie on both sides of the Nile south of Wadi Halfah, or the second cataract (near 22° N. lat.), with the exception of Abyssinia, and consequently comprises those countries which are known by the collective name of Nubia and Sennaar, to which must be added Kordofan. The most important part of Beléd-es-Súdan is Sennaar, and the seat of the provincial government has been fixed at Kharútm, a town built in modern times at the confluence of the Bahr-el-Abiad and Bahr-el-Azrek. The boundary lines of Sennaar are imperfectly known; and they have varied considerably at different times. The present area is estimated at about 60,000 square miles. On the north is Dar Shendy, a part of Nubia, on the east some wandering tribes, on the south-east Abyssinia, on the south the mountain tribes of the Nuba, and on the west is Kordofan.

Surface and Soil.—The most fertile portion of this country is that part which lies between the two great branches of the Nile, and is called the Island of Sennaar. At its southern extremity, between 11° and 12° N. lat., is a mountain region called Jebel Fungi. This region seems to constitute a link of that great chain which appears to traverse Africa in its whole width from east to west, near 10° N. lat., and which is called by Abulfeda and Edrisi Jebel-al-Komri, or the Mountains of the Moon. The information collected from the natives assigns to this range rich mines of gold and iron, both of which are worked. This part of Sennaar is a plain, on which only a few isolated hills rise. The greater part of this plain appears to be formed by the alluvial deposit of the rivers. It is nearly a dead level, and the Bahr-el-Azrek rises during the floods to within two and three feet of the summit of its banks, and the Bahr-el-Abiad in most parts spreads over a large tract of country. The soil is in general very good, and in some parts of excellent quality, though there are also tracts which are nearly sterile. Dhurra is sown at the end of the rainy season, but in general only so much is grown as is necessary for the maintenance of the population. The most northern part of the peninsula has little wood, and is less fertile than the southern. The bottom along the banks of the Bahr-el-Azrek is narrow, and similar to that in Egypt, being hardly more than two miles wide on an average. During the inundations it is annually covered with a deposit of rich earth, and is exceedingly fertile. But the valley of the Bahr-el-Abiad is of a different description. The low flat along its banks is of greater extent, generally measuring four miles across, but it is chiefly sandy and sterile, and after the inundation grass springs up, a production nearly unknown in the valley of the Bahr-el-Azrek and Nile. The flat country which lies at the back of these banks of the Bahr-el-Abiad is also inundated to a considerable extent. The woods which cover this tract contain many timber-trees of large size, especially on the western side of the river.

The country west of the Bahr-el-Abiad belongs principally to Kordofan [KORPOFAN]; south of it is a mountain region, whose general appellation seems to be Jebel Nuba, from a nation which inhabits its fastnesses; this mountain region is said to be rich in gold and iron. The most northern offsets of this region are called Jebel-Dair and Jebel Minmin, and approach within 26 miles of Obeid, the capital of Kordofan. The tribes inhabiting these mountains have not yet been subjected to the sway of the Pasha of Egypt, though the level country forms a part of Beléd-es-Súdan. That part of this

country which belongs to Sennaar is not equal in fertility to the island of Sennaar, part of the soil being light and too sandy.

The peninsula between the Bahr-el-Azrek and the Atbara, or Astaboras of the ancients, the largest of its confluent, is also a flat country. The plain extends southward to the country of the Shangallas, which belongs to Abyssinia, where it terminates at the mountain region of Habesh. In this plain are several isolated mountains which are the retreat of the nomadic tribes of the Shukeriehs and Bisharies, who cannot be dislodged from them, and wander about in the plains with their herds as long as they find pasture, retiring towards the end of the dry season to the uncultivated banks of the Atbara, where they still find grass when the vegetation of the plain has withered, and where they wait for the setting in of the rains. In general the soil of the plain is tolerably good, and after the rains will produce dhurra. The Shukerieh Arabs also cultivate some patches.

Rivers.—The more important rivers, the Bahr-el-Azrek and Bahr-el-Abiad, with their chief tributaries, are mentioned under NILE.

Climate.—In spring the thermometer at noon rises to 100° and 118°; but it is said that it attains a greater height about the summer solstice. The regular rainy season generally begins in the middle of May, or the beginning of June, and continues to the end of September. But some rains occur even in the beginning of April, which are generally attended by hard gales from the north or north-east. Before the rains regularly set in, two or three times in the spring hurricanes occur. The wind comes from the south-east. After blowing tremendously for ten or twenty minutes, the atmosphere assumes a blood-red colour, which is soon succeeded by total darkness, which lasts about a quarter of an hour. The hurricane usually subsides at the end of two hours from its commencement; but the air is loaded with sand for two or three days afterwards.

Productions.—The grain most cultivated is dhurra, or millet, and it is an article of great inland trade. Wheat is also cultivated. The cultivation of the sugar-cane seems to be confined to a few places. In the kitchen-gardens there are grown onions, red-pepper, bahmiyeh, a mucilaginous vegetable, chick-peas, kidney-beans, cucumbers, and some plants which are not found in Europe; cotton and tobacco are grown as objects of commerce; near the town of Sennaar there are lemon-trees. The timber on the banks of Bahr-el-Abiad is used for boat-building. The boats are built of acacia. In the desert between Sennaar and Kordofan there is a thorny shrub, called askanit, the fruit of which is used as food. The fruit of the allobd-tree is considered a dainty, and constitutes an article of trade. The fruits of the monkey-bread (*Adansonia digitata*), the doum-tree, and nebeck-tree are considered as very good.

Horses are more numerous in Sennaar than in the countries farther north on the banks of the Nile. The chief wealth of the numerous nomadic tribes which inhabit the uncultivated districts of the country, consists in their camels, cattle, sheep, and goats. The camels are killed for food. The cattle are of good size. The sheep and goats are without wool or hair. Fowls are plentiful in some places. Wild animals are very numerous. The elephant is found as far north as 14° 30' N. lat., and in some parts in great numbers. The giraffe is abundant in Atbara. The animals whose flesh is used as food, and which are very plentiful, are mountain goats, antelopes, wild cattle, wild asses, and hares. There are several kinds of hyenas and monkeys. The rivers are inhabited by the hippopotamus and the crocodile. From the skin of the hippopotamus whips are made, which are a considerable article of trade. The flesh of the crocodile is eaten. Birds are numerous. Water-fowl are plentiful on the banks of the Bahr-el-Abiad. Ostriches are abundant in the desert, especially in that tract which separates Sennaar from Kordofan; their feathers are a considerable article of trade. Wild Guinea-fowls are numerous. An immense quantity of honey is collected in these countries, especially on the islands of the Bahr-el-Abiad, and it is a considerable article of trade.

Gold and iron exist in the Jebel Fungi, and iron is also found in the desert which divides Sennaar from Kordofan. There are some salt works on the Bahr-el-Abiad, but most of the salt used in Sennaar by the rich is brought from Boeydha in Nubia. The poor use a brine as a substitute, which they procure by dissolving in hot water lumps of a reddish-coloured saline earth, which they obtain from the nomadic tribes of the Atbara.

Inhabitants.—The inhabitants of Sennaar are either free cultivators or 'mowelled.' The latter are a peculiar race; they are descendants of slaves, who from generation to generation live at large, and pay their masters monthly a part of their gains. If the slaves of two masters marry, their children become the joint property of their masters. In appearance there is no difference between the slaves and the free population. The slaves have usually a darker complexion, but some of them are light-coloured and handsome. The language spoken by the natives is the Arabic.

In the interior of Sennaar, south of 14° 30' N. lat., are the Bukarah Arabs, who have maintained their independence. On the western banks of the Bahr-el-Abiad is the Beduin tribe of Husaniyeh, which extends southward nearly to 13° 30' N. lat. They are generally fine men, a shade lighter than those of Sennaar, and the females are not so dark as the males. South of the Husaniyeh Arabs are the Shilluks. The few individuals of this nation who have been seen by Europeans were clumsily formed, their legs being too short for the size of the

trunk. The heads of some were shaved; the hair of those unshorn was curled and woolly. Their countenances are harsh and savage; their cheek-bones high, and noses narrow near the root, but broad and flattened towards the nostrils. The incisor teeth of the lower jaw had been extracted. The only weapons they had were sticks, shields, and spears of a rude construction. They speak a language different from that of their neighbours. They wear no covering, and worship the sun and moon. Opposite the Shilluks, on the eastern banks of the Bahr-el-Abiad, live the Denka, who were originally the same nation, but they are now quite distinct, and constantly at war. The principal wealth of both nations consists of cattle.

The peninsula of Atbara is the residence of two powerful tribes, the Bisharies, or Bishareen, and the Shukerieh. The former occupy the northern portion of the country. [BISHAREEN; NUBIA.] The Shukerieh are handsome men, with fine countenances, tall, and not black. They are proud, but more polished and less debauched than the Bisharies. They do not speak Arabic. Though these two tribes derive their subsistence chiefly from the produce of their herds of camels, cattle, sheep, and goats, they repair to the banks of the Atbara immediately after the inundation to sow dhurra, and remain there till the harvest is gathered in. During the hottest part of the summer, when the grass is dried up in the desert, they again descend to feed their cattle on the herbage on the borders of the stream.

Government.—The pasha of Egypt maintains a regiment of infantry and two regiments of cavalry in Beléd-es-Súdan, and governs the province by a sandjar, who resides in the town of Khartúm. But only a small portion of the country is immediately subject to the governor, nearly the whole being subordinately under the authority of native sheiks.

Towns.—The most populous place at present is *Khartúm*, situated at the confluence of the two great branches of the Nile. It has become a place of importance, in consequence of having been made the residence of the governor. The houses are built partly of sun-dried bricks and partly of dhurra-stalks. The former capital was *Sennaar*, which was destroyed when the Egyptians occupied the country in 1822, and in 1829 it consisted of a heap of ruins, except a few houses which were inhabited by some merchants. The town was afterwards rebuilt, and the inhabitants resumed their manufacturing industry. Among the manufactures are mats with beautiful devices made of split doum-leaves, and dyed of various colours, conical straw-covers for plates in elegant patterns, silver-stands for coffee-cups in flagree, warlike weapons, as spears, knives, &c., and amulets, which are worn for security from every kind of disease and casualty. There is a well-furnished bazaar. *Wady-Medinah* and *Missalemieh*, between Sennaar and Khartúm, carry on some commerce with the adjacent country. At *Monktrah*, on the Bahr-el-Abiad, are the dockyards in which boats are built for the pasha of Egypt, but it contains no inhabitants except the workmen employed in their construction. In the interior and within the mountain-region of Jebel Fungi is the town of *Goleh*, which is said to be equal in size to Sennaar, and to be noted for its iron-ware.

Manufactures.—That branch of industry in which the Sennaarese are most distinguished is leather, which is of the best quality, and much superior to that made in Egypt or Syria. This leather is worked into different articles, which have an extensive sale in the valley of the Nile and in Arabia. The most important of these articles are camel-saddles, sandals, and leathern-sacks. Where dates grow cords and ropes are made of the fibrous interior bark of the palm date-tree, and in some places of reeds. The shields made of the skins of the rhinoceros and giraffe are used all along the Nile and across the mountains as far as Cosseir and Kenneh in Upper Egypt. Cotton-cloth is made by the women for domestic use, but it constitutes also a considerable article of trade in Northern Africa, under the name of damour. The workers in gold, silver, and iron are very skilful, and execute their work neatly with very simple tools. Pottery is made to a considerable extent in Sennaar. In some places coloured straw-hats are made with great neatness, and they are sent to different countries in the neighbourhood.

Commerce.—The province of Beléd-es-Súdan is the seat of an extensive commerce. Its commercial relations with the interior of Africa extend as far as Begharmi. The caravans which depart from these places go as far as Cairo. Numerous pilgrims from the interior of Africa pass through Shendy and Sennaar on their road to Suakim on the Red Sea, and by the same way many products of the country and of the interior of Africa are sent to the coasts of Arabia, where they are partly exchanged for the goods brought from Hindustan and the Indian Archipelago, while European goods reach Abyssinia and the eastern countries of Súdan by the way of Egypt. Two caravan-routes lead to the port of Suakim on the Red Sea; one from Sennaar and the other from Shendy. There is a much frequented caravan-road from Shendy to Cairo, which for a considerable space follows the course of the Nile. At the village of Daraou, about 10 miles N. from Assouan, on the east bank of the river, the caravan-road terminates, and the goods are embarked on boats to be conveyed to Cairo and other places of Egypt. The common route between Shendy and Sennaar lies along the banks of the Nile and the Bahr-el-Azrek, but there is a shorter road through the desert, which runs nearly due south from Shendy to Abouharras at the confluence of the Bahr-el-Azrek

with the Rahad. Two caravan-roads lead from Sennaar to El-Obeid in Kordofan. From El-Obeid the route passes westward to El-Tusher, the present capital of Dar-Fur, and thence to Kobbe and Kubkabiya. The common commercial road from Sennaar to Gondar in Abyssinia runs in an east-south-eastern direction to Ras-el-Fil, where the merchants of both countries meet and exchange their goods.

Few of the articles imported into Sennaar are brought from European markets. The principal articles imported from Egypt are the sembil and mehleb, both of which are in great request in Súdán, the former as a perfume and medicine, and the latter as a condiment. The sembil is the *Valeria celtica* or *Spiga celtica* of the Italians, and is chiefly grown in the southern provinces of the Austrian dominions; it is sent from Venice and Trieste to Alexandria. The mehleb is brought from Armenia and Persia, and shipped at Smyrna and other ports of Asia Minor for Egypt. It appears to be the fruit of a *tillia*. Sugar is brought from Upper Egypt, and soap from Syria, where it is manufactured. From Egypt are also imported many manufactured articles, as takas (a sort of coarse cambric dyed blue), white cotton stuffs with red borders made at Mehalla in the Delta, melayes (a blue striped cotton cloth), linen made at Siout and Manfaloot, and sheepskins dressed with the wool on, which are often dyed blue and red, and are used as saddle-cloths for the horses, dromedaries, and asses of the natives, and as carpets for the women's apartments. Beads of wood, of coloured glass, coloured agate, coral, and amber are imported to a considerable extent. Paper, made in Genoa and Leghorn, goes to Dar-Fur and other countries farther west. Brass-wire is in great demand, as it is used for ornamenting the lances by twisting it round different parts of the shaft. Of hardware, the most saleable articles are common razors, files, thinblades, scissors, needles, nails, steels to strike fire with, and sword-blades. The sword-blades are made at Solingen on the Rhine. Tar is imported to make water-skins waterproof, and to rub the backs of the camels. Silver trinkets for female ornaments, such as bracelets and ear-rings, are imported in great numbers; most of them go to Dar-Fur. Looking-glasses of Venetian and Trieste manufacture, with gilt covers, are a considerable article in the Egyptian trade.

The principal article of export is slaves. They are partly imported into Sennaar from Abyssinia, Kordofan, and Dar-Fur, and partly taken from the mowelled, or native slaves of the country. Damour, or cotton-stuff, is always in great demand, as the cotton manufactories of Sennaar and those of Begharmi furnish the greater part of north-eastern Africa with articles of dress. Gold is partly got from the mines in the Fungi and Nuba Mountains, and partly from Abyssinia. Other important articles of export are ivory, mostly from Dar-Fur, rhinoceros horns, musk, whips and other articles of leather, ebony, the coffee brought from the western districts of Abyssinia, honey, and ostrich feathers. India goods reach Sennaar by the way of Jidda and Suakim. They consist of different sorts of cambric from Surat and Madras, of coarse muslins from Bengal, of spices, especially cloves and ginger, of India sugar, the beads called reyah, and sandal-wood.

The inland trade of Sennaar is very active, partly in consequence of the great number of caravans which continually traverse the country, and create a great demand for camels, and partly on account of the different productions of the several parts which constitute the province of Beléd-es-Súdán. No gold currency is in use among the merchants of Sennaar except unstamped pieces or rings of pure gold. They are of different sizes, from 30 paras (2d.) to 240 piastres (3s.); and during the whole time the market lasts an officer sits with the scales before him, and weighs gold gratis for all persons. Spanish dollars are current. In some parts the beads are used as small coin.

History.—The ancient history of Sennaar is very little known. It appears that it once formed a part of the empire of Abyssinia, and at a later period of Nubia. In the 13th or 14th century it was wrested from Nubia by a family which came originally from Teyssafaan, a country in Súdán; and at one time that family was in possession of nearly all Nubia, the whole country from the second cataract to the mountains of Fungi being subject to them. On the east their empire included Suakim and a large tract of the coast of the Red Sea, and on the west it extended beyond Kordofan. In the course of time the sovereigns, called 'muk', became too indolent to transact business, and appointed a vizier, who soon possessed himself of all the power, though he continued to pay outward respect to the muk. This took place about two centuries ago, and since that time the power of Sennaar has been decreasing, and several chiefs have become nominally and really independent. In 1822 the country was invaded by the army of Mohamed Ali under Ismael Pasha. The vizier made no resistance, but obtained good terms for himself, by which the southern part of Sennaar, which lies within the mountains of Fungi, was left to him as a vassal of the pasha of Egypt, and the muk was reduced to the station of a private individual.

(Burckhardt, *Travels in Nubia*; *London Geographical Journal*, vols. ii. v. ix. x.)

SENNECEY-LE-GRAND. [SAÔNE-ET-LOIRE.]

SENOUCHES. [EURE-ET-LOIRE.]

SENS, an archiepiscopal city in France, in the department of Yonne, the chief town of the fourth arrondissement, is situated in 48° 11' 54" N. lat., 3° 17' 12" E. long., on the right bank of the Yonne, 250 feet above the level of the sea, 70 miles S.E. from Paris by the Lyon

railway, and has tribunals of first instance and of commerce, a college, and 10,355 inhabitants in the commune. It occupies the site of the ancient *Agenticum*, which was afterwards called *Senones* from the name of the people to whom it belonged, and thence is derived the modern Sens. *Agenticum* or *Senones* became under the Romans the chief town of *Lugdunensis Quarta*, or *Senonia*. It became at the end of the 1st century of the Christian era the seat of a bishop, and afterwards of an archbishop. In the middle ages it was the capital of a county, which was united to the crown by the kings Robert and Henri I. The archdiocese of Sens is now united to that of Auxerre. The archsee of Sens-et-Auxerre is co-extensive with the department of Yonne; the province of the archbishop comprises also the sees of Troyes, Nevers, and Moulins.

The town is of an oval form, surrounded by ancient walls now partly destroyed. Some of the large stones of the foundation bear Roman inscriptions. Of the nine gates of the city, three belong to the middle ages, and the rest are modern. The streets, with the exception of that through which the Paris and Lyon road passes, are narrow and crooked, and the houses generally ill-built. There are two bridges over the Yonne, which is joined by the Vannes on the south side of the town. The principal public buildings are the cathedral, which is a large gothic structure of various dates, remarkable for the size and good effect of its interior, for its painted windows, and for the height of its tower; and the college, which is a modern structure. The cathedral is nearly as large as the metropolitan church of Notre-Dame in Paris. In the apse end, behind the Grand Altar, is a spirited representation of the martyrdom of St. Savinien, first bishop of Sens. In the middle of the choir is a white marble monument of the Dauphin (father of Louis XVI.) and his wife Maria Josepha. In one of the chapels of the nave is a beautiful sculptured altar-piece, representing the principal scenes of the Passion. In one of the suburbs is a church dedicated to St. Savinien, which dates from the 11th century. Many houses in the town date from the 14th and 15th centuries, and many of them are adorned with sculptures. There are public baths, a theatre, an hospital, an ecclesiastical seminary, and some pleasant public walks.

The chief manufactures are of glove- and shoe-leather, cotton-yarn, straw and chip hats, woollen stuffs, polished steel, glue, beer, candles, spirits, tiles, and earthenware. The chief trade is in corn and flour for the supply of Paris, wines, wool, hemp, tiles and bricks, bark, leather, tan, timber, &c. Linen is bleached. Sens has a public library of 6600 volumes, and a museum.

SERVAN, ST. [ILLE-ET-VILAINE.]

SERVIA, or SERBIA, a political division recently formed by decree of the emperor of Austria, consisting of portions of South Hungary and Slavonia. It is styled the *Woiwodschaf of Servia* and *Temeswar Banat*, and includes the Banat of Temeswar (comprising the counties of Bacz Bodrogh, Torontal, Temes, and Krasso, in other words, the territories of the Baczka and the Banat), and the Syrmian districts of Ruma and Illok. The emperor is styled *Grand-Woiwode*, and the actual governor *Vice-Woiwode*, who resides in Temeswar, and is assisted by a ministerial commission and a native administrative council. The *woiwodschaf* is divided into 5 districts. It has an area of 11,528 square miles, drained by the Maros, the Temes, the Theiss, and the Danube. The population amounts to 1,426,221 Serbs, Wallachs, Germans, and Hungarians. [CROATIA; HUNGARY; TEMESWAR.]

SERVIA (*Syrr, Serbie*), nominally an eyalet or province of European Turkey, in reality a tributary principality governed by an hereditary prince, was an integral part of European Turkey till the beginning of the present century. It is bounded N. by the Danube and the Save, which separate it from Austria, E. by Wallachia and Bulgaria, S. by Rumili and Albania, and W. by Bosnia, from which it is separated by the Drina, an affluent of the Save. The length of Servia from east to west is about 145 miles, from north to south about 150 miles. It lies entirely in the basin of the Danube, which river is joined by the Save, and afterwards by the Morava, which crosses the centre of Servia from south to north, receiving numerous affluents; those on its western or left bank come from the Mounts Stalatz, an offset of the Dinaric Alps which divide the waters of the Morava from those of the Drina, and those on its eastern bank from the Bulgarian Mountains which are offsets of the Balkan range. Servia is a country of mountains and valleys, in great part covered with ancient forests. The country has excellent pastures, in which are reared numerous herds of cattle. The population of Servia is about a million, mostly belonging to the Greek Church. The Servians, or Serbs, are a branch

of the Slavonic race, and their language is one of the most polished dialects of the Slavonian.

The principal towns of Servia are—*Semendria*, situated at the confluence of the Jassava with the Danube, a fortified town, with about 22,000 inhabitants: *BELGRADE*: *Poserovats*, or *Passerovits*, a regularly built town of 4000 inhabitants, in the lower part of the valley of the Morava, is celebrated for the treaty signed here by Prince Eugene in 1718, which deprived the Turks of Hungary, Little Wallachia, and part of Servia: *Zabatz*, or *Schabacs*, a fortified town with 12,000 inhabitants, near the mouth of the Dubrava in the Save: *Ujitzs*, near the borders of Bosnia, a town of 6000 inhabitants, carrying on a considerable trade: *Vallievo*, a neat little town, with 1500 inhabitants, on the Kolumbara, at the foot of the Medvedniak Mountains, nearly due south of Zabatz: *Kragojewatz*, a small town in the south of Servia, near the junction of the two Moravas, where a diet of the representatives of Servia proclaimed, in 1830, Milosch and his heirs princes of Servia: *Gladova*, or *Kladova*, on the Danube, in the east of the principality: population, 3000. The citadel of Gladova, called Feth Islam, is garrisoned by the Turks.

The soil in general is very fertile, but a large part of the country is in a state of nature, still unreclaimed, and covered with magnificent forests of oak and other timber-trees. The plains of the interior are in parts well cultivated, and yield fine crops of wheat, barley, maize, oats, rice, hemp, flax, tobacco, &c. The cleared parts of the valley of the Morava are especially productive of fine maize, and in proof of the natural fertility of the soil, it is enough to say that wild sainfoin grows luxuriantly along the road that ascends the valley. Cotton is grown in some of the valleys, and vineyards are planted in favourable situations. The best wines are those grown in the valley of the Morava, and those of Semendria, in the valley of the Jassava.

The face of the country is described as generally beautiful in the extreme; "Hills and woods, glades and streams, succeed in an endless chain, each link a perfect landscape," says the author of 'Frontier Lands of the Christian and Turk.' The population is for the most part scattered over the country in hamlets and villages; and substantial farmhouses, with extensive offices, are sometimes seen apart from the villages. The country abounds with game. Horses and horned cattle are bred in great numbers. Swine are countless. They feed wild in the oak-forests, and are exported in immense numbers to Hungary and Slavonia, where they are fattened and sent to Vienna and other towns of Germany. The fields in parts of the country are inclosed by hurdles to keep out the swine, which rove about half wild. Snakes and lizards are in parts very numerous. Mosquitoes and marsh fever render the low grounds, which in parts skirt the Save, uninhabitable.

The country is said to be rich in minerals, but of this source of wealth, as of the more readily worked wealth of the oak forests, little or no advantage is taken. Iron-ore is found at several points; very rich copper-ore is found at Madenbek in an offset of the Balkan near the eastern frontier. Silver is also found here. Salt is procured at several points. Agriculture and cattle and swine breeding seem the chief occupations. The people seem generally to enjoy a kind of rough prosperity, and to be in a state of material progress. The Servian princes have opened some good roads, the principal of which are those that cross the lower part of the principality from the frontier of Wallachia to Belgrade, and the road up the valley of the Morava from Belgrade and Semendria to Nissa. These lines are chiefly macadamised, in parts made with gravel.

"The Serbs," says the author of 'Frontier Lands,' before quoted, "are in figure the finest race I ever saw"—a fair people, of good, in many instances, of colossal stature, with blue eyes, light hair, and open countenances. The houses in the towns are in general well built, but in the villages and hamlets they are constructed in some instances with wattles plastered with mud, more generally of rough planks. Under the Turkish rule they enjoyed almost unlimited liberty as long as they paid their taxes; but under the rule of their princes this liberty has been vastly curtailed, by the introduction of the passport and quarantine systems, and of intricate custom-house regulations, which would be simply ridiculous as childish imitations of some of the great neighbouring states if they were not so detrimental to the progress of an otherwise promising country.

The principality is in spiritual matters subject to the archbishop of Belgrade, or Semendria, and to the bishops of Zabatz, Timok, and Ujitzs, who are paid by the government, the archbishop receiving 5000 dollars, and each of his suffragans 2500 dollars a year. The number of priests is about 652, who are paid by the parishioners. The number of monks is small. In 1840 there were 80 elementary schools, with about 1000 scholars; in 1850 there were 260, which with the college of Belgrade, had an aggregate of 8000 pupils. About 20 students are sent to Kieff, in Russia, to study theology, and about double that number are educated in the universities of Western Europe, chiefly in France. There is only one printing-press in the whole country, and that belongs to the government.

The revenues of the principality are estimated at a million dollars a year. The militia consists of two battalions of infantry of 1000 each, a squadron of cavalry 200 strong, and 300 artillerymen. But as the Serbs are eminently a martial people, it is estimated that the country could equip 150,000 foot and 10,000 horse.

The country of Servia under the Roman empire formed the province

of Mœsia Superior. It was invaded by the Goths under the emperor Valens, and some centuries later by the Servi, a tribe of Slavonians, to whom were allotted some grounds south of the Danube by the emperor Leo VI., in order to oppose them to the Bulgarians, who threatened the very existence of the empire in the 10th century. By degrees the Servians encroached also upon the territories of the empire, and in the 12th century the emperor Manuel Comnenus was obliged to fight against them in order to check their incursions. During the subsequent decay of the Eastern Empire, and its conquest and partition by the Latins, the Servians established themselves firmly in the country of Mœsia, forming an independent principality under a prince styled Despot, in the same manner as the neighbouring Slavonian states of Bosnia and Croatia. Murad I., sultan of the Ottomans, married a daughter of the Despot of Servia; but several years after, the Servians, Hungarians, and other Christian nations near the Danube, alarmed at the progress of the Turks in Albania, collected a large force under Lazar, Despot of Servia, and marched against Murad, who met the Christian army in the plain of Kossova, near the frontiers of Albania, A.D. 1389, and defeated it with dreadful slaughter, but was himself killed by a Servian noble, Miloah Obelóvitz, Lazar's son-in-law. Lazar was taken prisoner and killed by the Turks in revenge for the death of their own sultan. In the following century Sultan Murad II., who had married the sister of George, Despot of Servia, turned his arms against his brother-in-law about the year 1440, overran Servia, took the fortress of Semendria, and obliged George to take refuge at Ragusa, from whence he made his way to Hungary, where he joined the gallant Hunnyades, and through his assistance recovered part of his territories. At last Mohammed II., after taking Constantinople, finally conquered Servia, which he annexed to his empire, with the exception of Belgrade, which was bravely defended by the Hungarians under Hunnyades, and was only taken (in 1522) by Solymán the Great. Servia continued a province of the Turkish empire till 1717, when Prince Eugene, at the head of an Austrian army, took Belgrade and conquered a part of Servia, which was ceded by the sultan to Austria by the peace of Passarowitz, 1718. But in the subsequent war of 1739 the Austrians, being worsted by the Turks, lost Servia, and gave up Belgrade also by treaty. Marshal Laudon retook Belgrade in 1788, but Austria gave it up again to the sultan by the peace of Ssistova in 1791.

About the year 1804 the Servians, availing themselves of the revolt of Passwan Oglu, pasha of Widin, rose in arms throughout the country against the Porte. They chose for their leader George Petrowitsch, surnamed Kara, or the 'black,' a countryman who, having taken a part in a former unsuccessful insurrection in 1787, had fled into the Austrian territories, and served in the Austrian army in the campaign of 1788-9. After the peace in 1791 Kara George had returned to his country and resumed his profession of herdsman and grazier. He was stern and taciturn, but courageous and robust. In January 1806 two numerous Turkish armies, one from Bosnia under Bekir Pasha, and the other from Nissa in Rumili under Ibrahim, pasha of Scutari, entered Servia. Kara George had no more than 10,000 men, but they were determined, and knew well the country and the intricacies of its forests. He kept in check both armies, and in the month of August defeated the pasha of Bosnia, and drove him back across the Drina with great loss. He then turned rapidly against the pasha of Scutari, who proposed a truce. But the truce not being ratified by the Porte, George surprised and took Belgrade, except the citadel, which surrendered in 1807. Servia was now free from the Turks. A sort of military government was formed, consisting of the chief proprietors of the various districts, each of whom was at the head of a body of cavalry formed of his tenants and friends. These officers assembled once a year, about Christmas, at Belgrade, to deliberate, under the presidency of Kara George, upon the affairs of the country. A senate of twelve members, one elected by each district of Servia, constituted the permanent executive. Mutual jealousies and dissensions soon broke out between the principal governors and Kara George. The latter, in order to strengthen his power, undertook the invasion of Bosnia in 1809, whilst Russia was at war with the Porte. He proved unsuccessful, and was obliged to retire into Servia, protected by a diversion made by a Russian corps on the side of the Danube. In 1810 he defeated Kurschid Pasha, who had advanced from Nissa with 30,000 men, and soon after he routed another army from Bosnia, and drove it back across the Drina. He availed himself of these successes to obtain from the diet of 1811 more ample powers, and a sort of ministry, which resided continually near his person. The Porte proposed to acknowledge Kara George as Hospodar of Servia, on condition that the Turks should garrison all the fortresses and keep the arsenals and arms. It was easy for persons acquainted with Ottoman policy to foresee what would be the results of such an arrangement. The negotiations lasted till 1813, when the news of the success of Napoleon I. in Germany freed the Turks from the fear of Russia, and stimulated them to make a last effort against Servia. Two Turkish armies advanced, drove before them some Servian corps, and carried several strongholds. Kara George, losing on a sudden his firmness, crossed the Danube and took refuge in Austria, and afterwards in Bessarabia. Universal discouragement followed, and the Turks occupied the whole country and entered Belgrade. Servia became again a pashalik. Milosch Obranowitsch, originally a swineher-

alone kept up the insurrection about Jagodino, in the southern districts, but was at last obliged to accept the amnesty offered by the pasha for himself and followers. The Turks however having contrived to get into their hands the leaders of this last insurrection, shot a number of them, regardless of the amnesty, and impaled thirty-six of them at Belgrade, in front of the pasha's palace in 1815. Milosch himself effected his escape: he ran to the mountains, and the insurrection began afresh. Having assembled the Heyduks and the rugged and emigrants of the former insurrection, he attacked the kiaya, or lieutenant of the pasha, who had advanced against him from Belgrade at the head of 10,000 men. The kiaya was defeated with the loss of his artillery and baggage. The pasha came out of Belgrade with the rest of his troops, and was likewise defeated, and obliged to retire to Keupri under an escort given him by Milosch. Kurechid, pasha of Bosnia, sent another army under his lieutenant Ali, who was defeated, taken prisoner, and sent back to his master with presents. Milosch afterwards went himself to the camp of Kurechid Pasha to undertake negotiations of peace. The only article upon which they could not agree was that Milosch wished the Servians to remain armed, to which the pasha would not consent. When Milosch rose to mount his horse, the pasha's janizaries fell upon him, but Ali, who had been so generously treated by Milosch, interposed, representing that Milosch had come spontaneously and under a safe conduct, which ought not to be broken. Ali's firmness saved Milosch, who was allowed to depart. The negotiations continued; Servian deputies were sent to Constantinople, and at last a firman of peace came, appointing another pasha friendly to the Servians. The forts of Belgrade, Zabatz, Ujltza, Semendria, and Sokol were to remain in the hands of the Turks, but the Servians retained the administration of the country, their senate, and they alone taxed themselves. Meanwhile Kara George was living in Besearabia, where he seems to have entered into the Russian schemes for overthrowing Turkey. He retired to Servia with some confederates, with a design of raising the standard of insurrection, and was betrayed, it is said at the instigation of Milosch, into the hands of the Turks, who put him to death as he slept in a hut.

Milosch restored with some modification the constitution established by Kara George. He created a provincial administration; every district or knef has its kneven, or civil officer, and every great division or province has its obar-kneven, all of whom are paid by the treasury. Judicial courts were established in the various districts. A code, based mainly on the French code, was compiled. The clergy were made amenable to the same courts as the laity. Belgrade has a small Turkish garrison, and is the residence of a pasha, who has no direct authority in the affairs of the country. Servia pays a fixed amount of tribute to the Porta, which is yearly delivered by the prince into the hands of the pasha. The natives of Servia are allowed to trade all over the Ottoman empire, when furnished with Servian passports. By an imperial Hatti Sherif, issued in 1830, religious liberty, hereditary succession in the family of Milosch, the formation of a national militia, the right of erecting schools and hospitals, and the administration of public justice were among the privileges confirmed to, or conferred upon, the Serbs. For several years after this Milosch gave himself up to amassing wealth; when the senate established by the new constitution determined to examine the public accounts, he suddenly retired to Semlin. He soon returned however, and fomented a revolt against the senate. His complicity being discovered, he resigned his post, and withdrew to Bucharest. He was succeeded by Prince Milan, after whose death Prince Michael, the second son of Milosch, became ruler of the Serbs. Michael after a short period of power was deprived of the princely functions, for practices similar to those of his father: and Alexander, son of Kara George, the present ruler of Servia, was raised to the princely dignity.

The senate of Servia consists of 17 members chosen for life, from the most influential persons in the principality; they are irremovable by the prince, on whom they form a constitutional check. Since 1850 no Turk is allowed to hold real property in Servia, or to reside in it, except in one or other of the five fortresses before named. The Serbs are said to be favourable to the views of Russia, to which power they are akin in blood, language, and religion, and to whose intrigues they are mainly indebted for their favourable relations with the Porta.

SERVIAN. [HÉRAUL.]

SESIA, RIVER. [Pé.]

SESIA, VAL DI, or VALSESIA. [NOVARA.]

SESSA. [LAVORO, TERRA DI.]

SESTOS, the chief city of the Thracian Chersonesus, was situated on the Hellespont. Theopompus says that Sestos was a small but well-fortified town, which was connected with the port by a wall of 200 feet; and that, owing to its position, and the current from the Propontis, it commanded the channel. At the close of the great Persian war the town was besieged by the Athenians, and the inhabitants, after being reduced to the greatest straits by famine, opened the gates. The capture of Sestos (B.C. 479) terminated this great campaign, which was signalled by the victories of Salamis, Plataea, and Mycale; and with this event the history of Herodotus closes. (Strabo, p. 591; Herod., ix. 121; Thucyd., i. 89.)

SESTRI DE LEVANTE and DI PONENTE. [GENOA.]

SETANG, RIVER. [BRMA.]

SETTEF. [AŁOŁKIA.]

SETTLE, West Riding of Yorkshire, a market-town, and the seat of a Poor-Law Union, in the parish of Giggleswick, is situated in a mountainous district near the left bank of the river Riddle, in 54° 4' N. lat., 2° 18' W. long., distant 54 miles W.N.W. from York, 235 miles N.N.W. from London by road, and 258 miles by the North-Western railway. The population of the township of Settle in 1851 was 1976. The living is a perpetual curacy in the archdeaconry of Craven and diocese of Ripon. Settle Poor-Law Union contains 31 parishes and townships, with an area of 154,591 acres, and a population in 1851 of 13,782.

The town is situated at the foot of a limestone rock upwards of 200 feet high, called the Castleberg. The parish church is at Giggleswick, on the opposite side of the river, over which there is a stone bridge. In the town is a neat church in the early English style, built in 1338. The Wesleyan and Primitive Methodists, Independents, and Quakers have places of worship. There are National and Infant schools, a literary society, a mechanics institute, a news-room, and a savings bank. The Public Buildings is an Elizabethan edifice, erected in the market-place in 1852. Cotton-manufactures are carried on; the machinery is worked by water-power. Ropes and paper are made. The land in the neighbourhood, which is chiefly used for grazing, is exceedingly rich. The market is held on Tuesday; fairs for cattle are held frequently, and pleasure fairs twice or thrice in the year. A county court is held in the town.

SETUBAL. [ESTREMADURA, Portuguese.]

SEVASTOPOL. [CRIMEA; SEBASTOPOL.]

SEVENOAKS, Kent, a market-town, and the seat of a Poor-Law Union, in the parish of Sevenoaks, is situated in 51° 16' N. lat., 0° 11' E. long., distant 17 miles W. from Maidstone, and 23 miles S.S.E. from London. The population of the town of Sevenoaks in 1851 was 1850. The living is a vicarage in the archdeaconry of Maidstone and diocese of Canterbury. Sevenoaks Poor-Law Union contains 16 parishes and townships, with an area of 67,488 acres, and a population in 1851 of 22,095.

The town is situated on an eminence which forms the northern brow of the chalk-marl and greensand range of high lands, in the midst of a fertile and well-cultivated district. The streets are lighted with gas. The church is a spacious and handsome edifice, with a lofty square tower; it is chiefly in the perpendicular style. There are places of worship for Wesleyan Methodists and Baptists. The Grammar school, founded in 1418 by Sir William de Sevenoke, or Sennocke, a founding brought up by some charitable person in this town, is free to boys for classics only, and has two exhibitions of 65*l.* a year each: in 1854 there were 8 scholars on the foundation. This school, and a large range of almshouses founded at the same time by Sevenoke, is under the government of a corporation consisting of two wardens and four assistants. An endowed school, founded by Lady Margaret Boswell, provides for the instruction of 200 children. The market is on Saturday, chiefly for corn; a market held on the third Friday of each month for cattle has declined. There are two yearly fairs.

Adjoining Sevenoaks is Knole Park, one of the finest mansions in the kingdom. It is very spacious, of different dates, and contains a large and valuable collection of paintings, as well as much curious old furniture; it stands in a noble park of 800 acres, well stocked with deer and abounding with stately trees, especially beeches: both mansion and park are open to the public.

SEVER, ST. [LANDES.]

SEVERAC-LE-CHATEAU. [AVYRON.]

SEVERE, STE. [INDRE.]

SEVERN. The Severn is the finest, and, next to the Thames, the largest and most important of British rivers. The original name of the Severn was *Hafren*, of which Severn is only a corruption. It was subsequently called by the Romans *Sabrina*, a name given to it, as is said, in consequence of the fate of Sabra, or Sabrina, who was the daughter of Loocrine, king of Britain, by Estrildis, a captive virgin, in order to unite himself to whom Loocrine had divorced his former queen Gwendolen. On the death of the king, Gwendolen assumed command, and caused Sabrina and her mother to be drowned in the Hafren, which from that time received her name. Milton, in his *Comus*, has made Sabrina the goddess of the river.

The Severn rises on the western border of MONTGOMERYSHIRE, from a chalybeate spring on the eastern side of Plinlimmon, at a very considerable elevation, and within a very short distance from the sources of the rivers Wye and Rhiedol. It flows eastward about 12 miles to Llandiloes, as far as which place it still retains the original British name of Hafren. At Llandiloes the Severn receives the waters of the Clywedog; and thence it inclines to the north-east by Newtown and Welshpool; near the latter place it becomes navigable for small boats and barges. Some distance below Welshpool it is joined by the Vyrnwy, and about a mile lower quits Montgomeryshire.

Previous to entering SHROPSHIRE, the Severn inclines to the east, and this is its general direction through the vale of Shrewsbury. From the town of Shrewsbury, which it nearly surrounds, it takes a south-eastern course through Coalbrookdale to Bridgenorth, and enters Worcestershire a short distance above the town and port of Bewdley. The principal tributaries of the Severn in Shropshire

are—on the right bank, the Meole or Red-Brook, which enters at Shrewsbury, the Ound, Mar-Brook, and Bore-Brook; and on the left, the Perry, Tern, Bell-Brook, and Worf. The Severn receives the whole of the waters of the interior of Shropshire, and its course through that county is between 60 and 70 miles. From Bewdley the river runs southward to Stourport, where it receives the Stour on the left, and about 8 miles lower down the Salwarpe joins it on the same side. Five miles farther it reaches Worcester. Two miles below this city the Severn receives a considerable accession of water from the right bank by the junction of the river Teme, the principal part of whose course is in Worcestershire, but which rises in Radnorshire, and flows through portions of Herefordshire and Shropshire. Still flowing nearly south, the Severn passes Upton, and quits Worcestershire at Tewkesbury, where it receives the Avon, and enters Gloucestershire. [Avon, Upper.]

From Tewkesbury the river again changes its direction, and gradually inclines to the south-south-west, which direction it chiefly follows for the remainder of its course. A mile above the city of Gloucester the stream divides into two channels, which unite a little below Gloucester, forming the rich tract of land called Alney Island. The Frome joins it before reaching Newnham. A short distance below Newnham the channel widens considerably; and although it retains the name of river as far as the mouth of the Bristol, or Lower Avon, it is rather the estuary than the river. The total length of the Severn, from its source in Montgomeryshire to the Bristol Channel, is about 200 miles.

In the ancient division of Britain, the Severn appears to have formed the boundary between the territories of the Silures and the Ordovices on the west, and the Dobuni on the east. In the subsequent divisions of counties, it has scarcely anywhere been employed as a line of separation.

In the commencement of its course, the valley of the Severn is narrow, and supplies little pasturage; below Llanidloes it gradually opens, and is from one to two miles wide, and tolerably productive. The range of the Plinlimmon Hills, which, extending west, comprises the Long Mountain, and terminates in the Breidden Hills, separates the drainage of the Severn from that of the Wye, Teme, Clun, &c. By this range also the course of the Severn is deflected to the north. On the west and north-west the Berwyn Mountains separate the tributaries of the Severn from those of the Dovey and the Dee.

In respect to navigation, the Severn has long been of very great importance. It supplies the means of transporting the produce of mines and manufactories of various descriptions lying in the vicinity of the river to the sea, to North Wales, and the towns and remote districts of the counties through which it flows. Along the greater part of its course the use of the Severn as a navigable river has been impeded by fords and shoals, and by the deficiency of water in drought, and the superabundance of it during rainy seasons. The whole of the Severn navigation, extending upwards of 160 miles, is free from tolls.

The commercial importance of the Severn has been much increased by its connection with several canals, which are here enumerated:—the Stroudwater Canal, which commences at the Severn near Framiload, between Gloucester and Newnham, and terminates in the Thames and Severn Canal, thus uniting our two greatest navigable rivers; the Gloucester and Berkeley Canal, which shortens the navigation from the Severn near Berkeley, to Gloucester; the Gloucester and Ledbury Canal; the Worcester and Birmingham Canal; the Droitwich Canal, which runs along the valley of the Salwarpe; the Staffordshire and Worcestershire Canal, which commences at Stourport, on the Severn, and, following the course of the Stour, joins the Birmingham and Liverpool Junction Canal; the Shropshire Canal, which with its branches is used for transporting the produce of the manufacturing district of Coalbrookdale to the Severn, which it joins at Coalport; the Shrewsbury Canal, originally formed to convey coal to that town from Ketley in Shropshire, and since extended by a branch through Newport to the Birmingham and Liverpool Junction Canal before mentioned; and the Worcester and Birmingham Canal. The Montgomeryshire Canal commences in the Severn at Newtown, and passing Welshpool, communicates with a branch of the Ellesmere Canal, but as the Severn is not navigable as high as Newtown, this canal can hardly be included as one of the connecting links in the Severn navigation.

The fish found in the Severn are salmon, shad, lampreys, roach, dace, gudgeon, bleak, flounders, eels, lamperns, evers, chub, carp, trout, grayling, tench, and perch. Salmon were formerly plentiful, but are now scarce, although there are no weirs upon the river to impede the ascent of the fish.

A short distance above the point where the Severn merges in the Bristol Channel, it receives the Wye, which, although inferior in its size and the length of its course to the Severn, is much superior in point of picturesque scenery. The Wye has its source on the border of Montgomeryshire, and on the mountain of Plinlimmon, about 2 miles south-west from the source of the Severn. Taking a south-east direction, it receives a number of little tributaries, and quits Montgomeryshire and enters Radnorshire between the village of Llangergid and the town of Rhyader, at the distance of 18 miles from its source. Its course through Radnorshire is in a generally southern direction,

and will be found described under that county. At Glasbury the river inclines to the north, but on entering Herefordshire flows south-east. The river is navigable from Hereford, and indeed in the winter, and whenever there is a depth of water, barges ascend to within a short distance of Hay, for the conveyance of timber, &c. For a short distance the river divides Herefordshire first from Gloucestershire, and subsequently from Monmouthshire, and then enters the latter county, under which its further course will be found described. The spring-tides at Chepstow rise to a great height. [CHEPSTOW.] The length of the course of the Wye is about 130 miles. Its scenery throughout is almost without a rival among the rivers of Great Britain.

Owing to the isthmus or neck of land above the mouth of the Wye, and the projection of Aust Cliff on the opposite shore, the width of the Severn is here only one mile, while higher up, as was before stated, it expands to between two and three miles. At this narrow part of the estuary is the principal passage, called Aust Ferry, or Old Passage, from Somersetshire to Monmouthshire and South Wales. About four miles lower down is the New Passage, which is considerably wider, and not so much frequented.

The estuary of the Severn receives the drainage of about 5900 square miles, namely:—the Severn, 4500; the Wye, 1400. The Severn is charged with a larger amount of turbid sediment than any other river in Europe, the result of its own long course and the courses of its tributaries through tracts of marl and soft sandstone. This fine sediment is in some places deposited on its banks towards the mouth, and the quantity thus deposited is increased by artificial means. The mud is encouraged to accumulate upon lines of pile and oyster, which, as the tide retreats, retain the sediment. Upon these, other lines of oyster-fencing are placed, until new land is raised to a considerable height. On the other hand, the sudden rising of the tides has occasioned great damage to the low lands, to guard against which sea-walls, piles, and other precautionary means have been adopted. The inundations in the years 1608, 1687, 1703, and 1737, are recorded to have produced great devastation.

The Bristol Channel, commencing with the estuary of the Severn, separates Monmouthshire and South Wales from the counties of Somerset and Devon, and terminates in St. George's Channel. Its width from King's Road, the mouth of the Lower Avon, to the opposite coast, is about 5 miles. It then rapidly widens to about 12 miles, but is again slightly contracted between the southern point of Glamorganshire and the western part of Somersetshire. It again expands, forming, on the Welsh coast, Swansea and Caermarthen bays, and, on the coast of Devonshire, Barnstaple, or Bideford Bay. The width at its termination in St. George's Channel, taken from St. Gowan's Head on the coast of Pembrokeshire to Hartland Point in Devonshire, is about 40 miles. The coast-line, both on the Welsh and Devonshire sides, is extremely irregular. Lundy Island [DEVONSHIRE], and Caldy Island [Pembrokeshire], are noticed elsewhere. From Hartland Point to King's Road is about 90 miles; it appears that the tide travels over this distance in about an hour and a half. The tide increases as it advances. At Chepstow the tide rises 48 feet higher than at Lundy Island.

The 'bore' which enters the Severn is 9 feet high, and is produced, as in other places, by the depth and quantity of water on the inland side not allowing the surface there to be immediately raised by means of the transmitted pressure. The greatest velocity of the tidal current through the 'shoots,' or New Passage, is 14 miles an hour. This occurs lower down two hours after high-water, but as the Severn is approached the difference of time is diminished, according to the general observations on this subject.

SEVILLA, an old province of Spain, included in the great territorial division of Andalusia, is bounded N. by Estremadura, W. by Portugal, S.W. and S. by the Atlantic Ocean, E. by the province of Granada, and N.E. by the province of Cordova. It is situated between 36° 4' and 38° 13' N. lat., 4° 20' and 7° 18' W. long. The greatest length from north to south is about 150 miles; from east to west, about 180 miles. The area is 8989 square miles. The population in 1849 was 921,908. It is now divided into the three following modern provinces:—

Provinces.	Square Miles.	Population in 1849.
Sevilla	8989	420,000
Cadix		258,448
Huelva		153,462
Total	8989	921,908

A general description of the provinces comprised in Andalusia is given under that head. [ANDALUSIA.] The modern province of Sevilla occupies the inland portion of the old province; Cadix occupies the portion adjacent to the coast south of the estuary of the Guadalquivir; Huelva the portion adjacent to the coast north of that estuary. Sevilla is flat in the centre, hilly in the south, and mountainous in the north. Cadix is entirely hilly and mountainous. Huelva is flat and swampy on the south, but rises into the mountains of the Sierra Morena on the north-west.

Towns.—The city of Sevilla is the capital of the province.

[SEVILLA.] *Alcala de Guadaira*, 7 miles S.E. from Sevilla, contains an old Moorish castle, and has an extensive trade in grain. Population, 6700. *Algeciras*, in the province of Cadiz, a well-built seaport town on the west side of the Bay of Gibraltar, is 6 miles from Gibraltar by water, and 14 miles by land round the head of the bay. The population in 1845 was 11,077. The houses are low, but very clean and white, and the balconies and lattices of the windows, painted green, have a very pretty effect. The town contains a military hospital of the first class, and is defended by a battery called the Fuerte de Santiago. *Antequera*, 45 miles W.S.W. from the city of Granada, to which province it belongs, is situated near the eastern boundary of the province of Sevilla. It stands in a fine plain, near the south bank of the Guadaljorce, and contains six churches and several charitable institutions, and had in 1845 a population of 17,030. It is chiefly an agricultural town, but has manufactures of baize, paper, silk, and cotton. *Aracena*, in the province of Huelva, 60 miles N.W. from Sevilla, lies in a hollow among mountains. An eminence crowned by a ruined castle overlooks the town on the south, woody slopes overhang it on all sides, and the craggy ridges of the Sierra Morena rise high above at no great distance. The town is remarkably clean, and contains three churches. The population in 1845 was 4370. *Ayamonte*, in the province of Huelva, 27 miles W. by S. from Huelva, is situated on the slope of a lofty hill, at the point where the river Guadiana enters the sea. It is a fortified town, opposite to Castro-Marin in Portugal. It contains two churches, and had in 1845 a population of 6500. It has a small fishing port, and has some manufactures of soap and coarse earthenware.

Cadiz is the capital of the province of Cadiz. [CADIZ.]

Carmona, in the province of Sevilla, 16 miles E.N.E. from the city, occupies the brow of a lofty hill overlooking a wide and uncultivated plain. It is inclosed by old Moorish walls, which, on the eastern side especially, are flanked by numerous square towers of exceedingly massive structure. It contains a ruined fortress and a church with a remarkable tower; and had in 1845 a population of 13,072. In the time of the Moors this town was considered the key of Sevilla, and sustained a long siege previous to the capture of that city by the Christians. *Constantina*, in the province of Sevilla, 40 miles N.N.W. from the city, half encircles a steep isolated eminence, on which the castle is erected. The town consists mainly of one long street, and contained in 1845 a population of 6986. During the Peninsular War the castle was repaired and strengthened by the French, and was held by them as an important post in the line of communication between Andalusia and Estremadura. *Ecija*, in the province of Sevilla, 45 miles E. by N. from the city, stands on the left bank of the Jenil, on the high road from Cordova to Sevilla, in a fine plain, which produces abundance of corn and olives. The town contains several churches and hospitals, and has a beautiful alameda (public walk) on the bank of the Jenil, planted with trees and adorned with fountains and statues. There are manufactures of coarse woollens, linens, and leather. The population in 1845 was 28,370. It was named Colonia Augusta Firma by the Romans, and several Roman inscriptions and other antiquities have been found. *Huelva*, capital of the province of Huelva, 65 miles W. by S. from Sevilla, occupies the lower part of a declivity at the mouth of the Rio Odiel, and at the head of a shallow estuary formed by the discharge of the Rio Odiel and Rio Tinto into the Atlantic Ocean. The population in 1845 was 7173. *Jerez*, the modern Spanish spelling of *Xeres*. *Manzanilla*, in the province of Huelva, 30 miles W. from Sevilla, is situated in a plain which produces abundance of wheat, maize, and olives. Population, 2038. *Moguer*, in the province of Huelva, 12 miles E. from that town, stands on the left bank of the Rio Tinto, on the slope of a ridge which bounds the valley on the south. The town consists of a few long streets diverging from a common centre, and it has a small port. The population in 1845 was 6592. The old Franciscan convent in which Columbus was hospitably entertained and assisted by the prior in 1484, is preserved as a national monument. From 3000 to 4000 butts of wine are produced in the district and shipped to Xeres to be used in the manufacture of sherry. *Osuna*, in the province of Sevilla, 40 miles E.S.E. from the city, stands on the declivity of a hill crowned by a castle. It is a handsome town of semicircular form, containing 3 or 4 churches, 4 hospitals, 2 barracks, and a population of 17,556. It had a university which was abolished in 1824. There are some fine promenades in the vicinity. The extensive plain in front of the town is exceedingly fertile, and produces large quantities of grain, chiefly barley, olives, almonds, capers, the esparto rush, and some inferior wine. *Palos*, in the province of Huelva, 10 miles E. from Huelva, a small town with a small port on the estuary of the Rio Tinto, is distinguished as the place whence Columbus sailed on his first voyage of discovery, Aug. 3, 1492. The town contains about 1000 inhabitants. *Puerto de Santa Maria*, commonly called El Puerto (the Port), in the province of Cadiz, 6 miles N.E. from that city, is a large seaport-town, at the mouth of the Rio Guadalete, just outside the Bay of Cadiz. The mouth of the river forms the harbour, and a bar at the mouth prevents the entrance of large vessels. The Calle Larga is a handsome street about a mile in length, but the rest of the streets are narrow and badly paved. The population in 1845 was 17,930. Steamers ply regularly between this port and Cadiz, and it supplies Cadiz with most of the water required for drinking. The Bodegas, or wine-stores,

are lofty buildings with very thick walls, lit by narrow apertures. The thickness of the walls is in order to secure an even temperature for the wines, which are stored in long ranges of casks piled over each other tier above tier. *Puerto Real*, in the province of Cadiz, 5 miles E. from that city, is a clean seaport-town of well-built houses with flat roofs. It has a spacious market-place surrounded by stone arcades. It has a small port in the Bay of Cadiz, with a good pier and wharfs. It has manufactures of leather, and exports salt. Population, 3871. *San Lucar de Barrameda*, in the province of Cadiz, 15 miles N. from that city, is a seaport-town at the mouth of the Guadalquivir, on the southern shore. The town stands on a narrow flat bordering the river, and partly on a rising bank which overlooks it, the houses of the upper town rising above each other in terraces, and presenting a very picturesque appearance. An old Moorish castle crowns the brow of the hill. It contains 3 churches, 4 hospitals, and the buildings of several suppressed monasteries. The population is about 17,000. San Lucar exports wine, brandy, oil, and fruits, but its commerce is very small compared with what it was formerly. *Tarifa*, in the province of Cadiz, 55 miles S.E. from that city, stands on the most southern point of Spain, on the Strait of Gibraltar. It is divided by a ravine traversed by a periodical torrent, which entering from the east passes out at the west end. The town is surrounded by walls, and the houses are strongly built, standing on terraces which rise above each other from each side of the ravine. Where the torrent passes out two massive structures form part of the walls, whence a sandy neck of land, and then a causeway, joins the town to an island, or rather promontory, about 2000 yards in circumference, with perpendicular sides. The town is also defended by an old castle, and has barracks, storehouses, tanneries, potteries, and a profitable anchovy fishery. The population in 1845 was 8116. It was successfully defended by the British against an assault of the French troops under Victor and Laval, Dec. 30, 1811. *Utrera*, in the province of Sevilla, 18 miles S.S.E. from the city, a large and thriving town, principally inhabited by the wealthy landed proprietors and farmers, who cultivate the extensive corn-lands of the plains of Sevilla, and also manage the rich salt-marshes near the mouth of the Guadalquivir. These marshes feed great numbers of cattle, including the fine bulls for which Andalusia is celebrated. The town stands around a fortified inclosure, and has a Moorish castle. The streets are wide, and are kept clean by running streams. It contains a town-hall, covered market, prison, hospitals, and some remarkable churches. It has manufactures of soap and leather. The population in 1845 was 12,712. *Xeres (Jerez) de la Frontera*, in the province of Cadiz, 7 miles N.N.E. from Puerto de Santa Maria, and 11 miles E. by S. from San Lucar, is the town whence, by a corrupt pronunciation, the name Sherry is derived. The town is situated on an eminence about 2 miles north from the Guadalete. The streets of the old part of the town are narrow, ill-paved, and filthy; the modern part is tolerably well built. It contains 8 churches, one of which is collegiate, and 4 hospitals. It has an old fort, and there are remains of an old wall. The population in 1845 was 33,104. The finest Spanish wine is produced in the neighbourhood of Xeres. The bodegas, or wine stores, are similar to those at Puerto de Santa Maria. The annual produce of the Xeres district, together with those of Puerto de Santa Maria and San Lucar, is about 95,000 butts, or about 10,000,000 gallons.

SEVILLA (written *Seville* by the English), a city of Spain, capital of the territorial division of Andalusia, of the ancient province of Sevilla, and of the modern province of the same name, is situated in 37° 22' N. lat., 5° 48' W. long., on the east bank of the Guadalquivir, 70 miles N.N.E. from Cadiz. The river is here crossed by a bridge of boats connecting the city with the suburb of Triana, and is navigable thus far for vessels of 100 tons burden, but ships drawing more than 10 feet of water load and unload 8 miles lower down. Sevilla is the see of an archbishop, the residence of a captain-general, and the seat of a criminal court of justice. The population in 1845 was 84,927.

Sevilla is surrounded by Moorish walls, which are flanked by numerous towers, and have many gates. The form is circular, and the area is about five miles. The walls are constructed of tapia, a sort of concrete made of mortar, rubble, and stones, put moist in wooden frames, where it consolidates into a block fit for building, and becomes by length of time excessively hard. The portion near the Cordova Gate affords the most perfect specimen in Spain. Walls of tapia are still constructed in the ancient manner both in Andalusia and Barbary. The streets are for the most part exceedingly narrow, a labyrinth of lanes hardly wide enough to allow the passage of a single carriage. More than half of the city is of Moorish construction, and the best houses are still those built by the Moors or on their models. They have generally a large paved court ornamented with fountains and flowers, and surrounded by columns supporting galleries and rooms above. It is usual for the family to inhabit the ground-floor in summer, and the upper stories in winter. In summer a large canvass awning is drawn over the court by day, and beneath this shade the family usually sit and receive visitors. Of late years several new streets have been laid out in straight lines and with handsome modern houses. The Alameda Vieja, the old public walk, planted with trees, and decorated with fountains and statues, is a spacious promenade at the north-west angle of the city. It is now however comparatively deserted for the beautiful walks called Las Delicias, formed on the

bank of the river, extending southward, and planted with trees, shrubs, and flowers. Another modern promenade is called El Paseo de Christina. The great square, near the centre of the city, formerly called the Plaza de San Francisco, but now the Plaza de la Constitución, is very picturesque, with its arcades and balconies. The Plaza del Duque is the fashionable nocturnal promenade during the summer months. There are other squares, and a large Plaza de Toros (bull-arena), which is capable of accommodating about 14,000 spectators.

All or nearly all the public edifices worthy of note in Sevilla stand at the southern extremity, a short distance from the river, and within sight of each other. Here are the Cathedral, the Giralda, the Alcazar, the Lonja, and (outside the wall) the royal tobacco-manufactory.

The Cathedral occupies the site of the grand mosque of the Moors. It was commenced in 1349, and was opened for divine service in 1519. It is an imposing structure, of large size and grand proportions. It is the largest and finest cathedral in Spain. It is an oblong square, preserving the form of the original mosque; the length is 382 feet, the width 265 feet. The exterior exhibits various styles of architecture. The walls are supported by massy buttresses. There are 93 windows, some of which are painted, and the most beautiful in Spain. The windows are profusely ornamented with mouldings and tracery. The western façade remained in an unfinished state till 1827. Four rows of enormous clustered columns, eight in each row, divide the interior into a nave and six aisles. The roof of the nave is 134 feet above the pavement. The aisles are 38 feet lower, the two exterior being railed off, and formed into chapels. The choir is separated from the body of the church by a richly-wrought reja, or grating of iron. Over the entrances to the choir on each side are the two grand organs, one of which is stated to contain 5300 pipes, and to have 110 stops, being 50 more than the stops of the great organ at Haarlem. The Retablo of the high altar is a magnificent carving in wood. It is divided into 44 compartments. It was designed by Dancaert in 1442, and completed in 1550. The carvings represent sacred subjects from the Bible. Behind the high altar is the Capilla Real, a large gloomy chapel, containing the tomb of Fernando III., who took the city from the Moors. The other chapels, in all about 26, contain many of the finest works of the best masters of the Sevillian school, as Murillo, Zurbaran, Roelas, Pacheco, Cano, Morales, Vargas, Navarrete, and others.

The Giralda, a lofty square tower of Moorish architecture, which originally formed part of the ancient mosque, serves now as a belfry to the cathedral. It was built about 1198. It was originally only 250 feet high; but in 1568 Fernando Ruiz, an architect, raised it 100 feet higher. On the top is a statue of Faith, of gilt bronze, which, though 14 feet high, and of the enormous weight of 3600 lbs., turns on a pivot and acts as weathercock, thus giving its name Giralda to the tower, from the Spanish word 'girar,' to turn. The ascent to the belfry is not by stairs, but by an inclined plane which goes round and round, and is of easy ascent. This tower and the Court of the Orange-Trees (Patio de los Naranjos) are the only remains of the ancient Moorish mosque, which in point of size and magnificence equalled that of Cordova. Attached to the cathedral is a very valuable library called the Biblioteca Colombiana, from the name of the founder Fernando Columbus, the son of the great navigator, who bequeathed to it upwards of 20,000 volumes.

The edifice which after the cathedral most attracts the attention of travellers is the Alcazar (Al-Ksar), or royal palace of the ancient Moorish kings, which, though modernised by the Christian kings, still preserves much of its original beauty. In its present state it is a compound of Gothic and Moorish architecture. The principal hall, called La Sala de los Embajadores (Hall of Ambassadors), is as fine as that in the Alhambra. It is fifteen yards square, and three times that height. The pavement is of marble, the ceiling is painted blue and gold, and the panelling of the wainscots is formed of painted tiles. The gardens which surround the palace are very beautiful. In one of the rooms on the ground-floor are several statues, inscriptions, and other remains of antiquity, which have been found on the site of the ancient Italica, the birthplace of Trajan and Hadrian, which is contiguous to Sevilla.

Sevilla contains other buildings remarkable either for their antiquity or architecture. La Torre del Oro (the Tower of Gold) is so called because the ships laden with the precious metals at the time of the discovery of America, deposited their cargoes there. La Lonja, or Exchange, is a magnificent building, erected by Philip II. in 1523, over which are the archives of the colonies. The Casa de Pilatos, or palace belonging to the dukes of Alcalá; the archbishop's palace; the town-hall; the theatre; the naval college; the cannon-foundry; the prisons; the barracks; 11 hospitals; and the tobacco-manufactory, an immense building 600 feet in length by nearly 500 feet in breadth, inclosing twenty courts, and employing about 3000 persons, chiefly females, are among the chief edifices of Sevilla. The aqueduct called the Caños de Carmona, was originally constructed by the Romans, and afterwards repaired by the Moors: it conveys water from Alcalá.

Sevilla is said to have at one time contained 140 churches and wealthy convents. It now contains about 30 parish churches, of which some are remarkable for their architecture. Many of the conventual buildings still remain, and have been converted to secular uses. In that of La Merced have been collected the pictures and

GEOR. DIV. VOL. IV.

other works of art which have been removed from the other suppressed monasteries.

Sevilla has a university, founded in 1502; an academy of painting, sculpture, and architecture; a literary and scientific institution, named the Lyceó, and several other establishments for the diffusion of knowledge and education. The trade, which was very considerable, greatly declined at the separation of the Spanish colonies from the mother country; but it has since somewhat revived. Oil, wine, corn, hemp, flax, liquorice, but above all lemons and oranges, are annually exported in great quantities by the Guadalquivir. There is also an active fishery on the river. The imports are hides and flax from the Baltic, iron from the Asturias, and colonial produce from Cuba. The silk manufacture is of some importance. The other manufactures are woollen and linen goods, hats, soap, earthenware, leather, nitre, and ironmongery.

Steam-boats ply daily between Sevilla and Cadiz.

Sevilla, under the Romans, became a colony with the title of Colonia Julia Romula. It was afterwards held by the Goths till 712, when it was taken by the Moors, who made it a Kalifate, or kingdom. In 1247 the city was besieged by Fernando III., king of Castilla, and taken, after fifteen months, Nov. 23, 1248. From that period Sevilla formed part of the dominions of the king of Castilla, till the whole of Spain became one kingdom.

(Ford, *Handbook of Spain*; Townsend, *Journey in Spain*, and other volumes of more recent travels. There are three good histories of Sevilla—Morgado, *Historia de Sevilla*, Sev., 1587, fol.; Rodrigo Caro, *Antigüedades y Principado de Sevilla*, 1634, fol.; Ortiz y Zuñiga, *Anales Eclesiásticos de la Ciudad de Sevilla*.)

SEVRES, DEUX, a department of France, bounded N. by Maine-et-Loire, E. by the department of Vienne, S.E. by that of Charente, S.W. by that of Charente-Inférieure, and W. by that of Vendée. Its greatest length from north to south is 79 miles; from east to west about 41 miles. The area of the department is estimated at 2316.5 square miles. The population in 1841 was 310,203; in 1851 it was 323,615, giving 139.7 inhabitants to a square mile, or 34.88 below the average per square mile for the whole of France. The department was formed out of Upper Poitou, and is named from two rivers which traverse it.

The department is traversed by a chain of low granitic hills, which extends from the central group of Auvergne to the mouth of the Loire, bearing in part of its course the name of the Heights of Gâtine. These hills enter the department from the department of Vienne on the south-east side, and extend into the department of Vendée on the west side; they separate the basin of the Loire from the basins of the Charente, Sèvre-Niortaise, and Lay. The average height of these hills is about 450 feet. So much of the department as lies north-west of a line drawn from Fontenay in the department of Vendée eastward to St.-Maixent, and from thence northward, by Parthenay and Thouars, is occupied by the primary and lower secondary formations. The east and south of the department are occupied by the oolitic formations. Iron is found at various parts, and coal on the Vendean border. Marble, antimony, freestone for building, and mill-stones are dug. There are some mineral-waters, but none of great repute.

The portion of the department which belongs to the basin of the Loire is drained by the Sèvre-Nantaise, the Thouet, and the Dive, which last skirts the eastern border. The *Sèvre-Nantaise* rises in the Gâtine Hills, west of Parthenay, and, flowing north-west through this department and that of Vendée, throws itself into the Loire opposite the city of Nantes. It is not navigable. The *Dive* is navigable for a short distance. The *Thouet* receives the Cebron, the Thouet, the Argenton, and some other streams. The rest of the department is drained by the Boutonne and one or two other feeders of the Charente, and by the Sèvre-Niortaise and its feeders the Mignon, the Autise, and the Vendée. The *Sèvre-Niortaise* rises north of the town of Melle, near the source of the Béronne, a feeder of the Boutonne, and runs in a very tortuous course, and in a general western direction, past the town of Niort, from which it takes its distinctive name. From its junction with the Mignon to its mouth, in the Pertuis-Breton, it divides the department of Vendée from Charente-Inférieure. It is navigable for barges up to Niort; but in its lower course vessels of 100 tons go up with the tide to Marans [CHARENTE-INFÉRIEURE]; and by a canal vessels of even 300 tons can reach that town. The river flows in its lower course through an alluvial and marshy soil, in which it divides into several arms, many of which unite at Marans. The marshes in this part of its basin have been extensively drained and formed into polders. The Mignon is navigable for 7 miles above its junction with the Sèvre-Niortaise. There are many ponds and marshes in the Gâtine Hills.

The department is crossed by 9 imperial, 9 departmental, 5 military, and a great number of communal roads. It has no railways, but the Paris-Bordeaux line between Poitiers and Ruffec runs close upon the eastern boundary.

The temperature in the northern part of the department is colder than in the southern. In the southern part the winters are mild. The south-eastern part is considered the healthiest; in the north fevers and inflammation of the lungs are common; and the inhabitants of the marshy parts are affected by skin diseases.

The soil varies much; part of it is unproductive; one-third of the best land is constantly in fallow; yet the grain-harvest exceeds the consumption of the department. The area of the department is about 1,500,000 acres, of which two-thirds are under the plough. The chief productions are wheat, rye, barley, oats, flax, and hemp. The vine is grown chiefly in the south-west part, where the vintage is converted into brandy. In the north-eastern part about Thouars some tolerable white wine is grown, but in small quantity. The vineyards occupy above 50,000 acres; the gardens and orchards about 24,000 acres. Fruit-trees succeed very well except among the hills; the walnut is extensively cultivated. A considerable portion of heath is in the valley of the Sèvre-Nantaise, where the land is very poor. On the pasture lands and open heaths a great number of cattle is fed. The breed of horned cattle is very good, and a considerable number are sent into Normandy, there to be fattened for the markets which supply Paris. Sheep are also numerous, but the wool is of ordinary quality. The asses and mules which are bred in the neighbourhood of Melle are considered to be among the best in Europe. Swine and poultry are numerous.

The principal industrial products comprise shoe and glove leather (which are prepared in the neighbourhood of Niort, whence vast quantities of shoes and boots are exported), oil, vinegar, brandy, pottery, woollen-cloth, iron, and paper.

The department is divided into 4 arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Niort	10	95	105,948
2. Bressuire	6	91	69,388
3. Melle	7	98	77,849
4. Parthenay	8	75	70,430
Total	31	359	323,615

1. Of the first arrondissement and of the whole department the chief town is NIORT. Among the other towns are the following: *Conzelonges*, near the Autais, 15 miles N.W. from Niort, has a good corn-market, and a population of 2000. *St. Maixent*, on the slope of a hill on the right bank of the Sèvre-Niortaise, 14 miles N.E. from Niort, has a college and 4320 inhabitants, who manufacture woollen stuffs, and trade in corn, wool, and cattle. The town is ill laid out, and the houses are ill-built, but the public walks are agreeable, and the neighbourhood, which is very fertile, abounds with picturesque scenery. *Rohan-Rohan*, also called *Frontenay*, is on an elevated site between two small streams, the Guirande and the Courance, 11 miles S. from Niort, and has about 2300 inhabitants. A branch of the family of Rohan took the title of Rohan-Rohan from this town.

2. In the second arrondissement the chief town, *Bressuire* (population 2622), stands in a hilly country 35 miles N. from Niort, on a feeder of the Argenton, and has a handsome church, an ecclesiastical school, woollen and cotton manufactories, and a tribunal of first instance. The college is at *Thouars*, a town of 2244 inhabitants, on the slope of a hill above the Thouet, 15 miles N.E. from Bressuire. Thouars was a place of strength in the time of Pepin in the 8th century; and the English, when masters of Poitou, made it yet stronger; it was however taken from them by Duguesclin in 1372. It is surrounded partly by the river and partly by walls, and has two handsome churches, a college, two hospitals, and a handsome castle or mansion built by the Duchess de la Trémouille in the time of Louis XIII.: there are three public walks. Woollens, linens, hats, and cutlery are made; and trade is carried on in corn, hemp, horses, mules, and oxen.

3. In the third arrondissement the chief town is *Melle*, an ill-built town on a hill above the Béronne, 17 miles E.N.E. from Niort: population 2676. Melle has a college, a tribunal of first instance, some manufactures of coarse woollens, leather, paper, &c., and a considerable trade in corn, seeds, cattle, wool, and mules of fine breed. It is situated in a beautiful and fertile country, of which, from its situation on a hill, it has a commanding prospect. *Chef-Boutonne*, an ancient village near the source of the Boutonne, has a population of 2366, who manufacture serge, drugget, earthenware, and leather. *Lezay*, E.N.E. from Melle, on the Dive, has tile-works, and 2500 inhabitants in the commune, who are engaged in agriculture and in breeding horses and mules. In the neighbourhood are several large mansions or châteaux. *La-Mothe-Saint-Héraye*, 8 miles N. from Melle, near the source of the Sèvre-Niortaise, is pleasantly situated, and has flour-mills, and 2650 inhabitants, who manufacture coarse woollens and leather, and trade in seeds, flour, cattle, horses, and mules. The castle of La-Mothe, the finest specimen of turreted architecture in Poitou, was demolished in 1842.

4. In the fourth arrondissement the chief town is *Parthenay*, which is situated in a hilly well-wooded country, 33 miles N.N.E. from Niort, and has a college, a tribunal of first instance, and 4621 inhabitants in the commune. Parthenay is an ill-built place: it suffered materially in the English wars, the religious wars of the 16th century, and the Vendean war. It stands on a slope on the right bank of the Thouet.

There are some manufactures of woollen yarn, coarse woollens, and leather; and considerable trade in corn and cattle is carried on. Parthenay was the capital of the Poitevin district of Gâtine. At *Azéville*, a tolerably handsome town of 2000 inhabitants, on the right bank of the Thouet, there is a fountain which sends water into every house in the town, and gives rise to a stream which drives a mill at a very little distance from its source. It has the ruins of an ancient castle and of a monastery. Woollen-stuffs, hempen cloth, linen, and leather are manufactured; and trade is carried on in clocks and watches, sheep, wool, wine, brandy, corn, and flax. *Moncoustant*, 16 miles W.N.W. from Parthenay, near the Sèvre-Nantaise, has above 2000 inhabitants. *Thézemay*, E. by N. from Parthenay, and near the eastern boundary of the department, has about 2100 inhabitants in the commune.

This department, with the adjacent department of Vienne, forms the diocese of Poitiers, the bishop of which is a suffragan of the archbishop of Bordeaux. It is in the jurisdiction of the High Court and the University-Academy of Poitiers, and it belongs to the 15th military division, the head-quarters of which are at Nantes. It returns two members to the Legislative Chamber of the French empire. The Calvinists have five churches in Niort, Melle, St.-Maixent, La-Mothe, and Lezay; and seven meeting-houses in other places in the department.

SEYCHELLES, a group of islands in the Indian Ocean, situated between 3° 40' and 4° 50' S. lat., 55° 10' and 56° E. long. These islands rest on a bank of coral and sand, which extends from north to south about 200 miles, and from east to west from 30 to 40 miles. It is a kind of platform in the sea, on which the superstructure of the islands has been raised. The general depth of water on the bank varies between 12 and 40 fathoms. The number of islands altogether is about 30, but most of them are small. They afford many excellent harbours, which are never visited by tornadoes, and may at all seasons be considered perfectly safe. The largest islands are—Mahé (30,000 acres), Praslin (8000 acres), Silhouette (5700 acres), Digue (2000 acres), and Curieuse (1000 acres). The total population is about 7000, of whom about 600 are whites; the rest are blacks and coloured persons.

The surface of the islands is irregular, presenting a diversity of hills, rocks, and ravines, without any considerable extent of level ground. The rocks are granitic. The soil is generally thin, but good, and produces wild fruits and vegetables in abundance. Among the natural productions are cocoa-nuts, pine-apples, cucumbers, and red pepper. But the most remarkable production is the coco-do-mar, or Seychelles cocoa-nut, formerly supposed to be produced at the bottom of the sea, whence it took its name. The nuts weigh from 20 to 25 lbs. each, and contain a white jelly-like substance, which is eaten, but is tasteless. The shells, the fibrous covering, the leaves, and stalks of this palm-tree, are all used for various purposes. Another production is the Mahé wood, which is not inferior in colour and solidity to mahogany, and is equally well-adapted for cabinet-work, but is not found in sufficient quantity to allow of much being exported. The grains most cultivated are rice and maize. Mandioc is also grown, as well as cotton, coffee, tobacco, and the sugar-cane. Cattle and sheep are in considerable numbers. The climate is fine and healthy, and the heat not oppressive. The thermometer varies between 64° and 84° Fahr.

The island of Mahé is about 16 miles in length, and from three to four miles in width. The rugged chain of granitic hills which extends through its centre is in its highest parts about 400 feet above the sea. The town of *Mahé*, which is the residence of the government agent, is on the north-east side of the island. It is irregularly built, in a small glen, and contains only a few good houses. It is not far from a deep bay inclosed by a semicircle of tolerably high land. A few small vessels belong to the island, and many large schooner-rigged boats and numerous canoes. The smaller islands are only visited occasionally to obtain cocoa-nuts or turtles.

The Seychelles were partly explored in 1743, by order of Mahé de la Bourdonnais, then governor of Mauritius. About the year 1768 the French formed a colony on the island of Mahé. The Seychelles were captured by the British in 1794, but were not occupied till the capture of Mauritius in 1810. By the treaty of Paris, in 1815, they were ceded to the British, together with Mauritius. They are under the governor of Mauritius. [MAURITIUS.]

SHAFTESBURY, or SHASTON, Dorsetshire, a market-town, a municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated in 51° 2' N. lat., 2° 12' W. long., distant by road 27 miles N.N.W. from Dorchester, 105 miles W.S.W. from London. The population of the municipal borough in 1851 was 2503; that of the parliamentary borough was 9404. The borough is governed by 4 aldermen and 18 councillors, one of whom is mayor; and returns one member to the Imperial Parliament. The livings are in the archdeaconry of Dorset and diocese of Salisbury. Shaftesbury Poor-Law

Union comprises 19 parishes, with an area of 36,493 acres, and a population in 1851 of 18,029.

Shaftesbury is supposed to be the Caer Palladwr of the Britons. It appears to have been a station of the Romans. It was burnt by the Danes and restored by King Alfred. The name was variously written before it was fixed in its present form, which is sometimes altered into Shaston, or, in closer resemblance, Shafton. In the reign of Athelstan there were in the place two minis and an abbey of Benedictine nuns. To this abbey the body of King Edward the Martyr was conveyed after his murder at Corfe Castle. The possession of this relic attracted many visitors, and among others Canute the Great, who died at Shaftesbury in 1086. In 1313-14 Elizabeth, wife of Robert Bruce, king of Scotland, was detained as a prisoner in the abbey. Shaftesbury was incorporated in the reign of James I. From the time of Edward I till the passing of the Reform Act the borough returned two members to Parliament.

The town is built on a hill rising abruptly in the midst of a fertile district, and commanding an extensive view of the counties of Dorset, Somerset, and Wilts. It is lighted with gas and partially paved. St. Peter's church, in the middle of the town, consists of a nave and chancel, with aisles, and a square embattled tower: it is a building of considerable antiquity, much defaced by modern alterations. Trinity church, which is united in the same benefice with St. Peter's, was rebuilt in 1842, in the early English style. It stands in a spacious churchyard, laid out with rows of lime-trees. St. James's church is a neat building, consisting of a nave and chancel, and an embattled tower. St. Rombald's, or Rowald's, consists of a small nave and chancel, with a low square tower of modern date. The Independents, Wesleyan Methodists, and Quakers have places of worship. There are National, British, and Infant schools; also an endowed Blue-Coat school, in which 20 boys are clothed and educated for four years and then provided with a liberal sum for apprenticeship. In the vestry-room of Trinity church is an excellent theological library, established by the aid of the late Dr. Bray, for the use of the neighbouring clergy. The town has a public reading-room, a savings-bank, and some parochial charities. The town-hall is a handsome edifice, erected at the expense of the Marquis of Westminster. The trade of the place is limited to the sale of agricultural produce, particularly of butter and cheese, from the fine grazing lands of the district. There is a weekly market on Saturday, and fairs are held on the Saturday before Palm-Sunday, June 24th, and November 23rd. Quarter and petty sessions and a county court are held in the town.

SHAGNAN. [BADAKHSHAN.]

SHAHEE, LAKE. [PERSIA.]

SHANAGOLDEN. [LIMERICK.]

SHANG-HAE, or SHANG-HAI, a sea-port in China, the most northerly and most important of the ports opened to foreigners, is built on the left bank of the river Woo-sung, which is properly only the channel by which the waters of the Lake Tahoo, or Tai (the Great Lake), are discharged into the sea, in 31° 25' N. lat., 120° 40' E. long. The population of the city is somewhat under 150,000, but the suburbs are also densely peopled.

Though the course of the Woo-sung scarcely exceeds fifty miles, it brings down a great volume of water, is very deep, and readily navigable. Opposite the town of Shang-hae, which is about ten miles from its mouth, the depth in the middle of the stream varies from 6 to 8 fathoms, so that the largest vessels can come up to the harbour, and unload alongside of the commodious wharfs and large warehouses which occupy the banks of the river. At this place the Woo-sung is nearly half a mile wide. Two forts defend the mouth of the river; and on the city side of the river is a quay more than two miles long, and protected by two batteries.

The city, which is very large, is surrounded by a wall nearly three miles and a half in circuit. A canal extends around the exterior of the wall, and from it three canals traverse the city, lesser branches diverging from them in various directions. The streets are narrow, and many of them are paved with small tiles, similar to Dutch clinkers, which make a more agreeable footing than the slippery granite with which other towns in China are paved. In every part of the city are joss-houses, or temples, belonging to the various sects, though little sanctity appears to be attached to them. There are also several benevolent institutions, as the Jung-jin-tang, or Hall of Benevolence, a hospital, providing lodging and medical aid for the sick, burial for the unclaimed dead, and education for the young; a foundling hospital, &c. The government offices are not remarkable. There are in the city a mint, and considerable manufactories of vegetable oils, oil-cake, iron-ware, glass, paper, and flowered silk of a peculiar kind. There are several very large ice-houses in the city. The shops in Shang-hae are generally small, but wares of all descriptions, European as well as Chinese, are exhibited for sale; the specimens of Chinese skill and ingenuity are of almost endless variety, and many of much costliness. Du Halde, in his 'Description of China,' says, that in this town and its neighbourhood 200,000 weavers are occupied in making plain cottons and muslins; and Lindsey adds, that the nankeen cloth from Shang-hae is said to be the best in the empire: but late events have produced many changes.

As a commercial city Shang-hae is the most important on the coast of China. Its wharfs are crowded with vessels from all parts of China, Singapore, Borneo, Java, &c., as well as with the larger craft of Europe and America: it is said that as many as 3000 junks may be at times seen lying off Shang-hae, and 400 have been counted entering the port in a week. Our surprise at the great amount of native commerce will cease if we consider that there is no harbour on the Chinese coast between 30° and 35° N. lat., or between the bay of Ningpo on the south, and the peninsula of Shantung on the north. On this tract of coast the two largest rivers of China, the Yellow River and the Yant-se-kiang, enter the sea, and they bring great quantities of earthy matter, which they deposit along the coast, and thus render the whole tract inaccessible to boats beyond the size of a fishing-berge. The Woo-sung is the first river south of the Yant-se-kiang which is deep enough for the purposes of navigation, and hence the whole maritime commerce of this tract is concentrated at Shang-hae. The country which lies at the back of the coast is the most populous part of China, and contains many very large towns, among which those of Soo-tsheou-foo and Hang-tsheou-foo, both far more populous than Shan-hae, and there are others which contain considerably over 100,000 inhabitants, among which is the ancient capital of China, Nanking. [NANKING.] According to the Chinese census the country between 30° and 35° N. lat., extending from the sea about 200 miles inland, and comprehending the ancient province of Ki-an-gnan, or the present provinces of Ngan-hoë and Keang-soo, contains, on a surface not exceeding 70,000 square miles, a population of more than 40,000,000, or about 600 inhabitants to each square mile. Such a population cannot subsist on the produce of the soil even in the high state of agriculture by which this region is distinguished above all other parts of China. That portion of the immense quantity of grain carried into the port of Shang-hae which is not consumed in the town and its neighbourhood, is conveyed to the centre and even the western districts of China Proper, by the numerous canals which are connected with the Imperial Canal, or Yoon-ho, and the two great rivers above-mentioned. The exports consist of black- and green-teas, camphor, drugs, cotton, and manufactured goods, and the inhabitants pay for the food which they obtain from other countries by supplying their inhabitants with cotton, silk, and linen fabrics. Very large quantities of opium are imported. Sugar, edible birds'-nests, &c., are brought from the Eastern Archipelago; and cotton and woollen goods, hardware, &c., from England.

Shang-hae was captured by the English in 1842. In 1853 it fell into the hands of the rebels [CHINA, vol. ii. col. 483], but has since been retaken by the Imperialists. Since 1842, when the port was thrown open to foreigners, and British and American consuls allowed to reside at Shang-hae, a larger number of merchants, chiefly natives of England and the United States, have formed establishments there, and their residences and places of business make quite a new town. Many of their houses are of a superior class, and their gardens, for which Shang-hae has always been famous, rival and even surpass those of the Chinese. The progress of the rebellion has a good deal interfered with the prosperity of the place, and the English and American merchants have found it necessary to repel by force the encroachments of the Imperialists, and even to attack their entrenched camp.

SHANKLIN. [WIGHT, ISLE OF.]

SHANNON, a river of Ireland, one of the largest in the kingdom, has a course of 220 miles, and affords a navigable line of communication, which nearly intersects Ireland from north to south. It rises about 20 miles east from Sligo, and expanding at intervals into lakes, falls into the sea between the Loop and Kerry heads, 56 miles below Limerick. The Shannon is the outlet for the waters of an immense tract of country, and it gives facilities for commercial intercourse, not only by its communication with the sea, but also with the metro polis by means of two canals. This river must be viewed under two distinct heads, as it is locally known under two distinct names, namely—the Lower Shannon, including that portion of the river below Limerick, which is connected with the external commerce of the country; and the Upper Shannon, from its source down to Limerick, which is connected with its internal commerce.

The source of this noble stream is generally considered to be a circular basin of about 20 feet in diameter, situated at the southern base of the Cuilcagh Mountain, in Cavan county, whence it flows in a deep dead sluggish stream into Lough Allen, in the county of Leitrim [LEITRIM, County of], a small basin about 8 miles long and 3 to 4 miles broad, lying in the midst of a coal district, and 115 feet below the level of the source. Other small streams fall into this lake, almost any one of which may be considered the parent of this great river. Of these the largest are the Owenmore and the Dorbally, which join the Shannon before falling into the lake.

Leaving Lough Allen, the river is so obstructed by shallows, that a canal, passing to the eastward of it was cut, and since improved by the Shannon Commissioners, from its southern extremity near Drumshambo, to Battle-Bridge, a distance of nearly 5 miles; on this, as on most of the canals cut for the Shannon navigation, the fall is overcome by locks. From this point the river runs in a southerly direction, with a mid-channel depth varying from 5 to 20 feet, for 6 miles, when it receives the Boyle River from Lough Gara and Lough Key. By the removal of shoals, and the construction of a regulating weir and a lock at Knockvicar, near the entrance to Lough Key, the river has

been rendered navigable to within a mile of the town of Boyle. A mile below this point stands the town of Carrick-on-Shannon, where a quay-wall and harbour have been formed, and two miles farther occurs a small expansion called Corry Lough, whence the course of the river is tolerably straight and good as far as Jamestown, a distance of two miles. Here a weir has been formed, and a shallow circuitous bend is avoided by a canal two miles in length. On this canal there is a lock 110 feet long and 30 feet broad. From a mile below this canal nearly down to Ruskey are a series of small lakes surrounded by low hills, with diversified and in some parts well-wooded scenery. At Ruskey there is a regulating weir and lock. Two miles and a half below Ruskey the Shannon enters Lough Forbes [LONGFORD], which has an average depth of 7 or 8 feet, and has been cleared of its only obstruction, a shoal of small extent near the centre, where the lake is contracted to a breadth of only 350 yards. The removal of other shoals, and the construction of a weir and lock at Tarmonbarry, where a commodious wharf has also been formed, complete the upper navigation as far as Richmond Harbour, the grand depôt of the Royal Canal Company, near the village of Cloondra. Between this and Lanesborough, a distance of seven miles, the river is of an average breadth of 250 yards. At Lanesborough the Shannon is crossed by a stone bridge, with a swing-bridge for the passage of vessels. Above and below the bridge the river has been deepened, and by an improved channel the navigation here enters Lough Rea. [ROSCOMMON, County of.] Lough Rea is the second expansion of the Shannon in point of magnitude, as it is in order, from the mouth; it extends 16 miles in a north and south direction, and reaches within two miles of Athlone. From Lough Rea to Athlone, where the river was formerly much obstructed by eel-weirs and shallows, great improvements have been made; the channel has been deepened, and a regulating weir constructed, with a lock 170 feet long by 40 feet wide. There is also a spacious landing wharf, and a new bridge has been erected, with a swivel bridge over the line of navigation. Between this place and Lough Derg the river makes two large bends, and dividing itself into various branches forms islands, some of which are of considerable size. At Shannon-bridge, a military station 13½ miles below Athlone, the river has been deepened, the bridge underpinned and opened by a swivel-bridge, and an extensive landing wharf has been formed. A little lower the Suck enters the Shannon. In consequence of the recent improvements the waters of the Shannon have here been so much kept within their proper channel, as to relieve nearly 19,000 acres from flooding. The Suck, which forms the division between the counties of Galway and Roscommon, is a very fine river, and appears at its junction scarcely inferior to the Shannon itself, of which it is the largest tributary. It rises near Castlereagh, in the county of Roscommon, and has a circuitous course of about 60 miles, receiving in its passage a number of tributary streams. The Shannon receives at Shannon Harbour the Brosna from King's County, and the Grand Canal from Dublin. Immediately opposite is a branch of the canal, which runs up to Ballinaloe. About five miles lower, above the falls of Meelick and Killogue, which are the greatest in the whole line above Killaloe, a regulating weir, with a lock 170 feet long by 40 feet wide, and having a fall of 8 feet, has been erected. From below the falls, where it is joined by the Lower Brosna, the river affords a wide channel, generally above 20 feet deep, and marked out by beacons, to the entrance of Lough Derg, a distance of nine miles. The shores between Loughs Rea and Derg are low, consisting of lands of a rich calcareous nature, producing large crops of rank coarse grass, and affording pasturage for cattle. These rich lands are generally backed by bog-land elevated from 20 to 30 feet above the river, and towards Athlone by low rounded isolated limestone hills. There are few places where good firm land comes down to the river's edge. About a mile below Portumna the river enters Lough Derg, which is 20 miles in length, and varies in breadth from three-quarters of a mile to three miles direct distance, with large bays on both sides, which in some places cause an expanse of seven or eight miles. The scenery of this lake is very beautiful, especially towards the southern extremity, where it lies between hills of considerable elevation terminating abruptly on the lake. All the north-western shore, which forms part of the county of Galway, is low and abounds in bog-land. The Tipperary shore, which forms all the eastern side of the lake, is greatly diversified in appearance and character; to the north it consists of rounded limestone-hills, which are chiefly used for pasture, while to the south the mountains are higher, more abrupt, and consist of slate formation, which is worked to great advantage. The opposite shore, part of the county of Clare, is of like formation. Lough Derg contains few islands, but it abounds in rocks and dangerous shoals, and the shores, like those of Lough Rea, are difficult of approach from being so shallow and stony. The greatest depth is 120 feet; the southern portion is generally much deeper than that to the northward. The bottom is of marl, which is dredged up in great quantities for manure. At Mount Shannon, on the western shore of the lough, a pier and wharf have been constructed for the accommodation of the steamers plying on the river. At Killaloe, about a mile below Lough Derg, the channel has been deepened, and a regulating weir, 1180 feet long, has been raised across the river. From this place to Tarmonbarry, at the entrance of the Royal Canal, a distance of 85 miles, steamers of 200 horse power are daily plying, and the lakes are traversed by

tug steamers, towing trade-barges of from 60 to 100 tons burden. At Killaloe is the chief depôt and dockyard of the inland department of the Dublin Steam Navigation Company.

The Limerick navigation, which includes that part of the river between Killaloe and the city of Limerick, has a fall of 97 feet, which is overcome by a canal at each end and two regulating weirs. A series of falls below Killaloe-bridge is passed by a canal two miles long, cut close by the river on the Clare side. The rapids at O'Brien's bridge and at Parteen have been deepened, a weir and lock have been constructed at Corbally and World's End, a tracking bridge has been erected over the river at Plassey, and by the removal of numerous shoals the bed of the river has been rendered available to the utmost for the navigation of trade-barges. The communication with the Lower Shannon and the harbour of Limerick is completed by a canal a mile long. Immediately above Limerick the river divides into two branches, forming King's Island, on which the old town stands, with the cathedral, castle, and other public buildings. Just above the reunion of these two branches is the last fall of the river.

Under the name of Lower Shannon is comprehended that part of the river below Limerick which is navigable for sea-going vessels. This estuary is easy of access, and its approach is free from dangers; the entrance between the Loop and Kerry Heads is seven miles wide, and on Loop Head stands a lighthouse, showing a bright fixed light, at the height of 270 feet above high water. About 10 miles to the eastward is a kind of second entrance between Kilkadran and Beal Points, which is contracted to one mile and a half; and off Beal Point a dangerous sandbank extends nearly half a mile, which still further reduces the navigable channel. On Kilkadran Point is a lighthouse, which exhibits a fixed red light 133 feet above the sea, and inside this point is the small bay of Carrigaholt, which affords good shelter for small vessels. A few miles east from Carrigaholt Bay a landing quay and pier have been formed by the Shannon Commissioners at Querrin Creek. Above this there is anchorage in every part of the Shannon, though Scattery Island, Tarbert, Labasheda, and Foynes are the only places which offer good shelter from the prevailing westerly winds. On the Clare shore, opposite Scattery, stands the village of Kilrush. [KILRUSH.] A little above Foynes, on the opposite coast of Clare, is the new pier of Kiltteery, near which are a number of small islands, lying in the western entrance of the river Fergus, and more than half way up the Shannon towards Limerick. Below this the river presents a different appearance from that above the confluence of the Fergus; the land on both sides is high and bold, with a beach either of shingle or gravel beneath, and the channel is free from dangers; whilst above this point the land is so flat and low, that, with little exception, the whole shore on each side is one continued line of embankment. For eight or nine miles below Limerick the river is so shallow, that at low water every vessel must lie aground; but the channel has been recently improved by the removal of shoals and rocks, and has been carefully marked out by beacons.

At Limerick a very fine range of quays has been constructed, and a weir has been formed across the river below the town, with a lock to admit vessels at high water, so as to constitute a floating dock of the whole river above the weir.

Several rivers join the Lower Shannon, among which the Fergus deserves some notice, as it is navigable for vessels of 200 to 250 tons at high water as far as Clare, 9 miles from the Shannon, where a landing-wharf has been built by the Shannon Commissioners. About 9 miles below Limerick the Maigne falls into the Shannon on the Limerick side; though narrow, it is free from obstructions, except a rocky bar across the entrance, and is freely navigable for boats of 40 or 50 tons deeply laden as far as Adare, about 8 miles from its mouth. There are numerous other streams, many nearly dry at low water, though accessible at high water.

The spring-tides in the Shannon rise from 17 to 18 feet, the neap-tides about 14 feet; the velocity, which at the mouth does not exceed a mile an hour, increases as the river becomes narrower to upwards of three miles during the ebb at spring-tides; in consequence of which the young flood has so much resistance to overcome, that when it does so it rushes up almost like a bore, and the water rises during the first hour's flood as much as seven or eight feet, by which time a great portion of the mud-banks become covered, and from having a more expanded space to vent itself in, the velocity diminishes.

The improvements of the Shannon, which were begun by grants from the Irish Parliament and continued by the Directors-General of Inland Navigation, were in 1839 placed under the direction of commissioners, appointed under the Act 2 & 3 Vict. c. 61. The cost of the works was upwards of half a million of pounds sterling. The control of the navigation was transferred to the Board of Public Works. The navigation is opened for traffic throughout its whole length, from the upper extremity of Lough Allen to the city of Limerick, a distance of 143 miles, forming with the Boyle and Strokes-town branches a river and canal communication of 158 miles, of which 129 miles are adapted to the navigation of large steamers.

SHANNON BRIDGE. [KING'S COUNTY.]

SHAP. [WESTMORELAND.]

SHAPUR. [PERSIA.]

SHARDLOW, Derbyshire, a village and the seat of a Poor-Law

Union, in the parish of Aston-upon-Trent, is situated on the left bank of the river Trent, which here forms the boundary of the county, in 52° 52' N. lat., 1° 21' W. long., distant about 6 miles S.E. from Derby, and 120 miles N.N.W. from London. The population of the township and ecclesiastical district of Shardlow in 1851 was 1121. The living of Shardlow is a perpetual curacy in the archdeaconry of Derby and diocese of Lichfield. Shardlow Poor-Law Union contains 46 parishes and townships, with an area of 72,630 acres, and a population in 1851 of 32,318. The population is chiefly agricultural. Plaster or gypsum mines give employment to some of the inhabitants of Shardlow and Aston.

SHARNBROOK. [BEDFORDSHIRE.]

SHAT-EL-ARAB. [PERSIA.]

SHAWNREETOWN. [ILLINOIS.]

SHEEPSHED. [LIMONESTERSHIRE.]

SHEEPWASH. [DEVONSHIRE.]

SHEERNESS, Kent, a town in the parish of Minster-in-Sheppey, is situated at the north-west point of the Isle of Sheppey, on the right bank of the river Medway, at its junction with the Thames, in 51° 27' N. lat., 0° 44' E. long., distant 20 miles N.N.E. from Maidstone, and 47 miles E. by S. from London. The population of the town of Sheerness in 1851 was 8549. The living of Sheerness is a perpetual curacy in the archdeaconry of Maidstone and diocese of Canterbury.

In the time of Charles I. the site of the town was a swamp, at the extremity of which, after the Restoration, a fort was built and mounted with twelve guns, to secure the passage up the Medway. When the Dutch war broke out, it was intended to augment the fortifications; but on the 10th of July 1667 the Dutch forced their way up the Medway, beat down the defences, and took the fort, which was incomplete. It was soon restored on an enlarged scale, and has been from time to time augmented by additional works; and a dockyard, which has been made one of the finest in Europe, was established. In 1798 the mutiny of the fleet at the Nore excited great alarm. In 1827 Sheerness suffered from an extensive conflagration.

The town consists of three parts—Sheerness proper, including the fortresses and dockyards, and the suburbs of Blue-town and Mile-town: an outer line of fortifications comprehends Blue-town within its inclosure, but not Mile-town. The place has been much enlarged within the last few years. It is lighted by gas, and partially paved. The garrison, or fortress, occupies the extreme point of the island; the principal batteries front the Thames. A large fleet of ships in ordinary generally lies off Sheerness. The wharf fronts the Medway. The dockyard, store-houses, sail-lofts, &c., occupy an area of 60 acres. Close to the dock-gates is a handsome chapel, the appointment to which is in the Board of Admiralty; and in Mile-town is a new gothic church. There are places of worship for Wesleyan Methodists, Baptists, and Roman Catholics; a National school for boys and girls; and a savings bank. A county court is held in the town. Saturday is the market-day. The trade is chiefly dependent on the dockyard; but some shipments are made to London of corn and seed, the produce of the Isle of Sheppey, and the oyster-fishery is prosecuted to some extent. There are copper-works at a little distance. Sheerness is resorted to in summer for sea-bathing. A long jetty has been carried out into the river for landing passengers.

SHEFFIELD, West Riding of Yorkshire, a market-town, a municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Sheffield, is situated near the junction of the river Sheaf (from which the town is named) and three other rivers with the Don, in 53° 22' N. lat., 1° 28' W. long., distant 50 miles S.S.W. from York, 162 miles N.N.W. from London by road, and 162½ miles by the Great Northern railway. The population of the borough of Sheffield in 1851 was 135,310. The borough is governed by 14 aldermen and 42 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The living is a vicarage in the archdeaconry and diocese of York. Sheffield Poor-Law Union contains 4 townships, with an area of 10,950 acres, and a population in 1851 of 103,626.

Sheffield became a parliamentary borough and acquired the privilege of returning two members under the Reform Act. It received a charter of incorporation as a municipal borough on August 24th 1843. In population and commercial importance it is the second town of the county. With the exception of the single level outlet towards Doncaster, Sheffield is encompassed by an amphitheatre of hills pleasingly diversified in their appearance and culture. The manor of Sheffield is mentioned in Domesday Book. In the early part of the reign of Henry I. it was in the possession of the family of De Lovetot, who had here their baronial residence. They founded a hospital, called St. Leonards (suppressed in the reign of Henry VIII.), upon an eminence still called Spital Hill, established a corn-mill, erected a bridge over the Don, and fixed here the nucleus of a town, which from the natural advantages of the locality afterwards rose into importance. In 1296 Edward I. granted a charter to hold a weekly market and an annual fair in Sheffield. Sheffield had about this time acquired a reputation for iron manufactures, especially for falchion heads, arrow piles, and an ordinary kind of knives called whittles. The leading branches of industry in the place became permanently settled here before the introduction of steam, which has since been employed to sustain and extend them. Sheffield Manor acquired celebrity in the

reign of Elizabeth by the imprisonment there of Mary, queen of Scots. After being for some time confined in Tutbury Castle, in Staffordshire, she was, in 1570, removed to Sheffield Castle, and shortly afterwards to the Sheffield manor-house. She left Sheffield in 1584, having spent fourteen years of her imprisonment in this neighbourhood. The Duke of Alva caused many artisans to emigrate from the Netherlands into England, where they were well received by Queen Elizabeth, and the general rule was adopted of settling all of one craft in one spot. The workers in iron were, by the advice of the queen's chamberlain, the Earl of Shrewsbury, settled on his own estate at Sheffield, and the neighbourhood from this time became known for the manufacture of shears, sickles, knives of every kind, and scissora. In 1616 the Sheffield estates passed by marriage into the possession of Thomas Howard, earl of Arundel, who, on the restoration of Charles II., was restored to the title of Duke of Norfolk, forfeited by his ancestor in the reign of Elizabeth. In 1624 the cutlers obtained an act of incorporation. In the contest between Charles I. and the Parliament, Sir John Gell, with troops from Derbyshire, took military possession of the town and castle; but the Duke of Newcastle, at the head of the royal army, having taken Rotherham by storm, marched to Sheffield, when the Parliamentarians fled into Derbyshire. A garrison was left in Sheffield Castle under Major Thomas Beaumont, who held the town and castle till after the battle of Marston Moor, when, being besieged by 12,000 Parliamentary infantry, the castle was obliged to capitulate on August 10th 1644. It was then demolished by order of Parliament. No vestiges of it remain; but the names of Castle-Hill, Castle-Green, and Castle-Folds, still indicate its site.

Though Sheffield maintained its staple manufactures, it did not, during the 17th century, increase much in commercial importance. With the 18th century the business of the town began rapidly to make progress. In 1700 the town-hall was built, where the town business was transacted and the sessions held. In 1751 the river Don was made navigable to Tinsley, within three miles of Sheffield, but it was not till 1819 that the water communication was continued to the town by the opening of the Sheffield and Tinsley Canal. It was however in the latter half of the 18th century that the town made its most rapid advances. The art of silver-plating, invented by an ingenious mechanic named Thomas Bolsover, was so extensively applied here as to be soon generally known as Sheffield plate; the composition called Britannia metal was also invented and very largely manufactured here; lead-works and silk- and cotton-mills were established; and the merchants opened for the first time a direct communication with the continent; while towards the end of the century steam-power was employed in the manufactures of the town. Stage-coaches too were started to run to London; a bank was opened in the town; shambles and market buildings were erected; and reservoirs were formed in the neighbourhood for supplying the town with water.

During the present century Sheffield has been steadily advancing in prosperity and importance, and now displays all the features of a manufacturing town of the first class. As most of the merchants and principal manufacturers reside in the country, there are few dwelling-houses of a superior grade, but of late the shops in the principal streets have been rendered more ornamental, various good public buildings have been erected, and the general appearance of the town has been much improved. The streets are all well paved and lighted with gas. Sheffield in 1851 possessed 70 places of worship, of which 26 belonged to Methodists, 23 to the Church of England, 10 to Independents, 4 to Baptists, and one each to Quakers, Unitarians, Roman Catholics, Irvingites, and Jews. The total number of sittings provided was 44,189. The old parish church, a spacious cruciform gothic structure, 240 feet long by 130 feet broad, with a tower and lofty spire rising from the intersection, stands near the centre of the town. In the interior are several interesting monuments and pieces of sculpture. St. Paul's, erected in 1721, and St. James's, in 1789, are in the Grecian style. St. George's, built by the Parliamentary Commissioners in 1825, at a cost of more than 14,000*l.*, is a handsome and commodious edifice, in the style of the 14th century, with a fine western tower 139 feet high. The Roman Catholic chapel, opened in 1850, is in the decorated style, and cost about 8000*l.* It is cruciform, with a tower, surmounted with an elegant crocketed spire 200 feet high. The Royal Free Grammar school, founded in 1649, free to 30 boys for classics, has an income from endowment of about 150*l.* a year; it is under the care of a head and three other masters, and had 80 scholars in 1854. Wesley College, an extensive and handsome range of buildings, erected in 1838 at a cost—including the price of six acres of land, used as pleasure-grounds—of about 15,000*l.*, has accommodation for about 250 boarders. It is under the care of a governor, who is also chaplain, a head master, and 16 other teachers. The number of scholars in 1853 was 150. The Collegiate Proprietary school, founded in 1835, is under a principal and 8 other teachers, and had 79 scholars in 1854. A Charity school, founded about 1710, supports, clothes, and educates about 100 boys; another, founded about 1786, provides instruction, clothing, and maintenance for 70 girls. There are several National, British, and Infant schools; three Wesleyan day schools; a Roman Catholic school; the People's College; a Ragged school; a School of Design; the Sheffield Library, established in 1771, which has about 20,000 volumes, and about 280 subscribers; the Mechanics and Apprentices Library, commenced in 1824, which

has about 8000 volumes and about 700 subscribers; a literary and philosophical society, with a museum; an athensium, with reading-rooms, library, &c.; a mechanics institution and lyceum, with library, reading-rooms, lecture-room, &c.; and a Church of England instruction society, with classes, a library, a book-club, and a museum.

The public buildings consist of the town-hall; the Cutlers'-hall; the corn-exchange, erected in 1830 by the Duke of Norfolk, who owns the ground upon which a large portion of the town is built; the new market-hall, or the Norfolk market, opened on Christmas eve, 1851, a spacious structure 296 feet by 115 feet, with a roof of iron and glass, erected by the Duke of Norfolk at a cost of about 40,000*l.*; the fire-office, the assay-office, the assembly-rooms and theatre, the music-hall, two news-rooms, and the public baths. The cemetery is an extensive and well laid-out piece of ground of about 14 acres in extent, on the slope of a hill about a mile from the town. The botanical gardens, which are of considerable extent, are for beauty of situation unrivalled.

Among the charitable institutions are the General Infirmary, a noble building, on the north-west side of the town, with fever wards erected near it; the dispensary, and the Shrewsbury hospital, established and munificently endowed by the Earl of Shrewsbury, and which has been re-erected on a new site in a simple yet elegant style of architecture. In this hospital 20 poor men and 20 poor women have dwellings and weekly allowances. Hollis's hospital for poor women, widows of cutlers, provides for 17 almshouses and a governor, allows stipends to several clergymen and schoolmasters, and sustains a school for 70 children. The Licensed Victuallers' Asylum, near Grimsthorpe, erected in 1848, consists of a row of neat cottages in the Tudor style. Several valuable charities are under the management of the Cutlers' Company. There is a savings bank in the town.

There are two public bodies which are in possession of property applicable to the benefit and general improvement of the town, namely, the town trustees and the church burgesses. The principal manufacture of Sheffield is that of cutlery in all its branches, indeed of everything that can be fabricated of iron or of steel. The vast buildings used for grinding by steam form one of the peculiarities of Sheffield. Of the artisans of the town the spring-knife makers and the table-knife makers form the largest classes. Silver-plate and plated goods form also one of the staple manufactures of Sheffield. Its plated goods have a deserved reputation for strength and durability. Brass-foundries are numerous. Britannia metal, a superior kind of pewter composed of tin, antimony, and regulus, forms a cheap article of common use and great consumption, the manufacture of which occupies many hands. A superior but more costly kind of white metal called German silver is also largely wrought. Brushes, buttons, combs, and optical instruments are made here to a considerable extent; and there are various other manufactures connected with the staple commodities of the town, such as cabinet-case makers, engravers, haft and scale pressers and cutters, powder-flask and shot-belt makers, silver-refiners, wood-turners, &c. There are also many mercantile houses, some of which confine themselves to the home markets, while others export to the Continent, to Brazil, the Cape of Good Hope, and various other parts of the world, but far beyond any other in importance, to the United States of America. Quarter and petty sessions and a county court are held in the town. Tuesday and Saturday are the market days; fairs are held on the Tuesday and Wednesday in Trinity week, and on the 28th of November.

In the vicinity of the town are many pleasant walks, and numerous good mansions, occupied by Sheffield merchants and other wealthy persons. About a mile E. from the town is the large village of *Attercliffe*; population of the ecclesiastical district of Attercliffe, 3000 in 1851. The inhabitants are employed in occupations similar to those pursued in Sheffield. Besides the district church, called Christ church, erected in 1822 at a cost of about 14,000*l.*, there are places of worship for Wesleyan Methodists and Independents; a Town school, National schools, some almshouses, and a few minor charities.

SHEFFORD, Bedfordshire, a decayed market-town in the parish of Campton, is situated on the right bank of the river Ivel, in 52° 2' N. lat., 0° 20' W. long., distant 10 miles S.E. from Bedford, and 41 miles N.N.W. from London. The population of the township of Shefford in 1851 was 1052. The living is a perpetual curacy in the archdeaconry of Bedford and diocese of Ely. Shefford had formerly a weekly market on Friday, but it has long been discontinued. Four fairs are held annually, of which two, on January 23rd and Easter Monday, are considerable marts for sheep and cows. There are here the parochial chapel, a Roman Catholic chapel, a Free school, and an Infant school. At Shefford the Ivel has been converted into a navigable canal.

SHEKI. [GEORGIA, ASIATIC.]

SHELBURNE. [NOVA SCOTIA.]

SHELBYSVILLE. [INDIANA.]

SHELFORD, GREAT. [CAMBRIDGESHIRE.]

SHELLIFF, RIVER. [ALGERIE.]

SHELTON. [STAFFORDSHIRE.]

SHENDY. [NUBIA.]

SHEPPEY, ISLE OF, a liberty in the county of Kent, which gives name to a Poor-Law Union. Sheppey Poor-Law Union contains seven

parishes, with an area of 31,083 acres, and a population in 1851 of 13,385. The Isle of Sheppey is described under *KENT*.

SHEPTON MALLET, Somersetshire, a market-town, and the seat of a Poor-Law Union, in the parish of Shepton Mallet, is situated in a valley watered by a small feeder of the river Brue, in 51° 11' N. lat., 2° 32' W. long., distant 18 miles S.W. by S. from Bath, and 116 miles W.S.W. from London. The population of the town of Shepton Mallet in 1851 was 3885. The living is a rectory in the archdeaconry of Wells and diocese of Bath and Wells. Shepton Mallet Poor-Law Union contains 24 parishes and townships, with an area of 49,657 acres, and a population in 1851 of 16,957.

Shepton Mallet is a place of some antiquity; it is called *Septon* in Domesday Book; but, becoming afterwards part of the territory of the Mallet family, took the additional designation of Mallet. The principal street is broad and well built, lighted with gas, and paved. The church, a large and handsome cruciform structure, is on the east side of the market-place. It has a tower at the west end surmounted with a spire. The Wesleyan Methodists, Independents, Roman Catholics, and Unitarians have places of worship. The Free Grammar school, founded in 1627, which is free to 15 boys, has an income from endowment of 75*l.* a year, with a free house for the master. It had 50 scholars in 1854. There is also a National school. The county bridewell is at Shepton Mallet. The principal manufactures are those of woollen-cloth, serge, sail-cloth, silks, crapes, and velvet. The market on Friday is a considerable corn-market; there are fairs for cattle on June 18th and August 8th.

SHERBORNE. [HAMPSHIRE.]

SHERBOURNE, Dorsetshire, a market-town, and the seat of a Poor-Law Union, in the parish of Sherbourne, is situated on rising ground on the right bank of the river Yeo, in 50° 58' N. lat., 2° 30' W. long., distant 18 miles S. by E. from Dorchester, and 117 miles S.W. by W. from London. The population of the town of Sherbourne in 1851 was 3878. The living is a vicarage in the archdeaconry of Dorset and diocese of Salisbury. Sherbourne Poor-Law Union contains 30 parishes and townships, with an area of 39,478 acres, and a population in 1851 of 13,073.

Sherbourne was of considerable importance in the time of the Saxons, who called it 'Sciraburn,' or 'Scireburn.' Ina, king of the West Saxons, on the division of the diocese of Winchester, then the sole bishopric of the West Saxons, made Sherbourne the seat of an episcopal see in 705. The seat of the bishopric was removed, about 1075 or 1076, to Old Sarum. A monastery for secular canons was established here after the conversion of the West Saxons. The rule of St. Benedict was afterwards introduced, in 998, and it became an abbey, which continued till the dissolution of monasteries. A castle was built at Sherbourne by Roger, bishop of Sarum, in the reign of Henry I.; it changed hands once or twice in the civil war of Stephen and the Empress Maud. It was stormed in 1645 by Cromwell and Fairfax, after which it was demolished. In the reign of Edward III. the town sent representatives to parliament, and at a later period the assizes were often held here. In the time of Leland and Camden it was the seat of a considerable woollen manufacture. The clothing-trade declined, was replaced by the manufacture of buttons, bone-lace, and haberdashery, which was succeeded, towards the middle of the last century, by the silk manufacture.

The town is pleasantly situated, partly on the slope of a hill, partly in the pleasant vale of Blackmore. The streets are partially paved, lighted with gas, and supplied with water. The church is a large cruciform structure, of different dates, mostly perpendicular. The tower is 150 feet high. The church anciently belonged to the abbey. Attached to the church are four ancient chapels. This church has recently been restored at an expense of about 15,000*l.*, of which about one-half has been contributed by the Earl of Digby. The Wesleyan Methodists, Quakers, and Independents have places of worship in the town. The King's school, founded by Edward IV. in 1550, has an income from endowment of more than 1000*l.* a year, and has several exhibitions of 40*l.* a year, tenable for four years, either at Oxford or Cambridge. It is under a head-master and five other teachers, and had 109 scholars in 1854. The school is free to residents in the town or immediate neighbourhood, on payment of 6*l.* a year. The Earl of Digby presented to the school the remains of the abbey, which have been restored, providing a chapel, a dining-hall, a larger school-room, studies, &c. A school for girls is supported by the Earl of Digby. There are also a National school for boys, an Infant school, and a savings bank. There are several ancient houses in the town. The town-hall and market-house are near the church. There are several silk-throwing mills, and some of the inhabitants are employed in sewing gloves for manufacturers in Yeovil. Markets are held on Thursday and Saturday, of which the Saturday market is the most important; there are three yearly fairs.

The remains of the castle, which occupied an area of four acres, are on a rocky eminence at the east end of the town. In the fine pleasure-grounds which surround the ruins of the castle is Sherbourne Lodge, frequently called Sherbourne Castle, the residence of the Earl of Digby; it was built by Sir Walter Raleigh, and contains some interesting portraits.

SHERBOURNE. [GLOUCESTERSHIRE.]

SHERBURN. [YORKSHIRE.]
 SHERRINGHAM. [NORFOLK.]
 SHERSTON. [WILTSHIRE.]
 SHERWOOD FOREST. [NOTTINGHAMSHIRE.]

SHETLAND ISLANDS, Scotland, form the most remote group of islands incorporated with Great Britain. They are about 150 miles W. from Buchanness in Aberdeenshire, and are separated from the Orkneys, from which they lie N.W., by a channel about 50 miles broad. Excluding the two more detached islands, called Foula and Fair-Isle, the Shetlands lie between 59° 52' and 60° 5' N. lat., 0° 15' E. long., and 1° 50' W. long. Foula is about 20 miles W. from the Mainland of Shetland, and Fair-Isle about 25 miles S. from the nearest headland of the Mainland. The population of the islands in 1851 was 31,078. Shetland unites with the Orkneys in the return of one member to the Imperial Parliament.

Surface, Coast-Line, &c.—The Shetland group consists of more than 100 islands, islets, holms, and skerries, 32 of which are inhabited; the others are either small isles, on which cattle are pastured, or sterile masses of rock. The largest of the Shetland Isles, called the Mainland, is about 60 miles long, from its northern extremity, Feideland, to its southern termination, Sumburgh Head. Its breadth varies from 8 miles to 10 miles: at one part, from Sandness to Nestingbay, the breadth is 24 miles; but the coasts are singularly irregular, and indented with innumerable deep bays, distinguished by the provincial term 'Voes,' which so penetrate the interior, that no part of the island is more than three miles from the sea. The next largest island is Yell, 20 miles long and 6 miles broad. Unst, the third largest island, is about 11 miles long and 6 miles broad. The other islands are comparatively small: the largest are Fetlar, Whalsey, Bressay, Papa-Stour, Meikle-Roe, Burra, Foula, and Fair-Isle.

The general appearance of the Shetland Isles, as seen from the sea, is an unvarying line of abrupt coast. The elevation of the highest parts is not remarkable: Roeness Hill, in the Mainland, with an altitude of 1500 feet, is the highest hill in Shetland. Foula is distinguished from the other islands by a cluster of five lofty hills, terminating in pointed cones, the highest having an altitude of 1400 feet. The surface of the islands is rugged and wild, often desolate and sterile. The few tracts of cultivated and fertile land are generally near the coast. The towering headlands that frown over the dark and stormy seas and 'rousts' (as the turbulent surges raised by the conflicting currents and torrents that sweep round the headlands are called); the singular pyramids of rock that rise to a great elevation along several parts of the coast; and the openings of numerous lofty and dark caverns in the precipices of the coast—some of great beauty and others of gloomy grandeur—are highly picturesque features. The tides are remarkable for their unequal flow at different parts of the islands, and in opposite directions at the same time. The tide flows an hour earlier along the western than on the eastern sides of the islands, and does not recede below high-water mark more than two-third parts of the depth of the ebb tide at the Orkney Islands.

Geology and Mineralogy.—The southern part of the Mainland is composed of a ridge of clay-slate, lying parallel to secondary sandstone and conglomerate on the one side, and small islands of gneiss and sienite on the other. The centre of the Mainland is a solid mass of gneiss, having bluish gray quartz on the west side, and districts of sienitic greenstone and granite to the north. The island of Yell is formed of gneiss. Unst is chiefly formed of serpentine and diallage rock, bordering on a district of gneiss and another of micaceous slate. Fetlar is similar to Unst; and the more remote island of Foula is formed of high hills of sandstone, with clay- and mica-slate, gneiss and granite on its north-eastern shores. Fair-Isle also chiefly consists of sandstone. There are copper-veins at Sandlodge and in Fair-Isle; iron-mica at Titfield-Head, and iron pyrites at Garthness.

Climate, Agriculture, &c.—The Shetlands are subject to severe and long continued storms. Winter commences in October. The return of spring is imperceptible till the end of April. The climate is variable and humid, but to the natives it is decidedly healthy, and instances of great longevity are not uncommon.

In the high latitude of Shetland, the light of day at midsummer never totally disappears, and the smallest print can be read at midnight. During the winter the nights are proportionally long and dreary; and in the month of December the sun is not above the horizon more than five hours and a half.

Agriculture is conducted in a primitive manner; the inhabitants directing their attention chiefly to the fisheries. The small tenants have a small proportion of arable land, enough to raise a scanty supply of food for themselves and their families, and to allow them to devote the best part of their time to fishing. The lands are also frequently let under condition that the landlord is to receive all the fish at a fixed price, which enables him to derive a profit from the re-sale; while on the other hand the landlord is the purveyor of the fishing materials, and often of a great proportion of the tenants' food, upon which a profit also arises. The climate is so ill adapted to the raising of corn, that, although the soil is in several places good, only the most common descriptions of barley and oats are cultivated. The race of cattle peculiar to these islands is of diminutive size. The cow has long pointed horns, and is generally of more than one colour, dingy white and brown predominating. Three hundred-weight is above the

average weight of a cow, and three English quarts per day is the utmost quantity of milk yielded. The Shetland pony, or Sheltie, is annually exported in great numbers. These diminutive horses are extremely hardy and vigorous, and undergo much fatigue in proportion to their size. They provide their food from the hill pastures, and are never placed under shelter. The native sheep are remarkably small, and have a degree of nimbleness and vigilance which would be considered foreign to the nature of the animal by persons only acquainted with the flocks of other countries. The carcass of one weighs about 30 lbs. The colour of their wool, from which stockings and gloves are knit by the natives, is various, being white, dun black, and brown, and all these colours are often blended together in one animal.

The fisheries are the most important branch of industry. 'Sillocks,' the young of the coal-fish, literally swarm from May until September, close to the shores, affording abundance of a favourite food, and considerable quantities of oil. The ling and tusk fishery, in the open sea, is the most valuable and most hazardous, and, together with the cod fishery, contributes more to the prosperity of Shetland than any other. The herring fishery is also followed. The capture of whole herds of whales, known as 'bottle noses,' which approach the coast in pursuit of the herrings, supplies the natives occasionally with supplies of oil of very fine quality. The slaughter of seals in the deep caverns of the coast is engaged in to an extent sufficient to class it among the fisheries.

Divisions, Towns, &c.—The islands form 14 parishes, under the ecclesiastical jurisdiction of the Synod of Shetland. The Free Church has seven chapels, the Independents have six, and the United Presbyterians have two chapels. There are also some chapels for Wesleyan Methodists. The only town is Lerwick, which is situated on Bressay Sound, on the east side of the Mainland of Shetland. The population of the town in 1851 was 2904. The houses are built close to the water's edge; and the country being destitute of roads and wheeled vehicles, Lerwick presents a singularly confused appearance, with no other thoroughfare than a tortuous ill-paved path between the houses. It possesses many excellent shops, and has a harbour which is about a mile wide at the south entrance, expands opposite to the town, and again contracts; being fully protected by the shores of Bressay island on the one side, and by those of the Mainland on the other. The number of vessels registered at the port on December 31st, 1853, was 62, of 1986 tons burden. During 1853 there entered the port 111 sailing-vessels of 8121 tons, and 28 steam-vessels of 8960 tons; and during the same period there cleared from the port 105 sailing-vessels of 8116 tons, and 28 steam-vessels of 8960 tons. Besides the parish church there are in the town a Free Church and chapels for United Presbyterians and Independents. The only villages which require notice are Scalloway and Hillswick, both on the west side of the Mainland. Hillswick, population about 200, is 36 miles N.N.W. from Lerwick, and has a finely-sheltered harbour. The inhabitants are chiefly engaged in the ling and the herring fisheries. Many of the lochs in the parish abound with salmon-trout. Besides the parish church, there are chapels for Wesleyan Methodists and Independents. Scalloway, population about 400, about six miles W. by N. from Lerwick, was formerly the capital of Shetland. The Independents have a place of worship here. Scalloway has a good harbour, and near it along the coast are several commodious voes or bays, which afford convenient shelter to vessels. A short distance east from the village are remains of the castle of Scalloway, built about the year 1600 by Earl Patrick Stewart.

History, Antiquities, &c.—Antiquaries have long disputed whether the ancient Romans saw the Shetland Isles when they circumnavigated Britain, and much learning has been advanced to connect the *Thule* of Tacitus with Shetland. The country was peopled by Northmen, and was long subject to Norway. About 1380 the line of Norwegian earls ceased to retain their authority, and a Scottish nobleman, Henry Sinclair, obtained the earldom of Orkney, which included Shetland, from the King of Denmark and Norway. It continued in his family for about a century. In 1469 James III. of Scotland married Margaret, the daughter of the King of Denmark, and with her, obtained the Shetlands in security of her dowry, which never having been paid, the islands have since formed part of Scotland. The Norwegian laws and usages continued in force in Shetland until a very recent period, and thus the old laws and observances of Shetland essentially differ from those of Scotland. The free possession of lands is known by the term 'udal,' the proprietors being termed 'udallars,' and this property descends in the udaller's family without the evidence of any written instrument. The islands now form part of the united sheriffdom of Orkney and Shetland. [ORKNEY.]

There are several interesting remains of antiquity in Shetland,—such as Lawtings, or open courts of justice under the Norwegian laws; round towers, particularly that of Mousa, which is nearly entire; and, of more recent erection, the ruins of the large castle of Scalloway.

For several years a steam-vessel has plied regularly every week, from March till November, between Edinburgh and Lerwick in Shetland, calling on its way at Aberdeen and Wick.

SHIELDS, NORTH, Northumberland, a market-town, sea-port, and conjointly with the village of Tynemouth a parliamentary borough, in the parish of Tynemouth, is situated on the left bank and near the mouth of the river Tyne, in 55° 1' N. lat., 1° 26' W. long.

distant 7 miles E. by N. from Newcastle, 279 miles N.N.W. from London by road, and 301 miles by the North-Western, and York Newcastle and Berwick railways. The population of the township of North Shields in 1851 was 8882. The living of North Shields is a curacy, annexed to the vicarage of Tynemouth, in the archdeaconry of Northumberland and diocese of Durham.

North Shields first rose about the time of Edward I., under the protection of the Prior of Tynemouth, but its growth at that time was checked by the burgesses of Newcastle, who obtained a decree which compelled the prior to destroy the buildings which he had erected. The place continued in obscurity until Cromwell, in the time of the Commonwealth, caused an act to be passed for forming quays and establishing a market. The restrictions on the trade of the place were subsequently removed, and the town rose in importance. It now extends about a mile along the Tyne, opposite South Shields. The town is lighted with gas. The parish church of Tynemouth is at the eastern end of North Shields. There is a chapel of ease. A new church was completed in 1836. The Wesleyan, Primitive, and New Connexion Methodists, English Presbyterians, United Presbyterians, Independents, Baptists, Quakers, and Roman Catholics have places of worship. There are in the town National, British, and Infant schools; a school of industry for girls, partly endowed; a Presbyterian school; a Roman Catholic school; a savings bank; a handsome building for the subscription library; a mechanics institute; a theatre; assembly rooms; and commodious baths.

North Shields is a place of great trade. Numerous collieries are in the neighbourhood; ships of 300 tons can load at the quays. There is a great export of coals, chiefly to London and the eastern coasts of England and Scotland. Several vessels are engaged in the Greenland and Davis's Straits whale fishery. The number and tonnage of vessels registered as belonging to the port of Shields on December 31st, 1853, were, under 50 tons, 17 sailing-vessels of 545 tons, and 82 steam-vessels of 1646 tons; above 50 tons, 763 sailing-vessels of 201,104 tons. During 1853 there entered the port, in the coasting trade, 666 sailing-vessels of 66,468 tons, and 29 steam-vessels of 492 tons; and cleared, 1413 sailing-vessels of 151,897 tons, and 23 steam-vessels of 451 tons. In the colonial trade there entered 31 sailing-vessels of 9538 tons, and cleared 45 sailing-vessels of 17,538 tons. In the foreign trade there entered 541 British vessels of 109,665 tons, and 422 foreign vessels of 41,451 tons; and there cleared 483 British vessels of 92,932 tons, and 634 foreign vessels of 74,256 tons. A steam ferry affords communication with South Shields; there are steamers to Newcastle, and a railway gives communication with Tynemouth and with Newcastle. Ship-building, and the manufacture of sailcloth, cordage, chain-cables, and anchors, are actively carried on. Salt-pans, breweries, a pottery, and brick- and tile-works employ many hands. A county court is held. Saturday is the market-day; fairs are held on the last Friday in April and the first Friday in November.

SHIELDS, SOUTH, Durham, a market-town, seaport, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Jarrow, is situated on the right bank and at the mouth of the river Tyne, in 55° N. lat., 1° 26' W. long., distant 20 miles N.N.E. from Durham, 276 miles N.N.W. from London by road, and 290 miles by the Great Northern, and York Newcastle and Berwick railways. The population of the borough of South Shields, which includes the townships of Westoe and South Shields, was 23,974 in 1851. The borough is governed by a mayor, aldermen, and councillors; and returns one member to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry and diocese of Durham. South Shields Poor-Law Union contains six townships, with an area of 15,477 acres, and a population in 1851 of 35,577.

Of Jarrow and its ancient Benedictine monastery some particulars will be found in our notice of the county of DURHAM. South Shields (anciently written Le Sheeles) has risen into importance with the extension of the coal-trade in modern times. One inscription which has been dug up indicates that the Romans had a station here. The present town originated with the fishermen of the Tyne, who built here along the shore sheds, locally termed 'sheels' or 'shields,' to defend themselves from the weather.

The town of South Shields extends into the township of Westoe; the modern parts contain many good houses. The town is lighted with gas, and has a good supply of water. In a large square near the centre of the town is the town-hall, used also as an exchange and news-room, and having a market-house beneath. The parochial chapel has been so much altered that little of the ancient part can be traced, with the exception of the old tower. A chapel of ease is of modern erection, and there are two chapels for United Presbyterians, and one each for Wesleyan and Primitive Methodists, English Presbyterians, Independents, and Baptists. There are National and Charity schools, a school supported by Presbyterians, and a savings bank. There is a set of 22 comfortable small houses for master mariners above 60 years of age. A great quantity of coal is brought down the river in keels, and shipped here: some coal-pits are in the immediate vicinity. The shipping returns for 1853 are included in those of NORTH SHIELDS. Ship-building is carried on with great activity. There are spacious docks for building and repairing ships; also extensive glass-works, a pottery, manufactories of soda and alum, breweries, and rope-walks. A numerous body of pilots are employed

for navigating vessels into the Tyne. At the mouth of the Tyne is a pilot tower. There is weekly communication by steam-vessel with Hull and with Berwick-on-Tweed. A county court is held. The market is on Saturday; two fairs are held, but they are indifferently attended. The town possesses a subscription library; a literary, scientific, and mechanics institute; an exchange news-room; public baths; and a theatre.

SHIFFNALL, Shropshire, a market-town, and the seat of a Poor-Law Union, in the parish of Shiffnall, is situated near the Staffordshire border, in 52° 39' N. lat., 2° 19' W. long., distant 13 miles E.S.E. from Shrewsbury, 135 miles N.W. by W. from London by road, and 139 miles by the North-Western and Birmingham and Shrewsbury railways. The population of the township of Shiffnall in 1851 was 1958. The living is a vicarage in the archdeaconry of Salop and diocese of Lichfield. Shiffnall Poor-Law Union contains 15 parishes and townships, with an area of 45,453 acres, and a population in 1851 of 11,463. Shiffnall parish church is a handsome and spacious cruciform edifice. The Baptists have two chapels; and there are National schools, partly endowed, and a Blue-Coat school. Mines and coal-pits in the vicinity afford considerable employment. Tuesday is the market-day. Fairs are held in April, August, and November.

SHIKARPOOR. [HINDUSTAN.]

SHILDON. [DURHAM.]

SHILLELAGH, County Wicklow, Ireland, a village and the seat of a Poor-Law Union, is situated on a feeder of the Derry River, 31 miles S.W. from Wicklow, and 59 miles S.W. from Dublin by road. The population in 1851 was about 150. Shillelagh Poor-Law Union comprises 23 electoral divisions, with an area of 110,122 acres, and a population in 1841 of 34,435, in 1851 of 24,172. The village contains a chapel of ease, a school-house, dispensary, and Union workhouse. Fairs are held six times a year. In Coolattin Park, belonging to Earl Fitzwilliam, are some old oaks, which are all that remain of the oak forests for which the Shillelagh district was formerly noted.

SHINFIELD. [BERKSHIRE.]

SHINRONE. [KING'S COUNTY.]

SHIPSTON-ON-STOUR, Worcestershire, a market-town, and the seat of a Poor-Law Union, in the parish of Shipston-on-Stour, is situated on the left bank of the river Stour, in 52° 4' N. lat., 1° 38' W. long., distant 30 miles E.S.E. from Worcester, 83 miles W.N.W. from London. The population of the parish in 1851 was 1835. The living is a rectory in the archdeaconry and diocese of Worcester. Shipston-on-Stour Poor-Law Union contains 37 parishes and townships, with an area of 78,889 acres, and a population in 1851 of 20,651. Shipston is pleasantly situated in a hilly district. The town is lighted with gas. Besides the parish church there are chapels for Wesleyan Methodists and Baptists, National schools partly endowed, and a savings bank. The market-day is Saturday; fairs are held once a month. A county court is held in the town.

SHIRAZ. [PERSIA.]

SHIRVAN. [GEORGIA, ASIATIC.]

SHOA. [ABYSSINIA.]

SHOBDON. [HEREFORDSHIRE.]

SHOOSHEE. [GEORGIA, ASIATIC.]

SHOREHAM, NEW, Sussex, a market-town, sea-port, and parliamentary borough, in the parish of New Shoreham, is situated on the left bank and near the mouth of the river Adur, in 50° 50' N. lat., 0° 17' W. long., distant 24 miles E. by S. from Chichester, 56 miles S. by W. from London by road and by the London and South-Coast railway. The population of the parish of New Shoreham in 1851 was 2590; that of the parliamentary borough, which includes nearly all the rape of Bramber, was 30,553. The borough returns two members to the Imperial Parliament. The living of New Shoreham is a vicarage in the archdeaconry of Lewes and diocese of Chichester.

The borough of New Shoreham, so called to distinguish it from Old Shoreham, now a small village about a mile inland, was part of the possessions conferred by the Conqueror upon William de Braose, lord of the rape of Bramber. King John landed here from Normandy with a large army in 1199, and he made it a free port in 1210. In the time of Edward III. (1346) it contributed 26 ships towards the two fleets which were fitted out by the king, being one ship more than was furnished by London; Fowey, Yarmouth, and Dartmouth alone furnished a larger number. In 1758 an act was obtained for the improvement of the haven, but the growth of a sand-bank at the mouth of the Adur caused the embouchure to shift towards the east, and to advance a mile and a half in the course of half a century, so as to render the haven of little use. In 1816 an artificial channel was cut through the shingle embankment, and substantial piers were erected. The harbour mouth is still subject to a bar, which rises occasionally above the low-water level, and shifts its position from 60 to 160 feet from the pier-heads. The lift of the spring-tides is about 15 feet, and neaps about 9 feet. The depth of the water over the bar at high-water is from 14 to 17 feet, according to the tides and the state of the bar. The Adur was formerly crossed by a ford, once belonging to the priory of Hardham. In the year 1833 a handsome suspension-bridge was erected near the mouth of the river and close to Shoreham.

The number and tonnage of vessels registered as belonging to the port of Shoreham on December 31st 1853 were:—Under 50 tons 54 vessels, tonnage 1027; above 50 tons 62 vessels, tonnage 11,277.

During 1853 there entered at the port 909 vessels of 91,535 tons, and there cleared 366 vessels of 20,577 tons aggregate burden.

During the last few years much improvement has taken place in the town. It is lighted with gas and paved. The church, dedicated to St. Nicholas, is a large and elaborately-finished edifice of the 12th century. In the town are a Protestant Free Church and a chapel for Wesleyan Methodists. The college of St. Nicholas, at Shoreham, is a Grammar school for the education of youths of the middle classes. It had 60 scholars in 1854. Besides this school the college has St. John's Middle Grammar school, Hurstpierpoint, Sussex, which had 147 scholars in 1854, and St. George's Military, Naval, and Engineering school, Leyton, with 18 pupils in 1854. At Shoreham are National and Infant schools, a museum and conservatory, and a theatre.

The chief trade of Shoreham consists in the export of timber, and the import of coals, corn, timber, and Irish provisions; and it is a warehousing port for all descriptions of timber, and for colonial and foreign produce. There is a custom-house. The oyster-fishery is prosecuted with considerable success. Ship-building is carried on. Several of the Shoreham boatmen act as pilots. A corn-market is held every alternate Monday, and a fair on July 25th.

SHOTLEY-BRIDGE. [DURHAM.]

SHREVEPORT. [LOUISIANA.]

SHREWSBURY, the county town of Shropshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on the Severn, in 52° 43' N. lat., 2° 45' W. long., distant 153 miles N.W. by W. from London by road, and 161 miles by the North-Western and Shrewsbury and Birmingham railways, via Trent Valley. The borough is governed by 10 aldermen and 30 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The population of the borough in 1851 was 19,681. The livings are in the archdeaconry of Salop and diocese of Lichfield. Shrewsbury Poor-Law Union comprises six parishes, with an area of 18,032 acres, and a population in 1851 of 23,104.

It is supposed that a stronghold was established by the Britons at this place, when they found Wroxeter (the Uriconium of the Romans) no longer tenable against the Angles. The Welsh name was Pengwern. On the conquest of the town by the Anglo-Saxons, it received the name of Scrobbes-Byrig, and of this name the modern Shrewsbury is a corruption. Ethelfleda, 'the lady of the Mercians,' daughter of Alfred the Great, founded the collegiate church of St. Alkmund; Athelstane established a mint here, and it soon became the chief town of the shire.

The town was included in the earldom of Shrewsbury, granted by William the Conqueror to his kinsman Roger de Montgomery, who erected a castle at the entrance of the peninsula on which the town stands. The castle and town were surrendered to Henry I. by Robert de Belesme, the third earl, who had risen in arms in favour of Robert, Henry's brother. After being held for several years by the crown, the earldom was granted by Henry, in 1126, to his second wife. The town received a charter from Henry II., but the earliest charter extant is of Richard I. In 1215 the town was taken by the Welsh under Llewellyn the Great, prince of North Wales, who had joined the insurgent barons against John, but was not held long by him. In the war of Henry III. with his barons, Shrewsbury was taken, in 1264, by Simon de Montfort, the leader of the insurgent barons, and Llewellyn, grandson of Llewellyn the Great, prince of Wales; but the battle of Evesham, in 1265, restored it to the crown. In 1283 a parliament was assembled at Shrewsbury for the trial of David, the last prince of Wales, who was executed as a traitor. In the reign of Richard II. a parliament was held here, in 1397-98, at which the Earl of Hereford (afterwards Henry IV.) brought a charge of treason against the Duke of Norfolk. In the early part of the reign of Henry IV., in 1402, the king assembled an army here to march against Owen Glyndwr, and the year after he fought the famous battle of Shrewsbury against the insurgent Percies and their allies, when the insurgents were defeated with great slaughter. In the war of the Roses, Shrewsbury supported the Yorkists, and Edward IV. showed much favour to the townsmen. His second son Richard, the younger of the two princes murdered in the Tower, was born here.

In the civil war of Charles I. the king came to Shrewsbury, where he received liberal contributions of money and plate from the neighbouring gentry, and largely recruited his forces. The Earl of Denbigh and Colonel Mytton, the parliamentary commanders, having approached Shrewsbury (July, 1643), were repulsed by Sir Fulke Hunkes, an officer of the royalist garrison, of which Sir Francis Otley was governor. The town was however surprised and taken by the Parliamentarians in February, 1644. Shrewsbury is a borough by prescription, and has sent two members to Parliament since the 23rd Edward I.

The town stands chiefly on a peninsula formed by the Severn. It has gradually extended beyond the Severn on the east and west sides, forming the suburbs of Abbey-Foregate and Coleham on the east, and of Frankwell on the west; and on the north extending beyond the isthmus or neck occupied by the castle, forming the suburb of the Castle-Foregate. The town contains an usually large number of picturesque old half-timber houses, several of which are of a superior character. The streets are lighted with gas and paved; and the town is supplied with water from the river, and from a spring two miles distant. There are two bridges over the Severn: the English

bridge (built in 1774), a handsome freestone structure of seven semi-circular arches, connects the Abbey-Foregate with the town; and the Welsh bridge, a neat plain structure of five arches, connects it with Frankwell. There are some remains of the castle and of the ancient walls. There are also remains of monasteries of the Augustinian and Franciscan friars, and of the Benedictine abbey founded by Roger de Montgomery, in 1088. The Abbey church, a cruciform structure, was in great part demolished at the dissolution; the nave, western tower, and north porch now constitute the church of Holy Cross parish. St. Alkmund's church has been rebuilt in modern times, with the exception of the tower and spire (184 feet high), which belonged to the more ancient structure. St. Chad's has also been rebuilt; it is a Grecian structure, of circular form, with a tower 150 feet high. A small part of the old church of St. Chad now remains, and is used as a school. St. Julian's was rebuilt about the middle of the last century; but the tower, which is of Norman architecture, belonged to the old church. St. Mary's is an ancient large and fine cruciform church, with a tower and spire 220 feet high. The church has been in part restored, the rich antique stained windows have been repaired, and new ones inserted. The Independents have two chapels; the Wesleyan, Primitive, and New Connexion Methodists, the Baptists, Unitarians, Roman Catholics, Quakers, Welsh Independents, and Calvinistic Methodists, have each a place of worship. The Royal Free school of Edward VI. has an income of 3100*l.* a year, and numerous exhibitions to both universities; the number of scholars in 1850 was 105. There are also a British school, a Diocesan school, the Blue Coat or Bowdler's Charity school, and several National and Charity schools. There are a mechanics institute, the Shropshire Agricultural society, and the Shropshire and North Wales Natural History and Antiquarian society, with a museum and library. The hospitals and charitable institutions are numerous. Among them are the sick man's charity; the house of industry; the lying-in hospital, and the Salop infirmary, a plain Grecian structure with a Doric portico, rebuilt in 1830 at a cost of nearly 19,000*l.*

Among other buildings may be mentioned the town- and shire-hall, a spacious and handsome stone building; the Public Rooms, a fine Grecian structure, including the post-office, music-hall, and subscription news-room, erected in 1849; the ancient market-house of the age of Elizabeth; a spacious butter-market, built by the corporation in 1844; the town and county jail and house of correction; the military depot, a handsome brick building near the Abbey-Foregate; the lunatic asylum; the public baths; the circus; the column in honour of Lord Hill, at the entrance of the town from London; the public subscription library; the theatre; and the assembly-rooms. Of the ancient edifices of the town, the white-hall, and the council-house, with its richly-ornamented wooden gateway, are worthy of notice. On the south-west side of the town is 'the Quarry,' believed to be the site of a Roman theatre, which has been formed into a handsome public walk planted with lime-trees; it comprises about 20 acres, extending along the bank of the Severn.

The trade of the town is considerable, especially in Welsh cloths and flannel; thread, linen-yarn, and canvas are manufactured, and there are iron-works at Coleham. The town has long been famous for brawn and 'Shrewsbury cakes.' There is an excellent salmon fishery in the Severn. The river is navigable for boats of 30 or 40 tons, and there is a canal to near Wellington, which opens a communication with the Staffordshire collieries. On the banks of the river are extensive quays and warehouses. The town is connected by railway with Chester, Birmingham, and Hereford. Markets are held on Wednesday and Saturday, the latter for grain. Cattle markets are held monthly. Races are held in the second week of May. The county assizes, sessions for the county and town, and a county court, are held in Shrewsbury.

SHREWSBURY. [NEW JERSEY.]

SHRIVENHAM. [BERKSHIRE.]

SHROPSHIRE, or SALOP, a county in the west of England, is bounded N. by Cheshire, E. by Staffordshire, S. by the counties of Worcester and Hereford, and W. by the Welsh counties of Radnor, Montgomery, and Denbigh. It lies between 52° 18' and 53° 0' N. lat., 2° 14' and 3° 12' W. long. Its greatest length from north to south is 48 miles; from east to west, 40 miles. The area of the county is 1291 square miles, or 826,055 statute acres. The population in 1851 was 229,341.

Surface, Hydrography, and Communications.—Shropshire contains every variety of surface, from the rugged mountain to the fertile and cultivated valley. The river Severn separates the county into two nearly equal divisions, and forms a boundary between the more elevated districts of the west and south, and an extensive level on the north and north-east, which extends into Cheshire and Staffordshire. On the west various chains of Welsh mountains extend into Shropshire. The Berwyn range, which traverses Montgomeryshire, terminates within the north-western boundary of Shropshire, in Selattyn Hill, which is 1300 feet above the level of the sea. The Breiddin Hills, remarkable for their picturesque forms, are situated on the right bank of the Severn, near where that river enters Shropshire. The greater portion and highest parts of these hills lie in Montgomeryshire, but their north-eastern extremities extend four miles into this county. A long range of elevations, commencing in Radnorshire, extends into

the south-west of Shropshire, and forms the district of mountainous land called Clun Forest, portions of which attain an elevation of 1200 feet and upwards. Connected with this range by intermediate hills is an elevated tract situated north of Bishop's Castle, the central ridge of which runs nearly from south to north, and attains its highest point in Corudon Mountain, 1700 feet. On the east, this tract is flanked by a very singular mass of rocks called the Stiperstones. Proceeding to the south-east, another range of hills is approached, the most considerable portion of which, called the Longmynd, attaining the height of 1674 feet above the sea-level, is connected on the south with a mountainous district lying east of Clun Forest, and forms with it the watershed between the Clun and Onny rivers. On the eastern side of the Longmynd lies the valley of Church Stretton, which is bounded on the eastern side by the Caradoc Hills, reaching the height of from 900 to 1200 feet. This range, like those just described, runs from south-west to north-east. It extends across the Severn in tracts of inferior elevation, and terminates, near Wellington, in the remarkable and well-known hill called the Wrekin. This hill rises 1320 feet above the sea, and, being nearly detached from neighbouring hills forms a conspicuous object. The long narrow valley of Ape-Dale lies between the Caradoc Hills and an elevated ridge, called Wenlock-Edge, which extends from the valley of the Onny to the Severn at Coalbrookdale, a distance of about 20 miles. It rises gradually on the eastern side to a considerable height, but the western slope is very rapid. Wenlock-Edge is flanked on the east by a number of detached rounded hills, all of which, as well as the greater portion of Wenlock-Edge, are under cultivation or planted to their summits. Between the hills last described and the town of Ludlow lies a rich tract of low land, called Corve-Dale. This valley extends north to within a short distance of Wenlock, and on the south opens to the valley of the Teme. It is shut in on the east by a range of hills extending from Ludlow northward. Connected with this range, a little to the eastward, are the Clee Hills, a long ridge running due north and south, and rising here and there into lofty summits, two of which—Brown Clee Hill (1805 feet) and Titterstone Clee Hill (1750 feet)—are the highest points in the county.

The chief part of the northern division of Shropshire may be described as a plain rising gradually from the left bank of the Severn to the northern border of the county, just within which the northern edge of the basin of the Severn is no more than 300 feet above the sea. A small portion in the extreme north-west of the county belongs to the basin of the Dee, which river, and its feeder the Ceiriog, form part of the boundary. Another small district in the north-east of the county is drained by the Weaver (a feeder of the Mersey) and its tributaries.

There are extensive tracts of waste lands in Shropshire. Clun Forest is not, as its name would imply, a wooded tract; it consists of smooth rounded hills, which were formerly used as sheep-walks; the greater portion of it is now inclosed. The cultivation of mountain land is on the increase. There are numerous wastes between Shrewsbury and Drayton, and the county also contains several extensive mosses or bogs, such as Bagley Moors, between Shrewsbury and Ellesmere. The forest of Wyre lies on the right bank of the Severn, between the towns of Bewdley and Cleobury Mortimer. It is a large tract, covered principally with underwood, which is cut for the purpose of burning into charcoal to supply the iron-works in the vicinity. Shropshire contains a greater quantity of oak-timber than almost any other county in England.

The *Severn*, the chief and only navigable river in Shropshire, enters the county from Montgomeryshire, a short distance below its junction with the Yrwy. Its course is by Shrewsbury and Bridgenorth. Its entire course through the county is nearly 70 miles, for the whole of which distance it is navigable. [SEVERN.]

The *Teme* rises in Radnorshire, and enters Shropshire from Herefordshire a short distance above the town of Ludlow, whence it flows south to the border of the county, which it separates from Herefordshire and Worcestershire, entering the latter county below Tenbury, and falling into the Severn near Worcester. Throughout its whole course it flows through rich and picturesque scenery. The Clun and the Onny are feeders of the Teme. The *Tera* rises in a small pool on the borders of Staffordshire, in the north-eastern district of Shropshire, and flows south-west past Market-Drayton. It then takes a more southerly course, and is joined on the left bank by the river Mee, which runs near Newport. It runs again westward, and receives the Roden on the right, reaching the Severn between Atcham and Wroxeter. Its whole course is about 30 miles. The Perry, the Meole, the Cound, and the Warf are tributaries of the Severn. There are two or three streams in the county bearing the name of *Rea*, but the principal of them takes its rise in the parish of Ditton Priors, in the northern projection of the Clee Hills, and, running south past Cleobury Mortimer, unites with the Teme at Newnam, below Tenbury in Worcestershire. The *Corve* takes its rise on the western slope of the same ridge, and flows south-west through Corve-Dale into the Teme at Ludlow.

The fish that frequent that part of the Severn which is in Shropshire are salmon, trout, grayling, pike, perch, shad, chub, gudgeon, roach, dace, carp, flounders, eels, and a few lampreys. The fish of the other rivers and streams are principally trout and grayling.

The lakes, or natural pools of water, are not numerous or extensive. The largest is Ellesmere, near the town of that name. It covers about 116 acres. The smaller are Whitmere, Colemere, Avesmere, and Mereton pools.

The first canal formed in this county appears to have been a short line commencing at Donnington Wood, in the parish of Lilleshall, and terminating at Pave Lane near Newport, a distance of about seven miles, with a short branch to the lime-works at Lilleshall. This was continued by the Shropshire Canal, completed in 1792, to the Severn, at Coalport, below Coalbrookdale. The Shropshire Canal is $7\frac{1}{4}$ miles in length; it has a rise of 120 feet and a fall of 333 feet. It is of the greatest importance in conveying the produce of the coal, iron, and other works to the Severn. The Shrewsbury Canal starts from the Severn at Shrewsbury, and, after running on the left bank of that river for some distance, turns north-east and joins the Donnington and Shropshire canals a short distance E. by N. from Wellington. The Shrewsbury Canal is 17 miles long; it has a rise of 154 feet and a fall of 22 feet. Inclined planes are used in these canals instead of locks for the ascent and descent of boats. The Birmingham and Liverpool Junction Canal passes through the north-eastern part of the county, and there is communication between this and the Shrewsbury Canal. The Chester and Ellesmere Canal traverses the north of the county. A branch of it, known as the Montgomeryshire Canal, passes through the north-west of the county. It was intended to form another line from Hordley, on the Montgomeryshire Canal, to Shrewsbury, but it has not been carried farther than Weston Wharf. The southern part of Shropshire is devoid of water communication.

The principal coach-road in the county is the London and Holyhead road, which enters Shropshire between Wolverhampton and Shiffnall, passes through Shrewsbury, and enters Denbighshire near Chirk. It is 30 feet wide, exclusive of the footpaths. This road was the chief line of communication between London and Dublin before the introduction of railways. The Bristol, Shrewsbury, and Chester road enters Shropshire at Ludlow, passes through Church Stretton to Shrewsbury, and thence northward. There is a branch from this road leading from Ludlow to Bishop's Castle and Montgomery. There are coach roads from Bridgenorth to Shrewsbury, Ludlow to Birmingham over the Clee Hills, Ludlow to Wenlock and Coalbrookdale, and from Ludlow to Bridgenorth. There are also various roads communicating with Coalbrookdale, Wellington, Drayton, Newport, Ellesmere, Whitchurch, &c.

The Birmingham, Shrewsbury, and Chester railway enters the county on the east at Albrighton, and runs through Shiffnall and Wellington to Shrewsbury, whence it runs north-west through Baschurch, Whittington, Gobowen, and Chirk, where it crosses the Ceiriog into Denbighshire. From the Gobowen station a branch line of two miles in length runs to Oswestry. The Shrewsbury and Hereford railway runs south from Shrewsbury through Condover, Church Stretton, and down the vale of the Onny to Ludlow. The Shrewsbury and Stafford railway leaves the Birmingham, Shrewsbury, and Chester line at the Wellington station, and runs north-east past Newport. Besides these great lines there are many short rail and tram roads, connecting the various mines with the furnaces, the Severn, and the canals in the Coalbrookdale district.

Geology and Mineralogy.—The Severn nearly forms the division between the new red-sandstone system on the north, and the older formations on the south. An outlier of lias, situated between Whitchurch and Market-Drayton, lies in an elliptical basin, the new red-sandstone rising from beneath, and forming around the lias on the south the hills of Hawkstone, and appearing on the east and south-east at Belton and Market-Drayton, on the north-east in the rising ground extending towards Nantwich, and to the north-west in the undulating country near Whitchurch. The greater part of this basin consists of lower lias shale, finely laminated; but the overlying subdivision of the marlstone is also apparent at Preea. The strata contain the characteristic fossils of the lias. This outlier is distant 60 miles from the nearest point of the great lias formation in Worcestershire and Warwickshire.

The new red-sandstone system, which rises from beneath and surrounds the bed of lias, occupies the whole northern portion of the county, extending north and east into Cheshire and Staffordshire, and on the west passing into the coal formation of Chirk and Oswestry. On the south-west it warps round the edges of the Silurian rocks of Montgomeryshire, and extends for some miles south of the Severn to the coal formations about Westbury and Pontesbury, where the southern edge of the new red-sandstone overlies that coal-field which extends north-east to near Shrewsbury; but the sandstone again penetrates south to a narrow point near the Caradoc Hills, and is succeeded on the west by the coal-field of Le Botwood. The edges of the rocks of the Silurian system extending north across the Severn, as well as the trap rocks of the Wrekin, again deflect the sandstone, the boundary line of which is extended still farther to the north-east from Wellington to near Newport, by the coal formation of Coalbrookdale, on the western edge of which field the sandstone again appears, and occupies the remainder of the county east of the Severn. The new red-sandstone system in this part of England consists of saliferous marls and calcareous flags, red-sandstone and quartzose conglomerate, calcareous conglomerate, and lower red-sandstone. As the new red-

sandstone system in Shropshire occurs in the form of a basin, the lower members will appear towards the edges of that system; and accordingly the lower red-sandstone is met with all along the line that forms the boundary of the system.

The coal-field of Coalbrookdale, the most extensive and productive in the county, extends from near Wenlock, on the right bank of the Severn, across that river to Wallington and Lilleshall, while a thin tortuous zone extends south to Tasley, within a short distance of Bridgenorth. On the north-west and east, this coal-field is bounded and overlaid by the lower new red-sandstone. On the west it is flanked by a thin zone of the lower Silurian rocks, and by the trap rocks of the Wrekin and Ercall Hills, and on the south by the old red-sandstone and upper Silurian rocks. In the upper measures of this field there is a remarkable band of fresh-water limestone, the geological position of which is immediately under the youngest members of the carboniferous series. The coal and iron measures below it are generally more abundant in the northern than in the southern part of the field. The coal-measures on the east side of the field are not less than 1000 feet thick. The ironstone of this field is both concretionary and flat-bedded. The ores of iron are peroxides in sandstone, argillaceous carbonates in shale, and sulphurets in the coal. Petroleum occurs in great abundance in both the upper and lower measures, and some of the beds of shale of the latter afford excellent fire-clay, which is used in the manufacture of pipes and pottery. The Shrewsbury coal-field extends from the Severn at the Breiddin Hills on the west, to Shrewsbury on the east, and occupies a semicircular bay, of which Pontesbury is the southern point. The seams are separated from each other by red, green, and black shale, and clod.

The coal-field of Oswestry is situated on the western verge of the county, and is quite distinct from those already noticed. The productive portion of it is very limited, occupying a small area between Oswestry and the hills of Llanvorda, Trefonen, Treflach, and Sweeney. The carboniferous limestone is better developed here than in any other part of the county. It separates the millstone-grit from the older Silurian rocks, and has a maximum thickness of 500 feet.

The coal-fields of Shropshire remaining to be noticed are situated on the south side of the county. The Titterstone Cleve Hill coal-field lies between the towns of Ludlow and Cleobury Mortimer. At Cornbrook and Knowlbury in this field there are four principal beds of coal, which vary in thickness in different parts; and beneath the uppermost bed the shale contains concretions of ironstone of excellent quality, which also occur beneath the next seam. The millstone-grit rises at many points from beneath the productive coal-field, and is separated from the old red-sandstone by the carboniferous limestone at Oreton; but in other parts it rests immediately upon the sandstone. At Knowlbury the iron-ore is profitably worked. The coal-field of the Brown Cleve Hills lies a few miles north of the formation just described, and, like that, is surrounded on all sides by the old red-sandstone, which here separates the coal-measures into two distinct elevations, known as the Cleve Barf and the Abdon Barf. These two are the loftiest carboniferous tracts in Great Britain. The pits on the Abdon Barf are shallow. Those of the Cleve Barf vary from 14 to 80 yards. Nearly all the best coal has been extracted. In this coal-field, as well as in that of the Titterstone Cleve Hill, there is abundant evidence of the tract having been heaved up into its present position by powerful forces acting from beneath, which have thrown the carbonaceous masses into separate troughs or basins.

The coal-field of Wyre, or Bewdley Forest, lies east of those just described, occupies the south-eastern corner of the county, and extends into Worcestershire, the greater part of it lying within that county. It has a length from north to south of about 20 miles, and a breadth in the Forest of Wyre of 5 or 6 miles. That portion of it lying in Shropshire and extending southward in a narrow zone from near Bridgenorth, is bounded on the west by the old red-sandstone of Chelmarsh.

The old red-sandstone system occupies a considerable part of the southern division of the county. It terminates on the north in the coal-field of Coalbrookdale, and on the east in that of the Forest of Wyre. On the west it is bounded in Corve-dale by the upper Ludlow rock of the Silurian system. At Hayton's Bent, north of Ludlow, veins of copper-ore occur, which were formerly worked, but have been abandoned for upwards of a century. A large outlier of old red-sandstone, the principal part of which forms Clun Forest, occurs on the south-west of the county, and is separated from the great mass by wide intervening tracts of Silurian rocks. This outlier is nearly 100 square miles in superficial extent. Its western extremity reaches into Radnorshire.

The Silurian and Cambrian systems of rocks occupy all the southern division of the county lying west of a line drawn from Ludlow to the Severn at Coalbrookdale, with the exception of Clun Forest. The Ludlow rocks rise from the old red-sandstone of Corve-dale into eminences of 1000 or 1100 feet above the sea, exhibiting the subdivisions of the formation, namely, the upper Ludlow rock, Aymestry limestones, and lower Ludlow rock. West of these, and separated by Hope-dale, is an escarpment extending from the valley of the Onny to Coalbrookdale, called Wenlock-Edge, and composed of Wenlock limestone. This is succeeded by Wenlock shale, composing the valley of the Caradoc, or Church Stretton Hills, which consist chiefly

of different varieties of unbedded or amorphous trap, flanked on the east and west sides by Caradoc sandstone. On the north-eastern extremities of these Silurian rocks is an elevated and extensive tract of rocks of the Cambrian system, composing the Longmynd and other mountains, with outbreaks of trap, and these are again succeeded by Caradoc sandstone, the altered and irregular ridge of the Stiperstone, and the trap-rocks of Shelve and Corndon. A vast expanse of Ludlow rocks then succeeds, and extends into Montgomeryshire. Among the trap and sandstones of Shelve and Corndon occur several metalliferous veins containing ores of lead, &c., of considerable value.

The trap-rocks of the Wrekin, &c., as in the other volcanic districts, have disturbed and altered the adjacent strata, and from observing these phenomena and the dislocations of Coalbrookdale and the Cleve Hills, "it may," says Sir R. L. Murchison, "be affirmed that this district in Shropshire furnishes proofs of the alternate play and repose of volcanic action during very long periods." In the northern division of Shropshire granitic boulders occur both isolated and in groups: they occur in groups on the northern face of Haughmond Hill and the north-western slopes of the Wrekin, and isolated in the district lying a few miles south of Shrewsbury. There are numerous saline springs issuing from the new red-sandstone of North Shropshire. A saline spring, called Saltmoor, occurs also at Ashford, on the banks of the Teme below Ludlow, from which, at the period of the Norman conquest, it appears salt was manufactured. On Prolley Moor, on the western side of the Longmynd, there is a spring containing chloride of lime. Chalybeate springs occur near Sherlot Common, in the neighbourhood of Wenlock, at Moreton Say, and other places.

Soil and Agriculture.—The soil of the county along the right bank of the Severn is chiefly a red-clay and gravel, derived from and overlying the new red-sandstone formation; it is favourable for many kinds of agricultural produce. The south-west portion of the county is the least productive. The ground is too steep and elevated, and the soil too light to admit of general cultivation. The valleys consist of loam resting on gravel, and forming good meadow and pasture land. The farms are for the most part arable, but some are for grazing, for hay, for the dairy, and for rearing and feeding. The crops in general cultivation are wheat, barley, oats, peas, vetches, turnips, potatoes, and beans. Some hemp and flax are grown, and some hops on the southern edge of the county adjoining Herefordshire. Irrigation of the grass-land is extensively practised, and with the greatest advantage. The meadows adjoining the Severn and other rivers and streams are often overflowed; and the water lies on them, especially near the Severn, for a considerable time. The fertilising effect of these floods is very great; they generally occur before the grass is in a forward state, or after it has been mown and removed.

Shropshire is not remarkable for its dairy produce. The cattle are reared from the improved breeds of Lancashire, Cheshire, Leicestershire, and Staffordshire. In the neighbourhood of Bishop's Castle there is a good breed of cattle, of a dark-red colour; in the south the Herefordshire breed is more common. Most of the farmers rear a few calves every year. There are some horses bred in Shropshire, as well for the road as the plough. The waggon horses are generally of a strong black sort. Breeding mares constitute a portion of almost every team. On Clun Forest and the Longmynd a small hardy race is reared, approaching to the character of the Welsh pony. The old Shropshire sheep are horned, with black or mottled faces and legs. Their size is nearly that of the South-Down, but the neck is longer and the carcass not so compact. They abound on the Longmynd. The small Welsh breed of sheep exists here, as well as the large Leicestershire sheep. Upon the hills towards Wales the sheep are without horns, with white faces and with shorter legs, and heavier but coarser fleeces than the Shropshire sort. The sheep are not generally folded. Pigs are fattened to a great extent. Some cider and perry are made in the south of the county. The farms generally vary from 100 to 1000 acres; but on the borders of Wales there are many farms not exceeding 20 acres.

Mining, Industry, and Manufactures.—The mineral wealth of Shropshire has been indicated above. Several thousand persons are engaged in raising coal, ironstone, and lime, and in the manufacture of iron. Coal is raised in various parts of the county. In 1740 there were six furnaces in Shropshire, producing 2000 tons of iron annually. The trade was then languishing in consequence of the scarcity of wood charcoal for smelting. But about this period the iron-masters of Coalbrookdale adopted Edward Lord Dudley's invention of smelting iron with pit-coal, and with such success as to give a great and decided impulse to the trade, not only in Shropshire, but throughout England. It is in this county and Staffordshire that the manufacture of iron is seen in its greatest perfection. The beauty and finish of their rolling-machinery, which is run at an immense speed, enables them to secure almost the whole of the very small and extra sizes of iron, which they throw off at little more cost than the Welsh manufacturers do their common bars. A considerable quantity of lead is procured from the Snail-beach Hope, and other mines in the district of Shelve and Corndon.

Among the industrial products of the county are—iron-castings for mill-work and steam-machinery, nails, &c.; china, earthenware, tiles, &c., at Coalport, below Ironbridge on the Severn, and in the neighbourhood of Broseley; glass at Wrackwardine near Wallington;

flannel at Shrewsbury, Oswestry, Church Stretton, and Worthen; coarse linens and linen thread; carpets at Bridgenorth; gloves at Ludlow, &c. There are also numerous paper-mills and mills for dyeing woollen-cloth.

Divisions, Towns, &c.—Shropshire is divided into 12 hundreds, a liberty, and a franchise:—North Bradford in the north-east of the county; South Bradford, central and east; Brimstrey, east; Chirbury, west; Condover, central; Ford, west; Munslow, south; Oswestry, north-west; Overs, south; Pimhill, north; Purslow, south-west; Stottesden, south-east; Shrewsbury liberty, central; Wenlock franchise, central and east.

It contains the parliamentary boroughs and market-towns of BRIDGENORTH, LUDLOW, SHREWSBURY, and WENLOCK; and the market-towns of BISHOP'S CASTLE, BROSELEY, CLEOBURY MORTIMER, CLUN, DRAYTON-IN-HALES, or MARKET-DRAYTON, ELLESMERE, HALES-OWEN, NEWPORT, OSWESTRY, SHIFFNALL, CHURCH STRETTON, WELLINGTON, WEM, and WHITCHURCH. Each of these towns will be found described under its title.

The more important villages we notice here; the populations are those of 1851:—

Bromfield, population of the township 541, is situated on the left bank of the Teme, near the point where it receives the Onny, 3 miles N.W. from Ludlow. A short distance south from the village are the fine mansion and the grounds of Oakley Park. There are some remains of Bromfield priory, an establishment for monks of the Benedictine order. *Dawley*, population of the parish 9201, about 14 miles E. by S. from Shrewsbury, possesses a small market held on Saturday, and an annual fair. There are extensive coal, iron, and lime-works in the neighbourhood; the chain manufacture is carried on; bricks and tiles are made, and numerous tram-roads afford means for transmitting the produce from the respective works. Besides the parish church there are a chapel of ease; chapels for Wesleyan, Primitive, and New Connexion Methodists; National and British schools; and a parochial library. The streets are lighted with gas. *Hodnet*, population 2057, about 13 miles N.N.E. from Shrewsbury, has an ancient parish church, a Free school, and a National school. Malt- ing is carried on, and there are flour-mills. Three annual fairs are held. *Lilleshall*, population of the parish 3987, about 4 miles S.S.W. from Newport, is chiefly remarkable for its ancient Augustinian abbey. There are some beautiful remains of the Abbey church; the west and south doorways are of rich Norman character. The remains are in the occupation of a farmer. There are schools supported by the Duke of Sutherland and by the Lilleshall Mining Company; there is also a savings bank. *Pontesbury*, population of the parish 3363, about 7 miles S.S.W. from Shrewsbury, has some lead-mines, which employ a considerable number of persons. The parish church, which was formerly collegiate, was rebuilt some years ago. There are chapels for Baptists and Independents; also National schools. *Pree*, population of the parish 3196, about 6 miles N.N.E. from Wem, had formerly a market, which has been long discontinued. Two annual fairs are held. The parish church is an ancient cruciform edifice. The Independents have a chapel, and there are Free and Infant schools. Malt- ing is carried on. Tesselated pavements and other antiquities have been found here. *Tilstock*, population of the ecclesiastical district 593, about 3 miles S. from Whitchurch, has a neat chapel of ease, erected in 1834, a chapel for Wesleyan Methodists, and National schools. *Whittington*, population of the parish 1927, about 2½ miles N.E. from Oswestry, has a parish church, a chapel for Independents, and a Free school. Malt- ing is carried on. The ancient castle is noticed elsewhere. *Wombridge*, population of the parish 2166, is about 3 miles E. from Wellington, in an extensive mining district. The Shrewsbury Canal and the Shropshire Canal form a junction near Wombridge. Oakenates station of the Shrewsbury and Birmingham railway is close to the village. Coal and iron are extensively worked. Besides the parish church there are well-attended National schools. *Wrockwardine*, population of the parish 3107, is near the left bank of the river Teme, about 2 miles W. by N. from Wellington. The parish church is a venerable structure, strongly built. At Wrockwardine Wood is a chapel of ease, in connection with which, as well as with the parish church, are National schools. The Shrewsbury Canal, and the Shrewsbury and Birmingham railway, pass near the village. Coal and iron are extensively wrought.

Shropshire is partly in the diocese of Hereford, partly in that of Chester. The whole of the county is in the province of Canterbury. The county is included in the Oxford circuit. The assizes and quarter sessions are held at Shrewsbury, where is the county jail. County courts are held in Bishop's Castle, Bridgenorth, Cleobury Mortimer, Market-Drayton, Ludlow, Madeley, Newport, Shrewsbury, Wellington, Wem, and Whitchurch. Shropshire returns 12 members to parliament, of whom four are for the county, namely, two for the northern division and two for the southern; and two each for the boroughs of Shrewsbury, Bridgenorth, Ludlow, and Wenlock. By the Poor-Law Commissioners the county is divided into 16 unions, namely—Aitcham, Bridgenorth, Church Stretton, Cleobury Mortimer, Clun, Ellesmere, Ludlow, Madeley, Market-Drayton, Newport, Oswestry, Shiffnall, Shrewsbury, Wellington, Wem, and Whitchurch. These unions comprise 295 parishes and townships, with an area of 927,880 acres, and a population in 1851 of 249,716.

History, Antiquities, &c.—Previous to the Roman invasion, the district of which this county is now a part was inhabited by the Cornavii and the Ordovices, their territory being divided by the Severn. It is probable that part of the south of Shropshire was possessed by the Silures. After the subjugation of Britain this county formed part of the Roman province of Flavia Caesariensis. The western side of the county bears numerous traces of this remote period. There are remains of various British camps. The Gaer ditches near Clun, which bear traces of an ancient fortification, have been assigned by Camden and others as the spot where Caractacus encountered Ostorius Scapula and was vanquished. On a hill called Tongley, near Walcot, the seat of the Earl of Powis, are vestiges of a British encampment called Bury Ditch. Other British remains may be traced at Brocard's Castle, near Church Stretton; at Old Port (a corruption of Old Fort), near Oswestry; and on the Wrekin and Cleo Hills. Of Roman stations, one of the principal was Uriconium, or Viriconium, now Wroxeter, a village on the Severn, about 6 miles S.E. from Shrewsbury. A rampart and ditch, with remains of walls, 3 miles in circumference, mark the ancient boundaries of the city. Another Roman station was Mediolanum, supposed by some to have been near Market-Drayton, by others near Meivod; and a third was Rutunium, at Rowton. There were also Bravinium at Rushbury, Sariconium at Bury Hill, and Uricona at Sheriff-Hales. Near the village of Chesterton, in the neighbourhood of Bridgenorth, are the remains of a Roman camp called the Walls: the form is nearly square, and comprises upwards of 20 acres. The Roman road known as Watling-street traversed this county from east to south-west, as far as Church Stretton, whence it took a more southerly course, crossed the Onny at Little Stretton, and entered Herefordshire at the village of Leintwardine.

In the contests between the British and Roman inhabitants and the new invaders, the Saxons, the latter destroyed the Roman towns, Uriconium among the rest; they soon however built another city, to which they gave the name of Scrobbes-burg, the 'town of shrubs' (from the wooded appearance of the neighbourhood), now softened to Shrewsbury. These contests lasted for nearly a century and a half, when the Saxons ultimately succeeded in subduing the inland Britons. The district thus occupied by the Saxon chiefs extended as far as the base of the Welsh mountains, and became one extensive Saxon state, known by the name of Myrcnaland, or Myrcna-ric, 'the land or kingdom of the borderers,' Latinised into Mercia, and subsequently corrupted into the Marches of Wales, which were united to the kingdom of Mercia by Penda in 626. In consequence of attacks upon this portion of his territory by the Welsh princes, Offa, king of Mercia, formed the dyke or rampart which still bears his name, extending from Flintshire on the north to the Bristol Channel on the south, and which seems to have been intended as a defence as well as a boundary between the Saxons and the Britons. It crosses several portions of the western part of this county, and may be traced on the high ground where cultivation and the ploughshare have not levelled it. In 849 the Danes penetrated as far as the Severn, and in the following year reached Wales. In 896 they established themselves at Cwattbridge (Quatford) on the Severn, south of Bridgenorth, where they built a fortress, and passed the winter. At Cleobury Mortimer are the remains of what is supposed to have been a Danish camp. When Alfred succeeded in subduing the Danes, and uniting the seven Saxon kingdoms into one, Scrobbesburg was one of his principal cities, and he gave the same name to the shire of which it is the capital: from this name, Scrobbesburg-scire, has come the present designation, Shropshire.

William the Conqueror granted to his relative Roger de Montgomery nearly the whole of the county, and to many of his followers all the lands they might conquer from the Welsh; the consequence was, that a bitter warfare was carried on against the ancient possessors of the soil for upwards of three centuries. These Lords Marchers in course of time established a court of their own to settle disputes among themselves. They built towns and erected castles, and to them may be attributed the greater portion of the numerous castles in this county.

In consequence of repeated incursions of the Welsh, Edward I., in order to be near the seat of war, removed the courts of King's Bench and Exchequer to Shrewsbury, where they were held for some time. In 1397 Richard II. adjourned his parliament from Westminster to Shrewsbury, where it was held with great splendour. In the revolt of Owen Glyndwr, in the reign of Henry IV., this county was the theatre of several contests. The memorable conflict between Henry IV. and the Percies, known as the Battle of Shrewsbury, took place on the 21st of July, 1403, at Berwick, within three miles of Shrewsbury, and terminated in the defeat and death of Hotspur.

In the contests between the houses of York and Lancaster, Shrewsbury, Ludlow, and the border country in general, espoused the cause of the former; and it was perhaps in gratitude for these services that Edward IV. re-established the court of the resident and council of the marches of North Wales, which was held at Ludlow till its abolition by act of Parliament in the reign of William III. The Duke of Richmond, afterwards Henry VII., having assembled his army on the Long Mountain on the borders of this county, marched to Shrewsbury, where, after some hesitation on the part of the bailiff, he was enthu-

siastically received by the inhabitants, and joined by the tenants of the Earl of Shrewsbury, who accompanied him to Bosworth Field.

The most important of the old castles of Shropshire are mentioned in the notices of the towns referred to in a previous part of this article. It remains to notice briefly a few others of which remains still exist.

Acton Burnell Castle, 7 miles S. by E. from Shrewsbury, was founded or restored by Robert Burnell, bishop of Bath and Wells, treasurer and afterwards chancellor of England. It is remarkable as being the place where a parliament was held in 1284, in the reign of Edward I. The Act entitled Statutum de Mercatoribus was passed here. The remains of the castle consist of a square building, with a tower at each corner. Cause Castle, near Westbury, is a mere confused heap of ruins, a great portion of the stone having been removed. The site of the castle is one of the most lofty and commanding in the western border of this county. Hopton Castle, situated a little south of Clunbury, was held for the Parliament in the reign of Charles I., and was besieged for upwards of a fortnight. It is now in complete ruin. Whittington Castle, near Oswestry, was formerly a place of considerable importance; the ruins are extremely picturesque, and include eight massive towers. The east wall is washed by a lake.

The remains of some of the abbeys in Shropshire are very beautiful. Buildas Abbey, situated at the village of Buildas, on the right bank of the Severn, about 11 miles below Shrewsbury, was founded in the year 1135. The walls are nearly entire. The building is cruciform, with a massive tower rising from the intersection. The lower story of the tower remains, resting on four arches springing from brackets in the walls. Of Haughmond, or Hsghmond Abbey, situated on a rising ground 4 miles east of Shrewsbury, and founded in 1100, the chapter-house is entire. It is oblong, the upper end forming two sides of a hexagon. Lilleshall, or Lilleshull Abbey, near the village of Lilleshall, 3 miles S. from Newport, is an extremely beautiful ruin. It was founded in the reign of Stephen. The church, which was cruciform, was 228 feet in length. The south door communicating with the cloister is one of the richest early Norman arches in the kingdom. The abbeys of Shrewsbury and Wenlock are noticed elsewhere. There are also remains of an abbey near Alderbury, called New or White Abbey, founded by Fulke Fitz-Warine, in the early part of the 13th century. At Chirbury, on the borders of Montgomeryshire, are traces of an Augustinian priory, founded in the reign of John; its nave forms the present parish church. White Ladies' Priory, near Tong, on the borders of Staffordshire, is a picturesque ruin, situated in a sequestered spot. It was inhabited by White, or Cistercian, nuns as early as the reign of Richard I. or John. White Ladies' and Boscobel House, near it, afforded concealment for a short time to Charles II. after his defeat at Worcester.

Statistics: Religious Worship and Education.—According to the Returns of the Census in 1851, it appears that there were then in the County 679 places of worship, of which 291 belonged to the Church of England, 273 to eight sections of Methodists, 59 to Independents, 81 to Baptists, 11 to Roman Catholics, 3 to Quakers, 3 to Plymouth Brethren, 2 to Irvingites, 2 to Mormons, and 1 to Unitarians. The total number of sittings provided was 145,186. There were 559 day schools in the county, of which 247 were public schools, and 312 were private schools, with an aggregate of 25,254 scholars. Of Sunday schools there were 298, with 22,705 scholars. Of evening schools for adults there were 14, with 175 scholars. There were 8 literary and scientific institutions, with 802 members, and about 2500 volumes in the libraries belonging to them.

Savings Banks.—In 1853 the county possessed 11 savings banks at Bridgenorth, Ellesmere, Lilleshall, Market Drayton, Newport, Oswestry, Shiffnall, Shrewsbury, Wellington, Wenlock, and Whitchurch. The total amount owing to depositors on November 20th 1853 was 635,911*l.* 10*s.* 6*d.*

SHUMLA, or SHUMNA, a fortified town in European Turkey, is situated on the northern slope of an offset of the Balkan Mountains, which forms the watershed between the Paravati and the Akeli Kamchik rivers, near the point indicated by 43° 18' N. lat., 27° 2' E. long.; 225 miles N.N.W. from Constantinople, 65 miles S.E. from Rustschuk, 48 miles nearly due W. from Varna, and 60 miles S. by W. from Silistria, with all which towns it is connected by track-roads. Roads, or tracks, from the principal fortresses of the lower Danube and the Dobruscha on the north, and from the several passes of the Eastern Balkan on the south, converge upon Shumla; these advantages and its strong position make it the 'Key of the Balkan.' And yet it is not the town that is so strong, though it is defended by a wall and a citadel; but on the heights that command it on the south and west the Turks have formed entrenched camps, so as to prevent any enemy from reaching the passes of the Balkan by this route, and are enabled to detach forces for the defence of any point in the range that is threatened. The place itself has little resemblance to a town or a fortress; it is more like a vast Bulgarian village, each house standing within its own yard and gate, which inclose also the stables and cowhouses. The streets, so called, are dirty and unpaved. In 1847, when visited by General Jochmus, there were about 5000 Turkish and 1000 Christian families in Shumla, which would give a population of 30,000; 30 mosques and baths, one Greek and one Armenian church, and three Christian schools (in which the Bulgarian language, a Slavonic

dialect, is taught), cavalry and infant barracks, and a new hospital. Three new forts had been built in the plain, and one on the heights, and the garrison was only about 1000 infantry and 800 cavalry; but after the outbreak of the war with Russia the fortifications were greatly extended and completed by Omer Pasha, who made Shumla his headquarters for a considerable part of 1854.

Shumla is usually a place of some commerce; English and other foreign manufactures are exposed for sale in the bazaar. It had formerly, perhaps still has, considerable cotton, silk, and woollen manufactures, which supplied a great part of Bulgaria and Wallachia, but the Austrian trade since the establishment of steam navigation on the Danube, has injured these branches of commerce. There is also a good trade in copper and tin wares. The mausoleum of Djezair Hassan Pasha is named as one of the most attractive objects in Shumla. There are some Roman remains in the shape of decaying fountains and arches, and in the plain that skirts the town to the north and east there are many of the t^{ép}s, or mounds, which abound in Bulgaria. The Paravati River, which runs east of Shumla generally in a narrow valley to the sea at Varna, is the ancient *Lyginos*. The Kamchik, which drains the northern and southern slopes of the Little Balkan and enters the sea 14 miles south of Varna is the ancient *Pamysus*.

Shumla first came into the hands of the Turks by capitulation in 1387. The Russian armies in their attacks upon Turkey have been thrice repulsed from Shumla: in 1774 under Rumjanzow, in 1810 under Kaminskoi, and in 1828 under Wittgenstein. Soon after however Marshal Diebitsch, after fighting a battle at Kulefcha, a little to the east of Shumla, marched eastward by Pravati, and, forcing the passes of the Eastern Balkan, made himself master of Adrianople.

(General Jochmus, in *London Geographical Journal*, vol. xxiv.)

SHUSTER. [PERSIA.]

SIACK. [SUMATRA.]

SIAM, in Asia, including the countries tributary to or dependent on it, extends from 4° to 22° N. lat., 98° to 105° 20' E. long. It comprehends a vast extent of country in the peninsula beyond the Ganges, and the larger part of the Malay peninsula. It is bounded E. by the kingdom of Cochinchina, or Annam; N. by the province of Yun-nan, China, and that part of Laos which is subject to the Birman; W. by the Birman empire, from which it is separated by the river Saluen, the British province of Tenasserim, and the Gulf of Bengal; and S. by the independent states of the Malay peninsula, Perak, and Pahang. The area is very variously estimated, but is probably not less than 250,000 square miles. The population was estimated by Crawford at 2,790,000, but more recent travellers estimate it at from 5,000,000 to 6,000,000, which is probably much more nearly correct.

Surface, &c.—Siam possesses a great extent of coast. That portion of the Indian Ocean which is called the Gulf of Siam, and extends from south-east to north-west above 500 miles, with an average width of about 250 miles, is almost entirely surrounded by the countries subject to Siam. The Gulf of Bengal forms a coast-line of 529 miles; and the Indian Ocean, with the Gulf of Siam, one of 1467 miles.

A considerable portion of Siam is covered with mountains and hills. The mountainous and hilly part appears to be connected with two chains of mountains, running south and north, and terminating at their northern extremity in the snow-covered mountain ranges which surround the elevated table-land that forms the centre of the Chinese province of Yun-nan. Between these two ranges lies the wide valley of the river Menam.

The western of the two great chains, called by geographers the Mountains of Siam, separates the basins of the rivers Saluen and Menam, and occupies also the northern portion of the Malay peninsula, as far south as 11° N. lat. Towards its southern extremity (between 15° and 12° N. lat.), it is probably not more than 70 miles across, but is divided into two ridges, which inclose the narrow valley in which the Tenasserim River runs southward. The whole of this range appears to be covered with jungle or high trees. Some of the summits rise, according to a vague estimate, to between 5000 and 8000 feet. The ridge which extends along the eastern banks of the Tenasserim River is called by the Siamese Sam-ra-yot, or the 'Three Hundred Peaks.' It consists of lofty mountains, extremely rugged on their flanks as well as summits, and rising in innumerable bold conical peaks. This ridge, which lowers considerably as it approaches Kwi Point (12° N. lat.), does not come near the Gulf of Siam, but leaves between it and the shores a level country, apparently alluvial, on which rise some insulated peaks. The mountains of Siam terminate near 11° N. lat., on the isthmus of Kra. Three passes are known to lead over these mountains between Tenasserim and Siam, but only one of them seems adapted to facilitate the intercourse between the two countries. It leads from Molmein, near the confluence of the river Ataran with the Saluen, along the banks of the Ataran to its source, where the range is passed at a place called Prasong-tahu, or the 'Three Pagodas.' Thence it passes into Siam, and traverses the rich and fertile valley of the river Mekhlong nearly to its mouth, at the town of the same name.

The high ground which traverses the isthmus of Kra from north to south, extending from 12° to 9° N. lat., can hardly be called hilly. It is separated from both the mountains of Siam and those of the Malay peninsula, which lie north and south of it, by deep and

wide depressions. The northern of these depressions occurs near 11° N. lat., where the ground that separates the Pakchan River, which falls into the Gulf of Bengal, and the Choomphon River, which enters the Gulf of Siam, is so low, that, according to the statement of the natives, the two rivers often unite their waters during the spring-tides. Both rivers are navigable for boats, and they could be readily so connected as to constitute a short and direct water-communication across the isthmus between the Bay of Bengal and the Gulf of Siam. The southern depression occurs at the southern extremity of the isthmus of Kra, and crosses the peninsula obliquely from the Bay of Bengal, east of Phunga, or Ponga (8° 15' N. lat.), running north-east to the town of Pennom, east of which it expands to a great width, comprehending the low country on both sides of the river Thakham, between the towns of Phoon-phin and Chai-ya.

The mountains of the MALAY PENINSULA have been noticed under that head. The undulating country which separates the Malay mountains and the mountains of Siam from the Bay of Bengal, and extends a few miles inland, terminates on the shores with a coast of moderate elevation. It appears to be of slight fertility, and is thinly inhabited. At a distance of from 10 to 20 miles this coast is lined with a series of islands. The long channel between them and the mainland has depth enough for the largest vessels; near the continent there is indeed seldom above 4 or 5 fathoms, but near the islands there are generally from 20 to 30 fathoms. Many vessels sail through it during the south-western monsoon, as the heavy sea is greatly broken by the islands. The islands themselves are rocky, and most of them high: some rise to more than 3000 feet. The channels between them are very deep, and usually free from danger. Most of these islands are only from 2 to 6 miles long. The largest, from north to south, are the following:—*St. Matthew's Island* (10° N. lat.), also called *Elephant Island*, is about 12 miles long and 6 miles wide, and has at the north part an excellent harbour, 4 miles long and 3 miles wide, called *Elephant's Harbour*. The highest part, situated in the middle of the island, is nearly 3000 feet above the sea-level. *Salanga*, or *Junk Seylon* (8° N. lat.), is about 16 miles long and 6 miles wide. It is separated from the continent by the Strait of Papua, in which there are only from 2 to 3½ fathoms of water. On the east side of Salanga are some tolerably good harbours. Provisions are abundant, and tin was formerly exported. Towards its southern extremity is a high mountain. Farther south, between 6° 49' and 6° 8' N. lat., is the group of the *Lancava Islands*, which, in addition to several smaller ones, contains the islands of Trotto, Lancawi, and the two Laddas. They are also very elevated, and have some good though little frequented harbours.

The eastern coast of that portion of the Malay peninsula which belongs to Siam is much lower and wider, the mountains being frequently 15 and 20 miles distant. In fertility it is also superior to the western coast: several extensive tracts yield rich crops of rice; and others, though uncultivated and covered with jungle, exhibit a vigorous vegetation. The islands along this coast are not numerous, nor elevated, except Tantaem, the largest, which however is not very high.

To the east of the mountains of Siam is the large valley of the river Menam. According to Crawford, it extends from the most northern recess of the Gulf of Siam to Pech-ai (between 19° and 20° N. lat.) 360 miles; and its breadth at its southern extremity does not exceed 60 miles. But this alluvial tract towards its southern extremity, at least on the west, is inclosed by a more elevated country of equal width and of considerable fertility. In this valley, as far as it is known to Europeans, the fertility of the soil is not inferior to that of most countries between the tropics which are subject to the inundations of a large river. The banks of the river, being more elevated than the country at a distance, are studded with villages and towns, and the lower grounds are covered with extensive rice-fields.

The mountain range which divides the valley of the Menam from that of the river Maekhaun, or Camboja, is little known. Between 19° and 20° N. lat. a great interruption in the mountain chain occurs; and it is said that in these parts an arm of the river Maekhaun branches off and runs to the Menam, so as to constitute, at least during some part of the year, a natural water communication. This mountain range, which is called the mountains of Camboja, in consequence of its dividing the last-mentioned country from Siam, where it approaches the Gulf of Siam between the river Bang-pa-kung (14° 40' N. lat.) and Chan-ti-bon (12° 20' N. lat.), and again between Tung-yai (12° N. lat.) and Kong (11° N. lat.), is of moderate elevation, and covered to its summits with high trees and vegetation.

Between the towns of Chan-ti-bon and Tung-yai lies a plain, which extends from the shores of the Gulf of Siam far inland, the mountains in these parts receding so far from the shores as not to be visible from the sea. This tract, which constitutes the province of Chan-ti-bon, is one of the most fertile and populous districts in the Siamese empire. It is in general well cultivated, and from 300 to 400 vessels are employed in taking the produce to Bang-kok, near the mouth of the Menam, whence a great portion of it goes to China.

That portion of the Siamese empire which lies east of the Mountains of Camboja belongs to the basin of the river Maekhaun, or river of Camboja. It is almost entirely unknown, but seems to extend in wide plains, which terminate south of 15° N. lat. on the

river Maekhaun, which here divides Siam from Cochin-China, but north of 15° the plains reach so far east as to come up to the mountain range of Cochin-China, whose western declivity is in these parts included within the territories of Siam. This extensive country, though fertile, is but thinly peopled.

Rivers and Lakes.—The river Saluen, which forms the boundary between Siam and the Birman empire for 150 miles, is noticed under BRMA. The Maekhaun is noticed under COCHIN-CHINA. Several of the small rivers which drain the eastern side of the Malay peninsula are navigable for a few miles, as the Thawang, which passes near Ligor (between 8° and 9° N. lat.). But the most important of the rivers of Siam is the *Menam*, a name which signifies, in the Siamese language, 'mother of waters.' This river rises in the south-western districts of the Chinese province of Yunnan, with two branches. The western and longer one, called Nanting-ho, has its origin near 24° N. lat., and has a general southward course until it joins (south of 22° N. lat.) the other branch, called Maepraen, which the Siamese regard as the principal branch. The united river preserves the name of Maepraen, and traverses Lower Laos, or Yun-shan, where it becomes navigable for boats at the town of Chang-mai, or Zamaś, the capital of that country. Farther down the navigation is much impeded by rapids and cataracts, so that in several places, according to Kämpfer, goods must be taken out of the boats and transported to some distance by land. From the place where an arm of the Maekhaun is said to join the Menam, the river is called Menam, or Meinam, and, so far as we know, no impediments to navigation occur farther down. Above Ayuthia, the ancient capital, the river divides several times, and contains some very large and several smaller islands. On one of the latter Ayuthia is built. The last division of the waters occurs below Bang-kok, the present capital. When Kämpfer wrote, 1690, the middle embouchure called Tachin was the deepest, and by it large vessels entered the river, but at present both this and the western branch have only from 8 to 12 feet of water on the bar. The eastern arm, which at present is the only one navigable for large vessels, varies below Bang-kok from three-quarters of a mile to a mile and a half in width, and the depth, even close to the low banks, is from 6 to 10 fathoms, whilst its rapidity during the low tide is about 3 miles an hour; the navigation is however impeded by an extensive mud-bank which lies opposite its mouth, and extends about 10 miles into the sea. The highest water on this bar from February to September is about 13½ feet, and in the remaining four months, in which the country is inundated, somewhat more than 14 feet. The Menam, like all large rivers which have their source or course between the tropics, inundates the flat country contiguous to its banks. In the lower part of the river the water begins to overflow in the month of September, and continues to rise to the beginning or middle of November, when it decreases; and at the end of December the waters re-enter the bed. But farther to the north the increase takes place sooner. The inundations contribute greatly to the fertility of the alluvial tract by the mud which they deposit. The whole course of the Menam does not exceed 800 miles, and this river is therefore greatly inferior to the Irawaddi and the Maekhaun.

It is not known whether any of the upper tributaries of the Menam are navigable; but the two rivers which fall into it from the west near its mouth are both navigable. The most western, the *Mekhlong*, which has also given its name to the western embouchure of the Menam, runs through a country in which hills and plains of some extent alternate, and is navigable by boats up to the fortress of Luntshang, a place of some commerce 200 miles from the mouth of the river. The eastern river which reaches the sea by the central embouchure of the Menam, to which it gives its name, Tachin, is also navigable for a considerable distance. The plains along its banks are inhabited by many Chinese, who cultivate the sugar-cane.

About 30 miles east from the eastern mouth of the Menam is that of the river *Bang-pa-kung*, which originates in the mountains of Camboja, between 15° and 16° N. lat. It runs west-south-west; is said to be not much inferior in size to the Menam itself; and has an equal depth of water on its bar. It drains a country highly productive in rice and not inferior in fertility to the alluvial tract that surrounds Bang-kok and Ayuthia.

A large lake called the Lachado is said to exist in the parallel of, but a considerable distance west from, Ayuthia; a river called Talan carries off its waters to the Menam.

Climate.—At Bang-kok, the only place of which we have any detailed information, the year is divided between the dry and the wet seasons, as in other tropical countries. The dry season lasts from October to April, and during this time the weather is temperate, but in April and the beginning of May, before the rains set in, the thermometer is daily from 95° to 96° in the shade. The periodical rains commence early in May, and go on increasing, so that in June and July they are extremely heavy. In August the rains are usually light, and they cease in September. The river has then risen so as to inundate the country, and it continues to rise to the end of November. The greatest rise of the river at Bang-kok is 18 feet. During the rains hard gales from the south and south-west are frequent, and with the rain they moderate the heat. The prevailing winds are connected with the monsoons; and during the year blow regularly from all points of the compass.

Productions.—Siam is rich in natural productions. Rice is most extensively cultivated and largely exported, chiefly to China. On the alluvial soil of the Menam it generally yields forty-fold; and when only thirty-fold, it is considered an indifferent crop. With the exception of Bengal, Siam unquestionably exports more rice than any country in Asia. Maize is also extensively cultivated, particularly in the mountain districts, but it is not much exported. Wheat and other cereals are little if at all grown. Of leguminous plants, the *Phaseolus radiatus*, the *Phaseolus maximus*, and the *Arachis hypogaea* are most commonly cultivated, and the first is exported to China and the Malay Islands. The roots cultivated in other tropical countries are common, especially the sweet potato. The cocoa and areca palms are cultivated extensively in the lower tracts, and the oil obtained from the first is an important article of export. Siam is noted for a great variety and abundance of fruit-trees, and their produce surpasses that of all other parts of India in flavour. The neighbourhood of Bangkok is one forest of fruit-trees. The most exquisite fruits are the mango, the mangustan, the orange, the durian, the lichi, and the pineapple, with many others of inferior value.

Several other plants are cultivated as articles of foreign trade. The most important is the sugar-cane, which is extensively exported to China, the western parts of Hindustan, Persia, Arabia, and Europe. The cultivators of the cane are always Siamese, but the manufacturers of sugar are invariably Chinese. Black pepper of a superior quality is cultivated to an enormous extent in the country east of the Gulf of Siam; nearly the whole of it is exported to China. Tobacco, which formerly was imported, is now grown so generally, that considerable quantities are exported to Cochin-China and to several of the Malay countries; the best is grown in the countries east of the Gulf of Siam. Cotton does not succeed in the low countries, but a cotton of good quality is grown in the more elevated tracts on the Malay peninsula, and in those which divide the alluvial region of the Menam from the mountains of Siam.

The forests, which cover nearly all the mountain ranges of Siam, yield several articles of trade. Cardamums are collected in the forests on the mountains of Cambodia, and go to China, where they fetch a very high price. In the mountainous and woody districts of Laos a gum is collected which nearly resembles benzoin, with which it was long confounded. Gamboge is collected in the mountains of Cambodia, whence its name. Aquila-wood is procured in the countries east of the Gulf of Siam, as far north as 13° 30' N. lat., and considerable quantities of it go to China, where it is used as a perfume in the temples. Sapan-wood is got from the forests, with which the mountains of Siam are clothed, between 10° and 15° N. lat. In point of quantity, if not of value, it is the most considerable of all the exports of Siam. It is principally sent to China, but a very considerable quantity is also exported to Bengal and Europe.

The forests of Siam contain many valuable timber-trees; one which yields a considerable article of export, is called by the Siamese Waideng, or red-wood, and by the Portuguese Pao Rossa, or rose-wood, but it does not resemble the rose-wood used in Europe, though it is used in China, whither large quantities are exported for cabinet-work. The teak-forests are very extensive, but all of them are in Laos, or north of 16° N. lat.; great numbers of teak-trees are floated down the Menam, when the river is swollen, to Bangkok.

In Siam the elephant exists in the greatest perfection. The finest are found in the forest of Suphan, between 14° and 15° N. lat., west of Bangkok, but they inhabit every part of the kingdom. In Bangkok their use is prohibited, except to a few persons of very high rank. In all other parts of the country they are freely employed, both for riding and as beasts of burden, especially in Southern Laos, whose capital, Lanjang, takes its name from this circumstance, signifying 'the place of ten millions of elephants.' The number of wild elephants is very great, and they are regularly hunted on account of the government. White elephants are found occasionally; they are regarded with great veneration, and two or more are kept in a royal watt, or temple, and attended by a large band of priests. The person who succeeds in trapping a white elephant receives a considerable reward; if the animal be a very fine one the reward is a handsome pension, which is continued to his descendants. The double-horned rhinoceros is more frequently met with in Siam than in any other country: like the elephant it is hunted for its hide and horn, both of which are exported to China. The tiger is extremely common, though not equal in size to that of Bengal: his bones and skin constitute a considerable article of commerce with China; the bones are used by the Chinese as a medicine. The black tiger is by no means rare. The skins of leopards, which are also very common, go to China. The true civet (*Viverra civetta*) is reared by the Siamese for its musk. The scaly skin of the pangolin (*Manis pentadactyla*) is sent to China, where it also appears to be used for its supposed medicinal virtues. There is also the orang-utan. There are seven different kinds of deer, among which the common stag (*Cervus Elephas*), the muntjac, and the chevrotin (*Moschus pygmaeus* and *Javanicus*) are most common. The buffalo is numerous in the alluvial tracts, where it is preferred to the ox for agricultural labour. Black cattle are more numerous in the more elevated districts, and are only kept for agricultural purposes, their milk being too trifling in quantity to be useful, and the slaughter of them is forbidden even to strangers.

But the numerous wild cattle which are found in many parts of the country are shot by professed hunters, for their hides, horns, bones, and flesh; the flesh, after being converted into jerked beef, forms an article of trade with China. The horses of Siam are of a small kind, resembling our ponies. A small kind of goat is kept about the temples. Hogs are very numerous, both in a domestic and in a wild state. The lard, prepared with great care, is exported to the European settlements in the neighbouring countries. Fowls in their wild state exist in the forests of Siam, and the common fowl is reared in the lower countries. Common ducks are reared in great numbers by the Chinese, but geese are almost unknown. The peacock is common in the forests, and the feathers are exported to China. There are several species of pheasants and pigeons, and also of wading birds. The feathers of the kingfisher, the blue jay, the pelican, and several birds of the crane and stork families, are sent to China. There are tortoises and crocodiles in the Menam, but they are not so common as in the Ganges. The green turtle (*Testudo Midas*) abounds on the islands along the eastern shores of the Gulf of Siam, and the eggs are sent to Bangkok, where they are used for food. Lizards and serpents are numerous.

Fish are abundant, but generally of inferior quality; several kinds however are dried and exported. Shrimps and prawns dried and prepared are an article of export under the name of balachang. The *Coccus lacca* produces the dye or gum called lac in commerce. The lac of Siam is of very superior quality, containing a larger portion of colouring-matter than that of Bengal and of the Birman empire. It is exported to China and the European settlements.

Several kinds of animals in Siam contain individuals of a white colour, which is rarely the case in other countries. Besides white elephants, Finlayson found white monkeys, white buffaloes, and white deer, and he thinks that this anomaly in the colour of the animals is connected with the peculiarities of the climate.

Gold is obtained in small quantities in the mountains of the Malay peninsula, and at the southern extremity of those of Siam. Tin exists in many places in the southern mountains, in those of the Malay peninsula, and also on the island of Salanga. It constitutes a considerable article of export. Iron is very abundant in both ranges which form the boundary of the valley of the Menam, and is worked on a very extensive scale. Copper and lead are found in some places, and worked to some extent. Zinc is said to abound, but is not worked. Antimony is worked on a small scale. The sapphire, the Oriental ruby, and the Oriental topaz are obtained by digging the alluvial soil at the bottom of the hills that surround the plain of Chan-ti-bon. Salt is made in the low wooded and uninhabited country which extends along the sea between the mouths of the Menam.

Inhabitants.—The population of Siam is composed of different nations, part of whom are aborigines, and part emigrants from other countries. The first class of inhabitants consists of Siamese, Laos, Cambodjans, and Malays, who have attained a certain, though different degree of civilisation, and of Kariang, Lawa, Kha, Chong, and Samang, who occupy some mountain regions, and seem to be backward in civilisation. The immigrant nations are Chinese, Mohammedans, Hindoos, Peguans, and Portuguese.

The Siamese, Laos, Cambodjans, and Malays, who constitute about three-fourths of the entire population, seem to belong to the same race with the Birman and inhabitants of Cochin-China: they are all members of the great Mongol family. Their average height is five feet three inches. The skin is of a lighter colour than that of the Asiatics to the west of the Ganges, a colour which, in the high ranks, where a yellow cosmetic is generally used, approaches that of gold. Its texture is remarkably smooth, soft, and shining. They have a strong tendency to obesity. The cheek bones are large and prominent, and give to the whole face the form of a lozenge. The forehead, though less prominent towards the side, is broad, and covered with the hairy scalp in greater proportion than in any other people. In some it descends to within an inch, or even less, of the eyebrows, covers the whole of the temples, and stretches forward to within nearly the same distance of the outer angle of the eye. The diameter of the head from the front backwards is very short, and hence the general form is somewhat cylindrical; and, in a great number of instances, from the crown to the nape of the neck is nearly a straight line. The top of the head is often unusually flat. The hair is black, thick, coarse, and long. The features are never bold, prominent, or well defined. The nose is small, round at the point, but not flattened as in the negro; and the nostrils, instead of being parallel, diverge greatly. The mouth is wide, but not projecting; the lips are rather thick. The eyes are small, and the outer angles are more turned up than in the western races, though not so much as in the Chinese. The eyebrows are neither prominent nor well marked. The beard consists only of a few straggling hairs.

The Siamese call themselves Thay, but are called by the Malays, and some other neighbouring nations, Zëam, or Zam, from which word the term Siam is derived. They speak a peculiar language, of which however that which is spoken in Laos is only a dialect. It consists of monosyllabic words; but these are mixed with a considerable number of words taken from the Pali language, and others from the Chinese. The alphabet is mixed up with characters taken from the

Pali and Devanagari. It is used in common life, and some poetry and novels, as well as historical compositions, are written in it. But the sacred literature is only written in the Pali language, which, together with the worship of Buddha, was introduced into Siam and the adjacent countries in the 4th century of our era.

Divisions and Towns.—The government of Siam is an absolute despotism, not limited even by ancient customs, by the established tenets of religion, or by the authority of hereditary chiefs. Siam is composed of countries which constitute the kingdom of Siam, and are immediately subject to the sovereign; and also of tributary countries, governed by their own princes, who are dependent on the king of Siam. The former consist of the kingdom of Siam, called by the natives Iudara Thay-nu, and of a portion of the kingdom of Cambodia, called by the Siamese Iudara Shan. The tributary princes inhabit the countries north and south of the kingdom. On the north are the countries of the princes of Laos; and on the south the princes who govern a portion of the eastern coast of the Malay peninsula.

Iudara Thay-nu, or Siam Proper, comprehends the countries along the eastern coast of the Gulf of Siam, as far inland as the mountains of Cambodia, and those in the basin of the river Menam as far north as 19° N. lat., together with the isthmus of Kra, the Malay Peninsula, and as far south as the British colony of Province Wellesley, 5° N. lat. The small Malay kingdom of Keddah, or Queda, has been incorporated into Siam proper, and now constitutes a part of the province of Ligor. Siam proper is divided into eighteen provinces.

BANG-KOK, the new capital, and Ayuthia, the ancient capital, are on the banks of the Menam River. *Ayuthia, or Yuthia,* stands on an island formed by two arms of the river Menam, and is also called Duarawadi, and sometimes Iudara, or by the Europeans Siam. It was taken in 1767 by the Birmans, and from that time ceased to be the capital. It is now a mere ruin, with scarcely any inhabitants. The country which extends from this town southward to Bang-kok and the mouth of the river is well cultivated and has numerous villages, except near the sea, where the low shores, inundated by the high tides at full and change, are covered with trees, and only inhabited by persons who make salt.

Bang-pa-sie is near the mouth of the river Bang-pa-kung, which has a mud-bar with only 12 feet of water on it, but within the river deepens to from 2½ fathoms to 3 fathoms. The town is a considerable place, and carries on an active commerce with Bang-kok. Around it is a large tract of low alluvial ground of great fertility and very productive in rice and sugar-cane. Farther up on the banks of the same river is the town of Patriyu, which contains a considerable population, and is fortified.

Chan-ti-bün, the capital of a province of the same name, stands near the coast, 180 miles S.E. from Bang-pa-Sie; it is a small but rather populous and busy place, exporting the produce of the province, consisting of rice, pepper, gamboge, cardamums, and aquila-wood. The river on which it is built forms at its mouth a harbour that affords anchorage in 5 or 6 fathoms water, but the river is only navigated up to the town by small boats which carry goods from this place to Bang-kok. South of Chan-ti-bün is the small town of *Tung-hay,* near the mouth of a little river which falls into a broad arm of the sea. It exports pepper and aquila-wood.

Pi-sa-luk is a considerable town on the Menam, near 18° 30' N. lat. In the valley of the Mekhlong River, west of Bang-kok, there are also some commercial towns. At the mouth of the river is the town of *Mekhlong,* with 13,000 inhabitants, which has a harbour for small vessels, and carries on a considerable trade. Higher up, *Rat-phri,* has 10,000 inhabitants, *Pak-prck,* 8,000 inhabitants, and *Bant-chiom,* 5,000 inhabitants, and these places have a considerable trade with the adjacent countries. Much sapan-wood is cut in the forests on the neighbouring mountains. At *Lamtechang,* which is a small place, but has some commerce, the river becomes navigable. South of Mekhlong, near the shores of the Gulf of Siam, is the town *Pri-pri,* which has a considerable population, and exports rice and palm-sugar. The harbour is only accessible to vessels of small burden.

On the isthmus of Kra, along the coast of the Gulf of Siam, are the towns of Choomphon, Chai-ya, Bandon, Phumphin, and Phosuga, but none of them are of much consequence.

In the part of Siam proper which lies south of the isthmus of Kra, on the Malay peninsula, are several towns. *Ligor* has about 5,000 inhabitants, and some trade with China, to which country cotton, black pepper, tin, and rattans are exported. *Talung* lies farther to the south, on a river which falls into the channel between the mainland and the island of Tantailem. From this place a road crosses the peninsula, which leads to *Trang,* a small harbour and town on the Gulf of Bengal: it is not much used. Still farther south, and near the boundary of the Malay kingdom of Patani, is the town of *Sungora,* or *Sungkla,* which is built partly on the continent and partly on the southern extremity of the island of Tantailem.

Samui, a small island in the Gulf of Siam, near 10° N. lat., and several miles from the eastern coast of the isthmus of Kra, is very fertile, and a place of trade, being visited annually by some Chinese junks, which export cotton and edible birds'-nests. The group of the *Sichang Islands* lies within the more narrow portion of the Gulf of Siam, not far from the eastern coast. They are eight in number, and the largest, properly called *Sichang,* is five miles long and about a mile

and a quarter wide in its broadest part. Between this island and Kohkam, the next in magnitude, is an excellent harbour.

That portion of the kingdom of Siam which formerly belonged to the kingdom of Cambodia lies on the west of the river Maekhaun, and is called Bangtang. It consists for the most part of extensive level flats, which stretch from the river many miles westward to the mountains of Cambodia, but the population is said to be small.

The tributary states of Laos, and those on the Malay peninsula, are noticed under LAOS and MALAY PENINSULA.

Manufactures.—The Siamese do not distinguish themselves in any of the useful arts, and are much behind the Hindoos and Chinese. Even their vessels and trinkets of gold and silver are imported from China; but certain gold and silver vases of handsome form and neat workmanship are fabricated in the palace of the king, and presented to the chiefs as insignia of title and office. The manufacture of silk and cotton stuffs is wholly in the hands of women; the fabrics are of a very coarse and homely texture, and greatly inferior to those made in Java and Celebes. A common description of coarse pottery is made in the country, but all the ordinary and better descriptions are imported from China, and in large quantities. The Chinese, who settled in Siam during the last century, have introduced some branches of industry. Besides the fabrication of sugar, which they have greatly extended, and the working of the neglected mines of iron, they carry on the trades of blacksmith, tinsmith, and currier on a large scale. Considerable quantities of wrought-iron are produced by them, and at Bang-kok there are several extensive manufactures of cast-iron wholly conducted by Chinese. The manufacture of tin vessels is very considerable. The preparation of leather is carried on to a great extent, not for the purpose of making shoes, which are scarcely used, but for covering mattresses and pillows, and for exportation to China. Tigers' and leopards' skins, &c., are preserved with the fur on, and exported to China.

Commerce.—Siam, in a commercial point of view, is considered the most important of the three empires which divide among them the countries between the Gulf of Bengal and China. As all the provinces of the empire produce some articles which are in demand in foreign countries, and nearly all the foreign commerce is at present concentrated in the town of Bang-kok, the inland and coasting trade is very considerable. The most important branch of inland commerce is that with the northern provinces of Siam Proper and with Laos, and a vast number of boats come down the Menam laden with grain, cotton, sapan-wood, oil, timber, stick-lac, benzoin, some raw silk, ivory, bees'-wax, horns, and hides. The goods carried back are salt, salt fish, and Chinese, Indian, and European manufactures, and also those of Bang-kok. The produce of the province of Bang-tang, and also of Lan-jang, or Southern Laos, reaches Bang-kok by the river Bang-pa-kung. By this route are brought down gamboge, cardamums, stick-lac, varnish, raw hides, horns, and ivory. From the countries west of Bang-kok, especially those on the banks of the rivers Mekhlong and Tachin, great quantities of sugar, cotton, and sapan-wood are brought to Bang-kok. From the other ports goods are in general exported directly to China.

The most important branch of the foreign trade of Siam is that with China. It is partly carried on by Chinese vessels, but mostly in vessels built in Siam and navigated by Chinese. The principal commodities imported from China are coarse earthenware and porcelain, spelter, quicksilver, tea, vermicelli, dried fruits, raw silk, crapes, satins and other silk fabrics, nankeens, shoes, fans, umbrellas, writing paper, sacrificial paper, incense rods and many minor articles. A considerable number of passengers come annually to settle in Siam. The commodities exported to China have been already noticed. Besides the trade with China, which is carried on by sea, there is an overland trade between Laos and the province of Yun-nan; but as the roads traverse high mountain ranges the commerce is not very active. The imports consist of coarse Chinese woollens, some English broadcloths, pins, needles, and other descriptions of hardware, with some gold, copper, and lead. The returns are principally ivory, stick-lac, rhinoceros horns, and some minor articles. The commerce with Cochin-China is also considerable; but there appears to be scarcely any commercial intercourse existing between Siam and the Birman empire. Some trade is carried on between Molmein, in Tenasserim, and the northern districts of Siam. The British colony is supplied with live stock, and the trade seems gradually extending to many other articles. But the most important trade, next to that with China, is with the European establishments on the Malay Peninsula and the Sunda Islands, especially with the British colonies of Singapore, Malacca, and Pulo Penang, and with the Dutch establishments of Batavia, Cheribon, and Samarang in Java, Pontianac in Borneo, and Rhio in Bing-tang. The staple exports of Siam to these colonies are sugar, salt, oil, and rice, to which may be added the minor articles of stick-lac, iron-pans, coarse earthenware, and hog's lard. The returns are British and Indian piece-goods, some British woollens, opium, and glass, with the products of the adjacent countries which are suited for the Chinese market, such as pepper, tin, dragon's blood, rattans, tripang, edible birds'-nests, and camphor. The crews of the Siamese junks engaged in this trade are almost exclusively Chinese, but the vessels are built at Bang-kok.

Formerly the commodities of Hindustan and Europe reached the

capital of Siam by being transported across the isthmus of Kra and the Malay peninsula, by the roads which connect Poonga with Chai-ya, Phun-phin, and Bandon, Trang with Ligor, and Queda with Sungora. The goods were carried overland by elephants, the only animal of burden used in these parts, and the journey took from five to seven days. The goods were shipped on the shores of the Gulf of Siam for the capital. By these roads the tin, ivory, and edible birds'-nests of Salang are still brought to Siam; but not the manufactures of Europe and Hindustan, as Singapore is a better emporium for procuring the goods, and the conveyance by this route is less expensive.

In the present year, 1855, Sir J. Bowring succeeded in negotiating a treaty with the king of Siam, which is to come into operation in April, 1856, by which the restrictions which impede European trade with Siam are to be removed, and a new and moderate import tariff is to be substituted. British subjects are to be allowed the right to rent or purchase houses and lands within a certain distance of Bang-kok.

History.—The early history of Siam is entirely unknown. In 1511 the Portuguese, after the conquest of Malacca by Albuquerque, established an intercourse with Siam. In the 16th century Siam was for many years subject to the Birmans, but recovered its independence towards the close of that century. In 1612 the first English vessel went to Ayuthia. Towards the end of the 17th century, a European adventurer, a native of the island of Cephalonia, called Phaulkon, who previously to his arrival in Siam had served as a sailor, mostly in English vessels, by his talents gained the esteem of the king, and was by degrees promoted to one of the most important offices of government. He persuaded the king to encourage the civilisation of his subjects by inviting European settlers, and for that purpose to send an embassy to Louis XIV. of France. This embassy appeared in Europe in 1684, and the king of France sent two embassies to Siam in 1685 and 1687, and also a corps of 500 French soldiers. Phaulkon put the French in possession of the fortress of Bang-kok, but in 1690 a revolution took place, through which the reigning family lost the throne, the minister Phaulkon his life, and the French were expelled from the country. About 1760 the Birmans laid waste the country and took the capital, Ayuthia. The king of Siam had been killed in the assault, and his family was carried away to Ava as prisoners. Soon afterwards the Birman army left the country, and a chief named Phiat-tak, of Chinese descent, seized upon the throne and proclaimed himself king; but in 1782 he was deprived of his throne and life by an insurrection which placed the reigning family on the throne. Some further attempts of the Birmans to conquer at least a part of Siam entirely failed, and a truce was at last concluded between both parties in 1793. Since that time no remarkable event has taken place in the history of Siam.

SIASSI. [SOOLOO ARCHIPELAGO.]

SIÁWSK. [OREL.]

SIBERIA is the name of that part of the Russian empire which is in Asia, and extends from the Ural Mountains, which divide Europe from Asia, eastward to the seas of Okhotsk and Kamtchatka, both of which are parts of the Pacific Ocean. It lies between 45° 30' and 77° 40' N. lat., 60° and 190° E. long. The most eastern point is East Cape, or Vostochinii Noss, which is only about 48 miles from Cape Prince of Wales in America, from which it is separated by the narrowest part of Behring's Strait. The greatest length from east to west exceeds 3600 miles, and the greatest width from north to south is hardly less than 1950 miles. It is bounded E. by the Pacific Ocean, N. by the Polar Sea, W. by the Ural Mountains, and S. by the Chinese empire and the steppes of the Khirghis Cossaks. The basin of the Amur has recently been added to the Russian territories on the south. [AMUR; RUSSIA.]

Surface.—This immense country, which perhaps exceeds Europe in extent by upwards of a million square miles, presents little variety of surface. The western half, or that which lies west of the meridian of the North-East Cape (105° E. long.), may be described as nearly an uninterrupted plain. The eastern half, or that which lies east of 105° E. long., contains numerous mountain ranges and hills, which occupy a great extent of country, between which some plains are inclosed. The mountains in some places rise above the snow-line. The plains are at different elevations above the sea; the southern being perhaps 2000 feet above the sea-level, whilst the most northern are so low that a part of them is inundated during hard gales. We may describe the country in three portions, namely—Western, Central, and Eastern Siberia.

Western Siberia lies between the Ural Mountains (60° E. long.) and 85° E. long., and the surface consists of one extensive plain. According to its productive powers it may be divided into five regions, the steppe, the agricultural district, the mining district, the wooded region, and the northern plain, or tundra. The *Steppe* comprehends the southern part of the plain as far north as 55° N. lat., and extends from the base of the Ural Mountains to the banks of the river Irtish. It is called the *Steppe* of Ishim. Along its south-eastern border lies a wide hilly tract, about 300 miles in width, of which only the northern portion belongs to Russia. The valleys which divide the more elevated portions of the steppe generally consist of bare rocks without vegetation, and are partly covered with salt incrustations. The rivers have water in the cold season; in the hot season it is only found in a few places. The numerous small lakes have always a bitter or brackish water, and cannot be drunk. The vegetation consists only of artemisia, salsola,

GEOL. DIV. VOL. IV.

and salicornia. The more elevated tracts are covered with grass during the greater part of the year. But farther south, towards the higher ridge of the Ooltau, the country improves. Wells are more frequent at the foot of the hills, and though the grass grows only in tufts surrounded by a bare red-clay, it is tolerably abundant, and affords good pasture for the herds of the Khirghis Cossaks. There are a few tracts fit for agriculture. This hilly tract is separated from the Ural Mountains by a very level plain, which in these parts is only 300 miles wide, but farther north increases to double that width between 52° and 55°, where it occupies the whole country between the Ural Mountains and the Irtish River. This plain contains an immense number of small lakes, the water of which is brackish. The tracts which divide these lakes from one another, and rise a few feet above their level, have a soil consisting of sand or of yellow-clay, or of both together, and they support only a scanty vegetation. Many parts are covered with a salt efflorescence as white as snow, and produce several kinds of salicornia. The river Ishim runs slowly through a bottom never exceeding a mile in width: and on this narrow tract there are bushes and good pasture. The most fertile tracts lie round the lakes. In this steppe the summer is very hot, and the winter exceedingly cold; the quantity of rain is small, and usually falls at the approach of winter. The *Agricultural District* extends north of the steppe, between the Ishim line of fortifications on the south and 60° N. lat. Between the rivers Irtish and Oby it advances as far south as 61° N. lat. This region presents a great diversity of soil and productions. In that part which is contiguous to the Ural Mountains, called the *Steppe of Isset*, the declivities of the mountains are overgrown with forests, and numerous rivers descend from their summits. As these rivers are abundantly supplied with water in spring, they have excavated wide bottoms, which are covered with alluvial soil, and are comparatively fertile. Accordingly agriculture and the rearing of cattle are carried on to some extent. On the lower declivities of the Ural Mountains are numerous mines of iron and copper, in connection with which the extensive forests which cover the surface of the adjacent districts are exceedingly valuable. Of the country between the Tobol and the Irtish the cultivable tracts are those which immediately adjoin the lakes. Farther north the surface is hilly, especially between the Tobol and Ishim; and the soil is not inferior to that on the west of the Tobol. Between the Ishim and Irtish the country is nearly a flat, but somewhat elevated above the watercourses. Its productive power is small. Between the Irtish and the Oby occurs the *Steppe of Barabinsa*, which is only well known where it is traversed by the road that leads from Tobolsk to Tomak, and to the mining district. The soil is partly covered with swamps and lakes, several of which are of great extent, as those of Oobinskoi, Chany, and Chebakly: the more elevated tracts are traversed by many small rivers, which contain water all the year round. In most parts the surface is a dead level, and without vegetation; but in isolated spots it is covered with grass, and contains poplar and birch. The more elevated spots are frequently covered with a salt efflorescence, and the water of some of the lakes is brackish, especially those south of 54° N. lat. This tract is not much inhabited. The northern district of the *Steppe of Barabinsa* is covered with nearly continuous forests of firs and birch, on a very swampy soil. No agriculture is carried on, but wild animals are numerous, among which the beaver is considered the most valuable by the nomadic tribes that inhabit these forests and live chiefly on the produce of the chase. The south-eastern angle of the *Steppe of Barabinsa* contains a very remarkable depression, which begins about 20 miles due north of the town of Semipalatinsk, on the Irtish (50° 25' N. lat.), and extends in a north-north-east direction to the town of Bernal, on the Oby (53° 20' N. lat.), a distance of more than 200 miles. The width varies between 20 and 30 miles. The whole tract is covered with fine fir-trees, which are very valuable for the mining operations carried on at Bernal and in the Altai Mountains. The winters of the agricultural district are much colder than in Russia west of the Ural. At Tobolsk the thermometer every winter sinks to -25°, and sometimes to -30°, and it generally does not rise above -20° for four or six weeks together. The summer heat is very great. In July and August the thermometer usually rises to 85°, and even 90° after mid-day; but the nights are rather cold in comparison with other countries in which the daily temperature is as high. The *Mining District* extends over the south-eastern part of Western Siberia, and comprehends the most western portion of the ALTAI MOUNTAINS. The *Wooded Region* lies north of 60°, but, properly speaking, the northern portion of the *Steppe of Barabinsa*, as far south as 57°, ought to be included in it, as the general features are similar. The whole region is covered with a variety of species of pine and fir, and the birch is also common. No part of it is adapted to agriculture. A little rye and barley are cultivated, and some vegetables are grown. Fur-bearing animals abound in the district, and fish are obtained in considerable quantities in the river Oby. The climate in winter is severe, but the heat in summer is very considerable. The most northern part of Western Siberia is a low plain, called the *Tundra*. The surface is nearly a dead level, and quite destitute of trees. Only a few shrubs occur, whose roots do not penetrate the ground, and even these are of stunted growth. Even in summer ice is found only a few inches under the surface. The

soil is covered with moss, except in a few places where it is without vegetation. There are many small lakes, generally well stocked with fish. But the wandering tribes which inhabit this country derive their subsistence partly from their large herds of tame and of wild reindeer, and from the sea animals with which the sea abounds along their coasts, especially the morse and the seal.

Central Siberia lies between 85° and 105° E. long., and comprehends the greater part of the ALTAI MOUNTAINS, the hilly country east of the Oby River, as far north as its affluent the Ket, the vale of the Upper Yenesei, the plain of the Lower Angara River, the wooded plain, and the Tundra; in all six regions. The *Hilly Country* which lies west of the Altai Mountains, and extends to the eastern banks of the river Oby, by which it is separated from the Steppe of Barabinsa, is studded with hills near the Altai Mountains, but towards the north it extends in a plain, which is slightly undulating between the Oby and its affluent the Tom. It is almost entirely covered with coniferous trees, among which the *Pinus cembra* is numerous: the cones are collected, and constitute an article of commerce with the countries farther west. Cultivation is however limited, the soil of this tract being sandy and of inferior quality. East of the river Tom the country is a table-land, furrowed by numerous rivers, along the course of which there are many wide bottoms considerably depressed below the surface of the plain. These bottoms have a fertile soil; cultivation is carried on in them to a considerable extent, and there are numerous villages. The river Ket, which divides this region from the forest region, must be considered as the limit of cultivation in this part of Siberia. The *Vale of the Yenesei* is considered the warmest part of Siberia. It is perhaps also the most fertile. It is inclosed by mountain ridges, which sometimes rise above the snow-line. On the west of the vale, between 88° and 89° E. long., are the Teletskoi Mountains, so called from the lake of that name, which lies to the west of the range. On the south of the vale are the Mountains of Sayansk, which unite the Altai Mountains to the range called Erghik Targak Taiga, and separate Siberia from the Chinese empire. This range reaches northward to the vicinity of the town of Sayansk, and the river Yenesei makes its way through it by a long and narrow gorge. The vale extends about 350 miles from south to north, and nearly 200 miles from east to west, but perhaps not less than one-half of it is occupied by high mountains. The Yenesei flows through a wide bottom covered with alluvium from 2 to 3 feet thick, and of great fertility. Wheat, rye, and oats yield from 10 to 12 times their seed. The higher ground is abundantly watered, and the water-courses are fringed with trees, while the remainder is covered with a rich turf of grass all the year round. Some of the bottoms of these rivers are used as pasture-ground, and herds of cattle are sent from this country to other parts of Siberia. The rearing of cattle is favoured by the mild winters. The cattle remain the whole year round on the pastures, the cold not being intense, and frequently not occurring before Christmas, with the exception of night-frosts. On these plains many useful plants grow in a wild state, as the wild hemp, the wild flax, wild Siberian buckwheat, which is collected and used by the inhabitants in making a kind of porridge, and several sorts of *vaccinium* and *ribes*. The most eastern part of the southern portion of Central Siberia is the *Plain of the Lower Angara*. It is an inclined plane, which sinks towards the north, and in that direction is traversed by several rivers which run to the Lower Angara and Upper Toonguska. The surface is generally hilly, but in the direction from south to north it is traversed by some extensive valleys which are nearly level. The greater part of the elevated region is still covered with forests of larch, fir, and birch, and at intervals there are fields which produce moderate crops. Rye, oats, buckwheat, hemp, and tobacco are cultivated with success. In a few places agriculture extends to the narrow valleys which lie between the offsets of the mountain ranges, but these parts of the region are still inhabited by some small wandering tribes, who keep no domestic animals except camels, and this seems to be the most northern point of Siberia in which these animals are found. Some of them however have a few horses, cattle, or sheep. They hunt the elk, a large deer called marali, the musmon, a kind of mountain-goat, lynxes, and especially sables and squirrels. This region is characterised by the dryness of the atmosphere, owing to which only a small quantity of snow falls on this region. The winters however are extremely severe, and the mean annual temperature is only 31.5°, or a little below the freezing point. North of the courses of the rivers Upper Toonguska and Ket, of which the latter is a confluent of the Oby, lies the *Wooded Region* of Central Siberia, and along the Polar Sea extends the *Tundra*. They appear to be similar in character and products to those districts of Western Siberia which bear the same names. Agriculture is only carried on in the valley of the Yenesei River. At Yeneseisk several kinds of grain and vegetables are grown.

Eastern Siberia, or that part of it which lies east of 105° E. long., comprehends about one-half of the whole surface of the country. It contains a much smaller portion of land fit for agricultural purposes than the other divisions, which is partly owing to the severity of the climate, and partly to the greater elevation of its surface in those parts which are south of 60° N. lat. Along the shores of the Sea of Okhotak, between the Chinese frontier and the town of Okhotak, the coast is rocky and very high. The country rises with a steep ascent, and at a

short distance from the sea the general level is from 2500 to 3000 feet above it. This may also be considered as the general level of the immense tract which extends westward from the sea south of 60° N. lat. to the meridian of the town of Yakutsk, and then west-south-west to the northern and eastern shores of the Lake of Baikal, having in this part the vale of the river Lena for its northern boundary. It appears that the surface is a succession of plains, separated from one another by depressions, or by ridges of hills. The whole region is unfit for cultivation, and it does not appear that any considerable portion of it is adapted for pasture, as none of the numerous tribes of the Yakutes, who live chiefly on the produce of their herds, have settled on it, but the whole has been abandoned to the Toonguses, who get their subsistence by the chase. The surface is generally covered with trees, consisting chiefly of pines, firs, larch, and *Pinus cembra* intermixed with birches. The number of lakes is said to be very great, and many of them are surrounded by high hills: these lakes are usually covered with ice nearly the whole year round. Among the wild animals found in this region are numerous reindeer, and the argali or wild sheep. The climate of this part of Siberia is distinguished by the severity and the length of the winter. At the south-western extremity of this region lies the Lake of Baikal. [BAIKAL.] The mountain range which constitutes the southern edge of the table-land separates the streams which run northward to the river Lena from those which flow southward to the river Amur, and constituted till lately the boundary line between Siberia and the Chinese empire as far west as 119° E. long. The southern portion of Eastern Siberia is divided by a mountain range into two parts,—the basin of the Selenga, which falls into the Lake of Baikal, and that of the Shilka, one of the principal branches of the river Amur. The basin of the river Selenga is divided into two portions by the course of the river, which here runs in a general direction from south to north. The larger portion lies east of the river Selenga, and consists of three valleys, which extend from the summit of the Yablouoi Khrebet westward, and open into the valley of the Selenga. The upper portion of the valleys is too cold for cultivation; but in the lower part, which is generally from three to four miles wide, agriculture has been attempted with success, and in modern times it has been considerably improved by Polish emigrants, who have been sent into this region since 1772. They cultivate wheat, rye, buckwheat, flax, hemp, peas, and water-melons. The wider valley of the river Selenga itself appears in many parts to have an arid dry soil; but it contains good pasture, and in some places the soil is of considerable fertility, and cultivated by Russian families which have been settled there for upwards of 150 years. About twelve miles from its mouth, the Selenga enters a level plain of considerable extent, which may be considered as the delta of the river, as it is traversed by four arms into which the river divides on entering the plain. This plain extends for 22 miles on the shores of the Lake of Baikal, above which it is very slightly elevated. The western portion of the basin of the Selenga comprises a wide plain, which serves as a pasture-ground for the numerous herds of horses, cattle, and camels of the Buriates, who are in exclusive possession of that tract. The wooded mountains on the east of the Selenga are haunted by wild beasts, such as bears, gluttons, elks, deer, musk animals, wild hogs, ounces, lynxes, wolves, foxes, hares, sables, squirrels, martens, marmots, and wild goats. Many sheep and goats are kept, and their skins, especially those of the lambs, constitute an important article of export to China. That portion of Siberia which lies east of the basin of the Selenga, and is drained by the river Shilka and its two principal branches the Ingoda and Onon, is called Da-uria, which is said to signify 'boundary-country,' or 'border.' The whole, with the exception of a comparatively small tract along the south-eastern border, is a mountain region, traversed by several ridges running south-west and north-east, but nowhere rising to a great elevation. The mountains and hills supply good pasture for the greater part of the year. The valleys are flat and open, but most of them are fit for cultivation. North of 51° 30' N. lat. most of the cereals of Europe are grown. The most southern portion of this region, or that which lies south of 51° 30' N. lat., between the rivers Onon and Argun, is part of the Gobi, or rather, of that portion of it which is called the Steppe of the Kerlon, from the name of the upper course of the river Argun. [AMUR.] The surface is level, and is covered with numerous small stones, among which are jasper, agates, beryls, and topazes. No part of this level country is cultivable. The mountains of this region, especially those which lie between the Onon and Argun, are rich in silver, lead, tin, and zinc, all of which are worked. The Upper Vale of the river Lena is among the agricultural districts of Siberia, corn being grown as far north as the town of Yakutsk. Though the cultivation of corn and several vegetables generally succeeds in this vale, the greater part of it is covered with fir and pine trees; whilst the numerous islands and the low banks of the river are overgrown with birch, poplar, and willow. The wooded country is used as pasture by the Yakutes. The country round the town of Yakutsk may be considered as the richest pastoral tract in Eastern Siberia, though the ground is always frozen for a depth of 400 feet below the surface, and only a small layer of two or three feet is free from ice in summer. Its wealth is chiefly derived from the almost innumerable herds of cattle which pasture on the low country which extends from the river eastward to the river Aldan. A still

more extensive tract of rich pasture-land lies to the east of the Lena River, on both sides of the river Vilui. Many rich families of the Yakutes, who inhabit this tract, possess several hundred head of cattle. The whole country east of the middle course of the river Aldan, between 59° and 60° N. lat., is a mountain tract, extending more than 200 miles east and west to the vicinity of the Pacific. The most elevated part of it, which lies nearly in the middle, and is almost 100 miles wide, is more than 2400 feet above the sea-level. The Toongusses, a wandering tribe of hunters, inhabit this country. At the northern extremity of the Aldan Mountains (62° N. lat., and 141° E. long.) is a mountain knot from which two chains branch off. One of them runs from this point first due east, and then north-east, parallel to the shores of the sea of Okhotsk and the bay of Penginak. It is called by the Russians Stanavoi Khrebet, and covers two degrees of latitude in width; but some of its branches reach as far north as 67° N. lat. At the source of the river Anadir (near 164° E. long.) it divides into two branches. One of them runs first south-east, and then turns south, traversing the peninsula of Kamtschatka [KAMTCHATKA]; the other extends first towards the north, and then turns eastward, in which direction it terminates at Behring's Strait in the capes Vostochinii Noss, or East Cape, and Tshookotskoi Noss. The other chain which branches off from the mountain knot of the Aldan range at first runs north-north-west, but turns west near 64° N. lat., and continues in that direction, parallel to the lower course of the river Aldan, until it approaches the banks of the Lena, where it turns due north, and terminates near 67° N. lat. Between the Lena and the Kolyma the country improves considerably. It is traversed from south to north by several chains of hills, generally of small elevation, but in many places of considerable width. These hills are overgrown with birch and larch, but the trees do not attain their full growth. The greater part of this region is a level plain, without trees, but interspersed with numerous lakes, which contain plenty of fish, and have good pastures on their banks where the settlements of the Yakutes are. The 'albuty,' or dry lakes, which constitute a peculiar feature of Northern Siberia, are still more fertile. They are wide and flat valleys, very little depressed below the general surface of the plain. In spring, when the rivers inundate the adjacent country, they are filled with water, which remains there during the summer; but during the winter the ground bursts, and many narrow clefts are formed, by which the water runs off, and in the following summer the whole ground is covered with the finest turf. There are also good pastures near the declivities of the hills, but the remainder of the plain is chiefly covered with moss and is swampy. Between the river Indighirka on the west and the Alasei on the east are several extensive plains covered with moss, on which only a few larches creep along the ground. There are other wastes of considerable extent. Along the Polar Sea, and some distance from it, the country is a tundra, or low plain covered with moss, of the same description as that which occurs in Western Siberia. Between the Indighirka and Kolyma the surface is traversed by numerous low swells, which generally run south and north, and, terminating on the sea in bluffs, render the coast alternately high and low. The scanty population of this tract subsist almost entirely on the produce of their fisheries in the numerous lakes with which this country is interspersed. The country east of the Kolyma River is of a different description. The offsets of the Stanovoi Mountains come close up to the river, forming on its banks steep bluffs several hundred feet high, and the whole region is covered with ranges of mountains, frequently rising to 2000 or 3000 feet above the sea. In many places they reach the sea, forming on the shores several elevated capes, as Cape Baranov, Cape Shelagakoi, and North Cape. On the sea-shore however there are many tracts of level ground covered with moss. In the interior the valleys are rather wide, and generally swampy, but also often covered with good pastures. The forests of this region are abundantly stocked with animals, among which are countless herds of rein-deer, elks, black bears, foxes, sables, and gray squirrels. Multitudes of ducks, geese, and swans are taken in the Kolyma. The chief supply of food is from the fisheries in the rivers, which are extremely productive. The most common fish is the herring; but there is also salmon of several kinds. The country of the Tshooktshes, or the most north-eastern portion of the Asiatic continent, presents a succession of sterile valleys and bare rocks, whose vegetation is limited to that kind of moss which is the food of the reindeer. In a few sheltered valleys there are some willows which attain the size of shrubs. The climate is extremely severe. The valleys are generally swampy and full of small lakes. There are a few berry-bearing shrubs. A few families of the Tshooktshes subsist by fishing and killing sea animals along the coast; but the greater number live on the produce of their herds of tame reindeer, and by hunting those which are in a wild state. South of the country of the Tshooktshes is the peninsula of Kamtschatka.

We shall conclude this survey of Siberia with a few observations on the Polar Sea, which constitutes its northern boundary. Nearly opposite the middle of the coast-line of Siberia, or more precisely, opposite the country between the mouths of the rivers Yana and Indighirka, is a group of islands, which are called, from their discoverer, the Liakhehoff Islands. They consist of four larger and some smaller islands. The larger islands are named Kotelnoi, Fadeyefskoi, New Siberia, and Liakhehoff, and vary in size from 100 miles long by

60 miles broad, to 40 miles long by 20 miles broad. Even the summers on these islands are so cold that the snow does not entirely melt, and not a blade of grass grows. They consist of layers of ice, alternating with layers of sand, in which an incredible number of elephants' and other fossil bones are imbedded. The sea between these islands and the continent does not completely freeze before the last days of October, but along the coast of Siberia the ice is formed much earlier in the year, and soon acquires a degree of firmness. On the contrary, in spring, the ice melts much sooner along the coast, which is quite free from it in the month of June, whilst in the open sea it constitutes one unbroken sheet of ice up to the month of July, and the quantity is hardly perceptibly diminished even towards the end of the summer. It floats about in the sea in large masses, which, being impelled by currents and winds, are driven against one another with incredible force. These floating masses render the navigation of the Polar Sea extremely dangerous, and have frustrated attempts made to survey the entire coast; the tract still unsurveyed incloses the most northern cape of Siberia, called the North-East Cape, or Severo Vostochinii Noss. In endeavouring to reach the American continent by Behring's Strait, some explorers have made use of nartes, or sledges drawn by dogs. They generally set out in the latter part of the winter, from March to the end of May, when the cold is much less severe than in the earlier part of the winter. It has thus been ascertained that in winter the large body of the sea is open and free from masses of ice, but this open water occurs in different parts at different distances from the shore. In expeditions of this kind numerous ice-hills have been met with, which sometimes constitute single masses with steep declivities; at other times they form regular groups; and frequently they form long ridges. They consist of masses of ice irregularly united, but as the hollow places are filled up with snow, they appear to have a regular form. They vary in height from 10 to 70 feet, and are certainly of a different origin from the icebergs of the Greenland Sea. Salt is found on the ice wherever it is not covered with a thick layer of snow. It is in the form of small shot, and it has a somewhat bitter taste, but may be used. The persons who annually visit the Liakhehoff Islands, use it without the least inconvenience. This sea-salt, called *rasaól*, very much retards the progress of the nartes on the ice.

Climate.—Siberia is the coldest country in the northern hemisphere, if we except Greenland and the Arctic Archipelago of North America. It is much colder than any part of Europe situated in the same latitude. North Cape, in Europe, is near 71° 10' N. lat.; and Ustyansk, at the mouth of the river Yana, in 70° 55' N. lat. The latter place however is nearly 28 degrees colder, as the following table shows:—

	Mean annual temperature.	Mean tem. of Winter.	Mean tem. of Spring.	Mean tem. of Summer.	Mean tem. of Autumn.
North Cape . . .	+ 32°	+ 24°	+ 30°	+ 42°	+ 32°
Ustyansk . . .	+ 4 39°	- 24 9°	+ 27 01°	+ 40 15°	- 24 70°

Irkutak is only about 45' nearer the pole than London, and yet the mean annual temperature is lower than that of North Cape, being 31°; while the mean annual temperature of London exceeds 50°. But Irkutak is 1240 feet above the sea-level. This elevation however would lower its temperature only three or four degrees. The climate increases in severity as we proceed from west to east. The severity of the winter in Eastern Siberia is shown by the circumstance that quicksilver freezes every winter in the country near Irkutak, and in Yakutak it remains in a frozen state for two months together even in mild winters, and in severe seasons for three months. In a large part of Siberia the ground is frozen to a considerable depth even at the end of the summer. In Western Siberia the winter, although very cold, is much less so than in the eastern districts. The summers in Western Siberia are warm and sultry, chiefly in consequence of its proximity to the Great Caspian Desert, which is subject in summer to excessive heat. We may here give the temperature of two places at a considerable distance apart, namely, Bernal and Nishnei-Kolymak, of which the former may be considered one of the warmest and the latter one of the coldest places in Siberia. Bernal is in 53° 20' N. lat., 84° 10' E. long.; and Nishnei-Kolymak in 63° 31' N. lat., 160° 56' E. long. Bernal is 390 feet above the sea; Nishnei-Kolymak is almost on a level with the sea:—

	Mean annual temperature.	Mean tem. of Winter.	Mean tem. of Spring.	Mean tem. of Summer.	Mean tem. of Autumn.
Bernal . . .	+ 35 13°	+ 6 61°	+ 42 92°	+ 61 32°	+ 29 18°
Nishnei-Kolymak	+ 12 05°	- 19 03°	+ 36 15°	+ 44 41°	- 13 33°

Wrangel, who passed three years at Nishnei-Kolymak, gives a description of the climate of that place. The year is divided into two seasons, the winter and the summer. The river is covered with ice in the beginning of September, and is not free from it before the beginning of June. In October the cold is diminished by thick fogs and the vapours which rise from the sea, which then begins to freeze. The frost attains its greatest degree of severity in January, when the thermometer sinks to -60°. Respiration then becomes difficult, and the wild reindeer, the true inhabitant of the polar regions, hides itself in the thickest parts of the forests, and stands motionless. In February the cold does not decrease much; in March it begins to decrease more; but the cold which in these months is felt at sunrise

is unusually severe to the feelings. The wind which is called the hot wind blows from east-south-east, and raises the temperature suddenly from between -45° and -50° to $+29^{\circ}$ and upwards, but it generally does not last more than 24 hours. A sudden rise of the thermometer takes place during the month of June. It sometimes attains $+72^{\circ}50'$ at noon. In July the heat is greatest, and the weather more constant, but there are innumerable swarms of gnats, which torment men and animals. These gnats compel the numerous herds of reindeer to leave the forests, and to retire to the treeless country on the shores of the sea, when vast numbers of these animals are killed by the natives. In August the heat decreases rapidly, and night-frosts are frequent towards the end of that month.

Rivers.—Siberia has a great number of rivers, and as the whole course of most of them, and the greatest part of the course of the remainder, lies through a level and hilly country, nearly all of them are navigable for a great distance. The principal rivers run from south to north, from the agricultural districts to those where vegetation does not supply food to the inhabitants, and hence their great importance for internal intercourse. The tributaries, at least the greater number and the largest of them, run chiefly east and west, and form a water-communication between the agricultural districts themselves, and render it practicable for goods bought from the Chinese at Maimatahin to be transported to European Russia at nearly the same expense as those which are obtained at Canton are carried to Great Britain. Though all these rivers are frozen for more than six months of the year, the advantages arising from them are not thereby materially diminished, as the ice facilitates communication almost as much as the open water. Of the rivers of Siberia the most important are the Oby, the Yenesei, and the Lena.

The *Oby*, *Obi*, or *Ob*, the most western of the larger rivers of Siberia, is the largest river of the Old Continent. Its basin is said to comprehend more than 1,370,000 square miles, and is only inferior to that of the Amazonas and Plata in South America. This basin extends from 47° to 74° N. lat., 1890 miles in length, and in the widest part, near 55° N. lat., it is nearly 1200 miles across. The principal branch of the Obi is properly the Irtish, or the western of the two great branches which unite near $60^{\circ} 30'$ N. lat., but the eastern branch has the name of Obi before their union, and is therefore considered the principal river, though it is inferior to the Irtish in length of course. The *Irtish* rises in the Chinese empire, in the government of Gobdo, or the country of the Western Khalkas Mongols, probably between 46° and 47° N. lat., and 87° and 88° E. long. It runs nearly due west, and after about 70 miles falls into the lake of Zaizang. The *Irtish* issues from the north side of the lake, several miles from its western extremity. The lake, according to Humboldt, is about 1720 feet above the sea-level. The course of the river is nearly due north, and in a flat country, until it approaches the boundary-line of Siberia, where the mountains come close up to the river on both sides. It then turns to the west-north-west, and in that direction it runs in a narrow valley between rocky hills until it reaches Ust Kamenogorsk. The current in this part is rapid, and the river is navigated, though not without difficulty. It receives on the right the Buchtarma and other considerable tributaries. From Ust Kamenogorsk to Semiyarsk the river runs nearly due west, and below Semiyarsk it turns north-west, in which direction it continues to run to some miles below the town of Omsk, north of 55° N. lat. Below Omsk the *Irtish* turns first to the north-east, then to the north, and afterwards it runs again nearly due west to its confluence with the Tobol at Tobolsk. Before this union, the *Irtish* is joined from the south by the river *Ishim*, which runs more than 700 miles, but, draining a sterile and sandy country, contains very little water in proportion to its length, and is only navigated in the lower part of its course. The *Tobol*, which is nearly equal in length to the *Ishim*, is much more important. It rises near 52° N. lat., 60° E. long., on a flat swell of the Caucasian Desert, and runs for a short distance to the east, but the remainder of its course is to the east of north, through a level country, though in some places low offsets of the Ural Mountains approach the western banks. The *Tobol* receives several considerable affluents from the left, among which the *Ooi*, the *Iset*, the *Toora*, and *Towda* are the largest. At the confluence of the *Tobol* the *Irtish* changes its direction to the north-north-east, but turns to the north-north-west before it meets the *Obi*. The *Obi* rises in the Altai Mountains with two large branches, the *Katunga* and the *Biya*. The most remote branch of the *Katunga*, the *Chooya*, and that of the *Biya*, the *Choolyshman*, originate near 49° N. lat., within the Chinese government of Gobdo. Nearly all the waters collected within the Altai Mountains north of 49° N. lat. and between $84^{\circ} 30'$ and 90° E. long., run either east or west, and uniting between 50° and 51° N. lat., near the meridian of 87° E. long., form a large river, the *Katunga*. After the union of these rivers, the *Katunga* runs nearly due north with an extremely rapid course through the northern ridges of the Altai Mountains, until it reaches $52^{\circ} 30'$ N. lat., when it turns west, and entering a hilly region meets the other great branch of the *Obi*, the *Biya*. The *Katunga* is too rapid to be navigable. The place where the *Biya*, or *Choolyshman*, as it is called in the upper part of its course, originates, is not known, and we are very imperfectly acquainted with the course of this river above the Lake of Teletskoi. The *Choolyshman* falls into the Lake of Teletskoi near $51^{\circ} 40'$ N. lat.,

with several arms. This lake, called also Altyn-kul, or Altai Noor, is a true alpine lake, resembling in grandeur and beauty the Lake of Luzern. It is surrounded by wooded mountains, rising in the vicinity of the lake to the height of 4000 or 5000 feet, and Mount Toulak at its southern extremity attains an elevation exceeding 6000 feet. The lake is more than 40 miles from south-south-east to north-north-west, but at its northern extremity an arm runs westward for 20 miles more. At the southern extremity it is about 5 miles wide, but grows gradually narrower as it advances towards the north. The western arm is hardly a mile wide on an average. The lake is about 1900 feet above the sea-level. The river issuing from the western arm of the lake, under the name of *Biya*, in a western direction, soon turns to the north, but by degrees it resumes its western course, running between mountains and high hills, until it joins the *Katunga* below *Biak*, at *Katunak*. After this union the river is called *Obi*, or *Ob*. The *Obi* flows in a western direction until it is met from the south by the river *Charysh*, when it turns to the north, in which direction it continues with many windings to its confluence with the *Tom*, when it begins to run north-west until it reaches 75° E. long., from which place it flows west to its junction with the *Irtish*. Below the mouth of the *Charysh* the *Obi* is joined from the east by three rivers, which are navigable and important for the industry of Siberia even in its present state, namely, the *Tom*, the *Choolyn*, and the *Ket*. The current of the *Obi* below *Katunak* is very gentle, and does not offer the least obstruction to an easy navigation, but in approaching the *Irtish* it spreads its waters over a low country, and divides into many arms, which inclose large islands, and in this part shoals are numerous. The *Obi*, after its confluence with the *Irtish*, turns northward and flows in that direction to the vicinity of the polar circle, when, increasing to a great width, it turns east at *Obdursk*, and falls into the Gulf of *Obi* by three arms, of which the eastern is the largest and deepest. Where the *Obi* joins the *Irtish* it divides into two arms, of which the western is called *Beresowakye Protok*, or *Birch River*. The two arms unite more than 70 miles farther north, and inclose an island of that length and of a width varying in general from 5 to 6 miles. Farther north the river frequently divides again, as the alluvial and low plain which lies to the west of the river is from 40 to 50 miles wide, and the greater part of it is inundated in spring time. The gulf into which the *Obi* falls is between 70 and 80 miles wide and more than 400 miles long. Except several low islands which occur near the mouths of the river, only a few rocky islets appear, not far from the eastern shores of the gulf, but the gulf itself is so full of shoals, that large vessels find the navigation very difficult. At *Tobolsk* the *Obi* generally freezes about the 2nd of November, and at *Obdursk* in the middle of October. The ice generally breaks up at *Tobolsk* at the end of April, and at *Obdursk* about the middle of May. The gulf is frozen till the beginning of June. Large quantities of fish are taken in the *Obi* and in the Upper *Irtish*.

The *Yenesei* is the second river of Siberia in magnitude. Its basin covers an area of 1,020,000 square miles. The two remotest branches of the *Yenesei*, the *Ta-kem* and *Selenga*, originate in the Chinese empire. The *Ta-kem* rises where the two vast mountain chains of the *Erghek Targak Taiga* and the *Tangnu Oöla Mountains* [ALTAI MOUNTAINS, vol. i, col. 260] meet one another; and the *Selenga* rises south of the most remote branches of the *Yenesei*, on the eastern declivities of the *Tangnu Oöla*. [ALTAI MOUNTAINS, vol. i, col. 261.] The *Selenga* runs more than 450 miles in an eastern direction within the Chinese empire, where it is joined by two considerable tributaries, the *Ekhe*, which rises in the Lake of *Kossogol*, on the southern declivity of the *Erghek Targak Taiga Mountains*, and runs nearly parallel to the *Selenga*; and the *Orghon*, which originates in the *Khangai Mountains of the Gobi*, and runs from south to north. At the confluence of the last-mentioned tributary, the *Selenga* turns to the north, and soon enters Siberia, where it is joined from the east by the rivers *Chikoï*, *Khilok*, and *Uda*; it falls into the Lake of *Baikal* after a course of about 700 miles. [BAIKAL.] The only outlet of Lake *Baikal* is the *Lower Angara*, which on receiving the river *Oka* is called the *Upper Toonguska*, and flows into the *Yenesei*. This river then runs north-west until it has crossed 60° N. lat. A little below the town of *Yeneseisk* it receives from the left the *Kem*, a small river, which however is important as a link of the extensive line of water communication which extends from the boundary of the Chinese empire, south of the Lake of *Baikal*, to the base of the *Ural Mountains*. Before reaching 70° N. lat., the *Yenesei* enlarges into a wide estuary full of low islands and shoals, which is called the *Gulf of Yenesei*, and is on an average 20 miles wide, and more than 200 miles long. In its lower course the river is joined by several large rivers. The *Yenesei* freezes towards its mouth about the 10th of October, and the ice does not thaw before the beginning of June. The entire course of this river is about 2500 miles.

The *Lena* rises in the *Baikal Mountains* [ALTAI MOUNTAINS], hardly more than 20 miles from the banks of Lake *Baikal*, and about 50 miles N.E. from *Irkutsk*. Its basin is estimated to contain nearly 800,000 square miles, and its course is about 2000 miles long. It becomes navigable 50 miles from its source, at *Kotshuga*, a large village, which from this circumstance has become the depot of goods destined for the north-eastern part of Siberia and for the Russian

settlements in North America. The river runs generally in a north-east direction, passing Olekminak and Yakutsk. The remainder of its course is nearly due north. North of 70° N. lat. it enlarges to three or four miles in width, and at its mouth forms a delta, which projects into the sea, like that of the river Maekhaun, in the peninsula beyond the Ganges. This delta is traversed by several arms of the river, three of which form navigable channels: the western is called Krestovakoi, the central one Toomatskoi, and the eastern Bukooskoi. These channels are wide, but full of shoals. The Lena freezes over in the beginning of September, and is hardly free from ice before midsummer. Among the tributaries of the Lena are some very large rivers—the Vitima, the Olekma, the Aldan, and the Vilui.

Besides these large rivers there are others of less magnitude, but still so large that they would be considered important in any other country. The Anakara, 500 miles long, and the Olenek, more than 700 miles long, fall into the Polar Sea between the mouth of the Yenesei and the Lena. East of the Lena are the embouchures of the rivers Yana, Indighirka, and Kolyma. All these rivers are navigable, and of importance for the country, as the two greatest necessities of life, corn and salt, are brought by them from the southern districts of Siberia to the most northern parts. The Anadyr, or Anadir, and the Amur are separately noticed. [ANADYR; AMUR.] The small river Ud falls into the Sea of Okhotak near 55° N. lat. [ОКХОТСК.]

Productions.—The domestic animals vary greatly in size and form in different districts. This is especially the case with horses and sheep. Among the latter, the sheep kept by the Khirghis Cossaks, in the Steppe of Ishim, are distinguished by their thick tails and fine wool. All attempts to transport this species to other parts of Siberia have failed. In 1830 some landed proprietors in the neighbourhood of Irkutak introduced Spanish sheep, for the purpose of improving the wool of the native sheep.

Siberia is very rich in metals. There are three extensive mining districts. The most western comprehends the mines of the Ural Mountains. On the eastern declivity of that range the mines occur between 56° and 60° N. lat., where they occupy a tract of land about 40 miles in width. These mines yield great quantities of gold, silver, and copper; there is also some iron and platinum. The second mining district is that of Bernal. The mines yield much silver and copper, but less gold and lead. The mines from which these metals are obtained lie mostly in the Altai Mountains, and in those valleys which open to the Irtysh River. The third mining district is that of Nertshinak, which is situated on the east of the Yablonof Khrebet, in the basin of the river Amur. The mines contain gold, silver, iron, lead, zinc, antimony, and arsenic. [ALTAI MOUNTAINS, vol. i., col. 262; RUSSIA, vol. iv., col. 373.]

The western parts of Siberia get the salt which is required for their consumption from the salt-lakes in the steppes of Ishim and Barabinsk, in some of which the salt crystallises spontaneously. Two lakes of this kind occur also in the vale of the Yenesei, on the western declivity of the Teletskoi Mountains; one of them gives an annual produce of 180,000 poods. The countries bordering on the river Lena obtain salt partly from some salt-springs which occur in the vicinity of the town of Ust Kutak, and partly from the river Vilui, where, according to Erman, there are some lakes in which the salt crystallises, and he adds that from the same country rock-salt is brought to Yakutsk. Da-uria obtains its salt from one of the lakes of the Gobi, called Dabassunef Lake, not far from that of Khara. Several kinds of precious stones occur in Siberia, and diamonds have been found along the eastern declivity of the Uralian range. The amethysts, topazes, emeralds, and red turmalines are of great beauty; zircons of extraordinary size have been found near Miasak, south of Ekatarinburg. Several precious stones are brought from the Altai Mountains, the most valuable of which are jasper and porphyry of great beauty. The mountains of Da-uria contain beryls, topazes, emeralds, and some other stones of less value. In the Baikal Mountains, especially towards the western extremity of the lake, lapis-lazuli of a very fine quality is found. The most important mineral for domestic economy is a kind of mica, which divides into flat pieces like glass, and is extensively used all over Siberia, and even in European Russia, for windows.

The tusks of the fossil elephant constitute an article of commerce, and many persons make the discovery of them the business of their life. They are deposited in immense masses, which occur more frequently and are of larger extent as we proceed from south to north. The greatest number of these bones are brought from the Laikhoian Islands, but they are also numerous in the north-eastern part of Siberia, east of the river Lena. They are generally found at a certain depth, mostly in hills of clay, rarely in mould, and never in sand. The harder and more consistent the clay is, the better the bones are preserved.

Inhabitants.—When the Russians first entered Siberia, they found the country in possession of numerous tribes more or less addicted to a nomadic life; none of them cultivated the ground, and they had no permanent places of abode, with the exception of some Tartars in the vicinity of Tobolsk. Some of these tribes belonged to widely-spread nations, but others, often consisting of a small number of families, constituted separate nations. The small number of individuals in the several tribes rendered them unable to make effectual resistance to the Russians, who gradually subjugated this immense

country. In this struggle some of the smaller tribes seem to have entirely disappeared, or perhaps a remnant of them united itself to some neighbouring tribe, and was gradually incorporated. Though it is certain that several tribes or nations have disappeared, there are still about forty tribes, differing more or less in physical character and in language. Some of them belong to the Caucasian race, and others are akin to the Mongols. In noticing these tribes we begin from the Ural Mountains and proceed eastward.

The most north-western part of Siberia is occupied by the Samoyedes. South of the Samoyedes are the Ostiaks, who occupy both banks of the river Obi from Obdursk upwards to the confluence of that river with the Irtysh, and even south of this place there are some families. They also occupy the northern districts of the steppe of Barabinka, as far south as 60° N. lat. Eastward they are spread over the whole of the wooded region to the banks of the Yenesei. The Vogules live to the west of the Ostiaks, occupying the woods, and the mountains, valleys, and plains included within the Ural range and its declivities; they are even in possession of a narrow level tract along their base. In the plain they are found as far southward as the Toora. In the agricultural district which extends south of the country occupied by the Vogules and Ostiaks, the population consists of Russians and Tartars, and in most parts the latter are more numerous. The Tartars who live east of the river Tobol as far as the banks of the Irtysh, are known by the name of Tartars of Tobolsk. They are distinguished from their western neighbours by having adhered to the Islam, and by their fondness for travelling: hardly a caravan goes to Bokhara of which they are not the leaders. The Barabinkes, another tribe of Tartars, inhabit the steppe which bears their name. The most eastern of their tribes inhabit the mountains of Kooznesk, and are called Kooznesi, that is, smiths, on account of their occupation. They unite agriculture with mining, and produce annually a large quantity of iron, though in a very clumsy way. A considerable number of Bokharians have settled among the Russians and Tartars. The Bashkirs are noticed under RUSSIA (vol. iv., col. 375). We shall here only observe that this tribe is not found north of Ekatarinburg, but that between this place and Slatoust they constitute the bulk of the population. The Khirghis Cossaks, commonly called Kirghises, are one of the widest-spread nations in Asia, nearly the whole of the Caspian Desert being in their possession. Though a considerable portion of this nation is in some degree dependent on Russia, and another portion on China, their dependence is rather nominal than real, and their country is considered a part of TURKISTAN. The interior of the Altai Mountains is inhabited by a tribe of Calmucks, who are called the Calmuck mountaineers. Those who inhabit the eastern districts, namely, the valleys of the Chooya, Bashkaus, and Choolyshman, pay tribute both to the emperor of China and of Russia. Between the lakes of Teletskoi and the neighbourhood of Irkutak there is a number of small tribes. On the eastern declivities of the mountains of Teletskoi there are four nations of Turkish origin—the Biryusses, the Beltires, the Sagai, and the Katakinees. These tribes are in possession of the mountains and adjacent country as far east as the banks of the river Abakan, an affluent of the Yenesei. Between the rivers Abakan and the Yenesei are the Koibales, and many families belonging to this tribe are found east of the last-mentioned river, under the name of Motores and Kandym. In the mountains which divide the valley of the Yenesei from the plain of the Lower Angara there are several tribes allied to the Koibales in origin and language. The most northern, on the banks of the river Kam, are called Kamashes, and south-east of them, on the Uda, are the Karakas and Kangut. In the undulating country which lies between the lower course of the river Choona, an affluent of the Upper Toonguska, and the Yenesei, are the Yarinzes. Nearly contiguous to this country, but on the western side of the river Yenesei, and north of the town of Yeniseisk, are the Kasuimskie Ostiaks, also called the Ostiaks of the Yenesei.

The most populous of all the nations that inhabit Siberia, next to the Russians, are the Buriates, who occupy the country on both sides of the Lake of Baikal, and extend towards the east as far as the western banks of the river Onon. Their priests have a very rich literature, mostly on the subjects of Buddhism, which a great part of the Buriates have embraced, but the classical sacred books are written in Sanscrit. South of the Buriates, along the very boundary-line of the Chinese empire, between the rivers Selenga and Onon, a small number of Khalkas Mongols are settled. The most widely dispersed of the native nations of Siberia are the Toonguses. They occur even in Da-uria, particularly between the Onon and the Argun, and the northern districts of Mandshooria are also peopled with them. In these parts they unite agriculture with the keeping of animals, especially the reindeer. Farther north they are in possession of the country that incloses the Lake of Baikal on the north, and hence they extend to the Polar Sea. They are also found along the banks of the river Yenesei. The Toonguses are considered as the best formed of the native tribes of Siberia. They are generally of middling size, of a fine shape, and slender. Their face is less flat than that of the Mongols, their eyes small and lively, and their nose well formed, though rather small. Many of them have no beard, and the rest have very little. Their hair is black and lank, and rarely grows gray in old age. They are most accomplished horsemen. Though widely

speak over an immense country, the language of the most distant tribes of the Toongues is said to agree very nearly with that of the Mandshoo. The Yakutes, the most populous of the nations of Eastern Siberia, except the Buriates, are a Turkish tribe, who are almost entirely occupied with the care of their herds of cattle and horses and the dairy. They appear also to have attained a considerable degree of skill in tanning, and in working iron, which they get from the mines on the upper course of the river Vilui. The Yookahires are only found north of the Polar Circle, and mostly in parts where the wooded regions border on the tundras. They only live east of the Lena, and as far as the vicinity of Choun Bay. The Tahooktahes occupy the most north-eastern peninsula of Asia. To the west this tribe is met with as far as Choun Bay, and southward they are in possession of the whole basin of the Anadyr River. The Russians do not consider them as subjects of their emperor, and the Tahooktahes are very jealous of their independence. On this account they do not easily permit Europeans to enter their country. The Koriakes inhabit the northern part of the peninsula of Kamtchatka and the country about the gulfs of Penahinsk and Ishiginak, as well as the mountains of Stammovoi Khrebet. The peninsula of Kamtchatka is inhabited by Kamtchatdales. [КАМТОЧАТКА.]

Population.—The population of Siberia is now estimated at more than three millions and a half, exclusive of the Middle Horde, or Orda, of the Khirghis Cossaks, which is computed at more than a million of individuals. [RUSSIA, vol. iv. col. 378.] But this population is very unequally distributed over the surface of the country. Even the most populous districts, namely, the agricultural region in Western Siberia, the vale of the river Yenesei in Central Siberia, and the plain of the Lower Angara, would be considered very thinly peopled in any part of Europe, but they are thickly inhabited when compared with other parts of Siberia, where several tracts occur extending over a surface of from 20,000 to 30,000 square miles, which are entirely uninhabited, as for instance the country south and north of the Verkhnai Yanak Mountains. In other places a few families live at the distance of one or two days' journey from one another. The majority of the present inhabitants are Russians; all the other tribes do not much exceed one million.

Political Divisions and Towns.—The administration of Siberia is divided into two general governments, those of Western and Eastern Siberia. Western Siberia consists of the governments of Tobolsk and Tomsk and the province of Omsk; and Eastern Siberia of the governments of Yenesei and Irkutsk, and the provinces of Yakutsk, Okhotak, and Kamtchatka, to which are added the Russian settlements on the western coast of North America as far as 56° N. lat., and 141° W. long. All these divisions are governed by separate officers, who receive their orders from the governor-general, and can only apply to the court of St. Petersburg through him. A small but very important portion of Siberia is not subject to the authority of the general governor, but is united to the European governments of Perm and Orenburg.

That part of the government of Perm which is on the east of the Ural Mountains extends along their base from 55° 30' to 61° N. lat., and is the most populous, best cultivated, and most industrious portion of Siberia. Nearly all the numerous mines of the mining district of the Ural are included in this division. Besides Ekatarinburg, which is the seat of administration for the mines, it contains several remarkable places, as Berezov, with 2000 inhabitants; Newanok, with 10,000 inhabitants; Alpayewsk, with 2000 inhabitants; Nishnei Taghilak, with more than 20,000 inhabitants, in a district noted for its rich iron- and copper-mines and its washings of gold and platinum. In this place there are also extensive manufactures of lacquered-ware. Kushwinak, farther north, with about 6000 inhabitants, is built in the centre of a district rich in iron-mines; in its vicinity is the iron-mountain called Bladogat, which rises to 1370 feet above the sea-level. Verkhoturye has 3000 inhabitants, and is considered the most northern point where the alluvial beds that contain gold particles occur. They have been traced southward to the source of the Ural River, a distance exceeding 600 miles.

Only a small portion of the government of Orenburg lies east of the Ural Mountains. It is partly inhabited by Russians and Choowashes, and partly by Bashkirs. Its wealth consists chiefly in cattle. The largest town is Chelyabinsk, on the small river Mias, not far from the base of the Ural Mountains, with 5000 inhabitants. North-east of Chelyabinsk is Miask, the most southern place where gold is obtained by washing. Troitzk, on the river Oöi, with 3000 inhabitants, is a place of some trade, but its commerce is now limited to trade with the Khirghis Cossaks who inhabit the country south of the Oöi.

The government of Tobolsk comprehends the whole of Western Siberia north of 60° N. lat. and the western half of it south of that parallel, exclusive of the country of the Khirghis Cossaks. In this government no metals are found except some bog-iron; but salt is got from several lakes. The wealth of the southern districts consists in the produce of agriculture and the herds of cattle; that of the northern consists of the produce of the fisheries in the river Obi, and the numerous wild animals that inhabit the forests. In the southern districts wood is scarce, except along the base of the Ural Mountains.

The capital is Tobolsk, where the governor-general of Western Siberia resides. [ТОБОЛСК.] In the comparatively populous district

which extends south-west to the boundary of Perm are *Toorinsk*, on the river Toora, with 7000 inhabitants, mostly Tooralinzes, who carry on a considerable trade in furs, and have many tanning-pits; and *Tioomen*, with 10,000 inhabitants. Tioomen is the oldest city in Siberia, having been founded by Tartars in the time of Genghis Khan. On the banks of the river Tobol are the towns of *Yalootorovsk*, with 2000 inhabitants; and *Koorgan*, with about 1000 inhabitants. In the vicinity of the last-mentioned place there are numerous ancient tombs in the form of small hills; they are called 'koorgani.' One of them, called by Pallas a royal mausoleum, is nearly 500 feet in circumference. East of Tobolsk is *Tara*, built on the west bank of the Irtysh, with 3600 inhabitants. Vessels of 300 tons burden go from here to Tobolsk. *Surgut*, north-east of Tobolsk, on the river Obi, is a small place with 1500 inhabitants. *Berezov*, on the west bank of the Obi (63° 56' N. lat.), has 8000 inhabitants, and a considerable traffic in furs and fish. It is the most northern place in which rye and barley succeed.

The province of Omsk consists properly of two lines of fortifications and of the country of the Khirghis Cossaks. The capital, *Omsk*, is built on the east bank of the Irtysh, at the point where the two lines of fortifications meet. It is a well-fortified place, with 7500 inhabitants, and contains a military school for the Cossaks and a college for those who wish to learn the languages of Western Asia. From this place, as well as from two of the fortresses, *Petropawlawsk* on the Ishim, and *Semipalatinsk* on the Irtysh, caravans depart for Tashkend in Kokan, and for Bokhara, traversing the steppes of the Khirghis Cossaks. *Ust Kamenogorsk*, on the Irtysh, has about 2000 inhabitants. The new agricultural colony of *Kar-Karaly*, with the steppe of the Khirghis Cossaks, belongs to this province.

The government of Tomsk is rich in metals (silver, copper, lead, iron), and in grass in the mountainous part; the steppe abounds in wild animals, and the eastern districts in agricultural products, but cultivation does not extend much beyond the bottoms of the rivers. The capital is *Tomsk*, a town containing from 8000 to 9000 inhabitants, on the banks of the river Tom, and on the great road leading from Western to Eastern Siberia. It is rather a well-built town. *Koonesk*, on the river Tom, with 3500 inhabitants, lies in a district which abounds in iron- and copper-mines, the produce of which is brought to this place. *Bernaul*, on the west and elevated banks of the river Obi, is the centre of the mining industry in the Altai Mountains, as the ore of most of the mines is brought to Bernaul to be smelted, owing to the want of fuel in their neighbourhood. It contains between 8000 and 9000 inhabitants, extensive furnaces, and a school of mineralogy. Many Germans are employed in the town and vicinity, and a German church and school have been erected: there is also a public library. At *Kolywan*, which stands in a valley of the Altai Mountains on the small river Loktefka, there is a manufactory in which many objects are made of porphyry. *Biysk*, a fortress on the river Biya, not far from its confluence with the Katunga, has 2000 inhabitants.

The government of Yenesei is 1800 miles in length. Agriculture does not extend north of the town of Yenesei (58° N. lat.); but it is in a prosperous condition in the vale of the Yenesei, south of *Krasnoyark*, though even there cattle constitute the principal wealth of the inhabitants. Iron-ore abounds in the mountains that inclose the vale, and it is worked in a few places. North of the town of Yenesei the inhabitants live chiefly by fishing. The capital of this government is *Krasnoyark*, on the Yenesei, with 3300 inhabitants. This town carries on a considerable commerce. *Yenesei*, farther north, was formerly the capital, and is still the most populous place, having between 4000 and 5000 inhabitants, and possessing an active and extensive commerce. The fair in the month of August is much frequented. *Atahinsk*, west of *Krasnoyark* and the *Kachoga* mountains, contains between 1500 and 2000 inhabitants. The river *Choolym* is here navigable for large river barges. *Toorookhanak* (near 66° N. lat.), on the Yenesei, is small; but at certain seasons of the year it is visited by the neighbouring nomadic tribes, who exchange their furs for tobacco, flour, and other necessaries.

The government of Irkutsk is chiefly agricultural. Cattle, horses, camels, and sheep constitute the principal sources of wealth. The capital is *Irkutsk*, the residence of the governor-general of Eastern Siberia. This town is built on the east bank of the Lower Angara, opposite the mouth of the river Irkut, from which its name is derived, and contains about 20,000 inhabitants. The streets are straight and wide, but are not paved; most of the houses are built of timber. The palace of the governor-general, the medical institution, the grammar school, and the hall of the American Company, are good buildings. There are also a public library, a museum of natural history, a military school, and a school for navigation. Irkutsk is the centre of the commerce of Eastern Siberia. The town is 1240 feet above the sea-level, and the climate is very cold; but it is healthy and pleasant, owing to the dryness of the atmosphere. At *Telma*, north-west of Irkutsk, is a considerable manufacture of cloth, a smaller one of linen, and some glass-houses. *Kotahuga*, on the river Lena, is 1503 feet above the sea-level. In the country south of Lake Baikal is *Verchnei Udinsk*, on the river Uda, not far from its confluence with the Selenga; it has about 4000 inhabitants, who are engaged in commerce with Kiashta and Nertshinsk. At *Selenginsk*, a small place,

there is an English missionary establishment. West of it, in a steppe, is the seat of the Khamba Lama, the chief of the Buddhist religion among the Buriates: like the Dalai Lama in Tibet, the soul of the Lama is supposed to pass into his successor. Close to the boundary of the Chinese empire is the commercial town of Kiachta with Troizko Sawak. [KIACHTA.] In Da-uria is the town of *Nertshinsk*, a miserable place with 1000 inhabitants. Not far from the banks of the river Argun is *Nertshinskoi Sawod*, with 4000 inhabitants, the seat of administration for all the mines of this district.

The province of Yakutsk extends over all the north-eastern part of Siberia. Grain is only cultivated in the Vale of the Lena as far as Yakutsk; but the crops are uncertain, owing to the shortness of the warm season. In the basin of the Vilui there are mines of excellent iron. The most numerous and most wealthy tribe are the Yakutes, who are breeders of cattle, horses, and sheep. The capital is *Yakutsk*, on the river Lena, with more than 4000 inhabitants. Yakutsk is one of the best markets in Siberia for furs, especially sable, as this animal is very abundant in the wilderness south of the road leading to Okhotak, and the fur is of the best quality. In the northern districts are some places, as *Ust-Yansk* and *Nischnei-Kolymak*, to which the native tribes resort to exchange their furs for flour, tobacco, and other articles.

The province of Okhotak extends along the sea of that name, from the innermost corner of the Bay of *Penshinsk* to 58° N. lat., comprehending the lower coast and the mountains at the back of it. There is no cultivation here. The capital is *Okhotak*. [OKHOTSK.] At the most northern recess of the Bay of *Ishiginak*, one of the great inlets of the Sea of Okhotak, is the small town of *Ishiginak*, with 500 inhabitants, who live chiefly on the produce of their fishery, but have also some commerce.

The province of KAMTCHATKA is separately noticed.

Manufactures.—Siberia does not possess many manufacturing establishments. It has some tanneries, iron-foundries, glass-works, and manufactures of coarse woollen-stuffs and linen. An article of export is made at *Ekaterinburg* by the jewellers and cutters of precious stones. During nine months in the year the dress of the poor, as well as of the rich, consists of furs or sheep-skins, or the hides of the reindeer prepared in a peculiar way; and in the manufacture of these objects the nomadic nations, especially the *Samoyedes* and *Ostiaks*, excel.

Though the ocean washes the northern and eastern sides of Siberia, this country has no maritime commerce. The ice of the Polar Sea and the Sea of Okhotak prevents the free navigation of these waters, and the mountainous country which lines the shores of the Sea of Okhotak, affords nothing that could be brought into commerce except the furs of some wild animals. But Siberia carries on an extensive commerce with Russia, Bokhara, Tashkend, and China. The most important is the trade with Russia. The transport of the goods is effected by a road which leads from Perm in Russia to *Ekaterinburg* and *Tobolsk*. West of *Ekaterinburg* it crosses the Ural Mountains by a mountain pass, the highest part of which, near *Blimbayewak*, is 1698 feet above the sea. By this road the produce of the rich mines of Siberia is brought to Europe, as well as a great quantity of furs, and some leather and skins, which are chiefly collected among the nomadic tribes of the northern districts. The commerce which is carried on at *Kiachta* with the Chinese has been noticed under *KIACHTA*. The goods from *Irkutsk* to *Kiachta*, and from *Kiachta* to *Irkutsk*, are conveyed, from May to November, by large vessels which navigate the Lake of *Baikal* and the river *Selenga*, and in November and December by carts on a road which passes over the high mountain ranges that inclose the western portion of the lake called the *Kultuk*, and in winter by sledges on the ice of the lake itself. The greater part of the Chinese goods is afterwards sent to Western Siberia and to Europe at a comparatively small expense, nearly the whole transit being by water. The inhabitants of Siberia have also some commerce with *Kuldaha*, the capital of the Chinese government of *Ili*, or of *Songaria*, through the agency of the *Khirghis Cossaks*, who inhabit the country contiguous to the Chinese boundary. A regular commercial intercourse has been established between Siberia and the khanat of *Khokan*, by means of caravans passing through the steppes of the *Khirghis Cossaks*. These caravans are not composed of Siberians, but of *Bokharians*, *Armenians*, and *Siberian Tartars*. These Tartars can proceed with their goods to the town of *Kashgar* in Chinese *Turkistan*, from which place the Russians are excluded by the Chinese government, but the *Siberian Tartars* are admitted. The principal articles brought to Siberia are derived from the *Khirghis Cossaks*, and consist of cattle and horses, of which latter the consumption in the mining district is very great, and of felts made of the hair of camels and cattle, and of coarse carpets made of wool. The articles exported from Siberia by this way are chiefly corn for the consumption of the *Khirghis Cossaks*, and for the commerce with *Khokan*, Russian leather, otter-skins and seal-skins, woollen-cloth, looking-glasses, razors and some cutlery, combs of European manufacture, and particularly large quantities of iron and copper from the Ural mines. The commerce which is carried on between the town of *Troizk*, on the river *Ool*, in the department of *Orenburg*, and the town of *Bokhara*, is of a similar description. The caravans, which are composed of *Bokharians* and

Armenians settled at *Bokhara*, traverse the steppe of the Little Orda of the *Khirghis Cossaks*. Besides the articles brought from *Khokan*, the *Bokharians* import large quantities of raw cotton, and a few shawls of great value.

There is a considerable commerce carried on between the southern agricultural districts and the northern, which are inhabited by nomadic nations. A great number of Russian merchants at certain periods, especially in February, visit certain places to which the nomadic nations resort, to buy from the latter their furs and other objects. The Russian merchants give in return flour or bread, and a few manufactured articles. These places of commerce are very small, but are full of people at the time of the fairs. Among these places are *Obdurak* on the *Obi*, *Toorookhanak* on the *Yenesel*, *Ust-Yansk* on the *Yana*, and *Ostronoye* on the *Aniuy*, one of the confluents of the *Kolyma*. The most frequented are the first and the last. The fair of *Obdurak* is attended by all the nomadic nations that live between the town of *Archangel* on the *White Sea*, and the river *Yenesel*, by *Samoyedes*, *Syrianes*, *Ostiaks*, and *Vogules*. The fair at *Ostronoye* is attended by the tribes that inhabit the north-eastern peninsula of Asia, the *Yookahires*, *Lamutes*, *Toonguses*, *Choowanzes*, *Koriakes*, and particularly the *Tshooktahes*. The *Tshooktahes*, most of whom have frequent dealings with the native tribes of the north-west districts of America, are in general sufficiently skilful in trading with the Russians; but they are easily cheated out of their goods when spirits are offered to them, which however are only smuggled into the country in very small quantities, as the Russian government has prohibited the importation of this article. In the commercial intercourse of the *Tshooktahes* with the native tribes of Russian America, the island of *Imaklitt*, one of the group of the *Diomedes* or *Gwosdef Islands*, is generally the place where the exchange of goods takes place. The most active merchants are the American inhabitants of the two small islands called *King's Islet* or *Ookivok*, and *Asiak* or *Ajak*, especially those of the last-mentioned island, who dispose of the Russian goods which are obtained from the *Tshooktahes* along the coast of America, as far south as the peninsula of *Alaska*, and would probably carry them still farther to the east, if the settlements of the American Company did not provide the tribes in those parts with such articles. The *Tshooktahes*, as well as the Americans, visit the island of *Imaklitt* in summer in their boats called 'baidares,' which are made of whale-bone, and in winter in sledges which are drawn by dogs. The *Tshooktahes* bring tobacco, some iron utensils and ornaments obtained from the Russians, with a considerable number of reindeer dresses, as this animal does not appear to be common in any part of North America. The *Asiak-mutes*, or inhabitants of the island of *Asiak*, bring various descriptions of furs, and a great number of morse-tusks.

History.—Europeans had not the least knowledge of the existence of Siberia up to 1580. It is however certain that a part of it was conquered by *Gengis Khan* and his successors; for it appears that the *Buriates* were subjected to the *Kalkas Mongols* by that conqueror; and when the *Cossaks* had passed the Ural Mountains, they found that the country on both sides of the river *Irtish* was subject to *Kutshum Khan* and his *Tartars* or *Turks*. A *Cossak* chief called *Yermak Timofeyew*, passed the Ural Mountains with his small army in 1580, and made several important acquisitions of territory till 1584, when he was drowned in the *Irtish*. After his death his conquests were lost to Russia, but the power of *Kutshum Khan* (the *Tartar* chief of this district) had been broken, and he was unable to resume his former position. The Russians continued gradually to gain on him, until his empire was entirely destroyed, and all the country west of the river *Obi* was subjected to the sway of the *Czar*. In 1604 the town of *Tomsk* was built, which constituted a fresh point from which the bold spirits of the age might proceed farther east. In 1614 the different *Turkish* tribes that inhabited those parts, joined by the *Khirghis*, rose against the inhabitants of *Tomsk*, laid waste the whole country to the very gates of the town, and besieged the city itself. No succour could be sent from Europe, as Russia was then in great internal disorder, owing to the unsettled state of the country after the death of *Boris Godoonoff*, and the wars which preceded the accession of the family of *Romanoff* to the throne of Russia. But the inhabitants of *Tomak* maintained their footing, though their progress for some time was retarded; and several years afterwards, when the *Eastern Khirghis*, in despair of resisting the *Cossaks*, left the country and emigrated to the west, the progress of the Russians was very rapid. Small parties of adventurers, issuing from *Tomak*, advanced to the banks of the Lake *Baikal*, entered the basin of the river *Lena*, where they subjected, though not without considerable difficulty, the powerful nation of the *Yakutes*, and after passing the *Aldan Mountains*, reached the Sea of *Okhotak* in 1639. The populous nation of the *Buriates* had been attacked and partly conquered in 1620, but they frequently rebelled, and their complete submission was not effected before 1658. Soon afterwards the town of *Irkutsk* was built by *Iwan Pochaboff* (1661). Thus the whole of Siberia, with the exception of *Da-uria*, was subjected to Russia in about eighty years, without the government having been at the least expensive; for all these wars had been undertaken and brought to successful issue by private adventurers, mostly *Cossaks*, who were induced to such undertakings by the desire of plunder and by their roving habits. The

conquest of Da-uria was completed in the same way. Khabarow, a Pole by birth, had escaped from Yeneseisk with a few exiles, and after wandering about for some time in the woods which surround Lake Baikal, he and his followers settled, beyond the present boundary of Siberia, on the Amur, in 52° 9' N. lat., where they built a small fortress, called Alban. As they had offended their neighbours, some tribes of Toonguses, they feared they might be overpowered by numbers, and offered their conquest to the emperor of Russia, soliciting at the same time his forgiveness for their offences. Meanwhile the Toonguses had applied to the Chinese for assistance, and disputes subsequently arose between the courts of Peking and St. Petersburg; but by the intervention of the Jesuits who resided at Peking, a treaty was concluded in 1689, by which the boundary between Siberia and the Chinese empire was established. This treaty was confirmed by the treaty of 1727, in which Kiachta and Maimatshin were appointed as the only places where a commercial intercourse between the two countries should take place. At the same time Russia obtained permission to send every ten years a spiritual embassy to Peking, in order that the prisoners taken by the Chinese at the last conquest of Alban, and their offspring, might receive instruction in their religion.

SIBOURNE. [PYRÉNÉES, BASSES.]

SICILIES, KINGDOM OF THE TWO, is the title of an Italian monarchy, which comprises the southern part of the peninsula, being nearly one-third of continental Italy, and also the island of Sicily. It is the largest and most populous of the Italian States. The area and population are as follows:—

	Area in square miles.	Population in 1851.
Continental Territory	32,475	6,612,892
Island of Sicily	10,536	2,091,580
Total	43,011	8,704,472

In administrative language the continental territories are styled 'Dominj di quà del Faro' ('Dominions on this side the Strait of Messina'), while Sicily is designated 'Dominj di là del Faro' ('Dominions beyond the Strait of Messina'). Writers also use the denomination of Sicilia Citeriore and Sicilia Ulteriore, the designation having reference to Naples, the capital. A geographical and statistical account of each of these two great divisions is given under NAPLES, Kingdom of, and SICILY; and a sketch of the history is given under NAPLES, City, and at the end of SICILY.

SICILY, a large island in the Mediterranean Sea, which is separated by the narrow Strait of Messina, from the coast of Calabria. It is of triangular form, and obtained its ancient name *Zynacria* from its three principal promontories:—Lilybæum, now Capo Bofo, the most western point, which is about 90 miles distant from Cape Bon on the coast of Tunis; Pelorus, now Capo di Faro, the north-eastern angle, which faces the rock of Scylla, 3 miles distant on the Calabrian coast; and Pachynus, now Cape Passaro, the south-east point, which is 60 miles from the island of Malta. The length of the northern and southern sides of the island, not including the windings of the coast, is about 175 miles each; and that of the eastern side is about 115 miles. The area is 10,536 square miles according to the latest official returns, and the population at the census of 1851 amounted to 2,091,580. In the article SARDEGNA, it is stated that the island of Sardinia is, according to some, greater, according to others, less than Sicily; the true area of Sardinia is very nearly 9300 square miles, so that the island of Sicily exceeds it in area by about 1200 square miles.

A number of mountain-groups extend across the island from east to west, bearing various names; the Mounts Pelorias, or Dinamari, between Melazzo and Taormina, which seem to be a continuation of the Apennines of Calabria; the Herai Montes, farther west; the Nebrodes, now Monti Madonia, south of Cefalù and Termini, the highest summit of which, near the town of Polizzi, is said to be 6000 feet high; the Cratae, the ramifications of which extend to Palermo, and one of the highest summits of which is that of Calata-mauro, near Corleone; and, lastly, Mount San Giuliano, the ancient Eryx. These mountains are much nearer to the northern than to the southern coast, and the longest water-courses are consequently on the south side of them. Toward the centre of the island are the limestone mountains of Enna, now Castrogiovanni, about 3000 feet high, and Mount Artisino, which is still higher; both of these are offsets of the Nebrodes ridges: and farther south the lower groups of the mountains of Noto, formed of tertiary rocks, extending to Cape

Passaro; and the hills of Modica, the Hybla Minor of the ancients. Few summits in Sicily, with the exception of Ætna, exceed 4000 feet in height. Towards the eastern coast rises the detached group of Ætna, which occupies an area nearly 90 miles in circumference: the highest summit of Ætna is 10,617 feet above the sea. [ÆTNA.] At the southern base of Ætna lies the plain of Catania, the largest in the island. There are smaller plains along the southern coast, near Alicata, Terranova, Marsala, and at Melazzo on the northern coast; but the larger part of the surface of the island consists of mountains and valleys. The northern coast is generally high, the mountains in many places coming close to the sea. Few of the rivers are perennial. Of these few the principal are, the Giaretta, or Simæthus, which flows eastward through the plain of Catania; the Fiume Salso, the ancient Himera, which flows southward, and enters the sea near Alicata; and the Belice, or Hypsa, which flows into the sea near Selinunte, the site of the ruins of Selinus. Most of the rest are torrents, dry or nearly so in summer, but swelling into formidable floods in the rainy season.

Most of the mountains have been in the course of ages stripped of their ancient forests, and they now present a naked and barren appearance. The sides of Ætna however are still covered with fine forests of oaks, beech, maple, birch, fir, and magnificent chestnut-trees. A few other forests are scattered over the surface of the island, the principal being that of Caronia, near the northern coast; that of Capellaro, south of Palermo; the woods near Castelvetrano, on the southern coast; and the forest of Giummia, west of Calatagirona. The mineral productions of Sicily consist of copper and silver, which were once worked, but are now abandoned; ciannabar, sulphur, which is found in great abundance, especially near San Cataldo, Galati, Butera, Bifara, Tavara, and Montegrande, and forms a considerable article of export from Alicata, Girgenti, and Palma.

Sicily seems to contain no iron. Marble, alabaster, and other kinds of fine stones are found in abundance. Amber is found near Catania. There is rock salt near Castrogiovanni, but the greater part of the salt consumed or exported is sea-salt, which is made in extensive salterns along the coast, especially near Trapani, Marsala, and Agosta. The exported salt is mostly put on board Baltic or Norway traders.

Sicily has few lakes. The Lake of Lentini, so called from the town which occupies the site of the ancient Greek city of Leontini, which stood on the south-east shore of the lake, lies near the east coast between Catania and Syracuse. It is of considerable extent, about 12 miles in circumference, but stagnant, shallow, and insalubrious. It abounds with fish. The plain northward from Lentini, now called the Plain of Catania, is the ancient Leontinus Campus, celebrated for its luxuriant fertility. An ancient tradition fixes the abode of the Læstrygones in this plain. The Lake of Pergusa, near Castrogiovanni, in the centre of the island, is about 4 miles round. It is supposed to be the Lake Pergus mentioned in ancient tradition of the abduction of Proserpine by Pluto. There is a small lake near Randazzo at the northern foot of Ætna; and another called Cantarro near the coast of the western part of the island, a few miles from Castel-Vetrano.

The sea around the coast of Sicily abounds with fish of various sorts, but the most productive fisheries are those of the migrating fish, the sardine, and tunny. Most of the fish are consumed in Sicily and Naples and other parts of Italy.

The cultivation of corn is said to occupy about one-half of the tilled land. The best wheat is that of Termini. Corn was formerly dear in the sea-port towns, owing to the want of roads in the interior. The lower classes, especially in the interior, eat barley bread. Indian-corn and beans are cultivated to a small extent. Wine is made in abundance, especially in the southern part of the island. The white wines of Marsala, Castel-Vetrano, Catania, and Bronte are exported in considerable quantities. The amarena of Agosta and the muscat of Syracuse are fine dessert wines. The red wine of Faro is a good common wine. Sicilian wine is exported to England, Germany, Spanish America, and Brazil. The distillery of brandy has been greatly improved of late years, and a considerable quantity is exported to South America, as well as tartar, both white and red. Dried raisins, called zibib, are exported from Messina and other ports. Messina is the depôt for the currants of the Lipari Islands, of which about 12,000 barrels are yearly exported.

Olive-oil of an inferior quality is produced chiefly along the northern coast. The oil of Tusa and Cefalù is considered the best. Olive-plantations might easily be spread all over Sicily. Linseed-oil is made at Catania, and along the southern coast. Lemons and oranges are plentiful and fine, and are exported in considerable quantities; but much of the fruit is left to rot on the ground. The manufacture of citric acid, and essences of lemon, citron, orange, anise-seed, lavender, rosemary, and bergamot, constitutes another branch of industry. Silk, a staple article of Sicilian produce, is sold to French and Swiss manufacturers. The silk of Foria is the best; and next to it is the silk of Piana, Rametta, and San Martino. Messina is the great mart for silk.

Liquorice-juice is made chiefly at Catania, Patti, and Palermo, and exported to England and the north of Europe, where it is employed in brewing. The pods of the carob-tree, which grows wild in the southern part of the island, are exported to Trieste, Naples, Leghorn, and Genoa:

they are chiefly used as forage for horses. Manna, which is an exudation of the sweet sap of the ornus (a species of ash which grows in the mountains of Sicily) is procured by making vertical incisions in the bark of the tree. Almonds and pistachio-nuts also are largely exported to Germany and the north of Europe. Sumach is exported chiefly to England. The best sumach is that of Alcamo and Trapani. Kid-skins and lamb-skins, both dressed and undressed, are shipped from Messina to Germany and England. The other articles of Sicilian produce are—rice, nuts, walnuts, dried-figs, cantharides, honey, wax, gum, soda, and cotton, which is cultivated to a considerable extent. The sugar-cane (cannamele), which was once extensively cultivated in Sicily, is now entirely abandoned. The above list of products shows the great natural capabilities of the island.

Cattle are few in number, and mostly poor, owing to the want of the artificial grasses, and to their being neglected and left in the fields without stabling. Sheep are numerous, but little attention has been paid to improving the breed, and the wool is bad. Cheese is made from ewes' milk. Goats are in many places preferred to sheep. The government has established a stud of foreign stallions to improve the breed of horses. Wolves are common in the mountains and forests, and snakes in the low plains.

The population is distributed very unequally over the surface of the island. The coasts, especially the northern and eastern, are thickly studded with towns, whilst the central part of the island is comparatively uninhabited. The tract between Messina and Catania is the most populous part of the island, whilst in the west the tract between Alcamo and Trapani is almost a desert. The mountains are generally uninhabited. The want of roads, and the greater resources for industry afforded by the proximity of the sea, serve to explain this inequality.

Sicily was formerly divided into three great divisions, called Valli. 1. *Val di Mazzara*, which comprised the western part of the island; its eastern boundary very nearly coinciding with the northern and southern *Himera*, which both rise in the Madonia Mountains, and flow—the former northward, under the name of *Fiume Grande*, into the sea between Cefalù and Termini, the latter southward, under the name of *Fiume Salso*—into the sea at Alicata. The Fiume Salso has brackish waters after its junction with a small stream that flows from the salt-mines of Caltanissetta, and has obtained its name from this circumstance. 2. *Val di Demone*, which comprises the north and north-east of the island, as far south as the Simethus, or Giaretta, including the region of *Ætna*. 3. *Val di Noto*, which comprised all the rest of the island between the Salso and one of the head streams of the Giaretta, which passes San Filippo d'Argyro.

The island is now divided into seven provinces, the area, subdivisions, and population of which are as follows:—

Provinces.	Area in Sq. Miles.	Districts.	Communes.	Population in 1851.
Palermo	1984	4	72	514,717
Messina	1386	4	116	349,484
Catania	1761	2	81	378,991
Girgenti	1375	3	45	245,974
Noto	1482	3	41	237,814
Trapani	1358	3	21	182,809
Caltanissetta . .	1190	3	31	180,791
Total	10,536	22	407	2,091,580

The government of the island is placed in the hands of a general-governor, who is also commander-in-chief of the forces. Each province has its own Intendente, or civil governor; each district its Sottintendente, or subprefect; and each commune its Sindaco, or mayor, as in the continental dominions. [NAPLES, vol. iii. col. 907.] For judicial purposes the provinces are divided into judicatures, each having a judge of first instance for criminal and police matters. In the head town of each province is a collegiate court for civil suits. There is a 'Gran Corte Civile,' or High Court of Appeal, in each of the three principal cities, Palermo, Messina, and Catania, and a supreme court of justice at Palermo. For scientific instruction there are three universities, Palermo, Messina, and Catania; and 21 colleges in the various provincial towns. There is an institute for female education at Palermo; naval schools at Palermo, Termini, Cefalù, and Messina; a veterinary school at Palermo, and an academy of the fine arts in the same city.

Elementary instruction is much neglected; some elementary schools exist in the towns, but few in the rural communes. The great majority of the people is illiterate.

The religion of the inhabitants is the Roman Catholic. The ecclesiastical establishment consists of three archbishops—Palermo, Monreale, and Messina; 11 bishops—Syracusa, Mazzara, Cefalù, Patti, Nicosia, Piazza, Gerace, Girgenti, Caltagirone, Catania, and Lipari; 13 abbacies, and about 30,000 secular priests. The regular clergy consists of 7591 individuals, including lay brothers, distributed among 658 convents, of which 409 are possessed of property, and 249 are of the mendicant orders. Sicily having remained undisturbed by revolution or French invasion, the property of the convents has

GEOL. DIV. VOL. IV.

remained untouched. There are colonies of Greek or Epirote origin, which have retained the Eastern ritual, but acknowledge the Pope as their spiritual head, being of what is called United Greeks, who are Catholics in faith, but use the Greek ritual. The head of the Greek clergy resides in Messina, and is subject to the jurisdiction of the archbishop of Messina.

The governor-general represents the king's person, and is often a member of the royal family. He has under him a secretary of state; but all important matters are referred to a section of the council of state sitting at Naples, which section is specially concerned with the affairs of Sicily.

Sicily is not burthened with the conscription. Recruits for the army are obtained by voluntary enlistment. The permanent force kept in the island consists in ordinary times of 6000 men. The principal garrisons are those of Palermo, Messina, Syracuse, Trapani, Agosta, and Melazzo. There was formerly a rural police, called 'armigeri,' charged with the care of keeping the roads clear from outlaws; but it has been superseded by gendarmes. The present king, Ferdinand II., opened several carriage-roads throughout the island. During a visit to the island previous to 1840, he abolished every remnant of feudality, setting the example himself by renouncing several feudal duties and fees. He also ordered the demesne lands to be distributed among the poor rural population.

The manufactories of Sicily are unimportant. Cotton-cloth is manufactured at Messina, Catania, Palermo, and Caltagirone; silks at Palermo, Catania, and Nicolosi; leather at Messina; gloves, soap, artificial flowers, and paper, at Palermo; coral from the coast of Africa is wrought at Trapani. Sicilian vessels, mostly coasters, amount to about 1400, besides fishing-boats. The foreign trade of Sicily is carried on chiefly in Genoese, Austrian, French, and Spanish ships.

The principal towns of Sicily are:—PALERMO, MESSINA, CATANIA, SYRACUSE, AGOSTA, TRAPANI, and GIRGENTI. Among the inferior towns, the following deserve notice:—Melazzo, Patti, Taormina, Castro Reale, and Randazzo, noticed under MESSINA; Termini, Cefalù, Corleone, Monreale, and Carini, noticed under PALERMO; Caltagirone, Nicosia, Acì Reale, Paternò, Aderno, and San Filippo d'Argyro, noticed under CATANIA; Sciacca, Castronovo, Bivona, and Aragona, noticed under GIRGENTI; and MARSALA, ALCAMO, and ALICATA, noticed under their respective heads.

The other towns which deserve notice are:—*Castelvetrano*, near the site of the ancient Entella, in the west part of the island, with about 12,000 inhabitants, in a romantic situation on a hill in the province of Trapani; the ruins of the ancient Selinus are a few miles south of Castelvetrano, near the sea-coast. *Mazzara*, capital formerly of the Val di Mazzara, is situated in 37° 40' N. lat., 12° 34' 53" E. long., on the coast at the mouth of the Salemi, about 10 miles S.E. from Marsala, and the same distance west of Castelvetrano, and has 10,000 inhabitants. *Caltanissetta*, a town with above 20,000 inhabitants, a cathedral, and numerous churches and convents, is situated in the interior of the island, a few miles west of the Salso. *Caltabellotta*, on a hill north of Sciacca, near the south-west coast, has about 7000 inhabitants. *Castrogiovanni*, a town of 12,000 inhabitants, near the site of the ancient Enna, stands on a lofty hill of very difficult access, near the centre of the island, 36 miles W. from Catania and N.E. from Girgento. *Terranova*, on the site of the ancient Gela, on the south coast of the island, on the river Terranova, has about 9000 inhabitants, who carry on a considerable trade by sea. *Modica*, in the south of the island, 28 miles S.W. from Syracuse, is situated in one of the finest and most fertile districts in all Sicily; it has numerous churches and convents, and about 24,000 inhabitants. The finest cattle in Sicily, the finest wool, and the best cheese and butter, are produced on the territory of the city of Modica. East of Modica, on a hill near the coast, is *Noto*, the capital of the province of Noto, with a college, a rich collection of Greek, Roman, and Moorish coins, a museum of antiquities, an hospital, and about 18,000 inhabitants, who trade in corn, wine, and oil. *Piazza*, an episcopal town in the interior, 18 miles N. from Terranova, with 18,000 inhabitants, is situated on a hill halfway between Castrogiovanni and Caltagirone. *Castellammare*, on the gulf of that name on the north-western coast, between Palermo and Trapani, has a strong castle and large granaries: it is noticed under CASTELLAMMARE. *Salemi*, a fortified town, situated on a hill in the west part of the island, 16 miles S. from Castellammare, is built on the site of the ancient *Halicyæ*, and has about 12,000 inhabitants. Both names of this town are derived from the salt springs near it. *Leontini*, the ancient Leontini, has 6000 inhabitants and some good buildings; but the air is considered unhealthy in summer. *Carlentini*, a little south of the preceding, has 4000 inhabitants. *Geraci*, in the mountains, north-west of Nicosia, has 4000 inhabitants. Besides these, there are many other towns of less note. Sicily has many towns containing above three thousand inhabitants, as the population live chiefly in towns, and not in cottages dispersed about the country.

The small islands belonging to Sicily are—I. The group of the LIPARI ISLANDS.

II. The group of the Trapani Islands, anciently called *Ægates*, and lying opposite the promontories of Drepanum (Trapani) and Lilybæum. *Favignana*, the ancient *Ægusa*, about 16 miles from the mainland of Sicily, is 18 miles in circumference: it has good anchorage

ground for large vessels, and a strong castle. Favignana has good pastures and copious springs. A number of sheep are reared on this island, which is the largest of the group, and the surrounding sea abounds with fish. The woods contain hares and deer. *Martimo*, originally called Hiera, and afterwards Maritima from its standing farthest out at sea, is 11 miles in circuit, and 25 miles from the coast; it is rocky and naked, and the coast is bold and steep: wild thyme grows in abundance, and supplies nourishment for swarms of bees. It has a strong castle, which is used as a prison for state prisoners. *Levanzo*, the ancient Bucinna, north of Favignana, and about 10 miles distant from the point of Trapani, is 8 miles in circuit, and has some good pastures. The group comprises some smaller rocky islands, dangerous to navigators, among which are the two *Formiche*, and *Scoglio di Mezzo*, between *Levanzo*, Favignana, and the mainland. The *Ægates* are celebrated in history for the great naval victory gained by the Romans (B.C. 241) over the Carthaginian fleet towards the end of the first Punic war. There is a group of small islands south-east of Favignana and near Cape Lilybæum, one of which, *San Pantaleo*, is the ancient *Motya*, once a settlement of the Phœnicians, and afterwards a stronghold of the Carthaginians, which was destroyed by Dionysius the elder. There are some fragments of the walls and gateways of the ancient city. The island is only a mile and a half round; it is barren and inhabited only by a few fishermen. Outside San Pantaleo lies a group of low rocky islets called *Stagnone*. *Motya* was in ancient times connected with Sicily by a causeway.

III. The island of *Ustica*, 40 miles N. by W. from Palermo, is about 11 miles in circumference; the surface is hilly; it contains many olive and other trees, and large cisterns cut in the rock, as well as sepulchres and other traces of ancient colonisation. *Ustica* was for centuries deserted, owing to the island being exposed to the depredations of the Barbary pirates, until the year 1759, when a fresh colony was sent to it, with a garrison, and several small forts were built: the population is now in a thriving condition. [PALERMO.]

IV. The island of *Pantellaria*, the ancient *Cosyra*, is situated between the south-west coast of Sicily and the coast of Tunis, east of Cape Bon, from which it is about 44 miles distant. It is 60 miles from the nearest point of Sicily south of Mazzara. *Pantellaria* is about 36 miles in circumference; it is of volcanic formation, and produces the vine and the olive, cotton, pulse, fruits, and pasture, but little corn. The inhabitants, who number about 5000, are remarkably industrious. The island has several creeks with good anchorage-ground. An herb called *orsaglia*, which grows on the island, is used for dyeing. There is a warm soapy spring, which is used for bleaching and scouring linen, and other mineral springs. A copious spring in the middle of the island furnishes the inhabitants with drinkable water. There is a town, with several churches, and a castle with a garrison sent from Sicily.

V. South of *Pantellaria*, towards the coast of Tripoli, are the two uninhabited islands of *Linoso* and *Lampedosa*. *Linoso*, which is the smaller, is destitute of water, but *Lampedosa* has a good spring and good anchorage-ground, and a soil capable of cultivation; it was once inhabited. *Lampedosa* gives the title of prince to a Sicilian family. The crown of Sicily used to receive feudal homage from the grand-master of the order of Malta, that island, as well as *Gozo*, having formerly been subject to the kings of Sicily.

The best harbours on the coast of Sicily are those of Messina and Syracuse, which are perfectly safe. The ports of Palermo, Agosta, and Trapani are next in importance. But the southern coast is destitute of harbours; that of *Girgenti* is only fit for small craft, and therefore this coast is dreaded by Mediterranean sailors.

The ancient Sicilian population was formed out of a mixture of various nations, Sicani, Siculi, and Greek colonists. There was also an admixture of Punic blood, and afterwards of Roman and Campanian. After the fall of the Western Empire, the Byzantine Greeks remained masters of the island, till the Saracens came, and the Arab and Moorish race remained in Sicily for more than two centuries. Then came the Normans, and after them the Aragonese or Spaniards, who gained a lasting footing in the country. From all these races the actual Sicilians are derived, but it may be presumed that the indigenous Sicilian and the Greek and Punic blood are the three preponderating elements. Accordingly there is considerable difference of complexion and appearance among the inhabitants. The Sicilians are generally dark, and yet we sometimes see complexions as fair as in the north of Italy. Unless bent down by poverty or disease, the Sicilian exhibits a spare but muscular and erect form, lively dark eyes, great elasticity of limb, and quickness of motion. He is shrewd, quick-sighted, and very imitative. Although the climate and the state of society incline him to indolence, he is more easily roused into activity than the Neapolitan, and is more capable of perseverance. The Sicilian women are handsome, and amorous; and their countenances often exhibit a strong admixture of Greek features. The Sicilian oral language is a dialect of the Italian, and as such is noticed under the head ITALY. The modern Sicilian dialect can boast of *Meli*, a lyric poet equal if not superior to his countryman Theocritus.

History.—The legends of the Greeks speak of the giants, Cyclops, and Laestrygonians, who inhabited Sicily previous to the epoch of the Trojan war. The Sicani are next mentioned, who are said by some to have been Iberians. (Thucyd., vi. 2.) Other writers consider the

Sicani to be aborigines of Sicily. (Diodorus, v. 2.) The island is sometimes called *Sicania*, from them. The Siculi next came from Italy, and occupied the eastern part of Sicily about 300 years before the Greeks made any settlement in the island. The Siculi drove the Sicani to the southern and western parts of the island, to which they gave the name *Sicilia*. (Thucyd., vi. 2.) They built *Zancle*, *Agyra*, *Enna*, *Erbessus*, and *Hybla*. The Phœnicians are said to have colonised *Panormus*, *Soksis*, and *Motya*. Then came the *Elymsæ*, who are said to have built *Elyma*, *Entella*, and *Egesta*. In the year B.C. 750 a colony of Chalcidians from *Eubœa*, and *Megarians*, led by the Athenian *Thucles*, landed on the eastern coast, and built the town of *Naxos*. In the following year a party of Corinthians and other Dorians laid the foundation of *Syracuse*. About B.C. 712 a party of Rhodians and Cretans built *Gela* on the southern coast. In course of time a colony from *Gela* built *Agrigentum*, and the *Syracusans* colonised *Camarina*. A colony of *Megarians* settled at *Hybla*, and afterwards built *Selinus*, B.C. 651. Colonies from *Zancle* founded *Mylæ* and *Himera*. The interior of the country remained in possession of the Siculi, under their respective princes. *Hippocrates*, tyrant of *Gela*, about B.C. 495 defeated the Siculi, took *Naxos* and *Leontini*, and obliged the *Syracusans* to give up *Camarina*. Having joined *Anaxilas*, tyrant of *Rhegium*, they surprised *Zancle*, and shared the plunder between them. *Anaxilas* then invited a party of *Messenians* to colonise *Zancle*. The tyrant *Phalaris*, B.C. 565-550, extended and consolidated the power of *Agrigentum*. About 60 years later *Theron* was tyrant of *Agrigentum*. He raised most of the splendid buildings of *Agrigentum*, and he conquered *Himera*, thus extending the dominion of *Agrigentum* to the northern coast of the island. *Theron* and his son-in-law, *Gelon*, tyrant of *Syracuse*, together defeated the first invasion of the Carthaginians, B.C. 480.

Between B.C. 452 and 440, Sicily was distracted by an internal war between the Siculi, led by their king or chief *Deucetius*, and the states of *Agrigentum* and *Syracuse*. It terminated with the destruction of *Trinacria*, a stronghold of the Siculi, which is supposed to have been near *Palica*, east of *Caltagirone*, and on the western border of the great plain of *Catania*. The *Syracusans* next attacked *Leontini*. This was a war of races: the Doric cities taking part with *Syracuse*, and the Chalcidic cities with the *Leontini*. The latter, being the weakest, applied to the Athenians for assistance. The first Athenian expedition to Sicily took place B.C. 427, but it led to no decisive result. A new quarrel between *Egesta* and *Selinus* led to the second Athenian expedition to Sicily, B.C. 415, which terminated fatally for the Athenians. [SYRACUSE.] The *Egestans*, being left at the mercy of their enemies of *Selinus*, applied to *Carthage*, and this led to the second invasion of Sicily by the Carthaginians (B.C. 409), who, under the command of *Hannibal*, son of *Hasdrubal*, took and plundered *Selinus*, which never afterwards recovered. The Siculi of the interior having joined the Carthaginians, their united forces took and destroyed *Himera* 240 years after its foundation. The Carthaginians next attacked the powerful city of *Agrigentum*, and after a long siege took and destroyed it in B.C. 406. [AGRIGENTUM.]

The Carthaginians now settled in Sicily, where they remained for about a century and a half, till the first Punic war. *Syracuse* was the only city that effectually opposed *Carthage* and prevented its dominion extending over the whole island. After a succession of wars between *Carthage* and *Syracuse*, a treaty was concluded about B.C. 340, by which the Carthaginians retained possession of the western part of the island, the river *Halycus* (now the *Platani*), which enters the sea on the western side of *Cape Bianco*, 18 miles W. from *Girgenti*, forming the boundary of their dominions on that side, but they retained the city of *Heraclea Minoa*, on the left of the river at its mouth. *Lilybæum* in the south, *Eryx* in the west (on *Mount Eryx*, 6 miles from *Drepanum*), and *Panormus* in the north, were the principal settlements of the Carthaginians, and they flourished by commerce. The other towns formed a league, of which *Syracuse* was the head. *Timoleon* invited fresh Greek colonies to repopulate *Agrigentum*, *Agyra*, *Gela*, and other places which had been devastated during the war.

The Carthaginians availed themselves of the dissensions between *Syracuse* and *Agrigentum* to interfere as mediators, when, in reward for their mediation, they secured an extension of territory to the river *Himera*. A war broke out between *Syracuse* and *Carthage* about B.C. 310, the particulars of which are related under *CARTHAGE*, vol. ii., col. 363. *Pyrrhus*, son-in-law of *Agathocles*, came and drove the Carthaginians out of the island, with the exception of *Lilybæum*, which he could not take, and he suddenly abandoned Sicily to its own dissensions and the mercy of the Carthaginians.

Syracuse, in this emergency, elected *Hiero* for its commander, who began by attacking the *Mamertines* in *Messana*. The *Mamertines* called in the aid of the Carthaginians, who took possession of the citadel. The *Mamertines* however revolted against their new allies, and called in the Romans to assist them against both *Hiero* and the Carthaginians. This circumstance led to the first Punic war, at the end of which the Romans succeeded the Carthaginians in the possession of the west of Sicily—*Hiero* II., king of *Syracuse*, retaining possession of the eastern part as ally of Rome. During the second Punic war the Romans took *Syracuse*, and became masters of the whole island which they administered as a province under a prætor.

The oppression of one of its prætors Verres reduced the island almost to a barren waste, and his robberies stripped the towns of all their wealth and works of art.

During the wars of the Triumvirate, Sicily was for a time in possession of Sextus Pompeius, who was at last defeated and driven away by Octavian. After his assumption of supreme power, Augustus restored many towns of Sicily which had been devastated during the late wars; he sent colonies to Tauromenium, Catania, Thermæ Himerenses, Centuripi, Panormus, Thermæ Selinuntie, Heraclea, and Syracuse. Finding the extent of this last city too large to be filled again, he contented himself with colonising the island Ortygia, which has constituted ever since the modern town of Syracuse.

Christianity spread early into the island, and a persecution of the Christians took place under Nero. In the 3rd century of our era we find registered the names of bishops of Panormus.

About A.D. 440 the Vandals, under Genseric, landed from Africa on the western coast of Sicily and took Lilybæum. Theodoris, the Gothic king of Italy, added Sicily to his continental dominion. In the year 584 Belisarius reconquered Sicily for the emperor Justinian; and the island continued to be a dependence of the Eastern empire, and was administered by a governor styled 'Patrician,' who was sent from Constantinople.

About the year A.D. 826, one Euphemius, a Byzantine officer who commanded the imperial troops in Sicily, fell in love with a Sicilian maiden of noble birth, who was a nun, and took her by force from her convent. Complaints having been laid before the emperor, Euphemius was outlawed. He then revolted, and defeated the patrician Photinus, but not being strong enough to withstand the imperial forces, he sailed over to Africa and invited the emir of Kairwan to effect the conquest of the island. In June 827 the first Saracen expedition landed in Sicily, took Agrigentum and Minoa, Messina in 831, and Panormus in 835. It was not till 878 that the Saracens took Syracuse by storm. Soon after the Saracens of Sicily threw off their dependence on the emirs of Kairwan; but it became subject to the fatimide kalif El Mehad in 910. In 945 the fatimide kalif Al Mansur appointed an emir as permanent and hereditary governor of Sicily, who fixed his residence at Panormus. Under the rule of the emirs Sicily enjoyed a more orderly government and comparative tranquillity. Tauromenium, the last hold of the Byzantines, was taken by the Saracens in 962. In 964 Nicephorus Phocas sent a strong armament to recover Sicily. A battle took place near Rometta, in which the Saracens totally defeated the Byzantine army, with the loss of 10,000 men. After this Sicily was governed by a succession of emirs, nominally dependent on the fatimide kalifs. In 1036 a revolt broke out among the Sicilian Saracens against the emir El Achal, who was killed, and his brother El Hassan was driven away. In every town the leading Saracens assumed the local power, and thus Sicily became a prey to anarchy, which favoured the invasion by the Normans.

The Saracens never formed the bulk, nor more than about one-sixth, of the population. The Christians enjoyed the free exercise of their religion, paying a tribute, like other conquered subjects in Mohammedan states; but they had no political rights, and were subjects of the conquering race.

Of the numerous remains of antiquity existing in Sicily the most important are noticed under SYRACUSE and AGRIGENTUM. Taormina has an ancient theatre in tolerable preservation. Other remains of antiquity are seen at Catania, Lentini, Alicata, Messina, Modica, Paterno, and Segeste, or Egesta, near Trapani. The antiquities of Sicily have been described by Swinburne.

The Normans first entered Sicily as auxiliaries of Maniaces, Katapan of Apulia, whom they aided in recovering the island for the eastern emperors from the Saracens in 1037. But the weakness and mismanagement of the Byzantine rulers threw the island once more into the hands of the Saracens. About 1060 Pope Nicholas II. granted the investiture of Sicily to Robert Guiscard, duke of Apulia and Calabria, who commenced the conquest of the island in the following year by taking Messina. In 1070, aided by his brother Roger, he took Palermo, which he made his capital. At his death Robert left Sicily, with the exception of Palermo, to his brother Count Roger, who drove the last Saracen garrison in Sicily out of Noto, and assumed the title of Great Count of Sicily. Roger introduced the feudal system in the towns and districts which he had taken by force from the Saracens; the rest of the country was considered crown domains, the proprietors of which remained undisturbed under the name of 'alodialists,' or 'burgensetici.' He instituted the Sicilian parliament, or assembly of the great feudatories, both ecclesiastical and lay, who met when convoked by the prince. In 1091 he sailed to Malta, and obliged the Galt, or Saracen governor, to pay tribute to the count of Sicily.

Count Roger of Sicily died in 1101, and was succeeded by his son Roger, who, in reward for aiding his cousin Duke William of Apulia against his refractory vassals, obtained the city of Palermo, and thus became monarch of all Sicily. On the death of Duke William in 1127 without issue, Count Roger of Sicily succeeded after much opposition in establishing his authority over all Apulia, Calabria, and Salerno.

In the year 1130 Count Roger assembled a parliament at Salerno,

which decided that he should assume the title of King of Sicily. This resolution was unanimously confirmed by the Sicilian parliament which he soon after convoked at Palermo; and on Christmas-Day of that year Roger was solemnly crowned in the cathedral of Palermo by the four archbishops of Palermo, Salerno, Capua, and Benevento. He assumed the title of 'Rex Siciliae, Ducatus Apulie, Principatus Capue.' Pope Innocent II., who refused to acknowledge Roger's new dignity, marched with troops into Campania, but was surprised and taken prisoner in 1139 by Roger, who treated him with great respect, and on the 25th of July a treaty was concluded between them, by which the Pope granted to Roger the investiture of the kingdom of Sicily, the king swearing allegiance to the see of Rome, and promising the payment of an annual tribute. About the same time, on the death of the duke Sergius, the Neapolitans chose Roger's eldest son for their duke, retaining their municipal laws and liberties. In 1140 King Roger seized that part of Abruzzo which lies between the Pescara and the Tronto, and thus the Sicilian kingdom attained its compact form and the boundaries which it has retained to this day. In this reign the silver coin called a ducat was first coined, and the manufacture of silk was introduced into Sicily.

Roger died in 1154, at the age of 59. He was the third great man of his family. Robert Guiscard and Count Roger laid the foundations of the monarchy by their conquests, and King Roger consolidated the whole into a regular form, made a body of laws, and established an orderly system of administration.

The Norman dynasty ruled over Sicily till 1194, when it came with the rest of the kingdom under the Suabian dynasty, in the person of Frederick II., son of the emperor Henry VI. and Constance the posthumous daughter of King Roger. Frederick was the founder of the third estate, or Commons, in the island of Sicily, having called to sit in the Sicilian parliament two prud'hommes, or wise men, for every damease town. He also established a municipal body in every commune, and introduced many other wise reforms into his states. Frederick II. died in 1250. Conrad succeeded him, but died in 1254, leaving his only son Conradin two years of age. Manfred a natural son of Frederick, assumed the regency of the kingdom of Sicily. Manfred was crowned king at Palermo in 1258, with the assent of the Parliament on the rumour of the death of Conradin. At the battle of Benevento, fought in 1266, Manfred was defeated and killed by Charles of Anjou, who was acknowledged king of Sicily, Apulia, Calabria, &c. The young Conradin led an expedition in 1267 to recover his paternal kingdom; but he was defeated by Charles of Anjou at Tagliacozzo, and publicly beheaded at Naples in 1269.

The terrible massacre of the French in Sicily, known in history as the Sicilian vespera, put an end to the French or Angevine rule in Sicily in 1282. The Sicilians called to the throne Pedro, king of Aragon, who had married Constance, daughter of Manfred. Charles of Anjou retained the continental territories, and fixed his residence at Naples. Both styled themselves King of Sicily, and the usage began gradually to prevail at Naples of calling the island 'Sicily ultra pharum,' and the continental territories 'Sicily citra pharum.'

The island had a succession of Aragonese kings from this time till 1416, when Alfonso, son of Ferdinand (of Aragon), having succeeded his father as king of Aragon and Sicily, appointed a viceroy to govern Sicily. This was the beginning of the Spanish viceregal government in Sicily, which lasted, with a few short intervals, for above three centuries (till 1734), to the great disappointment and disadvantage of the Sicilians.

By the peace of Utrecht, Charles V. resigned his claims to Spain, but retained Naples, Sardinia, and Milan, and by the express intervention of England, Sicily was given to Victor Amadeus of Savoy, with the title of king. Victor Amadeus made his ingress into Palermo in 1714, and assembled the Sicilian parliament. The census of the island of Sicily, taken at this time, gave a return of 1,153,000 inhabitants, of which Palermo reckoned 120,000. An expedition sent by Cardinal Alberoni in 1718 took Sicily from Victor Amadeus, but England and Austria obliged the Spaniards to evacuate the island, and by a new arrangement Sardinia was given to Victor Amadeus and Sicily to the emperor Charles. Thus Sicily and Naples were again united under a foreign crown.

In 1734 a new war having broken out in Europe on the occasion of the disputed succession of Poland, Spain undertook to reconquer both Naples and Sicily. The Infante Don Carlos (Carlo Borbone), son of Philip V., marched with a well-appointed army and took Naples from the Austrians. He then proceeded to Sicily, which he also conquered after some resistance. At the same time Philip V. made a solemn renunciation of Naples and Sicily in favour of his son Don Carlos (who assumed the title of King of the Two Sicilies) and his heirs.

Carlo Borbons, under whom the country enjoyed peace, and a degree of prosperity to which it had been a stranger for centuries, having by the death of his brother Ferdinand VI. of Spain succeeded to the crown of that monarchy, resigned his kingdom of the Two Sicilies to his son Ferdinand, then eight years old, appointing a council of regency during his minority. The first part of the reign of Ferdinand, till the epoch of the French revolution, was spent in forwarding the system begun by his father. He married in 1768 Maria Carolina of Austria, daughter of Maria Theresa and sister of Marie Antionetta.

A French army having invaded the kingdom of Naples in 1799, Ferdinand and his court escaped to Sicily. In the following June the troops of Ferdinand, joined to a large Calabrian militia, led by cardinal Ruffo, retook the capital and the whole kingdom, and Ferdinand returned to Naples. In 1805 he entered secretly into a coalition against Napoleon, who after the victory of Austerlitz sent Marshal Massena against Naples, and for the second time Ferdinand took refuge in Sicily, where he remained with his court till 1815.

In 1812, a new representative constitution upon a liberal scale was proclaimed in Sicily. The parliament of 1814 was opened by the king in person, but after its dissolution he never called another. In the following year, after the defeat of Murat by the Austrians, king Ferdinand was restored to the throne of Naples. He assumed the title of Ferdinand I., King of the United Kingdom of the Two Sicilies, and the legislation and administration of both divisions of the kingdom were reduced to a uniform system. Thus the Sicilian constitution was virtually abolished.

In 1818, a new concordat for the Two Sicilies was agreed upon by the Pope. But a revolt broke out in 1820, in consequence of which the Spanish constitution of 1812 was proclaimed, and a united parliament convoked for Naples and Sicily. Sicily however, ever jealous of its nationality, demanded a separate parliament, and a repeal of the union effected by the king. The Parliament at Naples refused to listen to this demand, and an insurrection broke out at Palermo, which was put down with much bloodshed. In 1821 an Austrian army marched upon Naples, the constitution was abolished, and the king restored to absolute power. Ferdinand died in 1825, and was succeeded by his son Francis, who died in 1830. The present king, Ferdinand II., ascended the throne on the death of his father. He commenced his reign well, introducing many reforms in the finances, the tariff, and the personnel of the administration. An attempt, made by the Sicilians in 1831-2 to break off the union with Naples, was quickly suppressed. In January 1837, the cholera broke out with great violence; a fancy seized the people that the poor were poisoned by the physicians at the command of the government; the wealthy took to flight, and a panic seized the population including even the military. In six weeks there were not less than 26,000 deaths in the city of Palermo alone. Pernicious regulations made for the isolation of infected districts, led to a dearth of provisions and many tumults. At last the Palermitans, roused by political malcontents, disarmed the garrison, deposed the viceroy from his government, and broke off all connection with Naples; the palaces were plundered, and many physicians, their wives, and children thrown into the sea. Similar scenes took place in Catania (where there were 10,000 deaths), in Syracuse, and other places. To put an end to this state of anarchy, 3000 Swiss troops, under the command of General Sonnenberg and Del Carretto, chief of police, landed in the island and were received without opposition into the disaffected towns, where, while the pestilence was mowing down the people, the ringleaders of the insurrection were executed under sentence of courts martial. By a decree dated October 31, 1837, the separate administration of the island was abolished, the ministerial council for Sicilian affairs in Naples was suppressed, the island declared a Neapolitan province, and public offices in both parts of the kingdom ordered to be filled up without regard to the nationality of the candidates. In March 1838, the king visited the island, dissolved the courts martial, and granted an amnesty which excepted only the ringleaders in the late commotions.

The arbitrary interference of the king in his endeavour to check the sulphur trade of Sicily, led to new complications and humiliations. England and France were the principal customers for the sulphur of the island; but in 1838 a French company obtained a monopoly of the trade, on condition that the yearly consumption should be reduced from 900,000 to 600,000 cantars (150 lbs. or 160 lbs. each). The English government protested against this contract, as opposed to the interest of British subjects, and as the protest was disregarded an English fleet blockaded the coast and seized many Neapolitan vessels. In consequence of these vigorous measures the sulphur contract was cancelled, and the trade resumed its usual course.

Few events of importance occurred in Sicily for several years after this. There was but little symptom of discontent notwithstanding the loss of all its privileges. But the inspiring reforms that followed the election of Pius IX. in Central Italy, seemed to rouse the spirit of liberty in the hearts of the Sicilians, and in January 1848 the island broke out into a blaze of insurrection. Messina led the way (Jan. 6), Palermo raised the insurrectionary standard on the 12th, and on the 15th had established a native provisional government, with Ruggero Settimo as one of its chiefs. A royal fleet, under the Count of Aquila, the king's brother, bombarded the town, which was prepared for defence. The bombardment and several attempts at negotiation having failed, the king granted a constitution with two chambers and the usual guarantees on the 10th of February. A parliament met in Palermo in April, which decreed (April 15) the deposition of the king and the Bourbon dynasty. The king occupied with revolutionary troubles at home could do nothing but protest, and the Sicilians continued to frame their constitution, which, monarchical in form, was adopted by the parliament on the 10th of the following July, and on the next day, the Duke of Genoa, second son of Carlo Alberto, was

invited to occupy the throne. Still the king's necessities in his continental dominions allowed him merely to protest.

At last, General Filangieri (Prince de Satriano) was dispatched to Sicily, and commenced the reconquest of the island by the capture of Messina (September 7, 1848) after an obstinate resistance of two days. The zealous but somewhat indiscreet interference of the British and French representatives at the court of Naples, and the approach of a British and a French fleet, checked the progress of the king's arms, and raised high the hopes of the islanders, who had time to put all their towns into a state of defence. After long negotiations the king granted an ultimatum, offering every guarantee for constitutional liberty that any sensible people could desire. This decree, dated Feb. 28th, 1849, granted to Sicily, among other privileges, a general amnesty; a resident viceroy, failing the residence of the king; a separate Sicilian ministry; the responsibility of ministers, who must be native Sicilians; a separate budget; a parliament consisting of two chambers—peers and deputies; and a resident minister for Sicily at the court of Naples. On the 9th of March following the Sicilian parliament having considered this ultimatum, refused to accept it, ordered a levée-en-masse, and were left to fight out their battle single-handed. The struggle did not last long. The Prince of Satriano took the lines of Taormina (April 2), Catania (April 6); Agoato and Noto were soon mastered; and Palermo sent a deputation to announce a surrender at discretion on the 23rd of April. Some attempts were made however to continue the contest in the capital, but the prince at the head of his troops took possession of it on the 15th of May. And thus in Sicily, as elsewhere at this period, a paroxysmal effort to obtain constitutional liberty, ended in abortion.

SICYON and SICYONIA, the territory of Sicyon. Sicyonia was situated on the south coast of the Corinthian Gulf, and near the eastern extremity of the gulf. In the time of Strabo (p. 382, Casaub.) the river Nemea was the boundary on the east between Corinthia and Sicyonia. On the west it was bounded by the territory of Pellene (Herod., i. 145), and on the south by the territory of Phlius. Sicyonia consisted of a plain country along the coast and a higher tract extending a few miles inland. The area cannot be ascertained; it perhaps fell short of 100 square miles. The Asopus, a small stream, gave its name to a district called Asopia. In proceeding along the coast from the harbour of Sicyon westward, the small streams Helisson and Sythas were crossed. The Sythas was the boundary between Sicyonia and Pellene. In going from Corinthia to Sicyonia the Nemea was first crossed and then the Asopus. The old name of Sicyon was *Ægiale*, or *Ægiali*, which was afterwards changed into *Mecone*.

Sicyon, the chief town, was, according to some accounts, 20 stadia, and, according to others, 12 stadia from the sea. The old town was on the coast, and it became the port when the new town was built. Demetrius the son of Antigonus pulled down the city in the plain and built the new city close to the ancient Acropolis. In the time of Pausanias many of the public buildings were in a ruinous state; but it still contained works of some of the great sculptors of Greece. Between Sicyon and Phlius, 60 stadia from the former and 40 from the latter, was Titane, situated in a mountainous country. A road led direct from Sicyon through Titane to Phlius.

Ægialeus, according to tradition, was the founder of Sicyon. The Sicyonians sent 3000 hoplites to the battle of Platea; and they had 15 ships at the battle of Salamis. In the Peloponnesian war the Sicyonians joined the Spartan confederation.

As a school of art Sicyon holds a distinguished rank. This school was founded by Eupompus, and it produced Pamphilus and Apellea. Sicyon was also one of the most ancient seats of the plastic art. Canachus and Lysippus were natives of Sicyon.

SIDMOUTH, Devonshire, a market-town in the parish of Sidmouth, is situated at the mouth of the little river Sid, in 50° 41' N. lat., 3° 15' W. long., distant 14 miles E.S.E. from Exeter, and 156 miles S.W. by W. from London. The population of the town in 1851 was 2516. The living is a vicarage in the archdeaconry and diocese of Exeter.

Sidmouth was a borough and market-town, governed by a portreeve, as early as the 13th century. It was anciently one of the principal fishing-towns of Devonshire, but the fishery has declined. The town has recently risen into some importance as a watering-place. The hills on each side of the valley of the Sid rise to a considerable elevation, and form, towards the sea, bold and lofty cliffs. The narrowness of the valley does not admit of the town displaying a considerable front to the sea; but the villas and detached houses extend for some distance inland on both sides of the stream. A sea-wall, extending upwards of 1700 feet in length, forms an excellent promenade. The baths, public rooms, and libraries face the sea. The town is lighted with gas and paved. Markets are held on Tuesday and Saturday; fairs are held on Easter-Monday and the third Monday in September. The parish church, dedicated to St. Nicholas, was erected in the 15th century; it was enlarged a few years back. There are a chapel of ease, chapels for Wesleyan Methodists, Baptists, and Independents; and National and Infant schools.

SIDON, or ZIDON, the most ancient, and for a long time the chief city of Phœnicia, and probably the mother city of Tyre, which is called in the Bible "the daughter of Sidon." It stood on the coast of the Mediterranean, in a plain about a mile broad, about 30 miles

N. by E. from Tyre, 20 miles S. from Berytus (Beirut), and 66 miles W. from Damascus. It possessed a good harbour, and at a very early period became a great maritime and commercial city. As early as the time of Joshua (B.C. 1444) it is called 'Great Zidon.' The Sidonians are thought to have been the first manufacturers of glass (Plin., v. 17), and their skill in arts and manufactures is frequently referred to by Homer, as well as by later writers. They are often mentioned in the Bible as skilful builders. They were worshippers of the goddess Ashtoreth, whose head is commonly found upon their coins.

At the division of Canaan among the Israelites, Sidon, with the adjacent country, fell to the tribe of Asher, who were never able to conquer it. The importance of Sidon was gradually eclipsed by that of Tyre, which then became the chief city of Phœnicia. When Shalmanezar invaded Syria, Sidon separated itself from Tyre, and surrendered to him. The Sidonians furnished the best ships in the fleet which Xerxes collected for the invasion of Greece. (Herod., vii. 96; viii. 67.) Under Artaxerxes Ochus the Sidonians revolted, together with the other Phœnicians and the Cyprians. After a short siege Sidon was betrayed to Ochus by its king, Tennes, upon which the Sidonians burnt themselves with their city and treasures. (Diod. Sic., xvi. 41-45.) The city was rebuilt. It submitted to Alexander the Great without resistance. After his death it was subject alternately to the kings of Egypt and Syria, till it fell under the power of the Romans. *Saida*, or *Seyde*, still a place of some commerce, with about 6000 inhabitants, retains the name, and occupies part of the site of the ancient city, of which some traces are said to exist two miles inland. In a hill near the town are innumerable sepulchral cells, the walls of which in many instances are covered with Phœnician inscriptions. In the mountains, 8 miles east of Saida, is *Djoun*, long the residence of Lady Hester Stanhope, who died here June 1839. Sidon suffered a bombardment by the allied fleets of England, Austria, and Turkey in 1840.

Phœnician coin of Sidon.

SIDOUT. [CUDPARAH.]
SIEDLEC. [POLAND.]

SIENA, a province (compartimento) of Tuscany, which formerly comprehended the whole southern part of the grand-duchy, corresponding to the territory of the former republic of Siena, is bounded N. by Florence, W. by the Mediterranean, E. by Arezzo, and S. by the Papal States, from which it is partly divided by the river Fiora. The territory of the republic is now divided into two provinces, Siena and Grosseto. The province of Siena comprehends the highlands, or northern and eastern parts of the country; that of Grosseto comprehends the western and southern lowlands, or the extensive maremma known geographically by the name of Maremma Sinese, to distinguish it from the Pisan Maremma. The area and population of the two provinces are as follows:—

Provinces.	Area in Sq. Miles.	Communes	Population in 1852.
Siena . . .	1450	38	186,263
Grosseto . . .	1714	20	77,891
Total . . .	3173	58	264,154

The province of Siena lies in the upper basin of the Ombrone, and its affluents the Arbia, the Mersa, and the Orcia. The *Ombrone*, called *Umbro Major* by the Romans, to distinguish it from the *Umbro Minor* of Pistoia, is the largest river of Tuscany next to the Arno: it rises from a copious source near Ceta Mura, or Civita Mura, in the Monti di Chianti, a subapennine ridge which divides the valley of the Ombrone from that of the Upper Arno, and flows southward by Berardenga and Asciano, skirting the western base of Monte San Savino, which divides it from the valley of the Chiana; it then passes by the town of Buonconvento, below which it receives the *Arbia* from the north, which passes near the city of Siena. The Ombrone then inclines to the south-west, flowing along the western base of the hills of Montalcino, and receives the *Mersa* from the north-west, a tortuous stream which has a course of above fifty miles. It then flows directly south, through a narrow and deep defile between the hills of Montalcino on the east, and a hilly tract on the west that divides the waters of the Ombrone from those of the Bruna, which flows into the Lake of Castiglione. Issuing from the narrow gorge beyond Monte Antico, the Ombrone receives from the eastward the *Orcia*, a mountain torrent which drains the northern side of the volcanic group of Radicofani and Montamiata, and also the hilly region of Montepulciano. The Orcia has a course of about thirty miles. Passing by Paganico, the Ombrone forms a bend to the south-east, and passing through a low ridge it enters the wide plain of the Maremma, through which it

flows in a south-west direction, passing near Grosseto and the Lake of Castiglione, into which part of its water is conducted by a canal, in order to fill up by its alluvium that pestilential swamp; the main body of the river enters the sea at Torre della Trappola, after a course of about eighty miles.

The province of Siena consists of highlands and valleys, being crossed by various ranges of hills, composed mostly of marls covered by yellow-sand, and abounding with organic remains. [APENNINES.] Few summits exceed 1000 feet, except the Montagna di Cetona, or Monte Pisi, on the borders of the Val di Chiana, which is above 2500 feet high; the volcanic cone of Radicofani, which is above 3000 feet; and the partly volcanic group of Montamiata, or Monte Santa Fiora, which rises to about 5000 feet above the sea. The chief products are corn, wine, silk, fruit, and oil. Excellent marble is quarried near Siena. The province is crossed by the railway that unites Siena with the Florence, Pisa, and Leghorn line at Empoli.

The following are the principal towns:—*Siena*, which is noticed in a separate article. *Montalcino*, a walled town and bishop's see, situated on a lofty hill 20 miles south-east of Siena: it has a cathedral, a clerical seminary, several other churches and convents; manufactures of coarse linen, hats, pottery, and leather; and about 3800 inhabitants. *Colle*, on the slope of a hill near the sources of the river Elsa, an affluent of the Arno, 12 miles north-west of Siena, is a bishop's see; it has a fine cathedral, several other churches, a large hospital, a clerical seminary, a conservatory for the education of young girls, paper-mills, manufactories of woollens and hats, of glass, pottery, and leather, and about 2500 inhabitants.

The province of *Grosseto* consists chiefly of a vast tract of maremma along the coast of the Mediterranean from the valley of the Cornia on the borders of the province of Pisa, to the Lake of Burano and the river Fiora, being a length of about 70 miles, whilst its breadth from the sea-coast inland is from 15 to 20 miles. Besides the Ombrone, several rivers flow from the hills, which form a belt along the inland side of the Maremma, and crossing the plain run into the sea after a short course. These streams are, the *Cornia*, which after a course of 24 miles enters the shore-lake of Piombino; the *Pecora*, a small river near Massa, which enters the shore-lake of Scarlino; the *Bruna*, which enters the Lake of Castiglione; the *Albegna*, which, rising in the Monte Labro (a summit about 3600 feet high, forming part of the group of Montamiata) flows rapidly southward, past the ruins of the Etruscan city of Saturnia, and crossing the Maremma enters the sea north of Monte Argentaro.

The Maremma is not a uniform level, for at several points the hills approach near to the sea, dividing the plain into several basins, distinguished by the names of Maremma of Massa, Maremma of Grosseto, &c. Active measures were commenced for the drainage of a portion of the marshes of Grosseto, by the grand-ducal government in 1852. There is a succession of shore-lakes along the sea-coast, which by their mephitic exhalations in summer occasion malaria. The largest are the lagoon of Castiglione, and the Lake of Orbetello, which is salt, and occupies an area of about ten square miles. Between the Lake of Orbetello and the sea rises the rocky and lofty promontory of *Monte Argentaro*, a conspicuous object from the sea, which appears to have been once an island. Monte Argentaro is of calcareous formation; it occupies an area about 22 miles in circumference, and the summit is about 1700 feet high. It is joined to the mainland by two very narrow and low isthmuses which run between the Lake of Orbetello and the sea-coast, the northernmost of which is intersected by a narrow canal, uniting the lake and the sea. The sea at the base of Monte Argentaro is very deep, and forms two good harbours, *Santo Stefano* on the north and *Port Ercole* on the east. Port Ercole has a strong fort, and several towers defend the coast on the foot of the mount. The mountain is covered with forests which abound in game: it has copious springs and excellent pastures, and the air is perfectly healthy. Near Port Ercole are the ruins of the ancient Etrurian and Roman town of *Cosa*. The ruins are called *Ansedonia*, for what reason is unknown. The walls constructed with nicely-fitted polygonal blocks of hard limestone still remain in tolerable preservation, with a chain of towers, of which 14 still remain. The walls of Cosa inclose a quadrangle about a mile in circuit, forming the level summit of a hill about 600 feet above the sea. At the foot of the hill was a station *Subcosa*, or *Succosa*, on the Aurelian way. Port Ercole, which still retains its ancient name (*Portus Hercules*), was the port of Cosa. It is situated opposite Cosa, under the shoulder of Monte Argentaro.

The air of the Maremma is very unwholesome, and the towns situated in it, with the exception of Orbetello, are thinly inhabited, and subject to the malaria fever. The principal branch of industry is the rearing of cattle, which feed in the wide solitary plains, and the cutting of timber in the extensive forests. Corn is sown, but not to a great extent. The wine made in the Maremma is not in much esteem. Great hydraulic works undertaken since the accession of the present Grand Duke, have already produced a considerable improvement in the atmosphere of a portion of the Maremma. Several of the lagoons have been entirely drained, and become cultivable land; the rivers have been embanked; a fine road has been opened along the length of the province, parallel to the line of the ancient *V. Aurelia*; handsome bridges have been thrown across the rivers

Artesian wells have been made to provide the inhabitants of Grosseto and other places with wholesome water: and the consequence is that the population is increasing as the malaria decreases, fresh ground is broken up, and cultivation and life spread along the once desolate wastes. The chief products of the province are corn, wine, timber, silk, potash, and oil.

Grosseto, the head town, built in the middle ages from the ruins of the Etruscan town of *Rusellæ*, which was a few miles distant, lies in the midst of a wide plain between the Ombrone, the lagoon of Castiglione, and the sea-coast, from which it is distant 6 miles, and about 45 miles S. from Siena. It is surrounded by walls and bastions, and contains about 2500 inhabitants. It has a bishop's see, and has a clerical seminary, and a civil and criminal tribunal for the province. *Massa Maritima*, a bishop's see and a town with some fine buildings, is situated on a hill a few miles from the sea-coast, north-east of Piombino: population, about 3000. At *Follonica*, on the sea-coast, 10 miles S. from Massa, are extensive furnaces and iron-works, in which the iron from the mines of Elba is smelted. *Piombino* is a small fortified seaport-town, facing the island of Elba, from which it is divided by a channel about five miles wide. The principality of Piombino, which formerly included the island of Elba, belonged to Prince Bacciochi, brother-in-law of Napoleon I., from 1805 till 1815. Piombino is about 40 miles S. from Leghorn, and has about 1500 inhabitants. Near it are some traces of the ancient *Populonia*. The neighbouring lagoon is in progress of being drained. *Campiglia*, a thriving town in the valley of the Cornia, 10 miles N. from Piombino, stands on a hill, and has a handsome church built in the 12th century, an hospital, and a population of 2200. *Orbetello* is a considerable town, built on a promontory which projects into the salt lake of Orbetello. The walls of Orbetello are formed of large stones without cement, and the town is strongly fortified on the side of the isthmus which unites it with the mainland. The territory, which extended from the village of Talamone to the States of the Church and included also a portion of the island of Elba, belonged for centuries to Spain, and was ceded in the last century to the king of the Two Sicilies; but by the treaty of Vienna it was annexed to Tuscany, of which it naturally forms a part. The town of Orbetello has about 3000 inhabitants, and enjoys a healthy climate, though the surrounding country is affected by malaria. The lake abounds with fish. *Pitigliano*, an inland town in a fine situation in the valley of the Fiora at the foot of the lofty group of Montamiata, has about 2000 inhabitants. The *Fiora*, which has its source in the mountain of the same name, runs southward, and after a course of about 30 miles in the Tuscan territory enters the States of the Church, and passes near Montalto, after which it enters the sea.

The island of *Giglio*, the ancient *Igilium*, which belongs to the province of Grosseto, is 11 miles W. by S. from Monte Argentario: it has a harbour on its eastern coast, and a castle with a village on the hill above it. The surface is 6 miles long by 3 miles broad, and hilly; the rocks are of granitic formation, except in the western part, where they are calcareous. The inhabitants are very industrious, and cultivate corn and the vine. They export annually 12,000 barrels of wine to the continent. A number of them are fishermen and sailors. Almost all the families are possessed of some landed property. A considerable part of the island is covered with timber trees. When Rome was taken by Alaric a number of the citizens took refuge in this island.

The neighbouring island of *Giannutri* is about 5 miles in circuit: it is destitute of springs, and uninhabited. Some Roman remains have been found upon it, which show that the island was once inhabited. It is the ancient *Dianium*, which Pliny says the Greeks called *Artemisia*.

SIENA, a city in Tuscany, is situated on a hill surrounded by other hills, 24 miles S. from Florence, and 45 miles E.S.E. from Leghorn, on the high road from Florence to Rome, and has about 20,000 inhabitants. It is 24 miles by railway distant to the south-east from the Empoli junction on the Florence-Pisa railroad. Siena is an archbishop's see; it has a university, a town library of 50,000 volumes and several ancient and mediæval manuscripts, a gymnasium, a clerical seminary, several elementary schools, an academy of the fine arts, a deaf and dumb institution, a large hospital, an orphan asylum, a workhouse for the destitute, a savings bank, and an asylum for poor children. The principal manufactures consist of silks and woollens.

Siena abounds with fine churches. The cathedral, one of the oldest in Italy, is rich in marbles, sculptures, and paintings. The exterior is cased with marble, black and white. The pavement is of white marble, on which numerous figures have been engraved or cut in, representing biblical subjects. In the annexed hall, called the *Bibliotheca*, are 10 frescoes by Pinturicchio, representing the principal events of the life of Pope Pius II. (*Aeneas Sylvius Piccolomini* of Siena). The splendid chapel of the Chigi family, constructed by Pope Alexander VII., is rich in lapis-lazuli and green marble, bronzes, and statues. The baptistery, which is a separate church detached from the cathedral, as at Pisa and Florence, is an octagon, and entirely cased with marble inside and out, and adorned with sculptures by the earliest Tuscan artists. In the church of San Domenico is a good painting on wood of the Virgin and Child by Guido di Ghazzo of Siena, of the date 1221, long before the birth of Cimabue,

who has been generally considered as the restorer of Italian painting. In the academy of the fine arts of Siena there is a painting of St. Peter and St. John by Pierrolino of Siena, who flourished about A.D. 1100. Siena abounds with productions of the earlier artists, both of its own school and of the Florentine school. Among the numerous churches, those of San Martino, San Agostino, San Spirito, La Concezione, and others are rich in paintings by good masters, in the street Dell' Oca is the house, now converted into an oratory, in which Saint Catherine of Siena was born in 1347.

The Piazza del Campo is concave, in the form of a shell, and surrounded by arcades, and adorned with a fountain: it was once the forum of the republic of Siena. Eleven streets branch out of it. This piazza is immortalised by Dante in the 11th canto of his *Purgatorio*. The streets of Siena are generally narrow, crooked, and uneven. The general appearance is that of an old decayed city. In the 14th century, before the great plague of 1348, the population of Siena and its suburbs amounted to 180,000. The people of Siena are noted for the purity and melody of their speech.

Among the palaces the most remarkable is the Palazzo del Publico, or town-house, a massive structure of the middle ages, which is adorned with frescoes of the 13th and 14th centuries, commemorating events of the national history. The palaces Petrucci, Piccolomini, Saracini, Bandinelli, and Buonsignori contain some good paintings. The town-gate, called Porta Camollia, is remarkable for its architecture. Siena is well supplied with good water by aqueducts from the neighbouring hills, and is adorned with several handsome fountains.

Siena is mentioned among the Roman colonies by the name of *Sena Julia* or *Seva*. (Plin., iii. 5.) It is mentioned as a bishop's see in the 6th century. A council was held at Siena in 1058, wherein Pope Nicholas II. was elected. In the struggle between Gregory VII. and Henry IV., Siena generally espoused the cause of the emperor, Florence that of the Pope; and the two republics were therefore frequently at war. In 1258 Farinata degli Uberti, being exiled from Florence with other Ghibelines by the Guelph party, retired to Siena, where being joined by reinforcements from Sicily and Pisa, he marched with the militia of Siena to meet the Guelphs at Monte Aperto near the Arbia, and defeated them completely with the loss of 10,000 killed, and as many prisoners. The carroccio of Florence was dragged in triumph to Siena. After the establishment of Charles of Anjou at Naples, the Guelphs obtained for a time the preponderance at Siena, and the Ghibelines were banished. In the meantime Siena extended its dominion over the lowlands of the Maremma as far as the sea, but it never became a naval power like Pisa. For the last half of the 14th century the republic of Siena was torn by dissensions between the nobles, and a party led by the Salimbeni (themselves nobles), who wished to remodel the government. In 1384 the reformers were driven away to the number of 4000; the whole of the nobles who had been previously exiled returned into the town.

In 1432 the emperor Sigismund came to Siena, where he was received with great honour. In 1460 Pope Pius II. visited Siena, his native town, and strove, but with little success, to put an end to the civil discord which ever lurked in the bosom of that republic. In 1482 a new tumult broke out; many persons were arrested, some thrown out of the windows of the town-house, others beheaded in various prisons, and the rest banished, fined, and excluded for ever from civil offices. The old party of the reformers was then recalled, and the government became more democratic, but not more orderly; for factions continued to rage among the people. In 1487 the exiles entered the city by stratagem, and took possession of the state. A council of 720 citizens was then appointed from among various parties, which appointed an executive council of 24 individuals for five years, on the condition that the public offices should be no longer given by favour, but drawn for by lot. Pandolfo Petrucci, a citizen of an old family of Siena, an able unscrupulous man, rose to influential eminence by his activity in conducting the business of the council. He made himself still more powerful in the subsequent general disturbances of Italy, and became in reality the dictator of Siena. Petrucci died in 1512. His sons, not having the capacity of their father, did not long retain power, and were obliged to emigrate.

After the fall of Florence in 1530, Siena retained for many years its republican government, under the protection of Charles V.; but civil dissensions continuing, the emperor sent a Spanish garrison to enforce order, in 1547, and began building a castle to overawe the town. In 1552 the citizens, weary of Spanish interference, rose in arms and drove the Spaniards away, and applied for assistance to Henry II. of France, who sent them a small garrison. They also made common cause with the Florentine exiles led by Pietro Strozzi, which gave to Duke Cosmo of Florence an opportunity of interfering in the affairs of Siena. His troops, united to those of the emperor, destroyed the towns and villages which remained faithful to Siena. It was then that the Maremma was reduced to a wilderness. At last, in April, 1555, Siena capitulated through famine. In 1557 it was given up by Spain to Duke Cosmo, who reunited it with the rest of Tuscany, of which it has ever since formed a part.

SIERADZ. [POLAND.]

SIERCK. [MOSELLER.]

SIERRA LEONE is the name of a cape on the west coast of Africa, in 8° 30' N. lat., of a river or estuary which enters the ocean on the north side of the cape, and of a British colony established on a peninsula of which the cape forms the north-western extremity. The name has been extended to a large district, called the coast of Sierra Leone. This region comprehends those parts of Western Africa which are watered by the rivers that fall into the Atlantic between Cape Verga, in 10° 12' N. lat., and Sherboro Island, in 7° 30' N. lat. It is bounded N. by the part of Senegambia subject to the king of Fouta Jallon; E. by Sangara, a part of Súdán; S. by the Grain Coast; and W. by the Atlantic. Its area is estimated at 25,000 square miles.

Coast-line.—From Cape Verga the coast runs south-east to Alligator Point, and is low and flat, and covered with mangroves. It is divided into numerous islands by the several arms of the river Pongas and by the Dembia River, which reaches the sea a few miles N. from Alligator Point. That headland is the termination of the Soomba range, which rises in the interior to an elevation of 1705 feet. Beyond Alligator Point the Sangara River, of which the Dembia is a branch, opens into a deep bay, lined with a succession of shoals and reefs. The south shore of the bay terminates in Tumbo Point, a long rocky flat. Here the land rises gradually into a mountainous tract, of which the highest peak yet measured is Mount Kakullmah, 2910 feet above the sea-level. Within 6 miles from the shore at Tumbo Point, and 75 miles from Cape Verga, lie the Isles de Loos, or Ihas dos Idolos, a group of low islands and reefs inclosing a safe and convenient anchorage. These islands have a considerable native population. They possess a valuable fishery, and abound with the silk-cotton tree, and still more with the palm-tree, from which a large quantity of oil and wine is produced. The three principal islands are Crawford Island, which contains a British settlement, Factory Island, and Tamara, or Footabar.

From Tumbo Point the coast continues low and flat, and extends about 70 miles nearly due south to the peninsula of Sierra Leone. It is broken by the arms of several rivers into many clusters of islands, and the banks of the streams are clothed with mangroves. About midway the wooded island of Matacong lies near a headland, on the south side of which the river Fouricaria forms an estuary two miles wide, with a sand-bank across the channel. The estuary of the Sierra Leone River, from the Isle of Leopards on the north to Cape Sierra Leone on the south, has a width of 10 miles. The northern or Bullom shore is much depressed and marshy, and runs in a straight line to Tagrim Point, opposite Freetown. The southern shore is rocky, and between Freetown and the Cape is indented by several small bays, of which the most important is the Bay of Francia or St. George, where a number of streams from the adjacent heights combine to form the finest watering-place for ships on the coast. From Cape Sierra Leone, where a lighthouse has been lately erected, southward by False Cape to Cape Shilling, the west coast of the peninsula is rocky. The beach is beaten by a heavy surf, which can only be passed by canoes, and sometimes not even by them. Two islands, the Great and Little Bananas, lie near Cape Shilling, and resemble the adjoining coast in elevation and structure. They are almost continuous, and extend six miles in length and about a mile in breadth. The Great Banana contains many wild cattle. On these islands there are two villages, called Dublin and Ricketta.

Surface, Soil, and Produce.—From Cape Verga inland a tract of high land, much broken by ravines and narrow valleys, and nowhere more than 1000 feet above the sea-level, extends north by east, and then east, to the table-land of Fouta Jallon, near 11° W. long. Immediately within this northern boundary the country is still very little known. In general it is mountainous. From 9° W. long. a gently undulating tract spreads westward for 80 or 90 miles, with a general elevation of 800 feet above the sea. Extensive vales and fertile meadows, belted with strips of wood, and decorated with clumps of trees of the densest foliage, are occasionally diversified by hills, or broken by deep ravines, and furrowed by numerous rivulets, sunk far below the surface. The soil of the valleys is a rich vegetable mould mixed with iron-clay and sand, requiring little labour, and very productive. Some of the lower depressions become swamps during the rainy season. Rice and ground-nuts are the principal crops; maize, yams, and mandioc are extensively grown. Cattle and sheep are numerous. Horses are imported from Sangara, which lies farther east. This level country is bounded on the west by a mountain range running 60 miles from north to south between 11° and 12° W. long. The range is broken in several places by rivers flowing westward through spacious valleys. Sa Wollé, near 11° W. long., 9° N. lat., is 1900 feet high, and Semba town stands on a mountain 1900 feet above the sea. The hills, in a few places bare from their steepness, are generally belted round the base with camwood-trees, and on the higher parts dotted to the summits with palm-trees and clothed with grass, which continues green throughout the year. Between the fields are frequent clusters of palm-trees. The pine-apple is the prevailing fruit. Cattle and goats and other domestic animals are numerous. Between this hilly country and the sea lies the main part of the coast of Sierra Leone, forming a plain of about 100 miles in breadth, varied in some places by rocky tracts traversed by deep ravines, and in others

by depressions, which are converted by the rains into extensive swamps, and in the dry season are covered with grass nine or ten feet high. The country is fertile, but only partially cultivated. White or Carolina rice grows in great perfection; red rice, which keeps longer, is raised more extensively by the natives for their own consumption. Goats are common, but cattle and sheep are rare, and horses are not reared. Over all the interior, as well as in the colony, poultry is abundant, but of a diminutive kind. Guinea-fowls are plentiful, and much larger than those in England. Wild bees are very numerous. Fish abound on the coast and in all the rivers. The wild animals are the elephant, buffalo, various species of antelopes, monkeys, of which the chimpanzee is the most remarkable, leopards, and wolves.

The peninsula of Sierra Leone, which chiefly constitutes the territory of the colony, is 25 miles long from north to south by 12 miles broad. It is bounded N. by the Sierra Leone River; E. by the Bunce River and the Calmont Creek; S. by the Calmont Creek and Yawrey Bay; and W. by the Atlantic. Its area is 220 square miles. The interior of the peninsula is an elevated region of uneven surface, which rises from 400 to 1000 feet above the sea, and is overtopped by conical peaks, among which Sugar-Loaf and Leicester Mountains attain an elevation of between 2000 and 3000 feet. The whole region is covered with a good soil, which, on the arrival of the British colony, was entirely, and is still in part, clothed with large forest-trees, among which is the silk-cotton-tree, the trunks of which are made into canoes often large enough to contain 100 men. The indigenous esculents are yams, plantains, Indian corn, sweet potatoes, okro, pumpkins, and spinach. The fruits of the soil are the cocconut, the baobab, or monkey-bread, banana, orange, pine-apple, guava, pomegranate, lime, papaw, and African plum. Coffee, sugar, indigo, and cotton have been introduced by the British, and grow well. Some European fruits are cultivated on the higher parts, and the vine flourishes in the gardens of Freetown. Yams, mandioc, pumpkins, plantains, and Indian corn constitute the principal food of the inhabitants.

Rivers.—Of the rivers of Sierra Leone the most northern is the Pongas, which reaches the sea, on both sides of 10° N. lat., by four arms. Several rivers fall into the sea between Cape Tumbo and the estuary called the River of Sierra Leone. Some of these rivers, particularly the Mellikuri and Scarcies, are visited by vessels for camwood, teak-timber, and ground nuts. Of the great and little Scarcies, the former, called also Kaba and Mungo, runs more than 300 miles. The most important river is the Rokelle, which is navigable at certain seasons for a great part of its course. It rises in the mountains which separate Sierra Leone from Súdán, at an elevation of 1417 feet above the sea-level, and runs first south, and afterwards either west or south-west, until it approaches within 30 miles of the sea, when it spreads out in a wide estuary, called the River of Sierra Leone, which is 7 miles wide opposite Freetown, and constitutes the harbour of the colony. At the close of the dry season the Rokelle is navigable for boats only to Rokon, a distance of 50 miles from its estuary; but in all other seasons, to a much greater distance. The course of the Karamanka River, which falls into Yawrey Bay, is generally parallel to that of the Rokelle, and sometimes only 10 miles from it.

Geology.—The geology of this region is little known. The Sierra Leone Mountains, the Banana Islands, and the Isles de Loos are supposed to be of volcanic origin. The main section of the interior is a vast alluvial plain, through which basaltic rocks in many places protrude. Iron is worked in the most hilly parts of the interior. The natives have much gold, but it is brought from the countries on the upper part of the Joliba. Salt is made along the low shores.

Climate.—There are two seasons, the wet and the dry. The former lasts from May to November, and is always ushered in and terminated by tornadoes. Nothing can exceed the gloominess of the weather during this period. The hills are wrapped in impenetrable fogs, and the rain falls in such torrents as to prevent any one from leaving his house. At this period the diseases which prove so fatal to the coast have generally made their appearance, though they can scarcely be said to belong peculiarly to any season. The average quantity of rain which falls appears to be about 160 inches, of which one-half falls in July and August. The air is then loaded with vapours, the destructive effects of which are observed in many objects. The putrefaction of animal substances and the fermentation of vegetables take place with a rapidity that can hardly be conceived. The rains are often interrupted by several fine days in succession.

Being at no great distance from the equator, a high degree of heat is experienced all the year round. It is even probable that the mean heat of this country exceeds that of the equator, being 81° and 82°. The greatest heat is experienced in the months preceding the rainy season, in which the mean temperature may be about 83°. Sierra Leone does not enjoy the advantages arising from the trade-winds, which in the West Indies operate so powerfully in reducing the temperature and rendering the climate more tolerable to Europeans. There is however a pretty regular succession of sea and land breezes. The sea-breeze usually sets in at ten o'clock, but sometimes two or three hours later, and blows from the west-north-west. It is always cool and pleasant, but varies greatly in strength. The land-breezes set in about nine o'clock in the evening, and are in general heated, and loaded with humid exhalations from the low and swampy grounds

over which they pass. Sierra Leone is noted for the unhealthiness of its climate, but there is great variation in this point in different years. In the interior the rains are much less abundant, and the heat is four or five degrees less.

Inhabitants.—Five different tribes inhabit the coast of Sierra Leone, all of whom belong to the negro race, but they have attained different degrees of civilisation. The country north of the river Kaba is occupied by the Mandingoes, whose chief town is Fouricaria. Between this river and the Rokelle are the Timannees, near the sea, and the Limba farther inland. South of the Rokelle are the Kooranko, and the most eastern portion is occupied by the Soolima. It is probable that there are other tribes in those parts of the country which have not yet been visited by Europeans. The Mandingoes, who are Mohammedans, have made some progress in civilisation; they are distinguished by their activity and restlessness, and are penetrating farther south, some of them having settled in the vicinity of the American colony of Liberia. The Timannees occupy a country extending 90 miles from east to west, and 55 miles from north to south. Their country is divided into four nominal districts, governed by headmen, who always assume the title of king. They cultivate the ground, though with less skill and industry than their neighbours. The Timannees are very docile; they soon accommodate themselves to European habits, and are in general much attached to their employers. They have their fetishes and greegrees, and none of them have embraced Christianity or Mohammedanism. Their towns are Kambia, Porto Logo, Macabele, and Ma Yosso. The country of the Limba is still little known. The Kooranko occupy a country extending east to the banks of the Joliba. In language and costume they closely resemble the Mandingoes, but they are by no means so handsome or so intelligent. The language, except a few words which have suffered a little from corruption, is the same as that spoken by the Mandingoes, but their manners bear a stronger affinity to those of the Timannees. They dress however like the Mandingoes, with great decency, and the manufacture of cotton-cloth is general among them. The Kooranko country contains the towns of Seemeva, Kolakouka, and Kamato. The Soolima, who occupy the country between the Kooranko on the south and Foots Jallon on the north, are described as muscular and short in stature, averaging in height from 5 feet 6 inches to 5 feet 8 inches. The capital of the Soolima is Falaba, which consists of about 4000 huts, and contains about 10,000 inhabitants. Other towns in the interior are Sangoora, Semba, Mousaiah, and Konkodoogore, which have altogether about 15,000 inhabitants.

The population of the colony in 1851 was 44,501. It included individuals from as many as 100 African tribes. The number of Europeans was little more than 100. Of 5223 slaves brought to the colony in 1849 and 1850, as many as 3852 emigrated. The colony is divided into 16 parishes, which are under the superintendence of the Bishop of Sierra Leone, 13 European and three native clergymen. There are good stone churches in almost every important village in the colony. The Wesleyan Methodists have four ministers and several native lay preachers. They have seven chapels in Freetown, and eight in the villages. There are about 30 chapels belonging to other sects; the ministers are generally persons of colour. Extensive provision has been made for education in the colony. The Church Missionary Society and the Wesleyans have schools in the villages and many parts of the rural districts. In Freetown the Church Missionary Society has a Grammar school and a female institution, and near the town, the Fourah Bay Institution for general education and the training of teachers and ministers. The Wesleyan Methodists have also a training school at King Tom's Point in Freetown, in which the pupils are clothed and fed at the expense of the society.

The affairs of the colony are administered by a governor and a council of seven or more members, appointed by the crown at the recommendation of the governor; the chief justice, queen's advocate, and colonial secretary being members ex officio. The law courts are the Assize, Royal Commission and Chancery courts, the Court of the Ordinary, of the Recorder of Freetown, of Vice-Admiralty for adjudicating on captured slave ships, and the Police and Small Debt courts. The revenue is derived from customs duties, of which the most important is an ad-valorem duty of four per cent. on all British and foreign goods imported, and from a few local taxes, the most productive being the spirit licence. A house and land tax first levied in 1852 produced in that year 3075*l.* African produce pays no duty. The revenue for 1852 was 19,886*l.* 11*s.* 2*d.*, the expenditure was 19,708*l.* 14*s.* 2*d.* The principal articles exported from the colony are teak timber, camwood, ginger, pepper, palm-oil, nuts, gum-copal, colanuts, and ivory. The chief imports are India goods, cotton manufactures, arms, ammunition, hardware, beads, spirits, ale, and wine from Great Britain; and tobacco, lumber, and cotton goods from the United States. The fisheries of the Banana Islands and the Isles de Loss employ from 150 to 200 boats and canoes, and from 1000 to 1500 men.

Freetown, the capital, stands on the north side of the peninsula, and on the left bank of the Sierra Leone River, about 5 miles from the sea, in 8° 29' N. lat., 13° 9' W. long., on an inclined plane at the foot of some hills, on which are the governor's residence or Fort Thornton, the barracks, and some other public buildings. It is 50 feet above the sea-level at high-water mark, and is regularly laid out in

fine wide streets, thickly interspersed with orange, lime, banana, and cocoa-nut trees. Many of the houses are commodious and substantial stone buildings. The population of Freetown is about 16,000. The town contains St. George's church, a good stone building; several chapels and school-houses; the Church Missionary and Wesleyan Missionary institutions; a Grammar school; a market-house, fish-market, custom-house, and jail, including the lunatic asylum. The navigable entrance of the river is narrow, there being an extensive shoal with steep sides in the middle of the river, called the Bullom shoals. The river can only be entered with a sea breeze, which, though tolerably regular, is not always certain either in strength or duration. *Kissy*, a small village 2 miles E. from the town, has a church and parsonage, and a hospital, to which is appended the Bullom hospital, a building between the village and the sea. *Regent's-Town*, at the basin of Sugar-Loaf Hill, 6 miles S. from Freetown, consists of a number of streets regularly laid out, and contains a good stone church, a parsonage, several school-houses, including a missionary training institution, a government house, and several warehouses. Many houses of the natives are built of stone. *Gloucester*, between Freetown and Regent's-Town, has a neat stone church and missionary residence, with a government establishment for African children under a native schoolmaster. There are many other villages in the colony, with populations varying from 100 to nearly 2000. In the eastern districts are Wellington, Newlands, Allen's-Town, Hastings, Stanley, Victoria, Rokelle, Waterloo, Calmont-Town, Campbell-Town, and Macdonald. In the western district are Kent, Russell, York, and Sussex. In the mountainous district are Bathurst, Charlotte, Leicester, Gloucester, Wilberforce, Congo-Town, Murray-Town, Aberdeen, Lumley, Goderich, and Adonkia.

The British Colony of Sierra Leone was established in 1787 by some philanthropists, who intended to show that colonial productions could be obtained without the labour of slaves. In that year 470 negroes, then living in a state of destitution in London, were removed to it; and in 1790 their number was increased by 1196 individuals of the same race, who had been settled in Nova Scotia, but could not bear the severity of that climate. Ten years later, 550 Maroons were transported from Jamaica to Sierra Leone; and in 1819, when a black regiment in the West Indies was disbanded, 1222 black soldiers and their families were settled there. Since the abolition of the slave-trade in 1807, the slaves captured by the British cruisers have been settled in the colony, and the population has been thus so much increased, that in 1820 it amounted to 12,000, and in 1846 to about 45,000; since then it has been kept nearly stationary by emigration. In 1818 the Isles de Loss, and more recently the Banana Islands, were added to the colony by purchase.

SILESIA (Schlesien), a province of Prussia, is situated between 49° 40' and 52° 8' N. lat., 14° 25' and 19° 15' E. long. It is bounded N.W. by Brandenburg; N.E. by Posen; E. by Poland; S.E. by Austrian Galicia; S. by Austrian Silesia; and S.W. by Bohemia. The province is 210 miles in length from north-east to south-west, and from 70 to 80 miles in breadth from east to west. The area of the province is 15,695 square miles. The population in 1852 amounted to 3,173,171, of whom 31,373 were Jews, and the remainder Protestants and Catholics in nearly equal numbers. The river Oder, which becomes navigable soon after entering the Prussian boundary, divides the province in its whole length into two nearly equal parts, which are very different from each other. That on the left bank, which is called the German side, is hilly, but has a very fertile soil, which amply rewards the labour of the husbandman. That on the right bank, called the Polish side, consists chiefly of a sandy and not very fruitful soil. There are however some sandy tracts on the German side, and some rich and productive spots on the Polish side. The country is highest on the south-eastern frontier, and declines more towards the north-western frontier, where it is the lowest.

Where the frontiers of Silesia and Bohemia meet, a mountain chain rises, which extends southward to the sources of the Breswa and the Ostrawitz, where it joins the Carpathians, divides the basin of the Oder on the one side from those of the Elbe and Danube on the other, and forms the natural boundary between Silesia and Bohemia and Moravia. This chain, called by the general name of the Sudetic chain, is divided into different parts, bearing different names, as the Isergebirge, the Riesengebirge, the loftiest and wildest part of the whole chain, the Schneekoppe, which is 4950 feet above the level of the sea, the Glatz Mountains, &c. In the interior there are some ranges unconnected with the great chain—the principal of which is the Zobtengebirge, 2318 feet above the level of the sea. On the right side of the Oder, from the part where its course is to the northward, the high

land disappears, and those immense plains begin which characterise this part of Europe. The Oder, locally called the Ader, comes from Moravia, and receives the Elsa, the Klodnitz, the Slober, and the Bartach, on the right side; the Oppa, the Neisse, the Ohlau, and the Katsbach, on the left. The *Bober*, a considerable stream, which carries down the drainage of the northern slope of the Riesengebirge, traverses the north-eastern part of Silesia, passing Bunzlau and Sagan, below which town it forms for a short distance the boundary of Silesia and Prussian Saxony, and then entering Brandenburg, joins the Oder below Crossen. A small portion of the province west from Görlitz belongs to the basin of the Spree. There are few lakes, and those which are so called are rather large ponds. The largest are the Koschnitz, Moswitz, and Schlauer lakes. The last is however four miles in length, but nowhere above a mile in breadth. The air is tolerably mild, except in the mountainous tracts; but in the southern districts the temperature for obvious reasons is lower, and the winter longer and more severe.

Among the useful animals of the province are—horses, horned cattle, sheep, goats, swine, game, fish, bees, and domestic poultry. Wolves are found on the Zobtengebirge, otters in the Bober, and sometimes beavers in the Oder. The vegetable products are—corn, pulse, potatoes, garden vegetables, fruit, flax, tobacco, hops, madder, wood, teazle, and timber. The minerals are copper, lead, cobalt, arsenic, iron, and zinc. This last metal is found in Silesia and in the adjoining territory of Craoow in far greater quantities than in any other country in Europe. Other mineral products are sulphur, marble, alum, lime, and, above all, coal, of which about two millions and a half tons are annually obtained. Though Silesia is on the whole one of the most fertile and best cultivated provinces of Prussia, yet it does not produce sufficient corn for the consumption of its dense population. The province is traversed by the Vienna-Berlin railway, which passes through Oppeln, Brieg, Breslau, and Liegnitz, and from which a branch runs from Brieg to Neisse; another from Breslau to Schweidnitz, Frieberg, and Woldenburg; and a third from the Handorf station in the north of the province, and eastward to Glogau. At the Kohlfurt station, 82 miles W.N.W. from Breslau, the Saxo-Silesian railway from Dresden joins the Vienna-Berlin line, having passed in a portion of the north-west of the province the town of Görlitz.

The manufactures of Silesia are of the greatest importance, and that of linen has existed from a very remote time. It is carried on with little aid from machinery, and chiefly by the country people. The cotton manufacture has extended considerably since 1840. Woollen cloths are manufactured in some towns. There are sugar refineries in several places; tanneries at Breslau and Schweidnitz, and breweries and brandy-distilleries in most of the towns. Machinery has been introduced into some larger manufactories for textile products. The province is divided into three governments, which, with their respective areas and population in 1847, are as follows:—

Governments.	Area in Square Miles.	Population in 1847.
Breslau	5251	1,165,994
Oppeln	5148	987,818
Liegnitz	5301	913,497
Total	15,699	3,065,509

Austrian Silesia is that part of Silesia which was retained by Austria in the treaty of Hubertsburg in 1763. It is united with Moravia, with which it forms one province. [MORAVIA.]

Towns.—Breslau, the capital of Silesia, forms the subject of a separate article. [BRESLAU.] The other towns of the government of Breslau, which comprises the central part of Silesia, are as follows:—*Brieg*, a large manufacturing town of 12,000 inhabitants, is situated 28 miles by railway S.E. from Breslau, on the left bank of the Oder. It was formerly fortified, and still has a castle and an arsenal. The church of St. Nicolai, famous for its fine organ, the gymnasium, and the lunatic asylum are the most remarkable objects in the town. The industrial products include woollen-cloths, linen, tobacco, beer, &c. A railroad joins Brieg to Neisse, which stands 31 miles to the southward. *Frankenstein*, 36 miles S. from Breslau, stands on a high hill near the left bank of the Pause, and has a population of 6000, who manufacture broadcloth, linen, aqua-fortis, straw-plat, saltpetre, &c., and trade in corn. Seven miles S.W. from this town is the strong fortress of *Silberberg*, erected under Frederick the Great to defend one of the mountain passes into Bohemia. *Glatz*, 16 miles S.S.W. from Frankenstein, is a strongly-fortified town situated in a narrow valley on the left bank of the Neisse, and has 10,000 inhabitants, including the garrison. It is surrounded by walls, and defended by an old castle built on a high hill, and by a regular modern fortress erected on a hill on the opposite side of the town. Linen, leather, damask, broadcloth, and hosiery are manufactured. The town has a gymnasium and a Catholic college. *Oels*, 16 miles N.E. from Breslau, stands on the Oelse, and has 6000 inhabitants, who manufacture broadcloth and linen. The castle, the former residence of the princes of Brunswick-Oels, contains a valuable library and collections of natural history. The town has a gymnasium and a theatre. *Reichenbach*, a town of

5500 inhabitants, surrounded by walls and ditches, 31 miles S.S.W. from Breslau, has cotton factories, a synagogue, two private observatories, and several benevolent institutions. *Schweidnitz*, a fortified town on the Weistritz, is 35 miles by railway S.W. from Breslau. It has a gymnasium and 13,000 inhabitants, who manufacture gloves, leather, broadcloth, beer, tobacco, &c., and trade in wool. The Roman Catholic church of Schweidnitz is adorned with paintings, and has one of the loftiest towers in Silesia. The neighbourhood of Schweidnitz is a very beautiful country.

The towns in the other two governments are noticed under *LIGNITZ* and *OPPELN*.

SILHET, or *SYLHET*, Hindustan, a district in the presidency of Bengal, situated chiefly between 24° and 25° N. lat., 91° and 98° E. long., is bounded N. by the Cossyah Hills, E. by Muneepore, S. and W. by Tiperah and Mymensing. The area is computed at 3532 square miles. The population of the district is estimated at upwards of a million, supposed to be in the proportion of two Mohammedans to three Hindoos. The southern and central portion of the territory is a continuation of the flat surface of the lower districts of Bengal, and is subject to deep inundation during the rainy season. Towards the north-east the surface is broken irregularly into a number of detached hills, clothed to their summits with trees and verdure, and terminating in the steep and lofty ridges that rise to a height of 6000 feet along the boundary of the district. The western border is varied by a succession of fine vales and conical hills, which bound the valley of the Brahmaputra. The principal rivers are the Soormah and the Menga. The climate is healthy and the soil fertile. Besides chunam, or lime, which is found in inexhaustible quantities, and exported to all parts of Bengal, coal of a good quality is found in the district. Elephants, buffaloes, tigers, and deer are numerous. The rivers and streams swarm with fish. Oranges and limes grow in extensive plantations, and are largely exported. The other products are rice, sugar, cotton, cinnamon, cocoa-nuts, and other fruits. Wax, stick-lac, and aloe-wood are abundant. Baskets, strong cotton cloths, and a wild silk called muggadooties, are manufactured. The district is noted for boat-building; and Silhet shields are in much repute among the natives of Hindustan. The district is interspersed with numberless villages, and contains the towns of Aymerigunge, Chirra, and Silhet. *Silhet*, the chief town and the residence of the principal authorities of the district, is situated on the river Soormah, in 24° 55' N. lat., 91° 55' E. long., distant 120 miles N.E. from Dacca, and 325 miles N.E. from Calcutta by road.

SILISTRIA, or *Drystra*, the ancient name of which is Durosterum, in 44° 7' N. lat., 27° 12' E. long., 155 miles N.N.E. from Constantinople, is a fortified town in Bulgaria in European Turkey. It is the capital of a pashalic, and stands on the right bank of the Danube, which is here 1200 feet wide, and is studded with a series of islands between the town and the Wallachian shore. The town is large, defended by a citadel, and surrounded by double walls and ditches. The city itself is surrounded by ditches from 12 to 15 feet deep, and defended by strong palisades. The water-front of the town is protected by a fosse and wall. In the rear of the town are several tabias, or forts, the fire of some of which commands the islands opposite the town. On the land side the town is commanded by ranges of low hills. Silistria is ill-built; the streets are narrow and crooked, and the houses low; even the mosques and public baths partake of the general ugliness. There is however at the eastern extremity of the town a custom-house in a better style of architecture. The large magazines which surround it contain chiefly corn and flour. As it is a fortress built on the northern frontier, in the neighbourhood of the Danube, and is principally of a military character, the commerce has never been flourishing. The population amounts to 20,000.

Silistria has frequently been the theatre of sharp actions between the Russians and the Turks. It was unsuccessfully besieged by the Russians in 1778, and was again attacked by them in 1779, on which latter occasion they suffered a considerable loss. In 1828 General Rosh was obliged to retreat after besieging the town for some months; but it fell into the hands of the Russians in 1829, when Generals Diebitch and Krassowski took it by assault on the 30th of June. It was again attacked with a large force in May and June 1854 by the Russians, who, after enormous losses, retreated from the place, which was heroically defended by the Turks. The Russians were commanded first by Prince Gortschakoff, and lastly by Prince Paskiewitch; the Turks by Musa Kussul Pasha, aided by Captains Butler and Nasmyth, British officers, who happened to be in the place when the siege commenced. The Pasha was killed by the bursting of a shell; and Captain Butler died of fatigue and wounds received in defending the Arab Tabia earthwork. During this memorable siege the town and its defences were battered almost to ruins.

SILIVRI, a sea-port town of European Turkey, is situated 47 miles W. from Constantinople, and has about 5000 inhabitants. It is built in the form of an amphitheatre, on the declivity of a small hill facing the Sea of Marmara. It forms a beautiful object when seen from the sea. The top of the hill is crowned by the ruins of a fort, which was built under the Greek empire. The part of the town below the fort is solely occupied by Turks. The Turks have several mosques, and a market-place, which is much admired. The harbour admits only small vessels, and is generally filled with fishing-boats. Silivri

occupies the site of the ancient *Siletie*, which was a colony of Megaris.

SILSOE. [BEDFORDSHIRE.]
SILVERTON. [DEVONSHIRE.]
SILVES. [ALGARVE.]

SIMBIRSK, a government of Asiatic Russia, is situated between 52° and 57° N. lat., 42° 30' and 50° 5' E. long. It is bounded N. by Kasan, E. by the river Volga, which separates it from the new government of Samara, S. by Saratov and Pensa, and W. by Nijni-Novgorod. The area is 17,732 square miles, and the population 927,311. The surface is in general an undulating plain, but along the bank of the Volga there is a range of hills composed of clay, marl, limestone, and freestone, rising in some places to the height of 400 feet. The principal river of this government is the Volga, which enters it from Kasan, about the middle of the northern frontier, and runs in a direction nearly south to Stavropol, where it turns to the east; and there, after being joined by the Sok, coming from Orenburg, it makes a semicircular bend, and at Samara turns due west, in which direction it proceeds as far as the town of Sysran, when it again turns to the south. Among the minor rivers which belong to the basin of the Volga are the Ousa, and the Systan. The lakes and rivers are upwards of 500 in number, but they are all small. The climate is generally healthy; but the cold in winter and the heat in summer are extreme. The Volga is usually frozen during five months in the year.

The soil is generally fertile, and is carefully cultivated; producing rye, wheat, spelt, oats, barley, millet, and buckwheat. The inhabitants cultivate also the poppy, peas, lentils, flax, much hemp, tobacco, and some potatoes. Horticulture is in a backward state. In the northern parts of the government there are extensive forests. The breeding of cattle is attended to among the Kalmuck Tartars. The Tartars apply to agriculture with great success. Game is abundant, but the fur-bearing animals are scarce. The fisheries of various kinds in the Volga are productive. The minerals are alabaster, sulphur, and limestone.

The manufactures carried on are those of woollen cloths, blankets, carpets, sail-cloth, leather, silk, and nankeen. Glass-ware, soap, and candles are manufactured; and there are many spirit distilleries. The exports consist of horses, oxen, hemp, apples, water-melons, corn, fish, tallow, leather, raw hides, and millstones.

Simbirsk, the capital of the government, is situated on the right bank of the river Volga, and near the right bank of the Sviaga, which runs northward, while the Volga flows to the south. The town stands on an eminence which commands a fine view of the Volga and over an immense extent of country uninterrupted by forests. The town is not regularly built, but there are some broad and straight streets. Almost all the houses are of wood, but neat and convenient within. The churches, 16 in number, are all of stone, except one, which is of wood. There are two monasteries, a gymnasium, and manufactories of candles and soap, and some tanneries. The town is in a very fertile plain, and on one side there are gardens and orchards. The population amounts to 18,000. Of the other towns the most considerable is Sysran, on the river of the same name, near its conflux with the Volga. It has 8000 inhabitants, numerous churches, four public schools, and factories of various descriptions.

The government of Samara was constituted by a ukase issued in December 1850. It comprises three districts taken from the government of Orenburg, two districts of the government of Saratov, and one district, with two parts of districts of the government of Simbirsk. The area and population of each of the governments affected by this new arrangement, now stand as follows:—

Governments.	Area in Square Miles.	Population in 1846.
Simbirsk	17,732	927,311
Orenburg	96,701	1,192,823
Saratov	44,965	1,357,658

The government of Samara is composed of the following districts:—

Districts.	Governments from which the Districts were taken.	Area in Sq. Miles.	Population in 1846.
Samara	Simbirsk	5755	135,615

Samara, the capital of the government, is situated on the left bank of the Volga and the right bank of the Samara River. It contains about 11,000 inhabitants, who carry on a considerable trade in cattle, sheep, salt-fish, caviar, skins, leather, and tallow.

The town was built in 1591 as a defence against the Kalmucks. *Stavropol*, population 8400, the chief town of the Kalmucks, is situated on the left bank of the Volga, about 20 miles N.W. from Samara. This town was built for the Kalmucks on their conversion to Christianity, about the year 1737. In the centre is a kind of fort, surrounded with palisades, which is the residence of the chief of the Kalmucks. The Russian or Cossak garrison is in the upper town. The merchants reside together in a slobos, and the citizens occupy the lower town. *Bugulma*, about 140 miles N.E. from Samara, contains a population of about 2000, and carries on a considerable trade in cotton and woollen cloth. Two large fairs are held here annually. *Bugurustan*, on the river Kivel, which joins the Samara, is about 100 miles E.N.E. from Samara. *Busuluk*, is situated near the junction of the river Busuluk with the Samara, about 90 miles E.S.E. from Samara town. It possesses tanneries, and some trade. A large annual fair is held at Busuluk.

SINGAPORE is a British settlement in the East Indies, situated on the southern extremity of the Malay peninsula. It consists of the island of Singapore, and about 50 islets dispersed south and east from it in the Straits of Singapore. The territories of this settlement embrace a circumference of about 100 miles, including the seas and straits within 10 miles of the coast of the island of Singapore, and they lie between 1° 8' and 1° 32' N. lat., 103° 30' and 104° 10' E. long.

The island of Singapore has an elliptical form, and is about 25 miles in its greatest length from east to west, and 15 miles in its greatest width. The area is estimated at about 275 square miles. The island is divided from the continent of Asia by a long and narrow strait called Salat Tabrao, or the Old Strait of Singapore. This strait is nearly 40 miles long, and varies in width between 2 miles and a quarter of a mile. This strait was formerly navigated by vessels bound for the China seas; but the Strait of Singapore is now preferred. The Strait of Singapore is the high road between the eastern and western portions of maritime Asia.

The surface of the island is gently undulating, here and there rising into low rounded hills of inconsiderable elevation. The higher ground rises in general not more than 100 feet above the sea; the highest hill, called Bukit Timah, which is north-west of the town, does not attain 200 feet. The shores of the island are mostly low, and surrounded by mangrove-trees. In several places the coast is indented by salt-creeks, which sometimes penetrate into the land from three to six miles. When the island was first occupied by the British it was entirely—and is still for the greater part—covered with a forest composed of different kinds of trees, five or six of which are well adapted for every purpose in house-building. The water of the rivulets is almost always of a black colour, disagreeable taste, and peculiar odour, properties which it appears to derive from the peculiar nature of the superficial soil over which the streams flow. The water drawn from wells which are sunk lower than the sandy base is less sensibly marked by these disagreeable qualities. The southern and western division of the island consists of laterite resting on sandstone. Granite appears in the north and east. Iron-ore is abundant; but tin, so plentiful on the neighbouring continent, has not been found in the island.

The climate of Singapore is hot, but equable, the seasons varying very little. The atmosphere throughout the year is serene. The tempests of the China Sea sometimes occasion a considerable swell in the sea, and a similar but less remarkable effect is produced by a tempest in the Bay of Bengal. The effects of these remote tempests are particularly remarkable in the irregularity of the tides, which at times run in one direction for several days successively, and with great rapidity. The regular and periodical influence of the monsoons is slightly felt, the winds partaking more of the nature of land and sea breezes. To these circumstances must be attributed the great uniformity of the temperature, the frequent fall-of showers, and the absence of a periodical rainy season. The greatest quantity of rain falls in December and January, and the smallest in April and May. These frequent rains keep the island in a state of perpetual verdure. The thermometer ranges during the year between 72° and 88°. The mean annual temperature is 80.7° Fahr. The daily range of the thermometer never exceeds 10 degrees. The climate of Singapore is remarkably healthy, owing to the free ventilation that prevails, and to the almost entire absence of chilling land-winds.

Singapore is not rich in agricultural productions. Considerable tracts near the town have been cleared by the Chinese, who have succeeded in cultivating different kinds of fruits and vegetables, rice, coffee, sugar, cotton, and especially pepper and the betelvine (*Piper*

striboa). Only the summits of the higher grounds are barren, but on their slopes and in the depressions between them the soil frequently has a considerable degree of fertility. Tropical fruits succeed very well, such as the mangusteen, pine-apple, cocoa-nut, orange, and mango. The tropical vegetables, as the egg-plant, different kinds of pulse, the yam, the batata, different varieties of cucumber, and some others, grow very well, but the climate is too hot for most European vegetables. Large quantities of rice are imported from Sumatra and Java, and fruits from Malacca.

The animals of Europe have been introduced, but most of them are few in number, as pasture-grounds are scarce. The Chinese however keep a great number of hogs. Of the large quadrupeds of the continent tigers only are met with on the island. The loss of human life caused by the attacks of tigers is considerable. There are several kinds of monkeys, bats, and squirrels; also the icotides, the porcupine, the sloth, the pangolin, the wild hog, and two species of deer—the *Moschus pygmaeus*, which is smaller than an English hare, and the Indian roe (*Cervus Munjac*). Birds are numerous, especially different kinds of passerers, climbers, and waders. Tortoises are common. The coral-reefs and shoals in the vicinity of Singapore furnish that delicate fern-like sea-weed called 'aggar-aggar' (*Pucus saccharinus*) in abundance, and it forms an article of considerable export to China, where it is used in making thin glues and varnishes. It is made into a very fine jelly by Europeans and the native Portuguese.

In 1819, when the British took possession of the islands, the population amounted to about 150 individuals, mostly fishermen and pirates, who lived in a few miserable huts: about 80 of these were Chinese, the remainder Malays. In 1824, when the first census was taken, the population was 10,683; in 1852 it was estimated at 59,043, including Europeans, Indo-Britons, Native Portuguese, Christians, Armenians, Arabs, Chulians, and Klings from the coast of Coromandel; natives of Hindustan, Bugie, and Balinese; Malays, Chinese, Javanese, Kaffirs, Siamese, Jews, Parsees, and Bayanese. The Europeans are few. The Chinese are more than 30,000 in number, and the Malays about 12,000. The military force, which consists of a detachment of the Madras native regiment, with a small company of artillery, numbers about 500. The Europeans and Chinese constitute the wealthier classes. The Europeans are for the most part merchants, shopkeepers, and agents for mercantile houses in Europe. Most of the artisans, labourers, agriculturists, and shopkeepers are Chinese. The Malays are chiefly occupied in fishing, collecting sea-weed, and cutting timber, and many of them are employed as boatmen and sailors. The Bugis are almost invariably engaged in commerce, and the natives of India as petty shopkeepers, boatmen, and servants. The Chulians and Klings are daily labourers, artisans, and petty traders. The Kaffirs are the descendants of slaves, who have been brought by the Arabs from the Arabian and Abyssinian coasts. The most useful are the Chinese settlers.

The town of *Singapore* stands on the southern shores of the island, in 1° 17' 22" N. lat., 103° 51' 45" E. long., on a level and low plain of inconsiderable width, fronting the harbour. It extends about two miles along the shore, but only 1000 yards inland, where it is inclosed by hills from 100 to 150 feet high. The commercial portion of the town occupies the western extremity, and is separated from the other parts by a salt-creek, called the Singapore River, which is navigable for small craft. A good wooden bridge connects it with the eastern part, which contains the dwellings of the Europeans, the public offices, and the military cantonments. Contiguous to this portion of the town is the government-house, which is built on a hill. The most eastern part is occupied by the sultan of Johore, the Malays, and Bugis. The whole of the warehouses, and all the dwelling-houses in the principal streets in their vicinity, are built of brick and lime, and roofed with red tiles. The more distant dwelling-houses are built of wood, but roofed with tiles. The town contains a Missionary and an Armenian church, a court-house, jail, custom-house, baths, concert-rooms, several native schools, and the Singapore Institution founded by Sir Stamford Raffles, for the cultivation of the languages of China, Siam, and the Malay Archipelago. The institution comprises English, Malay, and Tamil schools, with upwards of 70 pupils. Ships lie in the roads of Singapore at the distance of from one to two miles from the town, according to their draught. With the assistance of lighters, cargoes are discharged and taken in with scarcely any interruption throughout the year. The lighters convey the goods to the river of Singapore, where they discharge them at a convenient quay, and at the door of the principal warehouses.

If the commerce of Singapore were limited to the produce of the place, it would give employment to very few vessels. Catechu or gambier, pepper, coffee, nutmegs, and a few of the finer fruits, are its principal products; and these, together with the pearl sago and iron implements, birds'-nests, trepang, tortoise-shell, and a large quantity of aggar-aggar, form the only native exports. But Singapore has risen into great importance as the emporium of Southern Asia and the Indian Archipelago. All the nations that inhabit the countries bordering on the Indian Ocean resort to it with the produce of their agriculture and manufacturing industry, and take in exchange such goods as are not grown or produced in their own countries. All of them find there a ready market. There is usually also an abundant supply of European goods. This has partly arisen from the harbour

of Singapore having been declared a free port, in which no export or import duties, nor any anchorage, harbour, or lighthouse fees are levied.

The commerce of Singapore may be divided into the Eastern trade, that of the Straits, and the Western trade. The Eastern trade, or that which is carried on with the countries east and south-east of Singapore, comprehends the commerce with China, the Spanish settlement of Manila, the independent tribes of the Indian Archipelago, the Dutch settlements on the island of Java and at Rhio, and the countries of the peninsula beyond the Ganges which lie east of the Malay Peninsula. The most important branches of this commerce are those with China, Java, and Siam.

The commerce with China is entirely carried on in Chinese vessels. They leave their respective ports during the north-east monsoon about January, and return with the south-west monsoon, which blows from April to October. From Canton the voyage is performed in from ten to twenty days, and from Fokien in twelve or fifteen days. The junks bring annually from 2000 to 2500 emigrants to Singapore. The principal articles of import are—camphor, crockery, raw silk, tea, joss-sticks, alum, hardware, and tobacco. The exports to China consist chiefly of guns, betel-nut, birds'-nests, béche-de-mer, cotton-twist, British cottons, iron, tin, opium, rice, black pepper, woollens, garro and lakka wood, and sapan wood.

The commerce between Singapore and Manila is carried on partly by Spanish and partly by American and English vessels. The imports from Manila into Singapore comprise hemp and rope, cigars, sugar, tea, sapan-wood, and a number of minor articles. The exports consist chiefly of opium, iron, and British cotton goods.

The trade with Celebes is almost exclusively in the hands of the Bugis of Waju, a country on the western side of that island, the inhabitants of which have colonised many islands of the Indian Archipelago, and carry on what may be called the foreign trade of the countries in which they have settled. They disperse the goods obtained at Singapore over most of the islands east of Celebes as far as the coast of New Guinea, and also over that chain of islands called the Lesser Sunda Islands. Their country vessels, called 'prahus,' arrive at Singapore during the prevalence of the eastern monsoon.

The commerce between Singapore and Borneo is almost exclusively carried on by native vessels, many of which are of great size; some of them are managed by Bugis. This trade is protected from pirates by the establishment of a British station at the port of Labuan.

An active commerce is carried on between Singapore and the rival settlement of the Dutch at Rhio, about sixty miles east-south-east. The direct commerce between Singapore and Java is limited to the three ports of Batavia, Samarang, and Surabaya; but European and India goods may be shipped from these places to any other Dutch settlement on the island of Java, or on the other islands of the archipelago, the Moluccas excepted. The commerce between Singapore and Siam is mostly carried on by the Chinese who are settled in that country, and in junks built at Bang-kok and other places. The commerce with Cochin China is carried on by the Chinese settled at Kangtso and Saigun in Camboja, and at Quinhon, Faifo, and Hué in Cochin China.

The commerce of the Straits is carried on with the Malay peninsula, the island of Sumatra, and other neighbouring islands. The harbours on the eastern side of the peninsula which trade with Singapore are Pahang, Tringanu, and Calantan, and this trade is rather active. On the western side the principal trade is with Penang, or Prince of Wales Island, and Malacca. The commerce between Singapore and the island of Sumatra is almost entirely limited to the ports along the eastern coast of the island; there is hardly any commercial intercourse with the Dutch settlements of Bencoolen, Padang, and Trapanuli, which are on the western coast. The commerce of the eastern coast is divided between Singapore and Penang. The harbours which have intercourse with Singapore are—Campar, Siack, Indragiri, Iambie, Assahan, and Batu Bara.

The western trade of Singapore comprehends that with Calcutta, Madras, Bombay, the island of Ceylon, and Arabia; with the Cape of Good Hope, Mauritius, and Australia; and with Europe and America. The commerce carried on with Calcutta is the most valuable. The commerce with Madras has been on the decline for several years, British manufactures having superseded the Madras piece-goods which formed the principal article of trade with that place. The commerce with Bombay is more important. The trade with Arabia is carried on by vessels which sail annually with Mohammedan pilgrims, who assemble at Singapore from Java and the neighbouring Malayan states. The trade with the United States is inconsiderable. The trade with Continental Europe is principally carried on by vessels under the French, Belgian, Hamburg, Bremen, and Danish flags.

The commerce of Singapore with Great Britain is of considerable amount. In 1853 the declared value of the goods exported from Great Britain to Singapore was 595,566*l*. The principal articles imported into Great Britain from Singapore are—caoutchouc, gum, gutta-percha, hides, mace, nutmegs, pepper, mother-of-pearl, oils, raw silk, sago, tin, and tortoise-shell.

The affairs of the settlement are administered by a governor, assisted by a council of several salaried members. A Recorder's Court has been established in Singapore. The revenue is raised from government

rents, dues, and fines, and from an excise on pork, opium, and home-made spirits. The total income for the year ending 30th April, 1852, was about 40,000*l.* The expenditure was 21,110*l.*, exclusive of the expenses for the military and convicts.

History.—On the site of the present British settlement formerly stood the capital of a Malay kingdom, the city of Singhapura (the 'Lion's Town'); and Sir Stamford Raffles was able in 1819 to trace the outer lines of the old city. It was next the capital of the kingdom of Malacca. This town was taken in 1252 by a king of Java, and the residence of the king was transferred to the town of Malacca, which was then founded. After that event the town seems gradually to have decayed, and the country to have been abandoned. It was then a part of the kingdom of Jahore, which had been so reduced by internal discord that some of the superior officers had become independent. One of them, the Tumungong, or chief justice, had got possession of the island of Singapore and the adjacent country, and from him the British obtained in 1819 permission to build a factory on the south shore of the island. Soon afterwards a person who had some claim to the throne of Jahore came to the British settlement, and received a small pension. From this person, who was afterwards king of Jahore, and the Tumungong, the British obtained in 1824 the sovereignty and fee-simple of the island, as well as of all the seas, straits, and islands, for the sum of 60,000 Spanish dollars, and an annuity of 24,000 Spanish dollars for their natural lives. In 1826 Singapore was placed under the provincial government of the Straits Settlement, which was fixed on Penang, or Prince of Wales Island. In 1851, by an order of the directors of the East India Company, Singapore, Malacca, and Prince of Wales Island, were detached from the presidency of Bengal, and constituted a separate government.

SINIGAGLIA. [PESARO-URBINO.]

SINOPE. [PAPLAGONIA.]

SIPHNO, called also *Siphanto* and *Sifanno*, an island in the Archipelago, forming one of the group called the Cyclades, is situated between 36° 50' and 37° 10' N. lat., 25° 10' E. long.; it lies opposite Antiparo, S.E. from Serpho, N.E. from Milo, and S.W. from Paro. It is oblong in form, and about 30 miles in circumference. [ARCHEPHELAGO, *Grecian.*] It was colonised by Ionians from Athens. (Herodotus, viii. 48.) In the reign of Polycrates, the tyrant of Samos, about B.C. 520, the inhabitants were very flourishing in consequence of their gold and silver mines, and, according to Herodotus (iii. 57), they were the most wealthy of the islanders. Their mines were afterwards less valuable. Siphnus is very little noticed by ancient authors. From Stephanus Byzantinus, Hesychius, and Suidas we learn that the natives were of dissolute manners, inasmuch that to do like a Siphnian was a term of reproach.

Fiedler mentions only two towns: *Kastron*, on a rocky hill overlooking the sea, which is the residence of the governor; and *Stawri*, called Stavril by Tournefort, in the centre of the island. Siphno is in the patriarchal of Nakscha. The bishop is also bishop of Milo. The population in the time of Tournefort was about 5000; they were taxed in the year 1700 at 4000 crowns of French money. The lands are chiefly laid out in vineyards. The chief trade is in silk, figs, honey, wax, sesame, and cotton stuffs, which are celebrated for their quality: the inhabitants import the raw material. There are very few sheep, horses, or horned cattle. The climate is good, and the inhabitants long-lived.

The antiquities of the island are few. On the south side, at Porto Plati Gallo, are the remains of an old Greek town. Tournefort speaks of a temple sacred to Pan near the castle, which is also noticed by Carpacchi, and of several marble sarcophagi with good sculpture. The Greek coins of Siphnus are very numerous: they are of gold, silver, and copper. *Kastron* is a castle built apparently when the Venetians first occupied the island. Various buildings bear the arms of the Gozzadini family, three of whom were still living there in the time of Tournefort.

SIRANG, or CERAM. [JAVA.]

SIRH'IND, Hindustan, a district in the protected Sikh territory, at the north-western extremity of the province of Delhi, is situated between 30° and 31° N. lat., 75° and 77° E. long., having the river Sutlej on the north, and on the east the head branches of the Jumna. It consists of extensive plains, which, lying at the head of India, as its name imports, divide the great desert from the lofty Himalayas, and form an open communication between the Punjab and the rest of Hindustan. The sacred river Sereswatee flows through the centre of the district. The country is well peopled and generally cultivated, but the periodical rains are not always sufficient to insure a crop. After a rainy season, during which the banks of the streams are flooded, the plains are clothed with good pasture, and the climate, cooled by the rains, is temperate and healthy. In the hottest season, however, the inhabitants are at times driven for shelter to subterranean dwellings. The principal towns are, *Patalah*, which is the largest and most flourishing; *Tahnesir*, an object of religious veneration to the Hindoos; and *Somanaa*. *Sirhind*, the ancient capital, now a heap of ruins, stands on the road to Belaspoor, in 30° 40' N. lat., 75° 55' W. long., distant 27 miles N.W. from Umballah, and 155 miles N.N.W. from the city of Delhi. It was founded or rebuilt in the 14th century, by Feroze III., who erected a fort in the town, and opened canals from the Sutlej and the Jumna for the irrigation of the

neighbouring district. Lying in the route of the Persian and Tartar invaders of Hindustan, the town was exposed to the ravages of war, and in 1707 was pillaged by the Sikhs, a disaster from which it has never recovered.

SIRINAGUR. [CASHMERE.]

SIROD. [JURA, Department of.]

SISSONNE. [AISENE.]

SISTERON. [ALPES, BASSES.]

SISTOVA, a town in Bulgaria, is situated on a height above the right bank of the Danube, 37 miles above Rustschuk, and 25 miles below Nikopoli, and has about 21,000 inhabitants. The town is defended by a citadel, and inclosed by a dry ditch and palisade. The houses are low and ill-built. The mosques, of which there are eight, are the only buildings worth notice. Sistova is a place of considerable commerce, and is looked upon by the Bulgarians as their proper capital. In ordinary times it has a good trade in corn, hides, leather, foreign manufactures, and colonial produce. The Turks and Austrians concluded a peace at Sistova in 1791.

SITKHA, the most important of the Russian settlements on the west coast of North America. Its proper name is New Arkhanghelak. This place lies in 57° 2' 50' N. lat., 135° 18' W. long., and is built on one of the group of islands which received from Vancouver the name of King George III's Archipelago. The population is about 1200, of whom 500 are employed by the Russian American company. The harbour, which Vancouver named Norfolk Sound, but which is now better known as the Bay of Sitkha, is spacious and safe, and offers excellent anchorage opposite the settlement. The place itself is surrounded by a wooden wall, and inclosed by mountains of considerable elevation, which are almost covered with forests, in which excellent timber is found. With the exception of the governor's house the dwellings are described as being little better than wooden hovels, huddled together without order or design. Ship-building constitutes the most important of the branches of industry, and the vessels of the Russian American Company are built here. New Arkhanghelak is the centre of the administration of the Russian territories in America, over which the American Company exercises sovereign powers, nearly in the same way as the Hudson's Bay Company over a much more extensive portion of North America. The collecting of furs is the exclusive object of both companies, and New Arkhanghelak may be compared with Fort York, which lies nearly under the same latitude on the eastern coast of America. The climate is milder here than on the east coast of America in the same latitude. A considerable amount of rain falls at Sitkha.

SITKHA, EAST and WEST. [ALEUTIAN ISLANDS.]

SITKOKF. [JAPAN.]

SITTINGBOURNE. [KENT.]

SIVAS, or SIWAS, a town in Asia Minor, on the north bank of the river Kizil-Irmak, in 39° 25' N. lat., 36° 55' E. long.; 100 miles S.W. by W. from Trebizond, and 100 miles N.E. from Kaisariyeh. It is the capital of a pashalic which comprehends the whole eastern part of Asia Minor, and which still bears the name of Rûm. The valley of the Kizil-Irmak, the ancient Halys, here spreads out into a broad and fertile plain. The situation, being level, with the exception of only one small circular elevation in the south-west, the whole city is seen to much advantage when approached from the north. It is interspersed with trees, without being buried in them, like most of the towns in these parts. The great number of chimneys seen above the house-tops indicate that the winter is severe; and the inhabitants affirm that it is as cold as at Erzurûm. The houses are well-built, partly tiled, partly flat-roofed, and intermingled with gardens. These, with the numerous minarets, give a cheerful aspect to the place. The bazaars are extensive and well stocked with goods, including many of British manufacture. The consumption of Sivas itself, and the circumstance of its furnishing supplies to many places, causes its transit-trade to be extensive. Sivas is inhabited by about 6000 families, of whom 1000 or 1100 are Armenians, and the rest Moslems. An Armenian historian states that the town contained 120,000 inhabitants in the time of Tamerlane; and that it capitulated to him on condition that their lives should be spared, which condition he most barbarously violated.

SIWAH is the modern name of the oasis in the Sahara, which was called by the Greeks and Romans Ammonium, Ammonia, or Ammoniac, from the celebrated oracle and temple of Jupiter Ammon, with whose worship the Greeks became acquainted through the Cyrenseans. The town of Siwah is in 29° 12' N. lat., 26° 17' E. long., and is about 160 English miles from the sea-coast. The whole oasis is about 15 geographical miles long and 12 miles broad, but Diodorus (xvii. 50) says that the length and breadth are about 50 stadia, which would only make a little more than 5 geographical miles. The surface is undulating, and in the north it is surrounded by high limestone hills; it is watered by many springs of fresh as well as of salt-water, the latter of which probably arise from the masses of salt mentioned by Herodotus. The ancients speak of three things as remarkable in this oasis: first, a well, called the Well of the Sun, of which the water was warm in the morning and evening, and cold at mid-day (Herod., iv. 181; Diodor., xvii. 50; Lucr., vi. 849, &c.; Pomp. Mel., l. 8); secondly, a large palace of the ancient kings of the Ammonians, which was surrounded by a triple wall, and situated in the centre of

the oasis (Diodor., xvii. 50); and thirdly, the temple of Jupiter Ammon, which was surrounded by a shady grove. Cambyses made an unsuccessful attempt to take the Ammonium (Herod., iii. 25); and it was visited by Alexander the Great. In the reign of the Ptolemies and under the Romans the oasis belonged to that nomos or province which was called Libya (Ptolem., iv. 5). In the time of Strabo (xvii., p. 813) the oracle was almost entirely neglected. In the middle ages the Arabs called this oasis Santariah.

The Ammonium, during its most flourishing state in ancient times, seems to have been well peopled; and the inhabitants, who lived in villages, are said to have consisted of three distinct tribes. The southern and western parts were inhabited by Æthiopians, the middle part by the Nasamones, and the north by a nomadic tribe of Libyans. The description which Diodorus gives of the beautiful climate of the oasis, and of its fertility, especially in fruit, is still applicable to it; nearly the whole oasis forms an uninterrupted succession of meadows, fields, and palm-groves; and the gardens produce an abundance of the most delicious fruits. The water however is said to be injurious to camels.

The present inhabitants consist chiefly of Berbers mixed with negroes, and all are very zealous Mohammedans. The principal place in it bears the name of Siwah, and has about 8000 inhabitants. This town and several other smaller places in the oasis are built upon eminences, and surrounded by walls to protect them from hostile inroads. The houses are all wretched huts, and the streets are narrow and dark.

Ruins of the ancient temple of Ammon are still visible. The paintings, sculptures, and hieroglyphics which remain on the walls, are copied and described in the work of Minutoli. There are also ruins of other places, especially in the neighbourhood of the modern village of Shargiah, which probably mark the sites of the ancient villages. The Wall of the Sun is near Shargiah, and is still remarkable for its varying temperature. Catacombs cut in the rocks have been discovered in four different parts of the oasis.

SIX-MILE-BRIDGE. [CLARE.]

SKEEN-ELF. [CHRISTIANSAND; NORWAY.]

SKERRIES. [DUBLIN, County.]

SKIBBEREEN, County Cork, Ireland, a market-town and the seat of a Poor-Law Union, is situated on the river Ilan, in 51° 34' N. lat., 9° 18' W. long., distant by road 52 miles S.W. from Cork, and 210 miles S.W. from Dublin. The population in 1851 was 3856. Skibberreen Poor-Law Union comprises 23 electoral divisions, with an area of 115,024 acres, and a population in 1851 of 38,059. The town contains a parish church, chapels for Roman Catholics and Wesleyan Methodists, two National schools, a court-house, market-house, dispensary, bridewell, and Union workhouse. In the town are flour-mills and a brewery. Quarter and petty sessions are held. There are six yearly fairs, at which large quantities of yarns and coarse linens are sold.

SKIDDAW. [CUMBERLAND.]

SKIPTON, or SKIPTON-IN-CRAVEN, West-Riding of Yorkshire, a market-town and the seat of a Poor-Law Union, in the parish of Skipton, is situated on an affluent of the river Aire, in 53° 58' N. lat., 2° 2' W. long., distant 44 miles W. from York, 216 miles N.N.W. from London by road, and 231 miles by the Great Northern and the Leeds and Colne branch of the Midland railways. The population of the town of Skipton in 1851 was 4982. The living is a vicarage in the archdeaconry of Craven and diocese of Ripon. Skipton Poor-Law Union contains 47 townships, with an area of 147,597 acres, and a population in 1851 of 28,363.

Skipton is an ancient town, which appears to have risen with the castle. The houses are built of stone. The only public building belonging to the town is the town-hall. Skipton Castle, a little to the east of the church, was formerly a place of great strength. It was built originally by Robert de Romillé, about the end of the reign of William the Conqueror. It stood a siege of three years against the parliamentary army, but was compelled to surrender on Dec. 22nd, 1645. In 1649 it was dismantled by order of parliament; but it was afterwards rebuilt by the Countess of Pembroke as a residence. Some parts of the old castle are incorporated with the modern building. The parish church is a substantial and spacious structure, parts of which are of great antiquity. The district church of Christ church was built in 1838; that of St. Mary's Embeay is a new erection on the site of the first ecclesiastical foundation in Craven. The Primitive Methodists have two chapels, and the Wesleyan Methodists, Independents, Swedenborgians, and Roman Catholics have each one chapel. There is a Free Grammar school, founded in 1548 by William Ermysted, canon-residentary of St. Paul's, London. The number of scholars in 1854 was above 60. The income from endowment is about 600*l.* a year. There are National and British schools, a mechanics institute, and a savings bank. The market, which is on Saturday, is a very large market for corn, and there are fairs on alternate Mondays for cattle and sheep. A county court is held. The population is partly agricultural, the vicinity forming an excellent grazing district, but the cotton manufacture is the chief source of employment. The Leeds and Liverpool Canal passes the town.

SKIRLAUGH, East Riding of Yorkshire, a village and the seat of a Poor-Law Union, in the parish of Swine, is situated in 53° 50'

N. lat., 0° 15' W. long., distant 9 miles N.N.E. from Hull, and 183 miles N. by W. from London. The population of the township of North Skirlaugh in 1851 was 190, of whom 68 were in the Union workhouse. The living is a chapelry annexed to the vicarage of Swine, in the archdeaconry of the East Riding and diocese of York. Skirlaugh Poor-Law Union contains 42 townships, with an area of 67,028 acres, and a population in 1851 of 9279. In the village is an elegant chapel, erected early in the 15th century by Walter Skirlaugh, bishop of Durham.

SKULL, Cork County, Ireland, a village and the seat of a Poor-Law Union, is situated in the midst of wild romantic scenery, at the head of Skull Harbour, in Roaring Water Bay, in 51° 33' N. lat., 9° 30' W. long., distant by road 64 miles S.W. from Cork, and 222 miles S.W. from Dublin. The population in 1851 was 535, besides 1811 in the Union Workhouse. Skull Poor-Law Union comprises 11 electoral divisions, with an area of 57,169 acres, and a population in 1851 of 16,418. The village contains a number of well-built houses; a neat parish church, built in 1720; a Roman Catholic and a Wesleyan Methodist chapel; two National schools, and others partly endowed; a dispensary; and the Union workhouse. The harbour is a convenient and sheltered roadstead, with an anchorage of three or four fathoms, accessible at all times of the tide. A rock, midway in the entrance, is dry at two hours' ebb. Behind the village Mount Gabriel rises to the height of 1835 feet. Skull is said to have been anciently a seat of learning, and to have derived its present name from its earlier title, St. Mary of the Schools.

SKYE, Inverness-shire, Scotland, one of the Hebrides, lies between 57° 2' and 57° 41' N. lat., 6° 37' and 6° 40' W. long. It is separated from the mainland by a narrow strait, forming the entrance to Loch Alsh, in some parts not more than a mile wide. The extreme length of the island, from the point of Sleat to the point of Aird, is about 44 miles; its breadth, at the northern part of the island, slightly exceeds 20 miles. The population in 1851 was 21,521.

Portree, the only town in the island, has been already noticed. [INVERNESS-SHIRE.] The island throughout is extremely mountainous. The Cuchullins, a chain of hills stretching along the south-western coast, are remarkable for their craggy peaks and fantastic outlines. They are generally of granitic formation, but one group is composed principally of hypersthene rock. The highest peak of these mountains is about 3220 feet. The coast is indented with lochs, and there are several small inland lakes, the most remarkable of which is Loch Coruisk, celebrated in Sir Walter Scott's 'Lord of the Isles.' The margin of this loch is composed of rough and precipitous rocks, rising to a gigantic height. The cave of Strathaird, the most remarkable of the natural beauties of Skye, is a cavern, the roof, floor, and walls of which are entirely covered with stalactites, many of them assuming elegant and fanciful forms. The soil of Skye is unproductive. There is scarcely any wheat grown, potatoes being the principal produce. The herring fishery furnishes a subsistence to the poorer population for a few months in the year.

SKYRO (Scyros), an island in the Ægean Sea, belonging to Turkey, lies east of the island of Eubœa, in 39° 10' N. lat., 25° 12' E. long. The earliest inhabitants were Pelasgians and Carians, and Dolopes. Homer records the capture of it by Achilles ('Il., x. 664), who is said to have been discovered there disguised in female attire before the Trojan war. Theseus was sent into exile to this island, and was murdered by Lycomedes, its king, who became jealous of his popularity. (Pausan., iii. 6.) In B.C. 476 it was taken by Cimon, when the inhabitants were enslaved, and a colony was sent thither from Athens. (Thucyd., i. 98.) Six or seven years after this event the bones of Theseus were removed to Athens. The island afterwards passed out of the hands of the Athenians, but was restored to them by the peace of Antalcidas, B.C. 386. It was taken by Demetrius Poliorcetes, and again given to Athens B.C. 196, in the treaty between Rome and Philip of Macedon. (Livy, xxxiii. 30.)

The island is 60 miles round. On the west side is a large bay (Panormo) with several islets, the most western of which, *Skyro Poulò*, is 8 miles from the nearest part of the island. The harbour here is called Kalamitza by the Greeks, and by the Italians Gran Spiaggia. Opposite to this, on the other side of the island, is *Port Akhili*, named from the Homeric hero Achilles. The isthmus between these two points divides the island into two parts: the southern portion is uncultivated, full of high mountains, intersected by deep gullies, and rugged and bare, except at their summits, where they are covered with oak, fir, and beech. Mount Cocyla, on the east coast, a little to the south of Port Akhili, is 2588 feet high. At the southern extremity of the island is a port called *Trimpouchois*, or *Trébokhâ*, corruptions of *Tre Boche*, or the Three Mouths. It is surrounded by wooded hills, and has three entrances, the one on each side being about one-third of a mile in width, and the middle one rather narrower. They are all safe and deep. There is a depth of about 20 fathoms water in the centre of the harbour.

The northern division of the island is less mountainous. The town of *St. George* (*Hagios Giorgios*), on the east coast, covers the north and west sides of a high rocky hill. It contains nearly the whole population of the island, which is about 3000. It is the seat of a bishop. On the summit of this hill are the ruins of a castle built during the middle ages, and many houses, all abandoned, which are used by t'

inhabitants to keep stores in. The houses of Skyros are flat-roofed, of two stories, the lower of stone, the upper of wood, surmounted by terraces covered with earth. This hill was the site of the ancient Acropolis; the remains of Hellenic walls and towers still exist on the hill and its slope towards the town. The greater part of the ancient city lay to the east, near the sea. In this direction there is a large semicircular bastion almost entire. In the neighbourhood of St. George is a plain four square miles in extent, which bears corn, grapes, and figs. There is another at Kalamitza, which is also fertile. Other products of the island are excellent wheat, madder, wine, honey, wax, oranges, and lemons. There are a few oxen, and about 15,000 head of sheep and goats. Feluccas and other vessels are built of mountain pine. Oak-timber is used for fire-wood. The inhabitants of Skyros are good seamen.

SLANE. [MEATH.]

SLAVE RIVER AND LAKE. [HUDSON'S BAY TERRITORIES.]

SLAVONIA. [CROATIA.]

SLAWKOW. [POLAND.]

SLEAFORD, Lincolnshire, a market-town and the seat of a Poor-Law Union, in the parish of New Sleaford, is situated on the little river Slea or Sleaford, in 53° 0' N. lat., 0° 23' W. long., distant 18 miles S. by E. from Lincoln, and 115 miles N. by W. from London. The population of the town of Sleaford in 1851 was 3729. The living is a vicarage in the archdeaconry and diocese of Lincoln. Sleaford Poor-Law Union contains 56 parishes and townships, with an area of 127,867 acres, and a population in 1851 of 24,412.

The town has received the name of New Sleaford to distinguish it from the adjacent village of Old Sleaford. The bishops of Lincoln had once a castle here. The church is a spacious cruciform building, with a tower of early English style, surmounted with a spire of later date, 144 feet high. There are chapels for Independents and other Dissenters; a Grammar school founded in 1604, which had 26 scholars in 1854; National schools, partly endowed; and a savings bank. The town-hall is a modern building. Quarter sessions and a county court are held in the town. Monday is the market-day; fairs are held on Plough Monday, Easter Monday, Whit-Monday, August 11th, and October 20th.

SLESWICK. [SCHLESWIG.]

SLIGO, a maritime county in the province of Connaught, Ireland, is bounded N. by the Atlantic Ocean and Donegal Bay; E. by the counties of Leitrim and Roscommon; S. by Roscommon and Mayo; and W. by Mayo. It lies between 53° 53' and 54° 26' N. lat., 8° 3' and 9° 1' W. long. Its greatest length from east to west is 41 miles, and from north to south 38 miles. The area is 721 square miles, or 461,753 acres, of which 290,696 acres are arable, 151,723 acres uncultivated, 6134 acres in plantations, 460 acres in towns, and 12,740 acres under water. The population in 1851 was 128,510.

Coast-Line and Islands.—The coast has an irregular outline, forming several bays and natural harbours. Except in Sligo Bay and along the coast eastward from it the shore is rocky. Off that part of the coast which extends north-eastward from Sligo Bay, distant between three and four miles, is Innismurray, a small island, about a mile long from east to west, which rises precipitously on every side except just at the east point. It contains about 209 acres of cultivable land, chiefly pasturage, and is inhabited by about a score of families. Two or three miles farther out to sea are the Boabinsy rocks. Sligo Bay is nearly six miles across at the entrance, and about 10 miles deep to the town of Sligo. On the south-west side of the entrance is Aughris Head, and on the north-east side is Roskeeragh Point. The bay is divided by projecting headlands into three smaller bays. The middle bay is that which leads to the town of Sligo; it is in great part occupied by a large bank called Cummeen Strand, but has a channel navigable to the town for vessels drawing 13 feet of water. In this bay are Covey Island, which forms a natural breakwater, and Oyster Island, on which are two lighthouses. There are extensive sands or other strands in Killala and Sligo bays, and along the coast eastward of Sligo Bay.

Surface, Hydrography, and Communications.—From the western boundary an extensive plain stretches eastward, narrowing as it approaches Ballysadere Harbour. From the coast it rises gradually to the base of the Slieve Gamph and Ox Mountains, the two parallel divisions of a range 25 miles long by 5 or 6 miles broad which runs in a south-easterly direction from the head of Ballysadere Bay to Foxford in Mayo. The height of the range within the county varies from 600 to nearly 1800 feet. On the north-west side the hills rise into steep rocky peaks, with intervening ravines of no great depth. On the south-east side the ascent is more gradual and less rocky, and the streams are more abundant. Along this side of the range the surface between the Mayo and Leitrim boundaries exhibits a succession of valleys and hilly or undulating tracts, with occasional heights of from 300 to 700 feet. North from the Curlew Hills, which rise 863 feet on the Roscommon border, Carrowkeel Mountain has an elevation of 1062 feet; and Keshcorran, a little to the west of it, is 1183 feet high. The Braughlieve Mountains, which belong also to Roscommon and Leitrim, have an altitude in this county of 1183 feet. The town of Sligo stands in an extensive plain, which spreads eastward to the border of Leitrim, and northward to the shores of Donegal Bay. Slieve Dacane, 900 feet high, and Sliah Mountain, a height of 967 feet,

bound this plain on the south. About five miles north from Sligo the plain is broken by Truskmore, King's Mountain, and Benbulbin, three heights which form part of a range that comes in from Leitrim and Fermanagh. Benbulbin, with an elevation of 1722 feet, has a gradual ascent on the south side, but the north side is nearly perpendicular. Knocknarea, a hill of similar form, with its steep side to the west, rises on the north-east shore of Ballysadere Bay to the height of 1078 feet.

The lakes of the county are mostly small, and the greater number belong partly to Leitrim and Roscommon. Lough Gill, the largest and most beautiful, extends nearly six miles eastward from the neighbourhood of Sligo to a point just within the county of Leitrim. It has an extreme width of two miles, and is 20 feet above the level of the sea at low water. Lough Arrow and Lough Gara, the latter chiefly, and the former nearly all within the county, on the border of Roscommon, are nearly as large as Lough Gill; both are studded with islands, and remarkable for their picturesque scenery. Lough Easky and Lough Talt lie in the valley that separates the Slieve Gamph and the Ox Mountains.

The navigable waters of the county are the estuary of the Moy in Killala Bay, and the estuaries of the Owenmore and Garrogue in the Bay of Sligo. The Moy is navigable to Ballina, and forms the boundary of the county from a point three miles above Ballina. The Owen-garrogue, one of its two principal branches, has its sources within the county, in the Ox and Curlew Mountains, and flowing in a south-westerly direction, contributes its waters to the main stream at Foxford. The Easky drains Lough Easky, collects several mountain streams in its course, and runs northward through the town of Easky into the Atlantic, which also receives from this part of the coast the Finnid, the Ballybeg, and the Dunneil. The Arrow, or Uncion, has its source in Lough Arrow, and flows northward to the head of Ballysadere Bay, falling over shelving rocks, and forming an imposing cataract near the termination of its course. The Owenmore rises among the Curlew and Keshcorran Mountains, and pursues a winding course northwards, through Templehouse Lough, joining the Arrow about two miles from its embouchure. About three miles higher, the Owenmore is entered by the Owenbeg, which flows from the Ox Mountains, eastward through the town of Coolaney. Lough Gill, which is fed by the Bonnet River from Leitrim, is drained by the Garrogue, which has a course of about three miles through the town of Sligo into the head of the bay. The Drumcliffe and the Duff or Buuroes, with other small streams, drain the district north from Sligo, the Duff entering Donegal Bay at the Leitrim boundary.

The principal roads are the mail-road from Dublin to Sligo, with a branch mail-road to Ballina and Castlebar; and the mail-road from Sligo to Ballyshannon (county of Donegal), from which place it continues to Donegal and Londonderry, with a branch-road to Enniskillen. The Ox Mountains are traversed by several passes; that through which the Dublin and Sligo mail-road runs presents some very picturesque scenery. The inland traffic to and from Sligo is of very considerable amount. In the parts about Sligo Bay produce is carried to market by water.

Geology, Mineralogy, &c.—The Ox Mountains consist chiefly of mica-slate, with occasionally granite, hornblende-slate, gneiss, and quartz-rock; the strata dip rapidly towards the south. The mica-slate extends eastward across the Owenmore River, and along the south side of Lough Gill, by Slieve Dacane and Sliah Mountain, into the county of Leitrim, forming a range which may be regarded as a prolongation of the Ox Mountains. At the base of the Ox Mountains, on both sides, the old red-sandstone and conglomerate are observed skirting the primary rocks, and sinking below the carboniferous limestone, which occupies the lower lands extending on one side to the sea and on the other to the Curlew and other mountains on the border of Roscommon. The Braughlieve Mountains belong to the carboniferous group, and the Curlew Mountains to the old red-sandstone group. [ROSCOMMON, County of.] The old red-sandstone also constitutes the headland on the north-eastern side of the entrance of Sligo Bay. The rest of the county is occupied by the formations of the carboniferous limestone group. Yellow-sandstone, the lowest member of the group, forms a considerable area in the northern extremity of the county, and appears in the ridge of mountains on the west side of Lough Gara. The lower limestone, the member next above the yellow-sandstone, is found at the base of the Curlew Mountains, near Lough Arrow, and yields gray and dove-coloured marble. The mountains on the north-eastern border of the county are formed of the middle or calp-limestone, and of the upper limestone, which in Mount Benbulbin forms a bed 500 feet thick. This county and the adjacent one of Mayo are traversed by trap-dykes unexampled for length, directness, and parallelism. Their direction is nearly east and west. Trachyte, a formation not observed elsewhere in the British Isles, is found on the shore of Killala Bay.

Copper- and lead-mines were formerly wrought in the Ox Mountains, and iron-ore in the mountain of Kilmacley. Iron-ore appears along several streams. Garnets are found near Lough Easky, and asbestos to the eastward. Manganese has been met with in the mountains south-west from Lough Gill, and brick-clay, suitable for the manufacture of coarse pottery, near Lough Gill on the Sligo and Ballintogher road.

Climate, Soil, and Produce.—The climate is very variable, affected by frequent rains, and high winds from the Atlantic, but on the whole mild and healthy. Thin mossy and sandy soils, or both intermixed, varied with a light gravelly loam, prevail in the district north from Sligo. Improving as they approach the plain of Sligo, they there pass into a deep rich loam, forming the finest land in the county. South from Sligo, along the valleys of the Arrow and Owenmore, and as far as the Curlew Mountains, are extensive tracks of productive land and rich pasturage, interspersed with occasional patches of bog. On the shores of Lough Gara the soil is excellent both for tillage and grazing, but towards the Ox Mountains the land along the southern border is inferior. The district lying between the Ox Mountains and the sea consists, to a great extent, of moor and deep moss, with a broad belt of cultivated land along the shores of Killala Bay and the Atlantic. Oats, potatoes, and a considerable quantity of wheat are raised. The occupations are mainly agricultural, and tillage is chiefly practised. Of late the introduction of an improved system of culture has been attempted, by the amalgamation of farms, and the employment of skilled agriculturists from other parts of the kingdom. In 1853 the number of acres under crop was 96,723, of which 1404 acres grew wheat; 42,308 acres oats; 2747 acres barley, bere, rye, peas and beans; 26,563 acres potatoes; 5128 acres turnips; 1761 acres mangel-wurzel, carrots, vetches, and other green crops; 695 acres flax; and 16,117 acres were in meadow and clover. Of plantations there were 7360 acres in 1841, yielding oak, ash, elm, beech, fir, mixed timber, and fruit. In 1852, on 13,992 holdings, there were 7251 horses, 5731 mules and asses, 83,819 head of cattle, 36,009 sheep, 17,612 pigs, 2242 goats, and 182,467 head of poultry.

A considerable number of the population are employed in fishing. The Sligo fishery district comprises 103 miles of maritime boundary, extending from Ballina Bridge to Abbey Point. In 1853 it had 216 registered vessels, employing 1269 men and boys. Coarse linens and woollens are manufactured in the county.

Divisions and Towns.—The county is chiefly in the dioceses of Achonry and Elphin, with small portions in those of Killala and Ardagh. It is divided into six baronies, Carberry, Coolavin, Corran, Leyny, Tireragh, and Tireril; and contains 41 parishes. The principal towns are Sligo, Ardnaree, a suburb of Ballina in Mayo, and Tobercurry. SLIGO and TOBERCURRY are noticed under their respective titles, and Ardnaree under that of BALLINA. The following towns and villages may be noticed here; the populations are those of 1851:—

Ballymote, population 965, a market-town, is situated at the junction of several roads, 14 miles S. by W. from Sligo. The parish church of Emlyfadd is a good building in the early English style, with a handsome tower and spire. There are chapels for Roman Catholics and Wesleyan Methodists, a court-house, dispensary, constabulary barrack, and bridewell. The place has a small manufacture of linen. Five annual fairs are held. The town is the seat of quarter and petty sessions. Close by it are the remains of a Franciscan friary, in which was composed the 'Psalter of Ballymote'; also the ruins of a castle built in the year 1300 by Richard de Burgo. The ruins consist of walls 60 feet high, with parapet and towers.

Ballysadere, population 670, is a small town 5 miles S. by W. from Sligo, at the head of Ardnaglass Harbour, on both sides of the Owenmore River, which here forms a very fine cascade. Several large flour- and oatmeal-mills have been erected on the different levels of the cascade, and a considerable export of oatmeal and flour takes place by the river, which is ascended by craft of 100 tons burden, to a small harbour below the falls. A limestone-quarry and a bleach-green are near the town. There are seven yearly fairs.

Collooney, population 568, is a market-town, situated on the right bank of the Owenmore, 7 miles S. from Sligo. The church is a handsome gothic building containing some good monuments. There are a Roman Catholic chapel, two schools, police-barracks, market-house, a linen-hall, and a dispensary. Near the town are a large bleach-ground and an oatmeal-mill. The market is on Thursday, and there are six yearly fairs. Petty sessions are held monthly.

Dromore West, a small post-town and the seat of a Poor-Law Union, is situated on the river Easky, and on the Sligo and Ballina road, 21 miles W. by S. from Sligo. It is a poor ill-built place, with a small population, and containing a National school, a dispensary, and the Union workhouse. Petty sessions are held fortnightly; and fairs five times a year. Dromore West Poor-Law Union comprises 17 electoral divisions, with an area of 96,965 acres, and a population in 1851 of 19,563.

Easky, population 513, is a small market-town, situated on the old or coast-road to Ballina, on the left bank of the river Easky, 27 miles W. from Sligo. It contains a neat parish church, a Roman Catholic chapel, a Baptist meeting-house, and a court-house. The market is on Wednesday. Quarter sessions and petty sessions are held.

Achonry, a poor hamlet, about 15 miles S.S.W. from Sligo, near the road to Tobercurry, is only remarkable as the seat of an ancient diocese, and contains little besides the parish church, which was built in 1823. The diocese of Achonry existed in the 6th century. It was united in the time of Charles I. to the see of Killala, and by the late Church Temporalities Act both were added to the diocese of Tuum. The diocese of Achonry comprehends the greater part of Sligo county, and

a small section of Mayo. It comprises 10 benefices. The chapter consists of a dean, archdeacon, precentor, and three prebendaries. A manor court is held in the village. *Bellaghy*, population 316, situated on the southern border of the county, has a market, held weekly, on Wednesday. Fairs are held five times a year. *Coolaney*, population 326, a village in the barony of Leyny, is situated on the right bank of the Owenbeg River, 10 miles S.S.W. from Sligo. The river is crossed by a bridge near the north end of the town. Coolaney forms one street parallel to the stream, and contains a Baptist meeting-house, a court-house, dispensary, and constabulary barracks. There are five yearly fairs. *Riverstown*, population 330, a village situated 23½ miles S.S.W. from Sligo, contains the parish church of Kilmacallane, a Roman Catholic chapel, a Methodist meeting-house, a school-house, dispensary, constabulary-barracks, two corn-mills, and two kilns. Petty sessions are held here.

The county returns three members to the Imperial Parliament, two for the county and one for the borough of Sligo. The assizes are held at Sligo, where are the county jail, the county infirmary, and a fever hospital. Quarter sessions are held there, and at Easky and Ballymote. Petty sessions are held in 14 places. The lunatic asylum for Connaught, to which this county is entitled to send 46 patients, is at Ballinaaloe. In the county are 12 dispensaries. A savings bank is established in Sligo town. In September 1852 there were 93 National schools in the county, attended by 5428 male and 5783 female children.

History and Antiquities.—This part of Connaught was made the scene of warfare between the descendants and family of Roderic O'Connor, the last monarch of Ireland, in their struggle for the principality of Connaught. Hugh O'Neil, chieftain of Tyrone, was defeated near Ballysadere, in 1200, when attempting to reinstate Cathal of the Bloody Hand, dethroned by his kinsman Carrach, who was supported by the Anglo-Normans under De Burgo. Some of the Anglo-Norman settlers were engaged on the side of Cathal. In 1245 the castle of Sligo was built, and, having been destroyed by the natives, was restored about the beginning of the next century. In the general rebellion near the close of Elizabeth's reign, the royal forces under Sir Conyers Clifford, president of Connaught, were surprised in this county by the natives under O'Rourke, chieftain of Breffney or Leitrim, and suffered considerable loss. In the rebellion of 1641 the county was occupied by the insurgents, and held by them till nearly the close of the war. In the war of the Revolution the county was held by the Jacobites.

The relics of antiquity are numerous. There are many cromlechs and other primeval monuments, such as the Giant's Cairn near Sligo, which consists of part of a circle of great stones. Remarkable caverns, the origin and purpose of which are unknown, occur in various parts of the county. Rath, or hill forts, are numerous; and at Drumcliffe there is the stump of a round tower with two ancient crosses. In every district monastic and other ecclesiastical remains are met with, and in some places the ancient structures have been converted into parish churches. There are ruined castles at Lough Gara, Ballinafad, Ardnaglas, Castle Connor, and several other places. The island of Innismurray contains some striking remains of the ecclesiastical architecture of different ages.

SLIGO, Ireland, the chief town of the county of Sligo, a market and sea-port town, a parliamentary borough, and the seat of a Poor-Law Union, is situated near the mouth of the river Garvogue or Garrogue, in 54° 22' N. lat., 8° 22' W. long., distant 131 miles N.W. from Dublin by road. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor; and returns one member to the Imperial Parliament. The population in 1851 was 11,104, besides 2216 in the Union workhouse. Sligo Poor-Law Union comprises 29 electoral divisions, with an area of 143,523 acres, and a population in 1851 of 58,565.

Sligo appears to have owed its importance to a castle and a monastery for Dominican friars, built here in the 13th century, by Maurice Fitzgerald, earl of Kildare, and at that time lord justice of Ireland. The town suffered repeated injuries from fire, and from the hostilities between the English and the native Irish. In the reign of James I. it received a grant of a market and two fairs, and was incorporated and made a parliamentary borough. In the civil war of James II. the town was taken by the Enniskilleners, who, after repelling one attack, were driven out by the Jacobites under Sarsfield; it was again occupied by the Protestants under Lord Granard.

The river, in passing through the town, changes its course from west to north and north-west, and is crossed by two bridges, the old bridge below the bend, and the new bridge above it. The town is situated partly within the bend of the river, but chiefly along its left bank. The houses are well-built, and many are handsome. The parish church of St. John is an ancient cruciform structure, with a massive square tower at the west end. Calry parish church is a modern gothic building, with a well-proportioned spire. There are a Roman Catholic chapel; a small Dominican friary, with a neat chapel attached; an Ursuline convent, and a convent of the Sisters of Mercy; a Presbyterian, an Independent, and two Methodist meeting-houses; and several schools. The other public buildings are, the county court-house and jail, the custom-house, linen-hall, a large butter-market, the Union workhouse, a new constabulary barrack, and

a lunatic asylum; and in an inclosure near Calry church, the fever hospital, infirmary, and dispensary. There is a savings bank in the town. The manufacture of linen is carried on; and there are soap-and candle-works, rope-walks, flour-mills, breweries, and a distillery. The river has an important salmon fishery. The port of Sligo is under the control of town and harbour commissioners, elected for life, who have much improved the harbour. The exports are chiefly of corn, meal, flour, butter, provisions, and linen-yarn; and the imports are West India produce, tobacco, refined sugar, tea, British spirits, wine, flax-seed, tallow, glass and earthenware, coals, iron, timber, and salt. In 1853 there were registered as belonging to the port, 13 vessels under 50 tons, and 19 of 50 tons and upwards, with an aggregate tonnage of 4140 tons; also two steamers of 111 tons. During 1853 there entered the port 204 sailing-vessels of 20,077 tons, and 177 steam-vessels of 24,684 tons; and there cleared 158 sailing-vessels of 15,443 tons, and 78 steam-vessels of 24,419 tons. The assizes for the county, and quarter and petty sessions, are held in the town. Fairs are held March 27th, May 7th, July 4th, August 11th, and October 9th. Tuesday and Saturday are the market-days. Steamers ply regularly between Sligo and Glasgow. In a part of the town, belonging to Lord Palmerston, are some ruins of the ancient monastery.

SMÅLAND. [SWEDEN.]

SMARDEN. [KENT.]

SMOLENSK, a government of European Russia, is situated between 53° 12' and 56° 30' N. lat., 30° 20' and 35° 20' E. long., and is bounded N. by the governments of Pakov and Twer; E. by those of Moscow, Kaluga, and Orel; S. by Czernigov; and W. by Mohilev and Witepak. The area is 21,572 square miles, and the population in 1846 amounted to 1,170,600.

The country is a high undulating plain, broken only by low hills. The soil is clay, mixed with sand and black mould. Some parts are very fertile, and all well repay the expense of cultivation. The principal rivers are—the DNEIPER, which rises in this government, but is not navigable in all this part of its course; the Obecha, the Mischa, the Kaspla, which run in a westerly direction to the Dina; the Ugra, which flows eastward to the Oka; the Gjat and the Wasuga, both of which run into the Volga. There are, it is said, 150 lakes, but none of considerable extent; and many morasses. As the country lies high, the climate is colder than that of other provinces in the same latitude. The frost in winter is very severe, and the ice does not break up till April; on the other hand, the heat of the summer months is very great, vegetation luxuriant, the weather not changeable, and the air salubrious.

The government produces vast quantities of rye and other grain, hemp, flax, tobacco and hops, culinary vegetables, and some fruit; but the wealth of the country consists chiefly in its immense forests, which supply timber for the use of the province itself, and also for the navy, particularly fine masts, which are sent to Riga. The forests abound in game of all kinds; elks, deer, wild boars, wolves, bears, and lynxes are found in them, and prodigious quantities of wild birds. Much attention is paid to the breed of horses, which are of a good Lithuanian stock. Oxen are used in agriculture as well as horses, and great numbers are fattened for exportation. Swine are very numerous, but sheep do not appear to thrive. The country people have great numbers of bees. The minerals are copper, salt, and bog-iron. The rural population manufacture linen and woollen cloths for domestic use. The Smolensk carpets are in great repute. There are numerous saw-mills, brandy-distilleries, tanneries, soap and candle manufactories, and some glass-works.

The exports are—agricultural produce of the different kinds above named; hemp-seed, linned, horse-hair, hides, hogs'-bristles, wool, honey, wax, masts to Riga, timber and firewood to the Dnieper, boats made for the navigation of the Oka, the Volga, and the Dina; horses, oxen, swine, salt-pork, tallow, and lard. Most of the articles are conveyed by land to Riga, Wilna, and Moscow; a great part of the cattle are driven to Poland, and thence to Germany; and the timber is floated down the rivers which fall into the Dina, the Oka, and the Volga. The imports are—colonial produce, wines, manufactured goods, and various other articles. The principal commercial towns are Wisama and Gahatak. Smolensk, situated on the main road to Moscow, likewise takes an active share in the foreign commerce, but is chiefly engaged with inland and retail trade.

The great majority of the inhabitants belong to the Greek Church, under the bishop of Smolensk, whose diocese is co-extensive with the government, and has 603 parishes. There are a few Poles, Jews, and Germans. Smolensk is within the limits of the university of Moscow. Elementary education is extending among the population, but is still in a backward state. The government is divided into 12 circles.

Smolensk, the chief town of the government, is in 54° 50' N. lat., 32° E. long., on the right bank of the Dnieper, which is here navigable, and crossed by a wooden bridge. It is surrounded with a wall 80 feet high and 15 feet thick, nearly two miles in circuit, but in many parts out of repair, and has a strong citadel. Smolensk is one of the

most ancient towns in Russia. Its name occurs in the Russian annals as far back as A.D. 879. The Lithuanians obtained possession of it in 1413. In the next two hundred and fifty years it was repeatedly taken and retaken by the Poles and Russians, till it was finally taken by the latter in 1654. In 1812 the first serious conflict between the French and the Russians took place (August 16 and 17) under the walls of Smolensk, when it was bombarded and set on fire. The French on their retreat in November following blew up part of the works. Though not a handsome city, Smolensk is now much superior to what it was before 1812, when it was almost entirely built of wood. The part rebuilt since that time is more regular; the houses are generally of stone, and many of them handsome. The public buildings are numerous: there are sixteen Greek churches, three convents, one Roman Catholic and one Lutheran chapel, numerous charitable institutions, a gymnasium, a seminary for priests, a military school, &c. In a military point of view Smolensk is considered a place of great importance, as it commands the road to Moscow, the heart of the Russian empire. The manufactures are linen, leather, silks, hats, and soap; there is also a brisk trade in the natural productions of the country. The population at the lowest estimate is 12,000; some late writers state it at 20,000.

Wisama, about 110 miles from Smolensk, on the road to Moscow, is a considerable town, with 12,000 inhabitants. It is situated on a river of the same name, and is built on a hill, and surrounded with a wall. There being large vacant spaces, it covers a great extent of ground, so that viewed at a distance it looks much more considerable than it really is, an illusion which is aided by the steeples and domes of nearly thirty churches.

Porostschje, on the Kaspla, which is here navigable, is a town with 6000 inhabitants, 50 miles N.N.W. from Smolensk. It has a considerable transit trade between Smolensk and Riga.

Among the other towns are—*Dorogobusch*, on the Dnieper, a pretty and well-built town, 50 miles E. by N. from Smolensk, with 4000 inhabitants, who have some manufactures and considerable trade; *Gahatak*, or *Gjat*, which is situated on the river Gjat, on the road to Moscow, in the east of the province, and has 3000 inhabitants, who have a considerable transit trade in corn, hemp, iron, and river-barges, for the construction of which the neighbouring forests afford excellent materials; and *Koslawt*, 70 miles S.S.E. from Smolensk, which has large corn-stores, several mills, and about 4000 inhabitants.

SMYRNA (*Jemir*), one of the most ancient Greek cities in Asia Minor. There was an Old Smyrna and New Smyrna. The old town lay on the north-east side of the Hermean Gulf or Gulf of Smyrna. According to some traditions it was originally an Æolian colony, and was afterwards taken possession of by some Ionian exiles of Colophon. (Herod., i. 16, 149.) It is said by Strabo to have been founded by an Ionian colony of Ephesus, where a part of the old town is said to have borne the name of Smyrna from an Amazon of the same name. Afterwards however the Ephesian colonists are said to have been expelled by the Æolians, and to have fled to Colophon, whence a short time after they returned, and recovered their original home. (Strabo, xiv.) Subsequently, about the year B.C. 700, Smyrna, which had hitherto belonged to Æolis, was admitted into the Ionian confederacy. This ancient town of Smyrna was by some supposed to have been the birthplace of Homer; and in its vicinity, on the banks of the little river Meles, there was a grotto in which Homer was said to have composed his poems. The Lydian king Sadyattes took and destroyed Smyrna, and distributed the inhabitants among a number of villages in the neighbourhood. (Strabo, xiv., p. 646; Herod., i. 16.) In this state they remained, according to Strabo, for 400 years; after which the town was rebuilt with great splendour by Antigonus and Lysimachus, or, according to Pausanias (vii. 5, § 1), and Pliny (v. 31), by Alexander the Great. This new town however was 20 stadia distant from the site of Old Smyrna, and 320 stadia from Ephesus, and was situated on the north bank of the river Meles, covering the plain as far as the sea, and occupying also a part of a hill which Pliny calls Mastusia. The city was or soon became the finest and largest in Asia Minor. (Strabo, xiv., p. 646.) When Asia Minor fell into the hands of the Romans, Smyrna became the seat of a conventus juridicus (Pliny, v. 31), and flourished as a commercial town. Trebonius, one of Cæsar's murderers, was besieged in Smyrna by Dolabella, who took the city, and destroyed a great part of it. (Strabo; Cic., 'Philip,' xi. 2.) But Smyrna soon recovered and flourished as before. Christianity was early established here, chiefly owing to the zeal of St. Polycarp, who was the first bishop of Smyrna, and suffered martyrdom there. (Iren., iii., 3, 4.) Smyrna appears in early times, as at present, to have been subject to frequent earthquakes. It was destroyed by an earthquake in A.D. 178, but it was restored by the emperor Marcus Aurelius. Before the introduction of Christianity the Smyrneans worshipped chiefly the heroine Nemesia, Homer, and the mother of the gods, whose temple stood near the sea-coast, and whose head is represented on the coin of which a representation is given in this article.

During the Eastern empire Smyrna again experienced several severe vicissitudes. Towards the close of the 11th century it fell into the hands of Tzachas, a Turkish pirate, and was nearly destroyed by a Greek fleet under John Duca. It was restored by the emperor Comnenus, but soon after fell into the hands of the Genoese, who

continued in possession of it until the year 1364. In 1402 it was taken by Tamerlane, and suffered very severely. The conqueror erected within its walls a tower constructed of stones and of the heads of his enemies. Soon after it came under the dominion of the Turks, under whom it has always been the most flourishing city of the Levant, notwithstanding that it has frequently been visited by earthquakes, fires, and the plague. One of the most destructive conflagrations that ever occurred in Smyrna took place on the night of July 28, 1841, whereby above 12,000 houses, many bazaars, mosques, and other public buildings, were destroyed.

Smyrna, the most important city of Asia Minor, and the centre of the Levant trade, rises in the form of an amphitheatre from the sea, and upon the hill above it (called Mount Pagus) there is an old castle which forms the citadel; over one of the gates there is a head which either represents Apollo or an Amazon, and over another a Roman eagle. It stands in 38° 25' N. lat., 27° 9' E. long., about 210 miles S.S.W. from Constantinople, at the bottom of a capacious bay, which has excellent anchorage, and is so deep that large ships come close to the wharfs. The bay extends into the city, and its margin is lined with quays, on which there are handsome stone houses, so that the city, with its domes and minarets, has a fine appearance on approaching it from the bay; but a great part of the interior, and especially that part which is built on the side of the hill, consists of low wooden houses, and the streets are ill-paved, narrow, crooked, and dirty. The inhabitants are probably about 180,000, of whom about 80,000 are Turks, 40,000 Greeks, 15,000 Jews, 10,000 Armenians, and about 5000 Franks. The Franks reside in Smyrna for purposes of commerce, and occupy, for the most part, the best quarter of the city near the bay. The Armenian quarter is on the lower slope of the hill, the upper part and western side are occupied by the Turkish part of the population. The Jews are confined to two small nooks between the Turks and Armenians. Except in the Frankish quarter the houses are chiefly built of wood, and only one story high. The town extends nearly two miles round the bay. The warehouses on the marina, or quays, are whitewashed. The port is frequented by ships from all nations, freighted with valuable cargoes both outward and inward. The chief imports are, coffee, sugar, indigo, tin, iron, lead, cotton-goods, and cotton-twist, rum and brandy, spices, cochineal, and a variety of other articles. The principal exports are, silk, opium, drugs and gums, galls, cotton-wool, valonia, fruit, figs and raisins. Besides these exports there are various kinds of skins, goats' wool, olive oil, wax, and a variety of other articles. The Turkish government has imposed hardly any restrictions on commerce; the duties are few and light. Most European states have consuls at Smyrna.

Coin of Smyrna. Actual size.

The city and its territory are governed by a pasha. There are large well aired barracks near the shore inclosed by an iron palisade. A British military hospital was established here in 1855. On the castle hill are some remains of ancient Smyrna, consisting of fragments of ancient columns which are used in the construction of graves in the large Turkish cemetery; portions of the old walls built into the walls of the castle, which stands on the site of the acropolis on the summit of Mount Pagus; some relics of a temple within the inclosure of the castle; the stadium, in which St. Polycarp suffered martyrdom, and which is formed in the side of the hill; and numerous columns, busts, cornices, and other architectural fragments, built into the walls of the Turkish town. Within the castle inclosure are the ruins of a mosque, which is said to have been the primitive church of Smyrna. At some distance to the south of the city runs the Meles, which is connected with the memory of Homer, and which is crossed by an aqueduct. The mosques of Smyrna are open to Christians; from the ceiling of the principal mosques are suspended by brass chains a vast number of lamps, ostrich eggs, and horsetails. The caravan bridge over the Meles, over which, especially in the fruit-season, strings of camels are constantly passing, is a point of great attraction with both Turks and Christians, and many coffee-houses are built along the banks of the immortal river. The neighbourhood of Smyrna is beautiful and fertile, owing to the prevalence of brigandage. Strollers are frequently carried off to the hills and detained till they are ransomed by their friends. About 5 miles east of the city, on the road to Sardis, at a place called Nimfi, is a gigantic human figure sculptured in relief, on a panel cut into the flat surface of the rock. This seems to be the memorial of Sesostris, described by Herodotus (ii. 106). A journal is published in Smyrna in the French language.

Steamers and sailing-vessels ply to Constantinople, Marseille, Malta, and the chief ports of the Mediterranean.

SNAITH. [YORKSHIRE.]
SNAKE ISLAND. [ANGUILLA.]
SNEEK. [FRIESLAND.]
SNEINTON. [NOTTINGHAMSHIRE.]
SNETTISHAM. [NORFOLK.]
SNOWDON. [CAERNARVONSHIRE.]

SOCIETY ISLANDS, the name given by Captain Cook in honour of the Royal Society of London, to a cluster of islands in the South Pacific Ocean. They consist of two groups of islands, about 70 miles apart, of which the most easterly group, including Tahiti or Otahete, is called the Georgian Islands. The following are the names of the Society Islands. The names are given according to the orthography introduced by the first missionaries, and used by the press now established among the people:—Meatia, Tahiti (Otahete), Eimeo, Maiaioiti, or Charles Sander's Island, Tetuaroa, Huahine, Raiatea, Tahaa, Borabora, Mauarua, Tuba, Lord Howe's Island, and Scilly Island.

The first five are those called the Georgian Islands, and the rest the Society Islands, when the two groups are distinguished. The list is exclusive of several islets which surround or are interspersed among these. The entire cluster extends from 16° 10' (Mauarua) to 17° 53' S. lat. (Meatia), and from 148° 9' 45" (Meatia) to 155° 24' 45" W. long. (Scilly Island).

Otaheite, or more properly O Tahiti, the largest of the islands, is about 35 miles long, and more than 130 miles in circumference. It consists of two peninsulas, of unequal extent, united by a low isthmus, somewhat more than 3 miles wide. The north-western and larger peninsula is called Opureone or Tahiti-nue (Great Tahiti), and the south-eastern Tiarrabooa, or Tahiti-iti (Little Tahiti). The surface is estimated to be about 430 square miles. The most remarkable of the anchorages on the coast, within the coral reef which surrounds the island, are, Mattaway Bay, near the north-eastern extremity; Soanoo Harbour, 4 miles westward of Mattaway; and Papiete, towards the north-western extremity of the island, which is now most frequented by European vessels and by American whalers. The interior of both peninsulas is occupied with mountain masses, which terminate in high and sharp peaks. The most elevated of these peaks, called Opureone, rises to between 7000 and 8000 feet above the sea-level; it is nearly in the centre of the larger peninsula. Some of the summits of the smaller peninsula are nearly as high. Except these peaks, the whole island, especially the lower hills, is covered with thick woods. The valleys are watered by fine streams, on the banks of which, as well as on the shores of the sea, are built the dwellings of the inhabitants. Lava, basalt, and pumice-stone, occur in several places.

The climate is very mild, the difference of temperature in the winter and summer months being inconsiderable. It is also very healthy, except during the rainy season. The bread-fruit trees and cocoa-palms are regularly planted, and batatas, yams, taro, and bananas are cultivated with care; the sugar-cane, which is of excellent quality, tobacco, and some other tropical plants are also cultivated. Cotton and indigo are cultivated to some extent, principally by Europeans. Arrow-root is exported in considerable quantities. Cloth is made, as in other islands of the Pacific, of the inner bark of the bread-fruit tree, the paper mulberry-tree, and the hibiscus; of the last also ropes are made. Oil is extracted from the cocoa-nut. Forests cover all the mountains of Tiarrabooa, and the southern declivities of those of Opureone. Some vessels have been built of the timber.

Otaheite was discovered in 1606, by the Spaniard Quiros, and called Sagittaria; Captain Wallis, who visited the island in 1767, called it King George's Island; and Bougainville, who visited it in the following year, named it Nouvelle Cythère. Cook, who visited it between 1769-78 several times, gave it the native name. He estimated the population at 200,000. After having been visited by several other navigators, missionaries were sent there to convert the islanders, in 1797. They found the natives friendly to strangers and devoid of treachery; but the tribes were continually at war with each other, and infanticide and human sacrifices were practised. The missionaries laboured without success till 1816, when the king of the island, Pomaree II., embraced Christianity, and introduced it among the natives. After his death (1821) during the minority of his son, the missionaries acquired influence, and by their advice a constitution was formed, and written laws were made (1825); but neither the constitution nor the laws appear to have been much attended to. The introduction of Christianity has effected the abolition of infanticide, of human sacrifices, and other immoral practices. The government is despotic, in the hands of the sovereign, who has absolute power in respect of landed property; each chief in his own district has a like arbitrary power over the land. The natives belong to the Malay race, and have made some progress in civilisation.

All the islands are mountainous in the interior, and have a border from one to four miles wide, of rich level land, extending from the base of the high land to the sea; and although the outline of each has some peculiarity distinguishing it from the rest, in their general appearance they resemble each other. Tetuaroa, Tubai, Lord Howe's, and the Scilly islands however form exceptions, as they are low coral

islands, seldom rising many feet above the sea. Eimeo is supposed to be about 25 miles in circumference; Huahine probably more than 30 miles; and Raiatea is somewhat larger. The others are of smaller extent. A corresponding resemblance prevails in the geological structure of the principal clusters and surrounding islands; the component substances being the same in all, although each has some distinguishing peculiarity of its own. There seems no reason to suppose that any of these islands are of altogether volcanic origin, like the Sandwich Islands. In the Society Islands there are basalts, whinstone dykes, and homogeneous earthy lava, retaining all the convolutions which cooling lava is known to assume; there are also kinds of hornstone, limestone, siliceous, breccia, and other substances, which under the action of fire do not appear to have altered their original form. Some are found in detached fragments, others in large masses. All the Society Islands, and many others in the Pacific, are surrounded by a belt of coral rock, from two or three to twenty yards in width, and situated at distances from a few yards to perhaps two miles from the shore. Against this barrier the long rolling waves of the wide Pacific are driven with terrific violence by the trade-winds, and, arrested by it, often rise 10, 12, or 14 feet above its surface. These reefs protect the low lands from the violence of the sea; for while beyond them the surface of the water is agitated by the slightest breeze, all within is smooth water. There is usually a break or opening in these marine barriers, which offers an easy passage for shipping. The soil is various. The sides of the mountains are frequently covered with a thin layer of light earth; but the summits of many of the inferior hills present a thick stratum of stiff red ochre or yellow marl. This is usually found on the lower hills that rise between the interior mountains and the shore. The natives use it as a pigment for staining or painting their doors, window-shutters, canoes, &c., and, when mixed with lime, the walls of their houses. The level tracts along the coast are the most valuable parts of the land. The soil of those tracts is a rich alluvial deposit, with a considerable mixture of vegetable mould, and is exceedingly prolific.

The climate, products, character, and condition of the inhabitants of the other islands are similar to those of Tahiti, as above described.

In the Society Islands the rainy season, the only variation of the tropical year, occurs when the sun is vertical, and generally continues from December to March: during this time the climate is more insalubrious and the sickness of the inhabitants greater than at any other period. Thunder and lightning are frequent, especially in the rainy season.

Hogs and dogs, and sometimes rats, were the only animals whose flesh was formerly eaten by the natives. The missionaries have introduced all our domestic animals; and all have succeeded very well, except the sheep. Many of the natives now possess hundreds of cattle, which, with their other produce, they sell, with mutual advantage, to the ships which touch at the islands for refreshments. Rabbits could not be preserved; cats have become common in houses, and are great favourites. The birds of these and the neighbouring islands are not distinguished by brilliancy of plumage or melody of song. There are however several varieties, and some of them in immense numbers. The most numerous class are the aquatic fowl. The albatross, the tropic bird, several kinds of petrel, with others, abound in all the islands, especially in Borabora and Mauarua. Among the lakes are several kinds of heron; and wild ducks resort to the lagoons and marshes. There are several kinds of birds of prey, and a number of the woodpecker tribe, with some small paroquets of rich and splendid plumage. The turtle-dove is found in the inland parts of some of the islands, and pigeons among the mountains. Among the few singing-birds the most conspicuous is that called by the natives 'omaomao,' which in appearance and note much resembles the thrush. Domestic fowl are abundant, and were found in the islands when originally discovered.

The Society Islanders are generally above the middle stature, but their limbs are much less muscular and firm than those of the Sandwich Islanders, whom in many respects they resemble; but they are more robust than the Marquesans, who are the most light and agile of the inhabitants of Eastern Polynesia. In size and physical power they are inferior to the New Zealanders. The countenance of the Society Islanders is open and prepossessing, though the features are bold and sometimes prominent. The facial angle is frequently as elevated as in the European. The prevailing complexion is an olive, a bronze, or a reddish-brown.

The mental capacity of the Society Islanders has hitherto been only partially developed. They are remarkably curious and inquisitive; and, compared with other Polynesian nations, may be said to possess considerable ingenuity, mechanical invention, and imitation. The distinguishing features of their civil polity—the imposing nature, numerous observances, and diversified ramifications of their superstition—the legends of their gods—the historical songs of their bards—the beautiful, figurative, and impassioned eloquence sometimes displayed in their national assemblies—and, above all, the copiousness, variety, precision, and purity of their language, with their extensive use of numbers, warrant the conclusion that they possess no mean mental capabilities.

By diseases, wars, infanticide, and the use of ardent spirits, the large population which these islands formerly contained was reduced

to a mere remnant when the missionaries came among them. The general adoption of Christianity put a stop to the evils in which this decline had originated; but for some years after the number of deaths considerably exceeded the births. About the years 1819 and 1820, the births were nearly equal to the deaths, and since that period the population has been rapidly increasing. The latest information estimates the inhabitants of these islands at 18,000 or 20,000. Most of the natives can now read and write. Their moral conduct has become more regular, and their social condition much improved; they have acquired the knowledge of various useful arts, and profitable branches of commerce have been opened. Numerous vessels of from 30 to 80 tons burden are usefully employed in trade, and in maintaining an intercourse between the several islands. A press has for many years been actively engaged in supplying the natives with publications in their own language, suited to their wants and their condition.

SOCORRO. [NEW GRANADA.]

SOCOTRA, is an island in the Indian Ocean, situated about 200 miles from Cape Guardafui, the most eastern point of Africa. It lies between 12° 16' and 12° 45' N. lat., 53° 25' and 57° 34' E. long., and extends about 70 miles from west to east, with an average width of 15 miles. It contains 1100 square miles.

Socotra consists chiefly of a table-land, which is between 700 and 800 feet above the level of the sea. North and south of the table-land are two plains. The surface of the island is in many parts level for a considerable extent; many hills are dispersed over it, and a granitic range of mountains stands on the northern edge of the table-land. This mountain mass may have a general elevation of about 3000 feet, but some of its numerous peaks rise to 5000 feet. On the more level parts of the table-land there are many wide depressions, which generally extend south and north, and form long valleys. The table-land descends to the plains generally with a steep declivity, but in a few places it comes close to the sea, as at Ras (Cape) Shuab, the western extremity of the island, and at Ras Kattany: near Ras Feling, on the southern coast, the cliffs skirt the shores for 8 miles.

In the southern plain, the force of the south-west monsoon, to which the coast is exposed, has carried the sand from the sea coast to some distance inland, where it forms a continuous range of sand-hills parallel to the beach, and hence it has spread over the plain, up to the very base of the table-land. The shores run in a continuous line without being broken by any inlet. The northern plain is not so low as the southern, nor so level, the surface being intersected by flat valleys in many places, and in others some masses of hills rise from 300 to 600 feet. The western districts of this plain, though less sterile than the southern plain, are more adapted for pasture than for cultivation, but the eastern districts have a superior soil, which is a reddish-coloured earth, covered at certain seasons with abundant grass, and well adapted for the cultivation of grain, fruit, and vegetables. With the exception of a few rivulets the streams on the island do not contain water all the year round. The inhabitants therefore collect rain-water in reservoirs. In most parts of the northern plain water is found at a distance of from 8 to 10 feet below the surface. The climate of Socotra is sultry. During the north-east monsoon there is an almost daily fall of rain. The south-west monsoon brings a clear and cloudless sky, and while it continues the stars generally shine with remarkable brilliancy.

The principal commercial products are derived from the aloe and dragon's-blood tree. The aloe plant (*Aloe spicata* or *Socotrina*) in the western districts covers the hills for many miles, at an elevation of from 500 to 2000 feet above the plains. The dragon's-blood tree grows in the same part of the island, at an elevation of from 800 to 2000 feet. These two plants are very abundant. There are several forest-trees, but none fit for timber. Yams, wild orange-trees, and date-trees are among the products of the island. Agriculture is limited to the cultivation of dukkum, a species of millet, beans and tobacco, with a little cotton and indigo.

There are no horses. The camel is the only animal of burden, and is nearly as sure-footed as the mule. The cows are small, and few in number. Sheep and goats in the western districts constitute the principal wealth of the inhabitants. The sheep are small, but yield good wool, of which thick cloaks are made. There are several kinds of goats, and one of them is found in a wild state on the mountains. There are civet-cats all over the island, rats, mice, and chameleons. There are several kinds of vultures, and also the flamingo. Turtles are found on the southern coast. Fish abound in several parts of the coast, and some families live on the produce of their fishing.

The population is estimated by Wellsted at 4000 individuals. It consists of two different nations, of which one called Socotran Arabs, is foreign, and the other called Beduins, is apparently aboriginal. The Arabs are the only cultivators of the ground; they also make ghee. They are zealous Mohammedans. The aborigines are called Beduins in consequence of their pastoral habits and their wandering mode of life. Their language appears to differ considerably from that of the Arabs. They are tall, with strong, muscular, and remarkably well-formed limbs; a facial angle like that of Europeans, the

nose slightly aquiline, the eyes lively and expressive, and the mouth well-formed. Their hair curls naturally, but does not approach to a woolly or crisp texture. Their general complexion is fair, but a few of them are as dark as the Hindoos. As they frequently change their abodes, and live in a country not abounding in building materials, they inhabit the numerous caverns which are found in the limestone hills of their country. They are Mohammedans, but they do not show much zeal in reference to religious duties. They are divided into families or tribes.

Socotra possesses no place which can be called a town. The capital is Tamarida, which is built not far from the northern shores, and contains a population of about 150 persons.

Socotra was known to Ptolemaeus, and to Arrian. It was visited by the Portuguese Fernandes Perara in 1604, and taken possession of by Albuquerque in 1507. It is not known at what time the Portuguese evacuated the island, but they probably left before the 16th century elapsed. It then returned under the sway of the sultan of Kisseen on the southern coast of Arabia. It now belongs to the Imam of Muscat.

SODOM. [DEAD SEA.]

SOFA'LA is a country on the east coast of Africa, extending from Cape Corrientes (25° S. lat.) to the vicinity of the river Luabo, the most southern arm of the Zambesi (19° S. lat.). This country, together with the province of Senna [SENNA], was formerly known by the name of Monomotapa, and was noted for the quantity of gold which was supposed to exist there. The name of Monomotapa is now antiquated, and the few gold-mines which exist are included in the province of Senna. [SENNA, vol iv., col. 499.]

The coast is low, and beset with shoals and sandbanks. Along the coast are the Bazaruta Islands, Chuluwan, and other islands. The mouths of several rivers have been visited. The most northern is the river Boosy, commonly called Jarra, which falls into a large shallow bay called Massangany. The river Sofala forms at its mouth a tolerable harbour, which is difficult of access on account of the bar. The most southern river is Inhamban, which is easy of access, and forms an excellent harbour. Ships may ascend to the town, about 8 miles from the entrance.

Ivory and bees-wax constitute the principal articles of export: they are sent to Mozambique. The native tribes are warlike. They use spears, and shields made of hide. They are divided into numerous tribes, and their chiefs come annually to the Portuguese settlements, where they receive some trifling presents. The most northern of the Portuguese settlements is Sofala, which consists only of a paltry fort and a few miserable mud-huts. The most important settlement is Inhamban, which is a small trading town with tolerably good buildings.

Sofala was visited in 1480 by Pedro Cavalhao, a Portuguese, before the way to India by sea was known. Albuquerque took possession of it, and in 1503 the fort of Sofala was built. The Portuguese have remained in possession of the country; but these settlements have been neglected.

SOHAM, Cambridgeshire, a town, in the parish of Soham, is situated in 52° 20' N. lat., 0° 20' E. long., distant 19 miles N.E. by N. from Cambridge, and 68 miles N. by E. from London. The population of the town in 1851 was 2756. The living is a vicarage, with the curacy of Barway annexed, in the archdeaconry of Sudbury and diocese of Ely. Soham parish church is a spacious cruciform edifice of the transition period from Norman to early English, and has a very fine embattled tower at the west end, erected in the 15th century; the chancel has been recently restored. There are chapels for Wesleyan and Primitive Methodists, Independents, Baptists, and Unitarians; an Endowed and a National school. St. Felix, the first bishop of the East Angles, is said to have founded a monastery at Soham, and to have placed here (about 630) the episcopal see, afterwards removed to Dunwich. In the vicinity of the town are orchards, gardens, and dairies; and cheese is made similar to the Stilton cheese. Trade in corn, coals, and malt is facilitated by a navigable cut from the river Ouse to Soham. A fair for cattle is held on May 9th, and a feast or pleasure fair is held for three days about the middle of June. A county court is held in the town.

SOIGNIES. [HAINAUT.]

SOISSONS, an episcopal town in France, capital of the second arrondissement in the department of Aisne, is prettily situated on the left bank of the river Aisne, 60 miles N.E. from Paris, on the high road from Paris to Brussels, in 49° 22' 53" N. lat., 3° 19' 40" E. long., at an elevation of 162 feet above the level of the sea, and has 7893 inhabitants in the commune, which does not comprise all the suburbs. It is the *Augusta Sessionum* of the Romans, which D'Anville and others identify with the Noviodunum of Cæsar ('De Bell. Gall.' ii. 12.) The city gave title to a bishop from very early times. The Roman roads popularly called 'Chaussées de Brunehaut' are near this town, which in the later period of the Roman domination was one of the most important places in the north of Gaul; and one of the last which remained under the government of the emperor. It was the seat of government of Ægidius and his son Syagrius, and near it the latter was defeated A.D. 486 by Clovis, who made Soissons the capital of the Franks.

Under the early Frankish princes, Soissons continued to be of

importance. Here Clovis espoused Clotilde; and upon the division of his dominions among his descendants, it gave name to one of the kingdoms formed out of them. Here, A.D. 752, Childéric III., the last Merovingian king, was deposed, and Pepin, son of Charles Martel, the first of the Carolingian dynasty, was raised upon a shield and proclaimed king in the Champ-de-Mars. Not content with this the then ordinary mode of inauguration, Pepin employed the ceremonies of the church at his coronation, and had himself consecrated in the cathedral of Soissons by the Pope's Legate. Charlemagne established famous schools in Soissons for the education of the clergy and the sons of the rich, in the monastery of St. Médard. The same abbey was twice the prison of Charlemagne's son, the emperor Louis le Debonnaire, and in the abbey church he was deposed by a decree of a council at the instigation of his own son Lothaire. In 922 Charles the Simple was defeated at Soissons by the troops of Robert, who fell in the battle. Under the kings of the third race Soissons was the capital of a county, and received from Louis VI. a municipal charter; but the burghesses, weary of the contentions which they had with their counts, surrendered their charter to the king Charles IV., in 1325. Philippe VI. (de Valois) granted them some privileges, but would not re-establish the municipality. In 1418 the town, then garrisoned by the Bourguignon party, was taken by the rival faction of the Armagnacs, who committed the most dreadful excesses. Having again fallen into the hands of the Bourguignons, it was a second time taken and pillaged by the Armagnacs. In the religious wars of the 16th century it suffered again. In the campaign of 1814 it was twice taken by the allies and as often retaken by the French; it was a third time besieged by the allies, bombarded, and much damaged.

A handsome stone bridge over the Aisne unites the town to the suburb of St. Vaast on the right bank. The town and the suburb of St. Vaast are fortified; the circuit of the walls includes many gardens and void spaces. The other suburbs are without the walls. The streets are for the most part neatly built, and well laid out; the houses are built of stone, and many of them covered with slate. The cathedral, founded in the 12th century, is a large and fine gothic church, with a tower 160 feet high. The painted glass in the rose windows of the transept, and in the nine large ogival windows which light as many chapels behind the choir, are admirable specimens of the art. Of the abbey of St. Jean-des-Vignes (in which Thomas à Becket, archbishop of Canterbury, was received in his exile), the west front of the church, with its two noble towers and spires, remains and is of rich gothic architecture. On the right bank of the Aisne are some remains of the abbey of St. Médard, mentioned above,—the crypt and supposed prison room of Louis le Debonnaire; but the chief part of the site is occupied by an asylum for deaf-mutes. In the crypt were buried kings Clothaire and Siegebert. These fine old abbatial buildings were demolished in the fury of the first French revolution. Soissons has an excellent public library of above 24,000 volumes, and several hundred valuable manuscripts; a college, a diocesan seminary; tribunals of first instance and of commerce; public walks, a theatre, and baths.

The manufactures are carpets, woollens, hosiery, coarse linen, twine, beer, seed-oil, leather, room paper, &c. Considerable trade is carried on in corn, flour, peas and beans, in hemp and flax for the supply of Paris; timber, firewood, and charcoal, which are sent down the Aisne to the capital. There is a good weekly market. A linen market is held on the last Saturday of every month; two six-day fairs are held, one the week before Whit-Sunday, and another the week after Martinmas. A railway has been commenced to connect Soissons with the Paris-Amiens railway, between Senlis and Creil.

SOKENS, THE. [ESSEX.]

SOKNA. [FEZZAN.]

SOKOLOW. [POLAND.]

SOL-GALITZKAIA. [COSTROMA.]

SOLANA. [CASTILLA-LA-NUOVA.]

SOLESME. [NORD.]

SOLEURE. [SOLOTHURN.]

SOLIHULL, Warwickshire, a town, and the seat of a Poor-Law Union, in the parish of Solihull, is situated in 52° 25' N. lat., 1° 45' W. long., distant 13 miles N.W. by N. from Warwick, and 103 miles N.W. by W. from London. The population of the parish of Solihull in 1851 was 3277. The living is a rectory in the archdeaconry of Coventry and diocese of Worcester. Solihull Poor-Law Union contains 11 parishes and townships, with an area of 46,015 acres, and a population in 1851 of 11,931. The houses in the town are generally modern and well built, and some of them are handsome. The church is a large and curious cruciform building, partly of decorated and partly of late perpendicular character. There are in Solihull chapels for Baptists, Independents, and Roman Catholics. The Grammar school, founded in the 43rd of Queen Elizabeth, is free to sons of residents; in 1851 the number of scholars was 16. There are a Free school for boys, and Palmer's Charity school for boys and girls. An annual fair is held on April 29th.

SOLIMANSK. [PERM.]

SOLINGEN. [DÜSSELDORF.]

SOLOMON'S ISLANDS. [NEW GEORGIA.]

SOLOR. [SUNDA ISLANDS.]

SOLOTHURN, or SOLEURE, a canton of Switzerland, is bo

N. by Baale, E. by Aargau, S. by Bern, and W. partly by Bern and partly by France. Its area is about 254 square miles, and the population at the census of 1851 amounted to 69,674, of whom 61,556 were Catholics, 21 Jews, and 8097 Protestants of different sects. The canton is crossed in the direction from south-west to north-east by the Jura, which forms several parallel ridges, and covers the greater part of the canton. The principal valley is that of the Aar, which runs in the same direction, flowing eastward of the Jura. The highest summits of the Jura in the canton of Soleure are the Weissenstein and the Hasenmatt; the latter is about 4400 feet above the sea. The canton of Soleure is one of the most productive in Switzerland, especially in corn, fruit, and vegetables. The vine thrives only in certain localities. The mulberry-tree is cultivated, and some silk is made. Horned cattle, sheep, goats, and pigs are numerous; the number of horses is about 5000. The horse-fair of Soleure is one of the principal in Switzerland. A considerable quantity of cheese is made, both of cows'-milk and goats'-milk, and part of it is exported. Part of the mountains are covered with timber-trees, especially fir and beech. The canton abounds in iron-mines, and the ore is smelted in the furnaces of St. Joseph, and worked at the iron-works of Klus. The other manufactures consist of leather, paper, woollens, and kirschwasser. There are also quarries of marble and gypsum.

A dialect of the Swiss-German is the language of the country. Most families are possessed of landed property. Every commune has an elementary school, and a normal school is established at Soleure. Most of the communes have a fund for the relief of their own poor.

The constitution of Soleure was for a long time aristocratical, but in 1831 a constitution was framed on a more popular system. The canton is divided into 10 electoral circles, each having its electoral college, which names a certain proportion of members to the Great Council, or legislature. The town of Soleure returns 34 out of the 109 members who compose the Great Council. A Little Council, chosen from among the members of the Great Council, constitutes the executive. The members of the Great Council are renewed every six years. Soleure returns three members to the National Council, or central representative chamber of Switzerland.

Soleure, or *Solothurn*, the chief town of the canton, and a bishop's see, is built on the Aar, 1320 feet above the sea, and is surrounded by walls. The population is 5870. The cathedral is reckoned the finest church in Switzerland; the tower is 190 feet high. The other remarkable buildings of Soleure are—the town-house, which is very old; the arsenal, the theatre, the hospital, the fountain in the market-place, the former church of the Jesuits, and several convents. Soleure has a gymnasium with six professors and a good library, a lyceum with three professors, and a faculty of theology divided into three classes. The town library has about 20,000 volumes and some valuable manuscripts. Soleure is 19 miles N. from Bern, and 26 miles S. from Basle.

Ober, on the left bank of the Aar, about 20 miles N.E. from Soleure, is a small place, with above 1500 inhabitants.

SOLRE-LE-CHATEAU. [NORD.]

SOLSONA. [CATALUÑA.]

SOLVA, or SOLFACH. [PEMBROKESHIRE.]

SOLWAY FRITH, an inlet of the Irish Sea, separating in one part England from Scotland, and extending inland from a line drawn between Rayberry Head in Kirkcudbrightshire to St. Bees' Head in Cumberland, 41 miles N.E. to the mouth of the Esk. The distance between the two above-mentioned headlands is more than 20 miles. About 17 miles up, between Southerness Point, Kirkcudbrightshire, and the Cumberland shore near Allonby, the width is 7 miles; it afterwards expands, then again contracts, and 15 miles farther up, between the mouth of the Annan, Dumfriesshire, and Bowness, Cumberland, is only 2 miles, which is its width for the remaining 9 miles.

On the Scottish shore the Solway Frith receives the rivers Urr, Nith, and Annan. [DUMFRIESSHIRE.] On the English shore it receives the Esk, with its tributaries the Liddle and the Line; the Eden, with numerous tributaries; the Wampool, the Waver, the Ellen, and the Derwent. [CUMBERLAND.] A considerable part of the frith is occupied by broad sands dry at low water, and intersected by the channels formed by the streams which flow into the frith. It is navigable through the greater part of its extent for vessels of 300 tons, and for vessels of 100 tons up to the head. It affords a supply of different kinds of fish, especially salmon. The tide sets into it with great force, the flood sometimes advancing with a head four feet high. The water has a whitish colour, from the great extent of sand over which it flows.

SOMBOURN, KING'S. [HAMPSHIRE.]

SOMERCOTES, NORTH. [LINCOLNSHIRE.]

SOMERSETSHIRE, a county in the west of England, is bounded N. by the Bristol Channel, the estuary of the Severn, and Gloucestershire; E. by Wiltshire; S. by Dorsetshire and Devonshire; and W. by Devonshire. It lies between 50° 49' and 51° 30' N. lat., 2° 14' and 3° 50' W. long. The longest line that can be drawn upon its surface from east to west measures 68 miles, from north to south 43 miles. A portion of the county however, extending 33 miles westward from Bidewater, has a mean breadth from north to south of only 13 miles. The area is 1636 square miles, or 1,028,090 acres. The population in 1841 was 435,599; in 1851 it was 443,916.

Surface, Coast-Line, and Geology.—Somersetshire is a hilly county,

and the ranges of hills are separated by low marshy flats. The north-eastern part is occupied by the eminences round Bristol and Bath, through which the Avon makes its way to the Severn. These eminences are irregularly grouped, and extend from Pill on the Avon, below Bristol, into Wiltshire: many of the valleys, called combes or coombs, which separate the hills, are drained by small feeders of the Avon. The principal heights in this part of the county are—Falkland Knoll, near Norton St. Philip, between Bath and Frome; Lansdown (813 feet high), and Claverton, Combe, and Odd Downs, near Bath; Dundry Hill, west of Keynsham (790 feet high); the summits of Broadfield Down, south of Bristol; and Leigh Down, west of that city. The summits of the hills in the immediate neighbourhood of Bath are of the oolitic formations. The great oolite furnishes the stone commonly known as Bath stone. Sometimes the lower oolitic beds form outlying eminences, such as Stantonbury Hill, Dundry Hill, and Mays Knoll. The inferior oolite is extensively quarried in Dundry Hill. The oolites rest on a platform of the lias formations, which appear on the lowest part of the slope of the oolite hills, or form detached hills to the south-west of them.

The valleys of the Avon and its feeders are occupied by the new red-sandstone formations, capped in some places by the newer magnesian limestone, which crowns the hills or rests in horizontal strata against the elevated beds of the coal-measures or of the mountain limestone, which latter, with the old red-sandstone, forms the constituent mass of Leigh and Broadfield Down, near Bristol. The mountain limestone of Leigh Down is prolonged across the Avon, and forms the well-known precipices of St. Vincent's rocks, Clifton, between which the Avon flows. Broadfield Down has two precipitous combes or valleys, Cleve and Brookley, less magnificent than the defile of Cheddar, but possessing, from the abundance of wood, more beauty. The coal-measures, mountain limestone, and old red-sandstone, belong to the carboniferous group of the Somersetshire and South Gloucestershire coal-field, and occupy the northern part of the county, extending to the Mendip Hills, though covered in most places by more recent formations. In this field are numerous coal-pits.

The eastern side of the county, extending from Bath to Yeovil, and the southern side, from Yeovil to Wellington, are occupied by hills of similar geological character to those around Bath, and uniting with them near that city. This range is divided into detached parts by the transverse valleys of the Brue, the Yeo or Ivel, the Parret, and the Isle. The vale of Taunton is occupied by the new red-sandstone. Good freestone is quarried in the inferior oolite near Shepton Mallet, and at Norton-under-Hamden; and the lias is much used for building cottages in the neighbourhood of Ilchester.

The Mendip Hills are a distinct range, stretching from west by north to east by south, and separated from the hills about Bath and Bristol by the narrow valley of the Yeo, a small stream which flows into the Bristol Channel near St. Thomas's Head. They extend at their western end to the coast, and unite at their eastern extremity with the hills near Frome. The length of the Mendips is about twenty-five miles; their breadth, between Stoke Rodney and West Harptree, six or seven miles. "This chain consists of a central axis of old red-sandstone, flanked on its opposite declivities by parallel bands of mountain limestone, dipping from it in opposite directions in angles varying from 30° to 70°. This central axis is not however visible throughout its whole course, being occasionally over-arched and concealed by the calcareous strata; but it appears in four ridges, forming the most elevated points of the chain, and disposed at nearly equal distances through its length. The cavern of Wookey Hole, and the defile of Cheddar cliffs, with its long line of stupendous mural precipices, certainly among the most magnificent objects of this kind in Britain, are the well-known features of this chain" (Conybeare and Phillips). The mineral treasures of the Mendips are important; zinc and calamine are obtained abundantly in the central and western part of the range. There are numerous coal-pits in the villages which lie north-west of Frome. The Mendips rise in some parts to more than 1000 feet. The long low ridge of Polden Hill is an offset from the eastern hills, extending about twenty miles in a direction parallel to the Mendips, from which it is separated by a wide fenny flat. Gypsum occurs abundantly in the red marl on the south side of Polden Hill, near Somerton.

In the western part of the county are the Quantock Hills, which in their culminating point, Bagborough Station, or Will's Neck, reach the height of 1270 feet. They consist of an elevated mass of a coarse gritstone, and belong to the slate formation which overspreads the north of Devonshire, separated however from the principal slate district by an intervening tract of new red-sandstone, which formation nearly surrounds the foot of the range. At the northern foot of the hills lias occurs, covering both the red-sandstone and the slates. Limestone, gypsum, and copper are found in these hills. The greater part of the county west of the Quantock Hills is occupied by an irregular hilly district, forming part of the wild moorlands of Exmoor Forest, and extending into the counties of Devon and Somerset. This hilly district is bounded south by the valley of the Tone, and north by the Bristol Channel. It is occupied by the slate-rocks of the Devonian range; but in some of the valleys near the coast these are covered by the new red-sandstone. The highest point in this district is Dunkerry Beacon, which is situated a little to the east of the Black

Barrow Down, and has an elevation of 1668 feet. Slate is quarried near Wiveliscombe.

There are mineral springs at Bath, Glastonbury, Alford, near Castle Cary, and Queen Camel, near Ilchester.

The coast from the mouth of the Avon runs about 15 or 16 miles south-west to Sand Point. About half of this extent is occupied by low cliffs, the remainder being chiefly marshy ground. From Sand Point the coast runs southward to Brean Down, a hill of mountain limestone, precipitous on every side, and surrounded by the sea, except just at its eastern end, where a marshy flat connects it with the mainland. On Uphill Bay, at the foot of Anchor Head Cliff, is the watering-place of Weston-super-Mare. From Brean Down the coast runs about seven miles southward, and then westward about seven or eight miles along the south of Bridgewater Bay. The greater part of the shore of the bay is formed by sand-hills, bounding the marshes which extend between the Mendip Hills and the lower offsets of the Quantock range. Towards the western extremity of the bay the coast is higher, and is lined by lias cliffs. From the extremity of Bridgewater Bay the coast runs westward 25 miles to the boundary of the county, and consists of alternations of cliffs and low ground. The coast is lined, with very little interruption, by sands, but except in Sand Bay, Uphill Bay, and Bridgewater Bay, they have little breadth. These three bays are filled up with sand, dry at low water, except in the channel of the Parret. The only islands are, Stert Island, opposite Stert Point, and Fenning's Island, both at the mouth of the Parret; and Flat Holm and Steep Holm, in the midst of the Bristol Channel. These two islands consist of limestone, and are both girt with cliffs: there is a lighthouse on Flat Holm, and another on the shore near Burnham, opposite Stert Island. The only harbours of any importance are formed by the rivers Avon and Parret. The roadstead of King's Road is at the mouth of the Avon.

Hydrography, Communications, &c.—The Avon flows on or within the northern border of the county for about 31 miles, and falls into the estuary of the Severn at King's Road, 10 miles below Bristol. [AVON.] It is navigable up to Bath (where the Kennet and Avon Canal locks into it) for barges, and to Bristol for sea-borne vessels. At the mouth of the Avon the spring-tides usually rise between 40 and 50 feet. The Avon receives the Frome and the Midford Brook above Bath, and the Chew at Keynsham. The Frome rises not far from Bruton, flows northward past the town of Frome, and joins the Avon between Bradford and Bath; its course (of about 20 miles) is within or upon the border of Somersetshire. The Avon is connected with the Thames by the Kennet and Avon Canal, which enters this county by the Dundas aqueduct over the Avon, and then follows the valley of that river to Bath. The Somersetshire Coal Canal is cut from the coal-works near Paulton into the Kennet and Avon Canal, on the border of the county: it is $9\frac{1}{2}$ miles long. Connected with this canal is a railway from the adjacent coal-works at Radstoke.

The Yeo rises at Compton Martin, on the northern slope of the Mendip Hills, and flows north-west 13 miles between them and Broadfield Down into the Bristol Channel. The Axe rises in Wookey Hole or Cavern, on the southern side of the same hills, near Wells, and flows north-west 21 miles, through the flats at their foot, into the Bristol Channel, at the eastern extremity of Brean Down. The Brue rises on the slope of the chalk-marl and green-sand hills, on the border of Somerset and Dorsetshire, and flows westward past Bruton and Glastonbury, 35 miles through the marshy flat between the Mendip and the Polden Hills into the estuary of the Parret. It has been made navigable for about a mile from its mouth to High Bridge, whence the navigation is continued to Glastonbury (13 miles) by a canal, that runs parallel to the Brue, and at some distance from its left bank.

The Parret, anciently the Pedred, the principal river in the county, rises at South Perrot, near Beaminster, in Dorsetshire. It reaches the border of Somersetshire about a mile from its source, and flows northward for 15 miles, passing South Petherton and Langport, between which towns it receives the Isle on its left bank and the Yeo on the right. From Langport the Parret flows north-west 12 miles, through a marshy flat to Bridgewater, receiving midway between that town and Langport the Tone on the left bank. Below Bridgewater the Parret has a winding course of 16 miles into Bridgewater Bay, receiving the Cary on its right bank, and uniting just at its outfall with the Brue. The Isle rises between Chard and Crewkerne, and flows north and north-east 15 or 16 miles into the Parret, through marshes which cover the lias formation. It passes near Ilminster. The Yeo or Ivel, not to be confounded with the Yeo previously described, rises in Dorsetshire, and flows first south-west and then northward to Yeovil, receiving several streams from the Dorsetshire chalk downs on the left bank. From Yeovil it flows in a circuitous course north-north-west to Ilchester, and thence west-north-west through marshes into the Parret, at Langport. The Tone rises in the southern slope of Brendon Hill, north-west of Wiveliscombe, and flows 10 miles south to the Devonshire border; it then turns eastward and flows 23 miles through the vale and past the town of Taunton into the Parret, on the north-western side of the Isle of Athelney. The Cary rises near Castle Cary, and flows westward through the marshes, across which it flows in an artificial bed, called the Sedgemoor Cut, into the Parret; its whole course is about 30 miles.

The navigation of this system of rivers commences at Ilchester on the Yeo, which is navigable for seven miles into the Parret at Langport. A little above Langport the navigation of the Parret commences, and continues to the mouth of that river. Ships of 200 tons can get up to Bridgewater. The Tone is navigable from Taunton to its junction with the Parret. The Bridgewater and Taunton Canal runs from the Parret, a little above Bridgewater, to Taunton, a distance of $12\frac{1}{2}$ miles. Another canal unites Chard and Ilminster.

In the fork between the Tone and the Parret is the *Isle of Athelney*, in which Alfred the Great took refuge when the Danes overran Wessex, and which still retains its name. It consists of a rising ground, of about 100 miles in extent, and was anciently covered with alder-wood. There is a farm-house on the isle.

The Ex rises in Exmoor Forest, in the most western part of the county, and flows first south-east and then south into Devonshire, which it enters a little west of Bampton, having previously formed the boundary between the two counties for about two miles. The Barle, a considerable feeder of the Ex, also rises in the most western part of Somersetshire, and flows south-westward past Dulverton into the Ex, on the Devonshire border.

The principal coach roads are those from London to Bristol, which unite near Bath; the road from Bath to Bristol through Keynsham; the road from London to Exeter through Salisbury, which passes through Yeovil, Crewkerne, and Chard; the Falmouth road, which runs through Wincanton, Ilchester, and Ilminster; the road from Bristol through Axbridge to Bridgewater, whence one road runs along the coast through Watchet, Dunster, and Porlock to Ilfracombe in Devonshire; a second by Milverton and Wiveliscombe to Barnstaple, Devon; and a third to Taunton, whence there are two roads to Exeter; the road from Bath to Taunton, through Wells and Glastonbury; the roads from Bristol and Bath, which unite at Shepton Mallet; and two roads leading westward from Frome, one to Shepton Mallet, Glastonbury, and Taunton, and the other to Bruton, Castle Cary, and Ilchester.

The Great Western railway enters the county near Bath, and runs by Bath to Bristol, where it is connected with the Bristol and Exeter railway, which runs past Bridgewater, Taunton, and Wellington into Devonshire. Short branch lines connect Clevedon and Weston-super-Mare with the Bristol and Exeter railway. The Wilts, Somerset, and Weymouth railway, which leaves the Great Western at the Corsham station, is open thence to Frome on the east of this county. All these railways are on the broad gauge, which system is carried northward by the Bristol and Birmingham line.

Soil, Climate, and Agriculture.—The county of Somerset possesses a soil and climate well suited to the growth of wheat and all the agricultural produce usually raised in England. There is a fair proportion of woodland without any extensive forests. In some of the vales, such as the extensive vale of Taunton, the soil is of a rich nature, and the wheat grown there is of superior quality. Excellent butter and cheese are made on the best pasture lands. The Cheddar cheese is famous for its quality. The cows are mostly of the Devon breed, but there are also many short-horns. The oxen fattened are either Devons or Herefords and short-horns. The state of agriculture has greatly improved of late years. The sheep on the best lands are of the Leicester or South Down breeds, with crosses between these and the Cotswold sheep. Many hogs are fattened, and very good bacon is cured. There are a few hop-gardens, and some good cider orchards.

Divisions, Towns, &c.—The county is divided into 40 hundreds, which we enumerate, commencing with the eastern division at the mouth of the Avon:—1, Portbury: 2, Hartcliffe and Beaminster: 3, Keynsham: 4, Bath-Forum, in which is the city of Bath: 5, Hampton and Claverton: 6, Wellow, on the eastern border: 7, Chew: 8, Frome: 9, Kilmersdon: 10, Chewton: 11, Winterstoke: 12, Wells-Forum, containing the city of Wells: 13, Whitstone: 14, Bruton: 15, Norton-Ferris: 16, Horethorne, the most south-eastern part of the county, including the town of Milborne Port: 17, Cateash: 18, Glaston-twelve-hides, in which is the town of Glastonbury: 19, Bempstone: 20, Brent-with-Wrington, along the east coast of Bridgewater Bay to the Brue, which river in the lower part of its course separates the eastern from the western division of Somersetshire.

In the western division are:—1, Huntspill and Puriton: 2, North Petherton, in which is the town of Bridgewater: 3, Whitley: 4, Somerton: 5, Pitney: 6, Tintinhull, which contains the town of Ilchester: 7, Martock: 8, Stone, on the southern border, containing Yeovil: 9, Houndsborough, Barwick, and Coker: 10, Crewkerne, also on the southern border, containing the town of Crewkerne: 11, South Petherton, which comprises the most southern part of the county, and extends west of Crewkerne up to the Parret: 12, East and West Kingsbury, consisting of several unconnected portions, and containing the towns of Chard, Wellington, and Wiveliscombe: 13, Abdick and Bulstone, containing the town of Ilminster: 14, Taunton and Taunton Dean, which includes the vale of Taunton and the greater part of the basin of the Tone: 15, North Curry: 16, Andersfield, including the isle of Athelney: 17, Cannington: 18, Williton and Freshmanning: 19, Carhampton, which includes all the coast beyond Watchet to the Devonshire border: and 20, Milverton, which lies on the Devonshire border, and contains the town of Milverton.

Somersetshire contains the cities of BATH and WELLS, a part of

the city of BRISTOL, the parliamentary boroughs of TAUNTON, BRIDGEWATER, and FROME, and the following places, some of which are municipal boroughs, and nearly all market-towns—AXBRIDGE, BRUWON, CHARD, CLUTTON, CREWKERNE, DULVERTON, GLASTONBURY, KEYENHAM, LANGPORT, SHEPTON MALLET, WELLINGTON, WILLITON, WENCARTON, and YEovil; all of these are noticed under their respective titles. The other towns, including Castle Cary, Dunster, Ilchester, Milborne Port, Milverton, Minehead, South Petherton, Somerton, Watchett, and Wiveliscombe, we notice here; the populations are those of 1851:—

Castle Cary, population of the parish 1860, is about 26 miles S.S.W. from Bath. The castle was built or strengthened by William Gouel de Percheval, in the reign of Stephen. The earthworks alone remain. The town is irregularly arranged; the houses are neatly built. The village of Almsford is almost part of the town. Castle Cary church is a handsome building on an elevated site. There are chapels for Wesleyan Methodists and Independents, National schools, and a savings bank. Flax-mills afford some employment. There are three fairs and seven great cattle-markets in the year.

Dunster, population of the parish 1184, is 18 miles N.W. by W. from Taunton. The West-Saxon kings had a fortress here. Dunster sent members to parliament in the 34th and 36th Edward III. There was a Benedictine priory here, founded by the De Mohuna. Dunster castle is a building in the Elizabethan style, in a richly-wooded park. The church is a spacious and handsome building, erected in the reign of Henry VII. A tower in the centre rests on four pillars. There are a chapel for Wesleyan Methodists, and an Endowed school. The market is on Friday, and there is a yearly fair on Whit-Monday.

Ilchester, or *Ivelchester* (from the river Ivel or Yeo, on which it stands), population 889, is about 38 miles S.S.W. from Bath. This town was an important Roman station, the Iechalis of Ptolemæus, who mentions it as one of the chief towns of the Belgæ. The Roman town was defended by a wall and deep ditch, comprehending an oblong quadrangle, through which the Fosse-way passed from north to south. Roman hypocausts and baths, foundations of ancient buildings, vast arches, tessellated pavements, urns, lachrymatories, pateræ, fibulæ, bracelets, and other relics of antiquity, have been discovered, and medals, especially of Vespasian, Trajan, and Antoninus Pius. Under the Saxons, who called the town Givelcestre, it was a place of note. It sent members to parliament in the reigns of Edward I. and Edward II., and with intervals subsequently till it was disfranchised by the Reform Act. There were three religious establishments in the town. The town lies in a rich valley, and consists of two parts—Ilchester proper and the village of Northover, which are separated by the Yeo or Ivel, which is crossed by a stone bridge of two large arches. The church is an ancient building, consisting of a nave, chancel, and north aisle or chapel, with a low octagonal tower. There are National schools. The county jail is at Ilchester. It is a spacious building of freestone. The town-hall is a neat modern building. Ilchester was the birthplace of Roger Bacon.

Milborne Port, population of the parish 1746, is on the Dorsetshire border, about 8 miles E. by N. from Yeovil. It was a borough and market-town at the time of the Domesday survey, and sent members to parliament in the time of Edward I., after which it ceased to send them till the reign of Charles I., when it regained the franchise, which it finally lost by the Reform Act. The town is pleasantly situated in a valley, and consists chiefly of detached houses. The ancient town-hall has a curious Norman doorway. The church is a large cruciform edifice, with a square tower: there are chapels for Wesleyan Methodists and Independents, and National schools. Leather-dressing and glove-making are carried on.

Milverton, population of the parish 2146, about 7 miles W. by N. from Taunton, was a market-town at the Conquest. The church, which occupies an elevated site in the centre of the town, is a spacious building of perpendicular character, 112 feet long by 60 feet broad: there are meeting-houses for Quakers and Independents, and a school for children of all denominations. Silk-throwing and the manufacture of flannel and woollen-cloth afford some employment to the inhabitants. The market is on Friday, and there are three yearly fairs.

Minehead, population of the parish 1542, is on the shore of the Bristol Channel, about 23 miles N.W. by W. from Taunton. The town was incorporated by Queen Elizabeth, and returned two members to parliament, until disfranchised by the Reform Act. The town consists of three parts: the upper town; the lower town, which is the principal part; and the Quay-town along the shore. The church, which is in the upper town, is large and handsome, with an embattled tower, 90 feet high, at the west end; it contains an alabaster statue of Queen Anne. The Baptists have a chapel. At Quay-town is a quay, faced with masonry and with a parapet towards the sea: also a custom-house. The herring-fishery is carried on along the coast. The market is on Wednesday, and there is a yearly fair. Minehead is resorted to by invalids on account of the mildness of the climate.

South Petherton, population of the town 2165, is about 16 miles E.S.E. from Taunton. Wigborough, in the parish of South Petherton, is supposed to have been the site of a Roman town. The Anglo-Saxon kings had a residence at South Petherton. In Domesday Book the town is called Sudperet. The church is cruciform, with a lofty but

plain octangular tower at the intersection. There are chapels for Independents and Wesleyan Methodists. Markets are held on Thursday and Saturday; a fair is held on July 6th.

Somerton, population of the parish 2140, about 17 miles E. by N. from Taunton, was a fortified town in the Saxon times. The West-Saxon kings had a palace here. The town is called Summertone in Domesday Book. It stands on a hill on the left bank of the river Cary, over which is a stone bridge. The houses are built of blue lias from quarries in the neighbourhood. The church, which is ancient, has an octangular embattled tower on the south side. There are a chapel for Independents, an Endowed Free school, and a range of almshouses. The market is on Tuesday, and there are seven fairs in the year. Alabaster and lias are quarried near the town.

Watchett, population of the hamlet about 950, is on the shore of the Bristol Channel, about 19 miles N.W. from Taunton. It was twice taken by the Danes, and the last time entirely ruined, in their war with Ethelred II. The parish church of St. Decuman's is in the village of that name, about a mile S. from Watchett, and is a large and handsome edifice. In Watchett are chapels for Baptists and Wesleyan Methodists. There is here a small harbour, formed by a pier, and some coasting trade is carried on; coals are imported from Wales, and lime and alabaster are exported. A market is held on Saturday, and a fair on November 17th.

Wiveliscombe, population of the parish 2861, is about 12 miles W. by N. from Taunton. On a hill a mile east of the town is a Roman camp. The town is in a valley or combe, inclosed by hills on all sides except the south-east. The church consists of a nave and side aisles, with a western tower and spire. There are Independent and Wesleyan Methodist chapels, National and Infant schools, an infirmary, and the ruins of an old residence of the bishops of Wells. The woollen manufacture is carried on. The markets are on Tuesday and Saturday; the former is a considerable corn-market, and the market on the last Tuesday in February is also a great cattle-market. There are two yearly fairs.

The following are a few of the principal villages, with the population of each parish in 1851:—

Long Ashton, population 1921, including 322 inmates of Bedminster Union workhouse, about 3 miles S.W. from Bristol, has several iron-works and collieries. The parish church is a neat edifice in the perpendicular style. There are National schools partly endowed. In the parish are two remarkable camps, on the hills overlooking the river Avon, opposite Clifton. *Backwell*, population 1074, about 7 miles S.W. by W. from Bristol, is situated just under Broadfield Down. There are here the parish church and National schools. Several collieries in the parish afford employment. *Banwell*, population 1878, about 15 miles S.W. from Bristol, is pleasantly situated under the northern slope of the Mendip Hills. The parish church is a fine building with windows of stained glass. The Wesleyan Methodists have a chapel, and there is a Free school. Fairs are held in January and July for cattle and sheep, and for cheese. Two remarkable caverns have been discovered here, one filled with diluvium, in which were embedded various fossil bones, the other covered with beautiful stalactites. During the existence of the West Saxon kingdom there was an abbey at Banwell, of which the abbacy was given by Alfred to his friend Asser. There are remains of an episcopal palace of the bishops of Bath and Wells, now a private residence. *Bath Easton*, population 1795, is on the right bank of the river Avon, about 3 miles N.E. from Bath. The parish church, a fine gothic structure, has at its west end a handsome embattled tower, 100 feet high; there are National and Infant schools. A silk-mill affords some employment. *Bathwick*, population 5162, is a suburb of the city of Bath, with which it has communication by Pulteney-bridge over the Avon. The Kennet and Avon Canal and the Great Western railway run through the parish. Many Roman antiquities have been found here. *Beckington*, population 1173, is about 3 miles N.N.E. from Frome. The woollen manufactures of Frome give employment to a considerable number of the inhabitants. The Baptists have a chapel here. *Burnham*, population 1701, on the Bristol Channel, near the mouth of the river Parret, 9 miles N. from Bridgewater, has a church whose lofty tower is useful as a sea-mark, and a lighthouse. The altar-piece of the church, sculptured in white marble, was designed by Inigo Jones. *Camerton*, population 1543, is about 7 miles S.W. by S. from Bath; many of the inhabitants find employment at the coal-pits of the Mendip coal-field. The Somerset Coal Canal passes through the parish. There are two Endowed schools. *Chew Magna*, population 2141, about 6 miles S. from Bristol, is chiefly dependent upon the coal-mines in the Mendip coal-field. In ancient times Chew Magna was a borough, and possessed a good woollen manufacture. There are National schools. *Old Cleve*, population 1550, about 16 miles N.W. from Taunton, possesses extensive remains of an ancient Cistercian monastery. An old cross with four steps, the pedestal and pillar almost entire, stands in the churchyard of the parish church. There is here a National school supported chiefly by the vicar. The hamlet of *Blue Anchor* in this parish is resorted to as a bathing-place. *Clevedon*, population 1906, on the shore of the Bristol Channel, 12 miles W. by S. from Bristol, is visited for bathing in the summer. The shore here is rocky, and the cliffs rise to a considerable height. The parish church is situated on a lofty rock. There are here a

chapel for Independents, and National and Infant schools. *East Coker*, population 1340, about 3 miles S.S.W. from Yeovil, has a fine cruciform church, a village school, an Infant school, and a row of almshouses for 12 persons. The remains of a Roman villa were discovered here in the middle of the last century. *Congresbury*, population 1258, on the left bank of the Yeo River, about 11 miles S.W. from Bristol, had anciently a market, which has been disused. A fair for cattle and horses is held on September 14th. There are National schools. *Curry Rivell*, population 1637, about 2 miles S.W. from Langport, has quarries of lias. Two fairs are held annually. In this parish, on a commanding eminence, is Burton Pynsent, the seat of the great Earl of Chatham, to whom a monument was erected in the park by his widow. There is a village school. *Huntspill*, population 1594, near the mouth of the Parret, 7 miles N. by W. from Bridgewater, was formerly a market-town. There are a National school and a village school. *Kilmerdon*, population 2196, about 9 miles S.S.W. from Bath, derives its chief support from the coal-mines in the vicinity. Besides the parish church there are a chapel for Wesleyan Methodists, an Endowed and an Infant school. *Lyncombe* and *Widcombe* form one parish, population 9974, properly a suburb of the city of Bath, from which it is separated by the Avon: the part nearest the river may be considered as the manufacturing part of Bath. Farther off are many detached villas and rows of good private houses. There are here National and Infant schools. The valley of Lyncombe is very beautiful. *Martock*, population 3154, about 7 miles W.N.W. from Yeovil, formerly a market-town, has a church with a tower 90 feet high, and a handsome altar-piece. In the market-place are the former market-house with an assembly-room over it, and a fluted column supporting a dial. Many of the inhabitants are employed in glove making and the weaving of sacking and girth-web. *Mells*, population 1186, about 3 miles W.N.W. from Frome, has numerous collieries and an extensive iron-work in the neighbourhood. Two fairs are held annually. There are National and Infant schools. Remains of two ancient encampments are in the parish. *Merriot*, population 1439, about 2 miles N. from Crewkerne, has a parish church, a chapel for Dissenters, and National schools. Glove-making and the weaving of sail-cloth and sacking are carried on. *Midsomer-Norton*, population 3799, about 9 miles S.W. from Bath, possesses a new church, a chapel for Wesleyan Methodists, and National and Infant schools. An annual fair is held on April 25th. *Montacute*, population 1042, about 4 miles W.N.W. from Yeovil, has extensive quarries. Some of the inhabitants are employed in glove-making. There is a chapel for Baptists. An annual fair is held on May 13th. Here was formerly a priory, richly endowed. *Naishsea*, population 2543, about 8 miles W. by S. from Bristol, gives name to the adjacent coal-field, the pits of which employ a considerable number of men; there are also stone quarries and important glass-works. There are National and Infant schools. *Paulton*, population 2104, about 8 miles S.W. from Bath, has a parish church, chapels for Wesleyan Methodists and Baptists, and National and Infant schools. Many of the inhabitants are engaged in the neighbouring collieries. *North Petherton*, population 3845, about 3 miles S. from Bridgewater, one of the largest villages in the county, was formerly a market-town, and still retains two fairs, which are held in May and November. *Pill*, or *Crockern-Pill*, population of the hamlet about 1600, is a pilot station on the Avon, about 6 miles below Bristol. There are here an Episcopal chapel, chapels for Independents and Baptists, and the Pill Benevolent schools. Several Roman antiquities have been found here. *Porlock*, population 854, is in the hilly district which occupies the western extremity of the county, 6 miles W. from Minehead. The church is an ancient gothic edifice, with a tower at the west end. Surmounting the tower are the remains of a spire, which was partly destroyed in a storm in the 17th century. The Danes were repulsed in an attack on this place in 918; but it was burned, and the neighbourhood plundered, by Harold, in the revolt of his family against Edward the Confessor in 1052. *Porlock Quay* is 2 miles N.W. from the village, on the shore; a small harbour is here formed by means of a pier. A very few small sloops and some fishing-boats belong to the place. The ancient market-cross is still standing. There are three yearly fairs for cattle and sheep. *Portishead*, or *Porteshead*, population 1084, about 11 miles W. by N. from Bristol, is frequented in summer for bathing. The parish church is a substantial building, with a tower surmounted with pinnacles. There are here a chapel for Independents, and National and Infant schools. *Radstock*, or *Radstoke*, population 1792, is situated in the Mendip coal-field, about 8 miles S.S.W. from Bath. Besides the parish church there is a chapel for Wesleyan Methodists. *Stogumber*, population 1456, about 11 miles S.S.W. from Taunton, was formerly a market-town: it has still two yearly fairs. The parish church is an ancient edifice of large size and handsome appearance; over the south aisle is an embattled tower, 72 feet high. There are a chapel for Baptists and a parish school. Brewing is carried on. *Timsbury*, population 1639, about 7 miles S.W. from Bath, has a parish church, a chapel for Wesleyan Methodists, and National schools. The Andover Canal affords facilities for transmitting the produce of the neighbouring collieries. *Twiverton*, or *Twerton*, population 2958, about 2 miles W. from Bath, is the seat of a considerable cloth manufacture. Over the Avon is an iron bridge of 120 feet span between the centres of the supporting piers, and 230 feet length in all. Besides

the parish church there are chapels for Wesleyan Methodists and Baptists. *Wedmore*, population 3905, about 5 miles S. by E. from Axbridge, stands on a gentle elevation; it was at one time the occasional residence of the West-Saxon kings. The parish church is a handsome cruciform edifice, with a tower 100 feet high rising from the intersection. The Wesleyan Methodists and Baptists have places of worship, and there are a National school partly endowed, and a Wesleyan school. *Weston*, population 3088, about 2 miles W.N.W. from Bath, has a parish church, a chapel for Wesleyan Methodists, and National and Infant schools. *Weston-super-Mare*, population 2103 in 1841, and 4034 in 1851, on the shore of the Bristol Channel, about 22 miles S.W. from Bristol, is a watering-place much frequented, especially by the inhabitants of Bristol; it has commodious inns, lodging-houses, and baths. The Bristol and Exeter railway has a short branch to Weston. The church, a neat building, occupies a commanding site on the slope of a hill. The Independents have a chapel, and there are National and Infant schools. Some of the inhabitants are engaged in the sprat and herring fishery. The town is lighted with gas. *Wrington*, population 1620, about 11 miles S.W. from Bristol, on the bank of the river Yeo, was formerly a market-town and had a yearly fair. Barley Wood, the residence of the late Hannah More, is in this parish. The Independents have a chapel, and there are National schools. Wrington was the birthplace of Locke.

Divisions for Ecclesiastical, Legal, and Parliamentary Purposes.—Somersetshire (except Bedminster, which is in the diocese of Bristol) constitutes the diocese of Bath and Wells, and is divided into the archdeaconries of Bath, Wells, and Taunton. The county is in the western circuit. The spring assizes are held at Taunton; the summer assizes at Bridgewater and Wells alternately. The quarter sessions are held at Wells, Bridgewater, Taunton, and Bath. County courts are held in Axbridge, Bath, Bridgewater, Bristol, Chard, Clutton, Crewkerne, Langport, Taunton, Wellington, Wells, Weston-super-Mare, Williton, Wincanton, and Yeovil. There are a county jail at Ilchester, a county jail and house of correction at Wilton near Taunton, and a county house of correction at Shepton Mallet. There are a city jail at Bath, a borough jail at Bridgewater, and a city and county lock-up house at Wells. The city jail and house of correction of Bristol are at Bedminster in this county. Before the Reform Act Somersetshire returned 16 members to the House of Commons, namely, two for the county, two each for the cities of Bath and Wells, and two each for the boroughs of Taunton, Bridgewater, Minehead, Ilchester, and Milborne Port. By the Reform and Boundary Acts the county has been formed into two divisions, each returning two members. Bath, Wells, Taunton, and Bridgewater still return two members each; Ilchester, Milborne Port, and Minehead have been disfranchised; and Frome has been constituted a parliamentary borough to return one member, so that 13 representatives are now sent by Somersetshire to the House of Commons. By the Poor-Law Commissioners the county is divided into the unions of Axbridge, Bath, Bedminster, Bridgewater, Chard, Clutton, Dulverton, Frome, Keynsham, Langport, Shepton Mallet, Taunton, Wellington, Wells, Williton, Wincanton, and Yeovil. These unions comprise 490 parishes and townships, with an area of 1,062,972 acres, and a population in 1851 of 461,844.

History and Antiquities.—In the earliest historical period part of this county was probably inhabited by the Belgæ. The territories of the Hædi and Cimbri were separated by the Parret, anciently called Uxella. In the Roman division of the island, Somersetshire was included in the province of Britannia Prima. The Antonine station *Aquæ Solis* (called also *Thermæ* by Richard) was Bath; the river on which it stands is called *Abona* by Richard, a name evidently identical with Avon. *Ad Sabrinam* is supposed to have been Portishead, or Portbury, west of Bristol. The *Avalonia* of Richard was in all probability Glastonbury; and the towns *Isolalis*, *Uxella*, and *Ad Aquas* are supposed to have stood on or near the sites now occupied by Ilchester, Bridgewater, and Wells respectively. The ancient road, the Fosse-way, enters the county near Bath, and runs south-west by Radstoke, Stratton-on-the-Fosse, Shepton Mallet, Street-on-the-Fosse near Shepton Mallet, East and West Lydford, Ilchester, and Petherton Bridge near South Petherton; and appears to have quitted the county not far from Chard. A Roman road from the coast runs along the crest of the Mendip Hills in the direction of *Sorbiodunum* (Old Sarum), crossing the Fosse-way at right angles. Roman antiquities have been found in considerable abundance at Bath, Ilchester, Yeovil, and other places. At South Cadbury, between Wincanton and Ilchester, is a remarkable camp commonly called Cadbury Castle, of irregular form, according to the shape of the hill on which it stands, with an inner and higher fort or prætorium. It is partly hewn in the solid rock, partly formed with a rampart of loose stones, and is defended by ditches. Various Roman antiquities, especially coins, and pavements, and other remains of buildings, have been dug up in the inclosure, which is about 30 acres in area. Another camp, three miles in circuit, of irregular form, on Hamden Hill, is supposed to have been Roman. The vallum is almost entire; the north-western part, the most difficult of access, is separated from the rest by an intrenchment. There are other Roman camps near Wiveliscombe, Milverton, Brompton Regis, near Dulverton, at Strington, between Bridgewater and Watchet at Cadbury, between Bristol and Clevedon, and at a third Cadbury between Bristol and Weston-super-Mare, on Brent Knoll, a lo.

eminence rising out of the flats between the Mendip and Polden hills, and at Long Ashton near Bristol, opposite Clifton. Coins in great abundance have been found in various places.

Besides the Roman camps above-mentioned there are several other ancient forts or camps scattered throughout the county. Doleberry Castle, on Mendip, is one of the most remarkable. Barrows are numerous, especially on the Mendip Hills, on the Quantock Hills, and the hilly districts west of these. The remarkable intrenchment called Wansdyke, is partly in this county. Commencing near Andover in Hampshire, it crossed the Wiltshire Downs, and entered Somersetshire near Bath-Hampton; and turning westward and then north-westward, so as to make a circuit round Bath, it ran along the hills by South Stoke, English Combe, Stanton Prior, Compton Dando, Norton Malreward, and Long Ashton, to the Bristol Channel at Portishead. The ancient camps on Bath-Hampton Down, Stantonbury Hill near Stanton Prior, and Mays Knoll near Norton Malreward, are just on the line of Wansdyke. This singular work is of unknown origin and date: it is intersected by a Roman road on Marlborough Downs in such a manner as to show it to be of earlier date than the road, and consequently earlier than the Roman conquest and settlement.

Of what are usually regarded as primeval antiquities, Somersetshire possesses but few. The principal is at *Stanton Drew*, 6 miles S. from Bristol, near the road to Wells: it consists of four groups of stones, which formed when complete two circles; and two other figures, one an ellipse, the other perhaps a rectangle. Some of the stones are 9 feet high, 22 feet in girth, and 15 tons in weight.

In the Saxon invasion this county was the scene of conflict: the battle of Mount Badon, in which the Britons under Arthur repulsed the Saxons under Cerdic, founder of the West-Saxon kingdom, is commonly fixed at or near Bath. In the reign of Cealwin of Wessex (A.D. 577), Bath was taken by the Saxons. About 658 the county was incorporated with Wessex by Cenwalch, who defeated the Britons at Penzelwood, near Wincanton. In the reign of Ethelwulf (845), a body of Danes was repulsed with great slaughter at Pedridan-muth, or the mouth of the Parret; and in the reign of Alfred, Somersetshire was again attacked by them. Alfred, when driven from his throne, found security in the marshes of the Isle of Athelney, at the junction of the Tone and Parret. After the battle of Edington, Guthrum the Dane was baptised at Alre, now Aller, near Langport; and Alfred and Guthrum spent twelve days at Wedmore, between Glastonbury and Axbridge, on the occasion. Edgar, in the latter part of his reign, was consecrated king at Acemannesceastre, now Bath (973). On his death (975) he was buried at Glastonbury. In the short reign of Edmund II. (Ironside), a severe battle took place between him and Canute at Penzelwood; and on the death of Edmund, the same year, he was buried at Glastonbury, near his grandfather Edgar. In the rising of Odo and other supporters of Robert of Normandy against William Rufus (1088), Bath and the neighbourhood were plundered by the insurgents. Some military operations were carried on in the reign of Stephen, who took Castle Cary and Richmond castles.

Of the middle ages there are several memorials, some of which are noticed above, and others in the articles on BATH, WELLS, GLASTONBURY, &c. The Augustinian priories of Stavordale near Wincanton, and Woodspring, near Weston-super-Mare, are tolerably entire, and are now converted into farm-houses. The remains of Montacute Cluniac priory, near Yeovil, and of Muchelney Benedictine Abbey, founded by King Athelstan, near Langport, are of considerable interest. Of the Carthusian priory of Hinton Charterhouse, near Bath, there are several remains: the present manor-house was built out of the ruins. Cannington church and Stogursey church, north-west of Bridgewater, and Witham Friary church, between Frome and Bruton, were all conventual churches: the first is a very fine building. The only important castellated remains are—Farleigh Castle, between Bath and Frome; Nunney, near Frome; and Walton Castle, near Clevedon. The ancient mansions of Montacute, near Yeovil; Shapwick, between Glastonbury and Bridgewater; Fairfield, near Stogursey, north-west of Bridgewater; Sutton Court, near Chew Magna, between Keynsham and Axbridge; Hinton St. George, near Crewkerne; and Barrow Court, near Bristol, all belong to the period which preceded the general revival of classical architecture.

In the civil war of Charles I. several memorable events occurred in this county, the principal of which were the defeat of the Parliamentarians under Sir W. Waller, on Lansdown Hill, near Bath, by a Royalist force under Prince Maurice and the Earl of Caernarvon, July 5th, 1643; and the blockade and siege of Taunton in 1645. [TAUNTON.] In the action on Lansdown Hill the Royalists lost many of their chiefs, among others Sir Bevil Grenville, to whom a monument, still remaining, was erected on the hill. Somersetshire was the principal scene of Monmouth's rebellion against James II. From Lyme in Dorsetshire, where he landed June 11th, 1685, Monmouth marched against Bridport, which he took by assault, and thence advanced by Axminster to Taunton, where he was received with great enthusiasm, and declared himself king. After a delay of some days at Taunton, he proceeded to Bridgewater and Glastonbury. The duke, after an unsuccessful attack upon Bristol, retired towards Wiltshire. A fierce engagement took place on the 6th July, in which Monmouth's army was defeated with great loss. In the subsequent severities under the commission of which Chief-Justice Jeffreys was at the head, Somersetshire was made

to bear a full share. The prisoners for trial in this county exceeded 1000, of whom at least 239 were executed, the sentences being carried into effect in thirty-six different towns and villages, among which they were distributed.

Statistics: Religious Worship and Education.—According to the Returns of the Census for 1851 there were then in the county 1129 places of worship, of which 553 belonged to the Church of England, 313 to six bodies of Methodists, 110 to Independents, 89 to Baptists, 15 to Quakers, 12 to Plymouth Brethren, 8 to Roman Catholics, 8 to Unitarians, and 6 to Mormons. The total number of sittings provided was 288,333. There were 1381 day schools, of which 490 were public schools, with 36,512 scholars, and 891 were private schools, with 17,208 scholars. The number of Sunday schools was 719, with 56,090 scholars; of these, 430 schools, with 32,444 scholars, belonged to the Church of England. Of evening schools for adults there were 19, with 272 scholars. There were 14 literary and scientific institutes in the county, with 1744 members, and possessing libraries numbering about 10,000 volumes.

Savings Banks.—In 1853 the county possessed 10 savings banks, at Bath, Bridgewater, Castle Cary, Crewkerne, Frome Selwood, Nether Stowey, Taunton, Wells, Wrington, and Yeovil. The amount owing to depositors on November 20th, 1853, was 778,897*l.* 2*s.*

SOMERSHAM. [HUNTINGDONSHIRE.]

SOMERTON. [SOMERSETSHIRE.]

SOMMA. [NAPLES, Province of.]

SOMMARIVA-DEL-BOSCO. [ALBA.]

SOMME, a department in France, is bounded N. by that of Pas-de-Calais, E. by Nord and Aisne, S. by Oise, and W. by the new department of Seine-Maritime and the English Channel. Its greatest length, from the neighbourhood of Ham to the mouth of the Seine, is about 80 miles; the greatest breadth, from the Bresle near Aumale to the neighbourhood of Lucheux, is 47 miles. The area is 2878.4 square miles. The population in 1841 was 559,680; in 1851 it was 570,641, giving 239.92 inhabitants to a square mile, or 65.34 above the average per square mile for the whole of France. The department is formed out of the old Picard districts of Amienais, Santerre, Ponthieu, and a part of Vermandois, which had Amiens, Péronne, Abbeville, and Ham respectively for their chief towns.

The surface of the department is generally level, in parts undulating and hilly. The coast, which runs nearly due north and south, is divided into two nearly equal parts by the estuary of the Somme; to the north of that river the shore is lined by sand-hills or downs, which protect the low grounds from the incursions of the sea; to the south of the Somme commence the cliffs which extend along the coast to the neighbourhood of Havre. The coast-line has undergone a considerable change even in comparatively recent times. In the 9th century the waves covered the low ground between the Somme and the Authie, several miles inland from the present shore. When the sea retired there remained for some time a large lake, long since dried up, the site of which forms one of the most fertile districts in the department. The whole of the department is occupied by the formations of the cretaceous group. The extensive chalk-plains are intersected at intervals by valleys, watered by streams, and presenting green meadows and trees, which contrast favourably with the general nakedness of the country. Some sandstone for paving is quarried, and peat is dug in some of the valleys.

The department is watered by the Somme and its tributaries, and by the Bresle and the Authie. The *Somme* rises in the department of Aisne, not far from St.-Quentin; it has first a south-western course for about 18 or 20 miles, and enters this department just above the town of Ham, below which it flows about 20 miles to the north-north-west to Cléry, below Péronne, and thence westward 30 miles to Amiens. Below Amiens its course is north-west in a tolerably direct line, past Abbeville, 45 miles to the sea. Its whole course is about 115 miles, 95 miles of which are in this department. Vessels of 150 tons and small steamers ascend the river as far as Abbeville; and barges of 40 to 50 tons ply between Abbeville and Amiens. By means of lateral canalisation, and the improvement of the bed of the river, the Somme has been made navigable from Amiens almost to its source. By means of this lateral canal a communication is opened into the canal of St.-Quentin, which used to be called the Angoulême Canal, and thus a communication is formed with the Escaut or Schelde, the Oise, and the Seine. [AISNE.] The principal feeders of the Somme are the Miraumont, the Nieve, and the Maie, on the right bank; and the Ayre, which receives the Dam or Don and the Noye, and the Celle, on the left bank. These are all small; but the Ayre has been made navigable for about 12 miles. The *Authie* rises not far from Doullens, and flows past that town in a north-west direction into the sea. It separates the department from Pas-de-Calais. The *Bresle* rises in the department of Oise, and flows north-west into the sea between this department and Seine-Maritime. Neither the Authie nor the Bresle is navigable; but the mouth of the latter forms the harbour of Tréport. [SEINE-INFÉRIEURE.]

The department is traversed by 10 imperial, 8 departmental, and a great number of communal roads; and also by railroads from Amiens to Paris, Boulogne, and Lille. A railway has been recently authorized to be made from Amiens to Rouen through Gournay.

The department is by no means naturally fertile; the soil consists

for the most part of a sandy clay resting upon chalk—nevertheless a great weight of corn is raised. Of the whole area, about 1,500,000 acres, four-fifths are under the plough. The principal crops are wheat, rye, and mixed grain. Barley and buckwheat are also grown; but oats and potatoes are comparatively little cultivated. A great quantity of corn is exported to the departments of Seine-Inférieure, Seine, and Nord. The meadows do not exceed 40,000 acres, nor do the open pasture-grounds much exceed 20,000 acres; yet horses, cows, and sheep are numerous. Poultry is very abundant and good. Pulse, seeds for oil, hops, hemp, and flax are grown. There are no vineyards, but the orchards and gardens are numerous and extensive. The apple is the fruit chiefly cultivated, and a considerable quantity of cider is made; it forms, with beer, the ordinary drink of the inhabitants. Game abounds, and sea fish and fresh-water fish are plentiful. The woodlands amount to about 138,000 acres.

The climate resembles that of the south of England, but is rather colder in winter. Among the minerals are building- and limestone, gypsum, potters'-clay, and coal, which is found near Doullens.

The manufactures comprise woollen-cloths, cotton fabrics, silks, linens, Cashmere shawls, chintzes, muslins, carpets, hosiery, glass, hardware, paper, leather, seed-oil, soap, pottery, and chemical products. The department has numerous bleach-works, cotton-factories, beet-root sugar-mills, dye-houses, and oil- and tan-mills. Steam-machinery is used in all the chief industrial establishments, especially in the neighbourhood of Amiens.

The department is divided into five arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Amiens . . .	8	249	189,968
2. Doullens . . .	4	88	60,010
3. Montdidier . . .	5	144	69,850
4. Péronne . . .	8	179	112,176
5. Abbeville . . .	10	171	138,637
Total . . .	35	831	570,641

1. Of the first arrondissement, and of the whole department, the chief town is AMIENS. *Airaines*, on the high road from Abbeville to Beauvais, and near the railway from Amiens to Abbeville, has a great number of oil- and corn-mills driven by three small streams that meet in the town, and 2200 inhabitants, who manufacture woollen-cloth, soap, and leather. *Corbie*, on the Somme, 10 miles E. by railway from Amiens, has some woollen manufactures and tan-mills, and about 2800 inhabitants. *Picquigny*, a small place of about 1500 inhabitants, on the left bank of the Somme, 9 miles from Amiens by railway, has some historical note. Here Guillaume, Longue-Epée, duke of Normandy, was assassinated in 942. Louis XI. had an interview with Edward IV. of England in 1475 on the bridge that spans the Somme, opposite Picquigny. *Poix*, a small well-built town, situated in a valley 17 miles W. from Amiens, midway between Beauvais and Abbeville, on the high-road from Boulogne to Paris, has a large tile-yard, a church which dates from the 12th century, and about 1100 inhabitants. A little east of Poix, on the Celle, is *Conty*, or *Conti*, formerly the capital of a principality, which gave title to one of the branches of the house of Bourbon. *Villers-Bretonneux*, a few miles S. from Corbie, has about 3200 inhabitants, who are engaged chiefly in the woollen manufactures.

2. In the second arrondissement the chief town, *Doullens*, situated on the left bank of the Authie, 19 miles N. from Amiens, is defended by a double citadel, formed by two forts or citadels communicating with each other. It has a tribunal of first instance, public offices, a theatre, two hospitals, and 4254 inhabitants. Trade is carried on in coarse linen, corn, oil, hemp, flax, and cattle.

3. In the third arrondissement the chief town is *Montdidier*, a wretched ill-built place with 3798 inhabitants, 22 miles S.E. from Amiens. Montdidier is situated on a hill on the right bank of the Dam, a feeder of the Avre; it is an old town, with some remains of the fortifications which formerly defended it. It has tribunals of first instance and of commerce, a college, and an agricultural society. Cotton-yarn, cotton-hose, and leather are manufactured; and trade is carried on in grain, pulse, cattle, poultry, peat, and coals. *Moreuil*, a well-built little town of 2200 inhabitants, is situated on the right bank of the Avre, 12 miles by railway S.S.E. from Amiens. *Roye*, built on the slope of a hill on the right bank of the Avre, 10 miles N.E. from Montdidier, has narrow streets and ill-built houses. The town-hall, a gothic building, is in the public square, which is large. The church of St.-Pierre is lighted through stained glass windows, representing the coronations of Clovis, Charlemagne, and St. Louis. There are manufactures of cotton-yarn, cotton and woollen stuffs, stockings, &c., and considerable trade is carried on in corn and flour for the supply of Paris. Roye was a place of strength in former times, and was repeatedly besieged.

4. In the fourth arrondissement the chief town is *Péronne*, which is situated on a hill above the right bank of the Somme, 30 miles E. from Amiens; and has a tribunal of first instance, a college, and 4142 inhabitants in the commune. Péronne was a place of importance in

the middle ages. Charles le Simple died here in captivity in 929. It was the scene of the interview (1468) between Louis XI. and Charles, duke of Bourgogne, described by Sir Walter Scott in 'Quentin Durward.' In 1536 it was besieged by Henri of Nassau, one of the officers of the emperor Charles V., but without success. It is still fortified by a brick rampart and a strong castle. The town has two suburbs; the houses are tolerably well built, and there are two churches, a nunnery, an hospital, and a theatre. Calico, dimity, muslin, lawn, and other cottons and linens are manufactured; also leather, seed-oil, and beet-root sugar. *Albert*, a station on the Great Northern of France railway, 15 miles N.W. from Péronne: population about 3000, who manufacture woollen-cloth, cotton stuffs, linen, leather, and paper. *Bray*, population 1500, on the Somme, afforded shelter to Philippe of Valois after the battle of Crécy. *Honnin*, 13 miles S.E. from Péronne, is situated in a marshy plain near the left bank of the Somme, and was in the middle ages a place of strength. It is surrounded by the ruins of its ancient fortifications, and has a castle, used as a state prison, and memorable as the place of confinement of the ministers of Charles X. and of Prince Charles Louis Napoleon Bonaparte, now emperor of the French, who for his attempt at revolution in Boulogne, underwent here part of his sentence to perpetual imprisonment from October 6, 1840, to May 26, 1846, when he effected his escape disguised as a workman. There are three parish churches and an hospital. The townsmen manufacture blankets and cotton goods, sabots, beet-root sugar, and oil. Population 2500.

5. In the fifth arrondissement the chief town is ABBEVILLE. *Cayeux* is a fishing village with about 2800 inhabitants, on the coast between the Somme and the Bresle. Above it is a lighthouse, which marks the entrance of the Somme. *Crécy*, a village of about 1700 inhabitants, 8 miles N. from Abbeville, was the scene of the memorable battle in which Edward III. defeated the French, August 26, 1346. *Rue*, on the little river Maie, near the coast between the Somme and the Authie, is celebrated for its chapel dedicated to the Holy Ghost, which is beautifully adorned with sculptures and stone tracery. Among the statues are those of Isabel of Portugal, Philippe, duke of Bourgogne, Louis XI., Louis XII., and Cardinal Bertrandi, in whose time the chapel was famous for its miraculous crucifix. Population above 2000. *Rue* was once a sea-port. *St.-Valery* is at the mouth of the Somme, on the southern bank of the river, which forms the harbour. It is built on the side of a hill, and has large warehouses, rope-walks, ship-building yards, and 3850 inhabitants. The harbour is capable of receiving ships of 300 tons. The tide rises about 12 feet. Considerable trade is carried on in sail- and packing-cloth, cordage, glass, wine, and brandy. Vessels are fitted out for the fisheries and the coasting trade. Steamers ply between St.-Valery and London. St.-Valery has a theatre, an hospital, and a school of hydrography. *St.-Riquier*, anciently called *Centule*, took its present name from St. Riquier, a native of the town, who founded here, in the 7th century, one of the most celebrated Benedictine abbeys in France. The church of the abbey still remains, and is the finest ecclesiastical building in the department after the cathedral of Amiens; there is also an hospital. Population 1600.

The department constitutes the diocese of Amiens. It is in the jurisdiction of the High Court of Amiens, and within the limits of the University-Academy of Douai. There are colleges in Amiens, Abbeville, and Péronne; an academy of sciences and a diocesan seminary in Amiens; and a preparatory ecclesiastical seminary at St.-Riquier. The Calvinists have a consistorial church at Amiens. The department belongs to the 3rd Military Division, of which Lille is head-quarters; and returns five members to the Legislative Chamber of the French empire.

SOMMERDA. [ERFURT.]

SOMMIÈRES. [GARD.]

SOMOROSTRO. [BASQUE PROVINCES.]

SONDENBORG. [ALSEN.]

SONDRIO. [VAITELLINA.]

SONGARIA is the name of a country in Asia, which constitutes the north-western portion of the Chinese empire. The name is derived from the Songares, one of the great divisions of the Kalmucks, or Olghs, who had taken possession of this country, and erected a powerful empire, which was destroyed by the Chinese after the middle of the 18th century. Songaria lies between 42° and 49° N. lat., and extends from 76° to 95° E. long. In length it extends upwards of 900 miles; but the width varies so much that on an average it probably does not much exceed 300 miles. This gives an area of 270,000 square miles.

Songaria occupies a very remarkable position on the globe. It forms the most northern portion of an isthmus, which separates the two largest deserts on the surface of the globe, with the exception of the Sahara in Africa. On the east of this isthmus is the Gobi, which, according to a rough estimate, has a surface exceeding 1,200,000 square miles. [GOBL.] On the west of the isthmus extends the low desert system that spreads out round the Caspian Sea on the north and east, and is even larger than the Gobi, covering an area of nearly 1,300,000 square miles. In this estimate the Descht Kowar, between the Caspian and the lower course of the Oxus, is considered as the most southern, and the Barabzinza Steppe in Siberia, between the rivers Irtysh and Obi, as the most northern portion; and it is assumed

that the Kalmuk Steppes, between the lower Volga and the Black Sea, constitutes its most western part.

The isthmus which separates these two large deserts is connected on the south (near 36° N. lat.) with the range of the Hindu Koosh, and on the north (near 50° N. lat.) with the western extremity of the Altai Mountains. South of 40° it lies north and south, and comprehends the countries known under the names of Badakshan and Bokhara. North of 40° it lies south-west and north-east, and comprehends the countries called Kokand and Songaria. South of 40° N. lat. the descent from the elevated Gobi to the low Caspian Desert is formed by an elevated range, a great part of which is always covered with snow, and the descent is rapid; but north of 40° N. lat., and especially in Songaria, it is formed by a number of extensive terraces, which, taken together, extend from east to west over a space of 500 miles.

On the east Songaria opens to the Gobi, and on the west to the Caspian Desert; but on the north and south it is bounded by two elevated mountain-ranges, the Thian-shan and the Altai Mountains. The space between the two ranges is traversed by numerous minor ranges, which lie in every direction, and divide the surface into numerous river-basins, which are entirely separated from one another, and each of which contains a lake, the receptacle of its drainage.

Thian-shan Mountains.—This extensive range of mountains extends in its western prolongation far into the Caspian Desert. The most western branch is known by the name of Ak-tagh, which occurs about 50 miles N. from Samarcand in Bokhara, near 41° N. lat., 67° E. long. From this point it extends eastward to the east of the meridian of the town of Hami in Chinese Turkistan; and seems, as far as is known, to terminate near 95° E. long. The extent from west to east is about 1400 miles. The Thian-shan do not greatly deviate from a circle of latitude, as their western extremity is near 41° N. lat., and their eastern between 43° and 44° N. lat.

The *Ak-tagh* rises boldly out of the steppe, but not to a great elevation, nor does it occupy a great width. Where it approaches the descent from the high table-land to the lower country it decreases in elevation and width, and takes the name of the *Aferah Mountains*. At the road which traverses the chain between Kashgar in Chinese Turkistan, and Khokhand, the range is probably 100 miles across, and rises so high that it is covered with snow nearly the whole year round: some parts even seem to rise above the snow-line. East of this road the mountains are called *Mus-tagh*, or *Moosoor*, and this name has been adopted to designate the range of the Thian-shan as far east as the great mass of the Bogdo Oölo Mountains, near 85° E. long. The western part of the *Mus-tagh* is stated to contain many high summits which are always covered with snow; but south of the Lake of Issikul, or *Temurtoo*, where it is crossed by two roads leading from Kuldsha, or Ili, to Uchi and Kashgar, the mountains are much below the snow-line. About 60 miles farther east however, where the road between Kuldsha and Aksoo traverses the chain, the snow-masses occupy from 9 to 10 miles of the central portion of the range, and those masses are stated to extend to a great distance east and west of the road. The higher portion is said to occupy about 40 miles in width; and when the lower heights which are contiguous to it on both sides are added, the whole breadth of the Thian-shan at the road can hardly be less than 80 miles. East of 85° E. long. is the *Bogdo Oölo*, which lies north of Karashar, and seems to be the most elevated and most extensive mountain mass of the Thian-shan. According to the information of the natives, the masses of snow and ice, and the glaciers which cover its summit, occupy a great space, and attain a considerable elevation above the snow-line. There is no road over this range between that which leads from Kuldsha to Kutche (83° E. long.), and another by which the range is traversed west of Turfan (89° E. long.), a distance of 300 miles. The most eastern part of the Thian-shan, or that which lies between 89° and 95° E. long., is very little known. Along the road west of Turfan, which leads from this place northward to Urumtsi, there are some snow-covered mountains; but farther east the range is considerably lower, and near 95° E. long. it terminates as abruptly in the eastern desert as the *Aktagh* rises in the western. It is indeed supposed that this mountain range continues through the Gobi until it unites, near 106° or 107° E. long., with the *In-shan*, which lies north of the great northern bend of the Hoang-ho; but this supposition is not borne out by the scanty information that we possess about this part of Asia.

Altai Mountains.—The Altai Mountains which bound Songaria on the north are described in a separate article. [ALTAI MOUNTAINS.] The part of the Altai range which lies south of the rivers Naryn and Bukhtarma, and consequently within the Chinese empire, and in Songaria, has been found to be the most elevated part of this mountain system which is known. South-east of the Kolson or Kolzun Bielki, or the Snow-Mountains of Kolson, which are the highest in Siberia, is what is called by the Russians the *Kurtahum Bielki*, or the Snow-Mountains of Kurtahum, which attain a much greater elevation, and form on their snow-covered tops an extensive ice-field above which no summit rises. But a very high summit stands near 88° 20' E. long., and this properly is called by the natives *Egtag Altai*, or *Great Altai*.

Mountain-Chains within Songaria.—It was formerly supposed that a continuous elevated chain of mountains connected the *Mus-tagh* with the Altai Mountains, and that this chain ran in a direction south-west and north-east. Such a chain does not exist. There is however an

uninterrupted continuation of high ground between both mountain systems. So far as is known, this high ground does not in any place fall to the common level of the country, nor even sink low enough to lose the appellation of mountains, and in some places it rises above the snow-line. The most elevated portion is the range called *Iren Khabirgan*, which at its eastern extremity is connected with the Bogdo Oölo. From the point of connection with that mass it first runs north-west, but afterwards turns west, and may be said to terminate with a considerable depression north of the town of Ili, or Kuldsha. The length of this chain may be about 200 miles, and we infer that it must rise to a great elevation and contain much snow on its summits, from the circumstance that the great road from Peking to Kuldsha traverses the chain at the depression north of Kuldsha, and does not cross it farther east, though if it did the road would be considerably shorter. The western continuation of the *Iren Khabirgan* is called the *Tokty Mountains*. This chain soon turns to the north-west and north, and extends along the western shore of Lake Alakul, or Alaktau-kul, until it terminates at the *Tarbagatai Mountains*. This last-mentioned chain runs east and west. The *Tokty Mountains* are of moderate elevation, but it is stated that near Lake Alakul a summit occurs which is always covered with snow. The chain is much lower which extends from the northern declivity of the *Tarbagatai Mountains* first northward and then north-eastward, until it terminates on the banks of the river *Irtish*, constituting in this part the boundary between the empires of China and of Russia. This most northern prolongation is called the *Kheirek Mountains*, which are separated from the Altai by the narrow valley of the *Irtish*. Another chain of mountains is connected with the *Tokty Mountains* near the south-western corner of the Alakul Lake. It is called *Ala-tau*, a name frequently occurring in these parts of Asia; and it extends first eastward to a short distance, and then north-east, until it joins the *Egtag*, or *Great Altai*, near the sources of the *Irtish*. The eastern extremity of the *Tarbagatai Mountains* is immediately connected with the *Ala-tau*. The *Tarbagatai Mountains* run about 400 miles east and west, and terminate, like the *Ak-tagh*, abruptly in the western desert. They seem to rise from 4000 to 6000 feet above the sea, and in some places snow in small patches is found even in summer. These ridges, and some others, less elevated or less known, divide the greater part of Songaria into numerous closed basins.

The basin of Lake *Issikul*, or *Temurtoo*, occupies the most south-western part of Songaria. The lake is nearly 100 miles long from east to west, and about 35 miles wide. At no great distance from its shores mountains inclose it on all sides, from which the lake receives a great supply of water. The surplus waters are carried off by the *Tchoui*, a river which leaves the lake at its western extremity, and traverses a great extent of the *Khirghis Desert*. On the south of the lake is the *Mus-tagh*, and on the north of it is a chain called *Ala-tau*. It is said that these mountains contain iron-ore which is worked.

East and north of Lake *Issikul* is the basin of the river *Ili*, which falls into the Lake of *Balkash*. It is the largest and most important of the basins of Songaria; it extends more than 400 miles east and west, and about 100 miles south and north, and probably has an area of 40,000 square miles. The *Ili* is formed by two head streams, the larger of which originates between 81° and 82° E. long., and runs under the name of *Tekes* north-east for more than 100 miles; the other and smaller branch originates in the angle between the *Iren Khabirgan* and the *Bogdo Oölo*, and runs west. From the place where these branches unite the river is called *Ili*, and runs to the west, inclining towards its termination to the north-west. It falls into Lake *Balkash* by several arms, after a course of more than 300 miles. Lake *Balkash* is the largest of the lakes of Songaria, and has no outlet, though it receives several other rivers from the north and east. The eastern half of the *Ili* basin has a very hilly surface, but it contains numerous tracts which are fit for agriculture. Since it has fallen under the sway of the Chinese the government has sent there a great number of military colonies, Mongols and *Mandshooes*, who unite agriculture with the breeding of cattle. Chinese convicts also are transported to the banks of the *Ili*. These Chinese are said to have already greatly contributed to change the face of the country by introducing several branches of cultivation. Farther west, about 80° E. long., the hills disappear, and the surface sinks to a level. The soil is much less fertile, and is chiefly covered with extensive bogs, in which only canes and rushes abound. It is nearly a desert, mainly tenanted by innumerable herds of wild hogs and other animals; but in approaching the country of the *Khirghis Cossaks*, south of Lake *Balkash*, it becomes a dry steppe, affording pasture-ground for horses, cattle, and sheep for several months in the year.

North of the eastern part of the basin of the river *Ili*, and separated from it by the *Iren Khabirgan* and the *Tokty Mountains*, is the basin of the Lake of *Borotala*, which is followed on the east by that of the Lake of *Ayar*, whose eastern extremity is contiguous to the basin of the Lake *Khulusutai*. The three basins occupy a line of at least 460 miles from east to west, near 45° N. lat. Only the western portion of the first basin has been visited by Europeans, and of the others some account is given in the Chinese geography. According to this information, it seems that this region, which extends to the base and over the northern declivities of the *Thian-shan*, is well watered, as a number of small rivers descend from the snow-covered

mountains, which in summer supply abundant means of watering the soil. It is stated that the Chinese and Mongols who have been transplanted to this country have made considerable progress in cultivating the ground, and that it is rather populous. But the cultivable and cultivated space is not of great width, as the rivers at a distance of 20 or 30 miles from the base of the mountains arrive at the lowest depression of the basins, and there form the three above-mentioned lakes, which are surrounded by extensive swamps. We have no information respecting the country to the north side of the lakes, nor respecting the extent of the lakes themselves.

North of the basins of the lakes of Ayar and Khulusutai are several smaller basins, and a larger one which is drained by the river Urungku, which falls into a large lake called *Kisibash*, or *Khassibash*. We are entirely unacquainted with the natural capacities of this region, and only know that the greater part of the Turgut Mongols, who left Russia in 1771 and 1772, were settled in these parts, whence we may infer that it is more fit for pasture than agricultural purposes.

The basin of the Lake Kisibash lies south-east of the basin of the river *Irtish*, which occupies that extensive tract of country which is south of the *Egtag*, or Great Altai, and north of the chain of the *Tarbagatai* Mountains, and is closed on the west by the low ridge of the *Kheirek* Mountains. This extensive basin was explored by command of Peter the Great. The expedition sailed to the Lake of *Zaisang*, from which the river issues. The lake is about 70 miles long and 10 miles wide, and abounds in fish. The banks are swampy and overgrown with reeds. The river *Irtish*, which originates in the *Egtag* Altai, enters the lake at its eastern extremity, after a course of about 250 miles. It may be navigated to a considerable distance by large river barges. The country about the lake was, when first visited, in possession of the Songares, and no part of the basin at that time seemed to be cultivated. At present, some tribes of *Khirghis* Cossaks are found in these parts, and they occupy this country exclusively, with the exception of a few Chinese and *Mandshoo*, who are established along the boundary-line of Siberia. In the eastern districts of the basin however some tribes of the Songares have maintained their footing. Nearly all of them lead a wandering life, and some live by the produce of the chase. The Russians, who dwell farther north on the banks of the *Irtish*, with the permission of the Chinese authorities carry on an extensive fishery in the river below its efflux from the lake, and a few of them advance even across the lake to the upper course of the river.

Between the *Tarbagatai* Mountains on the north, and the *Alatau* range on the south, is the basin of Lake *Alakul* and of the river *Imyl*. The lake is said to extend more than 60 miles east and west, and about half that length north and south. The course of the river does not much exceed 100 miles. The level part of the basin has a soil consisting of gravel, and consequently of little fertility, but at the base of the mountains and along the rivers there are many fertile tracts of considerable extent, which are cultivated with care by the *Khirghis* Cossaks, who came after the Songares had left the country.

In the Lake *Alakul* there is a lofty island called *Aral-tube*, which is an extinct volcano. Two other extinct volcanoes occur in the *Thian-shan* Mountains, the western called *Pe-shan*, near 83° E. long., and the eastern called *Hotaheou*, north of *Turfan*, near 90° E. long. Along the northern declivity of the *Thian-shan* Mountains there are several tracts which are covered with volcanic products, and on which sal-ammoniac and sulphur abound. It seems therefore that here, nearly in the centre of Asia, and at a distance of from 1000 to 1800 miles from the sea, an extensive volcanic system has once been in action, and the earthquakes, which even in modern times have been felt in this country, show that this powerful cause is still in operation.

Climate.—As this country is placed between two great deserts, which are no less distinguished by great heat in summer, than by severe cold in winter, we may suppose, in the absence of all positive information on the subject, that Songaria partakes of both in a considerable degree. Rain, which is so rare in the deserts, does not appear to be abundant in Songaria, as we must infer from the circumstance that where the ground is cultivated irrigation is practised; in winter however snow falls in considerable quantities.

Productions.—Wheat, barley, and millet are cultivated, but rice only in the southern districts, especially on the banks of the *Ili*. Tobacco is very extensively grown, and vegetables abound. There are excellent melons of several kinds. The lower declivities of the mountains are covered with trees, but the greater part of the country is destitute of them. The most common trees are pines, mountain-ash, poplars, willows, lime-trees, and birch.

The herds of the wandering tribes consist of horses, camels, cattle, and sheep. Deer, argali, and wild hogs are extremely numerous. Most of the lakes abound in fish. The fish taken by the Russians are chiefly sterlets, sturgeons, white salmon, *Salmo Aviatilis*, and *Gadus lota*.

The minerals which are mentioned are sal-ammoniac, sulphur, salt, iron, and coal. The last two minerals are found in abundance a few miles west of *Kuldsha*.

Inhabitants.—The *Khirghis* Cossaks possess the western districts since the downfall of the empire of the Songares. In the other parts of Songaria the different nations of the *Olöth* or *Kalmucks* form the

bulk of the population. The most numerous are the *Turgut*, or rather *Toorgoot*, who emigrated from Russia in 1771 and 1772, and were then estimated to amount to about 80,000 families. The two united nations of the *Olöth* proper and the Songares are dispersed over the whole country, and among them are settled the nations which, since 1757, have been sent there by the court of Peking, the *Tshagar* Mongols, the *Mandshoo*, and the Chinese themselves. The *Mandshoo* and Chinese are engaged in agriculture, commerce, trade, or employed by government. The *Tshagars* are soldiers and agriculturists, and chiefly live in the military colonies. The majority of the other tribes live on the produce of their herds, but many of them apply themselves to agriculture.

Divisions and Towns.—The eastern districts, or those which extend along the northern base of the *Thian-shan* Mountains, have been incorporated into the province of *Kansi*, which constitutes an integral part of China proper. The western districts are united under a provincial government, established at *Kuldsha* on the *Ili*, and constitute the government of *Ili*. These two parts together are also known under the name of *Thian-shan Petsu*, or the North Road of *Thian-shan*, as the great road from Peking to the north-western boundary of the Chinese empire traverses them in their length. The northern districts, that is, the basin of the rivers *Irtish* and *Urungku*, and some smaller basins, constitute a part of the government of *Khobdo*, or *Gobdo*, the greater portion of which lies east of the *Egtag* Altai.

That part which belongs to the province of *Kansi* contains the towns of *Barkol* and *Oorum-tai*. *Barkol*, called by the Chinese *Tshin-si-fu*, is near the eastern extremity of the *Thian-shan* Mountains, north of *Hami*; it is a fortress with a considerable garrison, and it has some commerce on account of the great road passing through it. The country in which it is built seems to be very elevated, as it is stated that snow sometimes occurs in July. *Oorum-tai*, or *Urum-tai*, which lies about 250 miles farther west, near the base of some offsets of the *Bogdo Oöla*, in a very fertile district, consist of two towns, *Old* and *New Oorum-tai*, which are about two miles from one another. They are well built, with wide streets. The military colony originally established at these places consisted of 8000 families. The town has a large population, and is considered to be the most thriving and industrious place in Songaria. The Chinese have established several manufactures and schools. The Chinese name of *Oorum-tai* is *Ty-hu-ohoo*. It is a town of the second class, the capital of the western district of *Kansi*. It carries on a considerable trade with *Kuldsha* and *Tarbagatai*.

The capital of the government of *Ili* is *Kuldsha*, or *Gouldsha*, called also *Ili* and *Kura*, and by the Chinese *Hoei-yuan-shing*. It stands about a mile from the banks of the river *Ili*, and is inclosed with a wall built of hewn stone 18 feet high. It contains about 10,000 houses and 50,000 inhabitants, and is the seat of the provincial government, and of the military administration of the army, which is posted along the western boundary of the Chinese empire. It carries on a considerable trade with *Oorum-tai* and *Signan* in *Shensi*, and also with *Kashgar* in Chinese *Turkistan*, and with *Tarbagatai*. About 9 miles N. from *Kuldsha* is *Kashmir*, or *Kashmir-hure*, a modern town with 3000 houses, mostly inhabited by Chinese settlers, who are very industrious. *Tarbagatai*, called by the *Khirghis* Cossaks *Toogotshuk*, and by the Chinese *Sou-shing-ching*, is situated not far from the southern base of the *Tarbagatai* Mountains, and is fortified. It contains about 600 houses, and 5000 inhabitants, of whom 2500 belong to the garrison. It carries on a considerable commerce with the *Khirghis* Cossaks, and has some trade with *Kuldsha*, *Oorum-tai*, and *Khobdo*.

That part of Songaria which belongs to the government of *Khobdo* appears to be almost entirely occupied by wandering tribes, and cultivation is hardly known. There are neither towns nor villages.

Commerce.—The town of *Kuldsha* is the centre of a considerable commerce with China. The most active branches seem to be the trade with China proper, and with the town of *Aksoo* in Chinese *Turkistan*; that with *Semipalatinskaya* in *Siberia* is less important. The principal imports are Chinese manufactures, which are consumed by the Chinese and *Mandshoo* families established in Songaria. Some of these articles, especially chinaware, are sold to the nomadic tribes.

The road from *Kuldsha* to *Aksoo* in Chinese *Turkistan* runs directly south, and crosses the *Thian-shan* Mountains a considerable distance east of the town of *Aksoo*. On the summit of the range a space 10 miles wide is covered with snow. The principal imports from *Aksoo* are cotton stuffs, made in the place or imported from *Kashgar* and *Khoten*. By this route also a few of the manufactures of *Hindustan* are brought to *Kuldsha*, especially muslins of indifferent qualities; some stuffs, half silk and half cotton; and several kinds of calicoes.

The road from *Kuldsha* to *Semipalatinskaya* separates from the road to *China* proper at the foot of the *Tokty* Mountains running northwards to *Tarbagatai*, and from this place it continues north, passing along the western banks of Lake *Zaisang*, until it enters *Russia*, where it turns north-west to *Semipalatinskaya*. The Russians import only cattle and sheep; and this they are permitted to do not as Russians but as subjects of some khan of the *Khirghis* Cossaks. They are paid in cotton stuffs of *Aksoo*, *Kashgar*, and *Khoten*.

Government.—The government of this province is on a military footing. The commander-in-chief of the troops is also invested with

the civil authority. The army stationed in Songaria probably consists of more than 60,000 men, of whom 28,000 are quartered in Kuldsha and the neighbourhood. The whole population of the country probably falls short of two millions, and three-fourths of this number are wandering tribes, who are very lightly taxed. The expenses therefore are much greater than the revenues. The Chinese government sends many goods from China, which are partly disposed of to the Khirghis Cossaks for cattle and sheep for the soldiers: a considerable quantity of silver also is annually received from Peking.

History.—After the eastern Mongols had conquered China, in the second half of the 13th century, the greater part of that nation settled in the conquered countries. Thus the population of their own native country was considerably diminished; and the Western Mongols, or Olöth, also called Kalmucks, began to extend farther to the east, and to increase in numbers. On the downfall of the Mongol dynasty in China, in 1368, the greatest number of the Eastern Mongols who had been settled in China perished in war, and only a small remnant returned to their native country. They found that their neighbours the Kalmucks were now more powerful than themselves; but the great fame which the Eastern Mongols had acquired by the exploits of Ghengis Khan and the conquest of China, kept the Olöth in awe for more than two centuries. In the 17th century however a war broke out between the Khalkas Mongols and the Galdan, or Khan of the Olöth, who wished them to acknowledge his supremacy as he had compelled the Songares and other tribes to do. The Khalkas were expelled from their country, and compelled to fly towards the country occupied by the Sunnites and Tahagar, two tribes which were already subject to the Mandshoos. To avoid destruction they submitted to the Chinese emperor (1688), and requested protection against their enemies. The emperor Kang-hi sent three armies against the Galdan. These forces, aided by Tse-vang Arabdan, the khan of the Songares, defeated the Galdan in several engagements, so that he was abandoned by nearly all his followers, and died by taking poison (1697). The Khalkas Mongols now returned to the country from which they had been expelled by the Olöth. On the ruins of the power of the Olöth rose that of the Songares. Tse-vang Arabdan subjected to his authority all the chiefs of the Olöth proper, conquered Turkistan, obliged another branch of the western Mongols, the Toorgut, to abandon the country west of Songaria, and to retreat to the banks of the Volga and Don, and took possession of Tibet. Thus nearly all the elevated region of Central Asia was subjected to his sway. A war with China followed, in which the Chinese armies were generally successful in expelling the Songares from the conquered provinces, but they could not get possession of Songaria. The death of the emperor Kang-hi and that of Arabdan occurred about the same date (1723), and for some time Songaria was torn by internal wars, in the course of which the throne was occupied by two usurpers, called Davatai and Amursana. Though at first closely united, they soon disagreed, and Amursana took refuge in China, where he was well received, and sent back (1755) with a Chinese army, as the lawful occupant of the throne of the Songares. The expedition was successful: Davatai was taken prisoner, and died soon afterwards. But Amursana did not intend to be a vassal of the emperor: he soon collected a large force, and destroyed two Chinese armies which were sent against him; but he was obliged to yield to the third (1757), which took possession of the whole country of Songaria and Turkistan. These continual wars nearly reduced the country to a desert. The Chinese wishing to re-people it, induced the Toorgut, who had taken refuge in Russia, to return to their native country in 1771 and 1772.

(Ritter, *Erdkunde von Asien*, vol. i.; Humboldt, *Fragments Asiatiqnes*.)

SONNING. [BERKSHIRE.]

SONORA. [MEXICO.]

SONSONATE. [SAN SALVADOR.]

SOODAN, or BELE'D EL SU'DAN ('the Country of the Blacks'), is a term applied by the Arabs to designate the interior of Africa; but, according to the geographical position of the country in which it is used, this term indicates different portions of that continent. The inhabitants of Egypt apply it to the countries south of the second cataract of the Nile (22° N. lat.), and a province has been formed of the countries in these parts which have been subjected to the sway of the pasha of Egypt, under the name of Beléd el Súdán. [SENNAAR.] The Arabs who trade to or are settled in Bornou, which is about 400 miles west of the Egyptian province, call 'Súdán' the countries which are still farther west, towards the middle course of the Quorra. The geographers of Europe designate all the countries along the southern edge of the Sahara from Senegambia and Sierra Leone on the west, to Dar-Fur on the east, by the term Súdán. Thus Súdán extends from 10° W. long. to 25° E. long., and is 2400 miles in length, with a supposed average width of about 350 miles, including an area of about 900,000 square miles. Its northern boundary towards the Great Desert is imperfectly known. In one part, at the most northern bend of the Quorra or Joliba, the fertile country extends to 17° N. lat.; but in other places, as in the vicinity of Lake Tchad, it does not come up to 14° N. lat. West of the course of the Quorra the southern boundary is formed by the Kong Mountains, between 7° and 11° N. lat.

Nearly up to the end of the last century this country was only known by the descriptions of the Arabian geographers and of Leo

Africanus. At that time (1790) the first European traveller, Houghton, entered Súdán from the west; but he was killed in 1791. The succeeding travellers were Mungo Park, in 1796 and 1797, Denham and Clapperton, between 1822 and 1826, Caillié in 1828, and Richard Lander, in 1830. The information we possess refers chiefly to the western and central districts of Súdán, the eastern not having yet been described by any European traveller.

Western Súdán comprehends the country west of the course of the Quorra, from Timbuctoo to its entrance into the delta at Abbazaca. The southern border of Western Súdán is formed by the Kong Mountains. Most of the rivers that descend from this mountain range to the south and north have very little water in the dry season. In the eastern part of the Kong Mountains the surface generally consists of a fertile soil, covered in some places with forests, but in others cleared and cultivated. The forests consist chiefly of tall trees, the intervening spaces being covered with luxuriant grasses. These forests abound in deer, antelopes, lions, leopards, elephants, wild asses, buffaloes, and hyænas; and in the Quorra the hippopotamus is common. The country, where cultivated, yields plentiful crops of indigo, tobacco, yams, wheat, and other kinds of corn, rice, onions, and other vegetables; and in the extensive pastures, great numbers of horses, bullocks, sheep, and goats are fed. In the neighbourhood of the river Quorra, the region is rather densely inhabited, and villages are numerous. There are also several large towns.

The country extending from the northern base of the Kong Mountains to the edge of the Sahara may be considered as a plain, the elevation being inconsiderable, and at wide intervals apart. The soil of this extensive tract is chiefly gray sand, alternating in some places with red sand, and frequently mixed with gravel, argillaceous earth, clay, and mould. In the vicinity of the watercourses it is subject to inundations for more than six months of the year. The more distant parts have the advantage of abundant rains. There are many shea-trees and nedés, the fruits of which are much esteemed by the natives; and the indigo plant abounds in several parts. The more fertile tracts are cultivated. The most common objects of cultivation are maize, millet, rice, tobacco, yams, onions, cotton, French beans, and water-melons. The colat or gora nuts are here collected, which constitute an important article of commerce all over the Western Súdán, and are carried from the Kong Mountains to Timbuctoo, and even to Tripoli. Domestic animals abound in most parts, especially black cattle of good size, sheep, and goats; the horses are of a small breed, except at Tangra, where they are rather large and of fine form. There are also asses and abundance of poultry. Dogs, serpents, lizards, rats, and mice serve as food to the natives. Fish abounds in the rivers. Wild bees are numerous, and wax and honey are largely consumed, and are also sent to other parts of Africa.

In this country the month of August is extremely stormy; and rain incessantly falls. It continues to fall every day until October, when though less frequent, the showers are still heavy, and set in with hurricanes from the south-east. In proportion as the rain diminishes, the heat increases, and the air becomes less damp and more salubrious. About the end of October the rains cease entirely, the days become exceedingly hot, and the nights cool. In November and December the weather is very fine, and the wind blows frequently from the north-east and sometimes from the north. A cold north wind begins to prevail at the end of December. At this season the trees shed their leaves.

The country between 10° 30' N. lat. and the southern banks of the Joliba River is less fertile. The surface of the country is slightly undulating or a level. Several tracts which are a little depressed below the general surface are swamps during the greatest part of the year, whilst others are always in this state. The first are either used as pasture-grounds, or rice is cultivated on them, as well as on the borders of the others, and along the alluvial banks of the rivers. Shea-trees and nedés are dispersed over large tracts, and here nearly all the vegetable butter is collected which is consumed on the banks of the Joliba as far as Timbuctoo. In a few places the baobab trees abound, whose leaves and fruit supply another article of trade to the countries farther north. In the more fertile tracts millet is extensively cultivated. The *Hibiscus cannabinus* abounds in many places, and ropes are made for sale at the markets on the Joliba, where these ropes are used to fasten together the boards of which the barges are made. The marshes are frequented by numbers of aquatic birds. From the ferruginous stones, which are so frequent in this region, iron is extracted, and is an article of export to the banks of the Joliba. The country along the banks of this river is annually inundated to a considerable extent. A great part of it has been converted into marshes, which serve as pasture-grounds; but on the drier parts rice, maize, and other grains are cultivated.

That part of Western Súdán which is north of the Joliba and the marshes contiguous to the river is tolerably fertile to a considerable distance from its banks. It is a plain, with occasional sandy hills and rocky eminences. The soil produces plentiful crops of millet and maize. Villages and towns are numerous. But in proceeding farther north, the soil becomes less fertile, as the sand of the Sahara is frequently thrown upon it by the strong north-eastern winds. There are numerous wild animals, as elephants, lions, panthers, leopards, and wild hogs. Among the domestic animals are camels.

The country on both sides of the Joliba is sultry and oppressive before the setting in of the rains. About the middle of June the heated atmosphere is agitated by violent gusts of wind, accompanied with thunder and rain. These usher in the rainy season, which continues to the month of November. The prevailing winds are from the south-west. The termination of the rainy season is likewise attended with violent tornadoes, after which the wind shifts to the north-east, and continues to blow from that quarter for the rest of the year. When the north-east wind sets in the grass becomes dry and withered, the rivers subside very rapidly, and the trees shed their leaves. At this period the 'hamattan' is commonly felt, a dry and parching wind blowing from the north-east, and accompanied by a thick smoky haze, through which the sun appears of a dull red colour. As this wind passes over the Great Desert, it becomes exceedingly hot and dry as it approaches Súdán, and parches up everything which is exposed to it.

Central Súdán comprehends that portion which extends from the river Quorra, where it flows southward, as far east as Lake Tchad and the river Shary, which falls into the lake, or from 5° to 16° E. long. It may be divided into two regions, a hilly, and an alluvial plain. The first occupies the country west of 11° E. long., and the plain occupies the remainder.

The hilly region seems to extend to the very border of the Sahara, which in these parts occurs between 14° and 15° N. lat. The surface is extremely diversified in character and in productiveness. The highest hills which have been seen are not much more than 700 feet above their base, and the general level of the country seems to be about 1000 or 1200 feet above the sea. A great part of this region extends in level plains, which are chiefly converted into large swamps or temporary lakes during the rainy season, but this circumstance is favourable to fertility. A large tract in which the swamps exist all the year round, situated north of 13° N. lat. and between 6° and 8° E. long., is known by the name of the Gondami Swamps. Hills of granite, of moderate elevation, inclose this tract on all sides, and prevent the water which collects on its surface from running off in any direction. These hills are covered with stunted trees, whilst the country between them and the swamps is overgrown with forests. Nearly all the rivers and watercourses of this region are very rapid and deep during the rainy season, but in the dry season only pools, sometimes single, sometimes in rows, occupy the lowest part of their bed. The soil retains moisture all the year round. Clay constitutes the predominant soil; in several places it is intermixed with gravel, and in others covered with a thin layer of sand. Its quality of retaining moisture for a long time, even under a burning sun, renders this region the most fertile tract of Africa north of the equator, and is populous in spite of the continual wars between its sovereigns, and its being situated in the centre of Africa and being nearly secluded from commercial intercourse with other parts of the world. The grains which are generally cultivated are rice, Indian corn, Guinea corn, and millet. Cotton, tobacco, and indigo are grown to a great extent. Yams, sweet potatoes, beans, and other vegetables are cultivated. In the districts south of 10° N. lat. palm-oil and cocoa-nut trees abound. In the same places plantains and bananas are grown in abundance. In the eastern districts date-trees are common. The fruit-trees which are most common are figs, pomegranates, limes, papaws, and tamarinds; the butter-tree also abounds in several places; the mango tree is cultivated, and occurs also in a wild state. The fields are often watered from deep wells.

The domestic animals are goats, sheep, asses, horses, and cattle. The horses are small, but along the northern border they are large and of a good breed, which is derived from that of the Tuariaks of the Sahara, but it is not equal to the Arab breed. In these districts many camels are also raised. Poultry abounds. In some woody parts, especially in the neighbourhood of the swamps of Gondami, there are numerous wild animals. Iron is the only mineral: it occurs in many places, and a small quantity is exported to the countries farther east. In this region the rainy season sets in at the end of May or beginning of June, and continues to the middle of September. The fall of rain is less, and is not so continuous, as in some other districts. Even in the height of the season, in August, there are several days without rain, and a continuation of rain for 24 hours is a rare occurrence. The prevailing wind changes regularly to all quarters of the compass. The diurnal change of the temperature is very great, the difference often amounting to 20 degrees, and sometimes to 25 and even 30 degrees, especially during the north-eastern winds. The natives keep fires all the year round in their huts.

The Plain of Central Súdán extends from 10° E. long. to Lake Tchad and the river Shary, and from 14° to 10° 30' N. lat., where it lies contiguous to a hilly country. This plain is probably the largest alluvial tract on the globe which occurs far inland, if the plain surrounding the Caspian Sea is excepted, which is of a different character. The alluvial plain of Súdán is nearly a dead level. It is very fertile, but not easily cultivated, owing to the rank vegetation caused by the rains. The southern districts however are in general rather populous, and a considerable portion of them is cleared and cultivated, but the country on both sides of the river Yeou is not much cultivated, and it is exposed to the predatory incursions of the Tuariaks, who inhabit that part of the Sahara which extends north of the plain. In many

parts there are extensive forests. The soil is a dark clay, which cracks during the dry season. The climate of this region differs considerably from that of the hilly region. It is in general much hotter, but the daily range of the thermometer is much less. The country therefore, notwithstanding the moisture of the air during and after the rainy season, is more healthy than in the hilly region. The mean annual temperature is 83·6°, that of the winter (December-February) 76·2°, of the spring (March-May) 90·3°, of the summer 84·6°, and of the autumn 82·7°. From the beginning of March to the end of July the heat is excessive, but not uniform. The nights are oppressively hot, but towards sun-rise the thermometer usually falls to 86° or 85°. Towards the middle of May the rains set in with violent tempests of thunder and lightning. The rain pours down in torrents, and continues sometimes for two or three days. Up to the end of June the ground, having been parched during the dry season, absorbs all the rain, but towards the end of July the lakes and rivers begin to overflow, and tracts of many square miles in extent are quickly converted into large lakes. The weather is without interruption cloudy, damp, and sultry; the wind hot and violent, and generally from the east and south. In October the rains are less frequent, the air mild and more fresh, and the weather serene; the wind blows from the north-west. December and January are rather cold. In February the heat increases rapidly. The principal objects of cultivation are gussup, which is a kind of millet, maize, cotton, and indigo. Kaheia and meloheia are two kinds of grass growing wild, the seeds of which are used as grain.

The domestic animals constitute the wealth of this country. Sheep, goats, cows, and oxen are numerous. In the lowlands, along the banks of Lake Tchad and the river Shary, many thousand head of cattle are pastured, and all over the country black cattle are very numerous. There is also a good breed of horses. Domestic fowls are very common; they are small, but well flavoured. Bees are very numerous, and honey constitutes an important article of food. There are lions, panthers, tiger-cats, leopards, hyenas, elephants, gazelles, antelopes, and other wild animals. The most common wild birds are pelicans, spoonbills, and Balearic cranes of large size. Ostriches are found along the northern boundary-line. Fish are numerous in the lake and the lower course of the river.

Rivers.—The largest river is the Quorra, which in the upper part of its course is called Joliba. This river is navigated in its whole extent, nearly from its source. Its course and its affluents are mentioned in the article NIGER, in which is also a notice of Lake Tchad, and of the rivers which flow into it.

Inhabitants.—The population is composed of aborigines who belong to the negro race, and foreigners. The negroes are almost exclusively the inhabitants of the mountain region of Kong, but in the plain north of that range they live intermixed with Mandingoes and Foulahs. In the hilly region of Central Súdán the negroes constitute the bulk of the population, but they are governed by Felláts, and in the eastern plain they are intermixed with Arabian tribes, which have here the ascendancy. These negroes live in small well-built huts, and generally wear a slight but decent dress, which is adapted to the climate. They apply themselves to agriculture, and in some parts the ground is cultivated with a considerable degree of skill. They manufacture great quantities of cotton-cloth, only from 5 to 6 inches wide, but of good texture. They are also expert in forging iron. They make arms, agricultural implements, and even needles. They also make earthenware of a grayish colour. The foreigners settled in Súdán are Mandingoes, Felláts, and Arabian tribes. The Mandingoes are only met with in the plain north of the Kong Mountains, where they have settled as merchants. They have attained a superiority by their higher degree of civilisation, and by being Mohammedans. Their language is generally spoken in all that part of the country in which they have settled. The Felláts are the same nation which in Senegambia is known by the name of Foulahs (SENEGAMBIA), and they speak the same language. It appears that the Felláts first settled in considerable numbers in the negro towns, like the Mandingoes, but towards the end of the last century they entered the country as conquerors, under the conduct of Danfodio, with a large army, and subjected in a few years the whole of Central Súdán to their sway. After the death of Danfodio however the sheik of Bornou succeeded in expelling them from the alluvial plain, but in the mountain region south of Mandara they have maintained their footing. The Arabs settled in Súdán are only found in the neighbourhood of Lake Tchad, where they lead a wandering life, living on the produce of their cattle, and are known by the name of Shouas.

Political Geography and Towns.—Súdán contains many large and small states, and there occur also extensive tracts, in which the inhabitants live in a peaceful state of society, without having entered into a political union. We shall notice these political divisions in the order of the natural regions:—

I. The Mountain Region of Western Súdán, or that of the Kong Mountains, is only partially known, between 3° and 7° E. long., and comprehends two extensive countries, Yarriba and Borgoo. The small river Moussa, which falls into the Quorra near 9° 20' N. lat., divides Yarriba from Borgoo. Borgoo seems to extend westward to a great distance. This region is very populous, and contains many

villages and towns. The kingdom of *Yarriba* seems to extend westward to the very boundary-line of *Ashantee*: on the south-west and south it is separated from the *Bight of Benin* only by the kingdom of *Dahomey* and a country called *Jaboo*. The *Quorra* divides *Yarriba* from the kingdoms of *Nyfi* and *Yaouri*. The present capital is *Eyeco*, or *Katunga*, which is situated in a fertile valley, about 20 miles from the river *Quorra*. It is inclosed by walls built of clay, about 20 feet high, and surrounded by a dry ditch. The walls are built in an oval form, and are about 15 miles in circumference. The king's houses are built of clay and have thatched roofs. A considerable part of the space inclosed by the walls is laid out in gardens or cultivated, and the population is about 20,000 individuals. The second town of the kingdom is *Bohoo*, which was formerly the capital of the kingdom. It has a triple wall, which is rather more than 20 miles in circuit, and is built on the slope of a very gentle and fertile hill, in an exceedingly well-cultivated country.

There are several large towns built on the banks of the *Quorra*, as *Lever* or *Lyaba*, near the boundary of *Borgoo*, which is very extensive and has a great population; *Bajiebo*, a flourishing and important trading town of great extent; *Lechee*, a very large and thriving place; *Egga*, which is of considerable extent, and has a large population; and *Kakunda*, which is governed by a sovereign independent of *Yarriba*, and consists of three or four considerable villages, situated within a short distance of one another. On the road leading from *Badagry* to *Eyeco* several other large towns are situated. Between *Eyeco* and *Bohoo* are *Etcho*, *Atoopa* (6000 inhabitants), and *Jagata*, a large and well-fortified town. South-west of *Bohoo* is *Kooso*, a large double-walled town, which has 20,000 inhabitants, and is a place of great trade; *Cháadoo*, with 7000 inhabitants; *Duffoo*, with 15,000 inhabitants, and considerable manufactures of cotton-cloth; *Assoudo*, with 10,000 inhabitants; *Assula*, with 6000 inhabitants; and *Jenna*, with from 8000 to 10,000 inhabitants.

Within the territories of the kingdom of *Yarriba* the *Fellátahs* have established some independent states, among which the towns of *Racca*, not far from *Eyeco* towards the north-east, and *Aloria*, south-west of the capital, are said to be very populous.

Borgoo, which lies to the north of *Yarriba*, consists, so far as we know, of ten states, governed by independent kings, and loosely connected with one another. The most powerful is the sovereign of *Niki*, and he is styled, by way of distinction, king or sultan of *Borgoo*. The countries of the kings of *Wawa*, *Kiáma*, and *Boosa* were visited by *Clapperton* and the *Landers*. The capitals have the names of the countries. *Kiáma* is built on the southern side of a rocky ridge, and surrounded by an extensive low clay wall; it is a commercial town, with 30,000 inhabitants. The houses consist of circular huts, built of clay and thatched. Inside the walls are plantations of corn and yams. *Wawa*, or *Wowow*, is a very neat and compactly built town, in the form of a square; it is surrounded by a good high clay wall and dry ditch. The streets are wide and airy, and the houses are of circular form, as in *Kiáma*. The town of *Boosa* is built on the banks of the western arm of the *Quorra*, which at this place divides into three branches, and it contains from 10,000 to 12,000 inhabitants. The houses are built in clusters inside the wall, and do not occupy above one-tenth of the ground inclosed.

Two caravan roads traverse this region, and are much frequented by merchants from *Houssa* and other countries of *Central Africa*. The most northern passes through *Kiáma*, and the southern through *Bohoo* and *Kooso*. These two roads lead to *Gonja*, a country lying west-north-west, either within the range of the *Kong Mountains* or along their northern base. The frequent fairs and market-days, which are regularly held in all the larger towns, show the degree of civilisation which this country has attained.

II. The southern part of the *Plain of Western Súdán* presents a remarkable instance of people living in society, and having attained a certain degree of civilisation, without entering into close political union. Towards the west, near the boundary of *Soolima* in *Sierra Leone*, and of *Foota Jallon* in *Senegambia*, there are some small states, among which we know *Sangara*, *Amana*, *Kankan*, and *Wassoolo*; but east of 7° W. long, each town and village, according to *Caillié*, is independent of the neighbouring towns and villages. Each place is inhabited by a mixture of *Mandingoes*, who are *Mohammedans*, and of *Bambarras*, most of whom are pagans. Still they live peaceably together, and the elders of each nation decide the differences arising among the people belonging to their nation. In this region no large towns are met with: some of them, which are situated on the caravan roads, contain a population of from 5000 to 7000 inhabitants, as *Kankan*, *Tangrera*, *Toomaneh*, and *Doosao*. *Kayaye* is said to be a larger place, but it has not been visited by Europeans. The commerce of this country is not considerable, and consists almost exclusively in the transport of the *colat-nuts* from *Gonja* to the countries on the banks of the *Joliba*, where salt is the principal article taken in exchange.

On the banks of the *Joliba* there are several kingdoms. That of *Booreh* comprises the greater part of the country between 9° and 7° W. long, on both sides of the river. It is inhabited by *Mandingoes*. The mountains which divide it from *Senegambia* are very rich in gold, of which a considerable quantity is annually obtained. The town of *Booreh* is said to be of considerable extent.

East of *Booreh* is the kingdom of *Bambarra* [*BAMBARRA*], in which

several towns of considerable extent are situated on the banks of the *Joliba*:—*Bammakoo*, a town from which the gold obtained from *Booreh* is sent down the river; *Marraboo* and *Koolikorro*, two places of some extent, which trade extensively in salt; *Baba*; *Yamina*, a place of considerable trade; *Sai*; *Sego* [*SEGO*]; *Sansanding* [*SANSANDING*]; and *Silla*.

East of *Bambarra* is the kingdom of *Jenneh*, the territory of which extends to the vicinity of 15° N. lat. It has obtained its name from *Jenneh*, the principal commercial town; but the capital and residence of the sultan is called *Ellam doo Lillahi* ('to the praise of God'), where there are said to be public schools in which children are taught gratuitously, and also schools for adults. The town of *Jenneh* is about six miles from the banks of the *Joliba*, but the whole country between the town and the river is cut up by numerous watercourses, so that river-vessels of 80 or 100 tons burden can come up to the town in the rainy season, and smaller vessels all the year round. The population may amount to 10,000. They send ivory, gold, rice, millet, honey, bees-wax, cured provisions, and onions; and also tamarinds, pimento, long pepper, leaves and fruits of the baobab, pistachio-nuts, beans, and colat-nuts, to *Timbuctoo*. Wax candles are made in *Jenneh*, and sent to *Timbuctoo*.

North of the kingdom of *Jenneh* is *Masina*, on the left side of the *Joliba*, and *Banan* on the right; they extend to the lake *Debo*. [*NIGER.*] North of the lake *Debo*, and on the east of the river, is an extensive country called *Dirimans*, whose capital is said to be *Alodia*. This country apparently extends to the vicinity of *TIMBUCTOO*.

In the north-western corner of *Súdán*, and contiguous to the boundary of *Senegambia*, are the kingdoms of *Kaarta* and *Ludamar*. *Kaarta* lies partly within the mountain range which constitutes the boundary between *Senegambia* and *Súdán*; and *Kassan*, which formerly was an independent kingdom, but has been conquered and united to *Kaarta*, is properly within *Senegambia*. *Kaarta* contains several very fertile plains and valleys. The capital is *Kemino*, and there are two large towns called *Asamangatory* and *Somantari*. The walls of *Asamangatory* are higher, stronger, and better constructed than those of any other town in these parts of *Africa*; and the town covers an extensive plain, noted for the quantity of earthenware which is there manufactured, and its great fertility in rice and onions. The kingdom of *Ludamar* borders on the *Sahara*, and consists of a succession of fertile and cultivated tracts and sandy deserts. The capital, *Yarra*, is of considerable extent, and the houses are built of stone cemented with clay. Other large places are *Deena* and *Sampaka*, which lie farther east than *Yarra*.

A large tract of *Súdán* extends along the southern border of the *Sahara*, between *Ludamar* and *Timbuctoo*. Of this tract the greater part belongs to the kingdom of *Boroo*, which appears to resemble *Ludamar* in productive powers, but is separated from the neighbouring states by sandy deserts. Its capital, *Wallet*, is said to be as large as *Timbuctoo*, and to carry on a very extensive trade in salt, which is brought from the great rock-salt mines of *Shingarín* [*SAHARA*], and sent to *Sansanding*, *Sego*, and *Yamina*, in *Bambarra*, where it is exchanged for corn and provisions.

III. The greater part of the hilly region of *Central Súdán* constituted at the beginning of the present century an integral part of the kingdom of *Houssa*, or was subject or tributary to it. This kingdom owed its foundation or its extension to *Danfodio*, after whose death most of the countries which he had subjected to his sway rose against his successor *Bello*, and several of those countries recovered their independence. The most populous and best cultivated districts are those which lie along the course of the *Quorra*, and the northern districts, between 11° and 13° 30' N. lat.

Along the banks of the river *Quorra*, from north to south, are *Yáoori*, *Nyfi*, and *Funda*. The capital of *Yáoori* bears the same name. It is a place of great extent and very populous, and is surrounded by a high wall upwards of twenty miles in circuit. The space inclosed is covered with clusters of huts, between which are cultivated tracts. In this place very neat saddles, country cloth, and gunpowder are manufactured. Where the countries of *Yáoori* and *Nyfi* join one another is the basin of the river *May-yarrow*, which is extremely fertile and thickly inhabited. There are here several large towns. *Tabra*, on both sides of the river, about 30 miles above its mouth, has about 20,000 inhabitants; *Koolfu*, on the northern banks of the river, a central point of inland trade, about 15,000 inhabitants; *Rajadawa*, about 7000 inhabitants; *Womba*, about 11,000 inhabitants; and *Guari*, a large and well fortified place, is the seat of a negro chief, who has made himself independent of *Houssa*. The capital of *Nyfi* is the town of *Nyfi*, which is known over all *Western Africa* for the excellent cotton-cloth made there. In *Nyfi* is the town of *Rabba*, built on the banks of the *Quorra*, on a gentle slope. It is the emporium of all the surrounding countries to a great distance, and several articles are brought to this place from *Tripoli* on the *Mediterranean*. It contains a population exceeding 40,000, and has manufactures of saddles and bridles made of red and yellow leather, cloth, shoes, boots, and sandals. Opposite the town, and near the western banks of the *Quorra*, lies the island of *Zagózhi*, which is 15 miles long and 3 miles in breadth, and being low is partly inundated in the rainy season. The inhabitants are partly sailors and fishermen, and partly employed in the manufacture of country cloth, which is of excellent quality.

There are several other branches of useful manufactures. Funda, the capital of the kingdom of Funda, is situated near the banks of the river Shary; it contains about 30,000 inhabitants, and has some manufactures of cotton cloth.

In the central districts of this region we are only acquainted with the countries of Zegzeg, Kano, Kashna, and Houssa proper. Zegzeg apparently extends between 8° and 11° E. long., 9° and 12° N. lat. In this country is the town of Kuttup, near 9° 40' N. lat., which comprises nearly 500 small villages, almost adjoining each other, and occupying nearly the whole of a vast and beautiful plain. A considerable traffic is carried on here in slaves and bullocks. Eggebee (near 9° E. long., 10° 50' N. lat.) is a very large and extremely neat town, surrounded with a high wall, and situated in the centre of a fine and highly cultivated plain. Zaria, or Zegzeg, the capital of this country, is inclosed by good walls, and contains a population of between 40,000 and 50,000, but a large portion of the area is occupied by swamps, corn-fields, and green plots. Rice of the finest quality is raised in the neighbourhood, and sent to distant countries. North of Zegzeg is Kano. Among the most remarkable places is Baesægie (11° 34' N. lat., 9° 13' E. long.), which is built in the midst of a large plain, and contains about 20,000 or 25,000 inhabitants, who are all engaged in trade. East of it is the town of Girkwa, a large place; and north-west of Girkwa is Kano, the capital of the country, and, as it appears, the most commercial town of Central Africa. It contains about 40,000 inhabitants, of whom more than one-half are slaves. During the dry months this place is resorted to by numerous travellers from all parts of Africa, from the Mediterranean and the Mountains of the Moon, and from Sennar and Ashantee. The city is of an irregular oval shape, about 15 miles in circumference, and surrounded by a clay wall 30 feet high, with a dry ditch in the inside, and another on the outside. Kano is both a commercial and a manufacturing town, and the division of labour is carried to a considerable extent. Within the walls of the city is a separate district or village for blind people, who are maintained at the expense of the government.

In the country of Kashna are the large towns of Jaza, Ratah, and Kutri, but the largest is the capital, also called Kashna, which is an important commercial town.

In Houssa proper, which lies west of Kashna, is the large town of Zirmie, and the capital, Sackatoo, or Sockatoo, which is built on the banks of the river Zirmie, which runs south-west, and is said to join the Quorra. Sackatoo was built about the year 1805, by Danfodio, the Fellâtah conqueror. The houses are laid out in regular well-built streets, and come close up to the walls. The walls are between 20 and 30 feet high, and have twelve gates, which are regularly closed at sun-set. The inhabitants are principally Fellâtahs, and possess numerous slaves, of whom a considerable number are employed in manufacturing cotton stuffs, and in tanning and iron-work. The commerce of Sockatoo is important.

IV. Nearly the whole of the alluvial plain of Central Sûdan constitutes the kingdom of Bornou, or may be considered as an appendage to it. [BORNOU.] It contains many towns, some of which are very populous. The capital, Kouka, is only a few miles distant from the banks of Lake Tchad. It is the residence of the sheik, and may have a population exceeding 10,000. The walls are well built of clay, and the whole space inclosed by them is occupied with houses, but the extensive market in the centre and some other open places take up about one-fourth of the area. Angornou, the largest and most populous place in Bornou, is likewise only a few miles from the Tchad. It contains above 30,000 inhabitants, but is a straggling place without walls. It is the principal commercial town of the country, where the caravans arriving from Fezzan or from Kano dispose of their goods. A few miles W. from Angornou is New Birnie, the residence of the sultan, which contains about 10,000 inhabitants. Farther south are the towns of Dugos, with 30,000 inhabitants, and Affagay, with 20,000 inhabitants. On the banks of the river Shary is Loggan, where much cotton-cloth is made and dyed. On the banks of the river Yeou are the towns of Kabshari, Kukabonea, Bedeekarfi, and Katgum. Burwha, north of the mouth of the river Yeou, and not far from Lake Tchad, is a well-fortified place, with about 5000 inhabitants.

South of Bornou is the kingdom of Mandara, which extends from 10° 30' to 9° 30' N. lat. Steep and rather high ridges inclose wide and open valleys, which are abundantly watered, and on this account, as well as the fertility of the soil, it is rich in natural productions, well cultivated, and densely peopled. The inhabitants are exclusively negroes, and are governed by a sovereign of their own race. The valleys of Mandara contain some considerable towns. Delow contains at least 10,000 inhabitants, and Mora, the residence of the sultan, is a strongly-fortified place, but of less extent.

Eastern Sûdan extends from 17° to 25° E. long. According to information furnished to European travellers by natives of Africa, who visited this district, it is divided into three countries or states. Kanem is contiguous to the eastern banks of Lake Tchad, and south of it lies Begharmi.

As a comparatively small portion of Sûdan has been seen by Europeans, it would be premature to give a decided opinion as to the relative importance of this part of Africa. But if we may judge from what we know of it, we must pronounce it superior to any other part in fertility, cultivation, and population.

(Park; Caillié; Denham, Clapperton, and Oudney; Richard and John Lander; Laird and Oldfield.)

SOOLIMANA, a country situated among the sources of the rivers which enter the sea at and immediately to the north of Sierra Leone. This territory extends between 9° 20' and 10° 28' W. long., and mostly south of 10° N. lat., being about 60 miles in breadth from north to south, and reaching from the present site of Falaba to the left bank of the Joliba or Niger. This is the native country of the Soolimas; but they now chiefly occupy a strip of land in the adjoining Kooranko territory, which is bounded S. by the river Rokelle, N. by Foola Jallon, W. by Limba and Tamisso, and E. by Kooranko proper and Soolimana, which latter is now used merely as a farming-ground, and only as a temporary residence.

The Soolima country is diversified with hills, vales, and meadows, belted with strips of wood, and decorated with clumps of trees of the densest foliage. The hills are composed of a light whitish granite. The soil of the valleys is remarkable for its fertility, and requires very little labour to prepare it for the seed. After sowing, which is generally before the 15th of June, the Soolima leaves his farm in Soolimana, until October, to the care of his wives, who clear the crop of weeds in the early stages of its growth. In October the husband returns from Kooranko, and both sexes labour together in getting in the harvest. Rice is the chief object of culture. Yams and ground-nuts, bananas, pine-apples, and oranges are the principal fruits. The Soolimas have numerous herds of cattle; and they also rear sheep, goats, and small poultry. The wild animals are numerous, especially elephants, buffaloes, a species of antelope, monkeys, leopards, and wolves.

All the principal towns of the Soolimas are in Kooranko. These are Falaba, the capital, Sangouia, Samba, Mousiah, and Konkodogore, containing in all about 25,000 souls, of which Falaba has about 6000. It derives its name from the Fala-Ba, or river Fala, on which it stands, and is nearly a mile and a half long by a mile in breadth, although closely built for an African town. The town is surrounded by a thick stockade of hard wood, and by a ditch 20 feet deep by as many broad. It is of an oblong shape, containing about 4000 circular houses or huts, which though built of clay and covered with conical roofs of thatch, are extremely neat, clean, and in many cases elegant. The palaver or court-house stands on an open piece of ground towards the south end of the town. In the centre of the town a large open piece of ground is left vacant for the purposes of exercise, of receiving strangers, and of holding grand palavers.

The Soolimas are partly heathen, partly Mohammedan; their stature ranges from 5 feet 6 inches to 5 feet 8 inches. They are well formed and muscular. In battle they use the spear, musket, sling, and bow. They exercise the most open hospitality to the strangers who visit them as traders. The trade of the country, which is monopolised by the king, is chiefly with the Sangaras and the Mandingoes. The former bring horses and gold, for which they receive a share of the goods—cloth, powder, flints, beads, &c.—brought from the coast by the Mandingoes, who in their turn receive slaves and other spoils of war, with a little ivory.

Except sowing and reaping, the principal cares of husbandry are left to the females, while the men look after the dairy and milk the cows. The women build houses and plaster walls, act as barbers and surgeons, &c., while the men employ themselves in sewing, and often in washing clothes. The dress of both sexes is very similar to that of the Mandingoes. Murder is the only crime punished with death; for all other crimes, fines, stripes, or slavery are the punishments. Death is inflicted by strangling. The mode of trial appears not unlike trial by jury.

SOOLOO ARCHIPELAGO is situated in the Indian Ocean, between the Philippines and the island of Borneo. It consists of two chains of islands, which lie nearly parallel, and, together with Borneo and the Philippines, inclose a portion of the ocean which is usually called the Sooloo Sea, sometimes the Mindoro Sea, from the Isle of Mindoro which lies north of it. The southern chain of islands, which is properly called the *Sooloo Islands*, begins on the west, opposite to the peninsula of Unsong in Borneo, near 5° N. lat., 119° 30' E. long., and extends east-north-east to 6° 50' N. lat., 122° 30' E. long., where it is separated from the south-western part of the island of Mindanao by the strait of Basilan. The northern chain, which is called the *Palawan Islands*, begins on the south near 7° N. lat., 116° 30' E. long., opposite Sampanmanjo Point in Borneo; and its southern portion, which is on both sides of the strait of Balabac, lies nearly south and north, but the remainder lies south-west and north-east. It terminates with the island of Busvagon on the south side of the Mindoro Strait, near 12° 20' N. lat., 120° 30' E. long. Large vessels enter and leave the Sooloo Sea by the straits of Basilan, Balabac, and Mindoro. The group of islands between the island of Palawan and the Apo bank in Mindoro Strait, is called *Calamianes*. Between Palawan and Panay, one of the Philippines, is the group of the *Ouyos Islands*. South of these is the *Cagayanes group*, and in the south part of the Sooloo Sea, near the northern coast of Borneo, lies the little group of the *Cagayan Sooloo*.

Though there are volcanoes in the islands of the Sooloo Archipelago, it does not appear that any of the numerous islands that compose these groups are of volcanic origin. The larger islands of the chain are of moderate height, but the mountains on the island of Palawan

attain a considerable elevation. Some of them are covered to the very summits with lofty trees, and others with rich pasturage, here and there intersected by cultivated grounds, whilst others again exhibit cultivation to the highest point, diversified only by groves of fruit-trees. Along the foot of the hills there are level grounds two or three miles wide, which are partly swampy, but mostly cultivated or planted with fruit-trees.

The wet season lasts from May to September, during the prevalence of the south-western monsoon, and the dry season lasts from October to April. But showers frequently occur during the dry season, and the rains of the other season are much more interrupted and irregular than in Hindustan. The heat is considerable, but not oppressive, being mostly tempered by the land and sea breezes. In summer it varies between 76° and 87°. The thermometer however falls to 75° only early in the mornings. The interior mountainous districts have a much lower temperature.

The soil of the country is generally rich, and the crops are abundant. The produce of rice, of which eight species are cultivated, is not sufficient for the consumption of the inhabitants, who are comparatively very numerous. Rice is imported from the Philippine Islands, and from the eastern coast of Borneo, which is (or was) subject to the Sultan of Sooloo. Two kinds of yams, sweet potatoes, and the Chinese potato, some wheat, pumpkins, cucumbers, radishes, &c. are grown. Fruit is extremely plentiful and of a delicious flavour; the chief kinds are mangoes, oranges, mangustan, durian, jack, champaka, plantains, and a great number of other fruits unknown in Europe. Sago-trees are numerous. Pepper, formerly cultivated with success, is grown only for home consumption. The cinnamon is particularly fine. The cacao-tree grows all over the island of Sooloo, and yields the common beverage of all classes. Indigo, cotton, and tobacco are also grown. The plant from which the Manila white rope is made and the gamuty are plentiful, and also a species of hemp and flax, of which the inhabitants manufacture their fishing-lines. Turmeric and ginger grow to perfection.

The forests which cover a large portion of the surface of the islands yield excellent timber, including teak, mahogany, ebony, &c. Many of the useful trees which grow in this archipelago are not yet known to botanists. The camphor bars collected in these woods is not inferior to that of Sumatra, and sells well in Japan and China. Sapan-wood, red-wood, and various dyeing woods are exported to Amoy in China. The sandal-wood and the clove and nutmeg-trees are said to exist here, and the bread-fruit and laka trees are abundant.

Buffaloes are not numerous; but Sooloo black cattle abound, and they are used as beasts of burden, and even for the saddle. The horses are of good breed and hardy. Hogs are not rare, though the inhabitants, being Mohammedans, do not eat them: they are consumed by the Chinese. Wild hogs are abundant. There are goats, some with spotted skins, and some beautiful small antelopes. The Sooloo Islands are the most eastern country in which the elephant is found: it was introduced from Borneo. The swallow which makes the edible bird's-nest is common in most of the islands.

The seas are abundantly stocked with fish. The most important productions of the sea are the sea-slugs, which under the name of tripang are sent to China, and the prawns and shrimps, which, after being pounded in a mortar into a soft mass, are an important article of commerce all over the Indian Archipelago and the countries beyond the Ganges, under the name of blachang. Sea-weed is exported to China. In several places pearls are found, which also go to China. A little gold has been found. Common salt is not used, but a salt made from burnt sea-weed is in general use.

The Sooloo chain consists of three groups, those of Basilan on the north-east, Sooloo in the middle, and Tawi-Tawi on the south-west. The first-mentioned group is composed of the large island of Basilan and several smaller ones. Basilan is about 45 miles long, and the average width may be 12 miles. The centre is hilly, but the sea-coast low and woody. It is very fertile, and sends much rice to Sooloo. It exports birds'-nests, mother-of-pearl, tortoise-shell, and a few pearls; cowries are abundant. The principal ports are Maloza on the south-west side and Gubawang on the north-east coast.

The Sooloo group consists of the larger island of that name and of several small islands. Sooloo is about 40 miles long and 10 miles wide on an average. The surface presents two hilly tracts, separated by a low and level plain. The population is variously estimated at 60,000 to 200,000. There are many small towns on the coast. The largest is Sooloo, Soung, or Soog, near the western extremity of the island, with a permanent population of 6800, among whom are 800 Chinese. The inhabitants of the town of Sooloo are said to be of Arabic descent. The coast population is of Malayan race and Mohammedans; but in the interior the mountains are inhabited by idolatrous Dyaks. More than half of the inhabitants are always engaged in trading voyages, in the pearl and tripang fisheries, and the collecting of birds'-nests. On the north coast is *Bokol*, with 6000 inhabitants, and on the south coast *Parang*, with 8000 inhabitants. All the products which have been mentioned as articles of export, are shipped from these towns. The larger of the other islands belonging to this group are *Pangutaran*, *Tapul*, and *Sikant*, or *Siant*, lying north-west and west of Sooloo.

Tawi-Tawi, is about 40 miles long and 12 miles wide. In the centre

are some hills of considerable elevation, and two lakes. One of the lakes, called *Dungon*, is united to the sea by a channel which is from five to seven fathoms deep, but has a bar, on which there are only a fathom and three quarters at low-water, and about four fathoms at spring-tides. The lake itself is about eight fathoms deep and is fresh at low-water. It is an excellent harbour for vessels which can pass the bar. The island is thinly inhabited. It exports tepey, tripang, birds'-nests, and many valuable pearls, but does not produce rice enough for the consumption. The principal town is *Dungon*, on the banks of the lake. The chain of small islands which extends along the southern coast of Tawi-Tawi consists of low islets, with numerous shoals between them. The channels that divide them are from six to eight fathoms deep, extremely intricate, and so narrow that the Chinese junks in some places require to be pushed on with poles. The most valuable pearl fishery is in these straits, which are accessible at all seasons, and fish is very plentiful and of large size. North of Tawi-Tawi is the *Tahaw Bank*, which consists of coral rocks covered with a layer of sand, and is in some places overgrown with shrubs and trees. It has no fresh water, but the pearl fishery is very valuable.

Between the north-eastern extremity of Borneo and the large island of Palawan are several smaller islands, and the three islands of Banquet, Balambangan, and Balabac, which are of some extent. They are thinly inhabited, and overrun with jungle and timber-trees. They produce chiefly wax, tripang, and tortoise. Balambangan, together with the north-eastern part of Borneo, was ceded to the British by the sultan of Sooloo, and a settlement was established there in 1763. But the British were expelled in 1773 by the Sooloo, who, finding the garrison weak and sickly, and off their guard, murdered them and set fire to the settlement. In 1803 the settlement was re-established, but again abandoned in the following year, on account of the expense of maintaining it.

The large island of *Palawan*, or *Palwan*, is more than 275 miles long, and on an average 32 miles wide. A continuous range of hills runs along the west side of the island. But along the eastern shores a low and generally level country extends from 10 to 20 miles inland. The northern portion of the island has been long subject to the Spaniards, and is called *Paragua*. It forms a part of the province of Calamianes, one of the political divisions of the Philippines. The low country south of 10° 20' N. lat. is tolerably well peopled, and subject to the sultan of Sooloo, but the hilly and mountainous region is in possession of the aboriginal inhabitants, who resemble the Papuas, and are continually at war with the inhabitants of the plains. The productions of the low lands and the adjacent seas are canes, cowries, wax, tortoise, tripang, and gum copal. Rice is also exported. The principal town is Babuyan, which is fortified, and has a population of about 2000.

The islands north of Palawan, namely, Linacapan, the Calamianes, and Coron, form politically a portion of the Philippines. Besides the islands hitherto noticed, the sway of the sultan of Sooloo extended until recently over a large portion of the north-eastern part of Borneo, as far south as Kaniungan Point at the entrance of Macassar Strait, and over more than a million and a half of people. [BORNEO.] Each Sooloo chief is sovereign in the country which belongs to him, and his authority depends on the number of his followers, or rather slaves, called *ambas*, who are his soldiers. The sultan was aided by a privy council called 'Ruma Bechara', the members of which were styled *Datu*. He derived all his revenues from his own estates, as no taxes are paid by the noblemen or their subjects, and the only revenue, consisting of the customs on goods imported, is shared between the king and his council. The petty chiefs of the more remote islands and those on the coast of Borneo, acknowledged the authority of the sultan, in order that they might be protected from the piracy of his subjects, or share the advantages arising from such predatory expeditions.

The fleets of piratical junks and prahus, or prows, belonging to the Sooloo sultan and his barbarous dependent chiefs, were for centuries the terror of the neighbouring seas. The Spaniards ever since the occupation of the Philippines in 1566, have been at war with these people. In 1646 they seized the island of Sooloo (which has been always the central nest of the atrocious gang), and gave it up to the sultan on condition of his paying tribute, but reserving the sovereignty and protectorship to her Catholic majesty. The atrocities recently committed on the inhabitants of the Philippines, induced the Marquis de Solana, governor of the Philippines, to proceed to the capital of Sooloo in December 1850 to demand redress. Instead of listening to his friendly warnings, the sultan ordered the batteries of the forts to fire upon the Spanish vessels, which formed the governor's escort. The Spaniards withdrew, collected a force at Zamboangan, in the island of Mindanao, and on the 28th of February, 1851, the governor-general opened fire with a small squadron on the forts and batteries of the town, while 3500 men, with 20 field pieces, were landed from transports to attack the place. After a desperate resistance the forts, which were defended by double rows of stockades filled between with coral reef, were taken and burnt. The Spaniards took out of these forts 143 pieces of artillery of English manufacture, which these piratical hordes had got from the English settlement, which they murdered in 1773. This important victory has completely

destroyed the power of the sultan of Sooloo, and deprived him of the means of defence and injury which it cost his ancestors nearly a century to acquire. We know not whether the Spanish government have annexed the Sooloo Islands to their possessions in the East.

The Sooloos belong to the Malay race, and most of the chiefs speak the Malay language. But the indigenous language is the Bisayan, which contains a great number of words that are used in the language of Sumatra. Many of the chiefs speak the Spanish language, and some the Chinese fluently. The Sooloos have made considerable progress in civilisation in the last two centuries. Many Chinese are settled in the islands, and great numbers of Christian slaves who were kidnapped from the Philippines. The people profess Mohammedanism, but they know little of their faith, and observe its religious rites still less.

Besides the Christian slaves, there are two classes of men, the 'Bajows' and the Lanuns. The Bajows inhabit the small towns on the coast, and fish for pearls, tripang, and sea-weed. They speak the same language as the Sooloos, and are Mohammedans. Though free, they are much oppressed by the datus and other chiefs. The Lanuns are, without exception, the greatest pirates on the globe. Their depredations are conducted in large fleets of prows in the Straits of Macassar, among the Moluccas, but more particularly among the Bisayas, or southern Philippines. The whole produce of their enterprises previous to the late Spanish expedition was sold at Sooloo, which was their grand entrepôt. But they have stations on most of the other islands. They paid the sultan 25 per cent. on their captures; and were bound to respect the Sooloo flag, and commit no depredations on vessels at anchor in Soog roadstead. The chiefs advanced them guns and powder, for which they were paid by a stipulated number of slaves.

The manufacturing industry of the inhabitants is very limited; but a large number of prows is built. Cotton-cloths of very fine texture and tartan-striped are woven, and some of them are exported. Sugar, indigo, saltpetre, and chocolate are only made for home consumption. There are cutlers who make 'crosses' or daggers, and some goldsmiths who make jewellery.

The commerce of the Sooloo Islands would be very considerable if it were not continually interrupted by the pirates. At present it is limited to the produce of the country, which chiefly goes to China. It is carried on by Chinese from the harbours of Amoy and Pactow. Their junks import furniture, particularly chests, brass utensils and wire, iron unwrought and iron pans, raw silk, mankeens, linen, a great quantity of porcelain and crockery, some piece-goods of flowered silk, cutlery, sugar-candy, tea, and some smaller articles. They take in return pearl-shells, betel-nuts, tripang, wax, sugar, sea-weed, birds'-nests, shark fins, camphor, tortoise-shells, pearls, ebony, sapan-wood, clove-bark, cinnamon, cowries, pepper, and sago. British vessels from Singapore sometimes visit the Sooloo Islands. Their cargo consists mostly of opium, cotton goods, chintzes, Swedish iron and steel, large spike nails for prow building, and some hardware. They receive in return the various products of the country, which they take to Canton, and thence return with a cargo of tea and other Chinese articles.

SOPHIA, a city in Bulgaria in European Turkey, situated on the route from Constantinople to Belgrade, about midway between Nissa and Philippopolis, near the point indicated by 42° 37' N. lat., 22° 27' E. long., in a wide plain bounded by high ramifications of the Balkan, and traversed by the Isca, a feeder of the Danube, and has about 10,000 inhabitants, the greater part of whom are Christians. It is a large place, and has a beautiful appearance from a distance, but the streets are narrow, tortuous, dirty, and lined by high mud walls, which here and there inclose good houses, but in general the houses are poorly built. It has a great number of mosques and Christian churches, which are the principal buildings in the city; there are also a large and well-frequented bazaar, public baths (which are supplied from a hot-spring), and khans. The chief industrial products are—knitted-stockings, for which Sophia is celebrated, broad-cloth, some silk-stuffs, leather, and tobacco. Sophia was formerly the residence of a pasha and capital of an eyalet of the same name, but the eyalet is now named from its capital, Nissa, called by the Turks Nish. It gives title to a Greek archbishop and to a Catholic bishop. There are hot-springs in the environs. Sophia is a place of considerable commerce. It was founded by the emperor Justinian on the site of the ancient *Sardica*. The only remains of antiquity are the ruins of the church founded by Justinian. *Sardica* is famous for the council held in it A.D. 347, which confirmed the decree of the Pope acquitting St. Athanasius of the charges brought against him at the council of Antioch. The council of *Sardica* also passed twenty canons, one of which permits a bishop condemned by a provincial council to appeal to the Pope. The Arian bishops, to the number of about eighty, withdrew from the council of *Sardica* to the town of Philippopolis, and held what they called the council of *Sardica*, in which they pronounced sentence of excommunication against Osius, St. Athanasius, and the Pope. SOUTH AUSTRALIA is a British colony, established on the southern shores of Australia, and extending between 132° and 141° E. long., from the coast, to the parallel of 26° S. lat., which constitutes its northern boundary. It is bounded E. by the colonies of New South Wales and Victoria, or Port Philip; S. by the Southern Ocean; and W. by the unoccupied territory which separates it from the colony of Western Australia. It has a coast line extending from the south-east to the north-west about 1500 miles. Within its boundary are contained two large bays, Spencer Gulf and the Gulf of St. Vincent, and the lower part of the course and basin of the river Murray. Kangaroo Island, which lies before the entrance of the Gulf of St. Vincent, is also annexed to it. The area of the colony is estimated at 300,000 square miles, or nearly 20,000,000 acres, of which the greater proportion is waste land. The population in 1840 was 14,610; in 1845 it was 22,390; in 1853 it was 70,000, exclusive of about 3700 natives.

The western portion of the territories is a mere waste. Near the western boundary-line, and as far east as Streaky Bay, the country along the sea coast is low and barren, without trees or high bushes, but covered with scrub. It is almost entirely destitute of grass, and also of water, except during the rains and a few days after they have ceased. South from Streaky Bay, the shore is skirted by low sand hummocks. Towards the southern extremity of the peninsula lying west of Spencer Gulf, especially east of Coffin's Bay, there are hills which attain an elevation of between 600 and 800 feet; they consist of sandstone, and are covered with wood. The interior of the peninsula is low and barren, but interspersed with salt-lakes. Between Streaky Bay and the head of Spencer Gulf lies a mountainous tract, exhibiting a succession of lofty rugged ranges, running from east to west, but turning north-west at their western extremity. They are called Gawler's Range, and attain an elevation of about 2000 feet above the sea-level, but decrease as they advance farther east. These ranges have a barren appearance, but are overgrown with prickly grass. There are no rivulets or springs, but between the hills are small salt-water lakes, with salsolaceous plants growing round their margins; fresh water is only found after the rains in the clefts of the rocks. In the country north from the Gawler range are extensive tracts of good pasture land, interspersed with fresh-water lakes.

The country situated on the western shores of Spencer Bay is of a much better description. It contains Port Lincoln, the most extensive and the best harbour in the colony. The harbour is protected at its mouth by Boston Island, and consists of three basins—Spalding Cove, Port Lincoln, and Boston Bay, in each of which there is not less than 10 or 12 fathoms water, with a bottom of muddy sand; they are capable of holding the navies of all Europe. Round these extensive sheets of water are many large tracts well wooded, and others grassy with single trees dispersed over them. The peninsula south of Port Lincoln is hilly, but well wooded, and has much good pasture ground, as has also the country north of it to the distance of 10 or 12 miles; but farther north the hills disappear and are followed by a low tract which extends along the shore, and is densely wooded with brush, among which are scattered a few small patches of grass. Water is only found near a few rocky elevations. At the back of this low and rather narrow tract is a moderately-elevated table-land, whose edge is broken, by deep gorges, into portions resembling hills. The soil is a sandy red loam, greatly mixed with stones, and presents only here and there a little grass, with patches of scrubby bushes, and a few small pines. No water has been discovered.

The table-land just mentioned is continued northward from the head of Spencer Gulf, where a rather narrow low tract separates it from Flinder's range. This tract is quite level, and has a sandy soil almost without vegetation. It is intersected by a watercourse, which comes down to the head of Spencer Gulf from Lake Torrens, a salt-water lake extending northward, and spreading towards the west, with a breadth, as far as it has been explored, of 14 or 15 miles. Flinder's range constitutes the western borders of a mountainous tract of considerable extent. It occupies in width a space more than 60 miles from west to east, lying east of Spencer Gulf. It may be said that this mountain tract terminates on the south of the banks of Broughton River, in 33° 30' S. lat., where a higher summit, Mount Bryan, occurs, with an elevation of 3012 feet. From these parts it extends nearly due north, with a small declination to the east to Mount Hopeless, in 29° 20' S. lat. This region is traversed by a great number of ridges, which in general run south and north, but grow gradually narrower toward the north; for in 31° S. lat. the region is only 30 miles across, and it is still less towards its northern termination. In the southern portion of this mountain region several summits attain an elevation of more than 2000 feet. Mount Brown, not far from the head of Spencer Gulf, rises 3000 feet above the sea. Farther north the mountains decrease in elevation. Between these ridges are plains

of considerable extent. The higher portions of the hills consist invariably of naked rock, generally sandstone. The lower slopes are covered with dense brush, and the valleys with low shrubs and occasional small patches of thin wiry grass. Some of the plains have an undulating surface, and then it is found that the higher parts are quite destitute of vegetation, whilst the slopes and valleys are overgrown with scrub. In other parts the plains are level, and some of them are covered with salsolaceous plants. During the rains, and a short time afterwards, running water is found at a few places among the hills. A little to the south of Mount Hopeless some good pastoral tracts have lately been discovered and occupied. The northern extremity of this mountain region is bounded by a level desert. A salt crust is found at intervals on the surface of the sand, and a few pieces of what appear to be drift timber are lying about. This desert is about 300 feet above the level of the sea. The river Broughton may be considered the southern boundary of this barren mountain region. It rises on the declivities of Mount Bryan, and appears to be of considerable size during the rainy season. In the dry season its upper course consists of extensive reaches of water connected by a strongly-running stream, into which several chains of ponds discharge their water during the rains. Lower down the Broughton winds through some broken hills of an open but barren description, and here the water is lost in the sands; only water-holes are found at intervals. Still farther down the channel, though very wide and deep, is quite dry. After the rains however the waters come down to Spencer Gulf.

South of the Broughton a few high hills are found, as the Razorback (2900 feet above the sea) and the Lagoon Hill (2260 feet), but they soon sink much lower. The country between these hills and the shores of Spencer Gulf presents open grassy downs, which are well adapted for sheep, and abundantly watered by ponds. With this part is connected Yorke Peninsula, which separates Spencer Gulf from the Gulf of St. Vincent. This peninsula is about 100 miles long, with an average width of 15 miles. Its surface is level, rising gently towards the interior; the soil is a light sandy loam, and generally wooded in a park-like manner, except towards the eastern shores, where the woods are thick and have underwood.

The best portion of the colony is the country lying on the east of the Gulf of St. Vincent. The interior of this tract is hilly. The hills run in a series of distinct ridges called ranges, from Mount Bryan range in the north, to Wakefield range, which spreads over the peninsula, between the Gulf of St. Vincent and Encounter Bay. The intervening space is occupied by the Belvidere, Barossa, and Mount Lofty ranges. Mount Lofty, which is about 12 miles E. from the city of Adelaide, rises to the height of 1200 feet. The several ranges are mostly well wooded with large timber-trees. Along the shores of the gulf are low sand-downs, on which only bushes grow. Between these downs and the hills is an undulating country, which contains a great portion of land capable of cultivation.

In this part the town of Adelaide, the capital of the colony, is situated. [ADELAIDE.] It is built on the southern border of the Torrens, a river which rises in the hills about 6 miles E. from the town. It can be called a river only in the rainy season, when the banks are full, and it runs with great velocity. In the dry season it consists of a number of expansions like small lakes, which are very deep and of considerable length, but rarely more than 30 or 40 feet wide. These pools are connected with each other by shallow places, in which the water is hardly a foot wide and an inch deep. At these places scarcely a current is perceptible in the dry season. The Torrens in that season does not reach the sea, but is lost in what is called the Reed-bed, a swampy flat depression overgrown with reeds, which is separated from the shores by the sandy downs. When the river is full the surplus water finds its way to the sea by running from the Reed-bed to the Creek, which is an inlet branching off from the Gulf of St. Vincent about 12 miles N.W. from Adelaide. It runs about 4 miles eastward and then 12 miles southward, terminating not far from the Reed-bed. Though there is a bank at the entrance of the creek, with only 14 or 15 feet of water over it, vessels of 500 tons burden can sail up to Port Adelaide, which is only four miles from the town, and has a good landing-place and wharfs. As the water in the wells of Adelaide is brackish, that of the Torrens River is used for all purposes, and is even transported to Port Adelaide for the consumption of the people there, and for the vessels. Besides the Torrens, the rivers Wakefield and Gawler, and the united streams of the Gilbert and Light, fall into the Gulf of St. Vincent north of Adelaide, as do on the south the Onkaparinga, Curralinga, Yankalilla, and several other streams, most of which are partly dried up during summer.

The Murray is the largest river in Australia, and its remotest tributaries rise in the Australian Alps, not far from the eastern shores of the continent. [AUSTRALIA.] It enters South Australia near 34° S. lat., and flows west for about 80 miles, when it suddenly turns to the south, and runs in that direction to the sea, before entering which it expands into a large lake called Lake Victoria, or Lake Alexandrina. This navigable river, which within the province has a uniform width of about 300 yards, and a minimum depth of 12 feet, runs in a level bottom about 4 miles wide, inclosed by grounds from 20 to 40 feet higher. Between the winding course of the stream and the base of the higher grounds, on both sides, are flats of greater or less extent, overgrown with reeds. The soil is of the richest kind,

being formed by an accumulation of vegetable matter, and as black as ebony; but as the destruction of the reeds requires much labour, little has been done to bring it under cultivation. Lake Victoria is about 30 miles long and 15 miles across in the widest part. It has a depth of from 36 to above 100 feet, and is united to Encounter Bay by three shallow channels, the shortest of which is four miles long. From the southern side of Lake Victoria branches off a narrow channel, which after two miles gradually expands into another lake of smaller dimensions, called Lake Albert. This lake is separated from the sea by a sandy neck of land and the Coorong. The whole course of the Murray, from the junction of the Darling, some miles east of the province line, to the Goolwa, which connects Lake Victoria with Encounter Bay, is about 350 miles. In August, September, and October, 1853, an experimental voyage up the river Murray was accomplished by Captain Cadell, with a steamer, the Lady Augusta, which had been specially constructed with a view to this service. Sir Henry Young, the governor of South Australia, accompanied the party; and the steamer reached Swan Hill, about 800 miles from the mouth of the river. The navigation of the Murray for such a distance into the interior, and the circumstance of its being available for about six months in the year, are of great importance to the prosperity of South Australia. Large quantities of wool can now be sent down the river from remote inland districts, and facilities of communication are afforded between the provinces of New South Wales, Victoria, and South Australia.

The higher country between the Murray River and the ranges which form the watershed between it and the Gulf of St. Vincent, is rather hilly near the bend of the river, and overgrown with light woods; it appears to be adapted for sheep-walks. The whole district between the Gulf of St. Vincent and the river Murray is generally computed to be one-third part barren, another third covered with forest or scrub, and the remaining third available for tillage or pastura. The country between the Murray and the eastern boundary of the province is generally barren.

At the sea-mouth of the Murray begins a narrow arm of the sea, which extends south-eastward along the shores, and parallel to them for more than 100 miles. It is called *Coorong*, and is separated from the open sea by a narrow strip of land covered with sand-downs of moderate elevation. At the back of the northern half of the Coorong is a belt of grassy hills overgrown with casuarina, and divided by plains of some extent with a good soil; fresh water is found at a depth underground rarely exceeding six feet. At the back of the southern half of the Coorong is a succession of salt-swamps and low shrubby hills. A low range, called the Wombat range, runs for 20 miles parallel to the Coorong at a distance of about 3 miles.

The Coorong terminates near 36° 30' S. lat., but beyond it, in the same line, are a number of lakes, which are separated from the sea by grassy flats. South of Cape Bernouilli, near 37° S. lat., the country consists of several ranges of wooded hills, generally running parallel to the shores, which are separated from each other by low level grounds, a great portion of which is subject to inundation; but the soil is excellent, and in many places these flats are dry and available for pasturage or agriculture. Within a few miles of the Cape is Guichen Bay, a convenient roadstead. In the district adjacent to the bay the grass is said to be unhealthy for sheep and young cattle.

The south-eastern portion of South Australia is one of the richest in the colony. A line drawn from Rivoli Bay, nearly due east to the boundary-line, divides it from the desert, which is farther north. Near the sea-shore low narrow ranges of wooded hills alternate with grassy plains and a few swamps. In approaching the higher country plains of considerable extent occur, which are covered with luxuriant forests. They extend to the foot of Burr range, a mountain tract divided into several ridges, which cover a great extent of surface, and are pretty well wooded. The highest point of this range rises to about 1000 feet above the sea. Between this range and the isolated mountains called Mount Gambier and Mount Schank, lies a well-wooded tract with large timber-trees and an excellent soil. The two last-mentioned summits are of volcanic origin. The soil of this region is of the richest description, being mostly of a black-brown loam, and the vegetation luxuriant. The value of this country for settlers is increased by having a good and safe harbour in Rivoli Bay.

Kangaroo Island, which lies before the entrance of the Gulf of St. Vincent, is 100 miles long from east to west, and on an average about 20 miles wide, which gives an area of 2000 square miles. It rises gradually from the sea, and does not attain a great elevation, the interior being occupied by extensive plains. Close to the shore, within a quarter to half a mile from the sea, it is covered with a thick forest; in the interior the country is open, and contains numerous ponds. Near the shore are lagoons, which are generally filled with fresh water, but some are salt. On the shore of Nepean Bay is a salt lagoon, on the banks of which large masses of crystallised salt are found. Nearly the whole of the island is available for agriculture or pasturage. In Nepean Bay, on the north-eastern shore, vessels may ride in perfect security during the western gales. On Cape Willoughby, its south-eastern extremity, is a lighthouse called Sturt Light.

Although the greater part of the territory of South Australia is unproductive, there are many good tracts of land. The richest portions of the colony are the Mount Gambier district, the Mount Barker

valleys, the Inman valley near Encounter Bay, the neighbourhood of Rapid Bay, the Willunga and Aldinga plains south of Adelaide, the Adelaide plains, Morphett vale, Lymedoch valley, and the Barossa and Angas lands.

The climate of South Australia is one of the finest in the world, resembling that of the south of Italy. The atmosphere is generally clear and elastic, and the sky remarkable for the variety and brilliancy of its colours. There are no prevalent diseases. On entering the country some are attacked with dysentery, which with a little care may be avoided. Adelaide has been occasionally visited with influenza; and at particular seasons there are some cases of ophthalmia, which is rather a swelling of the eyelids, caused by a small insect. The seasons are divided into dry and wet. The dry season begins at the end of August and continues to the end of March. In December and January, corresponding in temperature to our June and July, the heat is very great, and the ground so arid that the least breeze raises clouds of dust. Occasionally in summer a hot wind from the north blows over the plains, and compels all to seek shelter from the close and dusty atmosphere; but it seldom lasts many hours before it is succeeded by a cooling breeze from the south-west. The thermometer ranges as high as 115° Fahr. Its highest range in 1852 was 105°; its lowest, 44°; the average was 67°. The temperature is subject to sudden and very extraordinary changes; but these do not in general affect the health injuriously, neither do they occasion much inconvenience. During the wet season, from the end of March to August, it rains frequently and sometimes very heavily. During this period the earth is covered with the richest verdure, and the weather is so genial that the approach of summer is scarcely perceptible. In summer the grass is speedily parched, and frequently becomes so dry as to break when trampled on; but the ground is as rapidly clothed with fresh pasture by the showers which fall at no great intervals. The long droughts, with which New South Wales is periodically visited, are not known in the settled parts of South Australia. During the rainy season the wind blows from the west or south-west, and frequently in hard gales. In the dry season northern and north-eastern winds prevail. No fall of snow has been experienced, and in the Mount Barker district, the coldest part of the colony, the frost has only in rare instances been of such force as to form a thin crust of ice. The lowest temperature for the year is about 37°.

During the rainy or cold season a great number of whales visit the coasts of the colony, and are chased by British, American, and French vessels. The black whale is most frequent, but the sperm-whale also occurs. The native animals are—the kangaroo, the wallabi, a smaller species of the same genus, the wombat, the opossum, and the dingo, or Australian dog. Porcupines, although unknown on the mainland, are found in considerable numbers on Kangaroo Island. For several years locusts have appeared in great numbers, and caused much damage to gardens and young crops in the district around Adelaide. Birds are numerous, and distinguished by their beauty. The emu, several kinds of parakeets and cockatoos, partridges, and quails are common. The most common sea-fowl are—pelicans, black-swans, wild-ducks, divers, waders, cormorants, and Cape pigeons. Several kinds of fish are taken in the sea, as salmon, snappers, porpoises, and large and small sharks. There are several kinds of snakes and lizards: among the latter the iguana, which is eaten; among shell-fish, oysters and periwinkles are plentiful.

The colonists have imported horses from Tasmania and New South Wales, and ponies from the island of Timor in the Indian Archipelago; cattle and sheep from the Cape, Tasmania, New South Wales, and Victoria; hogs from New Zealand. Fowls are common, both the common species and the larger one from the countries of the Malays. The kangaroo-dog is a valuable cross-breed of the bull-dog and greyhound, and is used for chasing the emus and kangaroos.

The woods of South Australia contain many large trees, of which the stringy bark, the blue, white, and peppermint gum-trees, different species of the Eucalyptus, are the most useful, their timber serving for building and fencing, for the construction of carts and ploughs, and the manufacture of agricultural implements; but timber for finer purposes is imported from New South Wales and New Zealand. All kinds of grain are successfully cultivated: maize grows well, and also potatoes. Melons, water-melons, pumpkins, and cucumbers attain an uncommon size, as do also cauliflowers. Onions are cultivated to a great extent in Kangaroo Island. No edible fruit is indigenous, except some berries, which are eaten by the natives. Fruit-trees have been extensively introduced. At Adelaide a prize was awarded in 1851 for a collection of sixty varieties of apples grown about ten miles from the city. The peach grows luxuriantly. Oranges and lemons, olives and mulberries are cultivated to some extent. Every approved variety of grape is grown.

South Australia is rich in minerals. Iron-ore is found in many places, especially in the deserts. Copper-ore is very widely distributed in great abundance, and of the richest quality. Lead also exists in considerable quantity, and some gold has been found. Salt occurs in many places. Twelve copper-mines were in operation in 1851. These are—the Burra-Burra mine, 90 miles N. by E. from Adelaide; the Kapunda and North Kapunda mines, 50 miles N.N.E.; Karkulso mines, 76 miles N. by W.; Werthing mine, 14 miles S.S.W.; Perseverance mine, 12 miles N.E. by E., where parties were engaged digging for gold on licences; Tungkillo, or Reedy Creek mine, 35 miles E.N.E.;

the Consolidated mines in Barossa and Lymedoch Valley, 38 miles E. by N.; the Kanmantoo, Bremer, Wheel Mary, Wheel Maria, and Wheel Friendship mines, all in a group about 25 miles E.S.E. from Adelaide. The ore of the Burra-Burra mine is peculiarly rich. It contains 75 per cent. of metal, in the form of a pure oxide requiring no flux to smelt it, the heat of a blacksmith's forge sufficing to run the metal. The lode is 17 feet wide, of great extent, and is quarried like stone, in masses. The mine yields annually about 20,000 tons of copper ore, valued at 20*l.* per ton. The lead-mines are Glen Osmond and Wheel Watkins mines, about six miles south from Adelaide, and the Wheel Gawler and Yattagolings mines, the first two yielding 75 per cent. of metal.

The natives of South Australia, like those of New South Wales, belong to that race which is called Negro Australian. They have not yet attained an equal degree of civilisation with the native population of the eastern coast, but measures have been adopted for their improvement with some degree of success. There are schools at Adelaide and Port Lincoln for the education of the children. Connected with the latter is a training institution under the superintendence of Archdeacon Hale, in which the youths, after leaving school, are kept separate from the tribe, and instructed in the Christian religion and in some industrial pursuit. A number of youths are employed on stockholders' stations along the Murray. Though it appears certain that all the natives of the southern and eastern coast of Australia speak the same language, a marked difference exists in the dialects spoken in different parts. Various dialects are used within the territories of South Australia: one is spoken by the few isolated families which live in the districts west of 136° E. long.; another by the tribes inhabiting the vicinity of Adelaide; and the tribes along the banks of the Murray below the junction of the Darling, have been found to use four different dialects, three of which were unintelligible to natives from the neighbourhood of Lake Victoria. The tribes within the settled parts of the colony are generally peaceable and inoffensive.

The settled parts of the colony have been distributed into the counties of Frome, Burra, Stanley, Gawler, Light, Eyre, Adelaide, Sturt, Hindmarsh, Grey, Robe, Russell, all lying to the eastward of the gulfs of Spencer and St. Vincent; and the county of Flinders on the south-west shore of Spencer Gulf. Besides the city of Adelaide, Port Adelaide, and Albert Town, which are all noticed under ADELAIDE, a number of villages and small towns have sprung up around the capital and in the remoter parts of the colony. Within a few miles of the city are the villages of Thebarton, Hindmarsh, Bowden, Islington, Walkerville, Klemsig, Brighton, Kensington, and Good. The county towns, as they are called, are Gawler Town, 23 miles north from Adelaide; Angaston, farther north and east; and Koorunga, at the Burra-Burra mines; as also Mount Barker, Nairne, Bahannah, Macolesfield, Strathalbyn, Hhandorf, and Noarlunga, in the district south from Adelaide. A township has been laid out at Port Wakefield, at the head of the gulf of St. Vincent, where a considerable quantity of copper from the Burra-Burra mines has been shipped for Swansea. Roads and bridges have been liberally provided for as settlements have been formed.

The government of the colony is vested in a lieutenant-governor, an executive council, and a legislative council. The executive council consists of the governor, the colonial secretary, the advocate-general, and the surveyor-general. The legislative council, which was instituted in 1851, in terms of an Act of the Imperial Parliament, passed in August, 1850, consists of 24 members, 8 of whom are nominated by the crown, and 16 are elected by 10*l.* householders and the possessors of freehold property of the value of 100*l.* sterling, in the 16 districts into which the colony is divided for the purposes of the Act. The main source of revenue is the customs, the greater part of which is derived from the duties of 1*s.* per gallon on wines, and 10*s.* per gallon on spirits. There are no differential duties between British and foreign goods; but an 'ad valorem' duty of five per cent, or an equivalent rated duty, is charged on all imports except wines and spirits. The general colonial revenue in 1852 was 102,325*l.*, the expenditure was 88,238*l.* The land fund revenue was 121,187*l.*; the expenditure was 84,601*l.* The total exports in 1852, exclusive of bullion and coin, amounted to 736,267*l.*; the imports were 583,973*l.* The tonnage of shipping inwards and outwards during 1852 amounted to 202,507 tons. The postal revenue was 7200*l.*

For the promotion of education in the colony, an inspector of schools has been appointed. Schoolmasters obtain an annual grant of 20*l.* for the first 20 scholars, and 1*l.* for each additional scholar, the aid however in no case rising above 40*l.* per annum. The number of day schools receiving government aid in January 1853 was 69, with about 3800 scholars. The amount paid to teachers during the year was about 8100*l.*

In 1850 there were about 150 places of worship in the colony. The ministers of religion were 17 of the Church of England, under the superintendence of the Bishop of Adelaide; 11 of the Roman Catholic Church, under the Roman Catholic Bishop of Adelaide; 2 of the Church of Scotland; 2 of the Free Church of Scotland; 1 of the Scotch Presbyterians; 6 Wesleyan Methodist ministers, besides many local preachers; 2 Primitive Methodist missionaries, and several local preachers; 15 Independent, 8 Baptist, 6 German Lutheran, 1 German Independent, 3 Christian, and 2 Bible Christian ministers. The Ne

Church, the Quakers, and Jews, have each a place of worship in Adelaide.

The settlement of Adelaide was founded in 1836, but some months previously a few families had settled on Nepean Bay, in Kangaroo Island, at a place called Kingscote. At first the emigration to this colony was very great: and in 1840 the number of the white population was estimated at 15,000. In 1838 the colonies of Port Philip and New Zealand were founded, which offered greater advantages to the settler, and the current of emigration was directed to those colonies, to which it has continued mainly to run. In 1844, when South Australia was in a state of great depression, the discovery of its rich mines commenced, and since that period it has enjoyed almost continuous prosperity, and has received a large accession to its population. Settlements have been formed in all directions around Adelaide, over the hill country and plains between the Gulf of St. Vincent and the river Murray. The discovery of gold-fields in New South Wales and Victoria again checked emigration to South Australia, and withdrew a considerable number of its population. Some of the emigrants however returned, and the prosperity of the colony was not materially affected.

SOUTH BEND. [INDIANA.]

SOUTH BRENT. [DEVONSHIRE.]

SOUTH KINGSTON. [RHODE ISLAND.]

SOUTH MIMMS. [MIDDLESEX.]

SOUTH MOLTON, Devonshire, a market-town, municipal borough, and the seat of a Poor-Law Union, in the parish of South Molton, is situated on the right bank of the river Mole, in 51° N. lat., 3° 51' W. long., distant 26 miles N.N.W. from Exeter, and 178 miles W. by S. from London. The population of the town in 1851 was 4482. The borough is governed by four aldermen and 12 councillors, of whom one is mayor. The living is a perpetual curacy, in the archdeaconry of Barnstaple and diocese of Exeter. South Molton Poor-Law Union contains 29 parishes and townships, with an area of 123,233 acres, and a population in 1851 of 20,566.

South Molton consists of a spacious market-place and several streets, well-paved and lighted. The town buildings are the guildhall and the borough jail. The church, which is adjacent to the market-place, is a handsome building in the perpendicular style; it has a rich stone pulpit adorned with statues and a profusion of variously-carved foliage. The Wesleyan Methodists, Baptists, and Independents have chapels. Squier's Endowed school had 64 scholars in 1851, of whom 30 were free. There are also National and Infant schools. A county court is held in the town. Coarse woollens are made; the lace manufacture is also carried on. The market is on Saturday for corn and provisions; and there are several great markets and fairs held in the course of the year. Iron-ore is found in the vicinity.

SOUTH POLAR COUNTRIES. [POLAR COUNTRIES AND SEAS.]

SOUTH SHETLAND. [POLAR COUNTRIES.]

SOUTH SHIELDS. [SHIELDS, SOUTH.]

SOUTH STONEHAM, Hampshire, a village and the seat of a Poor-Law Union, in the parish of South Stoneham, is situated on the right bank of the river Itchin, where it expands into an estuary, in 50° 57' N. lat., 1° 22' W. long., distant 9 miles S. by W. from Winchester, and 71 miles S.W. from London. The population of the parish of South Stoneham in 1851 was 4961. The living is a vicarage in the archdeaconry and diocese of Winchester. South Stoneham Poor-Law Union contains nine parishes and townships, with an area of 30,715 acres, and a population in 1851 of 15,974. South Stoneham may in some respects be regarded as a suburb of Southampton, from which it is little more than two miles distant. A canal from Winchester comes to South Stoneham, communicating with the Southampton water by the estuary of the Itchin.

SOUTHALL. [MIDDLESEX.]

SOUTHAM, Warwickshire, a market-town, and the seat of a Poor-Law Union, in the parish of Southam, is situated in 52° 51' N. lat., 1° 23' W. long., distant 9 miles E. by S. from Warwick, and 82 miles N.W. by W. from London. The population of the parish of Southam in 1851 was 1711. The living is a rectory in the archdeaconry of Coventry and diocese of Worcester. Southam Poor-Law Union contains 19 parishes and townships, with an area of 49,260 acres, and a population in 1851 of 10,426. Southam parish church is of various dates; some portions are of decorated and others of perpendicular character. It has a western tower and spire. The Independents have a chapel, and there are National schools partly endowed, a dispensary, and an infirmary for diseases of the eye and ear. The market is on Monday, and there are several fairs in the course of the year. A county court is held. Near the town are two mineral springs.

SOUTHAMPTON, Hampshire, a town, a municipal and parliamentary borough, a seaport, and a county of itself, is situated on a peninsula between the rivers Alre, or Itchin, on the east, and the Test, or Anton, on the west, at the head of Southampton water, in 50° 54' N. lat., 1° 24' W. long., distant 12 miles S. by W. from Winchester, 74 miles S.W. from London by road, and 80 miles by the London and South-Western railway. The population of the borough in 1851 was 35,305. The borough is governed by 10 aldermen and 30 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry and diocese of Winchester. For Poor-Law purposes the town is governed under a Local Act.

The Roman town of Clausentum, though not on the exact site of Southampton, may be regarded as its predecessor. Clausentum stood on a point of land formed by the winding of the Itchin, on the left bank of that river, about 1 mile N.E. from Southampton, now occupied by Bittern Farm, where still exist traces of a fosse and vallum which defended the place on the land side. The foundation of the present town is ascribed to the Anglo-Saxons. The town was attacked but without success, by the Danes, in 837; plundered by them in 980; and again occupied as their winter-quarters in 994. In the Saxon Chronicle the town is called Hamtune and Suth-Hamtun; in the Domesday-Book, Hantone and Hentune. In 1339, being the year after the sack of Southampton by the French or Genoese fleet [HAMPSHIRE], the defences of the town were repaired and strengthened. It was at Southampton that Henry V. embarked in his first invasion of France in 1415. In 1512 the Marquis of Dorset, who was sent to the support of Ferdinand the Catholic in his war against France, embarked with 10,000 men at Southampton.

The county of the town of Southampton comprehends the whole of the point of land between the rivers, and extends about 3 miles along the bank of the Itchin. The town is built on a gravelly soil, somewhat elevated on the bank of the Anton, which washes it on the west and south sides. The principal street (High-street) runs north and south, and is divided into two parts by an ancient 'bar' or gateway belonging to the old town wall, considerable portions of which, with the west gate and south gate, are still standing. That part of the street which is south of the bar was included in the town, and is about half a mile long; the remainder, distinguished as 'High-street above bar,' or 'Above-bar-street,' belonged to the suburbs. The principal streets are lighted with gas and well paved. On the south side of the town is the quay, near which is the pier, a structure of considerable extent and elegance, erected some years since, and called Victoria Pier, after her Majesty, by whom, before her accession, it was opened. On the platform or battery near the quay is a long brass gun which bears the date 1542, and was presented to the town by Henry VIII. The Winchester road is adorned by a fine avenue of elms, which, however, are gradually disappearing as new houses are erected. The New Town, on the northern side, contains several spacious streets of excellent houses. A road from the southern part of the town to the Itchin leads to the floating bridge which forms the communication with Fareham, Gosport, and Portsmouth.

Southampton has five parish churches. Holy Rood church, a large and ancient structure, consists of a nave with side aisles and a choir or chancel; it has a tower and spire at the south-west angle, and a colonnade, or portico, which occupies the whole front. All Saints church is of Grecian Ionic architecture, and has been much admired; it contains the monuments of Carteret, the circumnavigator, and of Bryan Edwards, the historian of the West Indies. St. Michael's, the oldest church in Southampton, is in a square in the west part of the town; it has a tower between the nave and chancel; there are several Norman portions and some of later date; the windows are chiefly of perpendicular character. This church contains an ancient font of Norman character, and the monument of Chancellor Wriothesley. St. Mary's church was rebuilt in the last century on the foundations of the older structure. The total number of places of worship in Southampton in 1851 was 29, of which 10 belonged to the Establishment. The others belonged to Independents, Baptists, Wesleyan Methodists, Bible Christians, French Protestants, Quakers, Roman Catholics, Irvingites, and Mormons. The number of sittings provided in all was 17,959. The Grammar school, founded in 1553, and free to all boys of the town, had 11 scholars in 1851. The endowment yields 26l. 5s. per annum. The Diocesan Collegiate school, commenced in 1842, had 90 scholars in 1854. There are several Parochial, National, British, and Infant schools; a mechanics institution, with library and museum; a literary and scientific institution, also with a library and museum, and a savings bank. There are several ranges of almshouses, an infirmary, a dispensary, and various other charities.

Among the places of amusement are a theatre, two sets of assembly-rooms, billiard-rooms, and a racecourse. There are also bathing-rooms and a botanic garden. The Royal Yacht Club-house is a handsome structure. Little remains of the ancient castle, but a tower has been built on the site from the materials of the keep.

Southampton was anciently a place of great trade; wool and tin were exported; but it declined very much when the export of wool was prohibited. During the 18th century it revived, and since the beginning of the present century it has more than quadrupled its population. It is much frequented as a watering-place. The harbour, which is secure, affords good anchorage. Ship-building is extensively carried on; and extensive docks have been constructed. The tidal dock is paved with granite, and is lined on three sides with extensive warehouses. It is chiefly used by the large steam-vessels which frequent the port. The area of the basin is 16 acres; and it has 18 feet at low-water of spring-tides. The inner dock is for colliers and sailing vessels. Timber is imported from the Baltic and from America; coals from the north of England; stone from the western counties; and wine and brandy from Spain, Portugal, and France. There is a considerable Irish trade. A new custom-house has been erected in the vicinity of the docks.

The number and tonnage of vessels registered as belonging to the port

of Southampton on December 31st, 1853, were as follows:—Of and under 50 tons, 136 vessels, tonnage 3588; above 50 tons, 85, tonnage 10,744; with 21 steamers of 2129 tons burden. During 1853 there entered the port in the coasting trade 1757 sailing-vessels of 169,418 tons, and 172 steam-vessels of 48,243 tons; and there cleared 115 steam-vessels of 19,015 tons. In the colonial trade there entered 63 sailing-vessels of 4097 tons, and 252 steam-vessels of 68,127 tons; and cleared 70 sailing-vessels of 7533 tons, and 268 steam-vessels of 73,407 tons. In the foreign trade 236 sailing-vessels of 29,828 tons, and 361 steam-vessels of 150,124 tons entered; and 195 sailing-vessels of 21,172 tons, and 347 steam-vessels of 152,245 tons cleared during the year.

Southampton is now the largest packet port in the kingdom. The Peninsular and Oriental Steam-Packet company, the Royal West India Mail-Packet company, and several other steam-packet companies make the port their place of arrival and departure. The town possesses a large and increasing retail trade, chiefly in connection with the shipping. There are coach factories, a large iron-foundry, breweries, and an extensive sugar refinery. There are general markets on Tuesday, Thursday, and Saturday; a fish-market every day; and two yearly fairs, at one of which a great number of cattle are sold.

SOUTHMINSTER. [ESSEX.]

SOUTHPORT. [CONNECTICUT; LANCAHIRE.]

SOUTHWARK. [LONDON.]

SOUTHWELL, Nottinghamshire, a market-town and the seat of a Poor-Law Union, in the parish of Southwell, is pleasantly situated in 53° 5' N. lat., 0° 58' W. long., distant about 15 miles N.E. from Nottingham, and 132 miles N.N.W. from London by road. The population of the town of Southwell in 1851 was 3516. The living is a rectory in the archdeaconry of Nottingham and diocese of Lincoln. Southwell Poor-Law Union contains 60 parishes and townships, with an area of 117,142 acres, and a population in 1851 of 25,596.

Southwell is a place of considerable antiquity. There appears to have been a Roman station or outpost here. A church was established here by Paulinus, one of the early missionaries to the Anglo-Saxons. This church became collegiate, and was afterwards richly endowed by the liberality of prelates and nobles. Charles I. was frequently at Southwell during the civil war, and here he surrendered himself to the Scotch commissioners. The town contains many good houses. The collegiate church is a magnificent cruciform building, consisting of nave and aisles, transepts, choir, and eastern transepts, two western towers, and a central tower. The nave and transepts and the towers are Norman, of very bold character and well-executed details. The extreme length of the church is 306 feet, breadth of the nave and aisles 59 feet, breadth at the transepts 121 feet. The north porch is a large and much-enriched specimen of Norman. The nave and transepts have a wooden flat ceiling; the aisles have a stone groined roof. The choir and eastern transepts, which are of early English character, are among the finest specimens of that style in the kingdom, and are in good preservation. The entrance into the Minster-Yard is by ancient gateways, of which the western has a semicircular arch. In the yard are the extensive ruins of a former palace of the archbishops of York. The chapter of Southwell collegiate church consists of six canons and two minor canons. Annual meetings of the Nottinghamshire clergy are held at Southwell, which is the mother-church of the county. At Southwell are chapels for Wesleyan Methodists and Baptists; a Grammar school, which had 8 scholars in 1854; National and Infant schools, a savings bank, assembly-rooms, a theatre, and a house of correction for the county. The lace and hosiery manufactures employ a considerable number of workmen. Tanning and silk-throwing employ some of the inhabitants. The market is on Saturday, and there are fairs on Whit-Monday and October 21st.

SOUTHWOLD, Suffolk, a market-town, sea-port, and municipal borough, in the parish of Southwold, is situated on the east coast, near the mouth of the river Blyth, in 52° 19' N. lat., 1° 39' E. long., distant 37 miles N.E. from Ipswich, and 105 miles N.E. from London. The population of the borough of Southwold in 1851 was 2109. The borough is governed by 4 aldermen and 12 councillors, of whom one is mayor. The living is a perpetual curacy in the archdeaconry of Suffolk and diocese of Norwich.

Southwold was in the middle ages a place of some importance. In the reign of Henry VII. the town was incorporated by Act of Parliament. The hill on which the town stands forms a cliff towards the sea, and sinks on the other side into marshes. The only entrance to the town is on the north-west side, by a bridge over the Buss Creek. The top and sides of the hill round the town are chiefly uninclosed common. The church is a large and handsome building of perpendicular architecture, mostly of flint and stone. The western tower is about 100 feet high, and there are two low hexagonal towers at each angle of the eastern end of the chancel. There are chapels for Baptists, Wesleyan Methodists, and Independents. The town-hall is a

modern building, and there is a small jail. Thursday is the market-day: an annual fair is held on Trinity Monday and the two following days. Rope- and sail-making and brewing are carried on; but the principal branch of industry is the fishery, which employs a considerable number of men: there are some salt-works. The town is frequented in the bathing season by visitors.

SOUVIGNY. [ALLIER.]

SOWERBY. [YORKSHIRE.]

SPA. [LIEGE.]

SPAIN (*España* in Spanish), a kingdom of Europe, occupying the greater part of that peninsula which is divided from France by the mountain range of the Pyrenees. It is sometimes called the Spanish Peninsula, or briefly the Peninsula. It is situated between 36° and 43° 46' N. lat., 3° 20' E. long., and 7° 23' W. long. The most northern point is Cape Ortegal, and the most southern Tarifa. From its most north-western point, Cape Finisterre, to the most eastern point, Cape Creus, is a distance of nearly 600 miles; from Tarifa to Fuentarabia, near the boundary of France, on the Bay of Biscay, nearly 540 miles; and from Cape Ortegal to Cape de Gata, the most south-eastern promontory, about 556 miles. Spain is bounded E. by the Mediterranean Sea; S. by the Mediterranean Sea, the Strait of Gibraltar, and the Atlantic Ocean; E. by Portugal and the Atlantic Ocean; N. by the Bay of Biscay and France. The area of Spain is 177,718 square miles. The population in 1849 was 13,705,500. The political divisions, with the area and population of each, are given in the next page.

Colonial Possessions.—The **BALÆRIC ISLANDS** in the Mediterranean, and the **CANARIES** on the west coast of Africa, have been formed into two modern provinces, as shown in the following table. **CUBA**, **PUERTO RICO**, and some smaller islands in the West Indies, are under the government of the Capitan-General de la Havana. The **PHILIPPINES**, in the Indian Archipelago, are also under a captain-general. **FERNANDO PO**, and some other small islands in the Gulf of Guinea, belong to Spain; and Ceuta, Gomera, and Melilla, on the coast of Barbary, are used by the Spanish government as places for the transportation of convicts.

Coast.—The length of the coast-line of Spain, without taking into account the numerous small inlets, is about 1350 miles, of which about 750 are washed by the Mediterranean Sea, and about 600 by the Atlantic Ocean. The northern coast, from the boundary of France to Cape Ortegal, is about 300 miles. The north-western coast, from Cape Ortegal to the mouth of the Minho, is about 160 miles. The south-western coast, from the Punta de Europa on the Bay of Gibraltar to the mouth of the Guadiana, is about 140 miles.

The northern coast of Spain, from the boundary of France to the Punta de los Cairos (7° 17' W. long.), runs nearly in a continuous line, without any considerable break. The whole line is rocky, and the rocks nearly always approach the sea, where they form a mural line varying in height between 30 and 300 feet; but with the exception of one or two places the coast is free from rocks and islands, and the water is deep up to the shore. The coast farther west, between Punta de los Cairos and Cape Ortegal, preserves the same character, except that the inlets which occur along this short distance are wider, and the headlands project farther. From Cape Ortegal to Cape Finisterre, and thence to the mouth of the Minho, the coast is less elevated, though it is rocky, and the rocks come up to the beach. It is also very broken, and several headlands advance some miles into the sea, and some of the inlets enter several miles into the land, and form spacious harbours. [GALICIA.] The south-western coast-line is of a different character. From the high ground on which the town of Ayamonte is built, at the mouth of the Guadiana, a low shore begins and extends eastward to the harbour of Huelva, which is formed by the estuary of the rivers Odiel and Tinto. The coast-line is well defined, but skirted by low and sandy islands. Between the harbour of Huelva and the mouth of the river Guadalquivir the coast is extremely low, swampy, and sandy. Even small vessels cannot approach the beach. South of the mouth of the Guadalquivir the shores are again well defined, though low and occasionally swampy. Approaching Cape Trafalgar the coast begins to rise, and a moderately high shore runs along the northern side of the Strait of Gibraltar, and into the bay as far as the town of Algeciras. The remainder of the bay has a low and sandy shore, with the exception of the rock on which Gibraltar stands.

The coast of the Mediterranean from Punta de Europa to Cabo de Palos is in general elevated and rocky. The western portion, between the strait and the mouth of the river Guadalfeo near Motril, does not rise to a great height, and occasionally sinks down nearly to the level of the sea. East of Motril the coast is generally very high, sometimes several hundred feet, and there is no flat along the sea. This elevated coast extends to Cabo de Gata, and north of it to the town of Mojacar. From Mojacar to Cabo de Palos the rocks along the coast are of moderate elevation, and in a few places interrupted by flats. This extensive line of rocky coast has no indentations, and no harbour which vessels of moderate size can enter, with the exception of the excellent harbour of Cartagena and the harbour of Malaga, the latter being partly artificial. The open bay of Almeria, between Punta de Elena and Cabo de Gata, has good anchorage; but it is exposed to southern, south-eastern, and south-western winds, and to the violent gales which sometimes blow from the mountains that surround the bay.

At Cabo de Palos a low and sandy coast begins, which extends as far north as Cabo de Santa Pola, a short distance south of Alicante. It has no harbours even for small vessels or large boats, though it is intersected by several creeks, which in some places form small lagoons. From Cabo de Santa Pola to Villajoyosa the coast-line is generally low but rocky, and in some places the ridges which traverse the adjacent country terminate on the sea with steep hills of small extent and moderate elevation. From Villajoyosa to Denia the coast is almost without exception rocky and high, but does not rise to a great elevation. Between Cabo de Palos and Denia there is no harbour except that of Alicante.

From Denia to the mouth of the Ebro the coast is low and sandy. North of Castellon de la Plana a few low ridges terminate on the sea, forming a moderately high shore. This coast-line has no harbours even for vessels of moderate size; and Grao, the port of Valencia, is only a bad roadstead. Along this low coast there are many small lagoons, called Albuferas. [ALBUFERA DE VALENCIA.] South of the mouth of the Ebro is the Puerto de los Alfaques, which can only be entered by vessels drawing not more than fifteen feet.

From the mouth of the Ebro to the boundary of France the coast is alternately high and low, and both the low and the high shores generally continue for many miles. In this part there occur several harbours for small vessels; and two, Barcelona and Rosas, are deep enough for large ships. The small harbour of Salou, which is the port of Reus, is only fit for small vessels.

Surface.—Spain presents greater and more marked differences in the form of its surface than any other country of Europe of equal extent. The interior is an elevated table-land, which is from 2000 to 3000 feet above the sea-level. Though situated at the western extremity of Europe, and near the sea, which surrounds that part of the world, its elevation is higher than that of any other table-land of Europe. The table-land comprehends nearly the whole country which lies between 38° and 43° N. lat., and extends from near 1° to near 8° W. long. It does not advance to the sea, but on the north and west it is divided from the Bay of Biscay and the Atlantic by a comparatively narrow tract of mountainous country. Nor does it extend to the base of the Pyrenees, being separated from them by the basin of the river Ebro. Between the table-land and the Mediterranean there is also a lower country, which in some parts is hilly and even mountainous, and in others extends in wide plains. South of the table-land is the basin of the river Guadalquivir, by which the table-land is separated from another more elevated and more mountainous region, that of the Sierra Nevada, which extends over the southern part of Spain along the Mediterranean and the Strait of Gibraltar.

The table-land comprehends the eastern districts of Galicia, the whole of the province of Leon, that of Old Castile, with the exception of about one-fourth of its area which lies in the basin of the Ebro and along the Bay of Biscay, the whole of New Castile and Extremadura, the south-western districts of Aragon, and the northern districts of Murcia. According to a rough estimate it extends over a surface of about 92,000 square miles, or over more than one-half of the area of Spain.

The table-land is nearly surrounded by mountains. Along its northern edge rise with a steep ascent the mountains of Asturias, which in elevation nearly rival the Pyrenees. From the Sierra de Sejos, at the source of the Ebro, to the Sierra de Peñamarela, which lies near 7° W. long., the direction of the chain is from east to west, or nearly so, but in this part of the range the highest edge of the mountains runs south-west, but soon turns north, inclosing a narrow glen, in which the river Navia descends to the Bay of Biscay. For about 40 miles the range runs northward, until it approaches the Bay of Biscay within about 12 miles, when it again turns westward, and after having run about twenty miles in that direction, turns southward, dividing the basin of the upper Minho from the lower country which lies to the west of it. Near the town of Orense the mountain-chain terminates, or rather there is a depression through which the Minho flows; for on the east of the river rises another ridge, which runs east-south-east till it approaches the Duero, where it begins to form the boundary between Spain and Portugal.

The high grounds which divide the table-land from the basin of the Ebro cannot be considered as a mountain ridge in all their extent. Towards the western extremity of the river basin no mountain range divides it from the table-land. East of the town of Burgos rises the Sierra de Oca, which extends from west-north-west to east-south-east, and is followed by the Sierra de Cameros. Contiguous to it, and in the same direction, is the Sierra de Moncayo, which has its eastern termination near 2° W. long. From this point the edge of the table-land is less marked. It runs to the river Jalon, which it crosses near Calatayud, and afterwards in a south-eastern direction along the high grounds which form the right bank of the river Jiloca, which gradually rise into mountains near the town of Montalban, whence the mountain chain continues to the boundary between Aragon and Valencia. Thence the edge of the table-land runs southward along the elevated ridge which extends east of the river Turia, or Guadalaviar. It crosses this river north of Requena, and afterwards the river Jucar below its confluence with the Cabriel, and then continues southward, leaving the town of Almansa to the west, to the vicinity of Villena. South of the Jucar the edge of the table-land is not marked by a continuous

ridge, though some isolated mountains occur along it. Near Villena is the Sierra del Carache, which runs first south-west, and afterwards north-west, to the neighbourhood of Albacete (39° N. lat., 1° 55' W. long.). The Sierra del Carache seems to rise only a little above the table-land, but it presents a considerable ascent from the deep valley of the Segura, and that of the Mundo, a tributary of the Segura. Along the southern border of the table-land extends that range, or rather mountain region, which is called Sierra Morena. [ANDALUCIA.]

Other mountain ranges occur on the table-land itself. One of them constitutes a continuous range, traversing the plain in all its extent from east to west. It begins on the east near the high summit of the Sierra de Moncayo, and extends in a west-south-west direction through Castilla la Vieja, separates the province of Leon from Extremadura, and then passes into Portugal. [CASTILLA LA VIEJA.]

The table-land of Castilla la Nueva and Extremadura comprehends these two provinces, with the south-western districts of Aragon and the northern part of Murcia. The surface is much more diversified by hills and mountains than that of the northern plain. The mountain chains are of considerable extent, but they do not form continuous ranges, being interrupted by several depressions, which sink nearly to the level of the country. In the eastern districts of the table-land is the Sierra Molina, which begins north-west of the town of Molina, and south of the confluence of the Jiloca with the Jalón, in 41° N. lat. and 1° 30' W. long. It does not appear to be connected with the Sierra de Deza by a mountain ridge, but only by high ground. The Sierra de Molina runs southward, and does not rise much more than 1000 feet above the general level of the country in the northern parts. Where the rivers Tagus and Turia originate it sends off a branch, the Sierra de Albarracin, which runs south-east between the Turia on the east and the Júcar on the west, and extends to the edge of the table-land, near the town of Requena. From the sources of the Tagus the Sierra de Molina runs south-west, but near 40° S. lat., west of the town of Cuenca, it turns again to the south, and soon subsides into hills, which are slightly elevated above the level of the country. The Sierra de Molina is of very inconsiderable width, but it constitutes the watershed between the rivers which fall into the Mediterranean and those that run to the Atlantic. West of Cuenca a ridge of low mountains branches off from the Sierra de Molina, and runs westward, dividing the upper branches of the Tagus from those of the Guadiana. It terminates probably near Tarragona, east of Aranjuez. Thence to about 4° W. long., where the Sierra de Toledo seems to take its rise, the watershed between the Tagus and Guadiana is formed by high ground broken into steep hills. The Sierra de Toledo extends to 5° W. long., running east and west; but we are very imperfectly acquainted with this ridge. It does not appear to occupy a great width, nor to rise more than 1000 feet above the plain. It is not traversed by any road. Near 5° W. long. it sinks down to the level of the plain, but another range rises out of it, called the Sierra de Guadalupe, which extends westward to the boundary of Portugal, and enters that kingdom, where it is called Sierra de Portalegre. The Sierra del Guadalupe resembles the Sierra Morena more than the Mountains of Toledo. It consists of a number of narrow steep ridges, whose general direction is north-east or north-west, and they are sometimes connected by other ridges running east and west, but frequently unconnected, and separated by flats. The width of this region is considerable, as it fills nearly the whole tract between the rivers Tagus and Guadiana west of 5° W. long. None of the summits attain a great elevation above the level of the country.

The eastern portion of the table-land of Castilla la Nueva and Extremadura, comprehending the province of Cuenca, the northern districts of Murcia, and the adjacent countries, is the highest part of the table-land, and about 3000 feet above the level of the sea. The surface is very uneven, with the exception of the higher ground between the river-basins, which in some places extends in plains, and in others is diversified by numerous hills or low ridges. A very small portion of this region, which lies in the valleys along the rivers, and in some depressions of the plain, is under cultivation; the remainder has rather a sterile and very dry soil, and is either quite useless or only used as sheep-walks.

The central region of the table-land is between 3° and 5° W. long. It consists of two plains, the Plain of Madrid and Toledo, which lies north of the Mountains of Toledo, and the high broken ground which forms the watershed between the rivers Tagus and Guadiana; and the Plain of La Mancha, which lies to the south. These two plains are about 2000 feet above the sea-level. The productive powers and the surface of these two plains are nearly the same. The country consists of extensive levels, intersected by short ridges of low hills and rocks. It is destitute of trees, except some groves of evergreen oak, which are found near the hills, and plantations of olive-trees and vines near the villages. The level tracts produce wheat, but as part of these tracts are at a great distance from the villages, in which alone the farms are situated, a large portion of them is badly cultivated, and some tracts are partly overgrown with broom and the flax-leaved daphne (*Daphne Gnidium*).

The western portion of the table-land of Castilla la Nueva and Extremadura comprehends the country from 5° W. long. to the boundary of Portugal, or the province of Extremadura. This country has a very mountainous surface. The ridges of the Sierra de Guada-

lupe cover nearly all the country between the Tagus and the Guadiana. North of the Tagus several offsets of the Sierra de Gata traverse the country in a south-western direction. South of the Guadiana several branches of the Sierra Morena advance within a short distance of the river. Plains of some extent occur only along the banks of the principal rivers. They are small on the banks of the Tagus, but rather extensive on those of the Guadiana. The general level of the country is lower than in the plains farther east, as we may infer from the circumstances that snow and frost are not common in the Sierra de Guadalupe, in which the merino sheep pass the winter without the least injury in the open air. The productive powers of this region differ greatly in different parts. In the districts north of the Tagus there are wide valleys, containing much level ground, between the ridges of the Sierra de Gata; they have a rich soil, are well cultivated, and yield good crops. The hilly tract between the Tagus and Guadiana is nearly a desert. The summits of the ridges are bare; their slopes are clothed with forests of the evergreen oak, but the lower parts are destitute even of bushes. They are never cultivated, but preserved as the pasture-grounds of the merino sheep in winter. The cultivated spots are only found in the narrower valleys, and they are few and of small extent, even in the level country on the banks of the Guadiana, between Merida and Badajoz. To the south of the Guadiana the country improves. At no great distance from the river are plantations of olive-trees, which increase in number as we proceed up the valleys of the Sierra Morena. [CASTILLA LA NUEVA; EXTREMADURA.]

Rain is comparatively scarce on the table-land of Spain. It is stated that the annual quantity on an average does not amount to more than 10 inches, which is partly to be ascribed to the elevation of the more level part of the table-land, and partly to the circumstance that it is in most parts bounded by mountains which rise considerably above the general level of the plain, and prevent the moisture from reaching the flat country. The rain generally falls in the winter, and only a few showers occur in other seasons. The least quantity of rain falls in the mountain region of the Sierra de Guadalupe, and on the high plains of Cuenca and Murcia, where sometimes eight or nine months pass without a drop of rain falling. To this scarcity of rain the want of cultivation is chiefly to be attributed which is observed in the two last-mentioned regions. In summer excessive heat, and in winter a great degree of cold, are experienced.

The maritime region of the Atlantic and Bay of Biscay incloses the table-land on the north-west and north, and contains the western districts of Galicia, the province of Asturias, and the northern portion of Castilla la Vieja. That portion which lies south of Cape Ortegal is hardly more than 40 miles in width, and is traversed by numerous ridges, which have usually gentle slopes, so as to admit of cultivation to a considerable distance from their base. Their summits are crowned with forests. The lower country, which about Santiago de Compostella stretches out in extensive plains, is tolerably fertile and well cultivated. The climate is wet. The heat of the summer is moderate, and the winters far from being severe, except when the north winds blow, but they are not of long duration. [GALICIA.]

The country east of Cape Ortegal is of a somewhat different character. The Asturian Mountains, which descend southward to the plains of Leon and Castilla la Vieja with a very rapid slope, decline towards the north in long ridges, which grow lower as they approach the Bay of Biscay. In the vicinity of the principal range these lateral ridges are too steep and too high to be cultivated, and are only used as pasture-ground for cattle and goats: a considerable part of them is covered with forests. Towards the sea the ridges are lower and their declivities less steep, and here cultivation has ascended to some distance from their base. The valleys which lie between these ridges are narrow and elevated near the great chain, but they grow wider towards the sea. They have a tolerably fertile soil, and are well cultivated. Wheat, barley, and maize are grown. Great quantities of cider are annually made and exported. Chestnut-trees are so common that the chestnuts not only supply the lower classes with food, but also are exported to a great extent. The climate does not differ much from that of the western maritime tract, being also very wet, but the cold is greater, though the northern winds are not experienced in the same degree as in Galicia. [ASTURIAS; BASQUE PROVINCES.]

The basin of the river Ebro occupies a part of Castilla la Vieja, of the provinces of Vitoria and Navarra, the greater part of the provinces of Aragon, and a considerable portion of Cataluña. The northern boundary, from the sources of the river Segre on the east to those of the Arga on the west, is formed by the high chain of the Pyrenees. West of the sources of the river Arga a chain of mountains begins, which runs westward until it meets, near the sources of the Ebro, the Sierra de Sejos, or the eastern portion of the Asturian Mountains. This range, which is called Sierra de Aralar, is about 120 miles in length. It is much less elevated than the two great mountain systems which it connects. The mean elevation probably does not exceed 3000 feet above the sea-level.

The higher portion of the basin of the Ebro is considerably lower than the plain of Castilla la Vieja, which joins it on the south. This part of the basin of the Ebro forms a considerable depression between Castilla and Biscaya. The interior of the basin in this part is nearly a plain.

which extends north to Vitoria and south to Nagera, and is here and there intersected by detached groups of limestone hills. It has a tolerably fertile soil, and produces good crops of corn. Farther east many offsets branch off from the Sierra de Aralar and the Pyrenees, and west of the river Aragon these ridges cover at least three-fourths of the country north of the Ebro. Near the principal ridges they constitute extensive mountain masses, which are separated by narrow valleys. The masses themselves are unfit for cultivation, but are used as pasture-grounds, and a great part of them is covered with forests containing many fine timber-trees. The valleys are cultivated. About 12 miles from the river the mountain masses decrease in size and elevation, and soon sink down to hills, which extend to the banks of the river. Their slopes are partly cultivated, and yield good crops of maize, wheat, and other grain; there are also numerous plantations of vines, olive-trees, and chestnut-trees. Hemp and flax are extensively grown. Grain, oil, and wine, are exported to a considerable amount. [NAVARRA.]

East of the river Aragon more than half of the country north of the Ebro is covered with the branches of the Pyrenees. Between the sources of the rivers Aragon and Segre (that is, between 1° W. long. and 2° E. long.) is the highest portion of the Pyrenean Mountains, containing the lofty summits and extensive mountain masses of the Pic du Midi, of Monte Perdido, and Monte Maladeta. In this part the northern declivity is extremely steep; but towards the south the range slopes down in a long inclined plain, which terminates about 40 miles from the highest part of the range, north of 42° N. lat. The irregularly-inclined plain is furrowed by deep and narrow valleys. Near the great chain these valleys are almost unfit for cultivation, on account of the severity of the climate; but farther down narrow tracts occur which are cultivated with the grains of Northern Europe and with flax. As the mountains terminate north of 42° N. lat., a considerable tract of country extends between them and the banks of the Ebro. This tract is partly cultivable and partly a desert. The desert is not far from the banks of the river, and extends from the vicinity of Zaragoza on the west to near Mequinenza on the east, a distance of more than 50 miles in a straight line. It is about 10 or 12 miles in width, and formed by a swell of the ground, which in its highest part may rise 1500 feet above the level of the Ebro. The surface is a succession of slight ascents and descents, and the soil is extremely arid. This tract is called the Sierra de Alcubierre. It is nearly uninhabited, and almost a useless waste. A cultivated country surrounds it on all sides, though the soil is in general of indifferent quality, and the crops far from being abundant. But the plain of Lerida is an exception: it is distinguished by fertility, cultivation is general, and the waste lands are of small extent. It produces good crops of maize, wheat, rye, barley, oats, leguminous vegetables, fruit, wine, and oil. The countries within the basin of the Ebro south of the river contain a much larger proportion of arable land, and are much more populous than those on the north of the river. [ARAGON.]

The country which extends between the Sierra de Llena and the Mediterranean, and the lower course of the Ebro, may be considered an appendage of the basin of the Ebro. With few exceptions the surface is very hilly, and in some parts even mountainous. The ridges of hills which traverse it run partly parallel to the Sierra de Llena, and partly in an opposite direction towards the Mediterranean. The fertility is various. [CATALUÑA.]

The countries included in the basin of the Ebro differ greatly in climate, the valleys within the Pyrenees being so cold that the common kinds of grain do not succeed, while along the sea-shore and towards the mouth of the river most of the fruits of Southern Europe attain perfection. In general it may be observed that the part of the basin which is north of the river, with the exception of the tracts immediately situated on the shores of the Mediterranean, has more severe winters and colder summers than the great table-land, whilst the countries south of the river have a mild winter, and a much more temperate summer. The mean annual quantity of rain is between 20 and 26 inches, but it is much more in the elevated valleys of the Pyrenees. In the interior the climate is healthy, but not so on the coast. Barcelona has occasionally suffered from the yellow fever.

The eastern declivity of the table-land, from the mouth of the Ebro to Cabo de Palos, contains four regions, which differ in their natural features and productive powers. The most northern extends from the Ebro to Murviedro. Along the sea-shore there is a narrow strip of level ground, hardly more than two or three miles wide, which in a few places is interrupted by low hills. It is generally fertile, and in some places highly fertile. The hills which lie at the back of it, and the valleys between them, are also tolerably fertile and well cultivated, but where the country approaches the high table-land of Cuenca the soil is dry and less productive.

South of this hilly country is the plain of Valencia, which extends on the sea-shore from Murviedro to Gandia, a distance of more than 40 miles, and in its widest part, at the back of the town of Valencia, it extends about twenty miles inland. It is abundantly irrigated, and the whole is under cultivation. It is no less noted for the great variety of its fruits, and rich crops of rice, wheat, and other grain, than for the mildness of the climate, which never experiences frost, but yet is not considered healthy.

The country which lies south of the plain of Valencia, and extends

along the sea-shore from Gandia to the vicinity of Alicante and Elche, is extremely broken. It may be considered the most eastern offset of the great table-land, for its central districts are at a great elevation above the sea-level, as may be inferred from the severe cold which is experienced in the winter months, and from the circumstance that the most elevated ridges south of Alcoy, for some months of the year, are covered with snow. The valleys are usually narrow, and the level tracts between the mountains are of small extent, and their fertility not much above mediocrity, but all the arable land is cultivated with great industry, and the crops of maize and corn are tolerably abundant. [VALENCIA.]

South of this mountainous region the eastern declivity of the table-land extends much farther inland. On the west it reaches to the Sierra de Segura, and on the south it extends to 37° 20' N. lat. The western portion of this region (west of 2° W. long.) is almost entirely filled up with mountains which rise to between 4000 and 5000 feet above the sea-level. It is probable that the general elevation of the valleys is not less than 2000 feet, and that this tract unites the great table-land with the mountain region of the Sierra Nevada. The long narrow valleys are not fertile, and they are badly cultivated. East of 2° W. long. the mountains recede and leave wide valleys between them, which are distinguished by considerable fertility, and are covered with corn-fields and plantations of fruit-trees. [MURCIA.]

The basin of the river Guadalquivir lies between the great table-land and the mountain region of the Sierra Nevada. On the north is the Sierra Morena, and on the east the Sierra de Segura and the Sierra de Sagra. The mountains which constitute the southern boundary-line run along 37° 35' N. lat., east of 4° 30' W. long., but west of that meridian they decline to the south-west and terminate on the Atlantic in Cape Trafalgar. The lower level of this country is about 1500 feet below the high countries which lie north and south of it. The source of the river Guadalquivir is only 526 feet above the sea-level. Such a difference in the level of the country must of course be attended by a corresponding difference in vegetation and productions. [ANDALUCIA.]

Rivers.—Spain is drained by a great number of rivers, and some of them run for several hundred miles; but only a very few are navigable for small boats, and that only towards their mouths. Most of the rivers have only a very small quantity of water. This is mainly to be ascribed to the small amount of rain which falls on the table-land and the adjacent tracts, in which almost all the rivers rise; and this small quantity is very soon evaporated, as the highest parts of the interior are destitute of trees. Though the number of mountain ranges is very great, most of them are only for a few months of the year covered with a thin layer of snow, which dissolves very rapidly. It is remarkable that those rivers which are navigable become so only at places where they are joined by tributaries which originate in such mountains as rise above the snow-line. The Ebro becomes navigable at Tudela, after having been joined by the Aragon, which originates with numerous branches in the snow-covered mountains which surround the Pic du Midi. The Tagus is not navigable even for small boats above Alcantara, a town situated near the boundary of Portugal, and where it is joined by the Alagon, which river is supplied during the whole year with water from the snow-covered summit of the Sierra de Gredos. The Guadalquivir can only be navigated by small boats from the town of Palma downwards, for at that place it receives the Jenil, which derives the great supply of water that it brings down from the Sierra Nevada. The Duero begins to be navigable at the confluence of the Sabor, and after having received the Esla, which originates in the Asturian Mountains. But though the rivers of Spain are nearly useless for the transport of its productions, they are of great importance for fertilising the ground by irrigation. This practice is nearly general in all the countries which extend along the Mediterranean, and in the basin of the Guadalquivir. It cannot be introduced on the table-land, as the rivers which water it generally run in so deep a bed, and so much below the general surface of the country, that their waters cannot be made available for that purpose. In the northern and north-western maritime countries the rains are sufficiently abundant for the growth of corn without such artificial means.

The largest rivers are noticed under their proper heads. [DUERO; Ebro; TAGUS.] The other principal rivers are noticed under the names of those provinces in which they have the whole or the greatest part of their course. The Miño (Minho in Portuguese) is noticed under GALICIA; the Guadiana, under CASTILLA LA NUEVA and ALEMTEJO; the Guadalquivir, under ANDALUCIA; the Segura, under MURCIA; the Guadalajara, under CASTILLA LA NUEVA; and so the rest.

Geology.—The several mountain ranges of the Spanish peninsula, mostly extending from east-north-east to west-south-west, consist of primary rocks, but are separated from each other by extensive basins of tertiary strata.

The central portion of the Pyrenees, and the continuation of the chain through Biscaya and Asturias, is composed of quartzose and schistose rocks, red sandstones, shales, and gray limestones. The sierras east of Burgos extending to the Moncayo are crystalline schists, flanked by masses of sandstone and shale. The Sierra de Guadarrama, the main ridge of the Castilian table-land, consists of gneiss and other crystalline schists, with subordinate limestones pierced by granite. These central crystalline rocks are flanked by schists and silicious sandstones. The Sierra Morena consists mostly of lower silurian

rocks, which extend eastward into Murcia, and there occupy the largest part of the mountain region. The inferior portion of the Sierra Morena consists of schists and intercalated dark limestones, with quartzose sandstones, which, being very hard, form the peaks of the lower ridges. The upper silurian rocks are slightly exhibited in parts of the Sierra Morena, and also in some places on the southern flank of the Pyrenees. The rocks of the Sierra Nevada have been much metamorphosed. They seem to be of the same age as those of the Sierra Morena and the sierras of Murcia.

The same paleozoic succession seems to have prevailed over all the peninsula previous to the surface having been thrown up into those ridges which now form lines of separation between the different provinces. They have all been conformably and apparently simultaneously elevated.

The lower silurian limestones of Murcia contain the richest silver and lead-mines in Spain, particularly near Cartagena and in the Sierra de Almagrera. In Asturias carboniferous deposits are superimposed on limestones, some of which rise to the summits of the highest mountains. About 80 beds of coal have been recognised, most of which are nearly vertical. Valuable ores of iron exist among the Asturian Mountains, and some of them are wrought to advantage. Carboniferous deposits occupy a considerable area on the southern flanks of the Sierra Morena, and some of the beds of coal are wrought. The valuable quicksilver-mines are in a formation of dark-coloured slates. [ALMADEN.]

Climate and Productions.—The climate of Spain varies exceedingly in consequence of the great differences of elevation and diversity of position. The central table-land is exceedingly hot in summer, and cold in winter. [MADRID.] The coasts of the Mediterranean Sea are very hot in summer, and the atmosphere is very mild in winter. The winter is the season for rain. On the northern and western coasts the annual fall of rain is from 25 to 35 inches, while on the central table-land it is only 10 inches.

The most common kinds of grain which are cultivated in Spain are wheat, maize, barley, and rice. The largest quantity of wheat is produced in the northern provinces, in Cataluña, and on the plains of Castilla la Vieja and Leon. Rice is only grown in the countries along the Mediterranean, from the boundary of France to Cabo de Palos. Other objects of agriculture are hemp and flax, especially in the basin of the Ebro, and madder and saffron on the table-land in the vicinity of Cuenca. In the southern districts the sugar-cane and cotton are cultivated. The most common vegetables are onions, pumpkins, cucumbers, melons, water-melons, potatoes, beans, and peas. Many fruit-trees are cultivated, as almonds, figs, pomegranates, lemons, oranges, pistachio-nuts, carobas, dates in the southern districts, walnuts, hazel-nuts, and especially chestnuts. The chestnut-trees in some of the northern districts cover large tracts. Olive-trees occur in all parts, except the northern mountainous tracts, and the vineyards are extensive, except on the most elevated regions. Several of the Spanish wines are considerable articles of commerce, as Xeres (sherry), Malaga, Alicante, Malvasia, Tinto, and Val de Peñas. The annual produce of wine in Spain is about 120,000,000 gallons, of which Malaga produces from 30,000 to 40,000 butts (3,500,000 gallons), Andalucía 400,000 butts (40,000,000 gallons), Cataluña 600,000 pipes (60,000,000 gallons), Toledo 6,000,000 gallons, and Valencia 9,000,000 gallons. Brandy and raisins also are articles of export. Among the wild-trees are the sweet-acorn oak (*Quercus ballota*), the cork-tree (*Quercus suber*), the kermes oak (*Quercus coccifera*), and the sumach-tree. On the Asturian Mountains and on the southern slopes and offsets of the Pyrenees, there are large forests of fine timber-trees. The plant from which the barilla is obtained is cultivated in the plain of Murcia and some adjacent districts. The liquorice-plant is abundant in the vicinity of Sevilla and near the mouth of the Ebro, and the prepared juice is sent to all parts of Europe. The sparto-rush is used for making ropes, mats, baskets, &c.

Among the domestic animals the sheep and horses are distinguished. The sheep are noted for their fine wool, which forms an important article of export. They pass the summer on the Sierras de Guadarrama, Avila, and Gata, and the winter in the low mountains of Estremadura which lie between the Tagus and Guadiana. Their number amounts to five or six millions. Sheep are also numerous in other parts, but they have generally a coarse wool. The horses of Spain, and especially those of Andalucía, are noted for their beauty; but during the French occupation (1808-1814), nearly all the fine breeds were sent to France, and they are now comparatively scarce. Cattle are only numerous and of large size near the higher mountain ranges; in other parts they are small, with the exception of those fed in the salt-marshes of Sevilla. The asses and mules are distinguished by their size and beauty. Pigs are not very numerous. Goats are more numerous than in any country of Europe, especially on the table-land. There are a few mountain-goats on the Pyrenees. The mountains also contain wolves and other wild animals. The care of the silkworm, the cochineal insect, and bees, are branches of industry. In no country of Europe, except Italy, is so much silk obtained as in the eastern and southern provinces of Spain. The cochineal insect has been reared for the last forty years in Andalucía, Granada, and Estremadura. Bees are very abundant, and much honey and wax are obtained.

GEOG. DIV. VOL. IV.

Spain abounds in minerals, but, with the exception of the silver and lead-mines of Murcia and Andalucía, the quicksilver-mine of Almaden, and the iron-mines of Asturias, they are very imperfectly wrought.

Inhabitants.—The inhabitants of the Peninsula appear in the earliest historical times to have been Iberians, who were perhaps an aboriginal people, mingled with a considerable number of Celts, who had crossed the Pyrenees, and had partly overpowered the Iberians. The two races seem to have afterwards coalesced, and to have formed the nation of Celt-Iberians, but pure Iberian and pure Celtic tribes still remained in various parts of the Peninsula. During the whole period of ancient history the great bulk of the population remained unchanged, and all the subsequent infusions of Roman, Gothic, and Moorish blood have in no degree obliterated and but slightly altered the leading characteristics of the Iberian and Celtiberian races. Arnold, quoting Strabo (iii. p. 145), remarks, that "the grave dress, the temperance and sobriety, the unyielding spirit, the extreme indolence, the perseverance in guerilla warfare, and the remarkable absence of the highest military qualities, ascribed by the Greek and Roman writers to the ancient Iberians, are all more or less characteristic of the Spaniards of modern times. The courtesy and gallantry of the Spaniard to women has also come down to him from his Iberian ancestors." ("Hist. of Rome," iii. 396.) So also have the habits of brigandage, and the dislike and disunion which still subsist not only between the natives of Spain and Portugal, but between the inhabitants of several of the different provinces of Spain itself.

Commerce and Manufactures.—Spain, from the extent of its coast-line, its large ports of Cadix, Cartagena, and Ferrol, the number of its smaller harbours, its geographical position, and its abundance of natural productions, possesses very great commercial advantages, but those advantages have been diminished, and in a great measure destroyed, by the restrictive laws of the government. Smuggling to an enormous extent is carried on almost everywhere along the coast, especially at and near Gibraltar, and also from France across the Pyrenees, and from Portugal across the frontier. The articles smuggled through Gibraltar consist of cottons, linens, muslins, thread, stockings, and the like, and tobacco to a large amount.

The total imports into Spain during the year 1849 amounted to 587,171,795 reals (about 6,160,000*l.*). Of course these are the registered imports. The amount of goods smuggled into the country cannot be estimated. The exports during the same year amounted to 478,162,822 reals (about 5,000,000*l.*). The imports consist of colonial produce, dried fish and salted provisions, cotton and woollen goods, cutlery, glass, butter, and cheese. The exports consist of wool, wine, brandy, oil, fruits, chestnuts and nuts, cork, quicksilver, iron, silver, lead, and salt, with a small quantity of silk and manufactured goods. Of late years a large amount of wheat and flour has been exported from the northern provinces, chiefly to Cuba and Brazil.

The manufacturing industry, formerly considerable, has greatly declined. The government has still manufactures of tobacco, saltpetre, gunpowder, cannon, fire-arms, and porcelain, but they are all in a decayed state except the manufactory of cigars at Sevilla. Other manufactures are silks, coarse cottons and woollens, and leather. Cutlery and iron-ware are made to some amount in the Basque Provinces and Asturias.

Roads, Canals, and Railways.—The public roads in Spain, except those around the capital and the royal road from Madrid through Leon to Oviedo and the coast, are amongst the worst in Europe. The only canal of importance is the Imperial Canal, commenced by Charles V., extending along the southern bank of the Ebro. [ARAGON.] There are three or four small canals in the Castillas and in Murcia. The railways at present completed are—from Barcelona to Mataro, 17½ miles, opened in 1848; from Valencia to Alcoira, 22½ miles; from Valencia to Grao, 3 miles; from Madrid to Aranjuez; from Aranjuez to Almansa; from Alcazar to Pemblique.

Revenue, Army, and Navy.—The revenue in 1853 amounted to 12,751,000*l.* The public debt amounted to 115,186,000*l.* The army in 1854 numbered 99,489 men and 11,395 horses, exclusive of troops in the colonies. The navy in the same year consisted of 6 ships of from 80 to 90 guns, 12 frigates of from 30 to 40 guns; 12 corvettes of from 20 to 30 guns, 14 gun-brigs, 6 war-steamers, and other minor vessels. The fleet was manned by 9000 sailors and 15,000 marines.

Religion and Education.—The established religion is the Roman Catholic, and no other is allowed in the Spanish dominions. The crown presents the archbishops and bishops, who are confirmed by the Pope. The wealth of the church was at one time immense. After the revolution of 1836-7, the monastic orders were suppressed, and the convents and the lands belonging to them were sold; but the convents of nuns were suffered to remain till the death of the then occupants. A law has this year (1855) been passed for the sale of the whole of the church-property, and its conversion to secular uses.

Education is very little diffused. The lower classes receive little or no instruction, except in the principal cities, where infant-schools have of late years been established. The children of the upper classes are mostly educated in France and other countries. The universities, formerly numerous and of great reputation, are now reduced to about 14, and those are attended by only a comparatively small number of students in theology, law, and medicine. There are

however several academies and literary societies in Madrid, Cadiz, Sevilla, and other large cities.

Constitution and Government.—The government of Spain during the middle ages was absolute, though, from the earlier development of popular rights, the power of the king was more restricted than in any other country of Europe. Ferdinand the Catholic (Fernando V. of Castilla) aimed the first blow at Spanish liberty, by avoiding, as much as possible, the convocation of the Cortes. His successor, Charles V., completed the ruin of the Cortes, by entirely disregarding their petitions and defeating the citizens who rose in arms to support the cause of national liberty. Spain continued to be ruled despotically by the kings of the houses of Austria and Bourbon until the French invasion in 1808, when the deputies of the several provinces assembled at Cadiz, and framed a new constitution, which was sworn to and promulgated in 1812. At the close of the war however, Ferdinand VII. refused to give it his sanction, and he re-established the old forms of government; but being compelled soon after (1820) by a military insurrection, to swear to the constitution of 1812, it again became the law of the land, until it was a second time put down with the assistance of a French army.

On the death of Ferdinand (1833), his widow, Queen Christina, wishing to conciliate the liberal party, gave the nation a new charter, and re-established the ancient Cortes, with certain restrictions and modifications which rendered it of little or no value for the support of popular rights. At length, in 1836, the revision of the constitution was intrusted by the government to the two chambers of peers and deputies, and the new constitution of the Spanish kingdom was sworn to by the queen-regent in June, 1837. Two chambers were instituted—that of the Diputados and that of the Senadores—the members of which are invested with equal powers, but all bills relating to taxation are to be presented in the first instance to the lower chamber. Both chambers are elected by the people, the crown having the privilege of choosing one out of every three senators presented by the electors of the provinces. The new constitution has in most points been assimilated to those of the other representative states of Europe. The constitutional government however was gradually more and more neglected and violated, till in 1854 military insurrections in Barcelona and Madrid caused a revolution, and Espartero restored the constitutional government.

History.—Spain was named *Ispania*, *Iovavia*, and *Zrovia*, by the Greeks, Iberia and Hispania by the Romans. Hardly anything was known of the country till the Carthaginians and afterwards the Romans subdued and colonised it. The Phœnicians had previously numerous settlements on the southern coast, and the narrow tract between the sea-shore and the Sierra Nevada was inhabited by a mixed race of Iberians and Phœnicians called *Misopovikes*. The Rhodians and Phœceans also seem to have had settlements on the eastern coast. The Carthaginian general Hamilcar, about the year B.C. 237, began to introduce colonies on the southern coast; and the Carthaginian power continued to be extended under Hasdrubal and Hannibal till the Carthaginians were conquered and expelled by the Romans in the year B.C. 206. The Peninsula was then erected into a Roman province, and a struggle commenced between the Romans and the native inhabitants, which lasted till the subjugation of the northern mountaineers, the Gallaici, the Cantabri, and the Astures, by Augustus, about 25 years before the Christian era.

The Peninsula was at first politically divided by the Romans into two provinces, Hispania Citerior (Hither Spain) and Hispania Ulterior (Farther Spain); Hispania Citerior comprising the eastern and north-eastern districts, and Hispania Ulterior the southern districts, and the western as far as they had been subjugated. Afterwards, when the whole Peninsula had been conquered, it was divided into the three provinces of Tarraconensis (the eastern and northern districts), Bœtica (the southern district, or Andalusia), and Lusitania (the western district, or Portugal, and certain portions of Spain). This political division subsisted till the reign of Constantine the Great. During this period Spain was considered one of the most valuable and flourishing provinces of the Roman empire. According to Pliny, it contained 360 large cities. The organisation of the Spanish provinces is fully stated by Pliny (iii. 1, &c.).

About the beginning of the 5th century the Sueves, the Alans, and the Vandals crossed the Pyrenees, and settled in the Spanish Peninsula. They were succeeded by the Visigoths, who in A.D. 411 entered Catalonia, and in a short time compelled the Alans and Vandals to quit Spain for Africa. After a series of battles the Visigoths subdued the Sueves, and retained the command of the Peninsula till the year 711, when Tarik Ibn Zeyad, after defeating the Gothic armies on the banks of the Guadalete, took their capital city, Toledo. In a very few years the Moors obtained possession of the whole of the Peninsula, with the exception of the mountainous districts of the north, where they were successfully resisted. A series of battles gradually extended the Gothic conquests and power southward [ARAGON], till at length, in 1492, the Moorish capital [GRANADA] was taken by assault by the armies of Fernando and Isabel. On the death of Isabel in 1506 the crown of Castilla devolved on her daughter Joanna, wife of Philip, archduke of Austria; and on the death of the latter, on his son Carlos I., afterwards Charles V. and Emperor of Germany. Fernando died January 23, 1516, after appointing Cardinal Ximenes regent of

Castilla till the arrival of his grandson Carlos, who was then only 16 years of age. Ximenes governed the kingdom till 1518, when Carlos I. assumed the government of Spain. In the following year he was elected Emperor of Germany. With him commenced the dynasty of the house of Austria in Spain. After a reign of nearly 40 years he resigned all his power and possessions to his son Felipe II., and in 1567 retired to a monastery near Placencia in Estremadura, where he died in 1558. During the reign of Felipe II. the Moors were compelled by religious persecution to quit the kingdom, and to settle in Africa. Felipe died in 1598, and was succeeded by his son Felipe III., who died in 1621. He was succeeded by his son Felipe IV., whose reign lasted till 1665, in which year he died. He was succeeded by his son Carlos II., who died in 1700. Felipe V., who succeeded, was the second son of Louis, dauphin of France, and the first king of Spain of the house of Bourbon. He died in 1746, and was succeeded by his son Fernando VI., who died in 1759, without issue. His successor, Carlos III., was a son of Philip V. and king of the Two Sicilies. His death took place in 1788, when he was succeeded by his son Carlos IV. In 1807 the French armies began to enter Spain for the purpose of obtaining possession of the kingdom. On the 19th of March, 1808, Carlos IV. abdicated in favour of his son, Fernando VII. In the following May Carlos IV. and Fernando VII. signed a convention at Bayonne, by which they ceded the Spanish monarchy to Napoleon Bonaparte. But the inhabitants of Portugal and Spain refused to submit to the domination of the French. They rose almost universally against the invaders, and having entered into alliances with Great Britain, the Peninsular war was commenced, and continued till 1814, when the French were finally driven over the Pyrenees, and pursued into France.

After the capitulation of Paris in March, 1814, Fernando VII. regained his throne, and reigned till September 29, 1833, when he died, having left by his will his infant daughter Isabel heir to his throne. The queen-mother, Christina, was appointed queen-regent (Reina Gobernadora). Immediately afterwards Don Carlos, the late king's brother, laid claim to the throne on the ground that by the Salic law females were declared ineligible. A civil war ensued, which lasted till September, 1840, when the partisans of Don Carlos were finally defeated.

Early in 1854, in consequence of the arbitrary and unconstitutional measures of the Spanish government, insurrectionary movements occurred in Barcelona and other places. On the 22nd of February the whole kingdom was declared in a state of siege. On the 15th of July the city and garrison of Barcelona issued a 'pronunciamento' (a public declaration) against the government. This was followed, July 17, by an insurrection in Madrid. The streets were barricaded, and the people fought against the soldiers till July 19, when the ministry fled, the soldiers gave up the contest, and a National Junta was established. Espartero was reinstated in power; the constitutional government was re-established; and the queen-mother was banished from the kingdom, August 28, 1854.

Language.—Of the languages or dialects spoken in the Peninsula before it became a Roman province little or nothing is known. Strabo (iii. p. 139, Casaub.) says that various dialects were in use in his time among the inhabitants of the Peninsula. The Phœnicians and Greeks who settled in Spain must also have introduced their own languages, whilst the Celts, who occupied the northern and western districts, spoke their own tongue. During the long period of Roman domination all these languages seem to have made room for the Latin, except in the northern part of the Peninsula, where the Basque language was always and is still spoken. The northern nations who invaded Spain in the 5th century made no effort to introduce their own tongues, but adopted that of the natives, and spoke Latin, which they corrupted by making the nouns indeclinable, and extending the use of prepositions.

Then came the Arabs, whose language at one time must have been very generally spoken in the Peninsula. Nearly two centuries after the taking of Toledo by Alfonso VI., Arabic was still spoken there in preference to the Castilian, and most legal writings, even between Christian parties, were made in Arabic. Up to the end of the 13th century the kings of Aragon were in the habit of signing their names with the letters of the Arabic alphabet. On the taking of Sevilla by Fernando III., it was deemed necessary to translate the Gospels into Arabic, in order to instruct the Christian population of that city in the duties of religion, which, as well as their native language, they had completely forgotten.

Out of these heterogeneous elements the Castilian language, as the modern Spanish is properly called, was originally formed, though it would be difficult to say at what time it began to assume its present shape.

About the beginning of the 13th century three principal languages were spoken in the Peninsula. The Castilian (the Lengua Castellana) prevailed exclusively in the two Castiles and Leon; the Catalanian, a dialect resembling the Provençal, or Limosin, of the south of France, was spoken in Catalonia, Aragon, part of Valencia, and the Balearic Islands; and, lastly, the Cantabrian, or Basque, still maintained its ground, though greatly corrupted, along the northern side of the Pyrenees. About the same time the Portuguese, which originated in a mixture of the Galician dialect and the language spoken by the

French who served under Henry of Besançon, became more distinct from the Castilian. [PORTUGAL.] How far the Arabic has contributed to the formation of the modern Spanish is a contested point among Spanish critics. That the Castilian language has borrowed a considerable number of its words from the Arabic is a fact beyond all doubt. If any one opens the 'Diccionario de la Lengua Castellana,' published by the Royal Academy of Spain, he will find that most words beginning with *al*, or with the letters *j*, *x*, *z*, are of Arabic origin. The names of plants, flowers, drugs, minerals, furniture, dresses, weights and measures, &c., are, with a few exceptions, all Arabic, although there are also corresponding names derived from the Latin. All words relating to the different branches of the mechanical arts which were introduced by the Moors into Spain are likewise borrowed from their language. In general, nouns of Arabic origin abound more than either adverbs or prepositions, and these in proportion are more numerous than the verbs. The connection of both languages would be still greater, if the writers of the best age of Spanish literature had not formed their style on the Latin, and avoided, as much as possible, words of Arabic origin; to which may be added, that when the Academicians compiled the above-mentioned dictionary, they left out many words authorised by use, which are found in the oldest Spanish works. It was about the beginning of the 16th century, and during the reigns of Fernando and Isabel and Carlos V., that the Castilian became the general language of the Peninsula, though works in Valencian, Catalanian, and Basque continued to be published from time to time, and those languages were and are still spoken by a large number of the inhabitants of Spain.

SPA'LATRO, or SPA'LATO, a town of Dalmatia, situated on a promontory in a bay of the Adriatic, formed by the islands of Braza and Bua and the mainland. It is about midway between Zara and Ragusa, in 43° 30' N. lat., 16° 26' E. long. Spalatro has a harbour, sufficiently extensive, but not very safe. The town is walled and fortified, but the principal defence on the land side consists of the fort of Clissa, which commands a defile in the mountains towards the Turkish borders. Spalatro stands principally on the site of the extensive palace which the emperor Diocletian built for himself near the ancient town of *Salona*. *Salona* was destroyed by the Slavonians in the 7th century, but many remains of antiquity have been found by digging among the vineyards which occupy its former area between Spalatro and Clissa. The outer walls of the residence of Diocletian, which formed a square of nearly one mile, are in great measure still existing, as well as some of the gates. The cathedral of Spalatro is formed out of a temple built by Diocletian in the middle of the area of his residence; it contains some fine columns and is adorned with a handsome frieze. Other considerable remains of the Imperial buildings are seen within the precincts of Spalatro.

Spalatro is one of the most commercial towns of Dalmatia; the population is about 10,000.

SPALDING, Lincolnshire, a market-town, and the seat of a Poor-Law Union, in the parish of Spalding, is situated on the banks of the river Welland, in 52° 48' N. lat., 0° 9' W. long., distant 43 miles S.S.E. from Lincoln, 98 miles N.N.W. from London by road, and 93 miles by the Great Northern railway. The population of the town in 1851 was 7627. The living is a perpetual curacy, in the archdeaconry and diocese of Lincoln. Spalding Poor-Law Union contains nine parishes and townships, with an area of 70,181 acres, and a population in 1851 of 21,290.

As early as the Saxon times Spalding was a place of some consequence. A Benedictine monastery existed here. The district in which the town stands is fenny, but well drained. The town is clean, well paved, lighted with gas, and contains many neat houses. The town-hall is a strong brick building. The sessions-house is a large and handsome structure. There are assembly-rooms, a theatre, and a house of correction. The high bridge over the river Welland was rebuilt in 1838. The church, a fine edifice, chiefly of perpendicular character, has an elegant tower, surmounted with a crocketed spire. The Wesleyan Methodists, Independents, Baptists, and Quakers have places of worship. The Royal Free Grammar school, founded in 1568, which has an income from endowment of 174*l.* a year, had 19 scholars in 1854. There are also National schools, Endowed Blue-Coat schools, Willesby's Endowed Charity school, a Union school, and a savings bank. There is a considerable trade in corn, meal, flour, coal, timber, wool, oil-cake, and wine. Brick-making, bone-crushing, coach-making, brewing, and malting are carried on. There are some extensive steam flour-mills. Markets are held on Tuesday and Saturday. Fairs are held seven times a year. The river Welland is navigable up to the town for vessels of 70 tons burden. Quarter and petty sessions, and a county court, are held in the town.

SPANDAU. [BRANDENBURG.]

SPANISH TOWN. [JAMAICA.]

SPARTA, or, as it was sometimes called, *Lacedæmon*, the capital of Laconia, and the chief city of Peloponnesus, was situated on the right bank of the Eurotas, about 20 miles from the sea, in 37° 4' N. lat., 22° 26' E. long. It was built in a plain of some extent, and was bounded E. by the Eurotas, and S. by a smaller stream running into it, now called Trypiótiko, and supposed to be the ancient Knakion. On the north-west the torrent Labyca separated the height on which the acropolis stood from the spur of Mount Taygetus. On

the left or eastern bank of the Eurotas, is a range of hills at a little distance, on which stood the suburb Menelaïum. These hills of the Menelaïum form a part only of a steep bank which rises on the eastern side of the Eurotas to the height of 500 or 600 feet and is surmounted by a table-land, beyond which again lies an uneven country, intersected with ravines and rivers, gradually rising to Mount Parnon and the other summits of the range of mountains which bounds the view from the plain of Sparta on the east. A corresponding boundary on the west is formed by the more elevated range of Mount Taygetus; hence Homer applies the term 'hollow Lacedæmon' to the plain of Sparta, and to the city itself, which Strabo (vol. viii. p. 367) also speaks of as being in a hollow. There are two villages—Magúla and Psykhikó—on the site of Sparta, nearly a mile apart. The former is a little south of the ancient theatre; the latter in the south-east part of the site, near the left bank of the Trypiótiko. The principal modern town in the neighbourhood is Mistra, which lies about two miles to the west, on the slopes of Mount Taygetus.

The only considerable remnant of Hellenic workmanship is the theatre, from which Mistra and the surrounding neighbourhood have been supplied with stone for building. Colonel Leake thought that the exterior masonry and brickwork which still subsist are not older than the time of the Roman empire. Nevertheless, the theatre itself may have existed from an early period, though not originally used for dramatic purposes, but for gymnastic and choral exercises and public meetings. (Herod., vi. 67.) The centre of the building was excavated in a hill, but the ground does not afford much advantage compared with the situations of other Greek theatres. The largest diameter, says Sir W. Gell, was 418 feet in length; the orchestra is 140 feet wide, and adjoining are two parallel walls about the length of a furlong. In front of it there is a sepulchral chamber carefully built of large quadrangular stones. "Not far from the theatre," observes Colonel Leake, "I found two opposite doors, each formed of three stones, and buried almost to the soffit. On one side of these doors is some appearance of seats, as if the building had been a place of public assembly." In another place he found two other similar doors buried in the ground to nearly the same height. Another relic is an ancient bridge over the Trypiótiko, which is still in use, constructed of large single blocks of stone reaching from side to side. There is also part of an old causeway of similar construction at each end of the bridge.

Every part of the site of ancient Sparta is covered with fragments of wrought stones; and here and there are scattered pieces of Doric columns of white marble, and other relics of ancient buildings. The materials of the Roman walls, now nearly ruined, which once surrounded the principal heights of the city, are formed of similar fragments.

Of Sparta, Thucydides (i. 10) observes, that if "it were evacuated, and only the temples and foundations of its buildings left, posterity would be very incredulous about the extent of its former power, of which no adequate idea would be afforded by the city itself, as it was not embellished with temples and splendid edifices, nor built in contiguity, but in separate quarters." Such was the state of Sparta about B.C. 400; but with the increase of riches in after times, public monuments also multiplied with more rapidity than in earlier ages. These monuments, it appears from Pausanias, were still remaining about A.D. 200, in a more perfect and uninjured state than those of any other Grecian city except Athens.

The following summary of the topography is taken from Pausanias:—The Agora, or public square, which was in the north-west of the city, between the theatre and the acropolis, contained the council-house of the senate and the offices of the principal magistrates. The most remarkable building in this part of the city was the Persian portico, originally built of the spoils taken in the Persian war. It was ornamented with statues, in white marble, of some of the Persian generals, including that of Mardonius; and also with one of Artemisia, the queen of Halicarnassus, an ally of Xerxes. The Agora also contained shrines of Julius Cæsar and the emperor Augustus. A part of it was known by the name of the chorus, or dancing-place, in which young men danced at the games in honour of the Dorian god Apollo. In its immediate neighbourhood were various statues and temples. Southward from the Agora ran a street called Aphete, along the line of which was a number of public monuments, including a temple of Minerva Keleutheia, with a statue said to have been dedicated by Ulysses. At the end of the street, close to the city walls, was a temple of Dictynna, or Diana, and the royal tombs of the Eurypontidae.

The street in which the Skias was situated also led out of the Agora, a little eastward of the preceding street, and ran nearly parallel to the river, but at the distance of nearly half a mile. It extended to the walls, and crossed the Knakion by a bridge, of which there are still some remains. The Skias was an ancient place of assembly, of a circular form, and with a roof shaped like an umbrella. (Pausan., 12, 8.) Along this street also were various temples, statues, and altars, erected in honour of the tutelary divinities of Sparta and its heroes. In connection with these, Pausanias also mentions a quadrangular structure, surrounded with porticoes in which second-hand goods were sold. To the west of the Agora was a cenotaph of Brasidas

and near it a splendid theatre of white marble; opposite to which were the monuments of Pausanias and of Leonidas; near the latter was a pillar inscribed with the names of those who fell at Thermopylae, with the names of their fathers.

There was a place called Theomelida at Sparta, in which were the tombs of the royal house of the Agidae. In the same quarter was the temple of Diana Iasôra, or Pitanatis, and those of other divinities. Not far off, and on the banks of the Eurotas, was the Dromus, or racecourse, which contained two gymnasia. The Dromus was also embellished with various statues and temples. A little outside of the Dromus, Pausanias was shown the site of the house of Menelaus, one of the Grecian leaders at Troy. At the south-east of the Dromus was the Platanistes, which was nearly surrounded by running water, and so called from the plane-trees growing there. Two bridges formed the approaches to it, on one of which was a statue of Lycurgus, and of Hercules on the other. Like other parts of the city it contained several architectural remains in the time of Pausanias.

In another part of the city was the decorated public-hall, with various chapels dedicated to heroes, about it. Not far from the theatre, he adds, was a temple of Neptune Genethlius; and, after advancing a little, there was a small height, on which was an ancient temple, with a wooden statue of Venus in armour, and having an upper story sacred to Venus Morpho.

Lastly, there were temples of Diana Orthia and Latona in the place called Limnaeum, not far from which the Acropolis was probably situated. The Lacedaemonians had not a citadel of conspicuous elevation, like the Cadmeia at Thebes and the Larissa at Argos; but as there were several hills within the city, the highest of these was called the Acropolis. It contained, amongst a great number of other buildings, the temple of Minerva Chalciocous (that is, of the bronze house), begun by Tyndareus, and afterwards made of bronze, on which the actions of Hercules and of Castor and Pollux were worked in relief, together with other representations, of which the largest and most admirable were the Birth of Minerva and the figures of Neptune and Amphitrite. Of the other monuments in the same locality we shall only mention a bronze statue of Jupiter, which Pausanias says was the oldest extant of that material; it was formed of several separate pieces hammered together with nails.

Sparta was divided into five local tribes—the Pitanates, in the centre; the Limnates or Marshmen, north-west; the Messaetes, south-east; the Egidae, west; and Cynosurenses, south. The general form of the city was semicircular, and its circumference was about six Roman miles. It was not regularly fortified till the time of the Roman interference in Greece: it was completely surrounded with walls by order of Appius, the Roman legate. (Pausan., vii. 9, 8.) Two hundred and fifty years afterwards, when Pausanias visited Sparta, both walls and gates were in existence: no traces of them are visible now.

Constitution and Government.—This was of a very mixed nature, consisting of three or even four distinct elements, namely, royalty, a council of elders or senate, a general assembly, and, in later times, the Ephoralty.

The kingly authority existed at Sparta from the time of the conquest of the Peloponnesus by the Spartans, and was always shared by two persons at the same time. The two kings were the successive representatives of the two royal families descended from Eurysthenes and Procles, the twin sons of Aristodemus, under whom the conquest of Laconia was achieved. (Herod. vi. 52.) The constitutional powers of the kings were very limited. They presided over the council of elders (Herod. vi. 57; Thucyd. i. 20), and the vote of each counted for no more than that of a private senator. They had the right of addressing the public assembly; they sat as judges in a separate court of their own, where they decided upon private matters of importance. They were the commanders of the Spartan forces, and had the power of choosing from among the citizens persons to act as Proxeni, or protectors of foreigners visiting Sparta. When they had once crossed the borders of Laconia at the head of their forces, their authority became unlimited; on their return home, however, they were accountable for their conduct as generals. In fact in some instances the kings were dethroned or punished for misconduct and mismanagement as generals. They were not allowed to conclude treaties, or to determine the fate of cities, without communicating with the authorities at home. In the most ancient times the two kings had a joint command, but this led to inconvenience, and a law was passed, that in future one only of the two kings should have the command of the army on foreign service. The Spartan kings united the characters of priest and king (Herod. vi. 50), and officiated as high priest of the nation at all the public sacrifices offered for the state. On the accession of a king, all debts due from private individuals, to the state or the king, were remitted; and on the death of one of the kings, his funeral solemnities were celebrated by the whole community. There was a general mourning and suspension of all public business for ten days. (Herod. vi. 58.)

The senate (Gerusia) or council of elders was the aristocratical element of the constitution, and not peculiar to Sparta alone, but also found in other Dorian states. It included the two kings, who sat as presidents, and consisted of 30 members, 10 from each of the three tribes, and one from each of the divisions called obe. It was confined

to men of distinguished character and station: no one was eligible to it till he was 60 years of age (Plut., 'Lycur,' 26), and the additional qualifications were also of an aristocratic nature. (Arist., 'Pol,' ii. 6, 15.) The election was determined by vote, and the office was held for life, and irresponsible. The duties of the councillors were deliberative, judicial, and executive. In the first capacity they prepared measures and passed preliminary laws, which were laid before the popular assembly. As a criminal court they could punish with death or degradation, and that too without being restrained by a code of written laws. (Arist., 'Pol,' ii. 6.) They also appear to have exercised a judicial superintendence and censorship over the lives and manners of the citizens (Aul. Gell. xviii. 3), and probably were allowed a kind of patriarchal authority to enforce the observance of ancient usage and discipline. (Thirl., 'Hist. of Greece,' i. p. 318.)

The Ekklesia, or general assembly of the Spartan citizens, was not competent to originate any measure, but only to adopt or reject without alteration the laws and measures submitted to it by the proper authorities, a limitation which almost fixed the character of the Spartan constitution, and justifies an observation of Demosthenes ('Lept,' p. 489), that the Spartan senate was in many respects supreme. All citizens above the age of 30, not labouring under any disabilities, were admissible to the Ekklesia, or Apella, as it was called in the old Dorian dialect; but except magistrates, and especially the ephors and kings, no one addressed the people without being called upon. The same public officers also put the question to the vote; and as the magistrates only were the speakers and leaders of the assembly, the resolutions of the whole people are (particularly in foreign matters) spoken of as the decrees of those authorities alone. The voting was by acclamation. The regular meetings were held every full moon, and in cases of emergency extraordinary assemblies were called.

The popular assembly alone had the power to "proclaim a war, conclude a peace, enter into an armistice for any length of time, and all negotiations with foreign powers, though conducted by the kings and ephors, could be ratified by the same authority only." (Müller, 'Dorians.') The highest officers of the state, such as magistracies and priesthoods, were filled up "by the votes of the people; cases of disputed succession to the thrones were decided by them; changes in the constitution were proposed before them, and all new laws, after a previous resolution of the senate, were ratified by them." According to the theory of the constitution, the Ekklesia possessed the supreme political and legislative authority at Sparta, but subject to so many checks and limitations, that the government of the state is often spoken of as an aristocracy. One of these limitations was the Ephoralty, a power apparently foreign to the constitution as established by Lycurgus, and which appears in the first instance to have owed its aggrandisement to the connection established between itself and the assembly. In after times it encroached upon and overpowered the royal authority, and became the supporter of oligarchical principles and privileges.

The free citizens of the community were divided into two classes: one composed of the Spartans, or descendants of the Dorian conquerors of Laconia, and other individuals from time to time, but sparingly, associated with them; the other, of a subject population, living not in the city, but in the country, and called Perioeci, or 'dwellers round,' who, though personally free, were denied all political privileges, the government and administration of the state being confined to the Spartans exclusively.

In theory and name, the constitution as settled by Lycurgus was a democracy, with two hereditary magistrates at its head; but in practice (at least before the encroachments of the ephoralty) it worked as if the supreme authority had been placed in the hands of a minority, and therefore was in reality a limited aristocracy, independent and irrespective of the relation between the subject and the ruling classes. From his very birth every Spartan boy was treated as the child of the state, and as such was liable to be exposed to die at the discretion of his father's kin, if he was a deformed or sickly infant. In his earliest years he was not left entirely to the management of his parents, though under their care, and at the age of seven he entered upon a course of public discipline, increasing in severity as he approached manhood; and as this education had only one end in view, that of training citizens to serve and defend their country, the discipline was in every respect subservient to this object. No accomplishments or arts, except of a military character, were taught, while every effort was made to ensure military skill, activity, fortitude, and bravery. The Spartan was to be taught both to dare and to bear with fortitude; and for this purpose he was inured from his youth to a coarse and scanty fare, to insufficient clothing, to self-denial, and the severest trials of pain and hardship. (Cicero, 'Tus. Quæst.' v. 27.)

By another custom, the Spartan youths were compelled, sometimes from hunger, sometimes at the command of their captains, to get provisions or anything else by foraging in the fields or plundering houses; if successful, they retained their spoil, and were honoured with praise; if detected, they were punished, not for the attempt, but for their want of ingenuity. They were taught music, to sing, and to play on the flute and the harp, but only with the view of forming their moral tastes; and therefore the airs and the songs that they learnt were of a sacred or martial character. Hence the poetry of Homer was in very early times introduced into Sparta; and

Tyrtaeus, the martial poet, was held in especial honour, as animating and encouraging their youth. Gymnastic dancing also formed a part of Spartan education; and the Pyrrhic dance was taught to boys as a warlike exercise, imitative of the movements and actions of a combatant in battle. But the lessons most strongly impressed upon the young Spartan, and the duties most carefully inculcated, were those of modesty, obedience, and respect to rank and age. Together with all this, the young Spartan was impressed, both by precept and example, with a sense of shame; and taught to consider dishonour and disgrace as more terrible than death, when met either for the honour or at the command of his country. At the expiration of eighteen years, the Spartan youths passed from boyhood; and from this period to thirty they were considered to be in a state of transition to manhood. At twenty they served in the ranks. ('Dorians,' iv. 5, 8.) Even after maturity the Spartans were still expected to employ themselves in gymnastic exercises and amusements. (Xen., 'De Rep. Lacon,' v. 7.) Nor were they exempt from military service till sixty. The last years of their life were spent in the service of the community, in the council of the Gerusia, or in superintending the education of the young; and nowhere, it has been remarked by Cicero, had old age a more agreeable or more honourable position than at Sparta. Another important feature of the Spartan institutions was the *Syssitia*, or public meals, in which all the citizens of a suitable age joined. The guests were divided into societies, or clubs, generally of fifteen men; any vacancy was filled by ballot, and unanimous consent was requisite for the admission of new members. The repeat of each club was of a frugal and temperate character, but enlivened by social and cheerful conversation, and the entertainment was provided by the contributions of the individual members.

The chief strength of the Spartan forces was in the heavy-armed infantry, which was superior to that of any other state in Greece. Cavalry service was not thought highly of amongst them, the country being not fitted for the production of horses. The horsemen of Sparta, in the Peloponnesian war, were at first only 400, and afterwards rose to 600 men. (Müller, iii. 12, 6.) The naval service was chiefly confined to the *Periœci*.

The Spartan institutions, though almost entirely of a military tendency, incidentally served other important ends, such as the invigoration and health of the body, and the production of physical beauty. About B.C. 540 the Spartans were the most healthy of the Greeks (Xen., 'Rep. Lacon,' v. 9), and the handsomest men and women were found amongst them. But Sparta did not produce among her citizens the painter, the sculptor, the poet, or the historian. They were all warriors; and therefore the cultivation of the arts and sciences, and even of agriculture, was left almost entirely to the *Periœci* and the *Helots*. Lyrical and choral poetry indeed, for which the Dorian communities were famous, were cultivated and encouraged, but chiefly for religious purposes. The arts of rhetoric and eloquence too were studiously discouraged among them, as being instruments of deceit and misrepresentation, and inconsistent with the concise and sententious method of expression on which the Spartans prided themselves, and which they enforced on their youth by a regular training. Trade and commerce also were alien to their character; and these were left entirely to their provincial subjects. Any extensive trade indeed was rendered almost impossible by the want of a gold and silver coinage, iron being till the latest time their only legal currency. The very possession of gold or silver money was prohibited by their laws. And yet owing probably to the tendency of human nature to long for what is forbidden, "avarice appears to have been the vice to which the Spartan was most prone: money, for which he scarcely had any use, was a bait which even the purest patriotism could not resist." (Thirl., 'Hist. of Greece;' 'Dorians,' iii.)

Spartan girls were in many respects brought up similarly to the boys. They had their own gymnasia, and practised themselves in running, wrestling, and other exercises, which contributed to their health and vigour of constitution, in order that they might prove the mothers of a healthy progeny. The Spartan virgins, even in the company of men, generally wore but a single robe, without an upper garment; in which respect they were distinguished from married women. But the most remarkable feature in the social position of the Spartan women was the indulgence and respect universally shown to them, presenting a strong contrast with the treatment of the female sex among the Athenians and other nations of the Ionian race. So great was the influence of the women at Sparta, that the Spartans were often censured by other nations for submitting to their yoke.

The Spartans, and the Dorians generally, also differed from the rest of the Greeks in the freedom of intercourse which they allowed in public between the youth of both sexes, who were especially brought into contact at religious festivals and choruses. Hence at Sparta it was very possible for marriage to be the result of affection and love, which was seldom the case in the Ionian states of Greece. But still in this, as in everything else, private feelings and wishes were made subordinate to the interests of the community; and marriage was not considered merely as a private relation, but as a public institution, the chief end of which was to supply the state with a strong and healthy progeny. Intermarriage with foreign women was forbidden to all the Spartans, and to the *Heracleids*, or royal family, by a particular rhetra, or constitutional ordinance.

History.—The occupation of Laconia by the Spartans dates, according to the received chronology, from the year B.C. 1104, the 80th year after the Trojan war: but some writers place that event in B.C. 1048. About one of those periods the Dorians migrated from Doria, a district lying between the chains of Mount Ceta on the north and Parnassus on the south, and, under the command of three leaders, Aristodemus, Temenus, and Cresphontes, reputed descendants of Hercules, invaded the Peloponnesus; they were accompanied and guided in their expedition by Oxylus, an Ætolian chief, and soon succeeded, according to the poetical legend, in making themselves masters of the country. In the division which took place, Laconia was assigned to Aristodemus, Argos to Temenus, Messenia to Cresphontes, while Elis was given to Oxylus as a reward for his assistance. Till the conquest of Laconia was thoroughly effected, the Spartans were probably too much occupied at home to engage in foreign wars. Their earliest expeditions were into Arcadia and Argos. Against Tegea, the capital of the former country, they continued to wage war, and always unsuccessfully, for many generations. The first of the Messenian wars commenced about B.C. 743, and terminated in the defeat and subjection of Messenia. The struggle was renewed in B.C. 685, but ended in a like result B.C. 668.

From B.C. 668, the close of the second Messenian war, Sparta continued in a course of uninterrupted success, till she became supreme in the Peloponnesus, and pre-eminent in all Greece. The old contest with Tegea was at last decided in her favour, about the year B.C. 545. (Herod., i. 68.) Nearly at the same time the contest with Argos, for the possession of the tract of land called Thyrea, of which the Spartans had made themselves masters in the third generation after the conquest, was decided by a battle of 300 champions on each side, in which Argos lost the day, and Thyrea was won by the Spartans. (Herod., i. 82.) About B.C. 525, the Spartans were again in hostilities with Argos, and victorious over them in a decisive battle. At the instigation of the Delphian oracle they invaded Attica, under their king Cleomenes, for the purpose of expelling the usurper Hippias, an object which they effected in B.C. 510. Five years afterwards they again appeared in Attica as the supporters of the aristocratic party headed by Isagoras: they were led by Cleomenes; but the Spartan king, who had occupied the citadel, was obliged to capitulate, and submit to the terms dictated by the popular party at Athens. The expulsion of the Pisistratidæ from Athens, and the aid furnished by the Athenians to some of the revolted subjects of Persia, gave occasion to the Persian war. The battle of Marathon followed (B.C. 490), the honour of sharing in which the Spartans lost, from a superstitious regard to an ancient custom which forbade them to set out on an expedition before the moon was at the full. (Herod., vi. 106.) But ten years afterwards, when Xerxes invaded Greece, they fought against him, first at Thermopylæ, then at Salamis, and lastly at Plataeæ. At Thermopylæ, Leonidas, the Spartan king, with a handful of troops, long defied the hosts of the enemy; and at last, after dismissing his allies, fell, with his 300 Spartan citizens, in obedience, as their epitaph recorded of them, to the laws of their country. At Salamis, the chief command on the Greek side was entrusted to the Spartan Eurybiades, though the Lacedæmonians furnished only 16 ships, and the Athenians 180; and had not Themistocles interposed, Greece would have been ruined by his irresolute and narrow-minded policy. At the battle of Plataeæ, B.C. 479, the Spartans were present with a force of 5000 citizens, 5000 provincials, and 35,000 *Helots*; the chief command was in the hands of Pausanias, their general, and the valour and firmness of his troops mainly contributed to the success of the Grecian arms.

In the year B.C. 477 commenced what is called the Athenian ascendancy. The war was still carried on against Persia, in the Hellespont, and off the coast of Asia Minor, by the confederates, under the command of the Spartan Pausanias; the Athenian admirals being Aristides and Cimon. Pausanias by his haughtiness and arrogance disgusted the allies, who, with the exception of Ægina and the Peloponnesian states, called upon the Athenians to accept the supremacy in the alliance. (Thucyd., i. 95.) In the mean time Pausanias was recalled, and another commander was sent out in his stead; but it was too late; the confederates refused to submit to his command, whereupon he and his colleagues retired altogether from the conduct of the war, and left it to the Athenians.

The Spartans were on the eve of invading Attica as allies of the Thæsians, when a domestic disaster occurred to prevent them. This was caused by a shock of an earthquake (B.C. 464), so violent that the whole of Laconia was shaken by it, and, according to one account, only five houses were left standing in Sparta. The *Helots*, the descendants of the conquered Messenians, took advantage of this occurrence to rise against their oppressors, and, in conjunction with some of the *Periœci*, occupied their former stronghold of Ithome. The Spartans, not being very skilful as besiegers, solicited the assistance of the Athenians, who sent Cimon with a force to help them. Their assistance however not proving so efficacious as was expected, the Spartans doubted their good faith, and dismissed them. The Athenians resented the affront by allying themselves with the Argives, the old enemies of the Spartans, and shortly afterwards met them at Tanagra in Bœotia, as they were returning from an expedition into Doria, their mother country. A pitched battle was the consequence,

in which the Athenians were defeated with great loss (B.C. 457). In B.C. 455 the third Messenian war was concluded by the surrender of Ithome. The jealousy and distrust between the two states led to the Peloponnesian war, which lasted from B.C. 431 for 27 years. The issue of this war is related in the article ATHENS (vol. i. col. 637). It ended in the overthrow of Athens and the restoration of Sparta to the undisputed supremacy over the rest of Greece, after Athens had divided it with her for 73 years. One of Sparta's most valuable allies in the latter part of the war was the Persian Cyrus, and to show their gratitude to him, the Spartans furnished him with auxiliaries in his attempt to dethrone his brother Artaxerxes, the king of Persia. Cyrus failed; and the Ionian cities which had favoured him refused to submit to the satrap Tissaphernes, the successor of Cyrus in his province. Being too weak to resist him, they applied to Sparta, who sent a considerable force to aid them in asserting their independence. A reinforcement was afterwards (B.C. 396) sent out under the king Agesilaus, with a view of anticipating a threatened invasion of Greece by the Persians. His successes against the Persians were so great as to encourage him to form the design of overthrowing the Persian empire. But he was unexpectedly stopped in his preparations for this design. The satrap Tithraustes, unable to cope with him in the field, sent agents with a sum of money into Greece, raised a confederacy against Sparta, which included amongst its members Thebes, Argos, Corinth, and Athens. War first broke out between Thebes and Sparta; and the Lacedæmonians, having invaded Bœotia, were defeated at Haliartus, B.C. 395, with the loss of their general Lysander, who was slain under the walls. Agesilaus was summoned home. But before he arrived another engagement was fought, "the great battle," that of Corinth (B.C. 394), in which the Lacedæmonians gained the victory with a very trifling loss. This victory however was counterbalanced by a naval defeat by the Athenians off Cnidus. An army of the confederates was again assembled on the plain of Coroneia, where Agesilaus met them on his march homewards, and completely defeated them. The Spartans however were dispirited by the defeat of a brigade of their heavy-armed infantry (the mora) by the light-armed targeteers of Iphicrates, an Athenian general; and harassed by the descents on the Laconian coasts by Conon and Pharnabazus, they consented to negotiate a peace in the eighth year of the war, under the mediation of the Persian king. The convention was known by the name of the peace of Antalcidas (B.C. 387) and was highly favourable to Sparta.

The first use Sparta made of the advantages she had gained was to make an attack upon the people of Mantinea, a truce of thirty years with that city having just expired. The city was taken, and the inhabitants distributed into four country towns, so as to be under the influence of the aristocratic party, which was powerful and supported by Sparta (B.C. 385).

In B.C. 382 Sparta sent forces to aid the cities of Acanthus and Apollonia in Chalcidice against Olynthus, the ally of Thebes and Athens. One division of the forces, commanded by Phœbidæ, marched by Thebes, of which aided by the oligarchic party in the city, they seized the Cadmeia, or citadel, and thus made Thebes entirely dependent on Sparta. The war against Olynthus lasted four years, and ended in the capture of the city, B.C. 379.

The Spartans were now at their highest point of power. Olynthus was overthrown, Bœotia was dependent, Corinth friendly, Argos reduced, and Athens without allies. But a change soon came upon them. The Cadmeia was soon recovered by a band of exiles of the democratical party, and the Lacedæmonians were entirely expelled from the city; and shortly afterwards, Athens allied herself with Thebes against Sparta (B.C. 379). Hostilities were carried on for six or seven years, during which Sparta greatly distressed Thebes by ravaging and plundering its territory, and the Athenians were victorious at sea under Chabrias, off Naxos (B.C. 376). Athens soon after however concluded a separate treaty with Sparta (B.C. 374), which, though soon broken on account of the restoration of the Zakynthian exiles to their country by the Athenian admiral, was re-established, B.C. 371, and Thebes and Sparta now met single-handed. A Spartan army, then in Phocis, under Cleombrotus, was ordered to invade Bœotia. The Spartans met the Theban forces, commanded by Pelopidas and Epaminondas, on the plain of Leuctra, and were utterly defeated in a regular pitched battle, by inferior numbers, a circumstance unparalleled in the previous history of Sparta (B.C. 371). The battle was most decisive, and from it we may date the decline of the Spartan power. The people of Mantinea again assembled in one fortified city, which they called Megalopolis, and established a democratic government. The Thebans invaded Laconia under Epaminondas, and advanced into the immediate neighbourhood of the unwall'd capital, burning and pillaging. For the first time, the women of Sparta saw fires kindled by an enemy; and but for the vigilance and energy of Agesilaus, the city would have been taken. The whole plain of the Eurotas, as far as the sea-coast, was devastated. The Theban general collected together the expatriated Messenians, and restored them to their fatherland, thus establishing a permanent enemy close to Sparta (B.C. 367). In his last expedition into the Peloponnesus, Epaminondas nearly surprised and took Sparta in the absence of Agesilaus. He then resolved on a general engagement, and met the Spartans and their allies, amongst whom were the Athenians,

at Mantinea. His army was victorious, but he himself was slain. (B.C. 362.)

From this time Sparta ceased to be one of the leading states of Greece. Another power soon assumed the control in Grecian affairs, and when the Spartans attempted to enforce their claim to Messenia, Philip of Macedonia opposed their pretensions, and supported the independence of that country. After the battle of Chæroneia (B.C. 338), he invaded Laconia, and, according to Polybius (ix. 28), obliged her to surrender several small districts to the Argives, Arcadians, and Messenians. In the reign of Alexander, and while he was engaged in his eastern conquests, the Spartans made an attempt to overthrow the Macedonian empire, but they were defeated by Antipater, Alexander's lieutenant, and Agis, their king and commander, was slain, B.C. 331. In the contests which divided Greece after the death of Alexander, Demetrius, the son of Antigonus, was at war with the Spartans, and victorious over them in two engagements. Their next assailant was Pyrrhus (B.C. 288), against whom they made a gallant defence, assisted and animated by the women, whose spirit saved the city from capture. At that time it was walled. After that event we hear little of Sparta till the reigns of Agis III. and Cleomenes (B.C. 240). The institutions of Lycurgus, though existing in name, were then no longer of any force at Sparta. The regulation by which every head of a family was ensured the possession of a plot of land had been repealed. The number of Spartan citizens was considerably reduced, and a great accumulation of property was vested in the hands of a few people, many of whom were females. Agis and his friends wished to return to the original constitution, and the mode of life of former times. He perished in the attempt to carry out his views (B.C. 240), being murdered in prison at the instigation of the ephors, who had now monopolised almost all authority in the state. In B.C. 236, Cleomenes III. ascended the throne, and by stratagem and force succeeded in the attempt in which Agis had failed; a general division and re-distribution of property took place; some of the Periœci were adopted amongst the Spartan citizens; the old mode of education and the public meals were resumed; the ephors put to death, and their office abolished. Cleomenes also defeated the troops of the Achaean league in several engagements, and had conquered a great part of the Peloponnesus, when Aratus, the general of the Achæans, summoned Antigonus Doseon from Macedonia to oppose his progress. The Macedonians and Spartans met at Sellasia, on the borders of Laconia, and after a hard-fought and decisive battle Antigonus was victorious. He then marched to Sparta, and restored the former state of things. Cleomenes fled to Egypt.

Pausanias (iii. 6, 5) observes of him, that he was the last of the Agides, and shortly afterwards the sovereignty was sold by the ephors to Lycurgus, who was not even a Heracleid. He was succeeded by Machanidas, who is called a tyrant, and was conquered and slain by Philipœmen, the general of the Achæans. (Livy, xxviii. 5.) Nabia, the last of these usurpers, resisted the Achæans and Romans, who had now appeared in Greece. Nabia was assassinated, B.C. 192, and the Spartans were compelled soon after to join the Achaean league. After the capture of Corinth (B.C. 146) all Greece was reduced to a Roman province, but the inhabitants of Laconia enjoyed more freedom than the other states, being treated not so much like subjects as allies. The colonies of Sparta were but few; the principal were the island of Calliste or Thera, Cnidus, and Tarentum.

SPEEN. [BERKSHIRE.]

SPENCER GULF. [SOUTH AUSTRALIA.]

SPERLUNGA. [LAVORO, TERRA DL.]

SPEYER. [DORSETSHIRE.]

SPEY, RIVER. [ELGINSHIRE.]

SPEYER, or SPIRES, an ancient city in the kingdom of Bavaria, is situated in 49° 20' N. lat., 9° 35' E. long., at the mouth of the Speyerbach, on the left bank of the Rhine, in a pleasant and fertile country, 43 miles by railway S. from Mayence, and has about 9000 inhabitants. It is surrounded with walls and ditches, and has five gates. Of the churches 15 are Roman Catholic and 2 Lutheran. The most remarkable is the venerable cathedral, which was founded by the emperor Conrad in 1030, and completed by Henry IV. in 1061. It was very richly adorned, and contained the mortal remains of eight emperors, three empresses, and two imperial princesses; but their marble sepulchres, their statues, and silver coffins were desecrated and plundered by the French in 1689, and their bones scattered by order of Louvois. Some of the sepulchres have been restored. The diet of the German empire was frequently held at Speyer. In the diet of 1529, a protest made by the Reformers against certain proceedings of the emperors procured them the name of Protestants. The city has a gymnasium, a lyceum, an old town-hall, an hospital, an orphan-house, a botanic-garden, and a collection of antiquities. The principal manufactures are—snuff, sugar of lead, and wax; there are likewise some vinegar-works, cattle- and corn-markets, and a good transit trade in wine, corn, timber, &c., on the Rhine.

SPEZZIA. [GENOA.]

SPHACTERIA. [NAVARINO.]

SPIELBURG. [BRÜNN.]

SPILSBY, Lincolnshire, a market-town, and the seat of a Poor-Law Union, in the parish of Spilsby, is situated in 53° 10' N. lat., 0° 5' E. long., distant 30 miles E. by S. from Lincoln, and 129 miles N. by E.

from London. The population of the parish of Spilsby in 1851 was 1461. The living is a vicarage, in the archdeaconry and diocese of Lincoln. Spilsby Poor-Law Union contains 66 parishes and townships, with an area of 140,269 acres, and a population in 1851 of 28,937.

The town of Spilsby is neat, clean, and healthy. The town-hall is a plain brick-building on arches. The market-cross is a plain octagonal shaft, rising from a quadrangular base, and terminating in a vane. There is a court-house and house of correction. The parish church is a large edifice, of irregular architecture. The Wesleyan Methodists and Independents have places of worship. The Grammar school, founded by Edward VI., which is free to 30 boys, had 52 scholars in 1854. There are National schools, libraries, a young men's literary institution, and a savings bank. The market is held on Monday, and there are three fairs in the year. A county court is held.

SPINALONGA. [CANDIA.]

SPIRES. [SPYER.]

SPITZBERGEN, a group of islands situated nearer to the arctic pole than any other country on the globe. It lies between 76° 30' and 80° 30' N. lat., 9° and 22° E. long., between the Greenland Sea on the west, and Spitzbergen Sea, which separates it from Nova Zembla, on the east.

The group consists of four large and numerous small islands. The largest island, Spitzbergen proper, extends from 76° 30' to 80° N. lat.; a peninsula connected with it on the eastern side, is called New Friesland, or East Spitzbergen. South of New Friesland is *Edges Island*, which is separated from New Friesland by a strait called Tymens Fiord, or Freeman's Inlet. This strait is somewhat more than 50 miles long, and less than 10 miles wide. Along the southern coast of Edges Island numerous small islands cover the sea to a distance of 15 miles from the shores, and this group goes by the name of the *Thousand Islands*. To the east of New Friesland lies North-East Land, which extends from 79° 10' to 80° 10' N. lat., and is divided from the larger island by the Henlopen, or *Waygats Strait*, which is about 70 miles long, and varies in breadth from 4 to 11 miles. A considerable number of smaller islands are dispersed over the sea which surrounds North-East Land on the north and east, in Henlopen Strait, and round the north-western coast of Spitzbergen. At the distance of 12 to 15 miles from the western coast of Spitzbergen is *Charles Island*, or *Forland*, which is about 40 miles long. A long bay, called *Weide Jans Water*, with numerous inlets, runs north-north-east between Spitzbergen Proper and Spitzbergen East and Edges Island, to the isthmus that connects the two former. To the north of the isthmus is *Weide Bay*, which runs south-west.

The west coast of Spitzbergen is mountainous. The mountains generally rise within three miles of the sea, but in several places they commence at the coast. Between the shore and the mountains is a low level tract. It is commonly somewhat above the level of high-water mark, but in some places it is below it, and only prevented from being covered by the sea by a natural bank of shingle of the height of 10 or 15 feet. The mountains, which fill the interior of the island, rise to between 8000 and 4000 feet above the sea. Many branches of them run westward, and come close to the shore. Where these mountain ridges are at no great distance apart from one another, the intervening valleys, being of moderate extent, are filled with glaciers, which in several places constitute the very shores of the sea, forming a high perpendicular wall of ice from 100 to 400 feet high. The inland valleys, in all seasons, present a smooth and continuous bed of snow.

The southern extremity of Spitzbergen is called *Point Look-Out*, or *South Cape*; a low flat, about 40 square miles in surface, constitutes the termination of the coast. On the isthmus which joins this flat tract to the main body rises a mountain chain, which runs north, and soon attains a considerable elevation, as a large glacier, or iceberg, lies here along the sea-shore. On the west coast, or 77° N. lat., is a wide bay, called *Horn Sound*, near the southern shores of which lies *Mount Horn*, or *Hedge-Hog Mount*, which has several summits, the highest of which is 4395 feet. *Horn Sound* has tolerable anchorage. A little to the northward of *Horn Sound* is a glacier of immense extent, occupying 11 miles of the sea-coast, and 400 feet thick. *Bell Sound*, another wide bay, occurs between 77° 35' and 77° 40' N. lat., and within it are several anchoring-places. North of 78° is *Ice Sound*, where good anchorage is found at *Green Harbour*. That portion of Spitzbergen which is south of 78° 50' N. lat. consists of groups of isolated mountains, partly disposed in chains, having conical, pyramidal, or ridged summits, sometimes round backed, frequently terminating in points, and occasionally in acute peaks not unlike spires.

To the north of 78° 50' N. lat. are *English Bay*, *King's Bay*, and *Cross Bay*, in which there is good anchorage. Near the head of *King's Bay* there are three piles of rocks of a regular form, called the *Three Crowns*. They rest on the top of a mountain, and each commences with a square table or horizontal stratum of rock, on the top of which is another of similar form and height, but of smaller area; this is continued by a third and fourth, and so on, each succeeding stratum being less than that immediately below it, until it forms a pyramid of steps, almost as regular as if it were worked by art. North of *Cross Bay* the mountains are more disposed in chains than farther south. An inferior chain of hills, six or nine miles from the coast, runs

parallel to the shore, and from this chain several lateral ridges project into the sea. Between these lateral ridges are the *Seven Icebergs*, each of which is, on an average, about a mile in length, and about 200 feet high near the sea. The higher mountains terminate near 79° 35' N. lat., and the lower coast, which extends hence to the north, is indented by many small inlets, surrounded by numerous small islands of considerable height. In this part there are several very good harbours and anchorages, both in the inlets and between the islands, as *Magdalena Bay*, the excellent harbours of *Smeerenberg*, *Fair Haven*, *Vogel Sang*, the *Norways*, *Love Bay*, *Hecla Cove*, in the *Bay of Treurenburg*, on *Waygats Strait*, and others.

The centre of *Charles Island*, which lies opposite the western coast of Spitzbergen, is occupied by a mountain chain about 30 miles in length, rising on the west side from the sea, and on the east from a narrow strip of level ground only a few feet above the sea-level. The central part of this chain is perhaps the highest land near the sea. It rises from the water's edge by a continual ascent, at an angle at first of about 30 degrees, and increasing to 45 degrees and more, until it terminates in five distinct summits, of which the highest is 4500 feet and the lowest 4000 feet above the sea-level.

Along the north shores of Spitzbergen and North-East Land the country is neither so elevated nor are the hills so sharp-pointed as on the west coast. Some of the smaller islands, which occur along these shores, and considerable tracts of the mainland, are comparatively level. They also contain much more earth and clay, and the vegetation is rather more vigorous. Along the east coast of North-East Land there is a continuous line of glaciers extending to the shore. The *Seven Islands*, *Walden Island*, and *Ross Island* (the northernmost land known) lie to the north of it.

Extending to within 10 degrees of the pole, the climate of Spitzbergen is intensely cold. The mean temperature of the three warmest months on the western coast does not exceed 34° 50', and even at that season this part of the island is occasionally subject to a cold of 3, 4, and more degrees below the freezing-point. In the northern parts the longest day is four months; but from the 22nd of October to the 22nd of February the sun does not rise above the horizon. This long night however is not quite dark, for the sun, even during its greatest south declination, approaches within 18½ degrees of the horizon, and causes a faint twilight for about one-fourth part of every twenty-four hours. If we add to this the aurora-borealis, which sometimes exhibits a brilliancy approaching to a blaze of fire, the stars, which shine with unusual brightness, and the moon, which in her north declination appears for twelve or fourteen days together without setting, we may conceive that during the long night there is generally sufficient light to enable a person to go abroad. The winter sets in at the end of September. In the middle of October the frost is sometimes very intense, and it increases rapidly in November. But throughout the whole winter, when strong south winds occur, they are generally accompanied with mild weather, and sometimes with thaw. Storms at this season are frequent. A great quantity of snow falls every winter, but it accumulates principally in the sheltered gullies, lying on the level ground seldom more than five feet deep. Captain Parry however found that the climate of the northern coast is remarkably temperate in summer for the latitude, and very agreeable, but only so near the land, that of the adjacent sea being of a totally different character, owing to the almost continual fogs. In May and June the sea was almost entirely covered with large fields or floes of ice, but in August it was hardly possible to discover a single piece of ice, so great was the change which had been produced by the continual presence of the sun. The Spitzbergen sea is said to be much more open than any other part of the Arctic sea in so high a latitude.

The number of species of plants which have been found in Spitzbergen hardly exceeds forty, but vegetation is very rapid. Most of the plants spring up, flower, and produce seed in the course of a month or six weeks. They are of a dwarf size, and the only plant which partakes of the nature of a tree is a *Salix herbacea*, which grows to the height of three or four inches. The islands do not produce vegetables suitable or sufficient for the nourishment of a single human being; yet Russian whalers who frequent the east coast have, in several instances, resided for years upon Spitzbergen; and one, M. Sharostin, is named in the 'London Geographical Journal for 1858,' who passed thirty-nine winters on the island, and resided there fifteen years without having once left the island. In some parts of *King's Bay* a very beautiful marble and coal of good quality are abundant.

The quadrupeds are—polar foxes, polar bears, and rein-deer. The adjacent sea abounds in many species of whales and some other large fish. There are also many mooses, or walruses, and abundance of seals. Sea-fowl are exceedingly numerous.

Spitzbergen was discovered in 1596 by Barentz, Hemskeke, and Ryp, in their endeavour to effect a north-east passage to the Indies. It was named by them Spitzbergen (*Pointed Mountains*) from the numerous peaks observed on the coast.

SPLUGEN. [ALFA.]

SPOLETO, a province of the States of the Church, consists of the valley of the Nera, one of the principal affluents of the Tiber, of the valley of the Maroggia, another affluent of the Tiber, and of several ridges of highlands between them. This country is part of

the ancient Umbria. It is bounded N. by the provinces of Perugia and Camerino; E. by the province of Ascoli and the kingdom of Naples; S. by the province of Rieti; and W. by that of Viterbo, from which it is divided for the most part by the Tiber. The area is 1180 square miles, and the population by the census of 1850 was 123,765. The Central Apennines cover the eastern part of the province, in which are Monte della Sibilla (7300 feet) and Monte Vittore (8130 feet), the two highest summits in the States of the Church. Ramifications from the main chain stretch over other parts of the surface, rendering the province a very hilly country. A part of the province extends to the eastern slope of the Apennines, and is drained by the Tronto. The rest of the surface belongs to the basin of the Tiber. The Maroggia flows northward past Spoleto, and joins the Topino below Foligno, on its way to meet the Tiber. The Nera flows south past Terni, and being joined by the Corno and the Velino, also enters the Tiber. The Nera and the Maroggia are separated by the mountains of Somma, a ridge which is crossed between Spoleto and Terni. The most fertile part of the country is the valley of Spoleto, traversed by the Maroggia and yielding good crops of maize; wheat, pulse, melons, vines, almonds, chestnuts, and olives also flourish in the valleys. Horned cattle are numerous, and much cheese is made. Bees and silkworms are reared. The chief minerals are limestone, marble, gypsum, and potters' clay.

The province of Spoleto proper is divided into the three districts of Spoleto, Norcia, and Terni. *Spoleto* (ancient *Spoletum*), the head town of the province, is situated on a hill above the Maroggia, on the high road from Rome to Ancona, and has about 8000 inhabitants. An aqueduct, which served also as a bridge, crosses the Maroggia; it is a work of the Longobard times, but is now in a ruinous state. Spoleto has a handsome cathedral, adorned with frescoes by Filippo Lippi. Several other churches, the town-house, and the palace of the family Ancajani, are also worthy of notice. The castle of Spoleto contains some remains of Cyclopean walls. There are also remains of a Roman theatre, of several temples, and other antiquities. Spoleto is a bishop's see, and has a college and manufactories of hats and woollens. It carries on a considerable trade in corn, oil, wine, and truffles, which are found in the neighbourhood. Spoletum, then a Latin colony of Rome, was attacked by Hannibal after the battle of Trasimenus, but the inhabitants repulsed his attack, and thus checked his advance towards Rome. (Livy, xxii. 9.) An inscription above the gate called the Gate of Hannibal records the event. Half-way between Spoleto and Foligno are the sources of the Clitumnus, a small limpid feeder of the Maroggia. The fine large-horned cattle which fed on the banks of the Clitumnus were preferred by the ancient Romans for sacrifice, and also for the ceremony of their triumphs. (Virgil, 'Georg.' ii. 146.)

The other towns of the province are:—*Terni*, the ancient *Interamna*, built near the confluence of the Velino with the Nera, a bishop's see, with an old cathedral, the remains of an amphitheatre, two ancient temples and thermae, and about 6000 inhabitants. About three miles above Terni is the celebrated cascade of the Velino (sometimes called the 'Falls of Terni'), which is described in the article Rieti (vol. iii., cols. 303, 304). *Narni*, situated on a lofty precipitous hill on the left bank of the Nar, about eight miles above its junction with the Tiber, is the ancient *Narnia*. Before the conquest of the town by M. Fulvius, B.C. 299, it was called *Nequinum*, and it was an important city of Umbria. The Romans colonised it, and changed the name to Narnia, from its position on the Nar. Under the republic and the empire Narnia was a flourishing municipal town, and its strong position commanding the Flaminian Way, made it an important military post. The bridge constructed by Augustus, by which the Flaminian Way was carried across the ravine in which the Nar flows, was one of the most magnificent structures of the kind. It consisted of three arches, and the whole was built of massive blocks of white marble. The piers and one arch still remain. Narni at an early period (A.D. 360) became, and still is, the seat of a bishop. The principal buildings are—the castle, a convent crowned with towers, and the cathedral, which dates from the 13th century, and is dedicated to St. Giovenale, the first bishop of the see. The emperor Nerva and Pope John XVIII. were natives of Narni. Population, 3300. *Amelia*, a small town of 2000 inhabitants and a bishop's see, situated on a hill not far from the left bank of the Tiber, and above the confluence of the Nera, is noted for its raisins and its prunes. It occupies the site of the ancient *Ameria*, which is said to have been built by the Umbri several centuries before the foundation of Rome, and was afterwards in possession of the Etruscans. (Pliny, 'Hist. Nat.', iii. 19.) A considerable portion of the ancient polygonal walls still remain. *Bevagna*, the ancient *Mevania*, likewise a town of the Umbri, near the confluence of the Maroggia with the Topino, has about 2000 inhabitants. *Norcia*, the ancient *Narnia*, at the northern extremity of the province, and at the foot of Monte della Sibilla, is a bishop's see, and has 3000 inhabitants. A great number of swine are reared in the neighbourhood. The Corno, an affluent of the Nera, flows through a deep glen near Norcia.

SPREE, RIVER. [BERLIN; BRANDENBURG.]

SPRINGFIELD. [ILLINOIS; MASSACHUSETTS; OHIO.]

SPROWSTON. [NORFOLK.]

SQUILLACE. [CALABRIA.]

STACKPOLE. [PEMBROKESHIRE.]

STADT, a fortified town in Hanover, the capital of the province of

Stade, is situated in 55° 36' N. lat., 9° 24' E. long., about 22 miles W. from Hamburg, in a marshy country on the banks of the Schwinge, a navigable stream which falls into the Elbe about three miles below the town. Among the public buildings are three churches, a town-hall, a gymnasium, an orphan asylum, and a poorhouse. The town, with the suburbs, contains about 6000 inhabitants, who have manufactures of flannel, worsted stockings, hats, and lace. There are breweries and brandy distilleries, a cannon foundry, and a rope-walk. The transit trade is of some importance. The exports are fat oxen, wooden wares, and stockings. Some vessels go every year to the Greenland whale-fishery, and also to the seal and herring fishery.

At the mouth of the Schwinge is the castle of Brunshausen, off which an armed vessel is constantly stationed, for the purpose of collecting the duties levied by the Hanoverian government on all vessels passing up or down the Elbe. Since the completion of the railroad and the commercial harbour at Harburg, the Hanoverian government has reduced the toll on ships bound for this port, but still maintains the higher dues on vessels making for Hamburg.

STAFFA, a small uninhabited basaltic island on the western side of Scotland, about 8 miles W. from Mull, in 56° 28' N. lat., 6° 20' W. long.

The island is composed of amorphous and pillared basalt: the pillars have in many parts of the rugged coast yielded to the action of the sea, and permitted the formation of caves, some of them uncommonly picturesque, which are generally arched over by what seems to be amorphous trap-rock, but really is often prismatic in an irregular manner. The island has a very broken and unequal surface, affording poor pasture.

Skirting the coast in a boat, the caves and ranges of pillars, erect, or curved beneath a huge entablature of rock, and the regular pavement formed by the angular sections of the pillars, astonish the spectator. Fingal's Cave, the largest and most attractive of the caves, may be entered on foot on the south side, along a rugged pavement of pillar-tops. Its roof is formed partly of pillar-sections, and partly of the already-mentioned amorphous trap; the sides are straight vertical prisms of basalt, washed at their base by a deep and often tumultuous sea. Its length from the rock outside is 371 feet, from the pitch of the arch 250 feet; the breadth at the mouth is 54 feet, at the farther end 20 feet; the height of the arch at the mouth is 118 feet, at the inner end 70 feet; the pillars outside vary from 40 to 55 feet in height. The Boat Cave, the Cormorant Cave, and Fingal's Cave, may, in ordinary weather, be explored in a boat, and a landing may be effected on Buachailé (Boo-cha-la), the 'Herdaman's Isle,' which is remarkable for its arched columns of basalt.

The basaltic mass of Staffa may be regarded in three parts: a sub-jacent amorphous and lava-like mass, 11, 17, or 20 feet exposed, on which (especially beyond the north-west side of Fingal's Cave) the pillars rest, and these are covered by a seemingly amorphous but really irregularly prismatic entablature, from 30 to 66 feet in thickness. The tops of the pillars are usually in a nearly regular plane declining to the south-east, and their bases are also in a surface nearly parallel. The section of the pillars is rarely triangular or quadrangular, generally pentagonal or hexagonal. Some of them are two feet in diameter, others as small as one foot, nine inches, or even six inches. They are less regularly jointed than those of the Giants' Causeway, and usually the joint surfaces are concave in the lower stone. Zeolitic minerals occur sparingly in the basalt and in the interstices of the pillars. Steamers make excursions from Oban to Staffa during summer.

STAFFORD, the county town of Staffordshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on the left bank of the river Sow, in 52° 48' N. lat., 2° 7' W. long., distant 141 miles N.W. by W. from London by road, and 132½ miles by the London and North-Western railway via Trent Valley. The population of the borough of Stafford in 1851 was 11,829. The borough is governed by 6 aldermen and 18 councillors, of whom one is mayor, and returns two members to the Imperial Parliament. The living is a rectory in the archdeaconry of Stafford and diocese of Lichfield. Stafford Poor-Law Union contains 20 parishes and townships, with an area of 49,685 acres, and a population in 1851 of 22,632.

According to the 'Saxon Chronicle,' Ethelfleda, 'lady of Mercia,' built a fort at this place in the year 913 to keep the Danes of the neighbourhood in check. There was a castle near it in the middle ages. In the civil war of Charles I. the Royalists, after the capture of Lichfield Close by the Parliamentarians, retired to Stafford; and an indecisive battle was fought at Hopton Heath, two or three miles from the town, March 19th, 1643. The town was subsequently taken by the Parliamentarians; at a later period the castle was also taken. The castle, which is a mile and a half S.W. from the town, in Castle Church parish, has been of late years rebuilt. The town is well supplied with water, and the streets are lighted with gas and paved. The houses are in general well built, mostly of brick, and roofed with slate. Over the river Sow is a neat bridge. The public buildings are the county hall, a spacious stone building in the market-square; the county jail, and house of correction; the county infirmary; and the county lunatic asylum, a capacious and well-arranged building. There are two parochial churches: St. Mary's, formerly collegiate, is a large

and fine cruciform building, chiefly of early English date, with an octagonal tower at the intersection. The transept is 100 feet long and 25 feet broad. In 1847 this church was repaired and restored at a cost of about 16,000*l.* The church of St. Chad has a Norman chancel, with an east window of modern date, a modern nave, and a tower between the nave and chancel, of perpendicular character. In the town is a new district church. The Wesleyan Methodists, Baptists, Independents, Quakers, and Roman Catholics have places of worship. King Edward VI.'s Free Grammar school, founded in 1556, is free to all; its income for all purposes amounts to 312*l.* a year; it had 27 scholars in 1854. There are also National, British, and Ragged schools, a savings bank, a library, and a mechanics institute.

Stafford has sent members to Parliament since the 23rd Edward I. The assizes, quarter sessions, and a county court are held in the town. The manufacture of shoes, chiefly for the London market or for exportation, employs a considerable number of men. Cutlery is manufactured to a small extent. Tanning is carried on. The market is on Saturday; and there are five yearly fairs, chiefly for horses and cattle.

STAFFORDSHIRE, a midland county of England, bounded N.E. by Derbyshire, E. for a very short distance by Leicestershire, S.E. by Warwickshire, S. by Worcestershire, S.W. and W. by Shropshire, and N.W. by Cheshire. It lies between 52° 23' and 53° 14' N. lat., 1° 36' and 2° 27' W. long. The form of the county is irregular: its greatest length is from north to south, from Ax-edge Common, at the junction of Cheshire, Derbyshire, and Staffordshire, to the neighbourhood of Bewdley (Worcestershire), 60 miles; the greatest breadth, at right angles to the length, is from the junction of the Dove with the Trent, below Burton, to the neighbourhood of Market-Drayton (Shropshire), 38 miles. The area of the county is 1138 square miles, or 728,468 statute acres. The population in 1841 was 510,206; in 1851 it was 608,599.

Surface, Geology, and Mineralogy.—The northern is the highest part of the county. It consists chiefly of wild moorlands, formed by long ridges, extending from north-west to south-east, separated from each other by deep dells, or by valleys watered by the tributaries of the Trent, and gradually subsiding towards the banks of that river. The principal summits are—Cloud-end, Biddulph Moor, Mow Cop (1091 feet above the level of the sea), Bunster Hill, High Roches, Moreedge, Ecton Hill, Wever Hill (1154 feet), and Swinecote, or Swincoo Hill, in the northern part of the county. On the eastern side, between Abbots Bromley and Burton-upon-Trent, are the high grounds of Needwood Forest; and south of the Trent, toward the centre of the county, between Stafford and Lichfield, are the high grounds of Cannock Chase, one part of which (Castle Ring) is 715 feet high. The western side of the county is occupied by a tract of high ground, which separates the waters that flow westward by the Severn into the Atlantic, from those which flow eastward by the Trent and the Humber into the North Sea.

Nearly the whole of the county is included in the new red-sandstone district of central England. The northern part is indeed beyond the limit of this formation; and there are some insulated districts occupied by the coal-measures or other subrecent formations, which rise through the red-sandstone. Gypsum is quarried in Needwood Forest and in the adjacent part of the valley of the Dove. The pure white gypsum, or that slightly streaked with red, yields plaster of Paris, which is much used in the potteries for moulds; selected blocks are turned, or otherwise converted into ornamental articles. Limestone is quarried near Newcastle, in the pottery district. Brine-springs abound near the Trent, particularly at Weston, near Stafford, where salt-works have been established.

The Dudley, or South Staffordshire, coal-field extends from Crannock Chase to the Worcestershire border near Stourbridge, about 20 miles in length from north by east to south by west; and from King's Swinford to Soho, near Birmingham, 10 miles in breadth from west to east. The hills south-east of Dudley consist of one mass of basalt and amygdaloid, round which the coal-measures do not crop out, as round the limestone, but preserve their usual level in approaching it. The basalt is very pure, and is locally termed Rowley Rag. It is quarried for mending the roads and paving the streets of Birmingham. Trap rock (greenstone) is found in that part of the coal-field which is near Walsall; it is apparently part of a thick vertical greenstone dyke, with a wedge-shaped prolongation penetrating the adjacent carboniferous strata. The coal of the southern part of the Dudley field is distinguished by the occurrence of an extensive bed called the Main-coal, 30 feet thick, but this dips to the south, and crops out at Bilston. On the east side of the coal-field, near Walsall, the transition limestone again rises, and the carboniferous beds crop out against it. At Beaudesert, at the northern extremity of the field, cannel coal is obtained.

In the northern part of the county another coal-field (the Pottery coal-field) occurs, of triangular form, extending from Lane-End in the Potteries to Congleton in Cheshire. Its greatest breadth, which is in the southern part, forming the base of the triangle, is 8 or 10 miles. There are 32 beds of coal in this field, generally from 3 to 10 feet thick. The coal-works of the county are very numerous and important; in the south they supply the iron and other hardware manufactures of Birmingham, Dudley, Wolverhampton, &c.; and furnish

GEOG. DIV. VOL. IV.

fuel to the neighbouring counties to a considerable distance, and in the north they supply the fuel to the Pottery district. Ironstone is abundant in the Dudley coal-field.

The high moorlands of the northern part of the county consist partly of millstone-grit and shale; partly of carboniferous or mountain limestone. The millstone grit occupies the central and western portion, cropping out from beneath the Pottery and South Lancashire coal-fields, and overspreading the intervening country. The mountain limestone district comprehends the eastern moorlands, and extends across the upper valley of the Dove into Derbyshire. There are several lead-mines and copper-mines in this district.

Hydrography, Communications, &c.—The county belongs almost entirely to the basin of the Humber. The Trent, the most important tributary of that estuary, rises from three springs on the northern border of the county, near Knypersley Hall; and runs by Trentham, the seat of the Duke of Sutherland, past Stone and Rugeley to Burton, where it becomes navigable; and 2 or 3 miles below Burton quits the county altogether. [TRENT.]

The principal tributaries of the Trent are the Lymc from Newcastle-under-Lyme, the Sow, the Blyth, the Tame, the Mease, and the Dove. The Lymc joins the Trent on the right bank, not far from its source. The Mease during a part of its course separates the county from Derbyshire. The Sow rises about 6 miles N.W. from Eccleshall, near the western border of the county, and after a course of a few miles is joined on the left bank by the Mease Brook, which rises near the Sow, and has a course nearly parallel to it, but of rather greater length. The Sow flows through the town of Stafford to the junction of the Penk. The Penk rises near Wolverhampton, and flows 20 miles northward through Penkridge into the Sow, which it joins on the right bank. Four miles below the junction of the Penk, the Sow joins the Trent on the right bank. Its whole course is about 19 or 20 miles; it is not navigable. The Blyth rises about 4 miles E. from Hanley in the Potteries, and flows south-south-east 23 miles into the Trent, which it joins on the left bank, 5 miles below Rugeley. The Tame rises in Essington Wood, 4 miles N.W. from Walsall, and flows 15 miles south-east to Aston, a suburb of Birmingham, where it receives on the right bank the Rea brook, which flows through Birmingham. From the junction of the Rea the Tame flows eastward, receiving on the right bank the united streams of the Cole and the Blyth, each about 16 miles long; it then turns northward, and receives at Tamworth the Anker on the right bank, after which it flows into the Trent; its whole course is about 42 miles, partly in Warwickshire, but chiefly in Staffordshire.

The Dove rises near the northern extremity of the county, and flows south-south-east by or near Longnor, Ashbourne (Derbyshire), and Uttoxeter, into the Trent below Burton, dividing through nearly its whole course the counties of Derby and Stafford: its length is nearly 45 miles. It is not navigable. The upper part of its course is through the beautiful scenery of Dovedale on the border of the Peak. The *Manifold*, about 9 miles from its source, sinks into the ground, and after a subterraneous course of 4 miles rises again near Ilam, and shortly after joins the Dove; its tributary, the Hamps, sinks in like manner, and the junction of the two streams takes place underground. The *Churnet* rises on Biddulph Moor, 5 miles N.W. of Leek, and soon after expands into a sheet of water, or lake, from the lower end of which it continues its course by Leek, Alveton (or Alton), and Rochester, a little way below which it joins the Dove. The western border of the county belongs to the basin of the Severn, which flows for about 2 miles across the south-western corner of the county, near Over Arley. About 14 miles of the course of the *Stour* (which rises near Hales Owen (Shropshire), and joins the Severn at Stourport) are on or within the southern border of the county. The rivers of Staffordshire abound with fish, such as pike, trout, grayling, chub, perch, &c. Salmon are caught in the Severn, and occasionally in the Trent.

The canals of this county are numerous. The most important is the Trent and Mersey, or, as it is sometimes called, the Grand Trunk Canal. This canal, commencing in the Trent at the junction of the Derwent in Derbyshire, enters the county near the junction of the Trent and Dove, and follows the valley of the Trent to Stoke in the Potteries, from whence it continues its course north-west to the Mersey, at Runcorn Gap. About 50 miles of its course belong to Staffordshire. The Birmingham Canal and the Birmingham and Liverpool Junction Canal form another important line, entering the county near Birmingham, and passing through the iron and coal district, by Dudley and Wolverhampton, and then running north-west into Shropshire. The length of this line is about 32 miles. The Staffordshire and Worcestershire Canal commences in the Severn at Stourport, and enters Staffordshire near the village of Whittington, follows the valleys of the Stour and the Smestow, passes near Wolverhampton, and joins the Trent and Mersey canals near the junction of the Sow and the Trent. Its length in this county is nearly 40 miles. The Stourbridge Canal commences in the above canal at Stewponney, and extends to the town of Stourport. The Dudley Canal commences in the Birmingham and Worcester Canal (which, though not in this county, is connected with the Birmingham Canal noticed above), and proceeds to Dudley. A part only of the line is in Staffordshire. A cut unites it with the Stourbridge Canal, and consequently with the

Staffordshire and Worcestershire Canal. The Coventry Canal, from its commencement in the Trent and Mersey Canal at Fradley Heath to Fazeley near Tamworth, 11 miles, belongs to this county. At Fazeley it unites with the Birmingham and Fazeley Canal, which forms a part of the Birmingham Canal Navigations, and of which only a small part is in Staffordshire. In the northern part of the county is the Caldon Canal, which is a branch of the Trent and Mersey Canal, extending from the main line at Hanley in the Potteries north-eastward to the neighbourhood of Leek, to which town there is a cut; and from thence south-eastward to Uttoxeter, in the valley of the Dove. The Newcastle-under-Lyme Canal is a short canal from the Trent and Mersey Canal at Stoke-upon-Trent to Newcastle-under-Lyme. There are several other short canals in the county.

The London and North-Western railway enters the county near Bilston, and runs throughout in a north-north-west direction, quitting it a few miles south of Crewe. The Shrewsbury and Birmingham and one or two other short connecting lines pass from it in its progress through the county. The Trent Valley branch of the North-Western railway enters the county near Tamworth, and passes in a north-west direction to Stafford. It is continued from Colwich through the Pottery district to Congleton, by the North Staffordshire line. There are also several branch railways.

The principal coach-road in the county is the parliamentary road from London to Holyhead, which enters Staffordshire at Soho, near Birmingham, and runs through Wednesbury, Bilston, and Wolverhampton, a few miles beyond which it enters Shropshire. The Chester and Holyhead road enters the county at Tamworth, and runs by Lichfield, Stafford, Eccleshall, and Knighton, into Shropshire. The London and Liverpool road, branching from this at Wolsley Bridge, runs through Stone and Newcastle-under-Lyme into Cheshire. The road from London by Derby to Manchester crosses the northern part of the county through Leek. The road from Birmingham to Derby passes through Lichfield and Burton-upon-Trent. There are numerous minor roads.

Climate, Soil, Agriculture.—The air of this county is sharp in comparison with that of the counties situated to the south of it; while Staffordshire is more subject to continued rains, which make the crops later and the harvest more precarious. The average quantity of rain which falls in Staffordshire in the year is about 36 inches, while in the neighbourhood of London the average fall is only about 21 inches. The heavy soils consequently require thorough draining. The middle and southern portions of the county are comparatively flat, and have only gently undulating hills. This portion also contains the most fertile lands, and is in the best state of cultivation.

Of the entire area of the county about 150,000 acres are in roads, wastes, and woods. The remainder is productive either as arable land or pasture, the proportion of arable to pasture land being nearly as five to one. Along the banks of the rivers are rich and productive meadows, which are continually renovated by the depositions of fine mud in floods; but sometimes they are flooded at a time when the grass is fit for the scythe or already cut, in which cases much loss is sustained.

There is not much land in this county devoted to the grazing of cattle, or to extensive dairies, but many fine beasts are fattened in stalls on turnips, hay, and oil-cake, chiefly for the sake of the manure. The breed most esteemed is that of the short-horns. Of sheep, every breed is to be met with which is in any repute. The farm-horses in Staffordshire are active and strong, and in general well kept. The Staffordshire hog of the old breed is coarser than the Berkshire or Essex, but better pigs have been introduced.

Divisions, Towns, &c.—Staffordshire is divided into five hundreds, as follows:—Cuttleston or Cuddleston, central and west; Offlow or Offlow, east and south-east; Pyrehill or Pirehill, north-west and central; Seisdon, and Totmonslow, south, south-west, north, and north-east; with the city of Lichfield and the boroughs of Newcastle-under-Lyme and Stafford. It contains the county town and borough of STAFFORD; the city of LICHFIELD; the old boroughs of NEWCASTLE-UNDER-LYME, and TAMWORTH, and the new parliamentary boroughs of STOKES, WALSALL, and WOLVERHAMPTON; and the market-towns of Brierly Hill, BILSTON, BURSLEM (included in the borough of Stoke), BURTON-UPON-TRENT, CHEADLE, Eccleshall, Hanley (also included in Stoke), LEEK, LONGNOR, Longton, Rugeley, STONE, Tunstall (included in Stoke), UTTOXETER, and WEDNESBURY. The towns printed in small capitals are described under their respective titles; the others we notice here, with the decayed market-towns and principal villages; the population is that of 1851:—

Brierly Hill, population of the ecclesiastical district 8770, about 3 miles S.W. from Dudley, is a market-town, consisting chiefly of one long street, which is lighted with gas. The parochial chapel occupies an elevated site; there are chapels for Wesleyan and Primitive Methodists, Independents, and Baptists; National and Infant schools; a literary society, and a branch savings bank. The inhabitants are employed in coal-mines, iron-works, glass-works, brick-kilns, iron-rolling-mills, boiler-works, nail, chain, and spoke-making establishments, and malt-kilns. The market, which is important, is held on Saturday.

Eccleshall, population of the township 1427, about 7 miles N.W. by W. from Stafford, near the right bank of the river Sow. There is

here a residence of the Bishop of Lichfield. Eccleshall contains many well-built houses. In 1829, the chancel and north side of the church were rebuilt. The Independents have a chapel, and there are National schools. The market is held on Friday, and there are four cattle fairs in the year. Tanning, malting, and shoemaking are carried on.

Hanley, population of the town 25,369, is near the centre of the pottery district, about a mile from Stoke. It is the largest market-town in the district. The streets are wide, have a brick pavement for foot passengers on each side, and are lighted with gas. The market-place is large and surrounded by spacious shops. The market-hall is a convenient building. The church is a commodious brick building, with a tower 100 feet high. The Wesleyan and New Connexion Methodists, Independents, and Baptists have chapels, and there are National and British schools. There is a large paper-mill. The markets are on Wednesday and Saturday.

Longnor, population of the chapelry 561, about 10 miles N.E. from Leek, stands on the left bank of the river Manifold, near its source. The town possesses a neat stone chapel, with a lofty pinnacled tower; a chapel for Wesleyan Methodists; and two schools. The market is held on Tuesday, and there are eight fairs in the course of the year.

Longton, population 15,149, forms with Lane End one town, about 14 miles N. from Stafford. The town is irregularly laid out, but the more modern portions are built with some degree of uniformity. Gibraltar on the north and Dresden on the south are new towns or suburbs. The earthenware and china manufactures are the chief support of the place. Besides the parish church and St. John's chapel, there are chapels for Wesleyan and New Connexion Methodists, Independents, and other Dissenters, National schools, an athensium, a literary institution, libraries, and savings banks. Markets are held on Wednesday and Saturday, and fairs at Easter and Whitsuntide.

Rugeley, population 3054, about 8 miles N.W. by N. from Lichfield, near the north-eastern border of Cannock Chase, is irregularly laid out, but clean and neat. The town-hall is a good building. There are extensive gas-works. The church, a gothic edifice, was rebuilt in 1822. The tower and chancel of the old church still remain; the chancel is used for a school-room. There are chapels for Independents and Roman Catholics. The Grammar school, which is free to inhabitants of Rugeley and Brereton, has an income from endowment of 270*l.* a year, with a house; it had 30 scholars in 1854. There are also Endowed, National, Infant, and Roman Catholic schools, and a savings bank. There are iron-works in the town. Ropemaking, the manufacture of sheet-iron and tin-plate, the hat manufacture, and the making of agricultural implements employ some of the inhabitants. Tuesday is the market-day; four yearly fairs are held, one of which is a large horse-fair, and another a large horse, cattle, and sheep fair. Hagley Hall, the seat of the Hon. Robert Curzon, a fine old gothic mansion, stands in a spacious park near the town.

Tunstall, or *Tunstall Court*, population of the township 9566, about 4 miles N. from Newcastle-under-Lyme, is situated on elevated ground. There are here a market and court-house; a church; chapels for Wesleyan and Primitive Methodists; and National schools. The market is held on Saturday. Earthenware and blue tiles are manufactured; and there are corn-mills and chemical works.

The following places formerly had markets, but they have been discontinued:—*Belley*, population of the parish 882, about 7 miles W.N.W. from Newcastle-under-Lyme, is a well-built town, occupying a cheerful situation. The parish church is a neat structure, with a tower at the west end. The Wesleyan Methodists have a chapel, and there are National schools, partly endowed. In the vicinity are considerable market gardens. Fairs are held in April, July, and October. *Brewood*, population of the parish 8565, is about 8 miles N.N.W. from Wolverhampton, near the left bank of the river Penk. The parish church has a fine spire; there are chapels for Wesleyan Methodists, Independents, and Roman Catholics. The Grammar school, which is free to the inhabitants of Brewood, has an income of about 450*l.* a year. It had 61 scholars in 1852. There are National schools, a Roman Catholic Free school, and a savings bank. There was formerly a Benedictine nunnery at Brewood. *Cannock*, population 2099, about 9 miles S.S.E. from Stafford, gives name to Cannock Chase, which was formerly covered with oaks. Besides the parish church, a neat stone building of mixed styles, there are chapels for Wesleyan Methodists and Independents. There are also National schools. Edge-tools are manufactured. *Tutbury*, population of the parish 1798, about 10 miles E.S.E. from Uttoxeter, on the right bank of the Dove. Tutbury is described in Domesday-book, in which it is called Toteberie, as a borough with a market. The castle is also there mentioned. A Benedictine, or Clunian, monastery was founded here soon after the Conquest. Robert de Ferrars, earl of Derby, having joined the Earl of Leicester and the other insurgent barons in the war against Henry III., lost his castle of Tutbury, which was taken by Prince Edward; and, in consequence of his subsequent second rebellion, forfeited to the king, by whom it was bestowed on his son Edmund Crouchback. It was subsequently inherited by John of Gaunt, who rebuilt a great part of it, and lived here in great splendour. It was one of the places of confinement of Mary Queen of Scots. In the great civil war it was held by the Royalists, and was not taken till the spring of 1646, soon after which it was in great part demolished. The ruins of the castle are on the brow of the

hill on which the town stands, and are sufficient to show its former magnitude. The church, which is the nave of a much larger building, is a very interesting specimen of Norman ecclesiastical architecture. The Independents and Wesleyan and Primitive Methodists have chapels; and there are Free and Infant schools. Some cotton-spinning is carried on. Extensive glass-works give considerable employment. In 1831, about 100,000 small silver coins were found in the bed of the river Dove near Tutbury.

The following are some of the more important villages:—

Abbots Bromley, population 1563, about 13 miles E. by S. from Stafford, consists chiefly of one long straggling street, containing several neat houses. The parish church has been much modernised, but retains a Norman doorway. The Independents have a chapel, and there are National and Free schools. Three fairs are held annually for cattle. *Adridge*, population of the township 1178, about 4 miles N.E. from Walsall, has some well-built houses. The church, which has been recently repaired, has a good square tower. The Grammar school, founded in 1718, has an income from endowment of 130*l.* a year, and had 50 scholars in 1853, all free. There are also National and Free schools. *ALTONFIELD*. *Alton*, or *Alveton*, population of the township 1162, finely situated near the right bank of the Churnet, about 4 miles E. by S. from Cheadle, is a neat village, containing some good houses. The parish church, an ancient edifice of stone, was repaired and partly rebuilt in 1880. There are chapels for Wesleyan and Primitive Methodists, Independents, and Roman Catholics; also National schools. Alton Castle, a massive structure of gothic character, recently erected on the site of the former castle; St. John's Hospital; a mechanics institute; and an observatory, are among the objects requiring notice. Alton Towers, the magnificent seat of the Earl of Shrewsbury, about a mile from Alton, on the opposite side of the Churnet, has been considerably altered and added to during the last few years. A Roman Catholic chapel, monastery, and schools were erected under the direction of the late Mr. A. W. Pugin. *Amblecote*, population of the hamlet 1628, on the Worcestershire border, forms part of the parish of Old Swinford, the rest of which is in Worcestershire. Amblecote being in the iron and hardware district, its population is chiefly occupied in the various branches of the iron manufacture. *Aston*, population included in that of Stone parish, about 2 miles S.S.E. from Stone, on the right bank of the river Trent, has a neat district church, a Roman Catholic church, and a district school. Aston Hall is occupied by a community of the Roman Catholic Order of the Passionists, who also conduct a school for boys. *Audley*, population of the township 1080, about 5 miles N.W. from Newcastle-under-Lyme; it possesses an ancient church of decorated character, with a massive pinnacled tower; the chancel was rebuilt a few years back. The Wesleyan Methodists have a chapel and schools, and there are National schools. The Free Grammar school, founded in 1610, has an income from endowment of 190*l.* a year, and had 54 scholars in 1854. Coal and iron-stone are extensively worked in the neighbourhood. *Barlaston*, population 617, about 3 miles N. by W. from Stone, is situated on elevated ground, near the left bank of the river Trent, and on the line of the Grand Trunk Canal. The parish church is a modern brick edifice, except the tower, which is old, and constructed of stone. Near the church is Barlaston Hall, an elegant mansion. A school for boys and girls is supported by the Duke of Sutherland. *Barton-under-Needwood*, population of the township 1561, about 9 miles N.N.E. from Lichfield, has a chapel of ease, a stone edifice of Norman date, with a large square tower; chapels for Wesleyan and Primitive Methodists; and National and Free schools. *Biddulph*, population 2688, about 7 miles N. from Burslem, at the foot of the Mole Cop Hills, has an ancient parish church; a chapel of ease, in the early English style; chapels for Wesleyan and Primitive Methodists; and a Free school. In the vicinity are extensive collieries, quarries, a silk-mill, and a manufactory of spades and shovels. There are here the vestiges of a stone circle, called the Bridestones. *Blarwich*, population 4477, about 3 miles N.N.W. from Walsall, has a church, chapels for Wesleyan and Primitive Methodists, and Roman Catholics; and National schools. There are coal- and iron-mines, flour-mills, lime-works, and manufactures of awl-blades, bridle-bits, &c. *Darlaston*, population 10,590, about 2 miles S.W. from Walsall, has in its vicinity coal-pits and iron-mines, which, with stone-quarries and various branches of the hardware manufacture, employ a large proportion of the population. The parish church is a brick building of the 16th century. There are chapels for Wesleyan and Primitive Methodists and Independent, also National schools. A branch of the Birmingham Canal navigation passes near the village, and is carried over the Bescot Brook, at a height of 120 feet, by a handsome aqueduct bridge of two lofty arches. Over one part of the aqueduct is a viaduct for the Bentley-road. *Ditton*, population of the township 828, about 3 miles N.W. from Cheadle, has an ancient church, partly rebuilt in 1819, and a chapel for Wesleyan Methodists. The Free Grammar school, which has an income of about 260*l.* a year, had 84 scholars in 1854. *Drayton Bassett*, population 408, is about 9 miles S.E. from Lichfield. The parish church is a plain stone building with a square tower. There is a Free school. Drayton Manor, the seat of Sir Robert Peel, a mansion in the Elizabethan style, erected from designs by Sir Robert Smirke, is situated in an extensive and well-wooded park, about a mile north

from the village. *Ellastons*, population 1812, about 7 miles E. from Cheadle, has a handsome gothic church, situated on elevated ground, near the village; chapels for Wesleyan and Primitive Methodists, and National schools. *Etruria*, population 2306, is about 2 miles S.W. from Stoka. The church is a new stone building with a spire. The Wesleyan and New Connexion Methodists have chapels, and there are National and Infant schools. There are large gas-works, iron-works, and an extensive steam-engine factory. At Etruria is the celebrated porcelain manufactory founded by Josiah Wedgwood, who also built the village. *Fazeley*, population 1634, is situated on the river Tame, which is here crossed by a neat bridge. On the banks of the Fazeley Canal are extensive wharfs. Tape and oval laces are manufactured, and there is a mill for cotton spinning and doubling. The chapel of ease, a small neat building, was erected and endowed by the first Sir Robert Peel; the Wesleyan Methodists have a chapel, and there are National and Infant schools. Monthly fairs for sheep and cattle, and a yearly feast, are held. *Gnosall*, population 2678, about 7 miles W. by S. from Stafford, has a commodious church; a chapel for Wesleyan Methodists; and a Free school. Malting is carried on, and there are flour-mills. *Harborne*, population of the parish, exclusive of Smethwick township, 2350, about 3 miles S.W. from Birmingham, on a narrow outlying slip of the county, contains many respectable houses, the residences of Birmingham manufacturers. The church, which is of stone, is an ancient structure, but has been much altered. The Baptist and Wesleyan Methodists have places of worship. There are National and Infant schools, partly endowed; a Wesleyan school; and a library. In the vicinity are numerous market-gardens. *Handsworth*, population 7047, about 2 miles N.W. from Birmingham, has a parish church, which, except the tower, is modern. In the church are monuments to James Watt and Matthew Boulton, the eminent engineers and manufacturers of Soho. There are chapels for Wesleyan Methodists and Independents; also National and Infant schools. Iron- and coal-mines employ a considerable number of the inhabitants. *Kinfare*, or *Kinver*, population 2872, about 4 miles W. by S. from Stourbridge, has a church, partly of Norman date. The Wesleyan Methodists have a chapel. The Free Grammar school has an income from endowment of about 250*l.* a year, and had 86 scholars in 1854. Kinfare was at one time a borough and market-town; fairs are held for cattle, sheep, and pigs, in February, May, and December. Bar, rod, and sheet-iron are manufactured. *Kingsley*, population of the township 890, is about 3 miles N. from Cheadle. The church is an ancient gothic structure, with a tower. The Wesleyan and Primitive Methodists have chapels, and there are endowed National schools. Clockmaking employs some of the inhabitants. In the vicinity are flour-mills. *Leigh*, population of the township 965, about 5 miles W.N.W. from Uttoxeter, is situated in a rich grazing district, on the banks of the river Blythe. The church, a handsome cruciform edifice, with a battlemented tower rising from the intersection, was rebuilt, except the tower, in 1846. There is an endowed Free school. *Longdon*, population 1148, about 4 miles N.W. from Lichfield, is irregularly built and spread over a considerable space. The parish church is a handsome stone building of mixed Norman and pointed styles. The Wesleyan Methodists and Independents have chapels, and there are parochial and Infant schools. Shoemaking employs a considerable number of hands. Malting and brickmaking are carried on. Beaudesert, the seat of the Marquis of Anglesey, stands in a spacious park about a mile west from the village. *Madeley*, population 1423, about 5 miles W. by S. from Newcastle-under-Lyme; the parish church is of Norman character. The Wesleyan Methodists have a chapel, and there are endowed schools. Nail-making and machine-making are carried on. *Patttingham*, population 939, is about 6 miles W. from Wolverhampton. The chancel of the parish church is of early English character, other parts are of later date: a double piscina, sedilia, and ambry were lately discovered. There is a National school. In the vicinity are market-gardens. A cattle fair is held on the last Tuesday of April. *Rowley Regis*, population 14,249, about 8 miles W. from Birmingham, is dependent on the iron manufacture, which is carried on extensively in various departments. The British iron-works at Congreave employ numerous workmen. The old parish church is at Rowley village; the Wesleyan and Primitive Methodists and Baptists have places of worship; there are National schools, and the British Iron Company's schools at Reddal Hill. There are extensive coal- and iron-mines; and clay is found of a kind particularly suitable for the construction of furnaces. Chains, traces, gun-barrels, jews'-harps, gas-tubing, and agricultural implements are manufactured. *Rusall*, population 1946, about 2 miles N.N.E. from Walsall, has an old church, which has been much altered and modernised. There are National schools. Malting and brick-making are carried on. There are lime-works in the vicinity. *Sandon*, population 556, about 5 miles N.E. by N. from Stafford, has a church of early English character, standing on a rocky eminence, a short distance east from the village. Sandon Hall, the seat of the Earl of Harrowby, was burned down in June 1848. A monument to William Pitt stands on a hill in Sandon Park, and in another part of the park is a gothic temple in memory of the Right Hon. Spencer Percival. The park is open to the public. National schools are supported by the Earl of Harrowby. *Sedgley*, population 29,447, about 3 miles N.W. from Dudley, is situated in a hilly district which abounds in coal, ironstone, and lime. The manufacture of nails, locks,

fire-irons, chains, and iron safes, gives extensive employment. The church, erected by the late Earl of Dudley, is a handsome gothic structure. The east window is filled with stained glass representing the twelve apostles. The Wesleyan Methodists and Roman Catholics have chapels, and there are National and Infant schools. *Shelton*, one of the pottery towns, population of the township 14,796, is included in that of Hanley town given before. Shelton church is an elegant gothic structure, erected in 1834. The tower is 120 feet high. There are chapels for Primitive and New Connexion Methodists and Independents; National, British, Methodist New Connexion, and Infant schools; a School of Design; a subscription library; and a news-room. The town-hall and market-place are used jointly for Shelton and Hanley. The china and earthenware manufacture, chemical works, brewing, and the making of shoes and clogs, give extensive employment. The North Staffordshire Infirmary is situated here. *Shenstone*, population 2043, about 4 miles S. by W. from Lichfield, has many well-built houses. The church, which stands on the top of a hill, is an ancient cruciform structure, with a square tower. The Wesleyan Methodists have a chapel. Malting, boot- and shoe-making, and the manufacture of steam-engines and agricultural implements, give considerable employment. A cattle fair is held about the end of February. *Smethwick*, population of the chapelry 8379, about 4 miles W. from Birmingham, has very extensive glass-, iron-, and steel-works, smelting furnaces, chemical works, rolling-mills, &c.; wrought-iron boilers are manufactured. Messrs. Chance's glass-works, and Messrs. Fox, Henderson, and Co.'s engineering and iron-founding factories, are at Smethwick. There are also works for the manufacture of patent iron tubing, and patent enamelled hollow ware. Nail-making is carried on very extensively, the nailors chiefly working in their own houses. There are a chapel of ease, a chapel dedicated to the Holy Trinity, and chapels for Wesleyan Methodists, Independents, and Baptists. Near Smethwick there is over the New Birmingham and Dudley Canal an iron bridge, 264 feet long by 25 feet broad, and 68 feet high from its base, containing in all about 700 tons of iron. *Swinford Regis*, or *Kingswinford*, population 27,301, including the population of Briery Hill before noticed, about 9 miles S. by W. from Wolverhampton, is in a rich mining district. The former parish church, which is in the village of Kingswinford, was made a chapel of ease about 1830, when the new parish church was erected at Wordley; in 1843 it was constituted a separate parish church, and had a district assigned to it. There are National schools. *Tale-o'-th-Hill*, population of the township 1973, about 6 miles N. by W. from Newcastle-under-Lyme, is seated on a lofty hill, which affords an extensive prospect. The church, which was rebuilt in 1794, was enlarged about 1830, and the tower again rebuilt. The Wesleyan and Primitive Methodists have places of worship. There are National and Infant schools. In the neighbourhood are coal-mines and flour-mills. *Swinsterton*, population 946, about 4 miles W.N.W. from Stone, possesses an ancient parish church, a Roman Catholic chapel, and National schools. *Tettenhall*, or *Tattenhall*, population 3393, about 2 miles W.N.W. from Wolverhampton, contains many good houses, occupied chiefly by manufacturers and tradesmen of Wolverhampton. Locks, keys, and fire-irons are made here. Malting and brick-making are carried on. The church, which is now a royal free chapel, was anciently collegiate. It was enlarged in 1825, and re-pewed in 1841. There are endowed National and Infant schools. *Tipton*, or *Tibbington*, population 24,372, is about 2 miles N. by E. from Dudley, in the heart of the iron and coal district. It has risen into importance with the advance of these branches of the industry of Staffordshire. A considerable amount of heavy iron goods is manufactured for export. Railway iron-work, and the making of steam-engine boilers, employ several extensive establishments. There are several churches of the Establishment; chapels for Wesleyan, Primitive, and New Connexion Methodists, Independents, Baptists, and Unitarians; several National schools, and schools supported by Wesleyan, Primitive, and New Connexion Methodists. *Trentham*, population of the township 680, about 4 miles S.S.E. from Newcastle-under-Lyme, has a church, rebuilt in 1842 by the Duke of Sutherland. In the centre of the new burial ground, is a pyramidal mausoleum erected by the late duke for the family cemetery. Trentham Hall is a splendid mansion in the Italian style, considerably enlarged and improved under the direction of Sir Charles Barry, who has added a fine Belvedere tower 100 feet high. The pleasure grounds in the park are extensive, and beautifully laid out; the river Trent, which runs through the grounds, contributing greatly to the beauty of the scenery. The park is stocked with deer. There are schools supported by the Duke and Duchess of Sutherland. *Wednesfield*, population of the township 4858, about 2 miles N.E. from Wolverhampton, has a church of modern date, built of brick; two chapels for Wesleyan Methodists; a chapel for Independents; and National schools. There is here a large manufacture of keys, locks, hinges, traps, files, rasps, &c. Extensive collieries and iron-works are in operation. *Whittington*, population 809, about 3 miles E. by S. from Lichfield, has a square church of brick, with a stone tower, surmounted with a lofty spire. There is a Free school. Whittington Hall is a large ancient mansion, near the church. On the Heath, which is an unclosed sheep-walk upwards of 300 acres in extent, Lichfield races are held. *Willenhall*, population of the township 11,931, about 3 miles E. from Wolverhampton, has an ancient parish

church; two new district churches; chapels for Wesleyan and Primitive Methodists, and Baptists; National and British schools; and a school supported by Wesleyan Methodists. The iron manufacture in various branches is pursued here to a considerable extent: locks and padlocks of every variety are made; numerous iron-foundries are in operation. There are varnish-works and malt-kilns. Willenhall is lighted with gas. *Yaxall*, or *Yaxhall*, population 1496, about 7 miles N.N.E. from Lichfield, on the right bank of the river Swerborn, an affluent of the Trent, has an ancient gothic church; a Roman Catholic chapel; and National and Free schools. Cotton-spinning, brick-making, and malting are carried on.

Divisions for Ecclesiastical, Legal, and Parliamentary Purposes.—The county of Stafford is in the diocese of Lichfield, and constitutes the archdeaconry of Stafford. Staffordshire is in the Oxford circuit: the assizes and quarter sessions are held at Stafford, where is the county jail. County courts are held at Cheadle, Hanley, Leek, Lichfield, Newcastle, Rugeley, Stafford, Stone, Uttoxeter, Walsall, and Wolverhampton. The county lunatic asylum is at Stafford. The number of representatives returned to parliament by the county and places within it was before the Reform Act 10, namely, two knights of the shire, and two members each for the city of Lichfield and the boroughs of Newcastle-under-Lyme, Stafford, and Tamworth. By the Reform Act the county was formed into two divisions, and two members allotted to each. Wolverhampton, Stoke-upon-Trent, and Walsall were made parliamentary boroughs; the first and second to return two members each, Walsall to return one member. The whole number of representatives sent from the district was thus increased from 10 to 17. By the Poor-Law Commissioners the county is divided into 17 unions—Alstonfield, Burton-on-Trent, Cheadle, Leek, Lichfield, Newcastle-under-Lyme, Penkridge, Seisdon, Stafford, Stoke-upon-Trent, Stone, Tamworth, Uttoxeter, Walsall, West Bromwich, Wolstanton and Burslem, and Wolverhampton. These unions include 259 parishes and townships, and comprise an area of 743,278 acres, with a population in 1851 of 566,284.

History, Antiquities, &c.—In the earliest period of authentic history Staffordshire appears to have formed part of the territories of the Cornavii, or Carnabii. Under the Romans it was comprehended in the province of Flavia Cæsariensis. The ancient roads, Watling-street, Ryknield-street, and the Via Devana (Deva or Chester road) crossed this county. Watling-street entered it at Fazeley, near Tamworth, and ran west-north-west, a little to the south of Cannock and Penkridge into Shropshire. The turnpike-road from London to Shrewsbury falls in with Watling-street on Cannock Chase, and coincides with it through the remainder of its course in this county. The Roman towns of Etocetum and Pennocrucium were on this line of Watling-street: the first was at Wall, 2 miles S.S.W. from Lichfield; the second near Penkridge village. Ryknield-street entered the county across the Dove near Burton, and ran south-west by Burton and Alrewas to Etocetum, or Wall, where it crossed Watling-street, and turning more towards the south, ran by Sutton Park and Perry-barr Common into Warwickshire and Worcestershire. The Ad Trivonam (On-Trent) of Richard of Cirencester, may be fixed between Branston and Burton-upon-Trent. The Via Devana entered the county across the Trent near Ad Trivonam, and appears to have passed by Uttoxeter, and through the Pottery district into Cheshire. Chesterton, 2 miles N.W. from Newcastle, was probably a Roman station. There are traces of camps or other military works supposed to be Roman at Ashwood, near Kingswinford; at Oldbury, between Birmingham and Dudley; at Aldridge, between Sutton Coldfield and Walsall; and in Arley Wood, near Over Arley on the Severn. Roman antiquities have been discovered in various places.

There are some ancient camps, of which it is doubtful whether they belong to the British, Saxon, or Danish period. One of these, called Castle Old-Ford, or Old-Fort, near Stonall, about 4 miles S. from Lichfield, is very conspicuous. There are others in Beaudesert Park, near Rugeley; on Abbots Castle Hill, on the Shropshire border, between Wolverhampton and Bridgenorth; and at Barr Beacon, near Walsall. Tumuli are found in various parts of the county.

On the conquest of South Britain by the Saxons, the county was included in the kingdom of Mercia, or of the Middle Angles. When Wulfhere, king of Mercia, was converted to Christianity, the bishopric of Mercia (which had been previously founded under the rule of Penda and Oswio, the sons of Penda) was re-established, and fixed at Lichfield. There are the traces of an ancient camp or fort, called the Burgh, or Braff, near Maer. The Mercian kings appear often to have resided at Tamworth. In the division of the island between the Saxons and Danes, in the time of Alfred, Staffordshire was partly included in the Danelagh, or Danish territory, Watling-street being the boundary; but the whole was recovered by Alfred's successors. In the wars of Edward the Elder, son of Alfred, with the Danes (910), a battle was fought at Tettenhall Regis, near Wolverhampton, in which the Danes were beaten; and in the following year they sustained another great defeat at Wednesfield: two years after Ethelfleda, Lady of Mercia, sister of Edward, built forts at Tamworth and Stafford; and next year one at Eadesbyrig, which some suppose to be Wednesbury. Ethelfleda died at Tamworth in 920, at which town Edward assumed the direct government of Mercia. Under Edward

the Confessor there was an Earl of Staffordshire. There are in the county several camps which are doubtless of Saxon or Danish origin.

In the reign of Henry I. Staffordshire was ravaged by Robert de Belesme, who supported the claim of Robert of Normandy to the crown. In the reign of Edward II. the earls of Lancaster and Hereford, then in insurrection, were defeated by the king at Burton-upon-Trent. In the War of the Roses, the Yorkist Earl of Salisbury marching from the north towards London (1459) with 5000 men, was intercepted at Blore Heath, on the western side of the county, between Drayton (Salop) and Eccleshall, by 10,000 Lancastrians under Lord Audley. The good generalship of Salisbury secured the victory. Lord Audley was killed, with all his chief officers and a fourth part of his army. A stone pedestal, surmounted by an ancient wooden cross, marks the field of battle. Richard III. was with his army at Tamworth just before the battle of Bosworth Field.

The principal monuments of the middle ages are ecclesiastical. Lichfield Cathedral is the most important. At Croxden, about 5 miles S.E. from Cheadle, are remains of an abbey, founded in 1176 for Cistercian monks. The architecture is generally early English in style. The principal entrance and the west-end of the abbey are in good preservation.

Mary, queen of Scots, was imprisoned for some time, under the care of the Earl of Shrewsbury, at Tutbury Castle; also at Chartley. Holbeach House, where most of the Powder-Plot conspirators were taken or killed, is in Staffordshire, between Wolverhampton and Stourbridge.

In the great civil war the county generally embraced the side of the parliament, though several families sided with the Royalist party. Some Royalists, under the Earl of Chesterfield, garrisoned Lichfield Cathedral and close; but it was taken by the Parliamentarians, though with the loss of their general, Lord Brook, in March 1643. This post was retaken about a month after by Prince Rupert, who also took Burton: in the interval the Parliamentarians, under Sir William Brereton and Sir John Gell, had a severe but indecisive battle with the Royalists at Hopton Heath, near Stafford. The Parliamentarians occupied the towns of Stafford and Wolverhampton, and subsequently took Eccleshall Castle, and took and demolished Stafford Castle: they also besieged Tutbury Castle, but without success. Their horse had the advantage in a skirmish near Leek, which was one of their posts; and in the latter part of 1643 they gained the victory in two skirmishes with Colonel Hastings, the Royalist commander, in this county. In 1645 the king with his army marched through Staffordshire before the battle of Naseby, and was in it again after the battle. After the battle of Worcester (1651) Charles II. was at Boscobel House, in this county. In the rebellion of 1745 the Pretender's army was at Leek, while that of the Duke of Cumberland occupied Stone.

Religious Worship and Education.—According to the Returns of the Census in 1851 there were then in the county 863 places of worship, of which 377 belonged to five sections of Methodists, 317 to the Church of England, 63 to Independents, 35 to Baptists, 34 to Roman Catholics, 6 to Quakers, 6 to Unitarians, 5 to Plymouth Brethren, 5 to Mormons, and 4 to Presbyterians. The total number of sittings provided was 298,988. The number of day schools in the county was 1313, of which 440 were public schools, with 44,489 scholars, and 878 were private schools, with 21,698 scholars. Of Sunday schools there were 643, with 93,572 scholars. There were 29 literary and scientific institutions, with 3644 members, and upwards of 43,000 volumes in the libraries belonging to them.

Industry and Manufactures.—The southern part of Staffordshire is distinguished for its manufacturing industry in the production of iron and hardware (of which iron is the material); the north-west part of the county produces earthenware from the potteries in such quantity and excellence as to have gained the distinctive appellation of 'Staffordshire ware.' Both these manufactures are of comparatively modern date.

Savings Banks.—In 1853 the county possessed 23 savings banks, at Bilston, Brewwood, Burton-on-Trent, Cheadle, Eccleshall, Kingswinford, Leek, Lichfield, Newcastle-under-Lyme, Penkridge, Pirehill Meaford, Rugeley, Shelton, Shenston, Stafford, Tamworth, Trentham, Tunstall, Uttoxeter, Walsall, West Bromwich, Wolverhampton, and Yoxall and Barton. The amount owing to depositors, on November 20th, 1853, in 21 of these banks, for which returns were received, was 575,962*l.* 16*s.* 2*d.*

STAINDROP. [DUREHAM.]

STAINES, Middlesex, a market-town, and the seat of a Poor-Law Union, in the parish of Staines, is situated on the left bank of the river Thames, in 51° 26' N. lat., 0° 30' W. long., distant 17 miles W.S.W. from London by road, and 19 miles by the Windsor branch of the South-Western railway. The population of the town of Staines in 1851 was 2430. The living is a vicarage in the archdeaconry of Middlesex and diocese of London. Staines Poor-Law Union contains 13 parishes and townships, with an area of 24,881 acres, and a population in 1851 of 13,973.

The town of Staines consists of a principal street, extending about half a mile along the main road, and of some smaller streets branching from it. The town is lighted with gas and paved, and contains many well-built houses. A handsome granite bridge, of three arches, crosses the Thames at Staines; it was erected in 1832, at a cost of about

40,000*l.*, from a design by Rennie. The parish church is a modern building, with a square embattled tower. The Wesleyan Methodists, Independents, Baptists, and Quakers have places of worship, and there are National, British, and Infant schools; a school of industry, a literary and scientific institution, and a savings bank. The market is on Friday, and fairs are held on May 11th and September 19th. There are extensive mustard-mills, a brewery, and several flour-mills. Races are held annually on the meadows.

STALEBRIDGE. [DORSETSHIRE.]

STALEYBRIDGE, Lancashire, a market-town in the parish of Ashton-under-Line, is situated chiefly on the right bank of the river Tame, in 53° 30' N. lat., 2° 4' W. long., distant 8 miles E. by N. from Manchester, 185 miles N.W. by N. from London by road, and 192 miles by the London and North-Western railway via Trent Valley. The population of the town in 1851 was 20,760. The living is a perpetual curacy in the archdeaconry and diocese of Manchester. Staleybridge owes its importance chiefly to the cotton manufacture. Woollen-cloth is manufactured to some extent; there are also brass and iron foundries, machine-making factories, brickfields, collieries, stone-quarries, and corn-mills. The parochial chapel is an octagonal structure occupying an elevated site, and there are three district churches, chapels for Wesleyan, Primitive, New Connexion and Association Methodists, and for Independents, Baptists, and Roman Catholics; National, British, and Roman Catholic schools; a mechanics institute, and a savings bank. Saturday is the market-day; fairs are held on Easter Monday and November 5th. The cotton manufactures of the district are more particularly noticed in the article *ASHTON-UNDER-LINE*.

STALHAM. [NORFOLK.]

STAMFORD, or STANFORD, Lincolnshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on both sides of the river Welland (which here divides the counties of Lincoln and Northampton), in 52° 40' N. lat., 0° 28' W. long., distant 47 miles S. by E. from Lincoln, 89 miles N. by W. from London by road, and by the Great Northern and Leicester and Stamford railways. The population of the borough of Stamford (a portion of which, called Stamford Baron, is in Northamptonshire), was 8933 in 1851. The borough is governed by 6 aldermen and 18 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry and diocese of Lincoln. Stamford Poor-Law Union contains 37 parishes and townships, with an area of 52,858 acres, and a population in 1851 of 19,755.

Stamford is an ancient town, but authentic history is silent respecting it till the troubled period succeeding the Roman dominion, when the Picts and Scots were defeated here by the Britons and their Saxon allies, in 449. In the reign of Edward the Elder in 923, the part of Stamford south of the Welland was fortified by the Saxons; and the Danes, who occupied the northern part of the town, submitted. The town was one of the five Danish burghs which connected their Northumbrian and East Anglian possessions. In Domesday-book, Stamford, there called Stanford, is styled a king's borough. In 1190 the Jews of Stamford were plundered, and many of them slain by those who had enlisted for the crusade. One of the crosses which marked the resting-place of Queen Eleanor's body, was erected at Stamford: it was demolished in the civil troubles of Charles I. Stamford returned members to parliament as early as the 23rd Edward I. Several parliaments and councils were held in the town in the middle ages. There were 16 parish churches in the town and suburbs, and there were priories for Carmelite, Franciscan, Dominican, and Augustine friars (two in or near the town), and Benedictine monks (at St. Leonard's, just out of the town to the east); also several 'halls' or monastic schools. On occasion of some discontent at Oxford, a number of the students retired here in 1333, and were not induced to return without great difficulty. The town was greatly benefited in its trade by the settlement here, in 1572, of some Flemish Protestant refugees, silk and serge weavers, who settled at Stamford by advice of Lord Treasurer Burghley, lord of the manor.

Over the river Welland are an ancient stone bridge of five arches, and a handsome new bridge of three arches, built of granite in the Norman style, by the Marquis of Exeter. The town is well supplied with water, and lighted with gas. Many new houses have been built of late years. All Saints church consists of a nave and two aisles, and a chancel with one aisle. It is chiefly of early English architecture; the tower, spire, and two porches are of perpendicular character. The other churches are generally perpendicular in style. Part of the nave of the conventual church of the Benedictine priory of St. Leonard's is still standing, and is used as a barn. The west gate of the Carmelite or White Friary is still entire, just outside the town on the north-east side. Near it are part of a wall and a postern or back gateway of the Gray or Franciscan Friary. The Wesleyan and Reform Methodists, Independents, Roman Catholics, and Mormons have places of worship. The Grammar school was founded about 1530 by William Radcliffe, an alderman of the borough. The school possesses an endowment of about 600*l.* a year, and had 37 scholars in 1854. The Blue-Coat school, established in 1704, has an income from endowment of about 200*l.* a year; it is conducted on the British school system: the number of scholars in 1852 was 150, of whom 60 receive clothing as well as instruction. There are several National,

Infant, and Free schools. The Stamford, Rutland, and General Infirmary, erected in 1826, in consequence of a bequest by Henry Frier, Esq., a surgeon in Stamford, and which has since received several valuable additional endowments, had an income in 1851, from all sources, of 1313*l.* 8*s.* The cost of the building, amounting to upwards of 8000*l.*, was defrayed chiefly by public subscription. In the town are numerous endowed hospitals, almshouses, and other charities, a literary and scientific institution, with a museum, lecture-room, library, &c., and a savings bank. There are three extensive breweries, and a manufactory of agricultural implements. Near the Grammar school is a Norman gateway, anciently belonging to Brasenose College, one of the monastic schools, and now forming an entrance into a garden. The markets are on Monday and Friday; that on Friday is a good corn-market; there are several cattle-markets in the course of the year, and seven yearly fairs. Fat stock markets are held once a fortnight. The Welland, or rather a lateral cut to the natural bed of the river, is navigable up to the town for boats and small barges. The public baths, established in 1722 by the medical practitioners of Stamford, were rebuilt in 1828 by the present proprietor, the Marquis of Exeter. Quarter sessions and a county court are held.

STERNBERG. [MORAVIA.]

STETTIN, one of the three governments of the Prussian province of Pomerania, is bounded N. by the government of Stralsund and the Baltic; E. by the government of Cöslin; S. by Brandenburg; and W. by Mecklenburg. The area is about 5012 square miles. The population at the end of 1849 was 562,127. The surface is level. It belongs almost entirely to the basin of the Oder, which river falls into the Stettiner-Haff, a wide salt-lake that communicates with the Baltic by three narrow channels. The principal of these channels is the Swine, which runs between the island of Usedom and Wollin. The other channels are the Peene, west of Usedom, and the Divesow, east of Wollin Island. To the north of the island is the harbour of Swinemünde. Agriculture and the Baltic fishery afford occupation to the great mass of the inhabitants. There are few manufactures except in the towns. Railways connect Stettin, the capital of the government, with Berlin, Posen, Danzig, and Königsburg.

Stettin, or *Alt-Stettin*, the capital of the province of Pomerania, as well as of the government of Stettin, a flourishing commercial and strongly fortified town, is situated in 53° 26' N. lat., 14° 45' E. long., on an eminence on the left bank of the Oder, 78 miles by railway N.E. from Berlin, and has about 40,000 inhabitants. The Oder divides into four branches, the Parnitz, and the Great and the Little Regelitz, and the main stream. The principal and most strongly fortified part of the town is on the left bank of the Oder, and is connected by wooden bridges with the suburbs, some of which are included in the fortifications. The citadel is called Fort Prussia, besides which there are forts William and Leopold. The town has five principal gates and eight posterns. There are several squares. Of the public buildings, the most remarkable are—the palace, formerly the residence of the last Dukes of Pomerania, the government-house, the arsenal, the house of the provincial estates, with a considerable library, the great barracks, the three hospitals, and the theatre. There are five churches and a Roman Catholic chapel. Besides the gymnasium, to which an observatory is attached, there are a school for training teachers,

and a school of navigation. The manufactures are woollens, linen, cotton, leather, hats, stockings, ribands, sail-cloth, soap, and tobacco. Boats and ships are built, and ships' anchors for all the ships of the Prussian states are manufactured here. The trade of Stettin is very considerable, it is hampered however, as the commerce of all the Baltic ports is, by the Sound dues, which render the conveyance of goods more expensive, and the ships have not always return cargoes. Thus many goods which would naturally be exported from Stettin are sent to Hamburg. Another disadvantage is the difficult navigation of the Oder, ships drawing more than 7 feet water being obliged to stop at Swinemünde. Foreign goods and colonial produce for the supply of Berlin, Silesia, and the interior of Prussia are imported into Stettin. The number of ships that arrive here annually is above 1000. Foreign consuls reside in Stettin.

Among the other towns are ANKLAM: *Damm*, 4 miles by railway E. from Stettin, is a strongly-fortified town, with about 3000 inhabitants; *Demmin*, 72 miles N.W. from Stettin, at the junction of the Tollense and the Trebel with the Peene, is a manufacturing town of 7000 inhabitants, who carry on a considerable commerce in firewood, timber, corn, glass, malt, &c., by the Peene, which is navigable for small craft. Leather, linen, gloves, woollen-cloth, and tobacco are its chief industrial products; *Greiffenhagen*, S. of Stettin, on the right bank of the Oder, has a population of 6000, who manufacture broad-cloth, and trade in corn; *Stargard*, situated 21 miles by railway E.S.E. from Stettin, on the left bank of the navigable river Inna, a feeder of the Oder, has 11,500 inhabitants, including the suburbs. It is one of the best towns in Pomerania; is surrounded with a wall, and has three gates and three posterns. The chief manufactures are woollen-cloth, linen, hats, stockings, leather, soap, tobacco, pottery, beer, and spirits. There are in the town four churches, a gymnasium, and several schools and charitable institutions. Fairs are held annually for the sale of horses and cattle, wool, linen, &c. The town has a good export trade in corn and the other productions of the country. *Swinemünde*, a seaport town of about 5000 inhabitants, situated on the island of Usedom, at the entrance of the Swine Channel of the Oder into the Baltic, has sea baths, a custom-house, a handsome church, shipbuilding-yards, and a considerable trade. By means of extensive dams constructed in recent times, the harbour of Swinemünde, which is the outport of Stettin, has been made accessible to the largest ships. Steamers ply regularly to Stettin, the isle of Rugen, and other places along the coast: *Treptow*, situated on the left bank of the Rega, 57 miles N.N.E. from Stettin, has spirit distilleries, cloth factories, and 5500 inhabitants; *Alt-Treptow*, a walled town on the Tollense, has about 4000 inhabitants, who manufacture broadcloth, leather, and spirits.

STEBENVILLE. [OHIO.]

STEVENAGE. [HERTFORDSHIRE.]

STEVENTON. [BERKSHIRE.]

STEWARTON, Ayrshire, Scotland, a thriving manufacturing town, in the parish of Stewarton, is pleasantly situated on the right bank of the Annock Water, in 55° 40' N. lat., 4° 31' W. long., distant 6 miles N. by W. from Kilmarnock, and 18 miles S.S.W. from Glasgow. The population of the town in 1851 was 3184. The town is lighted with gas, and contains many well-built houses and good shops. Besides the parish church, there are places of worship for Free and United Presbyterians and for Independents. There are schools and libraries in connection with the parish, the Free and the United Presbyterian churches. Highland bonnets are extensively manufactured. There are mills for carding and spinning wool. The town has also long been celebrated for its manufacture of spindles employed in the spinning of cotton and worsted. Carpets are extensively manufactured, and linens and damasks are woven. Steel clock-work is manufactured and exported to a small extent. The market is held on Thursday. There are a town-house and a jail.

STEYER. [ENS.]

STEYERMARK, the German name for Styria.

STEYNING, Sussex, a market-town, and the seat of a Poor-Law Union, in the parish of Steyning, is situated near the right bank of the river Adur, in 50° 53' N. lat., 0° 19' W. long., distant 27 miles E. by N. from Chichester, and 50 miles S.S.W. from London. The population of the parish of Steyning in 1851 was 1464. The living is a vicarage in the archdeaconry and diocese of Chichester. Steyning Poor-Law Union contains 23 parishes and townships, with an area of 44,344 acres, and a population in 1851 of 16,867. The ancient road of Stane-street passed through the town, whence its name. Steyning is a borough by prescription, but was disfranchised by the Reform Act. The parish church, with the exception of the nave, is a modern building. The Wesleyan Methodists have a chapel. The Free Grammar school, founded in 1614, had 36 scholars in 1854. There are a National school and a mechanics institution. A parchment manufactory and two breweries afford some employment. The market is held once a fortnight, on Monday, for cattle and corn; a cattle fair is held on October 11th.

STIGLIANO. [BASILICATA.]

STILTON. [HUNTINGDONSHIRE.]

STIRLING, Stirlingshire, Scotland, a royal and parliamentary burgh and market-town, and the chief town of the county, is situated on an eminence near the right bank of the river Forth, in 56° 8' N. lat.,

4° 0' W. long., distant 29 miles N.E. from Glasgow, and 36 miles N.W. from Edinburgh by road and by the Edinburgh and Glasgow and Scottish Central railways. The population in 1851 was 12,837. The town is governed by a provost and 20 councillors, 4 of whom are bailies, and unites with Culross, Dunfermline, Inverkeithing, and Queensferry, in the return of one member to the Imperial Parliament.

A castle was early erected here, under the protection of which the town grew up; and from its commanding the passage of the Forth, soon rose into importance. Its earliest known charter as a royal burgh is dated 1119. In the 12th and 13th centuries Stirling castle was considered to be one of the four principal fortresses of the kingdom; and it is one of the four which are still upheld by virtue of the articles of the Union. It appears conspicuously in the history of the English wars, and was frequently the residence of the Scottish kings.

The town is irregularly laid out; a winding street, or road, not lined with houses throughout, leads to the bridge over the Forth, and by that towards Perth. The Castle Hill, a long and narrow ridge, is on the north-west side of the town, over which it rises gently, but presents a steep slope on the other sides, and is in some parts precipitous. The palace, built by James V., is now converted into a barrack; and the adjacent hall, built by James III. for the meeting of the Scottish parliament, is now a riding-school. Adjoining this is the chapel royal, built by James III., now employed as an armoury. The castle contains a depot of arms, and is occupied by a garrison. Several new and wide streets have been opened and others much improved of late years. The town is lighted with gas. The old church, a fine building chiefly of decorated architecture, stands near the castle. It was originally the conventual church of a Gray or Franciscan friary, founded by James IV. in 1494. The chancel was built by Cardinal Beaton. The building now forms two churches of the Establishment, called the East and West churches. There are another church of the establishment called the North church, two places of worship for the Free Church, two for the United Presbyterians, and one each for Baptists, Independents, Reformed Presbyterians, Scottish Episcopalians, and Roman Catholics, several schools, and a savings bank. South of the Gray Friars' church is Gowans's hospital, built in 1639; and north of it are the ruins of a curious old house of the earls of Mar, called Mar's Work. Another old house built by Sir William Alexander, earl of Stirling, is now used as a military hospital. The old bridge over the Forth is a structure of the 16th century; the new bridge is more convenient. The town-house is an old building with a spire; behind it is the jail. There are commodious corn and meat markets, and a handsome building, the Athenæum, devoted to literary purposes. There is also an extensive agricultural museum.

The chief manufactures are of tartan and tartan shawls, carpets, cotton goods, malt, and leather. There are dye-houses for yarns, rope-yards, and breweries. Considerable trade is carried on in corn, wood, coals, bricks, tiles, lime, and wool. There is constant communication by steamers with Newhaven, Leith, and the other places on the Forth. The Secession, now merged in the United Presbyterian Church, had its origin in Stirling in the year 1733, in consequence of proceedings taken by the Established Church against Ebenezer Erskine, one of the ministers of the West church, who opposed the arbitrary proceedings of the General Assembly. There are some important charitable institutions of ancient foundation in the town.

STIRLINGSHIRE, an inland county of Scotland, is bounded N. by Perthshire, N.E. by Clackmannanshire and a detached portion of Perthshire, E. and S.E. by Linlithgowshire, S. by Lanarkshire and Dumbartonshire, and S.W. and W. by Dumbartonshire, from which it is separated by Loch Lomond: it lies between 55° 53' and 56° 22' N. lat., 3° 38' and 4° 40' W. long. The form of the county is irregular: the greatest length is 45 miles; the greatest breadth about 18 miles. There are two insulated portions surrounded by the counties of Perth and Clackmannan. The area is 462 square miles, or 295,376 statute acres. The population in 1851 was 86,237. The county returns one member to the Imperial Parliament.

Surface, Geology.—The north-western extremity of the county is occupied by the mountain range which forms the western extremity of the Grampians, and separates Loch Lomond from Loch Chon and Loch Ard. Of this range the principal mountain is Ben Lomond, which rises to a height of 3197 feet above the level of the sea. This mountain is the best known of the mountains of Scotland, on account of its forming the southern extremity of the Highlands, and its situation near the banks of Loch Lomond. It is of easy ascent, and is covered with vegetation to the summit. At the foot of this mountain range, in Loch Lomond, are several islands, part of which are included in Stirlingshire. East of this district the face of the country becomes more level, and is occupied by rocks of the old red-sandstone group; but in the central parts of the shire it again rises into hills, which form the group of the CAMPSIE HILLS. These consist chiefly of large tabular masses of trap, the geological position and character of which vary considerably. The other hills of the group, the Gargunnoch, Fintry, and Kilsyth hills, are chiefly trap or whinstone; their slopes are broken with crags and glens. That part of the county which skirts the Lennox hills to the south and east, and is drained by the Kelvin, a feeder of the Clyde, and by the Carron and other tributaries of the Forth, belongs to the coal districts of Central Scotland, and

yields coal, ironstone, freestone, and limestone in considerable quantity. The carse, or dales, are generally occupied by the later formations, or by alluvium.

Hydrography and Communications.—The county belongs partly to the basin of the Forth and partly to that of the Clyde. The Duchray, one of the affluents which form the Forth, is for several miles the boundary of the county. The chief tributaries of the Forth in this county are the Bannockburn, the Carron, and the Avon. The Endrick and its feeder, the Blane, which drain the district between the Highlands and the Lennox Hills, and the Kelvin, which drains the southern part of the county, are affluents of the Clyde. The Endrick falls into Loch Lomond. In the parish of Fintry it falls over a rock 90 feet high, presenting, when the waters are swollen by a flood, a magnificent cascade: there is a second smaller fall lower down. The Forth and Clyde Canal has about 10 miles of its course in the county. The Edinburgh and Glasgow Union Canal joins the Forth and Clyde Canal at Port Downie, near Falkirk, about 4 miles from Grangemouth.

The Edinburgh and Glasgow railway passes through this county, in a course parallel to that of the Union and Forth and Clyde canals. The Scottish Central railway traverses the eastern part of the county. The Slamannan railway has also a part of its course in this county. The road from Edinburgh to Stirling, and thence to the north of Scotland, enters the county at Linlithgow, and runs by Falkirk, Bannockburn, and St. Ninians to Stirling. At Camelon, just beyond Falkirk, a road branches to Kilsyth, Kirkintilloch, and Glasgow. There is also a direct road from Stirling to Glasgow.

Soil, Agriculture, &c.—The hilly district of the centre, and the highland tract of the north-west, are in most places bleak and sterile; but the carse, or the valley of the Forth, from the neighbourhood of Falkirk to Stirling, consists of low and fertile alluvial lands. The eastern side of the county presents a finely-diversified appearance, and the view from Stirling Castle is of almost unequalled beauty. In the highland district only a very small proportion of the land is arable. Oats and barley, potatoes and turnips, are grown. The soil in the valley or Strath of Endrick is a rich brown loam. In the low ground which separates the Highlands from the Campsie Hills, and in the valleys of the Forth and of the Kelvin, the land is commonly divided into the carse, or valley, and the dryfield or upland slope between the valley and the moorland hills. Oats and hay form the principal crops; barley and potatoes are grown to a considerable extent; and turnips, beans, and wheat in smaller proportions. Dairy farms are numerous, the produce finding a ready market in Glasgow. The hills are occupied as sheep-walks. The black-faced sheep from Tweeddale are prevalent. The carse or valley of the Forth below Stirling, forming the eastern part of the county, is fertile, and, in an agricultural sense, is important. There is comparatively little waste land; the soil is wholly occupied in tillage or plantations; and the facility for obtaining manure has tended to the improvement of agriculture. Gardens and orchards are numerous and productive: the soil is particularly adapted to pear-trees. The horses reared are of a superior description. Leases are commonly for 19 years. Grain rents are usual in the carse of Stirling. The greatest fairs for cattle in Scotland are held near Falkirk in this county: they are known as Falkirk Trysts.

Divisions, Towns.—The county contains 23 entire parishes, and part of five others. The royal, municipal, and parliamentary burghs are FALKIRK and STIRLING; the less important towns are ALVA, BANNOCKBURN, DENNY, GRANGEMOUTH, KILSYTH, and LENNOXTOWN.

Alva, population 3058, situated at the foot of the Ochill Hills, about 6 miles E. from Stirling, near the rivet Devon, is a busy manufacturing place. Tartan shawls, blankets, plaidings, and chequered kerseymeres, are extensively made. The Established, Free, and United Presbyterian Churches have places of worship.

Denny, population 2446, about 9 miles S. by E. from Stirling, possesses paper-mills, charcoal grinding-mills, a dye-stuff mill, a saw-mill, and manufactures of husey-wolsey shawls and tartan-cloth. There are places of worship for Established, Free, and United Presbyterians.

Grangemouth, population included with Falkirk parish, of which it forms a part. The port of Grangemouth is situated about 3 miles N.E. from the town of Falkirk, at the junction of the Forth and Clyde Canal with the Carron, near the confluence of the Carron with the Forth. The Grange burn formerly joined the Carron at this spot, but has been made to join the Forth, a mile east from the town, in order to convert its former channel into wet docks. In the town are a modern church in the Norman style, and a Free church. The basin and harbour afford facilities for vessels of any size. Grangemouth has a custom-house; Alloa, Stirling, and Kincairdine are included in the port. The number of vessels registered as belonging to the port on December 31st, 1853, was 46 sailing-vessels of 8252 tons, and 7 steam-vessels of 823 tons burden. During 1853 there entered the port 817 sailing-vessels of 75,812 tons aggregate burden, and 79 steam-vessels of 19,654 tons; and there cleared 794 sailing-vessels of 75,853 tons, and 77 steam-vessels of 19,198 tons. The imports are—grain, timber, flax, manganese-ore, cheese, bark, manna, and Geneva, from Holland, Belgium, and Norway; and goods of all descriptions from London, Hull, and other British ports. The exports are—coals, pig and wrought iron, glass, bricks, cordage, linen-yarn, and cotton and woollen goods. Vessels are built, and sail-cloth and rope manufactured.

Kilsyth, population 3949, is in the parish of Kilsyth, 13 miles S. by W. from Stirling. Kilsyth is a burgh of barony; it has a baillie and four councillors elected annually. It is irregularly laid out; the houses are small: the streets are lighted with gas. The parish church is a modern building of considerable elegance. There are also a Free church, chapels for United Presbyterians and Independents, several schools, and a savings bank. The inhabitants are chiefly hand-loom weavers employed by the manufacturers of Glasgow. There are two factories, and a brick and tile work.

Lennoxton, population 3108, about 11 miles N. by E. from Glasgow, contains the parish church of Campsie, a chapel for United Presbyterians, and a handsome Roman Catholic chapel. The cotton manufacture is actively carried on. Lennox Castle is a spacious mansion of recent erection.

The following are some of the more important villages; the population is that of 1851:—

Balfroun, a manufacturing village, in the western part of the county, 18 miles N. from Glasgow: population of the parish, 1900. Balfroun is neatly built and clean, and the shops are lighted with gas from the cotton-works of Ballindalloch. There are here many hand-loom weavers. *Bridge of Allan*, a small village, 3 miles N. from Stirling, is much resorted to for its mineral springs. *Campsie*, population of the parish exclusive of Lennoxton, 3810, is situated in a valley watered by the streams of Glassert and Kelvin. It contains an alum and colour manufactory. In the vicinity are several print fields and cotton factories. *Carron*, a village in Larbert parish, about 2 miles N. from Falkirk. In the village are the Carron iron-works, among the most extensive in the kingdom. There are five blast or smelting furnaces, four cupola furnaces, and 20 air furnaces; besides mills for grinding fire-clay, boring cylinders, grinding and polishing the metal, &c. The articles manufactured are machinery, agricultural implements, cannon, carronades (which take their name from this place), &c. The Carron Company have about 20 vessels to export their goods to London and elsewhere, and bring back coal and lime. *Drymen*, about 22 miles N.W. from Glasgow: population of the parish, 1481. Many of the inhabitants are hand-loom weavers. *Kippen*, 11 miles W. from Stirling, population of the parish 1892, is celebrated for its distillery. Weaving is carried on. There are an Established and a Free church; an Endowed and a Parochial school. Several fairs are held. *Milngavie*, population about 1500, distant 7 miles N.W. from Glasgow, contains a chapel of ease, a United Presbyterian church, and a parochial school; a cotton-mill, two bleachfields, three printfields, a distillery, a paper-mill, and several corn-mills. *St. Ninians*, population about 1200, consists principally of one long street of old-fashioned houses. Some of these are very curious, and have not only the date of erection, but the implements or other emblems of the trade of the original occupier carved on stones on the front. There are in the village Established, Free, and United Presbyterian churches. The inhabitants manufacture nails, leather, and tartan and tartan shawls. *Strathblane*, population of the parish 1010, a small village 12 miles N. from Glasgow, contains a calico print-work and two bleachfields.

History, Antiquities, &c.—Stirlingshire was, at the most ancient historical period, included in the territory of the Damnonii. They were subdued by Agricola, A.D. 80, who formed a line of forts through their territory, reaching from the Forth to the Clyde: this line of forts, the Roman general Lollius Urbicus, in the reign of Antoninus Pius, about A.D. 140, connected by a continuous rampart [ANTONINUS WALL OR.] The remains of one of the forts may be seen at Castle-Cary, 6 miles W. from Falkirk, just where the rampart leaves the county. There are some other antiquities referrible perhaps to the Roman period, or to the periods immediately before it. Several of the primitive monuments, as earthen forts, cairns, and mounds or barrows, are found in Baldernock, Gargunnoch, Dumipace, and other parishes.

Cambuakenneth Abbey, one of the most celebrated in Scotland, was founded, in 1147, by David I., king of Scotland, on a small peninsula on the north side of the Forth, a little below Stirling. Of this edifice some ruined walls and the belfry tower still exist. In the invasion of Edward I. Stirling was abandoned by the Scots and occupied by the English (1296). Wallace defeated the English forces, in 1297, at the old bridge of Stirling, at that time a wooden structure. The following year Stirling Castle, which was garrisoned by the English, was besieged by the Scots, and forced by famine to surrender, in 1299. In 1303 Stirling Castle held out for three months against all the efforts of Edward I. in person. It was the last fortress that surrendered in Scotland. In 1314, Stirling Castle, which had been held by the English since 1303, surrendered after the battle of Bannockburn. In 1333 it came into the hands of Edward Balliol, but was retaken, in 1341, by the Scots. The castle was the scene of the assassination of the Earl of Douglas by James II., in 1451. It was the frequent residence of James V. James VI. was crowned at Stirling in 1567, at 13 months old; and during his childhood usually resided here, with his preceptor Buchanan, who wrote here his 'History of Scotland.' The earls of Angus and Mar, with others concerned in 'the raid of Ruthven,' took possession of Stirling in 1584, but were soon obliged to flee into England. Returning next year with a considerable force, they occupied the town, and prepared to invest the castle, where the king (James VI.) was, with a very inadequate force. An accommodation took place, and the judicial

sentence which had been passed against the fugitive lords was reversed. This transaction is commonly called 'the raid of Stirling.' On the introduction of the New Liturgy, in the reign of Charles I., in 1637, the privy council and the court of session were removed to Stirling; to which place also General Baillie, who commanded the Covenanters, fled after his disastrous defeat at Kilsyth by the Duke of Montrose. The Scotch army retired to Stirling after their defeat by Cromwell at Dunbar, in 1650. Monk, whom Cromwell left behind him, occupied the town soon after, and in a few days forced the castle to surrender.

Of the feudal period there are some remains in the county. Duntreath Castle, in Strathblane parish, is an extensive ruin. The remains of Colzium Castle crown an eminence near Kilsyth; and the castle of Almond is a massive ruin between Falkirk and Linlithgow. The ruins of Manuel Priory are near the castle of Almond.

Statistics: Religious Worship and Education.—According to the Returns of the Census in 1851, there were then in the county 99 places of worship, of which 31 belonged to the Established Church, 21 to the Free Church, 19 to the United Presbyterian Church, 7 to Methodists, 6 to Independents, 5 to Baptists, 4 to Roman Catholics, 2 to Reformed Presbyterians, and 2 to Episcopalians. The total number of sittings provided in 90 of these places of worship was 49,272. Of day schools there were 170, of which 103 were public schools, with 8432 scholars, and 67 private, with 2918 scholars. The number of Sabbath schools was 99, with 8122 scholars, and of evening schools for adults 17, with 415 scholars. There were four literary and scientific institutions with 787 members, and 2200 volumes in their libraries.

Savings Banks.—In 1853 the county possessed three savings banks, at Falkirk, Lennoxton, and Stirling. The amount owing to depositors on November 20th, 1853, was 31,102*l.* 8*s.* 3*d.*

STISTED. [ESSEX.]

STOCKBRIDGE, Hampshire, a market-town, and the seat of a Poor-Law Union, in the parish of Stockbridge, is situated on the banks of the river Anton or Test, in 51° 6' N. lat., 1° 29' W. long., distant 9 miles W.N.W. from Winchester, and 66 miles S.W. from London. The population of the borough and parish, which are co-extensive, was 1066 in 1851. The living is a perpetual curacy, in the archdeaconry and diocese of Winchester. Stockbridge Poor-Law Union contains 14 parishes and townships, with an area of 43,843 acres, and a population in 1851 of 7367. Stockbridge is a borough by prescription, and returned two members to Parliament till the passing of the Reform Act, when it was disfranchised. The town possesses a neat town-hall. The principal street contains seven bridges—over the river Anton at the west end, the Andover Canal about the middle of the town, and five small trout streams which cross the street at different parts. The parish church was erected in the reign of Stephen. There are a chapel for Independents, and a parochial school. Parchment is manufactured to some extent. The market is held on Thursday; and on July 10th is held one of the largest fairs in the county for lambs. Races are held in the neighbourhood.

STOCKHOLM, the capital of Sweden, is situated in 59° 20' N. lat., 18° E. long., on the channel by which the Mälar Lake discharges its waters into the Baltic, about 36 miles from the sea by the windings of the channel, but not more than 24 miles in a straight line. The channel is interspersed with numerous rocky islands.

The city of Stockholm is built partly on the continent and partly on nine islands formed by the above-mentioned channel: the islands are called holmen. The Staden Island, or Stockholm, occupies the centre of the town, and contains several fine public and private buildings. The royal palace, an edifice of great architectural merit, completed in 1753, stands on an eminence, and has attached to it a large garden. It contains a library and collections of paintings, coins, and antiquities. Near the palace is the colossal statue of Gustavus III., of bronze; and in its vicinity, along the eastern shore of the island, is the proper harbour of the town, in which the largest vessels find excellent anchorage. The Staden contains also the cathedral, or St. Nicolai church, in which the kings of Sweden are now crowned; and the Riddarhus, or hall of assembly of the nobles, in front of which is a statue of Gustavus Vasa, of bronze. From the Staden a stone bridge leads to the Riddarholmen, which is much smaller than Stockholm, but which contains the old palace and the old church of Riddarholmen, in which the kings and distinguished persons born in Sweden are buried, and about 5000 flags are hung up, the trophies of the Swedes in their numerous wars. In this church are the remains of Gustavus Adolphus. Riddarholmen Island contains several other public buildings.

Söder Malm, or the southern division of Stockholm, is built on the island of the same name, which is about 3 miles long and nearly 2 miles across in the widest part; it is joined to Stockholmen by a long bridge of boats, and provided with a large lock on account of the great rapidity with which Lake Mälar sometimes discharges its waters. In the Söder Malm is the great dépôt of iron. The most remarkable of the buildings are the town-hall, the Danviken, or Great Hospital, and the Maria Magdalene and the St. Catharine church. The island of Lang Holmen, which is farther west, and is united to the Söder Malm by a bridge, contains the houses of correction; and

on Räkning Holmen, which likewise is joined to Söder Malm by a bridge, there is a park.

The Norr Malm, or northern division of the town, is on a gentle slope, which gradually rises about 200 feet above the sea-level. It is much better built than the Söder Malm, and has several fine squares and streets. A well-built bridge connects it with Stockholmen. On the finest of the squares, called that of Gustavus Adolphus, is the bronze equestrian statue of that great king. Near the squares is the king's garden, which is used as a public promenade. Among the churches of this part of Stockholm, that of Adolphus Frederick is distinguished by its beauty. The observatory is well provided with astronomical instruments and a library; there is also a botanical garden. The island of Kungsholmen, which lies west of Norr Malm, is joined to it by two bridges. It contains the great iron-foundry established by an Englishman, Mr. Owen; a large hospital, the Bible printing-office, and the royal cannon-foundry of Marieberg. Contiguous to the Norr Malm on the east is Ladugords Gärdet, part of which has been built upon, whilst another part has been converted into a royal park, called Humblegard (Hop-garden), to which the public has access. The island of Blasii Holmen has been converted into a peninsula by filling up the narrow channel which divided it from the continent, and now constitutes a portion of Norr Malm. It contains some fine buildings. Kastellholmen, a very elevated island, is planted with fine trees; a castle is built here for the defence of the entrance of the harbour.

Stockholm is distinguished for the beauty of its environs. This arises in part from the diversified channels which separate the islands on which the city is built, and the picturesque variety of the channel banks. Country-houses are dispersed over the hills surrounding the town; but the chief place of holiday resort is the zoological garden, which lies eastward of the town. It occupies a peninsula two miles long and about one mile wide. Within the zoological garden is the royal country-seat of Johansdal, formerly called Rosendal, which is surrounded by a large park. The most distinguished of the royal country-houses lie to the west of the town, on islands in the Lake of Mälarn; they are Gripsholm, Drottningholm, and Swartåjö.

Stockholm is the seat of the government, and the place where the legislative bodies generally meet. It contains the offices of the branches of administration and the superior courts of justice. Besides the Royal Society of Sciences of Stockholm, which has greatly contributed to the advancement of natural philosophy, chemistry, and natural history, there are a royal academy of literature, history, and antiquities; the Swedish academy, whose object is to promote the cultivation of the native language; an academy of military sciences; an academy of liberal arts; a musical academy; an academy of agriculture, and numerous scientific, literary, and benevolent institutions. The institutions for education are also numerous.

The population of Stockholm in 1844 was 84,161; in 1850 it was 98,070. Stockholm is the most industrious and commercial town of Sweden. There are manufactures of cloth, cotton, calico, silk, ribands, sugar, tobacco, leather, cast-iron, and soap. Large quantities of foreign, and especially English, manufactures are annually imported. Nearly the whole of the superfluous produce of the countries north and west of Stockholm is brought here, to be exported to foreign countries. It is mostly shipped in Swedish vessels. The most important article of export is iron. Timber, boards, tar, pitch, copper, cobalt, ready-built vessels, steel, bricks, and a few manufactured articles are exported. An active commerce is carried on with England, the United States of North America, Denmark, France, Prussia, Portugal, the Netherlands, and Italy. The most important articles of import are sugar, coffee, woollen manufactured goods, cotton, silk, linens, china and crockery, cheese, hides and skins, tallow and candles, dyeing-woods, raisins, tea, butter, wool, and spirits.

STOCKPORT, Cheshire, an important manufacturing town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Stockport, is situated near the point where the rivers Thame and Goyt, by their junction, form the Mersey, in 53° 25' N. lat., 2° 8' W. long., distant 88 miles N.E. from Chester, 176 miles N.W. from London by road, and 182½ miles by the North-Western railway via Trent Valley. The population of the borough in 1851 was 58,835. The borough is governed by 14 aldermen and 42 councillors, of whom one is mayor, and returns two members to the Imperial Parliament. The living is a rectory in the archdeaconry and diocese of Chester. Stockport Poor-Law Union contains 17 parishes and townships, with an area of 30,709 acres, and a population in 1851 of 90,174.

The town of Stockport is irregularly laid out. In the centre is a large open market-place. The new market-house has a handsome front, and contains a large hall, covered by a semicircular iron roof, with lights in the crown. The town is well paved, and is lighted with gas. The market-place and the parish church are on a tolerably extensive level on the summit of the hill on which the town is built. There are four bridges in or near the town, over the Mersey, and one over the Thame. The 'old bridge' over the Mersey, near the market-place, is of one lofty arch. Below the old bridge is a bridge of 11 arches, crossing not only the river, but its valley, at an elevation of 40 feet above the water. Vernon Bridge was built by subscription in 1829. The Manchester and Birmingham branch of the North-Western railway is carried over the valley of the Mersey by a magnificent viaduct.

OSOG. DIV. VOL. IV.

The parish church, except the chancel, which is of the decorated style, is modern, having been rebuilt early in the present century, in the perpendicular style of architecture. There are in the borough 7 other places of worship belonging to the Establishment, 15 belonging to five sections of Methodists, 5 to Independents, 3 to Baptists, and 1 each to Roman Catholics, Unitarians, and Mormons. The Grammar and Free schools, founded in 1487, are under the patronage of the Goldsmiths' Company of London; the number of scholars in 1854 was 38 in the Free school, and 100 in the Grammar school; the school possesses two exhibitions of 50*l.* each at Oxford or Cambridge, tenable for 3½ years. There are also National, British, and Infant schools; schools connected with the Wesleyan Methodists and the Roman Catholics; a mechanics institute; several news-rooms; an infirmary; and a savings bank.

Stockport is one of the principal seats of the cotton manufacture. There are about 100 firms in Stockport and Heaton Norris engaged in different branches of this manufacture; there are also three cotton-printing establishments, two bleaching establishments, and several dye-houses. Besides the cotton manufacture, which is the staple of the town, the manufacture of silk goods, thread, hats, brushes, spindles, and shuttles is carried on. There are extensive engine- and machine-factories, several iron- and brass-foundries, and breweries in the town; and brick-fields in the vicinity. A branch canal communicates with the Manchester and Ashton Canal. The market is on Friday, and is the most important in Cheshire for corn, oatmeal, and cheese. There are four yearly fairs, chiefly for cattle. Petty sessions and a county court are held in the town.

STOCKTON, distinguished as STOCKTON-UPON-TEES, Durham, a market-town, sea-port, municipal borough, and the seat of a Poor-Law Union, in the parish of Stockton-upon-Tees, is situated on the left bank of the river Tees, about four miles from its mouth, in 54° 34' N. lat., 1° 18' W. long., distant 20 miles S.E. by S. from Durham, 242 miles N. by E. from London by road, and 247½ miles by the Great Northern and Leeds Northern railways. The population of the borough in 1851 was 1867; that of the town of Stockton was 9808. The borough is governed by 6 aldermen and 18 councillors, of whom one is mayor. The living is a vicarage in the archdeaconry and diocese of Durham. Stockton Poor-Law Union contains 42 parishes and townships, with an area of 88,774 acres, and a population in 1851 of 44,433.

Stockton was at an early period the residence of the bishops of Durham, who had a moated manor-house here, which afterwards was called the castle. The castle was demolished in 1652. The traces of the moat and embankment still mark the site. The river Tees approaches Stockton in a northward direction, and then makes a sudden bend towards the east. The town is laid out with considerable regularity; the principal street is broad, and extends nearly a mile from south to north. The wharf is on the bank of the river, just above the bend, and runs parallel to the High-street. At the southern extremity of the High-street a road from it crosses the Tees into Yorkshire by a stone bridge of five arches. The houses are for the most part of brick. Besides the parish church, a spacious brick-building erected early in the last century, there is another, called Holy Trinity church, a neat gothic edifice with a square tower, surmounted with an octagonal spire. There are places of worship for Independents, Baptists, Methodists, Presbyterians, Quakers, Roman Catholics, and Unitarians; National, British, Infant, Wesleyan, and Roman Catholic schools; a school of Industry for girls; a Blue-Coat charity school; a mechanics institute; news-rooms; a dispensary, and a savings bank. The town-hall is a quadrangular building, surmounted by a clock-tower and spire. There are a custom-house, assembly-rooms, billiard-rooms, and a small theatre.

The principal manufacture of Stockton is that of linen and sail-cloth; ship-building, rope and sail-making, and yarn and worsted spinning are carried on; there are also iron- and brass-foundries, breweries, and several corn-mills. The navigation of the river Tees has been improved by a cut just below the town, whereby a considerable bend is avoided. The chief imports are timber, deals, masts, spars, staves, iron, hemp, flax, tallow, oak-bark, linseed, clover-seed, hides, &c., from foreign parts; and groceries, wine, spirits, and colonial produce brought coastwise. The exports to foreign parts are chiefly lead, and that in small quantities: the exports coastwise to London, Leith, Hull, Sunderland, &c., are chiefly of flour, butter, cheese, bacon, oak, timber, linen, linen and worsted yarn, lead, and especially coal. The number of vessels registered as belonging to the port of Stockton on December 31st 1853 was—157 sailing-vessels of 28,408 tons aggregate burden, and 26 steam-vessels of 608 tons aggregate burden. During 1853 there entered the port 1000 sailing-vessels of 98,274 tons, and 1 steam-vessel of 13 tons burden, and cleared 3161 sailing-vessels of 305,540 tons burden, and 18 steam-vessels of 1183 tons. By the Stockton and Darlington, the Stockton, Hartlepool, and Clarence, and the Leeds Northern railways, which have stations at Stockton, the town is placed in connection with the whole railway system of England and Scotland; there are also several branch and junction lines for local convenience, in conveying the produce of the numerous collieries. Markets are held on Wednesday and Saturday. Two yearly fairs are held, besides a cattle-fair, or great market, on the last Wednesday of every month. There are extensive coal-works and

some brick-yards near the town, and salmon and other fisheries in the Tees. A county court is held in the town.

STOCKTON. [CALIFORNIA.]

STOGUMBER. [SOMERSETSHIRE.]

STOKE BY NAYLAND. [SUFFOLK.]

STOKE DAMEREL. [PLYMOUTH.]

STOKE FERRY. [NORFOLK.]

STOKE POGES. [BUCKINGHAMSHIRE.]

STOKE, distinguished as STOKE-UPON-TRENT, Staffordshire, a market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of Stoke, is situated in 53° 0' N. lat., 2° 10' W. long., distant 16 miles N. by W. from Stafford, 148 miles N.W. from London by road, and 146½ miles by the North Western and North Staffordshire railways. The population of Stoke parliamentary borough, which includes an extensive district, was 84,027 in 1851. The borough returns two members to the Imperial Parliament. The living is a rectory in the archdeaconry of Stafford and diocese of Lichfield. Stoke Poor-Law Union consists of the parish of Stoke, with an area of 10,490 acres, and a population in 1851 of 57,942.

In this district, the chief seat of the earthenware manufacture of England, familiarly designated "the Potteries," are the market-towns of Burslem, Hanley, Lane-End (with Longton), Stoke, and Tunstall Court. BURSLEM is described in a separate article. Lane-End, Longton, Hanley, and Tunstall are noticed under STAFFORDSHIRE. Stoke has many modern houses, built on a regular plan. The town-hall is a neat building, with an engine and lock-up-house beneath. The church is a modern gothic structure, with a tower 112 feet high. The Baptists and Roman Catholics have places of worship, and there are National schools and a Diocesan school. The earthenware manufactories of Stoke are among the most important in the district. There are numerous coal-works in the vicinity. The market is on Saturday, and is well supplied.

STOKECLIMSLAND. [CORNWALL.]

STOKESLEY, North Riding of Yorkshire, a market-town, and the seat of a Poor-Law Union, in the parish of Stokesley, is situated in the fertile district of Cleveland, in 54° 28' N. lat., 1° 11' W. long., distant 42 miles N. by W. from York, and 238 miles N.N.W. from London. The population of the parish of Stokesley in 1851 was 2446. The living is a rectory in the archdeaconry of Cleveland and diocese of York. Stokesley Poor-Law Union contains 28 parishes and townships, with an area of 60,374 acres, and a population in 1851 of 8666.

Stokesley is washed on the south by a remarkably fine trout stream, a branch of the river Leven. At a distance of from four to six miles, the Cleveland Hills rise in the form of a semicircular amphitheatre, of which Stokesley is the centre. The town consists chiefly of one street, with many well-built houses, and is lighted with gas. Besides the parish church, there are places of worship for Wesleyan, Primitive, and Calvinistic Methodists, and Independents. Preston Grammar school had 42 scholars in 1854. The National schools, called the schools of the Langbaugh West Society, are partly endowed. There are a dispensary, a mechanics institute, and a savings bank. An annual court-leet, a county court, and weekly petty sessions are held. The town has a considerable manufacture of linen. A good market is held on Saturday, and fairs three times in the year.

STOLPE. [CÖSLIN.]

STONE, Staffordshire, a market-town and the seat of a Poor-Law Union, in the parish of Stone, is situated on the left bank of the river Trent, in 52° 54' N. lat., 2° 8' W. long., distant 7 miles N. by E. from Stafford, 141 miles N.W. by W. from London by road, and 138 miles by the North-Western and North Staffordshire railways, via Trent Valley. The population of the town of Stone in 1851 was 3443. The living is a perpetual curacy in the archdeaconry of Stafford and diocese of Lichfield. Stone Poor-Law Union contains 10 parishes and townships, with an area of 68,524 acres, and a population in 1851 of 19,344.

The principal street of the town of Stone is a portion of the road from London to Liverpool. The river Trent is here crossed by a bridge. The town is lighted with gas and paved. The parish church contains a marble monument to the memory of Earl St. Vincent, with a bust of the earl by Chantrey. Christ church is a modern district church, erected in 1840. The Wesleyan Methodists, Independents, and Roman Catholics have places of worship. The Free Grammar school, founded in 1558, is free to six boys of the parish, and to 24 others on payment of a small fee. There are National and Infant schools, a mechanics institution, a literary society, and a savings bank. Shoemaking, tanning, malting, and brick-making are carried on. A county court is held. Tuesday is the market-day; a fair for cattle is held fortnightly; markets for cheese and bacon are held in April and November, and for cattle and sheep on August 5th. Some remains of an ancient Augustinian monastery are situated near the parish church.

STONE. [KENT.]

STONEHAVEN. [KINCARDINESHIRE.]

STORNOWAY. [ROSS-SHIRE.]

STORRINGTON. [SUSSEX.]

STOURBRIDGE, Worcestershire, a market-town, and the seat of a Poor-Law Union, in the parish of Old Swinford, is situated on the left bank of the river Stour, in 52° 27' N. lat., 2° 8' W. long., distant 23 miles N. by E. from Worcester, 122 miles N.W. by W. from London, and 125 miles by the North-Western and Oxford Worcester and Wolverhampton railways. The population of the town of Stourbridge in 1851 was 7847. The living is a perpetual curacy, in the archdeaconry and diocese of Worcester. Stourbridge Poor-Law Union contains 17 parishes and townships, with an area of 16,200 acres, and a population in 1851 of 57,850.

Stourbridge derives its name from its bridge over the Stour. The bridge is of stone, and forms at this place the communication between Worcestershire and Staffordshire. The town is rather irregularly built. The market-house is a spacious modern structure. Besides the church, which was built by subscription in 1742, there are places of worship for Independents, Wesleyan Methodists, Baptists, Unitarians, Quakers, and Roman Catholics. The Free Grammar school, founded by Edward VI. in 1551, is under the patronage of eight governors, and had an income in 1837 of 462*l.* a year from rent; the number of scholars in 1854 was 44. There are endowed National schools and an Infant school. The manufactures of Stourbridge consist chiefly of iron, glass, and fire-bricks. The bricks are made of the Stourbridge clay, which has long been celebrated for its excellence in resisting the action of fire; crucibles are also made of it.

STOURPORT. [WORCESTERSHIRE.]

STOW, a hundred in the county of Suffolk, which with several parishes in the adjoining hundred of Blackbourn, has been constituted a Poor-Law Union. Stow Union, the seat of which is at STOWMARKET, contains 34 parishes and townships, with an area of 55,342 acres, and a population in 1851 of 21,110.

STOW-ON-THE-WOLD, Gloucestershire, a market-town, and the seat of a Poor-Law Union, in the parish of Stow-on-the-Wold, is situated in 51° 56' N. lat., 1° 43' W. long., distant 26 miles E. by N. from Gloucester, and 82 miles W. by N. from London. The population of the parish in 1851 was 2250. The living is a rectory, in the archdeaconry of Gloucester and diocese of Gloucester and Bristol. Stow-on-the-Wold Poor-Law Union contains 28 parishes and townships, with an area of 41,131 acres, and a population in 1851 of 9982. The streets are irregularly arranged, and the houses, which are built of stone, are in general low. The parish church is a substantial structure, erected during the 14th and 15th centuries. In the town are a chapel for Baptists, a Free Grammar school, founded in 1609, which had 120 scholars in 1854, National and Infant schools, and a savings bank. Shoe-making affords considerable employment. The market is held on Thursday; there are fairs on May 12th and October 24th.

STOWE. [BUCKINGHAMSHIRE.]

STOWMARKET, Suffolk, a market-town, and the seat of the Stow Poor-Law Union, in the parish of Stowmarket, is situated on the river Gipping, in 52° 11' N. lat., 0° 59' E. long., distant 12 miles N.N.W. from Ipswich, 76 miles N.E. from London by road, and 80 miles by the Eastern Counties and Eastern Union railways. The population of the town of Stowmarket in 1851 was 8161. The living is a vicarage, in the archdeaconry of Suffolk and diocese of Norwich.

Stowmarket town contains some well-built houses, and is lighted with gas. The parish church is a handsome building, partly decorated and partly perpendicular in style; the tower is surmounted with a wooden spire, 120 feet high. The Baptists and Independents have places of worship, and there are National schools. There are an iron-foundry, and a small manufactory of rope, twines, and sacking. The Gipping has been made navigable up to the town, and timber, deal, coals, and slate, are brought up from Ipswich. The market, on Thursday, is well supplied with corn, cattle, and general merchandise; there are three yearly fairs.

STRABANE, County of Tyrone, Ireland, a market-town and the seat of a Poor-Law Union, is situated on the river Mourne, and on the Dublin and Londonderry road, in 54° 50' N. lat., 7° 28' W. long., distant 20 miles N.N.W. from Armagh, and 130 miles N.N.W. from Dublin by road. The population in 1851 was 5079, besides 628 inmates of the Union workhouse. Strabane Poor-Law Union comprises 24 electoral divisions, with an area of 134,341 acres, and a population in 1851 of 49,161. The town consists of an irregular group of streets and lanes, on the right bank of the river, and a suburb of a single winding street on the left bank. The more modern streets contain some handsome houses. Besides the parish church there are chapels for Roman Catholics, Presbyterians, and Methodists, several schools, a savings bank, a court-house, fever-hospital, dispensary, and bridewell. A canal, four miles long, between the Foyle and Strabane, facilitates its trade with Londonderry. The linen trade is carried on here. Strabane has an important salmon-fishery on the river Foyle. Quarter and petty sessions and a manor-court are held in the town. Fairs are held sixteen times in the year. Strabane returned two members to the Irish Parliament, but the corporation was dissolved by the Irish Municipal Reform Act.

STRADBALLY. [QUEEN'S COUNTY.]

STRALSUND, one of the three governments into which the Prussian province of Pomerania is divided, consists of what was formerly Swedish Pomerania, with the island of Rügen and some

other islands. It is bounded N. by the Baltic, E. and S. by the Peene, which separates it from the government of Stettin, and W. by Mecklenburg-Schwerin, from which it is divided by the navigable rivers Trebel and Reckenitz. The area is 1672 square miles, with a population of 187,058 at the end of 1849. The surface of the government is flat. The soil is a heavy loam and black mould of superior fertility. The products consist chiefly of wheat, rye, barley, peas, flax, and tobacco. The breed of horned cattle is not numerous, for want of sufficient pasture; sheep and hogs however are reared in great numbers, and there are immense flocks of geese. There are no manufactures of any importance except perhaps tobacco and spirits. The exports are flour, malt, and corn. The fisheries are very profitable.

Stralsund, the capital of the government, is situated in 54° 15' N. lat., 13° 8' E. long., in a sandy plain, bounded on one side by the Strait of Gellen (which separates the island of Rügen from the continent), and on the other sides by lakes and marshes, so that the town is connected with the continent only by bridges. The fortifications have been greatly strengthened in recent times. Stralsund is a gloomy place; the houses are built in the old style, the streets irregular, and the squares and market-places inconsiderable: it is however clean and well paved. The three principal churches are built in the gothic style, and contain many fine paintings. Among the other public buildings are the government-house, the town-hall (which contains the public library), the gymnasium (which has a library and cabinet of medals), the mint, the arsenal, and the water-works by which the city is supplied with good water. The manufactures consist of woollens, linen, sugar, starch, soap, candles, tobacco, leather, looking-glasses, household furniture, and playing-cards. There are brandy distilleries and oil-mills. The chief exports are wheat, malt, timber, wool, linen, &c. The harbour is spacious and safe, and deep enough for ships drawing 15 feet water. Stralsund was built about the year 1209, and was a member of the Hanseatic League. The town was unsuccessfully besieged by Wallenstein in 1628. In 1678 it was taken by the elector Frederick William of Brandenburg; in 1715 by Frederick William I., king of Prussia; and in 1807 by the French. By the treaty of Kiel in 1810 it was ceded with all Swedish Pomerania to Denmark, and by Denmark in 1815 to Prussia. The population of Stralsund is about 17,000.

The most important of the other towns of the government of Stralsund are—*Barth*, a small seaport town with about 5000 inhabitants, shipbuilding docks, and some trade in corn, wool, &c., is situated at the mouth of the river Barth, in an inlet of the Baltic, 10 miles N.W. from Stralsund. *Greifswalde*, 20 miles S. by E. from Stralsund, and about 2 miles from the mouth of the Ryek, which forms a good harbour for small vessels. This town is pretty well built, surrounded by promenades formed out of the old ramparts, and has a population of 12,000. It has a university, a botanical garden and observatory, a gymnasium, and a training-school. The industrial products are soap, leather, tobacco, oil, salt, &c. Ship-building and the coasting trade are actively carried on; steamers ply regularly in the open season to Sweden. *Wolgast*, a small seaport town at the mouth of the Peene, has shipbuilding yards, manufactures of soap and tobacco, and about 5000 inhabitants, who have some coasting trade. *Pudus*, on the south coast of the isle of Rügen, gives title to a prince, and is much resorted to in summer for its baths.

STRANGFORD. [DOWNSHIRE.]

STRANORLAR, County Donegal, Ireland, a market-town and the seat of a Poor-Law Union, is situated near the left bank of the river Finn, on the road from Londonderry to Donegal, in 54° 48' N. lat., 7° 46' W. long., distant by road 14 miles W. by S. from Lifford, and 144 miles N.N.W. from Dublin. The population in 1851 was 512. Stranorlar Poor-Law Union comprises 11 electoral divisions, with an area of 121,161 acres, and a population in 1851 of 21,970. The town contains a church, a Roman Catholic chapel, two Presbyterian meeting-houses, and a dispensary. There are several large bleaching-grounds near the town. Petty sessions are held monthly. Fairs are held six times a year.

STRANRAER. [WIGTONSHIRE.]

STRASBOURG, a town in France, capital of the department of Bas-Rhin, is situated on the Ill at a distance of about 2 miles from the left bank of the Rhine, 321 miles by railway E. from Paris, in 48° 34' 57" N. lat., 7° 44' 16" E. long., 473 feet above the level of the sea, and had 61,242 inhabitants in the commune in 1851, exclusive of the garrison and other sections of the floating population. A railroad 89 miles in length runs up the left bank of the Rhine from Strasbourg through Colmar and Mulhausen to Basle.

Strasbourg occupies the site of the Roman *Argentoratum*, which was in the territory of the Tribocci. It was near this town that Julian defeated the Allemans (A.D. 357). At a subsequent period it appears to have fallen into the hands of the Allemans, from whom it was taken by Clovis and the Franks. The Geographer of Ravenna calls it *Strasburgium*, which was subsequently modified into *Strasburg* and *Strassburg*. The Reformation was introduced in 1523, and the Protestants obtained possession of several of the churches. In 1681 Strasbourg was ceded with the rest of Alsace by Austria to Louis XIV., who so improved the defences as to render it one of the strongest fortresses in Europe.

The town stands in a flat situation, in form irregular; in circuit 5

or 6 miles. It is surrounded by a wall strengthened by bastions, ditches, and outworks, and has at its eastern extremity a citadel, with five bastions, constructed by Vauban, the outworks of which extend as far as the Rhine. This river is crossed by a bridge of boats to Kehl, a fortress in Baden, on the right bank, which is connected by a short branch with the railway from Basle to Frankfurt-am-Mayn. Strasbourg is entered by seven gates.

The river Ill flows through the town in a north-north-east direction. After it enters the city it divides into several branches, which reunite before it quits the place. The principal arm, which bears the name of the Bruche, is navigable, and receives on its right bank the Canal of the Rhine. The river can be made to inundate the neighbourhood, by means of a sluice at the point where it enters the town. There are about 50 bridges, some of stone, others of wood. Some of the branches of the Ill seem to have been ditches dug to encircle and defend the town before it had attained its present extent.

The city is irregularly built. The principal streets are wide enough and well laid out, and several of the squares are spacious and regular; but the greater number of the streets are narrow and crooked. The houses are all solidly built of stone, high, and, in many instances, surmounted by lofty roofs furnished with two or three tiers of windows. These picturesque high-roofed houses are gradually disappearing before modern improvements.

The principal public building is the cathedral of Notre-Dame, a Gothic edifice of singular beauty, which was founded in 1015 and not completed till 1439. The interior, consisting of a nave and aisles, transepts and choir, is 357 feet long and 79 feet high. The nave is 85 feet wide, and is separated from the aisles by nine massive pillars on each side. The choir has no aisles: it is 67 feet wide and lower than the nave. The interior is lighted through fine stained glass windows, one of which, over the great western door, is a magnificent rose window 48 feet in diameter. The stone pulpit, unequalled for the richness, variety, and elaborateness of its sculptured ornaments; an organ of admirable power and softness; and a remarkable astronomical clock; in the south transept are remarkable objects of the interior. The clock, which was made in 1571, after going for about 200 years went out of order and remained useless for nearly 50 years; it was repaired a few years ago by a watch-maker of the town, and still maintains its character as a most elaborately-finished, complicated and surprising piece of machinery. The most striking part of the cathedral is its western front, a masterpiece of enriched architecture. It is divided into three compartments by ornamented buttresses; and each compartment again into three portions by horizontal bands. The lower portions are occupied by three doorways, that in the centre being the most ornamented and the loftiest. In the second story the most striking feature is the enormous marygold window above mentioned; and three equestrian statues of Clovis, Dagobert, and Rudolph of Hapsburgh, in canopied openings in the buttresses. A fourth canopied opening is unoccupied. The third or upper portion has some beautiful windows. The northernmost of the three compartments is surmounted by a tower and spire. At each of the four corners of the tower is a spiral staircase inclosed in open work. The spire rises to the height of 466 feet above the pavement. It was originally designed to erect a similar spire over the south portal. The building was much injured during the first French revolution, but it has been since restored.

Of the other churches the most remarkable are those of St. Étienne (the oldest structure in Strasbourg), Sainte-Aurelie, St. Pierre-le-Vieux, St. Jean, St. Pierre-le-Jeune (the choir of which belongs to the Catholics, the nave to the Lutherans); the Temple Neuf (formerly a Dominican, now a Lutheran church); St. Louis; and St. Thomas, which belongs to the Lutherans and contains a mausoleum of Marshal de Saxe. The Temple Neuf has some lancet-shaped stained glass-windows of exquisite beauty. Among the other public buildings are—the ancient castle, with a terrace-walk on the Bruche; the episcopal palace; the office of the prefect; the town-hall; the custom-house; the court-house; the public granary; the theatre, which is adorned with an Ionic colonnade; the academy buildings, which contain collections of natural history and anatomy, and a medical library of 12,000 volumes; the college buildings; the episcopal seminary; the civil hospital; the orphan asylum; the corn-market, &c. The public library, consisting of 180,000 volumes, is kept in the building of which the Temple Neuf forms a part. Among the military structures the principal are—the arsenal, the artillery school, the cannon foundry, the Finkmatte and several other barracks, and the hospital. The vegetable market is adorned with a statue of Gutenberg; on an island in the Rhine, seen from the road to Kehl, is a monument in honour of Desaix; and on the Polygon, or artillery exercising ground, about a mile out of the town, is a monument to General Kleber. There are several public walks.

The trade of the town is very considerable: its manufactures include jewellery, metal buttons, starch, alum, oil of vitriol, white-lead, steel, cutlery, pins, combs, cast-iron goods, earthenware, porcelain, enamel, soap, oil from seeds, chicory, marocco and other leather, straw and other hats, woollen and cotton stuffs, cotton-yarn, hosiery, printed flannels, sail-cloth, oil-cloth, thread, carpeting, furs, paper-hangings, playing-cards, &c. There are bleach-grounds, dye-houses, rope-walks, tan-yards, breweries, printing-offices, plaster-kilns, tile-yards, an iron-

forge, a type-foundry, sugar-refineries, a snuff-manufactory, &c. There is a considerable trade carried on with other parts of France, and with Holland, Germany, Switzerland, and Italy, by means of the Rhine and the Ill and their connected navigation, and by railroads; much business is done also in corn, wine, tobacco, madder, hemp, hops, saffron, &c. Four important yearly fairs are held. Steamers ply on the Rhine between Strasbourg and Mayence.

Strasbourg gives title to a bishop, who is suffragan of the archbishop of Besançon, and whose diocese comprises the departments of Bas-Rhin and Haut-Rhin. It has a university-academy, which includes the same two departments in its limits. There are two seminaries for the Roman Catholic priesthood; a seminary of Lutheran theology; a college; schools of midwifery and pharmacy; a training school, a museum, an observatory, a botanic garden, where lectures are delivered; a society of agriculture, and public baths. Strasbourg is the seat of a Lutheran consistory, and of a consistorial synagogue.

STRATFORD. [ESSEX.]

STRATFORD, FENNY. [BUCKINGHAMSHIRE.]

STRATFORD, STONY, Buckinghamshire, a market-town, in the parish of Stony Stratford, is situated on the right bank of the river Ouse, which here separates the county from Northamptonshire, in 52° 3' N. lat., 0° 51' W. long., distant 7 miles N.E. from Buckingham, and 52 miles N.W. from London by road. The population was 1757 in 1851. The living is a perpetual curacy in the archdeaconry of Buckingham and diocese of Oxford. The town extends for about a mile along the line of the ancient Watling-street. St. Giles's, the parish church, was rebuilt in 1776; the church of St. Mary Magdalen was destroyed, except the tower, in 1742, in a fire which consumed a considerable part of the town. The Wesleyan Methodists, Independents, and Baptists have places of worship. A school for boys is partly supported by endowment. The only manufacture is that of lace. The market is held on Friday: fairs are held three times in the year.

STRATFORD-UPON-AVON, Warwickshire, a municipal borough, market-town, and the seat of a Poor-Law Union, in the parish of Stratford-upon-Avon, is situated on the right bank of the river Avon, in 52° 12' N. lat., 1° 43' W. long., 9 miles S.W. from Warwick, 96 miles N.W. from London by road, and 106 miles by the Great Western railway, and the Stratford branch of the Oxford Worcester and Wolverhampton railway. The population of the town in 1851 was 3372. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor. The living is a vicarage in the archdeaconry and diocese of Worcester. Stratford-upon-Avon Poor-Law Union contains 36 parishes and townships, with an area of 79,051 acres, and a population of 20,789 in 1851.

Stratford was a place of some consequence three centuries before the Conquest. The manor was included in the possessions of the bishopric of Worcester. The principal interest of the town is derived from its having been the birth-place of Shakspeare (1564), the place to which he retired in his maturer years, and where, in 1616, he died. In 1769 a festival termed 'the Jubilee' was celebrated at Stratford, in honour of Shakspeare, under the direction of Garrick; and a few years ago it was proposed to hold a triennial commemorative festival, but the series has not been kept up.

The town is approached from London by a long stone bridge of 14 pointed arches, erected in the reign of Henry VII. at the sole charge of Sir Hugh Clopton, lord mayor of London, and widened of late years. By another bridge just below, a railroad is carried across the river, and at the south end of the town is a wooden foot-bridge. The streets are irregularly laid out, but the principal ones are clean, well paved, and lighted with gas. The church is at the south-eastern corner of the town, near the bank of the river. It is a large and very handsome cruciform structure, having nave, chancel, aisles, and transept, with a fine tower and spire. The transept, tower, and some parts of the nave are good examples of early English. The upper part of the tower is of decorated character, with curious circular windows, having varied tracery. The chancel is a fine specimen of late perpendicular. In the interior, on the north wall of the chancel, is Shakspeare's monument. About 1840 the church was thoroughly repaired and restored, both externally and internally, at great expense and with much taste. There are several ancient sedilia with canopies in the interior, and two elegant modern carved stone pulpits. The remains of Shakspeare are buried in the chancel, on the north side. The monument against the wall is surmounted by a half-length effigy of Shakspeare, executed with some taste and skill. Stratford church was formerly collegiate.

Besides the parish church there is a chapel of ease, anciently the chapel belonging to the Guild of the Holy Cross. Some time after the dissolution of monastic institutions, the possessions of this fraternity were granted to the corporation of Stratford for specific purposes. The chapel is of late perpendicular character. Adjoining the chapel is the hall of the guild, an ancient building, which has undergone much alteration. The lower part is used for the business of the corporation, the upper part is occupied by the Grammar school. The Wesleyan and Primitive Methodists, Independents, Baptists, and Roman Catholics have places of worship. There are National and British schools. The Free Grammar school, founded in 1482 (and in which according to tradition Shakspeare was educated), has an income

from endowment of 545*l.*, and had 50 scholars in 1851. There are several town charities which are managed by 12 trustees; also a savings bank. A county court is held in the town. In the principal room of the town-hall are a portrait of Shakspeare by Benjamin Wilson, and one of Garrick by Gainsborough. A statue of Shakspeare stands in a niche on the northern front of the building. There is a theatre which stands within the precincts of Shakspeare's garden.

The occupations of the inhabitants of Stratford are chiefly agricultural, or dependent upon agriculture. The market, a considerable one for corn and cattle, is held on Friday. Eleven fairs are held in the year. The navigation of the Avon commences at Stratford. The Stratford-upon-Avon canal runs from the north side of the town to the Worcester and Birmingham Canal near Birmingham. The Stratford and Moreton goods railway extends from near the termination of the canal to near the town of Moreton-in-Marsh, Gloucestershire, 16 miles. Coal from the South Staffordshire coal-field is sent forward by it, and stone and agricultural produce are brought back. Part of the ancient house, in which Shakspeare is said to have been born, and which belonged to him at his death, is standing in Henley-street, on the north side of the town. A room in it, pointed out as the chamber of his birth, is covered with the names of visitors. This house and the adjoining tenements which originally formed part of it, were purchased a few years ago for the nation at a cost of about 4000*l.* Among the other note-worthy objects in Stratford and its vicinity are a curious old half-timber house in the High-street; the cottage of Anne Hathaway, Shakspeare's wife, in the adjoining parish of Shrottery; and Charlecote house, the seat of the Lucys, a few miles higher up the Avon.

STRATHAVEN. [LANARKSHIRE.]

STRATHFIELD SAYE. [HAMPSHIRE.]

STRATHMIGLO. [FIFESHIRE.]

STRATTON, Cornwall, a market-town and the seat of a Poor-Law Union, in the parish of Stratton, is situated near the shore of the Bristol Channel, in 50° 50' N. lat., 4° 30' W. long., distant 15 miles N.N.W. from Launceston, and 221 miles W.S.W. from London. The population of the parish of Stratton in 1851 was 1696, of which number the town contained about one-fourth. The living is a vicarage in the archdeaconry of Cornwall and diocese of Exeter. Stratton Poor-Law Union contains 11 parishes and townships, with an area of 54,406 acres, and a population in 1851 of 8580. Stratton is situated near the northern extremity of the county, on a rivulet which runs into the sea at Bude Haven. The harbour at Bude admits only small vessels.

[CORNWALL.]

STRAUBING, a town in Lower Bavaria, is situated in 48° 53' N. lat., 11° 35' E. long., on an eminence on the right bank of the Danube, 25 miles E. by S. from Ratisbon, and has about 9000 inhabitants. The town, which is well built, is divided into the upper and lower town, and is surrounded with walls, in which there are four principal gates. The moat is converted into gardens. The principal public buildings are the seven churches, the palace, the government-house, the gymnasium, and the town-house. There are four hospitals, a training-school, and an Ursuline convent. The handsomest part of the town is the great square, in which are the church of the Holy Trinity, the palace, the town-house, the government-house, and the church of St. James and St. Veit. This town has a good trade on the Danube, and great corn and cattle markets. The surrounding country is remarkably fertile.

STREATHAM. [SURREY.]

STRELITZ. [MECKLENBURG.]

STRETFORD. [LANCASHIRE.]

STRETTON, CHURCH. [CHURCH STRETTON.]

STRICHEN. [ABERDEENSHIRE.]

STROKESTOWN, Roscommon, Ireland, a market-town and the seat of a Poor-Law Union, is situated on the road from Dublin to Ballina, in 53° 47' N. lat., 8° 4' W. long., distant by road 12 miles N.N.E. from the town of Roscommon, and 90 miles N.W. by W. from Dublin. The population in 1851 was 1353. Strokestown Poor-Law Union comprises 20 electoral divisions, with an area of 90,036 acres, and a population in 1851 of 30,288. The parish church is a handsome octagonal structure with a tower and spire. There is a Roman Catholic chapel. The other public buildings are a court-house, a dispensary, a Union workhouse, and a bridewell. The market is held weekly on Friday. Fairs are held four times a year. Quarter and petty sessions are held in the town. Bawn House, the seat of Lord Hartland, is a massive edifice consisting of a centre with an Ionic portico and advancing wings. Near it are the ruins of an ancient church, now used as a family burial-place. The demesne contains an extensive deer-park.

STROMA, ISLAND. [CAITHNESS-SHIRE.]

STROMBOLI. [LIPARI ISLANDS.]

STROMNESS. [ORKNEY ISLANDS.]

STRONGOLL. [CALABRIA.]

STRONSA. [ORKNEY ISLANDS.]

STRÖMSTAD. [SWEDEN.]

STROOD. [KENT.]

STROUD, Gloucestershire, a market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of Stroud, is situated in a picturesque valley at the junction of two of the streams which form the Stroud Water (sometimes called the Frome), in 51° 45'

N. lat., 2° 12' W. long., distant 9 miles S. by E. from Gloucester, 101 miles W. by N. from London by road and by the Great Western railway. The population of the parliamentary borough in 1851 was 36,535. The borough returns two members to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry of Gloucester, and diocese of Gloucester and Bristol. Stroud Poor-Law Union contains 15 parishes and townships, with an area of 43,720 acres, and a population in 1851 of 37,386.

The borough of Stroud comprehends an important part of the west of England clothing district. The mills are situated on streams in deep ravines; the houses are built on the hill sides, in a scattered and irregular manner, and the valleys are studded with houses and thickly inhabited. The Stroud water has long been celebrated as being peculiarly adapted for use in the process of dyeing scarlet cloth. The town of Stroud is lighted with gas and paved, and contains many good houses. New subscription rooms have been recently erected. The parish church is a large building of various dates; it consists of a nave, chancel, and side aisles, with a tower and spire at the western end. There are also Trinity church, erected in 1837, chapels for Independents, Baptists, and Wesleyan and Primitive Methodists; National, British, and Infant schools; a dispensary, and a casualty hospital. The market is on Friday, and there are cattle-fairs on May 10th and August 21st. A county court is held.

STRYMON. [AMPHIPOLIS; MACEDONIA.]

STUBBEKIOBING. [FALSTER.]

STUHLWEISSENBERG. [HUNGARY.]

STURMINSTER, or STURMINSTER NEWTOWN CASTLE, Dorsetshire, a market-town and the seat of a Poor-Law Union, in the parish of Sturminster Newtown Castle, is situated in 50° 55' N. lat., 2° 18' W. long., distant 22 miles N.N.E. from Dorchester, and 109 miles W.S.W. from London. The population of the parish of Sturminster in 1851 was 1916, of which number the town contained about one-half. The living is a vicarage in the archdeaconry of Dorset and diocese of Salisbury. Sturminster Poor-Law Union contains 19 parishes and townships, with an area of 37,474 acres, and a population in 1851 of 10,382. Sturminster is situated in a fertile vale chiefly on the left bank of the river Stour; the two divisions of the town (Sturminster on the left, and Newtown Castle on the right bank) being connected by a causeway and a bridge of six arches. The market-house is a very ancient building; near it is the base of a cross, on four steps. The parish church is a handsome edifice, lately rebuilt, consisting of a chancel, nave, two aisles, and an embattled tower. The Wesleyan and Primitive Methodists have places of worship. There are National schools and a literary and scientific institution. The market for corn is held on Thursday. There are large markets for cattle on each alternate Thursday, and fairs on May 12th and October 24th.

STUTTGART, the capital of the kingdom of Würtemberg, is situated almost in the centre of the kingdom, within two miles of the left bank of the Neckar, in 48° 46' N. lat., 9° 10' E. long., 810 feet above the level of the sea, and has about 30,000 inhabitants. It lies at the bottom of a valley, surrounded on three sides by mountains and hills, which are covered with vineyards and gardens. The old part of the city is ill-built, the streets being narrow and irregular, and the houses, for the most part, of wood. The more modern parts have straight streets, intersecting each other at right angles, and contain many handsome buildings. The finest street is the Königs Strasse, which crosses the whole city and passes one end of the square, in which the old and new palaces and the theatre are situated. The new palace is a noble edifice, consisting of a centre and two wings; in front of it is a spacious parade. The gardens and grounds extend to the royal country-seat of Rosenstein, near Kannstadt. In the vicinity of the palace there are several public institutions. Among other buildings deserving notice are the gymnasium, the former military academy, the old palace, the opera-house, the foreign office, the royal mews, the palace of the estates of the kingdom, the new hospital; a colossal bronze statue of Schiller, designed by Thorwaldsen, has been erected in front of the Stiftskirche, which stands behind the old palace, and contains monuments of the dukes of Würtemberg; and the three barracks, which are among the most considerable buildings in the city. There are numerous public and private collections of works of art, and several libraries; the public royal library contains 200,000 volumes. The king's private library of 30,000 volumes contains valuable old works and manuscripts, and a great variety of modern publications. Stuttgart has a gymnasium, an academy of arts, a school of arts, a botanic garden, a veterinary school, a statistical society, a savings bank, and numerous useful and charitable institutions. The manufactures of Stuttgart comprise linen and woollen-cloths, silk, cotton, gloves, carpets, shawls, &c., articles in gold, silver, and bronze; mathematical, philosophical, optical, and musical instruments; cabinet furniture, lacerated ware, and carriages. The bark trade is extremely flourishing. The city is well situated for trade, the Neckar connecting it with the navigation of the Rhine. Railways unite it with Ulm, Augsburg, Munich, and Friedrichshafen, on the Lake of Constance; and a line running west-north-west from Stuttgart, joins the trunk-line of railway on the right bank of the Rhine at Bruchsal.

The name of Stuttgart first occurs in 1229. In 1286 it was besieged for seven weeks by the emperor Rudolph I. In 1320 the counts of

Württemberg fixed their residence here, and since 1482 it has been the capital of all the possessions of the house of Würtemberg.

STYRIA, a Crownland of Austria, formerly styled the Duchy of Styria, is situated between 45° 54' and 47° 50' N. lat., 13° 30' and 16° 25' E. long. It is bounded N. by the archduchy of Austria, W. by Illyria, S. by Illyria and Croatia, and E. by Croatia and Hungary. The northern and western part of the country is covered with high mountains, which are called by the general name of the Styrian Alps. One branch of these mountains separates the valley of the Enns from that of the Mur, runs south-east, as far as the Wild Alps, to the west of Semmering, where it joins the Noric Alps, and then proceeding in a south-easterly direction forms the boundary towards Austria below the Enns, extends into Hungary, and gradually declines to the plain of Oedenburg. The other branch divides the valley of the Mur from that of the Drave, and forms the frontier between Styria and Carinthia. To the south of the Mur the Bacher chain is the continuation of this branch. A third mountain chain runs from Loibl to the Save, and forms on that side the boundary towards Carinthia. None of the mountains rise to the line of perpetual snow; on the north-western frontier there are some glaciers, but still below the absolute snow-line. The highest mountains are the Grössenberg, 8381 feet; the Eisenhut, 7676 feet; the Grimming, 7540 feet; the Stangalpe, 7140 feet; the Hochschwab, 7154 feet; and the Bachstein, 7008 feet above the level of the sea. The southern and eastern part of the crownland contains few lofty mountains, but there are many of moderate elevation, and numerous gentle eminences, some of which are separated by extensive valleys. In conformity with the physical character of the country, it is popularly divided into Upper Styria, which comprises the smaller north-western portion, which is entirely mountainous, and Lower Styria, which is the south-eastern, and larger, lower, and level portion. The mountains of Styria are in many parts covered with valuable forests; and the whole country is well-wooded and celebrated for its romantic or beautiful scenery. The country has numerous rivers, all of which flow into the Danube, and for the most part by an east course. The principal rivers are the Mur, which rises in a lake, traverses the centre of the country for about 180 miles, and enters Hungary before its junction with the Drave; the Drave, the Enns, the Raab, and the Save, which touches the southern frontier, and receives the Sän and the Sotla. The Mur, Drave, Enns, and Save are navigable by boats. There are no large lakes, but many small ones. The country abounds in cold, warm, and hot mineral-springs. Like all countries that abound in limestone mountains, Styria has numerous caverns and grottoes.

The air in the mountains is cold; in the valleys the temperature is much milder. A great part of Upper Styria consists of limestone rocks and sterile mountains, but Lower Styria has many very fertile tracts. Among the animals are the common domestic animals, game, poultry, fish, and bees. The breeding of cattle is very general. The animals are small, they are driven in summer to the highest parts of the mountains, and brought back to the plains in autumn. Sheep are not numerous, and the horses are more fit for draught than for the saddle. The vegetable products are very diversified: wheat, rye, barley, and oats, though not abundant in Upper Styria, are of remarkably fine quality. In Lower Styria there are likewise maize, millet, and buckwheat, pulse, potatoes, and culinary vegetables, the poppy, sunflower, and rape-seed are grown for oil. A little hemp and some flax are raised; hops are cultivated with success. Wine and fruit are among the chief productions. Timber is a very important article. The principal kinds of timber are oak, beech, larch, pine, and fir; chestnut, walnut-tree, red yew, stone-pine, lime, white poplar, and willow are scattered over the whole country, but for the most part they grow in forests. Many of the inhabitants derive their entire means of subsistence from the forests. The timber is felled and exported in rafts down the rivers. Where there are no streams to float it the timber is conveyed down the sides of the mountains by means of semicircular troughs, which are composed of fir-trees with the bark off, and extend in some instances for many miles. Down these inclined planes the heavy logs descend with incredible velocity to the lake or stream which first receives them; they are then floated down to the lower country. Only the finest trunks are formed into rafts and transported to the Danube or into the Adriatic for ship-building. Sometimes the mountain streams are confined by sluice gates till sufficient water is collected to carry the wood down to a larger stream. By means of windlasses worked by the power of mountain torrents, the logs are conveyed up inclined planes from the valleys where this is necessary. A vast deal of the timber of these forests is used for fuel in the mines, and in the numerous smelting-works and furnaces, and other industrial establishments of the country; for this purpose a large proportion of it is converted into charcoal. The greatest wealth of Styria consists in its mines, which are confined to the smaller mountainous portion of the country. The most important minerals are iron, silver, copper, lead, alum, cobalt, sulphur, salt, marble, and coal.

The most important manufacture is iron. The iron-mines in the Erzberg, in the north of Styria, were well known to the Romans. This mountain does not contain the ore in veins or strata, but presents a solid mass of iron-ore, which has been wrought without interruption for eleven centuries. There are a few manufactories of linen, cotton,

woollens, and silk. There is a very brisk trade between Upper and Lower Styria; the latter supplies the former with corn, wine, and tobacco, and receives in return iron, timber, and salt. The exports to other countries are chiefly cattle, steel, iron, copper, and lead, to Austria, Hungary, and European Turkey; vast numbers of scythes and sickles, steel and some other iron-wares, to Italy, France, Poland, and Russia. Among the smaller articles of iron, several millions of Jews'-harpers are annually exported. The imports consist of fine cloths, linens, cottons, silks, and jewellery, and colonial produce. The transit trade between Italy and Germany, from Vienna to Trieste, is very important, and greatly facilitated by good roads, and by the Vienna-Trieste railway, which crosses the Semmering Mountain between Gloggnitz and Murzusschlag in this province, and passes through Bruck, Grätz, Mahrburg on the Drave, and Cilli.

The crownland is divided into three circles, which, with their subdivisions, area, and population, are as follows:—

Circles.	Area in Sq. Miles.	Arrondissements.	Population.
Bruck	3699	22	177,396
Grätz	2615	22	391,474
Mahrburg	2263	20	372,296
Total	8577	64	941,166

The inhabitants are mostly of German, partly of Wendish origin. They are all Catholics except about 5000, who are Lutherans, and 65 who are Calvinists. Education is widely diffused by means of the university of Grätz:—5 gymnasia in Grätz, Mahrburg, Cilli, Judenburg, and St. Lambrecht; 2 schools of art; 2 theological academies; and above 1250 common and adult schools.

Towns.—GRÄTZ, the capital of the whole crownland and of the circle of Grätz, forms the subject of a separate article. The other towns are mostly small; the more important are here given:—*Bruck*, a manufacturing town of 2500 inhabitants, is situated 33 miles N. by railway from Grätz, at the junction of the Murts with the Mur. Its position on a navigable river, and at the junction of several highways with the great road from Vienna to Italy, confers upon this town an important transit trade; besides which there is a great export of iron and iron implements manufactured in the furnaces and foundries of the town. *Judenburg*, higher up the Mur and on its right bank, has copper-works, a great manufacture of scythes, a printing-office, a gymnasium, and about 2000 inhabitants, exclusive of the military. In the mountains near it are mines of coal. *Leoben*, 9 miles W. from Bruck, on the left bank of the Mur, has a population of 2500, who trade in bar-iron, charcoal, and salt. There are numerous iron-mines and iron-works here; jet- and coal-mines are worked in the neighbourhood. The preliminaries of the treaty of Campo-Formio, between the French and the Austrians, were signed in this town in 1797. *Karstenfeld*, near the Hungarian frontier, has a custom-house, a large tobacco-factory, and about 4000 inhabitants. *Mahrburg*, 41 miles N.N.E. by railway from Cilli, stands on the left bank of the Drave, and has a population of 5000, who trade in wine, corn, leather, rosoglio, and fruits. It is defended by a castle, and has a gymnasium and an arsenal. *Cilli*, which is said to occupy the site of *Claudia Celeia*, a town in the south-east of Noricum, is situated on the Sän, 86 miles by railway S. from Grätz, and has a gymnasium, a training-school, and 2000 inhabitants, who trade in corn and wine. Coal-mines are worked near Cilli. *Bismers*, a village of about 1600 inhabitants, remarkable for its great iron-works and manufacture of steel, stands at the foot of the famous Erzberg, which is literally a mount of iron-ore about 3000 feet high and 5 miles in circuit.

SUABIA (Schwaben, the country of the *Suevi*), one of the ten circles into which Germany was divided previous to 1806, comprehended the south-western part of Germany, one of the most beautiful and fertile tracts of the whole empire, traversed by the Danube from the south-west to the north-east, and covered by the mountainous region of the Schwarzwald, or Black Forest, on the west, and by the Alps in the interior and on the south. It was situated between France, Bavaria, Switzerland, Franconia, and the circle of the Rhine, and had an area of 13,000 square miles, with 2,200,000 inhabitants. Its chief natural productions are corn, wine, and fruit, and in the mountainous parts minerals, and timber, which is floated down the Neckar and the Rhine to Holland. Christianity was introduced at the beginning of the 7th century by the Irish monk Columba. In the year 1030 Henry IV. gave the duchy of Suabia to Frederick of Hohenstauffen, the ancestor of the emperors of the house of Suabia. Under his successors the Suabians were the richest, the most civilised, and the most respected of all the nations of Germany. But when the Italian wars and the contest with the Guephs had broken the power of the house of Hohenstauffen, and it became extinct on the execution of Conrad in 1268, their vassals, cities, prelates, and counts made themselves independent. The country is now divided between Würtemberg, Bavaria, and Baden. The largest cities are Augsburg, Stuttgart, and Ulm. The Bavarian portion forms the circle of *Suabia*, which was formerly called Upper Danube. It has an area of 3675 square miles, and a population of 565,788. The chief town is Augsburg, which is

connected by railway and electro-telegraphic wires with all the principal towns of Germany.

SUAKIN, a seaport town, situated on an island near the west shore of the Red Sea, in 19° 4' N. lat., 37° 30' E. long. The island lies near the extremity of a narrow inlet, about 12 miles in length and 2 miles in width. The entrance of the bay is only about 60 fathoms wide, but it opens gradually to 2 miles. The town is separated from its suburb, called El Geyf, which stands on the mainland, by an arm of the sea about 500 yards wide. The harbour is formed by a projecting part of the continent to the east of the town. The arm of the sea on the west side affords no anchorage for ships of any size. The islands and all the surrounding country are sandy, and produce only a few shrubs or low acacias. The houses of the town have one or two stories, and are constructed of blocks of madreporas. The suburb El Geyf is larger than the town itself. Suakin has three mosques, and El Geyf one mosque. The water is bad. Burekhardt estimated the population of Suakin at about 8000, of whom 3000 live upon the island and the rest in El Geyf. Suakin is an important trading-place. It exports to Jidda, Hodeyda, and other Arabian ports commodities received from eastern and central Africa, such as slaves, gold, tobacco, incense, ostrich feathers, dhurrn, water-skins, leathern sacks, tanned hides, butter in a liquid state, doum mats, horses, and dromedaries. From Jidda and other Arabian ports are imported Indian and other tissues, as dresses and ornaments for women, household utensils, sugar, coffee, onions, dates, and much iron for lances and knives. Many of the African Mohammedans take Suakin on the pilgrimage to Mecca and Medina.

SUBIACO. [ROMA, COMARCA DL.]

SUBZULCOTE. [HINDUSTAN.]

SUDAN. [SOODAN.]

SUDBURY, Suffolk, a municipal borough, market-town, and the seat of a Poor-Law Union, is situated on the left bank of the river Stour, in 52° 2' N. lat., 0° 43' E. long., 16 miles S. from Bury St. Edmunds, 54 miles N.E. from London by road, and 68 miles by the Eastern Counties and Eastern Union railways. The population of the borough in 1851 was 6043. The borough is governed by four aldermen and 12 councillors, of whom one is mayor. Sudbury sent two members to Parliament until 1844, when it was disfranchised for bribery and corruption. The livings are in the archdeaconry of Sudbury and diocese of Ely. Sudbury Poor-Law Union contains 42 parishes and townships, with an area of 78,302 acres, and a population in 1851 of 30,814.

Sudbury is a borough by prescription. It was one of the first towns in which Edward III. settled the Flemings in order to instruct his subjects in the woollen manufacture. A church and priory, of which few vestiges remain, were erected here in 1272 for Dominican friars. The Knights Hospitallers had a house near the bridge, with the tolls of which it was endowed. Near the town was a Benedictine cell attached to Westminster Abbey. The three parish churches are chiefly of perpendicular character. All Saints church was, from the year 1150 to the Reformation, appropriated to St. Albans abbey. In the chancel of St. Gregory's church the body of Archbishop Theobald, who was beheaded in 1381 by Wat Tyler's mob, was interred; and the head, dried by art, is still preserved. The Independents, Baptists, and Quakers have places of worship. The Grammar school has an endowment of 90*l.* a year. There are Church of England, National, and British schools, and a savings bank.

The town is neat, clean, well-built, paved, and lighted. Ballingdon, in Essex, forms a suburb to Sudbury, with which it is united by a bridge over the Stour. The town-hall and the corn-exchange are modern buildings. The silk manufacture is the principal branch of industry in the town. The river navigation, which is not good, has been almost superseded by the railway. A corn-market is held on Thursday, and a general market on Saturday. Fairs are held in March and July. Quarter sessions and a county court are held.

SUDELEY. [GLOUCESTERSHIRE.]

SUDERMANIA. [SWEDEN.]

SUDETSCH or SUDETIC MOUNTAINS. [AUSTRIA; PRUSSIA.]

SUDSCHA. [KURSK.]

SUEZ, ISTHMUS OF, connects Africa with Asia, and separates the Mediterranean from the Red Sea. Its extent from north to south a little exceeds seventy-two miles. The most northern recess of the harbour of Suez, on the Red Sea, is hardly a mile south of 30° N. lat., and the village of Tyneh, on the Mediterranean, near the arm of the Nile, which in ancient times was called the Pelusiac, and which at present is blocked up with sand, is only about two miles north of 31° N. lat. There once existed a canal on the isthmus, and numerous traces of it still appear in several places; it united the Red Sea with the river Nile. This canal was commenced when Egypt was an independent kingdom, under Necho, about 2500 years ago, and was completed by Darius. (Herod. ii. 157.)

The whole tract, from Suez to Tyneh, is uninhabited. Drinkable water occurs only in one or two places. The surface, in general, consists of sandstone, which in many places, by disintegration, has been converted into sand. In some places occur considerable depressions, which are covered with salt swamps or salt lakes. A depression of a somewhat different kind extends across the isthmus from Suez to Tyneh, not in a straight line, but diverging first to the west, and after-

wards returning to the east, until it again reaches the straight line. In the southern part of this depression the canal of Necho had been made. Near 30° 10' N. lat. are several lakes called the Bitter Lakes, from the taste of their waters. Up to these lakes the direction of the depression is due north, or nearly so, but the lakes themselves turn to the north-west, and extend to 30° 30' N. lat. without interruption. Not far from the northern extremity of the Bitter Lakes are the ruins of a temple of Serapia. At a short distance to the north of these ruins is another depression, containing a small lake called Temsah, which is dry during the greater part of the year, but filled with water when the inundations of the Nile have attained their greatest height. From the Nile the water reaches this lake by a depression, in which the canal of Necho had originally been led. Northward of the Lake Temsah are some salt-marshes called Karsh, which occupy a space of a few miles in length from north to south. Between the salt-marshes and the Lake of Bellah is a similar stony country. The last-mentioned lake may be considered as the most southern branch of Lake Menzaleh, being united to it by low ground and marshes, which during the inundations of the Nile are covered with water. East of these lakes is a low stony tract, which, about 31° N. lat., joins the plain of Pelusium. The plain is a dead flat, with a sandy arid soil, in many parts covered with a thin layer of salt. When the water attains its greatest height in the Nile, the plain of Pelusium is almost entirely covered. At its eastern extremity is the small village of Tyneh, and about a mile to the south-west of it are a few ruins, which are supposed to be those of the ancient town of Pelusium. But no traces of the bed of that arm of the Nile, the Pelusiac, the name of which was derived from that town, can be discovered in any part of the plain. The country which extends to the west of the line described is covered with horizontal strata of sandstone, and presents few inequalities, except towards the south. The country which lies to the east of the line is stony as far south as the south end of the Lake of Bellah on the north, and as far north as the caravan-road from Cairo to Suez on the south, but that part of the country which intervenes between these two points is entirely covered with sand. A French engineer has recently obtained the authorisation of the Pasha of Egypt to cut a ship-canal, 92 miles in length, across the isthmus.

SUEZ, a town situated at the head of the westernmost of the two arms or "gulfs" in which the Red Sea terminates, is in 29° 57' 30" N. lat., 32° 31' 38" E. long., and 62½ geographical miles E. from Cairo. Suez is walled on three sides, being open to the sea on the north-east, where is the harbour and a good quay. Within the walls are many open places, and several khans built around large courts. The houses are in general poorly built. There is a bazaar, or street of shops, tolerably furnished with goods from Cairo. The inhabitants are about 1200 Moslems and 150 Christians of the Greek Church. The transit of the productions and merchandise of the east from the Red Sea to the Nile has always made this an important station, and caused the existence of a city in the vicinity, though Suez itself as a town cannot be traced to an earlier origin than the early part of the 16th century. The concourse of pilgrims who annually embark here for Mecca has also rendered necessary a town at this station. The circumstance of this port being the point of communication between Europe and India in connection with the Overland Mail, has given an impulse to the prosperity of Suez; but from the want of fresh water, and of every kind of verdure and cultivation, it can never become more than a place of passage, which both the traveller and inhabitant will quit as soon as possible.

SUFAID-KOH. [AFGHANISTAN.]

SUFFOLK, a maritime county on the east coast of England, lying between 51° 56' and 52° 37' N. lat., 0° 23' and 1° 46' E. long. It is bounded N. by Norfolk; E. by the German Ocean; S. by Essex; and W. by Cambridgeshire, from which it is separated by the river Lark, a feeder of the Great Ouse. The greatest length is from north-east to south-west, from Southtown, a suburb of Great Yarmouth, to near Haverhill, 68 miles; the greatest breadth, nearly at right angles to the length, is from the bank of the Little Ouse, in the north-west corner of the county, to Landguard Fort, opposite Harwich, 52 miles. The area of the county is 1454 square miles, or 947,681 statute acres: the population in 1841 was 315,073; in 1851 it was 337,215.

Surface; Coast-Line.—The surface of this county is gently undulating, except just along the north-western and some parts of the north-eastern border, where the land subsides into a marshy flat, scoured from overflow only by embanking the courses of the rivers. Some marshes also border the rivers in the south-east part, but none of these are of any extent. The highest ground in the county, as determined by the course of the waters, forms a ridge of crescent-like shape, extending through the centre of the county. It may be indicated by a line drawn from the neighbourhood of Lowestoft in the north-east, between Bungay and Halesworth, to the neighbourhood of Debenham; and thence to the western border of the county, passing between Stowmarket and Ixworth, between Bury and Lavenham, and between Newmarket and Clare. The waters which flow northward from this line fall into the Waveney or the Ouse; while those which flow southward join the Stour, the Orwell, the Deben, or other streams flowing into the German Ocean.

The coast has a tolerably regular outline, convex to the sea. The bays are shallow, and the headlands have little prominence. Hollesley

Bay, Aldeburgh, or Aldborough Bay, and Southwold, or Sole Bay, are the chief bays. The headlands are—the point on which Landguard Fort is placed, at the entrance of the estuary of the Orwell and the Stour, opposite Harwich; the point at Bowdsey; Orford Ness, near Orford; the point near the village of Thorpe; Easton Ness; and Lowestoft Ness, the most easterly point in Great Britain. The harbours are the estuaries of the rivers Stour and Orwell, Deben, Butley, or Alde, Blyth, and Yare, and the artificial cut through lake Lothing into the Waveney. The estuary of the Stour and the Orwell is for the most part lined with marshes.

The sea-shore from Landguard Fort is lined for about two miles with sand-hills, and thence for two miles, nearly to the estuary of the Deben, by low cliffs of crag upon blue-clay. Beyond the estuary of the Deben (which is skirted by a narrow line of marsh-land) cliffs of similar formation to those just mentioned recommence, and extend nearly three miles to the point at Bowdsey. The entire coast of the county is estimated at above fifty miles in extent, a great portion being low and marshy, and the remainder lined with cliffs of shingle or gravel, and red loam.

Geology, &c.—The greater part of the county is covered by diluvial beds. The exceptions are the crag and London clay district of the south-east, and the chalk district of the north-west. The crag and London clay district may be considered as bounded by a line drawn from Orford by Woodbridge and Ipswich to the banks of the Stour, between Sudbury and Nayland. The chalk is found to the north-west of a line drawn from Euston, near Thetford, to Bury St. Edmunds, and thence west by south to the border of the county. The crag formation consists chiefly of thin layers of quartzose-sand and comminuted shells, resting sometimes on chalk, sometimes on the London clay. It is divided into the red-crag and the coralline-crag. Lyell refers the crag formations to the Older Pliocene period. The thickness of the crag is not known: it has been penetrated 50 feet near Orford without reaching the bottom. The chalk of the north-western side of the county does not rise into high hills; the formation appears to extend under the diluvial beds which occupy the centre of the county.

Hydrography and Communications.—The Waveney and the Little Ouse, border rivers, which separate this county from Norfolk, and receive the drainage of the northern part, are described under NORFOLK; where also the navigable cut from the sea, through Lake Lothing, is described, though it belongs to Suffolk. The Suffolk tributaries of the Waveney are all small. In that part of the county which is adjacent to the lower part of the course of the Waveney are several small sheets of water, as Oulton Broad and Lake Lothing, Breydon Water, Fritton Decoy, and Flixton Decoy. Neither of these pieces of water has much breadth, except Breydon, and that, in its widest part, is not a mile across. The Lark, a tributary of the Greater Ouse, rises at Lawhall, 7 miles S. from Bury St. Edmunds, flows north to that town, and then flows north-west by Mildenhall, to the border of the county, which it skirts for a few miles, and then enters Cambridgeshire, where it joins the Greater Ouse. Its whole length is about thirty miles. It is navigable from Bury, and serves to convey produce from that town and neighbourhood to the river Ouse and the port of Lynn. Of the streams which drain the southern part of the county the Stour is the most important. It is described under ESSEX, which it divides from Suffolk. The Stour receives many tributaries, none of which are navigable.

The *Orwell*, or *Gipping*, as it is called in the upper part of its course, is formed by the junction of several streams, which unite just by Stowmarket, and flows south-east by Needham-Market to Ipswich. Below that town it expands into an estuary of considerable width, which unites at Harwich with the estuary of the Stour. It is the estuary alone which bears the name of Orwell. The course of this river to Ipswich is above 20 miles, for more than half of which (namely, from Stowmarket) it is navigable: the estuary is 10 or 12 miles long, and for the greater part of that distance more than half a mile wide at high-water. Sea-borne vessels of considerable burden get up to Ipswich. The *Deben* rises near Debenham, and flows about 20 miles in a winding course to Woodbridge, below which it becomes an estuary 9 or 10 miles long, and from a quarter to half a mile wide, navigable for sea-borne vessels of considerable burden. The *Alde* rises near the village of Brundish, and runs 11 miles south-east to its junction with the Ore, which rises near Framlingham, and has an eastward course of about 12 miles. From the junction the united stream, which is sometimes called Ore, sometimes Alde, flows about 15 miles into the sea. The course of this part of the river (which is, for the greater part of its length, an estuary) is remarkable: about eight miles below the junction of the Alde and the Ore, near the town of Aldeburgh, it approaches within 200 yards of the sea; and then turning suddenly, has the rest of its course nearly parallel to the shore, from which it is separated by a long, narrow, marshy peninsula. The principal feeder of the Alde is the *Butley*, a small river, the lower part of which becomes a tolerably wide estuary, opening into the estuary of the Alde just before it joins the sea. The Alde is navigable to Snape Bridge, near the head of the tideway. The part below the junction of the Butley is sometimes called Butley. The *Blyth* rises near Laxfield, and flows eastward 16 miles by the neighbourhood of Halesworth, near which it receives a small feeder, into

the sea near Southwold: it is navigable up to Halesworth, 8 or 9 miles. There are no canals within the county, but some of the smaller rivers have been made navigable.

The Norwich and Ipswich road enters the county at Stratford Bridge over the Stour, between Colchester and Ipswich, and runs to Ipswich, and thence northward by Stoke and Scole Bridge over the Waveney into the county of Norfolk. The Yarmouth road branches from the Norwich road at Ipswich, and runs through Woodbridge, Saxmundham, and Lowestoft. A second Yarmouth road branching from this at Blythburgh, between Saxmundham and Lowestoft, passes through Beccles, and rejoins the road just before entering Yarmouth. The Norwich and Newmarket road enters the county at Newmarket, runs eastward to Bury St. Edmunds, and then northward to Thetford in Norfolk. Another road to Norwich enters the county at Sudbury, and runs by Long Melford to Bury, and thence by Ixworth and Botesdale to the Norwich and Ipswich road at Scole. A road from Bury leads by Stowmarket and Needham-Market to Ipswich. The roads in all parts of the county are excellent.

The Eastern Counties and Eastern Union railway enters the county from Essex near Manningtree, and proceeds north by east to Ipswich, and thence north-west to Stowmarket, where it divides, one branch continuing north-west to Bury St. Edmunds, the other running north by east to Norwich, and quitting Suffolk near Diss. A short branch quits the main line at Bentley, and proceeds to Hadleigh. The Sudbury and the Newmarket branches of the Eastern Counties line just touch the border of the county; and the Norfolk line skirts the border for a short distance from Lakenheath and Brandon to Thetford. A short portion of the Lowestoft branch of the Norfolk line is within the county.

Climate, Soil, and Agriculture.—The climate is much drier than that of the more western counties of England; but also colder in spring, when the north-easterly winds prevail. The soil, although varying extremely, may be divided into three or four distinct kinds. A very rich loam, chiefly alluvial, is found in a small portion of the southern part of the county, between the Orwell and the Stour. The next class consists of heavier loams, varying in every degree, but in general resting on an impervious soil of marl or clay, and in most situations requiring the assistance of drains to carry off superfluous water. This soil is found in the whole of the centre of the county, from the Stour to the borders of Norfolk. Between the strong loam and the sea is a strip running from the north bank of the river Orwell to Yarmouth, diminishing in breadth as it stretches northward, and consisting chiefly of sand of various qualities, incumbent on a subsoil of crag, which is a loose rocky substance, composed of sand, gravel, and broken shells, partly consolidated into a kind of stone. Some of this sand is enriched by organic matter intimately mixed with it: this is excellent for roots, especially carrots, and bears very fine barley. In the portions which lie low, and which have at some time or other been covered with water, a very rich mud has been deposited, and has produced as rich a soil as may be desired. There is another tract of sand of a much inferior quality on the western extremity of the county, extending from Bury St. Edmunds to Thetford, with some better lands interspersed. The last class consists of the fen-lands, which, when properly drained, become valuable; but in their natural state, soaked in water, are of little value. The greater part of the land is under the plough. Improved systems of husbandry are generally introduced, and most of the usual crops are raised. There is no part of England where the implements of husbandry are more perfect than in Suffolk, or where new implements are tried with more readiness. This is owing in a great measure to the very excellent manufacturers of agricultural implements who live in the county. Of these manufacturers Messrs. Ransom of Ipswich, are the chief. The works of Messrs. Garrett, at Leiston, are of little less importance. Many farm-buildings of a superior class have been erected of late years.

Suffolk has but one breed of cattle which is peculiar to it. It is a polled breed, of which the cows are in great repute, and justly so. The oxen have not been much attended to, as most of the bull-calves are fattened for the butchers or sent toward Essex and London for that purpose. The Suffolk farm-horses are noted for their docility and steadiness. Suffolk pigs are perhaps, on the whole, the most profitable breed in England. They are well-shaped, short-legged, mostly white, with short upright ears, and the porkers of this breed are excellent. Suffolk has no indigenous breed of sheep; the South-down and a cross of this breed with the Leicester and Cotswold are very common.

Divisions, Towns, &c.—The county is divided into twenty hundreds, as follows, besides the liberty of the borough of Ipswich:—Blackbourn, Hartismere, Hoxne, and Wangford, north; Mutford and Lotheringland, north-east; Blything and Plomesgate, east; Colneis, Carlford, and Wilford, south-east; Samford, south; Babergh, south-west; Risbridge, west; Lackford, north-west; and Bosmere and Claydon, Cosford, Loes, Stow, Thedwestry, Thingos, and Thredling, central.

Suffolk contains the two county and borough towns of IPSWICH and BURY ST. EDMUNDS, the parliamentary borough of EYR, the parliamentary boroughs of ALDBOROUGH, or ALDEBURGH, DUNWICH, ORFORD, and SUDBURY, and the market-towns of BECCLES, BUNGAY, Clare, Debenham, Framlingham, Hadleigh, Halesworth, Lavenham, Lowestoft, Mildenhall, Newmarket, Saxmundham, SOUTH-

WOLD, STOWMARKET, Stradbroke, and WOODBRIDGE; with the ex-market-towns of BILDESTONE, Blythburgh, Botesdale, BRANDON, Haverhill (partly in Essex), Ixworth, Mendlesham, Needham-Market, Nayland, and Woolpit. The places printed in small capitals are described under their respective titles; of the rest we subjoin an account.

Clare, population of the parish 1769 in 1851, about 18 miles S.S.W. from Bury St. Edmunds, is situated on the left bank of the river Stour. The streets are wide, but the houses generally are of mean appearance. There is a corn-exchange of modern erection. The church, a fine large building, was recently repaired, and a new gallery added. There are places of worship for Baptists and Independents; also an Infant school. On the south side of the town are the vestiges of an old castle, and the remains of a priory of regular canons of St. Augustine. The market is on Monday for corn, and there are two small yearly fairs.

Haverhill, population of the parish 2535, of which number 257 were in Essex, is about 16 miles S.W. from Bury St. Edmunds. Haverhill consists chiefly of one street, wide, but lined with poor houses, along the road from Colchester to Cambridge. Besides the parish church, which is an ancient edifice, there are places of worship for Independents, Baptists, and Quakers, a National school, a Charity school, and a savings bank. Half a mile north-west of the town once stood a castle, of which there are now no remains. A weekly market and two annual fairs are held. A particular kind of stout twilled cotton, called drabbet, is made at Haverhill.

Saxmundham, population 1180 in 1851, is about 21 miles N.E. from Ipswich, on the road to Yarmouth. The town lies in a valley, through which, at the back of the houses, on the east side of the street, runs a small brook, a feeder of the Alde. The church is a neat building just out of the town. The Independents have a place of worship, and there are National schools. The market is on Thursday; there are two yearly fairs.

The following places had markets, which have been discontinued:—

Blythburgh, population 1118 (of whom 511 were in Blything Union workhouse) in 1851, is on the right bank of the Blyth, 30 miles N.E. from Ipswich. It was in the middle ages an important fishing and trading town. Sessions for the division were held here, and there was a jail, of which some portions remained till the middle of the last century. The church is of perpendicular character; the length of it is 127 feet, the width above 54 feet. Some portions of painted glass are in the windows. The Primitive Methodists have a chapel. There are remains of a priory for the canons of St. Augustine. *Botesdale*, population 626, is about 15 miles N.E. from Bury, on the road to Norwich by Scole. With the village of Rickingall Inferior it forms a street of more than a mile long. A market was formerly held at Botesdale on Thursday. There is a fair on Holy Thursday for cattle, pedlery, &c. The chapel at Botesdale has some good portions of perpendicular architecture. The Baptists and Wesleyan Methodists have chapels, and there is a National school. *Debenham*, population of the parish 1653 in 1851, is about 13 miles N. from Ipswich, on the river Deben, here a mere brook. From its situation on a declivity the town is clean, but the houses are generally poor. The church is a handsome edifice, and the market-house is a tolerably good building. There are a place of worship for Independents, National and Free schools, and a reading society. The market was held on Friday. There is one fair yearly. *Dunwich*, population 294, is on the coast, about 28 miles N.E. from Ipswich. Whilst East Anglia subsisted as a separate kingdom, Dunwich was a place of importance, and the seat of the first East Anglian bishopric, which was subsequently fixed at Norwich. In the civil war of John the townsmen adhered to the king, who had befriended the town, and granted it a charter of incorporation. They contributed several vessels and many men to the king's naval service in the French wars of Edward I. and III. In the war of the Roses they embraced the Yorkist party; and this, by inducing Henry VII. to incorporate the rival town of Southwold, contributed to the decay of the place. The chief cause of this decay however was the encroachment of the sea, which not only ruined the port, but washed away the greater part of the town. Besides the ruins of All Saints church (the only one remaining of seven churches which Dunwich once possessed), there are the remains of a Gray Friars house, and of the chapel of St. James's hospital. The present church was built in 1830. The village has a yearly fair. Some sprats and herrings are caught and cured here. The borough was disfranchised by the Reform Act. *Ixworth*, population 1189, is about 7 miles N.E. from Bury. There was anciently a priory for the regular canons of St. Augustine, founded about 1100. The parish church is a small ancient building. The Wesleyan Methodists and Baptists have chapels, and there are National and Infant schools. There are some remains of the priory, but the greater part of its site is now occupied by a modern mansion called Ixworth Abbey. *Mendlesham*, population 1442, is about 15 miles N. by W. from Ipswich. The village extends about three miles along the road. The market has long been given up. The church is a handsome building, and there are chapels for Wesleyan Methodists, Independents, and Baptists. A yearly fair is held on the 2nd and 3rd of October. An ancient silver crown of 60 ounces weight was found here near the close of the 17th century: it was supposed to have belonged to one of the East Anglian kings.

Nayland, 14 miles S.W. by W. from Ipswich, population 1153, occupies a low situation on the left bank of the Stour, over which there is a brick bridge, and is occasionally subject to inundation. The church is a handsome building, and there are a chapel for Independents, a National school, and a school supported by the Independents. There are some large flour-mills; a considerable quantity of corn and flour is sent down the river to be conveyed to London. There is a yearly fair. *Needham-Market*, population of the hamlet 1367, is about 9 miles N.W. by N. from Ipswich, on the road to Bury. The chapel is a mean building, with a wooden belfry; there are places of worship, with free schools attached, for Independents and Quakers. Theobald's Free Grammar school, founded in 1832, has an income from endowment of 57l. a year, and had 46 scholars in 1854. Some corn-mills are in the vicinity. *Orford*, population 1045, situated on the right bank of the Alde River, is 21 miles E. by N. from Ipswich. A royal castle was here in the time of Henry III., who granted a charter to the town. The town-hall is a small building. The chapel, when entire, was spacious; the nave alone is now used. The ruins of the chancel are of Norman architecture. The Independents and Primitive Methodists have places of worship. Of the castle only the keep remains: it is a polygon of 18 sides, with walls 90 feet high, and has 3 square towers in its circuit, which overtop the rest of the building. The architecture is Norman. It serves as a landmark for mariners. On the sea-shore, near Orford Ness, are two lighthouses. The market has been discontinued: a fair is held on June 24th. *Rendlesham*, population 359, is about 6 miles N.E. from Woodbridge. National schools are supported chiefly by subscription. Rendlesham House is a fine mansion a little way north from the village, said to be built on the site of a palace of Redwald, king of the East Angles. *Stradbroke*, population 1822, about 7 miles E. from Eye, has a fine church, with a square embattled tower; the nave is of considerable height, and the roof is groined; the altar window is of stained glass. The Baptists have a chapel, and there are free schools. There is a market on Tuesday for corn; a cattle fair is held on the third Monday in June; a statute fair for hiring servants on October 2nd. Petty sessions are held fortnightly. Linen-weaving, brewing, tin-plate working and gardening, are carried on. *Woolpit*, population 1071, is about 8 miles E. by S. from Bury, on the road to Stowmarket and Ipswich. The church is a handsome building, partly of decorated, partly of perpendicular character. The Primitive Methodists have a chapel, and there is a National school. The yearly cattle fair is one of the largest in the county. A very white brick, of remarkably good appearance, is made near the village.

The following are some of the more important villages, with the population of the respective parishes in 1851:—

Barton Mills, population 642, about 10 miles N.W. by W. from Bury St. Edmunds, on the left bank of the river Larke. The corn-mills established here employ a considerable number of persons. There are a small church, a chapel for Baptists, and National schools. *Benhall*, population 713, about 2 miles S.W. from Saxmundham. The church has been recently repaired, and a new chancel built. There are National and Infant schools. *East Bergholt*, population 1467, near the left bank of the Stour, about 7 miles S.S.E. from Hadleigh, has many good houses. The church is of perpendicular architecture. There are chapels for Wesleyan and Primitive Methodists; and National schools, partly endowed. A fair is held on the first Monday of July. *Barford*, population 1102, about 6 miles E. by S. from Sudbury, is pleasantly situated in a fertile valley. The church is a commodious structure, with a tower and spire. There are an Independent chapel; a Free Grammar school, founded in 1595, which has an income from endowment of about 45l. a year, and had 14 scholars in 1854; and National and Infant schools, partly endowed. *Bures*, population 1806, is about 7 miles S.S.E. from Sudbury, on the Stour, over which there is a bridge. The church is ancient. There are a chapel for Baptists, and National and Infant schools. Brick-making and malting are carried on, and there are flour-mills in the vicinity. A station of the Eastern Union railway is at Bures. *Burgh Castle*, population 344, about 4 miles W.S.W. from Yarmouth, has a small church, with a thatched roof and a round tower. There are National and Infant schools. The village is of considerable antiquity, and occupies a picturesque site. About half a mile south from the village are considerable remains of an ancient castle. *Coddensham*, population 1047, about 7 miles N. by W. from Ipswich, has an elegant gothic church, with a square tower. The Independents have a chapel, and there is a charity school. Shoe-making and lime-burning are the principal occupations. Petty sessions are held fortnightly. *Pressingfield*, population 1492, about 10 miles E.N.E. from Eye, is seated on an eminence; the village contains some good houses. The church, partly of Norman date, consists of nave, aisles, and chancel, with clerestory and a finely-carved oak roof. The Baptists have a large chapel, and there are National and Free schools. The former guild-hall is now a public-house. *Grundisburgh*, population 801, about 7 miles N.E. from Ipswich, has an ancient church, with a modern brick tower. There is a chapel for Baptists. Brick-making is carried on. In the vicinity is Grundisburgh Hall, a spacious mansion, standing in a well-wooded park. *Haughley*, population 971, about 3 miles N. by W. from Stowmarket, has a spacious old church, an Independent chapel, and a parochial school. Malting is carried on. There are some corn-mills. A fair for toys is held on August 25th. The remains

GEOG. DIV. VOL. IV.

of a castle cover a considerable area in the vicinity. *Hitcham*, population 1037, about 8 miles N. by W. from Hadleigh, has a commodious and handsome church, of Norman character, with a finely-carved roof; a chapel for Baptists, and a parochial school. *Holbrook*, population 857, about 7 miles S. from Ipswich, is situated on the right bank of the Holbrook, a small stream, which runs into the Stour at Holbrook Bay, about two miles from the village. The church is a large ancient structure. The Wesleyan Methodists have a chapel, and there are National schools. Malting is carried on. *Kelsale*, population 1157, about 2 miles N. from Saxmundham, has some well-built houses, surrounded with gardens. The church is situated on a hill, and is chiefly built of flint. There are an Endowed school for boys, and a Free school for girls. *Lakenheath*, population 1864, about 6 miles S.W. from Brandon, is situated on rising ground, in the midst of extensive warrens. The parish church is a commodious structure. The tower is surmounted with a leaden spire of considerable height. There are chapels for Wesleyan Methodists, Baptists, and the Countess of Huntingdon's Connexion. Goward's Charity school educates 32 boys. A fair for cattle and toys is held on the first Thursday after Midsummer Day. *Laxfield*, population 1147, is about 7 miles N. from Framlingham, near the source of the river Blyth. The church is a handsome edifice, with a pinnacled tower. The nave is of considerable height; there is a finely-ribbed roof, and the windows are filled with stained glass. There is a large antique font. The Baptists have a chapel, and there are National and Free schools. A small customary market for corn is held on Monday; fairs for cattle and sheep are held on May 12th and October 25th. *Leiston*, population 1580, about 4 miles N. by W. from Aldborough. The church, which is about a quarter of a mile W. from the village, consists of one aisle, with a thatched roof; the tower is of flint. The Wesleyan Methodists and Quakers have places of worship. The chief point of interest here is Messrs. Garrett's establishment for the manufacture of agricultural implements, which has been in operation for about three-quarters of a century, and is now one of the most important of its kind in the kingdom. There are some remains of Leiston Abbey. *Long Melford*, population 2587, on the left bank of a feeder of the Stour, about 3 miles N. from Sudbury, extends for about a mile along the road to Bury. The church is a handsome and commodious edifice, of perpendicular character. The Independents have a chapel; there are likewise National schools; two Free schools; and an almshouse or hospital for a warden, 12 poor men, and 2 poor women. Petty sessions are held fortnightly. A large cattle fair is held on the Thursday in Whitsun-week, and a pleasure fair on the two previous days. Melford has some old mansion-houses, among others, Melford Hall, an extensive Elizabethan structure, with four small round towers in front, standing in a spacious deer-park. *Melton*, population 1039, about 2 miles N. by E. from Woodbridge, on the right bank of the river Deben, has a parish church and National schools, and is the seat of the County Lunatic Asylum, which in 1851 contained 269 inmates. There are brick-works, an iron foundry, and corn-mills. *Mendham*, population 877, is pleasantly situated on the right bank of the Waveney, about 8 miles S.W. by S. from Bungay. The church is a massive structure, with a tower. The Wesleyan Methodists and Independents have places of worship. Near the church are some remains of a priory, founded in the reign of Stephen. *Metfield*, population 651, about 7 miles W. by N. from Halesworth, has an ancient church, with a tower; and a chapel for Primitive Methodists. Brick-making is carried on, and there are several corn-mills. *Old Newton*, population 792, about 3 miles N. by E. from Stowmarket, pleasantly situated on elevated ground, near the source of the Gipping, contains Dagworth-Hall, now a farm-house. The Wesleyan Methodists have a chapel, and there is a Parochial school. *Olney*, population 616, about 8 miles N. by E. from Ipswich, has a beautiful gothic church, with a tower; the windows are filled with stained glass. The Baptists have a chapel, and there are National schools. In the neighbourhood are corn-mills. *Oulton*, population 742, of whom 174 were in Mutford and Lothingland Union workhouse, is about 2 miles W. from Lowestoft. The population is chiefly agricultural, but an iron-foundry, a cement manufactory, and corn-mills, afford some employment. *Pakefield*, population 713, about 3 miles S.S.W. from Lowestoft. The coast being exposed and dangerous, the Humane Society of Lowestoft has a life-boat stationed at Pakefield. There is a lighthouse. The sea has gained considerably upon the land in this neighbourhood. In the village are National and Infant schools. *Pakenham*, population 1134, about 5 miles E.N.E. from Bury St. Edmunds, has a church, National schools, and some minor charities. The population is chiefly agricultural. *Peasenhall*, population 820, is about 7 miles S.S.W. from Halesworth. Besides the parish church, there is a small chapel for Dissenters. Glove-making and machine-making are carried on to a small extent, and there are corn-mills. *Redgrave*, population 1382, about 17 miles N.E. from Bury St. Edmunds, is pleasantly situated near the right bank of the Waveney. The church is a handsome building, and in the interior are some interesting monuments, including those of Sir Nicholas Bacon and his lady, and Judge Holt. There are National schools. An organ-building and pianoforte-making establishment gives some employment. Redgrave Hall, a spacious mansion, seated in an extensive park, well-wooded and stocked with deer, is about a mile south from the village. *Snape*, population 576, about

5 miles S. by E. from Saxmundham, has a small church, with a very ancient tower and a curiously-sculptured font. The Wesleyan Methodists have a chapel, and there are National schools. The site of Snape Abbey is now occupied by a farm-house. At Snape Bridge an annual horse fair is held on August 11th. On the river Alde are wharfs, where large quantities of barley and malt are shipped for London and other places. The *Southelmhams* are seven villages, situated near each other, varying in distance south-west from Bungay from 3 to 7 miles. The parish populations in 1851 were—All Saints, 232; St. Nicholas, 94; St. George, or St. Cross, or Sandcroft, 253; St. James, 269; St. Margaret, 182; St. Michael, 150; and St. Peter, 97. The bishops of Norwich had, in the 12th and 13th centuries, a palace and park at Southelmham. The villages are rural, and the inhabitants chiefly engaged in farming. All Saints' church is an ancient edifice, with a round tower. St. George's or Sandcroft church, a neat building, with a square tower, was enlarged in 1841. *Stoke-by-Nayland*, population 1406, about 6 miles S. by W. from Hadleigh, has a church, a chapel of ease, a Roman Catholic chapel, and National and Infant schools. The *Stonhams*—*Aspall Stonham*, population 814; *Earl Stonham*, 860; and *Parva* or *Little Stonham*, 402; are situated about 5 miles E.N.E. from Stowmarket. Aspall Stonham church is a good building, with a spire; there are a Free school and a National school. Earl Stonham has a fine church, with a tower; a small chapel for Dissenters, National schools, and some parochial charities. Stonham Parva has a gothic church, with chancel and square tower. The Baptists have a chapel, and there are National and Infant schools. *Sutton*, population 732, about 4 miles S.E. from Woodbridge, has an ancient church, built of stone and brick, and a small chapel for Baptists. There is a ferry across the Deben to Woodbridge. *Walsham-le-Willows*, population 1297, about 12 miles E.N.E. from Bury St. Edmunds, has a commodious and handsome church, with a tower; chapels for Wesleyan Methodists, Independents, and Baptists; and a Free school. Ropemaking, brewing, and malting are carried on. *Wickham Market*, population 1697, of whom 304 were in Plomesgate Union workhouse, about 5 miles N. by E. from Woodbridge, is situated on a hill commanding an extensive prospect. It possesses a church, which has been recently repaired; a chapel for Independents, enlarged in 1845; National and British schools; a literary and scientific institution, with museum and library; a horticultural society; a mutual benefit society; an odd fellows' lodge; and the public rooms, built in 1846. Brick-making is carried on. In the vicinity are numerous windmills. *Wingfield*, population 654, about 8 miles E. by N. from Eye, has a handsome church, with a clerestory of 24 windows; in the interior are several monuments of historical interest. There is a National school. A few traces remain of Wingfield Castle, a little way south from the village. *Yoxford*, population 1272, about 4 miles N. by E. from Saxmundham, is pleasantly situated, and has a well-built street of modern houses. There are National schools.

Divisions for Ecclesiastical and Legal Purposes.—Suffolk was formerly wholly included in the diocese of Norwich: the eastern part is still in that diocese, the western in the diocese of Ely. The county is divided into the archdeaconries of Suffolk and Sudbury. It is included in the Norfolk circuit. The assizes are held in the summer at Bury St. Edmunds, and in Lent at Ipswich. Quarter sessions for the respective divisions are held at Bury, Ipswich, Beccles, and Woodbridge. There are county jails and houses of correction at Bury and Ipswich; county houses of correction at Woodbridge and Beccles; and borough prisons at Ipswich, Bury, Eye, Sudbury, Aldeburgh, Southwold, and Orford. County courts are held at Beccles, Bury St. Edmunds, Eye, Framlingham, Halesworth, Harleston, Ipswich, Lowestoft, Mildenhall, Stowmarket, Thetford, and Woodbridge. By the Poor-Law Commissioners the county is divided into 17 unions, namely, Blything, Bosmere and Claydon, Bury St. Edmunds, Cosford, Hartismere, Hoxne, Ipswich, Mildenhall, Mutford and Lothingland, Plomesgate, Risbridge, Samford, Stow, Sudbury, Thingoe, Wangford, and Woodbridge. These unions comprise 514 parishes and townships, with an area of 928,819 acres, and a population in 1851 of 335,655. Before the Reform Act was passed Suffolk returned 16 members to Parliament: two for the county, and two each for Ipswich, Bury, Sudbury, Eye, Orford, Aldeburgh, and Dunwich. By the Reform Act the county was formed into two divisions, the Eastern and Western, each returning two members; Dunwich, Orford, and Aldeburgh were entirely disfranchised, and Eye was reduced to one member: Sudbury was disfranchised in 1844. Nine members are therefore now returned from Suffolk, being seven less than before the Reform Act.

History and Antiquities.—Suffolk appears to have been comprehended with Norfolk in the territories of the Simeni of Ptolemaus, called by others the Icenii. It was included in the Roman province of Flavia Caesariensis. There were several British or Roman towns in this county, as the *Sitomagus*, probably near Dunwich, *Cambretonium*, near Grundisburgh, and *Ad Ansam* of Antoninus, at Stratford. A road from Londinium (London) and Camalodunum (Colchester) entered the county at Stratford, between Colchester and Ipswich, and, leaving Ipswich on the right, ran in a northward direction to the Ipswich and Norwich road near Needham-Market; and then coincided with the present line of that road till it quits the county to enter Norfolk at Scole Inn. Another line, the 'Peddar-Way,' or 'Teddar-Way,' entering the county from Norfolk, across the Little Ouse near

Rushford, runs southward to the neighbourhood of Ixworth, where Roman remains have been discovered. The Ikenield-street crossed the county in a south-west direction from the Little Ouse to the neighbourhood of Newmarket. In the eastern part of Suffolk a road, known as Stone-street, entered the county across the estuary of the Waveney at Bungay, and ran by Halesworth to Dunwich. The south-western corner of the county was crossed by a road which formed part of a line from Camalodunum (Colchester) to Camboritum (Cambridge). There were other less important roads. Roman antiquities have been found at Blythburgh, on Bungay Common, at Bury, at Dunwich, at Eye, at Haughley, near Stowmarket, where a Norman castle was erected on the site of a Roman camp, at Ickworth, near Bury, at Ixning, or Exning, near Newmarket, at Stow Langtoft, where are the remains of a camp, at Felixstow, near the mouth of the Deben, at Wenham near Stratford, at Melford, and at other places.

In the Anglo-Saxon period Suffolk passed through similar changes to Norfolk. It was probably settled by a body of Angles independent of those who occupied Norfolk. The names of South Folk and North Folk describe the relative position of these two bodies. Suffolk was probably, from its proximity to the other Anglo-Saxon states, the more important division of the two. The battle in which Annas, or Anna, king of East Anglia, and his son Firminius, fell fighting against Penda, king of Mercia (A.D. 654), is supposed to have occurred at Bull Camp, or Bulchamp, near Blythburgh. Annas is said to have been buried at Blythburgh. St. Edmund, king of East Anglia, contemporary of Ethelred I., brother and predecessor of Alfred the Great, was taken by the Danes (870), and murdered at Hagilsdun, now Hoxne (on the bank of the Waveney, near Scole), and was first buried there; but his body was afterwards removed to Bury, which has obtained from him its distinctive title of Bury St. Edmunds. The Danes on several occasions plundered the town of Ipswich.

In the civil war of Stephen and Henry of Anjou, afterwards Henry II., Ipswich, which was held by Hugh Bigod for Henry, was taken by Stephen (1153). In 1173 a battle took place at Fornham St. Genevieve, between Bury and Mildenhall, when a body of Flemings, under the Earl of Leicester, in the interest of Prince Henry, against his father Henry II., were defeated by the king's army. In the civil war of John the county was reduced to subjection (1216) by William Fitzpiers, for Prince Louis of France, whom the barons had invited over to oppose John. In the insurrection of the populace in the time of Richard II. (1382), the people of Suffolk took arms, and murdered, at Bury, Sir John Cavendish, chief justice of England, and some of the monks of the abbey. In the disturbances caused by the attempt of Henry VIII. and his minister Wolsey to raise money by a royal decree (1525), the people of Suffolk rose in rebellion, but the dukes of Norfolk and Suffolk prevailed on them to disperse. A part of the inhabitants of Suffolk took part in Kett's rebellion (1549). On the death of Edward VI. and the proclamation of Lady Jane Grey as his successor, the Princess Mary, Edward's sister, who was at Kenninghall in Norfolk, removed to Framlingham Castle, where her partisans flocked to her. The Duke of Northumberland, Jane's father-in-law and general, advanced to Newmarket and from thence to Bury to oppose Mary, but retired next day to Cambridge; and the general feeling of the kingdom being in favour of Mary, she advanced from Framlingham to London, dismissing her Suffolk forces by the way.

In the middle ages Suffolk appears to have abounded with religious establishments. Tanner ('*Notitia Monastica*') enumerates 50 abbeys, priories, hospitals, or colleges. The interesting remains of Bury Abbey and the monastic ruins of Bungay are noticed in our accounts of those towns. There are remains of Butley Abbey, between Woodbridge and Orford; Sibton Abbey, near Yoxford; Herringfleet Augustinian Priory, near Lowestoft; Leiston Premonstratensian Abbey, near the coast, between Dunwich and Aldeburgh; and Mendham Cluniac Priory, on the Waveney. There are also monastic ruins at Eye, Dunwich, and Clare. Of castellated remains the most remarkable are Framlingham, Orford, Clare, Bungay, Mettingham, and Wingfield. Mettingham Castle is near Bungay; a considerable portion of the gate-tower and fragments of the walls are standing. Wingfield is near Eye: the south or entrance front is still entire; the west side has been made into a farm-house. Of old mansion-houses, with which the county abounds, Flixton Hall near Bungay; Giffard's Hall, at Stoke-by-Nayland, on the Stour; Helmingham Hall, near Debenham; Hengrave Hall, north-west of Bury; Kentwell Hall and Melford Hall, near Sudbury; and Parham Hall, near Framlingham, may be mentioned.

Few events connected with the great civil war of Charles I. occurred in this county. In the Dutch war of Charles II. two fierce engagements were fought on the coast. The first was fought 3rd June 1665 off Lowestoft. The English fleet consisted of 114 ships of war and a number of fire-ships and ketches, under the Duke of York (afterwards James II.), and the Dutch fleet, of above 100 ships of war, besides small vessels, under admirals Opdam, Cornelius van Tromp, and others. After a severe battle the Dutch were beaten with the loss of 18 men-of-war taken and 14 sunk or burned. The English lost one ship. The second battle was fought in Southwold Bay in 1672. A combined fleet, consisting, according to the lowest statement, of 65 English and 35 French men-of-war, under the Duke of York as

commander-in-chief, was lying in the bay in careless security, in spite of the warning of Lord Sandwich, who had pointed out the danger of their being surprised, when a Dutch fleet of 75, or, according to some accounts, of 91 men-of-war and a great number of smaller vessels, under De Ruyter as commander-in-chief, came unexpectedly on them on the 28th of May. A severe but indecisive action ensued. The English lost six ships of war, two burned, three sunk, and one taken. The Earl of Sandwich was killed, and a number of officers and 200 men were killed and wounded.

Statistics: Religious Worship and Education.—According to the Returns of the Census of 1851, it appears that there were then in the county 895 places of worship, of which 519 belonged to the Church of England, 163 to four sections of Methodists, 91 to Baptists, 90 to Independents, 8 to Quakers, 4 to Roman Catholics, 3 to Plymouth Brethren, 3 to Unitarians, 3 to Mormons, and 1 to Jews. The total number of sittings provided was 224,810. The number of Sunday schools in the county was 541, of which 375 belonged to the Church of England, 61 to Independents, 57 to three sections of Methodists, 41 to Baptists, 3 to Unitarians, and 1 to Roman Catholics. The aggregate number of scholars was 37,470. Of day schools there were 1070, of which 398 were public schools, with 27,387 scholars, and 672 were private schools, with 13,944 scholars. Of evening schools for adults there were 83, with 835 scholars. There were 15 literary and scientific institutions, with 1960 members, and libraries containing 19,355 volumes.

Savings Banks.—In 1853 the county possessed 13 savings banks, at Bungay, Bury St. Edmunds, Coddanham, Eye, Framlingham, Hadleigh, Halesworth, Haverhill, Ipswich (Cornhill), Ipswich (Quay parish), Lowestoft, Sudbury, and Woodbridge. The amount due to depositors on 20th November 1853 was 442,648*l.* 1*s.*

SUHL. [ERFURT.]

SUINDINUM. [MANE, LE.]

SUIPPES. [MABNE.]

SUKKUR. [HINDUSTAN.]

SULEIMANIYAH. [BAGHDAD.]

SULIMAN RANGE. [AFGHANISTAN.]

SULI, a mountainous district of Southern Albania, which extends in length about 30 miles from north to south, and about 20 miles in breadth, and is separated to the south-west from the coast of the Adriatic by a strip of lowland in which is Port Fanari, the ancient Elæa, at the mouth of the Acheron. On the south-east the highland of Suli is bounded by the plain of Arta, which extends to the gulf of the same name. Towards the north Suli borders on the district of Paramithia and on that of Janina towards the north-east. The river Glyky, the ancient Acheron, coming from the north, flows along a deep valley which intersects the highlands of Suli, and after being joined by several streams enters the Adriatic at Port Fanari. The district of Suli is part of the ancient Thesprotia, one of the three great divisions of Epirus. It contains eighteen villages or hamlets, of which ten or eleven are in the highlands, and the rest in the plain. The principal village, called Mega Suli, lies on a hill near the left bank of the Acheron. The whole population of Suli, at the time of the war with Ali Pasha, did not amount to more than 12,000, divided into about thirty tribes or clans, each consisting of several families related or allied to one another. The head of each clan was styled captain, and led his contingent in war, subject to a supreme commander, styled Polemarch, who was chosen by votes for the time.

In May, 1801, Ali Pasha began a war of extermination against Suli, and at last succeeded in conquering that stubborn population. Many of the Suliotes fell in the struggle, others were murdered by Ali's soldiers, many of the women threw themselves into the river rather than fall into the hands of the Turks; and the rest of the population, about 4000, contrived to reach Parga, whence they went to the Ionian Islands, then under the protection of Russia. [PARGA.] A few, trusting to the promises of Veli Pasha, Ali's son, remained in their desolate villages. In the war for the independence of Greece, a body of Suliotes fought at Missolongi against the Turks, and they were for a time in the pay of Lord Byron.

SULINA, RIVER. [BESSARABIA.]

SULLY. [LOIRET.]

SULMO'NA, or SOLMONA, an episcopal city in Italy, capoluogo of a second-class district, or sub-prefecture, in the Neapolitan province of Abruzzo Ultra II, is built in a deep valley drained by the Sagittario, an affluent of the Pescara, and shut in by the central ridge of the Apennines on the west, and the lofty group of Monte Majella on the east. This valley forms an important pass between the central and northern provinces of the kingdom, leading from the valley of the Pescara to that of the Sangro. The ancient *Sulmo*, Ovid's birth-place, was near the site of Sulmona; a few remains of a temple of Jupiter are visible at San Quirini, two miles from Sulmona. Sulmona is walled, and looks old and gloomy. It has about 8800 inhabitants, a college, a clerical seminary, some paper-mills, and manufactories of catgut, and sausages. The neighbourhood is fertile in wine, corn, and oil. The town has been long famous for its confectionary. The valley of Sulmona is intersected by several streams, and irrigated by artificial canals. Ovid, in his 'Tristia,' recalls to mind the copious and cool streams of his native country.

The town-hall and some of the churches of Sulmona are worthy of

notice for their architecture. Between the principal street and the public square runs an aqueduct, with pointed arches, erected in 1400. Near Sulmona is the splendid monastery of St. Peter Celestine, now suppressed. In the town above the barrack gate there is a piece of wretched sculpture, which the inhabitants are pleased to style a statue of Ovid, of whom they are very proud. Sulmo was one of the chief towns of the Peligni. Corfinium, another town of the Peligni, was in the same valley, a few miles north of Sulmo.

SULTANIYEH. [PERSIA.]

SUMATRA, a large island in the Indian Ocean, and the most western of the Sunda Islands. The equator traverses the island nearly in the middle. Sumatra extends full 6 degrees to the south of that line, and nearly as much to the north. The most western point, Acheen Head, is in 95° 20' E. long., and the most eastern part is in 108° E. long. The general direction of the island is nearly north-west and south-east, and its length rather exceeds 900 miles. The width south of 1° N. lat. is on an average 210 miles, but farther north not more than 140 miles. According to a rough estimate, its area may be about 160,000 square miles. The south-west side of Sumatra is bounded by the Indian Ocean; the northern part stretches into the Bay of Bengal; to the north-east it is divided from the Malay Peninsula by the Straits of Malacca. Between the southern extremity of these straits and the Island of Banca, it is washed by the Chinese Sea. It is divided from Banca by the Strait of Banca. The coast south of that strait is washed by the Java Sea, and its southern extremity is separated from Java by the Straits of Sunda.

Coast.—Sumatra terminates at the southern extremity on the Straits of Sunda in three promontories, including the bays of Lampong and Samangka; the latter is also called Keyser's Bay. The two bays lying between these capes contain several good and safe anchorages.

The south-western coast from Flat Point to Manna, a distance rather exceeding 150 miles, rises with a steep ascent and generally to a considerable elevation. The only practicable anchorages here are Croi and Cawoor, which are rather small. Along this part of the coast soundings are only found at a short distance from the shore. From Manna to Bencoolen, which are about 60 miles distant from each other, the cliffs descend to the shore with a gentle slope leaving a narrow beach. There are several tolerably good harbours, as at Manna and Poolo Bay. The coast is clear of rocks, and there are only a few shoals. The soundings are regular, and extend from 20 to 25 miles from the coast. From Bencoolen to Tapanooly Bay, a distance of about 450 miles, the coast-line is alternately low and high, but the cliffs are of moderate elevation, and not often steep. This part of the coast, especially from Indrapura to Tapanooly, is lined with a considerable number of islands and shoals. Though these islands and shoals render the navigation difficult, they protect the shipping against the tremendous surf to which the south-west coast of Sumatra is exposed, and make numerous good anchorages. Tapanooly harbour is so large and spacious, and possesses so many advantages, that it is considered as hardly surpassed by any harbour on the globe; many small islands are dispersed over it, and subdivide it into numerous smaller harbours or coves, where ships are sheltered from all winds. The coast continues to be lined with small rocky islands as far as Passage Island (2° 22' N. lat.), north-west of the mouth of Singhel River. But north of Tapanooly Bay the coast-line is low. There occur several good harbours, sheltered from all winds; and as the surf in these parts is less violent, they supply good anchorage.

Between 3° N. lat. and 3° S. lat., a chain of larger islands stretches parallel to the coast from north-west to south-east, at the distance of 60 or 70 miles. The sea between this chain of islands and Sumatra has soundings, but outside of the islands no soundings have been obtained. Between some of these islands there are safe channels. No coast perhaps is exposed to a more tremendous surf than the south-west coast of Sumatra, especially that portion of it which is south of the equator. This surf is very remarkable on account of its irregularities, for which no sufficient reason has been discovered. It seldom preserves the same degree of violence for two days together; often it rises like mountains in the morning and nearly subsides by night. Generally no landing can be effected in European boats, but only in catamarans. The north coast of Sumatra, between Acheen Head and Diamond Point, is called the coast of Pedir, and extends about 150 miles. The whole of this coast is high, and mostly steep, especially in the middle near Possangan Point. Most of the harbours are open roadsteads, but otherwise the anchorage is good. The north-eastern coast from Diamond Point to the mouth of the Rakan River, a distance of about 300 miles, is low, but well defined. North of Delli it is lined with sand-banks, and south of that place with mud-banks, which are traversed by a narrow channel, through which the rivers reach the sea. To the east of the mouth of Rakan River lies a headland, called Onjong Perbabeau, to the north-west of which a mud-bank extends about 11 or 12 miles. In this part the navigation of the Malacca Strait is very dangerous, as various sand-banks extend across it, with gaps and narrow channels of mud-soundings between them. Farther south is the Island (Pulo) of Rupa, extending about 25 miles in every direction. The Salat Rupa, or strait, which divides this island from the main body of Sumatra, admits only small vessels.

Between 1° 36' and 35' N. lat. there are three large islands, called Bacalisse, Padang, and Rankan, which are divided from Sumatra by Brewer's Strait, or Salat Panjang. This strait is from 1 to 5 miles wide, but navigable for large vessels. The coast-line of these islands and that of Sumatra in these parts is low and generally swampy. South of the southern extremity of Brewer's Strait, as far as the Strait of Banca, and along the western shores of this strait to Cape Lucepara, and thence to the eastern entrance of Sunda Strait, the coast-line is exceedingly low, and part of it is inundated at high-water. Shoals and mud banks of from 2 to 10 miles in width, extend along the coast.

Surface and Soil.—The north-eastern side of Sumatra is a low and level plain; the south-western is either mountainous or hilly, but our information respecting the interior is imperfect. The mountain region begins on the shores of the Straits of Sunda, with the elevated promontories of Tanjong Toca and Tanjong Kamantara. At a short distance from the first-named cape, and near the eastern shores of Lampong Bay, is the Raja Bassa Peak, which is about 1600 feet high. This mountain summit is connected with the extensive mountain masses which separate Lampong Bay from Samangka Bay, and on which the Keyzer's Peak probably rises to 5000 feet. Another range of mountains, which rises at the back of the flat tract between Tanjong China and Flat Point, runs north-west, and joins the great mass north of the innermost recess of Samangka Bay. The mountain region thus formed covers a tract about 100 miles in length by about 40 miles in width. In this part of the mountain region the country along the sea is a succession of high hills and narrow valleys, very little cultivated, and very thinly inhabited. It produces however much pepper. East of this range a much more elevated chain of mountains occurs at about 20 miles from the shores of the Indian Ocean. Some of the summits are visible from the sea. The space inclosed by the two parallel ridges is an elevated table-land, the surface of which is very broken and hilly; and it contains several large lakes, as those of Ranan and Lukitan. The level undulating country which surrounds these lakes is of great fertility, well cultivated, and comparatively well settled. It produces pepper, cotton, indigo, tobacco, sugar-cane, maize, rice, sweet potatoes, and several other roots; and also plantains and pine-apples. The numerous rivers which flow eastward constitute the principal branches of the two large rivers Tulan Booang and Palembang.

The central mountain region may be considered as extending from 4° 30' S. lat. to Tapanooly Bay, or 1° 40' N. lat. It contains the highest ranges in the whole system, and occupies a much larger tract in width than the other portions of the mountain region; but the mountains do not advance close to the shores of the Indian Ocean, being divided from it by a comparatively low tract, generally 20 miles in breadth, in some places less, and in others widening to 30 miles. This lower tract we are better acquainted with than any other portion of Sumatra, as several European settlements have existed here for two centuries. The surface of this tract is intersected and rendered uneven to a surprising degree by extensive swamps, which in many spots encompass islands and peninsulas of considerable size. The general level of the country rises very gradually to the base of the mountains, where the ascent is very abrupt and rather steep. The soil consists of a fine red vegetable clay, covered with a layer of black mould of no considerable depth. To the south of Bencoolen the country is almost an impervious forest. Springs are abundant, and the rivers are very numerous. The rivers are usually navigable for small craft from the point where they enter the low marshy ground to their mouth. But all the rivers have a bar across their embouchure, the effect of the surf which breaks along this coast-line.

There are only two seasons, the dry and wet, which are regulated by the monsoons. In most parts of India to the north of the equator the north-east monsoon prevails when the sun is in the southern hemisphere, and the south-western when the sun is in the northern hemisphere, but on this coast of Sumatra the monsoons are changed by the direction of the land, the north-eastern into a north-western, and the south-western into a south-eastern monsoon. The south-eastern monsoon begins about May and leaves off in September; the north-western monsoon begins in November and blows to the end of May. The south-eastern monsoon blows with great force and steadiness from the end of June to late in September; and during this period rain seldom falls, except in showers, and generally in the night. When the north-west monsoon is strongest, from November to January, the rain is abundant. The rains do not sensibly abate until March. Thunder and lightning are very frequent. The atmosphere is generally more cloudy than in Europe. The fog, which is observed to rise every morning among the distant hills, is dense to a surprising degree, and it seldom disperses till about three hours after sunrise. When the monsoons abate their strength sea and land breezes prevail. The sea-breeze sets in between nine and ten o'clock in the morning, subsequent to a calm, and declines with the setting sun; the land-breeze begins early in the night, and continues till eight or nine o'clock in the morning. The land-breezes are rather cool, a circumstance which influences the temperature of the night. The heat in the day-time is considerable, but rather less than might be expected near the equator. At Bencoolen the thermometer never rises above 86°, and even at Natal not above 88°: at sun-rise it is

usually as low as 70°, on account of the cool land-breeze which descends from the mountains, covered with clouds, and bathed in constant vapours or rain. The mean annual temperature is probably between 82° and 83°. As this region is traversed by the equator, the temperature is nearly equal all the year round.

Although the country is thinly inhabited and ill cultivated, except near the European settlements and a few ports which are visited by traders, it produces several articles of export, as pepper, camphor-burns, gold-dust, ivory, and benzoin. The productions include rice, maize, tobacco, cotton, indigo, sugar, coffee, and the most exquisite fruits in the Indian Archipelago, as the mangosteen, durian, jack-fruit, plantains, oranges, and others.

The mountain region which lies at the back of this low tract has only been partially explored by Europeans. It appears to be traversed by three, and in some parts by more than three, ranges, running parallel to the coast in the direction of the island from south-east to north-west. This region contains several volcanoes. The most southern of the volcanoes in Sumatra, Gunong Dempo, which is known, is near 3° 40' S. lat. Its three peaks rise to about 12,000 feet above the sea, and are always enveloped in smoke. A volcano of moderate elevation occurs about 80 miles east of Bencoolen, which made an eruption about a century ago, and emitted smoke for a long time. Near 1° 30' S. lat. is the volcano of Gunong Api, or Berapi, which rises to a great elevation. Mount Ophir, or Gunong Pasaman, which is near 5° N. lat., and 13,850 feet above the sea, has also the form of a volcano, but is not active. There are several other volcanoes in Sumatra. Near the lakes, as near that of Korinchi, or St. George's Lake, there are rice-fields. Indigo, cotton, and sugar-cane are also cultivated. The mountains which separate these cultivated tracts from the Indian Ocean attain a great elevation. The most remarkable of these countries inclosed within the mountain region is that of Menangkabau, which extends from 1° S. lat. to near the equator. It is a plain, extending about 50 miles in every direction, and surrounded by high mountains. The ranges which lie west of it, and separate it from the lower tract along the Indian Ocean, are only from 5500 to 6500 feet high, but those which lie south of it are much higher: one of the summits, the Bukit Talang, is 10,032 feet above the sea-level. The range which lies east of the plain contains no lofty summits. But on the north-east stands the mountain mass of the Kasumba, the highest mountain in Sumatra, which rises to about 15,000 feet above the sea-level, and west of it are the volcanoes of Berapi and Sinkalang. The surface of the plain is rather hilly and broken than undulating, and the lowest part of it is occupied by the Lake of Sincara, which is 1035 feet above the sea-level. The whole country is one continued scene of cultivation, interspersed with numerous towns and villages shaded by the cocoa-nut and fruit-trees. Sir Thomas Raffles estimates the population at about a million. Every kind of grain, fruit, or root cultivated in any part of Sumatra is grown here in abundance, and the people apply themselves also to manufactures. The waters which descend from the neighbouring mountains to the Lake of Sincara are carried off by a river called Ambalang, the most remote source of the river Indragiri, which falls into the China Sea between 0° and 30° S. lat. The plain of Menangkabau, not being greatly elevated above the level of the sea, does not materially differ in climate from the lower country along the shores of the Indian Ocean; but other parts are more elevated, and beyond the most western ridge the temperature is much lower.

The northern part of the mountain region, or that which extends from 1° N. lat. to the most northern extremity of the island, contains a low plain, which lies along the Indian Ocean, and may be about 10 or 12 miles in width, and rather a hilly tract, which lies at the back of the plain, and is about 25 miles across. The greater part of the plain is uncultivated, and very thinly inhabited. The mountain tract is traversed in the direction of the island by three or four ridges, which occupy only a small width and are separated by extensive plains. The central ridge seems to rise to the greatest height, and at its most northern extremity, south-east of the town of Acheen, is the Queen's Mountain, whose summit is at least 6900 feet above the sea-level. The most southern ridge terminates in Acheen Head, a bluff but not very lofty promontory. The ridges themselves are overgrown with forests, in which the camphor-tree is frequently met with south of 3° S. lat., and also the cassia-tree, and the tree from which benzoin is obtained. The whole country is cleared, and either planted with rice and maize, or used as pasture-grounds for buffaloes, cattle, and horses. Pepper plantations are numerous. The watershed in this region is generally formed by the eastern ridge of mountains, and consequently the rivers which drain the plains and longitudinal valleys have a longer course and are less rapid than farther south, and are used for inland navigation. One of the plains between the mountains is occupied by a large lake, the Laut Ayer Tawar Lake, which appears to be of great extent. In this region the dry season does not take place during the south-eastern but during the north-western monsoon.

The hilly tract which extends along the north coast of Sumatra, from the valley of Acheen and Queen's Mountain on the west to Diamond Point on the east, a distance of about 130 miles, may be considered as an appendage of the mountain-region. From the high coast which bounds the sea the country rises gradually to the south, until it attains an elevation of about 1000 feet above the sea. The

highest part of this tract is an abrupt conical peak, called Elephant Mountain. The climate of this country rather resembles that of Hindustan than that of the western coast. The monsoon blows from south-west from May to October; and during its strength, from May to September, the weather is very cloudy and much rain falls, but only in showers. The dry season takes place during the north-east monsoon, which regularly sets in towards the end of November, and blows steady to March. The climate of this tract is more healthy than that of the other parts of Sumatra. The soil is tolerably fertile, and produces abundance of rice, much of which is exported, cotton, and the finest tropical fruits, with several esculent vegetables. Cattle, horses, and goats are numerous. The principal commercial productions are betel-nuts and pepper. The country is well cultivated and populous.

The Great Plain, which extends over the eastern and probably the greater part of Sumatra, from Diamond Point to Tanjong Toca, presents some variety along the coast, but as far as the interior is known it has a nearly uniform character. The northern part of it, as far south as the mouth of the Rakan River, though low, is sufficiently elevated above the level of the sea to be out of the reach of its inundations at spring-tides. The rivers are short, but some of them have tolerably good harbours. The central portion of the plain, extending from Rakan River to Luoepera Point, is extremely low along the sea-coast, and a large portion of it is covered with water at spring-tides, and thus converted into a large swamp, which is thickly wooded. It is uncultivated, and nearly uninhabited, except by some straggling families on the banks of the rivers. At the back of it the country rises with a moderate elevation and stretches out into a level plain to the base of the mountain-region. It is traversed by several large rivers, which on entering the low part of the country expand to a great width. The country is tolerably well peopled. The southern part of the plain, or that which fronts the Java Sea between Luoepera Point and Tanjong Toca, is less known than any other part of Sumatra near the sea. Though low, it seems to be sufficiently elevated to be beyond the reach of the inundations at high tides. Towards the interior the land rises, but the rivers, and among them the large river Tulan Boang, run through a wide depression, which during the rainy season is entirely covered with water by the inundation of the rivers.

The distinction of dry and wet seasons can hardly be applied to this plain. Neither the north-east nor the south-west monsoon is felt in all its force. The prevailing winds from March to September are the land and sea breezes, which are usually steady in the night, but faint and frequently interrupted by long calms in the day. In the season of the south-west monsoon the Sumatras, as they are called, blow, especially in the first part of the night. They are sudden squalls, sometimes extremely severe, and are accompanied with tremendous thunder and lightning and heavy rain. The north-westers, which are less frequent, are likewise severe at the beginning, but they soon abate. The greatest quantity of rain falls in this season. The north-east monsoon is somewhat more regular, only interrupted by the land and sea breezes. Calms are less frequent than in the south-west monsoon, the breezes are steady, and the weather is much more settled. The heat in summer is great, and at that period the air is saturated with moisture. In the dry season, on the other hand, it is moderated by the steady breezes. The climate of this tract is considered unhealthy for Europeans.

The islands which lie near the north-eastern coast of Sumatra, within the Strait of Malacca, are uniformly low, and their soil appears to be chiefly composed of alluvium; but the south-western coast of the island, between 3° N. lat. and 3° S. lat., is fronted by a chain of islands distant from it a little more than a degree. The most northern is called by our navigators Hog Island, by the Malays Pulo Babi, and by the natives Si Malu. It is about 50 miles long and about 10 or 12 miles broad, high, hilly, and covered with trees. Pulo Nias, the largest island of this chain, extends nearly in a south-east direction about 70 miles, with an average width somewhat exceeding 18 miles. Many small islands line its shores, and the coast is generally steep. The land is usually high, well clothed with trees, and partly cultivated by the natives with rice. The inhabitants are very numerous. Pulo Nias produces rice, yams, and beans for exportation; also poultry, buffaloes, cattle, and goats in abundance. It has several good harbours. Pulo Batu, commonly called Pulo Mintao, extends north and south about 48 miles, and is about 16 miles wide. It is situated immediately south of the equator. Only the northern part of the island is inhabited. It produces sago, cocoa-nuts, hogs, poultry, and trepang. Dammar, cocoa-nuts, cocoa-nut oil, and trepang are exported to Padang. Si Beeroo, or North Porah, called Great Fortune by the Dutch, extends nearly north-west and south-east about 80 miles, with an average breadth of 12 miles. It is generally high land, covered with wood. Between this island and South Porah is Seafower's Channel, which is more than 8 miles wide. Si Porah, or South Porah, extends from north-west in a direction nearly south-east about 36 miles in length. There are three good harbours on the east side—Hurlock's Bay, Si Ooban Bay, and Si Labbah Bay. It is less elevated than Si Beeroo. Between this island and North Poggy is Nassau Strait, which is about 10 miles wide, and very safe. Then follow North and South Poggy islands. [NASSAU ISLANDS, vol. iii., col. 916.] At a great distance to the south is Engano Island, which has a triangular form, and is about 24 miles long and 18 miles broad in the widest part. It

is protected by a rocky shore. On the east side is an anchorage, but landing is very difficult. The inhabitants are much averse to intercourse with foreigners. They speak a language different from that of the other islands and of Sumatra. In the long and wide strait which separates the chain of islands just noticed from the main body of Sumatra, are the Baniah Islands, or Pulo Bania (that is, Many Islands). These islands produce chiefly trepang and edible birds'-nests.

According to Marsden, these islands, with the exception of Engano, whose inhabitants seem to belong to another race, are occupied by two nations, both of which belong to the race of the Malays, but considerably differ in stature and language. The inhabitants of the islands north of 1° S. lat. are called Maruwis. The nation inhabiting the islands south of 1° S. lat. are called Pagi, and are heathens.

Rivers.—The most important of the rivers which drain the south-west coast, which are navigated by small craft to some distance from their mouth, are from south to north as follows:—The Kataun (3° 20' S. lat.), the Ipoo (3° 5' S. lat.), the Indrapura (2° S. lat.), the Tabuyong (40' N. lat.), the Batang Tara (1° 25' N. lat.), and the Sinkel (2° 15' N. lat.). The last-mentioned river is much the largest on this coast, and its course considerably exceeds 100 miles. In the low country it is joined by the Sikeri, about 20 miles from its mouth. It is navigable for the greater part of its course for boats, and up to its confluence with the Sikeri the river is deep enough for vessels of considerable burden, but the bar at its mouth is dangerous.

The rivers which rise in the mountain region, and, traversing the eastern plain, fall into the Straits of Malacca and Banca, or into the China Sea, are larger and much better adapted for inland navigation. The most northern of them is the Delli River, which reaches the sea in 3° 46' S. lat. Its mouth is a quarter of a mile wide, and has two fathoms depth at its bar at low water, so as to admit vessels of moderate size. The Batu-Bhara River enters the sea in 3° 13' N. lat., and forms a small harbour at its mouth only accessible for small vessels. The Assahan River, which falls into the sea near 3° N. lat., forms at its mouth a harbour for small vessels.

The Rakan River is rather a wide estuary, which receives two considerable streams, than a river. These rivers at their confluence, which is more than 30 miles from the sea, are about a mile and a half wide. The river formed by their junction is about 2 miles wide, and continues so for several miles, when it enlarges to 4 miles, and where it reaches the sea it is 15 miles wide. At its mouth there are two low and woody islands, between which is the entrance to the river. The navigation of this river is dangerous, on account of the excessive rapidity of the tides and the very high bore thereby occasioned. The river is almost dry at low water of spring-tides.

The Siack River, which runs more than 200 miles measured along its course, rises in the mountain region, and probably on the northern declivity of Mount Kasumba, or in its neighbourhood. By this river the gold which is collected in the mountains of Menaugcabau is brought to the Strait of Malacca. The river at its mouth is only three-quarters of a mile wide, but it is very deep. The entrance of the river is further narrowed by a sandy spit, which is nearly dry at low water.

The Kampar falls into the Strait of Malacca at its most southern extremity, nearly opposite the Strait of Singapore. Its upper course lies within the mountain region. The harbour at the mouth of the river is not much visited by European vessels, on account of the velocity of the tides, which rise 15 feet, and run from 4 to 6 miles per hour. They produce a considerable bore. Coffee and other articles of trade are brought from this river to Singapore by the Malays in boats.

The river Indragiri, which falls into the Strait of Durian opposite the island of Lingin, rises in the centre of Menaugcabau, in the Lake of Sinkara, a little more than 1000 feet above the sea-level, and runs about 100 miles within the mountain region in a south-eastern direction. Its exit from that region is marked by a cataract near a place called Saluka. The mouth of the river is very wide, but subject to a very dangerous bore: it is rarely visited by European vessels, but the Malays bring from it great quantities of rice to Singapore. The whole course of the Indragiri probably is not less than 300 miles.

The Iambie River drains a great extent of country. One of its upper branches rises in St. George's Lake, in the country of the Korinchi. The several branches which flow from the mountains unite nearly midway between the mountains and the shore, about 100 miles from the mouth of the river. Below the town of Iambie the river divides into two arms, which unite about 30 miles from the sea, and inclose an island 30 miles long and 10 miles wide. Lower down the river divides again into two arms, which inclose a large delta. The western arm is called Qualla Nior and the eastern Qualla Sudda, and both of them divide again as they approach the sea. Only the most eastern and western arms are navigable for vessels of small burden, and even in these the navigation is intricate and dangerous, on account of the shoals and sand-banks.

The largest river of Sumatra is the Palembang, whose numerous upper branches originate in the mountain region between 2° 30' and 5° S. lat. The most southern of them brings down the waters of the large lake of Ranau. The best known of these rivers is that which rises in the district of Musi, immediately at the back of the range of hills visible from Bencoolen, and, on that account, has the name of

Ayer Mui in the early part of its course, but in the lower part is named the Tatong. The Mui River becomes navigable for boats before it leaves the mountain region at Muara Mulang, which is about 250 miles from the sea. Most of the southern districts of the mountain region send their goods to Palembang, and receive by this river those foreign articles which are consumed by the inhabitants. Most of the branches fall into the Tatong in the vicinity of the town of Palembang, where the river is above a mile wide. From Palembang downwards the river is called Palembang River. After the confluence of its numerous branches it turns northward, and begins to divide into several arms, reaching the sea with four mouths, which, with the intervening islands, occupy a space of more than 24 miles on the shores of the Strait of Banca. These arms are called from east to west Sulsee River, False River, Palembang River, and Salt River. The depth of these rivers varies between 3 and 10 fathoms; but in front of their mouths is an extensive bank of hard sand, with a thin superstratum of black mud, which is hardly covered at low water. The channels across this bank have only from 1½ to 2 fathoms at low water. At the full and change of the moon the tide rises from 7 to 8 feet.

The Tulan Booang, the most southern of the larger rivers of Sumatra, rises in the mountain region, but little is known of its course.

Climate.—The temperature of the coasts and lower parts of Sumatra is very agreeable. On the west coast, south of the equator, earthquakes are frequently felt; but in general they are slight. Water-spouts are very frequent along the western coast.

Productions.—Several varieties of rice are cultivated in the lowest plains and in the elevated valleys of the mountain range. Rice forms an important article of export from Acheen to Hindustan, and from the north-eastern coast to the British settlements on the Strait of Malacca. Some maize is grown. The most common esculent vegetables are—red and white yams, the St. Helena yam, sweet potatoes, common potatoes in the more elevated districts; bredy, a kind of spinach; lobuck, or the Spanish radish; the large purple brinjall, or egg-plant; many different sorts of beans, white and green peas, and onions. Chili, or capsicum, ginger, coriander, and cummin-seed are raised, especially on the western coast. Hemp is extensively cultivated, but only for smoking with tobacco. Tobacco is also grown, and is an article of export. Melons are raised on the plains. Sesamum is cultivated for its oil; and the Palma Christi, from which castor-oil is obtained, grows wild. The plantations of betel-vines are extensive. Indigo and cotton are raised for domestic use only.

Sumatra, like all the islands of the Indian Archipelago, is noted for the variety of its fruit-trees; the most important is the cocoa-nut tree. There are also plantations of plantains, banana, the bread-fruit tree, jack-tree, mangosteens, durians, mango, different kinds of orange- and lemon-trees, the pine-apple, the jambo, the guava, the papaya, the custard-apple, the pomegranate, and the tamarind.

Of the other plants and trees the most important is the pepper-vine, of which there are extensive gardens. The second as to importance is the areca-palm, which is grown most abundantly on the coast between Acheen Head and Diamond Point. On the eastern coast the plant from which gambier is obtained is largely cultivated. Sago is grown in several places on the eastern plain, but especially on the island of Rantau: large quantities go annually to Singapore. Clove- and nutmeg-trees were introduced by the English in 1798.

The tree from which the camphor-barus is obtained grows only in the northern districts, between 0° and 3° N. lat., north and south of the town of Baroos, from which the article has received its distinguishing name. In the same district are grown the tree from which benzoin is obtained, and those which yield cassia. In most places there are the dragon's-blood trees, and trees from which caoutchouc is obtained. Agila-wood is common. Extensive tracts of the eastern plain are covered with different kinds of canes, known by the general name of rattans, large quantities of which go to Europe and China. The forests cover about three-fourths of the island. The most useful trees are the poon, used for masts and spars; the marbau, used as beams for ships and houses; the iron-wood tree, the ebony-tree, and the rangi, which resembles mahogany.

The most useful of the domestic animals is the buffalo, which attains an extraordinary size, and is used for agricultural purposes and as an animal of burden. There are two kinds—white and black. The flesh is eaten, but that of the black kind is preferred. The milk is employed in making butter. Black cattle are not numerous, except on the coast of Pedir, where the plough is drawn by oxen. The horse is of a small breed, but well made and hardy. Sheep are few, and of a small size. Goats are numerous, but they are also small. The hog is of the Chinese breed.

Elephants are numerous, especially in the forests of the plain. The natives kill them with poison for the tusks and skin. The buffalo is found in a wild state. The rhinoceros is common, both that with a single horn and the double-horned species. Bears are numerous, and among them is the sun-bear. There are different kinds of deer, among which is the kanchil, called by Buffon 'chevrotin,' whose extreme length is only 16 inches, and the height 10 inches behind and 8 inches at the shoulders. The varieties of the monkey-tribe are innumerable, and among them the oran-utan is met with. There are sloths and

squirrels. The tiger is very large, and frequently destroys men and most animals. There are also tiger-cats, civet-cats, polecats, porcupines, hedgehogs, and pangolins, a species of *Manis*. Bats are very numerous. Alligators abound in most of the rivers. There are several species of lizards, of which the guana is eaten. Chameleons and flying lizards (*Draco volans*) are frequent. Snakes occur in great variety, among which is the boa. A few of them are poisonous. Oysters are frequently found adhering to the roots of the mangrove-trees with which the coast is lined. There is a great variety of shell-fish, particularly the gigantic keema, which is three feet in diameter, and more than two feet across.

No part of the ocean is so abundant in fish as the sea which surrounds the Indian Archipelago; but fish seem to be less plentiful on the western than on the eastern coast. The largest fishery is in Brewer's Strait opposite the town of Berkit Batu, where boats are engaged at all seasons in fishing the trubu, a fish about a cubit long; the roe is an article of trade, and the dried fish are sent into the interior of the island. In the Strait of Malacca is the dugong (*Halicora dugong*) and great numbers of sharks, the fins of which are exported to Singapore and China.

Besides the common fowl, which is as abundant as in most other countries, there is a much larger kind of domestic fowl in the Lampong country, where there is also that diminutive kind called the bantam. The wild fowl which is found in the woods differs little from the common sort, except in the uniformity of its brown colour. Among the wild birds the Sumatran pheasant is conspicuous for its beauty. Peacocks, eagles, and vultures are rare, but kites, crows, jackdaws, woodpeckers, and kingfishers are common. The hornbill is abundant. There are several species of storks, pigeons, and doves; and quails and partridges are common. The island swarms with insects. The variety of ants is astonishing. Bees are very abundant, but the honey is inferior to the English. The silk-worm is reared in a few places.

Sumatra was once noted for its gold, and a considerable quantity is still exported. The places in which it abounds are the mountains which surround the table-land of Menangcabau, but it is also found south and north of that country. Tin occurs in several places on the great plain, but is very little worked. Copper is found in the northern portions of the mountain region (between 2° and 3° N. lat.) to the south-east of Analaboo, where it occurs in great abundance in an extensive tract: it contains gold, but is not much worked. There is iron in the mountains of Menangcabau, where it is worked to a small extent. Sulphur is obtained from some of the volcanoes, and arsenic is found in several places. Saltpetre is found, and it is used by the natives for making gunpowder. Coal has been found in one or two places on the western coast. A little salt is made.

Inhabitants.—The interior of most of the larger islands of the Indian Archipelago is occupied by a race of negroes called Australian; but it does not appear that such a race is found in Sumatra. Marsden mentions two different races called Orang-Kuba and Orang-Gugu, who are dispersed in the woods. They live in the tract that separates the country of Labung from Palembang, speak a peculiar language, and eat whatever the woods afford. Another race called Orang-Abung is mentioned as inhabiting some mountainous tracts near Samangka Bay. If these small tribes are not the remnants of the aborigines of the island, the present inhabitants must be considered such. They all belong to the same race. Their languages may be considered as dialects of the same original language, though they have adopted different modes of writing them. There are however some differences in these points, which have led writers on this subject to divide them into five nations: the Atcheenese, the Battas, the Malays, the Sumatrans, and the Lampongs. The Atcheenese occupy the most northern part of the island, and differ considerably from the other nations, being in general rather taller, stouter, and of a darker complexion. [ATCHEEN.] The Battas occupy the sea-coast on the west side of the island from the river Sinkel to that of Tabuyong, and extend across the island to the east coast; they are rather below the stature of the Malays, and their complexions are fairer. [BATTA.] The Malays occupy, to the exclusion of all other nations, the whole of the great plain from the river Rakan on the north to that of Masuai on the south, and also the shores north of the Rakan River as far as Timian. The mountain table-land of Menangcabau was, according to the history of the Malays, the original seat of their nation, and from it they are supposed to have spread over the Indian Archipelago. The inhabitants of Menangcabau are still distinguished from all other nations of Sumatra by the advanced state of their agriculture, their manufactures, and civilisation; while the Malays, who inhabit the shores of the Strait of Malacca, appear to be a degenerated tribe, and are chiefly occupied in piracy. The Malays are Mohammedans, but not strict observers of the ceremonies of their faith. The name of Sumatrans comprehends all the tribes that inhabit the west coast, from the river Tabuyong (40° N. lat.) on the north, to the river Padang-Guchi (4° 40' S. lat.) on the south, and also occupy the mountain region south of Menangcabau as far as 5° S. lat. They are rather below the middle stature. Their limbs are generally slight, but well shaped, and particularly small at the wrists and ankles. Their eyes are uniformly dark and clear; the eyes of the southern women particularly bear a strong resemblance to those of the Chinese, being narrow and somewhat lower at the inner angles.

They speak several dialects, which contain a great number of Malay roots. The Lampongs occupy the most southern part of the island, both the mountain region south of the river Padang-Guchi and the plain south of the river Masusi. They have a strong resemblance to the Chinese, particularly in the roundness of the face and the form of the eyes; otherwise they do not differ in their persons from the Sumatrans. They are the fairest people in the island, and the women are the tallest and handomest. Their language differs considerably from that of the Sumatrans, and contains a great number of Javanese words. Nearly all the nations inhabiting Sumatra are on a level with respect to civilisation. The most advanced are those of Menanggaban and of Atcheen.

According to the history of the Malays, the whole island was once subject to the sovereign of Menanggaban, and this assertion is strongly supported by the veneration which is still shown by nearly all the inhabitants towards those who are connected with the reigning family of that country. Every village or town has its chief, who acknowledges only nominally one of the princes or sultans, of which there are several in the island, but he acts quite independently, and makes war on his neighbours as often as he pleases. The influence which for more than a century has been exercised by European settlers and governments has tended to diminish petty wars and promote peace among the natives.

The total population of Sumatra is estimated at between 3,000,000 and 4,000,000. The population of the Dutch settlements at the end of the year 1852 was as follows:—

Sumatra (west coast)	1,015,000
Bencoolen	110,000
Lampung	54,000
Palembang	305,000
Total	1,484,000

Political Divisions, Towns, and Places of Trade.—Sumatra is partly subject to native sovereigns and partly under the sway and influence of the Dutch. The independent states lie on the north-eastern coast, along the Straits of Durian and Malacca, from 2° S. lat. to the most northern extremity of the island, and extend along the south-western coast as far as 2° N. lat. The remainder of the south-western coast, with a considerable part of the mountain region, and the north-eastern coast as far north as 1° 30' S. lat., is either immediately subject to the Dutch or governed by princes dependent on them. The independent states are Atcheen [ATCHEEN], Siack, Indragiri, and Iambie on the coast, and that of the Battas in the interior.

1. The countries south of Diamond Point were formerly subject to the sultan of Atcheen, but are now governed by their own independent rajas, or sultans as they are called. On the coast along this district are the ports of Langkat, Balu China, Delli, Sardang, Batu-Bhara, and Assahan. The sultans of the four last places are nominally dependent on the king of Siack. It appears that the authority of these petty princes does not extend far from the sea, as the inland country is inhabited by the Battas, who however send the greater part of their produce to these ports in exchange for foreign goods. The commerce of this coast with Penang is very active, especially that of Balu China and Delli. These two places are only a few miles from each other, and each is built on the banks of a river, which is navigable for brigs to the town, and for large boats to a considerable distance from the sea. The advantages of this easy navigation have attracted the whole commerce of the country of the Battas to these two harbours. Traders from the interior (as Allas and Gacoa) and even from the banks of the Sinkel River and other places near the south-west coast, come over with various articles and carry back manufactured commodities. Batu-Bhara is the largest and most populous place on the north-east coast. The surrounding country produces only rattans, salt-fish, horses, and slaves, as articles of export. But Batu-Bhara is a free port, and mostly inhabited by merchants and shipowners. It is stated that 600 large trading boats belong to this port. These vessels are the carriers of this coast. They go in great numbers to Sardang, Delli, Batu-China, Langkat, and other pepper ports, and to Assahan, whence they bring large quantities of produce to Penang. Batu-Bhara is also a manufacturing place: large quantities of fine silk-cloth are made here, which is in great esteem in all the neighbouring countries, and largely exported. The last place on this coast is Assahan, which has a considerable amount of commerce. [ASSAHAN.]

2. Siack is the largest state on the north-east coast, extending from the vicinity of the Assahan (3° N. lat.) to the river Kampar (0°), and bounded S. by Indragiri, W. by Menanggaban, and N. by the Battas and Assahan. It is considered to extend even to 4° N. lat., but the chiefs of the tribes between Assahan and Delli are only nominally dependent on it, and even those south of 3° N. lat. are frequently at war with the king. The trading-places within this large tract are, from north to south, Bila, Panai; Tana-Putch, Kubu, and Rakan, on the Rakan River; Bukit-Batu on Brewer's Strait; Siack on Siack River, and Pulo-Lawang on the Kampar River. The town of Siack is situated on the right bank of the river of the same name, about 65 miles from its mouth. It sends many vessels to Malacca and Singapore with rattans, dammar, gambier, dye-wood, ebony, agila-wood, wax, ivory, silk, cloth, coffee, camphor, salt-fish, fish-roses, and

gold. The imports include salt, opium, cotton-cloth from the neighbouring countries, which is called coast cloth, chintzes from Surat and Europe, white cloth from Europe, raw silk and cotton, silk-stuffs, gum-lac, iron and steel in bars and tubs, Java tobacco, precious stones from Ceylon, gunpowder, and tin. Pulo-del-Lawang and other places on the Kampar River export a good deal of coffee to Singapore. The islands which lie on the east of Brewer's Strait belong to Siack. The largest of them, Rankan, is low and marshy: it produces a large quantity of raw sago, which is imported into Malacca and Singapore for the manufacture of pearl-sago.

3. Indragiri is a kingdom of small extent, comprehending only the countries on both sides of the river of that name, but extending to the base of the mountain region, where it borders on Menanggaban. It exports considerable quantities of rice to Singapore. Opposite the mouth of the river is the island of Lingin, and from that island northward to the capes of Burus and Romania and the port of Singapore, the sea is literally strewn with islands and innumerable rocks. Such a sea is favourable to piracy; and as this extremity of the China Sea is much navigated, partly on account of the rich countries in its vicinity (Java, Borneo, Sumatra), and partly as being the great thoroughfare of the commerce between eastern and western Asia, the pirate nation of the Illanos or Lanus, whose original country is the island of Magindanao [PHILIPPINES, vol. iv., col. 165], have pushed their settlements, which are found in all parts of the Indian Archipelago, as far as the shores of Indragiri. This is the most western settlement of these pirates.

4. Iambie is the most southern of the independent states of Sumatra. The boundary-line between it and the Dutch kingdom of Palembang begins on the shores of the sea near 2° S. lat., and extends south-west to the mountain region, where it terminates near 3° S. lat. The present capital, Tanapileh (Chosen Land), is situated a day's voyage above Old Iambie, which is 60 miles from the sea. The produce of the country is dragon's-blood, gambier, benzoin, and a variety of rattans, with some gold-dust.

5. The country of the Battas is separately described. [BATTAS, vol. i., col. 930.]

The Dutch possessions extend perhaps over half the area of the island. The southern portion of the plain is subject to them as far north as a line which begins near the mountains in the vicinity of 3° S. lat., and on the shores of the China Sea terminates near 2° S. lat. The greatest part of the mountain region south of 2° N. lat., though governed by their own chiefs, acknowledges the supreme authority of the Dutch government. The Dutch government have five regencies, or governments—Palembang, Lampung, Bencoolen, Padang, and Ayer Banghis. The first two are placed under the governor-general of Java, and the three last-mentioned regencies constitute the government of the west coast of Sumatra. Bencoolen is separately noticed. [BENC-COOLEN.]

The Regency of Palembang comprehends the kingdom of that name, and though the king keeps his title, the country is under the administration of the Dutch regent, but the power of the regent is very much circumscribed by that of the native chiefs. This extensive country is thinly inhabited. The town of Palembang however contains 25,000 inhabitants. The houses are of wood or bamboo, except the palace of the sultan and the principal mosque, which are of stone, and in the centre of the town. Though this place is about 70 miles from the mouth of the river, it carries on a considerable commerce, as the river is navigable for large vessels.

The Regency of Lampung comprehends that portion of the plain which lies south of the river Masusi, and that portion of the mountain region which surrounds the bays of Lampung and Samangka. It terminates on the west near Flat Point. The level part of the country is very thinly inhabited, and exports to Batavia only rice, pepper, and a little cotton. The only settlement of the Dutch, and the place where the regent resides, is Mangala, on the banks of the Tulan Booang.

The Regency of Padang comprehends the mountain region and the west coast between 1° 55' S. lat., and the equator. It therefore incloses the ancient kingdom of Menanggaban, whose population Raffles estimated at more than a million. In this regency there are numerous mines of gold, of which those situated in the district of Tiga Blas-Kotta are considered as very rich, more especially those of Songui Pago and Si-Payong. They lie to the east and south-east of Padang. The town of Padang, the residence of the governor of the west coast of Sumatra, and of the regent of Padang, is a small but well-built place. Ayer Adji is a small port.

The Regency of Ayer Banghis comprehends the mountain region and the west coast between the equator and 2° N. lat. Along the coast it extends somewhat farther north. In the southern districts of the mountain region there are several gold-mines, especially in those called Rawer, or Ran, and Mandilling. The two best harbours of Sumatra, the bays of Ayer Banghis and Tapanooly, are within these territories, and there is a good harbour also at Natal. Ayer Banghis is the seat of the resident. Natal is rather a populous trading town. On the Bay of Tapanooly are a few European commercial settlements.

Manufactures.—Nothing perhaps shows more clearly the advanced state of civilisation of the inhabitants of Sumatra than their manu-

facturing industry. The most important manufactures are those of iron and steel, which are carried to a considerable degree of perfection in Menangcabau, where iron has been worked from time immemorial. The kris (dagger) blades made here are famous all over the Indian Archipelago. Common implements of agriculture and several kinds of tools are made. Large quantities of fine silk-cloth are made at Batu-Bhara. Silk-cloth is made at Atcheen. Earthenware is made on an extensive scale at several places, especially at Menangcabau, whence Padang and Bencoolen are supplied with this article. The beautiful gold and silver filagree-work made in this island has long been admired, though it is executed with very coarse and imperfect tools.

History.—Marco Polo calls Sumatra Java Minor. The name of Sumatra occurs first in the travels of Nicolo di Conti, who visited it before 1449. The Malay name of the island is Pulo Percha. The Portuguese navigators reached the coast of Pedir in 1509, under Diego Lopez Siqueira. At this time it appears that the ancient kingdom of Menangcabau, which, according to the Malay history, extended over the whole island, had already been dismembered; but Atcheen was then governed by a powerful king, who prevented the Portuguese from gaining a footing in the island, and even tried to expel them from the town of Malacca. In 1575 a fleet of the Atcheenees destroyed the shipping of the Portuguese in the harbour of that town; and in 1582 another fleet tried to get possession of the town itself, though without success. From that time the kingdom of Atcheen began to be distracted by internal wars, and continual discord between the sovereigns and the hereditary chiefs, and fell by degrees into insignificance. The Dutch appeared first on the north coast towards the close of the 16th century, and the English early in the 17th. The pepper-trade was the great object of these two nations; the Dutch formed a settlement at Padang in 1649 or shortly before, and the English at Bencoolen in 1685. The Dutch also got a firm footing in the southern districts of the island. As allies of the sultan of Bantam, they erected a factory on the river Tulan Boeang, in the country of the Lampongs; and in 1664 extorted permission from the king of Palembang to establish one in the capital of that country. In 1811 the Dutch possessions, together with the island of Java, fell into the hands of the English. After the peace of Paris, in 1816, the Dutch colonies on the Indian Archipelago were restored to them. In 1824 the Dutch found it expedient to give up to the English the town of Malacca and some settlements in Hindustan in exchange for the British settlements on the west coast of Sumatra. A further accession of territory to the Dutch possessions took place in 1835, in consequence of a war with the Padries, a religious sect which began to appear in the country of Menangcabau about the beginning of this century. This sect aimed at the suppression of the practices of gambling, smoking opium, and drinking intoxicating liquors, on account of their effects, as they often led to the commission of murders, thefts, robbery, fraud, and tended to produce a depraved state of society. For about 15 or 16 years this doctrine was propagated only by conviction and persuasion, and the leader of the sect acquired many adherents; but about 1815 or 1816 a society was formed among the principal adherents of this new doctrine, for the purpose of compelling the other inhabitants to conform. The wars which arose devastated for many years the country of Menangcabau and some adjacent districts. Some of the small chieftains who inhabit the country between Padang and Menangcabau applied to the Dutch for protection, and the Dutch government took up their cause. The result was that the whole country of Menangcabau is now included in the Dutch possessions.

(Marsden; Crawford; Heyne; Anderson, *Account of a Mission to the East Coast of Sumatra*; Lady Raffles, *Memoirs of the Life and Public Services of the late Sir T. S. Raffles, &c.*; Moor, *Notices on the Indian Archipelago*, Singap., 1837; Anderson, *Acheen and the Ports on the North and East Coasts of Sumatra.*)

SUMBAWA, or SURUBAWA. [SUNDA ISLANDS.]

SUMMERHILL. [MEATH.]

SUMY. [CHABROFF.]

SUNDA ISLANDS is a term formerly used to designate the islands which inclose the Java Sea (which is also called the Sunda Sea, and is connected with the Indian Ocean by *Sunda Strait* between Java and Sumatra), namely, Java, Borneo, Sumatra, and Celebes. These four islands are still sometimes called the *Greater Sunda Islands*. The chain of islands which extends from the eastern extremity of Java to the coast of New Guinea, or Papua, are collectively named the *Lesser Sunda Islands*; so that under the term Sunda Islands the whole of the Indian Archipelago is comprehended, with the exception of the Moluccas, the Sooloo Archipelago, and the Philippines. The Greater Sunda Islands and their dependencies are noticed under separate heads. [BORNEO; CELEBES; JAVA; SUMATRA; BANCA; BILLITON; MADURA.]

The *Lesser Sunda Islands* are situated between 5° and 11° S. lat., 114° and 135° E. long. These islands were first visited by the Portuguese, who formed small settlements on some of them. The Dutch East India Company afterwards occupied them, in order to destroy the clove- and nutmeg-trees, and thus to secure to themselves a monopoly in the spice trade. The company accordingly prevented other Europeans from approaching these islands, and withheld all information respecting them; and it is only within the present century,

since the dissolution of the Dutch East India Company, that Europeans have become better acquainted with them.

The Lesser Sunda Islands consist of four large groups, which from west to east are called the Timor Islands, the Serawatte Islands, the Tenimber group, and the Aroo Islands. The term Lesser Sunda Islands is frequently applied to the Timor Islands alone.

The *Timor Group*, so called from the largest of the islands, extends from 114° to 127° 30' E. long., and comprehends the greater part of the islands and the larger islands of the whole chain. Between 114° and 119° E. long. it consists of three large islands, Bally, or BALI, LOMBOK, and Sumbawa, which lie west and east of one another. But between 119° and 127° E. long. the islands constitute a double row, of which the northern, lying between 8° and 9° S. lat., comprehends Comodo, Floris, Solor, Sebrao, Lomblen, Pantar, Ombay, and Wetter. The southern row forms a curve towards the south, advances nearly to 11° S. lat., and consists of the islands of Sumba, or Sandalwood, Savu, Rotti, Simao, and Timor. The straits which separate these islands from one another are often navigated by vessels bound to or from China, when they reach these seas in seasons during which the navigation through Sunda Strait is either dangerous or tedious.

The island of *Sumbawa*, or *Surubawa*, extends from west to east about 180 miles, its width varies between 50 and 20 miles; two large bays, Sallee and Bima bays, enter deeply into the island from the north. The average width may be 40 miles, which gives an area of 7200 miles. Along the southern shores of this large island extends a mountain range, which begins on the shores of the Strait of Allas (which separates Sumbawa from Lombok), and terminates on those of Sapy Strait. About the middle of this chain, and opposite the Bay of Sallee, which cuts it nearly in two, is a deep depression in the range, which is not much above the sea-level, and is covered with thick forests. The shores of this mountain tract are high and steep. The remainder of the island is generally hilly, but a few of the elevations rise considerably above the rest. The most remarkable of them is Tumbora Peak, a volcano, whose eruption in 1815 is one of the most terrible on record. Its elevation above the sea is between 8000 and 9000 feet. The low and level tracts occupy only a comparatively small part of the island, and they generally occur at the innermost recesses of the bays along the northern coast, and along the Strait of Sapy. The Strait of Allas presents a high and rocky coast, which however towards the north is lined by many low rocky islands. In soil this island seems to be much inferior to Lombok or Bali, but it does not differ in vegetable productions, except that in the forests, which cover a considerable part of its surface, there is a great number of teak-trees. The animals are also the same as in Bali, but buffaloes are far more numerous. The horses, or rather ponies, of this island, especially those of Bima, are the finest breed in the whole archipelago, and are extensively exported. Gold is collected in some of the small rivers. Pearls are found in Sallee Bay. Some intercourse exists between Bima and Java, and trading boats from Ceram and Celebes visit the port of Sumbawa. These seem to be the only places from which the produce of the island is exported.

To the east of Sumbawa is the *Strait of Sapy*, which on the other side is formed by the island of Comodo. The northern part of it is divided into two channels by the island of Gillibanta, which is of considerable size, and has a peak near the centre. Near the northern entrance of Sapy Strait is the island of Goonong Apee, which is very high, and formed of a large mountain with two summits, of which the south-eastern is called the Lawa Peak, and is a volcano. The island of Comodo consists of a high rocky mass covered with wood. On the east of it is the *Strait of Mangerye*, which is studded with numerous rocky islands.

East of this strait is the island of *Floris*, or Endé, which is about 200 miles long from east to west, and about 35 miles broad. The surface is hilly, particularly on the south side, where there are several high volcanoes. The principal town, Endé, on the south coast has an excellent harbour. Larantuka, on the east coast, is held by the Portuguese, who have converted many of the natives to the Catholic faith. The population of the south coast are called Rakka, and are said to be much addicted to cannibalism. [FLORIS.] The Dutch protection does not extend east of Floris; and the inhabitants of this island and the islands eastward of it are said to practise piracy. North of Floris, in 123° E. long., is *Comba* island, of conical shape and an active volcano.

East of the Strait of Floris are five islands of considerable extent: Sebrao, or Sabrao, and Solor, already mentioned; and Lomblen, Pantar, and Ombay, each comprehending an area of from 300 to 400 square miles. All of these are very high and bold, especially the three last mentioned. A peak on Lomblen is visible at the distance of 50 miles. On Pantar are three summits, the highest of which is an active volcano. The inhabitants of Sebrao are Christians, and connected with Larantuka. The chief town of the island is called *Adinara*, which is sometimes applied to the island itself. Solor is dependent on the Dutch of Coopang, and sends to that place large quantities of wax and fish-oil. The inhabitants of the coast are Mohammedans. The inhabitants of Lomblen, Pantar, and Ombay are numerous, and mostly if not entirely belong to the Haraforas race: they avoid communication with foreigners. These islands are very rarely visited by Europeans, and not frequently by Bugis, who obtain

from them large quantities of wax. The straits that divide the islands are said to be unsafe.

Sandalwood island, the native names for which are *Jindana* and *Sumba*, lies south of the Strait of Sapy and of the island of Flores. It extends from north-west to south-east about 100 miles, with an average width of 50 miles. This island forms a table-land of considerable elevation, most parts of the southern coast of which are visible at the distance of 30 miles. Its surface however is only undulating, except towards the west, where there is a peak, which can be seen at the distance of 60 miles. The inhabitants are Haraforas. The Dutch had succeeded in forming a commercial establishment there: they were however expelled, because they cut down some sandal-wood trees, as the inhabitants have the belief that for every tree of this kind which is cut down one of the natives loses his life. The Bugis of Endó in Flores obtain from the island large quantities of bees'-wax and birds'-nests. The coast is generally steep and without soundings. Anchorage is found only on the north-east coast in Padewahy, or Baring's Bay.

Between Sandalwood and Timor are the islands of *Sáwu* and *Rotti*. *Sáwu* is about 20 miles long, and on an average 10 miles wide. It is hilly throughout, and has a stony soil, but in good seasons it is tolerably fertile. The supply of water is very scanty. The cultivation of the ground is much neglected: it produces only small quantities of maize, millet, kaehang, and sweet potatoes, and sufficient cotton for home consumption. In dry seasons, when the crops fail, the inhabitants derive subsistence from the sugar of the lontar-trees, which they barter with the Bugis. The domestic animals are those of the other islands. The wild animals are hogs and deer. The inhabitants have frizzled hair, and resemble those of Timor.

Rotti extends from south-west to north-east about 60 miles, with an average width of 20 miles. The surface is a succession of low hills and narrow valleys; the soil is very stony but productive. The rivers are few and small. Rice in small quantity, with maize, millet, sweet potatoes, and kaehang are cultivated, but the crops are only equal to the consumption of the inhabitants. In dry seasons they depend on the sugar of the lontar-trees. Cotton is grown. The horses, or rather ponies, are better than those of Timor, but not equal to those of Sumbawa. The population is stated to exceed 50,000. The inhabitants, who resemble the Hindoos, have long lank hair, whilst nearly the whole of the inhabitants of the surrounding islands have frizzled hair. They are governed by chiefs, who acknowledge the supremacy of the Dutch. Some of the chiefs profess Christianity, but the majority are pagans. The exports consist of palm sugar, horses and buffaloes, and bees'-wax. The imports are cotton, muskets and ammunition, and manufactured goods.

The island of *Timor* is the largest of the Lesser Sunda Islands, being 300 miles long from south-west to north-east, and on an average 45 miles wide. A chain of mountains runs through the middle of the island, and some of the summits attain such an elevation that Flinders compares them with the mountains of Teneriffe. Though the greater part of the island consists of a succession of narrow valleys, and hills or mountains with steep sides, there are a few large plains, of which one of the largest is at the bottom of Coopang Bay, which is more than ten miles square. All the rivers are small, and descend so rapid a declivity, that none of them is navigable beyond the tidal point. The principal objects of agriculture are rice, maize, millet, pulse, sweet potatoes, and cotton. Maize is the principal article of food; and next to it the sugar of the lontar-palm. In some parts of the island a species of sago-palm is found, and used as food. Small quantities of sugar-cane are raised, but not for the purpose of making sugar. Oranges, jack-fruit, &c., abound. The domestic animals are horses, buffaloes, sheep, goats, dogs, and cats. The wild animals are buffaloes, deer, hogs, a species of large wild-cat, and monkeys. Gold is found in several of the rivers. Native copper also is said to abound in the Philaran Mountains, which are situated near the centre of the north-west side of the island. The natives are of a very dark colour, with frizzled bushy hair. They are below the middle size, and rather slight in figure. The chiefs in the southern coast acknowledge the authority of the Dutch. The eastern part of the north coast, as far west as Batoo-Gedé, is under the authority of the Portuguese.

Coopang is situated near the western extremity of the island, and is a large bay, about 12 miles wide at the mouth, and upwards of 20 miles deep. It is formed by the island of Semao on the south-west and a projecting point of Timor on the north, and has excellent anchorage. Fort Concordia, the principal settlement of the Dutch, is situated on the south side of the bay. The trade of this place is considerable, and is said to amount annually to rather more than 1,200,000 Spanish dollars. The principal articles of export are wax, sandal-wood, earth-oil, and cattle. The imports are cotton-cloth, chintees and handkerchiefs, China silks, China ware, China umbrellas, muskets, gunpowder, iron, coarse British cutlery, and lead. The Chinese and the Bugis visit this place.

The Portuguese have three settlements on the northern coast, Batoo-Gedé, Dilli, and Manatatoe. *Dilli* is the principal settlement. The harbour is open to all northerly winds, but is defended from the swell of the sea by a reef of rocks, which extends across it, leaving only a narrow passage at the north-west end, by which large ships enter the harbour. The town is rather populous, but meanly built, and the small houses of which it consists are scattered over a large

area, *NAV. VOL. IV.*

tract. The commerce of this place seems not to be inferior to that of Coopang. The principal articles of export are slaves, wax, sandal-wood, benzoin, and ambergris, most of which are exported to Macao, except the slaves, which go to other islands of the Indian archipelago, especially to Celebes. The imports are the same as at Coopang, with rather a greater proportion of Chinese goods.

To the north of Timor is the island of *Wetter*, or *Wetta*, as it is written in Keppel's 'Indian Archipelago.' This island is about 65 miles long and 20 wide. It is a high rocky mass, but much less elevated than Timor. The Dutch had formerly a small establishment on the south coast. The bulk of the population are Haraforas, but on the coast there are some Malay settlers. Between *Wetta* and Timor are two small islands, *Babi* and *Cambing*.

The *Serawatti* group, situated between 9° and 6° S. lat., 127° and 131° E. long., consists of two rows of islands, which extend between Timor and *Wetter* on the west and Timorlaut on the east. The southern series consists, besides several smaller islands, of which the greater number are uninhabited, of seven islands, which, from west to east, are *Kisser*, *Lettu*, *Moa*, *Lakor*, *Locan*, *Sermatte* or *Serawatti*, and *Baber Babá*.

Kisser is about 18 miles in circumference, and the surface is hilly. In the valleys, which have a fertile soil, and on the sides of many of the hills, rice is grown, with the sugar-cane, yams, sweet potatoes, tobacco, cotton, and many culinary vegetables, scarcely an available spot being left uncultivated. It contains between 7000 and 8000 inhabitants, some of whom are descended from the Dutch. Two dialects are spoken, which differ much. The natives are of middle size, generally well made, in colour dark brown, hair straight or slightly curled. This island is well provided with buffaloes, cattle, pigs, sheep, and fowls. The island is the resort of traders from Celebes, Amboyna, and Banda, and therefore an emporium for foreign goods, to obtain which it is visited by the natives of the islands to the eastward. The coast of the island is steep and rocky, but there are many small inlets for boats.

Lettu, which lies farther east, and is larger than *Kisser*, is surrounded by reefs at the distance of about half a mile. The interior is mountainous, but surrounded by a lower tract, which at a short distance from the shores rises into hills, on which the villages are built. Its productions are similar to those of *Kisser*. *Moa* is perhaps twice as large as *Kisser*. It has good anchorage on the east side. The surface is level, except that there is a high mountain, called *Karban*, at its north-eastern end. This peak resembles that of Teneriffe, but is not so high. The greatest part of the island is used as pasture for buffaloes, cattle, sheep, goats, and pigs. *Lakor* consists of coral rocks, is low and level, and only covered with a thin layer of earth. It contains no large trees, except cocoa-nut palms, and nearly the whole island is covered with low bushes. There is no fresh-water; the inhabitants use rain-water, which is collected in tanks. Small quantities of maize, yams, and sweet potatoes are grown. Many hogs and sheep are kept, and also a few buffaloes. *Locan* is surrounded by submarine reefs, on which there are several small islands. It consists of an elevated mountain, and is inhabited only at the north-eastern base of the mountain, where there are extensive plantations of cocoa-nut and sago-trees. Goats and hogs are plentiful. But the most important productions are trepang and tortoise-shells. *Serawatti*, or *Sermatta*, is not visited by Europeans, because no anchorage is found near it. It consists of a mass of rocks, running east and west, and rising abruptly out of the sea. It produces rice, maize, yams, &c., which, with some domestic animals, are brought to *Locan* for coarse cloth and a few other articles. The most eastern of the southern row of the *Serawatti* Islands is *Baber*, or *Babá*. It is nearly 30 miles long, with an average width of 10 miles. The surface is mountainous. It has good anchorage at the western extremity, near the village of *Tepa*. All the villages are in the west and south-east districts. The articles of cultivation are maize, yams, and cocoa-nuts. The domestic animals found in the other islands are plentiful here; there are also wild hogs and goats, and many kinds of birds.

The northern series of the *Serawatti* Islands contains a few smaller islands, four larger ones, *Roma*, *Damma*, *Nila*, and *Seroa*. The three last mentioned contain active volcanoes, which constitute the connecting link between the volcanoes of the Sunda Islands and those of the Malaccas. *Roma* is about 24 miles in circumference, and has an anchorage on the south and another on the north-west coast. The surface is a succession of hills and valleys. The island is covered with trees, except on the south coast, which alone is inhabited and cultivated. The inhabitants have made some progress in civilisation. The articles of export are wax, sandal-wood, edible birds'-nests, and great quantities of tortoise-shell. *Damma* is mountainous, but not very high, except the Peak of *Damma*, near the north-east coast, which always emits smoke: at its base there are hot-springs. It is not very fertile, and the inhabitants live mainly on the produce of their cocoa-nut and sago plantations, cultivating only a little maize, yams, and sweet potatoes. Game, wild hogs, and many kinds of birds are very abundant. *Nila* is a round mass of rocks rising with a steep ascent from a deep sea. There is a volcano on the east side, and on the north side an anchorage for small vessels. Its productions for export are hogs, fowls, and cocoa-nuts, which are brought to *Banda* by the islanders themselves. *Seroa*, or *Serra*, is likewise a

mass of volcanic rocks: in 1698 there was a terrible eruption, in which a part of the mountain subsided, and a lake was formed filled with burning matter. The population is small. Among the inhabitants of these islands are several converts to Christianity.

The *Tenimber Islands* are situated between 6° 30' and 8° 20' S. lat., 181° and 182° 20' E. long., and consist of one large island, Timorlaut, and three of moderate size, Cerra, Larrat, and Vordate, and a great number of smaller islands. The channels between these islands contain many trepang-banks. *Timorlaut* extends nearly 90 miles from south to north, and is 40 miles wide in the broadest part. The surface is rather undulating than hilly, and it is surrounded either by reefs or by mud-banks, which extend to a considerable distance from the shores. The natives are very inhospitable to strangers. *Cerra*, which lies west of Timorlaut, is very populous. The inhabitants are the traders of this group of islands, and export their cattle and other domestic animals, and also tortoise-shell and trepang to Banda. *Larrat*, a considerable island, to the north of Timorlaut, resembles it in surface. *Vordate*, north-east of Larrat, contains lofty hills, and is described as very fertile, and rich in all the products of these islands, except cattle. It is very populous. Sago-trees and cocoa-nut trees are abundant.

The inhabitants of the Tenimber Islands, like the inhabitants of Rotti, might be taken for Europeans, if their complexion was lighter. Their dwellings are from 20 to 30 feet long, from 12 to 15 feet wide, and divided into several rooms. They have vessels, about 50 feet long and from 10 to 12 feet wide, which are constructed with great skill, though without any iron. They pay also great attention to the cultivation of the ground.

The most eastern group of the Lesser Sunda Islands are the *Arroo Islands*, which consist of one large island, called *Kobrore* (70 miles long and about 30 miles wide on an average), and two other considerable islands, *Tyanna* and *Mykor*, which lie west of Kobrore, and are divided from it by a narrow strait. To the north of Kobrore and Mykor are eight or ten islands of moderate size, of which *Wammer*, *Wokan*, and *Wadyier* are the most remarkable. All these islands are moderately elevated, and they have a slightly undulating surface. The channels which divide them from one another are narrow, and the tides in them are very irregular. Cultivation is limited to the planting of sago-trees and the raising of yams. Rice is imported from Banda. Of domestic animals there are only hogs, goats, and fowls. The bird of paradise is found only here and in New Guinea; the feathers are an article of export. The principal articles of export are trepang, mother-of-pearl shells and tortoise-shells. The imports are coarse cotton-cloth of different colours, coarse cutlery, copper-wire, coarse China goods, arrack, anis-spirits, gongs, very small red corals, and some other minor articles. Foreign vessels visiting the islands go to Dobo, a port on the island of Wammer. [ABROO ISLANDS.]

SUNDA STRAIT. [JAVA; SUNDA ISLANDS.]

SUNDERBUNDS. [HINDUSTAN.]

SUNDERLAND, Durham, a market-town, sea-port, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Sunderland, is situated on the banks of the river Wear, at its mouth, in 54° 55' N. lat., 1° 22' W. long., distant 13 miles N.E. from Durham, 268 miles N.N.W. from London by road, and 302 miles by the Great Northern and York Newcastle and Berwick railways. The population of the municipal borough of Sunderland in 1851 was 63,897; that of the parliamentary borough, which includes several adjoining townships, was 67,394. The borough is governed by 14 aldermen and 42 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The living is a rectory, with the perpetual curacy of St. John annexed, in the archdeaconry and diocese of Durham. Sunderland Poor-Law Union contains 11 parishes and townships, with an area of 11,944 acres, and a population in 1851 of 70,576.

Northern or Monk Wearmouth, on the left bank of the Wear, was a place of some note in the Anglo-Saxon period. A monastery was founded here in 674, but was destroyed by the Danes in the 9th century, and the site remained desolate till after the Norman conquest, when it was restored. The first notice of South or Bishop Wearmouth (part of which was in 1719 constituted the parish of Sunderland) is in a charter of Hugh Pudsey, bishop of Durham, towards the close of the 12th century, recognising a borough in the parish, and granting privileges to the burgesses similar to those of the burgesses of Newcastle. Towards the close of the reign of Elizabeth the shipping of coal began, and the town of Sunderland increased considerably.

The parish of Sunderland occupies the point of land at the south side of the mouth of the Wear, and, with the exception of the town-moor or common of 70 acres, is covered with houses. One street, broad and handsome, communicates with the High-street of Bishop Wearmouth, and is lined with good houses: the other streets are densely-peopled narrow lanes. The High-street of Wearmouth and that of Sunderland form one line extending above a mile in length from east-north-east to west-south-west. The principal streets in Sunderland and Bishop Wearmouth are lighted with gas and paved. An abundant supply of good water is furnished to the houses at a very moderate annual charge. In that part of the town called Bishop Wearmouth Pans, are glass-houses and iron-works for the manufacture of articles

required by the shipping. Monk Wearmouth Shore lies along the river, immediately opposite to Sunderland. The river is crossed by an iron bridge of one arch having a span of 236 feet, erected, near the close of the last century, at a cost of above 40,000*l.* The height above low water is 60 feet to the spring and 94 feet to the centre of the arch, so that ships of 300 tons pass under it very readily by lowering their top-gallant masts.

Above the bridge, on both sides of the river, are extensive staiths for shipping coals. A little way higher up are the bottle-works of Ayre's Quay. A wet-dock, containing an area of nearly eight acres, with a tidal basin attached to it of about one acre, is on the low ground between Monk Wearmouth Shore and the sea, near the entrance to the harbour. An opening has been made through the North Ric to communicate with the river. A branch railway from the dock joins the Brandling Junction railway, which is connected with the Newcastle and Carlisle railway: thus a communication is established between the Irish Sea and the German Ocean. A spacious wet-dock was opened in June 1850, on the right bank of the river between the town and the sea-shore. The works extend from the river to Hendon Bay. In the great dock the depth in the middle at high water of ordinary spring-tides is 24 feet, and at neap-tides 20 feet 6 inches. Besides the site recovered from the sea, now occupied by the dock, an area of upwards of 25 acres of land has in like manner been gained from the sea to the eastward of the dock.

Sunderland parish church is a spacious brick-building, erected in the earlier part of the last century. In April 1851 there were in the town 63 places of worship, of which 31 belonged to five sections of Methodists, 9 to the Established Church, 6 to Baptists, 5 to Presbyterians, 4 to Independents, 2 to Jews, and 1 each to Quakers, Roman Catholics, and Unitarians. The total number of sittings provided was 80,766. There were 49 Sunday schools, with 6559 scholars; and 129 day schools, with 7546 scholars. The town possesses several almshouses; an infirmary and dispensary; an eye infirmary; a lying-in hospital; and a variety of benevolent institutions. A savings bank is in Monk Wearmouth.

In the town are a custom-house, an excise-office, and an exchange: the exchange is a neat modern building, and comprises a merchants'-walk, commercial-room, news-room, auction-mart, and justice-room. A new Lyceum Hall contains a large hall 90 feet by 48 feet, to accommodate 1800 persons; and two smaller rooms for public meetings, with offices, committee-rooms, &c. There are a theatre and an assembly-room. On the town-moor of Sunderland are extensive barracks. The market-place is commodious, and there are water-works and gas-works on a large scale. In Bishop Wearmouth is an atheneum, containing a large hall, with lecture theatre, museum, and library.

The preservation and improvement of the port and harbour of Sunderland have been effected by commissioners appointed under successive acts of parliament. Ships drawing 18 feet of water can now enter and depart from the harbour with safety. The building of the south pier was commenced in 1728, and the pier was extended from time to time. The north pier was commenced in 1786. In the early part of the present century both piers were in part rebuilt. The length of the south pier is 650 yards; of the north pier 590 yards. A lighthouse, 78 feet in height, erected near the end of the north pier in 1802, was in 1841 removed bodily to the eastern extremity of the new pier, a distance of nearly 150 yards. The light was exhibited nightly during the operation of removal. The gross weight moved was 338 tons.

The principal manufactures of Sunderland are of bottle and flint glass, anchors, chain-cables, and other iron goods for ships, and cordage. Ship-building is very extensively carried on. There are also numerous boat-builders, chain-cable manufacturers, sail-cloth manufacturers, anchor- and ship-smiths, rope, sail, mast, block-, and pump-makers; besides ship-owners, brokers, and chandlers. The ropewalks, in some of which steam-machinery is employed, are on a very large scale. Brick-making, digging coal, and the quarrying of grindstones are carried on in the neighbourhood; and there are copperas-works, brass-foundries, potteries, hat-manufactories, lime-works, timber-yards, saw-mills, flour-mills, tan-yards, and breweries. The commerce of the town is however more important than its manufactures. Coal is very extensively shipped at Sunderland. The number of vessels registered as belonging to the port on December 31st, 1854, was—Sailing-vessels under 50 tons 97, tonnage 2955; above 50 tons 803, tonnage 205,527; and 41 steam-vessels, tonnage 2338. During 1854 there entered and cleared at the port—in the coasting trade, sailing-vessels, inwards, 1523, tonnage 124,265; outwards, 11,439, tonnage 1,465,088; steam-vessels, inwards, 7, tonnage 526; outwards, 142, tonnage 53,338. In the colonial trade the returns are as follows:—Inwards, 132 vessels of 32,898 tons; outwards, 205 vessels of 45,642 tons. In the foreign trade the numbers are:—Inwards, 615 British vessels of 105,876 tons, and 1063 foreign vessels of 103,114 tons; outwards, 985 British vessels of 190,589 tons, and 1378 foreign vessels of 139,300 tons.

The export of lime is another principal branch of trade; also the export of glass and grindstones. The imports are timber and iron from the Baltic; butter, cheese, and flax from Holland; and a variety of goods brought coastwise. A considerable fishery is carried on. Sunderland is much frequented for sea-bathing; and the usual accommodations are provided for visitors. The market is held on Saturday:

there is also a cattle-market, and there are two yearly fairs. A county court is held in the town.

SUNDGAU. [RHIN, HAUT.]

SUNDSWALL. [ANGERMANNLAND.]

SUPERIOR, LAKE. [CANADA.]

SUR. [TYRE.]

SURABAYA. [JAVA.]

SURAT, or, as the natives pronounce it, *Soorut* ('beauty'), a large city on the western coast of Hindustan, in the presidency of Bombay and province of Gujerat, stands on the left bank of the Tapy, in 21° 12' N. lat., 72° 50' E. long.: the river falls into the Gulf of Cambay, 20 miles W. from the city. Surat is about 177 miles by road N. from Bombay: it is situated in a fertile country, with woody hills, long sheltered lanes, and patches of dense jungle. The neighbourhood is a favourite hunting district, wild hogs and other game being abundant.

The city of Surat is in the form of a semicircle; the Tapy is the chord, near the centre of which is a citadel or small fortified castle, garrisoned by a few sepoy and European artillerymen. The city is surrounded by a wall about six miles in circuit, in good repair, with semicircular bastions, and with battlements. The streets are narrow, winding, and unpaved. The houses are generally high, and are mostly constructed of a framework of timber filled up with bricks or sun-dried mud: those occupied by some of the principal merchants are of stone, and are large and well built. There are several handsome mosques; a neat English church, which was consecrated by Bishop Heber in 1825; an English school and numerous Hindoo schools; the custom-house; and the mint. The residence of the nawáb is modern. The hospital for aged and diseased animals is an establishment founded and richly endowed by the Jains. A large and picturesque burial-ground outside the city contains numerous tombs of former servants of the East India Company.

The population of Surat was estimated, in 1796, when its prosperity had confessedly declined, at not less than 600,000. It is now very much reduced, the commerce of the city having been transferred to Bombay, and probably does not reach 150,000. It consists of Hindoos, who are mostly Jains; of Mohammedans, many of whom are Boras; of Parsees; and of Armenians, Jews, and various other races, besides Europeans. There are also great numbers of religious mendicants in the city and neighbourhood. Surat is the station of a British military force; it is also the seat of the supreme court of justice for the whole presidency of Bombay, of a circuit court, and of a board of customs with a collector. The English society is numerous, and of the best kind.

The Tapy at Surat is a wide river, but the navigation, owing to shifting sandbanks, is unsafe even for boats, and at the mouth of the river is a dangerous bar. The boats which navigate the river are generally of 30 and 40 tons, half-decked, carrying two masts and two large latteen sails. The river opposite the city is braekish: water for domestic purposes is raised by oxen from wells, and there are also large tanks to collect the rain.

The imports to Surat are chiefly from Arabia, Bombay, and Brasil, and consist of grain and other articles of food, piece-goods, raw materials to be worked up into manufactures, and bullion. The exports are mostly manufactures of Surat and the neighbouring districts, raw cotton, which is shipped in large quantities to Bombay, and a few other articles of native produce. The old manufactures of Surat are mostly superseded by those of Great Britain. The vessels are chiefly English, Arabian, and Portuguese.

Surat is mentioned in the ancient Sanscrit poem, 'The Rámáyana.' After the conquest of Hindustan by the Mohammedans, it was the chief port at which they embarked on their pilgrimage to Mecca. The Portuguese, after establishing themselves at Calicut, Goa, and Damau, began to trade with Surat about 1561. In 1603 Mr. Mildenhall, a London merchant, reached Agra, and in 1606 obtained an ample grant of commercial privileges by a firman from the emperor Jehanghir. In 1612 a factory was established at Surat by treaty with the governor of Ahmedabad, and confirmed by imperial firman in 1613. In 1615 Surat became the chief station of the East India Company on the west coast of India.

The chief seat of government under the East India Company was at Surat till 1686, when it was removed to Bombay. In 1800 the nawáb was compelled by the English to sign a treaty, by which he resigned the entire government to the East India Company, who, on their part, agreed to pay him and his heirs one lac of rupees annually, together with one-fifth of the surplus annual revenue, after deducting all charges. The forms of state authority are retained.

SURFLEET. [LINCOLNSHIRE.]

SURINAM. [GUYANA, Dutch.]

SURREY, an inland county of England, bounded N. by Middlesex, from which it is separated throughout by the river Thames, E. by Kent, S. by Sussex, W. by Hampshire, and N.W. by Berkshire. It lies between 51° 4' and 51° 30' N. lat., 0° 3' E. long. and 0° 51' W. long. The length from east to west, from the Kentish border near Westerham to the Hampshire border near Farnham, is 40 miles; the breadth from north to south, from the bank of the Thames at Blackfriars bridge, London, to near Crawley (in Sussex) is 27 miles. The area is 748 square miles, or 478,792 statute acres. The population in 1841 was 584,036, in 1851 it was 683,082.

Surface and Geological Character.—The part of the county which lies north of a line drawn from the Kentish border near Beckenham, leaving Croydon a little to the south, and passing by Carshalton, Epsom, Ashstead, and Leatherhead, and thence to the Hampshire border near Ash, leaving Guildford a little to the south, may be regarded as belonging, with some exceptions which we shall notice, to the London clay formation. The district occupied by this formation is comparatively low. It forms however the line of hills extending on the south side of London, from New Cross, near Deptford, by Nunhead, Denmark Hill, Herne Hill, Brixton Hill, Clapham Rise and Battersea Rise, Wimbledon Common, and Richmond Hill. It also forms the hills running southward along the Kentish border from New Cross by Forest Hill, Sydenham, Penge Common, and Norwood.

North of the hills which extend from New Cross to Battersea the London clay is covered by alluvium; and it is probable that the greater part of this flat was, antecedently to the Roman period, overflowed by the river at every high tide, and formed an extensive marsh, which was gained from the river by embankment. Along the bank of the river too, between Putney and Richmond, the London clay is covered by alluvium.

The range of high and mostly waste grounds, Esher Common, Cobham Common, St. George's Hill (between Cobham and Weybridge), Woking Heath, Pirbright Common, Romping Downs, and Ash Common, which occur in the north-west part of the county, and which extend with slight interruption from the neighbourhood of Kingston to the Hampshire border; the range of St. Ann's Hill (240 feet), Shrubs Hill, and the other hills west of Chertsey and Bagshot Heath, extending from near the Thames to the Berkshire border; and the high ground of Cobham Ridges between these two ranges, are all formed of the siliceous sand and sandstone belonging to the upper marine formation, which here covers the London clay. The highest elevation does not exceed 463 feet.
