FOREWORD

The Iowa Crop and Livestock Reporting Service is the Iowa unit of a nation-wide organization which is entrusted with the responsibility of operating a standard statistical service for agriculture. The Division of Agricultural Statistics is a division of the Iowa State Department of Agriculture working in cooperation with the Agricultural Marketing Service of the United States Department of Agriculture. The year 1939 marked the one-hundredth anniversary of the collection of statistics of agriculture in the United States.

The general program of the Iowa Crop and Livestock Reporting Service is to meet the public needs and demands for summary data of an historical nature and for current statistical information of agricultural production in Iowa and the United States.

In recent years, there has been an increasing demand from agricultural organizations, commercial interests, teachers, legislators, and county, state and governmental agencies for agricultural data showing the trends of change in counties. Little has been done in the past to make available data for each county over an extended period of time. So urgent is the need for county data that some organizations have assembled such information at considerable cost. It is in response to these needs that this series is being issued.

The county data herein offered have been assembled from existing State and Federal documents and reports, under the supervision of Norman V. Strand, State-wide Work Projects Administration Supervisor of Agricultural Economics and Statistics projects. This is a report of work completed on Official Project 65-1-72-155 of the Work Projects Administration. Official Project 665-72-3-36 furnished the material for Tables 26 and 28.

The Iowa Agricultural Extension Service participated in the preparation of the materials in this report. Selected data from the files of the Iowa Agricultural Experiment Station have been released for publication in this series. Special credit is given to the Iowa assessors and tax officials who collect data on crops and livestock as required under the Iowa laws. Without these data by townships and counties detailed agricultural statistics would be less accurate and less complete.

Leslie M. Carl, Director
Division of Agricultural Statistics

Des Moines, Iowa
November, 1940

IOWA AGRICULTURAL STATISTICS - APPANOOSE COUNTY

Appanoose County, originally a part of the old Demoiné County, was established in 1843. However, it was temporarily attached to Van Buren County, and, in 1844, to Davis County. It became fully organized in 1846, and was named for a noted chief of the Sac and Fox Indians. 1/

The first settler on record to locate in the county was Ewing Kirby, who came from Missouri in 1838 and established a home near the present site of Cincinnati. Others soon followed and there were about 1,300 inhabitants in the county in 1846. 2/

The county-seat was originally named Chaldea, but later its citizens proposed to change it to Senterville in honor of Governor Senter of Tennessee. The committee in the State Legislature agreed to the change, but thinking the citizens had spelled the name incorrectly, the Legislature named the town Centerville instead of Senterville. 3/

This county is very rich in Mormon history. Two distinct movements crossed the county. The first was the Mormon trek from Missouri after their expulsion from that State in 1839. They entered the county in the southwest corner and traveled northeast on their way to Nauvoo, Illinois. The second was when they fled from Nauvoo in 1846 and were going westward; this time they passed through the northern part of the county. 4/

The North Missouri Railroad was built through the county in 1869. Moulton was one of the first towns to be built on the line. 5/

Area

Appanoose County is 21 $\frac{1}{2}$ by 24 miles in extent and contains 513 square miles 6/, or 328,320 acres. Of this number, 319,861 are listed as farm land. 7/ There are 17 townships of variable size in the county, and it ranks forty-seventh in point of size in the State.

Soils

The soils of Appanoose County are grouped into 5 classes according to their origin and location; namely, drift, loess, terrace, swamp and bottom-land, and residual. The drift soils cover 50.9 percent of the area and are divided into Shelby loam--40.1 percent, and Lindley loam--10.8 percent. The loess soils cover 35.7 percent of the surface and are divided into Grundy loams--25.9 percent, Putnam silt loam--7.3 percent, Marion silt loam--1.5 percent, Edina silt loam--0.4 percent, and Clinton silt loam--0.6 percent. The terrace soils cover 1.1 percent of the area and are divided into Calhoun silt loam--0.6 percent, Bremer silt loam--0.3 percent, and Waukesha loam--0.2 percent. The swamp and bottom-land soils cover 12.2 percent of the total surface and all soil types are in the Wabash loam series. The residual soil covers 0.1 percent of the surface and has but one type, the Crawford loam. 8/

Topography

In general, the topographic condition of the county varies from gently undulating areas in the interstream uplands to the rough, broken areas occurring in the immediate vicinity of the larger streams.

The drainage is effected mainly, by the Chariton River and its tributaries. These drain into the Missouri River system. Soap Creek and North Soap Creek, which drain the northeastern part of the county, and Fox River, which drains the east central part of the county, belong to the Mississippi River system. The divide which separates the drainage into the two river systems extends across the northwestern part of the county from Moravia to Moulton. 9/

Climate

The average temperature for 10 years (1930-1939 inclusive) was 50.3 degrees. 10/ The average precipitation for 51 years (1879-1930) was 34.27 inches, and the growing season averaged 166 days between the killing frost dates of April 23 and October 6 recorded from 1903 to 1930. 11/

Population

The population of this county grew very rapidly during its early years. Literally thousands of immigrants settled here for a time before going on, either into less populated areas of the State or further west.

It has a density of 48 persons per square mile, as compared with the State density of 44.

The following table shows the number of inhabitants recorded at 10-year intervals:

<u>Year</u>	<u>Inhabitants</u>	<u>Urban</u>	<u>Rural</u>
1850	3,131	-	-
1860	11,931	-	-
1870	16,456	-	-
1880	16,636	-	-
1890	18,961	-	-
1900	25,927	11,397	14,530
1910	28,701	14,982	13,719
1920	30,535 <u>12/</u>	18,283 <u>13/</u>	12,252
1930	24,835 <u>14/</u>	15,753	9,082
1935	-	-	9,694 <u>15/</u>

In 1930, the foreign born and native white inhabitants of foreign born or mixed parentage totaled 4,814, or 19.3 percent of the total population. Of this number, those of Yugoslavian descent led with 1,107, the English came next with 857, and the Italians had 848. Other nationalities had much smaller representations. 16/

Cooperatives

In 1937, there were 5 cooperative institutions in operation in this county--3 livestock enterprises, 1 petroleum plant and 1 merchandise establishment.

As a whole, they had 1,413 members, of which 700 were active, and 1,800 persons did business with the 5 concerns. The selling cooperatives had a business volume of \$29,600 and the purchasing cooperatives transacted \$113,603 worth of business.

Cooperatives may both buy and sell or they may perform one or the other function exclusively. Purchasing cooperatives buy non-farm commodities for distribution to their members and patrons, and selling cooperatives market farm commodities for their members and patrons. 17/

Fruit

There were 107,413 apple trees in 1884 and 159,896 bushels of apples reported in 1909. These were the years of greatest numbers and greatest production, respectively. The 1934 report listed 19,213 trees and 2,660 bushels. In 1874, 4,619 peach trees yielded a peak production of 1,203 bushels. In 1909, 48,288 peach trees, the largest number on record, produced only 205 bushels. In 1909, the record year for plum production, 19,626 trees bore 3,969 bushels. The greatest number of cherry trees, 15,975, was recorded in 1874, but the largest production, 6,628 bushels, was reported in 1909. The record number of vines and the largest production of grapes were listed respectively, in these same years. There were 24,485 vines and 179,085 pounds reported for those years, 18/

Note Regarding Yields of Corn

The crop assessors' statistical breakdown for corn acreage is as follows: (1) all corn, (2) corn husked for grain, (3) corn cut for silage, (4) corn cut for fodder and (5) corn hogged off. A total production is given for each farm which includes only that actually husked. In getting county totals of production, the acreage other than that husked is multiplied by the yield (derived by dividing total bushels corn husked by total acres husked) and added to summations of individual farm productions shown as husked. This assumes that acreage not husked would have produced the same yield as that actually husked.

In 1934 and 1936, both poor crop years, separate estimations of corn yield on acreage not husked were made by the State assessors' office because it was felt that farmers in those years would select their best acreages for husking and cut or hog off the rest, which would have a different and lower yield. This separate yield estimation was then multiplied by the acreage not husked and the total added to that reported as husked.

This was done by counties only and not by townships. The township yields for these two years, then, are somewhat high since they are based only on acreage husked for grain and bushels husked. The total corn acreage is shown by township with this yield, and any attempt to multiply it by the acreage shown to get total production will result in a too high figure. The county summary table figures for corn yield in 1934 and 1936 have been adjusted for poorer yields on that acreage not husked and these yields may legitimately be multiplied by the acreages shown there to arrive at total productions for the county.

In all other years actual township productions may be derived from the yield and acreage figures shown in the tables since corn yield has been assumed to be equal in all utilizations. The county yield and township yields are, therefore, consistent in all years except 1934 and 1936.

1938	28,505	10,784	5,475	503	49,531	16,836
1939	29,255	10,930	5,431	538	50,851	22,540

The figures in this table for the years 1870-1935 inclusive have been derived from the Federal Censuses for Iowa. These enumerations have been made as of different dates. Some enumerations were for a base date of January 1, others for a base date of April 1, and others for June 1.

The census enumerations made in 1920, 1925 and 1935 were for January 1. For comparability the enumerations made for the base dates of April 1 and June 1 were adjusted to an equivalent January 1 base. This adjustment procedure places the livestock data of the above table on the one inventory date of January 1.

The figures for 1936, 1937, 1938 and 1939 for all cattle and milk cows are estimates of the Division of Agricultural Statistics of the Iowa Department of Agriculture and those for horses, mules, hogs and sheep are adjusted State farm assessors' figures.

The adjusted county figures for horses, mules, hogs and sheep for the last four years in the table are more nearly accurate than those in Table 22 and comparison with these figures will provide an estimate of the bias displayed by the unadjusted State farm assessors' figures.

* Includes Milk Cows.

The statistics in this table are biased downward. They are printed only to permit inter-township and inter-annual comparisons. Unless townships are equal in size, comparisons may not be directly made. It is assumed that individual assessors are subject to approximately the same bias. Compare Table 21 for magnitude of the bias.
