The wood handle-bar has gained considerable favor in '96 and will probably gain more next year. Some of them are certainly beautifully attractive in appearance, and they all rather "set off" a bicycle; the bars of ram's horn shape are also striking examples of wood-bending. The wood, however, is certainly less reliable wonderfully the jars on hands and arms, but it is disliked by many of the older riders as being too elastic and springy. Unquestionably, the most effective application of power for propulsion would be attainable if every portion of the bicycle were absolutely without "give," but other things have to be considered, and the handles are a part where a degree of elasticity can be introduced without harmful loss of driving power, trackwork excepted. The wood bar is not likely to make a sweep like the wood rim, but will probably stay long and continue to grow.

JULIUS WILCOX.
ALEX. SCHWALBACH.

SOME PRACTICAL REPAIR WRINKLES.

Cyclists will get careless at times and put on more power to a wrench in adjusting than they suppose. The result is that wheels are constantly being brought in to repair shops with the shoulders of heads, clamps and the like partly broken or cracked. In Figure 1 is shown at A a common case of breakage of the upper head of the frame.

When such a break occurs, the cost of substituting new parts is considerable, and remedies should be sought to repair the fracture. It is useless to bind with wire, rivet and the like, as the jar of the machine soon loosens both wires and rivets. We have lately adopted the method shown in Figure 2 with success. It consists of turning down the shoulder of the head, and forming a seat for a wrought-iron ring B. This ring can be shrunk on, and a couple of pins D put through it into the shoulder C. Such a job will stand any amount of pressure and is lasting.

Frequently heavy men come into the shop with a saddle post snapped off at E as shown

in Figure 3. It is better to substitute the broken piece with a new one than tinker with the old. But a new one may not be at hand and the wheelman may wish to use his wheel at once. If so, put on a collar like F in Figure 4 and insert two or three pins through it. Then put in a brace bolt H, with nuts H. A larger view of the bolt is given in Figure 5, in which its shape may be seen. This way of repairing the break will assure strength.

Set screws are always more or less trouble to both users and repairers of bicycles unless they are kept in good condition. Ordinarily the point of a set screw is very hard. It would be useless to make a saddle-post or other shaft as hard as the point of the set screw; consequently the partly sharpened point of the set screw necessarily cuts miniature grooves and holes into whatever objects it contacts with. One of these objects is the saddle-post. Frequent setting and resetting of the saddle soon results in a series of indentures in the shaft (B) as represented by D in Figure 6. Therefore, when the adjustment is such that the point of the screw rests

upon a hump as shown, the chances are that the weight of the rider will shortly force the shaft down until the point of the screw drops into the worn groove, where it will stay.

To prevent this, take out the shaft, cut a flat surface, as marked E in Figure 7, thus giving the screw point E a new surface to contact with. Or the shaft can be heated and turned so as to present a new side, which will last until another season, maybe. Another way is to not touch the saddle-post, but merely grind the set screw to a point like G in Figure 8. Such a point will take hold even on the side of an incline.

Frequently saddle brackets must be recovered with new leather. Avoid putting in a rivet crooked, as indicated by A in Figure 9, as such a rivet will work loose, perhaps break off, and will be generally unsatisfactory. Avoid leaving a part of the head protruding at one side, as marked B, for this elevated portion will engage with things and be snapped off. Put in all rivets straight and head them up securely and uniformly, as illustrated by C. GEO. D. RICE.

SOCIETY AND CYCLE.

A clever society woman declares that the chief reason why her set does not indulge more in cycling is because a society woman's life is divided into four seasons:

Spring—When she dances but does not dare to cycle.

Summer—When she dances and dares to ride.

Autumn—When she dances but prefers to wheel.

Winter—When she no longer dances and cannot ride.

MAKING HIS ARGUMENT.

"The Man who wants to buy a real \$100 Wheel for \$18.75—surely his mottoes are not altogether good," said Mr. Bunco Bill, temporarily aiding as distributing agent for a cycle auction on the Bowery. "I have heard a Judge while I waited for my Turn in the Dock say, 'Cavaet emptor—let the Buyer beware.' I am not honest, but is my customer honest?"

BLESS THEM!

Now the bicycle is charged with ruining the booksellers' business. Maybe it is true, but, even so, there is a powerful amount of printed abomination that the human race would advantageously leave unread, and if this was what is getting the go-by through the agency of the wheel, blessings galore on the men who invented and perfected it!

GOOD ROADS WITH GOOD VOTERS.

A good road is the exception and a bad road is the rule. How much longer this expensive neglect of the highways will be permitted lies wholly with the voters, and until their representatives are impressed with the importance of this matter there will be no legislation such as is needed to bring about an improvement in the betterment of the public roads.

WAS A REGULAR RINGER.

In a recent cycle parade in Ferrol, Spain, the prize winner's wheel was claimed to be adorned with 6,000 small bells. Whether the judges were forced to count the bells on the winner's wheel, or whether they accepted his count of them, is not stated.

DECLINED.

"Excuse me," said the pneumatic tire to the tack which had tried to introduce itself, "excuse me, if you please, but really I do not consider your point well taken."

PLUMPLEY'S PLEASANT PASTIME.

As Mr. Plumpley entered his office the other morning he seemed very limp and weary as he dropped into an easy-chair, and his partner, noticing his condition, remarked:

"I tell you, Plumpley, this bicycle business will be the death of you yet. You go and overdo the thing by riding fifty or sixty miles a day, and the first thing this noon you'll be down sick with a fever. You pulling off your flesh at such a rate is sure to result in sickness and a big doctor's bill."

"But I didn't go near my wheel yesterday at all," replied Plumpley.

"Well, then, you rode it the day before yesterday. I can tell very well by your broken-down appearance that you have been taking a long ride, and you can't fool me when you say you were not riding yesterday."

"Now, see here," responded Plumpley, "you are away off in your calculations. I didn't have the wheel out at all yesterday. Not a single moment, I can assure you."

"Then why are you so fagged out?" asked his partner.

"Because, the other day, I was foolish enough to go and listen to my wife and buy an ice-cream freezer. She said we could save enough money by making our own ice-cream during the summer to pay for a new wheel for her—woman's economy, you know."

"Well," said Mr. Plumpley's partner, laughing, "I see the situation at a glance. You went and bought the ice-cream freezer, and carried it 'way out in the suburbs, as you carry everything else, from a pineapple to a clothes wringer, and you put in more hard work on it than you would have put into a century run. Now, why did you not send it out by express, old man?"

"I did send it out by express, and it landed at the house safe and sound on Saturday night."

"Then how did you come to exhaust yourself in this way? You look as if you had just finished in one of those Chicago twenty-four hour races, and I'm sure you are ten pounds lighter than you were on Saturday. Now, what's the matter?"

"You see," said Mr. Plumpley, as he rolled himself into a ball of comfort in the chair, "it is all due to the fact that my wife wanted me to make some ice-cream yesterday, just to see what the new freezer would do. After everything was in readiness I went down to the cellar and began to sprout it with might and main. When I did the grinding in a standing position it almost broke me in two, and when I straightened up for a rest the small of my back went off like a pistol shot. Then I sat down on a keg and clutched the freezer between my knees and ground away until I had ground the bark off both my shins and hadn't skin enough left on my hands to make a tire patch. I got mad and ground away for pretty near three hours without stopping. I was a wreck when I stopped. I was sore and exhausted, and had to go and take a shower bath, and all this was done to save the 60 cents we used to pay weekly for ready-made ice-cream. I actually put in three hours of hard work."

"That was certainly the roughest part of it, wasn't it?"

"No," replied Plumpley, "it was not the roughest part of it; it was the funniest part of it—the part of it that was bristling with side-splitting humor."

"How do you make that out?"

"Why, because the machine was guaranteed to be a one-minute ice-cream freezer."

ONE AT A TIME.

"I see a New Jersey girl was married in a bloomer suit. What next, I wonder?"

"Divorce suit, probably."

IN A COLLEGE TOWN.

To gain thoroughness in any business it is always well to begin early in life. H. G. Shepard, the well-known wood rim and handle-bar manufacturer, can easily lay claim to experience in bending almost since infancy, as in an address made before a convention of carriage makers he stated that his knowledge dated back to very youthful days, and that many, many times his good mother bent him over her knee to keep him straight, and it was a lesson he never forgot.

But, in all seriousness, the head of H. G. Shepard & Sons is a man of rare judgment regarding wood and its workings in every branch. From selecting it on the stump to the finished product it has been made a life-long study, and by pursuing the same businesslike methods, and by the same care and attention to the finer details that have brought fame and fortune in the carriage work, this old New Haven house enjoys an enviable reputation in the cycle trade.

They were among the wood-rim pioneers. In those days when a rim of any other material

than steel was looked upon with suspicion, it took nerve, and plenty of it, to force upon the market such a radical departure in bicycle construction as this meant. They were wise in their day, aiming for first-grade only, a principle that they have rigidly adhered to ever since, and Shepard's rims were soon sought by those who valued goods more for their quality than by a mere measure of dollars and cents.

The travelling man who journeys out to Shepard's factory is always assured of a hearty welcome, and no matter how busy they may be in their mill, and though covered with sawdust fresh from a buzzing lathe, a few moments can always be spared to talk business and exchange any trade gossip that may be interesting—a trait that it would pay many others to copy.

Near by the heavy pounding of hammers leads one by the sense of hearing alone to the shops of Kilbowe & Bishop, manufacturers of drop forgings. While yet a young concern the establishment is very complete, and gives every evidence of prosperity. Being men of large experience in their particular line, both ends of the firm can bend their energies to producing work that compares with the best,

and samples of forged steel are shown that virtually sell themselves.

For the coming season their patterns embrace all that is new. Many of their designs are novel and beautifully worked out, so that success will surely be perched upon their banner.

KNEW THE BRAND.

"I am lost!" she exclaimed, in a tone of terror.

"Fear not, fair one," said the hero, who had not rescued any one for three or four chapters, and was beginning to feel lonely. "I will protect you."

"I don't want protection," she answered. "What I want is a map and a compass and a guide book. I have just come from Boston, and the streets here are so straight that I am utterly confused."

"Then," said the hero, "I'm the very man you are looking for. I am the editor who publishes the routes for wheelmen in the daily papers."

"Is that the only help you can offer? Then I am indeed lost."

She knew the value of daily newspaper cycle routes

MCINTIRE IS NEW ENTIRE.

An Allegheny, Penn., man, Charles S. McIntire, has for a long time been working on a chainless bicycle, and is about to place on the market the result of his labor. The mechanism is of two steel driving rods, connected with the rear axle, running along each side of the rear wheel, the front ends of which are connected with driving apparatus, which is incased in a small dust-tight bracket. A case-hardened steel ball-bearing belt (something entirely new and unknown in mechanics before) passes over two wheels, incased in lubricant, so that the entire mechanism runs continually in a lubricant bath. There are absolutely no joints or parts exposed to the dust, no skirt guards being needed, as there is nothing to catch or soil the clothing. There is no more twisting or buckling of the frame as the wheel is propelled equally from both sides, the power being taken directly from the pedal cranks to the rear axle of the bicycle. In place of getting two impulses of power to each pedal revolution, as in the ordinary chain wheel, the power is applied constantly, there being absolutely no lost motion in the pedals, thus giving the rider perfect control of the machine, which can be propelled or stopped with one-third the effort of an ordinary chain machine.

SHE WASN'T TEST PROOF.

"I am glad," he said pleasantly, when she first appeared in her bloomers to accompany him on a trip up Riverside Drive, "that you have taken up this new woman idea."

"Really?" she asked, doubtfully. "I was afraid you wouldn't like it, but it does seem as if a woman should take a more important part in the affairs of life."

"Yes, indeed," he replied. "It will take her mind off her clothes, and that will be a great stride forward. She will care less for appearances and more for the realities of life. The trivial things that have heretofore claimed her attention will be ignored."

"Of course," she said proudly. "With our enlarged sphere of usefulness, brought about by cycling, we naturally take a broader view of things and become more self-reliant. Trifles cease to annoy us, and we are ready to grapple with the great problems of life."

"Exactly," he returned. "Now, if you were not thus converted you would be dreadfully mortified to think that your hat is not on straight, but, being a"—

"Good gracious!" she cried, excitedly. "I must look like a fright!"

"STOP, THIEF!"

A young man of Cleveland, Ohio, is about to apply for a patent on a device which he believes will exterminate the bicycle thief. The young man has affixed a miniature photograph to his bicycle, directly under the saddle. The photograph is inclosed in a square box and the apparatus only weighs two pounds and a half. In the centre of the box is the tinfoil cell, upon which he has imprinted the words "Stop, thief!" many times. A wire connects with the rear wheel of the bicycle, and with that the apparatus is complete.

When the young man enters a building he presses a button and his thief catcher is set. When the thief, who is always near by to take advantage of any careless person leaving a bicycle on the sidewalk, jumps into the saddle and starts to ride away, he is stopped by a voice which shouts, apparently behind him: "Stop, thief! Stop, thief!" The faster he rides the wheel the louder the voice pursues him, until finally the thief in disgust vaults off the wheel and leaves it to its fate. A pressure of the button by the owner and the mechanism is detached and the wheel runs smoothly.

WHERE THE HEART TELLS.

Tension and excess are common to all sports, and to this indictment even cycling pleads guilty, because in its enjoyment the motion is so easy and the effort required so slight, that there is a strong temptation to overdo. Women, lacking athletic experience, have had fewer lessons in muscular strain than men and are therefore the greatest sinners in this respect.

Both men and women, however, should always remember that panting and palpitation mean that one of the two chambers making up the main pumping power of the heart—namely, that one which has to do with driving the blood through the lungs, and which is robust only in laborers and athletes—is fighting hard under a load which may cause all degrees of over-stretching or acute dilation, from the most momentary embarrassment to a permanently crippled condition.

It may be said that the pulse should not range above 100 after a rest, but rules are hard to make. Tire is the test, and reaction.

UNCLE EPH'S APHORISMS.

Yo' kin trade yo'r amachoorism fo' a dollah, but yo' kin nebber trade back—'ceptin' yo' gits a talkin' lawyer and a racin' board wid a whitewash pail dey is anxious to empty.

Dah ah bad spots in some of de bes' bysickles, jes' as dar ah weeds in de bes' gahdens.

Het's a wise man dat knows de man who makes de bysickle he buys at de dry goods' store.

Dah ah men who ride century runs fo' exercise wen den wives ah sawin' wood.

Dis ridin' a bysickle 'ould be a heap mo' beautiful if dah war as many good ones sold as dah ar poor ones.

W'en money cums in at de windah amachoorism ah kicked out ob de do'.

Ef men am descended from de monkey dere am a heap of dem humpbacked scorchers who hab reason to be proud of dah ancestry.

FOR PERSONAL REASONS.

"Say, cull, d' yer t'ink dese bysickle fellers will run de railroads out of de biz?"

"Gee, I hope not!"

"W'y?"

"'Ow de dooce 'd yer ride on de trucks if dey did?"

THIS LOOKS PROMISING.

Since this paper first published the fact that the Pope Manufacturing Company intended putting a chainless bicycle on the market for 1897 THE WHEEL has been besieged with any number of inquiries regarding this form of machine from all sections of the country. It has also developed the fact that the Pope Company were not alone in their experiments and that for some time back inventors by the score have been trying their hands at the doing away of the chain. Among the number of plans to do this submitted to THE WHEEL the one illustrated was selected because it embodied as many points that appeal most thoroughly to the practical mechanic. It is the invention of J. A. Parker, No. 926 Drexel Building, Philadelphia, and the patent is dated June 10, 1896.

The illustration represents a sectional view through the crank-hanger, lower braces and rear wheel, and while the general view may show no radical departures from gears of this type, a close examination of the drawings brings to light many new points. The main object has been to provide means by which the adjustment of the bevel gearing that constitutes the driving mechanism may be readily and accurately accomplished, and

of furnishing a rigid frame for their retention when so adjusted.

A is the crank shaft, the driving side of which is provided with a bevel wheel, B, instead of the usual sprocket. This wheel gears into a bevel pinion, C, on the inner end of a tubular shaft, D, which surrounds and has its bearings on one of the lower braces, E. On the outer end of this shaft is a bevel wheel, F, which gears into a similar one, G, on the hub of the rear wheel, H.

One end of the axle, O, of the rear wheel has a teehead, I, which is bored out at an angle corresponding to that of the lower brace on which it is free to slide toward or from the crank shaft. The crank shaft, A, is screwed into a sleeve, J, which turns in the usual ball bearings in the crank hanger, this sleeve being locked at K to the crank shaft in whatever position the latter may be adjusted transversely. The tubular shaft, with its gear, can be adjusted on its cones until the front gear meshes correctly with the large bevel on crank shaft. The rear or driving wheel is then adjusted laterally on the lower brace, E, and transversely by rotating the sleeve, L, which is screwed on its axle,

until the rear wheels mesh together correctly; the rear axle and sleeve are then locked together. An adjustable stop, M, prevents the teeth from coming too close in pitch, and the rear wheel is kept firmly in place by the nut, N, screwing into the brace, E. Removing or replacing the rear wheel changes none of the adjustments of the gearing.

The lower end of one of the rear forks is attached to the teehead, I, the whole combination forming a frame in which the alignment is strong and rigid, in fact, the lower brace, E, with its tubular driving shaft being necessarily of heavier tube, may be considered the strongest part of the machine.

The gears are incased in aluminum shields which keep them practically dust proof, and as they can be kept well lubricated, the friction and wear is reduced to the lowest point.

As can be seen in the drawing, adjustment is possible at all points, and also that both the crank axle and rear wheel axle are fitted with inside cones, which, to some minds, is the coming form of construction at these points. A number of trial wheels have been made while experimenting, and have given extreme satisfaction. They ride easily, and, while subjected to some very severe tests, have stood all of them admirably, and the inventor claims that in this he has come closer to solving the problem of chainless wheels than anything yet offered in that direction.

SAGINAW'S WAY OF STOPPING LEAKS.

Another preparation to prevent leaks and punctures in pneumatic tires is "Short Stop," manufactured by Morley Bros., Saginaw, Mich. The solution is injected in the tire and is guaranteed to preserve the rubber, repair all imperfections and small leaks and to prevent punctures. The self-healing feature is performed by the compound filling completely, from the inside, any opening and defect in the rubber. No oil is used in its composition, hence the guarantee that it will not injure a tire. On the contrary, it is claimed that it will increase a tire's durability and resiliency.

SMITH, SULTAN & CO.

At last the fair crusade against the bicycle has found an ally, a fitting one, too. The Sultan of Turkey, that blood-stained clog on the hands of progress and humanity, has issued an order prohibiting cycling in and near Constantinople as immoral and "dangerous to the State, and an officer of an Italian corvette was taken into custody for having been found riding a bicycle, or a "devil's chariot," as the Turks name it.

SMILING AND CYCLING.

The Rev. Dr. Parkhurst says he has never seen a person smile on a bicycle. Come to think of it, it would be rather difficult to smile and hold on to the bar with one hand. The old-fashioned way of standing up to it is the easiest after all. Evidently the Doctor never thought of that.

JAMAICA SIDEWALKS FREE.

Long Island wheelmen will be pleased at the recent action of the Jamaica trustees, who have rescinded all ordinances prohibiting cycle riding on the sidewalks in that village. Fulton street, the main thoroughfare, is alone excepted.

THINK IT MAKES BUSINESS GOOD.

Wilkins—I wonder why it is that the medical journals are beginning to take an interest in the improvement of country roads.

Bilkins—I don't know; but I have heard that some of them declare cycling has produced half a dozen new diseases.

A SEPTEMBER OUTING

WILSON R. YARD

PART III.

SARATOGA—TICONDEROGA.

Suddenly southeastward, sweeps a darkening shadow, blotting the mountain slopes and filling the hollows, and we witness, from afar, the novel sight of a distant shower, while above Old Sol casts his warm, penetrating light rays from a cloud-flecked sky of serenest blue.

The tiny clubhouse is a gem; an Hungarian orchestra discourses sweet music, and Miss Posey suggests a stay for luncheon. As it has been decided that the noonday boat shall be taken to the upper end of the lake, all acquiesce, save the Centurion and the Scorcher, who determine to ride the lake shore road to the Sagamore, and there rejoin the party. So off they set, from the Lake House, through the village, and take the right fork at three-eighths of a mile. The road is good but rolling. Down they dash over an iron-hedged mountain stream, which forms a tiny cascade as it rushes lakeward, now through a lining of neat summer places, whose smooth, green, flower-decked lawns look cool and inviting, their tall trees obscuring the lake view. Up grade and down, here and there a charming water scene through the vista of waving branch and leaf, over rippling, chattering streams, through choice bits of woodland, groves of sweet-scented pines, thickets of hemlock and wild-

Near Poultney

wood, under sombre, frowning, moss-festooned rocks, till, as the road forks, they lead to the right, through a woods whose quiet depths echo the cawing crows and hum with insect life. Under a bluff, up a steep, with a neat view of lake and mountain, down a sandy slope, up again, under the shadow of a tiny stone chapel, through the little hamlet of Hillview, with its solitary store; then a long upgrade with the bluff sloping abruptly down to the lake's edge; now a charming view of the lake, a grove and a turn to the right as

the road forks. On by a silent burying-ground, past the ruins of the Agawam Hotel, up and down as the road grows poorer, to emerge from a bit of woodland into the town of Bolton. ($8\frac{1}{4}$ miles— $88\frac{1}{4}$ miles.)

They pass the white church and take the first turn to the right over the bridge to the Sagamore Hotel. ($2\frac{1}{2}$ miles— $90\frac{1}{4}$ miles.)

The Sagamore, situated on the lower end of Green Island, is one of the handsomest and most fashionable of the Lake George hotels. The surroundings and views are of the finest.

From here we take the boat to Baldwins, and a beautiful lake sail begins. In and out through the rocky, tree-clad isles the boat winds her way, stopping every few moments at some miniature wharf to land produce or passengers for the nearby hotel. Every turn of the prow presents a new and varied prospect, till the eye grows awary with its surfeit of scenic treats. The waters narrow and broaden in the embrace of rocky mount, while the towering peaks cast their darkening shadows on its placid surface, which reflect their rugged outlines with a softening light.

where we turn to the right over the bridge to the little hostelry, Hotel Alexandria. ($2\frac{1}{2}$ miles— $93\frac{1}{4}$.) Here we leave our wheels, to take a view of what was once the upper falls, for from this point the waters of Lake George fell in a series of beautiful cascades 247 feet to the level of Lake Champlain.

The falls now are but a name, numerous pipe lines diverting the waters to turn the ponderous machinery of the many mills that crown the enlivening rocks. Again does the Fair Novice rail against the vandalism of the un-

Ethan Allen's Cave.

The verdure-clothed slopes are taking on a rich and varied coloring under the deft, artistic touch of the autumnal sun. There towers Black Rock, the loftiest of lake shore peaks. On the opposite shore follow successively the heights of Tongue, Three and Five Mile Mounts; there on the right again the ridge of Elephant Mountain, looking across to the famous, legendary Deer's Leap and its twin, Bloomer Mountain. Then, as we leave the charming precincts of Hague, and round Friendly Point, we see Anthony's Nose and the "Old Man of the Mountain." A bit beyond and the historical peak of Roger's Rock looms up, while as we put into Baldwins, our journey's end, we see towering heavenward, far in the distance, grim Mount Defiance, overlooking both Lake George and Lake Champlain.

From the landing we have a short, steep bit of sand to labor over, and then a fine roadway skirting the upper lake to Alexandria,

romantic, matter-of-fact manufacturer. The bare, water-worn rocks, however, are interesting, and, coupled with the low rumble of the waters of the dam above, needs but little imagination to picture the time when this was a portage from lake to lake and the view of the valley is pretty, charming and pastoral.

Continuing, we bear to the left at a quarter of a mile over a firm bit of road, down a long, gradual descent, that takes a deal of back pedalling, into Ticonderoga, to the Burleigh House $1\frac{1}{4}$ mile— $94\frac{1}{2}$ miles.)

We've just time for a spin to the fort ruins ere nightfall. So we turn out Main street, cross the bridge, swing around under the hill, and have a long stiff climb that taxes all the sturdy energies of the Scorcher to conquer, and proves a Waterloo to the others. The view from the summit of the town and mountains pays for the toll, and we spin on to a rustic gate, where the road makes a sharp turn to the left. An aged, weazen-faced female

hurries with tottering step to swing wide the gate and catch the coppers dropped in her outstretched palm. We roll through a shaded park and note in a grove of giant oaks on the right the outline of the earthworks thrown up by the French. A down-hill run and we emerge on a broad plateau, to see the gray ruins of the old fort before us. Some time is spent in snap shots, explorations of breastworks, moat and crumbling barracks, while the men and the venturesome Bloomer Girl get down on all fours to explore the dank, nerve-chilling recesses of the underground room. The ample proportions of the Fat Man compel him to forego the greswome experience. A stroll down to the turf-covered outlines of the Grenadier Battery, on the precipitous edge of the point, where we enjoy a rare vista of Lake Champlain and the mountains, is followed by a run back to town, with all tired enough to seek the soft embrace of sweet Morpheus at an early hour. (4½ miles—99 miles.)

Another bright dawning—assuredly we are favored by the gods—a light repast and an early start. Out Main street to Elm Tree Lane, with a long upgrade before us, with its rewarding view, straight on at the cross road, over a clay road bed that is always good except in very wet weather. Now down, with views of mountain and vale, and we strike a bit of sand, but a friendly sidepath comes to our aid, and we roll merrily on through a collection of old houses, till the road forks by a neat house with yellow trimmings, we rightly choose the left branch up over the hill, following the line of telegraph poles, and have a toil through broad, cultivated fields with a wooded ridge on their eastern border, while westward they sweep down the slopes to the lake. Southward lies the town, its smoke-floated housetops glistening in the morning

sun. Now down along the mountain base under frowning ledges of shaggy rock that assume a myriad of fantastic shapes. The environments grow wilder and the Fair Novice timidly hints at bears and kindred evils. By a dismantled stone crusher, down through a deep ravine, along a narrow ledge, with the vale deep below us, wild and rugged, a swing, affording a fine view of the valley, a dip, one very poor bit or road that requires care in riding, a rise, and again a dip to a crossroad, with a white farmhouse on the left of the roadside. Here erroneous information leads us to take the shorter but poorer road to the right, which exercises all our care in riding for a considerable distance, until we turn to the left unto a good piece of macadam, and lead to the right up a steep hill by the brick church and monument square to the Crown Point House, Crown Point. (9¼ miles—105¼ miles.)

A rest, and we take the centre crossroad, down hill and over the bridge by the mill pond, then up, and bearing to the right we turn to the right at the second road, over a fine road, a series of dips and rises, through broad, fal-

low lands, with charming scenic treats. Cross the railroad tracks and take the right fork of clay, smooth and level to the extensive fort ruins (8 miles—116¼ miles). Here we ramble among the crumbling ruins, promenade the broad reach of earthworks, enjoying the charming views, and press our never tiring camera buttons. The ladies seek a shady dell in which to spread the light lunch for which the lack of a hotel has compelled provision, while the men seek a secluded spot on the lakeside for a refreshing dip. A tiny ferry slip juts out from the water's edge, where the lake narrows between Crown and Chimney points, and here we note a signal that we set for the little toy boat to call for us.

The Centurion, ever thoughtful, had suggested ere we left the hotel that, as we are now to enter the Prohibition Green Mountain State, it would be wise to see that our flasks are well supplied, a very sensible precaution, as innumerable fine orchards, whose trees bend low under a weight of ripening fruit, tempt the cravings of the inner man, ofttimes to excess.

Luncheon, and we embark on the wee ferry to Chimney Point.

From the ferry we follow the road up the hill and turn to the right on the crossroad. The roadbed is of clay and very fair travel-

Llama Cascade.

ling. Down by 'he lakeside we pass a large camping party, the tents looking neat and cosy, while cool breezes sweep upward from the waters, laden with sweet odors. We cross broad marsh lands, keep to the right as the road forks, and at about three miles bear to the left, following the main road, then straight on at the crossroad by the brown schoolhouse, through a broad farming district bounded by the distant ridges. Down and up and straight on, over a succession of easy grades, until the road bears to the left, then straight on as it forks to the right, up a long climb. (The signboards are very plentiful and distinct in Vermont, an admirable feature.)

On over dip and rise, with charming views as the valley broadens here and narrows there. By another school, down over a bridge and a turn sharp to the left upgrade; before us is a low tree-crested ridge beneath which crops out a moss-flecked ledge of white doëlite or coarse native marble, giving the ridge the name of "The Ledges." A sharp turn again to the left by the neat farmhouse directly under the ledge and up through a charming woodland grove, with a magnificent view as we reach the top of the far-distant Adirondack peaks on the one side, and the lofty, nearby domes of the Green Mountains on the other. The road swings to the right, and we see the spires of Middlebury. We keep straight on, at the crossroad downgrade into the town, passing on the right the white

marble college buildings, then the square; down across the bridge and bear right up the hill by the town hall to the Addison House (L. A. W. \$2.50). (16½ miles—132¾ miles.)

The town is very pretty, the roads smooth, well kept and lined with neat residences. About three miles below the town are Belden Falls, hardly worth a visit unless a stay is made. Otter Creek as we cross the bridge presents a very charming appearance, while

A Rutland Marble Quarry.

it rolls northward over the dam with a rumble and a roar.

After a rest we go southward on Pleasant street, well named, with its bower of trees, toward our destination, charming Lake Dunmore, nestling in the mountains at the foot of old Moosalamo. A block to the left, then to the right over a loamy pike, which deteriorates as we progress, and calls forth protestations from the Novice and the Fat Man. Now and again a bit of smooth side path relieves the strain, and never is it unridable. We turn to the left at the forks (noting the signboards), and follow the telegraph lines. A long grade up and down, bear to the right at the bottom of the hill, and then to the left as we reach the iron bridge, a rise and a down run, and at the foot we bear to the left, where the sign points to the lake. The road is upgrade, over the mountain, poor and unridable for some distance, then improves, and we roll down under a bower of trees through which peeps the lake, to the Lake Dunmore House (\$3) (7¼ miles—140 miles).

The lake is a charming, pellucid sheet, bordered by high, rocky cliffs, majestic pine mountains and beautiful meadows. The surrounding country is rich in historic and romantic associations. Thompson, in his charming story, "Green Mountain Boys," devotes some space to a pleasing description of the lake and the thrilling scenes of the tale are laid hereabouts. The walks and drives are beautiful, while the lake abounds in fish, and boats of all description are to be had at the hotel.

In the early morn we take boats, and after a delightful row across the lake to Kecey's, we climb the hillside to the Liana Cascade, named in honor of General Wool, a beautiful sheet of water pouring down the mountain side, a succession of falls nearly 200 feet in length. The roar of the sparkling waters, the lake, and the cool green hills, over which an awe-inspiring stillness prevails, call forth more poetry from the Fair Novice.

(To be Continued.)

PALMER

TIRES

THE PALMER PNEUMATIC TIRE CO. CHICAGO, ILL.

AGAIN WE WIN.

The National Circuit opened at Oakland, Cal., May 1, and closed at Washington Oct. 5. Races were held in nearly every city of importance in the United States. One thousand two hundred and sixteen (1,216) prizes were offered at the different meets on the Circuit, and

491

Prizes were won on PALMER TIRES, more than were won on the tires of any other manufacturer, and nearly as many as all makes combined. Since 1892 twice as many prizes have been won on PALMER TIRES on the National Circuit as all other tires combined, and in those three years more prizes have been won on PALMER TIRES, both off and on the Circuit, than on all other tires combined.

TWICE AS GOOD—TWICE AS EXPENSIVE.

TRADE CHANGES.

COLORADO.

Denver.—The Gerwing-Hilton-Kennedy Cy-
cle Company reported recorded chattel mor-
gage for \$10,660.

CONNECTICUT.

Bridgeport.—Bridgeport Cycle Company.
Business continued by W. B. Stiff.
Stamford.—Swayze & Lawrence, sporting
goods, etc., succeeded by E. S. Swayze.
Wallingford.—The Wheel and Cycle Bar
Company, incorporated by M. N. Wickwire,
Berlin; Roger S. Austin, Edward A. Wood,
Wallingford; Emma Treat Linsley, Torrington;
to manufacture wheels, spokes, hubs
and cycle-bars. Capital stock, \$10,000. This
new company absorbs the Cycle Bar Com-
pany and the Robinson Wheel Company.

DISTRICT OF COLUMBIA.

Washington.—Eastern Cycle Company re-
ported gave bill of sale for \$5.

GEORGIA.

Atlanta.—Atlanta Bicycle and Machine
Works is about ready to begin operations.

ILLINOIS.

Chicago.—The Standard Bicycle Manu-
facturing Company, incorporated by H. B.
Wickersham, F. E. Hayner and M. D.
Smalley. Capital stock, \$50,000.

Chicago.—The Monarch Cycle Manufac-
turing Company filed a petition in the United
States Circuit Court against the Royer Wheel
Company, of Cincinnati, Ohio. This is an ac-
tion to recover money due on account and
damages for the alleged violation of a con-
tract.

Peoria.—F. F. Ide Bicycle Company. Loss
by fire, \$35,000; fully insured.

KANSAS.

Havensdale.—R. C. Coverdale, hardware,
succeeded by Dennen, Eddy & Coverdale. Will
add bicycles, and desire agency.

MICHIGAN.

Detroit.—Wheeler Saddle Co., incorporated
by Edward S. and Benjamin F. Wheeler, Al-
fred A. Mann and Geo. C. Clark; to manufac-
ture bicycle saddles. Capital stock, \$20,000.

MINNESOTA.

Minneapolis.—W. L. Price, reported gave
bill of sale for \$1.

Winona.—Davis & McDowell commenced the
manufacture of Hiawatha bicycles.

MONTANA.

Helena.—The Clark & Curtin Hardware Co.,
incorporated by A. C. Clark and others. Will
deal in bicycles and desire agency.

NEW YORK.

Buffalo.—Holley Cycle Co., bicycle manu-
facturers. Charlotte Edwards reported gave
bill of sale for \$1,000.

Canandaigua.—John N. Willvs & Co., report-
ed assigned.

Ithaca.—R. O. Foster, gave judgment for
\$71.

New York.—John Kroder, incorporated, No.
512 Broadway, manufacturer of certain poles
and dealer in bicycles, assigned to F. Schwan-
hauser. The Sheriff is in charge of the stock
under five executions for \$22,000. The com-
pany was incorporated in 1892, with capital
stock of \$200,000.

WHERE COMFORT SEATS ITSELF.

The world has long since accepted the
theory that corduroy is the one material
which the loom is responsible for that is
practically unwearable. Perhaps the Me-
chanical Manufacturing Company, No. 14
Franklin street, Boston, believed this when
they chose corduroy as a covering for the
Perfection Pneumatic Cycle Seat they are
now putting on the market.

The base of this saddle is of laminated
fibre, the covering of the very finest imported

corduroy, mounted with gun metal fittings,
heavily nickeled. It is made in three styles,
two of which are shown herewith. The sad-
dle can be fitted to any saddle post, or ad-
justed to any angle. "It is extremely easy
and comfortable, and can be readily inflated
to any degree of rigidity desired. The elas-
ticity secured by its stay compartments ob-
viates all shocks, jars or strains, and thus
prevents injurious and dangerous conse-
quences. The seat is neat in appearance,
strong and resilient, equally suited for either
ladies or gentlemen," so the manufacturers
say.

OHIO.

Elyria.—The Fay Mfg. Co. new factory is
nearing completion.

OREGON.

Portland.—The Falcon Wheel Co., incorpo-
rated by H. K. Leonard, E. J. Leonard and W.
C. Irish, to deal in bicycles, etc. Capital stock,
\$10,000.

TEXAS.

Fort Worth.—Young & Baker Cycle Co.
Deed of trust for \$2,146.
Galveston.—Galveston Cycle Co. reported
sued for \$193.

VIRGINIA.

Lexington.—J. E. A. Gibbs has invented an
attachment for bicycles, which a company will
be organized to manufacture.

WISCONSIN.

Fort Atkinson.—Fred Dickerson will open
new store.

Milwaukee.—Bolte Cycle Works, Norris
Block, damaged by fire.

Milwaukee.—The Davidson Cycle Co., Chi-
cago, has sued Lindsay Bros. and W. H.
Stanley to recover possession of twenty-five
bicycles of the alleged value of \$2,800, which
were levied upon by the Sheriff.

Phillips.—J. F. Brietzman, repair shop, in-
terested purchased by J. M. Holdridge, who will
continue the business.

Sheboygan.—The Electric and Cycle Com-
pany incorporated by Charles V. Luin, J. L.
Acker and V. J. Luin. Capital stock, \$2,000.

Milwaukee.—Huenneken's Cycle Co., bicycle
manufacturers, reported changed name to A.
W. Huenneken's Sons Co.

Milwaukee.—Frederick Weil, bicycles, sport-
ing goods, etc., assigned.

Milwaukee.—Pollitt Cycle Co., bicycle manu-
facturers, reported gave bill of sale for \$1,046.

Darrach, Newark, N. J. Filed September 23, 1895.
Serial No. 563,356. (No model.)

DESIGNS.

26,031. Bicycle shaft and crank. William S.
Ward, Plantsville, Conn., assignor of one-half to
Edward W. Twitchell, same place. Filed July 25,
1896. Serial No. 600,558. Term of patent, 14 years.

26,032. Bicycle crank-shaft. William S. Ward,
Plantsville, Conn., assignor of one-half to Edward
W. Twitchell, same place. Filed July 25, 1896.
Serial No. 600,559. Term of patent, 14 years.

26,023. Cycle-hanger. George Lane, Poughkeep-
sie, N. Y. Filed July 29, 1896. Serial No. 600,957.
Term of patent, 14 years.

WILL PRAY FOR RESUMPTION.

The Hodzeman failure has meant much
deprivation to its employees, who constitute
the chief breadwinners of the village of
Tuckaheo, where the factory was located.
With that sublime faith found more often
among the lowly, the village pastor has
asked his congregation to offer up their
prayers that the factory may be again
opened.

TO DISPLACE FORGINGS.

Drop forgings, of course, can't talk. If they could they would undoubtedly say something interesting to the Whiteley Malleable Castings Company of Muncie, Ind., for it is the avowed intention of the Whiteley people to force the forgings to the wall. The means to that end is a peculiar metal, in its original form the finest imported pig iron, which, treated with the Whiteley process, becomes a metal that has virtues all its own—virtues which it is asserted will compel the respect of cycle manufacturers, for, be it known, the metal is to be worked into all manner of cycle fittings, which are claimed to possess greater strength than drop forgings and to require less labor in finishing and to be in other respects more generally economical.

The metal is in no sense an experiment. While the company has made but little noise it has been subjecting its product to a careful series of tests, both theoretic and actual, and it is highly indorsed by experts.

Whether or not their metal will, as the company expect, ultimately displace forgings entirely, it is sure to create a wave of interest in every cycle factory, now that the making of wheels has come to the point where the profit lies in economical production.

From the point of appearance the finished product attracts the eye at once. It has a particularly smooth surface, the parts needing but little finishing when they reach the cycle makers' hands.

Actual tests of the parts made by the company of this metal show gratifying results. Numberless pieces have been severely hammered on an anvil, bent and twisted in a vise, and in all cases no cracks or check marks show.

A word about the company and its capacity. The former is so widely known among manufacturers everywhere that an introduction is hardly necessary, but as to capacity: The plant is simply enormous, covering ten acres, with very nearly five acres of floor space. The foundry proper is 750 feet in length by 75 in width, and can take care of a hundred tons of metal a day. The use of natural gas—and the company controls a large gas territory—gives them an advantage in quality and cheapness of production that is no mean element.

The bicycle fittings of the Whiteley Company's new metal will be known as the McHaffie Steel Fittings, and the company will be pleased to hear from the trade.

IN THE TRADE TO STAY.

Poughkeepsie, N. Y., expects to enter the wheel trade in two directions. The Sussex Tire Company, with a capital of \$5,000 and a directorate composed of Messrs. Albert H. Gleason, Charles H. Broas and Charles A. Stuart, being one enterer, and the Sussex Cycle Company, organized by the same interests, being the other.

Albert H. Gleason, who is president of the new corporations, is a lawyer with an office at No. 265 Broadway, New York, and the other incorporators are connected with the same office. When interviewed, Mr. Gleason said that the companies were as yet only in a formative state, and without any need at present for more than nominal capital. They proposed in time to make a new tire, which might be described as belonging to the same class as the "Vim." They would also be in the field for the manufacture of bicycles.

Manufacturers would do well to look up the Peruvian market. There have been several small inquiries received from that country lately.

COMFORT FOR PUNCTURE SUFFERERS.

It is ever the unexpected that happens, and the man who never carries a repair outfit simply because punctures are unknown to him will sooner or later find out that it is a case of the pitcher that went too often to the well—and be landed high and dry miles away from home, cursing fate, when really his own carelessness is to blame. Of course, in defence of this it may be said that many repair tools are so complicated and so cumbersome that carrying them is a bother. The Boston Woven Hose and Rubber Company have issued a booklet, "Punctures, How to Get Them and How to Close Them," in which they describe a little apparatus designed to use with their new repair compound, "Vimoid," which consists of a peculiar, thick rubber composition, that is injected into the punctures, making, as is claimed, a permanent repair. The entire tool is complete in a handsome nickelled tube 4 by 3/4 inches, occupying a space in the toolbag much less than a pump, and in simplicity and clean-

HERE IS SOUND REASONING.

Dealing with the idiotic newspaper stories of the actual cost of a real \$100 wheel, and the subsequent cost of such untruthful statements upon the cycle trade, "Hardware" hews close to the line of sound sense with these remarks:

"This discussion left the unwarranted assumption on the minds of the buying public that a first-class cycle actually cost complete about \$31.31. So, by inference, a man ought to buy for \$40 or \$45 any cycle possessing superior riding quality. One would scarcely believe it possible that thinking men could be led so far astray, or that a man who, for the advancement of his daughter's musical ability holds an ambition which the name of Chickering or a Steinway alone could gratify, would unhesitatingly permit his son and heir to mount a cycle costing \$35 or even less, and mounted on which he risked his life and limb at almost every mile indicated by his cyclometer."

"Of what does reputation consist, and what benefit does merit bring its producer, if conditions such as these prevail and begot the judgment?"

"If all the pianos possessing unknown names were thrown on the market at bankrupt prices, it would not for a moment cause his judgment to swerve from those which he knows indicate quality, unpassed merit

A Naugatuck Valley Quartette.

ness making one of the most desirable things in its line yet offered. The book is well worth the reading, and will be gladly furnished on application at any of the company's offices.

EUROPEANIZING THE WEAVER OUTPUT.

H. Hardy, of the Hardy Cycle Company, has sailed for Europe on the Breton, of the French Line. He will represent the J. A. Weaver Cycle Fittings Company, of this city, and will establish permanent agencies for this firm in Paris, London, Brussels and Berlin. The J. A. Weaver Company has contracted for the entire 1897 output of barrel hubs of the Columbia Heights Drop Forge Company, of Brooklyn. The Weaver Company will shortly open a downtown branch in or near the Chambers street cycle district, with Mr. William A. Schnauffer as manager.

It is noticeable that as soon as a woman gets a wheel of her own she stops talking of how unmanly bicycling is.

and positive value. And yet, in the more important machine, constructed by makers of long standing and qualified experience, to be sold at an unchangeable price, he dismisses with scarcely a thought and buys a 'fake' wheel, sold at one-third the cost of the one known to possess acknowledged excellence. It is needless to remark that if his cycle-riding progeny are alive to-day, it should be considered a dispensation of divine Providence.

"These conditions cannot possibly affect the cycle market in 1897. Even the most obtuse can at least draw some wisdom from the bank of experience. Our makers of high-class wheels will find a ready trade for their production for 1897, not three or four fold in volume over any previous record-breaking year, but still of sufficient importance in quantity to make desirable a lavish expenditure in maintaining quality at present standard of merit.

"This alone would justify those more complete facilities for disposing of the same, that annually inspires the brain-energy of cycle manufacturers and the indefatigable ambition of their carefully selected agents."

McDONALD WITH THE WORCESTER.

The eastern branch of the Monarch Co., in Reade street, have lost the services of George McDonald, who has been with the concern for the last year. Mr. McDonald leaves the company on an amicable basis, and has signed a contract for several years with the Worcester Cycle Co., of Worcester, Mass., with temporary office at No. 45 Wall street. This company has an invested capital of \$800,000 in their plant. They were rather late in getting under way last year, but will be in good shape for next season's trade. They will open big New York offices, have their headquarters in the metropolis, and will put an ample staff of men on the road.

WILL SAIL FOR SIDNEY.

F. A. Peters, formerly with the Union Manufacturing Company, of Toledo, is about to sail for Sidney, Australia, in the interest of the Bean-Chamberlain Manufacturing Company, of Hudson, Mich. He will take with him models of the '97 Hudson cycles, and push their sale in Australia, New South Wales and New Zealand. He expects to remain in the Antipodes for two years.

WHAT A SPARK DID.

A stray spark from a blacksmith's anvil came near doing great damage to the Acme Manufacturing Company's plant at Reading, Penn., on Saturday last. It fell on a can of benzine, which at once exploded, throwing the burning fluid up the elevator shaft and igniting the woodwork. Two workmen were slightly burned, but the flames were subdued with but little damage to property.

TRY A FILLER.

As an evidence of faith in their newest production, Steel Carbonite Filler, the Glidden Varnish Company, Cleveland, Ohio, are offering to send a sample of the composition to such manufacturers as ask for it. The filler is designed to help out those who have been troubled by the rusting of the tubing where the enamel has been chipped.

FRICITION HAS VANISHED.

Peace has been restored among the members of the firm known as the Howard & Nichols Cycle Manufacturing Company, makers of the Howard chainless bicycle, at Newark, N. J. The troubles have been smoothed over out of court.

ABOUT GRANULATED RAWBONE.

"How to Case Harden, Color and Anneal with Granulated Rawbone," the little pamphlet issued by the Rogers & Hubbell Company, of Middletown, Conn., is well worth the reading of every one interested in the subject.

"NOTHING BUT THE BEST."

Compared to some others, the Duguid Saddle Co., of Syracuse, N. Y., is young in the cycle saddle business, but the industry in which they for many years previously had been engaged, and are still engaged—that of saddlery hardware—had given them many points which have served them well since

they added cycle saddles to their product; their guiding principle, "Nothing but the best," has done the rest.

In all they market fifteen styles of saddles, but their No. 7 is probably the best known to the trade. It is of that peculiar shape, very

broad at the back and narrow at the peak, which affords a most comfortable seat and at the same time is without the least danger of injury. It is formed of fine, heavy leather, fitted with a wooden cantle and double wire spring, with a clip that allows of adjustment

very close to the frame, and is especially adapted for the use of heavy riders.

The No. 9 is really two saddles in one. It has a foundation of leather formed and stitched as shown in the cut. The stitching prevents stretching and adds durability without destroying elasticity. Over this foundation is a formed cover of felt and soft leather, making an easy and comfortable saddle. The wooden cantle covered with canvas, shelled and with an easy wire spring, has pro-

duced a saddle that for quality, shape and appearance is one of the most durable and desirable of its kind.

The No. 15 comes under the head of a '97 pattern. It is not a freak or a novelty, but is built on principles that a long course of experiments has shown are right. Its construction embraces all those qualities which have made many imported saddles so popular among the knowing riders. The top is made of English tanned leather, so formed that it will remain permanently in shape and always pliable from cantle to nose-piece. The soft skirts cannot be forced outward, but remain in their proper position no matter what pressure is put on the leather. The cantle, spring and other metal parts are all made especially for this style and are collectively fitted and adjusted to the top seats to form a lively saddle. The same grade of detail shown on all Duguid saddles are carefully followed out, and from the standpoint of quality No. 15 should make a valuable addition to any make of wheel.

ONE OPENS, TWO CLOSE.

Cleveland, Ohio, Oct. 12.—The New York Tire Company has established a depot in this city. Harrison P. Smith, formerly manager of the Winton Bicolorama Riding School, will be in charge, with territory extending south to Columbus, Ohio, east to Erie, Penn., and west to Toledo, Ohio. It is the intention of the company to establish a free repair shop here about January 1.

The Forest City Cycle Livery, of No. 325 Erie street, and the Logan Cycle Company, Cedar avenue, opposite Logan avenue, will both discontinue business after November 1. The bulk of business at both places was in the renting line.

GIVING LIFE TO THE DEAD.

English Speculators Trying This on Defunct Companies—Some Fat Dividends Declared.

London, Oct. 3.—Tire resurrections are the order of the day now, and so long as they have had a license from the Dunlop Company, the lame, the halt and the blind are being re-animated into existence.

The Turner Tire Company, Preston Davies and Seddon have all been put through this process, for what reason it is hard to say, beyond that of winning over some thousands of pounds to the acute people who find that the public have an implicit faith in the future of any tire company that can manufacture under a Dunlop license. The method of re-juvenification is simple. You first get a bankrupt concern which has had a license (forced on it in the majority of instances) from the Dunlop Company. You then proceed to purchase as cheaply as possible—the price generally runs from 6d. per £1 shares to 2s. 6d.—as many shares as will justify your offering a composition to the creditors which they will accept. If you cannot get a good number of shares, of course it is not worth your while. The company cannot be taken out of bankruptcy until the entire debts have been paid, or, to be more accurate, the creditors have settled. Then a meeting of the stockholders is convened, and it is decided to add a couple of thousand of fresh capital to proceed to business once more, as though it had never been interrupted. The shares are quoted once more on the Stock Exchange, and dealings recommence in them. I know of instances in which £1 share scrip in a company of this sort has been purchased at 6d. and 9d., to be sold again at a premium on the original "face" value. That any of these re-juvenifications will ever turn out financial successes, I do not believe. Their only hope of benefiting their present proprietors is in the possibility of the Dunlop Tire Company determining to purchase the license they had granted in other days, and when their aims and prospects were not so gigantic as is now the case.

But this is not the only class of opportunist who find the present a golden time for them. Mr. Harvey Du Cros has sent to the press an almost verbatim copy of a letter which he has received from a gentleman who seeks, by a species of blackmail, to prevent the Dunlop Company from obtaining legal judgment against him for infringing their patents. I may say that the letter writer first found it convenient to leave for South Africa, from which ground of vantage he wrote the Dunlop Company as follows:

Cape Town, South Africa, Sept. 9, 1896.
Gentlemen: I left Newtown Mill, West Gorton, Manchester. I do not intend contesting your action against me any further, as I shall be in Johannesburg before you get this letter. I do not think it to my interest that you should lose your patent rights, and if you let your action against me drop, you will not be troubled with me any more selling pneumatic tires in England; but if you proceed to get an injunction against me, I shall write the judges and about forty members of Parliament and about thirty newspapers, giving the particulars of the agreement with Mr. (Lawson) that if he would not call Sir (Frederick B—), the Dunlop Tire Company would give him a license to make the tire. I shall also give what Sir (Frederick B—) was prepared to swear. I shall also give them the information that the Dunlop Tire Company paid (Mr. Charles —), London, £5,000 for Mr. Caswell not to proceed with the appeal. I may say I have a letter in my hand, written and signed by the above firm, stating it to be a fact. If you let your action against me drop I will say no more about it; but if you proceed I shall try

to bring the facts of the case before the British public. I am, yours truly,

JAMES GREGSON.

P. S. If you care to let me know your intentions, or have any proposition to make me, you can write to James Gregson, care the Rev. J. Scott, Russell street, Durban, South Africa.

I may say that I have had a legal search at the Cape Colonial Office, and am advised you have no patent rights over here for the endless wire, though I have not made any endless yet. Yours truly,

JAMES GREGSON.

I give the letter in full, because it bears, to some extent, on matters which I have written on in this column from time to time, and which I am informed will be gone into very fully at an approaching patent trial, in which the three persons whose names are suppressed will be found arranged—with or without their will—as witnesses for the opponents of the Dunlop Tire Company.

Company meetings are matters of daily occurrence now. Most of these are being held in consonance with legal rules of company formation, and do not do much more than show the subscribers that their property is actually alive and endeavoring to earn money. The burden of them all is wonderfully similar—enthusiastic satisfaction with the past, sanguine hopes of the future and promises of dividends ahead. A few have

votes its energies to bicycles which can be sold at £15 to £17 by agents at a good profit, its success seems to show that there is a better return to be got out of capital sunk in second and third than in first grade firms. The John Griffiths Cycle Corporation balance sheet is nearly due now, but nobody seems to know how "the world's largest cycle dealers" have fared this year. Last winter the £1 shares were "written down" to 7s. 6d. each, in order to wipe out the losses. These now stand at 20s. or so.

The statutory meeting of the Tubeless Pneumatic Tire Company was held last week in Birmingham, and though of a purely formal character it enabled C. A. Palmer, the chairman, to announce the directors' faith not only in the commercial future of the company, but, what is of very vital importance at present, the validity of the patents which the company has purchased. There is a deliberateness in the methods of the Dunlop Tire Company in this instance which, to my mind, is indicative of a legal conflict, which will last for years possibly, but which, in any case, will exhaust the resources of the law before either side can regard its victory as complete. With the principle of the tubeless tire I am quite satisfied; I leave others to judge of the patent.

Flotations which are pending are Coventry Machinists' Company, Ormond Cycle Company, Goodby & Co. (cheap machine makers, Wolverhampton), the Chainless Bicycle and the big French amalgamation, about which I gave particulars in my last. These will all pop up as soon as a few glowing balance sheets appear as incentives to public investment in the rather over-capitalized cycle trade. I have no doubt that next year will be a good one on this side if the weather is all right, but that it can return decent profits on the huge capitals subscribed this summer I very much doubt.

The shows will shortly be with us, and with the idea of ascertaining the intentions in this way of the American makers on this side I have written most of them, and up to date find that the Columbia, Fowler, Envoy, Stearns and Crescent will be on view at the Agricultural Hall, while the Crystal Palace will claim the Waverly, Spalding and Rambler, while at present the Cleveland people are undecided. Space has been taken for 20 Columbias, 20 Stearns, 20 Crescents and the same number of Fowlers, while thirty Ramblers and an equal number of Waverlys and Envoys will be shown. The show fixtures up to date on this side are: Stanley (London), November 20-28; National (London), December 4-12; Salon du Cycle (Paris), December 12-27; Manchester, January 2-9; Dublin, January 16-23; Glasgow, January 23-30.

Among the recent American trade visitors to London I dropped across Mr. J. Cockburn, who, some years ago, was a well known and prominent Scottish racing man. Mr. Cockburn, I believe, was over on a trip partly private and partly business. His firm is the Moore Fittings Company, of Newark, N. J., and the machine he had with him was a splendid example of an American wheel. I believe that he did good business here, and may return soon.

IF HE ONLY THOUGHT SO.

Sockstein—Do you belief dot bysickling is a valture?

Isaacson—Vot! Mine tear young frien', if I belief dot I vould ged me a bysickle tomorrow.

been in a position to declare dividends, but these have more than a few months' existence to look back upon. The Star Tire Company has given its stockholders no less than 300 per cent in profits this year, but most of it was made out of company dealing and flotation. The Jointless Rim Company has just declared a 20 per cent dividend as against 5 per cent last year, while I believe that both the Rover Cycle Company and the St. Georges Engineering Company are about to declare a 10 per cent dividend on the trading year which ended yesterday.

A company whose balance sheet is eagerly awaited is the Cycle Components Manufacturing Company. Speculation is rife as to the amount of profit, but I have been told that it amounts to £17,000, which would justify a 75 per cent dividend. A ring of speculators have been operating on these shares for some time past, with the object of getting hold of them. They "beared" them down last week to 72 £1 shares, but now they have gone up again to 82, so it is likely that some idea of the dividend to be declared has got abroad.

Another firm which has had a very fine year is the Star Cycle Company, of Wolverhampton. On a paid up capital of £27,000 a profit of no less than £17,000 has been made, I believe, and in consequence a 50 per cent dividend will be declared. As this firm de-

CHAMPION COOPER.

THE MONARCH KING WINS OUT.

HE IS REALLY AWAY AHEAD OF BALD IN BOTH
POINTS AND PERCENTAGE.

Cooper and Bald have met in 32 races this year, in 21 of which Cooper has defeated Bald, while the latter has beaten Cooper in only 11. Here is the summary:—

Fredonia,	June 6th,	Mile open,	Cooper first, Bald unplaced.
Fredonia,	June 6th,	2-mile handicap,	Cooper (scratch) first, Bald unplaced.
Rochester,	June 10th,	$\frac{1}{4}$ -mile open,	Cooper first, Bald third.
Rochester,	June 10th,	Mile open,	Cooper first, Bald second.
Utica,	June 15th,	Mile open,	Bald first, Cooper second.
Utica,	June 16th,	$\frac{1}{2}$ -mile open,	Cooper first, Bald second.
Battle Creek,	July 13th,	$\frac{1}{2}$ -mile open,	Bald first, Cooper second.
Battle Creek,	July 14th,	Mile open,	Cooper first, Bald second.
Kalamazoo,	July 15th,	$\frac{1}{2}$ -mile open,	Bald first, Cooper fourth.
Kalamazoo,	July 16th,	Mile open,	Bald first, Cooper second.
Detroit,	July 18th,	Mile open,	Cooper first, Bald third.
Lima,	July 29th,	Mile open,	Bald first, Cooper second.
Lima,	July 29th,	$\frac{1}{2}$ -mile open,	Cooper first, Bald unplaced.
Buffalo,	Aug. 7th,	Mile open,	Bald first, Cooper second.
Buffalo,	Aug. 8th,	Mile invitation,	Bald second, Cooper third.
Louisville,	Aug. 13th,	2-mile National championship,	Cooper first, Bald second.
Louisville,	Aug. 14th,	$\frac{1}{2}$ -mile National championship,	Cooper first, Bald third.
Louisville,	Aug. 14th,	$\frac{1}{4}$ mile National championship,	Cooper first; Bald did not qualify.
Louisville,	Aug. 15th,	5 mile National championship,	Cooper first, Bald unplaced.
Springfield,	Sept. 2d,	$\frac{1}{2}$ -mile open,	Bald second, Cooper third.
Springfield,	Sept. 2d,	Mile international,	Cooper second, Bald fourth.
Springfield,	Sept. 3d,	Mile record,	Cooper first; Bald did not qualify.
Springfield,	Sept. 3d,	$\frac{1}{2}$ -mile open,	Cooper first, Bald second.
Philadelphia,	Sept. 12th,	$\frac{1}{2}$ -mile invitation,	Cooper fifth; Bald did not qualify.
New York,	Sept. 19th,	$\frac{1}{2}$ -mile invitation,	Cooper first, Bald unplaced.
Plainfield,	Sept. 26th,	$\frac{1}{2}$ -mile open,	Cooper first, Bald second.
Plainfield,	Sept. 26th,	$\frac{1}{2}$ mile open,	Bald first, Cooper fourth.
Trenton,	Sept. 28th,	Mile open,	Cooper third, Bald unplaced.
Trenton,	Sept. 28th,	2-mile handicap,	Cooper (scratch) first, Bald fourth.
Washington,	Oct. 5th,	Mile open,	Bald first, Cooper third.
Washington,	Oct. 5th,	$\frac{3}{8}$ -mile open,	Bald first, Cooper second.
Washington,	Oct. 5th,	2-mile handicap,	Cooper (scratch) first, Bald third.

Of these 32 races, Cooper won 18, was second in 7, third in 4, fourth in 2, and fifth in 1; while Bald won 9, was second in 8, third in 4, fourth in 2, unplaced in 6, and did not qualify in 3. Counting three points for a first, two for a second, and one for a third, Cooper made 72, while Bald made but 47.

Cooper has won more money and more races than any other rider.

Cooper is the only rider who qualified in every heat.

Cooper won all of his heats but three, far more than any other rider.

Cooper won nearly all of the great races of the year, including four of the six National championships and the mile record at Springfield.

COOPER IS CHAMPION OF AMERICA.

Ride a Monarch and be a Cooper.

Chicago.

New York.

MONARCH CYCLE MFG. CO.

San Francisco. Toronto.

Kindly mention The Wheel.

SPACES ALLOTTED.

The Board of Trade Divides the Floor Room of Both Shows in a Thoroughly Equitable Manner.

With President Coleman's exhibit—that of the Western Wheel Works—located on the third floor, and Director Spalding's on the same floor, no room is left for charges of favoritism in the allotment of the spaces at the New York show. Nearly all of the other bicycle concerns secured room on the second floor, where the overflow of applicants were also provided for by leasing quarters at present in use for office purposes.

In all, there are 523 spaces, with 241 exhibitors at the New York show, and several spaces on the ground floor still to let. Of the exhibitors 106 make bicycles, 18 are tire makers, 16 parts and cycle fittings, 7 saddles, 7 lamps and 6 wood rims.

NEW YORK SHOW.

SECOND FLOOR.

 415 and 416, Gilliam Mfg. Co.

FOR THE SILVER RAMBLER.

Out Denverway they've got it so bad that they've had a Bryan and Sewell race meet, at which, not inappropriately, efforts were made to land the silver-embossed Rambler offered by Gormully & Jeffery for the fastest mile during the year by a Rambler amateur. W. Oudkirk, behind a quint, made the effort, and did it 1:48 1-5, three-fifths of a second outside of Hughes's record, which is the best to date. At the same meeting W. P. Senger, an amateur, mounted on a Rambler racer, broke the world's two-mile unpaced record, doing 4:27 3-5.

A STAR AMONG PEDALS.

With the approach of 1897 comes the new ideas in cycle accessories. A good pedal is a potent factor in an up-to-date mount, and inasmuch as the pedal receives about the least care and attention by the average rider, it needs to be dust proof, water proof, self-oiling and almost self-cleaning. A pedal with

about all the good points that the human mind has conceived, and one that will not bark your shins when trundling a wheel, is being marketed by the Bridgeport Gun and Implement Company, No. 313 Broadway, New York, and is known as the Star. The company have already perfected their '97 models, one of which is illustrated herewith. The Star rat-trap weighs fourteen ounces, the combination nineteen ounces. The pedals are made on a special plant of automatic machinery, every part being interchangeable and true to gauge. The axles, sleeves, cones and caps are cut from bars of special steel, and the frame and arms from cold rolled steel. One-eighth inch balls of the best quality are used throughout.

AN IMPROVED JIG.

As an almost companion part of their radial flexible drill the Stow Manufacturing Company, Binghamton, N. Y., have produced and are marketing an improved jig which will hold any size of frame, either drop or diamond, from twenty-two to twenty-eight inches. With the Stow drill and jig one man has drilled and pinned ninety diamond frames in a day. The drill, as is fairly well known, hangs from the ceiling, requiring no floor space, and has both up and down and rotary motions. It stops automatically, and no counter shaft is needed.

TWO YEARS OF PROOF.

A two-year-old adjustable handle-bar, one that has passed through the experimental stage, is shown in detail by the accompanying illustration. It is manufactured by Charles W. Morgan, Lockport, N. Y. It al-

lows perfect adjustment to any angle desired, and is free from teeth or notches, eliminating the tendency to slip. The bar is reversible for up or down turn, is made in any shape desired under the Palmiter patents for cold welding. The manufacturer is prepared to furnish the bar in large quantities to manufacturers or jobbers at low prices.

NEW PATENTS.

568,743. Bicycle Lock.—Louie H. Clark and Ernest A. Munger, Fond du Lac, Wis., assignors to William T. Allen and Arthur C. Ewen, Brooklyn, N. Y. Filed January 28, 1896. Serial No. 577,138. No model.
 568,752. Clamp for Repairing Bicycle Tires.—William Foth, Orange, N. J. Filed December 14, 1895. Serial No. 572,122. No model.
 568,767. Crank Shaft and Bearing for Bicycles.—Robert M. Keating, Springfield, Mass. Filed December 10, 1895. Serial No. 571,615. No model.
 568,768. Crank Shaft and Bearing for Bicycles, etc.—Robert M. Keating, Springfield, Mass. Filed June 1, 1896. Serial No. 593,732. No model.
 568,794. Patch for Bicycle Tires.—Albert C. Rehben, Menominee, Mich. Filed April 11, 1895. Serial No. 545,315. No model.
 568,802. Means for Attaching Bicycle Saddles.—Benjamin S. Seaman, Canton, Ohio. Filed November 11, 1895. Serial No. 568,569. No model.
 568,813. Tire for Bicycles.—William H. Taylor, Narragansett Pier, R. I. Filed December 26, 1895. Serial No. 573,257. No model.
 568,855. Bicycle Support.—Horace G. Kennedy, Denver, Col. Filed November 30, 1895. Serial No. 570,709. No model.
 568,862. Velocipede.—Robert Miehlem, Chicago, Ill. Filed December 3, 1894. Serial No. 530,698. No model.
 568,973. Bicycle Saddle.—Arthur L. Garford, Elyria, Ohio. Filed March 12, 1895. Serial No. 541,421. No model.
 568,974. Bicycle Saddle.—Arthur L. Garford, Elyria, Ohio. Filed March 15, 1895. Serial No. 541,890. No model.
 568,977. Bicycle Seat.—Robert E. Helmore, West Bay City, Mich. Filed August 24, 1895. Serial No. 560,380. No model.
 568,995. Ball Bearing for Bicycles.—Charles T. Brown, Chicago, Ill., assignor of one-half to Flora L. Brown, same place. Filed June 8, 1896. Serial No. 594,683. No model.
 569,027. Bicycle Riding Habit.—Herman Mostkowitz, Brooklyn, N. Y. Filed January 30, 1896. Serial No. 577,358. No model.
 569,071. Pneumatic Tire.—George W. Weiss, Brooklyn, N. Y. Filed February 24, 1893. Serial No. 465,698. No model.

DESIGNS.

26,150. Foot Rest for Pedals.—William Nichols Beardsley, Bridgeport, Conn. Filed February 12, 1896. Serial No. 579,083. Term of patent three and a half years.

TRADE-MARKS.

28,973. Emery and Corundum Wheels.—The Electric Emery Wheel Company, Newark, N. J. Filed February 28, 1896. Essential Feature.—A representation of a shield provided with hills and forests, and a representation of a deer, with a spread eagle perched on said shield, all arranged on a white field in the centre of a representation of an emery wheel, and the words "The Electric." Used since December 1, 1879.

28,975. Bicycles or Like Vehicles.—William Crawford, New York, N. Y. Filed August 25, 1896. Essential Feature.—The letter "N," with the words "New York" across the diagonal member, and the word "Flyer." Used since March 30, 1896.

28,976. Bicycles.—The Stoddard Manufacturing Company, Dayton, Ohio. Filed September 8, 1896. Essential Feature.—The word "Tigres." Used since August 29, 1896.

28,977. Velocipedes and Parts Thereof.—Pope Manufacturing Company, Hartford, Conn. Filed August 16, 1895. Essential Feature.—The word "Columbia" displayed in script letters and terminating in a paraph. Used since 1878.

DIED IN HARNESS.

Rufus Chandler, of Newark, N. J., who formally manufactured stands for bicycles under the name of the A. B. C. Company, was stricken with epileptic convulsions while teaching a woman to ride a wheel at his riding school in Newark last week, and died soon afterward. He was the inventor of several styles of stands and an apparatus intended to aid beginners in maintaining their equilibrium. Mr. Chandler was about fifty years of age.

It is a wise child that knows when to ask questions of its father regarding a bicycle.

SUNDRIES.

RECENT PATENTS.

568,394. VARIOUS-SPEED GEAR FOR VELOCIPEDS. REAR-ROCK WOODWARD, Chesham, England. Filed July 28, 1916. Serial No. 57,522. (No model.)

Claim.—In a varying-speed gear of the class herein described in combination therewith a clutch consisting of a sliding collar having a pin or projection at one end and a spiral groove or slot in which said pin or projection engages; a slot or recess in the driving-end in which said hole is carried; a pin or projection on each end of said hole at opposite ends of same which engage with the toothed wheel and a screwing to the shaft of which the collar is moved; a lever having a flange for operating said clutch or collar, substantially as described and illustrated herein.

568,372. BICYCLE-LOCK. ABRAHAM L. BURT, Dobson, N. H. Filed Mar. 20, 1916. Serial No. 584,169. (No model.)

Claim.—1. In a bicycle-lock, a case composed of the upper and lower sections, said lower section having a longitudinal recess with the depression in the bottom—the guide pin extending across said recess, the key adapted to fit upon said guide pin, the longitudinal movable bolt cut away at the exterior to receive the pin, the said serrated upper said bolt, the member-section having a longitudinal recess and supplemental recesses at the side of the main recess, the stop-pin and the rod having laterally-projecting ends, all arranged substantially as shown and described.

568,358. LANTERN-BRACKET FOR BICYCLES. ARNE A. BERTZ and JOHN C. WELLS, Burt, Hampton, Conn. Filed July 1, 1916. Serial No. 51,021. (No model.)

Claim.—In combination in a lamp-bracket for a bicycle, a clamp-base having a recessed surface on one side, a flexible wire clamp pivoted to fixed pivots on the clamp-base, a forked open bolt-rod located in the opposite end of the clamp-base from the pivots, a lamp-arm made of wire bent to shape and secured to the clamp-

base, a screw-bolt pivoted in the loop at the free end of the clamp, and a fastening-rod borne on the bolt and adapted to engage on the forked end of the clamp-base, all substantially as described.

568,406. BICYCLE ATTACHMENT. CHARLES R. HOWARD, Boston, U. S. Filed Apr. 10, 1916. Serial No. 587,803. (No model.)

Claim.—The combination with a bicycle of a head-halt attachment therefor consisting of a hollow standard having a sleeve or collar upon its lower end which is adapted to embrace the front bar of the bicycle-frame, a telescoping rod fitting within said standard, a nut-screw passing through said standard and engaging said rod, an adjustable collar on said rod, and a head-halt support whose supporting-rod is connected to said telescoping rod by a nut-and-washer joint, substantially as and for the purpose specified.

567,245. PNEUMATIC-TIRE SHIELD. JOSEPH L. LOWERY, New York, N. Y. Filed July 8, 1915. Serial No. 557,701. (No model.)

Claim.—A removable shield for pneumatic tires composed of flexible armor, an oppositely-disposed pair of twin hoops adapted to the opposite or base edge of said shield, and a series of laterally-disposed clamps for securing said hoops, substantially as and for the purpose specified.

568,474. BICYCLE-BRACKET. CHARLES H. CLARK, Rochester, N. Y. Assigned to The Rubber Stamp Company, Chicago, Ill. Filed Nov. 14, 1916. Serial No. 569,918. (No model.)

Claim.—1. In a bicycle-seat, the combination of a base-plate wide in the rear narrow in front and convex in cross-section; an inflatable tube consisting of a single length bent double, the free ends resting on opposite inclined sides of the convex end of the plate and the bent portion engaging the rear wide portion of the same, and a covering including the tube and secured down to the plate between the ends of the tube, thereby having them free to move laterally on the inflated plate as herein shown and described.

1,571,171. DRIVE-GEAR. ELMER A. BALDWIN, Utica, Mass., assigned to Amos J. Ocker, Framingham, Mass. Filed May 28, 1916. Serial No. 582,522. Original No. 53,877. Filed July 31, 1914.

Claim.—1. In a parallel-link drive-chain, the combination with the pair of links and the links intermediate of and connecting said

pair of studs connecting said pair of links and intermediate links and having the opposite sides of their bearing portions curved to fit the inner bearing-surfaces of the links, one of said curved bearing-portion being convex the outer or axis of the stud that the other, whereby by rotating the studs from their positions, turning them partly around and replacing them, the pairs of links may be drawn toward each other, thus shortening the chain, substantially as described.

568,593. BICYCLE-SEAT SUPPORT. CHRISTOPHER H. WATSON, Everett, Cal. Filed Nov. 20, 1915. Serial No. 570,538. (No model.)

Claim.—1. A bicycle-seat support, comprising a saddle-tube fitting in the center-brace of the bicycle in the upper end of which the

saddle-post is secured, said tube having a lower reduced portion, a spring-tube rigidly secured in the lower portion of said center-brace, its upper open end surrounding said reduced portion of said saddle-tube, a piston secured to said reduced portion and arranged to move in said spring-tube, an air-tight valve whereby air may be compressed in said spring-tube to support said piston and said saddle-tube, and a link in said spring-tube having its upper end secured to a keeper extending from said piston, its lower end resting on the bottom of said tube, as and for the purpose specified.

567,967. FOOT-REST AND CLAMP FOR BICYCLES. FREDERICK C. DUNN, New York, N. Y., assigned to Arthur R. Lee, Philadelphia, Pa. Filed July 17, 1915. Serial No. 563,301. (No model.)

Claim.—The combination, with the bicycle-stem, of a hand-clamp adapted to embrace said stem, and having an outwardly-projecting extension, substantially as set forth; a foot rest clamp adapted to embrace said outward extension of the holding-bow, and having bowed end portions provided with inwardly-projecting lips.

568,524. BICYCLE-SADDLE. ROBERT L. FRENCH and JOSEPH R. PALM, Brooklyn, N. Y. Filed Mar. 11, 1916. Serial No. 568,990. (No model.)

Claim.—1. A saddle, comprising a conical and a conical formed of two spaced-apart halves approximately circular in position, said halves being free to move vertically and laterally, as end for the purpose specified.

568,693. BELL. NORMAN T. MILLA, Everett, Mass., assignor of said bell to Alvin T. Morris, Brooklyn, Mass. Filed Oct. 5, 1915. Serial No. 564,760. (No model.)

Claim.—1. The base, its attached gong, a vibrating actuator having a support-gong, a rotatable hammer-carrier having an actuated piston, and connecting gearing, including a locking-gear, between the sequential actuating-gear and the hammer-carrier, substantially as described.

568,581. VARIABLE-SPEED ROCKER BICYCLE. FLEMING H. REICHARD, Hartford, Conn. Filed June 18, 1916. Serial No. 514,939. (No model.)

Claim.—1. The combination of a drive-wheel having its diameter at right angles to the rotating axis of said wheel and an obliquely-disposed gear on that end of the side shaft adjacent to the drive-wheel, and gear meshing with each other, and creating, one at each end of the crank-shaft, having their longitudinal axis in horizontal planes extending with the plane of the longer radii of the gears of the one side to one train at each complete rotation of said one-to-one train, the speed of the pedal-rockers is accelerated as they approach the dead-centers of their movements and is reduced at the mid-stroke portions of their ascending and descending movements.

568,667. STAYD BRACE FOR BICYCLES. SAMUEL S. BARACK, New York, N. Y. Filed Oct. 21, 1915. Serial No. 568,588. (No model.)

Claim.—1. The combination of a clamp-yoke connected to embrace a part of a bicycle frame and having one of its side arms provided with a projecting flange, locking-tongue, a transverse clamp-lob extending through the arm of the yoke and serving to clamp

568,404. BICYCLE-TOOL. ROBERT C. FAWCETT, Burlington, Ohio. Filed June 23, 1916. Serial No. 526,674. (No model.)

Claim.—In a combined wrench and air-pump, the combination substantially as heretofore described, of an outer jaw having a stem provided with a piston, an inner jaw freely slidable on said stem, a tabular handle which also serves as a pump-barrel firmly attached to the base of said inner jaw, and a valve device for not only locking and releasing the jaws for engaging the two jaws to cooperate as wrench-nutcracker, but also for sucking said jaw, for forcing it and the handle or barrel to slide freely on the stem and cooperate for service as an air-pump.

568,649. BICYCLE LAMP BRACKET. JOHN M. WHITFIELD, Buffalo, N. Y., assignor to the Fourth Manufacturing Company, same place. Filed Jan. 24, 1916. Serial No. 579,653.

Claim.—1. In a bicycle-lamp bracket, the combination of two mutually-recessing spring portions, hinges for each other, means for detachably securing them together at the opposite ends, outward-extending arms located on each of said clamping portions, and a spring lamp-supporting bracket having its ends mounted in said recessed lamp-supporting brackets being formed by the side pieces of its upward extending lamp-receiving portion, extending gradually from each other from the top downward, whereby when the lamp is engaged on said receiving portion, the two clamping portions are automatically and positively locked to each other, and around the bicycle-frame tube, as set forth.

568,662. VALVE FOR PNEUMATIC TIRES. JAMES H. MADDOCK and WALTER C. MADDOCK, New York, N. Y. Filed Mar. 1, 1916. Serial No. 583,842. (No model.)

Claim.—The combination of a device such as a wheel-rim adapted to be inflated and having an aperture, a annular elastic-rubber O. ring arranged upon the inside of the tire and around the aperture, and secured to the rubber cement to each inside of the tire, and the valve formed of a sheet of flexible material arranged within the tire and over the seat of said aperture, and connected by rubber cement to the tire, substantially as and for the purpose set forth.

568,667. STAYD BRACE FOR BICYCLES. SAMUEL S. BARACK, New York, N. Y. Filed Oct. 21, 1915. Serial No. 568,588. (No model.)

Claim.—1. The combination of a clamp-yoke connected to embrace a part of a bicycle frame and having one of its side arms provided with a projecting flange, locking-tongue, a transverse clamp-lob extending through the arm of the yoke and serving to clamp

the latter in a desired position upon a part of the bicycle frame, and a supporting arm mounted on the clamping-lob and having the inner side of its pivoted end portion provided with a depression or groove into which the clamping-lob fittingly springs when the supporting arm is in the position it occupies to sustain the bicycle, substantially as described.

If you shut your eyes to quality and style, the world is full of bargains; but if you are desirous of handling wheels worth their money, write to the

BOOK NOW READY.

Published by F. P. PRIAL, 88 West Broadway, New York.

MADE OF BICYCLE BRONZE.

Several new features are incorporated in the Turner compression clamp, manufactured by the Turner Brass Works, Chicago. Instead of a drop forging, bicycle bronze is used in its construction, which is fully equal in strength, it is claimed.

The sides of the Turner clamp are of graduated thickness, being slightly tapered from the centre to the ends. This shape puts the strength where it ought to be and makes a perfect bearing, so that when the clamp is compressed, it tightens up evenly all around the tube. This construction makes a tighter clamp on the fork stem, it is claimed, than is possible to get with any drop forging.

Another excellent feature is the ball and socket bearing of the bolt and clamp, which prevents the head of the bolt breaking off, as often happens with the drop forging clamps. The shoulder on the bolt and counterbore of the clamp are on the same curve, thus making a perfect seat, stronger and more durable than the drop forging and permitting the bolt to be tightened up snug without breaking.

WHERE HAS HE GONE?

Ernest W. Fellows, formerly a bicycle dealer in One-hundred-and-twenty-fifth-st., between Fifth and Lenox avenues, New York, agent for the Majestic line of wheels and Hulbert Bros.' sporting goods, and who, later, with one McDonald—now with the Home Rattan Company of Chicago—opened a cycle agency in Asbury Park, under the name of Harris & McDonald, is wanted. He recently obtained a Columbia drop-frame tandem from Amos Shirley's Harlem store, on the instalment plan, and a diamond frame tandem from S. B. Bowman's Harlem store. With these wheels and over \$1,000 worth of goods from the Hulbert Company, he decamped, and at last accounts was reported to be in Canada. The manner in which the goods were disposed of has not been discovered.

The Pope Company have already secured space for their exhibit in the International Exhibition which is to be held in Brussels next year.

WINS ON HIS MERITS.

To come in contact with a man like H. F. Hering means to meet an excellent example of the type of men who have brought the cycle trade to the point it occupies to-day—one of the largest and most powerful in the industrial world. Earnest, energetic, full of business and with a large amount of what we Americans call "push," Mr. Hering came to New-York from Boston to assume the management of the Boston Woven Hose and Rubber Company's branch house. Though yet a young man, Mr. Hering has made an unqualified success, so much so that a month ago a removal to larger quarters was absolutely necessary, and the new depot of the Boston Woven Hose and Rubber Company to-day occupies the greater part of 71 Reade street, extending through the block. In addition to the well-known Vim tires, the full line of the home company will here be handled by Mr. Hering, through a territory em-

H. F. Hering.

bracing not alone the metropolitan district, but Pennsylvania and the entire South as well.

Mr. Hering is not a new-comer in the rubber business, and while his connection with the Boston Company dates only from 1893, he was virtually raised in an "elastic atmosphere," since his father has been an expert in rubber for the last twenty-five years. The old saying that nothing succeeds like success is still true, and in Mr. Hering's case is found but another example of a successful man in a successful business.

GONE TO PHILADELPHIA.

C. A. Mussellman, the former advertising man of the Remington Arms Company, is now located in Philadelphia as the representative of Chase Tough Thread Tire Company. The Quaker City is a fertile field for everything connected with cycling, and the Chase Company will undoubtedly find a branch in that city profitable.

BEEN FIFTY YEARS IN BUSINESS.

This is the plant of the W. O. Hickok Manufacturing Company, Harrisburg, Pa., a concern that was established by W. O. Hickok, now deceased, in 1846. Next year the firm will place on the market a line of finest type of high-grade wheels. Their machine depart-

ment, which has been in operation for the past fifty years, is supplied with all the modern tools, the best of workmen are employed, and the superintendent of the cycle department has had twenty-eight years' experience in bicycle manufacture. Samples of their machines will be seen at the shows.

SITTING ON GLYCERINE.

E. D. Thompson, of Lawrence, Kan., is the inventor of an anti-vibration bicycle, a model of which has just been completed by the Syracuse Specialty Company. The device provides an air-cushion for the seat post, obtained by pumping the tube above the crank hanger full of air. The seat post works up and down at the pleasure of the rider in a packing box similar to those used in pneumatic presses. Leakage is absolutely prevented by a liquid seal composed of water and glycerine, which is compressed by the air pressure immediately under the butt of the seat post. The rider governs the pressure according to his weight, the object being to make the cushion stiff enough to hold him firmly up when moving over an even surface. When the path is uneven, the cushion yields to his weight by compression of the liquid and air, and the adjustment is so perfect that the seat post only comes back to the position under pressure of the pedal.

WILL BE A GOOD YEAR FOR GOOD WHEELS.

Manager F. I. Johnson, of the Iver Johnson Arms and Cycle Works, feels no anxiety as to the prospects of '97 trade, and believes that the present depression is only a precursor of magnificent business next year. He is now traveling through the West and South with '97 Iver Johnson and Fitchburg cycles, and has closed several large deals.

NEW WOOD-RIMMERS.

North Tonawanda, N. Y., has a new wood-rim factory. Gilie, Goddard & Fries is the name of the concern.

The Wheel

THE YOUNG TRADE REVIEW

Copyright 1896, by F. P. PRAL Co.

VOL. XVIII, No. 10.

NEW YORK AND CHICAGO, OCTOBER 23, 1896.

WHOLE No. 452.

POTTER OR ELLIOTT?

Which Will It Be? Some Reasons Why It May Not Possibly Be The Latter Gentleman.

Between Isaac B. Potter and the presidency of the League of American Wheelmen there stands but a pledge.

If Sterling Elliott, the present incumbent, stands for re-election—and, unless the heat of the political pot drives out his intention, he will stand for it—Mr. Potter will remain true to his pledge, a promise to support the Massachusetts man.

If Mr. Elliott should change his mind, Mr. Potter, almost beyond peradventure, will succeed to the office. THE WHEEL believes that before the National Assembly convenes Mr. Elliott will undergo such a change, and that Mr. Potter will be the next president; more than this, the belief is as profound that Mr. Potter will be president anyway; that he will be chosen whether or no Elliott does perform the affecting act of withdrawing himself. Things are already shaping that way.

Mr. Potter himself declares that he is not a candidate, and that he will remain true to his word and support Elliott if Elliott remains in the field. But he cannot conceal that he really would like to be president.

"I did say to Elliott," he went on in answer to THE WHEEL'S questioning, "that having done a good deal of work for the League, I would like to round it out by serving a term as president, but I will not fight for the office with any worthy man. I will vote for Mr. Elliott if he remains a candidate, but I really do not believe he will receive the undivided support of the New York delegation."

Mr. Potter believes that as election time approaches a warm "scramble," as he defined it, for the office will ensue. He could not or would not explain upon what he based the belief.

The National Assembly will meet in February at Albany, N. Y. The L. A. W. Executive Committee so decided at its meeting in this city on Friday last. Albany County is Mr. Potter's native heath, and in the course of the interview Mr. Potter remarked the fact, and left little room for doubt that he would like nothing better than to have Mr. Elliott stand down or release him from his pledge, that amid the scenes of his boyhood he might begin the "rounding out" of a cycling career which has made him known from ocean to ocean.

That there exists in this State an anti-Elliott sentiment is not generally known. That it is destined to grow is certain. An anti-Elliott delegate, who is quite close to Mr. Potter, made this very evident.

"I will not vote for Elliott under any circumstances whatsoever," he asserted, with considerable warmth. "I am for Potter, and, unless he expressly forbids, I shall vote for him; and, let me tell you, I am not alone in

my position. The delegation is now too big to be controlled by one man; most of the delegates are new men, and I do not believe Potter or any one else can make them vote as a unit."

That the free-silver States in the West and South have been offended by Mr. Elliott's espousal of the gold or sound-money cause in the official organ is well known, and that they will help turn his picture to the wall at the first opportunity is as sure. In certain Eastern States there is a feeling that Elliott's compromise with the New England railroads in the baggage matter showed a lack of backbone that has embarrassed the cyclists' cause in other States, and, after the successful fight in New York, was in the nature of a reflection on Chief Consul Potter. In this division there is a growing disposition to resent it, and to use it as political capital. It is reasonably certain when the disgruntled delegates of both sections put their heads together that the undoing of Elliott and the nomination of Potter will result.

New York, which will go to the Assembly with more than a hundred votes, will prove an immensely powerful factor.

ONE TO THE RECEIVER.

The New York Bicycle Equipment Company, a concern with a very large paper capital, marketing a very small article, the Minute Repair Kit, is in the hands of a receiver, S. B. Lawrence, who was director of the concern. Although this action was not taken until Tuesday last it was not unlooked for; it has been known for some time that the company was in financial straits and unable to meet its obligations. The receiver was appointed on the application of the directors of the company, viz., John D. Cheever, president; David H. Darling, treasurer; Christopher W. Youngman, vice-president and general manager, and S. B. Lawrence. The company was incorporated on January 15 last, with a capital stock of \$500,000. The liabilities are \$10,331, and assets \$5,896. Unfulfilled contracts aggregate \$62,000. The principal stockholders are C. W. Youngman, \$206,200; David H. Darling, trustee, \$141,200, and John D. Cheever, \$51,000.

WANT THEIR MONEY.

Washington, D. C., Oct. 17.—Suit for \$1,525.57 has been entered by the Bellis Cycle Company of Indiana against the Washington Cycle Company, composed of Wilber A. Marmaduke, A. F. Perry, and Calvin A. Holland. The plaintiff company claims to have sold bicycles and supplies to the defendant which have not been paid for.

STEEL TUBING ONLY.

Bloomsburg, Pa.—The Bloomsburg Brass and Copper Co. have temporarily abandoned the manufacture of brass and copper tubing, and are now devoting their attention to the manufacture of steel bicycle tubing.

THAT M. & W. DEAL.

Considerable Smoke; and Some Fire—The Few Facts Which Are Known About the Affair.

Early in August of the present year reports reached THE WHEEL that efforts were being made in London to capitalize the Morgan & Wright interests for some \$15,000,000. When asked at that time concerning its truth Chicago's famous tire makers promptly wired back "Nothing in it." These facts were published in THE WHEEL of August 7.

Last week some one resurrected the item and heralded it as "news." Morgan & Wright promptly published this card to the public: "We wish to say to our friends that we have no intention of going out of the tire business. We will continue to manufacture 'good' tires at the old stand, taking care of our customers as heretofore, and hope to do so for many years to come."

To THE WHEEL'S Chicago representative they added an unqualified denial of any change whatever in their business. Much has been made of the matter, however, the fact that Messrs. Frank W. Morgan and William Herrick quietly sailed for Europe on October 7 giving color to the printed reports.

The names of Attorney Auerbach, of H. B. Hollins & Co., New York bankers and brokers, and Mr. Alden, of the New York Commercial Company, have been connected with the reported negotiations. Mr. Auerbach is in Europe. Mr. Alden refuses to either affirm or deny the reports, or to say anything whatsoever concerning them. Mr. Hollins takes practically the same stand. After refusing to either deny or affirm knowledge or connection with the matter he added, "The garbled reports are likely to continue for a long time."

"Then the matter has not proceeded beyond mere negotiations," he was asked.

"Exactly so," he replied.

Other sources stated that returning Americans had told the Morgan & Wright people that their foreign business was not being done full justice, and this, it is said, is the real reason of the visit of Messrs. Morgan and Herrick.

LOZIER'S REPORTED SALE.

Two years ago the gossips had the Lozier interests sold to a foreign syndicate.

Two weeks ago, and closely following the tube-trust fiasco, the Lozier item was dug up and given a semblance of life. Certain papers accepted it with little or no reserve. It was too strongly colored for THE WHEEL to digest without salt, and, as expected, the yarn proves to be without foundation. In response to inquiries, Mr. H. A. Lozier writes:

"Who started it I do not know, but there is no truth whatever in the report. I have not sold, and do not expect to sell, to an English syndicate. It is like a great many other foolish reports which are being circulated."

THE COURT SAYS

Morgan & Wright Have the Best of Their Legal Argument With the Goodrich People.

After three years of legal fencing Morgan & Wright have scored over the B. F. Goodrich Company, of Akron, Ohio.

The fencing comprised test suits on the various claims of the Morgan & Wright patents which are the vital points of the Morgan & Wright tire. The Goodrich Company was selected to fight because of its size and importance in the trade. Volumes of testimony were taken during the three years, but the suit was not decided by the United States Circuit Court until October 15 last.

Every one of the claims which the Goodrich Company was alleged to infringe was allowed, and the validity of the Morgan & Wright patents thus assured. The decrees were entered by consent, and waive costs and damages.

The following are the claims on which suit was brought, and which the decree of the Court declared valid: All claims of patent No. 490,035, covering process of making Morgan & Wright tire sheath on a mandril; first, second, third, fourth, fifth, sixth and seventh claims of patent No. 502,047, covering two different features, the inside tube having flattened ends and the process of making the same; secondly, the feature of the ends of the inside tube overlapping each other; and fourth, sixth and eighth claims of patent No. 502,048, covering, firstly, a normally flattened air tube in a sheath which has a limited opening; and, secondly, the flattened tube having closed flattened ends.

The decrees in full are as follows: United States Circuit Court, Northern District of Ohio, Eastern Division.

DECREE No. 5,146.

DECREE.

And now, on this 15th day of October, A. D. 1896, this cause came on for hearing upon the bill of complaints, answers, replications and an agreement in writing between the complainants and the defendants (filed in case No. 5,147), wherein the defendants consent to the entry of a decree in this cause, waiving damages and costs, sustaining the validity of the first, second, third, fourth, fifth, sixth and seventh claims of the complainants' letters, patent No. 502,047, dated July 25, 1893, for an improvement in pneumatic tires, and holding the defendants to have infringed the same; and, the Court having duly considered the premises, and being fully advised thereof, it is, with the consent of the parties hereto, hereby adjudged, ordered and decreed, that said letters, patent No. 502,047 is a good and valid patent as to the first, second, third, fourth, fifth, sixth and seventh claims thereof; that the defendants have infringed each and every of said claims; and that an injunction be and is hereby awarded to the complainants, perpetually enjoining and restraining the defendants and each of them, their and each of their attorneys, agents, servants, workmen and employees, from directly or indirectly making, using, selling or practising the inventions, or any of the inventions, set forth in said claims or any thereof. And this decree is final.

AUGUSTUS J. RICKS, Judge.
DECREE No. 5,147.

And now, on this 15th day of October, A. D. 1896, this cause came on for hearing upon the bill of complaint, answers, replications and an agreement in writing between the complainants and the defendants, filed in this cause, wherein the defendants consent to the entry of a decree waiving damages and costs, sustaining the validity of the four claims of the complainants' letters patent No. 490,035, dated January 17, 1893, for improvements in the manufacture of pneumatic tires, and holding the defendants to have infringed the same; and, the court having duly considered the premises, and being fully advised thereof, it is, with the consent of the parties hereto, hereby adjudged, ordered and decreed that said letters patent No. 490,035 is a good and

valid patent as to all the claims thereof; that the defendants have infringed each and every of said claims; and that an injunction be and is hereby awarded to the complainants, perpetually enjoining and restraining the defendants, and each of them, their and each of their attorneys, agents, servants, workmen and employees, from directly or indirectly making, using, selling or practising the inventions, or any of the inventions, set forth in said claims or any thereof. And this decree is final.

AUGUSTUS J. RICKS, Judge.
DECREE No. 5,148.

And now, on this 15th day of October, A. D. 1896, this cause came on for hearing upon the bill of complaint, answers, replications, and an agreement in writing between the complainants and the defendants (filed in case No. 5,147), wherein the defendants consent to the entry of a decree in this cause, waiving damages and costs, sustaining the validity of the fourth, sixth and eighth claims of the complainants' letters patent No. 502,048, dated July 25, 1893, for an improvement in pneumatic tires, and holding the defendants to have infringed the same, and, the court having duly considered the premises, and being duly advised thereof, it is, with the consent of the parties hereto, hereby adjudged, ordered and decreed that said letters patent No. 502,048 is a good and valid patent as to the fourth, sixth and eighth claims thereof; that the defendants have infringed each and every of said three claims; and that an injunction be and is hereby awarded to the complainants perpetually enjoining and restraining the defendants and each of them, their and each of their attorneys, agents, servants, workmen and employees from directly or indirectly making, selling, using or practising the invention, or any of the inventions set forth in the fourth, sixth or eighth claims of said letters patent respectively. And this decree is final.

AUGUSTUS J. RICKS, Judge.

WHERE THEY WENT TO.

Exports of bicycles from the port of New York for the week ending October 13 were:

Antwerp, 19 cases bicycles, \$1,129.
Amsterdam, 1 case bicycles, \$40; 14 cases bicycles, \$320.
British Honduras, 9 crates bicycles, \$580; 1 case bicycle material, \$34.
Bremen, 22 cases bicycles, \$1,340; 2 cases bicycle material, \$1,340; 2 cases bicycle material, \$115; 3 cases velocipedes, \$32.
Brussels, 3 cases bicycles, \$600.
Brazil, 5 cases velocipedes, \$158; 1 case tricycles, \$15; 1 bicycle, \$60.
British Guiana, 7 crates bicycles, \$490.
British possessions in Africa, 9 cases bicycle material, \$329; 40 cases bicycles, \$4,157; 4 cases velocipedes, \$71.
British West Indies, 3 cases bicycle material, \$36; 30 packages bicycles, \$2,121; 2 crates tricycles, \$75; 3 cases bicycle material, \$245.
British Australia, 151 cases bicycles, \$9,292.
Central America, 2 cases bicycles, \$136; 2 packages bicycle material, \$32.
Copenhagen, 1 case bicycles, \$70.
Dutch East Indies, 4 crates bicycles, \$175.
Ecuador, 4 bicycles, \$255.
French West Indies, 7 crates bicycles, \$490.
Genoa, 9 packages bicycles, \$453.
Hamburg, 3 crates bicycles, \$125; 1 case bicycle material, \$39.
Havre, 1 case bicycle material, \$60; 5 cases bicycles, \$71.
London, 251 cases bicycles, \$30,211; 10 packages bicycle material, \$443; 15 cases cyclometers, \$3,100.
Liverpool, 10 cases bicycles, \$1,000; 5 cases cyclometers, \$21.
Mexico, 23 packages bicycles, \$1,128; 2 cases velocipedes, \$26.
Portuguese possessions in Africa, 1 case bicycles, \$110.
Rotterdam, 2 cases bicycles, \$181; 1 case bicycle material, \$32.
Southampton, 2 cases bicycles, \$200.
San Domingo, 2 cases bicycles, \$200.
Turin, 13 cases bicycles, \$1,375.
United States of Colombia, 3 cases bicycle material, \$202; 1 case bicycles, \$35.
Vienna, 15 packages bicycle material, \$2,251.
Venezuela, 4 cases bicycles, \$200; 1 case bicycle material, \$15; 1 case velocipedes, \$13.
Berlin, 2 cases bicycles, \$45.
Brisbane, 4 cases velocipedes, \$50.
Fondo, 1 case bicycles, \$40.
Sydney, 5 cases bicycle material, \$206; 18 cases bicycles, \$3,545.

OFFICIAL GUARANTEES.

These Are the Ones Authorized For Wheel and Tires For the Ensuing Year.

Both the Cycle Board of Trade and the Rubber Tire Association have completed the final drafts of the six months' guarantees which will be in force with the issuance of the '97 catalogue.

The bicycle guarantee will be as follows: We agree with the purchaser of each bicycle to make good, by repair or replacement, when delivered at our factory, transportation prepaid, any imperfection or defect in material or manufacture of such bicycle not caused by misuse or neglect; provided that the factory serial number shall be on such bicycle at the time the claim is made, and that all imperfect or defective parts shall be referred to us before any claim for repair or replacement shall be allowed. This guarantee continues for six months from the date of the sale by the agent.

Among those who have signed the agreement to insert such guarantee in their catalogues for 1897 are: R. L. Coleman, for West-ern Wheel Works; George H. Day, for the Pope Manufacturing Company; C. W. Dickerson, for the Sterling Cycle Works; Joseph L. Yost, for the Yost Manufacturing Company; E. C. Stearns & Co.; Syracuse Cycle Company; A. G. Spalding, for A. G. Spalding & Bros.; Charles F. Smith, for the Indiana Bicycle Company; William J. Bruff, for the Remington Arms Company; Joseph McKee, for McKee & Harrington; A. L. Garford, for the Garford Manufacturing Company; R. Philip Gormully, for Gormully & Jeffery.

The guarantee on tires as it will appear hereafter is in this form:

We agree with the purchaser of each tire to make good, by repair or replacement, when delivered to us, transportation prepaid, any imperfection or defect in material or manufacture of such tire not caused by misuse or neglect, provided such tire is accompanied by a signed statement from the owner giving the date on which the tire was purchased by him, together with the name and number of the wheel on which it was used, and that all imperfect or defective parts shall be referred to us before any claim for repairs or replacement shall be allowed.

We agree to repair, free of charge, any tire that can be repaired, providing such tire is delivered to us, transportation prepaid.

This guarantee continues for six months from the date of the sale by the agent, but expires in any event on May 1, 1898.

This agreement does not apply to tires into which any so-called anti-leak preparation has been introduced.

SINGLE PACING ONLY.

Single pacing only was permitted in the N. C. U. fifty-mile championship run on the Catford track, October 3, making it an interesting fight up to the last ten miles. Then the men dropped out one by one, until at the close but three of the twenty-three contestants remained. J. Silver, the Scottish champion, with a 90-gear, held the pace admirably and looked the winner up to the last five miles, when the high gear proved too much for him and he was repeatedly lapped by W. H. Bardsley, who won in 1 hr. 57 min. 28.45 sec. Silver finished four minutes later. But a handful of spectators witnessed the race.

HELL DO.

W. W. Armstrong, the Republican member of the New York House of Representatives who engineered the Bicycle Baggage bill through the Legislature last fall, has been nominated as one of the representatives to the State Board of Officers, L. A. W., from the Rochester district.

THOSE WHO CONTROL.

League Magnates Meet and Act Upon Several Important and Knotty Questions.

Bids from bill posters will probably be invited by the League of American Wheelmen before the year 1897 is very old.

The Executive Committee has been attacked by the "poster craze" and means that dead walls and weather-beaten barns and fences shall not be pre-empted by patent medicine men and theatrical folk. The League means to issue a poster of its own and paste it up wherever pasting up is possible. At a meeting of the committee in this city on Friday last this means of advertising was decided on, and an appropriation made which will be offered as a prize to the artist submitting the most acceptable design.

At the meeting every member was in attendance, viz., President Sterling Elliott, First Vice-President Charles F. Cossum, fresh from free-silvered Mexico, and Second Vice-President A. Cressy Morrison, from Brewsterville.

The poster idea was not the only surprise developed. President Elliott, via Secretary Bassett, turned up one of his own. The secretary was not in evidence, but his report was. It showed a balance on hand of \$14,495.93, of which \$7,214.70 was a free will offering from Publisher-President Elliott.

After running the official organ at a weekly loss of \$600 or \$700 for more than a year, the membership boom turned the tide and enabled Mr. Elliott to clear a profit. Although the profit was due to a strictly business transaction and there was no apparent reason for it, Mr. Elliott's League sentiment prevailed, and he voluntarily rebated to the League the amount stated. It was a gift which comparatively few will appreciate. When the fight is on his political opponents will almost certainly hound and pound him as relentlessly as other sacrificing officials have been pounded.

Under the discretion allowed them by the rule adopted at the last National Assembly to avoid the unwholesome trickery, wire-pulling and vote-trading politics which have always characterized the selection of the place for the annual National meet, the Executive Committee decided to accept President Elliott's suggestion that the place be chosen by a mail vote of the membership at large, the ballots to be cut from the official organ. The vote will be taken during January.

Albany, N. Y., was selected as the meeting place of the National Assembly on the second Monday in February next. The first day, as provided for in the bylaws, will be devoted entirely to road improvement discussion. One thousand dollars was appropriated to defray the expenses of the day. Another appropriation of \$500 was made to cover the expense of preparing matter relating to road improvement for publication in newspapers. This money will be expended under the direction of Otto Dornier, of Wisconsin, who is a member of the National Highway Improvement Committee.

ONE OFFICE LESS.

While it is a problem whether Sterling Elliott will be re-elected president of the League, it is a certainty that he won't hold the office of chief consul of the Massachusetts division next year. The nominating committee of that division have overlooked him completely. J. E. Tippet, Boston, will be his successor. A. D. Peck will again act as secretary-treasurer, with D. E. Miller vice-consul. There is no opposition in the Bay State this year.

ALWAYS IN ORDER.

Another fight has broken out in the Michigan division. An independent ticket has been placed in the field by the Detroit element, and the war is on. The regular ticket is headed by A. B. Richmond for Chief Consul, who held that position from 1888 to 1891, while Leo A. Caro is renominated for secretary-treasurer. The Detroiters have placed E. H. Hines at the head of their banner, and are working tooth and nail for his election as Chief Consul. The present incumbent, R. G. Steel, refused a renomination. Steel has held the office since J. M. Bresler was deposed from office and expelled from the League in 1893 on a charge of endeavoring to disrupt the organization. The Bresler episode brought the division's membership down to 400 members, but it has since increased to over 900. When deposed from office, Bresler refused to turn over the \$600 or \$700 in the treasury, and he still has it. It is now stated that if Hines is elected Bresler will return the funds. The division has shown a sorry lack of pluck and combativeness in not obtaining possession of the money ever since Bresler's attitude of hostility. But with Richmond in the field, the Detroit faction's candidate has but little chance.

A TUBELESS TIRE.

This is a possible "tire of the future," the Fleuss tubeless tire, to which THE WHEEL first called attention. It is now being marketed by the "Tubeless Pneumatic Tire and

Capon Heaton," No. 31 Moor street, Birmingham, England, and is attracting a deal of attention. As will be seen, it is detachable and of the clincher variety, but requires no inner tube.

RUCTIONS IN OLD PENNSY.

The Pennsylvania division is stirred up over the action of the friends of Dr. W. H. Mercur, of Pittsburg, who is running for vice-president in opposition to T. J. Keenan. Last week they mailed to all the members of the division illegal tickets containing only the name of Dr. Mercur as a candidate for the vice-presidency. It was known that the ticket sent out by the division officials would not be mailed before October 15, and it was thought that many of the "smooth-bore" tickets would be voted by those who would not know that Mr. Keenan was a candidate.

Under the by-laws adopted last August these votes could not be counted, but the friends of Mr. Mercur claim that the clause which would invalidate them is technically unconstitutional, which question will have to be decided by the Rules and Regulations Committee.

The regular tickets containing the names of all the nominees were issued this week.

East Brookfield, Mass.—E. H. Stoddard has purchased the entire plant of the Greyhound Bicycle Co. for \$8,000. He will dispose of the finished product at once and will begin designs for his 1897 wheels. The old name will be retained and an experienced manager will be in charge. Mr. Stoddard was the former president of the concern.

BYE BYE, BUTLERS.

Across the Stormy Ocean: After a Few French and Foreign Purses Sail the Brothers.

Although advertised to appear at a race meet in Philadelphia on Saturday, Tom Butler, accompanied by his brother Nat and Manager George S. McLeish, sailed on the St. Paul Wednesday for an extensive campaign abroad. E. A. McDuffee, the Malden crack, sailed on the same steamer, independent of the Butler party. After spending a few days in London they will proceed to Paris, where they will go into training prior to meeting all the foreign cracks. During their stay abroad they will appear at Nice, Naples, Madrid, Vienna, Antwerp and Brussels, and, if successful, will proceed to Australia to ride next summer.

Although all the Americans who have gone abroad this year have met with indifferent success, it is generally believed that the Butlers will be more successful. Tom Butler has been styled the "Michael of America." He is but nineteen years of age, and small of stature, but has done some wonderful work this season. After winning his novice race in June, 1894, he jumped at once into the top ranks of the amateurs. As a professional this year he has repeatedly defeated all the big men of the circuit, including Bald and Cooper. At the National meet at Louisville he captured two of the championships—the half and mile—and at Springfield won the international race (so-called). He rides with his head as well as his legs, and is one of the squarest riders on the path.

Nat Butler first became famous as a road rider, and has figured as scratch man in numerous "twenty-fives." He is twenty-five years of age, and considerable larger than his brother Tom. He has been on the path since 1893. He has a number of records and many brilliant victories to his credit. Nat has been off the path for the last six weeks on account of a broken collarbone. The Butlers are backed by E. C. Stearns & Co. McDuffee will ride a Waltham Comet. They were given a royal send-off when they left Boston on Monday.

PATEE WILL PUSH THINGS.

Illinois, with almost as large a cycling population to draw on as New York, Massachusetts and Pennsylvania, needs stirring up. It is sadly behind these leading States in League membership. Its lethargic condition is unaccountable, but there is going to be strife for the chief consulship this year, so there are hopes. The present incumbent, L. C. Jaquish, has been renominated, but he has a running mate in Fred Patee, known far and wide, both in sport and in the trade. George D. Locke, the present secretary-treasurer, has also been renominated.

HAS RIBS ON IT.

Ribbed or corrugated single tube tires promise to be a feature of next year's trade. The Brooklyn (N. Y.) Rubber Company's

Bernard tire will be of that type. It is shown herewith and looks a likely article. The Brooklyn concern has had twenty years' experience in rubber working and has facilities that will insure the quality of both grade and price.

Special Run On Clippers....

"GOUVERNEUR, N. Y., October 2, 1896.

"GRAND RAPIDS CYCLE Co., Grand Rapids, Mich.

"Dear Sirs: I am so well satisfied with the business associations we have had that I am pleased to say your postal of October 1st is correct in every way. Better value, better service and better treatment than we get as a rule from bicycle houses. *I especially value your promptness and willingness in the repair line.* I have not sold as many wheels as I anticipated this year, but shall make a special run on New Clippers next year, and hope, the times being better perhaps, to do a good business. Thanking you for all favors, I remain,

"Yours very truly,

"E. D. BARRY."

A Perfect Pedal...

THE JANNEY FOR '97.

SIMPLE, ARTISTIC AND THEREFORE ATTRACTIVE.

A pedal made on scientific lines with **no loose cones** and **no check nuts**. It will not bind and will not tighten. This is so important that you cannot afford to be without it in '97

By an improved process in hardening, the axles are rendered nearly twice as strong as steel hardened in the ordinary way.

The velvet dust shield makes it **dust and water proof**. The oil is retained in the bearings, and thus they are constantly supplied with lubricant.

Notice to Advertisers.

WHEEL ADVERTISERS are notified that change of advertisements is not guaranteed, unless copy is received by Saturday morning.

TO FOREIGN INFORMATION SEEKERS.

Owing to the number of inquiries received from abroad in regard to the status of American firms, THE WHEEL announces that it will give to all such inquiries the most careful attention, and all foreign merchants desiring advice or information regarding American trade are invited to correspond with THE WHEEL.

SIZE OF ELECTROTYPES.

Patrons who may send illustrations of machines or machinery for publication in THE WHEEL will please bear in mind that such electrotypes should not exceed 2¼ inches in width.

THEORIES OF SUCCESS.

AS man has seven ages, so has a business—or concern divers and different stages—as, for instance, birth, prime, climax and fins. Of all the stages through which a business passes, from the first young, solid, pushing, hopeful, enterprising days to the end, the most dangerous stage is that in which it is most susceptible to "dry rot."

By "dry rot" is meant old-fogysm, fossilism, blind and unreasonable conservatism—in brief, a gentle and general state of mental obfuscation. The disease is imperceptibly insidious; and, like all mortal ills, it is least apparent to those whom it most afflicts. They fancy they are still in the heyday of youth and vigor and activity, and are the last to realize that, day after day, they are dropping behind their competitors, are being elbowed out of their field. Then, one day, some one passes it

about the market place that they are no longer in the field, are non-competitive, non-progressive, on the shelf, out of the running. If the rumor be based on truth—and nothing be done—the day of "winding up," of "voluntary dissolution," or some other highly respectable finishing touch is not far off.

Every business must continually have brought into it new vitality to offset the natural disintegration and cobwebbery which affects business as well as all things in nature. The business must have injected into it new men with fresh ideas, men who have not been worked out, men who are still looking forward, who have yet to make their names, who are yet on the verge of their careers. These are the men who are inexhaustibly active, interested and creative. Their best talents and time are not devoted to assets, property, riches and reminiscence. Their talent is devoted to acquisition, not to calculation. They are of the present and the future—not of the past.

Usually a young man creates a business, and the business grows with his growth, and in time it often outruns him and his desires often outrun it. The made merchant longs for leisure, for pleasure, for vacation. In his double decade of grind, during which he has earned a niche and his competency, he has burned something out of himself, and nature suggests and sometimes compels a halt. And so he unconsciously lets up on that close scrutiny of details, that intense attention, that never-failing application, which has made the business a success.

At this stage a man of genuine perception and of true sight either retires and enjoys his competency and his honor, or if he does keep in harness he must gradually shed some of his burden of responsibility and activity upon shoulders that are able and willing to bear it. He should have about him a staff of men among whom he can distribute his labor and his leadership. If he has not, by a liberal policy and with the exercise of judgment, prudence and courtesy, gathered about him men of the necessary types, he is indeed unfortunate, and it is impossible for him to escape "dry rot" and failure. He is sure to be engulfed and dismayed.

On the other hand, a great many men of natural but untrained mental powers build up businesses which become entirely too big for them. Their success has been made by special development in one direction and in one line. So when a big business imposes upon them leading tasks of a different nature they stagger under the load. For instance, one man is a master of manufacture, but lost in finance; whereas another man may be shrewd at finance, but entirely at sea at the producing end. Yet, again, another man may be a great seller or distributor of material, but entirely at a loss inside the office or inside the factory. The business man who is essentially shrewd is he who most truly realizes his powers; and he is particularly shrewd if his limitations and deficiencies appeal to him with more force than to his triumphs and his talents. A business man must continuously attempt a proper realization of himself. His deficiencies he must

offset by the employment of men who have the qualities in which he is lacking. Such men are all about him and may be secured by perseverance and the exercise of discrimination.

A great many men in the very climax of their careers have speedily come to their end. The promise of greatness has never been fulfilled. The very bigness of their business makes them stagger under it. They develop a habit of uncertainty and of procrastination; they loiter and linger over new propositions; they decline or shrink from new suggestions; they refuse to reach out into new markets, to enter new avenues of trade; they have, in brief, lost the quality of leadership; they are no longer captains and are in splendid condition for the encroachment of the "dry rot" microbe, which is ever on the alert for promising material.

All business must have a head, a master, a leader. This leader must be open to suggestions from every point of the compass, from every person in whom he has vested employment; but he should sift, digest and weigh, and, in the end, he should lead, initiate and inaugurate. Leaders should have men about them capable of giving advice, not mere mannikins, but men who are themselves endowed with original and creative thought, and who are themselves leaders in their particular way and so far as their opportunities have permitted. The leader should be on the lookout for new methods of doing business, for fast and improved machinery if he is a manufacturer, for new methods of marketing, new customs in finance. He must look out for all these things or he should have pilots on the lookout for him. In this way he is sure not to fall behind the times. He is sure to be shouldered to shoulder with his competitors.

Some men in some concerns, especially if they are very old and very rich and used to triumphs, bank too much on experience, reputation and old-establishment. But, while these are matters of great import in old countries, they do not cut so large a swath in this newer country, in which men pass from class to class, from lowest to highest, with wonderful rapidity. The winning elements in trade to-day are products and prices, and the fineness of the one and comparative merit of the other count for everything. When these are wrong, when the product is too poor or the price is too high, then the business is wrong, and in crises of this kind, heroic efforts must at once be made to get right. One is then on the wrong road and must not pursue it in the vain hope of finding a side path leading back to the main highway; he must at once return to the original point and start over again—right.

One of the most important things to remember in connection with business is that very little on either side of the scales means success or failure. The dividing line between success and failure is not as sharply marked as most people think it is. It is almost as fine as the distinction between talent and genius. The scale can be turned, if there is half a chance, by courage, perseverance and judgment.

WHERE THE L. A. W. HAS ARRIVED.

AROUND the business and legislative structure of the L. A. W. there is no evergreen—no clinging evergreen—so securely and yet so insecurely rooted as the "Bulletin matter." Each year it has been pruned and grafted and re-fertilized; each time the tending has seemed to assure an increase of hardness, but as regularly as the month comes round each February finds the vine, or "matter," in need of renewed attention. Though sick, it will neither die nor live a life of unperfumed usefulness.

As February draws nearer the evergreen shows the old familiar signs. To the "new element" which will so largely compose the next National Assembly the subject may be fresh and interesting. It will afford them golden opportunities to spout and hear spoutings, and when it is all over the dear old matter will seem settled for aye, and in all probability recur as regularly the following year.

Just now the official organ, the "L. A. W. Bulletin," is draining most of the phosphate in the national treasury. When Mr. Elliott made the arrangements they seemed as usual to have finally solved the vexed question. He agreed to supply the membership with a weekly paper on a sliding scale. Up to 35,000 members the price would be 25 cents each. For each additional 5,000 the price would be increased five cents per member until 50 cents was reached, the money, of course, to be paid out of the National treasury, and the contract to be terminable on ninety days' notice.

At that time, March, 1895, the present membership of the League was a remote speck on the horizon, but during the present year New York, Pennsylvania and Massachusetts put on seven league boots and kept moving so well that the roll now bears more than 70,000 names. Of the renewal fee of \$1 per member, the national body receives 65 cents, and the State division 35 cents. The \$1 initiation fee of new applicants goes entirely to divisions.

From these figures it will be seen that since the membership reached 50,000 the L. A. W. after paying 50 cents per member for the "Bulletin" and mailing the member's card has had a net working capital of but 13 cents per capita.

For the eleven months ending February, 1896, when the membership was 39,000, the cost of running the League was \$12,000. Those who incline to a dabbling in figures may use this as a basis for finding where the League will land on the 13-cent plan.

The publisher-president—all praise to him—has this year done the handsome by voluntarily rebating some \$7,000 of the money received by him as publisher, else the situation at the end of the fiscal year might have suggested bankruptcy, as it did before the publisher's contribution was made public.

President Elliott's generosity has saved the day, but that some of his political opponents are almost eagerly awaiting an itemized statement of the League's finances, and

that the "Bulletin" contract in some form or other is again to be pounced upon and made the basis of political capital, there is reason to believe; indeed, it was an apparently innocent, but intentionally dropped remark of one skilled in the pastime of cycling politics that first directed attention to the dangerously close margin on which the L. A. W. is being operated. It is well to be prepared for an outburst.

PLAYING AT POLITICS.

WHAT a fascinating game is the game of politics as played in the League of American Wheelmen and its various divisions! It is superior to poker, baseball, chess, craps, golf, euchre, bowling, football, dice, chuck-farthing, lawn tennis, fakring, logic or the gift enterprise business. It is often played by experts sharper than many engaged in the shoving of the queer. There is more excitement in it than in moonshining among the mountains of Georgia.

There are some high old players at the game of League politics in New York. Their betters can't be found anywhere.

The countenances of the crack players are apt to be tinged with melancholy when seen in public. They do their laughing behind doors.

Not in all those parts of the world that lie outside the United States are there such ingenious players at the game of cycling politics as the American players.

The game in politics at which we are looking these days is one for which sharp wits are needed; but the National game that is to be played next year with the League presidency, pull and power as the prize, will be a game for the master players of the whole country, and it will be a stirring one, too.

PERCENTAGE FALLACY.

ALTHOUGH a good thing for the clever man who originated it, the percentage system of reckoning the standing of the racing men on the National Circuit is a magnificent fallacy; nothing more; nothing less. To be truthful, the exact position of every man in every race must be obtained. With this as the foundation of the system, we care not who he is, nor how experienced he may be, we maintain it to be a physical impossibility for any one, in the press stand, or out of it, to perform the feat with more than such accuracy as is entitled to the term by a broad stretch of courtesy. Too many big fields and close finishes have marked the racing year for any man to set up himself as referee, judge, scorer, umpire, and, in the vernacular, "the whole thing." With so many bricks of straw—of guess work—for a foundation, the entire system must be unstable, must totter and must fall.

All must be thankful that temporarily the bicycle as a pulpit theme has given place to the financial question.

SOME FACTS AND FIGURES.

"Besides, who knows precisely what brand new device may surprise the wheeling fraternity with the appearance of the fully guaranteed chainless bicycle for 1897, sold for the rational and up-to-date price of \$50?"

This is the tail-end of an editorial by our astute and potent contemporary, the New York Sun. Such is the way the "great dailies" mislead the public. THE WHEEL understands that it would cost thousands of dollars to build enough machinery to produce the first few chainless bicycles, because of the complicated nature of the bevelled gear, and because of the cost of that gear. No first-class bicycle can be sold for \$50; no perfected chainless bicycle can be sold for \$50. The price will be nearer \$150, and it is doubtful if the wheel will be guaranteed; rather will it be put out and left to earn its own reputation.

President Brock, of the Metropolitan Association of Cycling Clubs, is making a laudable and energetic effort to combine the interests of the several similar associations which exist in this vicinity. To that end he has called a meeting of club presidents for Wednesday evening next at the Bartholdi. He has letters of support from Presidents Keer, of the New Jersey Association, and Fuller, of the Long Island organization, which merit the belief that petty jealousies and differences will be buried, and an association befitting the first city in the land the result.

New York will go to the L. A. W. National Assembly with more than one hundred delegates. Pennsylvania will have seventy or eighty, and Massachusetts almost as many. It means that the League has become topheavy and unwieldy. A pruning—a new basis of representation—is imperative, else the great weight of legislative talent will swamp the ship.

Had Seneca been a wheelman he certainly would have been one of those Samaritans of the road who are ever ready and equipped to help a fellow-rider who has come to grief. For did he not declare: "To find one thankful man, I would oblige many that are not so"?

There is something for every man to be thankful for. Man should be thankful that he has the measles only once, and his first lesson on a wheel only the same number of times.

Men ridicule women because they waste so much time and thought on their cycle dress; but the woman who doesn't do it they unani-mously look down on as a frump.

The scorcher fails to understand that the pleasures of cycling descend gently upon those who ride like evening dew, but do not patter down like a hailstorm.

A pretty woman can lose her head on a wheel about as easily as she can her heart,

GO AS BAGGAGE HEREAFTER.

Missouri has decided that bicycles are baggage, and must be accepted as such by railway corporations. Judge Russell rendered the ruling.

The case in which the decision was made was that of J. R. Bettis vs. the Missouri Pacific Railroad Company. In his petition Bettis, who lives at Webster Groves, a suburb of St. Louis, stated that on April 2 last he bought a ticket, but the company refused to carry his wheel until he paid excess baggage rates on it, although up to that time no objection had been made to carrying it free. He obtained an alternative writ of mandamus compelling the railroad company to carry his bicycle free, and the company filed a motion to quash the writ. The latter motion was overruled by Judge Russell.

In his decision the Judge first reviewed the facts set forth in the plaintiff's petition. He said that in the motion to quash the alternative writ the railroad claimed that a private person could not set on foot a proceeding of this nature without the sanction of the official representatives of the State, and that a writ of mandamus would not lie because there was an adequate remedy for damages growing out of the refusal of the company to carry the bicycle free. The first point was overruled on the grounds that a railroad corporation was compellable by mandamus to exercise its duties of freight and carriage, and the fact that remedy by damages might be obtained did not preclude the remedy by mandamus. The Judge went into particulars as to what constituted baggage, and incidentally relieved himself of some individual opinions in this wise:

"Nothing which a crank or an eccentric person would take with him would be considered baggage," said he. "It is true that it has not been very many years since those who, like the plaintiff, were addicted to bicycle riding, were regarded as cranks, but his class has grown and his tribe multiplied, until it threatens to include all mankind, and we are forced to accord the wheelmen the average human intelligence; we cannot now say that only a crank would carry a wheel."

WHAT CONSTITUTES "ASSAULT."

A Jersey City lawyer was forced to dismount from his bicycle by the road hoghish tactics of a truckman, who persisted in zigzagging across the road in front of the wheelman. The lawyer promptly had the truckman arrested, charging him with assault. Justice Potts, before whom the case was tried, rendered the following decision: "It is an assault to ride dangerously near a person, thus causing him to fear injury to his person. (State vs. Sims, 35 S. C., 137, and Morton vs. Shoppe, 3 C. and P., 373). An assault is an attempt unlawfully to apply any or the least actual force to the person of another directly or indirectly, or, in other words, an assault is an unsuccessful attempt to do harm to the person of another, thereby causing a well-founded apprehension of immediate peril."

FORTY MILES, COST \$50,000.

Another scheme to build a cycle path between Washington and Baltimore has been floated. The project is a private enterprise, proposing the construction of a macadam path forty miles long and ten feet wide at a cost of about \$50,000. Half way between the two points it is proposed to build a clubhouse. The path will be supported by a toll of 25 cents. It is claimed that Baltimore and Washington capitalists are willing to invest money in the scheme.

GRAY WOLF AND PISTOL PETE.

A lugubrious story emanates from Reading, Penn. Its cycling coloring lies solely with a little circular card with advertising matter printed thereon, to boom the race meet held by the Electric Wheelmen in that city several weeks ago. It was provided with a red string, and many cyclists wore them around their necks. Some of these cards were used by a Reading manufacturer as packing paper in crating wheels shipped to Arizona. This week one of the cards, it is alleged by a "Ledger" correspondent, was returned to the club with a bullet hole through the centre. Accompanying it was this letter:

"Enclosed you will find one of your advertisements of a race meet held by your people. You will wonder how I got it out here and why I send it back. It has quite a history, I assure you. Last week a drunken Ute Indian, 'Gray Wolf' by name, came to our ranch and was looking for trouble. He had this card on him right over the heart. He started the fun with 'Bronco Ben,' one of my cowboys, and, well—there is not much to tell. The hole in the card explains it all. Bronco Ben uses a shooter and he shoots straight. I thought, no doubt, you would be glad to receive the card when you knew its history. Yours truly,

"PISTOL PETE."

"Foreman Santa Marie Ranch.
"N. E.—We buried 'Gray Wolf' the same day."

"BICYCLE" OLIVER.

Oliver is one of the cycling characters of the metropolitan district. No one knows his given name. His cards, his signs, his advertisements all read "Bicycle Oliver," and the name now comes as easily as Tom or Dick. His appearance was contemporaneous with the completion of the Coney Island wheelway. First he sold score cards at race meets and road events, and haunted the cycle path

with a foot pump and a kit of tools, in an endeavor to earn an honest penny by fixing a disabled wheel or mending a punctured tire. Then he purchased a tent and established a "repair shop" in the woods which adjoin the path. He soon became widely known. Latterly he has been in evidence at most of the race meets at Manhattan beach, his pump and tools near at hand, and a modest stock of small sundries displayed on a barrel, as shown in the picture. He is an earnest, obliging, energetic and thoroughly deserving fellow.

SUFFERED FROM COLD.

In celebration of the opening of Glenmore avenue, Brooklyn, as a macadamized boulevard, giving the long desired outlet from the city to the good roads of Queens County, a parade was held on Saturday last under the management of the Brooklyn Good Roads Association. About twenty-five clubs and several hundred unattached riders took part, with Charles H. Luscomb grand marshal. The parade was reviewed at the Union League Club by a number of the city officials.

PAID HIS LIFE FOR A PEDAL PIN.

For years the festive bandits and the genial bank burglars have utilized the horse to make good their escape after playfully holding up a train or filling the ever timid cashier full of neat, round holes. All this, however, is likely to be changed. Already the enterprising law-breaker has recognized in the wheel an instrument that to his class is destined to fill a long felt want. It is faster than a horse.

The two robbers who rode into Sherburne, Minn., shot two men dead in the Bank of Sherburne, helped themselves to \$1,000 in cash and then merrily scorched out of town were enterprising, up-to-date young men, and unless they came to a most untimely end in the immediate vicinity of a scaffold a new and hitherto unfiled field, in which by strict parsimony and close attention to business they might have in a few years eked out fortunes, is opened up to them.

Just imagine the possibilities of a cycle school for thugs! A place where crooks could be taught how to scorch out of a policeman's reach in three lessons. And to go still further in stimulating their enterprise, they might offer club rates to select parties of five or more burglars. Then, too, a cycle lamp might be invented that could be used in case of emergency as a dark lantern. Unfortunately, one of these Sherburne bank depleters was mounted on a bargain-counter wheel, and when gayly riding off with the wealth he had pre-empted, broke a pedal pin and was shot. Moral: When indulging in bicycle bank looting, ride a high-grade wheel.

INDOOR CENTURIONS.

Century riding has been so popular among Philadelphia riders this season that the proprietors of the Armory Bicycle Academy have conceived the idea of catering to the 100-mile grinders during the reign of cold and windy weather. Commencing November 2, and continuing two weeks, from 9 a. m. to 7 p. m., a century tournament will be inaugurated, open to amateurs, male or female, under these rules: Contestants must ride their own wheels, equipped with cyclometers; must ride 100 miles between 9 a. m. and 7 p. m. on any one day during the tournament to become eligible for a medal. Those who make 100 miles on more days than one shall receive a bar for each 100 miles made. Contestants can enter any day; re-entries allowed. The three ladies and gentlemen that ride the greatest number of miles over 100 between 9 a. m. and 7 p. m. on any one day during the tournament will be awarded special prizes.

ROOM FOR THE WHEELMEN.

New York cyclists who ride on the Boulevard will, in a measure, be protected from the recklessness of truck drivers in the future. Alderman Olcott's ordinance, passed by the Board of Aldermen several weeks ago, has been signed by the Mayor, and will be enforced by the police at once. The new law provides that all trucks shall pursue their courses north or south in single file, next to either gutters, and that the inner sides of the Western Boulevard—those nearest the strip of parkway that divides the thoroughfares—shall be used exclusively by bicyclists, light wagons, road wagons and other pleasure vehicles. The penalty for an infractor of this law is \$5.

NEW JERSEY IN LINE.

A bill will be introduced in the New Jersey Legislature this winter, similar to the Armstrong bill, compelling railroads to carry wheels free. The New Jersey Division will also attempt to have all toll roads abolished.

WHAT A WHEELWOMAN FAILS IN.

She can't for the life of her make head or tail of the catalogue which describes the wheel she rides.

She can't appreciate the finest scenery when riding amid it, if she knows her hair is out of curl.

She cannot, not even when the most daring of riders, scratch a match on the sole of her boot with which to light her lamp—at least in an unconcerned manner.

She can't help gauging every other wheelwoman she meets on the road by her clothes, even though experience has taught her that beggars sometimes ride in fine coaches.

She can't pay a bet, even the simple little race-meet wager of violets or bonbons, without the fiercest sort of a struggle with herself to relinquish the forfeit.

MADE A GOD OF HIM.

It is not a far cry to 1870, and yet in June of that year Mr. Kemp, an English druggist, rode through Hindostan on a bicycle, was taken by the Hindoos for the god Vishnu and worshipped in a temple. The English authorities were actually compelled to send an armed expedition to rescue the deified druggist from his gilded prison.

COMPARING DOG METHODS.

An English remedy for the discouraging of an offensive dog is the tying of a string to the monkey-wrench, then dropping the wrench on the head of the offending canine. Such cures for this sort of annoyance seem rather obsolete. In America the usual remedy is for the rider to dismount and tickle the dog with a hickory club or half a brick.

NOT WORTH TWENTY.

New York has a law which allows a wheelman arrested for a misdemeanor to leave his wheel as security for his future appearance in court. For the first time on record a rider has failed to redeem his wheel, and a \$20 fine against a scorcher is to be satisfied by the city selling the wheel he left for security.

HANDLE POISONING.

Here is a brand new one. Mr. McIntosh, of Beaver Falls, deposes that he is suffering from a painful eruption on his hands, feet and lips, which aforesaid eruption he deposes is the direct result of poison communicated to his system from the handles of his wheel.

ALMOST FORGOTTEN.

How many people are there who will recognize in Thomas Stevens, acting manager of an English theatrical company, which landed in New York last week, the famous Tom Stevens who first put the wheel marks of a bicycle around the world?

THE LEGS OF HIS LEVIES.

Think of what Napoleon the Great got out of the legs of his levies! Think of what to that consummate strategist and tactician infantry mounted on the noiseless and swiftly revolving wheel would have meant!

COMPARING THEM.

The supremacy of the cycle makes the question of good roads not a matter of policy only, but of right. A bridle path constitutes a portion of every city park in this country, yet the number of equestrians is scarcely a fraction of the army of cyclists.

CAME HIGH.

Two tandem riders of Washington, Ind., ran over a pedestrian, severely injuring him. The victim sued for \$2,000 damages, and a jury awarded him \$400.

HAS MET KINGS AND PRINCES.

Henry A. Spaulding, whose features are here pictured, is president of the Spaulding-Pepper Company, Chicopee Falls, Mass. Mr. Spaulding has been in the tire trade since 1894. Previously he was for twenty-five years one of the most prominent men in the jewelry trade. He was Tiffany & Co.'s representative in Paris for eighteen years, and during that period visited every crowned head and prominent dignitary in Europe. He takes great pride in an antique scrap book, which is kept carefully locked in a safe, and which contains personal letters and mementoes of various sorts from the royalties of Europe.

In 1888 he sold his interest in Tiffany & Co. and founded the now famous firm of Spaulding & Co., Chicago. In 1893 overwork and the climate of Chicago, which did not agree with him, compelled him to take a trip to Japan for his health. On his return he purchased an interest in the Spaulding & Pepper Company, and succeeded his cousin, T. H. Spaulding, as president.

Henry A. Spaulding.

Mr. Spaulding is one of the men whose ideas of business are based upon conservatism and dignity, in addition to enterprise. He believes in producing and marketing a tire that is as perfect as money, machinery and brains can make it.

He has been a member of the Chicago Club, Standard Club, of Paris; the Japan Fine Arts Society (of which he was made a member by the Emperor of Japan) and the Historical Society.

DIAMONDS TO MEET DEMANDS.

After having been made under contract for years, Lovell Diamonds are now being built in a home entirely their own. This home—the new factory in Portland, Me., has been splendidly equipped, and will manufacture everything except the tires, tubing, spokes and rims. More high-grade Lovells will be turned out than in the past. Medium grades will still be made, but not in such quantities as in past years; the bulk of the product will be high-grade. While the wheels will be made in Portland, the general business will, as always, be conducted from the Lovell Arms Co.'s main office in Boston.

GOING TO INSURE MEMBERS.

The proposition of adding an insurance scheme to the list of L. A. W. benefits, which has so often been talked of, has been taken up in Australia by the League of Victorian Wheelmen, which has arranged that its members shall be insured against cycling accidents. Membership includes the annual premium, sufficient to cover \$750 in the event of death, and weekly payments in proportion.

MORE TROUBLE.

After satisfactorily arranging the internal ructions among the stockholders, the Howard & Nichols Cycle Company, of Newark, N. J., makers of the Howard chainless wheel, struck another snag. At the close of last week all their employes quit work, because, in theatrical parlance, "the ghost failed to walk." The men claimed that they had not been paid their wages for two weeks, and were tired of promises. Subsequently all but four of the men were induced to return to work. Speaking of the trouble, President C. O. Howard, said:

"For two weeks we have been working night and day to fill an order for thirty wheels. We were unable to fill it, and so yesterday I went to New York to have the order held over. When I returned home the men were complaining because they had received nothing for two weeks. I had placed my hopes on the order, and told the men that if they could not trust the company for their wages to leave. Only four men did so. There has been no Sheriff's notice posted on the door."

GOING AND COMING.

Cleveland, Oct. 19.—The local branch of the Yost Manufacturing Company will be closed in a few days. Falcons will probably be sold here through an agency next year, though in case satisfactory arrangements cannot be made the branch will be reopened in the spring.

Cleveland must have been unusually attractive for tire people the past few days. Among those in town were John F. Palmer, president of the Palmer Company; C. M. Fairchild, of The New York Tire Company; J. D. Anderson, Jr., Hartford Rubber Works Company; Bert Work, Goodrich Rubber Company; Kirk Brown and W. M. Perrett, Dunlop Tire Company, and Arthur E. Flavell, New Brunswick Tire Company.

SOUNDS A WARNING.

"Ironmonger," of London, says: "It is imagined by some that many American makers who have been flocking to our shores have only come here temporarily, having overestimated the demands of the American trade, and finding themselves saddled with surplus stock. We do not in the least suppose that many of the largest American concerns have the slightest idea of relinquishing the hold they have obtained on the English market; and this view is borne out by the announcement that the Lozier Manufacturing Company intend making 10,000 low-priced machines next year for the English trade."

HULBERT ON TOP.

Messrs. Hulbert Bros. report that the business of the Messinger Saddle Company is moving along apace. In a few days they will have their travellers on the road. All will be glad to hear that the doors of their old stand on Twenty-third street will shortly be thrown open to the public and that Hulbert Bros. will resume their sporting goods business.

MET AND PARTED.

The man upon the bicycle,
The man upon his feet,
Collide, and quickly both of them
Lie dead upon the street.
The man upon his feet has gone
Unto a rest eternal;
The man who scorched is scorching yet
In the regions called infernal.

WHAT HAS MADE SINGLE-TUBE TIRES FAMOUS?

Hartford Tires, OF COURSE.

Whenever you think of single-tube tires you connect them with the name
Hartford.

The public do likewise.

To Bicycle Riders: We Make Our Tube OF FIFTY CARBON STEEL

Because a Tube like this of

Is just as strong as

a Tube like this of

This diagram does not show how much stronger and more durable our tube is than the usual quality in the market because it does not include the always bad and more or less uncertain effects of "pickling." By ordinary methods tube is annealed in the open fire and pickled from eight to twenty times, according to finished size. By the use of a patented annealing process, controlled by us for tube making, our tube never comes in contact with the fire and is never pickled. There is no "theory" about this. Our thorough tests show that even with the greatest precautions in pickling (not usually taken), pickled tube is weaker and more brittle than tube made of the same material without pickling. Send for a Catalogue.

THE POPE TUBE CO.,
HARTFORD, CONN.

While weight for weight in a Bicycle FIFTY CARBON Steel will last so long

and TWENTY-FIVE CARBON Steel will last only so long

Kindly mention The Wheel.

STRAW IN HIS MOUTH.

That Was Part of Michael's Record-Breaking Equipment—Johnson Tries the Game and Fails.

Chicago, Oct. 15.—With a piece of straw between his teeth and aided by several crews of local pacemakers, James Michael to-day wiped out all of Tom Linton's world's records from two to five miles. The Garfield Park track was the scene of the onslaught. Eighteen thousand people were present, and owing to their wild cheering at the close Michael was unaware of the fact that he was riding the last lap and made no finishing sprint, losing thereby the opportunity of cutting off another second or so.

He was paced by two quads and three triplets. One quad was manned by Waller (steersman), Myers, Lawson and Staver. On the other were seated Fitzgerald (first), Simkin, Bicker and Newhouse.

The Jallu brothers and Stenson rode one of the triplets, while Phillips, Van Ness and Bradis manned the second, and Stewart, Davis and Edwards handled the third.

Michael rode two miles in warming up and then huffed the rear wheel of the triplet steered by Stewart, as they started on the sprint for the first half-mile. The triplet got away from the tape in poor style, and the start was greeted with groans.

He was carried to the three-eighths pole, where the Jallu brothers picked him up neatly and hurried him over the line for the first half in 0:53 3-5. The pace grew hotter as the wiry Frenchmen took him the entire next lap, riding the half in 0:54 3-5, and the mile was covered in 1:50 1-5.

At the mile and one-eighth pole the Fitzgerald quad made a fair pick-up and led the way to the completion of the mile and a half. This half was ridden in 0:51 4-5.

Phillips, Van Ness and Bradis made a pretty pick-up just before taking the lower turn and carried Michael the remaining distance of the two miles. The time for this half was 0:53.

He had ridden two miles in 3:35, smashing John S. Johnson's world's record of 3:38 3-5 for the same distance made last Thursday on the same track.

After completing the two miles the Jallu team took him under its wing for the following three-quarters of a mile, where the quad manned by Waller, Myers, Lawson and Staver took him the rest of the distance.

Two and one-half miles were covered in 4:13 1-5. Three miles were reeled off in 5:29 4-5, three and one-half in 6:28 3-5, four in 7:25, four and one-half in 8:21, and five miles in 9:17 1-5. The last half was ridden in 0:56 1-5.

In three trials the little Welshman has pulled the American record from 9:51 to the present world's record figures.

Johnson made a try at the world's figures for the mile yesterday morning, and while he created no new marks rode a very fast mile in 1:43 2-5. The quarter was done in 0:25 4-5, the half in 0:49 2-5 and the three-quarters in 1:16 2-5. Faulty pacing in the last half by one of the quads probably prevented him from riding it in 1:41 or 1:42. Summary of Michael's times:

One mile	1:50 1-5
Two miles	3:35
Three miles	5:29 4-5
Four miles	7:25
Five miles	9:17 1-5

American racing men with an eye on Australia prize-money will be interested to know that \$8,250 is to be hung up at Melbourne on January 26.

HOW FAST AND HOW FAR?

How fast can a mile be ridden on a bicycle? How far can one be ridden in an hour? These are the twin questions of the cycle speed world. The first question is so often answered and so often altered that it has ceased to be as interesting a problem as the last-named one. A study of the hour record reveals the fact that the first half of eight countries' records belong to British riders. The records and their holders are:

Country.	Riders.	Miles.	Yards.
England.....	J. W. Stocks.....	31	548
France.....	T. Linton.....	30	197
Denmark.....	A. A. Chase.....	28	1,500

Australia.....	Carpenter.....	23	97

COLUMBIA LANDS DAWSON.

Columbia College next season will have a brilliant addition to its cycling team in the person of Ray Dawson, the Boonton (N. J.)

Ray Dawson.

crack. Dawson is the son of a Boonton merchant, who takes more pride and interest in his son's career on the track than does the genial young rider himself. He has been on the track about three years, but not until this season did he present championship form. Dawson, with Harrison, Ripley and Roome, has been the life of the amateur events held in New Jersey this year, a battle of the very tape ensuing at each meeting, and they all have beaten each other. Dawson has a room full of prizes, won this season in the metropolitan district. He is the sort of amateur that causes no work for the Racing Board, and the kind that delights the heart of the chairman. He has abandoned the wheel for the present for a course of study at Columbia College.

FIVE ON THE ROAD.

San Francisco, Cal., Oct. 18.—C. M. Smith, of the Garden City Cyclers, San Jose, broke the five-mile road record to-day, covering the Millitas (San Jose) course in 10 min. 20 sec. flat. He was paced by a tandem for the first two miles, and a second tandem then paced him for the last three miles of the course. The best previous record was 11 min. 11 2-5 sec., made by George Hardin, of the San Francisco Road Club.

IN SIXTY MINUTES.

England Puts Up a Number of New Figures Within the Hour for Both Singles and Tandems.

Close to thirty-one and a half miles in the hour!

A couple of years ago no one would have believed it. It was then the great ambition to get within sight of thirty miles, and it was not until this season, but a few months ago, that the long-cherished dream became a reality. But thirty miles an hour is now a back mark. Even a thirty-one-mile-an-hour clip will not place one's name on the record scale of world's achievements on the track. Each mile now must be reeled off at about an average speed of 1:55 to make an impression on the latest figures.

The present record holders are McGregor and Nelson, English tandemites, comparatively unknown to fame. They have the distinction of travelling faster for an hour than any one else on any style of cycle. Their tandem record, established on the Catford track, is 31 miles, 610 yards—62 yards to the good of Stocks's single figures. During their ride they cut all tandem records from six miles on, and world's best for any style of cycle from twenty-four miles. The figures follow:

Miles.	M.	S.	Miles.	M.	S.
1.....	1:56	1-5	17.....	22:22	2-5

*World's tandem bests from here.

*World's bests any cycle from here.

An analysis of the figures put up by J. W. Stocks in his hour record ride on the Crystal Palace track, London, when he cut Tom Linton's record by 543 yards, shows what a phenomenal rider the Catford crack is. Although handicapped somewhat by deficiencies in pacing at the start, he reeled off mile after mile under two minutes and succeeded in getting under Linton's figures at twenty-eight miles. The twenty-fourth mile was ridden in 1:49 3-5, within two-fifths of the English amateur record. He rode the first mile in 1:58 2-5 and the last in 1:50. His first ten miles occupied 19:02 3-5, the second 19:13 3-5, and the third 19:17 3-5. Had faster pacing been available he would probably have covered over thirty-one and a half miles. His principal times follow, all being records below twenty-eight miles:

Miles.	Stocks.	Linton.
5	9:28 4-5	9:17 3-5
10	19:02 2-5	18:41 3-5
15	28:12 2-5	28:12 2-5
20	38:16	37:53 4-5
25	47:58 3-5	47:41
26	49:53 4-5	49:40 3-5
27	51:49 4-5	51:47 4-5
28	53:42 4-5	53:48 2-5
29	55:38 3-5	55:50
30	57:33 3-5	57:56 2-5
31	59:23 3-5	59:59 3-5

Distance in one hour, 31 miles 548 yards. Time for 50 kilometres (31 miles 123 yards), 59:31 1-5, also record.

RECORD GONE ABOARD.

London, Oct. 19.—Not to be outdone by Michael, Tom Linton regained the five-mile record to-day at the Crystal Palace track, and beat as well the three, four and five mile records. He rode the five miles in 9:16 flat, against Michael's 9:17 1-5 at Chicago.

RACING BOARD'S BULLETIN.

F. A. Kellar, Pigeon, Pa., is suspended pending investigation.

Suspension placed upon W. C. Mills, Kearney, Neb., has been removed.

PERMANENT SUSPENSIONS.

W. E. Harmon and Godfrey Schmidt, Los Angeles, Cal., for competing in unsanctioned races during term of suspension.

T. Q. Hall, Los Angeles, Cal., for officiating at unsanctioned races during term of suspension.

La Crosse County Agricultural Society, West Salem, Wis., and Dowagiac County Fair Association, Dowagiac, Mich., have been placed upon the list of those to whom the sanction privilege is denied.

The F. Miller, announced in last week's Bulletin as connected with the Iroquois Wheelmen is not a member of that organization.

SUSPENDED.

For competing at unsanctioned races, Jesse James, Latham, Mo.; James Adams, California, Mo.; Ivy Newton, High Point, Mo., suspended for sixty days from October 12.

For competing while under suspension, six months have been added to the term of Arthur Dakin, New Orleans, La., making his suspension expire January 17, 1898.

Charles A. Griffin, Bayonne, N. J., suspended pending return of prize.

For competing in unsanctioned races, Charles Bell, John Briggs, Warren Wilson, Frank Parmley, Frank Rue, Burlington, Kans.; Harry Johnson, W. Shillingford, W. Phillips, D. Gracey, — Hessler and — Parker, Newton, Kans., are suspended for sixty days from October 15.

For false entry, F. B. Maxwell, Anderson, S. C., suspended for six months from October 15.

For repeated false entry after warning, Thornley Hudson, Phillipsburg, Pa., suspended for ninety days from October 15, and thereafter until entry fees are paid.

For repeated false entry, J. J. Heiges, Brockwayville, Pa., is suspended for ninety days from October 15, and thereafter until entry fees are paid and prize returned.

For competing at unsanctioned races, W. F. Selby, of Peoria, Ill.; W. S. Turnbull, Peoria, Ill.; Ed Harkins, Marshfield, Wis.; Bert Hicks, Merrillan, Wis.; — Kittell, Nellsville, Wis., are suspended for ninety days from October 15.

For competing at unsanctioned races after warning, Hugh Bennett, Hartford, Mich.; H. W. Williams, Michigan City, Ind.; Fred Northrop, Benton Harbor, Mich.; Charles Tuttle, Dowagiac, Mich.; Claude Babcock, Dowagiac, Mich.; George Salters, Dowagiac, Mich.; C. M. Sesor, Dowagiac, Mich.; John Austin, Dowagiac, Mich.; Ed Emmons, Dowagiac, Mich.; James Smith, Dowagiac, Mich.; Frank E. Mosher, Dowagiac, Mich.; George Martin, West Salem, Wis.; S. M. Johnson, West Salem, Wis.; M. Nutting, Midway, Wis.; H. M. Pierson, Sparta, Wis.; Harry Kurtzman, Sparta, Wis.; J. Jensen, O. Gundersen, H. Perkins, A. Wenterton, O. Paul, O. Erickson, A. Gundersen, A. Anderson, H. N. Hudson, Joseph Ness, John Bremberg, E. A. Rudolf, John Sheridan, Robert Currie, G. W. Klein, H. P. Johnson, Fred Larson, Fred Johnson, Charles Johnson, Monte Street, T. McCormick, W. G. Brockman, F. K. Felberger, Joseph Maha, A. Pouley, P. Altringer, A. C. Ispen, Charles H. Moyer, Joseph Sekal, C. F. Carlson, V. Fleming, James Joric, F. Hendry, Al King, all of Chicago, Ill., are suspended for six months from October 16.

For competing at unsanctioned races, L. P. Helm, H. Hoag, Jesse Noyes, Corwin Slenz, Bert De Koyer, W. M. Dickerson, of Baraboo, Wis.; Ross Kellogg and Ed A. Rockwood, of Portage, Wis., are suspended for sixty days from October 16.

For competing while under suspension, one year has been added to the term of J. J. Penzenek, Chicago, Ill., making same expire December 3, 1897.

For false entry, W. H. Sutherland, Milo, Ill., is suspended for sixty days.

PROFESSIONALIZED.

Ruff, Chicago, Ill., clause (b). Gus Steele, Chicago, Ill., clause (b).

OF COURSE IT IS NOT OUR ZIM.

In the several interviews Zimmerman has had with reporters lately, he has declared that he was too taken up with business to devote any time to answering challenges now for next year's racing. It has not, however, transpired just what line of business Zimmy was engaged in. Perhaps the following advertisement in a Buffalo paper may shed some light upon the question, though it hardly seems possible that the genuine A. A. could have become a mere twanger of the guitar and a teacher of the art of dancing. Here is the advertisement, nevertheless:

PROF. A. A. ZIMMERMAN'S
Academy of Dancing and Music
220-224 Genesee Street, Near Michigan, First Floor.
SOCIETY, STAGE AND FANCY DANCES

OF EVERY DESCRIPTION TAUGHT.

Beginners' class every Tuesday. Social every Thursday evening. Advanced classes every Saturday. Children's class Saturday afternoon. Walking taught rapidly. Private lessons given at any hour. Thorough and scientific instruction given on zither, guitar, mandolin and banjo. Send for circular.

Joseph Houseman, Chicago, Ill., clause (b). Anton Stolz, Milwaukee, Wis., own request. George Hathaway, Spring Green, Wis., clause (b).

Elmer Linn, Aurora, Ill., clause (f). W. C. Mills, Kearney, Neb., clause (d).

SANCTIONS GRANTED.

October 23—Jefferson County Fair Association, De Soto, Mo.

October 23—West Florida Cycle and Good Roads Club, Pensacola, Fla.

October 24—S. B. Lucy, Richmond, Va.

October 24—Inter. Athletic Park and American Co., Washington, D. C.

October 21—Montour Agricultural Society, Danville, Pa.

October 19—Princeton University Track Athletic Association, Princeton, N. J.

October 21—Federalburg Cycle Club, Federalburg, Md.

October 21—The Hustlers, Philadelphia, Pa.

POSITIVELY THE LAST.

One more race meet remains for the delectation of Philadelphians. It takes place at the Tioga track to-morrow. The chief feature is an attempt by Robert McCurdy to lower the hour record.

ECK AND HIS EXPECTATIONS.

Chicago, Oct. 15.—Plans are being arranged by Tom Eck for extensive record-breaking attempts in the South. If perfected, Nashville will be the scene of the first attacks. Michael and Johnson will, of course, be the stars of the party. They will have a small army of pace-makers, so far arranged as follows: Weing, Mertens, Davis and Newhouse, first "quad"; Waller, Myers, Kenyon and Staver, "kindergarten quad"; Victor, Henry and Bonnet Jallu, first triplet; Stevenson, Wing and O'Connor, second triplet; Lund, Skelton, Bowler, Bainbridge and Kennedy, quintet.

At Nashville it is intended to use the Cumberland mile track by day, and give exhibitions at the Coliseum at night. From there the men will go to Chillicothe, where records will be attacked on the kite-shaped track.

After Nashville and Chillicothe the party will go to New Orleans for two weeks. At that city Michael will try to reduce the hour record recently made by Stocks. He will also go for all records from 3 to 100 miles, leaving Johnson to care for all marks up to the third mile.

From New Orleans the party will return to Chicago and disband, after which Johnson will prepare for his annual attempt at reducing skating records, and Michael, it is said, will go to New York. He will sail for England early in November.

ZIMMY SETTLES CHALLENGE TALK.

All the talk of a match race between Zimmerman and Bald, which has been going the rounds for the last ten days, has been summarily squelched by the ex-champion himself. In a statement to the press he says:

"This talk of a match race between E. C. Bald and myself is all rot. There is absolutely nothing in it. I have received many letters and telegrams concerning the matter, and I believe Bald will be here to see me. In the first place, it is all foolishness to talk now of arranging a match race for next season, as there is no telling what might happen to either of us during the winter, and as for a race within the next ten days, that is out of the question. Besides, my personal business at present occupies all my time, and I could not afford to give it up in its present prosperous state to race. It seems ridiculous at this late date to talk of match races for \$5,000 and \$10,000. I have not the slightest idea at present what my intentions for next year will be, but I will not give up my business to race if it remains as it is at present. Personally, I do not care to race again, and the chances are that I will not. Further than this I do not care to say anything in reference to the match race with Bald."

The story was floated by the publication of the statement that Zimmy was ready to meet any of the "men of the year" for \$5,000, a "challenge" which Bald took up.

THEY WON'T RACE.

Chicago, Oct. 19.—All efforts to arrange a match between Bald and Cooper have proved futile, and Bald has left this city for the East. Bald offered to place his check in a stakeholder's hand for any amount up to \$1,000 to bind a match, but Cooper and his employers, it is said, declined.

KISER WANTS SANGER.

Earl Kiser has an idea that he can beat Sanger hands down, and is hot after a match race with the Milwaukeean. Sanger has failed to secure backing for his proposed Denver record-breaking trip, but expects to go at his own expense.

MONTE WANTS MORE.

Denver, Oct. 14.—By his thorough sportsmanship and gameness Monte Scott has gained many friends in this city. Although beaten by Hackenberger in the twenty-five-mile match race, Scott is not at all cast down, and has challenged the "buttermilk boy," as Hackenberger is dubbed, to another race, to be run in opposite directions, conceding Hackenberger the regular way and the pole. Scott is not satisfied with the first race, because it was ridden from opposite sides of the track instead of in opposite directions. Hackenberger has not as yet accepted the challenge, although Scott's money is up.

As previously stated, Scott lays the blame for his defeat to the rarefied air.

He had been advised to reach Denver just before the race, so that the altitude would not affect him. The advice proved ill-timed and Scott felt the effects of the air before he had ridden the first mile. He suffered exceedingly during the race, and was prevented from doing his best in the contest, though he gave his opponent a hard game throughout.

WILL KNOW THE TIME.

Three gold watches fell to the prowess of W. C. Roome on Saturday last. He won all the open events at the meet of the Hudson County Wheelmen on the famous Guttenburg, N. J., trotting track, a track which has stood idle for many months, and which, in consequence, was in a heavy condition. A cold wind made it uncomfortable for both spectators and contestants. Summary:

Half-mile, scratch—1, W. C. Roome; 2, J. Jasper, H. W.; 3, W. H. Crane, jr. Time—1:10.

One mile, scratch—1, W. C. Roome; 2, J. Jasper; 3, B. T. Allen. Time—2:38.

Two-mile, handicap—1, W. C. Roome (scratch); 2, C. Deury (140 yards); 3, F. W. Richt (80 yards). Time—5:08.

One-mile club handicap—Won by Howard Storer (80 yards). Time—2:23.

Five-mile club championship—Won by George E. Blakeslee. Time—15:20.

FELT LOST WITHOUT IT.

For the first time since early spring Philadelphians had no race meet to attend on Saturday last. So, as a matter of habit, the professionals of the Quaker City journeyed to the meet at Hazleton, Pa., where they took everything in sight, Church and Starbuck dividing honors. Summary:

One mile, open—1, G. A. Dewitt, Wilkesbarre; 2, S. K. Stutzman, Reading. Time—2:47.

One mile open, professional—1, C. A. Church, Philadelphia; 2, E. P. Acker, Philadelphia; 3, Robert McCurdy. Time—2:27.

Two-mile handicap—1, DeWitt; 2, Stutzman. Time—5:11.

Three miles, professional—1, Starbuck; 2, Church; 3, Jack; 4, Bartholomew. Time—7:41.

Five-mile handicap—1, Stutzman; 2, DeWitt. No time.

NO FUN IN THIS KIND OF A RACE.

A race that had but few witnesses, and one that resulted in two of the participants being mulcted \$5 each instead of gaining laurels, took place over the Coney Island Path one night last week. The contest was between the Kings County Wheelmen's triplet and the Greenwich Wheelmen's sextuplet. The teams met by chance at the Coney Island end of the Path and agreed to race to Prospect Park. When the triplet reached the Brooklyn end of the Path the sex was not in sight. The crew had been overhauled by an officer and two of them were placed under arrest for scorching. The other four took to their heels and escaped. The captured riders were fined \$5 the next morning by Judge Steers.

HE WEIGHED IN.

Because Sidney Whitmer, of the Black Rock C. C., Buffalo, N. Y., tips the scales at 234 pounds, he was given ten minutes' handicap in the club annual ten-mile road race on Saturday last. It was expected that two or three miles of riding would wind him. Therefore the astonishment of the handicapper and officials can be imagined when he crossed the tape first in 31:07. Whitmer stands five feet three inches in height, and now awaits all comers of his weight for a challenge ten-mile race. He wants it to be understood that although somewhat fleshy he is still a scorcher.

TWO EXPELLED.

Two members of the Kings County Wheelmen, Brooklyn, who took Captain Needham's quad from the clubhouse without permission and damaged it to the extent of \$80, have been expelled from membership.

SEEMED SIGNIFICANT

When the Announcer at the Tin Cup Gulch Race Meet called off the Winners as "Sixteen-Two-One."

BELGIUM WINS.

An international tandem race took place in Paris on Sunday, October 4, between three teams representing England, France and Belgium. The first and third heats went to the Belgians, Havet and Buchner, while Edwards and Barden, English, took the second. The Frenchmen, Jacquelin and Morin, were vanquished completely in all three heats.

JAY TOOK TWO OUT OF THREE.

Jay Eaton defeated Conn Baker in a match race at the Coliseum, Nashville, Tenn., last week, winning two out of three heats. Each heat resulted in a sensational finish. "The first Eaton won by barely the width of his tire; the second went to Baker by a length; the third Eaton caught by half a length. The times were 2:14 2-5, 2:12, 2:15 3-5.

WON ONE WAY.

E. S. Edwards made a second unsuccessful attempt to lower the New-York-Philadelphia and return record on Sunday last. He started at 2:05 a. m., and reached the Quaker City in 7h. 51m. Rain and mud compelled him to abandon the return trip. His time is 59 minutes under Staubach's time for the outward trip.

At 5:50 a. m. Albert Peitscher, of Yorkville, also started for Philadelphia with record-breaking intentions. At New-Brunswick his wheel broke down. He returned to New-York by train.

"I SHALL RACE NO MORE."

Defeat has evidently disheartened Cabanne. Since the match race with Coburn, in which he was beaten two straight heats, he has announced his determination to retire from the track and devote himself to business. "I like the sport," he is quoted as saying, "but I like my business better. I shall not give up my wheel, but I shall race no more."

RED-HOT COURSE.

Many English road records have been broken over a road bearing the peculiar title of the Devil's Highway. "Scorching" would seem to come naturally over such a road, since, if it leads to its namesake's abiding place, it must be broad and well paved with good intentions.

WILL NOT RACE ON SUNDAY.

Timely warning from the Racing Board caused the Niantic Wheelmen, of Jersey City, to abandon their race meet billed for Sunday last. The events were for members only, and the promoters had an idea that the Board's sanction was unnecessary. On Election Day the club will hold an open meet on the Guttenburg track.

BACK TO HIS TOLLGATE.

C. W. Krick, Pennsylvania's champion amateur, rode his last race of the season at Bloomsburg, Pa., last week. He was thrown by a collision and had his collarbone broken. Krick has had an exceptionally successful year on the path, having won close to 100 prizes.

SIXTY-FOUR AND A WINNER.

G. and J.'s offer of a gold souvenir to all Ramblerites covering 3,000 miles during the year has developed a 64-year-old who has proven his claim to one of the trinkets—W. H. Bentley, of Grand Meadow, Minn.

SARATOGA IN SNOWTIME.

A series of winter cycle races will be held at the Casino Cycling Academy, Saratoga, N. Y., on a twelve-lap track, scientifically banked, starting to-night. A twenty-four-hour race will be the opening attraction.

TOO HOT FOR HIM.

Satan entered the gate of his stronghold. He looked about him.

"It used to be a place of torture, but"—
(He had just returned from the earth. A week he had spent in dodging scorchers).
"Sheel isn't what it used to be," he sighed.

Tom Linton has pledged himself before the season ends to crowd thirty-two miles of riding within sixty miles of time.

Don't call the man who bets on a race a fool; wait till the men get across the finishing tape.

Frank T. Fowler has withdrawn his suit against F. M. Sprohne, of the Fowler Cycle Mfg. Co., and arranged matters satisfactorily to all concerned.

SHE WAS DOING SPLENDIDLY.

At Least Her Friend Told the Fleshy
 Novice That She Seemed To Be
 So Doing.

She was moving laboriously around the floor of an uptown cycle academy, with an expression of ineffable self-consciousness on her face. She varied this look, occasionally, by a deprecatory simper that broadened into a smile when she reached the end of the room where her friend sat. When the instructor had rolled her down to that point, this enthusiastic friend never failed to lean over the railing, which separated her from the floor of the rink and call out: "Why, Mary, you're doing splendid!"

Mary always received this compliment with a smile which might have been intended as a protest against such flattery. But it was in reality a modest indorsement of her friend's opinion. Mary felt that she was doing splendidly. It was her first lesson. Three times around the rink she had rolled her 180 pounds. She has grown red in the face, very red. Her hair was coming down and her hat was badly listed to port. Perspiration was streaming down her cheeks. But the bicycle was moving and she was on top of it and she had been able to stay there, so it was natural enough that people should say she was doing splendidly. It seemed only the acknowledgment that her expertness had earned.

In this feeling of self-satisfaction, which she justified to herself as she rolled around the room, Mary eliminated one factor. She was conscious of the instructor's presence. She couldn't have forgotten him, for one of his arms was around her waist and with one hand on the handle-bar he was guiding the machine. If she could have overlooked these realities it is not likely that the puffing and grunting which accompanied her triumphant progress around the rink could have escaped her, for his face was only a few inches from her ear and he was laboring mightily. Undoubtedly Mary was vividly conscious of all these signs of the instructor's presence. It was only in apportioning his share in her success that she ignored him completely. It would not have been flattering to her if she realized that, beyond sitting in the saddle and putting her feet on the pedals, she had no more to do with the progress of the wheel around the room than her friend who was sitting at the other end of the hall. The instructor pushed the bicycle, Mary's feet involuntarily responded to the revolution of the pedals while he held her up, and in this way the first lesson was a success. She had done all she could to send the machine over to one side or the other, and she clutched the handle-bars in a desperate grip; but the man managed to keep her upright. He did it bravely through the half hour, pushing against her with all his force when the wheel started to fall toward him, and clinging to it as desperately as a drowning man, when it fell to the other side. He dragged the machine back to its stall and, as he sank into a chair, Mary was heard telling her friend that it was really a great deal easier than she had ever supposed, and that she thought herself, for a first lesson, she hadn't done half badly.

That is the usual result of a woman's first lesson in a cycle school. The staggering attendant keeps the bicycle up and pushes her around. Beyond keeping her seat in the saddle she has nothing to do with the affair, but she is delighted. "So much simpler than I thought," she tells her friends. It is generally the second or third lesson that changes her view of the matter. From the time the instructor's belt leaves its place around her

waist and the front wheel wobbles with no expert hand to steady it, the thing begins to look a little more difficult. Sometimes it doesn't happen as early as the third lesson. The solemn procession of the lady beginner leaning all of her weight that the bicycle does not support against the instructor's chest, continues sometimes through eight or ten lessons. But cases of arrested development as aggravated as these always said, after the first lesson, that it was a great deal easier than they had ever supposed.

DECORATING A TABLE.

At a recent dinner given by a couple of aristocratic wheelmen to a party of their own and the fair sex, the cycle idea was carried out in the table decoration in a manner most original. In the centre of the table was a bicycle made of wire with wheels of black velvet and gray satin outlined with roses. There was a lamp in front lighted by electricity, while from the handles fell creepers, smilax and tuberose. Graceful streamers of ribbons escaped from the bouquets which

SLOW DOWN-HILL MATCHES.

A new variation of the hill-climbing-coasting contests has appeared in France. A steep hill is chosen, brakelless wheels are used, and the rider consuming the greatest amount of time in descending wins the contest. Recently a paper promoted one of these new-fangled downhill events. All contestants were compelled to ride in a straight line, without zigzagging, and of course a competitor putting a foot on the ground was disqualified. The length of the hill was one-quarter of a mile, and very steep. There was a large number of competitors, divided into a dozen heats. In one of the heats not a single man succeeded in reaching the bottom of the hill on his wheel.

The successful man allowed the others to cut the pace at the rate of a mile an hour, and at no time did he show any disposition to push the field along. The pace told on the leaders, who dropped out, while the winner, by a magnificent display of back pedalling, rapidly increased the distance that separated him from the others.

After going half the distance he had the race

On the "WISSAHICKON"

covered the saddle, and from the tool bag, left half-open, roses were escaping. On the cloth were wheels formed of roses, the circles and spokes of gray and black velvet. The candles had shades made like bicycle lamps, while ribbons of various colors of narrow width were caught across the table, laid on the cloth, and suspended over it from the centre bicycle. The menus were in the form of bicycles made of cardboard.

ROOM IN SPAIN.

The senioritas of Spain have at last taken up cycling, and it is expected that this innovation will, in time, relieve them from the espionage of the ever-present duenna. A machine called "L'Americaine," embellished with a spread eagle and the United States coat of arms, is being advertised. There seems to be room for American cycles in Spain, for Germany is barred out by tariff discrimination, and the French and English wheels have proven unsatisfactory.

at his mercy, being the only one left in the contest. The winner covered the quarter of a mile in twenty-two minutes, which almost touches the record of a suburban train.

READY IN FORTY SECONDS.

An interesting feature of the recent French manoeuvres was the use of a company of cyclists to gain the flank of opposing cavalry by using a hilly path through woods. The wheelmen made their way successfully to the place assigned, surmounting or clearing away obstacles, and, opening fire on the cavalry force opposing them, forced it to abandon the position it was holding. It was found that the folding wheels could be got upon the backs of the riders in fifty seconds and unloaded and made ready for riding in forty. This use of bicycles for the rapid transportation of men to the flank of the enemy is seen to be one of the most effective where the wheel is relied upon for other than dispatch carrying.

TRADE IN THE SOUTH.

Theodore F. Merselles, of the Western Wheel Works, is a freshly returned Southern traveller. He made a flying trip, in Crescent interests, as far as St. Augustine. The Southern agents are already alert for 1897 wheels, because, on account of the climate, their season is an all-the-year-round season. At present the weather is delightful in this Southern country, and a sea bath at St. Augustine is one of the enjoyments of the times. The cotton crop has been sold, and Southern people feel in good condition over it, and the returns from cotton offset, in a measure, the frost which took the life out of the orange crop last season, and which, by the way, will leave orange trees without fruit-bearing capacity for four or five seasons.

This, however, has had a beneficial side, since orange-growers have turned their attention to other phases of commercial life, the result being of great advantage to Florida and the Southern States. Jacksonville is the chief distributing coast port. One of the features of Southern trade is the number of bicycle stores that have been closed up, though this is not by any means confined to that territory. Legitimate agents who hung on through the devastating cut-price career of their contemporaries have now taken heart and are looking forward to a legitimate and substantial season.

BACK TO AMERICA.

Men who make bicycle machinery will be specially interested to learn that Harvey Du Cros, Jr., is again in America.

He left here last season after a residence of two years as the head of the Dunlop tire interests in this country. His present visit will be of short duration, and has to do more with cycle machinery than cycle tires. On the other side they are now making Dunlop bicycles as well as Dunlop tires, and Mr. Du Cros is here to make heavy purchases of tools and machinery that will increase the facilities of the Dunlop cycle factory. He has already placed large orders with the Cleveland Machine Screw Co., the Garvin Mfg. Co., and others and before leaving will have contracted for well over \$100,000 worth of American goods. Those who know the great wealth of the Du Cros interests will realize how desirable is the patronage of Mr. Du Cros. He is, of course, making his headquarters in New York at the American Dunlop tire factory, on West Fourteenth street.

TWO POPULAR MEN.

A Boston man, George H. Strout, who has for two years been with Horace Partridge & Co., will be manager of the sales department of the Monarch Cycle Co.'s Eastern branch in New-York. He succeeds George S. Macdonald, who took charge of the Worcester Co.'s business on Tuesday of this week. Before leaving, Mr. Chandler Robbins, head of the Monarch Co.'s eastern business, made Mr. Macdonald a handsome present, while the employees presented him with a silver smoking set as a testimonial of their regard.

HE FLEW IN.

A brilliant-hued and extremely large sized fly alighted in the office of THE WHEEL this week after a safe journey from Cleveland, Ohio. It was delegated to this office by the Glidden Varnish Company, the name of which firm adorns its wings. The fly's only ambition is to hold matches. It is ornamental and handy.

Sympathy for the loser in a race is usually strongest when your money is on him.

WILL RESIST 330 POUNDS PRESSURE.

Founded twelve years ago by Anton C. Eggers, the Ideal Rubber Company, of No. 28 Rodney street, Brooklyn, N. Y. soon earned for itself, by quality, workmanship and business methods, a prominent place in the fine rubber goods business, their speciality being druggists' wares.

A year and a half ago they began the manufacture of pneumatic tires, which were of such merit as to be used on the Wolf-American, Lovell Diamond, Tribune and Owen bicycles. Next year the Ideal people are going into this branch of the business on a more extended scale, and with redoubled energy. A ribbed or corrugated single tube will be a feature of their product.

A. C. Eggers, the president, has been in the rubber business for eighteen years. He is well known on the road as a clever salesman, and a good all-around business man. George Simpson, vice-president of the company, and Adolph Van Braag, treasurer, are also well known to the trade.

A. C. Eggers.

The Ideal factory, Nos. 631 to 630 Kent avenue, Brooklyn, occupies 20,000 square feet of space. It is equipped with modern machinery, and has every facility for turning out high-grade work.

The tires are made of pure rubber and the finest Sea Island cotton. They contain no dead weight compounds, and consequently produce little or no friction. The ribbed tread prevents slipping on smooth surfaces, and a broad guarantee covers each tire shipped from the factory. They are manufactured to resist 330 pounds hydraulic pressure to the square inch.

AN INSTALMENT DECISION.

A \$59 bicycle, claimed to be a first-class machine, was the cause of a suit at Pawtucket, R. I., last week. It was claimed by the plaintiffs, Shartenberg & Robinson, that they sold the defendant, Thomas Maxon, the wheel last May on the instalment plan. The defendant paid \$10 down and the balance was to be paid at the rate of \$8 a month. Since the purchase of the bicycle the defendant paid in all \$21. Last month Maxon brought the machine to the store, and informed the firm that he did not want it. The machine was considerably damaged, and the tires were badly punctured. Hence the suit.

The defendant claimed that the bicycle was not as represented. He was given to understand that it was as good as any in the market, and after he had the machine a few months he saw that it was an inferior article.

Judgment was for the plaintiff, but the defendant took an appeal.

CHAINLESS TRIED AND PRAISED.

"The London Field" has this to say regarding the French chainless wheel which has been so successfully ridden by Riviere: "We have had the opportunity of trying the chainless gearing on a light machine of French construction. The ingenious simplicity with which it has been applied cannot fail to please the eye, and on this account alone it is sure to prove attractive. There is no emission of oil to soil the dress and attract the dust, and the ease with which it can be cleaned will commend it to many. A couple of weeks' riding has impressed us very favorably with its merits, and as far as that experience permits us to form an opinion we have no reason to regard the chainless gearing as in any respect inferior to the chain. The gear we used was about 70-inch, and it seemed quite capable of developing any speed required with no more than the customary persuasion. We rode up Woodcock Hill, near Barnet, with as much ease as we have ever ascended it on a machine of equal gear, so we do not think it will exhibit any deficiency as a hill-climber. The questions of weight and cost often determined the fate of useful devices, but in the case of the chainless gear we are assured that the machine complete will not cost more than a chain-driven safety of equal quality that is furnished with a gear case, nor will it weigh more."

SEEING IS BELIEVING.

Among the strangers within Gotham's gates is John L. Tillotson, of the big Tillotson publishing house in Bolton, England, which, as an incidental feature, prints the "Wheeler." He brought with him an English wheel, gear case, mud guards and all, but seems already enamored of American mounts, and has his heart set on taking one home with him. He came prepared to believe the English stories that American wheels are no lighter than those of foreign make, but has already convinced himself. Mr. Tillotson states what was half suspected, that the big cycling boom of the present year has caused every other butcher, baker and candlestick maker to consider the advisability of turning cycle manufacturer—a condition which existed here last season.

EUROPEAN REPRESENTATIVES.

The foreign representative of the Syracuse Cycle Company is W. O. Turrell. George N. Pierce & Co., of Buffalo, have a representative on the other side, with a view to introducing their Pierce bicycle. The Buffalo Cycle Company, of Buffalo, have appointed the London hardware men, J. C. Plimpton & Co., as their English representatives. The America cycles are on view at No. 1 High street, Aldgate, London, England. The Overman Wheel Company and the Royal Cycle Company have also representatives abroad. The first-named company will exhibit at the Stanley show. The Warwick cycles are handled at Hunt & Co.'s, Dufferin street, Golden Lane, London. They are built with narrow tread, detachable tires and steel rims if desired.

COMES TO NEW YORK.

S. Y. l'Hommedieu, for many years general manager of the Columbia Rubber Works, has resigned his position and sold his interest in the company. His successor is H. C. Corson, vice-president and general manager of the Goodrich Rubber Company, of Akron, Ohio. The Columbia Rubber Works are selling agents for the Goodrich Company, and Mr. Corson will spend only a portion of his time in New York. He is a New Yorker by birth, but went West some years ago.

National Board of Trade of Cycle Manufacturers.

271 BROADWAY, NEW YORK.
Phone No. 4117 Cortlandt.

President, R. L. COLEMAN.
Second Vice-President, GEORGE H. DAY.
First Vice-President, R. P. GORMULLY.
Treasurer, W. A. REDDING.
Secretary, ERNEST R. FRANKS.

Mercantile Agency, Collection Department and Information Bureau.

Rubber Tire Association.

President, THEODORE A. DODGE.
Second Vice-President, E. T. PERKINS.
First Vice-President, L. K. McCLYMONDS.
Treasurer, GEORGE F. HODGMAN.
Secretary, KIRK BROWN,
504-506 West Fourteenth Street, New York.

NATIONAL CYCLE SHOWS.

Under the auspices of the National Board of Trade of Cycle Manufacturers.

January 23-30—Chicago, Coliseum.
February 6-13—New York, Grand Central Palace.

FOREIGN CYCLE SHOWS.

Nov. 20-28—Stanley; Agricultural Hall, Islington, London, N.; E. A. Lamb, Secretary, 57 Chancery Lane, W. C. Telegraphic address: "Insuppressible, London."
Dec. 4-12—London, National Show, Crystal Palace; Frank Peach, Secretary, 48 Holborn Viaduct, London.
Dec. 12-17—Paris, Palais d' Industrie, Champs Elysees; M. Bivort, Manager.
Jan. 2-9—Manchester, Eng.
Jan. 16-23—Dublin, Ireland; Royal Dublin Society Building, Belle Bridge; R. Wilson, Secretary, 14 D'Oiler Street.
Jan. 23-30—Glasgow, Scotland; A. G. Rennie, Secretary, 49 Lilybark Gardens.

TRADE CHANGES.

CALIFORNIA.

Ventura—Brakey & Jones. Dissolved. O. T. Jones continues.

CANADA

Galt, Ont.—Angus Cameron. Assigned to W. S. Turnbull.

CONNECTICUT.

Bridgeport—Premier Cycle Manufacturing Company. J. C. Cassidy, formerly vice-president, now receiver.

DELAWARE.

Wilmington—Bradford & Breneman, succeeded by J. C. Bradford.

GEORGIA.

Columbus—Ross Bicycle Exchange, removed to larger quarters, corner of Twelfth street and Third avenue.

ILLINOIS.

Chicago—Royal Pedal Company, incorporated. Sold out under mortgage, \$750.

Chicago—Western Union Bicycle Manufacturing Company. Judgment by default, \$1,312.62. Defendant enters motion to re-open.

Chicago—The John Grant Company. Sued, \$300.

Mt. Sterling.—H. Ross will open bicycle store.

INDIANA.

Indianapolis—Munger Cycle Company. Judgments aggregating \$4,055.88.

Melrose—Stephen W. Harvey. Real estate mortgage, \$1,000.

KANSAS.

Topeka.—Ed Lacey, bicycles, moving from 837 Kansas avenue to room formerly occupied by Mrs. W. C. Sly.

MAINE.

Portland.—The Atlantic Rubber Co., organized, with Henry J. Dougherty president, and Frank E. Tingley treasurer; to manufacture pneumatic tires, etc. Capital stock, \$100,000.

MICHIGAN.

Manistee.—C. H. Haskins and Ed Olson, new store.

MINNESOTA.

New Trier.—Fred Kaufman, William Ista and John Denn, new store.
St. Peter.—Klein & Co., furniture dealers, have added bicycles, handling the Columbia.

MISSOURI.

Kansas City—Missouri Cycle Company. (John A. Conrad.) Judgment prof. Accounts worthless.

NEW JERSEY.

Jersey City—Savonette Manufacturing Company. Ask for appointment of receiver.

Jersey City—George B. Spearin & Co. William G. Gerhardt appointed trustee.

Newark—Howard-Nichols Cycle Manufacturing Company. Judgment, \$229.

NEW YORK.

Buffalo.—The Globe Cycle Works, incorporated for \$50,000 by William H. Penseyres, Charles Haberer, A. Penseyres and A. E. Haberer.

Elbridge—Elbridge Cycle Company. Court orders assignee to re-sell.

New York.—Forcipe Co. incorporated by W. E. Prall, Charles T. Hunt, Fernando Baltes; to manufacture bicycles and a patented appliance for same. Capital stock, \$500,000.

CHICAGO

New York—J. H. Dietz & Co. Judgment, \$114.79.

New York—S. F. Myers & Co. Additional judgments aggregating \$36,171.

Tonawanda—Tonawanda Bicycle Company. Asking extension.

OHIO.

Cincinnati—Clermont & Co. Harris retires; John H. Clermont continues.

Newark.—Theodore M. Ball & Son, bicycles, etc., assigned to Judge Rees. Assets and liabilities not given.

Sandusky.—W. A. Glicher has taken agency for Quaker bicycle.

Springfield.—The Lagonda Cycle Co., incorporated by C. E. Petrie, J. M. Goods, I. W. Frey and C. H. Pierce; to manufacture bicycles. Capital stock, \$200,000.

Toledo.—Ed M. Falke assigned to P. MacGahan.

Toledo.—The National Bicycle Co., incorporated by E. N. Crook, D. S. Helpmen and M. N. Crery. Capital stock, \$30,000.

Toledo—Thomas D. Cochran. Sold out.

Toledo—Colton Manufacturing Company. Not incorporated. Succeeded by Summit Cycle Company.

PENNSYLVANIA.

Erie.—J. Roth, new store, at 1,018 State street.

Huntingdon.—H. H. Lane Manufacturing Company. H. H. Lane asking creditors to petition court for removal of assignee and appointment of receiver. Sale advertised for October 22.

Pittsburg.—S. M. Jones & Co. Sued, \$4,776.97.

WISCONSIN.

Ripon.—P. S. Soranson and Ed Eekles, of Fond du Lac, have established a plant here and will manufacture bicycles.

VERMONT.

Barre.—F. W. Sherburne. Sold out to Frank Nicholas.

VIRGINIA.

Richmond.—T. J. Haas. Sells stock, tools, etc., to Sol Haas, \$300.

RECENT PATENTS.

No. 569,158. Bicycle Alarm.—Benjamin Arnold, East Greenwich, R. I. Filed July 13, 1896. Serial No. 598,976. No model.

No. 569,172. Bicycle Tire.—John W. Carns and Edward Fallor, Pierce, Ohio. Filed December 30, 1895. Serial No. 573,691. No model.

No. 569,216. Sprocket Wheel.—John Lindsay, Millbury, Mass. Filed September 26, 1895. Serial No. 563,729. No model.

No. 569,289. Support for Bicycles.—James S. Lynch, Brooklyn, N. Y. Filed January 27, 1896. Serial No. 576,919. No model.

No. 569,322. Cyclometer.—Charles H. Clawson, Everett, Mass., assignor to John W. Wilson, Boston, Mass. Filed September 5, 1895. Serial No. 561,512. No model.

No. 569,326. Bicycle Saddle. Alfred C. Drury and George E. Sims, Chicago, Ill. Filed March 25, 1896. Serial No. 564,803. No model.

No. 569,349. Adjustable Bicycle Handle-Bar.—Benjamin Porter, Ellendale, N. D. Filed May 29, 1896. Serial No. 563,621. No model.

No. 569,354. Folding Bicycle.—Michael B. Ryan, Bridgeport, Conn. Filed March 25, 1896. Serial No. 564,921. No model.

No. 569,370. Wheel Tire.—William Corliss, Providence, R. I. Filed December 11, 1895. Serial No. 571,819. No model.

No. 569,394. Bicycle.—Hezekiah J. Thompson, Nassau, Bahama Islands. Filed January 8, 1896. Serial No. 574,776. No model.

No. 569,438. Bicycle Handle.—Charles O. Spurr, Brockton, Mass. Filed February 4, 1896. Serial No. 578,026. No model.

No. 569,493. Bicycle Stand.—Ferraud Giacinto, New York, N. Y. Filed October 31, 1895. Serial No. 567,540. No model.

No. 569,594. Bicycle Lock.—Charles B. Woodbury, Washington, D. C. Filed February 11, 1896. Serial No. 578,892. No model.

DESIGNS.

No. 26,177. Bicycle Lamp Body.—George Havell, Newark, N. J., assignor to the Havell Manufacturing Company, same place. Filed May 22, 1896. Serial No. 592,681. Term of patent, fourteen years.

No. 26,173. Bicycle Frame.—Luther G. Billings, Clifton, N. Y. Filed August 28, 1896. Serial No. 604,224. Term of patent, fourteen years.

TRADE-MARKS.

No. 29,008. Bicycles, Velocipedes and Articles Accessory Thereo.—The Lozier Manufacturing Company, Toledo, Ohio. Filed August 19, 1896. Essential feature, shield-like figures and connecting and intersecting bars, displayed on a background of contrasting color or tint. Used since October 21, 1895.

No. 29,009. Bicycles.—The Stoddard Manufacturing Company, Dayton, Ohio. Filed September 8, 1895. Essential feature, the word "Tiger" or a representation of a tiger. Used since January 5, 1895.

FOR A TRIPLE OUTPUT.

Out in Fon du Lac, Wis., the United States Manufacturing Company are having the pleasure of moving into a new building which will allow them to triple their output of U. S. cyclometers and lamp brackets. While the cyclometer the United States people have made such a success with weighs only 1 1/4 ounces, and is barely an inch in length, it accurately registers up to 10,000, three features which have undoubtedly been the foundation stones of its success.

THE PALMER
PNEUMATIC TIRE CO.
CHICAGO, ILL.

A FOUR-TIME WINNER.

Last week we announced that again more prizes had been won on PALMER TIRES on the National Circuit than had been won on any other tires, and we have the figures to prove it. A summary of all the meets from Oakland to Washington (excepting Lima, Ohio, for which our report is incomplete), shows that 491 prizes were won on PALMER TIRES, whereas the nearest competitor had only 451 prizes to his credit (not counting the Lima meet, which offered 21 prizes). Thus, in 1896, as in 1893, 1894 and 1895, PALMER TIRES are winners on the National Circuit

More Prizes Have Been Won on Palmer Tires Than on All Other Tires Combined

Since PALMER TIRES were first offered to the public (season of 1892-1893), and this has been accomplished in the face of the most extravagant expenditures of money by jealous competitors, whose tires racing men will not ride unless big inducements are offered. The riders know that only PALMER TIRES are fast.

A MISSTATEMENT CORRECTED.

New York, October 5, 1896.

THE PALMER PNEUMATIC TIRE CO.

GENTLEMEN—I wish to state for your information and record that in the *Brooklyn Citizen* 10 mile road race, held on September 30th, I rode a Sterling wheel, fitted with Palmer Tires, and not _____ tires.

GEORGE H. BELL.

Kindly mention The Wheel when writing.

A SEPTEMBER OUTING

WILSON R. YARD

PART IV.

TICONDEROGA—NORTH ADAMS.

Re-embarking, we row along the rock-bound eastern shore, with the treeclad slopes rising abruptly from the water's edge to the gory-gray rock crest of Moosalamo, and land at a huge boulder by three silvery-peaked niches, for a wood ramble to Ethan Allen's cave, in which he is said to have taken shelter for several days with some of his trusty followers. The pathway lies upward through the whispering woods, where dying thunders roll from the far cascade, over mossy rocks and fallen forest giants, soft beds of pine needles and tinted birch leaves. There to the left is a smaller cave, beneath a massive rock fragment, that mayhap has given snug shelter to some hardy patriot or prowling bear; there, another, and now a climb up the ledge side, and there stands a huge, jagged fragment, one of those unaccountable freaks of Nature, bearing at its base the dark, tunnel-like entrance to the tiny cave. Overhead the giant trees form a dense network of branches, shutting out the sun's penetrating rays, and making a "time-exposure" necessary, but, alas, as none have the necessary tripod, for once our cameras are naught.

Lake of Catherine

We return in time for luncheon, and then spin over the smooth shaded lake drive, cross the lake outlet by the Mountain Spring House, and skirt the brook wandering through the vale to the right, to the town of Salisbury (3½ miles—143½ miles).

Here we turn to the left uphill over a poor piece of road, then down, keeping right at the fork. Still on downgrade with pleasing views of the vale and stream, straight ahead at the crossroads, over a succession of hills and

hollows. As the road improves we pass "Forest Park," the stockfarm and private trotting track of Mr. Watson. Opposite on the hill slope stands the village cemetery, which combination, says the Bloomer Girl, calls up Amelle Rives's novel, "The Quick and the Dead." We bear around to the left and into the neat town of Brandon, to the Brandon House (L. A. W., \$2) on the square (7¼ miles—150¾ miles).

We take the centre road leading from the hotel, to the right of the monument, fine macadam from a mile, then a clay pike, which grows very poor. A long upgrade, then a down that can be coasted with a brake. The road winds past marble quarries, and we keep to the right at both forks. Now over the hills with a charming valley view, in the centre of which lies the little town of Proctor, a culminating point of cumulation hill contours, and we roll down into the hamlet of Pitsford to the Mountain View House (\$2) (7¾ miles—158½ miles.)

To the left here down the hill, then up over a clay pike into Rutland and turn to the right at the square on Centre street to the Berwick House (L. A. W., \$2.50), (8¾ miles—167¼ miles).

The town is very pretty and businesslike, the public buildings are handsome and the streets well paved, some of asphalt. Large

the second largest sheet of water in the State. A road that skirts the lake shore for several miles is reached via Hydeville, affording a pretty run.

The morn breaks a bit cloudy, but as all are provided with gossamer capes an early start is made. Soon the dark rolling clouds majestically sail across the dome of sky, leaving but fleecy flecks in their wake, to tint the blue and soften the bright sun's rays.

We push on the straight, smooth road through Hydeville, where the tongue of the lake narrows down to canal-like proportions. Here we again encroach upon the sidewalk to avoid a bit of sand. Now a view of the spires and housetops of Fair Haven, with a rich background of hills, and we lead to the left at the fork into the town (5 miles—183¾ miles). We keep to the left by the band square, and on down the hill. The town surrounding the square reminds one forcibly of some of the towns of the north of England, with its low, trim, stone buildings, shaded park and bandstand.

Equinox Trout Pond, Manchester

Lake Bomoseen
Near Castleton

marble quarries pierce the nearby hills. Leaving, we continue our Centre street to Grove, and turn to the right, following the trolley tracks to State street, where they diverge; we follow the left branch of the hill by the House of Correction buildings, from where we have a pleasant bird's-eye of the town. Then on down the valley, taking the sidepath when the road is poor, bear to the right across the bridge, low-falls on the left, and run into West Rutland, following the track to the fork (4¾ miles—171½ miles).

Here we keep to the left by the old White House, leaving the tracks, and take the next road to the left under the shadow of Jack Hanley's Mountains, which loom up in a double peak across the narrow vale.

The road swings up, around and along a ledge, away from which slopes the deep valley, traversed by the railroad and a pretty stream. The roadbed is smooth and hard and we make a rapid spin to Castleton to the Bomoseen House (L. A. W., \$2) (7¾ miles—178¾ miles).

Castleton is situated near the lower end of Lake Bomoseen, a noted fishing resort, and

We cross the bridge and keep to the left up a short, steep hill, then along under a rocky ledge, through a pastoral region, and at two miles bear to the right as the road forks over an iron bridge, shortly passing "Elwinoma," the neat stock farm of Maxey McGregor, a local celebrity.

On over another bridge and straight ahead to a fork where we bear left for Poultney, keeping to the left across the tracks to the Poultney House (\$2) (5¾ miles—189½ miles.)

From here we take the first turn to the right, then first left, and then to the right again, over a covered bridge and up a grade, from which we get a charming view of Lake St. Catherine in the distance in a cleft of the mountains.

The roadway is very pretty, though the surface but fair for a way. A road branches to the right to the Lake View House on the upper lake end. We keep to the left, winding along the base of the mountain, which rises precipitously a series of rocky ledges and crags, to which the stunted trees cling tenaciously. Through a shady bower and a turn brings the waters close to the roadside; now

we skirt the lake shore over a fine bit of road to the steamboat dock (3¼ miles—197¼ miles), opposite which, on a low promontory, deep in a grove of fine trees, stands the St. Catherine House (\$3). We cross the bridge just below and pull up for dinner.

Continuing, we recross the bridge and take the road southward, still skirting the lower lake over a good downgrade, to the tiny town of Wells (3½ miles—200¼ miles). We keep to the right of the wee triangular park with its three churches, and turn to the left on the crossroad, down over the bridge. Now for a long climb, a long coast and another long climb, over a fine road surface, with charming views down the valley, across the lower end of which stretches a wall of green mountains, straight on at the crossroad, a swing to the left, a rise and a long, steep, downgrade that requires care as the road sways sharply to the left near the bottom. We bear to the left, then a swing to the right, and as the valley broadens into rich pasture and farmlands we follow the winding course of the Manchester River, which seems to be digressing one of the laws of nature and flow uphill, so easy is the road grade. A bend now affords a bright view of the town of Pawlet on the hillside.

We cross the bridge below the mill pond, and keep to the centre road up the hill by the red brick house, and have a smooth road with a continuous, everchanging panorama of hill and valley into East Rupert (9¼ miles—210¼ miles).

Straight ahead over a prettily shaded wood road, with the town of Dorset coloring the landscape to the left, up a slight hill, and we take the left fork. (The straight fork is more direct, but poorer.)

Straight on down the valley through Dorset (2½ miles—213 miles). A smooth, firm road led downgrade through the vale to Manchester Station (7 miles—220 miles). Here we turn to the right by the Colburn House, as the valley swings westward along the base of Equinox Mountain, with the broad, fertile meadows through which flows the Battenkill River on our left, surmounted by the high Taconic range beyond. The roadway is lined with neat cottages as we enter the main street of Manchester and pull up at the Equinox House (\$4) (1½ miles—221¼ miles).

The house is large, well appointed and beautifully situated on the mountain side, while the view from its wide piazzas is superb. The main street is broad and shaded by a double row of century-old elms and maples. The Equinox golf links are near by, and numerous and varied are the attractions of this ideal mountain retreat. Notably among them are Table Rock, commanding an extensive view, and Skinner Hollow, a vast, natural amphitheatre in which is a disappearing stream, and an extensive but partially explored cavern containing perpetual snow. The numerous streams and mountain tarns abound in trout, and the drives and walks are many and interesting.

Mr. Charles F. Orvis, the village postmaster, has in his store the fine collection of fishing tackle, flies and mountain scenes that was exhibited at the World's Fair. He is also the authority on all the choice retreats haunted by the gamey trout. We've plenty of time for a visit to the spring, the cascades and other nearby attractions ere the declining orb of day hides his resplendent face behind Equinox.

The Fair Novice makes some rare sketches with her deft pencil, and regales us with choice poetic bits, while the Fat Man, who is an ardent disciple of Isaac Walton, endeavors to beguile us into a day's stay in this charming spot, and essays to work upon the religious scruples of the Chaperon, as the

morrow is Sunday. But she fails to see the fine distinction between Sunday riding and Sunday fishing. However, a test vote carries the day, and we remain over to give all a rest. The day proves cloudy and showery, with bits of bright sunshine, and each is to his own pleasure bent.

Monday dawns, bright, clear and balmy, and we all start with renewed vigor for a long run.

Leaving, we take the right fork up the hill by the pretty cemetery of Dellwood, then on over Ormsby Hill as the road winds, and turn to the left at Bentley's store down over the sparkling Battenkill, and crossing the tracks keep straight on through Sunderland, which boasts no hotel. We cross and recross the tracks over a fair but rolling road, and have a down run into East Arlington (9 miles—230½ miles).

We keep straight on over two bridges and turn to the left as the road forks over a good, level valley road. This is part of the old stage line from Burlington northward to Burlington and St. Albans, and several old mossy, time-stained mile stones are still to be seen on the right of the road. We bear to the left at the fork where sign reads "Shaftsbury, 3 miles," cross tracks and run along under the hillside over a poor bit of road to Shaftsbury station (4 miles—235 miles).

Now over the tracks and up a long hill through to farm lands, then down through

a small settlement with a fine view of the valley southward, the houses of South Shaftsbury and the tall obelisk-like shaft of Bennington Monument, o'ertopping all, against the sky, an unsurpassed landscape of upwards of eight miles.

Down hill again, over the tracks into South Shaftsbury (2½ miles). We keep straight on at the crossroad, taking the sidepath, then up, over a rolling dirt road, with another magnificent scene from the top of the hills, the distant town, the monument and grim emerald-clad Mount Anthony, a vista that calls forth exclamations of delight from even the prosaic Fatman.

A long, steep downgrade, in which numerous thank-e-mam's preclude coasting unless under rigid use of brake, to the right over the bridge, then to the left over a covered bridge, where the river winds very prettily, and again to the left over a smooth, shaded roadway, skirting the grounds of the Soldiers' Home, whose neat, yellow-hued buildings stand off in a grove to the left, and we turn into Hunt street, two blocks to North street, taking that direct to the Putnam House (\$2) for lunch (10¼ miles—245¼ miles). Here in the lobby a mountain spring gushes up fountain-like, cool and refreshing. The town is neat and pretty and quite businesslike.

For the monument we go out North street a block to the stone blacksmith shop, and turn to the right to Monument avenue, direct

to the shaft, which is over 200 feet high and is accessible to the height of 188 feet up a tedious climb of more than 300 steps. The view, however, repays the knee-cracking ascent, for we have an admirable overlook of the hills and valley for miles in every direction, and all it costs is 10 cents. Here again the Fair Novice grows enthusiastic and murmurs a quotation from Burns, which she deems appropriate:

The lawns wood-fringed in Nature's native taste;
The hillocks draped in Nature's careless haste;
The arches striding o'er the silvery stream;
The village glittering in the noontide beam.

September is "fair time" in this district, but we have the questionable misfortune to just miss dates, much to the disappointment of the Novice, who does so love to enthuse over colossal hogs, huce oxen and mammoth pumpkins, to say nothing of country bumpkins.

From the hotel we continue out North street up a stiff hill, with a charming view of the fast-receding town and then of the valley before us as we reach a down run. We bear to the right on the main road of good dirt surface, following the line of poles, and then at about two miles to the left for Pownall. The road now is rolling and not overgood, but the scenery is superb, and we roll into North Pownall just on the State line (6¼ miles—251½ miles). We keep on to the right as a road forks by the brown church, around under the hill on a bluff, with an entrancing view of the Hoosac Valley to the westward. Then, as we swing around to the left on a bit of downgrade we see the town of Pownall, calm and peaceful in the valley below. Upward slope the glorious Berkshires, a succession of well-tilled fields to their summits, while the river winds in and out in serpentine twists through the vale; here broadening to lake-like proportions, there rushing through a narrow confine of mossy banks, while over all hangs a charmingly pastoral quiet.

A long down plunge into the upper precincts of the town to a small hostelry, the Pownall House (2¼ miles—254¼ miles).

We keep straight ahead, the road skirting the river bank, with the hills rising abruptly on our left. Now under a rocky ledge, now over a deep, wooded ravine, now by a trim farm, now through a bit of wood, until a rise brings the houses of the pretty college town of Williamstown to the fore, and we cross the covered bridge. Here the road forks, one leading to the town, the other to the left to the railroad station and up the valley to North Adams, the Tunnel City, the metropolis of the Hoosac Valley. The Centurion and Scorchers prevail in making it the terminus of a side run, so we turn to the left and shortly striking the trolley track follow them directly into the town, passing the large factories at Centerville on Blackinton—then crossing the railroad and mounting to the right side by the cemetery, from which vantage point we have a fine bird's-eye view of the town, in which stand prominently the churches and the new Berkshire Sanitarium. We roll down into the town and turn on Main street to the Wilson House (\$3) (9¼ miles—263½ miles).

The streets of the city are broad, well paved and tree-bordered. Main street is the business thoroughfare, and branching from it to the right at the monument is Church street, the principal residential avenue, lined with handsome, velvety lawned houses.

Here the Berkshires reach their grandest culmination, for near by towers Old Graylock, the highest peak in the State; and within sight of the city the lofty range is pierced by the world-famous Hoosac Tunnel, a gigantic piece of engineering skill.

Peoria Tires

The Great Centurian,

THOS. W. DAVIS,

Rides a Pair of Peoria Tires

6,233 MILES!

SEE WHAT HE SAYS OF THEM:

PEORIA RUBBER & MFG. CO.

PEORIA, ILL., Sept. 12th, 1896.

GENTLEMEN—I take pleasure in giving you an unsolicited testimonial in regard to the high grade and durability of Peoria Tires. I have your single-tube tires on my wheel, and they have run since the 19th of May to the 12th of September, 6,233 miles. During that time I have had neither puncture nor leak of any kind, and they are still in good condition. I have ridden nearly 30,000 miles on other and different makes of tires, and never could get over 1,800 miles on any of them without puncture or other trouble. I ride on all kinds of roads and have given your tires a thorough test, and consider that you have one of the best tires ever made, and would recommend them to riders as such.

Yours very truly,

THOMAS W. DAVIS.

Every wheelman in Illinois will agree that the best of Illinois roads are bad enough and that the average is mighty poor. Mr. Davis' mileage was made within 100 miles of Peoria, and almost every city and town in every direction within that distance was visited during his many long rides on Peoria Tires. What better test can tires be subjected to?

Do not be skeptical. Try a pair of Peoria Tires. They are all we represent them to be. Full of life and resilience, and made of the best material obtainable.

Peoria Single-Tubes, fitted to any bicycle, . . . \$8.00 per pair.

Web Tread, Double Tube, fitted to any bicycle, . . . 7.00 per pair.

Peoria Rubber and Mfg. Co.,

PEORIA, ILL.

Kindly mention The Wheel.

Peoria Rubber and Mfg. Co.

JUST OVER THE BORDER.

The Market Mexico Offers Americans and the Inadequate Methods Adopted to Secure It.

United States Consul Donnelly, resident in Mexico, is responsible for some excellent advice to American manufacturers which should not be lost upon the cycle makers, now they are so thoroughly awake to the good business existing in a foreign market for the surplus product of bicycles. Consul Donnelly says that the United States does more business with the 5,000,000 English-speaking people in Canada than with the 30,000,000 and more Spanish-speaking people in South America, although the latter people are more naturally our allies, all being parts of one great American republic. Yet, notwithstanding this and even in the face of the fact that their ports are much nearer to ours than to those of Europe, Europeans get there ahead of us and take the trade because they know the language of the country better than we do. Consul Donnelly has the following interesting remarks to make concerning Mexico:

"Within a few hours' ride by rail from our frontier are 14,000,000 people—one-half the population of England—a people advancing rapidly in all the arts of civilization, a people who will soon require as necessities what are now luxuries, who will be housed, fed and clad as well as any people of Europe. What a field this would be if worked with that skill and industry and tireless vigor which have made our domestic trade the wonder of the world! But it is not so worked. Ignorance of the language makes our usual business methods impossible. The Spanish tongue builds about the country, for American trade, a barrier bigger than the tariff.

"To many of our merchants Mexico appears to be as remote as China or Japan, and they strive for her trade by methods that might serve with countries of the Orient. They depend upon consuls for information, an effort which, to be of any avail, should have the full time and best energies of competent Spanish-speaking agents. Almost daily the mail brings to my office letters containing circulars which I am requested to distribute among Mexican merchants. Some of these are in English and are utterly useless; the rest, in Spanish, have even less effect than circulars at home.

"Would any manufacturer of mining machinery send as agent to Cripple Creek, for instance, some Russian emigrant, whatever his fluency in his own tongue, who is ignorant of English? Yet American agents and principals, too, come to Mexico from the United States knowing as little Spanish as Sanscrit. Good talkers, these, around home, no doubt; but once across the Rio Grande the alert, keen, quick-witted American is stricken dumb and tongue-tied. He readily turns his American dollars into Mexican pesos, but he cannot turn his English into Spanish. He goes through the land envying the graduate of an institute for the deaf. He may do some business—money and goods talk—but money and goods, be their merit ever so great, nowadays need the advocacy of a ready tongue. Be it known that in the ever-quickening competition in Mexican markets circulars won't do, nor letters, nor the friendly offices of consuls. Mexican trade must be talked for and it must be talked for in Spanish.

"The influence of language on trade is well understood in America; nowhere else is it so powerfully exercised. 'Talking business' is our national gift; surely this gift should not forsake us at our southern border. Ignorance of Spanish bars the way to intercourse with nearly half the people of our continent. Knowledge of Spanish takes down that bar and leaves clear to American methods the whole field of American trade."

BACK TO THE GOOD OLD DAYS.

Whether or no there will be a reaction in favor of the rubbered pedal, once so universally used, is for the future to decide. But that cycling is in the early days of what may be termed the age of comfort is fairly plain. The cushioned frame, the padded saddle, the wood handle-bar, the upturned bar, the gear case, the lessened and lessening talk of weight and gear, are each and all straws that point to the one direction.

It would not be strange, therefore, if interest in the rubbered pedal should revive, for certainly it is a contribution to cycling comfort, if anything is. The man accustomed to the rat-trap pattern has but to put his feet on the rubber-plated article to convince himself. The velvety feeling is little short of amazing.

That there is an undercurrent in favor of the rubber-slight, perhaps, but nevertheless noticeable—at least one pedal-making concern, the Cycle Improvement Company, believes. Their Janney pedal is made in both patterns, so they can have no particular object in exploiting the idea. Inquiries and orders are the foundation of the belief.

While expressing this conviction, Secretary Grey was showing THE WHEEL man through the factory at Westboro, Mass., which was an eye opener in more than one respect. Those who have an idea that pedal-making is a comparatively trifling industry need but visit the Janney factory to have the idea removed. Not only is everything well arranged and well kept, but the floor space and number of metal-working and polishing machines, and the nickeling plant, would do credit to a bicycle factory of no small pretensions. Over all and directly overlooking the work is the inventor of the pedal, Mr. Janney himself, who impresses one as a particularly bright and painstaking man. To produce only high-class work is the firm's aim. It is but fair to say that every facility seems at hand to make the aim unerring and easy.

SPRAIN CURING.

Sprains of the ankle come to novice and expert alike, and the cure thereof is not always as easy as it might be. The most successful treatment is use of hot foot baths for fifteen minutes three times a day; follow each bath with massage for fifteen minutes, then apply snugly a rubber bandage from toes as high as ankle and have patient walk. Ballet dancers use this method with such success that they are seldom incapacitated for work longer than a week.

SPICK AND SPAN.

"Heard you sold your team and bought a wheel?"

"Yep. I prefer the present spin to the past span."

AS IT IS SPOKE.

"They froze me out of that heat."

"How?"

"Made it too hot for me."

MR. ERNEST TERAH HOOLEY.

He Goes For New Fields to Capitalize and Conquer—The Foreign Stock Gamble Continues.

London, Oct. 10.—Mr. Ernest Terah Hooley has been straying from the paths of cycle finance as a relaxation during the dullness, and his opening move has fairly startled the financial world. What he chooses to do with cycling concerns is treated as a matter of a man setting his own house in order. By suddenly purchasing the well-advertised business of "Bovril, Ltd.," for £2,000,000 he has upset some gallipots and sent up the £1 shares from £3 5s to £4 10s.

Satisfied with this incursion into the open market he has returned to his first love, and the prospectus of Clement, Gladiator & Humber (France), Ltd., with a trifle of £900,000 as a registered capital, has been launched this morning. Of this sum £200,000 consists of 6 per cent cumulative preference shares of £1 each, and the remainder of the issue ordinary £1 shares. The directorate consists of Earl de la Warr, Hon. Derrick Keppel (aide-de-camp to the Duke of York), M. Clement, M. Darraac and M. D. Rucker. It is stated that the turnover of the three businesses which are being amalgamated, for between eighteen months and two years ending August 31, amounted to over £600,000, while the profits of the Clement & Gladiator companies amounted to £87,000; but the profits of Humber's are not stated, which is a matter of comment. The purchase price is £900,000, but the promoter agrees to provide a working capital of £150,000.

I am told that the Board of the Rover Cycle Co., Ltd., have decided to apply the profits earned for the last year to a reserve fund instead of declaring a 10 per cent dividend. This of course has sent the stock down. I also am told that the dividend of Humber's Extension for the current year will amount to 25 per cent, and that the Dunlop deferred dividend will be 12½ per cent. As Humber's Extensions are at the same figure as Dunlop deferred (30s), it is obvious that the former are worth buying at present. These figures won't be declared for some weeks yet.

Another flotation which will appear next week is that of Lamplugh & Middlemore, Ltd., a fusion of two of our leading cycle saddle, horse saddle and accessory makers. The share capital is £130,000, divided into 80,000 £1 ordinary shares and 10,000 6 per cent cumulative preference shares of £5 each. The directors include John Griffith, the head of the great retail house of that name, and Mr. H. A. Lamplugh. The certified profits of Middlemore for the last six months is shown at £5,800 and of the Lamplugh at £4,400. The purchase price is fixed at £165,000, which I can only say is quite sufficient.

The Davis Sewing Machine Company will show twenty Dayton's at the Stanley Show, and the Monarch Cycle Company thirty Monarchs at the Palace, all the wheels being built on English lines.

TEACHING THE ENGLISH LANGUAGE.

British sticklers for correct diction declare that there is no philological justification in America's use of the word "wheel" as a synonym for "bicycle." Says one of the sticklers: "Our American cousins may defend its use if they can, though it is difficult to reconcile it with the purity of diction which survives in their permanent literature; but against its adoption over here a timely protest is emphatically required."

Among all sports cycling is the only one which may unite an entire family in the same exercises and pleasures.

WANTED, A TOOLROOM.

What Is Needed in Every Cycle Factory Where Good Work and Time Saving Is Sought.

Most factories have a toolroom. Every shop should have a nucleus thereof at least. Tools are simply helps. Their value depends on their helpfulness. They should be as good as possible, provided they are not too good to be used. The man whose tools are too good to use did not exercise good judgment in buying them. But whether good or poor, their helpfulness depends very largely on their handiness and on their condition. These two features are the important reasons for maintaining a toolroom. The tools in a neighboring hardware store, although many and various and in good condition, are of

worn off the drills, if there ever were any on them, does not count, for the block is numbered. A second or third trial finds the right size, or if there is no right size there, it finds a larger and smaller each nearest the right size. Their difference is greater than the error of using either would be, and as their difference is known, the man decides knowingly as to which to use, and the result thereof. If there is a right size belonging to the assortment, but temporarily absent (in other hands for instance), its vacant place in the block indicates the fact, and no time is wasted.

So much for the drill block; but it can be misused. Drills can be mislaid, and the smaller drills dropped into the larger holes till the whole value as a classifying device is lost.

Here is where the toolroom comes in and

a mere "office help." He should be a tool-maker and user. If the shop is small, he may do other work, but it should be secondary. The objection that "his time is too valuable to permit him to be kept around to simply hand out tools as wanted," is based on a misunderstanding of the matter. The many minutes of the cheaper man's time and the better quality of the work will far more than repay the cost of the few minutes of the toolkeeper's time. When tools are taken out of the toolkeeper's hands for use, there should be left with him some evidence as to who has them.

An excellent method is for each man to have metal checks about the size of a dime or nickel, bearing his name, or, what is simpler, a number by which he is designated. When he takes a tool he leaves a check which is put in the place of the tool and remains

MAKES A DIFFERENCE WHOSE OX IS GORED.

8 A. M.—Mr. Suburb scorns to be seen carrying a bundle for his wife.

7 P. M.—He brings home a few things for himself, however.

little service to the shop man because of the time and money required to get them. How much better are the drills in the average cigarbox full of mixed sizes?

The workman desires to duplicate a certain hole. He fishes around in the box for a drill, tries it in the hole, finds it wrong, drops it back, hunts for another with like result, and continues the haphazard search till, finally growing desperate, he pours the aggregation out on the bench and goes through it from one side toward the other, only to find that there is no drill of the right size in that mixture. In all probability he has to partly repeat the process now in order to find a drill nearest the right size and use. The result is lost time, higher cost, poorer work and a dissatisfied feeling in the workman, all because of no fault of his.

How different the result would have been if those drills were kept points up in a drill block.

The fact that the numbers were mostly

shows its value. The keeper of said room sees that the drills are returned after using, that they are in their places, and last but not least, that they are in fit order to do work well and rapidly. The rule that every user is supposed to return tools in good order may not be a bad one, but it will not keep tools in order. The workman is judged by his work, and he gets small thanks or credit for putting the general tools in order, so that in a short while all are so dull or so badly ground (for not every one can grind a drill correctly) that more than half their cutting speed is lost.

The foregoing remarks apply with even greater force to taps and dies. They vary more widely than drills, for they are of different thread pitch for the same size frequently, much time is wasted and many a thread stripped or tap broken in laborious endeavors to cut threads with dull tools.

The gist of the matter is that every shop should have a toolkeeper. He should not be

there till the tool returns. The workman must not be allowed to make the exchange in either direction. That is the toolkeeper's business, and he must see to and handle it both ways, so he may know its condition at all times. If the factory keeps the toolkeeper busy even most of the time, he should have a toolroom and tool sharpening and making appliances. He will, if the right man, prove the most economical man on the job, although it might be hard to show direct proof to that effect. A comparison of cost cards with similar factory not having a toolkeeper would probably tell the story.

It has been said that "a good workman can get along with poor tools, but a novice needs the best." While this is true, it is equally true that the best tools are none too good for any user, and if men are supplied with good tools they will do more work, better work, and feel better about it, all of which is to be desired.

Moral—Have good tools and keep them so.

CHARLES E. DURYEA.

BLUSH PROVOKING PREVALENT.

The wheelwoman who desires to blush unseen—and there are such women—has a pretty hard time of it nowadays. All the cycle-frequented streets are infested by an interested and hypercritical throng of spectators. These gather upon the curbstone and view the passing wheel folk just as they would a procession of National or civic interest.

As in any other show, it is the women participants who receive the most attention. All eyes are fixed upon the wheelwomen, and when a particularly handsome hat or an especially fetching costume strikes the fancy of the crowd it is not low murmurs of appreciation that are heard. All this is in superlative evidence on Sunday.

It consequently does much to discourage Sunday riding. There are women, of course, to whom the idea of riding upon Sunday is unwelcome for many reasons, but this attention of the New York police is not likely to make the idea any more welcome.

Sabbath day riding upon the Boulevard for instance, has become just about as private and secluded a performance as an "act" upon the dramatic stage. More so, indeed, for the Boulevard is free to all.

UNCLE EPH'S IDEAS.

De bad luck of mos' riders hain't nuffin but dar own bad judgment.

Try an keep yo'r trubbles toe yo'se'f; no udder riker wants dem.

Eddy crank kin lay ideas about a bysickle, but it takes a label-headed man toe hatch dem.

Eben death kain't cure de disease ob advertising what hain't so; hit breaks out on de tombstone.

De rider who calls hisse'f an idiot ebber-time anything happens his bysickle wid neb-bah fo'gib you fo' agreein' wid him.

Hit's a pe'r kind ob politeness dat won' wurk as well on a bysickle as in a parlor.

Doan' you think cause yer can ride faster dan some udder folks dat yoe knows ebber-tying dar is about bysickling. De Lawd doan nebbet bestow all His gifts on one indivijle. De lightnin' bug ain' got no stinger, an' de skeeter ain' got no lamp.

TICKLED THE OLD MAN.

His City Niece (visiting the farm)—Oh, uncle! Here comes a lot of wheelmen pedaling down the road.

Uncle Josh—Pedlin', eh? Waal, I'm mighty glad them fellers has found somethin' useful to do besides tryin' to make us farmers build stone roads for 'em to ride their bysickles on.

WHERE WHEEL TAX IS HIGH.

If a practical unicycle is ever invented during the time Spain controls Manila, there will be a place where the one-wheeled vehicle would meet with a warm reception. Every vehicle in the Philippines is taxed \$3 per year or each wheel it runs on.

SORRY FOR HER.

Every woman who rides a wheel either inwardly or outwardly pities the one who doesn't, and firmly believes that if the uninitiated is strong riding would make her stronger, and if she is weak it would make her strong.

DOING STUNTS.

As an acrobatic rider,
Your baby's not a dunce;
For ev'ry day within the week
He rides four wheels at once.

BALL AND CHAIN REPAIRS.

When a link of a chain wears out at the holes indicated at A, A, fig. 1, the link need not be thrown away, as it can be fixed for further use by boring the oblong holes large enough to make them round, as shown at A1 in the next link, and a collar inserted the correct size, as indicated by B in the next view. This brings the hole down to right size for the rivet. In order to make the inserted collar remain firmly in place drill a small hole and put in a pin, as illustrated at C in the finished link.

If a link breaks out at one end, as presented at D in fig. 2, the same can be fixed by closing up the fracture (after heating it) and inserting a steel pin in the manner shown at F in adjoining view. When the rivets of sprocket chains wear down in the way signified by F in fig. 3, the chain becomes very loose and wobbly, even if the proper chain adjustments are tightened up. Besides it will run irregularly, and at times mount the cogs of the gears. A new chain is advisable, although the old one may be fixed quite cheaply by substituting new rivets, as

marked A, in same figure, in which it may be seen that the stud of the new rivet closes up all slackness, thus making the chain practically as good as new.

There are just about enough wheels in use where the wheel bearings are of the type shown in fig. 4 to make it an object for repair people to keep in touch with such wheels. The trouble with pattern of bearing is that one series of balls has a tendency to run ahead of the other series, thus creating unequal wear in a few months. This bearing consists of the axle A and bearings B, B.

When a man brings a wheel to us with these bearings we effect a remedy by taking out the balls and pinning them in pairs, as indicated in fig. 6, in which it may be seen that a rod extends from one to the other. The manner of attaching the rod ends is presented in fig. 5, in which two ways are shown. In the first, the rod is threaded and screwed in at C, and keyed with the pin D. In the other, the rod is inserted into the bored hole without a thread and headed up at E. Either way serves the purpose, allowing the balls to have something by which to govern their movements regularly, and each series works in harmony with the other.

GEO. D. RICE.

WANDERERS IN THE ROADWAY.

It could be demonstrated without any great difficulty that most cycle accidents, and the number is much smaller than is generally supposed, are due to pedestrians who often carelessly, and frequently with deliberation, step down from the curb and out into the roadway covered with vehicles without attempting to dodge the procession.

Sometimes they seem to get in the way purposely in order to express their contempt for riders and drivers, and it is not unusual to see covneys of these unclassified bipeds sauntering along the road, where they have no business at all, for blocks at a time.

Such people cannot be protected by law. It is doubtful whether they deserve to be. Having no regard for the safety or comfort of others, and willing to risk almost anything to prove that they are just as good as anybody, if not better, and can walk where they have a mind to if it takes a leg, they do not deserve very much consideration from the lawgivers.

Invariably these very people are the very ones who would run for a policeman if they chanced to see a wheelman riding a dozen feet on the sidewalk.

YOU SEE THEM EVERYWHERE.

"Ismallah!"

"Khallyed, seest thou yon form upon the dim horizon?"

"What is it, lad?"

"By the Prophet's beard, my eyes are dim with age."

"Yea, my father, I am looking. I see two humps, and"—

"Either a Bactrian camel or a couple of those around-the-world-without-a-cent wheelmen."

"We are safe! Praise be to Allah!"

MERELY AIRY PERSIFLAGE.

"Officer Jones," said the Chicago Chief of Police, severely, "it is charged that you said 'Ah, there!' to a wheelwoman in bloomers, at the park entrance."

"Faith, an' I did, sor. Sure, 'twas meself a-thinkin' no leddy 'ud resent a dillicate compliment loike that."

HAD PUT HIS MONEY THERE.

"There's money in bicycles," said the man who is young and single.

"Yes," replied his seasoned and married friend. "I'm sure there is. I have been putting half my salary in them for the last four years, and my family is not all supplied yet."

MORE THAN ALL OTHERS.

The bicycle is used as a mode of motion by more citizens than the number which covers all other vehicles combined. And yet few communities seem to know that there is a wheel within their limits, if the provision they have made for wheelmen is any criterion.

HORSE AND HORSE.

"Taking it altogether," remarked the Horse, reflectively, "I can't say that I regret the bicycle. You see, the red-haired girl joke was bringing reproach upon my gray hairs. Death before dishonor, don't you know."

NOTHING IS NEW.

It is folly to call the bicycle new. Even mythology recognized it and, curiously enough, made its divinity a female. The significance of her name has been strangely overlooked for centuries. It was Psyche.

BRIEF BITS FOR BUSY MEN.

France is the home of the motor vehicle.

The Singer Cycle Company in 1896 earned a net profit of \$250,000 for English stockholders.

First-class horseless carriages command a ready sale abroad at an average price of about \$1,250.

The Raleigh Cycle Company have netted a profit of over \$100,000 on the last seven months' business.

As the year closes the famous be-boomed Simpson chain gradually disappears from the foreign record list.

An inventor expects a fortune from a combined bell and lamp, whereby the heat from the latter is used to ring the former.

Antwerp, owing to its dock facilities and low charges therefor, has become a favorite port of entry for American wheels shipped abroad.

In 1893 a first-class wheel in England retailed at \$140; to-day the same machine, improved in every way, can be bought for \$100.

Italian wheelmen have been granted by the Government permission to use the telegraph poles for the purpose of attaching signboards.

One American in every twenty-five rides a wheel, while in France, despite its great admiration for the bicycle, only one French citizen in each 250 of population rides.

Attaching a cyclometer, built upon the pedometer principle, to the leg of the rider, in place of upon the wheel itself, is the fortune-winner one inventor thinks he has found.

Almost without exception, American concerns exhibiting at the Stanley show were given the worst spaces possible. What a queer thing the British idea of fair play is.

"The American invasion" of the British cycle market, it is estimated, will reach 40,000 to 50,000 wheels in 1897, unless there is some entirely unforeseen check put upon it.

Pneumatic tires are genuine gold producers to patent lawyers. Any number of people outside the cycle trade, and more in it, all think they have a "good thing" in a new or improved tire.

A strike of cycle dealers has broken out at Madrid. On October 1 every cycle depot in the Spanish capital closed its doors as a protest against the new taxes, which are nearly twice as heavy as the old ones.

Heretofore very nearly all motor vehicles have depended upon the chain for the transmission of their motive power. Now, however, one is being built with a bevelled gear similar to that which is to be used in driving the bicycle.

Bicycle exports from New York: July, \$342,202; August, \$211,769; September, \$241,391; total for three months, \$795,362. Four hundred and two thousand nine hundred and sixty-six dollars of the total went to Great Britain.

A new brand of crude rubber called "Mollendo" is being quoted with increasing frequency. A Liverpool paper reports. "It comes from Mollendo, a Peruvian seaport, and is quoted at from 2d. to 2½d. below the corresponding grades of tire rubber." By the way, it is classified as "fine," right alongside of the Para article.

Japan has a complete india rubber factory. The entire plant, together with the material, machinery and operatives, was supplied by a New York house. The rubber mill was constructed by the Birmingham Iron Foundry, Birmingham, Conn.

A French motor tricycle weighing 130 pounds and costing \$320, has successfully carried a weight of 230 pounds sixty miles over the roads without a refilling of the oil tanks. On level stretches the machine has shown a speed of better than twenty-five miles per hour.

English corporations have come to the conclusion that they give their affairs too much publicity in their annual reports. Some of the largest have already changed, and others intend to make alterations, in their bylaws which will keep such details as capital invested, net profits and the like from the public eye.

"An Expert in Rubber."

The results of the various motor-vehicle races in France show that these conveyances are still in the experimental stage. A very large proportion break down, though it must be admitted that they are exposed to great and unusual strains in being driven at their top speed for hours at a time, and this often exceeds twenty miles an hour.

The Japanese ask for exhibits of manufactured merchandise for the Commercial Museum at Osaka, which is to be a Government institution in the nature of a permanent industrial exposition. American cycle-makers might find this an excellent opening for their machines in Japan. Particulars can be had by addressing the American Consul.

George H. Petit.—Aluminium is the form preferred by the best writers, as well as by the chemists and persons who extract aluminium and use it. The original name was aluminium; but that was confounded with alumina, the clay from which the metal is extracted; so to prevent confusion the German chemists proposed aluminium.

Some one has estimated that the manufacturing and business houses of the United States pay out annually \$750,000,000 for commercial travellers, \$300,000,000 of which is for expenses and \$450,000,000 for salaries and commissions.

It is intended to establish at Binghamton, N. Y., a home for indigent commercial travellers and their dependent widows and children. One hundred and fifty thousand dollars is needed for the charity. An attempt will be made to realize that sum at the Commercial Travellers' Fair, to be held in Madison Square Garden from December 15 to December 28.

The Horseshoers' Protective Association, which has been holding its annual convention at New-York, "declares that, in spite of the bicycles, there are more horses in the country now than ever before." The great majority of bicyclists, he explains, would not own horses anyway. In Ohio there are 19,000 more horses than a year ago. New York has 12,500 and Michigan 17,000 more.

The question among English riders of 28 versus 30 inch front wheels seems to have solved itself. Equal-sized wheels are now the standard for most British types. It was considered for a long time by British riders that the 30-inch driver steered more steadily than the 28; but evidence seemed to show that there was nothing to choose between the two, when both machines were equally well made; and the 30-inch was at least a pound heavier.

An excellent way for a dealer to keep his stock fully up to the demands of his trade is to provide each clerk with a small "want" book. When a customer asks for an article not in the shop, the clerk to whom the request is made should immediately jot it down under the date of the day. A glance over the book for a month back will give the proprietor an idea of whether it would pay to keep certain sundries and parts, and if so, what quantities to order.

The preparations being made for the Tennessee Centennial Exhibition which will open in Nashville on May 7 next, confirm the impression that it will be an event of National importance. The grounds have been carefully laid out, and a number of the largest buildings are nearing completion. According to an article appearing elsewhere in this issue, the South is the great unworked field for cycle selling now left in this country. Whether this be true or not, no cycle manufacturer will make a mistake in exhibiting his wares at Nashville.

Two rivals of the steam engine in its usual form are now receiving much attention—the steam turbine and the gas engine. Which one is eventually to displace the reciprocating steam engine for the direct driving of dynamos is a matter of doubt, but the Westinghouse Machine Company, which builds the well-known Westinghouse steam engine, is preparing itself for either event by embarking in the manufacture of both steam turbines and gas engines. It has recently placed both upon the market. The turbine is of the Parsons type, which has for some years been on the market in England. The gas engine is a new design, the result of some years of experiment by Mr. George Westinghouse. It is a two-cylinder engine, using the Otto cycle, but with a governor which controls the admission of both air and gas in such a way that an explosion occurs at every stroke. The result is a very good regulation, such that dynamos driven directly on the shaft of the engine furnish an entirely satisfactory light, free from flickering.

WARNER GOES EAST.

D. D. Warner, manager of the D. D. Warner Co., of Madison, Wis., left for a ten-day trip East on Saturday last in the interest of his concern, who manufacture the Warner Special.

The Warner Co., with '96 as its initial year, has scored a success in the achievement of a top-notch position for itself among the high-grade makers.

In a talk with Mr. Warner just prior to his departure for Eastern fields, he expressed the utmost confidence in next year's situation.

"Election or no election, Bryan or McKinley, gold or silver, we are manufacturing, and shall continue to manufacture, bicycles," is the way Mr. Warner puts it, and the expression is the keynote to his position as regards getting ready for next season's game. With a firm belief in the steadiness of the general demand for wheels, and confidence in their ability to make a high-grade wheel as economically as any one, they have made every preparation for a legitimate increase in their output for '97, and the factory wheels have been turning on '97 product for some time.

The '97 model has excellent distinctive features; not freakish notions, but small mechanical improvements which contribute to the elements of simplicity and appearance. The company is hardly prepared to outline them at length at the moment.

"Bicycle manufacturers have sent their teams through the South the past year, and people are rapidly waking up to the importance of the wheel as a pleasure and health medium. To show the chance for development, it is stated on good authority that Dallas, Tex., a town of 35,000 inhabitants, has only been able to boast of about 500 wheels the past season. Interest is rapidly increasing, however, and a two-weeks' race meet is now in progress there. In Springfield, Ill., a city but slightly larger than Dallas, there are probably 7,000 wheels, and in Bloomington, Ill., with a population of 25,000, the number of wheels is about 4,000. Not only in Dallas but all through Texas an excellent business is anticipated by manufacturers and jobbers next season. Throughout the South much the same state of affairs exists. Taking the view of makers and jobbers as a criterion, the South promises to be the most prominent factor in the bicycle trade next season."

SOME EXPORT FIGURES.

The German import duty amounts to only \$5.75 per 200 pounds, or 85 cents on thirty-pound wheels. Assuming the average price of a bicycle to be \$67, the duty would be about 1.3 per cent of the value. No other country in the world has as low a tariff on bicycles as Germany.

Cape Colony levies a duty of 25 per cent ad valorem, Natal 5 per cent ad valorem,

TRADE PAPERS AND TRADE PEOPLE.

There is no closer student of the trade than J. Elmer Pratt, he who has done so much to build up the Grand Rapids Cycle Co. When he is in first-class working order, his typewriter turns off some refreshing communications.

In an essay on journalistic monstrosities, he has given his ideas of what the cycle journal should be and should not be. Mr. Pratt, by-the-by, has unconsciously outlined THE WHEEL'S policy, because THE WHEEL has fulfilled his requirements of the ideal, and has, more than any other paper, refused to bring temporary fake concerns into competition with legitimate firms by giving them the use of its advertising columns.

"There is nothing that tells so forcibly with a newspaper or trade paper as the continuous advertisement of good firms," says Mr. Pratt. "It doesn't do a paper or magazine any good to carry a firm two or three months in the year. It looks to the new advertiser and possible customer as if the medium was not a paying one. The bicycle papers had much better aim to get the best customers and then keep them. Of course it is absolutely impossible to keep everything that you get, but there are a great many advertisements taken by the bicycle papers and given first-class positions, low rates, lots of trade notes and everything else to help boom them along, which are speculations pure and simple. The advertisers are in the bicycle business because

Evolution of the Suspension Wheel.—From Scientific American.

The line will be as heretofore, high-grade only. One grade only, and that the best, is the company's motto.

The list will be \$100.

The gentlemen's model will be made in 22½, 24½, 26½ and 28½ inch frames, 1½ tubing, and with choice of finish.

The ladies' wheel will be of the double drop frame type.

Warner tandems will be a new addition to the line and will list at \$150. They will be made in both double diamond and combination frames.

LOOK TO THE SOUTH.

"While it is quite probable that the number of wheels sold next year will not much exceed that of last year," says "Stoves and Hardware," "there is one field that is going to be much more thoroughly worked by manufacturers and jobbers than ever before, with the prospect of stimulating a demand equal to that in sections where the best business has heretofore been done. We refer to that important portion of the country known as the South.

"While there have been many wheels sold there the past season, more than ever before, the wheel has by no means reached the popularity it has experienced in the North. There has not been a wheel 'craze' in the South. But it appears that there is going to be a change the coming season, although it is by no means likely that the demand will reach its highest point for several years.

Transvaal 7½ per cent ad valorem, plus 5 per cent transit duty; United States, 35 per cent ad valorem; Canada, 27½ per cent ad valorem; Belgium, 12 per cent ad valorem; Bulgaria, 10½ per cent ad valorem; Denmark, 10 per cent ad valorem; Egypt, 8 per cent ad valorem; France, 18 cents per pound; Greece, 20 per cent ad valorem; Holland, 5 per cent ad valorem; Italy, \$8 per wheel; Norway, 27 per cent ad valorem; New Zealand, 20 per cent ad valorem; Portugal, 27 per cent ad valorem; Queensland, 15 per cent ad valorem; Roumania, \$1.50 per wheel; Russia, \$9 per wheel; Spain, 6½ cents per pound; Sweden, 15 per cent ad valorem; Switzerland, 6 cents per pound; Tasmania, 10 per cent ad valorem; Turkey, 8 per cent ad valorem.

According to this, a German wheel would pay in the United States an import duty of \$24, while an American wheel would have to pay in Germany only 85 cents. If it was necessary to buy American bicycles in order to satisfy the home demand, there would be no just cause for an increase of the German import duty. But apart from new cycle plants building, the existing ones have increased their capacity so that the manufacturers are already afraid of overproduction.

WHAT HE DID NOT DO.

The Rev. Mr. Harps—What did you do, Brother Isaac, when that bicycle of yours threw you off on your head?

Alkali Ike (grimly)—Wal, I didn't hold no prayer-meetin', if anybody asks you!

they think they can make a little money out of it. They are not in it because they think it is here to stay. They have not a plant or permanent business. A bicycle paper does all in its power to help these concerns to injure legitimate manufacturers by unnecessary cutting of prices and to also contaminate trade.

"Such papers as THE WHEEL, Referee, Cycling Life and American Cyclist have a strong influence with the trade and yield a power that we do not believe the papers themselves realize. A straight, profitable business, at one price and on the same terms, can be done if the man has got the backbone to stick to it. If he has not, he will have flexible prices, flexible terms, flexible opinions and an unreliable publication."

DETACHABLE CYCLE MOTOR.

Isaac H. Davis, of Boston, has patented a motor attachment for bicycles which is extremely ingenious. The motor is so arranged that it can be easily and quickly attached to a bicycle of any standard make or construction. When secured in place the motor extends to the right-hand side of the wheel far enough to allow the rider to easily dismount from the saddle, and at the same time is so arranged as not to interfere with the operation of the pedals in case the motor gets out of order or the supply of steam be shut off.

The trouble with the beginner in cycling is that he has a way of winding up his tongue, setting it going and then leaving it.

CHAIN VERSUS GEAR.

What the Advantages and Faults Are of These Two Forms of Cycle Propulsion.

A really new mode of carrying power to the wheel may be pronounced non-discoverable because non-existent; such surprises as remain are likely to come in the motor vehicle. Mere detail of construction excepted, the man-driving mode will continue to be some application of devices familiar in general mechanics and also heretofore tried. But between the G. O. and the other extreme of the "Broncho" type there is no way of placing the rider over the driven wheel-axle. So it is entirely safe to say, if anything in prediction is safe, that some device for transmitting power from what we may, for the purpose, call its centre of production to the driven axle itself will indefinitely be necessary.

One of the most important and burning questions at present is, How is the power to be thus carried? There are eight possible ways of so carrying it: (1) By a leather belt; (2) a metallic band, pierced with holes to engage projections on the sprockets or provided with projections to enter hollows thereon; (3) a wire rope, with or without projections; (4) a system of cranks and connecting-rods; (5) a row of spur gears to close the gap between the two driven centres; (6) the chain; (7) a shaft to bridge the gap, provided with bevel gears at each end; (8) some form of clutch or ratchet action at either of the centres, operated by some device of lever. To make the list complete, the plain rod with universal joints might be added to it, for that is capable of carrying power at an angle; but its inability to do anything more than "gear level" is enough to make an end of it as a bicycle possibility.

SIFTING POWER CLAIMS.

Of the above, No. 1 is obviously not worth consideration, for it shares with several others the destructive fault that while it would "carry" the power it would spillet too much of that on the way, like a bucket with holes. Nos. 2 and 3 are only the belt modified to prevent slippage; these can be passed by with the remark that their defects make them quite impracticable. No. 4 is borrowed, perhaps not in the first instance, from the double-acting engine without dead centres. It is the best practical way of converting reciprocal into rotary motion, but as a mode of merely transmitting rotary motion over a gap of distance it is highly unmechanical. In a bicycle, it would involve multiplication of parts and bearings; moreover (and much worse), although there is no dead centre, one crank being "on" when the other is "off," the radius of pull through the crank varies constantly in length, and hence it is unfit for use with man-power, which has no surplus to draw upon. A bicycle so built would run interestingly and sweetly on a stand; on the road it wouldn't. No. 5 would fill up the gap, but would involve the defects of gearing, heavy weight, cost, lost motion, and such heavy friction and wear that it is not practicable. No. 8 has some scope for variation, but any ratchet necessarily gives up back-peddalling, and rotary action is also so firmly fixed now that pedalling in only part of the circle cannot be expected to come in.

Nos. 6 and 7 remain to consider, and just now the threatened struggle seems to be between the chain and the bevel gear; the vast advantage of possession is with the former, yet changes are sometimes so rapid that this alone will not effectually bar the chainless.

The chainless or bevel-gear plan proposes to bridge the gap between crank axle and rear

axle by a simple straight shaft to carry the power. The front sprocket becomes a wheel with teeth on either its inner or outer face, the teeth being oblique to the axle instead of parallel with it; the rear sprocket becomes a similar wheel, toothed on its outer face; each end of the shaft carries a pinion, meshing into the two wheels just named, and nearly at right angles with them. Spur gears run in one plane; bevel gears carry power around a corner, and the toothed portion of such gears, instead of having teeth on lines radiating from the wheel centre, forms the outside surface of a slice from a cone. In this there is nothing at all new.

ADVANTAGES OF SPROCKETS.

Sprocket wheels, having few and coarse teeth, can have them forged on and then cut to shape, or to cut them entire from the solid is a simple piece of milling; but gears have many and small teeth, which must be cut from the solid, and the sides of the bevel tooth are not parallel, its thickness varying at every point, so that ordinary milling will not serve. This, however, is a trouble for the maker, and may be met by special tools, so that there need not be any materially increased cost over that of the present construction—at least to the largest makers. If there were an increase, however, that might not be counted a drawback to those who wish to maintain the \$100 price.

Weight will necessarily be increased, and one trouble—not very important, yet of some account as a selling consideration—is that to alter the ratio of gearing on any one machine is almost impossible. The rider cannot make the change himself; if that can practically be done at all it must be a shop process, with cost and difficulty.

The large bevel wheel on the crank shaft can easily be placed almost or quite in line with the driving-wheel; so much we readily admit is a gain, because removing the unequal and twisting strain which comes on the bearings of that shaft by having the load of work on one side as at present. The first tendency of chain pull is to drag the rear wheel and the crank shaft together, and the main office of the right-hand rear brace is to resist this. No such strain exists with the shaft plan; the first tendency, instead, is to roll the shaft to the right and to tear it, together with its accompanying brace, away from the wheel. The bearings on the shaft must meet this stress, and this construction evidently introduces a lateral—or we might call it a spreading or splitting—pressure to which the bicycle frame has not yet been subjected.

COMPARING THEIR FRICTION.

As for friction in running, provided the teeth have the most correct shape and the most perfect fit, it may be a debatable question how their friction, under heavy pressure, will compare with the friction in chain-driving, the conditions otherwise being the same in both cases. Immediately the question arises whether these conditions can be made the same in both cases, as we shall presently consider somewhat. From spur gears we cannot hope to get much better than 96 per cent of the power expended; with two pairs of the bevel, according to so good an authority as Professor Barr, of Sibley College, not more than 92 or 94 can be expected, under the best of circumstances. The frictional loss in chain transmission, chain and sprockets being well made, is said to be about 4 per cent, and some further reduction from this may reasonably be looked for. The Morse Mfg. Co.—who certainly deserve honorable mention for successful effort in a right direction—claim to have conclusively tested one of their roller joint chains, taken just as it came off a bicycle after

a season's use, and without lubrication, with the result of showing a frictional loss of less than 2-3 of 1 per cent.

Construction on the bevel-gear plan, we ought to remark here, must be of the highest, and pity should be secured in advance for the unfortunates who buy bargain-counter or even second-grade bevel-gear wheels, if any such are ever made. The gear must also be well taken care of, or it will turn fiercely rebellious. Even if it does not "run in oil," the strictest boxing of it is imperative. There is no spare space for intruding material, and no "accommodating" disposition. Any entering gravel will start a rumus instantly, and if a bit of stone should be carried in there would at once be raised a question of survival between the stone and a tooth. To look at the behavior of the chain in such cases, exposed to everything as it is, most riders have observed that running through mud causes a "snapping," which proceeds from mud forcing between the chain blocks and the sprocket teeth, but stones do not seem to get in. The explanation is that whatever falls on the upper half of the chain is kept off the sprocket by the chain itself; that there is a measure of elasticity in the chain, as we shall presently mention further; and that the mode of engagement between chain and sprocket tooth is such as to rather throw off than pull in any unyielding material.

WHEN A TOOTH BREAKS.

Breaking, or even chipping, of a tooth in the gear would obviously put the running out of action and increase the danger of further breakage. Such a break would be a serious trouble, even should it kindly not occur out on the road. We do not know of any successful mode of repair short of substituting a new toothed wheel for the broken one, nor can we suggest any temporary expedient for the rider caught by such a mishap; if away from home, he would have to get home as best he could. Nor may we refrain from pointing out that the number of teeth in contact at a time is not so large that the lack of one can pass without disturbance. Moreover, this breakage cannot be considered beyond the list of possible ordinary accidents, because contact between each pair of gears is confined to two or three teeth at a time, and the driving strain is thus concentrated upon a slight slip of metal, the usual engagement being of one tooth, in one wheel, between two teeth of another, so that in use the thrusts of driving must be borne by a single tooth. The sprocket tooth, on the contrary, is thick in the direction of the strain; that pull which tends to break off a tooth always covers at least half of each sprocket, so that it is distributed over a number of teeth. The result is that a sprocket tooth rarely breaks, nor is there any considerable percentage of break in chains. Probably this exemption proceeds largely from a measure of elasticity which the chain possesses; suddenly put a heavy forward thrust on pedal, or let some accident suddenly interrupt the forward movement more quickly than the driving power can be taken off, and the shock in either case may be lessened and absorbed, because the connection between power and load, through the chain, is not quite rigid. Whether this explanation be accepted as practical, or be deemed fanciful, it is certain that in the driving mechanism on the gear plan there is no elasticity whatever; hence any violent irregularities in driving must expend themselves—with at least a tendency to fracture by shock—upon the single tooth in action at one time as above stated.

Moreover, we cannot make an honest and complete analysis without pointing out that

the breaking of a single tooth, in either one of the four bevelled wheels, must instantly render the gear inoperative.

WHERE CONTRAST IS GREATEST.

The most marked contrast between the bevel gear and the chain is in what we may call the "accommodation" in the latter and the total absence of that agreeable quality in the former; for this we have just given one instance. The chain has now settled down to a uniform quarter-inch in width and an inch in pitch; any chain runs on any sprocket, and chains and parts are not only interchangeable, but are stock goods, procurable anywhere, almost as readily as nails. So much for comparative ease of replacing broken parts, but in respect to operation we are confronted by the most dangerous fault of the bevel gear for bicycle use, namely: its shaft must be absolutely in line. Let an extra strain or an accident of any sort cause this to be sprung, or bent a little, and the rider is in trouble forthwith, with perhaps nothing visibly wrong. The bearings will twist and "work" and the gears will bind and jam; either the rider must spend his strength grinding against a destructive friction or the parts will not move at all, and the bicycle wants the shoulder or the ambulance. This is no fancy picture; it is a simple statement of how exceedingly wrong such a device becomes when wrong at all; it is all right, or it is all wrong—it knows no middle. Chain driving is in this respect the exact reverse. The chain is loose and full of joints; therefore it has flexibility in operation. It may be loaded with mud, or the driving wheel may be out of line with the front sprocket and the frame; or the front sprocket itself may be bent so that it "works" instead of running in one plane at right angles with the crank axle; still the bicycle can be used, with more or less increase of friction, and in such cases many a strong and not very watchful rider shoves his way along without noticing any difference, the simple reason being that the flopping, bending chain adjusts itself to a kink when it encounters one and makes no fuss about it. It is flexible, not stiff and unyielding. Whatever its faults, the chain is in this important particular the ideal device for driving a bicycle.

HERE IS AN IDEA.

It occurs to us here that at least a hopeful attempt might be made to omit the shaft and connect the pairs of bevel gears by a strong, spirally wound steel wire, spring-fashion, with the coils in close or nearly close contact, being preferably so placed as to receive a twisting strain from the usual driving, since it must necessarily take the opposite pull by back-peddalling. The practical difficulties of such a device we do not stop to discuss; suffice it that they are not distinctly prohibitive, and it would substitute for the rigidity of the shaft a saving measure of yield against sudden strains and modify the alignment danger.

It must follow that, as respects the mere resistance of the moving parts between themselves, almost any springing of the rear braces or the other portions of the frame will not stop a chain-driven bicycle, unless the bearings are caused to bind. On the other hand, when we consider the properties of the bevel shaft, as above set forth, we see that the mechanical problem is more formidable than appears on the surface. The primary tendency of chain pull is to draw the two sprockets together; the secondary effect is to revolve them. The primary tendency of the bevel driving is to thrust the shaft outward, and this has to be effectually met and converted. In order to accomplish this, is it not likely that more and different trussing will

be necessary—that the frame itself must have a new design?

GOOD POINTS ABOUT GEARS.

No chainguards would be needed, and the peculiar defects of the chain would be avoided; so there is something rather taking in the general idea. An argument may also be raised on behalf of the bevel gear, from its familiar and successful use in mechanics, but such arguments easily lead to a fallacy. For example, there was a time, ball bearings not having become thoroughly established in cycle construction, when it was urged that those cannot be very helpful, or they would have long ago been applied generally, to vehicles in particular. But the matter of load has something to do with this; cost of construction and care affects it also, and in railway cars, for instance, a saving of power by reducing friction is of comparatively trifling account. In the machine-shop, the bevel gear goes into places where there is no substitute; with rare exceptions, the load on it is uniform; the objections to it above cited are of little force or do not exist at all. But in building such a specialized product as a bicycle, we have to keep in view stanchness, non-liability to derangement, and the controlling fact that the rider has no power to waste. The foundation fact—and a most interesting study, also—is that he can push along the machine and himself with greater speed and less labor than he can push himself alone; this fact, and not advertising or even the desire for athleticism, is the secret of the bicycle. Everything must be made subject to this end, and devices good elsewhere are not necessarily good here.

LARGER SPROCKETS COMING.

With the important exception that the chain has been reduced in width and pitch, that the quality of material and accuracy of fitting in it have been bettered, and that sprocket cutting has been improved, the chain is as it was at first—that is, its essence is unchanged, comparatively little inventive thought and experimental test having been directed to it. Assuredly it would be a capital error to assume that the chain is now at its best; it would be more nearly right to say that the chain has not really begun to show what it can do. The cycloidal rear sprocket, for example, has received considerable attention from some makers, and perhaps this form of curve might be usefully applied to the front one also. Here we may say that one of the well-kept trade secrets is that larger sprockets will be in vogue next year. The seven-tooth, which has been the minimum, is already quietly discarded by many makers, and in '97 we may expect to see rear sprockets with eight or ten teeth and front ones from twenty-three to twenty-eight. A slight increase in weight, necessarily, but the practical result will be a very marked decrease in strain, especially on the chain and on the hub and spokes of the driven wheel; high gear will also be more practicable, and spurting and back-peddalling, other things being equal, will be somewhat easier.

THE CHAIN'S GREATEST FAULT.

The most unmechanical feature of the chain is clearly its unprotected condition, which causes it, most absurdly when the stress laid upon the bearings is considered, to be "lubricated" with grit. Change this condition by using an effective cover, boxing it as well as the bevel gear necessarily must be, and a long stride will surely be taken toward settling the problem of propulsion. First and last, much space has been given to advocacy of the gear case by the American wheel press, and yet, after having borrowed of England nearly everything else (the wood rim always excepted),

not one American maker—whether the obstacle has been the bugbear of weight, or the cost, or the lack of demand—has covered the chain. The cases shown last winter by Singer will be remembered, and it is perhaps significant that an Englishman is now advertising a case in *THE WHEEL*. We do not stop to criticize that case, or to suggest details for the perfect one. Possibly it need not be quite boxlike in shape, it must be a complete protection; it must be light, must not rattle or have fastenings that easily work loose; it also must be very easily removable; but if it is as good as that proposed for the bevel gear, it will amply do. And all said on the proper care of chains in a recent article by Mr. Wilcox should have renewed emphasis, for an abused or neglected chain cannot possibly give the highest efficiency. No part of any piece of machinery can be counted upon to return good for evil; it is more like the echo in disposition, and a bicycle may be imagined to take delight in kicking back upon those who misuse it.

ROYALTY AND PATENT POSSIBILITIES.

There has been some flutter caused lately by statements that the bevel gear is to be put on the market next year by the oldest American concern, which has also, it is said, secured a foundation English patent and perhaps some others of importance as a support; and only a week or two ago we were treated to a "notice" in this vein, which even raised the question, What will become of the chain bicycles now made or about to be made? But this is going at a little too hot a pace. It is quite true that the company in question will control the trade and re-establish their royalty system, if they can; we need not feel savage about that, for probably any one of us would do just the same if he could. But there's the "if." Times are not as they were where the familiar list of patents, of which the Lallement was the most important, were in being. There is not now capital and established position on one side and on the other people who have mainly both yet to make; nor has everybody now got to make one type of bicycle, which in fact clearly infringes. Suppose the bevel gear proves really worth contending for, it will find large and vested interests opposed, and it must prove very seriously superior before those interests will consent to take the yoke of license.

It is said that all roads lead to Rome, and if the trade is really about to drop the chain for the gear, the latter not being free to all, like the former, the Peter's pence that go annually to Rome will be insignificant compared to the bicycle dollars that we have to be paid to the American Pontiff. But this condition has itself to meet some conditions first. Suppose the bevel gear seems likely to be a "go"; there will be in the situation itself a spur for chain improvement as an escape. Some really original chain may be possible—we do not say; at least, the prospect of a license will stimulate improvement, including the gear case. By-the-way, the English patent mentioned has only two years more to run from this date, and even if the bevel gear fulfils the utmost cry about it and proves the thing the cycling world is waiting for it will take at least the year '97 to find that out.

CONCLUSION—NOT YET.

For the reasons above set forth, we are not of the opinion—not yet—that the chain bicycle has had its day, and that there is going to be trouble in disposing of any reasonable output of reasonably well-made product. What '97 shows we shall better know next autumn; but this is the present outlook as we see it. Certainly we do not expect that all eyes—and certainly that all parties interested and all riders—will agree with our views; we should count them feeble views if they did not call out friendly dissent. If we accomplish no more than to do that, and thus to induce more light on the subject, we shall not have written quite in vain. That the bevel gear will carry the field by storm—or very rapidly by any other rate of advance—we do not expect; but it must have a fair opportunity to prove itself. We are neither for it nor against it. The best in cycles is only good enough, either for maker, dealer or rider; the best is what we are for.

RECENT PATENTS.

67,625. BICYCLE-SUPPORTING FRAME. EDWARD C. WATERBURY, Inverness, Mass. Filed Apr. 2, 1894. Serial No. 568,985. (No model.)

Claim.—A bicycle-supporting frame composed of a track-bar, a curved cross-piece, and a standard pivotally attached to the track-bar and arranged to swing in a line with the track-bar, substantially as specified.

68,802. MEANS FOR ATTACHING BICYCLE-SADDLES. SEYMOUR S. SHAW, Canton, Ohio. Filed Nov. 11, 1894. Serial No. 648,062. (No model.)

Claim.—The combination with the seat-frame and post of a bicycle, of the said frame with slots at right angles to each other through one of which said seat-frame and post pass, and the wedge-shaped blocks passing through the slots at right angles to said frame, and the screw-bolt and nut for holding said wedge-shaped blocks in place, substantially as described.

69,074. PNEUMATIC TIRE. GEORGE W. WEAVER, Brooklyn, N. Y. Filed Feb. 24, 1893. Serial No. 668,606. (No model.)

Claim.—A pneumatic tire, consisting of an outer flexible sheathing-tube, an inclosed inflatable tube, a cushion located between said tubes adjacent to the tread of the tire, the said cushion being of a substantially semi-circular form in cross section and arranged with its outer curved surface as a support to the sheathing-tube, whereby an air-space is formed between the tubes at each side thereof from a central point at the tread of the tire to the inner side of the same opposite said tread, the inflatable tube being of such dimensions in cross-section relative to the sheathing-tube as to only contact on one side with the said cushion and on the opposite side with said cushion and at a central point on the inner side, substantially as described and for the purpose set forth.

69,276. GRAB-SEAT AND BEARING FOR BICYCLES. ROBERT M. KERRIN, Springfield, Mass. Filed Dec. 1, 1894. Serial No. 591,733. (No model.)

Claim.—The combination of a crank-shaft consisting of two shaft-sections the ends of which are adapted to interlock and prevent when so interlocked rotation of one without the other, a sleeve having at one end a cone-bearing integral therewith and engaging one end of the shaft-section by an interior threaded connection and provided at its opposite end with an exterior thread, a bearing-piece having an interior thread to engage a thread on the shaft-section & bearing, an extension interiorly threaded to engage the thread on the end of the sleeve, a bracket at bearing-ribs at each end thereof and a ball interposed between the bearing-ribs and cone, substantially as shown.

67,949. BICYCLE-FRAME. EDWARD J. DE BUREAU, New Orleans, La. Filed Mar. 14, 1894. Serial No. 583,291. (No model.)

Claim.—The combination with the crank-shaft of the lever D, the dotted chain-wheel the friction disk, the brake-band connecting the chain-wheel and lever and the spring adjustably secured to the chain-wheel and bearing upon said lever at its opposite end substantially as specified.

68,794. PATCH FOR BICYCLE-TIRES. ALBERT C. REEHER, Muskegon, Mich. Filed Apr. 11, 1894. Serial No. 646,515. (No model.)

Claim.—The combination with the outer case or cover of a pneumatic tire, of a patch consisting of a piece of flexible material secured to the inner surface of the tire by means of cement, a layer of which is interposed between the adjacent faces of the tire and patch, the said patch being further secured to the tire by spaced rows of stitches extending substantially at right angles to each other, the said stitches being passed through both the patch and the tire, while the cement is in a plastic condition, whereby the said plastic cement is drawn by the thread into and caused to fill the perforations formed by the stitches, in such manner as to render both the outer case and patch impervious to air, substantially as described.

68,973. BICYCLE-SADDLE. ARTHUR L. GARBER, RYMA, Ohio. Filed Mar. 18, 1893. Serial No. 541,621. (No model.)

Claim.—In a bicycle saddle, the combination of a middle-seat bent downward at the sides but not at the front end, and a transverse lateral bar having side arms which are secured to the downwardly-turned sides of the seat near the front end thereof, and a rearwardly-extended arm which is secured to the outer side of the seat, with a seat support secured to the rear end of the seat, and having at its front end two separated vertical ears, a threaded screw extending between and secured to said ears, a screw which extends into said sleeve and has a cylindrical front end which passes through a cylindrical hole in the transverse plate, and an auxiliary spring which bears against the rear side of the said plate, and screw having a longitudinal slot in its front end, substantially as and for the purpose specified.

68,977. BICYCLE-SEAT. ROBERT M. BELMOR, West Bay City, Mich. Filed Aug. 24, 1894. Serial No. 660,380. (No model.)

Claim.—In a bicycle, the combination with the frame, of a seat-bar hinged thereto at one end, a cylinder on the frame beneath the front end of the seat, a freely movable plate and spring connected to the seat-bar at its upper end, and a piston on its lower end engaging in the cylinder, substantially as described.

68,818. TIRE FOR BICYCLES. WILLIAM H. TAYLOR, Narragansett, R. I. Filed Dec. 20, 1893. Serial No. 571,527. (No model.)

Claim.—In a bicycle-tire the combination, of a series of springs, a short distance apart, a bar carried inside of said rings, and riveted to them, a waxen covering for said rings and bar, and short strips of metal placed on the outside of said waxen covering, without riveting, and held in place by a textile strip cemented over them, to the textile covering, substantially as described.

68,753. CLAMP FOR REPAIRING BICYCLE-TIRES. WILLIAM FORB. Orange, N. J. Filed Dec. 14, 1893. Serial No. 571,183. (No model.)

Claim.—A tire-repairing clamp, provided with an aperture to embrace the neck of a repair-patch and provided with means for holding it upon the tire during the inflation of the same, substantially as herein set forth.

68,743. BICYCLE-LOCK. LOUIS H. CLARK and RICHARD A. MORROW, Ford du Lac, Wis. Assigned to WILLIAM T. ALLEN and ARTHUR C. BROWN, Brooklyn, N. Y. Filed Aug. 28, 1894. Serial No. 571,133. (No model.)

Claim.—The combination with the lock-cases, of rotary tamblers having notched peripheries and notched interiorly, carriers located in the central openings of the tamblers and occupying the same plane, and carriers each having a projection adapted to enter one of the interior notches and project beyond the face of the carrier, a rotary dial having a projection whereby to turn the carriers, and keys to turn the tamblers and set both, substantially as set forth.

68,843. VELOCIPED. ROBERT MUELLER, Chicago, Ill. Filed Dec. 2, 1894. Serial No. 530,668. (No model.)

Claim.—A velocipede having in combination a driving-lever having a crank, a driving-lever having a floating pivot and being provided with lug and notch connection with said crank whereby it may be adjusted, and means for yieldingly holding said lug and notch in engagement, substantially as set forth.

68,989. SUPPORT FOR BICYCLES. JAMES S. LYMAN, Brooklyn, N. Y. Filed Jan. 27, 1894. Serial No. 571,818. (No model.)

Claim.—A support for bicycles or other vehicles, comprising a frame, which is provided with four projection arms, two of which are free to swing on the frame, and each of which is provided at its outer end with a clamp, substantially as described.

68,837. SPOCKET-WHEEL. JOHN COVENS, Hartford, Conn. Filed June 19, 1894. Serial No. 574,137. (No model.)

Claim.—A sprocket-wheel having a movable member provided with a pair of oppositely-extending projections, one of which projections is provided with a recess.

68,912. WHEEL-BUR. JOHN J. LARA, SYRACUSE, N. Y. Filed July 4, 1894. Serial No. 574,354. (No model.)

Claim.—A wheel-bur composed of a main tube provided with perforations in its end portion for the attachment of the spokes, a hubbing secured with its body portion to the outer surface of the main tube and terminated with circumferentially-reduced end portions, and hub-bearing-taps inserted in the end portion of the hubbing and provided with flanges seated on the ends of the hubbing as set forth.

68,974. BICYCLE-SADDLE. ARTHUR L. GARBER, RYMA, Ohio. Filed Mar. 18, 1893. Serial No. 541,800. (No model.)

Claim.—In a bicycle-saddle, the combination of the rear seat-support made of flat spring-steel having its front end upturned, and a block which embraces said end and is adapted to slide upon said seat-support, with a coiled wire spring having two strands, the rear ends of which are seated in notches in said block, and a screw which passes loosely through a hole in the upturned end of the rear seat-support and which secures the strands to the hole in the said block, and screw having a head which abuts against the front side of said upturned end, substantially as and for the purpose specified.

Claim.—As an improved article of manufacture, the bicycle-seat herein described, comprising the upright standard, a stabilizer bar, forked upper portion, whose arms are supported by a narrow space adapted to receive the bicycle-crank, and space being of sufficient depth to allow the crank to rock downward thereon until the pedal engages the lower part of the support on one side, and the butt of the crank the upper part of the support on the opposite side, as and for the purpose set forth.

STUDIED ON THE BOULEVARD.

He had that crafty eye which belongs to a Boulevardier. Not the Parisian boulevardier, but the cafe and sidewalk, but the New York one, the man who finds sights to interest him on New York's great wheel parade-way—the Boulevard. He evidently knew a thing or two about the game, hence his opinions are worth quoting. Said he:

"If every man and woman that has learned to ride the bicycle in New York had been compelled to do it in private, not half the scorchers who are expert now would ever have undertaken to learn. The prosperity of the cycle and its schools rests largely on the fact that a man or woman can get an audience there for 50 cents. During the full hour he, or she, is certain of the more or less exclusive regard of a good number of persons. People who have posed with uncertain results for years are able now to go to the cycle academies and be positively sure of having some one to watch them.

"If one rides well his chances are better, for there is no end of opportunity skillfully to evade unlucky beginners, and the figure eight, as well as the pedal mount, or leap into the saddle, is a play which is bound to appeal to the grand stand. It would be an unwise man who drove the spectators out of his school. Prosperity would go with them, and, knowing this, there is every inducement offered to the casual pedestrian to get him into the rink, to help make up the audience there.

"It is very much easier for the women than the men to get their 'public,' as it would be called if they were actors. They are independent of the schools, and can leave them as soon as they have learned to ride, which is not by any manner of means the course they follow.

"The woman who has the courage of her mistaken convictions can don bloomers and mount her wheel secure in the conviction that every man she passes will turn and look at her.

"She can shorten her skirts and create almost the same effect, so long as she takes enough off them. This isn't as certain, though, as the bloomers. They are still infallible, even if there are signs that their power to attract is going into decadence. They can still be relied on in the street for a certain effect, even if a few more hundreds of them on the Boulevard will satisfy a man's curiosity on the subject. The only hope of their continuing to interest is that the subject inside of them shall always be changing and yet remain the same person of manifold and inexhaustible charms that she always has been, whether she goes about bifurcated or integral."

HERE ARE TRICYCLES.

Seizing the opportunity afforded by the suggestion of Messrs. Schwabach and Wilcox that "three or four of the smaller makers should shape their plants for the production of tricycles," the Tinkham Cycle Company rise to remark that they have done that very thing. Right here in New York they are building thirty-five-pound tricycles in two patterns, which they are "willing to put alongside of any tricycle or bicycle in the world." The '97 model is already in evidence.

DIFFERENCE IN OPINION.

Doctor (to assistant)—Did you call on Mr. Fixem this morning?

Assistant—Yes, sir; and found him at work in his repair shop, as usual.

Doctor—Did you ask him how he was?

Assistant—Certainly. He said he was worse, but I could see plainly that he was "on the mend."

NO "BREAKING-IN" NEEDED.

The bicycle saddle of to-day may be placed in two distinct classes—the hammock pattern, consisting of leather or any other material stretched between two points of a spring, and the rigid pattern, that should more properly be called a seat. Among the latter none are better known than the "Hollenbeck," manufactured by Frank A. Hollenbeck & Co., Syracuse. During the season just past this saddle has earned a reputation that necessitated a removal to larger quarters and the

conversion of Nos. 228 and 229 Walton street into a very complete plant for the making of this article.

The '97 Hollenbeck is already in evidence. The base is a single piece of stamped metal—a splendid specimen of such work—which is entirely covered with leather, which prevents rusting of the metal parts; properly cushioned, of course, and finished in fetching style, none can be more attractive. It is claimed for the improved Hollenbeck that that decidedly uncomfortable proceeding known as "breaking in" is entirely done away with, as its construction is on such hygienic principles that

absolutely no soreness is experienced, even on the first trial.

The spring and cantle are in one piece, making it one of the lightest saddles of its size on the market. Two widths are furnished, 10½ and 8½ inches.

Merit is sure to gain its own reward, and a bedrock principle of using nothing but the best materials and a laudable desire for perfection would seem to assure a flattering call for the saddle.

FUTURE BRIGHT TO THEM.

The Demorest Manufacturing Company, Williamsport, Penn., are now turning out the 1897 models. From the orders already booked the Demorest people declare that, as far as they are concerned, they see no reason why next season should not be as excellent for the trade at large as it certainly promises to be for the Demorest.

ROLLED UP, TOO.

The fat scorcher rode o'er the stray canine
And flattened him east and west;
He hadn't a chance to omit one whine,
But his pants no doubt were pressed.

HE HAD IDEAS.

His trousers bagged at the knees, were frayed at the bottom and hung like meal sacks upon a pair of pikestaffs.

Withal, he had ideas, burning ideas, and he was bound to give them utterance. The office boy headed him off as he was making a beeline for the editorial rooms.

He explained he had something the readers of the paper wanted to read, thereupon the office boy, knowing his business, extracted the following:

"Now, what do you mean by this tirade against the bloomer costume? We sneer, we swear, we ridicule, but why should we be double-barrelled idiots on this subject? We like long dresses because, so to speak, we were born that way. But why shouldn't a woman wear clothes that fit the occasion, provided they are becoming? I draw the line there, because to be unbecomingly dressed is a crime. The women of China, Turkey, Persia, all wear short clothes. That is, about two hundred millions, and why should we raise such a howl if a few American girls do the same thing, eh?"

The office boy's only answer was "I dunno," and he turned in the story for space-filling purposes.

ADVICE TO KNOW-IT-ALLS.

In a Warren street window is exhibited an armor-clad tire which attracts any number of Johnny-know-it-alls, each of whom is bent on airing his ignorance of things in general and that tire in particular. For the benefit of those sidewalk experts the owners of the store had this sign prominently displayed alongside of the tire:

"To the Amateur Lecturer.—Don't try to explain this tire to the public, as you probably don't know what you are talking about; and as we pay a man to do this work and hate to have him idle, please step inside and get the facts."

WILL CATER TO THE CYCLE TRADE.

There has been completed during the last year at Youngstown, Ohio, one of the most complete plants of its kind in America. The concern owning the plant is the Finished Steel Company, which furnishes polished shafting from ¼ inch in diameter up to 4½ inches in diameter, being the only concern in the country that gets up to 4½ inches. They are also prepared to furnish many special makes, and will cater largely to the cycle trade.

SOME PROFIT HERE.

Some idea of the magnitude of the recent cycle boom in England may be gained from the fact that at the annual meeting of the Star Tube Company, of Birmingham, a dividend of 200 per cent and a bonus of 400 per cent for the half-year was declared, and the chairman of the company stated that the orders on the books exceeded the whole of last year's output and increased profits would be made next year.

TWICE AS MANY TEETH.

Supt. Metz, of the Waltham Mfg. Co., is experimenting with a new chain and sprocket, the latter having twice as many teeth as are on the sprockets now in general use. He is much impressed with it, but that it will be made a feature of the Orient bicycle it is yet too soon to say.

ART AND INFORMATION ALLIED.

People who like pictures, and who would learn something about wood rims, Winona rims in particular, should obtain the catalogue of the Winona (Minn.) Wood Rim Co. The photographic reproductions of the logging scenes cannot fail to interest.

VOL. XVIII., No. 11.

NEW YORK AND CHICAGO, OCTOBER 30, 1896.

WHOLE No. 453.

FOWLER PLANTS HIMSELF.

He Purchases the Munger Plant and Will Once More Be a Trade Factor.

Frank T. Fowler has purchased the plant and business of the Munger Cycle Company, of Indianapolis. The property is at present in the hands of a receiver and the compact requires the sanction of the court to be final.

Ordinarily such a transaction would create profound surprise, but of late Fowler has been bustling about so nervously that he was on the card to "do something." That he would again engage in the manufacture of bicycles, an offer to purchase an embarrassed plant in Chicago, made early in the summer, and his negotiations with foreign folk made certain. His purchase of the Munger plant in consequence seems almost a matter of course.

The deal conveys the machinery and name to Mr. Fowler, whose intention it is to remove the property to Chicago and continue the business as the Munger Cycle Company and the manufacture of the Munger bicycle. It is understood that Fred S. Dickinson, who was formerly associated with the Munger people, will become one of Mr. Fowler's right hand men.

INTO THE RECEIVER'S HANDS.

On the application of C. G. Howard, president of the Howard and Nichols Manufacturing Company, of Newark, N. J., Elwood C. Harris was last week appointed receiver on a bond of \$80,000. The company's assets are estimated at \$60,000, while the liabilities amount to \$13,500, \$9,000 of which are contested. The concern was organized under the laws of New Jersey, with \$500,000 capital, on November 29, 1895, to engage in the manufacture of a chainless bicycle. The machine was a modification of the old League chainless. Dissension among the stockholders and slowness in the manufacture of the wheels brought about the failure. But few of the machines were on the market.

FOURDRINIER TO THE FRONT.

Boston is to have a show of its own this year. A sanction has been granted to the Boston Cycle Board of Trade for February 20 to 27, a week after the New York show. The Mechanics' Building has already been secured for the time specified. The association has been incorporated, with a capital of \$5,000, to carry the project. The show will be in charge of the Board of Directors, as follows: F. O. Very, president; J. N. Leach, vice-president; John F. Morrill, secretary; C. P. Cubberly, treasurer; Albert A. Pope, W. T. Maguire and Arthur Sidwell, C. W. Fourdrinier has been appointed general manager. It is expected that it will be a reproduction, to a great extent, of the New-York show.

FROM OVER THE OCEAN.

L. T. Wilmarth, the head of the Grand Rapids (Mich.) Cycle Co., was in New York this week en route home after a two months' sojourn in Europe. Pleasure was the main object of his trip abroad, but he could not resist a few business calls and talks. His company's foreign business is and has been handled through the great export house of Henry W. Peabody & Co., and Mr. Wilmarth feels well satisfied with the results. His visit convinced him pretty well that so far as England is concerned the American makers have not only sent too many wheels, but have injured their cause by a slashing of prices. The Continent, he believes, will be the most fruitful field. He means to assist in the tilling by issuing catalogues of the Clipper bicycles in both the French and German languages. In Germany he heard comparatively little of the anti-American sentiment which the German cycle papers were striving to create. Germany is not even using the whole of its own product, but is shipping wheels to Russia, which country Mr. Wilmarth believes also offers opportunities for the American makers. He believes that, while labor in Germany and in all Europe may be cheaper than here, American machinery will more than offset it. Mr. Wilmarth also believes that while trade in Europe may not prove permanent, Americans will ever be able to compete with South Africa, Australia or any country where water transportation equalizes matters fairly well. The Grand Rapids people have already done some little business in both of those countries.

EMPLOYEES PREFERRED CREDITORS.

An assignment was made by the Tonawanda Bicycle Company last week, naming its employes as preferred creditors. They are to receive their wages first, and after the legal expenses for the assignment are paid the other debts are to be paid in proportion. The company was organized two years ago, and was composed of William Goddard, Joel S. Drury, George Fries, Philip Perew, C. H. Walters, W. M. Gilie and George W. Quinlain. The assignee is William J. Kearney, of Lockport. The heavy loss recently entailed by fire is given as the reason for the assignment.

NO STATEMENTS YET.

Wilmington, Del., Oct. 23.—Chancellor Nicholson has appointed Alfred D. Poole receiver for the McDaniel & Merriew Manufacturing Company, manufacturers of the Robin Hood bicycle. The appointment was made on the application of Charles E. Frist, a stockholder, on the ground that the corporation is practically insolvent. No statement regarding assets and liabilities has been issued. Charles A. Lagen, of Philadelphia, is vice-president of the concern. The receivership does not affect the McDaniel & Merriew Cycle Company.

LUCAS'S NEW DEPARTURE.

England's Famous Lamps Will Now Be Made by New England's Famous Bell Makers.

Time was when Lucas's lamps, the King of the Road, in particular, practically controlled the trade of this country, despite the import tax which was paid on them. The great number of competing lamps which have come into being have compelled a sharing of honors, but the demand for Lucas luminaries has never ceased, having been fostered and met during late years by the New Departure Bell Company. On the 20th inst. definite steps were taken toward the manufacture of the lamps in this country, the Joseph Lucas & Son Company being incorporated under the laws of the State of Connecticut on that date. The factory will be located at Bristol, Conn., where the general executive headquarters of the company will also be. The incorporators are Albert F. Rockwell, John J. Jennings, William A. Graham, Charles S. Treadway, Joseph Lucas, Harry Lucas, George A. Graham and Thomas J. Atkins. The officers of the company are William A. Graham, president; John J. Jennings, vice-president, and Albert F. Rockwell, secretary and treasurer. The capital stock is \$50,000. The manufacture of the Lucas lamps will hereafter be carried on in this country by the above company, under the general management of A. F. Rockwell in connection with the New Departure Bell Company, of Bristol, the officers of which latter company are identified with those of the new company.

A large portion of the new buildings and plans for the New Departure Bell Company will be occupied by the Joseph Lucas & Son Company.

The intimate relations existing between the two companies and the closer allied interests will result in a much better satisfaction to the trade and many economies of production, the advantages of which will be given to the dealers in and users of the lamps. The new line for '97 will be much improved in both quality and finish, and will introduce many new and distinctive features in construction. John H. Graham & Co., No. 113 Chambers street, New York, are selling agents for the products of the Lucas Company.

GRAND, GLITTERING AND GIGANTIC.

Madison Square Garden will, after all, have some attraction for showgoers during cycle show week. On the evening of February 8 it will be the scene of the fancy dress cycling carnival promoted by the New York Journal. It will be a gigantic affair, so gigantic that out-of-townners who are coming to the show will do well to make a note of the date and speak well in advance for cards.

McKee & Harrington, makers of the Lyndhurst, are experimenting with a chainless bicycle.

HARD LUCK IN PLENTY.

Two years ago E. C. Yeatman on a four-tenth stretch of roadway near Washington, D. C., covered 330 $\frac{1}{2}$ miles within twenty-four hours. Later in the same year B. W. Twyman, on a Louisville, Ky., boulevard, did 340 miles. Yeatman's figures have been generally accepted by the press as the American record, but as they were not made over a fifty-mile stretch they do not appear on the Century Road Club's books, the Century Road Club's twenty-four hour record of 277 miles standing to the credit of A. W. W. Evans, of New Brunswick, N. J.

On Saturday last Arthur E. Smith, better known as Letter Carrier Smith, replaced Evans's figures by covering 295 $\frac{1}{2}$ miles on the Niles-Wheeling-Libertyville course on the outskirts of Chicago.

Smith was paced for most of the distance, but had more than a minimum of hard luck. Early in the day—he started at 1:51 p. m.—a nut came off his wheel, and while another was being hunted for he mounted his pace-makers' tandem and rode it alone for some twelve miles. Soon after he ran into his pace-makers, and in falling injured his shoulder. Later he ran into a fencerall lying in the middle of the road and fell, breaking a pedal and bruising his kneecap. He was compelled to remain idle while another wheel was being secured. On the new wheel he had not ridden more than a mile when he ran over a nail-studded plank and punctured both tires. He was much discouraged by his accidents and in addition was badly chilled by the cold during the night. He recovered, however, and finished at a 2:30 clip. Smith rode an Adlake fitted with M. & W. tires.

FATHER TIME'S MURDERERS.

Nashville, Oct. 27.—Eck's combination of record breakers and pacers began the attack on Father Time to-day. In the afternoon at Cumberland Park Johnson rode a quarter-mile, paced, in 0:22 2-5, a trifle lower than the record made at Coronado last spring. Johnson was paced to the tape by the quad captained by Frank Waller, and throughout the ride by the sex captained by Saunders, of Boston. The track was soft, not having been fully prepared for the coming trials, and the ride was unofficial, although timed by a dozen watches. Two hundred people were present.

On the previous evening at the Coliseum Michael put up new indoor figures for five and ten miles. He rode five miles in 10:35 and ten miles in 21:35 1-5. Johnson cut the track record to 2:04 4-5.

READY FOR RECORD.

Charles A. Ready, of East Orange, who rode over the New York-Philadelphia and return course in 18 hours 59 minutes on October 18, will on Sunday next endeavor to reduce the record to sixteen hours. He will be paced by five tandems. The record is credited to G. R. Richman, of Philadelphia, 17 hours 17 minutes.

CHASED A FIVE-MILE RECORD.

London, Oct. 27.—The five-mile tandem record was lowered to 9:23 to-day at Sydenham by the Chase brothers.

Shakespeare asks, "What great men have been in love?" That was before racing became a profession. The great men of the track are all in love—with themselves.

A man's estimate of his own ability as a rider is generally considerably above the contract price.

GERMANS ARE CLEVER.

Mr. J. C. Monaghan, United States Consul at Chemnitz, writes as follows concerning the prospects for American imports into Germany:

"There may be a temporary market for machines. The German imitates, as well as originates. He takes machines that have not been protected by letters patent, uses them as models and constructs from them hundreds of others.

"There is a big field for bicycles that can be sold at \$50 to \$75. For the \$100 machines the field is smaller. The craze for cycling, while not as bad, perhaps, as with us, is certainly in a somewhat advanced stage. Parties who have seen American wheels certainly prefer them to all others. Our manufacturers must learn sooner or later to 'patent' their machines in the German Empire if they want to sell them."

IRVING S. VENTRES.

Manager Union Nut and Bolt Co., Metropolitan Agents for America Cycles.

GOOD FOR HIS BUSINESS.

First Spectator—Doesn't it make you feel depressed to see young men gambling and wasting their money the way those racing men are said to do?

Second Spectator—No; I can't truly say it does, my friend. I'm a pawnbroker.

A DIGITATED DEBATE.

First Bystander—Horror! Those two riders are trying to scratch each other's eyes out.

Second Bystander—No, they are not. It's a deaf and dumb man and his wife arguing over which shall occupy the front seat of their new tandem.

SOUR-APPLE PRAISE.

"Some folks," said Uncle Eph, "doan' 'pear ter take no pride in speakin' de troof about de bysickle anudder man rides 'cep'in' when it gwine ter huht de udder man's feelin's."

WAIT!

The wisdom of the ages

Is: "Wait! Just wait!"

The wisest word of sages

Is: "Wait! Just wait!"

There is promise in the sky

Of a chainless by and by.

Keep on hoping till you die

And wait! Just wait!

HOW THE MAJOR VIEWS THINGS.

Know "Billy" Atwell, he of the silvering curls, who presides over the bicycle department of William Reid & Sons in Boston? Ever hear Atwell talk when he is in talking fettle? Then you've missed something. To hear him rattle off strings of cheery words at the rate of 250 to the minute is something of a treat. Though Atwell has a somewhat careworn look, his language is usually full of sunshine—the sort of talk that drives away the blues.

"What of next season?" he said when a WHEEL man put the question. "We're going to have a rattling year. Yes, sir, I think it will be a rattling year. Election? It doesn't matter much which way it goes, people will buy wheels. If people have been out of work, where'll they get the money? They'll get it. They'll get it, sir. Why, sir, it would surprise you to see some of the people who come in here and buy. They will buy bicycles before they'll buy clothes. If they have a bicycle, a cycling suit and a sweater they're satisfied. I know where a thousand bicycles are stored in this town waiting for the good times next year. The man offered them to us for \$21 each. He needed the ready cash, but we did not want them. He sold them to a speculator here, and next spring they'll be placed on the market, and they'll bring a good price, too."

Talking of export trade, Mr. Atwell related how a bit of courtesy resulted in bringing much business to their doors. A party of sixteen American riders of New Mail bicycles who were going abroad to tour Europe came to the Reid establishment to have their wheels crated. The work was done and money offered in payment. The money was refused, and nothing more thought of the matter. But the party and their American wheels attracted attention and inquiry, and as a direct result several shipments of New Mails—one an order for 100 wheels—have gone to European shores.

WANTED THE BEST, AND GOT IT.

The Davis & Egan Machine Tool Company, of Cincinnati, Ohio, report the closing of a contract with the Reading Standard Manufacturing Company, of Reading, Penn., for a complete outfit of machinery for the manufacture of bicycle hubs and pedals. They have also closed with the Stoddard Manufacturing Company, of Dayton, Ohio, for an equipment of machinery for manufacturing bicycle pedals.

SAVING TIME AND MONEY.

It is better to buy first-class machines and have few repairs than to buy cheap machines and have many repairs. And it is cheaper, too, in the end; much cheaper if the time the machine is unridable on account of repairs is charged against it.

SEE WHAT THEY HAVE.

Forksides, tandem forks and reinforced bottom tubes are the specialties of the Cleveland (Ohio) Brazed Fork and Tubing Co., whose facilities are such that they can talk interestingly to the trade generally.

Of the hundreds of friends a racer has when he is a king of the track, he is fortunate if he has one left when he eventuates into the "also ran" division.

While few of the arguments against scorchers are based upon Darwinian principles, still there is quite often a great deal of monkey business about them.

QUESTION OF PRICE.

Why at Least One Wheel Commands a Higher Figure Than the General Average.

During the current season, while practically all other high-grade bicycles were listed at \$100, American Humbers were selling for \$110. Later in the year, when business was depressed and the talk was of reduction of price, Humber & Co. came out with a notice of an increase from \$110 to \$115. When the news got abroad there followed a general smile-accompanied headshake. The hardihood of the firm, in the face of existing conditions, became a matter of comment. Elliott Burris, the managing director of the Humber's American interests, had, however, studied the situation and knew well what he was about when he settled on the increase in price. A WHEEL man journeyed to Westboro, Mass., to learn what Mr. Burris had to say concerning the move.

"I came," said the newspaperman, "to learn the secret of how or why Humbers are expected to bring \$15 more than other American high-grades. It will probably interest the trade generally."

Mr. Burris leaned back in his chair.

"Why do people pay \$1,800 for a Brewster landau when they can go elsewhere and purchase a landau for \$900?" was his questioning reply. "They know that Brewster reputation and Brewster quality is worth the difference," he went on, after a pause. He then picked up from his desk a letter. Before referring to it, he injected a narrative. "A few years ago," he said, "I took my cycle to a driving club of which I was a member. I left it inside the building. It had not been there a great while, when an attendant hunted me up and informed me that the chairman of the House Committee had ordered it removed from the premises. I told the man to leave it where it was. 'But, Mr. Burris,' he said, 'I do not obey orders I will lose my position.' 'You leave that cycle just where it is. Don't you dare to remove it. If you are discharged, I will take care of you.'

"A year ago," continued Mr. Burris, "when the members of the club became interested in cycling, and a cycling department was instituted, the chairman of the House Committee came to me and stated that he would like to have me place a stock of Humbers in the rental room and to agree to allow a reduction in price on such as were purchased by club members. I offered to take charge of the department if he would permit me to place my own men in it and allow me to conduct it on Humber principles, of which a cutting of price is not one. He declined and made arrangements with others." After this preface, Mr. Burris read the letter which he held. In brief, it sought to reopen negotiations between Humber & Co. and the swell driving club in question, and incidentally paid tribute to the Humber bicycles, which were in use by many of the club's members.

Mr. Burris submitted that it was this sort of thing that best disclosed the "secret."

What constituted Humber quality and Humber features? Mr. Burris did not believe in discussing such matters.

"Our men," said he, "are instructed not to discuss construction. It usually develops differences of opinion that satisfy no one and do no good."

Output? Another subject which Mr. Burris is rather inclined to taboo. In the course of conversation it came out, however, that he had figured on producing 8,000 Humbers during the current year, but when he foresaw the slump, the quantity was reduced to 7,000, of which some 1,400 went abroad. In this

connection, Mr. Burris voiced a sound business principle, which he enforces, and which is in line with what THE WHEEL recently said concerning validity of contracts. As is generally known, it is a practice of agents to contract early in the season for a specified number of wheels, or "cycles," as Mr. Burris religiously and invariably termed them. If they fail to dispose of the entire number before the close of the season, they either "beg off" or repudiate the agreement, and, so far as known, none has ever been brought to book on that account. In the Humber agreements the agents bind themselves to account for their entire order. If all the wheels specified have not been shipped from the factory, they have the option of taking what remain or paying Humber & Co. 25 per cent of their value.

"If this is not done," said Mr. Burris, "how can we properly base our output?"

Of course, Mr. Burris had something to say concerning the chainless cycle. It is a subject dear to his heart, and but for a dash of cold water thrown by the parent concern, it is more than probable that a chainless American Humber would have been on the market during 1896. Mr. Burris has been for years interested practically in bevel gears, and without unseemly egotism he says he believes he knows as much about them as any one living. It was Burris who built the chainless wheel on which "Jack" Knowles, of Brooklyn, rode sixty centuries on sixty consecutive days, two years ago, and it was Burris who "paid the freight." His experience with that type of gear has led him to believe that weight will

The Garford Ladies' Pad Saddle.

be one of the greatest difficulties to be overcome. Knowles's wheel, he explained, was fitted with racing tires and racing rims, and in every way shaved to the lowest possible limit, yet do what he might, he could not get the weight below 26 pounds. Side play will be another possible stumbling block, but this Mr. Burris believes he knows how to get around.

From chainless cycles Mr. Burris drifted to gear cases, which he is inclined to believe will be used to a limited extent, and will give those who use them a "devil's own time," to use his own words. American wheels are not built to be equipped with gear cases, and the crude cases and crude attempts to fit them will cause the trouble. Mr. Burris also sides with Mr. A. H. Overman in the opinion that gear cases offer such resistance to the wind as will militate against their extended use.

"What of the export trade?"

"The Englishmen will be able to take care of themselves," replied Mr. Burris, smilingly. He added that the cutting of prices on American wheels would not redound to their benefit.

The talk of foreign affairs induced Mr. Burris to hope that THE WHEEL would state that the much exploited advertisement of a damaged American bicycle by a London concern was not the work of Humber & Co., as had been stated. The firm responsible for it was the Marvel syndicate, who got hold of 500 Humbers by a sharp move, and then turned the guns against Humber & Co. themselves. The Marvel people foresaw the wheel famine and contracted for 500 Humbers for immedi-

ate delivery. When the rush came they insisted on their pound of flesh, and while the Humber's London branch was offering excuses for not filling orders, the Marvels were advertising. "Why wait for Humbers when you can get them from us without delay?" Mr. Burris states that so great was the demand for bicycles in London, that while there he saw aristocratic folk drive up, and, rather than assume a chance of losing the prizes, carry their long-waited for wheels away in their crested carriages.

After one obtains a proper idea of the aim and policy of Humber & Co., foreformed cynicism is apt to give way to admiration. They aspire to be the Brewsters or the Tiffanys of the cycle trade, an ambition which none can gainsay. They aim to do business on high-grade and strictly business principles; to make goods which will command the price asked and which will appeal to the high-grade people whose patronage is sought, and who are able to pay it; to make contracts which mean what they say; to divorce unhealthy sentiment and roundabout methods from business; to conduct their end of the cycle business on lines that conform to those employed by the older and age-established industries. The cycle trade is yet new; competition is still fierce. The task which Humber & Co. have set for themselves is of the uphill order. In the face of existing conditions it requires no little backbone to hew to the line. Whatever may be thought of him, it is not fulsome praise to say that Elliott Burris seems to possess the requisite inflexibility of vertebrae.

A. O. McGarrett, who is to have charge of the Humber New England interests, was in Westboro at the time of THE WHEEL'S visit. A chance remark led him to say: "I wish you could simply see the inspection that Humbers have to pass. Why, the scrap heap would make a fair output of some high-grade bicycles."

MAKING IT RIGHT.

In last week's WHEEL it was stated that the J. A. Weaver Company would open a downtown branch with Mr. William Schnauffer as manager. This is an error. The downtown branch of the Weaver Company has been opened in Reade street, by the firm of Miller & Schnauffer, consisting of Charles E. Miller, who is well and favorably known in the local cycle trade, and Mr. Schnauffer.

ONE DETAIL MISSING.

The sufferer slowly raised his eyelids.

"Where am I?" he asked.

"You were run into by another rider," answered the attendant.

Later, as he was about to breathe his last, he asked in a touching manner, "What wheel did he ride?"

NO CRIME IN THEIR EYES.

"I guess I better plead guilty," said the gentleman who was in jail on a charge of stealing a bicycle.

"Not much you won't," said the lawyer. "I've got two livery-stable keepers and a nervous, near-sighted man on the jury."

THE MEMORY HAUNTED HIM.

"Now you have hidden it, what do you think of that \$38.47 wheel of mine?"

"Es-s-s-! Don't, don't—I don't want to think of it. I'm trying hard to forget it."

EYES FRONT!

"Ah!" exclaimed the heavy weight, as he dropped into the saddle. "I may have an awful corporation on me, but still I have something to look forward to each ride I take."

NEW CLIPPER BEARINGS.

DETROIT, Mich., Oct. 5, 1896.
Grand Rapids Cycle Co., Grand Rapids, Mich.
 GENTLEMEN—I want to congratulate you on your Clipper Bicycle bearings for '96. So far we have not replaced a single bearing, nor heard of one wearing in the slightest manner. Yours truly,
J. F. MACAULEY.

Mr. Macauley sold 344 Clipper Bicycles up to September 1, 1896.

A Perfect Pedal...

THE JANNEY FOR '97.

No loose cones and no check nuts—it will not bind and will not tighten. Dust and water proof. Oil always there—cannot escape.

SIMPLE, ARTISTIC AND THEREFORE ATTRACTIVE.

MEN'S COMBINATION PEDAL.

MEN'S RAT-TRAP PEDAL.

A cheap pedal injures the reputation of your wheel and costs high when all things are taken into consideration. There are other good pedals in the market—naturally we think ours is the best—so we ask you to compare.

Think what it means never to have the rider find fault with the pedals, so important, and yet so small a part of the bicycle.

WHEEL ADVERTISERS are notified that change of advertisements is not guaranteed, unless copy is received by Saturday morning.

IMPORTANT NOTICE.

The attention of the trade is called to the information blank on page 57 of this issue. Manufacturers, handlers of parts, sundries and specialties, sellers of raw material and finished material, in fact all who are interested in the wholesale bicycle trade, are requested to immediately fill out this Trade Directory blank and forward same to THE WHEEL. This information will be compiled in Directory of the American Cycling Trade, which will be accurate and up-to-date in every respect, and designed to serve as a handbook or reference book for people engaged in the cycle trade. Besides a classified list containing the name, address and class of output of the entire cycle trade, it will also have a classified index of each article or product, alphabetically arranged, so that the name of the producer can be readily ascertained. The cycle trade is now so extensive that an accurate work of this kind is needed.

THE BANKER AND THE BICYCLE.

THE bicycle trade can trace a great deal of its present distress to the unreasonable position which the banks have taken regarding all concerns connected with the cycling business. The banks started out years ago with the belief that cycling was a fad, and they still fondly hug that delusion, and nothing will rout it. The banks have also found out that some people without capital and with a more or less venturesome spirit embarked in the bicycle trade, and made ducks and drakes of their business, without regard to credit or reputation, and, in some cases, without regard to even the laws of

common honesty. Therefore, with that timidity and overcautiousness that are to be found in their highest development only in the heavily burdened capitalist, they rush to the extreme conclusion that the bicycle business is rotten to the core, and that its merchants are unworthy of credit, unworthy even of consideration.

Some firms of reputation and substantially a legacy have gone to the wall who would have stood proudly and hopefully in their working place if the banks had been half reasonable. In many cases banks have refused to advance loans upon ordinary collateral, and they have often refused to take even the average risk. On the contrary, they jumped to the extreme, and refused accommodation to cycling concerns upon any terms whatever. A frightened capitalist, by the way, is the most frightened object which it is possible for man to contemplate.

Of course we should be sorry to look for looseness in banking institutions and in banking men; they must be men of strength and prudence and conservatism. But it seems that the longer a man is a banker, and the bigger banker he is, the more he seems to become incrustured with a mail-coat most difficult to pierce. His movements on the chess-board year after year become more restricted. He casts away one rule after another, until he finally arrives at a stage which is politely called Shylockian. When the disease has well set in, this style of banker is no longer a human being, but rather a financial automaton, fingering gilt-edged paper lovingly, with daily migration between his home and his office, thinking no new thoughts, signing a few bits of paper, sipping at his club from 4 p. m. until the dinner hour, and fancying himself a big fellow. Truly, the old, conservative, successful banker is one of the most amusing specimens in the ichthyolite collection.

GET READY!

THERE is one thing the prudent man in the trade must keep in mind in these days of despondency and dull business, and this is that the history of all American industrial and commercial existence has been a series of alternate hill-climbing and coasting. Just now we are fast nearing the end of a long and dangerous coast down into the valley of dull times. But get ready to catch the pedals. The bottom has been reached, and once more the long pleasant climb up the sunny slope of the hill of prosperity is to begin.

For three years the natural and normal demand in every line of business has been depressed and repressed. Idle capital has been accumulating. Idle energies have been chafing under enforced restraint. Schemes for profitable investment have been accumulating. Cost of material and equipments and supplies has been reduced to unheard-of cheapness. The energies of the people have been curbed, but their earning powers have been greatly increased. Meantime opportunities have been multiplying. Thirty thousand miles of rail-

road have been built on paper. Equipments, materials, tools, supplies are needed by the millions of dollars' worth, a statement in which there is not an iota of exaggeration. Well! what is the matter?

Several influences conspired in 1893 to wind up the prosperous era preceding. For three years we have been restricting, economizing, liquidating. Are we through with this? We see ahead a new era of healthful prosperity. This is the encouraging probability that faces us. Our enlarged and well organized manufacturing facilities make us most thoroughly equipped for the heavier demands, without rushing us into speculative prices and values. But even great movements, such as this now looming in sight, cannot come with suddenness. The great crops now being harvested are the foundation of it. The manufacturing industries will quickly feel the reflected vigor, and the cycle maker, more than any other manufacturer, will concurrently profit by the expanding activity.

CAUSE AND EFFECT.

THE failures which have been announced in the trade during the last three or four months, and the number of chattel mortgages reported by the weekly sheets of the commercial agencies, indicate exceptional conditions and a stringency and tightness in the affairs of many concerns that are not in the throes of actual dissolution. An examination into the majority of the failures show they were due to non-collectability of accounts. This is no reflection on the good business management of the heads of these concerns, any more than a disastrous squall or storm is a reflection on the nautical skill or bravery of a sea captain.

The banks have not improved the situation by decreasing accommodations and discounting of paper. In such emergencies they never do, but look out for their own bacon. Considering what creditors could do, sheriffs have remarkably little to do in the cycle trade. A forbearing spirit prevails throughout the trade. Each man deals kindly with his business neighbor, feeling the fault is not with individuals. Foreclosures by wholesale would only make matters worse. The motive power of business—money—has been restricted.

To protect existing obligations until the motive power is again turned on, and avoid fresh ones where possible, is about all that the business world can do. The encouraging feature about most of our failures is that the creditors stand a good chance of getting their money and the workmen of continued employment as soon as legal matters are shaped up and the political bugaboo is next week put to sleep for another year. Let us be thankful that the end of all this uncertainty is so near and so surely at hand.

It is useless to fret over the little troubles which come to every rider. Fretting will never remove them, and it only weakens energy and mars enjoyment.

SHAVINGS SHOW THE WIND.

EVERY straw points to an overproduction of wood rims and wood bars. The fact is as clear as day.

At the present moment there is no need of alarm, but the situation, plainly stated, requires the serious consideration of those most interested. It must be patent to them all. A stitch in time will prevent misfortune; the present is the most opportune time.

The additions to old plants and the host of new people who have come into the business have brought about a condition similar to that which existed and which this season undid the bicycle industry itself.

The wood rim manufacturers have a splendid organization. They should "get together" and seek to avoid the slump which is casting its shadow before and by which all will suffer and some will fall.

If "hip-hip-hurrah" could build chainless bicycles they would have been quite an everyday affair by this time. The hurrahing and prophesying and shouting that have been done by space writers on the daily papers for the chainless since THE WHEEL announced its probable coming, has been, in one sense, ludicrous, and is suggestive of the little summer evening wind gusts that often precede the gentle shower that leisurely follows. We will yet have the chainless, and it will be a triumph of mechanical skill and of the cycle builder's art. The difficulties that all spasmodic efforts have developed will only serve to point the way to success. The tom-tom beaters will rest their wrists for a while and put up their drums, and give the mechanics and manufacturers a chance to hear their own voices, while they proceed with their work of building a gear-driven bicycle that will answer all the exacting requirements of the day and hour.

The man who is never positive, who in those questions affecting his own and the trade's future or present welfare attempts to stand upon the fence, balancing himself there until he thinks it will pay him best to fall on one side or the other, is a danger to himself and to the trade he has parasitically fastened himself upon. Neutrality is no favorite, for we are so formed that it is scarcely possible for us to stand neuter in our hearts, although we may deem it prudent to appear so in our actions.

Beyond a certain point in the career of a speedy racing man for him to allege his devotion to racing is born solely of his love of sport is pusillanimous. It is a temporary local substitute for moral courage. The child is carried whither his nurse thinks best; the man rides where he will. Sentiment and convention lead us until we are of a stature to act independently. After that, my wrong in a choice of a racing career may be your right—no general rule binds.

The man that holds aloof from such trade organizations as the Board of Trade and de-

nounces them as unworthy of support is the same gentleman that does the most complaining about the very trouble which merely an acquaintance with members in the trade would render impossible—and how can one belong to a trade organization without becoming acquainted with his business associates?

Those who are engaged in the quixotic fight against the bicycle as an instrument of evil and a corrupter of the morals of those who ride it would do well to study the words of Burke, wherein he says: "Wise men will apply their remedies to vices, not to names; to the causes of evil which are permanent, not the occasional organs by which they act and the transitory modes in which they appear."

The New York Aldermen have set aside Jerome and Central avenues as speedways for fast horses. To be consistent, will the considerate gentlemen now make similar provision for scorching cyclists? There is as much, if not more exhilaration in speeding a bicycle as in speeding a horse, and the former outnumber the latter 100 to 1.

Elegance of language may not be in the power of all of us; but simplicity and straightforwardness are. Write much as you would speak; speak as you think. If with your inferiors, speak no coarser than usual; if with your superiors, no finer. Be what you say, and, within the rules of prudence, say what you are.

The time for splurge has passed by, and has left on the stream not a little flotsam and jetsam to mark its reign. The time for splurge on rents has gone by. The time for splurge on catalogues has gone by. A reasonable rent and a plain catalogue are two good things to start out with.

Just at this time there is extreme virtue in those who are indebted to the agent and the manufacturer taking to themselves as a motto the revised edition of the old adage, which reads: "To owe is human, to pay up divine."

To try and make all people believe that one pattern of wheel is the best for all riders, under all circumstances, would be as likely of accomplishment as attempting to turn the sun into a snowball by fanning its face with a palmleaf fan.

There are bad women on bicycles as there are everywhere else. But the bicycle did not make them bad. Such a proposition is preposterous, and none would laugh at it more than the fallen women themselves.

What is more becoming in a woman than red cheeks? But nature ought to provide them, and if she does not, a wheel, and the judicious use thereof, will soon remedy the defect for her.

If in the moment of recovery from an unexpected spill you make a few unparliamentary remarks, the recording angel will see the provocation and omit making a note of them.

It gives a man such a mortifying shock to meet one who knows more about cycling than himself that most men give thanks daily that they have not yet met that person.

"Down with the anti-cycle legislator!" cries a contemporary. These are sizzling words; but you cannot make a Welsh rabbit by merely thinking of a strong, new cheese.

The manufacturer who does the most now to push his trade will be in the best position to push it after the political hubbub subsides, and vice versa.

To say that some women will not be attractive in bloomers is to talk nonsense. Women will be attractive in anything. Look at her sleeves.

The things a racer has done in his career on the track sometimes do not give as good an idea of his character as the things he has refrained from doing.

When you do some men the favor of aiding them in an accident, instead of appreciating it they flatter themselves that they have worked you.

Did you ever see a small dog running after a man on a bicycle and thinking it was running away from him? Some things remind us of that.

It is a poor wheel, indeed, that cannot furnish some defense for itself. Even a run-down clock is right twice in the twenty-four hours.

What is called nervousness in a woman when an accident occurs to the wheel she rides would be termed ill-temper in a man.

Prejudices for and against a wheel are, for the most part, but the shadows of truths regarding its good qualities or bad.

Every one has originality, but not every one is able to show it in the successful designing and marketing of a bicycle.

He who works hard should seek his recreation in something like cycling, that between comes and goes easy.

Amateurism that needs protection is no amateurism; love of sport that fears ordinary contacts is fragility.

No persons are more frequently wrong in regard to a wheel than those who will not admit they are wrong.

The man who thinks he would do great things in cycling if he only had time will never find the time.

It too often happens in these days the way of the transgressor of the amateur law is strewn with roses.

No entomologist has yet given us a broad, comprehensive idea of the humbug bicycle.

It does not cost much to advertise the faults of a wheel or the rider thereof.

LEAGUE VOTERS, ATTENTION!

The scene of the next League meet will be decided by a mail vote by the members of the '97 National Assembly. To overcome the squabbles that have arisen in the past this plan was decided on at the last meeting of the Assembly: All towns which desire to compete for the '97 meet should as soon as convenient file with Secretary Bassett a formal application, setting forth briefly the fact that the '97 meet is desired in that place, and if so awarded that proper arrangements will be made and carried out.

Such applications should be made and sent by some responsible organization in the town, to insure its proper standing before the L. A. W. membership.

As soon as the delegates to the National Assembly are elected a full list will be published of delegates and all others who are entitled to a vote on the meet question. About the middle of January an official ballot will be sent to each voter, who may fill out the same and return it by mail to the secretary, to be opened and counted by a

LO, THE POOR ADVERTISING CANVASSER!

To the careless observer the gentleman who calls upon the trade for its advertising patronage is a happy-go-lucky fellow with a good salary, fine clothes, a liberal supply of money for expenses, a large acquaintance among good people of cycling, and an ever-ready smile and joke for everybody. To outsiders he presents a jolly picture of unalloyed pleasure, an object of general envy to the unsuccessful. But look behind the curtain.

The advertising solicitor is employed expressly to sell space in his paper, and is expected to earn a good profit for his paper above all expenses. He is almost certain to lose his position if he cannot. He must watch the trade closely and possess a fund of timely information on all matters connected with it. He must be a good judge of human nature—one who can learn the character of his customers.

The advertising man sacrifices his meals to catch a train. He arises at daylight and travels all night. He lays the foundation for

TIRES IN THE JUNK TRADE.

"What do you pay for tire-scrap?" was asked of a junk-dealer in Ann street, in front of whose extensive shop was seen a bicycle tire on top of a heap of rubbish just received.

"At the rate of \$100 a ton for bicycle-tires, and \$75 for old rubbers." (That would make 5 cents and 3½ cents per pound respectively—lower than published quotations for scrap, but this dealer sells in turn for higher figures.)

"Do you handle tires by the ton?" was then asked.

"By the ton, or the single tire. I buy all that come in." Then he continued, in answer to more questions: "There's a good demand for them. They're worth more than rubber shoes, because there's better gum in them. It was about August last year that I first began to get old tires along with other rubber scrap that came to me in lots of rags. I looked around and found out what they were worth, and since then I've taken all that I could get of them. There are several big rag-dealers in the city that handle tire-

THE OLD, OLD STORY.

"No, old man, this trip is strictly for pleasure. I'll not think of bicycles until I return."

"My bicycles, Mr. Frenchy, are the best that skill and money can produce. You will make the mistake of your life if you do not take the agency. I have already placed agencies in fifteen cities in England, Scotland, Ireland and Germany."

special committee. The result will be announced on February 5, five days before the National Assembly, which will be held at Albany, N. Y., on February 10.

TEN CENTS FOR FIVE MILES.

In two months it is expected that the elevated cycle path over the five-mile stretch of meadows which intervenes between Atlantic City and the mainland of New Jersey will be completed. The path is to be elevated eight feet above the land, and is to be twelve feet wide. Along each side will run plain wooden railings, and incandescent electric lights will be placed at short intervals for the entire distance. A toll of ten cents will be charged for each direction.

TESTS EVEN GOODNESS.

"Good people are always happy," remarked the parson.

"But suppose a good man punctures a tire the first time he rides his new wheel?"

rheumatism, cultivates dyspepsia, robs himself of a home, and is engaged in a ceaseless, tireless struggle to fill the blank pages of his paper with the makers' advertisements. He has to push in order to do this, but to succeed he must be polite, educated and a gentleman.

WHAT TO SING ABOUT.

Sing high, sing high, for the glow of health
That blooms the cheek so cheerily
Of the maids alike who roll in wealth,
Or who toll all day unwearily;
For the sinews firm, the strength like steel,
For the muscles large, dimensional,
That come to the maid who rides the wheel,
Despite all rules conventional.

Sing high, sing high, for the lady fair,
Not quite untouched by vanity,
And who knows her chic and her dashing air
Bewitch all male humanity;
Whose eyes shine bright with a lustre glad,
And whose voice rings out so girlishly;
The lovely maid with the cycling fad,
Whom pruders deery so churlishly.

scrap, and plenty of mills ready to grind them up. A big lot of tires comes from the repair shops all over town. Solid rubber tires come in, too, but they are worth only half as much as the pneumatics. Nor are the red pneumatics worth as much as the others."

OF COURSE THEY WILL FIGHT.

The railroads of Missouri will pay no attention to Judge Russell's decision denying that bicycles are extra freight, according to the attorney of one of the roads. The Missouri Pacific will fight the case in the higher courts, and until it is fully settled none of the roads will carry wheels free.

FOR LENZ'S MURDER.

A claim for \$40,000 indemnity has been placed in the hands of Minister Terrell against the Turkish Government, on behalf of the mother of Frank Lenz, who was murdered by Kurds last year while en route on a tour round the world.

ROE AND PATCHOGUE,

Combined with Hard Luck, Brought Defeat to the Ever-Victorious Kings County Wheelmen.

For the first time in almost a decade a team from the Kings County Wheelmen has tasted defeat in a road race.

The dose was bitter, but they swallowed it like men. Misfortune contributed to the result. In sight of the tape a countryman in a wagon partly blocked the way; in attempting to dodge it, one man fell, and to save himself, Charles T. Earl, the star of the Kings County team, was compelled to run off the road and into the yard of a nearby house. He dismounted, turned and remounted, but when he again reached the road the crowd had swept by, and Earl could finish no better than fifteenth. Hendrickson, too, had been interfered with and his position affected. Despite their misfortune the club finished second. The Patchogue Wheelmen were the victors. They also had a quota of bad luck. At the very start, Bailey, of their team, broke his chain and was compelled to find another wheel, while Nat Roe fell at the turn and bent his handlebar. He recovered so quickly, however, and rode so well that he crossed the line first in a ferocious finish.

All this happened in the first team race promoted by the Associated Cycling Clubs of Long Island, which occurred on the Merrick Road on Saturday last. It was limited to Long Island clubs, and was the first successful race of the sort that has happened hereabouts in many years.

In the days of the high wheel, team road racing was immensely popular. The New York and New Jersey Team Road Racing Association fostered it, and for a time interest was at white heat. But early in the game the Kings County Wheelmen developed their mettle. Once they were beaten by the Harlem Wheelmen; once they were defeated by the Hudson County Wheelmen. This much and no more. Their repeated victories became monotonous, and finally disrupted the organization. Last year the Metropolitan Association of Cycling Clubs undertook to revive the sport. The day was set and everything in readiness, when the police interfered and caused a postponement. Another date and course were selected. It was raining pitchforks and frying-pans at the time, and only the Kings County Wheelmen turned out a full team. They rode over the course and were awarded the trophy. They would probably have won in any event.

In Saturday's race the talent again picked them to win. The distance was ten miles, five out and five back. Six teams of four men each entered. All started the full number except the Liberty Wheelmen, who were one man short.

Going out it was a fight against the wind. Coming back it was easy sailing. Two hundred yards from home in the middle of the road was an obstinate wagoner, who refused to clear the way. As they neared him the racers, who were pretty closely bunched, divided to pass on either side of the wagon. Some crowding and one fall followed. Hendrickson was forced off the macadam road, and Earl, as already narrated, was compelled to run into a yard to save himself. The others got clear and a vicious sprint to the tape followed. Nat Roe got the best of the argument by a length; "Wally" Owens, the man who is never in condition surprised himself by finishing second, a length in front of Harry Roe. This was the order of finish:

When the first bunch came in sight a tandem manned by G. Bennett Smith and Frank D. White, was blazing the way. Instantly a cry of illegal pacemaking arose, and after the finish the tandems were orally mobbed by a maddened crowd. They explained that they were merely trying to beat the racers home, and had no intention of pacing any one, but as both men are old hands at road racing, their tactics are inexcusable and merit the condemnation which they have received. Several protests resulted, but Referee Will R. Pitman disallowed all of them.

THE NAME TOLD THE GAME.

Philadelphia was to have had a race meet at Tioga on Saturday, but it did not take place. A handful of people arrived at the gates to the grounds at the advertised time, but "The Hustlers," the promoters, announced that the meet would not take place until next Saturday. The promoting organization bearing the above euphonious title, is said to be a body of racing men who intend to revolutionize cycle racing by conducting their own meets, and sharing the profits. They started out in business by advertising the appearance of Tom Butler, despite the fact that he had left the country. "The Hustlers" next season intend to apply for a sanction for every Saturday and holiday that will be allotted to Philadelphia, so as to shut off all the clubs and other promoters. If the scheme is successful, they contemplate forming branches in all the principal cities, and eventually control all the racing in the country.

VERY VICHY.

Saratoga air and water, while invigorating to many, are apparently not particularly stimulating to long-distance riders. In the twenty-four-hour race at the Casino on Friday and Saturday last, the winner, W. A. Elkes, covered 306 miles, just about 250 miles short of the distance the Frenchmen are in the habit of travelling in the same time. The track at Saratoga is of wood, ten laps to the mile. The scores of the other contestants were: E. C. Smith, 300 miles 1 lap; W. A. French, 211; G. T. Schulze, 133. A match race was run between W. J. Hofstetter, who rode a bicycle eight miles, against M. F. Donovan, who walked three miles. The cyclist won.

PRINCE'S PARADISE.

His Newest Coliseum Opened with Eclat, Records, and a Claim for "Fastest in America."

Of course, a new indoor track cannot be opened in an up-to-date and proper manner without clipping a record or two, and the inaugural meet at the Memphis Coliseum was no exception to the rule. Tom Cooper started the jig by riding a lap in 17 3-5 seconds in practice, which time Con Baker demolished on the following day by negotiating a lap in 17 1-5 seconds. Then, just to get even, Cooper, on the opening night of the three-night meet, October 22, took a try at Baker's quarter-mile record, unpaced, of 26 3-5 seconds, and when he finished all the Memphis watches had stopped at 26 2-5 seconds, which, according to the enthusiastic press men, shows that the track is the fastest indoor track in America. There was a large aggregation of both amateur and professional riders present, and a good attendance. Summary:

1/2 Mile professional, handicap—1, Jay Eaton; 2, Tom Cooper; 3, Clarence Woodward, Nashville. Time, 2:28.

1/2 Mile, amateur—1, Gilbert Logue, Nashville; 2, J. Keith, Nashville; 3, E. Hipple, Memphis. Time, 2:17 3-5.

Professional, mile—1, Zach Oliver, Memphis; 2, Creston Barrick, Nashville; 3, George Hooper, Springfield, Tenn. Time, 3 minutes.

1/2 Mile, professional, scratch—1, Clarence Woodward; 2, Eli Winsett, Portland, Ore.; 3, Benjamin Stowers, Atalla, Ala. Time 2:11 1-5.

Cooper went against the half-mile indoor record of 0:59 1-5, held by Parsons on the second night. With a flying start he covered the distance in 0:58 2-5. Summary:

One mile, professional—1, Tom Cooper; 2, Jay Eaton; 3, Con Baker. Time, 2:34.

1/2 Mile, amateur—1, Gilbert Logue; 2, J. Keith; 3, Andrew Sanders. Time, 2:23 3-5.

One mile, professional, consolation—1, Robert Walthour, Atlanta; 2, Ross Gill, Nashville; 3, H. Smith, Atlanta. Time, 2:16 1-5.

1/2 Mile, professional, invitation—1, Lewis Dorris, Nashville; 2, George Quinn, Mobile; 3, W. H. Pickens, Birmingham. Time, 2:14 4-5.

BRIGHT WAS THE BRIGHTON FLYER.

Although finishing twenty-ninth in the Brighton Flyer ten-mile road race, at West Medford, Mass., October 24, Thomas Barnaby won time prize from scratch, in 21:14 1-5, from a field of 140 riders. Urquhart, the other scratch man, sustained a fall, and was compelled to drop out. Barnaby and Turner, a 10-second man, worked together, and the two mowed down the field in a lively fashion, Turner winning by scarcely half a wheel in the final sprint. The race was one of the most spirited held in the vicinity of Boston, and was practically the last of the season. The winner, Collette, finished twenty seconds ahead of the second man, who led a bunch of a dozen. The first ten men to finish were: 1, F. Collette (2:30), 25:22; 2, J. E. Ballentine (2:20), 25:40; 3, B. E. Brewster (2:40), 25:40; 4, C. E. Woodworth (2:20), 26:31; 5, J. W. Mann (1:50), 25:22; 6, C. E. Larson (2:40), 26:14; 7, Fred Warren (1:40), 25:15; 8, W. V. Olson (1:30), 25:07; 9, L. J. Solari (1:40), 25:17 1/2; 10, A. E. Darlow (1:50), 25:27 3-5.

EVERYTHING FROM TWO TO FIVE.

London, Oct. 22.—All tandem records from two to five miles were lowered at the Crystal Park track to-day by McGregor and Nelson. They covered the latter distance in 9:24 3-5.

TWO MAIDENS RODE.

One maid was plump and one was not. Their pace on wheels was scorching hot; And folks cried, as their flight was seen: "A streak of fat and one of lean."

WHAT HAS MADE SINGLE-TUBE TIRES FAMOUS?

Hartford Tires, OF COURSE.

Whenever you think of single-tube tires you connect them with the name
Hartford.

The public do likewise.

To Bicycle Riders: We Make Our Tube OF FIFTY CARBON STEEL

Because a Tube like this of

Is just as strong as

a Tube like this of

This diagram does not show how much stronger and more durable our tube is than the usual quality in the market because it does not include the always bad and more or less uncertain effects of "pickling." By ordinary methods tube is annealed in the open fire and pickled from eight to twenty times, according to finished size. By the use of a patented annealing process, controlled by us for tube making, our tube never comes in contact with the fire and is never pickled. There is no "theory" about this. Our thorough tests show that even with the greatest precautions in pickling (not usually taken), pickled tube is weaker and more brittle than tube made of the same material without pickling. Send for a Catalogue.

THE POPE TUBE CO.,
HARTFORD, CONN.

While weight for weight in a Bicycle FIFTY CARBON Steel will last so long

and TWENTY-FIVE CARBON Steel will last only so long

COOPER'S CASH IS UP.

A check for \$500, as a guarantee, has been put up by L. M. Richardson in behalf of Tom Cooper for a series of match races with Bald. It is stipulated that the races shall be for \$1,000 a side, best two in three, to take place within thirty days. Cooper does not care whether the races are paced or not, and is not particular where they are held, indoors or out. Bald has accepted the challenge and has agreed to ride within thirty days after the articles are signed.

When Bald returned home from Chicago recently, after failing to get on a series of races with Cooper, he said he fully expected to hear from his rival when the latter had gotten himself in trim, which it was said he was diligently engaged in doing. Bald has been taking things easy since the close of the National circuit, and has been keeping himself in such condition that comparatively little training will be required to put him on edge. Bald intimated that in the condition he and Cooper finished the National circuit the latter was afraid to meet him. A close friend of Bald stated that Cooper had been in active training since then, and, now that he was fit, was looking for a match with Bald, whom he expected to find out of condition. Bald will begin at once to put himself in shape.

RACERS ORGANIZED.

Melbourne, Aus., Sept. 25.—The racing men here have formed themselves into an association for mutual aid and benefit, which result was brought about by the inertness of the governing body in matters relating to the path. Most of the prominent racing men are connected with the trade directly or indirectly, and as the trade is debarred from the council table of the League, racing matters did not get the consideration due to them. The League Council does not half like it, and have been endeavoring to permeate a feeling around that the new association is for opposing the League, whereas the racing men merely wish to suggest, not only things necessary, but point out the best methods of application to the governing faction.

The relay ride from Melbourne to Sydney has just ended. Forty-two hours and 35 minutes was the time for the 604 miles. The ride was run under adverse circumstances, headwinds and rain almost all the way. The last man who bore the message to the Governor received a tremendous reception.

CHATHAM CRACKED, BRANTFORD BROKEN.

Record-breaking is now the proper game among the Canadian cracks. At the Chatham track, October 23, Harley Davidson lowered the mile record, flying start, paced, from 2:05 to 2:03 $\frac{1}{2}$, while Parkins and Humphrey cut the mile tandem record down to 1:01 $\frac{1}{2}$. John Davidson, an amateur, went for the hour record of twenty-three miles. He is not a Stocks or Linton by any manner of means, but he got the record, covering twenty-four miles 200 yards. Davidson also lowered the mile amateur record to 2:08 2-5. Its life was short, however. At Brantford, on October 26, R. O. Blayney brought it down to 2:06 2-5. R. E. Axton, on the same track, essayed to break the hour record. Although not successful with the record, he succeeded in breaking his collar bone in a collision with a tandem, and is now willing to let some one else hack at the figures. He got under record at thirteen miles, and was still under the figures at nineteen miles, when he fell. The Canadian hour record is open to improvement by three or four miles before it becomes a mark worthy of the foeman's steel.

COULD NOT CHILL THEIR ENTHUSIASM.

Although cold and windy, H. K. Roe rode five miles in 11:19 4-5 at the Patchogue, L. I., Wheelmen's meet October 21. A multicycle race was a feature that greatly interested the Long Islanders, which a triplet crew won from scratch. Summary:

One-mile novice—1, Joseph T. Losee; 2, W. B. Dickerson; 3, S. D. Ferguson. Time—3:17 3-5.

One-mile scratch—1, H. K. Roe; 2, C. W. Ruland; 3, Henry Homan. Time—2:10 4-5.

One-mile handicap—1, Frank Shaw, scratch; 2, Walter Overton, scratch; 3, Benj. Oven, scratch. Time—3:01.

One-mile multicycle race, standing start—1 Arthur Terry. "Nat" Roe and Edward Woodruff on triplet, scratch; 2, H. K. Roe and C. W. Ruland, tandem, 100 yards; 3, Henry Howard, single, 300 yards. Time—2:09 3-5.

Record trial, one mile, flying start—"Nat" Roe, paced by triplet and tandem. Time—2:07 1-5.

TWO ROUNDS OF THE CLOCK.

After Rivierre established a twenty-four-hour record of over 537 miles for twenty-four hours several weeks ago, Huret challenged him to a twice-around-the-clock race. The event was run on an indoor winter track in Paris, and resulted in a complete downfall for Rivierre and the demolishment of his time. Huret rode strongly from the start, and established a fresh record by covering 545 miles 1,292 yards. He got under records at four hours, and never went outside thereafter. At twelve hours he had ridden 294 miles. Rivierre lost ground from the start, and finally dropped out. It is said for him that he was not well, and should not have started.

WILLIAM WAS AT HOME.

William Martin, now racing in Australia, is as mild a spoken man as ever scuttled a ship, otherwise William's mildness is deceptive. An Australian hoodlum, who objected to something Martin had done or had failed to do, recently forced his way into Martin's dressing-room, declaring he was going to take it out of gentle Billy's hide. In less than thirty seconds an ambulance call was sent, and the most damaged Australian in the Antipodes was borne away in it, to slowly recover consciousness in a hospital and to learn that men are always not as mild as their speech might possibly indicate.

QUICK AS A WINK.

A new timing instrument called a "pendulumchronoscope" was recently exhibited at the Brooklyn Institute of Arts and Sciences. It is said to measure accurately down to one thousandth part of a second. The speed of a cannon ball can be determined by the new timer, and it will tell the lapse of time between the firing of the starter's pistol and the starting of the racer, or determine how long it takes a boxer to deliver a blow, to say nothing of recording the time required to pronounce the name of the instrument itself. It is claimed to be the most remarkable timing instrument in the world.

BEATING THE RECORD BUSH.

Johnson, Michael & Eck's brigade of pacemakers left Chicago late last week for Nashville on a hunt after records. They will try for records of all distances at Nashville, Memphis and New Orleans. At the last-named place Frank Waller, the Dutchman, will try for the world's twenty-four-hour record, and at Memphis he will attempt 300 miles in twelve hours on the indoor track. Michael will also try for records at Memphis. Eck is taking South with him the greatest pace-breaking aggregation ever sent to record-breaking camp, including sextuplet, quad and triplet teams.

TWO LEGS FASTER THAN FOUR.

An interesting hour race took place at the Crystal Palace track October 10, between J. W. Stocks, the holder of the hour record on a single, and McGregor and Nelson, the tandem hour champions. All the contestants had numerous pacemakers. At fifteen miles Stocks gained half a lap and held it to the end, winning by 577 yards, the figures being: Stocks, 29 miles 1,012 yards; McGregor and Nelson, 29 miles 435 yards. These figures are inferior to the records put up the previous week by the same men by about two miles.

"HACK" HEMMED AND HAWED.

After hemming and hawing for a week, Hackenberger has agreed to meet Monte Scott again in a twenty-five-mile race. The date set is November 6, on the Denver Wheel Club's track. This time the riders will start from the same mark, but will ride in opposite directions. Scott has conceded the regular way, or left arm to the pole, to Hackenberger. The purse is \$800 and net gate receipts, all expenses to be paid by the winner. A number of races will be added to make an interesting programme.

SUNDAY CENTURY SCORCHING.

Departing from the monotony of century runs, the Long Island City Wheelmen promoted a hundred-mile race on Sunday last, over the Valley Stream course. Sixty-five riders started in the scorch. W. J. White took the honors for time, although he twice lost the proper road, finishing in 6:25:00. He rode the first fifty miles in 2:35:00. Frederick Hildebrandt, jr., finished second, in 6:50:00. None of the other contestants finished under seven hours.

HE SENT POSTAL CARDS.

G. Raymond Richman, a Philadelphian, is credited with cutting down the New York-Philadelphia and return record to 17 hours and 17 minutes, starting and finishing at the City Hall, New York. Richman started at 3:55 a. m. on Friday morning, and reached Philadelphia in 12:50 p. m. Three timers clocked him on both ends, and he was checked by a series of postal cards. The entire distance is 226 miles.

TURNING OUT A JOKE.

Your Frenchman is ever a wit. Huret, the famous racer, when asked by the census-taker what was his profession, in place of replying "professional racer," answered "turner on wood and cement." This reply was literally correct, when the surfacing of foreign tracks is remembered.

FORTY IN THE WIND.

Although cold and windy, forty men started in the Pierce ten-mile road race, Buffalo, October 24. The scratch man, J. A. Finn, won time prize in 25:22, finishing third. E. Eagles, 4 minutes, won in 29:20.

BELONGS IN THE LINTON FAMILY.

London, Oct. 21.—Tom Linton again holds the hour record. At the Crystal Palace track to-day, he covered a distance of 31 miles 582 yards. This is 34 yards to the good of Stock's record.

NO POPE RACING TEAM.

At Denver last week Colonel Pope, in an interview, denied the report that the Pope Company would back a racing team next season.

Lewis, Megson and Payne, the Australian champions, have left London for the Continent. They met with but little success in England.

PALMER

TIRES

THE PALMER PNEUMATIC TIRE CO. CHICAGO, ILL.

PALMER PRIZES

We won the prizes on the National Circuit this year without trying. Others strove to do the same thing; bent every energy to accomplish it, and failed.

Try as much as they can, it is impossible for other makers to equal the speed of Palmer Tires.

Competitors have made every effort to secure the results we obtain without the least exertion.

Thousands and thousands of dollars have been spent by envious rivals in high-salaried teams to secure the majority of the prizes offered on the National Circuit, but Palmer Tires have always distanced the field.

Palmer Tires first appeared on the racetrack in 1893, and in that year every racing man in America, and many in Europe, rode them. Each year following a great majority of the prizes have been won on Palmer Tires.

Fast tires are easy-running tires. Palmer Tires are fast tires—the fastest in the world.

It's the fabric—Palmer fabric—that makes them fast, and we put it in all tires—tandem tires, quad tires, road tires, and the lightest of light racers, the only difference being that the roadster contains more rubber than the racer.

THE PALMER PNEUMATIC TIRE COMPANY

Kindly mention The Wheel.

BEARING THE AMATEUR MARKET.

Some of the true inwardness of British amateurism came out in a recent trial in London, where a racing man was brought into court by a tire company which sought to restrain him from riding a wheel equipped with tires made by a rival concern. The attorney for the tire company declared that the racer had bound himself by an agreement to ride only the plaintiff's tires and rims for one year. In return for this the racer was to receive \$2.50 per week and two pairs of tires and rims, his expenses when racing away from London, and so much extra for pacemaking. Not thoroughly appreciating the good thing he had the racer signed with another tire company for a salary of \$15 per week. The suit then followed.

When the manager of the tire company's racing department took the stand to testify against the racing man, the following interesting dialogue between witness and judge took place:

Judge—In February did you cease to pay him 10s. a week for nine weeks?

Witness—Yes.

"Why was that?"

"There was some dispute with the authorities about his license as an amateur."

"Was he suspended?"

"Yes."

"When the agreement was signed, was he an amateur?"

"Yes."

"How can you pay an 'amateur' 10s. a week for riding? When he signed the agreement, did you, as the manager of this great concern, regard him as an amateur or a professional?"

"As a professional."

"Yet you held him out as an amateur before the sporting public. Are you surprised to hear that when the authorities heard how he was employed they ceased to regard him as an amateur?"

"They need not have heard of it."

The Judge then declared he should order a non-suit on the ground that when the licensing authorities of the sport very properly stopped defendant's career as an amateur the company broke their agreement in not paying him his weekly salary.

BIASED JUDGMENT.

It's one of the phenomena of devotion to the wheel that as soon as a man stops riding he believes cycling has begun to decline. He will tell you that he does not see half as many people riding, as he did about two weeks ago. He will explain that for a whole day he went without seeing a single rider, and on the next day saw only two.

When he begins to ride again the proof that the habit has been resumed lies close at hand. "It's curious," he will say, "what a brace cycling has taken lately. I guess it must be the weather, or people coming back to town. Two weeks ago it looked as though the whole thing was dying out."

He believes that implicitly, when, as a matter of fact, probably nobody else had stopped riding.

CHANCE FOR SENSATION SPRINGERS.

According to the figure fiend, if all the people in the world were gathered together a wheelman could ride around them in less than four hours. Sensation loving newspapers should not allow this chance to escape them. The people of the world should be assembled and a reporter should be given orders to see if he could accomplish what the figure claims is possible.

Black lead is preferred by many old riders to any other form of chain lubricant.

RACING BOARD'S BULLETIN.

SUSPENDED PENDING INVESTIGATION.
F. F. Goodman, New York.
D. Herman, Jr., Roy Hunsaker, F. Nichols, Will Irwin, Vic. Labady, Leon Hawley, Henry Lewis, all of Galveston, Texas.

SUSPENDED.

Six months from October 19, for competing in a novice race after having won a prize, A. L. Richardson, Milwaukee, Wis.

Ninety days from October 19, for competing in a novice race after having won a prize, and thereafter pending return of prize won, Charles Holway, Chicago, Ill.

Six months from October 19, competing while under suspension, J. H. Crooks, Galesburg, Ill.

Six months from October 19, for competing as an amateur after having accepted expenses, W. A. Barbeau, New York City, N. Y.

Six months from October 19, for conduct detrimental to the best interests of cycling, F. E. Paige, Batavia, N. Y.

One year from October 3, for competing in unsanctioned Sunday races, after warning, — Shumam, Robert Mason, — Heller, — Thesler, — Ketzler, Harry Rellie, Joseph McGraff, all of Elizabeth, N. Y.

Thirty days from October 21, unsanctioned races, — McCarthy, — Butler, — Rauber, — Moquin, — Ryan, and Shanahan, Worcester, Mass.

Sixty days, from October 21, unsanctioned races, after warning, M. H. Sylvia, E. K. Vanderwalker, H. Dudley, W. Hewitt, F. E. Knowles, P. J. Rellie, C. Burt, — Carroll, A. Dary and — Cranshaw, Tounton, Mass.

PROFESSIONALIZED.

Charles Holway, Chicago, Ill., Clause B. Dennis McCarthy, Chicago, Ill., Clause B. J. H. Crooks, Galesburg, Ill., Clause I.

W. P. Burhans, Ionia, Mich., Clause D, vote of Racing Board.

F. E. Paige, Batavia, N. Y., vote of Racing Board.

Jack B. Oliver, Memphis, Tenn., own request. H. Prestilidge, Memphis, Tenn., own request. Dick Yeates, Memphis, Tenn., own request.

SANCTIONS GRANTED.

October 31, University of Pennsylvania, Philadelphia, Pa.

November 21, Twenty-third Regiment Athletic Association, Brooklyn, N. Y.

RECORD ACCEPTED.

One mile, paced, flying start against time, amateur record 1:41-5, by Amos B. Hughes, Denver, Col., June 19, 1896.

HELPING THE SALESMAN.

What travelling man is there who does not prefer to work for a firm whose wheels are known rather than for the unknown? He does not relish creating a reputation for himself and for his goods. It is his firm's business to create the reputation. He has sufficient toil and trouble aside from this. His business is increased and his trouble lessened by the firm's advertising.

The manufacturer who is wise will always advertise his goods to the consumer, although he does not sell direct to him or even to the retailer. The jobber and the retailer buy what they know their customers want. The wheels with the best reputation enjoy their favor and command the best prices. Advertising which educates the consumer and builds up a standing for the wheels is the most effective "plugging" for the drummer.

MADE HIM MAD.

"Wise men hesitate about buying those bargain-counter wheels; only fools are certain," he observed, in the course of a conversation with his tender spouse.

"I don't know about that," she said, testily.

"Well, I am certain of it," he exclaimed. And for a long time he was puzzled why she burst out laughing at him. And then he felt angry with himself.

The "melancholy days" came when the tame wheel poet began to write about them.

LEGS AS CHARACTER DELINEATORS.

"Did you ever notice," asked the observant man, "that you could never tell what the general character of a man for efficiency and ability is simply by seeing his head and face and the upper part of his body? It is a fact. You have got to see a man's legs to be able to give a fair estimate of him, and if this rule applies as surely to women—and of that I can't speak with anything like certainty from lack of chances to make observations—then the quicker universal cycle riding comes in the better it will be for the young men who are seeking wives; that is, of course, supposing that they are going to exercise some judgment in making their selections.

"The manner in which I was first led to observe this was through a man who occupied the humble place of cashier in a cheap restaurant. Why a man with such an intellectual face should be occupying such a cheap place was a fresh source of wonder to me every time I saw him there. His head was well formed, his voice and manners were those of a man well brought up, his hands were shapely, and the whole of his body, so far as could be seen as he stood behind the cash counter, was that of an active, well-formed, vigorous man.

"But one day I saw him riding a bicycle on the Boulevard, and there was then no room to question why he was a sort of mental. It was all in his legs. There was no lack of mere physical strength in his legs apparently, for he rode all right, but the trouble is best expressed in the term sloppy. They were uncertain, indeterminate legs, that had a sort of unfinished look about them, and the man's feet, instead of matching his hands, were just as sloppy in form as his legs. I have seen many such pairs of legs in an idiot asylum.

"Since that time I have noted the appearance of the legs of many of the persons whom I know, and compared their character with the known histories of those persons, and in no case have I failed to find that a sloppy pair of legs was the mark of the man who were failures in life, despite the possession of good health, good habits, good natural talents, and these often combined with all the advantages which education and well-off parents could give to them in beginning the world.

"On the other hand, whenever I see a man pass me on a wheel with a good clean cut pair of legs answering to those of a race-horse, or with a sturdy, emphatic pair of legs, I am just as certain as I can be that that man is going to get there. Can it be, do you suppose, that it is because of an instinctive knowledge of this that we seek so naturally to see what sort of ankles the women have, and will spend hours in that study on a rainy day without wearying? Applied by my rule it would certainly be a profitable study, and the coming days when cycling will have made general the wearing of knickerbockers will aid it; but I still fear that we shall never be able to make sure of the character of the women we see unless the law were to step in to aid us."

NEEDS DAILY GROOMING.

A good horse is groomed every day, and a good wheel deserves the same treatment. If cleaned after every trip it prolongs the life of the wheel, and in the end saves time and temper. A clean wheel reflects the habits of its rider. The rider of a dirty wheel is generally slovenly in person.

HAD HEARD IT BEFORE.

"That is a very familiar air," remarked the owner of a bargain-counter wheel, as for the twentieth time he heard the hiss of a punctured tire.

GREAT BOOK THIS WOULD BE.

Some day somebody will write a book upon "What Not to Wear Upon a Bicycle." Its first chapter will treat of veils. If there is any article of apparel that appears to more out-of-place advantage upon the wheel, the woman of good taste does not know it. And yet one is continually encountering veiled wheelwomen. They wear all kinds of veils. There is the little mask affair that the up-to-date Mary of the rural districts straps across her sharp nose when she hies her forth to call the chattle home. There is the fluffy mass that envelops and supposedly lends enchantment to the whole head. Indeed, the bridal veil is about the only article of the species that the woman cyclist has failed to appropriate. Mourning veils of the deepest dye have been many times in floating evidence upon the wheel.

But whatever the veil, its combination with the wheel is always incongruous and in miserable taste. Veils are not needed in riding the bicycle, for hats that need veils should not be worn.

And this will be the subject of Chapter II—hats. However charming and acceptable the big hat may be in the theatre, it should never be worn when cycling. The reason for this is appealing. In the theatre the big hat only bothers other people, but upon the wheel it is No. 1 herself who is incommode. She soon finds out that flapping brims catch the wind and retard her progress. The wearing of fancy bonnets upon the bicycle should also be discouraged. In summer, of course, a straw sailor is the most popular headgear for the bicycle, although its breadth of brim is apt to catch the wind. But for both summer, winter and all seasons practical experience declares for a cap. Still there are caps and caps.

In color the cap should match, or at least harmonize with, the suit, but the dark blue cap is always the most becoming. For comfort it should choose the jockey shape—that which has been adopted by the golfing girl. The yachting cap is popular with many women cyclists, but it is warmer and weightier than the light, close-fitting jockey. Some dashing damsels take kindly to the military cap for wheel wear—gilt braid, brass buttons and all; but this clashes with good taste.

The book's remaining chapters will, of course, concern the rest of the cycling costume. The woman awheel in the Park the other morning in a sleek black velvet gown, with vest and epaulettes of white chiffon, will have a page all to herself. Much attention will also be given to the girl who has just been stricken with the cycling fever, and who contemplates slashing off a foot or so from her last summer's serge skirt, with the idea that it will "do." The advice to all who thus contemplate conquering with economy will be "Don't."

An interesting chapter will deal with that portentous problem, "How to keep the skirt of the cycle costume from riding up." One way to help the matter is to line the skirt with silk, another is to put weights about the skirt edge. It isn't necessary to line the skirt throughout with silk, the front breadths so treated being sufficient, but it must be stout, well wearing silk. The weights, too, need only to appear upon the edge of the front breadths.

PROVING HIS LOVE.

"Love the racing man?" gurgled old Eagle Eye, as he swung the suspension bar into action, "Why, I fairly ideleize him!"

HARDY PERENNIALS.

There are lots of blooming flowers,
That the frost nips in the patch;
But we've other kinds of bloomers,
That the frost can never catch.

THE MAN AND THE MAID.

There is nothing pleasanter in all one's recollections of those halcyon days of a wabbling novitiate than the recollection which comes of an experience with an instructor in a cycle school who has been forced to take charge of your wabbling self when he does not feel like it. He never does feel like it, and when it comes to old women and men, no matter what their ages may be. It is only the hope of substantial financial reward that ever induces instructors to look at this class of pupils, much less bother with them. The old ladies—meaning old from a cycle instructor's point of view, who classes as old any woman over thirty—have to be handled gently; but the men—they can look out for themselves, and they generally have to.

"Too bad I can't have you now," she said to him, as the line was waiting to get a chance for an instructor, "My check's 15; this fellow here is ahead of me."

This to the instructor in an audible tone for the benefit of the "fellow," but he never budged. For nearly an hour, while this same girl and instructor careered around the rink, men had been waiting. He wanted a lesson. "Git on!" said the instructor, pushing a wheel toward him. "Ever rode before?"

The man made a crude effort to get into the saddle. The instructor was holding the wheel with one hand and talking over his shoulder with the girl. The bicycle fell, and so did the man. "This is a wise guy I've got, ain't it?" said the instructor to the girl, as he stooped to

pick up the wheel. "You just keep your eye on him."

The man got into the saddle again, the instructor grumbled. "Don't hold so tight to the handle-bars; they ain't going to keep you on," and pushed the wheel forward. It was a hard half hour that followed, but it ended promptly. There was no lapping over in this lesson. The instructors are too conscientious to allow that in the case of a man or an old woman. The case is different, of course, when it comes to something that goes about in a shirt waist and sailor hat.

Sometimes when you think your companion on the road is enjoying himself because he is annoying you, he really annoys you because he is enjoying himself.

Speaking of the now popular cycle parade, Berlin should easily score a win. One is billed for next year there, the first prize in which is \$2,500.

If the finish of a hard ride finds you "too tired to sleep," try the drinking of a glass of hot milk, and sleep will usually follow.

The man who makes a fool of himself on a wheel invariably tries to throw the blame of the job on some one else.

The pleasantest of all fellows to tour with is the one who foots the bill.

No woman cares to know why she rides a wheel.

WHERE THE INSTRUCTOR COMES IN.

Unthinking people there are who have been heard to declare that bicycle schools are conducted solely for the amusement and profit of those gentlemen who, for a consideration, have sacrificed their spotless amateurism to act as instructors. This is manifestly an exaggeration.

Primarily, riding schools are run to boom a certain make of wheels, and this fact is never lost sight of, even in the effort to make it pleasant for the instructors; but they do not have a good time; they manage to combine work and play in such proportions that it has been said the former never suffers from the latter. Instructors are notoriously models of impartiality in doing their duty, as they understand it.

If a young thing—not too young, however—in a pink shirt waist, a tailor-made short skirt and a sailor hat, has paid for half an hour, and rides just three times as long as that, the instructor takes just as much care of her as though she had stopped when her time was up.

The flat-chested girl with glasses who has been waiting patiently for forty minutes to get a wheel cannot swerve him from the path of duty. He simply allows her to wait. She does wait, until the superintendent gets on to the game, calls in the wheel and its pink-waisted rider, and threatens to fire the instructor if anything of the sort happens again, which is enough, in its way, to show that the amusement of the instructor is not the sole object of a man putting his money and time into running a cycle school.

SOME LIGHT LITERATURE.

Buy a good lamp—there are numbers of them—and enjoy riding your wheel at night. You will feel fully repaid for the small extra expense, when out with a less fortunate companion who is constantly dismounting and begging matches to light his cheap lantern.

Many riders complain about their lamps continually going out and blame it on the lamp, when the fault, in many cases, is entirely their own, and can be easily remedied. A cycle lamp, like any other lamp, must be kept clean, the wick kept trimmed and the right kind of oil used. When lighted, the flame should not be turned up too high.

In connection with the foregoing, it might be well to say that before starting out see that your lamp is filled; do not wait until you are several miles from home, when you find to your dismay there is no oil in the font, for it is very doubtful whether your lamp will burn a dry wick, no matter how expensive a lamp you have.

GET THEE TO A REPAIRER!

"Don't monkey with a buzz saw," or, in other words, when you find anything about your wheel out of order, fix it immediately or take it to some repair shop, if you can't do it yourself. Many a rider has had a day's riding spoiled through some neglect of this kind. Always examine the wheel before going out, otherwise you may find it necessary to walk home when you least expect it.

THE TROTTING-HORSE CYCLE.

A bicycle is shortly to be placed on the French market, called "La Trotteuse," in which the rider does not sit on a saddle, but stands straight up on the machine, pedals and walks, or, more correctly perhaps, slides along.

PUTTING HIM ON.

Johnny—Papa, what is mileage?

Papa—Mileage is what the Government pays Congressmen for travelling on passes, and bicycle clubs give foolish members medals for.

TESTING AND TIRE PLUGGING.

There is always something in the repair shop needing testing. Steel balls, tubing, parts of frames, shafts, studs and the like require to be tested to ascertain their strength. A regular testing machine is an expensive piece of property. Here, however, is a very cheap all-around testing device which may be rigged up by any one who desires it, as the contrivance is not patented.

Procure an iron frame of a second-hand cylinder printing press or something like it, and use one side, this being represented by A in Fig. 1. To this frame bolt boxes firmly for the several shafts shown in the cut. The driving belt is indicated F, and this drives the gears, G, these in turn driving the shafts, H H, the latter being run in bearings fastened to the uprights B B. The shafts H H are cut with a screw press thread, so when revolved they operate upon the iron press

FIG 1

FIG 2

FIG 5

FIG 6

blocks, C C, and compress whatever object is placed between them at E D, which is simply a foundation block.

Suppose some steel balls are to be tested. Two or three would be placed between sheets of wrought iron and subjected to heavy pressure between the blocks C C of testing machine. If the balls were pressed into the metal as represented by C C in Fig. 2, in which A and B are the sheets of wrought iron, it would indicate that the balls could stand severe pressure. Inferior balls would elongate, flatten, crush or crack under the strain.

Making spiral steel springs is a part of the cycle repairer's trade. There are not so many spiral steel springs on the average bicycle as to warrant keeping a supply on hand, therefore it is customary to wait until it is known just what sort of a spring is needed before making one. A very simple way of turning out serviceable spiral steel springs requires the use of a rod and gas jet only. First

select a steel rod of the right proportions for the spring desired, and secure it in an upright position in a bench vise, as shown in Fig. 3, in which A is the vise and B the rod. Wind the wire around this rod as shown by C, first taking out the temper if the rod is too stiff.

Wind the wire closely and evenly, securing the ends so they will not unwind; heat both rod and wire to a red heat, and plunge into cold water. If an open spring is desired, draw to right dimensions before tempering. The final process requires the wire to be rubbed with oil and held over the flame, as shown in Fig. 4, until the oil is burned or dried off. The rod and wire are marked D. The spring is now ready for use.

Wheelmen often come to a repair shop with a punctured tire, and ask that the leak be fixed at once so they can continue their ride. A combination patch like A in Fig. 5 may be made in about fifteen minutes, or the leak plugged as represented by B in a short while, or an outer patch, C, put on in a few moments. For repairing an ordinary outer tire puncture hastily, however, keep a sort of a syringe arrangement, filled with a quick healing composition, on hand, and repair a leak after the manner shown in Fig. 6. The composition is made of printer's roller compound, fish glue, borax, degrass and chalk. Keep the syringe, D, filled and in a warm place, and when a wheelman wants an average puncture fixed quickly, insert the syringe nozzle, C, into the puncture as shown, and deposit about a teaspoonful of the composition around the break inside the tubing. The inner tube, D, is not interfered with. It serves, however, to press the composition up against the leak, closing the latter, and the machine can be used at once.

GEORGE D. RICE.

PAID HIM WELL.

Louys, the young Greek who, at the revived Olympic games at Athens, won the prize of Marathon, is the object of the greatest admiration among his countrymen, and has received innumerable valuable presents. One is a pretty piece of property in Ainarrousse, his native village. The Athens-Laurriain Railway Company has bestowed on him a perpetual free ticket for the passage of himself and his wheel over its line; a barber has vowed to shave him and a tailor to clothe him gratis as long as he lives. And best of all it is whispered in Athens that the young hero of the stadium is engaged to marry an American girl.

IN DEAR OLD ERIN.

Corkonian pedestrians have been warned by the Irish police "to be careful not to step off the pavement after dark, as they are likely to be knocked down by a cyclist." To relieve the situation a Cork newspaper suggests that wheelmen light their lamps on dark nights.

WISE UNTO HIS GENERATION.

WARM UNDER THE COLLAR.

He was mad clear through. Any one with half an eye could see that. His shoes were in such a dilapidated condition that he had to wind cord around them to keep them on his feet; his knickerbockers were torn and covered with dirt, likewise his stockings and sweater, while blood oozed out of a big rent in his coat sleeve. He had a deep cut over his left eye, his nose was skinned, and three front teeth were missing from his upper jaw. He yanked his wrecked wheel into the little office of the country tavern with such savage fury that the cat jumped out of the window, upsetting three flower pots that were on the sill, and the innkeeper awoke from his dreams with such a start that he fell from his chair.

"Say, old man, did you ever see a genuine, pig-headed, Ignoramus and double-distilled fool? Well, look at me, then; I'm one. Yes, sir, I am! Look pretty, don't I? All I want is a dunce cap two feet high. You wouldn't believe it, but yesterday morning I started out on a little tour, as spick and span as could be. Expected a fine trip. Look at my ignominious end! Oh, if I only had him here a minute! Just a minute!" but at this instant he was interrupted by the entrance of a dapper young man with a whip in his hand.

"Guess I'll have to put up here all night, my good man," he said to the proprietor. "My horse has gone lame, you see. I'm the cycle editor of the 'Daily Bazon,' and"—

"You are, hey?" put in the dilapidated wheelman. "Then you're just the man I'm looking for. Do you advise young, inexperienced and trusting readers of your measly sheet the best roads to take when they ask questions while temporarily insane?"

"Well, I have that honor. What of it?"

"What of it? Just pick out a soft place on the floor and prepare to get licked, young man. Look at me! Look at me good! I'm one of your many victims. See my clothes, my broken wheel, my bruises and torn flesh? What of it? Bang! You will make a trusting reader ride twenty miles out of his way—bang!—you will put him on in the worst roads on God's footstool, eh?—bang!—you will make him walk over two mountains or sleep in the grass?—bang!" And then he stopped for lack of wind.

And as he washed the gore from his hands the proprietor telephoned for a doctor and told the hired girl to prepare a room for a boarder, who would probably desire to remain abed for at least a week.

TIME TO MAKE A MOVE.

"Yes," said little Jim to his juvenile friend, "I'm goin'er run away from home."

"And fight Indians?"

"I don't know about that. But I'm goin' to get away from whut's comin'. I've had paw's trousers cut down to fit me, an' never found fault. But since maw got a wheel and is wearin' bloomers, I'm taking no more chances."

LACIONIC.

"Hello! Been racing?"

"Yep."

"Get anything?"

"Yep."

"What?"

"Left."

FAILED TO PAT HIM ON THE BACK.

The fat novice was full of enthusiasm but empty of experience. He came in with a rush, saying: "I'm off for a tour through the Berkshires. It'll be two weeks before I'm back in my flat again."

"Oh!" said his friend who knew his riding ability. "Bet it won't be two hours before you're flat on your back again."

A PALACIOUS CLUBHOUSE.

Every once in a while some club possessed of a lengthy membership roll, puts forth the claim of being the largest cycling club in the universe. If the various claims were sifted down, there is little doubt that the distinction would fall to either the Century Wheelmen of Philadelphia, the Century Wheelmen of New York, or the Illinois Cycling Club of Chicago, with the chances largely in favor of the latter. The Illinois club has a membership of over 600, of whom all are active wheelmen except twenty-five. The associate membership list is limited to that number, and has been full for a long time.

The club was organized ten years ago, in August, 1886, with a charter membership of fourteen. It has been a League club from the time of its organization. It has had its ups and downs, of course, but the ups have largely outnumbered the downs. With the great growth of cycling, it has expanded in a marvellous manner, as the length of the roll at present attests. In the spring of '95 the club became ambitious to obtain a house of its own. Arrangements were soon consummated, and a site, 50x100 feet purchased at the corner of Washington Boulevard and Francisco street, in the finest residential portion of Chicago's West Side. Plans for the building were pre-

baths. Above the bathrooms are the lockers.

The formal opening of the clubhouse occurred on the 22d inst. The building was draped in cardinal and gold, the colors of the club, and cut flowers and palms distributed in proper profusion. A mandolin orchestra on the first floor and an orchestra on the stage furnished music for the dancing. The exercises were brief, consisting of an address of welcome by President Frank Gerlach, an address by Frank Hamlin, Corporation Counsel of Chicago, and another by Judge John Barton Payne.

Any history or quasi-history of the club which failed to mention W. A. Davis would be scarcely complete. Mr. Davis is at present secretary of the organization, but has been continuously in harness, and in one position or another, from president and captain down, almost since the inception of the club. Without Davis it is possible there would have been no Illinois Cycling Club.

The policy of the club has been conservative

Illinois C. C.'s New Clubhouse, Chicago.

pared by Messrs. Watson and Hazelton, both of whom are members of the club. The cornerstone was laid January 18 last, but it was not until August 1 that the club took possession.

The house is believed to be the very swellest cycling club structure in the country. The illustration shows that the belief is at least fairly well founded. The basement is of Bedford stone, and the upper stories of buff-colored brick, the first floor being of a slightly darker shade than the second and third. In the basement are located a barber shop, wheelroom, bowling alleys, engine and store rooms. The entrance to the parlor floor is on Washington Boulevard, and leads to an octagonal rotunda. A circular well runs from the ceiling of the vestibule to the floor above. On the first floor, in addition to the parlors, are reading-rooms, library and café; also the secretary's and quartermaster's offices, with the steward's quarters in the extreme rear of the building. An angular staircase leads to the floor above, where are lounging rooms, card rooms, and a billiard-room, containing six billiard and two pool tables. On the third floor is the gymnasium, 37x60 feet, also the cloak and sparing rooms, and ladies' retiring-rooms. The gymnasium is so arranged that it may be cleared for dancing purposes, and as it also contains a stage, for theatrical or entertainment purposes. Back of the stage are the bathrooms, which contain both shower and tub

but progressive. It has representatives on the track, an exceptionally strong football team, a baseball nine, and an amateur minstrel troupe.

FILLED HER WITH FUNERAL FEELING

The attraction of gravitation is as nothing compared to the attraction of the bicycle. There was an excellent example of this upon the Boulevard the other day. A fair scorcher was bowling along the highway. Her suit was the smartest, her wheel the trimmest of the army feeting past. Altogether she was an effective specimen of the wheelwoman. It is difficult to connect her with anything like a fall or a collision.

But presently a large black hearse, unattached to any funeral train, came trotting along in that rapid, jocund fashion common to that vehicle when off duty, and at once the attraction of the bicycle was evident. It immediately marked the hearse for its own, and in spite of all the efforts of the natty rider the two vehicles banged straight into each other.

Nobody was injured; indeed, it didn't take a minute to resolve the tangled heap into its original elements. But the combination was irresistibly funny. And as the scorchers brushed the dust from her draperies she was heard to murmur: "Well, of all things—a hearse!"

A SEPTEMBER OUTING Wilson R. TARD

PART V. NORTH ADAMS—ALBANY.

The drives and walks are enchanting, while the principal scenic attractions are Witt's Ledges, from which an enticing panorama may be enjoyed; the charming water-hewn foundations of the Natural Bridge, a mile or so out Eagle street, a span of pure white marble over a picturesque chasm, through which tumble the sparkling waters of Hudson's Brook; and the cascade, a little over a mile to the west, where a mountain rill comes tumbling down the eastern side of Graylock with a fall of nearly a thousand feet in the course of two miles, forming a beautiful cascade in an abrupt plunge of some forty feet. The walk up the notch road is romantic and wild to the extreme and rouses all the romance and poetry latent in the bosom of the Fair Novice, while the climb to Graylock's lofty summit is but seven miles over a fine road of easy grades, where from the brow is claimed a vision of 100 miles, embracing sections of five States.

Leaving this fair manufacturing town, we retrace our way about five miles, following the trolley line to where it crosses the railroad, and thence direct to Main street, Williamstown. (6 miles—269½ miles.)

On this broad elm-bowered avenue are situated all the college buildings, and at the street end stands the handsome, well-appointed Graylock Hotel. (\$3.)

This pretty college town, named for the founder of Williams College, Colonel Ephraim Williams, a hero of the French and Indian War, is picturesquely located among the hills, surrounded by the prominent peaks of Graylock, Mount Williams, the Dome and other lesser points of the Tatic and Hoosac ranges, while the beauty of its streets make it one of the prettiest towns through which our route lays. Again does the Fair Novice enthuse, and her irresistible pleadings cause

the stern janitor to show us through the buildings. Here President Garfield was educated, and here he sent his sons. It was while en route to visit one that he was made the target of a brutal assassin's aim.

With a half-regretful adieu to the charming village we wheel out South street—straight, level and smooth—and from now on have fine riding—so fine, in fact, that the Centurian and the Scorcher talk earnestly of a century run, but are prevailed upon not to so basely desert the ladies.

In and out by the roadside, now through mossy meadows, now through woodland and tangle thickets flows a singing brook, rippling over a pebbly bed. We spin on through groves and dells, bearing to the right into South Williamstown, with its little stone chapel. (3¾ miles.)

Now to the left as the road branches with the charming mountain resort of Idlewild on the right when some one suggests luncheon. 'Tis a bit early but we stop. (4½ miles—27¾ miles.)

From here the road winds around down into the valley smooth and fine, with easy grades. We cross and recross the babbling brook; through farmlands, by orchards of ripening fruit, bits of woodland, shaded dells and rocky ravines; now the trees obscure our view; now the valley opens out—a new scene at every rise, a new charm at every turn.

down a rocky tree-clad gorge in a series of miniature rapids and falls. We turn to the left now, and then to the right, the road rolling, smooth and good; an upclimb and a long, jolly coast from the chimney ruins at the hill top. As we whiz down, the Fair Novice calls our attention to a quaint old stone house, prettily festooned with richly tinted ivy from base to roof peak. On through a neat grove and we make a sharp turn to the left, as the road branches near a red grist mill, then a swing around to the right and into the town of Lanesboro. (4¾ miles—28½ miles.)

As we spin through the town over a fine, level piece of smooth macadam we see in the distance the shining waters of Lake Pontou-suc. The road approaches the lake, and soon

Kinderhook Creek.

We take the right fork now for Lanesboro, through a pleasing bit of woodland; the road is a bit hilly, but smooth and good, with the ever-changing scenery of hill and dell. Down on the left winds a stream through a shaded ravine, and upward comes the musical rhythmic ripple of the waters on the summer air, while the twittering of the feathery denizens of the yon waving boughs mingle pleasantly with the murmuring buzz of insect life and the saucy chatter of a frisky chipmunk that skips before us along the fence-rail. Now by a rumbling mill, its motive power flowing

we are skirting its shores through a fine grove of pines. The southern shore is lined with neat summer cottages and at its extreme lower end is a succession of picnic grounds and like resorts, by which we dash and enter North street, following the trolley lines directly into town.

On the left of the roadside flows a branch of the Housatonic River, the outlet of the lake. Here it broadens into a pretty millpond, and there plunges over a dam in a very charming falls. The roadbed is superb. We pass the massive and impressive stone-arched entrance

to Pittsfield Cemetery and swing on through North street, with its bordering of fine residences, into the bustling business portion of the town. ($5\frac{1}{4}$ m.—2904m.) The Berkshire, the L. A. W. hotel (\$2.50), is just to the right, on West street, near the depot.

Pittsfield is very charming, and numerous and many are the drives round about over the finest roads in the country.

The beautiful town of Lenox lies seven miles southward, directly out South street, and Stockbridge an equal distance below, over a magnificent road, replete with charming views and skirting a beautiful sheet of water embedded in the hills—Lake Shrevoerac.

The Fair Novice is very desirous of passing through the quaint Shaker settlements, of which she has heard so much; so, as they lie directly west of Pittsfield, on the slopes of the Lebanon Mountains, and are on the best and prettiest route to Albany, our Journey's end, we conclude to stay over and enjoy a few of the beauties of Pittsfield, while the Scorcher and the Centurion start off for a lively spin to Lenox and are eagerly joined by the Bloomer Girl. The rest take in the park, the residential streets and pretty Silver Lake, and thus add a few more miles to their score.

Bright and early we wheel out South street to West Housatonic, on which we turn westward, down over the bridge and up under the railroad span, where we take the cycle path at the roadside. The views are charming; behind us lies the town, its houses dotting the hillsides and peeping here and there through the rich waving trees, while before us rise the tops of the Lebanon range. Now over another bridge, still following the path to its termination, which we deeply regret, though the road is all that can be desired. Through a straggling settlement and a sharp turn to the right up over the hill by the red brick blacksmith shop and through the settlement of the Pittsfield Shakers, with their queer, bare-looking, boxlike houses, neat and well kept in their coat of white.

Now we cross the Shaker brook, and, as the road forks, take the right branch straight up over the hill; poor, but the other and prettier road is under repairs at present.

Main Street
New Lebanon

The Shakers, so the Fair Novice informs us, are a communistic-religious sect of English origin, somewhat on the Quaker order, and believing in Christ's second appearance. They received their cognomen in derision, arising from their queer movements in their religious dances. They were once quite numerous in this region, where they first settled over a century ago. They are quiet, conservative and very industrious. Their houses and farms are surprisingly neat and well kept—a rather agreeable contrast to some of the farms by which we have spun, and an example deserving emulation from some of our shiftless, paint-shunning brethren of the fields, whose spare time is spent around the postoffice or village store in rambling discussions of political and financial subjects which their attenuated brains can never comprehensively grasp.

The New Lebanon Shakers in the past held open services on Sunday, which drew large

crowds of the curious from all parts, but lately, owing probably to a lack of order on the part of the sightsees, they have closed them to the prying public.

Now begins a mountain climb up a long rideable grade, through a double row of well-trimmed willows. Here again do this curious people show their love of neatness, for theirs are the hands that trim these graceful waving trees. Down on the left is a pretty gorge, echoing with the cry of the quail and discordant croak of the crow, while from its fastness comes the low, musical murmur of a mountain stream. On through the avenue of well-trimmed willows till the hilltop is reached, and we see before us a steep decline that prudence bids us walk—no, back-pedaling can withstand it.

'Tis only a short mile, and the charming run as the valley broadens out through the vista of trees deserves all our attention. Then below us lies the quiet settlement of the Lebanon Shakers, their huge barnlike houses looking trim and neat, despite their plainness; their well-tilled fields and extensive outbuildings.

The road forks and we bear to the right under the brow of the hill, passing the meeting-house on the left, and on down a long hill which we coast. Off to the west spreads the rich valley, dotted with houses and inclosed with a ridge of verdure-clad hills. We rush down and turn to the right by the neat stone chapel direct to Lebanon Springs ($11\frac{1}{4}$ m.—3013m.), where the Field Inn caters to the wants of the wheelmen.

The Springs was once a favorite summer resort, but of late, for some unaccountable reason, it has lost its prestige. No more charming or salubrious spot could well be found. The

Bridge at Malden

huge caravansary on the hillside—the Columbia Hotel—still makes a feeble pretence of life and gaiety.

Right by its entrance is the famous spring, discharging its health-giving mineral waters at the rate of 500 gallons a minute and maintaining the remarkable temperature of 73 degrees the year round.

From the broad hotel piazzas an extensive view of the valley is enjoyed, while the environments are wild and picturesque. After a short rest during which the Fair Novice gives vent to her pent-up feelings, we remount and retrace the main road to the little stone kirk and here branch to the right on a fine piece of road, over the bridge and then to the left into the quiet hamlet of West Lebanon.

Off across the fields eastward rises the wooded height of Mount Lebanon, reflecting a myriad of color tints in the morning sun.

We thread the village street, bordered by several well-appointed residences and swing to the right by the church. The road is level and fine, the broad fields resplendent in autumnal tints and the hills cool and refreshing.

We spin on, with a backward glance at the receding mountains, through farm lands and small settlements; now up a rise through a grove of pines in which a colony of crows are holding a political caucus; now through a small town boasting a store, postoffice and hotel, over a bridge and straight on till as the road forks we bear to the left, noting the friendly signboard.

The roadbed is fine, and the grades hardly perceptible. Again we keep the straight road by a yellow farmhouse (the left branch leading to Brainard Station); now down a long coastable grade through the town, over two bridges and up a rise. Here the low hills rise a series of rounded, velvety-clad knobs in every direction.

We keep to the left on the main road over a bridge and down with care—the bottom is very rough—then we keep left again as the road forks through a pretty bit of woodland, with a stream wandering through the vale below.

The road winds, following the course of the stream, now through open farming country, now through tree-bordered lanes, with the stream rippling over its rocky bed close beside us, till it expands into a pretty isle-dotted mill pond, and we swing around to the right over Malden Bridge into the town of Malden. ($13\frac{1}{4}$ m.—315m.)

The stream is the Kinderhook Creek, which flows southwestward many a mile ere it reaches its terminus in the Hudson.

Through the town, and at the first fork bear to the right over a dirt road that shortly improves to macadam; around under the hill, then up a long grade with a magnificent view from the top, even to the distant river's edge, then a long down grade requiring care into the town of Nassau to the band square—Nassau House \$2. ($3\frac{3}{4}$ m.)

Here we turn to the left, over the bridge and straight on, up rise and down bank until we reach an iron bridge, just this side of which leads off to the left the old post road to New York.

The Centurion and the Scorcher are bent on making the run of a century and a half, so after a rest and a chat a sorrowful adieu is said, and they dash off, leaving the ladies to the fatherly care of the Fat Man. The Bloomer Girl would fain share their luck, but the chaperone demurs.

We continue through Shodack Centre over a fine roadway of easy grades, dash through to the tollgate and reaching the top of the hill see the imposing mass of the Capitol before us, then a roll down into East Greenbush, a turn left to the river road of smooth asphalt, over which we roll to the bridge, pay our toll of two pennies each, and enter Albany, our journey's end, at Broadway, with a score of 351 miles to our credit and an expense account, says the Fair Novice, who has also a head for figures, of \$35, for the ten days' trip—including one fare to gay New York.

BOLTING THE DOOR.

Dunlops Seeking to Shut Out Competition— Cycle Show Premiums—Chainless Arguments.

London, Oct. 17.—The Dunlop Tire Company have made a move which bids fair to convulse the cycle trade. It is simply the issue of an agreement whereby all signatories bind themselves for five years not to supply any other tires on their machines than Dunlops or those specially exempted.

The exemptions are few and are controlled by percentages. The favored few are the Beeston, Warwick and Clincher. The inducement offered is a rebate of 7s. per pair of tires, and as this is a serious matter for the smaller firms there is much heart-burning and protest. The large firms can afford to stand out, as by purchasing the maximum number per season they can obtain a discount of 5s. per pair, so that the extra 2s. is not worth binding themselves for. It is quite different, however, with the smaller fry, who, generally speaking, do a lower-priced trade, and consequently could appreciate such a heavy reduction as 7s. It is understood that Humbers, the Raleigh, the Coventry Machinists Company, Trent, Quadrant, Triumph and Rover among the big firms have adopted it, but in all full forty firms have adopted it.

It is plainly a very businesslike attempt to obtain a guaranteed trade for five years to come, and is probably inspired by the projected opposition of the Pleus Tubeless and other firms with which the Dunlop is in grips with in the law courts.

The others have not been idle and attempts have been made to induce the Cycle Manufacturers' Trade Protective Association to interfere, but trade jealousies have prevented any policy being formulated up to date. The Palmer Tire Company have decided to reduce the price of their tires to equal the rebate offered by the Dunlop Company, and in addition to run a second quality tire to compete with the Warwick and Beeston.

The only grievance for the makers that I can see in the proposal is the danger of a more successful tire than the Dunlop being invented and marketed, but even were that to occur I am confident that the weight of money at the command of the Dunlop Company would permit them to buy out any competitor no matter how powerful. The success of the Tubeless tire would introduce such, but even admitting its ultimate success I know that Mr. Du Cros would possess its patents on the day after that success was made evident. At present quite nine-tenths of our English machines are sold with Dunlop tires fitted to them, so that in a trade sense the cycle makers are merely binding the future if they sign.

The authorities of the Brussels Cycle Show have adopted a very sensible method of attracting trade attention to their show by offering prizes for—

1. The best wrench exhibited which will not cut or burr the nut by use.
 2. A motor for machines which must weigh twenty-one pounds or under and develop one horse-power indicated and be inexplosive in action.
 3. A means of transmitting power evenly to both sides of the driving wheel.
 4. The best frame for a bicycle having regard to design, weight and its distribution.
- The idea may be worth imitating, but the jurors should first insure their lives. I can well remember the wraith which Douglass Leechman called down on his head for awarding a medal which had been put up by the promoters of the first Birmingham show in '90 or '91 for the best designed safety

which was exhibited. A comparatively unknown local tinworker won the medal against several firms with world-wide reputations, and the spectacle has warned show promoters in England from repeating the experiment.

The promised boom of the chainless bicycle has not yet come here, and the squabble between Rivierre and the Acatens gearmakers, which is being thrashed out in the French cycle press, is not likely to assist it. The great long-distance crack has won his name and fame on one of their machines, but having fallen out with the makers he is now riding a Simpson chained bicycle, and is engaged in blackguarding the machine for all he is worth. If what he says be true, then Rivierre must be a wonderful rider—much more wonderful than his easy defeat by Huret would lead one to imagine. He beat Huret's records on a chainless machine, but on the Simpson he fell a very easy victim.

PASSING OF THE SAD SEASON.

Cycling has laid the melancholy days on the shelf. Those who do not believe this should make a trip to the Coney Island Cycle Path

G. W. Weymouth,
Manager Simonds Rolling Machine Co., Fitchburg, Mass.
He has been nominated for Congress.

some fine October afternoon, and if the passing show isn't enough to convince them that this is not the saddest but the gayest time of the year, then argument is useless. From the time the pedestrian gets off the trolley car at the Willink entrance of Prospect Park, walks through to the south gate, and follows the Cycle Path to the water's edge at West Brighton, there is color and gayety and motion in nature and humanity. The brown, gold, red and green leaves rustle in the crisp breeze and fall down in fits of ecstasy as the flocks of riders fly past.

TELLS THE WHOLE STORY.

When English cycle manufacturers complain of being undersold by Germans they unconsciously advertise their inability to meet German competition. When, in turn, Germans complain of being undersold by Americans, they not only show their own inability to compete with the cycle manufacturers of America, but also prove that the English are fast losing their former supremacy in the trade.

Frederic Villiers, the famous war artist, is having a specially constructed bicycle built for his use on battlefields.

"COULDN'T GIVE THEM AWAY."

An English Trade Magnate's Opinion of Some of America's Pet Cycle Fittings.

With the name Du Cros so intricately interwoven in the English cycle trade, it is natural that almost anything said by any member of the remarkable family should be of some interest, the utterances of Harvey Du Cros, jr., who lived a term of business years in this country, because of the fact, being of more particular interest, perhaps. His return on a machinery-buying mission, after an absence of some two years, afforded THE WHEEL an opportunity of having him talk on matters of more than less moment to Americans generally.

"What was the English output during the current year?" he was asked.

"About 450,000 or 500,000 machines."

"How much greater will it be next season?"

"Not very much, if any, unless the makers are able to get machinery fast enough."

"Are not a lot of new people rushing into the business?"

"No; I don't think anyone can name more than six new concerns. But the old makers are all extending and increasing their facilities."

"What is the price of high grades?"

"One hundred and twenty-five dollars. There has been no change in twelve years and none is likely."

"How about cheap wheels?"

"They list at about \$65. I don't believe there's a \$50 wheel on the market."

"What discounts are allowed agents?"

"They range from 30 to 45 per cent. The agents usually allow purchasers 5 or 10 off."

"What is your opinion of the chances of American wheels in England?"

"They won't go—not unless they are rebuilt."

"What's the matter with them?"

"Gingerbreadry."

"In what respects?"

At the time of the conversation the interviewer had with him an \$150 American tandem. Mr. Du Cros held an umbrella. Using it as a pointer, and in answer to the question, Mr. Du Cros first tapped the brake.

"You couldn't give that away in England," he remarked. The brake in question is not a particularly praiseworthy article, and as much was admitted.

"They wouldn't have such a saddle," went on Mr. Du Cros, pointing to one of the hammock pattern, which was on the tandem.

"Why not?"

"They want spring saddles, and rightly, too."

The Du Cros umbrella next tapped the lugs and bolts.

"They wouldn't have such things. Look at the size of them," was his comment. "And those round cranks! You couldn't give them away. In England they will have square cranks or nothing."

The maroon enamel, the exposed chain, the idler adjustment, the offset of the rear fork ends and stays, and the pedals were other subjects of criticism.

"The Englishmen want something solid," Mr. Du Cros remarked, as a summing up.

Relative to the magnificently prolonged boom in cycle and tire stocks, which has amazed the average American, Mr. Du Cros explained that it was largely due to the tremendous amount of English capital which was withdrawn from Africa because of the upheavals there. All that has been necessary to attract this idle money, said Mr. Du Cros was a flotation bearing the names of a prominent directorate. He believes, however, that the boom has been pretty well punctured.

VICTORS AT HOME.

Springfield, Mass., Oct. 26.—Victors have placed another coasting contest to their credit, this time the much-heralded contest of the Massasoit Bicycle Club, which was held this afternoon on Meeting Hill in West Springfield. The famous Massasoit road races must hereafter share their popularity with the coasting contests. The weather was favorable, and the sport was witnessed by not less than 2,000 people. Victors won, but in the preliminary heats Spaldings and Orients made a strong showing.

The prize winners were F. E. Halley, of Chicopeg Falls; H. A. Woodward, of New York, and J. E. Whittlesey, of New York. Halley and Whittlesey rode Victors and Woodward rode a Humber. The distances were 2,798, 2,789 and 2,761 feet respectively.

In addition to the three winners those who qualified in the semi-final heat were H. B. Sargent, Spalding, 2,717 feet; William Firman, Victor, 2,714 feet; W. H. Wells, Spalding, 2,705 feet; F. M. Coe, Orient, 2,695 feet; I. G. Perry, Spalding, 2,634 feet; H. H. Janeway, Victor, 2,625 feet; A. O. McGarrett, Humber, 2,597 feet; G. A. Campbell, Victor, 2,571 feet, and William Crompton, Victor, 2,542 feet.

DURVEA GOING ABROAD.

The Durvea Motor Wagon Company, of Springfield, Mass., will enter three wagons in an English motor wagon parade from London to Brighton, early next month. The parade is to celebrate the removal by Parliament of restrictions which compelled motor wagons in London to display a red flag and to travel at a pace not faster than three miles an hour. The Durvea representatives will also make arrangements for the formation of an English company.

LOZIER LEADS A LAND BOOM.

Springfield, Mass., Oct. 26.—The building of the Lozier factory at Westfield has enormously increased the value of real estate in the part of the town in which the factory is located. A syndicate has bought the land near the factory, and a good-sized town is springing up thereabouts. Sixty houses, worth from \$5,000 to \$4,000 each, will be built immediately. The coming of the Loziers will also increase the town's income from taxes many thousands of dollars.

SOMETHING OF INTEREST.

"The material it is made of and its splendid finish will commend it to the most exacting buyer," is the pleasing manner in which the Reading (Pa.) Cycle Mfg. Co. launch their Vindex wheel. The Reading people are level-headed folk who do not expect to set the world afire, but who believe that if merit tells, it will tell them something as interesting as they are in position to tell agents.

AN AUSTRALIAN WARNING.

THE WHEEL'S Melbourne correspondent writes that there is danger of a glut of American wheels in the Australian market. Australia, he says, must no longer be considered a profitable dumping ground, else some one will be very, very sorry ere the end comes. The note of warning is worth heeding.

ROOM FOR EXPANSION.

That their plant may be like unto their name, the Ideal Machine Company, Hartford, Conn., have added over 4,000 square feet of floor space, in which will be placed new additional machinery for the purpose of turning out cycle parts.

RED AS A ROSE.

With the great number of lamps which have been marketed, it is a bit surprising that until the introduction of the Neverout none has embodied that feature thought indispensable in the lanterns used on high wheels—a ruby lens as a rear signal. Of course, when the lamp is attached to the head of the wheel such a lens is valueless; but fork brackets are now so largely in use that it will prove of real service. The Rose Manufacturing Company, of Philadelphia, who make the Neverout, think so well of it that the combination of ruby lens and reflector has been patented. The idea, of course, necessitates the placing of the clamp of the lamp in a different position, which is

accomplished in the manner shown in the illustration; the bracket is made a part of the clamp, and is such that it may be fastened on either side of the front forks.

The lower part of the body of the lamp is elongated and completely incloses the oil tank, which is fastened and securely held by a spring clamp cap, which automatically locks the wick. At the top of the elongation made for the tank there is special ventilation to keep the entire lamp from getting hot, rendering it non-explosive. In New York the selling agents for the Neverout will be Waldron Brothers, who have temporary offices at No. 634 Columbus avenue.

HAS A HOST OF FRIENDS.

J. W. Murphy, "Big Jim" Murphy, as he is affectionately called by those who know him best, has severed his connection with R. H. Wolf & Co. Ill-health is stated as the cause of severance. Murphy is one of your big, whole-souled, good-natured fellows, who makes friends almost wherever he goes.

ANOTHER IN SYRACUSE.

The Olive Wheel Company, who have succeeded to the factory of the Dodge Cycle Company, of Syracuse, will market two lines of wheels next year, the Olive, their leader, and a cheaper grade. They will also make a bid for foreign trade. A. T. Jones will "do" Europe in their interests.

DEPEND UPON ELECTION.

J. W. Van Praag, of the Ideal Rubber Company, Brooklyn, returned last week from the West. He reports a very favorable outlook for '97 trade, and brought home with him several big contracts, but, as seems to be usual nowadays, they depend upon the result of the coming election.

MIGHT DO.

"Great idea, my boy! Bound to make me rich beyond the wildest dream of avarice."

"What is it?"

"A wheelless wheel."

ON THE MISSOURI'S BANKS.

Kansas City, Oct. 23.—The cycle trade of this city and vicinity has been rather dull for the past three months. Early in the season all dealers were looking forward to this being the banner year in the bicycle business, but in the latter part of the summer everything tightened down, and business in this line, as in all others, has been very quiet ever since.

W. M. Young, of the Midland Cycle Company, has just returned from a Texas trip, and reports that trade is pretty good yet in that Southern country, and there appears to be no reason for a dull season in the winter down there, as they can ride wheels the year around.

The Waltham Manufacturing Company, Waltham, Mass., have sold out their branch establishment in this city to the Aladdin Cycle Company, who purchased their stock, furniture and fixtures, and will move their business from the old stand to the building now occupied by the Waltham Manufacturing Company, 1,111 Grand avenue. Mr. James S. Holmes, jr., the vice-president and general manager of the Waltham Manufacturing Company, has been in the city several days, and attended to the transfer in person. It has been the desire of the home office for some time to place their wheels with some agency here who would give them the proper attention, and thus do away with the branch office, and they are particularly pleased with the arrangements just completed.

J. C. Merrill, travelling for the Stover Manufacturing Company, makers of the Phoenix, has been in the city, and went from here direct to St. Louis.

E. P. Moriarity expects to soon go on the road for the H. A. Lozier Manufacturing Company, and will cover Missouri, Kansas and the Northwestern territory.

The Kansas City branch of the E. W. Walker, Stutz Company, which has been under the management of S. P. Yeakel, is now temporarily closed, and J. G. Roth is now attending to what little business the firm is transacting from this point. It is understood that the office will be opened again soon after election.

Parlin & Orendorff Company, during an interview, remarked that they had worked up quite a Mexican trade on their line of bicycles, and while there was considerable bother, owing to small technicalities with the customs authorities, they expect to continue working up this export business.

When spoken to in regard to handling bicycles, the Buford & George Manufacturing Company said that they were as yet undecided about the matter; they did not know exactly how that report got abroad. They volunteered the information, however, that they had been handling a line of implements manufactured by the Stoddard Manufacturing Company, Dayton, Ohio, and as this firm has a large factory building now lying idle, they have decided to open it up as a bicycle factory, and it was possible that they would act as the Kansas City agents for that wheel.

WAS A BOY WONDER ONCE.

W. M. Haradon will hereafter talk Orients instead of Remingtons, having severed his connection with the Remington Arms Company last week to accept a position with the Waltham Manufacturing Company. Few who read this will recognize in Haradon the business man, Haradon the one-time boy wonder and hill climber. Time was when he was one of Springfield's pets, second perhaps to Hendee only.

When a man gets ahead of his expectations, they spurt and pass him.

BRIEF BITS FOR BUSY MEN.

Don't waste time on a tour in fretting about the time you have wasted.

Sterling Elliott has invented a new locking nut which prevents the nut from working loose under any and all circumstances.

The "Ironmonger" states that it is expected that American lamps, pedals and other sundries will be imported for next season's trade.

There are now bicycles with electric motors and electric lights, but there is still a class that is not happy; it wants a beer-pump attachment.

The Guatemalan Exposition will open March 15, 1897. Space can be secured until November 15 of this year. The principal manufacturing countries have already secured space.

The fact that a superintendent assures a workman that there is no danger, and tells him to return to work, does not relieve the workman of the assumption of risk; he being of full age, and knowing the danger.

Some one has told the London Times that in America there are more than 500 factories, each with an annual output of not less than 1,000 bicycles, and between eight and nine thousand turning out smaller quantities.

An employer is not bound to anticipate every probable risk which may happen in the use of a machine, but discharges his duty if he gives such general instructions as will enable the employe to comprehend the danger.

Americans are commencing to push even their steel tubing in England, instead of buying from that country as they did in the past. The Ellwood Weldless Tube Company have already opened an office on Holborn Viaduct, London.

Where an employe's duty to inspect and repair the machinery is incident to his use of the machinery in a common employment with other workmen, the employer is not liable to fellow-workmen for the negligence of such employe.

The estimated richest nation in the world is the United States, its pile being figured up at \$64,000,000,000. Great Britain manages to exist with \$47,000,000,000; France, \$42,000,000,000; Germany, \$31,000,000,000, and Russia, \$25,000,000,000.

American bicycles are shipped to Australia via San Francisco, then by the Oceanic Steamship Company to Sydney, which is a distributing point. The Australian papers acknowledge a great increase of American shipments to Australia and New Zealand.

The United States Commercial Agent at Firth, Scotland, Mr. Carpenter, writes that the bicycle trade has struck that country hard. Two local manufacturers have enlarged their plants, and two new companies are already announced. Mr. Carpenter invites competition.

An employe who calls a surgeon to aid an injured employe is not liable for the negligence or malpractice of the surgeon, provided the latter had knowledge and skill ordinarily possessed by other surgeons, and the employer had no reason to suspect that the surgeon would fail in his duty.

The manufacturers of the United States have been invited to compete in an exhibition of machinery at Munich, Bavaria, in 1898. Every invitation of this kind should be gladly accepted by the wheel trade. No other cycle makers in the world have so much to gain and so little to lose by such competitive exhibitions.

Australia imports \$600,000 worth of goods per year, per capita, as against \$120,000 per year, per capita, in the United States, and supports four hundred lines of steamers to Europe, and one to the United States, also a fleet of coast steamers. Australians, by the way, are friendly to America, and so half the commercial battle is won for us.

The South Dakota Supreme Court has rendered a decision supporting a law passed by the State Legislature at its last session denying rights to foreign corporations doing business in the State without filing with the Secretary of State a copy of articles of incorporation and appointing resident agents upon whom process can be served.

An employe of mature years, who was removed from one employment and set to work in another, without objection by him, cannot recover from his employer for injuries received through his unfamiliarity with the machinery which he was required to operate, unless his employer knew of his inexperience in that direction, or was informed of it by the employee.

Certain fire insurance companies have the following clause in their policies: "In the adjustment of any loss under this policy the value of all bicycles shall be considered the retail catalogue price less 40 per cent, and parts of bicycles and bicycle sundries supplied by the Blank Company 25 per cent less than the price at which they are invoiced to the branch hereby insured."

When the condition of a factory and the relative situations of the deceased and his fellow-workmen would suggest, to a person of common intelligence, menacing and obvious perils from the use and operation of the machinery, an employe who continues to work in it assumes the risk, though it arises from the negligence of the employer, and the latter is not liable for the death of the employe.

Notice has been given that the Argentine Republic has made an important concession, giving manufacturers in the United States the privilege of importing their products into that country under bond, free of duty, until sold. All goods must be sent in through the regular ports, and may be taken to any city of the Republic. If sold, the duty is to be paid, and if they are not disposed of the goods can be reshipped to the United States without paying any duty. Such a concession had been previously made by the Venezuelan Republic.

France has been doing quite a fair export trade this year. The value of the French cycles sent out amounted to \$900,000 for the first seven months of the year, which is a considerable increase upon the previous exports for the same period of other seasons.

Fancy cycles being ridden in the Cannibal Islands, in youth the object of such fervid fancy! A number of American bicycles have been sent to the South Sea Islands, and one of the features is that the natives do not have to dress in order to ride. Already race meets have been held at Papeiti, which is on the Island of Tahiti. In Hawaii American wheels are in great favor, while a San Francisco firm has just booked an order from the Cook Islands.

A sample warehouse, for exhibiting American products of various kinds, is to be opened at Caracas, Venezuela, under the auspices of the National Association of Manufacturers of the United States. The concession obtained from the Venezuelan Government permits the entry of goods for exhibit free of duty, with the dues to be paid only in case of actual sale. The association, with its headquarters at No. 1,751 North Fourth street, Philadelphia, issues a circular of information describing the building proposed for the permanent exhibition, with a plan of the spaces allotted for goods.

The names of two prominent racing men are associated in an odd manner by the town of McDonald, Penn., coming to the front with a proposed new industry in the shape of a paper shirt factory. J. S. Johnson is the projector, and the garment he proposes to make is to be worn between the under and outer shirts as a protection against the frosty winds of winter, a fact which Johnson thinks will give the garment quite a sale among wheelmen. Johnson is now having paper manufactured especially for this purpose, and expects to be able to give employment to about twenty women.

Few American manufacturers who in their export trade came in contact with the pound sterling are aware that it was originally a pound weight of silver. It was divided into twenty parts called shillings, and each of these was divided into twelve parts, called pennies or pennyweights. Thus the penny was originally a silver coin weighing the 240th part of a pound. This was the starting point of the English monetary system. At the time when the silver pound, with its subdivisions, was established by royal decree there was no gold coinage in England, but it was introduced in the year 1345, at which time another royal decree prescribed that one pound weight of coined gold should pass as the equivalent of 12½ pounds of coined silver.

It is suggested that on January 1, 1900, a new division of the year into thirteen months be instituted. It is claimed that this is not so preposterous as most people would be likely to consider it at the first thought. The promulgator of the idea says that if such a division were made, the first twelve months would have just twenty-eight days, or four weeks each, and the new month twenty-nine, to make 365, and thirty in leap years. After a few days there would be no need to refer to calendars, as the same day of the week would have the same date through the year. If January 1 were, say, Monday, every Monday would be the 1st, 8th, 15th and 22d; every Tuesday the 2d, 9th, 16th and 23d, and so throughout the year. The changes of the moon would be on about the same dates through the year, and many calculations, like interest, dates of maturing notes and other important dates, would be simplified.

MAKING THE VERY BEST THEY KNOW HOW.

Certainly the B. F. Goodrich Company, of Akron, Ohio, should be competent to make a good tire—good in the highest sense of the term.

As the largest and one of the most prominent manufacturers of general rubber goods in America, they have experience in and facilities for rubber working that are not to be gainsaid. Then, too, they were among the first to engage in the manufacture of cycle tires, having been engaged in it practically at the inception of the business. They have not only made tires bearing their own name, but have produced under contract the tires of a large number of the best American cycle makers. Latterly they have turned their attention to the Goodrich single-tube tire, which they are now prepared to supply to the trade in large or small quantities. The tire, they say, is the culmination of their years of manufacturing experience. It will be made with both plain and corrugated or ribbed tread, the latter being one of the developments of the present season. They state their case very nicely in these words:

"To say that our tire is the best single-tube is a bit stereotyped, and might be considered egotism, so we simply state to the trade and to the user that we don't know how to make a better tire than this. If it cost twice as much to make, we couldn't put better stuff in it nor make it more carefully."

J. F. Ives, recently of the Mechanical Rubber Company, of Cleveland, who left them to become manager of the tire department of the Goodrich Company, is now on the road for his concern, calling on the larger makers. Mr. Ives's friends will be agreeably surprised to learn that on October 8 he quietly went and got married.

WHEN SAUNTERING UP MAIN STREET.

If one should walk Main street in the pretty town of Auburn, N. Y., the pounding of steam hammers would easily draw attention to the drop-forge establishment of the E. D. Clapp Manufacturing Company, where everything in the nature of drop forgings is manufactured. Carriage hardware forms the greater part of the business, but within the last two years the making of cycle forgings has had its full share of attention. Cranks of all shapes and sizes are a specialty, but every other style of forging used in the modern wheel can be furnished with equal facility. Many large orders for next year have already been booked, and those who require or are likely to require forgings must needs be up and doing lest the matter of deliveries return to worry them. The Clapp Company are good people to get in touch with in any event.

WHERE METALLIC OXIDES COME IN.

The cracking of tires, so annoying, is believed to be caused by the oxidation of the caoutchouc, the essential oil of caoutchouc. Vulcanization does not lessen the affinity of this substance for oxygen. The compounds used tend to fill the pores of the rubber and thus somewhat reduce the opportunity for oxidation, but the metallic oxides and other substances which it is the custom to introduce in vulcanization and dyeing, including sulphuric acid from antimony sulphide, are found to be often injurious, and boiling in caustic soda to remove the "bloom" left on by an excess of sulphur may also cause injury. The result of a comparison of analysis of the damaged tire with those of the sound article is stated to be a very great increase in the percentage of oxygen and some loss of carbon and sulphur.

WORTH THE PRICE ASKED.

After all, there will be a hundred-dollar Humber on the market. Excepting the tire, it will, however, be a reproduction of the '96 model, and will not embody any of the new features which will characterize the '97 mounts. Humber & Co. came to this decision because, in their own words, the special machinery and special tools which were necessary in the manufacture of '96 Humpers, costing many thousands of dollars, would be lost entirely should they discontinue the manufacture of 1896 models, and also because their workmen can now make '96 parts cheaper than they could last season. The hundred-dollar wheel will embody Humber quality in every respect. It is not to be understood that Humber & Co. will manufacture two grades of wheels.

A CREDIT TO ITS MAKERS.

To many of the anti-vibratory devices which have been introduced during recent years are of the sort that mar the make-up of the wheel, and while their value may be undoubted their appearances are against them. The improved Lund Pneumatic Grip is among the exceptions. As now made, it is far superior to the original. The air chamber has been perfected, and will hold air for a much longer period than formerly. A new tip has been fitted, which improves the appearance considerably, and pigskin instead of ordinary leather is used as a covering, the whole being a credit to its makers, the Lund Pneumatic Grip Company, Aqueduct Building, Rochester, N. Y.

THRONES FOR SPEED KINGS.

A racing-saddle has been added to the stock of the Wheeler Saddle Company, of Detroit, Mich. It is illustrated herewith. It is designed to permit the freest possible action of the legs, and at the same time give a

secure and natural support to the rider. The frame is entirely of wood, the nose narrower than in other styles. The leather is secured to the frame at both nose and cantle, and rests upon a felt pad mounted on the frame. The construction of the clip permits the saddle to accommodate any position of the rider. The tread is very narrow, and for lightness, comfort and speed this saddle is claimed to be unsurpassed.

NO CONTEST IN THIS ELECTION.

All of the old officers of the Hall-Shone Company, of Rochester, N. Y., were re-elected at the annual meeting last week, viz.: E. H. Hall, president and treasurer; F. A. Norcott, vice-president, and H. L. Hall, secretary. The company is planning for extensive business in its cycle accessories during 1897. Removal to larger quarters in January will be one of the first steps.

AN UNEXPECTED DEATH.

The sudden death from typhoid pneumonia of J. Oram Gormully, of Coventry, England, a cousin of R. Philip Gormully, of the G. & J. Co., who, for the past four years has been in charge of the Gormully & Jeffery interests in England, is announced. A widow survives him.

CREATING CRANKS TO ORDER.

In the good old days one of the cyclophobists of the time described a bicycle as a toy propelled by three cranks, two of steel and one of flesh, the latter seated in the saddle. The alleged joke is almost due for resurrection. It is here used merely to preface the fact that Richard Eccles, of Auburn, N. Y., is a crank-maker—that is, a manufacturer of cranks—the steel kind. For years Mr. Eccles has been engaged extensively in the forging of carriage trimmings, and as the manufacture of bicycle forgings is not wholly dissimilar, a year or two since he added that branch of work to his business. His work has proven satisfactory wherever used, and as a result the business has been profitable to the gentleman of Auburn. While he makes cycle forgings of all kinds, sprockets, bottom sprockets and the like, cranks are his specialty. He has experimented extensively, in order to secure the proper steel for the purpose, and has, he believes, hit it just right. He carries in stock cranks of both flat and round patterns, but is able to manufacture them in any size, style or shape required. To those who are in want of anything of the sort, he is well worth seeing.

WILL OPEN THEIR EYES.

English showgoers will have opportunity to rail at something else American. Gormully & Jeffery's Tiffanyized silver embossed and jeweled Rambler has been sent abroad for exhibit at the shows in London and Paris. There is small doubt that it will create something of a furor, and enable the Yankee-phobists to once more turn their teeth this way. This Rambler is the same which is being offered for the fastest mile by a Rambler amateur before November 1; there is small doubt that it will fall to A. B. Hughes, of Denver, who has negotiated a mile in competition in 1:47.35.

HAIL TO THE CHIEF!

One of Milwaukee's infants, the Chief Cycle Manufacturing Company, is moving about in a manner wonderful for one so young. It is now in its new quarters, 213 to 218 West Water street, where it has ample room and will turn out several thousand bicycles during '97. The new models are already in evidence, and embody several decided changes, which it is believed will add greatly to their selling qualities. President Hyman states that while the Chief will, as ever, be the concern's leader, and will continue to be listed at \$100, several cheaper grades will also be produced.

A VETERAN OF '76.

Edward Bufum, than whom few men are better known to the New England trade, has been chosen as general manager of the Stearns factory in Toronto, Canada. Mr. Bufum has been connected with the firm of H. B. Shattuck & Co., Stearns's agents in New England, and knows the game from A to Z. He has been salesman, traveller, dealer and pretty much everything else. Years ago he was a racing man of some pretensions, having held the championship of Rhode Island. He has been a wheelman since 1876.

STARLIGHT AND LAMPLIGHT.

Cycle lamps are to be manufactured in Newark, N. J., by the Starlight Lamp Company, a concern that was incorporated last week. The capital stock is fixed at \$50,000, of which \$2,000 has been paid in. The incorporators are E. J. S. Van Houten, of Nyack; Charles F. Cole, of Brooklyn, and James D. Clark, of Elizabeth.

National Board of Trade of Cycle Manufacturers.

271 BROADWAY, NEW YORK.
Phone No. 4117 Cortlandt.

President, R. L. COLEMAN. First Vice-President, R. P. GORMULLY.
Second Vice-President, GEORGE H. DAY. Treasurer, W. A. REDDING.

Secretary,
ERNEST R. FRANKS.

Mercantile Agency, Collection Department and Information Bureau.

Rubber Tire Association.

President, THEODORE A. DODGE. First Vice-President, L. K. McCLYMONDS.
Second Vice-President, GEORGE T. PERKINS. Treasurer, GEORGE F. HODGMAN.

Secretary,
KIRK BROWN,
504-506 West Fourteenth Street, New York.

NATIONAL CYCLE SHOWS.

Under the auspices of the National Board of Trade of Cycle Manufacturers.

January 23-30—Chicago, Coliseum.
February 6-13—New York, Grand Central Palace.
February 20-27—Boston, Mechanics' Building; C. W. Fourdrinier, Mgr. Boston Cycle Board of Trade.

FOREIGN CYCLE SHOWS.

Nov. 20-28—Stanley; Agricultural Hall, Islington, London, N.; E. A. Lamb, Secretary, 57 Chancery Lane, W. C. Telegraphic address: "Insuperable, London."
Dec. 4-12—London, National Show, Crystal Palace; Frank Peach, Secretary, 48 Holborn Viaduct, London.
Dec. 12-19—Paris, Palais d' Industrie, Champs Elysees; M. Bivort, Manager.
Jan. 2-9—Manchester, Eng.
Jan. 16-23—Dublin, Ireland; Royal Dublin Society Building, Balls Bridge; R. Wilson, Secretary, 14 D'Olier Street.
Jan. 23-30—Glasgow, Scotland; A. G. Rennie, Secretary, 49 Lilybank Gardens.

TRADE CHANGES.

ALABAMA.

Montgomery.—Jackson & Ross, new store at 28 Dexter avenue.

CALIFORNIA.

Stockton.—W. J. Goldsworthy & Co., meeting of creditors called.

St. Helena.—T. J. Creer, business leased to H. Baublitz and Charles Jessen.

San Francisco.—The Robert Malcolm Co., incorporated by P. W. Pratt, Robt. Malcolm, Emma Quitzow, H. W. Quitzow, E. H. Mattner; to manufacture metal goods and bicycle materials. Capital stock, \$50,000.

Santa Barbara.—John Frechel, moved into larger quarters.

Ventura.—Brakey & Jones, reported dissolved.

COLORADO.

Denver.—Knight Music Co. Mortgagee in possession, representing local creditors.

CONNECTICUT.

Danbury.—Folding Bicycle Company. Offering compromise 50 per cent. Liabilities, \$7,000; assets, value not estimated.

Waterbury.—Waterbury Wrench Company. Factory destroyed by fire.

DELAWARE.

Wilmington.—McDaniel & Merrihew Cycle Company. Receiver appointed.

ILLINOIS.

Chicago.—The Dodson Manufacturing Company, incorporated by J. H. Dodson, Maris T. Kendig and Albert E. Dacey; to manufacture bicycles. Capital stock, \$10,000.

Chicago.—Gladiator Cycle Works. Receiver applied for. Application will probably be denied.

Chicago.—F. S. Waters Co. Owen A. Wheeler sues F. S. Waters individually for an accounting.

Dixon.—Smith & Coe. Dissolved.

Freeport.—Michael Redlinger, reported recorded chattel mortgage for \$303.

INDIANA.

Logansport.—Burgman Cycle Co. Closing out.

Rushville.—Albert L. Allen, succeeded by the Mauzy Co.

IOWA.

Boone.—S. E. Burnham Co., new bicycle factory on Elm street. Will manufacture the Topic bicycle.

Keokuk.—Fanning Ball Bearing Chain Co., reported attached \$1,133.

Mt. Pleasant.—Mt. Pleasant Cycle Co. Chattel mortgage \$560.

MASSACHUSETTS.

Chicopee Falls.—Chicopee Falls Wheel Co. Attachment dissolved, directors having filed bond for \$2,000.

Franklin.—O. J. Daniels. Assigned.

MICHIGAN.

Chelsea.—The Glazier Stove Works will manufacture bicycles. Estimated cost of plant, \$50,000.

Flint.—H. H. Bickford, stock and business purchased by G. C. Abraham.

Marshall.—Royal Cycle Works. The following directors were elected at the annual meeting: J. L. Dobbins, J. Wiseman, S. H. Gorham, L. F. Page, J. F. Smiley and others.

Schoolcraft.—Howard Cook. Removed to Battle Creek, Mich.

The Improved Tally-Ho Lamp—Bridgport Gun Implement Co., N. Y.

MISSOURI.

St. Louis.—Century Cycle Co., chattel mortgage for \$751.

NEBRASKA.

Omaha.—Ak-Sar-Ben Cycle Co., reported given judgment for \$458.

NEW BRUNSWICK.

St. John.—March Bros. Reported given judgment for \$28.

NEW HAMPSHIRE.

Keene.—Richards & Dana. Discontinue. J. T. Abbott, agent, settling claims.

NEW JERSEY.

Camden.—Edward Reeder's bicycle cement factory damaged by fire. Loss, \$500; covered by insurance.

Newark.—Howard & Nichols Manufacturing Company. On application of C. G. Howard, president of the company, Ethel C. Harris appointed receiver. Liabilities, \$13,500; estimated assets, \$60,000.

Newark.—Searles & Starr Company. Requesting extension.

NEW MEXICO.

Raton.—J. C. Trimble, new store.

NEW YORK.

Binghamton.—Ogden & Green. Porter L. Green withdraws. George H. Ogden continues.

Brooklyn.—W. C. & F. J. Dunham. Judgment, \$270.33.

Brooklyn.—Bosse & Co. Out of business. Whereabouts unknown.

New York.—Roberts & Brinkerhoff, carriages, sleighs and Fox bicycles, No. 117 Chambers street, in hands of Sheriff, on claims in favor of the J. B. McFarlan Carriage Company, of Connellsville, Ind., for \$3,275, and in favor of Thomas L. Curley and Robert L. Hedges, as surviving partners of Roland Davis, of Hamilton, Ohio, for \$1,420.

Syracuse.—American League Cycle Association. Attached, \$374.49.

Tonawanda.—Tonawanda Bicycle Company. Assigned to William J. Kearney. George Fries, of this company, makes personal assignment to Charles Much.

Utica.—Richard Mortimer, of the late Unique Cycle Company, arrested, charged with grand larceny on claim of the Keating Cycle Company, for \$220.

OHIO.

Cincinnati.—Francis Van Meerbeke, bicycles, reported given real estate mortgage for \$2,200.

Cleveland.—The Plugine Company. Requesting twelve months' extension.

Columbus.—A. L. Baker's bicycle store damaged by fire to the extent of \$1,000; partially insured.

Lucas.—J. S. Charles, hardware, will add bicycles and desires agency.

Springfield.—H. W. Potter, reported gone out of business.

ONTARIO.

Galt.—Angus Cameron, reported assigned. Smith's Falls.—Wheelmen's Headquarters destroyed by fire; insured.

PENNSYLVANIA.

Harrisburg.—Given & Hossenberger. Hossenberger withdraws. J. Roberts Given continues.

Lancaster.—Hurst & Herr. Assigned. Execution, \$450.

Philadelphia.—Chashmore & Greenhalgh. Sold out by Sheriff.

SOUTH CAROLINA.

Florence.—John Trevathan, bicycle repair shop in rear of "Reform Advocate" office.

LOYAL AS EVER.

Hereafter the Wesson-Nivison Manufacturing Company, who make the Loyal bicycle and Loyal bicycle parts at Cortland, N. Y., will be known as the Wesson Manufacturing Company. The Supreme Court of the State has authorized the change of name.

NEW PATENTS.

569,813. Baggage support for bicycles. Daniel Chamberlain, Boston, Mass. Filed May 6, 1896. Serial No. 590,428. (No model.)

569,877. Handle for velocipedes. Henry H. Luscomb, Hartford, Conn. Filed November 5, 1895. Serial No. 568,016. (No model.)

569,977. Cycle saddle. Lucien Perisse, Paris, France. Filed March 25, 1896. Serial No. 584,821. (No model.) Patented in France January 13, 1896, No. 250,468.

569,981. Bicycle saddle. Edgar Strakosch, Baltimore, Md. Filed May 16, 1896. Serial No. 581,748. (No model.)

Trade-marks:

23,028. Athletic, bicyclists' and sportsmen's wear. A. G. Spalding & Brothers, Chicago, Ill. Filed September 14, 1896. Essential feature, a representation of a baseball. Used since 1884.

23,022. Velocipedes and their parts and bicycle sundries. A. G. Spalding & Brothers, Chicago, Ill. Filed September 14, 1896. Essential feature, a representation of a baseball. Used since 1882.

23,032. Bicycles. National Sewing Machine Company, Belvidere, Ill. Filed September 25, 1896. Essential feature, a representation of a wheel and a sewing-machine head inclosed by the rim thereof. Used since May 4, 1896.

BROUGHT FROM ABROAD.

Washington, D. C., Oct. 23.—The latest statistics compiled by the Treasury Department gives the following imports of bicycle sundries entered for "immediate consumption" during the years ending June 30, 1895 and 1896:

Cycles and parts of same, 1895—Duty 35 per cent. Imports valued at \$576; total duties on importations, \$201 60. Average ad valorem rate of duty, 35 per cent.

Wicking, lamp or candle, woven, braided or twisted; lining for bicycle tires, and spindle binding, 1895—Duty 45 per cent. Imports valued at \$8,548 99; total duties on importations, \$3,806 55. Average ad valorem rate of duty, 45 per cent.

Imports of bicycles and parts of the same for the year ending June 30, 1896—Duty 35 per cent. Imports valued at \$56,960; total duties on importations, \$19,936. Average ad valorem rate of duty, 35 per cent.

Wicking, lamp or candle, woven, braided or twisted; lining for bicycle tires, and spindle binding—Duty 45 per cent. Imports valued at \$4,103; total duties on importations, \$1,846 25. Average ad valorem rate of duty, 45 per cent.

Imports of rubber for immediate consumption, 1894—Duty 30 per cent. Imports valued at \$241,967 97; total duties collected, \$72,500 37. Average ad valorem rate of duty, 30 per cent. 1895—Duty 30 per cent. Imports valued at \$44,785; total duties collected, \$13,435 50. Average ad valorem rate of duty, 30 per cent.

The free imports of crude rubber during the year ending June 30, 1896, were: 1,873,675 pounds, valued at \$134,492. Average value per unit of quantity, 7 2-10 cents.

Cement, for bicycles, 1894—Duty 20 per cent. Valued at \$5,726 48; total duties collected, \$1,145 30. Average ad valorem rate of duty, 20 per cent. 1895—Duty 20 per cent. Valued at \$3,285; total duties collected, \$657. Average ad valorem rate of duty, 20 per cent.

WHERE WHEELS COME HIGH.

According to the report of the French Consul at Rio Janeiro, the cycle business there must be an exceedingly profitable one. He says:

"Since the opening of the Paulo bicycle rink in September, 1895, the trade in bicycles, tri-cycles and similar articles has taken considerable extension in San Paulo, in which the population exceeds 180,000 inhabitants, of all nationalities. The wheels imported brought high prices. The English wheels were worth from \$200 to \$220, and the French wheels from \$150 to \$200. As yet, few American bicycles have been imported, but what few dealers are receiving bring from \$50 to \$100 more than they cost in their own country."

NORWEGIAN TRADE.

C. E. Soutum & Co., of Christiania, Norway, who import bicycles into Norway, report that American bicycles are getting on in that country, and they also make special mention of the popularity of the M. & W., G. & J., Hartford and Akron tires. The roads are not rough, but they are filled in with stone, so that the tires are put to a hard test. They suggest heavier tires for their country.

IN HATTON GARDEN.

As THE WHEEL announced a week or two since, the foreign inquiry which has reached the Newton Rubber Works has been sufficient to justify the establishment of a foreign branch. The Newton people have just completed arrangements with Griffith Coit, 47 Hatton Garden, London, to act as their representative. He will carry a full line of Newton tires and other goods.

An advertisement in a Sunday paper calls for "a safety for a young lady with 54-inch wheels."

"Ideal" Wood Rims

WITH INTERLOCKING JOINT.
PATENTED.

The simplest, most ingenious, and strongest joint made—so expert wheel manufacturers say. Holds with and without glue. Can't pull it apart; nothing like it yet in the market. The most careful and critical examination invited. Write us for samples; they will cost you nothing. Investigate before placing your '97 contract. We are not beginners—twenty-five successful years' experience in turning and bending woods. Use us and we will do you good

"IDEAL" WOOD HANDLE-BARS.

Made of second-growth timber. Correct patterns. Excellent finish and mountings. Prices right. Use us and we will do you good.

KERR BROTHERS & CO.,
Hicksville, Ohio, U. S. A.

Kindly mention The Wheel.

You Run No Risk

All of the firms whose names are listed in this book are houses of first-class reputation.

BOOK NOW READY.

Published by F. P. PRIAL, 88 West Broadway, New York.

LOOK OUT FOR POLICEMEN!

There are those in the world who have such an uncomplimentary opinion of policemen that they have been known to declare that it is safest when possessing anything of value never to show it to a policeman. The Warman-Schub Cycle House has lately been convinced that this opinion of a policeman is not without considerable foundation in fact.

Along in May the Warman-Schub house exhibited a very clever cycle ambulance, which same ambulance first came under a Chicago police captain's notice some time in August. The captain at once hid himself to Warman-Schub, dilated upon his "pull," promised a writup in the daily papers on the strength thereof, and induced Mr. J. I. Warman, the inventor and patentee of the ambulance, to allow the captain to exploit the same as a timely and much-needed invention.

All this Mr. Warman did, and now he has the satisfaction of seeing his invention appear in print as the result of the stupendous thought of the police captain aforementioned. Verily, police captains have an unusually taking way, and the foregoing is sufficient proof thereof!

WILL KEEP OPEN HOUSE.

One of the absentees from the New York Show will be the Tinkham Cycle Co. of this city. They state that they could not obtain such position as they desired. They will, however, show their full line of bicycles, tri-cycles and carriers at the Fifty-ninth street store, and will loan wheels to all visiting agents who desire to see the city a wheel.

MAKING THEIR "MARK."

Adams & Westlake mean to impress "a mark of high degree" more thoroughly on the Pacific Coast. To that end they are establishing a branch house in San Francisco. It will be opened November 1. E. H. Kimball, who was connected with the Golden State and Miners' Iron Works, the former Adlake agents, will be in charge.

STRINGENT SUNDAY AGREEMENT.

The Chattanooga, Tenn., bicycle dealers have entered into an ironclad agreement to suspend business on Sunday. By the terms of the agreement, any dealer who rents or repairs a wheel, or does any business whatsoever on Sunday, forfeits \$25, the amount to be divided among his competitors.

TO HELP THE LION ROAR.

L. S. Seidelin, of the Monarch Cycle Manufacturing Company, sailed for Europe on Saturday to look after the interests of the firm on the Continent.

C. W. Fourdrinier will be general manager of the Boston cycle show. He has been in New York getting points at Board of Trade headquarters.

OBTAINED BY A SMALL DOG.

The Fulghum Mfg. Co., 26 to 32 W. Washington street, Chicago, are marketing the "Benoit Adjustable Handlebar." They claim it meets every requirement of the rider; that is, it can be adjusted to a variety of positions, and at the same time is strong, firm, and of neat appearance.

The accompanying cut gives some idea as to the many positions to which the bar can be adjusted. These adjustments are obtained by a small dog in the end of each bar, where it fits into the head socket or clamp, which when pushed in allows the bar to be turned, but as

it reaches the next notch or hole in the clamp immediately snaps into place and holds the bar perfectly rigid. A bolt is provided which, when tightened, adds additional strength to the clamp and prevents any part from working in gloose. The tubing used is 7/8-inch 18-gauge and of best quality, all parts being heavily nicked.

The Benoit bar is also made in wood; the only difference from the steel bar is that the dog is not used.

WANT YOUR EXAMINATION.

"Nothing like it on the market," is the assertion made concerning their Ideal wood rim by Kerr Bros. & Co., of Hicksville, Ohio. The rim has an ingenious interlocking joint, and as the firm invites examination and criticism, and has had twenty-five years' experience in turning and bending woods, their goods and claims are entitled to respectful consideration. Wood handlebars are, of course, also included in their wares.

FIRE BURIED WATERBURY.

Fire destroyed the building occupied by the Waterbury Wrench Co., Worcester, Mass., last week. The firm manufactured a new patent cycle wrench. Loss, \$18,000; insurance, \$12,000.

HE HAS QUITE A CONTRACT.

While the talk is all of shipping American bicycles to England, it will probably surprise not a few people to learn that there is at present in the country a Briton who seeks to reimplant an English wheel in this country. Fred Dray, representing the Coventry Machinists' Company, Coventry, England, manufacturers of Swift cycles, is the gentleman. He is making an extended trip through this country, principally for pleasure, but he also expects to make arrangements for marketing the Swift cycles. He will go as far West as St. Louis, returning to New-York through Canada. Swifts were once well known, and cut a considerable figure on this side of the water.

MALTBY'S NEW TRICK.

W. S. Maltby, who formerly handled Keatings at 1 Park Place, this city, has united with the Maltby-Henley Company, of 20 Warren street, who for the past twenty-five years have been well known throughout the country as manufacturers of hardware specialties and silver-plated ware. The company will have the exclusive sale of Keatings, both wholesale and retail, in the metropolitan district, which includes Long Island, Staten Island and Westchester County, and will also retail the Stearns, Crescent and Tinkham cycles.

CAME OVER FROM PARIS.

C. Bertrand, the head of the American Importing Company, No. 6 Place de Madeline, Paris, France, is at present in this country. His firm are agents for the Cleveland bicycle in France. They do an immense business, having sold a great number of Cleverlands during the past year. In addition to bicycles, the firm jobs quantities of sundries throughout their territory. Mr. Bertrand is in Cleveland, Ohio, talking '97 business with H. A. Lozier & Co.

THE FALCON KING FLIES AWAY.

President Joseph L. Yost, of the Yost Manufacturing Company, sailed on the Germanic on Wednesday for an extended trip through Europe. The company has distributing agencies in both Paris and London, through which retail agencies have been established in numerous continental cities. Mr. Yost goes chiefly to look over the field and feel the pulse of the foreign market.

BEEEN INCORPORATED.

The Boston Cycle Board of Trade Company has been incorporated under the laws of Maine, with Frederick A. Verry, of Newton, Mass., president; Carle P. Cubberly, of Somerville, Mass., treasurer. The "promotion of the common interests of manufacturers and dealers in bicycles" is given as its objects. Capital stock, \$5,000.

CYCLING TRADE REVIEW

VOL. XVIII. —No. 12.

NEW YORK AND CHICAGO, NOVEMBER 6, 1896.

[WHOLE NUMBER, 454.]

18 YEARS' CAMPAIGN

“ for sound Bicycles and Bicycle Improvement must have proven successful.

“ Else would we have inaugurated years ago our “leadership” of bicycle vogue by “originating” also the recently introduced fashions of “dying young” or “removing nameplates” for bargain purposes.

“ That’s reasonable, isn’t it ?

“ The free hand of INNOVATION has been duly restrained by personal PRACTICAL EXPERIENCE—not only TESTS, there is a difference.

“ That’s why Rambler improvements have invariably survived and become standard.

“ We have helped our competitors that much at least.

“ The most successful bicycle agents this year, and those whose selling seasons outlasted those of their competitors, have handled exclusively G. & J. Tires and

RAMBLER BICYCLES.

We shall increase our agency list in the U. S. A. and FOREIGN COUNTRIES and also make some changes in present agencies. All applications for Rambler agencies should be sent to nearest G. & J. branch house.

Catalogue will be sent upon application.

GORMULLY & JEFFERY MFG. CO.,

“ Bicycle Builders for 17 Years.”

NEW YORK: 939-945 Eighth Avenue.

BROOKLYN: 342-344 Flatbush Avenue.

COVENTRY, ENG.

A. D. Meiselbach Company,

MANUFACTURERS OF

BICYCLES

North Milwaukee, Wisconsin.

Kindly mention The Wheel.

High-Grade Rims for High-Grade Wheels.

There's a reason why manufacturers of highest grade cycles adopt

FAIRBANKS WOOD RIMS

season after season—a good reason—They're the best.

Other rims may shrink and warp, splinter and crack, and look cheap and inferior into the bargain, but "From Greenland's Icy Mountain to India's Coral Strand," everywhere and all the time, those rims bearing our trade-mark are of the same

Enduring Quality--- The Best.

"Fenton" Bicycles are fitted with them.

JAMESTOWN, N. Y., July 27, 1896. FAIRBANKS WOOD RIM CO., Bradford, Penn.

Gentlemen: Replying to your favor of the 25th inst., we take pleasure in stating that we have used practically all Fairbanks Wood Rims on our output since '93. We think the fact that we used them season after season on our output is as satisfactory a comment as we can make as to what we think of Fairbanks Wood Rims.

Very truly yours, PENTON METALLIC MFG. CO. (Signed) A. Guilbert, Jr., Sec. and Treas.

Add value to your product by using Genuine Fairbanks—the finest goods made.

LAMINATED AND ONE-PIECE RIMS. WOOD HANDLE-BARS (LAMINATED AND PLAIN). WOOD DRESS AND CHAIN GUARDS.

FAIRBANKS WOOD RIM CO.,

Office and Principal Factories, - - BRADFORD, PENN.

THIS IS THE TREAD OF THE PEBBLED VIM

LANCASTER, PA.,

Oct. 13, 1896.

I thank you very kindly for the '97 repair kit. I tried it and find it does its work quickly, easily and very satisfactorily. I have showed the '97 kit to the boys and they are very much pleased with it. I have always stood up for **VIM TIRES**, and only found one fault—namely, the hard tire not being easy to insert plug into. But as it is overcome now I am perfectly satisfied and happy with the thought of quick and easy repairs without carrying a carpenter shop along. I am confident, as I have always been, that **VIM TIRES** resist puncture better than any other make.

ISAAC T. LUTZ.

Our Tool Bags and Saddles

FOR 1897 ARE NOW READY. 22 NEW DESIGNS IN TOOL BAGS, 12 OF WHICH PATENTS APPLIED FOR OF NEW STYLES IN SADDLES

3 OF WHICH PATENTS APPLIED FOR

Our New Hygienic Saddles.

(PATENT APPLIED FOR.)

A firm seat combined with an easy spring that can be changed to a stiff spring by any rider in a moment's time. Has been used over rough roads by many experts for the past four months, and is pronounced by all to be the best saddle ever made. Endorsed by leading physicians all over the country. When using this saddle, it is just as easy to ride over cobblestones and railroad tracks as it is to ride over asphalt pavements.

New and improved shaped tops of finest oak tanned leather. Qualities the best. Prices the lowest. It will pay you to write for catalogues and prices.

SINGLE-TUBE TIRES

S. T. T.

“Don't Never Prophecy Unless You Know”

Is a capital and a safe rule, especially in politics. But when

SINGLE-TUBE TIRES

Increase from 15 per cent. in 1894 to 33 per cent. in 1895, and to 50 per cent. in 1896, it is safe enough to prophecy that the season of 1897 will see the Bicycles of America shod with

Over 65 per cent. of Single-Tube Tires.

Licensed SINGLE-TUBE TIRES are made only by the following manufacturers:

The Boston Woven Hose and Rubber Co.,
The Brooklyn Rubber Company,
L. C. Chase & Co. of Boston,
The Diamond Rubber Company,
The B. F. Goodrich Company,
The Hodgman Rubber Company,
The Ideal Rubber Company,
The Indiana Rubber & Insulated Wire Co.,
The Kokomo Rubber Company,
The Mechanical Rubber Co. of Chicago,

The Mechanical Rubber Co. of Cleveland,
The Newton Rubber Works,
The New York Belting & Packing Co., Ltd.,
The New York Tire Company,
The North American Rubber Company,
The Palmer Pneumatic Tire Company,
The Peoria Rubber & Manufacturing Co.,
The Pope Manufacturing Company,
The Revere Rubber Company,
The Spaulding & Pepper Company.

ALL OTHERS ARE INFRINGERS.

SUITS have been brought in every United States Circuit where infringements have occurred.

Peoria Tires

The Great Centurian,

THOS. W. DAVIS,

Rides a Pair of Peoria Tires

6,233 MILES!

SEE WHAT HE SAYS OF THEM:

PEORIA RUBBER & MFG. CO.

PEORIA, ILL., Sept. 12th, 1896.

GENTLEMEN—I take pleasure in giving you an unsolicited testimonial in regard to the high grade and durability of Peoria Tires. I have your single-tube tires on my wheel, and they have run since the 19th of May to the 12th of September, 6,233 miles. During that time I have had neither puncture nor leak of any kind, and they are still in good condition. I have ridden nearly 30,000 miles on other and different makes of tires, and never could get over 1,800 miles on any of them without puncture or other trouble. I ride on all kinds of roads and have given your tires a thorough test, and consider that you have one of the best tires ever made, and would recommend them to riders as such.

Yours very truly,

THOMAS W. DAVIS.

Every wheelman in Illinois will agree that the best of Illinois roads are bad enough and that the average is mighty poor. Mr. Davis' mileage was made within 100 miles of Peoria, and almost every city and town in every direction within that distance was visited during his many long rides on Peoria Tires. What better test can tires be subjected to?

Do not be skeptical. Try a pair of Peoria Tires. They are all we represent them to be. Full of life and resilience, and made of the best material obtainable.

Peoria Single-Tubes, fitted to any bicycle, . . . \$8.00 per pair.

Web Tread, Double Tube, fitted to any bicycle, . . . 7.00 per pair.

TOUGH TREAD
TIRE

What All Bicycle Riders
Have Been Looking For ❁ ❁

A single-tube pneumatic road tire that will not puncture at every sharp object with which it comes in contact. Chase's Tough Tread Tire is constructed with a tread very difficult to penetrate; yet it retains great resiliency, giving ease and comfort to the rider. After most rigid and severe tests, this tire has demonstrated its superiority as a road tire over all pneumatic tires, and has reduced the chances of puncture at least 95 per cent.

This tire costs no more than any other first-class tire. Price, \$10.00 per pair.
If your dealer does not carry this tire, send direct to

The Hercules WOOD RIM CO.

Factory, AU SABLE, MICH.
General Sales Office, DETROIT, MICH.

THE HERCULES RIM consists of two layers of wood, between which is a strip of chemically prepared fibre of **great strength**; the three strips are so joined as to be **absolutely undetachable**; the different joints are each located in a different part of the rim. The main features accomplished in the rim are, that while it weighs slightly less than an all-wood rim, it is very much stronger; it is very elastic, and the special fibre strip is an absolute preventative of splitting. The disposition of the average rider to follow the racing custom of blowing his tire to the maximum seems likely to result in an unheard of quantity of split rims the coming season. As already stated,

THE HERCULES RIM WILL NOT SPLIT.

The color of fibre is either red or dark, as preferred, and is a positive addition to the beauty of the rim.

DUST AND CHAIN GUARDS,

In Bird's-Eye, and Plain Maple or Elm.

OUR GUARDS ARE NOT MOULDED OR WARPED, but worked out from blanks $\frac{1}{2}$ x 2 in., giving them all the strength and stiffness required with the least amount of weight. Our workmanship on these cannot be excelled. Samples upon application.

Aluminum Frame Saddle.

This company has been at improvements in the saddle line for a long time, and in getting up new goods for the coming season, it has been their aim to make a complete line of saddles, not only for show, but to stand the wear and tear. We are making a regular Leather-Seated Saddle, with special construction of frame, and included in that line is a new style of Lady's Saddle, which has special features which make it, without a doubt, the best Lady's Saddle on the market. We also have in connection with this line a Lady's and a Gentleman's Leather-Laced Saddle, which are constructed with the latest special features. Besides the above we have a new designed saddle, which, we think, will take the lead among the riders the coming season. It is made with a light aluminum frame, heavily padded and covered with a handsome leather top. We absolutely guarantee against stretching or breakage of this saddle, and it is considered by the best long-distance riders as the easiest seat ever put on a bicycle.

YOUNG TRADE REVIEW

Copyright 1896, by F. P. PRAL CO.

VOL. XVIII, No. 12.

NEW YORK AND CHICAGO, NOVEMBER 6, 1896.

WHOLE No. 454.

EASY AS CAN BE.

Boston's Famous Hill No Longer Has the Terrors for Wheelmen It Once Had.

Historic Corey Hill, Boston, was stormed by a squad of cyclists on Saturday last, all straining every muscle to reach the summit in the quickest possible time. The hill is half a mile long. The professional record stands at 2 minutes flat by F. St. Onge. The best amateur time was 2:14. Four men succeeded in getting under the amateur figures, but the professional time was not equalled. The men were started at intervals of two minutes in the single and tandem climbs. Robert Urquhart was the first man away. He finished in 2:02, fourteen seconds under the amateur record, and no one was able to touch him.

The tandem climb created much interest. No less than seven chains had been broken in practice trials. Not a chain broke in the contest. The Urquhart brothers pumped their machine up the hill at a sprinting clip, making the fastest time in which the hill has ever been climbed.

The hour contest was exciting from start to finish. "Bob" Urquhart jumped the bunch as they got away, and led up the hill, never being headed. His wheel was fitted with a hand brake. The other wheels were fitted with foot brakes of the metal and shoe kinds. F. P. Kent, the Rowley racing man, started a sprint after Urquhart when the contest was half over, but could not catch him. The men coasted the hill faster than they ever rode in a race, yet no one was thrown, and the excellent police arrangements kept the course clear. Summary:

SINGLE CLIMB, UNPACED.

Robert Urquhart, Fowler wheel, Vim tires, 60 gear, 7-inch cranks. Time—2:02.

F. P. Kent, Fowler wheel, Vim tires, 60 gear, 6½-inch cranks. Time—2:11 2-5.

James Urquhart, Fowler wheel, Vim tires, 60 gear, 6½-inch cranks. Time—2:11 3-5.

J. S. Magoon, Fowler, M. & W., 60 gear, 6½-inch cranks. Time—2:12.

J. L. Turner, Comet, M. & W., 70 gear, 7½-inch cranks. Time—2:18 3-5.

J. E. Ballentine, Orient, Vim, 63 gear, 6½-inch cranks. Time—2:30 2-5.

J. F. Bertsch, Fowler, Chase, 60, 7-inch cranks. Time—2:51 2-5.

John Williams, Vesuvius, Vim, 60, 7-inch cranks. Time—2:57 1-5.

F. Werner, Iver Johnson, Chase, 63, 7-inch cranks. Time—3:00 2-5.

Frank L. Parnham, Iver Johnson, Chase, 63, 7-inch cranks. Time—3:09 1-5.

TANDEM CLIMB, UNPACED.

Urquhart brothers, Fowler, Vim, 53 gear, 6½-inch cranks. Time—1:51.

Magoon and Ballentine, Fowler, M. & W., 49 gear, 7-inch. Time—2:03.

Lynch and Vogel, Transit, Newton, 56, 6½-inch. Time—2:06 1-5.

Turner and Bertsch, Fowler, M. & W., 56, 6½-inch. Time—2:29 1-5.

Hour Contest—Won by Rob Urquhart, thirteen ascents and descents in 56:15; F. P. Kent, J. L. Turner, F. Werner, second, third and fourth, with twelve ascents and descents each in one hour.

AN ATTRACTIVE SUGGESTION.

In response to the call of President Brock, of the Metropolitan Association of Cycle Clubs, representatives of some fifteen New York clubs attended the meeting at the Hotel Bartholdi on Saturday last. They talked for four hours, and finally had appointed a committee comprising one representative from each club present to interest other clubs and to secure proper authorization from their own clubs. It developed that the end in view is the formation of the Associated Cycling Clubs of New York City, and the continuance of the M. A. C. C. as a central organization, to be composed of delegates elected from the delegations of various associations of clubs in this vicinity, of which there are five. To make the co-operation more unanimous and the central organization more powerful when concerted action is necessary, it is possible that provision will be made for representation from the Good Roads Association and L. A. W. consulates—a most attractive suggestion.

GOOD PEOPLE IN HARD LUCK.

As a result of the failure of the McDaniel & Merrihew Cycle Manufacturing Co., who made the Robin Hood bicycle in Wilmington, Del., the McDaniel & Merrihew Cycle Co., who were agents for the Rambler, Stearns and other wheels, are also in trouble. On judgments aggregating some \$20,000 the sheriff on Friday last took possession of the store at No. 1,011 Market street. The business was allowed to go on. A receiver will probably be appointed. One of the judgments against the company is for \$3,400 in favor of B. Frank McDaniel, administrator of his mother's estate, and one for about \$16,000 in favor of the Gormully & Jeffery Manufacturing Co.

ADMINISTRATOR WANTS DAMAGES.

While training on the Coliseum track, Nashville, last August, William R. Pearson fell and received injuries from which he died. Last week George T. Pearson, administrator, instituted suit for \$25,000 damages against the Coliseum Company.

RESOLD BY THE SHERIFF.

The stock of the Elbridge (N. Y.) Cycle Co. has been resold by the Sheriff. F. B. Scott, president of the Syracuse Supply Co., purchased the machinery for \$2,055. The unfinished bicycles were bought by Mrs. C. L. Higgins for \$2,675.

NOT IN THE RECEIVER'S HANDS.

The report that the Gladiator Cycle Company, of Chicago, had applied for a receiver turns out to be untrue. President Wenter states that several such reports have been circulated by a former employe who, to obtain revenge, has endeavored to injure the company's credit.

Cleveland and Westfield bicycles will hereafter be running mates. The Westfield is an addition to the Lozier line, and will be made in the new factory in the Massachusetts town of that name.

AFTER ECK.

The Racing Board Serves Him with Notice That He Must Pay or Be Suspended.

From Philadelphia comes the announcement that Chairman Gideon is again after Tom Eck's scalp. It seems that shortly after his return from France he made arrangements with the promoters of one of the Maine meets to bring a number of racing men there to compete in the races and to do some exhibition riding, it being agreed that \$1,200 was to be expended for expenses and prizes. When the time for the meet arrived, however, Eck was not on hand, greatly to the disgust of the public and the promoters of the meet, and the latter filed a protest against the veteran manager with the Racing Board.

After several letters from Chairman Gideon had remained unanswered, Eck wrote stating that his failure to be on hand was owing to the fact that he had not sufficient funds to defray the cost of transportation. It was the opinion of the chairman that the Board could not recognize this as a valid excuse, and that Eck should have informed himself on this point before the arrangements were made, so it was decided that the Maine men would have to be compensated by a sum of money, to meet the expenses of advertising, etc., incurred through Eck's promise.

In spite of repeated reminders from the Board, this sum has not been forthcoming, and the chairman on Tuesday informed Eck that unless the matter was settled he would again be placed under the ban of the Board, ruled off the track, and prohibited from having charge of the team riding under the League rules.

MR. COLE WARMS TO THE FIGHT.

East Brookfield, Mass., Oct. 31.—E. L. Cole, through his counsel, Colonel W. A. Gile, has filed a bill in equity, asking the Supreme Court to set aside the sale of the plant of the Greyhound Bicycle Company. The property was sold for \$800, and Mr. Cole alleges that he offered \$10,500 for it, and he still stands ready, and offers in his bill to pay it. The sale was made under the decree of the Insolvency Court without notice to the creditors or Mr. Cole.

Mr. Cole further charges in his bill that the property instead of being sold to E. H. Stoddard, who was co-stockholder with Mr. Cole, it passed into the hands of his wife, and the bill alleges this was done in fraud of the creditors.

THESE WILL DIRECT.

At the annual meeting of the Cycloid Cycle Company, of Grand Rapids, Mich., these officers were elected: F. A. Simonds, president; E. C. Studley, vice-president; J. C. Simonds, treasurer; W. B. Jarvis, secretary and general manager; Chauncey H. Fisher, William Cooper and A. Vidro, directors.

HOW TO SELL WHEELS.

Some very sound and practical ideas regarding the best means of selling bicycles are accumulating in the Crescent Bulletin, the Western Wheel Works' "official organ." The Crescent people have sought the views of the largest and more successful among their agents, and are reprinting the opinions for the benefit of the others. Berrang & Zacharias, the well-known Asbury Park firm, have just added their contribution. It deserves the heed of agents everywhere. The New Jersey men say:

"Begin with advertising judiciously and well. Just how to do this, however, is a problem that few of us have been able to solve.

"So far as we have been able to check results, it is money wasted to place an advertisement in the hotel registers, city directories and many of the church fair and some other programmes. Our advice would be to use only the columns of the local press, and two carefully selected lists—one of the riders, the other of known-to-be non-riders. To these lists we aim to send out, at stated periods, postal cards, circulars, etc. We are firm believers in postal-card advertising.

"Advertising alone will not make sales. It should, however, attract possible buyers to your store, when, if your wheels are cleanly kept and tastefully displayed, your employees courteous and attentive, sales will follow.

"When you see a customer entering the store, feeling the tires and acting as if he were entirely disinterested, look out for him. He has the bicycle fever, and is sure to purchase a wheel from you or one of your competitors. Step up to him and make him perfectly at home.

"Bear in mind this fact, also, that it often takes months, if not years, to make a convert. This is especially so with the more desirable class of customers, and has been perhaps more noticeable in the early days of the trade than within the last few years.

"We have found that we made many friends, and thereby sales, by taking care of a customer who, a stranger in our town, purchased his wheel in some other city, extending to the stranger the same courteous treatment that we always aim to extend to those to whom we had always sold wheels, and have often wondered why agents, as a rule, will not show the proper attention to customers who have purchased wheels elsewhere. Our experience proves that it pays, and is one of the little things that leads on to success.

"Your first duty is to make a sale; after that comes another just as important and one that should lead on to other sales and enable you to hold your own against all competition—that is, of taking care of the wheel in the way of looking after the adjustments, seeing that the wheels are trued, etc.; few customers but what appreciate little attentions of this sort.

"It is astonishing how some people will ride a bicycle with the bearings too loose, chain either too tight or too loose, etc. After a sale is made see that the handle-bar and saddle are properly adjusted to your customer before they leave the store; this is especially important with lady riders.

"When it becomes necessary to repair or replace parts under the guarantee, correct the trouble with a smile and do not make your customer feel uncomfortable, as some we know in the trade do.

"The department stores that are making such havoc at the present time in prices, we think will really benefit the trade in future sales. Many people are riding wheels to-day at \$25 that can well afford the best on the market. These riders, now that they have the fever, will become dissatisfied with the department-store wheels, and can be easily induced to ride a reliable make, by another season.

"In selecting your line of wheels, purchase only from the manufacturers who uphold the price of their goods not only in theory, but in practice. Our firm belief is that few agents will survive who attempt to do business on a price-cutting basis."

BUILT ON TRUE TRIANGLE LINES.

Tinkham carriers have undergone a transformation. The '97 models are built on the true triangle principle, the strongest and stiffest form of construction known to science, which will place them in a class by themselves. The Tinkham Company have had some of the machines cover twenty miles per day for six months, and that they have not been in the repair shop once is good proof of their worth. They have 18-inch steering

wheels instead of 28-inch, as last year, and all are fitted with gear cases of Tinkham design and manufacture. The Philadelphia Item has already contracted for a number of the carriers; several orders from abroad are also in hand. The Tinkham people have also improved their tricycle wherever possible, and report a small but steady demand. The three-wheelers are turned out in their New-York shop, but they say, however, there is little profit in such machines except as an advertisement.

HE HAD NO RIGHT TO THINK.

"I cannot believe it!"

An angry flush mounted to the young man's forehead, and he rose, impatiently, from his seat and beat his golf stick nervously on the floor. "No," he said, turning to face the girl, who, but a few short moments before, had so suddenly and ruthlessly thrust him aside, "I cannot believe that you really mean what you say. We have known each other for years. Ours has been no sudden passion. Think of its gradual growth—of how strong has been the love that has bound us. And now, after all that has passed, do you mean to tell me that, in the full possession of your senses, you have calmly reached the decision that we are unfitted for each other?"

"I have," replied his companion, the light of a high resolve shining from her unfinching eyes. "Do you suppose I could ever marry a man who thinks the wheel he rides is a better make than mine?"

THE PRICE OF A NECK.

A hickory handlebar with their patented "Can't Slip" locking device, is being marketed by the Hall Manufacturing Company, Wallingford, Conn. In remarking that both the wood and fittings are more expensive than those in general use, the Hall people pertinently ask: "Is a rider's neck worth the difference when that difference is but a trifle?"

INFINTESIMAL.

"How do you feel then?"

"As small as a man feels who has been run over by a bicycle ridden by a woman."

Straus tires will hereafter be marketed by Oliver, Straus & Co., of this city. They will be made by the Akron Rubber Company.

DURYEA'S MOTOR VEHICLES.

The Duryea Motor Wagon Company, of Springfield, Mass., shipped three motor wagons to England last week, which will arrive there in time to take part in the parade to be held near London on November 14 in honor of the repeal of the locomotive-laws, which for thirty years past have obstructed and retarded automobile vehicles in England. They have closed a contract lately with the Canada Manufacturing Company, of this city and Carteret, N. J., looking toward the manufacture of motor vehicles of the heavier types, such as delivery wagons, trucks, omnibuses, motor-cars and launches, all using Duryea motors.

The Canada Company have a large car factory at Carteret well equipped with modern machinery and finely adapted to the proposed work. A large dock frontage on salt water and excellent railway connections afford unsurpassed shipping facilities. Mr. Charles E. Duryea, of Peoria, Ill., president of the American Motor League, and well-known to readers of THE WHEEL, is at Carteret superintending the construction of a delivery wagon and a large omnibus now under way. The motor vehicle industry bids fair to assume large proportions in the near future, and the Duryea Company are apparently increasing their present lead.

TRY THEM BEFORE YOU BUY THEM.

Theim & Co., the St. Paul (Minn.) firm whose toe clips are probably the best known of their several cycle accessories, give a guarantee with those articles that is easily in a class by itself. It says: "Every pair of our improved adjustable toe clips are guaranteed for one year, and should a pair become broken, by accident or other causes, we will gladly replace them free of charge upon receipt of damaged pair. Dealers are requested to allow their patrons to try them for one week, and should they not prove perfectly satisfactory, take them back and refund the money. We will make good every pair damaged from such causes."

ON THE LAWS OF HYGIENE.

Hygienic or cushion frames are making progress. The Warwick Cycle Manufacturing Company and several other well-known manufacturers are supplying them as an option, and others have the matter under advisement. The Hygienic Wheel Company, Nos. 909 and 910 Bets Building, Philadelphia, who make the frame, promise a much improved and particularly fine article for '97, and believe that it will prove such as will impress every cyclist who values his or her comfort.

SEE SUCCESS AHEAD.

At the annual election of officers of the Hay & Willits Manufacturing Company, makers of Outing bicycles, the old officers, consisting of Thomas Hay, president; Ed D. Evans, vice-president; George H. Evans, secretary and treasurer, and V. B. Willits, manager of the factory, were re-elected for the coming year. The reports were of a character satisfactory to the stockholders. Prospects are bright for a good business during 1897.

AN OUTING FOR THE OUTING.

O. B. Henderson, of the Hay & Willits Manufacturing Company, is in England in the interest of the Outing bicycle. He reports excellent success, and the probabilities are that the Outing wheel, during the coming season, will be well represented in Great Britain.

A spoon brake weighing but six ounces will be a feature of the '97 Gendron.

NEW CLIPPER BEARINGS.

DETROIT, Mich., Oct. 5, 1896.

Grand Rapids Cycle Co., Grand Rapids, Mich.

GENTLEMEN—I want to congratulate you on your Clipper Bicycle bearings for '96. So far we have not replaced a single bearing, nor heard of one wearing in the slightest manner. Yours truly,

J. F. MACAULEY.

Mr. Macauley sold 344 Clipper Bicycles up to September 1, 1896.

A Perfect Pedal...

THE JANNEY FOR '97.

No loose cones and no check nuts—it will not bind and will not tighten. Dust and water proof. Oil always there—cannot escape.

SIMPLE, ARTISTIC AND THEREFORE ATTRACTIVE.

MEN'S COMBINATION PEDAL.

MEN'S RAT-TRAP PEDAL.

A cheap pedal injures the reputation of your wheel and costs high when all things are taken into consideration. There are other good pedals in the market—naturally we think ours is the best—so we ask you to compare.

Think what it means never to have the rider find fault with the pedals, so important, and yet so small a part of the bicycle.

Notice to Advertisers.

WHEEL ADVERTISERS are notified that change of advertisements is not guaranteed, unless copy is received by Saturday morning.

IMPORTANT NOTICE.

The attention of the trade is called to the information blank on page 51 of this issue. Manufacturers, handlers of parts, sundries and specialties, sellers of raw material and finished material, in fact all who are interested in the wholesale bicycle trade, are requested to immediately fill out this Trade Directory blank and forward same to THE WHEEL. This information will be compiled in Directory of the American Cycling Trade, which will be accurate and up-to-date in every respect, and designed to serve as a handbook or reference book for people engaged in the cycle trade. Besides a classified list containing the name, address and class of output of the entire cycle trade, it will also have a classified index of each article or product, alphabetically arranged, so that the name of the producer can be readily ascertained. The cycle trade is now so extensive that an accurate work of this kind is needed.

PRICE AND QUALITY STANDARDS

DURING the first week of August of this year, when the cycle trade was at its lowest point—because there was then so much of doubt and so much of the calendar ahead of us, while now we are on the threshold of revivification—THE WHEEL bird's-eye-viewed the causes of failure and of flattery, and expressed the conviction that the sooner a '97 high-grade list price was fixed upon, the better it would be for the cycling trade.

An early announcement of a standard high-grade price was all the more necessary, in

view of the widespread attempt, on the part of space-fillers in the daily press, to teach the people that the highest-grade bicycle cost anywhere from \$30.31 down. There were also the frantic attempts of the department stores to sell bicycles for little or nothing, and the wholesale "dumping" of bicycles, made necessary by over-production and under-capitalization.

THE WHEEL urged the leading firms to take the initiative. THE WHEEL particularly urged the Board of Trade Executive to take up the questions of standard price and maintained price, and to give those questions an impartial and thorough discussion. THE WHEEL is now in a position to state that the Board of Trade Executive did not fail in its duty, and at the last meeting of the Board, its Executive (at which there was a full attendance, each man among the twelve representing firms among the most important in this country), the question of high-grade list price was exhaustively discussed, and the result of that discussion, after strenuous and eloquent arguments on both sides of the case, was an understood agreement that the '97 price on high-grade bicycles will be \$100.

Up to that time about a dozen of the makers of our best bicycles—wheels of stanchness and style—had already announced their price of \$100.00, and, in some cases, \$115 and \$125. The courage indicated by their early announcements is worthy of commendation, and now that the pioneers in a standard \$100.00 price have been followed by practically concerted action on the part of the Board of Trade Executive, there is no reason to believe that the price for the best wheel will be less than \$100.00.

Of course, it is to be expected that some among that large army who scribble in the daily press sensation and balderdash, will at once commence to pooh-pooh a \$100.00 price and will endeavor to instill into the public the idea that such a price is fictitious, exorbitant and illogical—that it cannot be held; that there will be a slump later on, and that the proper and only thing to do is to "wait" for that slump. It is unfortunate that the editors, both managing and departmental, of the great dailies, are not able to give such matters a more careful espionage, in which case the greater mass of this fictitious matter would not percolate through the public print. These managing and departmental editors would first know that their papers should not be used to batter down a trade which has just passed through a deplorably bad season. These managers would know also that never again will the American public have a deluge of cheap wheels such as the season just closing has produced. These editors would learn that conservatism is now the order of the hour.

Some forty firms of importance have failed during the year, and, of the many firms who are left—the majority of them good, and some few not so good—hardly any are doubling up or extending their capacity. Most of them, in fact, will be satisfied with producing next year exactly the number of

wheels they are certain they can sell, exactly the number of wheels the public will take at a profitable price. The keynote of next season's bicycle trade is—Production in accordance with demand. When the season opens, few factories will have their store-rooms loaded up to the roof with product, waiting for the influx of orders and the outflow of bicycles. They will have on hand only moderate sized stocks, and if they find it possible to sell more wheels than they had at first provided for, they will be in a position to crowd on some extra stock, since most of them have arranged their plans with that possibility in mind.

There have been very much in evidence this year two kinds of wheels, the very good and the very bad. The very bad have been more in evidence than ever before, and have been sold at lower prices than ever before. The public has absorbed them, but the firms who have made them have not been prevented from going to the wall. The cycle trade is now happily rid of them. In many cases they were capital-less adventurers or impecunious faddists. Their product and themselves are well out of the way.

In the season of '97, the public, so far as we can see at present, may, at times, have to wait for the better class of bicycles, and will have to pay living prices for them. We make this statement in view of the expected revival of business, which must revive with the new change in Administration, which especially must revive after capital and energy have been so long dammed up, waiting for occasion and opportunity.

Now that the list price of high-grade wheels has been practically settled, some of the talent of cycle merchants should be devoted to maintenance of price. Few will be prepared to say that a cast-iron agreement can be drawn up and lived out; but some preliminary work can be done. A spirit of mutual confidence can be inspired among the makers of high-class wheels. They can do much for one another, and in the end all will benefit.

Of course we must still expect some "Cheap Johns" in the bicycle trade; for the capitalist who wants to get out, the man who has bitten off too much, the man who makes wheels which won't sell, and the man whose wheels cost him too much—all these will want to unload, and a few of them must always be with us. But, in the main, the trade has been cleansed, purified and strengthened, and its capacity more or less limited. Even some of those firms against whom there has never been a breath of suspicion, have had their fingers burned badly during this year. They have learned order and conservatism and the necessity of sticking to the legitimate, for only the legitimate is profitable in the long run, and no business man who is in business for a day or a summer is a business man. He is an interloper, a saunterer on the business thoroughfare—oftentimes a commercial criminal since he ruins not only himself, but robs others of the legitimate reward of investment and labor.

FOR A CYCLE SPEEDWAY.

WHEN some two or three years since the desirability of a speedway for cyclists was suggested to THE WHEEL we gave as our opinion that the time was not ripe to advocate such a measure, except on a limited scale. We suggested that the Park Commissioners be petitioned to set aside "the Circle," an out-of-the-way spot in Central Park, for speeding purposes. This was done, but the authorities turned discourteously deaf ears to the appeals.

In the interim work on the million-dollar Harlem Speedway has progressed with reasonable dispatch, but not fast enough to please the horsemen for whom it is designed. Possessed of "pull," they last week had railroaded with amazing swiftness through the Board of Aldermen a measure setting aside two splendid avenues whereon they may speed their horses to their hearts' content, and without fear of arrest, which will serve their purpose until the Speedway is completed. Meanwhile the cycling scorcher is left to his thoughts and to the condemnation of the press and public.

Under the law of 1887—the Liberty bill—we believe he has as much right to use without limit to pace and without hindrance any highway or byway that is or may be set aside for the speeding of horses. We do not believe that he can be barred from either Central or Jerome avenues, or from the Harlem Speedway when it is completed. Should this be done, or an arrest follow, it will furnish splendid grounds for a civil suit. The law seems quite clear on this point. It says:

"The commissioners, trustees or other authorities having charge or control of any public street, public highway, public parkway, driveway, or public place in this State, shall have no power or authority to pass, enforce, or maintain any ordinance, rule or regulation by which any person using a bicycle shall be excluded or prohibited from the free use of any public highway, street, avenue, roadway, driveway, parkway, or public place, at any time when the same is open to the free use of persons having and using other pleasure carriages."

That discrimination against bicycles should be impossible was the one intent of the law. To grant horsemen the right to scorch and to deny it to wheelmen is certainly discrimination and manifestly unfair. Against the desire of horse owners to possess a speedway, we have naught to say. We know the exhilaration that comes from a drive behind a lithe-limbed trotter. Against the action of the Aldermen in providing means for the pleasure we have naught to say. But we do maintain that they must now make similar provision for wheelmen, who outnumber the horseowners 100 to 1. None but the scorching extremist will care to encroach on the equestrian's preserves. The element of danger is too great and, more than this, it is well known that the soft road surface necessary for horses is almost fatal to cycling enjoyment.

We are all prone to rail against the scorcher, but at heart we know that he is seldom as

black as he is painted. He is thoughtless and indiscreet, but as a rule he is a most skilful rider. He knows how to properly handle himself and his wheel, but he selects the wrong time and place to extend himself, possibly because there is no right time and place, race tracks and race meetings excepted.

As we said last week, there is as much exhilaration in speeding a bicycle as in speeding a horse; perhaps more. The wheelman who has never exceeded the dawdling legal limit of eight or ten miles per hour has never experienced it. He is, however, a "rara avis," as we all know. The desire to "let out a link" is human. Not to "let out" occasionally is to lose the quickened heart beats, the expanded lungs, the glowing cheek, the brightened eye, and the tingling coursing of the fresh, warm blood in every vein. Eight miles per hour scarce moves the sluggish blood. The same impulse that moves the horseman to desire a speedway moves the cyclist to scorch, even at the risk of arrest, no matter where he is.

The authorities have provided for the few hundred horsemen. They should now make provision for the many thousand wheelmen. If New York City can afford to expend \$1,000,000 for the former, it can afford \$100,000 for the latter. The smaller sum will easily construct a path such as the Coney Island wheelway, than which no better cycling speedway could be asked. The time is now ripe for the advocacy of such a demand. The clubs and New York wheelmen generally should take action. In the face of what has been done for horsemen, we do not see how the authorities can reasonably refuse to heed the demand.

THE FRONT SEAT.

TO BE a success in these times we must own a horn and toot it continually. To get a front seat in the grand stand past which rush the record-makers of trade, we must walk in, push our way past slower men, and take the seat; and we must look as if we not only owned it, but had a mortgage on all the private boxes, and could occupy any one of them if we so desired. The man who wants to succeed must struggle for this front seat, even if he has to jostle the real owner and put his umbrella down on his soft corn. Once in a while he may be set back where he belongs, but he will get in front oftener than if he should wait to be invited forward.

The world has not time to analyze character, weigh merit and to decide as to the relative ability of men. This is a fast, hurrying, rushing world of ours, and it is very much influenced by the value that a man sets on himself. If he says: "I am the greatest designer and the largest manufacturer of bicycles in the country," the world is apt to take it for granted that he is, rather than go to the trouble of holding a civil service examination of his merits. If he says: "I am but a poor, ordinary, everyday cycle maker," the world will say: "You look like it; get out of the way."

We have taken a practical, worldly view of the matter, and the amount of moral ethics in

this article may seem to you limited, but there is truth enough in it to bulge out at the edges and split up the seams, and the timid advertiser should find therein food for much thought.

WHIRLIGIGS AND CURLYCUES.

MANY ingenious but otherwise worthless cycle inventions are constantly challenging our attention. They occupy a large share of the news of the day, and the people are successively interested in and excited over the promised wonders to be accomplished. We hear a great noise, we see a bright flash, and then there is silence and darkness.

As to the things which are merely novel or ingenious, it is one thing to think up those things, even to the minute details of them, but it is quite another thing to deliberately and with great perseverance go to work and make them. Every inventor, when racking his brain for some device or arrangement to accomplish a given purpose in cycling, has all kinds of whirligigs and curlycues come through his head.

Among the arrangements thought of, some are evidently absurd and impossible, some barely possible, some possible and practical but costly or complicated, some cheap and simple but otherwise less satisfactory, and so on, the devices in various shades of excellence thronging through his brain, and his supreme function is to make the best selection and application possible out of a host of possibilities suggested, and never to be carried away by the novelty, the ingenuity, or the complication of a device, as the patent reports each week show so many evidently are, to their misfortune.

According to the prices established by New York Magistrates in imposing fines, the privilege of running down other users of the public highways by drunken cabmen and truck-drivers is only worth \$3, while that of committing the unpardonable crime of riding a bicycle without a lamp is valued at \$5. Verily, Solomon was an idiot when compared to a New York Magistrate!

It is pleasant to reflect that mannish-appearing wheelwomen will always be an insignificant minority in cycling.

A fool is born every minute, and the supply of fool bicycles for him to ride are invented in the same proportion.

What we wish to remember we must thoroughly possess. If it is in the line of building a bicycle, we must be master of it, not only laboring diligently, but in understanding each step, being interested in each detail, seeing the relation of each part to the whole, and cultivating a determination for excellence.

You know a great deal about a rider when you know what kind of rider he isn't.

The infant cycle prodigy is usually an infant nuisance,

TESTED AGENTS AND ADVERTISING

As a Result Their Books Balanced Beautifully, and the Cycle Papers Proved Their Worth.

One of the concerns which is feeling at peace with itself and with all the world as a result of the year's business is the Iver Johnson Arms and Cycle Works. E. H. ("Ned") Wilcox, who manages the cycle interests, reflects the contentment.

Despite a season of adversity in the trade, the Iver Johnson people came through without the loss of a penny, although marketing some 10,000 wheels, and with the services of but a single traveller—a record deserving of a plume. One account required the services of an attorney to settle, but that was straightened out satisfactorily to the Fitchburg firm. The secret of the record? Wilcox had a financial idea of his own, which worked as he expected. By a simple test an agent whose account remained unpaid beyond a certain period was rated undesirable, and was courteously relieved from service. It required some courage to carry out the policy, but the end abundantly justified the means.

In addition to proving the financial worth of agents, Mr. Wilcox also made a thorough and practical test of the channels—the advertising mediums—through which business reached the Iver Johnson Works. The result is a glorious tribute to the cycling press. Mr. Wilcox says, without reserve, that nine-tenths of their business is directly traceable to the cycling publications in which they were represented. The Iver Johnson wheels were advertised in nearly all of the prominent weekly and monthly periodicals, as well, so that the result can scarcely be termed a chance hit. All were given the same test. No business inquiry was suffered to pass unnoticed or uninvestigated. If it failed to mention its source or inspiration a polite and nicely worded request, inclosing a two-cent stamp for reply, and seeking enlightenment, went from the Fitchburg factory. It is these replies and on the business which followed that Mr. Wilcox bases his testimony. He went into the matter very thoroughly, with purpose aforethought, and without prejudice. The investigation was impartial, and was conducted on the only feasible plan. The result will probably astonish some of the gentlemen who are inclined to the placing of an advertisement in the light of a benevolent or philanthropic contribution.

Located in a quiet part of Fitchburg, Mass., and partly surrounded by a picket-fence, the four big symmetrical brick buildings and as many more substantial outhouses of the Johnson works in themselves constitute quite a settlement. Capable of producing 15,000 bicycles and more than half a million pistols each year, the capital represented is not difficult to conceive. The plant is splendidly equipped, and, as seems usual in New-England factories, there is a place for everything and everything is in its place.

After having parts and processes explained by such a clear, untechnical and logical, and yet far from boastful, talker as "Ned" Wilcox, one cannot leave the place without being convinced that Iver Johnson cycles are thoroughly good cycles. Wilcox can pick up a threaded screw or bolt or other part of the wheel and point out the beauties, the smooth, well-finished spirals of such a minor point as lath-chased threads or take up the big, rough drop-forging which is worked into the head and head connections of the Iver Johnson and go into the fine points of drop-forgings so that none can misunderstand. And, truth to tell, this forging is a magnificent specimen of the art, which is not such a far-fetched

definition as some might imagine. The entire head of the wheel is a solid piece of steel, bored out and finished until it becomes steel tubing; the spurs for connecting the top and bottom bars of the frame form part of the same forging, and are bored taperingly, rendering reinforcement unnecessary. Wilcox will ask you whether heads made of steel, in which the atoms have been compressed under the terrific poundings of giant hammers, are stronger and better than those formed of steel which has been drawn and the atoms spread out to a great length. He will give you a few more like that. You may scratch your head, but unless you are amazingly clever you will have a time of it in combating him. The average man will be convinced and leave full of respect for Wilcox and the wheels he sells.

WAS NOT INTERESTED IN HATS.

Mr. Slooper came in the other day from the Boulevard and told Mrs. Slooper all about Mrs. Smartelos's new cycle costume.

"It was great," he said. "It had a skirt that came about up to her knees, and knickerbockers underneath. The skirt wasn't one of those full things, you know; it was real scant. Then there were golf stockings and low shoes just the same color as the suit, a sort of dusty brown. And the stockings!"

"What sort of hat did she wear?" interrupted Mrs. Slooper.

Mr. Slooper was silent for an instant. Then, "I didn't look at her hat," he said.

HIS TURN NOW.

The strong man of the hour, and what he is expected to do.

WORTHY THE WHEEL HE RIDES.

On the Texas circuit Floyd A. McFarland, of the Monarch team, did some brilliant work, winning eleven firsts, three seconds and one third, Gardiner, Wells and Stevens were the biggest men pitted against him.

AGAIN LAWSON DIDN'T.

At the Coliseum, Nashville, October 29, a match race for three miles took place between Lawson, of Chicago, and Woodward, of Nashville. Woodward won in 6:51 1-5.

On the Merrick course last week A. G. Releya, K. C. W., rode five miles in 11:31 3-5, breaking the New York State record by 10s.

CRYSTAL PALACE CLIPS.

Two amateur records were clipped at the Anerley meet in Crystal Palace, London, October 17. Clark and Battersby placed the tandem mark at 1:56 1-5, and A. G. Wright put up a new hour's record of 29 miles 454 yards.

CREDITED WITH THIS.

W. L. Eckhardt, of Baltimore, is credited with riding an unpaced mile, straightaway, on the York road in 1:37 last week.

As a novelty the managers of London's new racetrack at Crystal Palace have offered a prize for a race on ordinaries.

COUNTING THEIR MONEY.

British Cycle Companies Reporting Their Profits to Stockholders—Some New Tandems.

London, Oct. 24.—As the result of an annual tour of discovery in the Midlands, the object of which is to obtain early information regarding new features and designs, I cannot say that I have unearthed much that is novel, but I have seen quite enough to convince me that there will be terrific competition here next summer. Huge concerns like Humpers, the Raleigh, Singer and Coventry Machinists companies have practically provided for a doubled or trebled output, so that there will be no lack of high-grade home product. I think that I have before pointed out that almost everybody is building new premises in order to cope with next year's anticipated trade. Without any doubt the output from the English factories will be double what it has been, so that any American firm which has not provided itself with good representatives here and made its arrangements satisfactorily now need scarcely think of attempting to do so in the spring.

From a financial point of view the present is a very slack month. Very little stuff is being delivered, and, as accounts have been fairly and promptly met by buyers, owing to the good season, there are few outstanding accounts to worry over.

Balance-sheets are still appearing. The Raleigh report discloses a profit of £22,000 and an ordinary dividend of 10 per cent. The Coventry Cross Company (late Warman & Hazlewood) also declare 10 per cent; Alldays & Onions, 10 per cent; Cycle Components, 20 per cent, but the Rudge-Whitworth Company have not been in a position to do more than pay their preference claims and wipe out half of last year's losses. The Raleigh dividend was a trifle disappointing, as the £1 shares rose as high as 35 shillings on the strength of reported big profits—they now stand at 30 shillings. The Coventry Cross and Alldays & Onions results are agreeable surprises, but the others are also disappointments to shareholders. The Cycle Components were reputed, as I reported recently, to have made profits amounting to £170,000 on a capital of £160,000, and the £1 shares touched 90 shillings on the strength of a huge dividend, which was confidently expected. The "prophecy" proves to be nearly correct, as net profits amount to £180,000, of which £153,000, however, was obtained from sales of patents and proprietary interests on the Westwood rim, the Hudson Tube Company and Carter's gear case. All this has been put to reserve, and the dividend declared out of the ordinary profits. This is, no doubt, a sound business policy, looking at the present inflated condition of the trade, but, all the same, some people who buy £1 shares in a cycle concern at 90 shillings demand more than 8 per cent for their money at present. The Rudge-Whitworth, however, is the most grievous disappointment, and the ordinary £1 shares which had been fairly steady—about par—for some time, dropped at once to 13 shillings.

Humber & Co.'s balance-sheet is expected shortly, and I am told that it will disclose a net profit of £100,000. If this be so, and I have no reason to doubt it, the £1 ordinary shares are bound to appreciate rapidly, as they stand at 30 shillings as I write.

The John Griffiths Cycle Corporation, who advertise themselves as the largest retail cycle dealers in the world, are losing or relinquishing a few of their leading lines. For instance, the New Rapid makers have closed

their accounts, and now the Raleigh, one of their best selling lines, is about to pass into other hands. I hear various reasons assigned, but I will probably be very near the truth when I surmise that these firms have taken umbrage at the Corporation deciding to use a full line of its own wheels—the Dunlop—in first and second grades. These machines are built for them by the Cycle Components Manufacturing Company, and already J. W. Stocks has made them famous by his brilliant riding on a "second" grader. The J. G. C. C. balance-sheet is nearly due, and is expected to be a good one, but I "hæe ma doots," as the Scotchman said.

About the beginning of the year the Osmond people brought out a new design in tandems to meet the desire gradually growing for a machine on which the lady occupies the rear saddle. I saw that machine then, so that I must confess that I was much surprised to find in the Raleigh depot in Nottingham a tandem on exactly similar lines. Osmond specialties in the way of D section forks and the single bottom backbone are eliminated. This is the Raleigh tandem referred to:

It is claimed that the machine is even more rigid than an ordinary racing tandem, though no reasons were given me, and I can see none beyond the weight, which is 55 pounds, as compared to 40. The chief dimensions are 26-inch front frame, 21-inch back, 5 1/4-inch rear tread and 66 1/2 gear.

The Coventry Machinists shareholders met the other day and talked a good deal about annulling their contract to sell their company, made some months ago, because the purchase had not been completed so far as handing over the coin went. That they had some reason on their side is, I think, shown by the fact that the purchasers who have not completed their part of the agreement will become possessed of £54,000 which has been earned in profits since the transfer was agreed on.

FOR SOCIABILITY'S SAKE.

Humber & Co., that is, the American factory, are experimenting with a companion or social bicycle, and will probably market a limited number next season.

COLORED UP.

Whene'er he had punctured,
His patriotic grew;
His face got red, he then turned white,
And made the air look blue.

Marle & Co., who make the Acatene-Metropole or chainless cycles in Paris, have applied the bevel-gearing not only to men and women's bicycles, but to tricycles, tandems and triplets. The lightest single is catalogued at

IN GOOD COMPANY.

Chicago, Nov. 1.—Gus A. Pleus, manager of the bicycle interests of the A. F. Shapleigh Hardware Company, of St. Louis, was a welcome Chicago visitor last week. He was busily engaged looking over the bicycle and sundry field, with a view of placing his orders for '97 stock immediately succeeding the election. He made a pleasant acquisition to the large crowd of bicycle people at the Wellington Hotel, among whom are Montague Perrett, of the American Dunlop Tire Company; William H. Cahn, of New York; Fred S. Dickinson, of the Reading Tire Company; also F. W. Heustis, manager of the same concern; Messrs. Thayer and Jones, of Hamilton-Kenwood Cycle Company, and the jolly Wilbur F. Knapp, from Hooker & Co., San Francisco.

MADE IN MADISON.

D. D. Warner's trip to this part of the country was prolific of results. A number of export orders were closed and the Eastern agency for Warner cycles placed with C. J. Stebbins, No. 103 Reade street, this city. The Warner, made in Madison, Wis., is comparatively a new wheel hereabouts, but Mr. Warner states that Eastern criticism was so favorable that he has reason to expect good business. Wheels will be ready for delivery December 1.

WANT WHEELMEN'S HELP.

The co-operation of the wheelmen of New York State has been asked by the president of the Society for the Prevention of Cruelty to Animals in having enforced the law making it a misdemeanor to place in the street any article or substance likely to injure any animal. Bicycle tires share an equal risk with the hoofs of horses by the non-enforcement of the law.

SHOOTERS FOR THE SHOOTERS.

Folks who wonder what become of all the bicycles that are manufactured might profitably turn their speculation to firearms. In the Iver Johnson factory at Fitchburg, Mass., where both wheels and shooting irons are made, no less than 1,800 pistols are turned out daily when the plant is going full tilt.

AN OPENING IN ITALY.

Baldi Brothers, Florence, Italy, are in position to handle a line of American wheels, cycle accessories and sporting goods. No out-of-date stock is wanted. It is explicitly stipulated that only '97 goods are desired.

Transcontinental tourists claim that the particles of sand in the breeze blowing off a desert are the quickest possible destroyers of a tire. The air and sand are nature's sandblast.

twenty-four pounds, and sells for \$125, the same as the chain-gear machines made by the firm. The catalogue, in which the G. & J. tire figures conspicuously, is quite American, both as to cover and arrangement and style of the printed matter and illustrations.

HARTFORD TIRES.

Before deciding on next year's tires remember that

Hartford Tires are the Original Single-Tubes.

We made them for years while other makers worked along a different line.

Hartford Tires are the Best-Known Single-Tubes.

When anyone speaks of a single-tube tire you think of a Hartford at once.

Use tires with an established reputation.

Your wheels will sell easier.

To Bicycle Riders: We Make Our Tube OF FIFTY CARBON STEEL

Because a Tube like this of

Is just as strong as

a Tube like this of

This diagram does not show how much stronger and more durable our tube is than the usual quality in the market because it does not include the always bad and more or less uncertain effects of "pickling." By ordinary methods tube is annealed in the open fire and pickled from eight to twenty times, according to finished size. By the use of a patented annealing process, controlled by us for tube making, our tube never comes in contact with the fire and is never pickled. There is no "theory" about this. Our thorough tests show that even with the greatest precautions in pickling (not usually taken), pickled tube is weaker and more brittle than tube made of the same material without pickling. Send for a Catalogue.

THE POPE TUBE CO.,
HARTFORD, CONN.

While weight for weight in a Bicycle FIFTY CARBON Steel will last so long

and TWENTY-FIVE CARBON Steel will last only so long

ROUND THE RECORD BUSH.

"Way Down South in Dixie" the Ecks-ites Are Plucking Record Plums.

Nashville, Nov. 2.—Ever since Wednesday of last week there has been an almost continuous shaking of the record tree at the Cumberland Park track. The result is that many of the choicest of the plums have fallen to the untiring energy of Johnson and his mates. On Wednesday the weather was perfect for fast time. Johnson first went for the half-mile, paced by a sex and a quad. He succeeded in lowering the half-mile record to 47 seconds, cutting the mark of 47 4-5 seconds by Kiser, made at Coronado. In the ride, through an error, Johnson went 100 feet over the distance, the correct time being equal to 45 2-5 seconds.

In the quarter-trial the quad carried the sextuplet to the tape with Johnson trailing, and the latter flew with the men, crossing the tape in the phenomenal time of 20 2-5 seconds, about eight feet back of the big machine.

The quadruplet team, captained by Frank Waller, with Myers, of Minneapolis; Bradis, of Chicago, and Staver, of Portland, cut the half-mile unpaced record to 49 4-5 seconds, breaking the record of 52 seconds by the Grace quad in England.

On Thursday four records fell. To make his half-mile decisive and correct in distance Johnson first went for the mark again, and not only beat the time, but made a large cut in the estimated time. He made the half-mile in 44 1-5 seconds, which is 3 3-5 seconds lower than the record formerly held by Kiser.

Next the third-mile figures were altered. The mark was 30 2-5 seconds, held by Kiser. Johnson reeled off the first quarter in 20 seconds, two-fifths of a second lower than his previous day's record, finishing the third in 27 4-5 seconds. He was paced by the quad and the sex to the tape. Later Waller, Myers, Bradis and Staver placed the quad record, unpaced, for a third at 31 1-5 seconds, and the triplet record for a half was lowered to 48 2-5 seconds by Phillips, Bradis and Myers. On Friday Johnson was not lucky. He missed the mile record by two seconds, and the unpaced quarter by one-fifth of a second. Phillips and Wing, the tandem team, broke the quarter-mile unpaced record, doing 22 3-5 seconds, the broken record being 23 2-5 seconds by Kiser and Randall at Coronado. The official half-mile unpaced tandem record was lowered by Phillips and Bradis, who did 51 1-5 seconds, lowering 52 3-5 seconds by Taylor and Hewitt. Weing and Steenson established a third-of-a-mile unpaced tandem mark of 32 2-5 seconds. Weing, Davis, Steenson and Phillips on a quad tied the unpaced quarter-mile record of 23 seconds for that machine.

Johnson's efforts on Saturday were again centred on the mile. He made three attempts, all of which were failures. He has, however, the honor of riding the three fastest miles ever ridden by one man in a day. In the first trial he finished in 1:42, the second was in 1:40, the third in 1:41. He closed the week's work by changing the three-quarter mark of 1:15 3-5 to 1:13 2-5. Failure in the mile attempts was laid to the cross wind and to the fact that the pacing crews have taken part in races every night at the Coliseum indoor track and had become weary. Horse-racing at the track this week compelled the team to break camp, and on Monday they left for New Orleans, where Michael will have his innings. He will go for all figures from three to a hundred miles. Ten records is the result of the week's work here.

Michael's work at the Coliseum resulted in a new ten-mile indoor record of 21:27 3-5.

CANADIAN TIME CONQUERORS.

Canadian records have also had a thorough shaking-up during the past week. The Brantford track has been the scene of the greatest activity. On October 28 Angus McLeod started the game by riding a quarter-mile paced in 0:25 1-5. The quarter-mile professional record, unpaced, standing start, was broken by Fred Westbrook, time 29 seconds, beating the record 1 1/4 seconds. The mile open record, amateur, was broken by R. O. Blaney; time 2:03 3-5; former record, 2:05. The two-mile amateur record was also captured by Blaney in 4:23; previous record, 4:29. The one-mile flying start, paced, was won by Angus McLeod, time 1:53 2-5, beating the record 3-5 seconds. In the half-mile amateur tandem, flying start, Boake and Tucker rode it in 54 seconds, beating the Canadian record 8 seconds, and making a new world's amateur record.

On October 31 the wind blew at the rate of forty miles an hour, and no attempts were made over a quarter of a mile. With the exception of about twenty yards at the start the wind was on the backs of the riders. Tucker and Boake, who are about the fastest tandem team in Canada, first lowered the quarter-mile tandem, flying start, to 0:24 4-5. Next McLeod took a try. Paced by two tandems he finished in 0:24 1/2. Westbrook afterward cut the paced, standing start, to 0:28 4-5.

At Toronto on October 30, John Davidson rode 26 miles 1,599 yards in the hour at the Hanlon Point track, cutting the amateur figures from 3 to 26 miles. On the following day A. McEachran rode two miles, flying start, paced in 4:11 1-5, the former record being 4:45. Frank Moore lowered the unpaced standing start amateur quarter to 0:31.

SMELLING A MOUSE.

There is a hazy feeling in Buffalo over the legality of the time made by L. George over the Erie-Buffalo course—4 hours 25 minutes—cutting deeply into A. B. McDonell's alleged time of 4:40:09. Although McDonell's figures were accepted by the Century Road Club, there are many who entertained the belief that the time was "faked." Efforts are being made to secure affidavits from the timers and checkers who officiated at George's last ride, but there is, nevertheless, a feeling that he must have ridden something faster than a cycle. George has offered to substantiate his claim for the record by going over the course again. George made a claim for the record last season, which was not accepted, and it seems strange that experience did not teach him the necessity of having proper officials.

EVEN IN PHILADELPHIA.

Philadelphians, too, have the record-breaking fever. At the Point Breeze track October 29, W. G. Douglass, of the University of Pennsylvania team, went for the amateur paced record for ten miles, and got in, incidentally cutting the times for eight and nine miles, as well. A quad carried him the first five, and alternated with a tandem during the last five. His times follow:

1	2:10		6	13:28
2	4:22		7	15:42
3	6:38		*8	17:54
4	8:56 4-5		*9	20:09
5	11:15		*10	22:13

*Records.

Later Hill and Gardiner cut the amateur tandem mile record to 2:02 3-5.

TO SLOWVILLE AND BACK.

Albert Peitscher, of the Yorkville Wheelmen, negotiated the New York-Philadelphia and return course in 18 hours 17 minutes on Sunday last, Peitscher's friends claim

this as the record, overlooking Richman's figures of 17 hours 17 minutes, said to have been made on the previous Sunday. He was paced both ways.

H. J. McGrane, of the Century Wheelmen, started shortly after Peitscher and galloped on him on the outward trip, cutting down the record for one way to 7 hours 45 minutes. On the return journey he fell and broke his kneecap by running over a chicken.

MAY NOT BE SO LAUGHABLE LATER ON.

A despatch to a Boston paper relative to the safe arrival of the Butler brothers in London says: The advent of the Butlers in Paris will be received with no end of amusement, for the French riders have begun to think that America had sickened of contests in this part of the world. Tom Butler will surprise the Parisians. They will look at this slight built lad with incredulity. They will laugh to themselves of what they think must be the finish.

ACCIDENTS AND CONFUSION.

Probably a more unsatisfactory event never took place than the ten-mile road race of the Iroquois Wheelmen on the Hudson County Boulevard on Tuesday. The winner was disqualified for accepting pace, and the next two men collided near the tape. One had an eye gouged out and the other sustained two broken ribs. This so rattled the officials that they failed to score the positions of any of the following men, and the affair ended in utter confusion, although the judges finally awarded the race to A. Michel.

TRYING FOR A TRIANGULAR.

As a result of the recent team race between Long Island clubs, efforts are being made to arrange a triangular race between the victors, the Pathogue Wheelmen, and the Kings County Wheelmen and the South Brooklyn Wheelmen. The finish of the last race was extremely close, and the K. C. W. team blame the loss to the interference of a farm wagon near the tape.

DIDN'T RIDE LIKE HIS NAME.

Memphis, Tenn., Nov. 3.—Cooper was defeated by Jay Eaton in a three-mile match race for a purse of \$500 at the Coliseum tonight. He finished in 6:31, erasing from the slate the indoor record of 6:44 by Mertens. The men were paced by a tandem. Gilbert Logue cut the half-mile indoor record from 1:04 to 1:02 1-5.

PEDALLED FOR IN A PALACE.

London, Oct. 31.—At the Crystal Palace today McGregor and Nelson, on a tandem bicycle, broke the record for from thirty-two to fifty miles. They covered the latter distance in 1:47:08 2-5.

At Catford, Colliver and Chinn established a new tandem record for a quarter of a mile, with a flying start. Their time was 0:24 3-5.

BEAT THE BROTHERS' BEST.

London, Oct. 28.—At the Crystal Palace today McGregor and Nelson regained the five-mile tandem bicycle record, covering the distance in 9:21 3-5, beating the time made by the Chase brothers yesterday by 1 2-5 seconds. They also beat all records for three and four miles, finishing the fourth mile in 7:24 1-5.

CUT AND SHAVED.

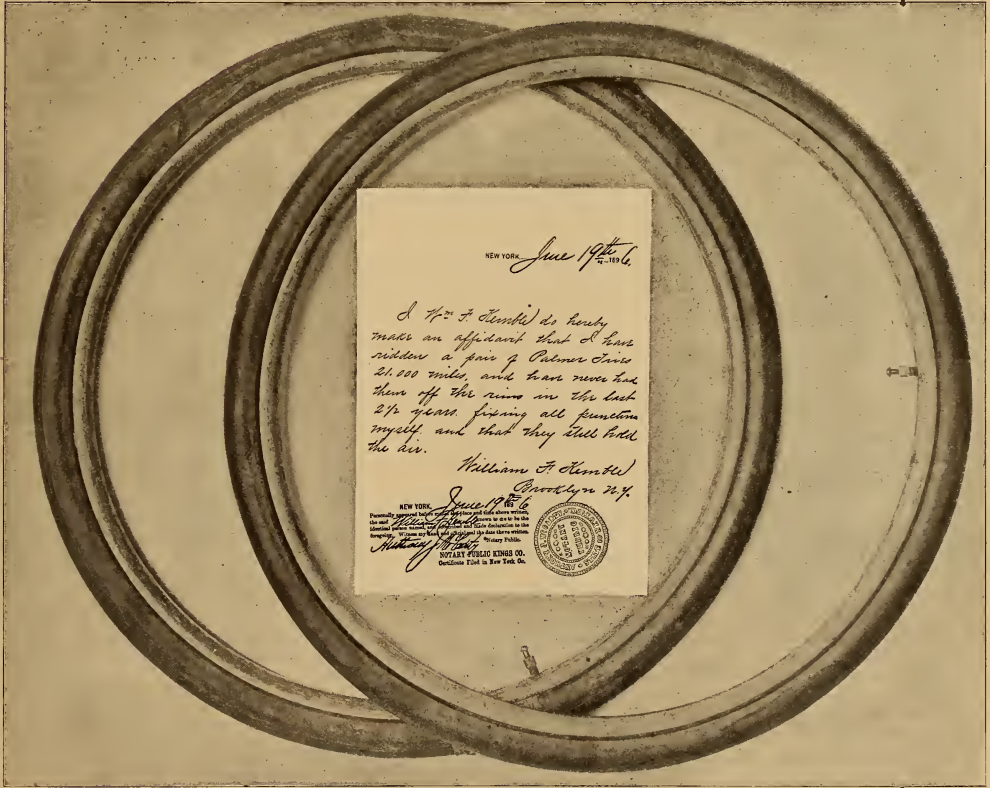

New York State records were the marks at which H. K. Roe aimed at the Pathogue track on Saturday last. He cut the five-mile figures from 11:19 to 11:11, and shaved the ten-mile to 22:53 1/2. He was paced by two tandems and a triplet.

21,000 MILES ON ONE PAIR OF PALMER TIRES...

Look at the picture! The tires are not very much worn, and they still hold air.

A single pair of pneumatic tires—made of rubber and Palmer fabric, and as full of life as a vivacious debutante—stand the strain of twenty one thousand miles of road plugging.

Such a record has never been equaled by the tires of any other maker.

Perfect tires always outwear cheap tires. There is no reason why you should use others when you can get Palmers—the perfect tires.

There is no higher standard than Palmer Perfection

THE PALMER PNEUMATIC TIRE COMPANY

PEOPLE LACKED FAITH.

Philadelphia's last meet of the season was run at the Tioga track on Saturday last. It was promoted by the local professional riders, the men who have declared their intention of governing cycle racing in that city next year. Their debut as promoters was discouraging. In point of attendance it was a frost, scarcely a handful of spectators being present, although the day was perfect. The fastest riders of the Quaker City were on hand, and they put up some excellent times. E. Aker, with a standing start, rode a mile in 2:00 4-5; Douglass, the amateur rider, rode the same distance unpaced in 2:01, and a half-mile paced flying start in 0:57 1-5, and B. E. Stevens covered a third of a mile in 0:37 1-5.

The meet wound up with an attempt for the hour record by H. E. Bartholomew. He was poorly paced throughout, but succeeded in doing 25 miles and 980 yards inside of the given time, increasing the best previous figures on the track made by Starbuck by about 200 yards. The times made in the three contests were uniformly slow. Summary:

Professional mile, scratch—1, E. S. Aker; 2, H. E. Bartholomew; 3, W. S. Keil. Time—2:30 1-5.

Professional, one-fourth mile, scratch—1, H. E. Bartholomew; 2, E. S. Aker; 3, A. C. Meixell. Time—0:36.

Amateur mile, scratch—1, W. G. Douglass; 2, N. H. Cressy; 3, W. Wignmore. Time—2:30.

Amateur, one-half-mile, scratch—1, W. G. Douglass; 2, W. H. Cressy; 3, J. B. Clift. Time—1:20 3-5.

Trial against one-half-mile—W. G. Douglass, flying start, paced. Time—0:57 1-5.

Trial against time, one-third-mile—B. E. Stevens, flying start, paced. Time—0:37 1-5.

Trial against time, one mile—E. S. Aker, flying start, paced. Time—2:00 4-5.

Trial against time, one mile, flying start, paced—W. G. Douglass. Time—2:01.

K. C. W.'S ANNUAL.

Over the Merrick course the Kings County Wheelmen held their annual "twenty-five" on Election Day. It resulted in a clean sweep for the scratch men. The result: 1, C. T. Earle, scratch, 1:13:57; 2, C. M. Hendrickson, scratch, 1:13:58; 3, C. S. Henshaw, scratch, 1:13:58; 4, E. A. Laws, scratch, 1:13:58; 5, T. J. Hall, jr., 3:30, 1:17:51; 6, F. K. Pretz, 5:30, 1:20:36; 7, S. A. Southwick, 9:00, 1:30:35; 8, H. E. James, 7:30, 1:32:00.

ON GUTTENBURG MOUNTAIN.

C. M. Ertz and C. W. Dyer took the honors at the Riverside Wheelmen's meet on the Guttenburg, N. J., track Election Day. The former took the mile open in 2:29 3-5 from Tomlinson and Beam, and with W. A. Brown as mate won the mile tandem. Dyer won the novice in 2:29 4-5 and the mile for non-racing men. The five-mile club championship went to J. T. Beam in 12:15 1-5, with Ertz second.

SLOW TIME, BIG MONEY.

It isn't often that one can ride a mile in 4:25 2-5 and win \$1,000, but this is what is said to have occurred at the Springfield track last week. The event was a match race between P. F. Carrill, of Waltham, and J. F. Smith, of Albany, for a purse of \$1,000. Carrill won after a loafing race in the above time.

RACING EVERYWHERE.

An unprecedented number of club road races were run in the metropolitan district on Election Day. The balmy weather and springlike sun made going as easy as during the summer months. The Irvington-Milburn course, the Merrick Road and the Hudson County Boulevard were all the scenes of lively contests.

AMONG THE KANGAROOS.

Recent Australian advices via San Francisco report that the Rouen 100-mile road race from Bendigo to Melbourne on September 16 was won by W. S. Weld (32 minutes in 5:28:32), beating Broadbent's record by 17 minutes. At Sydney, October 26, W. L. Kerr won the mile invitation race in 2:53 4-5, and the five-mile New South Wales championship in 14:22 1-5. Over 19,000 spectators were present.

In the spring cycling carnival, attended by 8,000 people, at the Sydney Agricultural Grounds on September 25, the "great challenge race," twenty-five miles, between the Americans, Martin and McDonell, resolved itself after the twenty-second lap into the hollowest kind of contest. Martin reserved his strength until the last and won by little more than half a lap, which, in the early stages of the race he had to secure to bring him on level terms with McDonell. The time was 1:15:24 3-5. In the mile spring handicap event, won by F. Eichler, (80 yards) in 2:14 2-5, Martin was not placed.

E. A. Pearson won the fifty-mile road race on September 16, from Paramatta to Penrith, in 3:21. The Italian crack cyclist, Stephen Bolde, arrived at Sydney from Milan on September 22, and has entered the great Austral event. As Melbourne enjoys the privilege of giving the biggest prize in the world for a handicap cycling event, so Sydney is to occupy the post of honor in respect to scratch races, and \$25,000 will be given in the coming championship meeting, in which Martin, McDonell and other foreigners have entered.

HURET WAS HUNGRY.

Among the other expenses of twenty-four-hour races must be considered the one of feeding. In Huret's recent successful attack on the around-the-clock game, his commissary department supplied and Huret consumed the following: Six pints of milk and rice, four pints of Julien soup, six pints of chocolate made with milk, six pints of pure tea, no milk; four pints of coffee, fourteen pints of Vichy water, (mild soda water), twelve pints pure milk, six pounds tapioca soup, one pound beef juice, seven pounds of grapes, two bottles Rhine wine, three bottles of port, one bottle of champagne, some buttered toast, an omelette, a little Chartreuse and eighteen eggs.

NOW HE ROLLS IN WEALTH.

Only two years ago a baker's boy of Paris, too poor to own or rent a bicycle, borrowed one and finished first in a race. The name of the baker's boy was Jacquelin. To-day there appears in French papers the following advertisement:

Jacquelin, being obliged to go for his military service shortly, wishes to sell as soon as possible a turnout composed as follows: First, a Russian trotter, high-stepper, fine action, fast; second, an American buggy, by very well-known maker; third, various harness. The lot in first-class condition. Inquire—

And yet there are some people who ask, Does racing pay?

THAT LONG-PROMISED TRACK.

The Track Committee of the St. Louis Cycle Board of Trade is conferring with the owners of a large estate in that city with a view of purchasing the property for the purpose of laying down an up-to-date track. They hope to meet part of the necessary expense by making the grounds the headquarters of all the cycling clubs of the city. Their idea is to build clubhouses on an adjacent lot.

EVERYTHING FOR THE RACER.

Atlanta, Ga., Nov. 1.—If the plans of N. H. Eggleston, of the Piedmont Track Racing Association, are carried to an issue, Atlanta will become the Mecca for the record-breakers in the future. Before the winter has passed the city will possess as fine an indoor and outdoor track as there is in the country. The newly organized company has been met half way by the Atlanta Amusement Co., on whose grounds the association is going to operate. The Manufactures Building and the Georgia State buildings are to be turned over to them, and also the present outdoor track. Mr. Eggleston said in describing the proposed work:

"The first thing that will be done is to build a fine indoor bicycle track in the Manufactures Building. By our contract we are obligated to complete this feature in ninety days after the contract is signed. As to the track itself, by building a half-story all around the Manufactures Building we can put in there a six-lap track that has no equal.

"In Memphis the new Coliseum Company has a track with a radius of 188 feet, 20 feet wide, and banked 10 feet on the curves. This is considered the finest track of its kind in the country, but the proposed track here will be much better. It will have a radius of 208 feet, be 22 feet wide, and with a radius of 104 feet at the curves they will not have to be banked much. We will also have six laps to the mile.

"The track will be made of the finest wood, one by two, laid edgewise, so that the rider runs with the grain of the wood. It will be built on improved scientific principles, and intended for speed.

"In the four towers of the building we are to have living apartments given over free to the crack Northern racers if we get them here for their winter training. It is simply a perfect plan for racing men. They can come here and live right in the building with the track. On rainy days they may train just as well as in good weather, without going out. In good, warm weather they would also have the advantage of the outdoor cycle track, which will not be 100 yards distant.

"This outdoor track is to be built inside of the present track, and will be one-third of a mile in length. This track is also to be of wood, which is quite a novelty for outdoor tracks.

MARTIN AND THE GOOD THING.

It has been claimed for "Billy" Martin, who is now building up a satisfactory bank account on Australian racetracks, that a chance to secure a dollar never passes him. Not long since an Australian inventor who had patented a supplementary hand-power attachment came to Martin and offered him a fat price to use the same in a record trial Martin was billed for. In event of breaking a record an important additional price was to be paid for each record. Martin had the same proposition from the makers of the wheel and tires he used, so he was anxious to make a success of the trial.

Mounted on a ninety-six geared wheel, which weighed with hand-power gear, thirty-six pounds, Martin succeeded in doing twenty-six miles 380 yards in the hour, and his time for twenty-five miles was 57 min. 20 sec. His other figures were: One mile, 2:02 2-5; two miles, 4:08 4-5; three, 6:19; four, 8:33; five, 10:48; six, 13:03; seven, 15:17 2-5; ten, 22:14. All of which figures will be accepted as records by the Queensland League, with the result that Martin's bank account will be materially increased. It was noticeable that when Martin passed the grandstand each lap he industriously plied the hand-power gear, but once he was away therefrom he relied more upon the power of those sturdy legs of his than he did upon the freak invention.

RACING BOARD'S BULLETIN.

SUSPENDED.

Ninety days, from October 26, competing in un-sanctioned races—Clyde Roberts, Walter Frucky, Wibley Frucky, Columbus Grove, Ohio; W. E. Rudy, Lima, Ohio; Pratt Carr, Harry Oberbeck, Leray, Spitsnag, James Miller, Pearl Allen, Harry Ramp, Ottawa, Ohio.

Until July 1, 1897, competing in un-sanctioned races—Dabby Crawfis, Cartes McDowell, Alf Stamen, Ottawa, Ohio.

Ninety days, from October 27, un-sanctioned races—L. Munyon, Don Miller, J. Will Blake, Ben Brown, Viroqua, Wis.; Henry Olson, Sparta, Wis.

Until January 1, 1899, for unfair dealings in connection with cycle racing—Win Runyan, Marion, Ind.

Ninety days, from October 27, competing in amateur races after becoming a professional—C. L. Johnson and L. S. Duckworth, Keosauqua, Ia.

John T. Williams, Nevada, Mo., until prize wonfully kept by him is returned.

One year, from October 29, for repeatedly competing in un-sanctioned races and in amateur events after becoming professionals—Frank Evans, Will May, George Hunt, Owosso, Mich.

Six months, from October 29, repeatedly competing in un-sanctioned races—P. Rathaway, Owosso, Mich., and Charles Geotzen, Chesaning, Mich.

Three months, from October 29, un-sanctioned races—William Douglas, Sam Ampsoker, Jr., J. Thayer, Ernest Gould, Bert Corey, Owosso, Mich.; —Huntoon, Ovid, Mich.; —Chiles, Easton, Mich.; W. Smith, Owosso, Mich.

Six months, from October 29, competing while under suspension—Forest Bigelow, Columbus, Ohio.

Ninety days, from October 30, for entering classes to which they were not entitled to ride—Ray S. Hofheins and Joe Mahaney, Buffalo, N. Y.

Ninety days, from October 31, competing in un-sanctioned races—Albert Olsen, Clear Lake, Ia.

Cleveland Forksides and "D" Rear Forks
P. & F. Saddles
U. S. Projectile Weldless Tubing
Hamilton Brazed Tubing
Fiber-Bucks'in Grips
Fay & Bowen Spokes, Nipples and Oilers

Kindly mention The Wheel.

NO SOFT SNAP.

R. L. Jefferson, the English tourist, has arrived in London, after an adventurous tour to Irkutsk, the capital of Siberia. Jefferson is no stranger to these long jaunts; in 1894 he pedalled to Constantinople; in the following year he went a-wheel to Moscow and back, from London, in forty-nine days. This year his trip has been of longer duration. Starting from London on March 21 he rode to Harwich, crossing to the Hook of Holland, and thence travelling via Rotterdam, Amsterdam, Bremen, Hamburg, Danzig, Königsberg, Riga and St. Petersburg to Moscow. Thence across the inhospitable region of Siberia to Irkutsk, which city he reached on August 17, being actually 150 days upon the road. Out of these he rode 110 days, resting, either from choice or necessity induced by bad weather, on the remaining days. On ninety-four days it rained; on two days it snowed; and only on fifty-four days could decent weather be said to have existed. On twenty-four days between Nijni-Novgorod and Ashinsk, the roadway was impassable either on wheel or on foot. Jefferson crossed thirty-four rivers by ferry boats, and passed through 2,141 towns and villages from start to finish. The total distance covered, either riding, walking beside, or carrying his bicycle, is 6,574 miles—London to Moscow, 2,380 miles, thence to Irkutsk, 4,194 miles. Jefferson has collected over 500 signatures in English, French, Dutch, German, Russian, Finnish, Tartar and Chinese, testifying to his progress throughout, and has almost daily sent postcards to both England and his Russian destination.

HYDRAULIC WELDING.

Humber & Co. are said to have discovered a process by which joints are welded together by hydraulic power. When two tubes are to be joined the one is made to fit into the other and the inside of the outer one is spirally grooved along the length of the proposed joint. Then immense hydraulic power is brought to bear inside the inner tube, which is pressed into the grooves of the outer tubing, which form a kind of mould to which the inner tube is shaped. On the removal of the water pressure the two tubes are joined together indissolubly. By this process the expense of welding will be considerably reduced, as the operation only occupies five minutes.

SHE HAS SOLVED THE QUESTION.

Cycling as a means of restful exercise now scarcely needs to be pointed out. As a woman said lately: "The beauty of the wheel's cure of insomnia, incipient nervous prostration, and the rest of the ills of the overworked is that it cures in spite of lack of faith, want of skill, or any handicap.

"You get on your wheel, and there is no getting away from it; it must absorb your attention; you cannot worry about the children, the house, the office, finances—any of your cares—you have got to think about your poise on the wheel and watch your surroundings, and in so doing you get out of yourself in spite of yourself. Every physician will tell you that this is all that is needed."

CASE OF TOE-TURNING.

Men's big toes used to face the others, as the thumb faces the fingers. In those happy days our ancestors could go to sleep roosting on a firmly-grasped limb. Much walking has straightened out the big toe, which was originally made for the face-about plan of climbing and grasping. Perhaps the universal use of the bicycle will turn 'em round again. Prehensile toes would be good for pedalling.

A ROTARY RINGER.

A multitude of bells are on the market, but apart from the large, obnoxious gongs which some riders have attached to the rear forks of their machines for theatrical effect, there are but few that are not intended to be fastened to the handlebar. An exception to the line is the Ericson automatic bell, manufactured by Nutter, Barnes & Co., Boston. This bell is attached to the front fork, directly over the forward wheel. A small wire runs up to

a lever fastened to the handlebar, a pressure on which causes a wheel to come in contact with the front tire, the rotation of which rings the bell. In rapid motion it sounds similar to an electric bell. The manufacturers claim it to be durable, effective, light, free from rattling qualities. It will not interfere with a brake or coasting, and is easily adjusted.

Berlin has a cycling association, to which wedded couples are alone eligible to membership.

WHEN WOMEN MEET.

It was in one of those quaint New-England towns, where the roads are but another name for a morass in wet weather, and stone patch in dry. It was cheaper for the town authorities to grant wheelmen permission to ride upon the village sidewalks than it was to build decent streets, at least the wise men in control thought so, and a law in favor of sidewalk riding found a resting-place upon the pages of the book containing the village ordinances.

The village belle, mounted on her wheel, was hurriedly riding to the postoffice to post a letter before the mail closed. Just ahead of her walked a woman in the centre of the sidewalk. Slower and slower rode the belle, and louder and louder rang her namesake; but the woman wouldn't budge. You could tell by the way she wrapped her black shawl around her that she had her teeth set.

"Will you kindly move a little?" asked the belle finally; never a move from the woman. The belle pushed on, intending to pass as the sidewalk widened. Then the woman lost her head, unset her teeth, and let her shawl go. As a result the belle struck her, and dismounted suddenly. The woman glared at her savagely.

"The road's the place for such things," she said viciously. Now the belle wasn't a "thing"; she didn't wear bloomers.

"I agree with you, madam," replied she of the wheel politely, "but as long as the Selectmen allow us to ride on the sidewalk, I shall ride there."

"I'll never move out o' the way o' one o' them things again," said the woman.

"You didn't move out of the way for me," explained the wheelwoman; "that was the trouble"; and so, having had the last word, the belle mounted and rode on triumphantly; and she heard the woman's jaws snap vindictively behind her.

NEW NEST OF A GREAT "BIRD."

To term the Barnes Cycle Company's factory a coté is to carry out the nickname of the Barnes wheel, the White Flyer, which thousands of times has been flatteringly referred to as a "bird." Behold, therefore, the

cote. It has but just been enlarged. The big, substantial five-story brick structure is an addition of the present summer. It conveys its own tale—a story of prosperity and abundant recognition of merit.

HALLADAY BICYCLES.

Our models for 1897 will
be ready-sellers.

We have made improvements.

WOOD WILL WIN.

As It Triumphed in Light Carriage Construction, so Will It Finally in Cycling.

To the Editor of THE WHEEL.

Wood as a constructive part of a bicycle is a plant of moderate growth. It commenced in the wood rim that has by its good qualities come to the front, where it is likely to remain as the best construction for that part, filling, as it does, all the requirements of strength, elasticity and durability, the same as it has done of the light carriage, of which the bicycle is but a modification.

In this respect it may be said that the same requirements in one are desirable in the other. They are alike in rigidity, that is, as far as is possible under the conditions. Where the wheels are held in proper line, it is the effort to secure a uniform line or direction to the turning wheels which is obtained in the set of the axle in the fixed position.

I need not rehearse the efforts of inventors and mechanics to secure sufficient elasticity to make the bicycle a practical vehicle. The pneumatic tire did away with the other numerous devices for that purpose, and the wood rim came as a fitting mate for the tire.

Now comes the wood handle-bar, with its evident merit, and also with its critics, novices in wood, who can tell you of its utter worthlessness, as they told you of the value of all other improvements that did not at once bud into the full effulgence of blooming usefulness. Like humanity, the wood bars have their imperfections; but in the hands of the practical inventor they are likely to become the right thing for the place. The sharp vibration of the steel bar and the ever-present liability to break at the critical moment when security is most needed are completely avoided, and in place the desired elasticity of a vibrating part is secured, to any degree the mechanic may elect. This may be rank nonsense to some writers on this subject, as they seem to consider rigidity the crowning and only desirable element in the bicycle, taking no stock in any means save the pneumatic tire to secure it.

The bars of to-day may be loosely held by the clamp, they may be too small to sustain, in torsional strain, a man of 200 pounds weight, the varnish may be defective. In the early days of light carriages such troubles were probably encountered, but the spoke was given its elasticity, the rim also had it, and the steel tire, added to the steel spring, brought other improvements, until the early makers achieved a wonder in construction, in which every part except the axle was a spring, true to its right position when in rest, but elasticity itself when in use. Such carriages were wonders to older makers, who had not conceived the principle on which they were built. This elasticity is a living element in the bicycle, as in the carriage, and is and will be enlarged upon until the wheel of to-day will be a cradle as compared with past productions.

If they can help it, inventors and mechanics will not suffer their patrons to be shaken and bumped over rough roads. They will use wood handle-bars, make them stronger where they vibrate too much; they will use better varnish, and if the clamp is inefficient it will be improved until no bar can vibrate in or escape in the slightest degree its grip. It is coming; I may say it is here, as what is wanted will be supplied to the rider, or the American inventor will perish in the attempt to supply his wants for a consideration.

Every part, from the ground up to the

rider, must yield to the road inequalities, to make riding easy under all conditions, and such means to obtain such a result will be adopted wherever they can be utilized, and at the same time secure and retain rigidity in the chain and wheel lines. This is demanded by the rider. The wood handle-bar will prove a step in that direction under modifications that experience may justify.

Other improvements of like nature will come forward and mature, notwithstanding apparent failures. There is a demand, and the requirements are likely to be realized in some form.

ANSON SEARLS.

RESTS AND RETARDS.

In the evolution of the bicycle, as beauty and lightness became paramount, the brake was gradually discarded in bicycle construction for its clumsy appearance and inconvenience. Even woman's pride in the appearance of her wheel overcame at last her natural conservatism, and brakes have been practically done away with against the better judgment of a nearly every one.

A brake and coaster attachment which combines simplicity and effectiveness from a scientific and mechanical point of view has been placed on the market by Armstrong Bros.

Toll Co., No. 98 West Washington street, Chicago. While neither disfiguring nor inconvenient, it furnishes the rider a means whereby he may absolutely control the speed of his wheel.

Clark's Automatic Brake and Coaster, as it is termed, is shown in the cut with attachments complete fitted to bicycle. When moving forward the clutch or hook of lever slips smoothly over lower reach of chain, but when the motion of chain is reversed, as in back pedalling, the clutch grips the first link of chain, and by means of lever draws a friction band tightly about drum on hub. By means

of a roller ratchet applied to sprocket, the sprocket can be disengaged from hub at pleasure by simply holding the feet at rest on the pedals; the chain, sprocket and pedals remaining stationary while the wheel remains free to run. When coasting in this manner a slight reverse motion of pedals applies brake, while at the same time the rider is free to resume forward pedalling at any time without inconvenience.

It is slightly and neat in appearance, all parts and attachments are nickel-plated, the hub bearings are of the best tool steel, and both material and workmanship are guaranteed first-class in every respect.

DUBBED "HOG TOWN."

Objectors in Canada to Toronto's Prominence Bestow This Derogatory Title Upon It.

Simcoe, Can., Nov. 1.—"Tell your troubles to a policeman, we have troubles of our own," is the way the Canadian Wheelmen's Association officials talk these days.

There is an incipient rebellion in the Toronto portion of the association, and although it will not develop into anything serious, it is sufficient to cause no little anxiety. Toronto boasts of at least 10,000 cyclists, and of this large number about five hundred belong to the association. With such a small showing as this, Toronto wants to run the whole thing. So marked has been this tendency in the past that the other towns dubbed Toronto "hog town," and were not backward in saying it. For years they have had the pick of the best offices and given good things generally, but as sure as the flag end of the season came around a kick of some sort of more or less magnitude was generated in Toronto. For years it was against the "Canadian Wheelman," the official organ of the association, being published in Simcoe. Then they wanted the secretary's office removed from Simcoe to Toronto, notwithstanding that they had the president, the chairman of the Racing Board and most of the members of the Board in the city. H. B. Donly has now a five-year contract for publishing the "Wheelman," so the kick this year is against the fee. "It is too large," howl these Toronto people. "Fifty cents a member is too much for the benefits derived. They think a sliding scale of fees should be adopted of \$5, \$10 or \$15, according to membership. They stand alone in this matter. The small clubs outside of Toronto do not object to the 50 cents, nor do the large clubs of other cities think it too much. They believe it is the only equitable way of doing business, assessing each member a stated sum for the year's revenue. Leading cyclists all over the country have expressed their opinion in favor of the present system, and it is not likely that the kick emanating in the Athenaeum Club of Toronto will in any way rebound to the detriment of the C. W. A. On the contrary, it will be apt to weld the outside clubs in a close alliance, and in the end promote the general welfare. The membership of the association is now nearly 9,000, and if Toronto had done anywhere near her duty the list would ere this have contained over 10,000 names.

The fight for the '97 meet is beginning in earnest. Several towns have expressed their desire to entertain the members next July, and Chatham is hard at work enlisting the support of anybody and everybody enlistable. Brantford, Woodstock and possibly Toronto will be the other contestants. There is an agitation on foot to hold Provincial meets on Dominion Day, July 1, and then have the Dominion meet on Labor Day. Several advantages are claimed for the scheme, and the advisability of making the change will be one of the subjects for discussion at the annual business meeting on next Good Friday.

George H. Orr, chairman of the Racing Board, has expressed his determination of retiring at the end of the year, and his name has been mentioned in connection with the presidency. Of course Dr. Balfour, ex-vice-president and chairman of the Membership Committee, will be in the race, and the contest will likely be between these two, with the odds favoring Mr. Orr. For the vice-president, C. W. Wells, of Waterloo, is the only person mentioned up to date.

WORLD CYCLES ARE FASTEST OF ALL.

PRICES IN JAPAN.

Yokohama, Japan, Oct. 9.—Despite all that has been printed, there are at present but four bicycle workshops of note in Japan, two in Tokio, one in Kyoto, and one in this city. All were opened some three or four years since. Mr. Kajino's workshops in Yokohama and Mr. Sasaki's in Asabu, Tokio, being the pioneers. On their big workshop is that of Mr. Morita, in Honjo, Tokio.

The output of each shop does not exceed 130 or 150 wheels per annum; the mechanics employed number seventeen in one, and but ten in the other. They are not adepts at the work, their experience being limited. At present many different kinds of bicycles are manufactured in the workshops of Tokio and elsewhere, the price of the machines varying very much.

A pneumatic tired bicycle of the first class from the Morita factory costs \$58 92, a second machine \$49 10, but one of special make costs \$73 05.

The pneumatic tire, being difficult to repair, is not in favor with Japanese riders, who prefer substance to fashion. They like the solid tired bicycle, which is more durable, and costs less to keep in repair. The latter sell, for a first-class machine, \$51.50; second-class, \$46 64; third-class, \$39 63; fourth-class, \$34 39.

The high, or ordinary bicycles, though in vogue formerly, are not now popular. Their price is comparatively low, a first-class machine costing \$31 15, a second-class \$27, a third-class \$22.

Both the Tokio shops are patronized by the postoffice, and one is under the patronage of the Metropolitan Police.

Generally speaking, bicycle-riding is not so popular in Tokio as in Yokohama, riders in that city being confined to employes of mercantile and banking corporations, head clerks of large shops, and school teachers. In Tokio the home made machine and foreign makes are closely balanced in point of numbers.

With the increase of riders, the patronage accorded to Japanese machines is on the increase.

NOW ON AIR WE RIDE.

It often happens that we get too much of a good thing, but when it comes to using compressed air in connection with the bicycle, the limit has by no means been reached. Every day shows something new; the pneumatic tire was quickly followed by a plethora of inflated saddles, handle-bar grips, seat posts, and even the hubs of the wheels were remembered. Naturally by far the big majority of these inventions turn out impractical, and it is a pleasure to record an article with the many advantages claimed for the pneumatic saddle made by the Craig Saddle Company, Lawrence, Mass. It is constructed on what is now known as the anatomical principle, i. e., with two cushions and a depression down the centre. This form allows a division of the air chamber into three cells, the partition of each being pierced by a small hole which maintains a uniform pressure in all three parts, and also prevents sudden changes when softly inflated. The outside of the cover is perfectly smooth, and there are no seams to rip or wear the clothing. In case of necessity to repair the rubber parts, it is a very easy matter, a simple unlacing accomplishing the desired result, and furthermore, all Craig saddles are fully covered by a guarantee that protects the rider against any defects in material or workmanship. A book describing their line more fully will be mailed to any one desiring it.

Never write a "trade note" which you would not have appear in print with your name signed to it.

PATCHING FRAMES AND TUBES.

It is seldom that a frame is broken so badly as to require the amount of mending and patching shown in Fig. 1. A front wheel caught in a car track, and a team passed over the frame in such a way that all three tubes were snapped short off adjacent to the rear wheel hub. The bicycle was fixed in the following manner.

The parts were removed from the frame, all indentures to the tubes were straightened and the fractures spliced with steel unions, as shown in the drawing, in which the tubes are shown sectionally, so as to indicate the interior plan. The arrows A designate the point of the fracture in each tube. The steel splices are marked B. Each was secured firmly to place by aid of rivets and small screws. The heads of all these were countersunk, smoothed and finally brazed and enamelled, so that the repairing could hardly be detected.

It was found, however, that these interior unions did not make the frame as steady as

FIG 1

FIG 2

FIG 3

FIG 4

FIG 5

FIG 6

FIG 7

needed, so braces C were put in and fastened with screws, as shown, resulting in an effective remedy. The wheel is now in service.

The processes of mending inner tubes vary some from outer tube work. In Fig. 2 is given a sectional view of a good way to unite the ends of an inner tube. Or, if a fracture occurs in the tube, the same can be cut at the defect and the ends overlapped, as shown at D and E. Most inner tubes will stand the necessary stretching for the overlapping.

Among other modes for lacing the studs of inner tubes are those given in connection with the other sketches. The dovetail method is used to some extent by repairers, and ordinarily results in a good job. This is shown in Fig. 3, F marking the union of the ends. The parts can be sewn together with a sailor's needle and cord, and a patch put over the whole as indicated by G in Fig. 4. The usual

glutinous compound or sealing cement will be used to adhere the parts.

Dealing with lacing ends of inner tubes, repairers differ a good deal on the subject. The writer has had the advantage of engaging the services of repairers from other shops, and in most every case the men come with a different style of lacing. Some have an idea that lacing tubes does not count for much, and they follow no system, but slap in the laces haphazard. Others have a positive method and closely follow it.

I find that the work of the former is usually poor, while that of the latter is efficient. I give in Figs. 5 and 6 some good methods of lacing inner tubes and which were introduced by skilled men. Style A is readily made by punching small holes around the tube and sewing-in the lace or cord on the same plan as is adopted in lacing a belt. The laces are crossed over alternately, as shown. It is claimed that style B in Fig. 6 is very strong. It consists of a sort of a double lacing, thus distributing the strain over the tube to a greater extent than in most systems. We have sent out many laced like this and received no complaints.

Although the common sailor's needle is very good to sew tube laces with, a needle bent to the shape of the one shown in Fig. 7 is serviceable. In this view C marks the tube, D the needle, G the cord, or lace leather, of raw hide; E the lace hole in the one side and F the lace hole in the other. A little practice with a needle bent to this shape will make tube-sewing easy to any one.

GEORGE D. RICE.

TAPERED AND CUT IN LENGTHS.

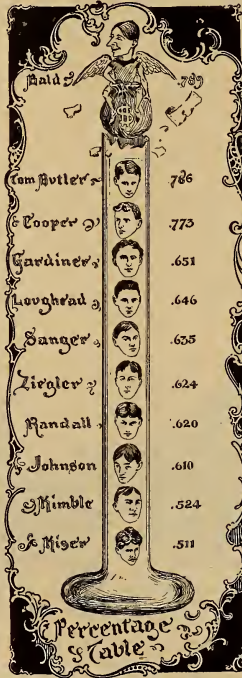

To a certain extent the metal worker is like the burnt child. He knows that burning destroys, or, rather, affects certain integrals of the material that may be on hand, and while he does not dread the fire, he naturally avoids it as much as possible. Of course, where brazing is necessary, heating is necessary. To reinforce with tubing is to require brazing. To braze is to heat.

With the reinforcement of tubing cutting a considerable feature in the cycle industry, and with so many clever men engaged in the tube-making trade, it is not surprising that efforts should have been made to produce tubing that is structurally reinforced, and which would thereby avoid at least one brazing operation. It is not surprising that the efforts should have proven unsuccessful, and that the tube should be in favor. The Seamless Structural Tube Company, 138 North Eleventh street, Brooklyn, N. Y., who engaged in the drawing of that class of tubes, have brought it to a high state of perfection, and are in position to interest almost every one who has use for such material. They have added a deal of perfected machinery during the year, and are able to render better service than ever before. They are supplying their taper gauge frame tubing, cut to such lengths as are ordered, thus saving the cycle-maker not only the cost of reinforcing, but the waste incident to the purchase of random lengths. They will also continue the manufacture of their structurally reinforced forksides, and in every way seem to be catering practically to those who are their patrons, or who are likely to become such.

FROM YARN TO CYCLES.

E. L. Cole, formerly of the Greyhound Bicycle Mfg. Co., East Brookfield, Mass., has leased a disused yarn mill in that town, and will equip it for the manufacture of bicycles.

A man may pray without ceasing, but it won't avail him much in cycling unless to it he adds pay without ceasing.

Facts and figures cannot be made to lie.

The juggling of the returns won't win the coveted position.

Races can be won on the path, but not on paper.

Others do the talking, but Bald, the White Flyer, wins nevertheless.

THE BARNES CYCLE CO., Syracuse, N. Y.

Kindly mention The Wheel.

From one point of view the record or story of a relay race is of more than passing importance. The route followed is always carefully mapped out months ahead, and it is fair to assume, therefore, that not only the most direct but also the best roads are chosen.

The transcontinental relay of the present year affords a fair instance. Full accounts were made public by the managers of the enterprises; and while most of it is done with an eye to advertising, it is not to be denied that the reports were of value to the general public, particularly those interested in road reform. No mode of travel could possibly bring the subject of road facilities so strongly before the mind as these enthusiasm-stirring races, the hourly bulletins of which are eagerly scanned by thousands in hundreds of cities, towns and hamlets. The riders' progress is chronicled with al-

most theatrical effect, and in the recent race it seemed as though every mile of the way was fraught with obstacles and dangers. The whole affair could not have been made more spectacular under the skillful hand of a modern playwright.

Men plunged down steep roads, waded through gullies, labored through stretches of sandy road, sped on their mad careers over railroad ties, and, in one instance, took a wild race for life and a road record through a railroad tunnel at night.

The final conclusion upon it all was that our highways, those we have, are a disgrace to a civilized people.

It is doubtful if in this great country there is a stretch of continuously improved rideable road of 500 miles.

How different it is in Europe! There, a perfect network of smooth, broad, level highways cover the country. Of course, military operations have contributed in a large degree to this condition. But when we turn to far-away India and behold its magnificent Grand Trunk Road, stretching out for sixteen hundred miles from the City of Palaces to the Khyber Pass, we are chagrined at the contrast it presents to even the most boasted of our roads.

It is an ideal road—broad and smooth, with no grades which the average rider could not take, and passes through scenery the romance of which is beyond the pen to de-

scribe. In the history of this ride Thomas Stevens, who first girdled the globe on a bicycle, went into rhapsodies over it, but even then he did it scant justice.

The Grand Trunk Road was begun by a Mohammedan Emperor in the sixteenth century, and only finished by the British for military purposes, in the first half of this present century.

The road is metalled with kunkah, a porous limestone, which, when crushed and wet, becomes cemented into a solid mass as hard as natural stone. This kunkah is found in all parts of Northern India. Ages of alternate packing, rolling and wetting through the rainy season have made it smooth and hard as a marble-topped table.

How our boasted cycle paths and the "ribbons of asphalt" pale before the glories of this grand old road!

How the scorcher would enjoy this perfect path, with no greater drawback than an occasional meeting with a frisky, jabbering monkey, or a lean and hungry tiger!

India has an impassable boundary on the north frontier, in the towering Himalayas, whose icy heights cannot be crossed except through mountain passes. Of these, the Khyber Pass, in the northwest, is one of the most important, being the gate through

form and red and blue turban, form an ever-watchful guard, making it safe to ride at any time during the good season.

India, like all tropical countries, has its wet and dry seasons. It also is visited by the monsoon, strong winds which sweep over the ocean and Hindostan six months at a time, then change and blow six months the other way. It is next to impossible to ride against this wind. Probably the most agreeable time for bicycle riding is just after the wet season, when natural evaporation cools the air, and the road is, if anything, greatly improved by the rains.

The native of India is not progressive. Modern methods have been introduced with the

The Grand Trunk Road.

which the enormous land trade of India passes.

To this Pass India of to-day owes the foundation of the finest and longest road in existence. For centuries caravans have plodded their never-ending journeys from Calcutta, through the valley at the foot of the Himalayas, and over into the Western countries, to barter with their neighbors.

Running through cities, towns and jungles, past ruins and temples, and across mighty rivers, this road is the main artery of upper India, through which flows a tide of travel from the countries to the northwest, gathering up an increasing host from every town and city by the way.

England keeps her rich possession, perhaps the most populous country in the world, in order only by ever-watchful care. The large army maintained in India by the British, together with the building of many railroads, has done much to modernize the country. At intervals of ten miles along the road (Grand Trunk) are police chowkees, in the grateful shade of wayside trees. The distance between these posts is considered a day's march for troops in times of peace. The tall sikh (soldier-police), clad in blue uni-

form and red and blue turban, form an ever-watchful guard, making it safe to ride at any time during the good season.

While the excessive heat does not admit of any great activity, the bicycle has found a permanent home in India. Many of them are used by Europeans, but the native rides, too. His wheel may not be an 1896 model. It is apt to be an old boneshaker. It is possible, too, that a flapping white robe and turban may not be considered the ideal bicycle costume, yet its wearer covers many miles a day on his old-timer, pedalling swiftly over the hard surface of India's fine road.

The road begins at Calcutta, the capital of India and the centre of most of its trade. It lies on the east bank of the Hoogli River, and stretches back round the broad maidan, a grassy plain behind Fort William. Calcutta is a city of white buildings, with domes, towers and minarets on every side. Its houses, large and airy, have deep verandas, with many supporting columns.

The river is alive with shipping at this point. Steamers and sailing vessels of every nationality rest on its muddy waters. From the

river the traveller sees Fort William, half hidden behind its deep moat, and the white domes of this Oriental city. The mall is alive with people of many races. The bazaars are crowded. The ebony-hued Bengalee, clad in white, elbow the tall, light-haired merchant from Cabool, in his turban and sheepskin. All kinds meet here.

A continuous stream of crude-looking carts passes through the narrow streets. Everywhere the mind receives vivid impressions; the eye is met by startling contrasts.

Palaces and mat huts stand side by side; rich and poor dwell in peaceable confusion.

In the early morning the river bank is crowded with people performing their devotions, of which bathing forms no small part. The rest of the rite consists in touching the forehead and cheeks with red, white and yellow earth, while they incant "Ram! ram! ram!"

Calcutta boasts of many fine buildings, among which are the mint, a facsimile of the temple of Minerva at Athens, the Cathedral of St. John and four Government colleges.

Running out from Calcutta, across the Hoogli River by bridge, the road swings into country slightly hilly, with Mount Parisnath, some 4,500 feet high, in the distance. Throngs of people, merchants, traders, pilgrims—all kinds—on foot, or in carts drawn by quaint-looking Brahmini cows, crowd the road. On either side a border of trees casts a grateful shade, through which the traveller catches glimpses of luxuriant dwellings. Queer little eating stalls dot the roadside, where one may partake of chowel and dood (rice and milk) served in dishes made of banyan leaves.

The natives of caste serve foreigners with food in dishes which can be destroyed after using. Their religion teaches that the touch of an unbeliever defiles. The native merchant will not receive payment for his wares direct from the hand of a customer not of his caste. The money must be laid down first, then he picks it up. At wayside drinking fountains the Brahmin pilgrim uses his own cup, for he will not touch his lips to one which a sahib has defiled. The fact that the foreign element of India is large, and is attended by natives as servants, coupled with this peculiar custom, forms one of the conflicting features of life in India.

A good day's run from Calcutta through a rich country and the city of Hoogli is reached. The road here leads through the valley of the Dammodah, which is thick with cocoonat, bamboo and banyan trees, growing in luxuriant confusion. As the great northern plain is veined with rivers, many fine bridges, masterpieces of engineering skill and architecture, are seen along the road, but very often the sluggish streams are crossed by ferry or by the native bullock gharri.

Through Bardhwan and Asansol, and the road becomes more or less hilly, running through a jungle, rank with the richest vegetation.

At intervals along here there are platforms erected, with a high pole in the centre, where travellers may escape from the wild beasts which infest the jungle by shinning to the top.

Here the scorcher, accustomed to the excitement of a spurt from a bicycle policeman, may find a new sensation. The hungry Bengal tiger is a scorcher, too, and the fleeing cyclist, putting on his best burst of speed to reach a friendly pole, falls off his wheel at its foot, and climbs to the top with a grateful, thumping heart. Few cycle paths can offer such diversions! Coasting, racing, collisions or even dashing over precipices become quiet pastimes in comparison.

The road winds on, looking like a white, dusty streak in the rich green landscape, and into Benares, on the left bank of the Ganges,

a confusion of temples, palaces and ghats, or bathing stairs—a dense maze of narrow, irregular streets crowded with Brahmins, pilgrims, merchants. Temples and shrines attract worshippers day and night. This city was the scene of a mutinous outbreak in 1857.

Following the valley of the Ganges the road runs through one of the most populous and productive districts in India. At the junction of this river with the Jumna, the two holy streams of India, is Allahabad, the "City of God." The city is thronged with pilgrims at all times, but at the time of the Great Fair, held once every twelve years, it is so crowded with poor pilgrims that the natives call it "Fakirabad," the "City of Beggars."

The horrors of the Indian Mutiny in 1857 left their mark here, too, for the city was but a heap of blackened ruins.

The life of the natives is made up, to a great extent, of religious ceremonies, of which pilgrimages to some sacred river or tomb are not the least important. Every city and town along the road, every little village, has its temple, sacred stone or some fantastic god.

The road is crowded with fakirs (religious beggars), some of whom do penance by journeying along in uncomfortable positions, as on hands and knees, or with hands and feet tied together, rolling head over heels. When one considers that each one of these fakirs evidences his religious fervor by a constant incanting and singing, or by ringing bells and clanging cymbals, it is apparent that the Grand Trunk road is a scene of confusion near Allahabad.

But the country becomes flat and monotonous. One dreary waste of marsh succeeds another, varied only by occasional rice fields. In the midst of this uninteresting country is Futtehpur, a busy town.

Some fifty miles of these flatlands, and the road leads in the fine broad street of Cawnpore, one of the centres of the mutiny, commemorated by its beautiful memorial garden. It is now an important railroad centre and the scene of great business activity. Its streets are broad and smooth, and its buildings show that beauty of architecture of which the natives have been masters for centuries.

Across the Jumna River, on a pontoon bridge, where numbers of crocodiles float lazily on the stream or bask in the sun on the muddy shore, and a fine stretch of road is ahead. Villages and ruins of cities dot the landscape, which appears a rich blending of olden glory and modern enterprise. The road itself is a scene of indescribable confusion. Small shops on either side offer their wares for sale to crowds of travellers who stop by the way to see. Passenger carts drawn by patient camels move slowly along. Brahmin cows amble past, drawing wagons laden with merchandise. And the bicycle is there, too. Members of the Bicycle Corps of the Army pedal along, then a helmet-covered European, or perhaps an ungainly native, doubled up like a grasshopper, on an old wheel. Ponderous elephants swing along through the crowd, bearing parties of pilgrims to some shrine.

These clumsy creatures bear upon their backs four people; two in the howdah (chair), a mahout or driver seated on the neck, and one on the crupper who holds an umbrella. A man walks beside the elephant, bidding him "be careful," "take care," and telling him of the condition of the road and where to step.

The training of these big animals is carried to such a point that the slightest motion of the mahout is understood and obeyed.

The City of Delhi, with its miles of red sandstone walls, traces of olden splendor, is now reached. No other city, not even Rome, has known such extremes of glory and humiliation. Little now remains of the palaces which gave the city its air of grandeur. Every foot of ground within and around its walls is historical, yet it has become merely a prosperous commercial town and a great railway centre. No city in India has finer thoroughfares than those of Delhi, ten in number, though the smaller streets are narrow and crooked.

With the exception of a small tract the country around Delhi is stony and hard, or sandy, requiring artificial irrigation. It is dotted with the debris of ancient buildings, the ruins of fallen cities, round which the romance of antiquity still lingers.

Swarms of monkeys overrun the country. In fact, they overrun the villages and towns. The Hindu has an aversion to killing any living thing. The monkeys scramble about unmolested and climb in great numbers, in utmost freedom, all over the houses. They grow so accustomed to man that as you ride along a chattering brood is apt to be capering in the road before you, and never break for the trees until you are well again upon them.

These animals are considered sacred by the people, and their antics are seldom interfered with. When the monkey population of one locality becomes too bold, the natives catch great numbers of them and ship them by train to another section. Cases have been known, however, where a kind-hearted Hindu has slyly released whole batches of those doomed for deportation.

The road winds through a low, unhealthy plain to Kurnaul, where the rank jungle encroaches on the very town, and further on, through the walled town of Umballa. A slight hill must be mounted, and Jalundar is reached and passed. Rows of sesum or banyan trees line the road. A few buffaloes graze in the fields nearby, tended by watchful natives. Women with heavy rings in their noses and ears gather at the stalls or eating places by the way, and caravans, perhaps far distant Cabool or Herat, move slowly along.

Through this wild, rich landscape stretches the road, a white line on the dark foliage. Fruitful plantations and beautiful suburban streets, shaded by thickets of trees, lead to Lahore, a walled city with irregular brick buildings. This section of India, owing to its elevation and distance from the ocean, is dependent on artificial irrigation, very little rain falling.

The road now takes one northwestward, across the Land of the Five Rivers, by the Gujerat battlefield to Peshawur, an important frontier outpost overlooking the mouth of the formidable Khyber Pass. It is an unhealthy town, where fever is prevalent.

Fourteen miles further this marvellous road ends at the Khyber Pass, whose rocky heights prevent it being carried further. The Pass and country beyond is infested with a band of robbers, the Khuber tribe, whose fierce, lawless ways render riding unsafe beyond Peshawur.

But sixteen hundred miles is enough! A glorious monument, indeed, to the builder!

M. A.

SHE DECIDED JUSTLY.

A Thorough Knowledge of the Woes of
Degeneracy Caused Justice to Be
Rendered.

And it had come to pass that the ever-advancing woman had at last seized the reins of government, law and justice. The scene was in one of the new city courts. The Judge, the renowned Miss New Solomon, sat dignified in her seat of honor. Her decisions were famed the world over for clearness and justice. Great nations submitted their disputes to her for arbitrament and were pleased to learn from her the truth of their positions. That she should sit dignified was, therefore, not to be wondered at, but there was perplexity in her countenance now. There was a case before her the like of which never had been known since her great namesake sat in judgment over two women who contended for a baby. In all her law books, in all her experience, there was no suggestion of precedents for such a case as this.

As the matter stood to a casual observer it was this: Mr. George Wheelking, a beautifully mustached young man, dressed in gray knickerbockers, dark-red sweater, brown and yellow golfing stockings, and improved cycling shoes, claimed that he was the sole and only owner of a fine silver and gold plated bicycle that was in the court for Her Honor to look at. But there was another claimant, a young man just as beautifully mustached as Mr. Wheelking, and quite as handsome otherwise, who appeared in brown corduroy knickerbockers, gray sweater, yellow and red golfing stockings and quite as improved shoes. This claimant was Mr. William Wobblesome.

Neither had witnesses, and so the learned Judge questioned them and cross-questioned them, but each seemed equally truthful, and the Judge paused nonplussed for the first time since she had sat in that high seat. Finally she arose from her chair and ordered the court room seats stacked around the sides. The audience was sent to the galleries, where they waited with breathless interest as the brawny court attendants carried out the Judge's orders. The reporters were not disturbed, being inside the rail, and only the swish of the pencils broke the silence as the Judge turned to Mr. Wheelking and said:

"Take that wheel, sir, and ride the best you know how." And the Judge sat down and busied herself taking the hairpins out of her hair and then putting them back again.

Mr. Wheelking blushed very prettily as he gave his very baggy knickerbockers a twitch and prepared to mount. As gracefully as a bird he rose and settled in the saddle and began to ride. There was not a woman there whose heart did not jump. The men, of course, tried to see a fault, but even they could not help noticing that Mr. Wheelking seemed to fit the wheel exactly. A look flitting across the Judge's face as of a smile was translated by one of the reporters as an indication that the decision was going in favor of the rider, and she sent out a full report of a decision then and there for the Fake News Association, the standard sensational news gathering organization of the city.

Mr. Wheelking rode divinely in and around the massive pillars, backward, forward, turning all the beautiful figures, and in all the ways that pretty riders know how. The flutter on Judge New Solomon's mouth became a smile. As Mr. Wheelking dismounted, Mr. Wobblesome came daintily forward, and, as airily as a falling leaf, landed in the saddle and began to ride. The applause that followed Mr. Wheelking's performance died away in wonderment.

When the Fake Association's reporter saw Mr. Wobblesome riding as gracefully as Mr.

Wheelking she gazed into the Judge's face and saw there, instead of a decisive smile, a look of surprise, followed by the same old look of perplexity; whereupon she reached wildly for the nearest telegraph operator, and the recipients of the Fake Association's reports took out several columns of interesting matter and announced that the case was still under consideration. As for the evening editions already printed and on the streets, they let the matter slide without comment.

When Mr. Wobblesome dismounted the critics could point out no difference between the riding of the two graceful young men, and the Judge looked as if she would like to have a good cry, but she bit her lips and restrained herself.

Here was a case that needed a measure entirely different from the usual method of deciding such things, and the Judge determined to decide it according to masculine human nature as she understood it. So she stood up, and, with a wave of her hand that silenced even the whisperings of gossiping men, she spoke in measured tones and syllables:

"Thus does this court decide. Listen, that you may distinctly hear. Rather than render

BRAVERY OF WOMAN.

They had met in a riding academy. In the nature of things they had been thrown together in their novitiate. The company misery likes had induced them to venture upon the road together while yet the warnings of the gentle instructor was ringing in their ears. He and She were sailing along a nice, smooth stretch of road, proud in their supposed mastery of the wily wheel, when a sharp turn of the road brought in sight an innocent-looking Irishman. Straightway, as is the peculiar custom of a novice's wheel, the one She rode darted viciously at the astonished Irishman. She, screaming as it is possible Europa screamed when the bull ran away with her. The man crossed the road and the bicycle followed. She clung wildly to the handles.

"He!" She cried; but He could not help her. He was struggling with his own machine, which evinced an inclination to roll in the middle of the road. The Irishman dodged the attack of the bicycle, and just in time. She threw herself upon his shoulder as he machine circled neatly around the bewildered citizen and fell on the ground in front of him. "Sure, that do be a queer way of ridin'!

THE MODERN MAID OF TROY.

There was a young lady of Troy,
Whose life was a mission of joy.
She was fair as a flower,
And grace was her dower,
And to court was pleasant employ.

But now there's a change taken place,
Rave not o'er her maidenly grace,
For true are the rumors
That she cycles in bloomers,
Which she wears with no blush on her face.

Alas for this maiden of Troy,
That she should her chances destroy;
For do you suppose
That a man would propose
To a girl who looks more like a boy?

a decision unworthy of this court, or fail to render one in any case, I do declare that the bicycle in question shall be bestowed on Miss Laura Bloomer unreservedly."

Mr. Wheelking turned to leave the court, giving Mr. Wobblesome a look that said plainly:

"Anyhow, you won't have it," while Mr. Wobblesome burst into tears.

At this the Judge rose up, and, in a voice that echoed through the courtroom, said:

"Decision withdrawn, for it is plain to see now that the wheel belongs to Mr. Wobblesome. Poor fellow, take it."

Thus came it to pass in the days of degeneracy.

NO CHANGE PERCEPTIBLE.

Mrs. McGuire (whose husband has lately made money on contracts)—An' how do I look on me wheel, Mrs. Flaherty?

Mrs. Flaherty—Yez jist look loike ould toimes, Mrs. McGuire.

Mrs. McGuire (puzzled)—Ould toimes?
Mrs. Flaherty—Yis; whin Oi used to look over th' fince an' see yez leanin' over th' wash-tub!

mum," was all the man said; and She, overcome with confusion, could not explain matters to him.

He came to her rescue then, though it was rather late.

"You may thank your stars, my friend," He said, with becoming sternness, "that this lady knew how to ride. You don't realize your escape. Never have I seen deadly intention expressed more clearly than in the look of that bicycle when it saw you. 'Queer way of riding?' he went on, waxing eloquent; 'queer way?' A good way of riding, my friend. Thank this lady's skill and presence of mind, thank her noble self-sacrifice, that made her throw herself on you and drag you from beneath the wheels of this monster, now panting at your feet."

She and the Irishman both stood silent when He paused.

"Come," said He, in the tone of the Roman father leading his daughter out of the forum to be immolated on the family altar in the back parlor. He could not wrap a toga about her; but he, so to speak, enfolded her in the bicycle, and they two rode on, while the Irishman went on his way in silence.

WAYS OF WORLD GIRDLERS.

How They Do the Circum-Cycle Act in Fact and on Paper as Reported by an Outsider.

"What is the most amusing thing I saw on my trip to Japan?" said a wheelman, who had just returned from the journey. "Well, take it all in all, I don't think I saw anything more laughable than the performance of the alleged around-the-world - on-a-bicycle - without - a-cent wheelmen. Every ship bound for the far East takes several of these heroes and heroines.

"On the way to Asia the passengers do not know the heroes, or even suspect them. As the wheels are stored in the cabin baggage-room, it is impossible for the rest of the passengers, looking on at a pallid who turns ill at the smell of a cigar, or a girl who lies next to death's door in her stateroom, to dream that these are the people who are going to write home to the papers that they have been chased by Persian bandits and lunched with the Kafir kings as they annihilated Puck's record round the globe. When the ship stops at Yokohama, out come the wheels, and the heroes ride the full length of the Bund—a commercial street about a mile long. The rest of Yokohama is on a hill too steep for wheeling. At Kobe and Nagasaki the town sites are more nearly level, and the heroes ride perhaps, two miles, having their wheels lifted back aboard the steamer as she voyages from place to place. Having done Japan by going ashore at three points, they forge fearlessly ahead on the steamer, yearning to brave the terrors of China on their flying tires.

"China they discover to be one of the finest fields for this place of reckless devilry in all the world. The ship takes them to Shanghai where the Bund is nearly two miles long and all lined with churches, clubs, banks, and brokers' and shipping offices—as safe and occidental as Broadway. They hear that they can ride five miles on the Maloo and the Bubbling Well road before they come to the muddy towpaths that form the actual roads of that part of China, along which no wheelman can ride. With their hearts in their throats, fancying every coolie they meet to be a murderer, fresh from sacking a missionary's house, they pedal onward. When they come to the tea-gardens, where the gateways swarm with Chinese, they all but faint, and could the Chinese dandies and courtesans at these gates read what the cyclists afterward report of their experiences at the time, they would find themselves described as an undisciplined mob of soldiers and lawless retainers in front of a mandarin's palace, with this additional statement: "They scowled so fiercely and made such threatening gestures, that only the swiftness of my wheel prevented another massacre being added to the list of crimes against foreigners in China.

"Back to the ship the wheeling hero flies and writes notes of his hairbreadth escapes in Central China, until the vessel passes Woosung, and begins to rock him back into seasickness. Hong Kong is the next place at which the bicycle is taken out—a British possession, no more to be regarded as dangerous for a foreign lady of the most timid temperament to walk about alone in, than is the European republic of Shanghai, or that haunt of mountain desperadoes in New Jersey, called Tuxedo. So the journey around the world continues—aboard ship, and the historic wheel safe in the baggage-room, and only an occasional chance occurring to take it out in places like Singapore, Aden, Port Said, Alexandria and the rest of the desperate lurking-places of European merchants on the way to Europe. Terrible moments are experienced and recorded on the way. For instance, on the Red Sea, notes are kept of the ferocious character of

the inhabitants of the dark continent. On the Mediterranean the ship passes Greece, with its pirates, and Italy, with its banditti, in each of which savage and relentless bodies of people are worked into the wheelman's or wheelgirl's diary, in such an effective way, as to almost make the diarist turn pale as he or she reads over what has been written.

"Finally comes Southampton or Liverpool or Havre, and there the now world-famous wheel makes its last spin—so that its owner can truthfully say that he has "done Europe"—before being hoisted aboard a steamer homeward bound for New-York."

COWS AND CYCLES.

A drove of cows crossing a road or going along it is not a pleasant sight to the nervous rider of a bicycle, however it may be to a painter. Cows are irresponsible things, with no regard for a bicycle, no interest in a bell,

A SHATTERED REPUTATION.

"Here come the two celebrated scientists, Professors Brown and Green. What a pleasure it would be to listen to their learned conversation." (By this time the tandem reached the two learned gentlemen, and the riders heard:) "My new bicycle suit is a peach, it is—," and then the tandem was out of hearing.

and an absolute lack of even the commonest or gardenest politeness. They care less for the rule of the road than the scorchers or truck-drivers do, and they flaunt their contempt for it offensively. At least, this is the opinion of people after some study of cows on the roads, when the people have lived in places where opportunities of studying such cows were numerous. Why, one cow can walk on both sides of the road, and in the middle, too, if a bicycle is coming—not only can, but does.

ONLY A MOOSE.

"Dear me!" said Mrs. Sleepmore, looking up from her paper, "but women who ride bicycles are getting brave nowadays."

"Brave?" echoed Mr. Sleepmore.

"Yes. Here is a story about a woman down in Maine, who was out riding and shot a mouse. She—pshaw! I read it wrong. It was only a moose."

PLAIN JANE AND THE DUKE.

She Converts Him to Cycling in Her Usual Thorough American Way.

The Duchess of Ratburrow was writhing, poor thing, on the horns of a dilemma. Painful position, very. She was the greatest of great ladies, full of fire and fashion, and with a blush flung bangly arms round the neck of her lord and master. The unfortunate man was a shocking sufferer, having a bad unearned increment, and enduring constant pain on account of his back being broader than his views.

"Ratsey," she cried, "Duky darling!" (When first she brought him with the millions of her American dollars, she had ventured to apostrophise him as "ducky," but His Grace thought it infra dig., and they compromised by omitting the vulgar "c.")

"Duky," she said, raising pale, distinguished eyes to a Chippendale mirror, "I have made up my mind."

"Don't," expostulated the trembling peer. "You are so rash!"

"What is more, I have made up yours." "To make up the mind of an English duke," he remarked, with dignity, "requires no ordinary intellect; yet I believe with your determination you are capable of anything, Jane."

(That his aristocratic rib should have been named plain Jane was a chronic sorrow, even though it was tempered by the fact she fed and clothed him.)

"Don't keep me in suspense," he continued; "In fact, to descend to one of your Americanisms, I insist on Your Grace letting the cat out of the bag with the least possible delay."

"As you will," she replied. "Your blood be on your coronet. Prepare for a revelation." "Wretched woman!—I beg pardon!—wretched grande dame! what have you done now?"

"I am madly in love with—"
"By my taffeta and ermine, I swear—"
"Peace, peace!" said Jane. "Compose yourself, duky, that is Plantagenet. Forgive the slip. I am agitated. My mind runs on slips." The Duke groaned.

"Horrid, awful slips!"
With a countenance of alabaster he tore at his sandy topknot.

"I have deceived you. I admit it. Stooped to folly."

A supercilious cry rent the air as the Duke staggered on his patrician limbs.

With womanly impulse, flinging caste to the winds, Jane caught the majestic form to her palpitating alpaca, and, watering his expensive features with duchessy drops, cried in passionate accents: "My King! My sensitive plant! Heavens! It's his unlucky back! Be calm, Plantagenet. I have—been—learning—to-ride a wheel! There!"

The Duke flapped a reviving toe, and squeezed the angust fingers.

"I am madly enamoured of—my machine." The peer smoothed a ruffled topknot with ineffable grace.

"Likewise I am determined you shall take lessons. Now it is no use, duky. I mean to be tender but firm with you."

The potentate gave a stertorous chortle, and, stretching out his arms, fell in a strawberry-leaf swoon on the parquet floor, his dual head on the lap of his adored Jane.

REGULAR CYCLE SOLOMON.

"Bunkins, I guess, is about the smartest man in the bicycle business," said the citizen who observes.

"Knows a great deal, does he?"

"Knows a great deal? I should say so. Why, sir, that man knows almost as much about a wheel as the man who has ridden one for six weeks imagines he knows."

SIDEWALK LAW.

Judicial Opinion on the Right of Villages to Grant Wheelmen Sidewalk Permits.

Justice Werner, of Rochester, N. Y., has handed down a decision in the case of Anna Lechner against the village of Newark, which will be of great interest to wheelmen. It grants the demurrer to the complaint upon the ground that it does not state facts sufficient to constitute a cause of action, and orders judgment for the defendant upon the demurrer, plaintiff to have leave to serve an amended complaint within twenty days.

The action was brought to recover damages for injuries sustained by the plaintiff, when William Fahy, who was riding a bicycle on the sidewalks of the village, ran into her. The rider had a license to ride on the walks, which had been granted to him through a village ordinance which established a system of registration for sidewalk cycling. The plaintiff's cause of action is founded upon the idea that by the alleged unlawful adoption of the ordinance in question, the village is liable.

In his opinion, Justice Werner says:

"Plaintiff's contention is that the bicycle is a vehicle, and as such has no right upon the sidewalk, notwithstanding the ordinance adopted by the defendant. The legal status of the bicycle in this State is fixed by section 162 of the highway law, which is a part of the general laws of 1892. . . . The bicycle, although classed as a vehicle, and governed by the laws of the road when used in the highway, is nevertheless a vehicle which, like the baby carriage, has a sphere of its own. . . . The use of those vehicles upon the sidewalk may or may not create a nuisance, and may or may not interfere with the proper use thereof by pedestrians, according to the circumstances of the case. What would amount to an unlawful interference with the rights of pedestrians or constitute a nuisance upon the crowded streets of a populous city might not cause the slightest inconvenience upon the walks of a rural village."

The justice then passes to the question as to whether the act of the village trustees in adopting the ordinance giving to wheelmen the right, under certain conditions, to use the walks of the village, is unlawful, so that the defendant became liable for the injury. He quotes from section 652 of the penal code in regard to the punishment for driving teams, vehicles, cattle, etc., on the sidewalks, and section 163 of the highway law in reference to the rights of riders. He says of the latter section that it "forbids the exclusion of the bicycle from the use of the highway or street when it is opened to other carriages; it does not prevent the proper authorities from requiring, directing, prohibiting the use of bells, lamps or other appurtenances or prevent the proper authorities from prohibiting the use of any bicycle upon the sidewalks. The right of the wheelmen to that part of the highway open to other carriage is absolute." He says the language of this section "recognizes the absolute rights of the bicycle when upon that part of the highway usually set apart for the exclusive use of vehicles, but it also seems to recognize the peculiar sphere of the bicycle as a vehicle, by vesting in the proper authorities a discretionary power to direct or prohibit certain things in connection with its use. The giving of discretion to prohibit presupposes the power to grant the thing which may be prohibited."

The justice quotes from section 654-a of the penal code in regard to throwing glass, tacks, nails, etc., which might injure a bicycle and its being a misdemeanor. Then he asks the question: "Why should it be made a misdemeanor to place upon the sidewalks anything

which might injure or puncture any tire used on a bicycle, if it was the intention of the Legislature to make it unlawful to ride a bicycle upon the sidewalks?"

After quoting a number of authorities and cases to support his view, the justice continues: "If there is nothing in the general laws to prohibit the adoption of the ordinances licensing riders of bicycles to use the sidewalks in the village, the defendant has the power to grant such license. Having such power, the mere granting of the license does not make the defendant liable for injuries sustained in consequence of the improper or negligent acts of the license, unless after notice that such license was in the first instance an improper person, or was negligent or careless in the exercise of the privilege granted him, the defendant neglected or refused to revoke the license or take other steps for the safety of the public."

The justice says it is conceded that if the riding of bicycles upon the streets of the village were proven a nuisance the maintenance of

JUVENILITY AND RECKLESSNESS.

A large number, probably a majority of the prisoners brought to the police courts for reckless driving, are mere boys, often not more than twelve or fourteen years old. They are employed to drive the wagons of butchers and grocers, and rattle through the uptown streets, a menace to children and women. It is from such vehicles as these that riders of bicycles have most to fear.

The greater portion of accidents are caused through no negligence of the riders, but through the malice or stupidity of the men driving the wagons. The wheelman has everything to lose. A collision which may have the most serious results for him rarely means any damage to the horse-propelled vehicle. Secure in this knowledge, the drivers dash about, leaving the wheelman to extricate himself as well as he may from the danger they cause.

The drivers are safe from arrest unless their acts have caused some serious damage. A rider has his wheel to look after, and unless he feels a particularly smarting sense of in-

CORRECT WORD.

SHE—I wonder who that girl on a wheel is?

HE—Why, that's Sallie Dasher posing as an opponent of leggings.

SHE—Posing! You mean exposing, don't you?

such nuisance would be unlawful, but the complaint does not furnish sufficient basis for such allegations.

In conclusion, Justice Werner says:

"As has already been suggested, the allegation that the defendant had no power to adopt said ordinance is one of law, and does not affect defendant's right to demur. If, therefore, this ordinance was not per se unlawful, and did not create a public nuisance, the defendant cannot be held liable for the injuries to the plaintiff, in the absence of affirmative negligence on its part, even though it may have acted unwisely in passing this particular ordinance. These views necessarily lead to the conclusion that the complaint does not state facts sufficient to constitute a cause of action, and that defendant's demurrer is well taken."

TWISTING FACTS.

"Now let me show you," observed the inventor to the capitalist, whose leg elongation he was attempting, "wherein the truth lies."

jury, there is little likelihood that he will attempt to overtake a driver, who, when he is apprehended, may not have been guilty of any technical breach of the law.

There are reckless riders of the bicycle who bring danger on themselves in their efforts to get along rapidly, but the number of those that take these risks is smaller compared with the majority that are striving to get along and keep out of the way of the drivers. The big trucks, for instance, keep deliberately in the middle of the road, and they are often large enough to make it practically impossible for wheelmen to pass on either side of them.

But it is when the small boy is on the box that the danger is greatest. He cannot drive, for one thing, and there is for him no pleasure such as "pestering" the wheelmen, for another. When the drivers have acquired any part of the caution of those who ride bicycles, collisions will soon be a thing of the past.

REGULAR SCORCHER THIS.

Cleveland, O., Oct. 29.—A strange-looking vehicle has been seen upon our streets the past few days. In appearance it resembles somewhat an old-fashioned stage coach, only it is not so high, and the two seats are arranged back to back. Inquiry disclosed that it was Alex Winton's horseless carriage, and that the test runs had been highly satisfactory. Last Thursday was the first day out of the shop, and its behavior in turning corners, stopping, starting, etc., could not be found fault with. It can go very slowly, and, if necessary, it can maintain a speed of over thirty miles an hour. The carriage can be stopped much quicker than a vehicle drawn by horses; while moving at a rate of ten miles an hour, it has been brought to a standstill in twice its own length, and going fifteen miles an hour it can be entirely checked in about twenty feet. A turn can be made in a ten-

foot radius. Gasoline is the motive power, and the estimated cost of running the carriage two hundred miles is only 50 cents, with gasoline at 10 cents per gallon. The same lever that applies and throws off the power also applies the brakes (pressing internally) and reverses. The pneumatic tires with which the carriage is fitted are about five inches in diameter, their tread being half an inch thick. The car seen upon the streets was only for experimental purposes, and a different pattern will be given to the public. The cost, it is said, will range from \$500 to \$3,000. The existing pattern weighs 1,050 pounds, but this will be materially lightened. Mr. Winton, who is the mechanical expert of the Winton Bicycle Company, has been working on the motor for three years, and has been three months in assembling the machine.

A female bicycle thief is Cleveland's latest production. Mrs. Laura J. Ford, giving her address as No. 290 Huntington street, is the culprit. She was arrested at the instance of the Darling Cycle Company. Detective Reeves, who made the arrest, says the police have been looking for Mrs. Ford all summer, and that they have several similar charges against her. Her plan was to hire a machine and give a different name and address in each case. The wheel stolen from the Darling Company was rented July 27, and never returned. The charge against the woman is grand larceny.

FOR SIX MONTHS.

The White Sewing Machine Co., Cleveland, has the distinction of being the first to make use of the six months' guarantee adopted by the Board of Trade. It appears in their recently issued advance catalogue, which, by the way, is quite attractive in itself.

HIP-POCKET CURLERS.

Texas has to stand much abuse, but the charge that her wheelwomen had their bloomers made with a hip pocket for the ever-ready revolver has been clearly refuted. The receptacle is for the curling-irons.

COPENHAGEN'S CHAINLESS CYCLE.

Copenhagen, Denmark, is to have a factory for the construction of chainless bicycles. The Kohlmeyer-Halberstadt patent will be operated, the Danish rights having been sold to those interested by Gustav Halberstadt to whom inventor Ingo E. Kohlmeyer assigned the patent. The mechanism has also been patented in Germany (No. 63,101, Nov. 28, 1891), in England (No. 20,764, Nov. 28, 1891), in France (No. 204,704, Dec. 7, 1891), and in America (No. 563,971, July 14, 1896). The principal feature is that one of the bevel gears has fixed teeth and the other rolling teeth conical in shape, with both ends in ball bearings. This, it is claimed, entirely prevents wear.

Mr. Halberstadt, who is a large importer of American machinery in Copenhagen, writes that an English syndicate has an option on the patent, which is thus described in the American specifications:

The bicycle is provided with the usual crank-shaft A, carrying the cranks B, and E, journaled in ball-bearings F, arranged in an auxiliary frame G, forming part of the main frame of the bicycle. The shaft E extends longitudinally and carries at its rear end a bevel gear-wheel I, secured on the hub J of the driving-wheel journaled on the axle K. Now, when the pedals are set in motion by the rider of the bicycle a rotary motion is given to the crank-shaft A, and this motion is transmitted by the bevel gear-wheels C and D to the longitudinally extending shaft E, which transmits this motion by the bevel

gear-wheels H and I to the hub J of the driving-wheel, so that the bicycle is propelled forward.

The bevel gear-wheels D and H have their teeth, preferably made in the shape of rollers L, made conical, with the pointed ends L, engaging ball-bearings N, arranged in the flanges of the gear-wheels D and H. By this arrangement the friction of the meshing gear-wheels is considerably reduced, it being understood that all the bevel gear-wheels may be constructed with such journaled rollers as their teeth, if desired.

By the arrangement described the rotary motion of the crank-shaft A is directly transmitted to the driving-wheel without the use of the endless sprocket-chain and sprocket-wheels now employed in bicycles.

Having thus fully described my invention, I claim as new and desire to secure by letters Patent—

1. The combination with the drive and the driven-shaft of a counter-shaft geared thereto, the gears on the counter-shaft being formed with parallel flanges each having circularly-arranged series of opposed ball-bearings and roller-like teeth journaled at their ends in said ball-bearings, substantially as described.
2. The combination with the drive and the driven-shaft of a counter-shaft having an inclosing case provided with ball-bearings in which it turns, the gears on the counter-shaft being formed with parallel flanges provided with circularly-arranged series of ball-bearings and roller-like teeth having conical ends journaled in said ball-bearings, substantially as described.

3. The combination with the hub and parallel flanges having opposed recesses or sockets and openings respectively of the ball-bearings N N, held removably in said recesses and openings and the roller-like teeth journaled at their ends in the opposed ball-bearings, substantially as described.

SKATES AND CLIPS.

At first blush few would be able to see any connection between skates and wood handle-bars, or understand why a maker of one should become vitally interested in the other. They could scarcely be blamed either. It remained for P. Lowentraut, a large skate manufacturer of Newark, N. J., to develop the connection. Every one knows how simply ingenious and yet how secure is a skate clamp; nearly every one knows how secure must be the clamp or clip for a wood bar. It

should follow that the designer and maker of one should be equally capable of designing and making the other. Mr. Lowentraut believes that so far as he is concerned it does follow. He has produced a clip, which is offered in proof of his belief. It is pictured herewith.

It is so made that it is not necessary to take off either of the grips to slide the clip on, and only one bolt is necessary, this being directly on the under side of the bar, hiding

the nut completely. It is made possible by this construction to draw it in very closely, so that the gauge of the bar need not be anywhere nearly correct. It is made of steel tubing and forgings throughout, and presents a very neat appearance. J. H. Graham & Co., 113 Chambers street, New York, are selling agents, and it will make it an option on the Downey handle-bar which is sold by the Graham people.

KNOWS THE BUSINESS FROM A TO Z.

H. H. Kramm has been added to the staff of the Reading (Pa.) Standard Manufacturing Company, who make not only bicycles, but bicycle tools as well. Mr. Kramm is "well up" in the business. He spent the last three years in the service of Hulbert Brothers & Co.

STEALING TIRE-MAKERS' THUNDER.

Coffins are like pneumatics—the inventors' aim is now to make them airtight. "No person," recently wrote an imaginative undertaker, "having once used one of our airtight coffins will ever use any other pneumatic."

MORE COULD NOT BE SAID.

"Is Wobblesome healthy?"
"I should say that he had a fortune of tire-maker's size."

The CHAMPION Wood Handle-Bar CLIP for Bicycles.

Wood Handle-Bar and Bicycle Manufacturers will do well to look into the merits of the Champion Wood Handle-Bar Clip:

- 1st—It is reversible and adjustable to all degrees.
- 2d—It is neat, strong, durable and practical.
- 3d—The Champion Clip conforms and binds itself to the entire circle of all shapes, styles and sizes of handle-bars.
- 4th—The handle-bar can be entirely finished in polish and hand-grips before the clip is applied.
- 5th—The adjusting of the handle-bar is in its most convenient position when on the bicycle, as the head of the bicycle acts as a clamp by holding the stem, leaving all the adjusting to be done by the turning of the handle-bar. With this

powerful leverage the youngest riders can as easily adjust as the most experienced.

- 6th—After adjusted, the bar is stiff and firm; impossible to get loose or out of place.
- 7th—The Champion Clip is constructed of the best seamless steel tubing and specially made steel drop forgings.

We solicit correspondence from Wood Handle-Bar and Bicycle Manufacturers, or all in want of a perfect Handle-Bar Clip for Wood Handle-Bars.

We are also the manufacturers of the celebrated Champion Steel Pressure Blowers, Fan Blowers, Exhaust Fans, Lever and Crank Blowers, Screw Plates, Taps and Dies, Portable Forges, Tire Benders and Shrinkers, Blacksmith Drills, Etc.

FOR MUTUAL PROTECTION.

Like links in a chain, wheelmen are rapidly being united by means of protective associations, which, in the end, will do much to mitigate the brutality and carelessness the rider often experiences at the hands of the driver. The latest of these links owes its formation to Mr. L. E. ter Meer, No. 38 Park Row, and is known as the Wheelmen's Mutual Protective Association. Moral suasion allied with publicity are the corrective means the new association relies upon. Exemplifying how this will be worked, President ter Meer says:

"The driver of Mr. X, the grocer, seeing a lady on a wheel coming up the road in an opposite direction to his vehicle, not only omits to keep on the right side, but turns his horse sideways, so as to block the road. The cyclist, not prepared for such manoeuvring, nearly runs into the horse, but, fortunately, is skilful enough to make a jumping dismount and save herself. (This is an ordinary case; the reader may work it out in a hundred different ways, with various results.) Having obtained his purpose, Mr. Driver grins or bestows on his victim a parting shot in choicest vernacular, and drives off in a halo of glory.

"For the casual observer here the curtain drops. But the cyclist, a member of the W. M. P. A., has noted the name and address of the wagon's owner, immediately reports the incident to the W. M. P. A. headquarters, and in the next semi-monthly W. M. P. A. Bulletin the case is recorded, giving the full address of the driver's employer.

"In most cases a number of the Bulletin's readers trade at that store, and, according to their pledge to the association, at once use their influence as customers so as to cause the offender to be reprimanded, and threatened with dismissal should the offence be repeated. There is not a tradesman living who, were he to lose one or more customers through an obnoxious driver's fault, would not be ready to reprimand and, if necessary, discharge the latter.

"The mere knowledge of the existence of such a society will cause tradesmen to caution their drivers. This is only a very mild case, but it shows how mutual protection can be worked. Cases of more serious nature will be taken in hand by the Executive of the W. M. P. A., and, if necessary, by their lawyer.

"In each district a prominent citizen, member of the W. M. P. A., will be appointed as a representative, and will unite his influence, when needed, with the endeavors of individual members. But it is the purpose of the association to help themselves, to improve matters by their personal, co-operative actions, and, if possible, to do this without the aid of the law courts."

No less a personage than the Hon. Timothy L. Woodruff, Brooklyn's Park Commissioner, is vice-president of the new organization, and at the price of from 50 to 75 cents per year for membership few riders can refuse to become associated with the organization.

NO BALM IN GILEAD.

The tire that held the air went down,
The sweeping wheels rolled on;
And what was Gotham, glorious town,
To her whose air was gone?

She lived, for life has many a bump,
Ere sorrow breaks its chain;
Still comes not air without a pump;
She never smiled again!

There passed proud forms before her gaze,
The scorchers and the fair;
But who would leave the glittering maze
To pump her tire with air?

Before her swept the bloomer-girl,
In pleasure's reckless train;
But nought could check that giddy whirl;
She never smiled again!

CASE OF EVOLUTION.

What harness is to a horse a saddle is to a bicycle. It is but a short step from one to the other, and when, a few years ago, Butler & Ward, of Newark, made the step, it was not very surprising. They were then prominent in the harness business, as they are now in the cycle saddle trade. Newark has a wide reputation as a manufacturing centre, and well it might have, for there are more fac-

ories there than in all the rest of New-Jersey. The illustration shows the factory, at 226-228 Halsey street, in which B. & W. saddles are made. Newark's greatest factory population speaks volumes for the labor which can be employed there, and possibly explains why Butler & Ward's saddles enjoy their reputation.

OTHER "GOOD" THINGS.

Morgan & Wright are naturally so thoroughly associated with the tires bearing their name that comparatively few are aware that they carry in stock other goods sufficient to merit the issuance of a 20-page pamphlet, descriptive of them. Wrenches, toe clips, air compressor valves, pedal rubbers, chain lubricant, cement kettles, vulcanizers, liquid tire cement, rubber solution and wood rims are the articles illustrated and listed. This word to the wise should be sufficient for those who know how clever is the firm in their tire deals, but who knew nothing of their other wares.

TURNING THEM INTO SOLIDS.

People with porous tires or tires that will not hold air may be interested in the cork composition patented by E. W. Hopkins, No. 636 East One hundred and thirty-eighth street, this city. The composition is designed to entirely fill the tube, making the tire puncture-proof, and rendering inflation unnecessary. Mr. Hopkins does not expect his article to affect the sale of pneumatics, but believes that it will meet a want of those who buy second-hand wheels, or who cannot afford to purchase new tires.

CORKING CORKENE PLURALITY.

Sixty thousand pairs of Corkene handles have been contracted for by the Crawford Manufacturing Company, the order, of course, being placed with J. A. Weaver & Co., of this city, who make the grips. Weaver & Co. executed an indemnity bond guaranteeing delivery.

HERE ARE GEAR CASES.

At least one American firm has "plumped" for gear cases, the Tinkham Cycle Co., of this city. All '97 Tinkhams will be equipped with the case, and, in all likelihood, without extra cost.

A MESINGER MESSAGE.

Mesinger saddles, '97 patterns, will soon be very much in evidence. "Advance proofs," so to speak, are already in circulation. No great change from the '96 models was possible, the alterations being in minor points, where experience had proven them most

needed. The saddle is much thinner on the pommel, the felt is thicker, and the saddle therefore softer. There is no projection in the back, and, under medical advice, the outline of their V-shaped aperture has been changed to a form believed to be anatomically correct

A tension screw turning in either direction to relieve or tighten the leather top is among the new features.

The saddle will be made in three widths: narrow, 8 inches; wide, 9 inches; extra wide,

10 inches. They will be furnished in three colors, black, maroon and russet.

A spring attachment is the most novel feature introduced. This can be furnished with any of the different widths of saddles, and al-

lows perfect freedom of motion in every direction. The springs are so arranged that they will not throw the rider from the saddle when jolted.

In the course of its manufacture a bicycle passes through the hands of no less than fifty-four operators before it is ready to be sold.

RIDING ROUGH SHOD OVER THE ROADS.

Abroad rough-tread tires, or "corrugated covers," as they are generally termed, are in extensive use. The patterns of the corrugations are almost as bewildering as those of golf hose. On this side of the water their use has not been so great, but the horoscope of 1897 reveals signs that the star of the rough-tread will soon be in the ascendancy. Practically all makers of both single and double tubes will supply a tire of the sort. As a seller some of them will even make it lead their smooth-tread article. The New York Belting and Packing Co. will be of this number. In advocating their League embossed-tread tire they state the case cleverly in this fashion: "You wouldn't think of wearing smooth-soled rubber shoes. All rubbers have embossed or corrugated soles to give a firm tread; we do precisely the same thing with our rubber tires and for the very same reason."

WILL GET MORE FOR THEIR MONEY.

"The people who purchase \$75 wheels around Christmas time, or early in the season," said a tradesman who is usually logical, and who knows what he is talking about, "will get better value for their money than they ever got before. Nearly all the \$100 machines which were carried over this year will be changed in one or two petty details and worked off as \$75 wheels."

A SHINING EXAMPLE.

Every one is anxious to shine in this world; the bright parts of a bicycle are inanimate, but they, too, must shine. This lustre adds beauty to the wheel. To nickel-plate properly has become an art, and while much depends on the manual labor expended, without proper apparatus and materials the most skillful could scarcely hope to accomplish good results. The picture shows where such necessities are

made—the factory of the Hanson & Van Winkle Co., on Market street, in Newark, N. J. The firm is so old and well known that practically every one must be aware that they are in position to meet the very want of the nickel-plater, from the complete paraphernalia of a complete nickel-plating establishment to the simplest salt used in the solution.

MAP MILES AND CYCLOMETER ONES.

Did you ever hear two riders discussing—or, rather, cussing—the variation existing between the miles recorded by their tired muscles and those recorded by their cyclometers? Surely, you must have, and you could not have failed to notice that invariably it was claimed that the record of the former was greater than that of the latter. In other words, the cussers did not believe that they

were credited by the registering machine with the actual number of miles they had ridden according to map and milestone.

The strangest thing to me is that in all these discussions I have heard, not one of the questioners of the cyclometers' accuracy ever grasped the germ idea of the whole question, which is the utter impossibility of any instrument measuring wheel revolutions to record, on ordinary roads, the distance travelled according to the map. Surveyors do not measure distances by surface length up and down hill, but by levels; and on a hilly road the surface length as recorded by cyclometered revolutions will be many yards to the mile longer than the real distance recorded by milestones or on a good map.

By way of reductio ad absurdum take the extreme (and impossible) case of a hill suddenly rising sixty degrees, and on reaching the summit falling again at the same angle till it reached the level; in other words, a hill the two sides and base of which formed an equilateral triangle. The distance on a map from A to C on the accompanying diagram is just one mile, yet a cyclist following the line C D E would cover, and his cyclometer would record, just two miles. Yet this is the sort of thing that happens on a reduced scale every time wheelmen take their rides abroad, so that it is no wonder they complain of their cyclometers. In short, no cyclometer can give more than a rough guess at the distance from point to point really covered.

SLOW COACH.

JUST LIKE A MAN.

He and She were rather past the heyday of youth, in fact when they took to cycling unsympathetic friends took occasion to remark that they were old enough to know better. But age does not always bring wisdom, proven was this by the fact that at the moment He and She, barely out of their middle-aged novitiate, were wildly coasting an unknown hill with brakeless wheels. When they reached the bottom of the hill they were going very much faster than they wanted to.

"Slow up!" He cried to his wife.

"I can't!" She gasped, "and the road—takes—a turn!" She flew round it, while He, exulting in his newly acquired foothold on a single pedal, followed after her as best he could.

"I shall fall off," came disjointedly to his ear from the front.

"You won't!" shouted He, as he bent over the handles. "Keep your mouth shut and imagine that you're all right."

This was not polite, but it was effective. She cast a look of contempt and anger, with a strong suggestion of terror in it, at her husband, who had now caught up with her; and she kept her mouth shut and stuck on. "You're doing finely," said He, encouragingly. "Now put your feet on the pedals and we'll push on."

There are times to talk and times to shut up; this was one of the latter.

QUAKER KINKS.

"Examine the Quaker and it won't take you twenty minutes to conclude that it would be better to sell it than to compete with it." This is a reasonably modest address to cycle agents from the Penn Manufacturing Company, Erie, Penn., who make the Quaker. Their '97 line is now complete. It will consist of two roadster wheels for men, a racer, two ladies' wheels and two tandems. The line represents no radical departure in model, but many of the constructive features are original and distinctive, and such as the makers believe will appeal to the thoughtful.

The pedals, handle-bar adjustment, seat-post adjustment and crank-shaft are cited as instances. The seat-post is held in position—a

position instantly adjustable at the wish of the rider—by means of a clamp, the loosening of the single bolt of which permits raising or lowering of the seat-post bracket.

The pedals are formed of three pieces of sheet steel riveted together in such manner as to present, in end section, a triangle. They are very light, and, by reason of their

form, "incredibly strong," in the words of the Quaker people. They may be used with or without rubber plates, at the option of the rider.

The Quaker handle-bars are instantly adjustable to any position. The centre of the handle-bar is corrugated. A pilot, the lower face of which conforms in curvature to the circumference of the bar, and toothed to fit the corrugations therein, rests lightly upon said corrugations, and is held in place by a threaded plug, recessed at its lower end to

receive the upper end of pilot. This plug screws into the upper side of the handle-bar clamp, and when the handle-bar is adjusted and clamped in the position desired, the plug is screwed down, forcing the teeth of the pilot into the corrugations upon the handle-bar, firmly holding the bar in the position in which it is placed.

The crank-shaft is of the finest tool steel, the ends for reception of the cranks being of triangular form. The eye of the crank conforms, in opening, to crank-shaft end, as per cut herewith. The shaft end of crank is sawn open, and is supplied with a clamp-bolt, so that, in position, it may be drawn down and caused to grip tightly the shaft end. There is no weak point. As a further precaution against accident, a safety screw, with flat head, slightly larger in diameter than crank-shaft, is let into the end of the shaft, the head forming a flange which prevents the crank slipping off the shaft in the event that, by oversight or negligence, the

crank clamp-bolt should not be sufficiently tightly drawn.

The front and rear hubs and the crank-hanger are provided with inner lubrication tubes, which conduct the oil directly to the ball races, accomplishing a very material saving of oil, reducing also the frequency of the necessity for oiling and assuring the highest degree of cleanliness.

The dust-cap, employed on front and rear hubs and crank-hanger, is of new design. It is the combination of the cone, a steel washer, a felt washer, a steel dust-cap and a mill-edged steel nut. The cone being placed in position, the steel washer is pressed close up to its outer face. The felt washer is then slipped into place, against the steel washer. The steel dust-cap is next placed in position and forced tightly into place by means of the milled-edged steel nut, making an absolutely dust-proof dust-cap.

The Penn Manufacturing Company naturally believe that their wheels will attract their full measure of attention the coming season, and not without reason.

SADDLES THAT SUIT.

As manufacturers of tool bags, H. M. Rosenblatt & Co., of Philadelphia, have made such a reputation for themselves that they should be thoroughly at home in the manufacture of bicycle saddles. They have made saddles for some time past, but now they intend going into that department on a greater scale, but with the same thoroughness and energy that have marked their efforts in other lines. Their '97 saddle appears to have many features to commend it. It is a firm saddle combined

with an easy spring, which can readily be changed to a stiffer tension in a moment. As may be seen in the illustration, it really has a double spring, one being very flexible, that can be quickly removed and a clip substituted to the top or stiffer spring, thus making either a comfortable riding seat or a scorching saddle. They say that it has been used over rough roads by many experts for the last four months, and won nothing but praise. The top is of the finest tanned leather, of first-class

quality, and—what is very essential—a low price is asked.

Of course, their toolbags need but little reference. Twenty-two new designs are offered, and to any one who has dealt with H. M. Rosenblatt & Co. before, little more need be said.

The volume of their business during '96 was enormous. It would stagger a few people of expressed in figures, but if maintaining the standard of goods and their low margin of profit will merit a continuance, they mean to merit it.

National Board of Trade of Cycle Manufacturers.

271 BROADWAY, NEW YORK.
Phone No. 4117 Corlandt.

President, R. L. COLEMAN.
First Vice-President, R. P. GORMULLY.
Second Vice-President, GEORGE H. DAY.
Treasurer, W. A. REDDING.
Secretary, ERNEST R. FRANKS.

Mercantile Agency, Collection Department and Information Bureau.

Rubber Tire Association.

President, THEODORE A. DODGE.
First Vice-President, L. K. MCCLYMONDS.
Second Vice-President, GEORGE T. PERKINS.
Treasurer, GEORGE F. HODGMAN.
Secretary, KIRK BROWN.
501-506 West Fourteenth Street, New York.

National Bicycle Wood Rim Manufacturers' Association.

President, E. S. MEAD.
Treasurer, N. D. DOUGHMAN.
Secretary, W. W. STALL, Bedford, Mass.

NATIONAL CYCLE SHOWS.

Under the auspices of the National Board of Trade of Cycle Manufacturers.

January 23-30—Chicago, Colis-um.
February 6-13—New York, Grand Central Palace.
February 20-27—Boston, Mechanics' Building; C. W. Foudrimer, Mgr. Boston Cycle Board of Trade.

FOREIGN CYCLE SHOWS.

Nov. 20-28—Stanley; Agricultural Hall, Islington, London, N.; E. A. Lamb, Secretary, 57 Chancery Lane, W. C. Telegraphic address: "Insuppressible, London."
Dec. 4-12—London, National Show, Crystal Palace; Frank Peach, Secretary, 48 Holborn Viaduct, London.
Dec. 12-27—Paris, Palais d' Industrie, Champs Elysees; M. Bivort, Manager.
Jan. 2-9—Manchester, Eng.
Jan. 16-27—Dublin, Ireland; Royal Dublin Society Building, Balls Bridge; R. Wilson, Secretary, 14 D'Olier Street.
Jan. 27-30—Glasgow, Scotland; A. G. Rennie, Secretary, 49 Lilybank Gardens.

TRADE CHANGES.

ALABAMA.
Huntsville—Bell, Rhea & Co., new store; will manufacture and repair bicycles.
CALIFORNIA.
Riverside—Victor Noble, sold out to W. S. Collins.
Santa Ana—Wright & Bundy. A. Y. Wright gave bill of sale for \$2,000.
COLORADO.
Colorado Springs—Wahl Bros., partnership dissolved.
GEORGIA.
A. F. Pharr, bicycles, reported recorded chattel mortgage for \$398.
ILLINOIS.
Chicago—R. H. Mursell, assignee for the Sterner Wheel & Sporting Goods Company, has filed in the County Court a list of claims against the insolvent company, amounting to \$4,775.42; assets, over \$700.
Chicago—Smith, Seib & Co. now operated by Chicago Tip and Tire Company.
Chicago—F. S. Waters & Co. sued for \$2,500 by New Castle Tube Company.
Waukegan—F. T. Wheeler damaged by fire. Loss, about \$700.
INDIANA.
Evansville—Viets & Davidson. E. S. Viets reported to have given chattel mortgage for \$500; real estate mortgage for \$1,200.
Springfield—A. G. Gruendler, reported chattel mortgage for \$104.
Evansville—Evansville Cycle Works failed.
Westfield—The Cycle Heights Company, organized, with Charles H. Parsons, president;

R. B. Alden, treasurer; and R. A. Knight and C. H. Moore, trustees; to develop the property in the vicinity of the Lozier bicycle works on East Silver street. Capital stock \$45,000.

IOWA.

Webster City—M. B. Everson. Bill of sale, \$1,000.
Des Moines—Pacemaker Bicycle Company. Judgment for \$3,165.

MASSACHUSETTS.

Cambridge—William W. Furness. Chattel mortgage for \$700.
Peabody—Ernest J. Porter. Mortgages, stock, etc., \$500.

MICHIGAN.

Fennville—A. M. Hulson will manufacture and repair bicycles. He will make a wheel called the Pennville, and a cheaper grade.
Saginaw—W. L. Marr Cycle Company succeeded by W. L. Marr.

MINNESOTA.

Hutchinson—Clark Robbins, new store.
Owatonna—The Moorhouse Cycle Building destroyed by fire, with all its contents. Loss, about \$3,500.

NEW JERSEY.

Newark—Probst Supply Company closed by Sheriff.

NEW YORK.

Buffalo—The directors of the Imperial Cycle Company made application to Justice Laughlin for an order requiring all persons interested in the affairs of the corporation to show cause on February 3 why the company should not be dissolved. The order was made, and F. Gibbons appointed referee.
Dansville—Allen & Kramer. Dissolved.
Elbridge—Elbridge Cycle Company. Stock and machinery sold by Sheriff; \$5,161.10.
Haverstraw—Buchanan & Weiant. Dissolved. G. B. Buchanan continues.
New York—Cycle Components Company incorporated by Alvin L. Strasburger, William H. Cashen and Robert Perkins, to manufacture bicycles and bicycle appliances. Capital stock, \$25,000.

New York—Hodgman Rubber Company. Judgment entered vs. George F. Hodgman; \$4,742.55.
New York—S. H. Ellis. Chattel mortgage, \$350.
Syracuse—American League Cycle Association. Attachment vacated; claim paid.
OHIO.
Toledo—Charles Truman & Co. reported sued for \$767.
PENNSYLVANIA.
Bloomfield—Darlington & Reeder will erect a large rim factory and planing mill, and place machinery.
Shamokin—J. H. Eisenhart. Offering 25 per cent in settlement.
Scranton—A. W. Jervis. Sold out by constable.
Williamsport—Harris High Art Cycle Company. Organized with \$250,000 capital.

RHODE ISLAND.

Providence—Fred W. Webb. Chattel mortgage, \$195.

TENNESSEE.

Chattanooga—Graham Cycle Company, bicycles, 120 East Eighth street, offering stock for sale.

TEXAS.

Tyler—N. W. White sued for \$200.
Fort Worth—L. E. Day sued for \$183.27.

VIRGINIA.

Newport News—J. Ingersoll desires correspondence with dealers in bicycle parts and with specialists in repair work.

WISCONSIN.

Milwaukee—The Lake City Manufacturing Company incorporated by F. Tanhauser, E. S. Mack and H. Landauer. Capital stock, \$1,000.
Whitewater—M. J. Taft, new store.

COMPARISONS ARE ODIOUS.

Exports of American cycles and cycle materials continue brisk. For the week ending October 27 the value was \$61,711, England taking one-third of the goods and Australia and Italy the bulk of the remainder. The appended list details the shipments. For the sake of comparison, the cycle exports from England for the week ending October 16 are also given. It is of interest, and may furnish a few "clues" to the American trade.

TRASURY CIRCLE RULING.

The Treasury Department has promulgated a decision with regard to the dutiable classification of bicycle saddles as follows: "The goods are bicycle saddles composed of leather and metal. They were assessed for duty at 35 per cent as manufactures of metal, and are claimed to be dutiable at 30 per cent under paragraph 353, Act of August, 1894, February 8, 1894 (G. A. 2,455), on information received from the Pope Mfg. Company, and on an estimate of the value of the materials abroad, a similar claim of the importer's was sustained. But since that time there have been numerous sales and shipments to this country of the leather and metal parts separately, and the prices at which the respective parts have been sold, invoiced and appraised are conclusive as to the incorrectness of our previous decision. We find, therefore, that metal is the component material of chief value and affirm the assessment of duty."

MEDAL AND DIPLOMA.

Humbers were the only bicycles exhibited at the American Institute Fair in this city. They were awarded a special medal and diploma for "originality of design, superiority of construction, quality of materials used, excellence of finish and strength and durability, as demonstrated by tests."

ALLIGATORS IN THE WEST.

The Reading (Mass.) Rubber Tire Co. has enrolled as "one of theirs" Fred S. Dickinson, who will look after the alligator tire trade west of the Ohio. He will have headquarters in Chicago.

PATENTS GRANTED.

570,015. Velocipede. Thomas Hall, Manchester, England. Filed June 4, 1895. Serial No. 551,690. (No model.)

570,052. Bicycle gearing. Abel F. Price, U. S. Navy. Filed January 2, 1896. Serial No. 574,067. (No model.)

570,142. Implement for replacing inner tubes of pneumatic tires. William S. McCutcheon, El Paso, Tex. Filed October 7, 1895. Serial No. 564,913. (No model.)

570,179. Bicycle. Thomas S. Miller, Burlington, Iowa. Filed July 22, 1895. Serial No. 556,742. (No model.)

570,187. Bicycle handle-bar. Frederick C. Rockwell, Hartford, Conn. Filed June 9, 1896. Serial No. 594,850. (No model.)

570,208. Gear for motorcycles. George H. Ellis and John F. Steward, Chicago, Ill. Filed January 23, 1896. Serial No. 576,543. (No model.)

570,240. Bicycle-lamp bracket. Charles F. Walker, Chicago, Ill. Filed November 14, 1895. Serial No. 568,899. (No model.)

570,250. Bicycle wheel. Rimmon C. Fay, Hion, N. Y., assignor to the Remington Arms Company, New York, N. Y. Filed January 28, 1896. Serial No. 577,108. (No model.)

570,271. Bicycle. George H. Sears, Rochester, N. Y., assignor of one-half to George Hahn, same place. Filed January 18, 1896. Serial No. 576,007. (No model.)

570,285. Folding canopy for bicycles. John Kaufman, Philadelphia, Penn. Filed July 30, 1896. Serial No. 601,074. (No model.)

570,310. Fastening for bicycle posts. Frederick I. Johnson, Fitchburg, Mass., assignor to the Iver Johnson's Arms and Cycle Works, same place. Filed July 26, 1895. Serial No. 557,286. (No model.)

570,320. Bicycle. Edwin Y. MacKenzie, Kingston, Jamaica. Filed October 16, 1895. Serial No. 565,911. (No model.)

570,327. Bicycle. John J. Naregang, Leersport, Penn. Filed June 22, 1896. Serial No. 596,495. (No model.)

570,428. Ball-bearing for bicycles. Elmer C. Howe, Waltham, Mass., assignor to the American Waltham Manufacturing Company, same place. Filed December 23, 1895. Serial No. 572,930. (No model.)

570,440. Motor vehicle. Edward J. Pennington, Chicago Heights, Ill., assignor to the Motor Cycle Company, Chicago. Filed March 21, 1895. Serial No. 467,044. (No model.) Patented in England December 11, 1895. No. 23,711.

TRADE-MARKS.

29,051. Composition for repairing pneumatic tires. Boston Woven Hose and Rubber Company, Boston, Mass., New York, N. Y., Chicago, Ill., San Francisco, Cal., and Cleveland, Ohio. Filed September 18, 1896. Essential feature: The word "Vimodil." Used since July, 1896.

29,052. Pneumatic or solid-rubber tires. L. C. Chase & Co., Boston, Mass. Filed September 19, 1896. Essential feature: The word "Chase." Used since July 1, 1896.

RECENT PATENTS.

570,327. BICYCLE. John J. Naregang, Leersport, Pa. Filed June 22, 1896. Serial No. 596,495. (No model.)

Claim.—The combination, with the rear-wheel axle and the frame union or post-pipe, of a lengthwise slot, of the seat-adjusting screw, the adjusting nut applied to the latter and engaging the same as specified, the guide-wheel for said screw and a clamp-socket working in contact with the washer, substantially as shown and described.

569,005. BALL-BEARING FOR BICYCLES. CHARLES T. BROWN, Chicago, Ill., assignor to Form B. Brown, same place. Filed July 9, 1896. Serial No. 568,685. (No model.)

Claim.—A ball-bearing comprising a shaft, a cone thereon each having a track, one cone being adjustable, a spring cone having internally extending annular flanges, balls interposed between the cones and a spool longitudinally movable on the shaft between the cones and spool being provided on its ends with tracks for the balls, and such tracks corresponding with the track on the cones.

569,045. PANTS-LEG GUARD. SAMUEL J. TURNER and CHARLES J. GILBERT, Minneapolis, Minn., assignors of one-half to George J. Turner, same place. Filed Sept. 30, 1895. Serial No. 565,109. (No model.)

Claim.—A passing-guard composed of wire so bent upon itself as to form, near one end of the guard, rings, the wire being adapted to grasp and hold the ends of the pants, the whole being adapted to encircle the leg and tightly clamp the pants about the leg, substantially as shown and described.

569,055. SHOWER ATTACHMENT FOR BICYCLES. FREDERICK S. PRATT, Cambridge, Ohio. Filed Oct. 21, 1895. Serial No. 568,915. (No model.)

Claim.—A device of the kind described, the combination of the attaching member adapted to be connected to the bicycle-frame, a lead-supporting arm connected to it and extending therefrom and two brass arms below the latter adapted to engage inwardly the lead between their free ends to prevent the same from slipping.

569,706. BICYCLE SADDLE. BRANTLEY L. WYMAN, Santa Rosa, Cal. Filed Nov. 23, 1895. Serial No. 570,007. (No model.)

Claim.—In a bicycle-saddle, a flat seat-plate curved to form a lateral convex rear portion and having parallel forward extension, said plate having a central opening of a substantially transverse oval form with a forward extension and said opening being entirely within the edges of the plate whereby the plate extends forwardly to the rear, and plate hinges also downwardly flanges bounding its outer periphery and the periphery of the plate center, and provided with perforations a transverse flexible rib extending substantially correspondingly with the plate and having lateral bulges coincident with those of the flanges whereby it is readily removable, and an inner expansible tube or lining and means for adjusting the same.

570,142. IMPLEMENT FOR REPLACING INNER TUBES OF PNEUMATIC TIRES. WILLIAM S. MCCUTCHEON, El Paso, Tex. Filed Oct. 7, 1895. Serial No. 564,913. (No model.)

Claim.—In a implement for replacing the inner tubes of pneumatic tires, a grip for the end of the inner tube containing the tapering plug adapted for connection at its smaller end with a drawing-in cord, and the tapering device of a device to fit over the plug and clamp the tube end thereon, substantially as described.

570,340. BICYCLE LAMP BRACKET. CHARLES F. WALKER, Chicago, Ill. Filed Nov. 14, 1895. Serial No. 568,899. (No model.)

Claim.—A lamp holding bracket, consisting of two clamping members detachably secured together, one of said members being adapted to be converted into a reverse position with reference to the other member, substantially as described.

569,352. VELOCIPEDE WHEEL-LEVER. THOMAS B. JEFFERY, Chicago, Ill. Filed Aug. 11, 1895. Serial No. 564,818. (No model.)

Claim.—In a velocipede, in combination substantially as set forth a below back-lever having the knifepoint formed integrally therewith by riding and expanding the end portion of the lower tire cover-carriage frame and said knifepoint having its edge folded or crinkled longitudinally and a filing device adapted to rest in the concavity of said knifepoint and be retained by the folding or crinkled edge of the same.

569,216. SPOCKET-WHEEL. JOHN LINCOLN, Melbury, Mass. Filed Sept. 28, 1895. Serial No. 563,793. (No model.)

Claim.—A sprocket-wheel having teeth made in circumferentially-ribbed section, and means for adjusting said sections whereby the teeth may be expanded or contracted.

569,705. OMINIUS KIMBLE and FARMER BICYCLE. CHARLES J. GILBERT, Minneapolis, Minn. Filed Apr. 14, 1896. Serial No. 566,117. (No model.)

Claim.—A bicycle frame, comprising forward and rear sections whereon the wheels are attached, said forward section comprising a standard 2, a head and parts connecting the same, said rear section comprising the back and horizontal bars, said sections adapted to be secured to one another, and an independent middle section adapted to be inserted between the forward and rear sections, said middle section comprising upper or steering parts, and upper and lower horizontal sections, nests carried upon the forward and middle sections, and suitable driving mechanisms also carried thereon, substantially as described.

570,179. BICYCLE. THOMAS S. MILLER, Burlington, Iowa. Filed July 22, 1895. Serial No. 556,742. (No model.)

Claim.—The combination with a tubular holder and tubular fork-stem with divergent flange projecting there and holder and a threaded and conoidally-bored clamping-head, to hold said parts together, of a short interior rib at the upper end of said fork-stem and a tubular longitudinally-grooved handle-bar post with said fork-stem and rib so seated thereon, substantially as specified.

570,394. BICYCLE. BRUCE L. THOMPSON, Nassau, Bahamas Islands. Filed Aug. 1, 1896. Serial No. 574,778. (No model.)

Claim.—In a bicycle, the combination of the bars of the bicycle-frame, a crank axle carrying a sprocket, and a shield or casing comprising the central horizontal plane having at each end a clip, to engage the bars of the bicycle-frame, and provided with downwardly-curved horizontal plates which take said ends of the crank-sprocket and said plate provided with a radial slotting device over the crank axle, as set forth.

569,504. PNEUMATIC TIRE. ANDREW CLAFFY, Brooklyn, N. Y. Filed Oct. 11, 1895. Serial No. 563,389. (No model.)

Claim.—In pneumatic tire for bicycles and other vehicles, the combination of the inner rubber tube, A, the thick canvas or duck tube, B, rendered waterproof, a reinforcing section or strip of heavy mil-leather, the edges of which are slitted or skirted down, secured to the outside of the said strip of canvas or duck, and a covering layer of rubber attached to the canvas as a reinforcing part, and upon the edges of the latter, substantially as herein shown and described.

569,923. STEAM-TRIP. CHARLES R. BROWN, Everett, Mass. Assignor to John W. Wilson, Boston, Mass. Filed Sept. 5, 1895. Serial No. 561,512. (No model.)

Claim.—A cyclometer comprising the following instrumentalities, viz: a containing case of substantially small diameter provided with a dial having four openings arranged in a substantially straight line, four conducting-disks located within the casing and arranged in a circle, each disk having one end connected to one of the openings in the dial, and each disk being provided with indications or numbers arranged at an angle to a radial line through the center of the numeral, the two outside or endmost disks being located in a different plane from the two intermediates.

Claim.—The combination with the tubular bearing and the hub-horn rotating thereon and provided with a ratchet, of a tubular latch or bolt mounted in the said bearing, sliding freely along the handle-bar tube in engagement with the ratchet, and extended out through the end of said bearing and there provided with a finger-piece, substantially as set forth for the purpose specified.

569,234. ADJUSTABLE BICYCLE HANDLE-BAR. BENJAMIN PUTZ, Elizabeth, N. J. Filed May 29, 1896. Serial No. 568,851. (No model.)

570,155. DEVICE FOR REPAIRING PNEUMATIC TIRES. LEWIS T. HOPKINS, Ellettsville, Ind. Filed Sept. 3, 1895. Serial No. 564,114. (No model.)

Claim.—A tool for repairing bicycle-tires, comprising two shafts, each having a point approximately at right angles to its ends, the shafts being adapted to be separately connected and thereby to bring the points into position to clamp between them a folded patch, the points when so related being adapted to be thrust through the wall of a bicycle-tire and carry with them the folded patch, and the angle between the points and shafts being adapted to limit the forward movement of the points.

569,172. BICYCLE-TIRE. JOHN W. GILBERT and EDWARD FALLON, Peru, Ind. Filed Oct. 18, 1895. Serial No. 571,851. (No model.)

Claim.—The combination of the tire A provided with the inside webbing B, the casing C of the springs B provided with the said webbing C, the retaining block B located above the lower convolution of the tire, and the tire A, substantially as described.

569,261. COMPOUND REINFORCED TIRE. GEORGE T. WARWICK, Newark, N. J. Filed Mar. 24, 1896. Serial No. 576,692. (No model.)

Claim.—The combination of a tube-section A, formed from a sheet-metal blank by bending the blank into tubular form and forming therein a reinforcing dovetail between the ends, and a tube-section B, formed from a sheet-metal blank with its edges constituting the inner flange, the latter section B being secured to the inner edge of the tube-section A, and having its lips disposed upon the flange of the said dovetail portion of the inner tube, the said tube-sections and being compressed, having the inner wall of the tube webbing unbolstered, substantially as described.

567,849. BALL-BEARING. CHARLES H. CHAFFIN, Orono, Maine. Filed Nov. 16, 1895. Serial No. 568,125. (No model.)

Claim.—A ball-bearing comprising a recess having raised tracks of different radii, bearing-balls arranged thereupon, said tracks divergent arranged between said bearing-balls, and a supporting device adapted to sustain such said bearing-balls with their free ends near the rear-decrescent line of the axis of the bearing-balls which they separate, substantially as described.

569,336. BICYCLE SADDLE. ALFRED D. DUNN and GEORGE R. SAGE, Orono, N. Y. Filed May 25, 1896. Serial No. 564,863. (No model.)

Claim.—A saddle for cycles comprising a suitable base, a front-curve secured to said extending over said base, padding inserted between the base and the cover and terminating in rear of the front edge of the saddle base, and an inflatable tube or bladder located at front edge of the saddle, between the base and the cover, and the tube or bladder or cavity made by the termination of the padding, substantially as described.

BRIEF BITS FOR BUSY MEN.

Of the 2,500 members in the New York Athletic Club, 1,126 are cyclists.

Bids are being invited by the Government authorities in Brazil for the supply of 22,000 enamelled plates to be affixed to bicycles in 1897.

G. B. Schuchardt, of Schuchardt & Schuette, of Berlin, Germany, and H. Greif, chief engineer of the concern, are visiting this country. They are among the largest importers in Germany of American machinery.

Even the carpet mills have caught the bicycle craze, and several Massachusetts factories are turning out rugs and carpets that show conspicuous designs of yellow and green tandems carrying merry pink youths and purple maidens.

A bill has been introduced in the Vermont Legislature to compel railroads to carry bicycles as baggage. The bill to tax bicycle owners 75 cents annually, the proceeds going to provide public cycle paths, has been advanced to third reading.

A Birmingham, England, paper tries to make its readers swallow this yarn: Recently the Austrian Government offered a Birmingham mechanic a salary of \$5,000 per annum and a profit of 2½ per cent on the business, to conduct a cycle factory, but the offer was declined.

Every mechanic knows that he cannot successfully temper a piece of steel until the outside surface, or bark, as it is technically called, is removed, and every steel maker will advise a man that in order to successfully temper good tool steel he must first remove all of this scale or bark.

What is more exasperating when you are attempting to air your technical knowledge of a wheel to forget the name of a part just as you are on the point of naming it, and then go groping around for it in the dark, with the tail just tickling the fringe of your recollection—and never get it!

The Assessor of the District of Columbia has recommended that an annual tax of \$1 be imposed on all bicycles in actual use in the District, that all rental wheels be licensed, and that a "registry of bicycles" be kept. It is thought that such a tax would amount yearly to some \$50,000.

There are now twenty large cycle factories in Austria, whose annual output is estimated at about 25,000 to 30,000 machines. The importation of foreign machines has greatly declined, but many small manufacturers still procure unfinished parts of the machines from other countries, and notably from England.

By a simple chemical process aluminum can be dyed to any desired hue. As aluminum cannot stand the heat necessary to stove enamel, this offers the maker of the aluminum cycle fittings a chance of pleasing such customers as prefer the metal to be disguised. It is hard to distinguish the result from ordinary enamel.

An important influence which works in favor of the British manufacturer in his competition in foreign markets with American manufacturers is undoubtedly the British system of banking, which is not only much more complete and comprehensive, but also much more closely related to business in other countries than is our own.

If one of a partnership sells out, bona fide, his interest to his co-partner or to another,

without in any way retaining his equity to have the partnership creditors paid out of the assets, the property is converted into the individual property of the purchaser, free from all the equities of the seller, even if the purchaser, as the consideration for such purchase, agrees to pay the firm debts; otherwise, if the purchaser agrees expressly or impliedly to apply the assets to such purchase.

In the Kingdom of Saxony a step is being taken which America might note with profit. The Export Union is getting up a book containing the names, addresses and business of 600 reliable concerns seeking export trade, which will be printed in four languages—English, German, Spanish, French—for distribution in foreign countries where these languages are spoken.

For toolroom or jobbing work, where uniformity of sizes is not of prime importance, the solid reamer can be made to "do"; but for manufacturing operations it has no proper place, as, no matter how made—relieved or not—it is only a question of time when it will lose its size. The inserted blade reamer, with the blades in wedge-shaped grooves, will keep its size indefinitely if properly used.

Metal parts may be coated with aluminum or aluminum alloy electrically by placing them in a bath of 10 aluminum tartrate, 0.5 ammonium chloride, 100 water, bath temperature about 26 to 40 degrees C.; if the anode is insoluble, the bath is emptied and fresh aluminum tartrate dissolved. If aluminum is the anode, the bath to be kept entirely or weakly alkaline. Four or ten volts or more are required for the deposition of the aluminum.

The production of Para rubber increased from 8,243,000 pounds in 1865, to 15,144,000 in 1875, 29,310,000 in 1885, and 46,363,000 pounds in 1895; the great advance in the decade between '85 and '95 being the direct result of the increased demand produced by the tire-makers. Last year 37,456,000 pounds were delivered to manufacturers in the United States, against 31,062,000 pounds in 1894, and 35,583,000 pounds in 1893. The highest price paid in this country last year for fine Para rubber was 81½ cents, in November.

The cycle trade, and many good mechanics therein, are prone to think too highly of self-evident ingenuity. The highest ingenuity begets the most simple devices, and, so, often defeats itself so far as the securing of popu-

lar applause is concerned. We, as a people, have a reputation as inventors which we may hope to hold for long years to come; but it is not as ingenious inventors that we should be known. The supreme inventor is the successful inventor, and in his brain judgment has a more exalted seat than imagination.

To find a market in Italy it is claimed that American high-grade wheels must retail for from \$80 to \$100, and in these prices must be included \$15 for freight and duty. To market a wheel requires it to be invoiced wholesale at not more than \$80, advertising charges, posting bills and hangers to be supplied free by the American maker. After the American manufacturer has done all this he is asked to take his pay at sixty days, less 2½ discount, or four months net draft. Under these conditions it is very probable Italy will not be immediately overrun with American high-grade wheels.

The cycle inventor does not always, or perhaps even generally, deliberately set to work to devise something for a particular purpose. The true inventor's mind works often automatically, and in spite of him keeps conjuring up new and untried and unheard-of possibilities in cycling. The things so brought up probably do not differ so much from those which are worked up with deliberate purpose. The ideas so born are probably bad, indifferent or good, the same as the others, and the work of selection and approval is as imperative with the spontaneous invention as with those which are born of persevering brain cudgeling.

The International Exposition to be held in Brussels, Belgium, beginning May 24, will afford an excellent opportunity for American cycle manufacturers to place their goods in competition with those of other countries. It will be advisable for the exhibitor to have a special representative in charge of his exhibit who can speak French. But in the case of small exhibits arrangements for the unpacking, installation and care of the same may be made with Mr. Jean Verhaegen, Place Loos 1, Antwerp, Belgium. For further information address the Commissioners, J. H. Gore, Columbian University, and Thomas Wilson, U. S. National Museum, Washington, D. C.

To recall a letter, even after it has reached the postoffice at its destination, apply to the postmaster for a "withdrawal blank," and when this is filed out and a deposit made to cover the expense the postmaster will telegraph to the postmaster at the letter's destination asking that it be promptly returned. The applicant signs this agreement: "It is hereby agreed that, if the letter is returned to me, I will protect you from any and all claims made against you for such return and will fully indemnify you for any loss you may sustain by reason of such action. And I herewith deposit \$— to cover all expenses incurred and will deliver to you the envelope of the letter returned."

A study of India rubber statistics, as furnished by all producing countries, leaves it open to doubt whether the increase of rubber is commensurate with the increase of demand, when the prospects and probabilities which bicycle construction and carriage tire requirements present are taken into account. Up to this time production has kept pace with demand. But to all appearances there has been this year, and perhaps last year, a rather sudden expansion of demand. Next year the demand will probably be greater. The expansion may and probably will grow from year to year, though India rubber importers are not apprehensive, apparently, of any scarcity.

The New FORKSIDE

TAPER GAUGE.

THE accompanying sketch shows our **ONE-PIECE FORKSIDE**. These Forksides are made from taper gauge material by our special process, being heavy in the walls at the curve where the fork stem is attached, gradually reducing in thickness as the strain is lessened, to a point near the hub. The walls are then reinforced again in the gauge to provide a suitable bearing.

The Strongest, Most Graceful and Best FORKSIDE on the Market.

WHEEL OF MYSTERY.

Chainless wheels will be nowhere in comparison with a machine which is to be exhibited at the forthcoming Stanley Show in London. The coming of this mechanical wonder is heralded in this mysterious fashion: At the annual stockholders' meeting of one of the largest English cycle companies, the president of the company said that the directors had involved the company in an investment for the time being of a few hundred pounds, viz., for the purpose of building certain machines, which, he ventured to say, "would cause a sensation in the world of cycles such as has never up to the present time been experienced. In other words, they were interested in a powerful syndicate formed to introduce a cycle to the public which is driven neither by chain, gearing rods, nor, he might say, mechanical contrivances, but by a wonderful adaptation of an old principle in use in our chief public buildings of to-day. An increase of power was provided that would admit of any one of them propelling the machine at thirty-five miles an hour—uphill if desired. By means of this invention just one-tenth part of the power required to drive an ordinary cycle at a certain rate of speed will be required to propel a safety fitted with the new invention."

LAUNCHING THE LAMINATED.

Adjoining the Lake Erie and Western Railroad, at Tipton, Ind., is rapidly being completed a new brick building, 50x150 feet, which will be the new home of the Laminated Steel Tube Company, a newly incorporated concern with a \$50,000 paid-in capital. The officers of the company are John P. Kemp, president; James N. Waugh, secretary and treasurer, and Colonel J. M. Hunter, vice-president and general manager. The laminated plant will be planned for an annual output of 5,000,000 feet of tubing, and eventually the company will be in the market to contract with the trade for the rapid and satisfactory assembling of frames of all standard sizes.

Warren Street, Model, Well-
Lighted Lofts; Steam Heat,
Electric Light, Electric Power.

IN THE HEART OF THE CYCLING DISTRICT.

Uncle Josh to the theatre went;
He had never been there before,
So he held his parachute on his knees,
And he hung his dice on the floor.
And he occupied a first front seat,
Quite close up to the stage,
Where he could look the actors through
And the eyes of the girls engage.
He brought with him most everything
To keep from getting gium,
And chewed until his jaws got tired
White's famous Pepsin gum.

White's Pepsin and YUCATAN gum is sold all over the world.

WHY THEY PLEASSED HIM.

"If dere is any invention dat I have a profound respect fur," said Meandering Mike, "it's dese mile-a-minute bysickles, what you reads about."

"Whut's de reason?" inquired Plodding Pete. "Dey never work."

In the darkling gloom of the midnight lone,
There came a call on my telephone,
And impressed with fears that I dare not own,
I crept from my bed with a rueful groan;
For the floor was cold as a paving stone,
And the germs of the dread la grippe were soon,
While I waited the words of my friend unknown.

The sad wres sang in their tuneless drone,
And then, in a dreary monotone,
In my startled ears these words were blown
From the frozen poles to the torrid zone.
From the Rio Grande and the River Rhone
To Plymouth Rock and the Blarney Stone,
The New Departure Bells are known,
For they have a tone that is all their own.

Seam filled with an alloy that we guarantee will not melt under 1,800 degrees. It amalgamates the joints together equal to a weld. It is steel in nature, being homogeneous and tough, and containing a sufficient amount of carbon to make it adhere to the tubing, the same as welding. This alloy, when brought to 300 or 400 degrees of heat for enameling, does not throw off a gas, as does common phosphorus spelter, and cause the enamel to crack and creep along the seam where it is brazed. Our tubing is absolutely smooth inside and out-side. It can be used in any and all parts of the bicycle where the seamless drawn tubing is applicable. Cut to exact lengths wanted; no waste. Perfectly round, true to gauge and straight. Analysis of steel furnished upon application.

PRESSES, DIES,

and SPECIAL MACHINERY for

BICYCLE WORK

TUBE-TAPERING ATTACHMENT.

This is a useful attachment for manufacturers who do not require tapered tubes in such quantities as to call for a separate machine. The tube is clamped in a device which imparts to it a rotary motion, and at the same time a longitudinal advance, thus pushing the tube into the tapering dies in a manner which insures very perfect work. The attachment is easily removed, making the press available for general punching, piercing and bending.

Special catalogue.

Semi-drop.

7-inch drop—Ram's Horn.

3-inch drop—Ram's Horn.

SEE THAT FERRULE? And only find it on Rastetter Wood Handle-Bars.

The Ferrule protects the wood from being worn by clamp. The Ferrule is a piece of seamless steel tubing compressed over the bar, and the clamp is fastened over it; therefore it gives a solid surface to clamp upon. Wood is not a hard resisting surface, consequently if you clamp directly on the wood bar it compresses and in a short time your clamp becomes loose. We make LAMINATED WOOD RIMS by a new process; and also SINGLE-PIECE RIMS fitted with our new '97 Joint. You can't open it—Try it. Also MUD and CHAIN GUARDS, Saddle Cantels, etc.

Julius Andrae & Sons' Co.
Keating Wheel Co.

LAMINATED

Trade-Mark.

Are you interested in connecting two good names—your own as that of a maker of **High-Grade Machines**, with ours as that of the makers of the **Boston Laminated Wood Rim**, the highest grade wood rim made in the world?

Our men on the road are working twenty-four hours a day, and their time is at your disposal. If you want to close, wire us and we will see you within twenty-four hours with the **best goods in the world**, which we are willing to sell at a fair profit on the cost of manufacturing.

USE BOSTON LAMINATED.

Kindly mention The Wheel.

POINTS TO CONSIDER

IN OUR

REINFORCED LAMINATED RIM:

Two rims required to make one.
Twice the labor necessary over any other laminated rim.
Twice the material used over any other laminated rim.
Twice the life endurance over any other laminated rim.

No splitting.
No joints coming apart.
No outside glue joints to open up.
Perfectly true and round.
Perfectly seasoned.
Piano finish.

Stands the strongest pressure over all other Laminated Rims, and guaranteed absolutely.

AND
CYCLING TRADE REVIEW

Copyright 1896, by F. P. PRIAL Co.

VOL. XVIII., No. 13.

NEW YORK AND CHICAGO, NOVEMBER 13, 1896.

WHOLE No. 455.

NONE FOR PALMER.

He Is Not Syndicating His Business, Nor Does He Shortly Expect to Do So.

Chicago, Nov. 7.—It is not to be expected that when purchases of tire companies and rumored purchases, capitalization deals and dazzling investments by English syndicates, that the Palmer Tire Company should occupy the lonesome position of not being bid for. Too solid a concern is the Palmer Tire Company, too high grade their reputation for fast tires, too inflexible the price of their product to meet with neglect at the hands of the rumor-mongers.

A WHEEL man went over to the Palmer office to find out from John F. Palmer all about it. He found that he was to give rather than to receive.

It is pleasant to interview Mr. Palmer. When you get through he has said something. He speaks emphatically, incisively, decisively, and leaves no room for any misunderstanding of his position.

"So it's come around to us, has it?" said Mr. Palmer, when THE WHEEL man told him of his mission. "Well," he continued, brushing the ashes from a twenty-five-cent Havana and surveying the careful crease in his trousers. "I expected it. I did not think they would leave us out entirely in the free advertising that other tire concerns have been getting lately. But, as for us, all I can say is, I will have to spoil a good story for you. You can say for the Palmer Tire Company as coming from me, and I ought to know something about it, that the Palmer Tire Company has not been sold, that there will be no change in the personnel or management or ownership of our concern whatever. You can say it positively, and there ought to be no better authority than ourselves. If there is any English syndicate or American syndicate or any one wanting to buy the Palmer Tire Company they have not made us an offer. What we are concerning ourselves about is the sale of Palmer tires to manufacturers and dealers and riders. We are always open to those sales, from one pair up."

And that's all there is to the rumor of the sale of the Palmer Tire Company.

CAME DOWN OFF THEIR HIGH HORSE.

Ever since the passage of the Armstrong bill in New York State, requiring railroads to carry bicycles free in that State, the Northern Central Railway Company, operated by the Pennsylvania Company, has refused to recognize the provisions of the bill, claiming it to be unconstitutional.

The New York Division recently notified the company that they intended to contest the matter in the courts, and last week the Pennsylvania Company issued orders to check wheels as baggage on all its connections within the State of New York.

RUMORS ARE WRONG.

Toledo, Ohio, Nov. 7.—Trade circles here were quite startled this week by the sensational announcement in one of the daily papers that there had been an amalgamation between the Viking people and the Dautless Company, the latter's factory having burned down some months ago and left them in the peculiar position of possessing a name but not a home.

The report is untrue. There have been no negotiations toward the amalgamation of the two concerns, nor toward the disposal of the Viking plant to any one.

The Union Company are very well able to paddle their own canoe. On the occasion of THE WHEEL man's visit, Edward Eager, of their selling force, had just returned from a Southern trip, burdened with orders from established Viking agents, and several new ones.

The company will have two '97 models, at \$75 and \$100 respectively.

HALF LOAF, BETTER THAN NO BREAD.

As a result of the efforts of the Pennsylvania Division, the Pennsylvania Railroad has somewhat modified its tariff for the transportation of bicycles, making a reduction of about a third from the old rates. The new schedule of rates provides for a minimum charge of 10 cents for any distance for which the passenger fare is not above that sum; for any distance covered by a passenger fare between 10 and 15 cents, a charge of 14 cents is required; for any distance covered by a fare from 15 cents to \$1.15, a charge of 15 cents is required, and for each 30 cents in passenger fare above that amount 5 cents additional. For "machines with two or more seats" a double fare is required, and lamps are taken only "at the owner's risk."

This reduction was made as a compromise with the Division, which was endeavoring to secure legislative action. The officials claimed that they would ignore any provisions even if passed by the State Legislature.

WHEELMEN WON A BRIDGE.

It was decided on Tuesday last week to bridge the Raritan River, between Perth Amboy and South Amboy, thus shortening the ride by road twenty miles from New-York to the Jersey summer resorts. It was a ballot of the wheelmen, and to the wheelmen is due the honor of piling up a 1,200 majority in favor of the bridge.

The project has been fought in Middlesex County for the last ten years, but the measure had always been defeated in the Board of Freeholders by the farmers in the upper part of the county. A bill was passed by the last Legislature authorizing the bridge to be built after the project had been left to the popular vote of the county. The popular vote on Tuesday was cast in favor of the bridge.

TO CATALOGUE COVERERS.

Get Designs Ready for the Board and Maybe You'll Win Money and Glory.

Artists, ahoy! Here's a chance for each and all of you, be you of high or low degree. The National Cycle Board of Trade wants designs for the covers of the show catalogues. Competition is desired, and a fair field and no favor is assured. Here is the invitation in detail:

The National Board of Trade of Cycle Manufacturers offers two first prizes of \$50 each and two second prizes of \$50 each for the best designs for the front faces of two catalogues to be issued in connection with the cycle shows of 1897, to be held in Chicago and New-York, respectively.

All drawings must be delivered, carriage paid, to E. R. Franks, Secretary, No. 271 Broadway, New-York, on or before 12 o'clock noon, January 1, 1897.

All drawings must be accompanied by a sealed envelope containing the name and address of the author thereof. The drawings must bear no signature, name, device or other distinguishing mark. The drawings and accompanying sealed envelope will be carefully numbered upon receipt.

Size of drawings, 12 inches wide by 18 inches high, to be reduced in reproduction to 6 inches by 9 inches, size of cover of catalogues.

All drawings must be delivered flat, either mounted on cardboard or on stretchers.

Designs must be suitable for reproduction in not more than three colors or combinations thereof.

The designs for the Chicago catalogue bear the title: Second National Cycle Exhibition, Chicago, January 23 to 30, 1897. And designs for the New-York catalogue must bear the title: Third National Cycle Exhibition, New-York, February 6 to 13, 1897.

Any designs violating these conditions will positively not be considered.

The designs awarded prizes will become the property of the Board.

The Board reserves the right to exhibit any or all the designs at Chicago and New-York, and those not premiated will be returned to their authors on or before March 1, 1897.

The Board reserves the right to publish any of the designs, giving credit to the authors thereof.

Decision will be rendered on or before January 10, 1897.

The competition will be conducted and decision rendered by this jury of award: Edward Penfield, art editor, Harper's Weekly; George W. Breck, president, Art Students' League; E. E. Bartlett, president, Bartlett & Co.

DEAL IS OFF.

Frank T. Fowler is not, after all, in possession of the Mungler Cycle Company's plant at Indianapolis. A hitch over the price developed just when the deal seemed consummated, and as no amicable settlement could be reached, everything was declared "off."

LOOKS FISHY.

Denver Nov. 5.—With what is described as a forty-knot breeze at his back and on a down-hill, straightaway course, Stanley M. Barrow is said by his companions to have ridden a mile in 58.35 seconds to-day. Barrows claim rests on the affidavits of Robert Yardley and Frank C. Wolff. The former swears that he stopped his watch at the beginning of the course at 1:07.31 3-5, when Barrows started, and the latter makes affidavit that at the end of the mile, where he was stationed, his watch was stopped at 1:08.30 1-5. Although the affidavits are straight, not a rider in town believes in the time. The course was rough, and even with the forty-miles-an-hour wind at his back, it is the general opinion that it would have been impossible for him to have kept in the saddle at such a terrific speed.

FORCED FORWARD BY FORCIPEDA.

When an ambitious rider tries for a long-distance road record, one like the New-York to Philadelphia and return record—which involves something like eighteen hours' riding at top speed—for instance, any appliance or device which will reduce the work or help him in any way becomes almost a necessity when it is proved that the device does these things.

The Forcipedé, which was recently illustrated in THE WHEEL, is claimed to be such an appliance. Two of the numerous men who have ridden for the above-mentioned record within the last few weeks used the Forcipedé on their mounts, and on their return spoke in glowing terms of it. Next Sunday Edwards and Carlson are booked for another attempt on the same record. They are convinced of the Forcipedé's merits, and will use it.

EDWARD WAS A HIGH-ROLLER.

Edward C. Bald developed into quite a plunger prior to the Presidential election. He was eager to bet the greater portion of his winnings on the cycle path on McKinley, and gave all sorts of odds. The day before election he stormed the stronghold of the Bryanites and began a series of remarks bearing on the lack of nerve displayed by the silver men in their betting.

He offered to bet \$1,000 to \$300 on McKinley, and was finally taken up by a Canadian farmer, who produced his money in gold pieces. This display shamed two other Bryan men, and they offered to do as well. Bald took them up, leaving \$3,000 in the hands of the stakeholder. So for once Bald was a good-size purse without turning a hair.

WERE BUSY VOTING FOR MCK.

Of the 19,000 members of the New York State Division, L. A. W., but 3,659 cast ballots in the annual mail vote which closed last week. As there was no opposition to the present incumbents, they will succeed themselves. Fourteen members voted against Chief Consul Potter, thirty-one against Vice-Chief Consul Underhill and seven against Secretary-Treasurer Bull.

NEVER PHASED HIM.

From Hackensack, N. J., comes the story of a wheelman who, while coasting down a hill, ran into one of the cars of a moving train. According to the tale, the wheel merely bounded back for several yards, after which the rider dismounted a moment, and then kept on his way uninjured.

Lumsden, who is at present training at Paris, starts on November 25 for this country with Platt-Betts, Chase and Tom Linton.

JOHN O. BLAKE DEAD.

John O. Blake, president of the Chicago Cycle Board of Trade, and manager of the Gormully & Jeffery Mfg. Co.'s retail store in that city, is dead. His taking off was as unexpected as it was tragic. He died by his own hand, accidentally, it is believed. His family and friends say there was no reason why he should have committed suicide, and the Coroner's jury returned an open verdict.

The sad occurrence transpired on Thursday evening of last week. Mr. Blake had dined with his family. After the meal they all went into the parlor. Mr. Blake returned to the dining-room, and almost immediately his wife was startled by the report of a pistol shot. She found her husband clutching the table. He had a wound near the heart, but before becoming unconscious told his wife that the shooting was accidental. The revolver was found in his coat pocket. He usually carried it in his hip pocket, and his friends think it was discharged while he was changing it from one pocket to another. He died early Friday morning, leaving a wife and a grown son.

Mr. Blake was forty-six years of age, and for nearly twenty years had been prominently identified with cycling. He was one of the first men in the West to ride a bicycle, and one of the first to become interested in the L. A. W. In the early days of the League he was its

most conspicuous Western advocate. He served several terms as Chief Consul of the Illinois Division, was a member of the National Racing Board, the Transportation Committee, and other committees, and was never a laggard. He invariably acquitted himself with credit. He early engaged with the John Wilkinson Co., who handled G. & J. bicycles in the West, and thus became identified with the trade. Later he went with A. G. Spalding & Bros. Six years ago he returned to his first love as manager of the Gormully & Jeffery store at No. 85 Madison street, Chicago. His success was instant and emphatic. From a losing venture he transformed the handsome establishment into one of the most popular and most profitable in the city.

His popularity and range of acquaintance was little short of marvellous. He stood high in the Masonic order, but there seemed no limit to his influence. He seemed to be able to wield power in almost any direction, in railroad, newspaper, political, insurance, theatrical, police, and every other circle. He never splurged; he never boasted. He was the embodiment of nervous energy, but did everything so quietly that even those who knew him well were at a loss to understand how he did it.

Mr. Blake was the sort of man who won confidence; he was a good adviser, and a friend to be trusted. These traits, coupled to a generous nature, and his wonderful influence, made

it possible for him to render much good to his fellow-men. If one-half of those whom John Blake helped during his lifetime but pay tribute, his memoriam will be a precious evergreen to those whom he has left behind.

Mr. Blake was a small, slender, wiry, dark complexioned, intensely black-haired man; he was active, alert, thoughtful, and of a highly nervous temperament. Of late years his health was very poor. His face had grown thin and careworn, and he seemed suffering keenly, but he seldom complained, although several times forced to relinquish work for weeks at a time. But none expected his tragic end. His loss will be felt. Sorrow will be sincere.

THEY'LL BE SORRY LATER ON.

That frosty and unsuccessful race meet given by the "Hustlers"—the promoters of the new organization that is to blight the League—at the Tioga track, Philadelphia, two weeks ago, did not discourage the would-be revolutionizers in the least. They have secured the good will of another newspaper man, and the wires are being kept warm with prognostications of the League's downfall. From the West and South, according to the "Hustlers" representative, come reports that the cyclists and meet promoters are organizing to fight against the League. Here is the latest screeed from the Philadelphia band of malcontents:

"The Brotherhood of American Wheelmen is no idle talk. Such an organization will surely be in the field next season. The principal members are racing men who have it 'up their sleeves' for the L. A. W. Racing Board, and will not give in until their movement brings certain reforms which they justly demand. They are all confident of success, having been promised the support of all the big racing men.

"It is also the intention of the Brotherhood to set a scale of prices for all events, and to boycott all race meet promoters who refuse to line up to their demands. If they are unable to get what they request, it is intended to run a race meet every week, whether the Racing Board gives its sanction or not. I am not at present in a position to make public the names of the racers, who are 'pushing the thing along,' having promised not to do so, but it will not be breaking a promise to say that all the racing men of note hereabouts have signified their intention of joining the Brotherhood and sticking to it through thick and thin.

"With the Brotherhood, the uprising for Sunday racing in the West and the fight for female races in the South, to contend with, it will be seen that the members of the League of American Wheelmen's Racing Board have troubles of their own. The men who are now working for the success of the Brotherhood have communicated with the leaders of the fights in the South and West, and a combine of the forces is looked for."

DOING A CLEAN BUSINESS.

Pittsburg, Pa., has a "House to House Bicycle Cleaning Company." The head of the concern makes arrangements to call or send trustworthy employes to houses, flats or offices, once, twice or as many times a week as the customer desires, and thoroughly clean and oil the wheel or wheels of those who subscribe. He has been in the business but a fortnight, but says he already has a profitable list of patrons, and that in the spring, when the wheeling season opens, he will have several branches in operation.

DEADLY BLOOMERS.

A Western woman flagged an express train with her petticoat and so saved many lives. If she had worn bloomers those lives would have been lost.

AS TO ASPHALT RIBBONS.

CYCLISTS are not behindhand in enthusiastically demanding their rights and in appealing for their privileges; yet, when they win the one or receive the other, the song of praise does not approach a measure of hearty voluminosity. Their appreciation appears to be not loudly enough voiced. Certainly that is the case in Gotham. For instance, one of the greatest concessions ever made to cyclists was the Hudson street asphalt strip. It must be remembered that the asphalted street, even though re-surfaced for the cyclists' special benefit, is of value to all classes of citizens. It makes the street cleaner and healthier, more passable for the resident and for the pedestrian. It is smoother and faster and more useful for those who drive. The asphalt strip does not accomplish any of these things except in small measure. This is a special privilege for the cyclist and for him only.

The case in point—the Hudson street strip—was taken under consideration at the very moment of suggestion, was rapidly passed upon, and was in actual use within a few weeks after the inception of the idea. Yet we hear little of it, though it is quietly growing upon the cycling public. It affords an inlet into downtown Gotham and an outlet to the East, South and West—to the East for the Jersey district, to the West for the Long Island district, and to the South for the Staten Island district. It is also a splendid approach for out-of-town cyclists from the three points of the compass mentioned. Had the completion of this strip been properly celebrated, had the proper officials been

thanked for their energy, had the cyclists marked their keen appreciation of this radical divergence in their favor, such praise—no matter in what form it materialized—beside accomplishing the purpose of politely recognizing the favor, would also lead to the construction of other strips of this kind both in New-York and elsewhere.

The point to be made about this Hudson street strip is that this street is pre-eminently the trucking promenade of New-York. It is the vehicular Broadway. No other street in America's greatest city can, in the morning and in the evening, and throughout the day for that matter, show such a stream of vehicles of the heavier class. The miles of freight and express river docks readily explain to the New-Yorker the cause of this truck popularity and truck congestion. So that the asphalt strip on Hudson street does not accomplish what had been first expected of it. What is really wanted is a strip along the car track, because the trucks hug the curbs, and numberless detours are necessary.

What is wanted is an asphalt strip in streets paralleling Hudson street; in thoroughfares which are not so heavily thronged. It is reported that the construction of a strip of this kind, which is merely laid on top of a slightly depressed strip of pavement, is not a costly operation, and THE WHEEL suggests that cyclists throughout the country keep these asphalt ribbons in mind. In many cases they will afford the much-desired solution of easy and pleasant cycling rapid transit through the city streets and avenues.

VALUE OF DISCUSSION.

THERE is here and there a man in the trade who finds fault with a process or method because it lacks perfection and doesn't do everything—They complain of a certain thing or system, when their argument or objection, if it has any validity, is against the nature of things.

Let us illustrate what we mean. The cook-book may give you most minute directions for making all kinds of dishes, and yet, after you have thoroughly studied it and nearly memorized it, you will not be a competent cook. You will only be put on the way to be one. To go up higher in the scale of effort, there is, for a radically different instance, the artist. He can tell you all about colors, lines, lights, shades, perspective, values and motives; and yet, when you have learned all this, you are not an artist.

And why are these things so?

Simply because it is only theory and not practice that they are able to communicate. Now, when a writer or talker says, in effect: "I don't see anything in precept; that 'discussions in a wheel paper of this need or that in the trade fly over the heads of manufacturers,'" and so forth, he is doing the same as a bystander would who should object to the ploughing and harrowing of a field because those preliminary efforts do not of

themselves produce the harvested crop. The truth is they were never intended to do more than a part of the work. The cook-book will help you to cook, the artist will help you to paint and the trade paper's discussions and criticisms will help you to quicker hit the bullseye of success. And there they all stop.

They cannot deliver to you in a package absolute experience. They merely plough and harrow your field. It is your part to see that the subsequent effort is applied. These comparisons may not be precisely to the point for an ideally correct analogy; but they come sufficiently near for the purpose of illustration.

Of course there will be differences of opinion as to the efficiency of specific methods of designing, building and marketing bicycles, not only among the writers about it, but even among the experts who both write and work practically in applying their ideas. This means that, like medicine—and unlike mathematics—cycle trading is not an exact science. But we don't dispense with doctors because they work so often empirically; nor should the manufacturer, despise the thought and discussion upon his matter because much that is said may not be fruitful.

It is well to know what is the best and worst that can be said of a thing at any rate. In fact, no man can be quite so sure of his own position in the trade when he fails to find out what others believe. "In the multitude of counsels," says the proverb, "there is safety."

Men who know the most about a subject are quite often those who are the most anxious to get opinions of all sorts upon it. Mr. P. T. Barnum would be thought to be a man sufficient for himself—especially in his own peculiar business; and there is no doubt but that he was. At the same time he was indefatigable in eliciting the most various opinions, as opportunity offered, on every plan and undertaking he had in mind. When these views were all gathered and focussed, he knew, whether he accepted one of them or rejected them all, just exactly what to do.

ADVERTISING TESTS.

THERE are a whole lot of people who think they know a whole lot about advertising. They invent various methods of testing or measuring mediums. The schemes are ingenious, sometimes even to the point of the wonderful. They invent all kinds of fictitious names and addresses, check up, mark down, classify, and all the rest of it—and yet, after all, it is very hard to trace results. Usually the average busy man does not stop to explain where an advertisement has caught his eye. The thing he is after is results, and usually he will not go out of his way to benefit the advertiser or the advertising medium.

There are, however, two very good ways in which one can tabulate with success. One is to give away something to all persons who tell you where they first read your advertisement; the second is to inclose them a postage stamp and ask them to please inform you, etc., etc. Of course, the first method is costly and

the second method is a time-waster and a money-waster, and few advertisers ever go to the trouble of employing the one or the other, for all good advertisers believe in printers' ink, and no matter where it is used, they believe it has some benefit. When made, however, the tests are interesting and of undoubted value to whomsoever advertisers. To an unbeliever, that competent "doctor of advertising," Nat Fowler, once prescribed an advertisement which, in the smallest type and in the most out of the way corner, should offer a rose-wood piano or a yellow dog to all who applied. Whether or no E. H. Wilcox, of Iver Johnson's Arms and Cycle Works, saw the prescription, he applied a somewhat similar test during the past season. In their advertisements he offered the souvenirs left over from the cycle shows, and later on in the year supplemented this with conditional offers of revolvers. The results convinced Mr. Wilcox, as it must convince others, of the worth of trade papers. Mr. Wilcox so stated to a WHEEL representative who interviewed him. The acknowledgment appeared in our issue of last week. It is worthy of editorial emphasis. Here it is:

Mr. Wilcox made a thorough and practical test of the channels—the advertising mediums—through which business reached the Iver Johnson Works. The result is a glorious tribute to the cycling press. Mr. Wilcox says, without reserve, that nine-tenths of their business is directly traceable to the cycling publications in which they were represented. The Iver Johnson wheels were advertised in nearly all of the prominent weekly and monthly periodicals as well, so that the result can scarcely be termed a chance hit. All were given the same test. No business inquiry was suffered to pass unnoticed or uninvestigated. If it failed to mention its source or inspiration, a polite and nicely worded request, inclosing a two-cent stamp for reply and seeking enlightenment, went from the Fitchburg factory. It is on these replies and on the business which followed that Mr. Wilcox bases his testimony. He went into the matter very thoroughly, with purpose and forethought and without prejudice. The investigation was impartial and was conducted on the only feasible plan. The result will probably astonish some of the gentlemen who are inclined to the placing of an advertisement in the light of a benevolent or philanthropic contribution.

SAVING THE YOUNG.

AFTER election, Thanksgiving; after Thanksgiving, Christmas; after Christmas, New Year's; in the intervening lapses, thoughts and talks of gifts for the little ones. If the youngsters' wishes are respected, there is no doubt but that the demand for juvenile bicycles will be enormously quickened within the next few weeks. Realizing it, the far-seeing manufacturer has already shaped his plans accordingly. The wise dealer is doing likewise. The wise parent will realize that his children's bones are precious. In purchasing the gift bicycle he will not be guided wholly by price, by the anything-will-do-for-the-children idea. It has prevailed too largely in the past. There is need for education. The press should preach it. The juvenile claptrap should be decried. There was never a time

when it has been possible to purchase such splendid juvenile bicycles as will be on the market in time for the holiday trade of the present year. There was never an article in which a comparatively insignificant difference in price will beget a magnificent difference in value received and in service rendered. It should be borne in mind when a purchase is made. Penny wisdom, when the well-being of a child is concerned, is culpable. When buying, buy a wheel that bears the nameplate of a reputable bicycle manufacturer, who values his good name and whose guarantee is not a collection of empty words, or don't buy. It is better to be sure than to be sorry.

RUNNING INTO TROUBLE.

FROM a mysterious and nebulous nowhere in particular comes the whispered story of how the racing men are going to combine and run the League, or run opposition thereto, or do something or other no one knows just what. If the racing men know what is best for themselves, if they have ever studied the sad result of the slaughter of the auriferous egg-bearing goose, if they have even that modicum of brains which is categorized under the broad term of horse-sense, the racing men will daily in an extremely dainty fashion with any anti-League organization.

History has shown during the last fifteen years that there is lack of vitality and longevity about those organizations and people who have declared that they intended to knock out the L. A. W. Unforgotten and untombstoned graves contain all that is left of these brave anti-Leaguers, and candor compels us to admit that some of these ancient League destroyers were manned and officered by brighter, brainer and better men than, as a rule, ornament the ranks of the second-raters on the racetrack.

The sad fate of the Western gentleman who bit off more than he could chew should not be forgotten just now. Even the voracity of the racing man may meet with a fatal check, and the advisability of letting well enough alone was never so prominent as it is in this case. The racing man possessed of brains will demonstrate this fact most conclusively by declining to have anything to do with this alleged anti-League movement.

He was an honest man and a gentleman. He helped the many; he spoke ill of none. He followed the truest of religions, the golden rule most precious epitaph and heirloom. Heaven grant the rest thou so well earned, John Blake.

An uptown livery stable-keeper replied rather impatiently to a request for his opinion of the bicycle, and the very next day he was thrown from his horse and had his collar-bone broken. Thus orthodoxy as to methods of riding is vindicated, and retribution calls for its own. Men speak disrespectfully of the bicycle on peril of their bones.

At this season of the year when catalogues and other printed matter are in process of compilation it is timely to remark that the terms "gent's wheel" or "gent's model" are repulsive, and are tabooed in even half-refined society. If "gentlemen" is too lengthy, "men" will fill the bill admirably. "Gent" is even more odiferous than "bike."

What woman shall wear on the bicycle is a question that can never be settled. If the most beautiful, rational and comfortable costume in the world were universally adopted to-day it would be discarded tomorrow for any old thing having the magic charm of novelty.

The theory of producing increased speed in a bicycle without calling upon an increase of power to accomplish it is an impracticable plan of doing something that is impossible.

Don't tell a man he has made a fool of himself in his choice of a wheel. If he knows he has, he will resent being reminded of it; and if he doesn't, he will think you are a fool.

Always listen to advice about your wheel. If it has no other value, it may enable you to show your friend later on that he didn't know what he was talking about.

Fools can ask questions about cycling which wise men cannot answer; but the wise men are not always wise enough to see that they can't.

A golden tip to enterprising manufacturers—Start early and avoid the rush upon the market of wheels bearing the name McKinley.

Speed on the part of an expert rider is less dangerous to the public's safety than is the five miles an hour of the wabbling novice.

Be sure you are right; but don't make yourself disagreeable by insisting that everybody else in cycling is wrong.

Always carefully sift the talk you hear about what is to happen in the trade next season.

In these days the match between cracker-jacks only seems to light on the money box.

True cycling does not measure the greatness of the country ridden by square miles.

A properly constituted trade puff is taken with a grain of salt and a pound of sugar.

A great scheme in the wheel business is to keep a sharp lookout on the outlook.

The most expensive experiences in cycling are those purchased below cost.

Records are the coupons that are cut off the bonds of speed.

Every neglected wheel repair marries and raises a family.

Racer and politician both object to being scratched.

COST OF A FUNERAL PACE.

Since Philadelphia has taken to asphalt streets there has been a consequent diminution of street railway receipts from cycle competition, estimated at over \$2,000 a day, or over \$700,000 a year.

OLD AND THE NEW.

The past and the present got together at Camden, Me., the other night, when at an old-fashioned spelling-school the first prize was a bicycle lantern.

SOME CYCLE TAX EXEMPTIONS.

In taxing cycles in Holland the Government exempts the wheels belonging to soldiers, policemen and those workmen who reside at least one mile from their place of business.

GOLD-BANDED ANKLES.

One of London's alleged smart set is trying to introduce the fashion of riding with a golden band encircling each of her smart ankles.

IT IS ALL OF THESE.

An enthusiastic wheelwoman has given vent to her admiration of the wheel by describing it as being as strong as a horse, light as a baby, swift as the wind, and as comfortable as a rocking-chair.

EIGHT ASSISTANTS.

Secretary Bassett now employs eight assistants to help him "run the L. A. W." They occupy three offices in the Hutchinson Building, Boston

ANTI-WIND ASCENDERS.

A couple of light rubber bands around the coat sleeve near the cuff will prevent the cold air ascending one's sleeve to strike the most susceptible portion of the anatomy—the armpit.

Worry about the wheel they ride will make almost anybody thin except the people who worry and ride because they are fat.

ALPHABETICALLY ADVISED.

O manufacturer, when at your e e e,
 On some trade papers you should c c c,
 And this advice if you are y y y:
 Go straight away and advert i i i.
 You'll find the project of some u u u—
 Do not delay—there's no e x q q q.
 Be wise at once, prolong your d a a u,
 A silent business soon d k k k.

HAD TO USE THEM.

Although it was unanimously decided at the recent congress of the German Cyclists' Union that no foreign words should be used in the official organ, there is hardly a page of that publication in which dozens of English words cannot be found.

When the effort of propelling a wheel is absent, then alone is a woman's riding graceful.

MANAGER J. S. JJ

Mike Cements Some More New Figures Upon the Ex-Ecksonian Record Slate.

New Orleans, Nov. 10.—Manager John S. Johnson's record-breaking team arrived in this city early last week and went into camp at the Cement Camp. Tom Eck accompanied the party. Figuratively speaking, he has been relegated to the grandstand. He resigned as manager at Nashville, in favor of his protégé, and Johnson at once received the appointment. Eck's resignation was not of his own volition. As told last week, the Racing Board demanded him to settle a pecuniary matter with a Portland (Me.) association for not appearing as agreed with his group of riders in that city upon his return from Europe. Eck did not come to scratch as ordered, and he was dethroned from the managership by Chairman Gideon's action in refusing to legalize the trials. With the change of managers, the Racing Board appointed official referees and sanctioned the trials. Eck has asked that the matter be arbitrated by the Board, and, meanwhile, acts as a friend and adviser to Manager Johnson.

The hard work at Nashville and the long journey from that city affected the condition of the men, and they have been having hard work in regaining their former fine edge. Cold weather has also deterred the trials.

The first successful attack on scythe-bearer took place on Friday of last week, when Phillips and Brades, of Chicago, and Myer, of Minneapolis, rode one mile, unpaced, on the triplet, in 1:49, lowering the best previous time of 1:50 made by O'Connor, Bainbridge and Clark at Kalamazoo July 14 last. The same team rode a practice mile in 1:51. The quarters in the official trial were 0:25 3-5, 0:52 3-5 and 1:19 2-5.

Michael, who has been out of form since coming here, rode ten miles as warming up and broke the 10-mile American record of 20:45 made by De Cardy at Louisville. The official referee for these trials was H. C. Foutton. Michael's time by miles was:

Miles.	Time	Miles.	Time
1.....	1:55	6.....	11:35 1-5
2.....	3:49	7.....	13:34 2-5
3.....	5:46	8.....	15:33
4.....	7:42	9.....	17:30 4-5
5.....	9:41 1-5	10.....	19:25

All American records from the six-mile mark. He was paced by one quad, three triplets and a tandem, and averaged miles at about 1:56.

On Saturday there was a discouraging wind blowing, but the little Welshman made another trial and set up new four and five mile marks for the world, cutting each by several seconds. His time for the four miles was 7:21, for the five miles 9:12 3-5, and by an error he sprinted an extra quarter in 0:28. Michael was paced by the "sex" for the first mile in 1:45 2-5; by the Jallu brothers' triplet team for the second mile, doing 3:38 2-5 for the two miles. His second mile was done in 1:53, the third, with the Phillips triplet team pacing, in 1:51 4-5, the three-mile time being 5:30 1-5, two-fifths of a second above the record. The Weinig quad took him two laps, finishing the third mile and starting the fourth, and the "sex" brought him safely within the four-mile mark, with 7:21 as the time, breaking the record 3 2-5 seconds, and doing the fourth mile in 1:50 4-5. The Jallus paced the last two laps after the "sex" dropped out, his last mile being 1:51 4-5, making the total 9:12 3-5, a substantial cut of the mark of 9:16 by Tom Linton. Summary of the times:

Miles.	Time	Miles.	Time
1.....	1:45 2-5	4.....	7:21
2.....	3:38 2-5	5.....	9:12 3-5
3.....	5:30 1-5		

MIKE INTO THE GAME AGAIN.

New Orleans, Nov. 10.—In the face of a strong wind, shortly before dark to-night, Michael wrested another record from his townsman, Tom Linton, riding ten miles in 18:49 1-5, seven and three-fifths under Linton's world record. All American records were cut from six to ten miles inclusive. These records were held by himself, made at this track on Friday last. The pace-makers were the sex, one quad and three triplets, some new men being placed upon one triplet with Waller. The time for the first mile was 1:48, with the sex pacing. The two miles were done in 3:37, the three miles in 5:31 1-5, and the four miles in 7:24 4-5, a cut of a second from the world's mark, placed by Michael in his Chicago trials at five miles. Six miles in 11:10 4-5 to-day was a large slice off the American record held by Michael of 11:35 1-5 and 2 1-5 seconds behind the world's record. Seven miles to-day in 13:10 was a cut of 24 2-5 seconds from the American record, and ten seconds back of world's record. Eight miles to-day in 15:00 is a cut of 33 seconds from the American record and is 6 4-5 seconds back of the world's record mark. Nine miles in 16:59 4-5 is 31 seconds lower than the former American record and 11 4-5 seconds slower than world's record time, and the ten miles in 18:49 1-5 is 35 4-5 seconds lower than the American mark, and 7 3-5 seconds lower than the world's record. Michael called for faster pace all through. Summary:

1 mile.....	1:48	6 miles.....	11:10 4-5
2 miles.....	3:37	7 miles.....	13:10
3 miles.....	5:31 1-5	8 miles.....	15:00
4 miles.....	7:24 4-5	9 miles.....	16:59 4-5
5 miles.....	9:16	10 miles.....	18:49 1-5

DARE YOU TO KNOCK THIS CHIP OFF.

Now that the Bald-Cooper babble is subsiding without having attained results, Arthur Gardiner has placed a chip on his shoulder and bid either of the two to knock it off. John West, his trainer, fixed the chip in place by issuing this defi:

On behalf of Arthur Gardiner, of the Morgan & Wright racing team, I beg leave to use your columns for the purpose of challenging either E. C. Bald or Tom Cooper to a series of three unpaced races, the distance to be one mile, two miles and five miles, for a purse of either \$1,000 or \$2,000 for the series, the winner to take all of the purse. Races to be run within thirty days after the articles are signed. It is immaterial to me on which track or at which point the races shall be held, and the only condition I shall impose is that the men start on opposite sides of the track, both riding in the same direction. This challenge is not an advertising dodge. I mean business, and as an earnest of this I have deposited the sum of \$500 forfeit money with Mr. George Stewart, president of the Thistle Cycling Club, Chicago, Ill. Upon acceptance of this challenge I shall immediately deposit with Mr. Stewart the balance of the agreed stake. This offer remains open for two weeks from date.

MONTE AND THE MILKMAN.

Denver, Nov. 6.—Monte Scott has again fallen a victim to the sturdy Hackenberger in a twenty-five-mile race. He was beaten in the second contest, run to-day, by a third of a mile. Scott attributed his primal defeat to the rarified air, and thought that after a month's acclimation he could turn the tables. He challenged Hackenberger, making as a condition that the men start from opposite sides of the track and ride in opposite directions. This was agreed to by the Denverite, and after careful training both men expressed themselves as being in the best of condition for the race. The day was windy and cold, and the men made a good ride, Hackenberger finishing in one hour two minutes and two seconds. In the last mile Hackenberger was cramped in the right leg, but in spite of this handicap he won, though Scott gained considerably on his competitor in the last mile.

RACING BOARD'S BULLETIN.

PROFESSIONALIZED.

M. C. Lawrence, Memphis, Tenn., clause (A).
W. F. Gregg, Marysville, Ohio, own request.
L. L. Miner, Jamestown, N. Y., vote of L. A. W. Racing Board.

E. J. Duncan, Franklin, Ind., vote of L. A. W. Racing Board.

David P. Kochenderfer, Newport, Pa., clause (D).

C. W. Sieg, Duncannon, Pa., clause (I).
Percy Elliott, Newport, Pa., clause (I).

E. L. De Camp, Pen Yan, N. Y., clause (D).
W. G. Irwin, Galveston, Tex., clause (A).

L. T. Flansburg, Kalamazoo, Mich., clause (C).
W. S. Sanderson, Memphis, Tenn., own request.

SUSPENSIONS RAISED.

E. J. Duncan, Franklin, Ind.
L. L. Miner, Jamestown, N. J.
F. A. Gately, Roxbury, Mass.
Luther Lady, Harrisburg, Pa.
L. Shields, Lewistown, Pa.
S. H. Charters, Harrisburg, Pa.
F. F. Goodman, New York City, N. Y.

RECORDS ACCEPTED.

One mile, professional, unpaced, flying start, against time, 1:59 1-5, Clinton R. Coulter, Denver, Col., October 2, 1886.

SUSPENDED PENDING INVESTIGATION.

Charles Lomax, Philadelphia, Penn.
R. Shiner, Philadelphia, Penn.
The Nanticoke Athletic Club, Nanticoke, Penn., and Dundee Park, Nanticoke, Penn., have been placed upon the list of those to whom sanction privileges are denied, for failure to provide proper prizes.

SUSPENDED.

For repeatedly competing in unsanctioned races while under suspension, M. C. Lawrence, Memphis, Tenn., has been placed upon the permanent suspension list of the League.

For entering races to which they were not entitled to ride, F. P. Connelly, South Manchester, Conn., and W. Robinson, Manchester Green, Conn., are suspended for ninety days from November 2.

For competing in unsanctioned races, C. W. Sieg, Duncannon, Penn.; Percy Elliott and David S. Kochenderfer, Newport, Penn., are suspended for sixty days from November 3.

L. T. Flansburg, Kalamazoo, Mich., is suspended until July 1, 1897, for unfair dealings in connection with cycle racing.

SANCTIONS GRANTED.

November 13, Eugene Field Monument Fund, Washington, D. C.

November 12, Columbia State Fair Association, Columbia, S. C.

November 25, International Athletic Park and Amusement Company, Washington, D. C.

November 26, Mercury Wheel Club, Texarkana, Tex.

November 26, El Paso Cycle Track Club, El Paso, Tex.

TAUGHT THEM A LESSON.

The French Union believes in striking while the iron is hot. Soibud and Mercler, two native racing men, recently learned this to their sorrow. They had lost their heat of a tandem race, but claimed a foul, which was not allowed. Wild with rage, they joined in the final during the first lap. The starter then fired a second shot, announcing a false start, and everybody except Soibud and Mercler got off. They continued and covered the distance amid a scene of great excitement; in fact, some of the public were for the rebellious team, and some against, and a very little would have sufficed to make the crowd wreck the track. Immediately after these two riders had finished their little performance, the officials fined them 100 francs each and suspended them for a year.

GOT MIXED.

Then the minister, preaching a sermon to wheelmen, with his mind on matters terrestrial, said: "And the streets of the eternal city are paved with aspha—gold." Some there were in the congregation who audibly tittered.

HARTFORD TIRES.

Before deciding on next year's tires remember that

Hartford Tires are the Original Single-Tubes.

We made them for years while other makers worked along a different line.

Hartford Tires are the Best-Known Single-Tubes.

When anyone speaks of a single-tube tire you think of a Hartford at once.

Use tires with an established reputation.

Your wheels will sell easier.

To Bicycle Riders: We Make Our Tube OF FIFTY CARBON STEEL

Because a Tube like this of

Is just as strong as

a Tube like this of

This diagram does not show how much stronger and more durable our tube is than the usual quality in the market because it does not include the always bad and more or less uncertain effects of "pickling." By ordinary methods tube is annealed in the open fire and pickled from eight to twenty times, according to finished size. By the use of a patented annealing process, controlled by us for tube making, our tube never comes in contact with the fire and is never pickled. There is no "theory" about this. Our thorough tests show that even with the greatest precautions in pickling (not usually taken), pickled tube is weaker and more brittle than tube made of the same material without pickling. Send for a Catalogue.

THE POPE TUBE CO.,
HARTFORD, CONN.

While weight for weight in a Bicycle FIFTY CARBON Steel will last so long

and TWENTY-FIVE CARBON Steel will last only so long

Kindly mention The Wheel.

RECORDS WHILE YOU WAIT.

Three records are doomed to utter annihilation at the Point Breeze track, Philadelphia, to-morrow. Just what particular records they are is not known up to the time of going to press, but with the positiveness of an Eck, the Philadelphia Driving Park Association guarantees the staid inhabitants of Slowville that a trio of records will surely be broken. No exception is made for atmospheric conditions, nor do they offer to throw in another one or two for good measure. To gather in the three marks guaranteed they will have quints, quads and triplets galore for pacing, and a score of sturdy Quakers to man them, including Aker, Jack, Church and McCurdy. The card announced by the press agent is as follows: Mile novice, amateur, with a special prize for the breaking of the world's novice record; two-mile tandem race for the world's competitive record; attempt on the world's five-mile record by B. E. Stevens; one-mile professional for the world's single-paced competitive record; trial to beat his own world's record of 22:13 for ten miles paced by W. G. Douglass, and an attempt to lower the world's hour competitive record by H. E. Bartholomew.

"HOD" AND THE "SPIDER."

W. C. Williams, of Albion, Mich., sends the following voluntary contribution: "E. W. Lunn, known as 'Spider,' is the star of Albion and has won several good races. He has been riding two years, commencing in 1895. In 1895 he rode a Cleveland, and his '96 mount has been a Thistle. This season he commenced riding in June, and has won fourteen first, nine seconds and four thirds. In all races he competed in he finished well up in the front. At Hillsdale he took the five-mile open with ease; at Marshall he captured the half-mile open and five-mile handicap from scratch; at Springfield he took the quarter and one-mile open; at Jackson he took second in the one-mile handicap from fifty starters. He will, no doubt, be a speedy 'boy' next year and will, no doubt, make record go. He will ride in England with his little brother in all the short-distance races. 'Hod,' his brother, will try to capture all the races for boys. Ernest has many friends, and has made a record for himself by riding the last season and clerking in a drug store at the same time. They will ride Thistles, fitted with Vim tires."

HOW LINTON LANDED IT.

Tom Linton, who regained the hour record, on October 22, as reported briefly by cable, was the first man to ride over thirty miles in the hour. After Stocks made over thirty-one miles, Linton waited a week at the Crystal Palace track for favorable weather to regain the record. Following several unsuccessful starts, he finally succeeded in shaving Stocks's figures by the narrow margin of 84 yards. He was paced by two quints and five quads. Although dragged along at a terrific clip, it was not until twenty-six miles that he got inside record, maintaining his advantage to the end. The new figures, which are likely to stand for the remainder of the season, are:

Miles.	Linton's time.		Stocks's time.	
	M. S.	M. S.	M. S.	M. S.
26.....	49:40		49:49-2-5	
27.....	51:38-1-5		51:47-4-5	
28.....	53:37-2-5		53:42-4-5	
29.....	55:34-4-5		55:38-2-5	
30.....	57:32-4-5		57:33-3-5	
31.....	59:22-4-5		59:23-3-5	

One hour, 31 miles 582 yards. Previous best, 31 miles 548 yards, by Stocks.

"Le Sprint" is the suggestive name of a French cycle paper devoted to racing.

SMALL POTATOES AND FEW IN A HILL.

Ever since the silver meet at Denver, on July 4, when A. B. Hughes rode a mile in competition in 1:47 4-5, setting a mark for the \$1,000 Rambler offered by Gormully & Jeffery Manufacturing Company, all attempts to lower the figures have proved futile. There is also a prize of \$500 offered to the promoters of the meet at which the fastest competitive mile is made. The latter prize has caused an unpleasant state of affairs at Denver. Last week numerous attempts were made by P. J. Becker and others to cut Hughes's time. The silver meet promoters resented these trials. Charges of professionalism were lodged against Becker with the local member of the Racing Board, in order to keep him off the track, but the charges were so vague that they were not considered. An appeal was made to Chairman Gideon, but he declined to interfere with the local representative. Open threats were then made by the silver men to the effect that any amateur cutting Hughes's time would be thrown into the professional ranks. So vigorous have been their efforts to intimidate riders that they are likely to secure the much-coveted purse.

BORDERING ON GOLD BRICKISM.

CENTURY SATISFIED WITH THESE.

The following road records have been allowed by the Century Road Club: Robert Gerwing, 5 miles, 11:37, Nov. 24, 1892. Colorado State record. A. B. McDonell, 10 miles, 21:25, May 26, 1896. New-York State and American record. A. B. McDonell, 15 miles, 34:32, May 26, 1896. New-York State and American record. A. B. McDonell, 20 miles, 46:30, May 26, 1896. New-York State and American record. A. E. Smith, Utica N. Y., 1 day, 11 hours, 51 minutes, July 3-4, 1896. Course record. Otto V. Mueller and J. N. Hallfax, Chicago-Milwaukee, 7:35, August 16, 1896. Tandem record. T. O. Vaux, 5 miles, 9:24, October 28, 1896. Colorado State and American record.

NO LIGHT TASK THIS.

Record-breaking in the dark is not propitious to good looks, according to C. M. Hendrickson, of the Kings County Wheelmen: He attempted to cut the road figures up to fifteen miles on Saturday last on the Merrick course, Long Island, but did not get away until shortly before darkness set in. At twelve miles he collided with his pacemakers in the darkness, and sustained a fall which badly bruised his face and closed one eye. Nevertheless he remounted and finished the fifteen in 36:57 1-5, a shade under the State record. He also cut the ten-mile State record from 24:47 4-5 to 24:20 1-5. Three tandems and a quad paced him.

FROM KALAMAZOO TO NEW ORLEANS.

At Kalamazoo last July, at the National Circuit meet, O'Conner, Clarke and Bainbridge, of the Morgan & Wright team, were asked to pace Cooper for a mile. There was no triplet handy except one which had other than the "good tires" on it. They used it, however, and, without intending to do so, broke the record for the triplet unpaced mile, flying start, doing 1:50. The tiremaker whose tires were used saw the joke, and used it. At New Orleans, November 6, Morgan & Wright tires got the record back again; time, 1:49. The riders were Phillips, Meyers and Brodis, on a Franklin triplet.

FOUGHT IN A TEN-MILE.

Over the Elizabeth-Springfield course, New Jersey, about seventy riders of the Metropolitan District fought in a ten-mile handicap on Saturday last. The first scratch man, M. R. Brown, secured twenty-first position and time prize in 26:19, with E. T. Allen, another scratch man, a second behind. The winner, Hicks, finished by a scant half-wheel length ahead of Hedeman. The first five men to finish follow: 1, W. H. Hicks (3:00), 27 minutes; 2, F. Hedeman (3:00), 27:04 3-5; 3, H. Hooper (2:45), 26:03 2-5; 4, W. Saich (3:00), 27:05 3-5; 5, C. O. Sigler (3:00), 27:30 3-5.

FAILED TO COME TO TIME.

"Eddie" McDowell, who has posed as a champion roller skater and professional cyclist for several years, arranged for an indoor cycling tournament in a Philadelphia armory last week. A feature of the affair was to have been a race between McDowell on roller skates and Charles Church on a wheel. At the appointed time contestants and spectators gathered at the building, but for reasons best known to himself McDowell stayed away. After waiting an hour the crowd grew angry and threatened trouble, but finally dispersed.

THREE C'S AND RECORD.

On the Catford track, London, November 6, Collier and Chinn, on a tandem, cut the quarter-mile English record, standing start, to 29 1-5 seconds.

VENI, VIDI, VICTOR.

Victories of the Victor bicycle in coasting contests are becoming so common that in heralding its most recent winning one is almost tempted to top it off with an "as usual." Baltimore was the scene of the contest, November 3 was the date. Some seventy-five men participated. The five who coasted farthest in the preliminary heat started in the final. This is the result:

Riders.	Wheel.	Tire.	Gear.	Feet.	Final.
H. W. Wilson..	Victor	Victor	77	2,409	2,586
A. H. Carroll..	Stearns	Palmer	68	2,401	2,571
R. H. Carr, Jr.	Victor	Victor	73	2,356	2,550
J. M. Suter....	Victor	Victor	73	2,353	2,526
B. H. Rich, de, Jr.	Wolf-Am.	Palmer	68	2,359	2,546
J. H. McMillan.	Stearns	Palmer	68	2,349	2,549

W. D. Young..	Columbia	Hartford	64	2,310	2,510
Albert Andras.	Wolf-Am.	Palmer	73	2,301	2,501

SPEED, COST AND CAUSE.

How the Human Pacemaker Has Grown Too Costly for Further Use That Way.

The rapid growth of the cycle industry and the introduction of the cycle to a vast number of people have resulted in a multitude of broken records.

Cycle-makers broke records in order to advertise their goods; cycle riders broke records to advertise themselves, to demonstrate their ability or to benefit their pocketbooks; while the whole cycling public, new and enthusiastic in the sport, took great interest in records and patronized speed events. The effect was like a fire in the forest, progressive and reacting. The enthusiasm increased the sale of cycles, which in turn increased the enthusiasm by increasing the number of riders. In less than a score of years the cycle has risen from an acrobat's implement which nobody wanted or would take as a gift, to a popular vehicle necessary to many and taking no small part in the civilization of to-day.

To this result pacemakers contributed no small amount.

When, a few years ago, Bert Myers, of Peoria, made a mile straightaway, with a strong wind at his back, in 2:13, many were skeptical. They did not know how great is the resistance of a mile of air under ordinary circumstances.

Some time later Johnson surprised the world by doing a mile in 1:53 behind a sulky. This result was largely attributed to an elliptic sprocket which he used, and a craze for similar sprockets almost resulted. These sprockets had some advantages and some bad points, but its greater cost caused manufacturers to avoid it, and it ceased to be heard of. By this time Johnson was riding another make of wheel, and advocating round sprockets; and it began to dawn on the public that the speed was in the pacemaking. Since then pacemaking has become a fine art, and records for all distances have tumbled.

The tandem, which had failed to be popular when presented to the riding public, came into use as a pacemaker, and through this introduction has been accepted by the public quite extensively.

After this came triplets, "quads," "quints," and finally the sextuplet, each with increasing speed. Whether this is the limit or whether more riders may be accommodated remains to be proven; but it is probable that the mechanical limit of number is not yet reached.

Another limit, however, has loomed up. This is a financial one. Six riders to pace one means that records cost much money. Therefore the motor cycle is hailed with delight.

The most successful form so far consists of a cycle provided with electric motor and storage batteries instead of cranks. Although quite heavy, it is perfectly manageable, and has a speed in excess of what may be had by leg muscles. Although the weight of storage batteries forbids long-distance runs, this can be met on the track by having a second cycle which can be substituted while the first is provided with fresh batteries. In the shorter distances, however, this is not necessary, as the batteries can be changed for fresh ones between the events.

The expense of maintaining such a machine is so much less than the expense of a team of riders that its first cost cuts little figure, and as its ability to give just the desired speed is much greater than can be had from a team it is likely that electric-paced contests and more broken records are things of the near future. The progress that has been made with petroleum-driven vehicles in the last year gives ground to expect something

in this line in the near future. Two, three and four wheelers are in use, and giving very fair satisfaction on the road, and there is no reason why they may not be geared higher and applied to track service. They are lighter than similar electric-driven vehicles, and may be charged with sufficient liquid fuel for very long runs. The cost of maintenance is less than with the electric, and there are no acids to spill in case of accident. The sparking apparatus either has no liquid or is hermetically sealed, and as the spark is always made in the cylinder of the engine and nowhere else, there is no danger of fire in case of accident.

Heavy four-wheelers, built for road use, have already a record of five miles in less than twelve minutes, and there is reason to believe that this may be doubled without difficulty if good tracks of large size and properly banked can be had.

Tube Tapering Press, E. W. Bliss Co., Brooklyn.

The two-wheeler, however, will be a much faster vehicle, for it has no sidewise oscillation due to inequalities of the roadway, and can be inclined on the curves.

It is more than probable that the gasoline-driven motor-bicycle will, in the very near future, show us paces rivalling the railway speeds, and will take its place as the popular pacemaker for record-breakers.

CHARLES E. DURYE.

A rider with the soul of a true collector has carefully kept each and every object which has been responsible for a puncture to his tire.

Don't be too anxious to show your cycling attainments. Knowledge was not intended to be the servant of vanity.

The scorcher who follows his bent too freely is likely to become warped.

A PAGE FROM HISTORY.

How a Couple of Corns Succeeded in Making a Man President of the Great L. A. W.

Naturally, the selection of a president for such an organization as the League of American Wheelmen is of more than passing moment. Usually his election is the result of weeks of hobnobbing, wire-pulling and nose-counting and a multiplicity of "deals." On a few occasions an eleventh hour surprise has been developed, but as a general thing the man is practically elected before the National Assembly convenes.

In the game of president-making none has been cleverer or more successful than W. M. Brewster—"Pop" Brewster, as he is affectionately and almost universally called. His long experience has made him an adept, and when he ceases to dabble in the more or less fascinating pastime, the coterie of "insiders" will have lost one of its most pungent and picturesque characters. "Pop" is a great wag. No champagne is more sparklingly dry. He can give voice to a flow of sidesplitting witticisms without a change of his young-old countenance. There is seldom a twinkle behind his glasses. His eyes look out from behind them with what is almost a stare of childish innocence. He seldom joins in the laugh for which he is responsible. There is no straining for effect.

A few days since one of those concerned related the part Brewster played in the reelection of James R. Dunn to the League presidency in 1890.

Dunn had not proven a particularly brilliant success, and George R. Bidwell, of this city, was being quietly boomed as his successor. To advance the Bidwell interests, W. H. DeGraaf—peace to his soul—had been dispatched to Washington, where the National Assembly was to meet, several days in advance of the other workers. When the latter arrived they found that DeGraaf had performed his mission so well that Bidwell seemed a sure winner. When Dunn discovered how things were going he button-holed Brewster.

"Pop," he is reported to have said, mournfully, "everything seems to be going against me lately. I've had sickness in my family, my business is in a bad way, I've got two corns that are giving me tortures, and now the boys are going back on me when all I have left is my League prestige. It's pretty hard on a man, I tell you."

"Why the devil didn't you let us know that before," responded Brewster, with never a frown. "Of course, you know we can't let your family affairs or your business troubles enter into the matter, but if you've got corns that alters the case altogether. I'll see what I can do."

Brewster fell to work industriously. A caucous resulted and Brewster presided. He stated the case exactly as it had been related by Dunn.

"Gentlemen," he wound up, in his inimitably dry fashion, "you've heard the facts of the matter. It is for you to say whether we shall vote against a man who has soft corns. Personally, I don't think we should. It seems to me one of the very best reasons why he should be elected. How many among those present have soft corns? He went on in this strain—and those who know the man know it is quite like him—for some time, and when the caucous came to end Brewster's urgings for Dunn had prevailed.

When the Bidwell men heard of the meeting and the decision to support Dunn they were confounded. One of them sought Brewster and took him to task.

"Now don't flare up, old man, until you know the facts," pacifically advised Brewster. "When I came here I had no idea of fooling with the presidency, but when 'Jim' Dunn came to me and told me he was suffering with soft corns, I simply turned in and did what I could for him. Would you vote against a man with corns? Of course you wouldn't. Nor will I, and let me tell you that unless George Bidwell has a full-grown bunton on each foot he doesn't stand a ghost of a chance."

Dunn was re-elected.

TRADE AT TOLEDO.

Toledo, Ohio, Nov. 9.—With one exception every bicycle concern in Toledo was awaiting the result of the election in order to determine its business plans for 1897. In fact, one well-known plant, the Snell Cycle Fittings Company, had seriously counted the cost of an indefinite shutdown in the event of Bryan's election. As it was, this concern posted notices last Wednesday to the effect that all departments would be at once filled with the necessary workmen, and the winter season will be as busy as that of 1895-96.

The couriers of the various Toledo concerns were all at home on Election Day, but nearly all had left town again before the close of last week. E. A. Eager, of the Viking Company, who has just returned from a 5,000-mile jaunt through the South, came home with his ideas solidly crystallized in the direction of free coinage, and was able to pick up a few bets on Bryan about town. Now he is sorry that he spoke.

Colonel Raynor, of the Lozier Manf'g Company, said to THE WHEEL correspondent yesterday: "Orders are coming in at a great rate. We are now employing between 600 and 700 men, and expect to increase this number as the demand increases. We have increased our force fully 50 per cent during the last month. We feel very confident that the good times of 1892 are with us again. Our mail this morning was very encouraging, and our men have all taken the road again."

The Gendron Wheel Company has already put its 1897 catalogue to press, and it will be out in a few days. This company will put six models on the market—two for men, two for women, and two for juveniles. "I do not look for any big depreciation in prices from those which prevailed last year," said President Fisher. "There were no less than 127 bicycle concerns that went down during the year just closing. A manufacturer cannot let a dealer have his output for less than the actual cost of making it and last very long, you know and that was what several bicycle makers undertook to do. It is a little too early yet to fully outline our plans for the year, but we anticipate a good business."

The only Toledo bicycle manufacturer who did not think the country would go to "the demniton bow-wows" in the event of Bryan's election was Joseph L. Yost.

Ever since the embarrassment of the Truman Cycle Company the valuable plant of that establishment has been lying idle awaiting a purchaser. It was announced this week that Toledo parties who have been looking over the field are favorably inclined toward securing possession of the Truman plant and starting it at an early day. It is intimated that either this will be done or the Northern National Bank, which is now in possession of the property, will itself reorganize the company and put it on a sound financial basis for the early resumption of business.

Among the new bicycle deals of the last week is the consolidation of the Maumee Cycle Company and the Tally-Ho Tandem Company. The machinery of the latter company is now being moved to the Maumee factory. The new company will at once get matters into shape for the manufacture of its next year's product, although it will probably be three or four weeks before any wheels are ready for market.

"The Meilink Manufacturing Company" is the title of a new bicycle establishment which will shortly begin business at the original Dauntless plant, on Cherry street. The members of the company are William Young, of Chicago, and Charles F. Meilink, formerly superintendent and secretary of the Dauntless company. The plant will be operated throughout by electricity, and will be well-equipped with modern machinery. The new company will devote special attention to the manufacture of flush joints and hubs, under valuable patents recently taken out by Mr. Meilink.

FOR FLORAL OFFERINGS.

A Kansas City widow who is called gay because she rides a bicycle defends herself against the allegation by declaring her chief object in purchasing a wheel was to carry flowers to the cemetery to place on her husband's grave.

The bicycle has done more to revolutionize society from its condition of indoor supineness to one of physical and mental robustness than any other factor in latter-day progress.

Some racing men's time seems to be counterfeited money, judging by what they have to show for it.

WHERE GOOD ADVICE IS GIVEN.

A page of the Iver Johnson's Arms and Cycle Works '97 catalogue will be devoted to the cycle press and will say: "It is an unquestioned fact that the sport or business of cycling is only half accomplished by those who are not in touch with their fellows through the mediums of the cycling journals. A subscription will repay you a thousandfold."

WITH ANY IN THE SCHUYLKILL VALLEY.

From a small beginning the Keystone Bicycle Company, West Reading, Penn., has grown to a large and sturdy institution. Its new factory, which is nearing completion, will rank with any in the Schuylkill Valley, and with the liberal policy that has been outlined will enable the company to fill its mission of catering to the jobbing trade in a manner that should please all hands.

ON THE OTHER SIDE.

I. N. Buckwalter is "doing" Europe in the interests of the Wynnewood bicycles. He sailed on the 31st ult., and after visiting Birmingham and London will proceed to Antwerp, where a Wynnewood agency was established early in the year. A. M. Schaffey & Co., who market the Wynnewood from No. 92 Reade street, this city, will include a tandem in their '97 line. Like the singles, it will be listed at a popular price.

TOM COOPER IN COLORS.

Clubs desiring to add a picture of Tom Cooper to their "art galleries" can obtain a handsome lithograph of the speedy young man by applying to the Monarch Cycle Company, No. 83 Reade street, this city. The portrait is 18x25 inches and is to be had for the asking.

SO ALL MAY KNOW THEM.

Because of the large sale of their cycle machinery, the Diamond Machine Co., Providence, R. I., has issued a special catalogue illustrating and describing the several machines. Ball case grinders, internal grinders, radial drills, polishing machines and drop presses are listed.

DUST TO DUST.

Bookseller—There is a handsome vellum-bound copy of Ruskin's "Ethics of the Dust;" what will you offer, Mr. Cohencycle?

Mr. Cohencycle—Nodding! Dose books on der professional question make me sick!

GEAR, POWER AND CRANK.

I have been somewhat perplexed by reading the following in an English paper, credited to C. W. Brown, who, so I am informed, is regarded as very much of an authority on all matters appertaining to cycles, their construction, riding, etc. Mr. Brown is quoted thuswise:

"One axiom must not be lost sight of, and that is that it requires the same amount of power to propel a machine a certain distance in a certain time with a high as with a low gear."

This view has also been asserted by several other authorities of late, but I confess to an ignorance as to why they have arrived at such a conclusion.

A moment's consideration will show that the force from a cycle rider's leg is mainly dissipated in three movements, viz.:

- (a) In driving the machine.
- (b) In overcoming the dead point.
- (c) In raising the foot from its lowest to its highest level once more.

Mr. Brown's axiom only applies to movement a, and yet the other two are together answerable for a considerable amount of waste energy.

It is obvious that by raising the gear we increase the strain at a—the most useful position for the concentration of force; we at the same time limit the amount of energy wasted by causing the dead point to be encountered and the leg to be raised less often throughout a journey.

On the other hand, we could so lower a gear that a rider using it and compelled to travel at the rate of five miles an hour along a level road would, in a short time, have to desist through exhaustion. This fatigue would be in chief part due to energy expended at b and c.

A 56-inch ordinary was a 56-inch, whatever the length of crank; it might have anything from a 5 to a 7-inch crank and yet it was only a 56-inch bicycle. If this is so, why attempt to introduce a new factor into safeties under an old name. Mr. Brown gives as an example a machine with $6\frac{1}{2}$ -inch cranks, geared to 65 inches; with $6\frac{1}{2}$ -inch cranks he says this would be geared to 62 $\frac{1}{2}$ inches. Now, a bicycle geared to 65 inches will for one turn of the crank progress 20 $\frac{1}{2}$ inches, and a 62 $\frac{1}{2}$ will only cover 197.14 inches, and yet the same machine will cover the same ground for one revolution of the crank whether that crank be only 1 inch or 12 inches long.

It will require a good deal of persuading to convince me that a gear up to one's full strength does not economize energy to a greater degree than when a lower gear is employed.

I have not touched on the question of friction, as I think the diminution in favor of the high gear is not worth taking into consideration save as another proof of the falsity of Mr. Brown's axiom.—High, Low, Jack and the Gear.

SAVING TIME AND MONEY.

The municipal lighting plant at Edinburgh, Scotland, furnishes current for 150 arc lamps for street lighting. The turning out of these lights, which are on the same mains as the incandescent lights, was done by hand. The time formerly occupied was nearly two hours, when the attendant went around on foot. But a man is now sent on a bicycle, and does the work in half an hour. The city finds that by lessening the time of unnecessary use of current and consumption of carbons it is saving \$200 worth of electricity every year.

Good intentions never die—which may be one reason why they are so seldom carried out by wheelmen.

SOME TIMELY TIPS.

Cycle repairers and fixers are not supposed to be carpenters, but they are often called upon to do carpentering work. Now there is a bicycle in most every household, one of the problems has been how best to keep it out of the way, yet in a dry, handy place. To put a wheel in the cellar means that the dampness will produce rust and mildew. To keep it in a back yard means that it will be exposed to the weather. If kept in a hallway the wheel is in the way.

As a remedy for some of these troubles, here is shown a type of stand which is unpatented, cheap, easy to make, and adaptable to place in any hallway. Fig. 1 shows an interior view of the stand, which consists of the top, A, sides B and D, and bottom C. The back is solid and, like the sides, of wood. The front is one piece and, being hinged, can be opened wide enough to admit the machine. We have made a number of these from common pine, although if made from some of the hardwoods and finished off an attractive piece of furniture would result.

FIG 1

FIG 2

FIG 3

FIG 4

FIG 5

FIG 6

FIG 7

FIG 8

Blocks E should be nailed to the bottom to rest the wheels upon. Shelves F F will serve to put tools, oilcan, or other articles upon. The box can be made airtight with fabric if it is desired to store the wheel in a damp place. The front and sides may be finished off with fancy work, as shown in Fig. 2. If a scarf or other article is placed over the top, the affair will answer as a shelf, and be ornamental.

Regardless of how much care may be taken of wheels, parts will tarnish. Replating is about the only remedy. When fitting up appliances with which to make ready parts for nickel-plating, erect a polishing belt as shown in Fig. 3, in which the belt B is covered with sheepskin, and arranged to run on the wheels A A, these being rapidly turned by the belt D and drive wheel C. Bent parts and all

crevices of a handlebar or like part can be got at with such an arrangement.

In Fig. 4 is a view of another type of wheel which will be required, consisting of the drive pulley E and the larger wheel around which are the bristles F. This wheel finishes off the work. A felt wheel for greasing is made from rolls of felt wrapped about a wood pulley, as represented by A in Fig. 5. B is the driving-belt. The felt absorbs the grease and the surface produced puts a fine polish upon parts.

For grinding purposes an emery wheel, C, driven by belt D and furnished with the stand F as in Fig. 6 will be required. Use No. 60 or 70 emery for cutting, and about 100 or 120 for finishing. This work prepares the parts for nickel-plating.

Oils and greases for lubricating and preserving purposes often cause trouble. Wheelmen frequently come in with the ball bearings of their wheels choked with vaseline, etc. Fig. 7 shows a ball-bearing wheel hub, and a man need not be a mechanic to see how easily stiff, greasy matter could block the balls. A rider brought his wheel to the shop only a few days ago, remarking that the bearings were very stiff. And so they were. The wheels turned hard, yet did not grind or show indications of binding. The bearings were taken apart and most of them revealed gummed, greasy substances gathered about the cones and balls, as illustrated at A and B in Fig. 8. The rider acknowledged using inferior oils and vaseline to lubricate with. A thorough cleaning and an oiling with proper lubricants quickly set matters right. GEO. D. RICE.

THE PROFITS OF A CRANK.

"Well, that's the best day's business I've done this week, and I lost \$35 doing it," remarked the proprietor of an uptown cycle store, when he finally sold the man with the narrow forehead a wheel at a loss at the end of a three hours' session, during which the merits and demerits of every wheel in the market had been gone over.

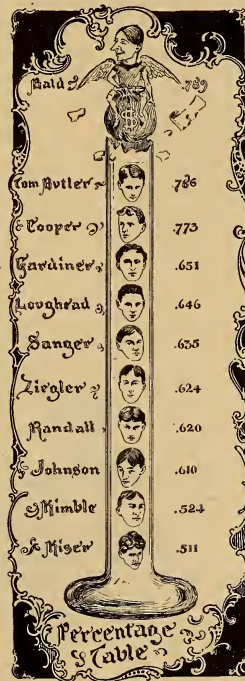

"I can't see where losing both time and money on a crank like that is good business," said his friend, the grocer, who had just dropped in to talk over election.

"Of course, you don't. Why, that man's going to be ten times the crank he is now, and that's why I was so anxious to land him. A wheel crank is one of the noblest works of the Creator, in the eyes of a dealer in bicycles. A wheel crank—and the cities and towns are full of 'em, thank goodness—is a rider who is perpetually dissatisfied with his own mount and perpetually pleased with that of his neighbor until he gets one like the latter. I've sold a man a bicycle and had him bring it back within two weeks after he purchased it and trade it off for another make and pay me a nice cash difference.

"It is possible that that fellow I just landed will get through the first year with his wheel without wishing that he had bought another, but I am pretty confident that he will come back to me within two months and begin negotiations looking to the purchase of some other make. After he has had the second wheel a while he will be trading for a third, and it is not at all improbable that within the next three years he will own half a dozen wheels, and eventually come back to the make that he purchased first. That is not in the least uncommon. It is like the characteristics of the small boy who swaps jackknives, or the trait for horse trading that seems to run through every man's character, whether they be called cranks or not."

TWO YEARS AND FOUR HUNDRED.

A Paris cocher—that's French for cab-driver—has been given a sentence of two years in prison, plus a \$400 fine, for running down two wheelmen.

Facts and figures cannot be made to lie.

The juggling of the returns won't win the coveted position.

Races can be won on the path, but not on paper.

Others do the talking, but Bald, the White Flyer, wins nevertheless.

THE BARNES CYCLE CO., Syracuse, N. Y.

Kindly mention The Wheel.

AS AN ECONOMY.

How the Agent Caused the Dodger to Openly Face the Cycle Riding Question.

He had fought against and talked against cycling as long as he could. When first he began he had a numerous audience of assenting friends, but one by one they had themselves bought wheels, and when they had learned the enjoyment thereof no longer listened to or applauded the pessimistic theories of their friend. He theorized; they knew.

Finally, alone in his anti-wheel ideas, forsaken and laughed at by his former companions, he, too, determined to buy a bicycle. To save his soul for the arguments he time and time again had brought to bear against the bicycle, yet lacking the courage to confess he had been mistaken in his former dislike to the machine, he hid behind the often used excuse of his tribe and declared he was taking to cycling for economy's sake—to save money, bless you!

The dealer had seen a lot of his kind and was determined that he should not skulk behind any such threadbare excuse, so he said to him:

"Economy in what?" The dealer looked at the would-be purchaser for a moment, and then, noting the puzzled expression upon his face, continued without waiting for an answer: "If you mean economy in medicine you are safe in buying a bicycle. If you mean economy in anything else you have made a serious mistake. There is no economy in a bicycle."

"But see how much carfare I shall save," said the man.

"How much?" was the rejoinder. "You ride on the street cars twice in one day, I presume." The man nodded assent. "Quite right. That costs you ten cents. You will not be able to ride more than 250 days in each year, on a very liberal estimate. On each of those 250 days your car fare would have cost you ten cents. Less than \$25, therefore, is the total amount needed for car fare during the time that you may be able to ride your wheel. You want to purchase a wheel for \$100. Therefore it will take you more than four years by saving car fares to pay for the bicycle. Do you understand now why I said there would be no economy in the purchase of a wheel?"

"Yes," replied the dodger, uncomfortably, "I do."

"But I haven't finished all that I was going to say," said the dealer. "The first cost of a wheel is only the beginning. You will not have had a bicycle more than two weeks, after you have learned to ride it well, when you will begin to plan trips around the country. It will at once strike you that it is a cheap and easy way to go to the various resorts near the city and to explore the country round about, much of which, doubtless, you, like many others, have never seen, because you could not afford to hire a horse and carriage. I can assure you that you will not take more than one such trip before you will make up your mind that it is better to have a regulation bicycle suit of clothing in which to dress yourself when you take long rides. Knickerbockers, stockings, shoes, sweater and cap will cost you at least \$20, if the material is good. Thus your outfit will have cost you about \$120. You can't travel around on these entertaining and interesting excursions without paying something for food and extras. That you may make as costly as you please, but I know that you will have a tremendous appetite if you are like most mortals, and a fine appetite is one of the costliest things on earth."

"If you keep on much longer," said the man, "you won't sell me a wheel, and I will stick to the street cars, in spite of the fact that I

thought I was going to do a good turn for myself by purchasing one."

"I'm simply honest with you," said the dealer. "I have had a great many people come to me with exactly the same idea that you had as to the economy of buying a bicycle. I always make it a point to discourage them, just as I have done you, and I instruct my assistants to do the same thing. But I hadn't finished. It is probable that you will have an accident or two, perhaps more, during the season. Perhaps you will puncture your tire. It is possible, indeed, that you will ruin both tires, and that will cost you considerable money. The best terms on which I can sell you a wheel are not low enough to permit you to take one by paying only the amount that you would save in car fare."

"Dear me," said the man, "I hadn't thought of it in that light at all. I don't see what people mean when they talk about the money they save on car fare. You've taken pretty much all of the bicycle conceit out of me. I

item for the street car companies to lose. But don't think for a moment that the men are saving anything. Those wheels must be paid for. If you desire to be frugal economical in the purchase of a wheel, these are the rules: Stop riding on the street cars, stop using tobacco, stop drinking alcoholic beverages and other beverages that haven't any alcohol in them but cost more than good pure water; don't bet on the races or buy tickets in raffles. I think that by following those directions you could purchase a wheel, save money, and improve your health 20 per cent."

Then the dealer made a sale. The dodger was driven out into the open.

NEVER SAW A TEE.

"There's a man who has done some good work on the links."

"Why, he looks more like a banker than a golf-player."

"Who said anything about golf? He's the biggest maker of bicycle chains in America."

A SCORCHER.

MANUFACTURER—Are all these items for railroad fares?
TRAVELING SALESMAN—Yes.
Well, you are certainly a hard road rider.

don't think it would be good policy for me to buy a bicycle at all, after listening to you."

"Quite the contrary. I have put you thoroughly in the way of buying a bicycle. I am quite sure now that you will make a purchase. You will not go into it with your eyes blinded. You will not try to make out that the bicycle is going to be a domestic economy for you, when the fact of the matter is you don't want it for any such purpose. You want it for amusement, and if, incidentally, you can save a few dollars in car fare, all well and good. But don't buy a wheel with the idea that it is like putting your money in a savings bank. If good health is money in your pocket, and it can't help but be, you may figure the purchase of a bicycle as economy. It is the most glorious exercise that I know of, and I am not saying that because I am selling bicycles, either."

"Why is it, then, if all that you say is true, and I can't see why it is not, that people talk about the street car companies losing money when the season permits the use of bicycles?"

"Because they do lose money. But, bless you, my friend, you don't save it, for we get it. The street car companies are out, but the bicycle dealers are in. I know of two factories where over 800 men ride to and from their work on bicycles during the summer months. You may readily see that it is an important

THOSE IRRESISTIBLE INSTRUCTORS.

They are very irresistible, these riding-school instructors.

It is interesting to see them win their way with the women who take lessons; not only with the young girls, but with very well-appearing women, the best that go to the schools to learn, and to see how successful this gentle accompaniment to the lesson is. A curious thing about the little intimacy that grows up so quickly is that it does not interfere with the woman's tipping the attendant afterward. It has never been known to interfere with his accepting a tip, and maybe it has rather inclined her to offer it. The interview generally comes to an end with the same servility in the man's manner that was noticeable at first.

The opening conversation is the formal talk of people who bear different stations, but it is bound to grow personal. He asks her if she has ridden before, and how much. Just as she is telling him, her wheel swerves and he seizes her arm in time to steady it and prevent her falling. From that time he is her protector. The servility has gone out of his manner.

They smile and talk, and nine women out of ten coquette with him as self-consciously as if he had brought them to dinner or had taken them out in a cotillon. These women are not those that go to the rink for the avowed purpose of flirting with the instructors.

They go to learn to ride.

IN THE LONG AGO.

The Course of True Love, Tandems and
Brakeless Singles Did Not Run
Smoothly.

"Grammercy!" quoth the Baron d'Agincourt, as he rolled off his wheel into a flower-bed, "'tis a full-mettled steed! Methinks those varlets have fed him with overmuch oil of late, so restive is he become. And, lack-a-day! My doublet is besmirched with mire! Thou smilest, I see, Agatha. There is but scant reason for merriment, shameless girl!"

"Nay," replied the beautiful Lady Agatha, as with exquisite skill she rode her dainty steed (a thoroughbred, full-nickelled light roadster) up and down the terrace, "'twas not at thy mishap, dear father! Of a truth thou must be sorely bruised. Was not that thy seventh fall this afternoon? If I smile, 'tis but that I am happy."

"Humph!" said the Baron, as he hopped painfully behind his machine, vainly endeavoring to mount anew. "Happy, eh? And wherefore? Whom hast thou seen to change thy mood so since this morning? 'Twas but a few hours ago that thou wast weeping over some trifle of a spilt oil can. Ah, I am up at last!"

"I have seen none," said the lovely maiden, with blushing cheeks; "at least, save only"—She hesitated, doubtfully.

"Whom, girl?" insisted her father. "Sir Algernon Fitzclarencé."

With a desperate wobble the Baron rode toward her, his face purple with passion.

"What, thou hast chosen to disobey me again? Talking with him whom I had forbidden to come within twenty leagues of my castle! Now, by St. Puncture, both thou and he shall rue this day! I say that!"

The Baron's skill failed him once more, and he was shot off into the gooseberry bushes.

"Nay, hear me, dear father!"

"Cease!" roared the angry Baron. "What ho, there! Lead the Lady Agatha," he commanded as twenty men rushed forth in answer to his summons, "into the upper dungeon. And, varlets, bring me the sticking plaster."

'Twas midnight. Alone in the dismal cell to which her father's cruelty had consigned her, the Lady Agatha wept unceasingly. Sleep came not to her weary eyes; she paced restlessly up and down or gazed through the narrow bars of the window over the moonlit landscape.

Suddenly she started! Was it fancy? Nay, 'twas a human voice, manly, resonant, and strong, that sang beneath her window. She could catch some of the words:

O sweetest blossom of the lea,
O daintiest flower of the field!
For love, for hopeless love of thee
My reason must her kingdom yield.

Good heavens! It was Algernon Fitzclarencé!

Across the land, across the main,
A single steed shall bear us twain.

He was ascending by a ladder! His face appeared at the window!

"Ah, darling Agatha," he said, "news was brought me of thy parlous state! But dry thy tears, my sweet! See"—he snapped the massive bars with the little finger of his left hand—"the cage is broken. One of the swiftest tandems is saddled for us at the castle gate. Let us fly together!"

Noislessly the gallant steed flitted along the road.

"Were't not best to light our lamp?" whispered Agatha. "Methinks that the sage councillors of the village"—

"Nay, I fear them not," said the intrepid Fitzclarencé. "Enough for me is the light of thine eyes."

Suddenly their steed slackened pace, and a faint hissing sound was heard. They looked at one another and groaned.

"We are punctured!" cried Agatha. It was too true. At the foot of a steep hill they dismounted, their tires flabby, shapeless, useless. Fitzclarencé passed his hand over the ground. "As I thought!" he said bitterly, "'tis thy father that hath contrived this! He hath scattered tacks broadcast over the road to foil our attempt to escape! But we will baffle him."

For some minutes he worked the tire pump in silence. Suddenly a sound was heard at which Agatha grew deathly pale. It was the clear resonant note of a bicycle bell!

"We are pursued!" she cried. "Let us fly, Algernon."

"We cannot," said her practical lover; "the tires are empty. We can but meet our doom bravely!"

Louder and louder came the noise of whirring wheels. Then—a whirr, and the Baron, breathless, pale with terror, went by them like a flash if lightning! Fitzclarencé understood in a moment what had happened. The Baron was one of those fool novices who despised a brake, and had allowed his machine to run away with him down the hill!

To stop him was impossible. He went along the highway for thirty-two and a half miles, and then, with a last despairing yell, he vanished over the cliff, still seated on his steed, and was buried beneath the waves of the English Channel. So Fitzclarencé and Agatha returned to the castle and lived happily ever after.

QUE BRADOR DE RECUERDOES.

Cycling has left its imprint upon the language of every civilized country. Mexico is the latest to note this, a Mexican paper saying: "Record breaker" is the latest term adopted from English into the hospitable family of Spanish speech, which, although elegant and sonorous, is sometimes lacking in conciseness. What with "records" and "handicaps" the vocabulary of "el sport" is augmenting. Some one more bold than erudite translates the first-named term "que-brador de recuerdos!"

IN INVERSE RATIO.

"It shows the inconsistency of a man," said the abnormally new "new wheelwoman."

"What does?"

"The course the Smithites are taking about bloomers. They object to a woman wearing them on a bicycle."

"Yes, and properly."

"And the less of them she wears the more they object to it!"

RINGING THE CHANGES.

"Say, Sweet's pretty badly gone on Miss Pushpedal. I just saw him putting a ring on her finger."

"What of it? A man has a right to ring his bicycle belle, hasn't he?"

A HARD WORLD.

"Once," she mused, "I felt as if all the world were against me. Yes; the first time I fell off my wheel."

JUST A ROLLIN'.

Sing a song o' cycling,
Movin' right along,
All the country ringin'
With that halleluia song!
'Way from Maine to Texas
Hear the chorus rise—
Rollin' on an' rollin'
Till it echoes in the skies!

LIGHT IN HIS HAT.

How the Professor Illuminated His Upper
Story at the Expense of His
Comfort.

There were those who said the professor had more wheels than the pair he bestrode; but that is neither here nor there; envy must have its fling, and even professors cannot expect to escape from the flinging thereof. The professor was an expert in ohms, volts and arcs, but he looked upon the donning of knickerbockers, golf-stockings and cricket caps as affectations when riding a bicycle. A derby hat, sackcoat, and long trousers, fastened at their bottoms, were good enough for him or any other man, so said the professor.

While his mind was full of light the professor forgot to provide his wheel with the same thing, and so it came to pass that the professor was captured by a cycle policeman, and had to pay \$3 for his negligence. Then he was mad clear through, was the professor. He declared neither the law nor its minions could make him put a lamp on his wheel, so he rigged up a pocket battery lamp and fitted the light inside of the derby hat he wore when riding, cutting openings in the hat to allow the light to shine through. In the front was a plain white lense; on the right side was one of green glass, and one the left side one of red glass. You see the professor's idea was that his lights would show which way he was heading when he rode after dark. "Any man who knows the rule of the road," said he, "will know by the color of my lights which way I am heading, and can keep out of my way." This was very convenient for the professor, as his sight was rather dim, letting alone the fact that he had one glass eye; and this being the case, he often ran into people and horses and things when he was out after dark.

He made a good deal of a sensation the first time he appeared on the Boulevard with his headlight and his sidelights burning their brightest, and, as was natural, he had a pretty big crowd following him. The policemen were a little doubtful about the thing at the start, for a policeman always thinks that anything that is new must be unlawful. However, the professor was so respected that even the policemen hesitated to club their ideas into his head.

JUST ABOUT SO.

Julian Hawthorne has truthfully said that bicycling is a freemasonry broader in its membership than any other save human nature itself. The man of brawn and the man of brains are as one in the saddle. Youth and age alike can do their mile in three minutes or under.

A woman on horseback in a trim riding habit is an alluring sight, but we miss one important feature—the rhythmic grace of motion, which nothing but the bicycle affords. The entire pose shows the figure to the best advantage, and the slight, unconscious swaying of the body to maintain the balance imparts an element of life to the spectacle which is more fascinating than the most studied art of attitude.

ATTACKING HIM FROM BEHIND.

"I see," said Woody Funne, "that the racing men in Philadelphia have decided to take another tack to beat Gideon, and are going to run their own race meets."

"Have they?" was the response of the man with sealskin whiskers. "Well, that'll make it harder for Gideon to sit down on them, won't it?"

WOMAN'S LOVE OF DRESS.

The inconsistency of the average man finds special revelation in his attitude and opinions regarding woman's love for handsome and becoming cycle raiment. The smaller in nature the man, the more does he range himself in opposition to this trait in woman. The wheelman worthy the name is just the reverse of his weaker and more narrow-minded brother. The right sort of a man recognizes in his wife's or his sister's love of becoming raiment for year upon the wheel a womanly characteristic without which she would lack a most valuable attribute, one that she has inherited from Mother Eve.

In proportion as races reveal barbarism, so do the women of such races show indifference to their apparel, and, vice versa, as man attains civilization and refinement, the women manifest taste and the instinct of adornment in direct proportion to the plane occupied by the race to which they belong. The extremes of these types are found in the American woman of to-day and the squaw of the lowest grade of Indian in the far West. Yet there are men of intelligence in the conduct of their business and of presumably good sense in most of the affairs of life that seem to regard it as a duty to discourage the women of their household in all matters relating to their gowning.

Such men do not merit the wheel companionship of womanly, well-dressed wives, and should be mated with blowsy, careless persons fit to make one shudder. A desire to appear to advantage on a wheel in becoming raiment is a thoroughly feminine trait, and as such should be encouraged by every man in a position to guide, counsel or protect a woman. Yet it is the exceptional man that does this. The average masculine will permit a dollar to so obscure his sense and hide his manners as to make his fair dependents shrink, as from an ordeal, from what should be regarded as a pleasure and a privilege by every male breadwinner.

LARIATS, LASSOES AND RIATAS.

In San Francisco the park policemen are supplied with lariats with which to capture the scorchers who infringe park regulations by scorching. Now that the New-York police force is being reformed and improved, it seems that the introduction here of the riata would not be a bad idea. Of course a lasso in the hands of an ordinary policeman at the start would be as rhino to a rhinoceros, but by practice he might attain an expertness that would be perfection itself. Prizes could be given as an encouragement to proficiency, and ten-day offenders could be used as models to be lassoed at various ranges. The policemen could stand at the scratch, and the fugitive be sprung from a trap, like a pigeon, at say, fifty feet distant. They could also practice the art upon a wheel, to increase their deftness and accuracy when on foot.

TAKING NO CHANCES.

"You won't mind my leaving my wheel here in your office, will you? I know you don't ride one, and"—

"No, I don't ride one very well yet, but I began taking lessons yesterday"—

"Er—Come to think of it, I guess I won't impose on your good nature, old man."

THAT "FIVE-MINUTE WALK."

Citily—Commuter isn't late at the office now-days. Has he moved into the city?

Madison—No; but he's got a wheel to ride the five minutes' walk between his house and the Lonelywood station, and he can scorch the distance now in nine minutes.

BEFORE THE FLOOD.

"Say, Shem," remarked Ham one fine, sunny day on which the contractors on the ark had laid off because of the lack of iron stringers delayed by the factory of Damascus working overtime on a new cycle tube contract it had taken, "say, I believe the old man is a little woozy; don't you?"

"Well, I don't know," said Shem, reflectively; "father never seemed quite right to me, but he has always done well in a business way, and mother seems to think he is all right. Still, this flood idea that he has got into his noodle looks a little queer. I wouldn't care so much if he hadn't entirely ruined the wheel business with all his wet weather predictions. His talk about it makes us all ridiculous, too.

"Did you see that interview with father in the Ararat Hebrew yesterday? Pa loaded the reporter down to the gunnels with fact and fancy, and the cuss printed it all. He added on the end that, flood or no flood, pa was going to have the finest menagerie since Hagenbeck, and it would be a good thing for Arabia, as the Egyptians and Phœnician wheelmen were organizing tours to see the big ark."

"Well, I don't know," said Ham. "I hope there will be a cloudburst, to keep the old man's courage up, for his heart is set on a flood; but I wager we'll have a three years' drouth. The sloughs are all dry now. Hello, see Japhet, there; the little devil is sticking splinters in the tires of dad's new wheel. If pa saw that he'd leather him, sure."

SILLY WOMEN AND SENSIBLE ONES.

Would a woman tipping the beam at 200 have a street gown made of a large plaid material, or would a tall, angular woman dress in conspicuous perpendicular stripes, thus accentuating the defects of their figures? No, indeed, but the former pedals and puffs on the Boulevard, clad in home-made costumes of some conspicuous material, and right behind her comes the tall woman in one, the first ever made by her dressmaker.

She smiles contentedly as she gazes down at her wrinkled, home-made leggings, and wonders if it be true that cycling develops the calves so rapidly as some people assert. The women with trim figures, who would look well and appropriately dressed in well-cut cycle suits, gaze upon such specimens and say to one another: "We'll stick to our skirts, even at the risk of our bodily safety and comfort." And the trim-figured ones are wise upon their generation in making such a decision.

A NOCTURNE OF THE NILE.

"Ah, my 'Tony, you will always love me, won't you, dearest?"

Notwithstanding the fact that Cleopatra's taper fingers were held fast in his strong right hand and her brick bronze hair floated around him like a golden dream, a shadow of annoyance passed over Antony's face.

"Yes," he said at length, "I shall always love you, unless—"

She gazed up at him with a strange fear in her eyes.

"—You become a victim of the hateful bloomer habit."

Reassured by her expressed belief that she was not built that way, he clasped her tightly in his arms, and then, mounting their tandem, through the long dusky twilight they rode on in happy silence, drinking in the lotus-laden breezes from the sleepy Nile.

PELL OUT WITH HIM.

"Beautiful fall weather," remarked Dipsey to Miss Skirtles, as she stood near her fallen wheel, brushing the mud from her costume. And now they never converse.

SHE WAS TURNED AROUND

A well-known society woman, who had finally to succumb to the all-prevailing cycle, because of the inconvenience of skirts decided to adopt bloomers for a trip she and her husband intended to make through the Berkshires, and left her order and measure with the ladies' department of a well-known tailor. In answer to a card to "call at her earliest convenience to try on," she dropped in the other day. The lady fitter at the time was not in, but the new woman said that didn't make any difference, and she would try them on, anyhow.

She was, therefore, ushered into the small dressing-room and tried the patience of the proprietor and cutter, who awaited her appearance, for she was gone a good while.

When she did come out finally, she was in bloomers, but not in a very equable frame of mind. Turning to the proprietor, she exclaimed:

"This is a horrid fit. I don't see how you could have made such a botch. I don't know just how they ought to be, but I know they are not right. I can scarcely breathe. Where they ought to be tight they are loose, and where they ought to be loose they are tight.

The proprietor looked at the cutter and the cutter looked at the proprietor. The proprietor blushed, but the cutter, who was behind the lady's back, smiled and boldly winked at his employer.

Then the proprietor determined on heroic measures. Gently, but firmly, he said:

"My dear madam, if you'll kindly return to the dressing-room and put them on right side before I think you will find that they fit all right."

Sadly she disappeared behind the curtain and said never a word.

THE WINNING QUARTETTE.

Sunshine, sleep and fresh air are the three great restorers and vitalizers of the human frame; as such they are necessities to existence; yet many people tax their brains in close rooms both day and night, and without realizing that they are extremists in this direction, they wonder how they become victims to nervous prostration, paralysis, St. Vitus's dance, hysteria and kindred disorders.

Cycling ranks almost equal in importance to these three restorers; with a due amount of these four, almost any human being born of healthful parents may enjoy good health, but it is of the greatest importance to add to these, and above these, a judicious "moderation in all things," if you would enjoy the very best that life holds in store for you.

SING A SONG OF CYCLES.

Sing a song of cycles, a pocket full of gold!
Four-and-twenty different kinds, and each
the best one sold;

Each one with its partisans its eulogies to
sing;

Every one the daintiest that ever bore a king.
The king has left his counting-house' and
wisely spent his money;

The queen and he are cycling, forgetting
bread and honey;

The maid has bought a wheel, too, and left
her hanging clothes;

'Twould take a nimble blackbird now to nip
off half her nose.

JOAN AFTER A RECORD.

"Ah!" cried Joan of Arc. The Maid of Orleans drew herself up proudly. "I will live in history as the first female to wear a coat of male, and"—a gleam of triumph shone in her eye—"the nether garments to match." In her exultation she caused her barbed steed to prance until the rivets rattled in her castron bloomers.

LOOK ON
THIS AND THEN ON THAT.

THEY ARE BOTH.....

MESINGERS

AND BOTH ARE GOOD,

But one embodies ideas a year old, and the other is up-to-date. The market is full of imitations and infringements of the former (the sincerest flattery), because they were sellers, and we shall continue to make them, but the '97 is as much of an advancement as the '96 was over the common strap saddle. Insist on the '97 Mesingers on your wheels and your manufacturer will give them to you without extra charge.

SOME '97 CHANGES.

Wider back, narrower pommel, anatomical outline of V-shaped cut improved. Seat-post clip adjusts to post and saddle independently. Made of the best forged steel. New slack adjustment. No bolt in the rear.

The RATTAN and peculiar weaving of it is the success of all our saddles.

MESINGER BICYCLE SADDLE CO.,

Manufacturers of Saddles and Air Brakes,

NEW YORK CITY.

TOLD OF TERAH.

Accounts of His Versatility and Ability
as a Promoter—An Amusing
Editorial Liar.

London, Oct. 31.—E. T. Hooley has sprung a fresh sensation by an "offer" to purchase the John Griffiths Cycle Corporation, as a going concern, for a net sum of £400,000.

This company had originally been floated in 1894, with £175,000 capital, but it was a failure, and at the end of last year it was decided to write down the value of the 11 shares to 7s. 6d., so as to wipe out all losses. Thanks to a highly successful season, the shares had been gradually appreciating, until they reached 38s. a few months ago. The inevitable setback came, and they declined to 18s. They were at this figure a fortnight ago, but day by day they rose steadily in quite a puzzling way, the buying being from outsiders. When they touched 26s. the "offer" was made, and, getting out almost immediately, huge lots were bought. Under the circumstances the price ought to have jumped considerably, but it only rose to 29s. and then immediately receded to 25s. The offer was considered yesterday by the directors, but their decision has not leaked out, though, as the price has risen again to 27s. 6d., it almost looks as though the deal was on.

The break in the monotony of quiet which has afflicted the company-promoting ranks for some time has come at last, and in quick succession the Swift Cycle Company, the Bagot Tyre Company and the Pattison Saddle Company have all been flung on the market.

The first named is the new title of the old Coventry Machinists Company, Ltd., and I must say that, knowing that the purchase price of the latter was £250,000 Mr. Hooley has been most moderate in his demand for a fresh capital. This is to be £300,000, and I am quite certain that it will have been oversubscribed. The directorate includes R. L. Philpot, who had practically made the old company; Harvey du Cros, jr., Alfred du Cros and C. W. Hely, the wealthy Dubliner.

The Bagot Tyre flotation was not quite so successful an affair. Two hundred thousand pounds was the amount asked for, but I believe that the public did not go frantic in an endeavor to secure an allotment, consequently the whole affair almost fell through until Mr. Hooley's assistance was secured.

Under these circumstances it is not surprising that the promoters were able to corner the market at the start, and Bagots were quoted at 25s. premium, but the bears were too strong ultimately, and next day they dropped to 22s. 6d., and are now 16s. 6d. premium, and likely to go lower. The Bagot tyre is being made under the Preston Davies patents and license, so far as its fixing goes, and, with all due deference to the promoters, that is the best part of the tyre.

But the Pattison saddle flotation is the biggest joke of the lot. Some years ago Mr. Pattison introduced his bifurcated saddle, and it was well spoken of by those who tried it, but its popularity never got beyond that rather embarrassing stage, and of late it quite went out of the ken even of those like myself, whose duty it is to keep in touch with every line of trade included under the head of cycling. On Wednesday last, however, our old pal reappeared as the applicant for £100,000 in cash from the public, of which £80,000 was the promoters' share. I would not like to say that over 800 Pat-

tison saddles have ever been sold, so you can guess of the character of the promotion.

As a sample of the huge profits that can be made out of the cycle trade when properly handled, commend one to the reports of the group of companies hitherto banded together under the direction of Albert Eadie—otherwise known as the Emperor of Redditch. The Eadie Manufacturing Company has just declared what in effect is a dividend of 115 per cent, and the Eadie Chain Company, Ltd., has followed this up with the modest effort of 100 per cent. R. W. Smith, who has just returned from a tour among your labor-saving cycle toolmakers, is a main factor in these brilliant successes. It is on the back of such results as these that the public are induced to support the rottenest flotations.

The American cycle press has been reviling their British contemporaries for their partisanship in the matter of English vs. American cycles, but I wonder what they would say if they read the silly, bigoted lick-spitting which such papers as Jerome K. Jerome's "To-day" indulges in to please the English trade. Take this for instance—a clipping from its latest issue:

I am every day expecting to hear a wild cry of rage against American machines. Their true character is being discovered, and very few English riders have anything good to say about them. It cannot be said that they have not been given a reasonable trial. This year they have been purchased in an almost reckless manner by English riders. Cheapness has been their first recommendation, and a fancy appearance the second. Speaking of them generally, I must say I think they have proved absolute failures, and, of course, their English admirers, finding them untrustworthy, have diminished in numbers. Next year the cyclist will buy his American machine with his eyes open. There will have been revelations long before then, and, in the face of these, he still persists in purchasing foreign machines, he must be prepared to stand by the consequences and forego the sympathy of his fellow-cyclists.

The summer has been sufficiently long to prove that there is something really bad in half of the American machines sold in this country. Still more damaging evidence will be secured against them during this coming winter. They are gaudy deceits, with fantastically painted tubing and wooden rims, and will never do honest work on our rough roads in the winter. Many of these machines, bought at the beginning of the winter, are, by this time, tumbling to pieces. They break record in becoming obsolete and useless. An English-made machine that has degenerated into a crock at the end of three years' hard work is honestly worth more than the average American article after it has been ridden through its first season. The life of a cheap American machine is one season, and it might, without doing it an injustice, be christened "the single-season machine."

All this is undoubtedly written with the idea of forcing American makers to advertise in this journal, and, as it has a large circulation, and is popularly considered an honest, straightforward type of journal, I fear that unless such policy is adopted American machines will be considerably discounted in good quarters before the falseness of the criticism is made plain. I do not think that the English trade, as a whole, look on this style of thing with favor, but several second-rate firms are quoting from "To-day" in their advertisements. The cycle press here is ignoring the whole business.

WAIL OF THE SHORT MAN.

"What did you think of the big cycle parade the other day?"

"I was in the crowd trying to get a look at it, and I think I can truthfully say that it was by far the biggest parade of bicycles I never saw."

NORTHWESTERLY.

Trade Has Advanced in That Direction Despite the Idea That It Would Not.

Vancouver, B. C., November 6.—The bicycle trade of this place during the year 1896 has been in a highly flourishing condition, and the prospects are exceedingly bright that it will in '97 eclipse its previous records. This will be understood when it is taken into consideration that '96 was the first year that the "boom" proper reached this Western city. Of course, for several years past cycling has been a favorite pastime here, but it was not until this year that it became popular with the masses, so to speak. Probably this is accounted for by the fact that this year three renting agencies were established, which have tended to cultivate the public's taste for cycling, for previously if a person wanted to ride a machine he had to purchase one, and it is not everybody that can afford to buy. Now, these bicycle stores renting wheels at popular prices, namely, 25 cents per hour, have done away with all that trouble, and the proprietors of these renting agencies have consequently reaped a rich harvest in return for their enterprise. The following wheels are represented here: March, Hyslop, Climax, Brantford, Cleveland, Columbia, Dayton, New Barnes (Canadian), Stearns, Belvidere, Gendron, Remington, Crawford, King of Scorchers, Cavalier, Massey-Harris, Henley, Evans & Dodge, Perfect, Garden City, Dominion, Eldredge. There is, however, room undoubtedly for other leading American manufacturers. There will be five repair shops and four renting stores at least in full operation in '97.

As a criterion, I would mention that Ernest Easthope is asking for prices from manufacturers for twenty machines in order to add a renting department to his establishment, and another dealer of this place is advertising in a Canadian cycling paper for cash prices for twenty-five or thirty strictly high-grade wheels for similar purposes. This tends to show what will be done in the cycling line here next year. Victoria, B. C., this year has been a hotbed of bicycle agencies, and New Westminster and Nanaimo, the other leading cities of this province, have a very fair representation also. The Good Bicycle Co., of Brantford, Ont., makers of the "Brantford," will shortly open a branch house here, which is to be their shipping depot for China, Japan, Hawaiian Islands and Australian trade. As Vancouver is the port from which the steamers to Honolulu, Australia, China and Japan run, it is more than probable that several Canadian manufacturers will establish branch houses in this city during the next few months. There is one thing the manufacturers who do business with agents in this province should remember, and that is, a peculiarity of the climate of British Columbia is that we have two or three weeks regularly each year in February of dry and warm weather (it is never very cold here), and during that warm period the public commence to purchase their respective mounts, and consequently the agents who have wheels on hand at that early date reap the benefit. This is worth bearing in mind.

TOO LAZY TO WORK EVEN PEDALS.

"I had the best kind of chance," remarked Mr. Dismal Dawson, as he held out his cup for a little more coffee, "to steal a bysickie." "And you nobly resisted the temptation?" said the lady, as she cut another slice of pie.

"Yes'm, I don't know, though," continued Mr. Dawson, "whither I would or not if it had been one of them self-propellers what runs themselves."

ON THE OTHER SIDE.

What One Student of the Foreign Market for Americans Learned Regarding Same.

Toledo, Ohio, Nov. 9.—The Board of Trade of this city were invited by the Government of Denmark to send representatives to the International Exposition at Copenhagen, which opened September 1. The Board were slow in taking advantage of the invitation, so that the Exposition had been open for some weeks before they took action. W. T. Dewey, general manager of the Maumee Cycle Company, who is also secretary of the Yost Manufacturing Company, was selected as one of the representatives, and sailed about the middle of September, but after his arrival in England he could not escape the conclusion that the limited time at his disposal was not adequate for such an investigation of the trade conditions of Copenhagen as would be of value to his constituents, and that the Exposition, while an important event, was hardly of a nature to justify a simple visit.

He decided, therefore, to spend a bit of time in England and France in purely personal fashion, and returned home in time to cast his vote for "honest money."

THE WHEEL man in an offhand chat got him to talk a bit. Mr. Dewey accentuates the fact that his impressions may be superficial, being the result of so hurried a trip.

"No, sir," he said, "I do not think that the general run of American machines have made as yet a very serious impression on the English trade, although a strong assault has been made the past season. The English machine, while heavy and to the eye of an American rider somewhat cumbersome, is nevertheless better adapted to the conditions of their climate and roads than the American pattern. The average English manufacturer is much more alert and alive to conditions than he is generally given credit for, and while he is at present behind us in means for economical and uniform manufacture, I am sure that he will be well in front just as soon as he finds that it is a matter necessary to take up in order to protect himself. He gives the public what it wants, and the Englishman seems to want what is safest and most comfortable. Witness the success of the English in their foreign trade all over the globe. Our factories have had an outlet over there this year, more on account of the shortage of English wheels than because of the demand for ours, except in the case of a few makes, which have had a footing in past seasons."

"This shortage will be more than made good this next season, and American wheels will be likely to suffer. The difference between English and American wheels is largely in the matter of fittings. The average English wheel, disencumbered of its fittings, will not scale much heavier than an American one. The Englishman buys his wheel for practical purposes in all kinds of weather. I was absolutely amazed to see the number of machines on the streets of London on rainy and muddy days. In each case they were fitted with brakes, heavy, durable saddles, practical mud guards and gear cases.

"I do think that several of the American manufacturers who got over there early and made strenuous efforts to introduce their goods will do a good permanent business, but it will be a case of fight, and the business will come from those who invest in new wrinkles and novelties. The American manufacturer who has not already a strong foothold there had better leave the English market alone.

"The American wheel has taught the Eng-

lish riding classes that a bicycle for ordinary road riding can be just a bit lighter and still stand up, and the English maker has learned his lesson and will give them what they want."

About the French makers, however, Mr. Dewey waxed enthusiastic. It is in France, he feels, that the real market for and the real appreciation of American bicycles exists. Why? Because, he explains, in France the American bicycle is fashionable. The impulsiveness of the race is characteristic. Their sentiment is stronger than their merchantship. They are volatile to a degree, and their like or dislike of another nation is a factor in their purchases of the latter's goods. French bicycles are not, generally speaking, very good cycles (although there are several striking exceptions), and the French have bought English bicycles because they were indisputably better goods than they could get at home. They have a strong sympathy for the American nation, and would rather buy American than English goods.

"Yes, so long as the French makers do not make as good goods as the Americans Yankee wheels will find many French purchasers, and that state of things is likely to continue for some time. Even should evenness of quality eventually prevail, the lively American wheels will have secured so strong a foothold as to be permanent factors in the market.

"It costs, I am sure, quite a deal more to build the Frenchman's wheel than our own.

"The only thing I fear is the possible success of the effort now in progress in France to have the tariff on wheels so raised as to make the cost of laying down a wheel there about twenty dollars. From what I gathered, however, I do not think the effort likely to be successful. The present cost of laying down a wheel is about ten dollars."

CASE OF SOFT PEDAL AND CYCLE ONE.

When Captain John Smith, on his around-the-world wheel tour, was carried a prisoner into Colonel Powhatan's fine old Colonial mansion in Virginia he heard the atmosphere shattered into splinters by Pocahontas practising "The Maiden's Prayer" on the piano, a piece of music that was just then becoming popular. Miss Powhatan was having a neat little finger scorch along the keyboard, now and then letting one hand get out of control and cross over the other to wiggle the keys of a little tinkling symphony "all by its ownty" on the upper register, from which the heat had been turned off. Captain Smith watched this proceeding a moment, then turning to Colonel Powhatan and raising his eyeless with his lace-cuffed hand he said:

"Bah Jove! Powhatan, we English have heard, you know, a good deal said, you see, about the torchah practised by you red men—ah, you know; but I'm very, very certain that we had no, ah—conception of the severity of it, to be suah, or I never should have attempted to ride this bicycle through this blawsted country, don't you know?"

"Kunnel Smith, sah," replied Colonel Powhatan, with true Virginian dignity, "yo' remark, sah, does you no credit, sah. Had it not been for yondah girl, sah, we should have had you clubbed, yes, clubbed, sah!"

"Ah, weally, pon honah!" said Captain Smith, startled by his narrow escape; "vervvy kind of her, I'm sure."

And Pocahontas smiled sweetly at the gallant young Englishman, for, like all her American sisters, she had designs on almost anything that wore a monocle and rode a wheel.

In the choice of their future abiding places, heaven will suffer among cycle-riding shades, because of the superior facilities for scorching offered by the other place.

ELLIOTT FOR ELECTION.

Tells of His Hobby and Declares He Has Not Had Time to Carry It Out.

Sterling Elliott would like to remain president of the L. A. W. for another year. Of course, every one who knew anything at all knew this weeks ago, but Mr. Elliott did not "officially unbosom himself" until Saturday last. He did the unbosoming with a pen. This is what he wrote and gave to the press:

"I am a candidate for re-election to the L. A. W. presidency, for the reason that I have found it impossible to accomplish in one year all that I had hoped for, even though the growth in membership has been phenomenal.

"The gain for the past nine months is over 31,000 members, and the gain in treasury is over \$13,000. In view of these facts, I trust that my request for re-election may not seem presumptuous to those who have only the welfare of the L. A. W. at heart.

"As I stated in my roads speech in Baltimore, I believe that by far the most important mission of the L. A. W. is highway improvement agitation, and the passage of laws looking to the actual carrying out of the work. I promptly appointed a highway improvement committee, consisting of some of the best men for such work that our organization contains, but owing to a peculiar combination of circumstances practically nothing has been done.

"My pet hobby for several years has been the establishment of an L. A. W. press bureau, from which should be furnished systematically good roads matter for publication in the largest possible number of agricultural and other papers, the work to be done under the supervision of the Highway Improvement Committee. I believe that greater results in the direction of road improvement can be accomplished by this than by any other means at our command. It has been possible only within the last month to take the preliminary steps toward such a press bureau. Tangible results from its work cannot be seen before next year.

"Although I have been obliged to partially neglect the work of the Massachusetts Division, it has still hampered me, to some extent, in my work for the National L. A. W., for no man can do full justice to both offices at once. It may be proper for me to call attention to the fact that Massachusetts has by far the largest number of League members in proportion to its inhabitants, and that it has a much larger sum than its treasury knew before. Massachusetts has also the most effective system of building State roads which has yet been discovered.

"I have plans already in process, to be explained shortly, which I fully believe will place the League membership at 150,000 by January 1, 1898, and, being more or less human, I naturally desire to have the satisfaction and credit incident to the fulfillment of this prediction. Assuming, of course, that present results and indications would justify the assembly in trusting me with the office for another year."

Whether this declaration will take any of the wind out of the Potter and the Morrison booms remains to be seen. The latter does not just know "where it is at," while the Potter movement, which is more of an undercurrent than an inflation, is just as strong as it ever was, and is likely to wash the Elliott pebble off the beach.

TWO TERMS ENOUGH.

"You're a scorcher, an idiot, a"—she said, after he had run into her.
 "That'll do," he answered, his mind full of politics. "Stop just where you are. I'm no believer in a third term."

POINTS ON PEORIA PRODUCTS.

Peoria, Ill., Nov. 9.—Sylph bicycles will be listed in 1897 at exactly the same figure they were catalogued during the current year—\$100. Their makers, Rouse, Hazard & Co., have made the announcement. The first of the '97 models will leave the factory this week. Harry G. Rouse gives me these specifications and matters of mechanical detail: Frame, 22, 24 and 26 inch; main frame, 1½-inch tubing; rear forks, ¾; rear frame braces, ¾, both the latter made with "D" tubing; outside reinforcements. Benson patent detachable sprocket, simple, neat and boltless, can be removed without taking off crank axle or removing the pedal. Seat-post and handle-bar clamps will be novelties, neat, simple and boltless. The crank axle is another novelty. It is in two pieces, and so shaped that the movable crank and chain, as well as gear, may be removed without either taking out the cups, changing adjustment or unbolting the chain. These two novelties are R., H. & Co. inventions, for patents on which applications have been made and are now pending. The chain adjustment is still another new feature, effective in permitting the removal of the rear wheel without changing the adjustment or removing the axle nuts. "The orange crown" will be a distinctive feature, the color having been associated with the Sylph for two seasons. The general construction is such that there is ample room provided with a tread measuring from the pedal ends of cranks of only five inches; yet 7-inch cranks will be used with a 24-tooth rear sprocket, and tires as large as two inches may be used. Sprockets up to 9-tooth front and 24-tooth rear, with genuine Perry Hubber chain. There will also be plenty of room for a gear case.

The crank-hanger will be dropped two inches, balls in crank bearing ¾ inch in front and rear ¼ inch. Bearings are one of this firm's hobbies, and will have ball-retainers, with a device for carrying the oil directly to the balls. These dust-proof bearings will, of course, be made of the best tool steel. A change has been made from two-point to three-point bearings, after a careful series of exhaustive experiments, which show the three-point wear longest and are best.

Overlands for 1897, both ladies' and gentlemen's models, will list at \$75 and \$50; youths' and misses' 26-inch at \$50, and 24-inch at \$40.

The \$75 Overlands will be similar to the Sylph, but will lack the outside reinforcements and "D" tubing, and will have the ordinary style of seat-post instead of boltless that will be used upon the Sylph. Frame—24-inch diamond, 22-inch drop pattern, finished in maroon enamel, very highly finished and handsomely decorated. The \$50 pattern will be the same as the '96 \$85 model, with the nickel-plating omitted from the fork crowns and ends; the orange crowns will be a distinctive marking of the entire line.

The \$50 26-inch youths' and misses' wheel will be the same as this year's \$65 machine, but provided with the 1897 fork; the \$40 boys' and girls' 24-inch will be the same as the \$45 wheel of '96 design, except the fork.

In addition, Rouse, Hazard & Co. will build a tandem, of which the list price and specifications are not yet fully decided.

BANDING TOGETHER.

Even in South America wheelmen have grown numerous enough to demand a national organization. The Liga Salvadorena is the latest, composed of riders living in San Salvador.

The best some men get in cycling is the worst of it.

HAVE A FULL LINE.

All other things being equal, there is probably no one who would not prefer the highest possible grade of wheel without regard to its cost. All other things, however, are not equal, and consequently wheels and their prices must both be built to suit the pocket-books and requirements of their purchasers. It is with this idea that the Thomas Manufacturing Company, of Springfield, Ohio, have concluded to enter the field of cycle building. The three cardinal points of their cycle making and selling will be: the best possible wheel for the money asked for it; quality of output to be sought for rather than quantity, and the asking of a just price from which they cannot and will not deviate. Success comes surely along these lines, and such concerns are welcome to the cycle trade as they have been in other lines of manufacturing.

The Thomas leaders will be a flush-jointed 1¼-tubed wheel listing at \$100, and another with the parts precisely the same, with 1½-inch tubing and outside tapered connections at \$85. To make the line complete an up-to-date medium-grade wheel listing somewhere between \$75 and \$65 will be turned out. So that the rising generation may not be overlooked, a full line of juvenile 24 and 26 inch wheels, with 1½-inch tubing in the frames, will complete the Thomas Company's offering to the trade.

With W. C. Johnson acting as director-general of the Thomas output, an efficient corps of agents and travelling men is already assured, so there is no possible danger of the light of Thomas being hidden under a bushel measure or otherwise. If the reputation of the wheel was not already assured by that of the company building it, perhaps the fact that Superintendent Fay, formerly with the Remington Arms Company, was in charge of the Thomas Company's cycle plant would of itself be sufficient guarantee of the quality of the Thomas line.

It is a safe prediction that when the history of the newcomers in the trade is written up at the end of next season, the name of the Thomas Manufacturing Company will not be missing from the list of successful ones.

THEY WANT AMERICAN WHEELS.

A Continental (Italian) agent is open for negotiations for American wheels. Address C. Foreign, care THE WHEEL. Propositions held confidential and will be forwarded.

Wanted—100 wheels of good reputation from America by Theodore J. Gort, Holbok, Denmark; reputation and status unknown to THE WHEEL.

Five hundred wheels of good, medium or first-class grade are wanted by a firm in Holland. Must be 1897 wheels. If negotiations are satisfactory, order may be run up to 2,000 or 3,000. Cash will be paid. Address A, Foreign, care THE WHEEL. Propositions held confidential and will be forwarded.

NUMBERS TO THE FRONT.

Romanian wheelmen are compelled by law not only to carry a large numbered tag upon their wheels, but the same number must be plainly painted on the lens of their lamps, so as to be plainly discernible at night time.

TRYING THE CHAINLESS.

The French army has been ordered to give the new bevel-gear wheel an exhaustive test. If the result is satisfactory the machine will be adopted in place of the chain-gear one now in use.

WANTS TO KNOW.

A policeman's very first question when anything happens to a cyclist is invariably, "Where's your light?"

NO REMORSE WITH THIS GRIP.

There is a you-can't-shake-me-loose spirit about Chicago when she fastens herself upon a good thing that seems to penetrate through the business ideas of her people. Give a Chicagoan a good idea and he sticks to it until he lands the idea and himself a winner. The Morse Machinery Company, No. 1,720 Michigan avenue, had an idea that no part of a wheel needed improvement more than the handles and handle-bars; vibration was killing, therefore vibration should be killed; but how?

The question had been asked a thousand times, but the answers were not equally numerous. The Morse Company submitted their solution of the question in the Morse grip, wherein a double-coiled spring is embedded in soft rubber, grooved for ventilation, and provided with a simple, but effective device for fastening it to the handle-bar so it cannot be shaken loose therefrom.

The handles are easily attached to any bar, though where users of the Morse grip do not care about taking off the old handles and replacing them with the new ones the Morse Company will supply bar and grips complete, all ready for use. To use the words of an admirer, the Morse grip "is as full of good points as an egg is full of meat."

BACK TO HIS OLD HOME.

Dave J. Post is going back to Hartford. He has been on the fence for some time. He has had a snug berth as manager of the Peerless Manufacturing Company, in Cleveland, Ohio, and to relinquish it has meant several long conflicts of feeling. But he finally elected to return to his old New England home, where his personal interests, particularly those in the Veeder Manufacturing Company and the Cycle Supply Company, are centred. His resignation of the Cleveland position has been tendered, and Post will be established in Hartford shortly after this is in type. In some respects, Mr. Post's move is not wholly surprising. The Veeder Company in particular has grown marvelously in the last few months, the new Veeder cyclometer, which is no larger than a thumb nail, having sprung into well-deserved popularity and contributed largely to the growth. Mr. Post has ideas for still further extending his interests, and that they will quickly develop now that he is to devote his whole time to them those who know the energy and level-headedness of the man will not doubt for an instant.

WANT TO SHOW CYCLES.

Three local cycle shows have been sanctioned by the National Board of Trade, those at Boston, Philadelphia and Pittsburg, each of which is promoted by the local boards, and will occupy the week February 20 to 27. Three applications have been refused, those of Wisshickon Wheelmen, Germantown, Pa.; Penn Wheelmen, Reading Pa., and Central Wheelmen, Brooklyn, N. Y. Applications are under consideration from the Cycle Club of Brooklyn and Syracuse Local Cycle Board of Trade.

In all cases the applications of local cycle Boards of Trade will be given preference.

WORTH LOOKING INTO.

Makers of cycles, parts and novelties who are seeking foreign trade, will do well to "look up" Klaas Baving, Zwolle, Holland, who, elsewhere in this issue, advertises for American goods.

NINETY-NINE BETTER.

"Mamma, what is a 'Sabbath day journey,' like what's in the Sunday-school lesson?"
"About a mile, my dear; but the Sabbath day journey of to-day is"—
"Oh, I know, mamma—a century run."

Kindly mention The Wheel.

EVERYTHING THE MAKER WANTS.

It isn't so very long ago since the Toledo (Ohio) Cycle Supply Company came into being—less than two years, to particularize. Their formation was the result of the excellent opportunity then offered for a house that could serve as a medium between parts-man and cycle maker; with money enough to buy cheaply, with the experience to know what the trade would want, and the prestige to dictate to its principals what to make up and what to leave alone for an ensuing season; all in all, to relieve the parts-man of the labor and worry of marketing his goods and thus permitting the concentration in the manufacturing of his product.

The Toledo Cycle Supply company was the result of the general need of a house on these lines. And it prospered. From an unpretentious beginning it has grown to power, and since success itself is the master of success, its future is likely to be on the plane of even larger purchases, larger sales and added accounts.

The company practically sells exclusively to the manufacturing trade. It will supply the new maker or the old one everything and anything he can use in the putting together of bicycles, from pedal pins to complete frames.

It has, however, its specialties. The manufactures of the Snell Cycle Fittings Company, for which concern it is general sales agent, is one of them. Snell's fittings are so well known as to be in all truth an advertisement for the character of the firm selling them. Forgings, hubs, pedals, frames and frame connections are the main items of the Snell product handled by the Cycle Supply Company.

Butler & Ward saddles constitute another specialty, and a goodly portion of the Newark firm's output goes through the Cycle Supply Company. Cilley chains form another item, which the company claims are first-grade goods at medium-grade prices.

The "good" tires of Morgan & Wright is another account of the Toledo concern, and are the only tires they handle.

On wood rims they are well fitted to take care of the trade by supplying the popular Plymouth brand, made at Plymouth, Ind., by the Indiana Novelty Manufacturing Company.

The newest account of the company is the tubing of the American Weldless Steel Tube Company of their home town.

All in all, the Cycle Supply Company is headquarters for cycle material. It has everything—spokes, nipples, wrenches, oil cups and what not.

The personnel of the concern consists of Samuel Snell, who is president; A. A. Barber, H. J. Thompson and H. H. Nelson.

ATTENTION TO THE NEW.

New machines should be carefully adjusted directly they come from the makers, and it will usually be found that after about fifty miles or so the process should be gone through again, as the bearings do not get into proper place. Perhaps the head is the most important point, and next comes the crank axle. As a rule, both these bearings will shake loose rather quickly for the first ride or two, but afterward will remain adjusted for a considerable time. Many machines are often seriously damaged by insufficient attention being given to this matter of adjustment.

SHE SCORCHES.

A daily paper observes that "the wheel-woman has come to stay." Not much! She has come to move, and the fellow who doesn't give her the road will be run over.

INTENDED TO PLEASE THE RIDERS.

When the now hyphenated Hamilton-Kenwood Cycle Co. linked fortunes and a few months since established their home in Grand Rapids, Mich., it was predicted that a particularly fine wheel for '97 would result. There were men in both concerns so well versed in the art that the combination of such brain matter could scarce result otherwise.

Hamilton.

Predictions are in a fair way of fulfillment. The first of the '97 Hamiltons are putting in an appearance, and display not only an attractiveness of pattern and finish, but a painstaking effort in the matter of mechanical details. The aim has been to produce a wheel that the unmechanical rider may readily adjust, clean, care for and comprehend generally.

Wellington.

The bearings and cranks afford a fair instance. While some special machines have been built embodying the principle, the Hamilton-Kenwood Company believe they are the first to place on the market a stock wheel built with two-point bearing cones that are stationary upon the axles, and upon which the balls are held by suitable retaining rings.

Hamilton Tandem.

The results obtained are obvious. The axles may be removed with cones and balls intact, and thus are easy of access. The rings also retain lubricant, so that the bearings need oiling less frequently than bearings of the usual type. As these cones are stationary, the adjustment is made by means of the cups. This renders adjustment possible with-

Hamilton.

out disturbing the nuts by which the axles are held in the frame and avoids the forcing of the cone against the balls when the axle nut is tightened, which often causes the bursting of the cup or otherwise injuring the bearings.

This method of construction also renders it impossible to adjust the bearings too tight, as when the lock nut is screwed into place the

tendency is to carry the bearings from each other, preventing any possibility of undue tightness. The bearings in the crank axle are made on the same plan, tool steel cones being forced upon the quill into which the divided cranks are screwed. These cranks are of the two-piece type, joined in the centre by an improved method and are removable by means of a stud, which is a fixture in the yoke, being screwed into the plane of rotation of a milled lug projecting from the surface of the cone-bearing sleeve. This enables the rider to at any time remove or tighten his cranks without the use of wrench or spanner.

Both sprockets are detachable, the front one being removable over the crank. They are locked in place by means of milled lugs seated in milled recesses in the crank-spider and in the rear hub flange.

In the Hamilton the seat-post forging is not split in the usual manner, the clamp being so arranged that the forging presents a smooth, cylindrical surface, where it is ordinarily milled out, and contains within this cylindrical projection a sliding nut, which, by being drawn into place by means of an ornamental hexagon headbolt, comes into contact with a split bushing, through which passes the seatpost, thus binding the different parts together in a perfectly secure manner.

The handle-bars have adjustable grips, and a 6-inch adjustment vertically in head, which is believed to be enough to satisfy any rider. The handle-bar is clamped into place from the interior, so that the ordinary clamp and split fork stem is avoided, and the head presents a smooth, finished appearance.

Recognizing that the weak point of a bicycle has generally been the junction of the fork sides with the crown and stem, the Hamilton company have adopted a triple-plate crown similar to that used on a few tandems in '96, which, while being light and graceful, is of such length that it distributes the breaking point over a large surface.

The adjustment of the chain is another detail to which much attention was devoted, with the result that the rear fork ends of the Hamilton are serrated, and the rear axle fitted with two blocks serrated to correspond with the fork ends. These parts are not enamelled, but nickel-plated, and, consequently, clean and free to lock together.

The frame of the Hamilton Ladies' Special, while somewhat on the lines that have been previously adopted, is so planned that the step required to mount this machine is some four inches lower than that required on ladies' machines of ordinary type. The lines are all true curves, and such as produce the greatest strength possible to be attained in a drop frame.

The size of tubing has been given much thought and is 1 1/4 in the main frame, 1 1/8 in the head, 3/4 D in the rear frame tubes, and 3/8 in the upper braces.

The Hamiltons have flush joints throughout, with all connections made from drop forgings. The Hamilton tandems have been designed upon the same lines as in the single wheels. They have flush joints made from 1 1/4 tubing, with the bearings the same in design as used upon the singles. The front chain is of the centre driver type, thus securing a narrow tread, and the stretch is taken up by means of eccentrics, so there are no unsightly idlers, as are commonly used.

While the output of the Hamilton-Kenwood factory is principally of high-grade work, yet in order to satisfy the demands of agents for a real line, they will put on the market the Wellington at \$75, and the 808 at \$60. These machines are of the conventional type, being built with 1 1/2 tubing with outside connections, and the workmanship is in every way first-class, and is fully up in finish to any machine class of the same grade manufactured. All models will be in enamelled black and maroon, but any other color will be supplied when desired. This rule will also apply to the tires. It is the policy of the company to give riders what they want.

ENTER '97 VICTORS.

Two new Victors will make their appearance in '97—a road racer and a double-tubed lady's wheel. The former will, of course, be lighter than the Victor roadster, but both rear and front diamonds will be longer than in the latter. The wheel base, however, is not increased. The added length of the frame is offset by a straighter fork. The hanger drops about one inch, which shortens the head that much. The angle of the upright tube and head has been changed to correspond with the demands of racing men. The fork is straight almost its entire length, with a short curve near the end.

The single-tube Victoria will be retained. The double-tube frame is simply an addition to the line. The tubes which constitute the backbone on this machine are one inch in diameter. The lowest one is straight from the head to a point about eight inches from the hanger, where it curves to meet the centre hanger connection. The top bone is curved its full length in such a way as to give the most room for the skirts, and conform in symmetrical line with the lower tube.

In construction '97 Victors will show changes only in minor details. Larger tubing will be used in certain parts, and the forks will be straighter and the sides more nearly oval.

AUTOMATIC AND PRACTICAL.

This automatic toeclip is being marketed by Eugene Arnstein, of Chicago. It seems practical enough to merit no little consideration. After being clamped to the pedal it acts by the pressure applied to the wire project, which brings the clip up to and over the toe

of the shoe and holds the foot firmly in place. When the pressure is removed the clip drops down, releasing the foot and allowing freedom for dismounting.

HERE'S HOPING THE SIGNS ARE TRUE.

If signs of the times read aright, the Hodgman Rubber Company, of Broadway and Grand street, New York, will continue to be a factor in the tire trade. Their company is now in the hands of a receiver, but matters are being run just as if the company had had no financial difficulty. Affairs are cleaning themselves up nicely, and the Hodgman people expect in a short time to enter into possession of their property clean and clear. Meanwhile orders are being received, and Hodgman tires are being gotten out promptly.

LETTING EACH LEG KNOW.

"What's the secret of learning to ride the bicycle?"
 "Reverse the Scriptures."
 "How so?"
 "Always let your left leg know what your right leg doeth."

A somewhat discouraging and foreboding sign in front of an open-air Boulevard tea-chery reads, "Riding taught with pains."

LIKE A LOCOMOTIVE HEADLIGHT.

It is sometimes hard to throw new light on an old subject, but everything new regarding bicycle lamps is eagerly sought by all who ride wheels. Absolute perfection is an impossibility, but it is an excellent goal to strive for and he who makes an earnest effort to that end usually reaps a reward.

For years it has been contended that the ideal bicycle lamp should resemble the headlight of a locomotive as nearly as possible, and now Markt & Co., the big London exporters, whose New York office is at 193 and 194 West street, are offering the American trade The World, a German-made illuminator that is in all respects a headlight in miniature, glass chimney and all, with the result that it gives a light of great power.

In appearance it slightly differs from the conventional patterns, as it is hardly possible to construct a lamp on this principle as com-

pactly as one with a naked flame. The lens is 3 1/2 inches in diameter and, backed by a parabolic reflector, throws a tremendous light surface. The oil reservoir is attached by two simple clamps, and every part of the lamp is easily accessible for cleaning. However, it is in the chimney that the most radical departure is shown. By its use all smoking of the reflector is avoided, besides allowing a flame of great steadiness. The lamp is handsomely nickelled, and weighs but fourteen ounces.

Four other models are shown, of which the Globus, weighing but eight ounces, is the best seller.

DIFFICULT FORGINGS A SPECIALTY.

Charles W. Dornage, the one-time racing man and cycle manufacturer, is now a member of the McKaig-Dornage Drop Forging Company, which has established itself at No. 1,286 West avenue, Buffalo, N. Y. Difficult forgings is their specialty. The Messrs. McKaig have spent their lives at the hammers, and are naturally well up in the business. They have supplied a number of cycle makers in New York State. Their stock patterns, from which forgings can be made on short notice, include detachable sprockets, sprocket centres, fork ends, hubs, handle-bar clamps, brake levers, pedal centres, single-piece fork crowns and seat-post clusters, and other connections for flush and outside joints.

PLACED IN THE POSTAL.

W. E. Lindsay & Co., of Milwaukee, have planted the standard of the Lindsay bicycle in the East, in No. 205 Postal Telegraph Building, this city. H. J. Warner, a bright, well-spoken young man, is in charge.

Harry B. Reid, the Owen agent, at No. 8 Park Place, this city, reports the theft of Owen bicycles Nos. 44 and 91.

WHERE THEY GO AND THEIR VALUE.

Exports of bicycles and bicycle material from New York for the week ending November 3:

Antwerp	\$855
Aden	325
Brazil	283
British Australia	1,243

Peru	75
Plymouth	65
Southampton	2,763
United States of Colombia.....	523
Venezuela	15
Total	\$27,810

WHERE THE EYE OF THE CLIP IS SLIPPED.

Despite the multiplicity of "clips" for wood handle-bars, it is not probable that a device so neat, simple and effective as that made by the Standard Manufacturing Company, No. 212 North Queen street, Lancaster, Penn., will fail to interest the trade. It consists of

but three pieces; its principle can readily be understood by a glance at the illustration. The eye of the clip is slipped over the bar and drawn down through the shaft by a nut securely clamping the bar in any position desired, at the same time avoiding the necessity of any extra contrivance fastening directly to the wood. The end nut is of the same diameter as the shaft, so that it in no way interferes with clamping it tightly in the head of the machine.

GIVE A NAME, GET A WHEEL.

Put on your thinking cap and conjure an appropriate name for a bicycle. The Reading Standard Manufacturing Company, of Reading, Pa., will make it worth the effort. They are producing a new wheel, a strictly high-grade \$100 wheel. It is yet unnamed. The world is invited to assist in the naming. To he or she who suggests the most suitable name, the name which is adopted, they will present one of the bicycles. To the person suggesting the "next best" name they will award one of their \$80 wheels. All suggestions must be filed before December 1. The names must be original, of course, and suggestive of high quality, comfort, swiftness, progressiveness and patriotism.

WELDED BY WATER.

How Heat Is to Be Supplanted by Wet in the Cycle Welding of the Future.

Two wonders are simultaneously to be accomplished in the British cycle trade—welding is to be done by water, and Mr. Terah Hooley has organized a \$2,000,000 stock company to boom the process, not one single share of stock in which is to be offered to the public. The new process is the invention of Charles Crowden, the head of Humber's mechanical department, a gentleman whom the old-timers will best remember as the designer of the Kangaroo, the first radical departure from the orthodox lines of cycle construction, as laid down by the good old ordinary.

In untechnical language, the result sought for and obtained is about this: Suppose two tubes are to be joined. One is made to fit into the other. The inside of the outer one is spirally grooved along the length of the proposed joint. Water-power is brought to bear inside the inner one. The water endeavors to burst it, but it merely succeeds in pressing it into the grooves of the outer tube, which form a kind of mould to which the inner tube is shaped. The inner tube is not only shaped to the grooving by the water pressure, but it is fixed to it. On the removal of the pressure the two tubes are indissolubly united, and the object is attained.

Heretofore the frame of a bicycle in its first stages has had to be brazed. This causes deterioration of the tubes by overheating; and they have then had to be reinforced and strengthened by bushing; then the frame had to be sand-blasted, clearing off the scale. By the new invention all this is accomplished at once, without heating, so its inventor claims.

It is said that tubes joined by this system have been subjected to the severest tests, and in every case it has been possible to tear away the tube below the lug, and in some instances, to wrench even the lug and the tube away above or below the joint, but the joint has never been made to budge.

Cycling dealing with the new departure says: Like many another invention which has required practically a lifetime of thought and experimentalizing, this system of hydraulic jointing is simplicity itself, and but slight explanation is required to describe it; the accompanying sketches will, in fact, be almost sufficient in themselves. Fig. 1 illustrates an ordinary head lug, with spirally cut keying grooves, the directions of the spirals being right and left-handed, and crossing each other as shown. These spirals can be provided for in the mould that is ordinarily used for a malleable casting, and the lug has only to be bored out to the requisite size as usual. If the lug used is a stamping, then the spirals are cut as an ordinary thread is (only square instead of V-shaped), after the hole has been bored. Wherever a joint is required in a frame, it is treated in this manner, and instead of brazing each joint separately, the whole of the fittings that require joining together, are fitted up in their proper position, and are held together with what Mr. Crowden calls "hydraulic cement." The whole frame as fitted is placed in a jig, as shown in the rough sketch (Fig. 2). This jig is in two halves, like a mould, and the inside is an exact fit of the outline of the frame, and the reason for this is obvious. When the pressure of the water or oil is introduced into the interior of the whole frame, and if the fit is imperfect or full, the tubes will swell by the interior hydraulic pressure (which varies

from four to six tons, as may be required), forcing the tubes into any inequalities of the mould or jig, the same as an airtube of a pneumatic tire is forced when fully inflated. The hydraulic pressure is gradually applied to the limit required, and it takes from four to five minutes to complete the joining of the frame. Every joint is made simultaneously, and as the spirally cut keying grooves are the only places into which the tubes can be

forced, it necessarily follows that upon the full hydraulic pressure being introduced, a perfectly strong joint is made between the tube and the lug, it would offer a counter resistance to the tube forcing itself into the keying grooves, and the hydraulic cement prevents this in the initial stages of the hydraulic pressure. Even should the water get in between, it is again forced out through a small hole in the lug, the position of which is

in one of the threads of the spiral keying grooves. The jig itself is necessarily bulky and heavy, as it has to withstand the whole of the strain of the enormous interior hydraulic pressure. The top half of the jig or mould is raised and lowered by overhead tackle, in the same manner as the large dish-covers one sees at a restaurant; and the two halves are held securely together by hydraulic pressure, the tubes and lugs are

tenaciously joined together, and the crossing of the spirally cut keying grooves resist all torsional strain, as well as tension and compression. The advantages of the system must be obvious; there is no scale or deterioration of tubes through heating, consequently less bushing is required, and the result is a much lighter frame. Then again, the frame requires little or no truing after being removed from the jig.

NOT AS SMOOTH AS SILK.

"What is haste, papa?"
 "Haste? Why, to move rapidly, to hurry along like one of those bent-up bicycle idiots, for example—to make haste, you know."
 "Oh, indeed! I thought it was some kind of silk; Mamma said she was married in haste."

PATENTS GRANTED.

GOING FOR SEVEN NOW.

Evidently the Champion handle-bar clip has won its way without much trouble. Its makers, the Champion Blower and Forge Company, Lancaster, Penn., report that the sales have already touched six figures.

MOTHER OF PEARL.

Mother of pearl "transfers" for decorating frames is a '97 novelty being marketed by the well-known enamel maker, Eugene Arnstein, No. 113 Franklin street, Chicago. It is said to produce an effect strikingly like the genuine article.

WITH CHICAGO HEADQUARTERS.

H. H. Wylie, formerly with the Fowler Cycle Manufacturing Company has engaged with the G. H. Haulenbeck Advertising Agency. He will have charge of the Western interests, with headquarters in Chicago.

KNOWS BETTER NOW.

An unusual accident happened to a Cleveland rider who was knocked off his wheel by the nose-bag of a truck horse, who tossed his bagged head just as the rider was passing.

The King Cushion Saddle.

The Only Perfect Seat.

Upholstered like a library chair—soft and yielding, yet constructed to avoid pressure on any delicate parts.

Constructed from coil springs and hair, upholstered in rich leather, handsomely finished.

This Saddle embodies the points of advantage of the pneumatic without any of its faults. No leakage of air, no rolling, no heating, no forcing of air into the pommel.

NEW IDEA FOR A TOE CLIP.

J. M. Cassidy, No. 12 Canal street, Albany, N. Y., believes in toeclips. He believes they should form a part of all pedals, believes it so thoroughly that he has thought how best to do it with such excellent results that a patent is now in the mill. The patent does not cover the toeclip as it is ordinarily known. The Cassidy invention is designed to form a constructive part. It is simple enough, and seems practical enough to merit consideration. The inner side plate of the

pedal is shaped as shown in the illustration, while on the far end of the barrel is affixed, by means of an adjustable collar, a pivoted and recessed plate or arm. It will readily be seen that this can be adjusted to any width of shoe, and will hold it as securely as a clip or cleat. When a quick dismount is necessary, a sudden push forward or pull backward will cause the pivoted plate to move in that direction and release the shoe.

BARGAIN-COUNTER TRADERS.

It is rumored in Washington says "Stoves and Hardware Reporter," that the department stores there will not handle bicycles or sundries next season, and it is stated in this connection that manufacturers are beginning to appreciate that the best results are obtained by marketing their product through legitimate tradé channels. It is to be hoped that this is true.

The department store, as a demoralizer of prices in all lines, is recognized everywhere. The desire to influence trade to their stores causes them to make cuts in prices from time to time, which serve frequently to set the price on those articles and to compel the adoption of sacrifice prices by the legitimate trade competing with them.

The department store trade is doubtless a strong temptation to manufacturers, but we believe that if it were sturdily resisted the resulting gain in steadiness of price and the added incentive given to the regular trade to push the goods of manufacturers taking such a stand would more than compensate them.

DOMINIONIZING WARWICKS.

Warwicks have been cutting such a considerable figure in the Canadian trade that the Warwick Cycle Manufacturing Company has elected to make its wheel more than ever a factor in the Dominion. To that end they will establish a depot in Montreal, with T. T. Cartwright in charge. Mr. Cartwright has travelled the territory and popularized himself, so that he is well fitted for the post. He has obtained managerial experience as the head of the Warwick branch in Cleveland, Ohio, which will not be affected by the change.

BETTER AND CHEAPER.

While the figure has not been announced, the Mesinger Bicycle Saddle Company say that the price of the '97 Mesinger will be less than that which prevailed during the current year. They also announce that they will continue the manufacture of the '96 model, which will be sold for less money than ever before.

The latest English tire is made of felt. Of course, it is expected to fill a long-felt want.

FOR JUVENILE SAFETY AND COMFORT.

Improvement in juvenile bicycles will be a marked feature of the '97 product. Better goods for less money than were ever to be had before will be the rule.

The juvenile line of that sterling old concern, the Gendron Wheel Company, Toledo, Ohio, is a splendid typification. The Signals, as they will be titled, are not only extremely good looking, but will embody high-class material, and all the up-to-date ideas in cycle construction, from wood handle-bars, barrel hubs and bottom brackets and gold striping up or down. They will be made in three models and will list at \$40. These specifications will give a truer idea of their worth:

Frame—Depth to centre of crank shaft, in Nos. 1 and 3, 16 inches; in No. 2, 19 inches; seamless steel tubing throughout, head tube, 1 1/4

inch; centre tubes, 1 inch; rear forks, 3/4 inch; rear stays, 5/8 inch; connections made with sheet steel stampings; yoke bracket, barrel pattern. Fork—Tubular stamped steel crown, with tubular steel blades; no forgings nor castings. Wheels—24 inches, dustproof nickel-plated barrel hubs; tangent spokes, nickel plated; fitted regularly with wood rims. Tires—1 1/4 inch Akron double tube tires. Bearings—Full ball bearings throughout; ball retainers in yoke and

hubs. Pedals—The Gendron juvenile barrel pedal, with rubber plates. Gear—51 in Nos. 1 and 3, 58 in No. 2; round spring steel cranks, 5 inches. Chain—1/4 inch solid block steel chain. Handle-bar—Fitted regularly with wood bar, but seamless steel tube bar will be furnished at same price if desired. Finish—In black enamel, with ornamenting and striping. Weight—No. 1, 20 pounds; No. 2, 21 pounds; No. 3, 22 pounds. Price—Each, \$40. Full guaranteed.

THE BAND, THE BAR AND THE FERRULE.

Louis Rastetter & Son are just completing a two-story brick extension to their Fort Wayne, Ind., factory, to accommodate the increasing demands for their laminated and single piece wood rims and handle-bars.

The distinctive feature of the Rastetter wood handle-bars is the ferrule, a band of seamless steel tubing secured in the centre of the bar where the clamp is fastened, preventing the clamp from coming in direct contact with the wood. It is explained that the ferrule compresses the fibre of the wood, and both strengthens and protects the wood bar at the point where the strain concentrates.

Mr. Rastetter says they experimented almost a year with wood bars, and also by fastening the clamp directly over the wood bar, but their experience has shown that it was impractical, because the clamp would wear the wood bar and weaken it.

The Rastetter plant is working full time on present orders; next week thirteen hours will constitute a working day.

A Continental (Dutch) agent is open for negotiations for American wheels. Address B. Foreign, care THE WHEEL. Propositions held confidential and will be forwarded.

LOOKS LIKE AN ANTI-LEAKER.

Inventors do not come from any particular social class; sometimes they are mechanics, sometimes millionaires. In some cases they have little or no knowledge of the business to which their device or principle applies. So it is with Mr. L. Hirsch. He is a dealer in precious stones, and is not a cyclist. He knows little concerning the appliances a wheelman needs in taking care of his wheel, yet he has invented and placed on the market a cycle oil can that looks all over a good thing.

The "Safety Oiler" is a compact, neat, simply constructed little device. Its novel feature is the tubular spout attachment, as shown in the accompanying illustration. When the spout is pushed into the can it drops over a pin which is soldered to the bottom of the oiler. This automatically closes the spout, and leakage is impossible. When the spout is drawn out its entire length the wheelman is enabled to oil hubs and such parts without being compelled to force his hand and fingers through the spokes. The "Safety Oiler" is also made in larger sizes for heavy machinery. Mr. Hirsch's address is No. 65 Nassau street, this city.

TO SUIT ALL DEMANDS.

Whoever uses enamel cannot do better than to get in touch with Eugene Arnstein, of Chicago. In the past Mr. Arnstein was able to cope with almost any reasonable demand. During the year he has improved and increased until he now occupies an enviable position. He can supply either baking or quick-drying enamels, and the brushes to apply them, or the ovens in which to bake them, while in the matter of colors he offers a wide range of selection, having added six new shades to his already long line. His pure white baking enamel, a product of the current year, is his especial pride. It is the result of much experimentation, and he believes, and not without reason, that it is "just right."

Mr. Arnstein's enamels, ovens and brushes share notice with his vulcanizer, which is too well and widely known to require more than passing remark. He has four of them in operation in his place at No. 113 Franklin street, and that one girl attendant is all the attention they require, is sufficient to convey an idea of their economic worth.

A new lamp oil, plug and rim cement, a liquid puncture cure for single-tube tires, a mother of pearl transfer and an automatic toe clip complete the Arnstein line.

NO GROWING HERE.

Says President Spaulding, of the Spaulding & Pepper Company: "With the present capacity of our Chicopee Falls works, we have enough orders on hand to keep them running twenty-four hours a day for the next two years. This is literally true," adds Mr. Spaulding. The concern had booked a great number of tire orders conditional on McKinley's election, and after that happy occurrence started the factory working full time.

BARGAIN IN TOOLS AND MACHINERY.

A splendid opportunity to secure tools and machinery and cycle material will be afforded by the receivers' sale of the equipment of the factory of the defunct Thorn Manufacturing Company, which occurs at Washington, D. C., on Wednesday next. The receivers' advertisement, detailing the goods to be sold, appears in this issue.

January 23-30—Glasgow, Scotland; A. G. Rennie, secretary, 49 Lilybank Gardens.

TRADE CHANGES.**CALIFORNIA.**

San Francisco.—W. B. Cookson. Attached \$37.

Riverside.—W. S. Collins, closing out.
Pasadena.—Palmatier & Van Etter, closing out.

CONNECTICUT.

New-Haven.—The E. C. Bennett Co. Name changed by order of court to Veru Bicycle and Rubber Co. M. Bennett withdraws.

Norwich.—Geo. W. Cilley Co., incorporated Geo. W. and Frank E. Cilley, and Frank H. Allen; to manufacture bicycle parts. Capital stock, \$50,000.

Waterbury.—M. J. Leavenworth. Reported gone out of business.

IDAHO.

Boise.—E. Gordon, receives deed, \$300.

ILLINOIS.

Bloomington.—C. C. Martens, bicycles, etc., reported sued for \$400 and \$300.

Chicago.—The Onward Co., incorporated by H. W. Hamlin, D. W. Graves and E. A. Otis; to manufacture bicycles; capital stock, \$2,500.

Chicago.—C. W. Barr, president of Barr Cycle Clothing Co., filed a bill in the Superior Court, asking for a receiver for the concern. The firm was started October, 1895, and the other stockholders are J. A. Cost, Thos. Allison and J. Devor, of the Belfast Linen Co.

Chicago.—Gordon M. Richardson. Four chattel mortgages aggregating \$17,139, covering merchandise, machinery, etc. Mortgagees took possession, selling stock of bicycles for \$16,000. Three suits entered, aggregating \$4,128 71.

Moweauqua.—Snell & Walker. Out of business.

INDIANA.

Lafayette.—M. E. Sears Implement Co., chattel mortgages, \$14,660.

MICHIGAN.

Detroit.—Geo. Hilsendegen. Bicycles returned to Chicago, attached on disputed claim \$11,070 71.

MISSOURI.

Kansas City.—The Midland Cycle and Supply Company damaged by fire. Most of the

error. Application to vacate made November 9.

Buffalo.—The Martin and Gibson Manufacturing Company incorporated to manufacture bicycles; capital, \$60,000. Directors, Hiram C. Martin, John L. Gibson and Charles G. Shepard, of Buffalo, and George W. Houk, of Elmira.

Illion.—Remington Arms Company. Hartley & Graham have purchased the interest formerly owned by the Winchester Arms Company, and are now sole owners of the big plant.

Ithaca.—Talby & Lainhart, bicycles, dissolved partnership.

New York.—L. J. Leyrer, reported gave bill of sale for \$2,500.

New York.—Ball Tire Company, incorporated by William A. Courtland, John D. Ducker and Richard Van Cott, to manufacture bicycle tires. Capital, \$200,000.

New York.—Circle Cycle Company, incorporated by Benjamin P. Ryder, Henry W. Brooks and George W. Burnham. Capital stock, \$500,000.

New York and Brooklyn.—S. Goldberg. Judgment, \$328 18.

New York.—John Kroder. Assignee files report, showing liabilities, \$102,554; nominal assets, \$150,758; actual assets, \$69,574.

New York.—Travis & Travis. Chattel mortgage to J. H. Dalton, \$400.

Rochester.—F. O. Bullis, reported gave judgment for \$278.

Rochester.—George H. Sears, assigned one-half his business to G. Haahn.

Utica.—Otto L. Endres, reported recorded chattel mortgage for \$103. Bill of sale for \$79.

OHIO.

Toledo.—Wilson Cycle Company, manufacturers of cycle parts, gave chattel mortgage for \$2,000 to George Wilson. Later they assigned to Walter F. Brown. Assets and liabilities each estimated, \$2,500. Creditors petition that receiver be appointed.

OREGON.

Woodburn.—L. Waldman. Burned out. Loss, \$4,000; insured, \$2,600.

PENNSYLVANIA.

Eric.—The Excelsior Manufacturing Company will install new machinery for manufacturing bicycles, etc.

Philadelphia.—Leon Strauss, reported gave judgment for \$358.

Philadelphia.—Holbrook Cycle Company, assigned to John Weaver. Liabilities, \$10,000, including judgment confessed, \$8,071.

Philadelphia.—Machold Cycle Saddle Company. Incorporated. Capital stock, \$6,000.

Wilkesbarre.—B. F. Connor and George W. Peifer, new store.

SOUTH CAROLINA.

Columbia.—Richard & Nixon. Assigned to W. D. Melton. Liabilities, \$4,134; assets, \$3,580.

TEXAS.

Temple.—The Temple Cycle Company, Hubbard & Russell, proprietors, has given a deed of trust, with preferred creditors.

WASHINGTON.

Seattle.—Seattle Cycle Company. Assigned.

WISCONSIN.

La Crosse.—Koebaum & Walker, reported to have given judgment for \$260.

Milwaukee.—Lake Cycle Manufacturing Company, F. Thanhauser, E. S. Mack, H. Landauer; capital stock, \$1,000.

ATWELL AT BUFFALO.

The New York Tire Company will establish a branch in Buffalo. J. A. Atwell, formerly with Stearns & Co.'s racing department, will be in charge.

loss (about \$1,000) was in the repair shop, and was fully covered by insurance.

MINNESOTA.

Minneapolis.—C. L. Featherstone, reported gave bill of sale for \$500.

Minneapolis.—Isaac R. Snow made a voluntary assignment, for the benefit of his personal creditors, to E. R. Gaylord. This does not involve the Snow Mfg. Co., of which Mr. Snow is president.

NEW JERSEY.

Newark.—Howard & Nichols Cycle Mfg. Co. Receiver's statement shows assets, \$23,742 42; liabilities, \$25,736.

Newark.—Starlight Lamp Co. Incorporated by Erskine J. S. Van Houten, Nyack; Chas. F. Cole, Brooklyn; Jas. D. Clark, Elizabeth, N. J.; to manufacture bicycle lamps. Capital stock, \$50,000.

Plainfield.—Hobert E. Rider. Incorporated. Rutherford.—W. D. Peck. Chattel mortgage, \$600.

Trenton.—Standard Cycle Company (Anna and Vestilla Pursell) sold to J. E. Pursell, trading as the Trenton Cycle Company.

NEW YORK.

Buffalo.—A. F. Nussbaum, reported judgment for \$104.

Buffalo.—Niagara Cycle Fittings Company. Judgment entered in New York City, \$926—

The Wheeler REFORM

Built to sit on, not to straddle.

THE WHEELER REFORM SADDLE has jumped into great favor with the public. Why? It has the best shape. It conforms perfectly to the anatomy of the rider. No dangerous pressure on the sensitive parts. **Saddle Soreness** is unknown where it is used. It will not sag or get out of shape. It is the greatest favorite for long-distance riding. It is the neatest, does not get out of repair, and is the perfection of saddle manufacture.

Price, **\$3.50**. If your dealer cannot supply you, send to the **Wheeler Saddle Company, Detroit, Mich.**

Kindly mention The Wheel.

RECENT PATENTS.

670,899. BICYCLE LANTERN. FLORA BERRY, Bridgeport, Conn. Assignor to The Bridgeport Brass Company, same place. Filed Aug. 7, 1895. Serial No. 583,388. (No model.)

Claim.—In a bicycle lantern the combination with a body of a removable outer shell having openings 14 to permit free escape of the products of combustion, openings 15 to permit free entrance of outside air and a ring 15 and an independently removable inner shell having openings 7 to permit free escape of the products of combustion and a non-perforated top plate, said ring 16 covering the openings in the outer shell and leaving an opening 26 between the outer shell and the outer shell.

670,900. BICYCLE HALL BEARING. WALTER L. WHEELER, New York, Mich. Filed Oct. 12, 1895. Serial No. 565,500. (No model.)

Claim.—The hub O provided with flanges F, and the shaft Q, combined with the sleeve H applied to the shaft and provided with enlarged ends, the balls 15, the tapered sleeves T placed upon the shaft and having their inner ends to bear against the outer ends of the cones of the sleeve, and the adjusting cap U, secured upon the ends of the hub and provided with flanges upon their outer end, substantially as shown.

670,901. BALL-BEARING FOR BICYCLES. EMER C. HOWE, Waltham, Mass. Assignor to the American Waltham Manufacturing Company, same place. Filed Dec. 23, 1895. Serial No. 672,980. (No model.)

Claim.—In a bearing of the class referred to, in combination with a cup and cone, balls mounted to travel in the annular space between said cup and cone, and a separator-plate secured to receive said balls, said plate being vertically movable at the small end of the cone.

670,902. SPEED-OMETER. MONMOUTH BOWEN, London, England. Assignor of his right to William R. Dorr, Chicago, Ill. Filed Sep. 18, 1895. Serial No. 583,770. (No model.) Patented in England June 13, 1895. No. 11,560.

Claim.—The combination with the driving and driven parts of a speed-rod and an eccentric-bearing and a characterizing comprising a main-shaft with a chain wheel on the eccentric-bearing and a chain wheel on the other part, said chain gear, with both chain wheels, a pinion the concentrically-mounted chain wheel, a dial-rod engaging the pin, a second flange rigid with the dial-rod flange, a lever for the second flange, a lever for operating the dial-rod, and link mechanism in operative connection with the dial-rod and lever substantially as set forth.

670,187. BICYCLE HANDLE-BAR. FREDERICK C. BOWEN, Hartford, Conn. Filed June 4, 1894. Serial No. 694,503. (No model.)

Claim.—In a new article of manufacture, a curved steering bar for bicycles consisting of a stiff taper cone formed to shape with its entire exterior surface composed of particles of cork and a binder called in a homogeneous mass by heat and pressure, substantially as specified.

670,680. HANDLE-BAR FOR BICYCLES. THOMAS B. MCGOWAN, Boston, Mass. Filed Oct. 24, 1895. Serial No. 598,677. (No model.)

Claim.—In a bicycle handle-bar made in two sections fastened upon a bolt passing through the end of each of the posts, one of said sections having means to adjust against the shaft and at its free end.

670,083. SADDLE COVER. ARTHUR F. KLECKA, Philadelphia, Pa. Filed Feb. 2, 1895. Serial No. 571,095. (No model.)

Claim.—A new article of manufacture, a seat-protecting cover for saddles consisting of a yielding pad of felted fibrous material having a thickened portion extending inwardly over its entire rear end and the extending forward along the longitudinal center of the pad to the front thereof, the sides of the pad on each side of said thickened portion being tapered or reduced in thickness, and said pad being coated upon one side with a waterproof material, and means for securing the pad to the saddle, substantially as described.

670,698. GEARING. FREDERICK C. CURTIS, Anderson, Ind. Assignor to the Wheel Company, same place. Filed Dec. 21, 1895. Serial No. 679,745. (No model.)

Claim.—An including casing, and the sprocket-wheels revolving therein, provided with teeth of having the grooves in their outer ends, combined with a series of links having enlarged ends and a straight central connecting part, one of the ends being made convex on its outer end and the other concave, and both ends being on their inner sides where they come in contact with the grooved teeth, substantially as shown.

670,809. FASTENING FOR BICYCLE-POSTS. FREDERICK I. JOHNSON, Flintburg, Mass. Assignor to the Ives Johnson's Arms and Cycle Works, same place. Filed July 10, 1895. Serial No. 557,584. (No model.)

Claim.—In a bicycle, the combination of a tube split at its end and provided with a recess, a post held in said tube and having one side flattened, an elastic clamping-ring including the end of said split tube.

670,871. BICYCLE. GEORGE S. BRAN, Binghamton, N. Y. Assignor to George S. Bran, same place. Filed Jan. 18, 1895. Serial No. 578,007. (No model.)

Claim.—In combination with the frame of a bicycle, the head of which is hollow, and one of the parts, B, as also hollow and tapering outwardly, of a crank shaft, a piston within the enlarged part, a reciprocating driver within the head, and a connector between the driver and the piston substantially as set forth.

670,146. BALL-BEARING FOR AFRICAN TRIPPER WHEEL-HEAD. EDWARD E. BARTER, Jersey City, N. J. Filed Dec. 31, 1895. Serial No. 673,388. (No model.)

Claim.—In a ball bearing, the combination of the cone or cup-shaped outer spring-shaft or disk concentrically to render it expandable and seated in the aforsaid groove by automatic reaction of said plate as set forth.

670,521. BICYCLE LOCK. JAMES R. TAYLOR, Washington, D. C. Filed Feb. 18, 1896. Serial No. 575,338. (No model.)

Claim.—The combination with two forks of a bicycle and a keeper attached to one fork, of a bolt pivotally connected to the other fork and adapted to slide endwise and means for automatically sliding the bolt endwise on the pivot bearing when in horizontal position, substantially as set forth.

670,137. ENDLESS TUBULAR FABRIC. GEORGE C. WOOD, Worcester, Mass. Filed Feb. 20, 1896. Serial No. 581,253. (No model.)

Claim.—In a bicycle, an endless tubular fabric having a succession of continuous courses of threads extending around the circumf. of the same, the component threads of a course extending oppositely in riging directions and each thread meeting only part way around the transverse circumference of the fabric, the said component threads of each course interlocking with each other along lines extending longitudinally in the fabric, and each course overlying the preceding courses and gaining upon the preceding course, as stated, substantially as described.

670,390. BICYCLE WHEEL. RAMON C. PAT. ILLINOIS, N. Y. Assignor to the Remington Arms Company, New York, N. Y. Filed Jan. 28, 1896. Serial No. 577,138. (No model.)

Claim.—In a wheel for bicycles or other vehicles, the combination of a rim and a tubular hub perforated at either end with a plurality of rows of holes, with spoke-wires extending through the hub between holes in adjacent rows, and having their opposite ends connected to the rim, substantially as described.

670,015. VELOCIPED. THOMAS HALL, Manchester, England. Filed June 8, 1895. Serial No. 561,890. (No model.)

Claim.—A transformer or differential driving gear for cycles comprising in combination with the pedals and cranks a driving spindle B fitted with two keys 5 one at either end and secured fixed thereto, two sprocket-wheels C of equal and capable of sliding the frame with a key 6 to engage with the said keys on the driving-spindle, grooved bosses on the sprocket-wheels C, a sliding guide E riding

ing longitudinally of the driving-spindle B provided with inclined or beveled edges and forked ends, which engage in the grooves in the sprockets, the metal brackets F with a dovetail groove or channel in which the guide E slides and by which it is supported the metal lug G of the driving-spindle, the two sprocket-wheels C, the two sprocket-wheels L attached to the back driving-wheel K and the driving-chain M connecting the sprocket-wheels C C with the sprocket-wheels L L, substantially as described and shown.

670,024. SPEED-MEASURER. HARRY R. ENLART, Elvira, Cuba. Filed Aug. 26, 1895. Serial No. 569,687. (No model.)

Claim.—In a pneumatic speedometer, the combination of a casing A, a hollow shaft entering the casing, a friction-wheel secured to the outer end of said shaft, a flanged ring secured to the wheel, and a fan-wheel secured to the shaft within the casing, with a casing E a shaft journaled therein, a fan-wheel secured to said shaft, a tube connecting said casing, and terminating in a jet-nozzle in the casing E, an adjustable spring acting on the shaft against the piston, a piston secured to said shaft, and a dial, substantially as and for the purpose specified.

HALE, HEARTY AND HEFTY.

Gormully & Jeffery's mileage souvenirs have developed another hale and hearty old gentleman, whose head is sprinkled with "the ashes of his youth," J. H. Thompson, of Denver, Col., who, despite his fifty-six years and his 230 pounds, has pedaled a Rambler 6,712 miles within six months.

LIKE THE GREEN-BAY TREE.

George S. Atwater, once chairman of the L. A. W. Racing Board, has severed his connection with the Akron (Ohio) India Rubber Company and assumed charge of the tire department of J. A. Weaver & Co., a firm which less than a year since was conducting a modest retail store on Eighth-ave., this city, but which has extended with really marvelous rapidity, and promises to prove a top-notch in the cycle material trade. Their tire, the Kennedy, will be on the market in a very few days.

WON'T SELL THEMSELVES.

Hear the Hickok Manufacturing Company, who make the Hickok bicycle, at Harrisburg, Penn.: "We are not making the only good bicycle on the market by any means; there are others. The best bicycle that was ever made needs a good man to sell it. We want good men—good agents." Such frank statements impress the average man. They are likely to redound to the benefit of the Hickok people, who for fifty years have been building high-class ruling machines. Not once during the half century has a strike or other difficulty disturbed their factory.

EUROPEAN BUSINESS.

The secretary and manager of a manufacturing incorporation will shortly go abroad, calling exclusively on the bicycle trade of the principal European cities in the interests of a specialty for his company.

In connection with the above, he will be able to represent one or two responsible houses who are seeking business relations with the above trade. Personal interview if necessary. Address European, P. O. Box 215, Rochester, N. Y.

In the darkling gloom of the midnight lone,
There came a call on my telephone,
And impressed with fears that I dare not own,
I leapt from my bed with a rueful groan;
For the floor was cold as a paving stone,
And the germs of the dread grippie were soon,
While I waited the words of my friend unknown.

The sad wires sang in their tuneless drone,
And then, in a dreary monotone,
In my ears startled these words were blown:
"From the frozen poles to the torrid zone,
From the Rio Grande and the River Rhone
To Plymouth Rock and the Battery slope,
The New Departure Bells are known,
For they have a tone that is all their own!"

ART BOOKLET
FREE UPON APPLICATION
THE NEW DEPARTURE BELL CO. Bristol, Conn.

THE GREATEST PLEASURE

Can be obtained from your bicycle oil only when the equipment is first class. An oil can is the most important accessory, and the best oil can is the "PERFECT" POCKET OILER. This oiler does not leak. It also regulates the supply of oil to a city. Experience will convince you that the "Perfect" is without an equal.

Price, 25 cents each. Handsomely nickel-plated.
Be sure you have a "Perfect." No other "is just as good."

CUSHMAN & DENISON, 172 Ninth Avenue, - - - NEW YORK.
Kindly mention The Wheel.

FOR SALE, EXCHANGE, WANTS.

TWENTY-FIVE WORDS, 35 CENTS.

Each additional word two cents. Cash invariably in advance.

ONE RAMBLER TANDEM, 1895 pattern, in good order, used very little. Will sell low for cash or exchange for high-grade bicycle. S. F. Alston, Tuscaloosa, Ala. 11-13c

BICYCLE PLANT FOR SALE.

One of the best equipped plants in the country; situated in New York City; fully equipped in every department and detail with the newest and most modern machinery and tools; now running; capacity, 200 wheels a week. Principals only address SACRIFICE, care The Wheel. 11-13-p

E. S. Edwards lowered the record from New York to Philadelphia, on October 18th, 59 minutes, with the FORCIPED attached to his wheel. We offer a prize to any rider who breaks a long-distance record on any machine with a FORCIPED attached. It has been done, and can be done every time, all conditions being equal. Call or address FORCIPED COMPANY, 445 Broome Street, New York City. c-1f

WEST END CYCLE COMPANY.

Notice is hereby given that the partnership heretofore existing between the undersigned, doing business under the name of the West End Cycle Company, at No. 820 Broadway, New-York City, is hereby dissolved from and of this date.

Dated New York City, November 7, 1896.

WILLIAM SHARPLES,
MARCUS F. BARGEBUHR.

THREE-STAR BRAND.

Situation as travelling salesman for bicycles, tires, rims, or parts. Three months' engagement desired. Have had twelve years' experience in cycle trade. Am well acquainted with jobbers and factories. References furnished. *, care of THE WHEEL.

EMPLOYMENT COLUMN.

Advertisements in this Column Free.

Patrons of this column will please notify us when they desire notice withdrawn.

SITUATIONS WANTED.

Wanted—Position as assembler, wheel truer, or repairman; has seven years' experience; references. Address J. S. Allen, Fillmore House, Buffalo, N. Y.

Salesman and repairman desires position; unquestionable references from present employer; have been two years in present position. Address H. N. V., care of The Wheel.

Correspondence solicited from bicycle manufacturers requiring the services of manager or assistant by one having a thorough knowledge of and experience in the bicycle business; capable of taking entire charge of executive department; only first-class connections considered. Address A. N. V., care of The Wheel.

New York or Boston branch house management with eastern territory wanted by a capable, thorough bicycle business man of large experience; a connection desired. Address A. N. V., care of The Wheel.

Toolmaker of ten years' experience on brass and bicycle work, used to fine work, would like a position in charge; am first-class repair hand on bicycles; best references. Address, with full particulars, W. G. D., Box 41, Oak Hill, Conn.

Wanted—Position as foreman over assembling or filing department by a competent young man who can furnish good references. Address X Y Z, care of The Wheel.

Wanted—Position as foreman in bicycle factory; am acquainted with bicycle construction; have had charge of brazing department in one of the largest concerns in the country; also foreman in large machine shop for several years; first-class recommendations from both. Address Cycle, 61 Oak Street, Hartford, Conn.

Wanted—Situation by an old factory foreman; understands thoroughly all branches of the bicycle business; large experience handling men; first-class references. Address Lock Box 200, Janestown, N. Y.

Young man, 22 years of age, thoroughly experienced in the bicycle business, desires clerical position with good concern; can furnish A. references. Address T. D. M., care of The Wheel.

Machinist who had charge of repairing chain department machinery last season wants position; references. H. E. Beck, Bellefonte, Pa.

Wanted—Position as frame maker, wheel builder or assembler; eight years' practical experience on high-grade work. Address A. N. C., care of C. H. Haynes, 182 E. 78th Street, N. Y. City.

Wanted—A position as traveling salesman for a good reliable bicycle firm; long experience; A. references. Address Alba W. Root, General Delivery, Rochester, N. Y.

Wanted—Position as assistant superintendent or general foreman of tool and machine department, by a man of thirty-five, with twelve years' experience; am expert in system and construction and thorough in inspection of work; am in no hurry, being employed at present, but open for an immediate engagement. Address Westboro, care of The Wheel.

Superintendent is open for engagement; fourteen years' experience; systematic and accurate for manufacturing high class wheels at the lowest possible cost. Address H. H., care of The Wheel.

Situation wanted by a mechanic, thoroughly competent in all branches of the cycle trade; eleven years' experience, four years as working foreman. Address Accurate, care of The Wheel.

Position wanted by a thoroughly experienced cycle repairman and practical electrician; four years' experience in repair work and seven in electrical; can furnish best of references. Address Gus Miller, Lock Box 4, Little Falls, N. Y.

HELP WANTED.

Wanted—A first-class cycle repairman to do general work; good wages and steady employment to the right man. Address H. M. Wiedler, Lake Linden, Mich.

Wanted—A foreman for machine room, employing about 100 men; must be competent, a hustler, and good disciplinarian; must be able to take full charge of this branch. Apply with references to Universal, care of The Wheel.

Wanted—To correspond with an American mechanic who can furnish reliable references as to ability and integrity as a first-class bicycle builder. No pretenders or second-grade workmen wanted. Address Corson Cycle Mfg. Co., Natick, Mass., N. H.

Bicycle Tubing—Wanted foreman who thoroughly understands the manufacture of cold-drawn seamless steel tubing; to one who is familiar with this trade in all its branches a good position is open; applications treated confidentially. If so desired, address, with age, reference, salary, experience, etc., Draw Bench, care The Wheel.

Wanted a first-class cycle repairman for an established concern in the South; references required; must be thoroughly competent; mention wages expected. C. Cycle Co., 312 King St., Charleston, S. C.

1896
CYCLING TRADE REVIEW

Copyright 1896, by F. P. PRIAL Co.

VOL. XVIII., No. 14.

NEW YORK AND CHICAGO, NOVEMBER 20, 1896.

WHOLE No. 456.

COLUMBIAS, \$100.

Price of the Pope Product Will Remain at the Same Figure as Formerly.

'97 Columbias will list at \$100. Late last week the Pope Manufacturing Company made official announcement of the fact. It created scarcely a ripple of surprise. Everyone in the know expected it, and the announcement of any other figure would have created little short of consternation. It was known, as THE WHEEL stated last week, that at the Board of Trade meeting a tacit agreement on a \$100 price had been reached.

Hartfords, the Pope Company's medium grade, will be listed at \$75. This is in the nature of an increase. At the beginning of the year they were catalogued at \$85, but later were reduced to \$65. One who has seen the '97 Hartfords states that they have undergone a marvellous change and will prove the greatest value for the money ever offered. They will be made of the inch and an eighth 50 carbon steel tubing.

In the Columbias nickel steel tubing will be employed. Reinforced flush joints, D-shaped off-set chain stays, tubular hubs and a new method of spoking will be among the changes in mechanical detail. A recessed sprocket, which permits of a more direct line of the bearings, is another. The name plate will be of the same pattern as this year, but will be made of sterling silver, handsomely chased.

Concerning the chainless Columbia, the Pope announcement is silent, but it is known that the company's agency contracts stipulates that the bevel-gear wheel shall not be sold to agents during the year 1897, which means that the output will be limited, and will be disposed of direct from headquarters. Inability to obtain sufficient gear-cutting machinery has undoubtedly been one of the causes of this decision, but those who have seen the sample wheels in Hartford, say that once they are seen by the general public, it will be hard to stay the demand. It is an uncommonly good looking.

The '97 Columbias were this year submitted to genuine road tests. For two months two corps of men were employed pounding the first twenty models over the Connecticut roads. They were ridden 100 miles each day regardless of weather, the two corps relieving each other at noon each day.

FOWLER BIDS FOR AN EASTERN FACTORY.

Worcester, Mass., Nov. 18.—Frank T. Fowler is here dickering for the Windle Cycle Company's plant. It seems extremely probable that he will effect a purchase.

WORTH MORE THAN THAT.

The latest foreign flotation story has to do with E. C. Stearns & Co., who, rumor states, are capitalizing in London for \$2,000,000.

QUEER INSURANCE TANGLES.

Chicago, Nov. 13.—Following the rumblings and reports of internal dissension which have been heard for the last two or three months F. H. Barker, yesterday filed a bill in the Circuit Court asking for a receiver for the American Wheelmen's Protective Association.

Barker is a stockholder in the defendant corporation, holding ten shares. It was incorporated November 23, 1894, with a capital stock of \$1,000. Its object was to conduct an agency for registering, tracing and recovering lost and stolen bicycles. Shortly after it began business more than 23,000 wheelmen registered their wheels upon the books of the concern. The contract between the corporation and its members was in effect an agreement to insure every member of the association against loss of his or her bicycle by theft.

The complainant alleges that the association has collected \$30,000, and that out of that amount only \$6,500 has been expended for the expenses of the concern. It is set forth that notice was given to Recorder Chase that the capital stock would be increased to \$50,000, but the additional \$49,000 has never been paid in. The officers of the association are: Charles E. Kremer, president; Glenwood Preble, vice-president, and Edward Duncan Sniffen, secretary and treasurer.

The bill makes some rather sensational charges against Sniffen. It is alleged that he issued to himself 4,900 shares of stock, representing the increase, and 5,000 shares of overissue, the par value of which is \$99,000. Sniffen, it is alleged, expended on his personal account all of the \$30,000 collected excepting the \$6,500 used for expenses of the corporation. Mr. Barker contends that Sniffen certified a report of the corporation in which it was represented that its assets amounted to \$127,669 70, when, as a matter of fact, its resources never reached that amount. It will be recalled that only a short while since charges were made against Sniffen which led to the publication of a statement from certain of the directors exonerating him.

TIRE TROUBLE COMING.

All signs fall if the approaching season does not mark an interesting era in the tire trade. Colonel Theodore Dodge is on the alert, and is starting proceedings against all of the single-tube makers who are not operating under his license. Most of the defendants are showing fight, and litigation will be plentiful. Many of them have adopted a well-pared schedule of prices, and are assuring dealers legal protection. The India Rubber Company, of Akron, Ohio, for whom Oliver, Straus & Co., of this city, are general agents, are among these. They recently added \$60,000 to their capital, and are offering an unguaranteed tire for \$3.75 and guaranteed tires from \$4.50 to \$5.50 per pair.

RAMBLERS, \$80.

The Chicago Pioneers Break from the Hundred-Dollar Standard—Tire Prices Lowered.

While it has been known for some time that nearly, if not all, of the older and larger and more prominent manufacturers would remain true to the \$100 standard, it has been apparent that the Gormully & Jeffery Manufacturing Company was in a state of mind. This and their reductions on Ramblers during the current year made it difficult to "get a line" on their '97 price. It was not possible to learn whether they would return to the \$100 standard or maintain the reduced figure—\$85. It is settled now, however. The firm has done neither the one thing or the other. They have set \$80 as the future price of 28-inch Rambler singles, \$90 for the special 30-inch Rambler and \$130 for Rambler tandems. Their racer will be built only to order.

The new features for 1897 are larger tubing, 1½-inch head and 1½-inch upper and lower bar and seat rest; barrel hubs, front and rear wheel, and barrel crank shaft; a new arrangement of reinforcement; dished rear fork lower braces; new pedals; new saddle; new chain and new rear wood rims, mahogany piano finish. The standard finish will be black, gold striped. Optional colors, olive, dark green, dark blue and maroon, striped.

Contemporaneous with the announcement of the reduction on Ramblers comes notice of a reduction in the retail price of G. & J. tires from \$15 to \$12 per pair, with a corresponding reduction in the wholesale figures. The tires will be unchanged save that the '97 pattern will have seven instead of five corrugations as heretofore.

ARIELS CENTURY-PRICED.

Ariels have taken their place in the \$100 column. The Ariel Cycle Manufacturing Co. so announces in this issue of THE WHEEL. Incidentally, the announcement embodies testimony from an Ariel rider which should specially interest those foreigners who delight in prattlingly terming American wheels "one season machines." A bicycle that has been in use since 1891 gives the lie to such gabblers better than mere words.

STICKING TO STANDARD PRICES.

Chicago, Nov. 18.—Monarch prices will undergo no change. The Monarch roadster will be listed at \$100, the racer at \$125, the tandem at \$150.

The price of Sterlings also will remain \$100.

STEARNS AT THE CENTURY MARK.

Syracuse, Nov. 16.—During 1897 Stearns bicycles will cost just as much as during the current year, \$100. The Stearns special at \$125 will also be retained.

TOLD OF TERAH.

How He Rolled Up a Fortune in Cycle Shares—Other Concerns to Be Floated.

London, Nov. 6.—Ernest Terah Hooley has been made a Lieutenant of the Corporation of London, and, in consequence, has been unbosoming himself to some newspaper men on his past and present. Why he should feel called upon to show his hand simply because he is now privileged to appear at Court clad in a uniform more gorgeous than even those of the flunkeys at the Empire Theatre to whom Li Hung Chang insisted on being introduced when here, I don't know. The fact remains, however, that he has, and all the incipient plutocrats of London are earnestly studying the Hooley gospel.

He rents the whole of the first floor of the Midland Grand Hotel, at St. Pancras Station at \$1,000 a week, so as to have room to breathe. He claims to be the largest sheep farmer in England, and to know on sight each one of the 300 herds he owns. He started life at twenty-two with his mother's fortune of \$175,000, so that he is not quite a self-made man, as the term is accepted. Still, he has done very well, thank you, for he states that as a stock broker he was living at the rate of \$15,000 a year, and earning \$80,000 until he touched the cycle market as an investor in Humber's shares. He bought a pile of these at 5½, and reconstructed the concern when they had touched £24, making \$1,825,000 by the operation. It is not to be wondered at that he decided to abandon stock broking after this, and adopted, instead, the rôle of general dealer in cycle and tire building companies. He boasts that all his concerns are in a healthy state, but I don't quite follow this. I suppose, in the general view of the case, he is right. When a man has launched companies with aggregate capitals of \$50,675,000 on the market he is entitled to brag when only \$8,500,000 of it has depreciated a little, and this is Hooley's record. He claims to be able to command no less than \$100,000,000 if required, so that it is obvious that the man who starts bearing Hooley's stuff is in for a tough job, as the Dublin broker who sold 19,000 Dunlop deferred stock just on the first settlement. He broke the market for two days down to 8s. premium, but had to buy in at 15s.

The Swift Cycle Company flotation went off all right last week, as did the Westwood Manufacturing Company, which includes the business of Starley Brothers, the sons of William Starley, who is regarded as the founder of the Coventry cycle trade. The great saddle combination of Lamplugh and Middlemore only scraped through by the help of Mr. Singer, who, rumor says, took up no less than 50,000 shares. There is a corner in Bagots, and a suspense in John Griffiths Corporation shares. I told last week that Mr. Hooley had offered £400,000 for that business and had been asked to bind the offer with a deposit of £100,000, but so far the £100,000 has not rolled up.

To the general surprise the Self-Sealing Air Chamber Company has declared a dividend of 7 per cent on the last season's trading, but the report contained the ominous statement that fines amounting to £800 had been collected from various firms for failure to complete their contracted orders. Cycle makers don't pay fines in this way unless they see that it is probably the cheaper way out of a hole. Make your first loss your last is good advice. There are some rumors of an amalgamation of the Warwick and Beeston Tire companies, with the view to

a flotation which would undoubtedly go well, both tires being made under exceptionally favorable licenses. The latest flotation to appear is Townsend Brothers, of Coventry, who asks to-day for £80,000 for a well-established business which last year yielded a profit of £11,118. The purchase price is £65,000, and very probably the deal will be effected.

The chainless bicycle is beginning to cause a flutter here now, and I believe that I am right in asserting that Mr. E. T. Hooley has taken the Acateon flotation in hand, and will shortly put it on the English market for \$750,000. It naturally follows that the affair will go through, but how the public will regard the machine will have to be demonstrated next season.

PENNSYLVANIA POLITICS.

After a long and bitter fight Thomas J. Keenan, jr., of Pittsburg, has been re-elected vice-consul of the Pennsylvania Division. W. H. Mercur, of the same city, who ran against him on an opposition ticket and fought for the office tooth and nail, was utterly snowed under, the vote standing 3,217 for Keenan to 926 for Mercur. A much larger vote was cast than in any previous election held in Pennsylvania, and the task of counting was an arduous one, from the fact that, owing to two sets of tickets having been received by the members, many of them voted twice, making necessary a careful comparison of the two sets of ballots. There was no opposition in the other offices, except among the representatives. S. A. Boyle was re-elected chief consul, receiving 4,470 votes, and P. S. Collins, secretary-treasurer, 4,494 votes. Forty-six votes were cast in favor of George D. Gideon for chief consul, O. S. Bunnell and H. D. Le Cato were among the few unsuccessful candidates for the position of representative.

VOTERS WERE SCARCE.

In proportion to the membership, the vote in the Massachusetts Division was as light as in the New York Division's election, the total number of ballots cast being 2,522. There were no opposing candidates. In the scattering vote Sterling Elliott, the present incumbent, received 99 votes for chief consul and J. Fred Adams 15. The officers elected are: Chief consul, J. Emery Tippett, Boston; vice-consul, D. Edward Miller, Springfield; secretary-treasurer, Alonzo D. Peck, Boston.

REGULARS WIN.

An interesting fight over the presidency of the Good Roads Association of Brooklyn, caused much excitement at the annual election on Tuesday night. The opposition ticket, headed by C. J. Balmanno, was turned down by an overwhelming vote. A. H. Angell was re-elected president; George T. Stebbins, vice-president; H. Strugnell, treasurer, and W. O. Eschwege, secretary.

KIREKER, KEER AND TATTERSALL.

C. Frank Kireker, of Paterson, is the new chief consul of the New Jersey Division. He received 1,061 votes out of a total of 1,063 ballots. Fred J. Keer, of Newark, received 1,062 votes for the vice-consulship, and James C. Tattersall was re-elected secretary-treasurer.

PROVEN GOOD AND RE-ELECTED.

All of the old officers of the District of Columbia Division have been elected for another term, as follows: Chief Consul, William T. Robertson; vice-consul, W. K. Larrimore; secretary-treasurer, Charles E. Wood; representative, G. A. Mansfield.

HAIRSPRING HAPPENING.

Wheels Went Round Too Rapidly and the Rider Was Baked in Consequence.

A Buffalo man who is proud of his ability as a road rider had a peculiar experience last week. The man, who for the purpose of identification might as well be called Jones, had occasion to go to Rochester. The roads were in good condition, and the air was just right for riding, so he concluded to save his railroad fare and make the trip on his wheel. He started out bright and early in the morning, giving himself plenty of time, as he thought, to reach his destination by noon.

Jones had carefully mapped out his route and set a time by which he should reach each point between Buffalo and Rochester. Batavia, he figured, he could make in about two hours and a half. As he had started from Buffalo at 7 o'clock, this would make him due at Batavia at 9:30 o'clock. He peddled along, taking no note of the time, until he reached a point on his schedule where he was due to arrive at 8:30 o'clock. He pulled out his watch, and to his horror and surprise found that it registered 9:15. He leaned over his handle-bars and began to scorch for all he was worth.

The wheel and the rider fairly flew over the ground. It was absolutely necessary that Jones should reach Rochester by noon, and if he was already three-quarters of an hour behind him, it behooved him to get a move on. After keeping up a terrific pace for about fifteen minutes, as he thought, Jones pulled out his watch. Horrors! It was already 9:45 o'clock, and he had not gone more than four miles at the most. The sweat began to pour off his brow as he redoubled his efforts to make up for lost time.

After a short period of this exciting work the stragging houses on the outskirts of Batavia began to appear. Jones still kept up his speed, for he was already away behind schedule time and must gain in some way. He looked neither to the right nor to the left, but peddled on as if his life depended upon it. At last just as he was fairly inside the city lines, he slackened speed, stopped, dismounted and sank to the ground exhausted. For a few minutes Jones sat on the curbstone, leaning against a lamp post. Then he looked at his watch. It was 10:30.

He dropped the watch back in his pocket and started to mount. As he lifted himself to the saddle his eye caught a large clock in a jeweller's window. It said 9:15 o'clock. Jones rubbed his eyes and looked again. Still the clock pointed to quarter-past 9. Jones dismounted, stepped into the jeweller's shop and asked the time.

"There's the regulator, you can see for yourself," was the reply of the proprietor, as he pointed to the same clock that Jones had seen in the window.

"Then what's the matter with my watch?" asked Jones as he pulled the timepiece from his pocket. Its hands pointed to 10:45 o'clock. The jeweller took it, listened a minute and opened the case. Then he jabbed a screw-driver into the works and handed it back to Mr. Jones. "The hairspring was caught, so that it was gaining time. It was running about twice as fast as it should," he explained. Jones thanked the jeweller and cursed his own luck. He was too thoroughly tired to attempt to finish his ride to Rochester, and, wheeling slowly to the station, he boarded the next train.

IN KANSAS.

The election in the Kansas Division resulted as follows: Chief consul, R. C. Manley, Lawrence; vice-consul, J. L. Bishop, Salina; secretary-treasurer, W. C. F. Reishenbach, Topeka.

DIGNITY AND THE PEDAL.

WITH the increasing popularity of the bicycle there comes from certain staid and dyspeptic quarters a query that concerns directly neither the wheel's hygienic influence nor its excessive cost, and yet is of interest to both men and women: Does riding a bicycle for pleasure comport with the dignity attached to official station? In other words, may one who straddles and propels a wheel preserve at the same time the respect and influence required for his official character, be he judge, clergyman, or officer of the forces of the United States? Some contend that when a Justice of the United States Supreme Court sallies forth upon his wheel and sets the pace, others should fall in line and say nothing; but there are persons who think differently.

Can a judge, say these idolators of conventional decorum, use his legs in pump-handle fashion and retain his judicial sublimity intact? Fancy so sober-minded an individual as the average schoolmaster, who must constitute himself the terror of a body of pupils spurring into the school yard with a penchant spine! Can he confront his school with the same regal self-possession as before? And as for the captain of a man-of-war, for instance, after a jolly, care-forgetting spin, can he expect to exercise over his men the discipline absolutely necessary to his rank?

In the name of the prophet, why not? One's legs are given for the prime purpose of locomotion, and if it is dignified to put one foot before the other to walk, it can be none the less dignified to raise one foot above the other in order to ride. Walking is not

easier than riding a bicycle. Grinding a hand organ is easier than playing a piano. Although in each case the results may be similar, the performance that is more scientific is the one likely to be more respected.

If any wheelman is supersensitive as to the matter of dress, he is privileged to cycle the streets in a silk hat; but let no one underrate the fulness of dignity that belongs to every disciple of the wheel.

QUESTION OF VALUE.

THE time is near at hand, if, in fact, it has not already arrived, when purchasers of bicycles will learn that it is not economic or wise to buy the cheapest of everything. Within certain limits and under certain conditions it is wise to buy the cheapest and best. There are a set of conditions and circumstances, however, where the buying of the cheapest is the dearest. A cheaper article can be produced sooner than a dearer one, and where a dearer one would often never be produced at all. The first range of cycle acquisition is effected under the difficulty that a limited sum of money must cover the many things wanted or needed. Hence the buying of cheap things at the expense of quality and ultimate economy. This will be remedied as the surplus of earnings of the masses over cost of living increases. For that reason an era of prosperity such as is now upon us brings demands for finer products. Manufacturers who produce fine wheels, and those makers who send out the most serviceable machines, but at prices above those that outwardly look just as well, are disconcerted and habitually discouraged at the success of those who readily dispose of less meritorious and, in the long run, less economic bicycles.

The logical and natural explanation of all this is that during the period when the masses of the people are securing what might be termed their initial acquisitions in cycling the deterioration of purchases, because of inferiority of manufacture, is very rapid. A bargain counter bicycle is back in the repair shop in a couple of months, while a high grade machine that outwardly looks no better, perhaps, is practically a stranger to a repair shop for years. This may be an extreme statement, but all manufacturers understand that the better makes, as a rule, last proportionally longer than the poorer makes.

But it does not follow that everything cheap is dearer than every corresponding thing at higher prices. A good many things have to be looked at. It would afford a good deal of instruction if repair bills of different makes of machines in corresponding grades of service as to severity in wear and tear could be collected and made available for purposes of comparison for manufacturers, jobbers and buyers. But this, except in a limited way, is impracticable.

Bicycles are not subjected to like service under like conditions, and are seldom equally cared for from the makers' and repairers'

standpoints. But there is need of more information on this subject, and manufacturers would be benefited if it were gathered and made to show the relative or comparative economic merits of machines representing the varying degrees of cost of manufacture, from the poorest to the best. Just how such information should be or could be gathered we are not prepared to say; but we could place our finger on firms who really do make high grade bicycles, who think they would sell more of them if the ultimate economy of such a bicycle could be demonstrated by such facts and figures as we suggest should be collected.

But there are fundamental conditions controlling and directing this steady trend in the direction of better cycle workmanship, material and finish. It is a question whether we can do much more than to assist it by showing by figures of service that the better is cheaper. Even were all these figures spread out, cheap wheels would continue to sell and the finer ones meet with only limited sale, because people need something in wheels that will stick together beneath them, and they must have it right away and all the time. This involves no reflection on the maker of cheap bicycles. The wonder is that so much bicycle can be got into \$40 to \$50 as is gotten in. The builders of moderate cost machines deserve the approbation of cycle users for the wonderful strides they have made in construction, in putting as good material, as good workmanship, as good finish into them for as little money as they are doing. The manufacturer does not make cheap work for the mere love of cheap work. He finds a demand facing him for a given product at a given value, and he meets that demand, and meets it with a skill in execution and an honesty of purpose, and with a vigor of commercial enterprise, that entitles him to the thanks and approval of all who use bicycles.

THE WREATH AND ITS MATERIAL.

AN other man; a bicycle faster than any other rides; another rides it a greater distance than it has ever been ridden; still another goes up hill or down hill better than his brethren, and then we place a figurative wreath of laurel upon his perspiring brow and tell him he is famous

What is this "fame" we so lavishly bestow? Is it not a mere recognition which passes for fame, and which is given during the brief life of the subject of the recognition?

As to posthumous fame in such a puny world as that of ours, we have no means of knowing its effect upon the subject of it. In the nature of things, there can be no exact definition of either fame or happiness. If fame be distinguished from mere notoriety, its elements must be these:

A public recognition of the character of an individual, of his doings and of his capacity for doing, and a knowledge of that recognition must give rise to a feeling of pleasure, which is a degree, or form, or quality, of happiness. Fame cannot be acquired without

action, and action most frequently gives rise to controversy and criticism. There are supporters and friends, and there are opponents and enemies.

At its best the "fame" of a cycle hero is the most fleeting of all fame, and hardly worthy of even the notice we have given it here.

PERSPIRATORY EQUIVALENT.

PROF. HUXLEY, before he died, announced his belief that sooner or later we would arrive at a mechanical equivalent of consciousness, as we have now of steam, electrical and other forces. He said that if a pound weight falling one foot produced a certain amount of heat, the same pound weight, falling through one foot on a man's hand produced a definite amount of feeling, and this feeling produced a corresponding desire to be rid of the pain; knowing, then, that there is a certain parity between pain and the desire to be rid of it, we can by the magic of mathematics reach the mechanical equivalent of the mentality involved.

The Professor is dead, or we would be tempted to ask him how to find out the perspiratory equivalent of suspense undergone each week by a very large proportion of the 5,000 racing men in America up to the time Chairman Gideon wipes the gore off his snickersnee, puts it on the shelf and issues his weekly bulletin of the dead and injured. A snickersnee falling through a few feet onto the back of a racing man's neck must give rise to several million candle-power of heat—we don't know exactly how many—but the mechanical equivalent must be way up. It must be considerable, too, while the said racer each week waits for the snickersnee to snick.

The bicycle has been regarded from many points of view. There are people to whom it merely presents conclusive reasons why women should wear trousers. In the light of which they look upon this they approve or disapprove of the wheel. It has been difficult hitherto to find such reasons, yet the triumph of sex seemed to hang upon it. Apparently an ethical significance inheres in bifurcated clothes which is shared by no style of skirt.

The Church can learn several lessons from the bicycle. Any person who has ridden a wheel knows that few can stand still without falling. And few can ride along in a rut without losing their balance. The Church needs to keep apace with the times. The church that stands still will fall in these days.

If every wheelman who is big enough will get off his wheel and soundly thrash every other user of the public highways he meets riding on the wrong side of the road he will be doing a service to his fellow-wheelmen and mankind in general.

Competent authorities estimate that there are 1,000 good talkers to one good thinker among men. Here is food for reflection on the part of those who believe it is as easy to design a good bicycle as it is to sell it.

No just man desires to interfere with the privileges or the pleasure of bicyclists, but those who, perhaps foolishly, prefer to walk have a right to insist that they shall not be run down or their lives endangered.

Some of the leading lights on the racing circuit are very much like Panurge in "Rabelais." It will be remembered that that interesting person had 120 ways of spending money and only one of making it.

Some men are so conceited and so over-estimate their weight and importance in cycling that when they ride toward the west they expect the East to tip up.

There is much in the name of a wheel and the reputation of its maker. To the fascination of these many a purchaser surrenders judgment hoodwinked.

Experience has taught many racers who have become has-beens on the track and want-to-bes in the trade, that it is usually a hard job to get a soft one.

When an accident happens to another rider's wheel and you stop to aid him, remember advice may help, but it isn't help, just the same.

Adam may have missed some of the luxuries of this life, but he didn't have to teach his wife to ride a wheel nor kick at the bloomers she wore.

There are braying men in the world as well as braying asses; for what is loud and senseless talking and swearing any other than braying.

The proven pleasure of cycling as compared to the possible harm thereof is as Niagara to a glass of circus lemonade.

It is a man's duty to have a wheel. A bicycle is not a luxury, but one of the necessities of life.

Most riders are like the lamps on their wheels when they go out—that is to say, they smoke.

When a woman takes to the wheel she is known in public by the company she doesn't keep.

Don't worry about the wheel's privileges until you have secured the wheel's rights.

We may not all be poor creatures, but we are all creatures, and most of us are poor.

Charity cannot cover trade sins as fast as gossips can invent them.

Cycle arguments with a fool show that there are two.

Friendly cycle advice has cost many a man a friend.

Every wheel is a failure according to somebody.

ON LOOKING BACKWARD.

A rider of the bicycle need not keep one eye behind and one in front, as a matter of law. This is the decision made by the Appellate Division of the Supreme Court in the case of James H. Rooks, a minor. Rooks was going down Broadway, riding on the cable slot, when a car of a cross-town line using the Broadway tracks came upon him from behind, knocked him off his wheel and injured him.

The action of Rooks to recover damages for personal injuries was dismissed by the lower court on his own evidence that he did not look behind him. The Court said that as a matter of law the failure to look behind him was such contributory negligence as would prevent a recovery. Rooks said that he heard the car just as it was upon him, and that before he could spurt ahead of it he was run down. He had heard only the rumbling of the car, for no gong had sounded, nor had any whistle or cry of the driver warned him. The lower court held that the cable slot was a place of danger which required the exercise of corresponding vigilance on the part of the cyclist.

In deciding that the matter of contributory negligence was a question that should have been submitted to the jury instead of being decided as a matter of law, the Appellate Division says:

The trial court held him guilty of contributory negligence because he failed to look back. No such duty was imposed upon him as a matter of law. His primary duty was to look in front of him, indeed, to keep a good lookout all around. But he could not ride upon his bicycle at all, certainly not with safety, and yet keep his head turned so as to observe what was going on behind. Whether his failure to observe the car at the time of and under the circumstances surrounding the accident amounts to contributory negligence was, to say the least, a question for the jury. He certainly had the right to expect the usual warning in the rear.

A new trial is ordered.

SINCE THE FEDERATION WAS FORMED.

About a month ago the New York, New Haven and Hartford Railroad issued an order compelling cyclists to remove cyclometers, lanterns or tool bags before placing their wheels aboard trains, or to give the baggage agent a waiver of any claims to recover on losses occasioned by leaving them attached to wheels. The order was issued, it is said, because of the numerous complaints of damage to or loss of accessories. Frequent protests and wordy wars with employes from irate cyclists, however, has caused the company to rescind the order, and there is peace once more along the line.

ANCIENT AND HONORABLES.

What proved to be an interesting spectacle to the throng of riders on the Coney Island and Cycle Path on Sunday last was a party of South Brooklyn Wheelmen mounted on crocks of aged vintage and of all descriptions. High wheels, Stars, Eagles and solid-tired safeties of the fifty-pound order were all in line. Brooklyn was scoured for wheels of the patterns in vogue ten years ago, and the result was truly sensational. The run attracted more attention than a circus parade. Going down the Path fully 300 riders tagged on behind.

TO ENJOY THEMSELVES.

A large and roomy homestead on the Merrick Road, Long Island, known as the Baldwin property, has been purchased by the Seawanhaka Country Cycling Club, of Brooklyn. It will be turned into a country clubhouse fitted with every facility for cyclists to enjoy themselves.

JOHNSONIANS IN MEMPHIS.

Memphis, Tenn., Nov. 17.—Indoor records are bound to suffer this week. The World team arrived here on Sunday, and every night during the present week the Coliseum track will be the scene of record-breaking trials and contests between a score of fast professionals. On the opening night, Monday, Johnson cut Eaton's mile indoor record of 1:58½ to 1:48 3-5, paced by the Jallu brothers.

The triplet lowered the world's unpaced record of 1.49. Michael went against his record of 10:35 for five miles, made on the eight-lap track at Nashville. He was paced by twenty men on triplets and tandems. His time by miles was: 1:55 3-5, 3:49, 5:58 1-5, 7:48 2-5, 9:48 2-5. The final of the mile open was won by John Lawson; Newhouse, Buffalo, second, and Martens, St. Paul, third. Time, 2:14 2-5. Crooks, Buffalo, and Phillips, Chicago, also ran.

John Lawson, of Chicago, distinguished himself on Tuesday night by establishing a fifty-mile unpaced record. He rode 23 miles in the first hour, and 44½ miles in two hours, finishing 50 miles in 2:16:03. The previous best was 2:29, by Becker. Lawson cut Becker's time from 25 miles on. The times for each five miles to-day were: Five, 13:11; ten, 26:25; fifteen, 39:25; twenty, 59:55; twenty-five, 1:05:17; thirty, 1:19:59, record; thirty-five, 1:33:24, record; forty, 1:47:25, record; forty-five, 2:01:46, record; fifty, 2:16:03, record.

In the evening Johnson rode a mile in 1:52, paced by the Jallu brothers, against his record of the track of 1:48 3-5. Michael again lowered his five-mile indoor record. He was well paced and rode the first mile in 1:45, the four miles, 7:41 4-5, and, sprinting gamely, finished the five in 9:36, a cut of 12 seconds.

On Wednesday Michael will try for the hour record, and on Thursday Waller will endeavor to get the 12-hour record.

SOME FOREIGN CRACKS.

A party of English riders will sail for New York to-morrow, to compete in the Madison Square Garden meet. Among the men expected are Lumsden, who will ride in the six-day race; Tom Linton, William Chappel, J. Platt-Betts and the Chase brothers. Linton holds the hour record, Betts the English mile and other short distance records, and the Chase brothers about all the tandem records.

"TEDDY" TAKES JAY ON.

"Teddy" Goodman has accepted Jay Eaton's challenge to ride against any man in America during the Madison Square Garden meet. Eaton has arrived at his home in Elizabeth, N. J., and will keep in condition for indoor racing. At Memphis, last week, in a return match with Cooper, he was beaten half a length by the Detroit rider. The time was 2:13 1-5.

BROKEN AT THE BREEZE.

At the Point Breeze track, Philadelphia, on Tuesday, Hill and Gardiner cut the three, four and five-mile unpaced tandem records. Their times were as follows: 1 mile, 2:13; 2 miles, 4:30; 3 miles, 6:49 2-5; 4 miles, 9:10 3-5; 5 miles, 11:27 3-5. The previous best for five miles was 11:39.

TAKING CONTRACTS.

In addition to the match with Morin on November 22, Tom Butler has signed to ride against Jaap Eden on December 6, and, with his brother Nat, will tackle the French tandemics, Huret and Buchner, on December 13,

TRIUMPHANT HICKORY.

One of the strikingly new features at the last Chicago cycle show was the Old Hickory bicycle, the product of the Tonk Manufacturing Company, piano stool makers in that city. The wheels, frames and all, were of wood, and it is strictly within the bounds of truth to say that they were the best

looking wheels of the kind that had been seen. They were the subjects of much cavil, of course, but for all of that the Tonk people tell THE WHEEL that the Old Hickory met with sufficient demand and gave such satisfaction that they mean to largely increase the output and to add several models

to the line. Instead of one height of frame, they will have three each of men's and women's models. Two styles of tandems will also be made. Sample '97 wheels are already in evidence. The illustrations show what they are like.

TAKING NO CHANCES.

No action was taken in regard to the revised articles of alliance between the Amateur Athletic Union and the League at the meeting of the A. A. U. held in New York on Monday. Pressure of business prevented Chairman Gideon from attending the meeting. His presence at the meeting was desired principally to discuss the question of a new agreement between the two organizations under which each should refuse sanction to any meeting previously refused sanction by the other. Mr. Gideon thinks that, while such an agreement would hardly be of any benefit to the League, which is fully able to control the sport, it would not be likely to injure it in any way, and that if the support of the organization will help the athletic body it might, as a matter of friendly courtesy, be entered into as an experiment for a year.

GUARANTEED RIMS.

In line with the makers of cycles and tires, the Fairbanks Wood Rim Company has adopted a six months' guarantee.

HE HAD TROUBLES OF HIS OWN.

"A house that I went into one night in a town not very far out of New York," said the retired burglar, "didn't begin to pan out as well as I expected it would, and I couldn't help feeling a little bit disappointed. I'd been all over the house and hadn't got much more'n enough to pay my carfare. But when I came downstairs again I saw standing in a corner of the hall by the front door something that I hadn't noticed when I went up, that pleased me very much, and that was a tricycle; a girl's tricycle, with two high wheels and a small wheel in front, with galvanized wire spokes, and a long handle to steer by, and a seat upholstered with red velvet, and all that sort of thing, you know. You've seen lots of 'em, no doubt.

"Well, now, my little girl had been asking me for some time for a tricycle, but business had been so everlasting bad that I really hadn't felt as though I could afford to buy her one, but here was one waiting for me to carry off, and it made me smile to look at it; a bright new one it was, too. It was pretty near Christmas, and I thought I'd keep it and give it to her for a Christmas present.

"There wasn't any rubber tires on it, so I didn't dare roll it across the hall, but I picked it up and carried it to a door that opened into an entry that opened on to the cellar stairs, the way I'd come in. I got it to the first door all right, and into that entry way or hall without hitting anything, but in getting it through the door leading to the cellar stairs, goin' first myself and backin' down with it, the long handle flopped over somehow and caught in the door when I was just a step down. I tried to free it, and it freed easier than I expected, and I lost my balance and lost my hold on the tricycle and fell downstairs.

"Noise? Well, now, I tell you, I was in a steamboat explosion once, and once in an explosion in a sawmill; but I never began to hear so much noise in my life as I did when me and that tricycle rolled down the cellar stairs. The tricycle fell over me and I fell over the tricycle, and somewhere on the way down I believe I must have fell through the tricycle, for when we got down to the bottom I was all scratched and cut and my clothes were tore, and the tricycle was a wreck. I stood there for a minute looking at it, till I heard two men coming down the stairs to the hall above, and then I went away and left it lying there at the foot of the cellar stairs.

"So, you see, my little girl didn't get her tricycle that Christmas, after all."

FREE SHOW ADVERTISING.

Every exhibitor at the National Cycle show is to be given advertising space in the official catalogue, free of charge. The Board of Trade has taken time by the forelock, and in advising the trade of the fact have warned them to beware of "souvenirs" and other such affairs. Only the official publication will be permitted in the show.

RODE OFF REJOICING.

Cycling has become a necessary and highly valuable attribute to the practice of burglary. At least two thieves who entered a house at Fairfield, Ct., last week found it so. After securing all the valuables in the house they rode away on a tandem, which they found in the basement, and no doubt enjoyed the early morning scorch.

SHOWN IN LONDON AND PARIS.

R. H. Wolf & Co., Ltd., will exhibit their complete line of 1897 models of Wolf-American singles, tandems and duplex for exhibition at the Stanley show in London and the Paris Exhibition.

AN EVEN DOZEN.

Manager Johnson's Lusty - Legged Legion Carry Those Records from New Orleans.

New-Orleans, La., Nov. 15.—With twelve records in their belts, made on the saucer track in this city, Manager Johnson, "Jimmy" Michael, Adviser Eck and the World team's small army of pacers, together with their "sex," "quads" and "triplets," broke camp Friday night and departed for Memphis. Twenty-two records have been captured by the World team since leaving Chicago, and Michael and Johnson have designs on many more at the new indoor track at Memphis. In the way of long-distance rides, Michael will try for the 50 and 100 mile records, and Waller will go for the twelve-hour mark. Work on the short distance figures will be resumed on the Cumberland Park track, Nashville, on the following week.

On Wednesday Michael made another attack on the ten-mile mark, but missed it by thirteen seconds. The pacing was not fast enough to suit him and he outsprinted them at the finish. His time by miles were:

Mile.	Mile.
1	1:49 1-5/8
2	3:38 2-5/7
3	5:28
4	7:26 1-5/8
5	9:18 1-5/10

This failure seemingly acted as a spur on the little Welshman, for the next day, Thursday, he went at the work hammer and tongs, again weighing but 100 pounds. Pushing a 105-gear World wheel, and with a never-ending cry for faster pace, he rode lap after lap at about a 1:52 pace, concluding the ten miles in 18:33 1-5, against Linton's world record of 18:41 3-5.

The air was clear and dry, and the trial was made just before dusk. The pacing was superb, all records being cut, from two miles to the finish.

The two and three mile records lowered were made by Michael in Chicago, the four and five mile marks by Michael on this track last Saturday, and the six to ten mile, inclusive, by Tom Linton in England.

A goodly crowd was present, and no less than six watches were held on the ride. Michael was paced by the "sex" captained by Saunders, the "quad" captained by Waller, with three local men up; the triplet team, and the Jallu brothers of Paris. With the exception of the "sex," which went for a mile each time but the last, the machines changed each half mile, and each change was made successfully.

Michael finished fresh and was immediately surrounded by the crowd and carried from the track. None of those present were more overjoyed than the pacemakers. They had done magnificent work, lowering the figures put up with the help of twice as many men. Michael's time per mile were as follows: 1:49 3-5, 1:43 4-5, 1:49 2-3, 1:52 1-5, 1:52 4-5, 1:52 2-5, 1:53 2-5, 1:53, 1:53 4-5, 1:52 4-5.

Miles.	Michael, Miles.	Previous record.
1	1:49 3-5	1:31 1-5
2	3:33 2-5	3:25
3	5:22 4-5	5:29 4-5
4	7:15	7:31
5	9:07 4-5	9:12 3-5
6	11:00 1-5	11:08 2-5
7	12:53 3-5	13:00
8	14:46 3-5	14:53 1-5
9	16:40 2-5	16:47 1-5
10	18:33 1-5/10	18:41 3-5

Previous to this great ride, Johnson went for the two-mile mark behind the "sex" for the first mile, and at the three-quarter-mile lowered his own mark made at Nashville from 1:13 2-5 to 1:10. The "sex" died here and he

HAWKSHAW HELPED.

He Got at the Alleged Secrets of the Allen - Mercury Race Meet Row.

A hearing was given by Chairman Gideon last week to the dispute between the Allen and Mercury Wheelmen, of Allentown, Pa., over the suspension and professionalizing of Corser, Crouse and Daupenspeck. A Pinkerton detective, employed by the Mercury Club, handed in as testimony 130 pages of closely written matter, tending to prove that the charges against the men were furnished and prosecuted by a clique of members of the Allen Wheelmen for spite. The testimony is said to make a good case for the reinstatement of the riders. If the Racing Board does not reinstate the men, the Mercury Club will bring the case before the National Assembly, and in court afterward, if necessary. The part played by the detective, H. J. Barrett, is probably without precedent in the history of cycle racing, and reads like fiction. He was engaged to ascertain who had made the charges and furnished the evidence against the professionalized riders. Posing as an insurance agent, he called at one of the cycle stores in Allentown and finally bought a wheel. He was taught to ride and invited to join the Allen Wheelmen, which he did after making a great fuss about investigating the virtues of the Mercurys. He was invited to go along on club runs and accepted. Three times he accompanied the Allen racing team to the Hazleton races, and acted as trainer and rubber down. He also trained and rubbed down the Allen riders at the other races. He made the acquaintance of all the Allen members, met many Mercury riders, and met many other people about town. He went along to Bethlehem and met Union and Packer Wheelmen. He was in such high favor with the Allens that he was to be made vice-president at the next election. Little by little he discovered what he wanted to know, until at last he reported that he had found out that the Allens had made the charges against the Mercury racers, and he specified the individuals.

The detective was up late at night and early in the morning. He drank with the boys, treated and was treated. He seems to have been liberal with cigars. At one time there was a rumor among the Allens that there was a traitor among them. "But," adds Mr. Barrett, "I am sure they do not suspect me." When his work was finished he didn't reveal himself. He said he had to leave for Washington for several weeks upon orders from the home office of his insurance company. He even had some telegraphic communication with his Allentown friends after he reached the office of the Pinkerton agency in Philadelphia.

RECORD HACHENBERGERED.

Denver, Col., Nov. 16.—A series of successful record-breaking trials were held at the Denver Wheel Club's track to-day, under the Racing Board's sanction. A. L. Hachenberger, brother of O. B. Hachenberger, rode 25 miles unpaced in 1:04:20. The previous record was 1:05:30 2-5, made by A. F. Senn. Hachenberger also lowered the ten mile record held by Senn 2-5 seconds. Sanger and Swanbrough on a tandem established the following records: One mile, 1:55 3-5; two miles, 3:19 4-5; three miles, 6:07 1-5.

THINK THIRTY-THREE.

McGregor and Nelson, the English tandemites, think that next year the hour tandem record will be placed at 33 miles.

finished in 1:41 3-5. His first quarter was 0:24, his second 0:23, and third 0:23. With any one of the pacemaking machines at hand to pick him up he would have cut the mile record three seconds at least.

Michael was unable to go for the one-hour record on Friday, having caught cold during the ten-mile ride, so Johnson tried for the much-coveted mile record of 1:39 1-5 by Hamilton. Last spring Kiser made fourteen unsuccessful attempts to cut this time, and Johnson made his eighth and ninth trials Friday, and then gave it up for the present. In the morning he rode the distance in 1:42 2-5, and in the afternoon 1:42 2-5 was the best he could do.

In his trial of that morning the canvas placed under the tire whipped out and the lashing round the tire scared the "sex" crew enough to slow the time very materially while travelling at the frightful speed that must be maintained to gain this mark. The quarters of the morning trial were 0:24, 0:49 2-5, 1:17 1-5 and 1:44, and of the afternoon 0:24, 0:49, 1:15 and 1:42 2-5.

In the trial of the morning Johnson lowered the world's record for one kilometre, held by himself, at 1:01 2-5. His time of the morning was 1:00 4-5, afternoon 1:00 2-5. The record broken was made by Johnson at the Catford track in London.

BOREAS SWOOPED, RECORD REMAINED.

Despite the guarantee of the managers of the Point Breeze track, Philadelphia, to have three records broken on Saturday last, no figures on the record slate were changed. Old Boreas swooped down on the Quaker City and ripped and snorted about the track at such a rate that record-breaking was out of the question. After several unsuccessful trials the affair was postponed until Monday. On that day the weather was more favorable to fast going, and three amateur records fell to the credit of B. B. Stevens. Paced by two quads and a tandem he made the following times:

Stevens.	Previous times.
1 mile.....	2:04
2 "	4:02 3-5 2
3 "	6:08 3
4 "	8:16 4
5 "	10:21 5

Hill and Gardner and Alcott and Marriott, on tandems, went for the amateur competition record of 4:18. The former team finished in 4:31. W. H. Cressy rode a third in thirty-six seconds, a State record.

Douglas tried for the one-mile amateur paced record, but something occurred to his machine that compelled him to slow up. The quad manned by Wigmore, Hensel, Clift and Stevens finished the mile in 1:54.

CANADIAN TIME CONQUERORS.

Canadian records were again shaken up at Hamilton, Ont., November 15. John Davidson, of Toronto, paced by a tandem, broke two world's amateur records, flying start and standing, at a half-mile. The flying record was cut from 52 4-5 to 52 2-5 seconds, and the standing record from 58 to 57 2-5 seconds. Beemer and Hutchins, of Toronto, broke the amateur tandem record, going an eighth of a mile in 12 seconds. Harley Davidson and Miller, of Toronto, established a new professional tandem record for a quarter of a mile, the time being 27 2-5 seconds.

THREE FOR A THOUSAND.

E. A. McDuffee is training at the Catford track preparatory to opening his racing campaign in France. He has accepted a challenge from Barden to ride a series of three races for one, two and three miles for \$1,000 a side.

WHEN YOU SEE THE STAMP

HARTFORD, CONN.

While weight for weight in a Bicycle our FIFTY CARBON Steel will last so long

and TWENTY-FIVE CARBON Steel will last only so long

Kindly mention The Wheel.

SAND AND GRAVEL RECORD.

Since a gentleman, rejoicing in the not uncommon name of McLaughlin, first invented that form of riding a bicycle which consists in dropping down the side of a mountain while seated in the saddle of the machine, no one has attempted to steal the McLaughlin thunder like the gentleman from Denver. Choosing the Rocky Mountains to drop from and a hurricane to aid him, the Denver gentleman rests his claim on doing a mile in fifty-eight seconds. Perhaps the feat would have been more remarkable if he had succeeded in riding the mile in any less time, when the character of the stimulus is considered.

The report adds that in this brief and flying trip he gathered in his eyes so much sand and gravel that he spent ten minutes in restoring his sight. It is presumed that he practised the same celerity in digging as he did in pedalling, and it is evident therefore that whoever attempts to rival his performance must make a similar sand and gravel record. The episode opens up an entirely new field of cycling endeavor and should particularly encourage oculists to try for these fresh laurels. It seems to pave the way for a glorious future for the cycle eye.

LIME IN HIS LAMPS.

Monte Scott accounts for his second defeat at the hands of Hachenberger by not starting his sprint at the eighteenth mile instead of the twentieth, and by the dust which got in his eyes.

When the race was finished Scott was blind. For several minutes, he said, he had been able to keep the track only by a dim perception of the two white lines of white-wash placed along the track to keep the men from colliding. He feared the strain on his eyes had seriously affected them, but when he called a doctor in, quantities of lime were taken out of them. The heavy wind which swept over the track had driven the particles into his eyes, and he says he got it principally at the turn to the east of the judge's stand. Here is where he passed Hachenberger, and every time the wind blew the dust from the "Buttermilk Boy's" wheel in his face. Twice during Friday night the doctor attended him, and, though there is no fear of danger to his eyesight, he will feel the effects for some time. Despite his two defeats, he has confidence in his own powers, and believes he is a better rider than the victor.

HOFSTETTER'S BIG CASINO.

At the Casino Rink, Saratoga, N. Y., last week, a six days, four hours a day, race took place for the amusement of the townspeople, but after the first two nights they grew weary of the event and retired to their couches at their accustomed early hour. The event was devoid of interest after the middle of the week, when Hofstetter's victory became a certainty, barring accident. On Tuesday night Frank Albert, the old time all-week contestant, ran into Smith, who had been thrown by a tire coming off. Both men remounted, but after riding three miles, Albert retired for medical treatment, when it was found that his collarbone was fractured. At the conclusion of the race on Saturday night Hofstetter secured first money by riding 492 miles and 3 laps. The scores of the other men were: Smith, 491 miles 3 laps; Schock, 490 miles 3 laps; Golden, 486 miles 9 laps.

ON SUNDAY, MORIN.

Tom Butler has been matched against Morin, the French crack. The race will take place at the winter track on Sunday next.

RACING BOARD'S BULLETIN.

SUSPENDED.

The French professionals, Mordier and Solbud, are suspended from all connection with track racing for six months and one year, respectively, from October 18, 1896, by the French Association, and are therefore not eligible to track races in this country.

John H. Johnson, Toledo, Ohio, from all track racing pending return of prize.

Six months, from November 14, un sanctioned races, after warning: A. Monson, A. J. Thibodeau, Hjalme Ogren, Clarence W. Anderson, Martin J. Bolstad, H. Paulson, B. Clausen, H. Tronvig, Ray Lloyd, Hugo W. Ogren, Fred Emery, E. O. Erickson, Peter B. Peterson and Louis Anderson, Chicago, Ill.; William Loon, Detroit, Mich.; Michael H. Edwards, William Clark, Warsaw; — Wesley, — Van Patter and — Lettredge, Detroit, Mich.; — Primrose, New York; — Paige, Oberlin, Ohio; — Blake, Cleveland, Ohio; — Washington, Ypsilanti, Mich.; — Fletcher, Baltimore, Md.

PROFESSIONALIZED.

C. D. Mackay, Portland, Ore., vote of Racing Board.

James W. Cowan, Los Angeles, Cal., vote of Racing Board, Clause D.

Phil Kitchen, Los Angeles, Cal., Clause D.

F. A. Bell, Los Angeles, Cal., Clause D.

Charles W. Stimson, Los Angeles, Cal., Clause D.

Albert D. Tompkins, Los Angeles, Cal., vote of Racing Board, Clause D.

F. Falley, Dallas, Texas, Clause I.

Ed Phillips, Dallas, Texas, Clause I.

E. P. McClare, Chicago, Ill., own request.

SANCTIONS GRANTED.

November 25, Twenty-second Regiment, New York City, N. Y.

December 19, Eighth Regiment, N. G. N. Y., New York City, N. Y.

December 19, Liberty Wheelmen and Company F, Thirteenth Regiment, Brooklyn, N. Y.

January 13, '97, South Brooklyn Wheelmen and Company G, Thirteenth Regiment, Brooklyn, N. Y.

November 18, 19 and 20, Valdosta Chamber of Commerce, Valdosta, Ga.

TURNED OVER TO HACK AND SANGER.

Bald will take no action in regard to Gardiner's challenge for a series of match races. He thinks it somewhat remarkable that all the men who desire match races with him have waited until he has got safely out of condition before issuing their challenges. He says that he will not accept the Gardiner offer at this time. He also objects to the idea of riding unpaced from opposite sides of the track. "If Gardiner wants to ride in that style," he says, "let him tackle Sanger or Hachenberger."

FOR A MONUMENT.

A race meet was held at Washington, D. C., last week for the benefit of the Eugene Field monument fund. A raw, chilly wind and occasional showers had a depressing effect on the attendance, there being scarcely spectators enough present to form a corporal's guard. The weather also had a depressing effect on the contestants, all the events being won in slow time. William Sims, Fred Schade, George Ball and George Dannemiller won the principal events.

TANDEM RECORDS GO.

All tandem records from thirty-five to fifty miles were broken by the Chase brothers, at the Catford track, London, November 13. They covered the latter distance in 1:38:14-25.

McGregor and Nelson, the English tandem team, rode a half mile in 57 1-5 seconds at the Crystal Palace track, November 11. English record.

MORIN'S STREAK OF YELLOW.

Morin, the French crack, has lost caste with the Parisian followers of the cycle path. He failed to appear for the second heat of the match race with Jacquelin, resulting in the much-advertised race ending in a fiasco. The first heat, as previously reported, went to Morin. In the second heat the men collided and fell and the event was postponed. After a lot of argument, Morin agreed to ride on Sunday morning, October 25. Afterward he refused to ride in the morning, but promised to ride in the afternoon. He did not appear at the track. Jacquelin rode the distance and was awarded the prize. He afterward rode a match race with Arend, the German crack, and won. Morin's action brought out comments which were not in any way complimentary to himself, and he has been severely criticised by the foreign cycle press.

STILL DOING BUSINESS.

Despite the threatened imbroglio with the Racing Board, Tom Eck is laying plans for the future. A proposition made to the Velodrome Bicycle Track Association for the appearance of Michael, Johnson, the Jallu brothers, and other pacers, in that city for the winter season has been accepted, and the inducements desired agreed to. The appearance of the combination on the Pacific Coast now remains with Eck and his employers. If the record breakers reach California it is fair to surmise that they may eventually drift to Australia.

AN EASY JOB.

In less than twenty minutes on one day last week Chairman Gideon's errand boy with a \$2 hand press and twenty-six pieces of type, set up, printed and bound a complete edition of a work containing the name of every American racing man who is a real amateur and has ridden a mile in less than 2:10.

ALL-WINTER RACING.

On Sunday, October 25, the Seine track outdoors, was closed with a meet, and the Jaquelin-Morin match race, while the winter indoor track opened for the season of cold weather. There was an immense attendance at both places. Racing will be continued in Paris all through the winter.

ANOTHER ROPE FOR TOM.

Tom Eck has another rope around his neck. The Quill Club Wheelmen found that they reimbursed him \$50 too much for the appearance of his team at their meet, and demanded its return. Repeated promises have come to naught, so the matter has been referred to the Racing Board.

ON A DRILL FLOOR.

Armory racing was inaugurated in New York for the coming indoor season on Saturday night at the games of the Thirteenth Regiment A. A. The two miles handicap went to W. E. Mosher, R. W., 150 yards, F. J. Kirsch, 140 yards, second.

BREEZY RECORD BREAKING.

On the Point Breeze track, Philadelphia, November 10, W. G. Douglas lowered G. W. Adams's three-mile amateur paced, lying start record from 6:30 2-5 to 6:20 3-5.

FOR THE INTERNATIONALS.

Like Springfield, Glasgow, Scotland, has a Hampden Park. It will be the scene of the next international races, when a new track will be completed.

J. Silver has reduced the Scottish hour record to 26 miles 1,418 yards.

PALMER TIRES

To Bicycle Manufacturers:

Competition will be keen in the bicycle business next year. The demand for high-grade wheels will be good, but not so good as to warrant any maker or dealer in saying this or that equipment will do because the price is low. Riders will demand the best, and they will get it.

Under such circumstances, it looks like good business to forestall the demand and be prepared to furnish such pneumatic tires as time and experience have proven best.

It is a well-known fact that a bicycle fitted with Palmer Tires will run easier than the same bicycle fitted with other tires. Can any maker afford to sacrifice ease of running in his bicycles?

A bicycle fitted with Palmer Tires is not likely to make its owner walk. Palmer Tires are too easily mended—if they puncture. Can any bicycle maker afford to furnish tires that will render his wheels useless?

Tires which are not perfectly resilient—free to change shape when depressed with no other resistance than that of the air—will make a wheel go to rack. Palmer Tires are perfectly resilient. They adjust themselves to uneven surfaces. Do you want your bicycle racked to pieces?

No matter how good the wheel, its reputation is made or marred by the tires furnished.

Palmer Tires never marred any wheel's good name. They have made reputations for so many different makes, however, that it is a popular impression among riders that Palmer Tires mark the high-grade wheel.

THE PALMER PNEUMATIC TIRE COMPANY

133-139 S. CLINTON STREET, CHICAGO

New York Repair Department: 66 Reade Street

Selling Agents: The Columbia Rubber Works Co., New York and Chicago

Kindly mention The Wheel.

POINTS ON PEORIA.

How This Western City Has Made Its Mark in Cycle Trade and History.

Peoria, Ill., Nov. 14.—The aboriginals faded from sight in this Western country as the fame of this town grew, for the firewater made here did not agree with the noble savage as well as with the stronger-stomached individuals of white parentage. The great

Where Overland and Sylph Cycles are made.

corn belt of the West lay, prosperous and fertile, in every direction from the great distilleries which took the corn that was too poor to feed or to grind and made it into whiskey, until the fame of the town spread even unto Wall street, when the chiefs from that oasis swept out in warlike array and garnered in many spoils from the magnates of the "trust." As the town built one reputation upon whiskey it bids fair to now build another upon wheels, and as yet there seems to be none in Wall street to molest or make afraid those who enter upon the new industry.

Lying partly in the winding valley of the river and partly upon the bluffs which overlook the lake which is shown more distinctly upon the maps than in the water, Peoria abounds in streets and roads favorable to the daily use of the wheel. Back in 1879, the year when the trade got its first start here, these streets were mud and the roads were dirt, and the bicycle man's name was Dennis. Harry Rouse, the first rider, as well as the pioneer salesman offering wheels to Peorians, had a big stock of enthusiasm then with a small stock of wheels, and as the wheels grew in number and size (for some gigantic ordinaries were ridden by the tall fellows) his eagerness for the fray kept pace with the ever-widening field. The town began to improve its streets by the use of stone and gravel, while the county followed pace with the main travelled roads, which were gravelled and kept up in fair riding shape.

With the encouragement thus afforded the riders in the town began to look ahead to the future development of the new sport, and, finding advantages in club life, organized in January, 1881 League Club No. 20, now the fifth oldest bicycle club in the country. The club has had a useful history, serving for several years as the only club of any particular degree of activity and life that was maintained in the town, and in addition playing a very important part in the formation of public opinion. In those early days the wheelmen courted public favor for their beloved sport with a sedulous care that is unknown to those whose interest in wheels and wheeling dates

back to the days when the pneumatic tire absorbed whatever jar was left in the cycle's contact with a cold, rocky world. As in all the other movements connected with bicycling in Central Illinois, Harry Rouse played a prominent part in the club life until he became so busily engaged in selling wheels as to have only a limited amount of time to devote to its club life. The club early became famous for its smokers, hard times and other social gatherings, which kept its memory green seven days a week. As it grew in num-

them hard work, fame and glory. Lake View Park, with its half-mile track, witnessed the serious fracture of numberless world's records, and even more races of great interest, and will ever remain green in history as the scene of the dethroning of Windle by the mighty Zimmerman. In these three international tournaments the track was repeatedly resurveyed, but its length was each time re-established, to the chagrin of the dissatisfied. Since the last of these tournaments the club has held a number of successful meets, that of 1896 being a good example. Under the leadership of its president, Charles P. Watson (ex-President Harrison's former private secretary), the attendance was large, and on Peoria Day the business centre was closed during the race hours, throwing into the way of thousands the opportunity of attendance.

The riders of the city now number well on towards 10,000, and this of itself calls for a large and well appointed retail trade and affords a handsome nucleus to the factories and wholesalers whose headquarters are here. When the first wheels were sold in Peoria the census showed it had a population of some 30,000; seventeen years later from almost the same identical city limits there rolled up a registered list of voters for the 1896 election which (figured on the same basis as used in New York, 5.89 to 1), indicates an actual population of well over 75,000, although modestly forbids her citizens claiming more than 70,000. At present there are four large and well equipped bicycle factories with numbers of repair shops where more or less manufacturing is done. In the summer of 1896 there were said to be thirty-six regular retail agencies operating in the city, and one of the four largest claimed to have sold up to August 280 of one particular brand, they carrying four or five brands. This will give some idea of the retailers' point of view in the past. For 1897 there will apparently be a marked decrease in the number of houses handling wheels; several

bers it took to itself enlarged quarters on the third floor of the library building, only to again emerge from a small jacket to a larger one, going to a remodelled residence one block from the leading hotel and just in the edge of the residence portion of the city. Here they waxed strong and valiant, until there be those who predict that with the full advent of

Peoria Rubber & Mfg. Co.'s Factory.

the much-heralded prosperity the club may arrogate to itself a home constructed specially to meet its requirements.

Several years after its effect was being felt in the increased local interest in cycling, the Peoria Bicycle Club inaugurated a series of international tournaments, which brought

of those who sold them last summer regarded them merely as a side line and found that however good bicycles might be they did not mix very well with furniture, drugs, boots and shoes and other such commodities.

In a wholesale way Peoria's largest trade has been from the factories, of which the

first one to be mentioned makes the famous Sylph and Overland wheels. This factory is a distinct evolution. As before mentioned Harry G. Rouse, the president of the company, was the first rider in Central Illinois. In 1879 he began handling wheels in connection with the trade in farm machinery and vehicles carried on by G. W. Rouse & Son, whose business dated back to 1864. After several years of continuous growth their retail trade began to develop into a wholesale trade, and they in turn entered upon the importation of wheels. A little later Mr. G. W. Rouse met with a runaway accident which caused his death and left H. G. Rouse as the head of the firm. His natural inclinations and a shrewd foresight led him to devote his energies more largely than ever to the wheel trade. His individual interest in the sport had led him to join the L. A. W. when that organization was in a nebulous condition, his original number being 18, which upon the renumbering dropped to No. 6, and which will come to the front one or two more places at the next renumbering, as at least one of the first five has joined the great majority. In the mean time his sales of wheels grew apace, and he labored in season and out for the sport.

With the sporadic spread of the "craze" there developed a field which could not be reached by agencies, for there were none educated sufficiently to understand how to sell wheels, and the firm of G. W. Rouse & Son began to sell on the "easy payment plan without extra charge." That they were the first house applying this to the wheel business, coupled with their skill as advertisers, led to an enormous growth of this branch of the business. In 1883 Frank S. Beavis was associated with the firm in this branch of the trade, and under his skillful direction sales by correspondence reached from Australia to Newfoundland and from Hong Kong to St. Petersburg. He remained in this department for twelve years and only retired in 1895 to accept a very flattering offer from the Eclipse Bicycle Company at Elmira, N. Y., as manager of agencies.

With the increase of the trade the business was incorporated as Rouse, Hazard & Co., and after importing the Ormonde a contract was made covering the United States and Mexico for the famous Rudge. About this time the first manufacturing attempted in Peoria was done for this firm and gradually a large product was being turned out under charge of F. F. Ide, who afterward organized the F. F. Ide Manufacturing Company. In 1895, after a number of evolutionary changes, the old working quarters became entirely too limited and were devoted entirely to warehouse and repair purposes, a new factory being erected at Peoria Heights in the suburbs of the city.

This factory is fitted with the best machinery and has a capacity of 15,000 to 20,000 wheels a year, making both the Sylphs and Overlands. The management of the company is in the hands of H. G. Rouse, president, and S. B. Hazard, secretary and treasurer. The factory is now getting under headway for the 1897 trade, with the new models all completed and preparations being made to turn out Sylphs that will "sell easy," as well as Overlands, "always reliable." Naturally enough this concern has served as a school for wheelmen in many ways. In addition to Mr. Beavis, mentioned above, Messrs. Ide and Doubet, of the F. F. Ide Manufacturing Company, and Fred Patee, of the Peoria Rubber and Manufacturing Company, were formerly connected with it in various ways.

As stated, F. F. Ide, a local machinist of much skill, was interested in the early manufacturing here. Some four years ago he

organized a separate company called the F. F. Ide Manufacturing Company, which leased the old Peoria Watch Company's plant and established a complete factory. In 1895 they added largely to the other building, and increased their manufacturing capacity quite largely. The reputation of the Ide has been along the line of high-art bicycles, to which their patent spring crank has added not a little by its beauty and utility. The wheels were handsome, held at handsome prices and notwithstanding the rage for low-priced goods they turned up many a check for \$125 and \$140 wheels during the last two years. The Ide Manufacturing Company, however, had the misfortune on the 7th of last October to have a fire which completely destroyed the main building and badly damaged the remainder of it. Before the smoke quit curling they had contractors estimating on a new building, which is now approaching completion, and into which they will move as soon as the ground floor can be cleared from the builder's debris.

The management of the company is in the hands of Sylvester Doubet, president; George H. Sampson, secretary and treasurer, and F. F. Ide, superintendent. For 1897 they will offer the same line of goods, with the Ide tandem, and will have a capacity of some 5,000 wheels.

The firm of Luthy & Co. has for years been engaged in the implement and vehicle business, and in 1890 they began jobbing bicycles. From this their ideas of wheels began to develop, and C. T. Luthy, who is the owner of much fine horse flesh, took particular interest in the problem of constructing a wheel that would be to the generality of machines the same that the racehorse is to equine animals of every day pace. Beginning constructive work in the latter months of 1895, they equipped a factory with the latest patterns of machinery and began the development of a machine which they were determined should excel wherever they were able to obtain excellence. They have listed the resultant wheel at \$150 and call it "The Luthy." Among other achievements for which they say it should have credit is a marvellous facility for climbing hills, one of the local hills in Glen Oak Park having been climbed, descended and re-climbed on a machine geared to 80, while riders of equal repute failed to climb it once on their regular mounts geared lower. The product so far has been relatively very small, and it will be introduced generally for the first time in 1897. Both C. T. Luthy and his brother Ferd Luthy regard it as par excellence a city wheel, and adapted to the highest and best trade of this character. The factory has been evolved along the line of quality and has a capacity of probably 3,000 wheels per annum.

The Peoria Rubber and Manufacturing Company is a concern which has made for itself a large and liberal place in the annals of the town, although its history dates back only some fifteen months. The officers are Monroe Seiberling, president and general manager; J. H. Seiberling, vice-president; C. J. Butler, secretary; A. G. Seiberling, treasurer; F. L. Kryder, assistant treasurer, and Fred Patee, assistant general manager and sales manager. On September 20, 1895, they started to build. With the factory and everything fresh from the contractors' hands they still found time to build and sell 10,800 Patee wheels during the season of 1896. For 1897 they will construct from 25,000 to 30,000 wheels, while in their tire department they already have in sight orders from other manufacturers for some 80,000 pairs of Peoria single and double-tube tires. With the additions, they now have some 150,000 square feet of floor in their factory. The factory is located further out than that of Rouse, Hazard & Co., and is for the present connected

with the city by a "dummy" line, although the management have organized a streetcar company, and obtained a franchise for a four-mile line through the heart of the city. The erection of the factory has been a decided stimulus to the real estate business in that locality.

While the city cannot claim to be one of the largest manufacturing centres, the factories mentioned are doing a safe, conservative business, and will have a combined capacity of from 45,000 to 60,000 wheels for 1897, and the Peoria Rubber and Manufacturing Company will also have the capacity in its rubber department of 200,000 pairs of tires.

DUPLEX ON THE DECISION.

Why is the Wolff-American bicycle the best bicycle built in America? That is a pertinent question propounded by R. H. Wolff & Co., limited, makers of Wolff-American cycles. This firm believes that there are a large number of persons who can answer this question satisfactorily. Notably those who are riders of the Wolff-American. But in order to more fully decide the question, R. H. Wolff & Co. propose to give an 1897 Wolff-American Duplex to the person who gives the best ten reasons in answer.

As the Duplex is worth \$200, and a prize worth competing for, the contest should produce interesting results. The decision will be made by a committee of experts, and will be announced after the conclusion of the Boston Cycle show in February.

No answers will be considered unless addressed to the Publicity Department, care of R. H. Wolff & Co., limited, 116th, 117th and 118th streets and Harlem River, New York.

SEWING MACHINES AND CYCLES.

It is an interesting fact that very many of those who to-day stand high in the cycle trade were formerly or are still engaged in the manufacture of sewing machines. The drift from the one business to the other seemed so easy and natural, that when the makers of the well-known Demorest sewing machine joined the throng they proved a desirable accession. They are the sort of people who value their good name and whose utterances stand for something. Cyclingly they propose being more aggressive than ever during the coming season, and the Demorest bicycle is likely to prove a considerable factor as a result. The Demorest factory at Williamsport, Pa., is a busy place. Agents are likely to find it of interest to direct their inquiries that way.

TUBING FREE FOR A FRAME.

If any manufacturer does not learn the quality of the Sinfret tubing it is his own fault. The Hamilton (Ohio) Tube Company, who make it, afford an opportunity that is wide open. They offer to send gratis to any manufacturer who desires it, and who advises them of the required lengths, gauges and diameters, a quantity of the Sinfret tubing sufficient for a sample frame. Such an offer bespeaks unbounded confidence in the article. The Hamilton Company, however, makes seamless as well as the Sinfret and other lockjoint tubes. They are now in possession of their new quarters, which increases their capacity threefold. The factory is running fourteen hours per day to fill orders in hand.

SELLING LANE ASSETS.

By order of the court, John L. Flenner, assignee of the H. H. Lane Manufacturing Company, Huntingdon, Pa., will dispose of the assets of the concern at public sale on December 3. The property includes some 25 bicycles, a lot of cycle material and a deal of machinery.

INVENTORS' PARADISE.

Washington, Nov. 14.—Inventive genius is gambolling riotously in the cycling field. During the month of September there were recorded in the United States Patent Office over 1,100 applications for patents, all of which pertained in some respects to bicycling. Two hundred of these were under the head of general construction. Fifty-six were for brakes of one kind or another. Saddles numbered fifty-two; chains, thirty-one; valves, twenty-two; lubricants, twenty-five, and locks, nineteen. Besides these, there were other applications for alarms, dress-guards, luggage-carriers, etc. The work of the Patent Office is generally behind from one to four months. The division to which cycle patents are referred is included under the latter category. On October 20 there were 10,717 applications for all kinds of patents on hand, of which 1,256 were in the division which includes cycling inventions. Some idea of the multitude of applications for patents that pour in upon the Government devoted to this work may be gained from the above figures. The present force is capable of granting but a limited number of patents per week, so that the work continually runs behind.

During the month of October, fifty-seven patents relating to cycles and accessories were granted. Of course, many applications are rejected for obvious reasons. The patents for cycling inventions issued the past month were as follows: For bicycles entire, 10; motor cycle, 1; wheels, 1; brakes, 1; luggage-carriers, 1; saddles and appliances for attaching same, 8; tires, 5; pedals, 1; bell, 1; locks, 2; apparatus for repairing tires and punctures, 4; lamps and lamp-brackets, 2; bearings, 4; handle-bars and handles, 5; sprocket-wheels, 2; gears, 2; footplate for pedal, 1; cyclometer, 1; supports, 3.

FORCING FOWLERS FORWARD.

Fowler emissaries are up and doing. A contract with the Lee-Clarke-Anderson Company, Omaha, Neb., for 2,000 Fowlers, and the agency for the State of Nebraska and slices of Kansas, Iowa and South Dakota, and another with J. A. Johnston, Pittsburg, Pa., for 1,000 wheels and the Fowler representation in Western Pennsylvania, are among the big results already reported.

HARD-RUBBERED HANDLE-BAR.

A handle bar covered with hard rubber will be one of an Orient origination for '97. It is said to produce a very rich effect. The "pitch line gearing" will be another new feature. The makers of the Orient, the Waltham (Mass.) Manufacturing Company, believe that when this style of chain and sprocket gets about, bevelled gears will receive a setback.

"QUALITY AND PRICES RIGHT."

"Everything from frames to coasters" will continue to be the policy of the Moore Cycle Fittings Co., whose factory is in Harrison, N. J., near Newark. New designs for the year 1897 are ready, and all are treated of in the Moore catalogue just issued. "Quality and prices right" is the significant phrase which is coupled to the announcement of new designs.

SPREADING LYNDBURST GOSPEL.

McKee & Harrington's travelling men started on the road this week, to boom the Lyndhurst for '97. Paul Grosch is covering New England, J. E. Travers is looking after New York State and Pennsylvania, and Joseph McKee is on an extended Southern trip. Additional salesmen will be sent out in a few weeks.

KOKOMO—SHE BEAR.

Kokomo! Queer name for a tire, eh? Not now so odd sounding to those tire users who have grown accustomed to it during the last year, but still odd enough to quickly attract the attention of those who happen across it for the first few times, a point of benefit to its makers, the Kokomo Rubber Company. Nearly every one in the trade knows that the tires take their name from the town in which they are manufactured, Kokomo, Ind., but few know that the original Kokomo was an Indian chief, and that the term itself means "She bear." The rubber company will make the most of it. They have adopted a bear for their trademark, which will hereafter appear on all of their tires and other goods. No pun is intended by the remark that it may be well to bear it in mind. The Kokomo people have mapped out an aggressive policy, and mean that Kokomo tires shall enter into the calculations of all who have need for tires. They do not purpose "educating the public," but will supply whatever the public desires, either single or double tube tires, with either rough or smooth tread. The tires are hand made, and the method of construction is such, the makers explain, that they are not easily punctured. No soapstone is used in the single tubes, rendering repairs the easier when they are necessary. The factory is well equipped with modern machinery, and is such as assures proper facilities for both quality and quantity.

Slade, Hipp & Meloy, Nos. 300-302 Wabash avenue, Chicago, are general selling agents for the tires, Will F. Davis being the representative of the company.

THEY WANT AMERICAN WHEELS.

A Continental (Italian) agent is open for negotiations for American wheels. Address C. Foreign, care THE WHEEL. Propositions held confidential and will be forwarded.

Wanted—100 wheels of good reputation from America by Theodore J. Gort, Holbok, Denmark; reputation and status unknown to THE WHEEL.

Five hundred wheels of good, medium or first-class grade are wanted by a firm in Holland. Must be 1897 wheels. If negotiations are satisfactory, order may be run up to 2,000 or 3,000. Cash will be paid. Address A, Foreign, care THE WHEEL. Propositions held confidential and will be forwarded.

A Continental (Dutch) agent is open for negotiations for American wheels. Address B, Foreign, care THE WHEEL. Propositions held confidential and will be forwarded.

EVERY NICKELPLATER INTERESTED.

Each year along about snow time comes the annual shower of catalogues. One of the first drops of the '97 downpour comes from Maxwell M. Mayer, of No. 335 East One-hundred-and-seventh street. He has produced a modest little sixteen-page book, in which are described the improvements recently made in the construction of his well-known dynamos. In addition to letters from well-known manufacturers which testify to the merits of the Mayer dynamo, the catalogue is replete with instruction and recipes which will be found valuable by the nickel plater.

TWO OF THIS KIND.

J. W. Grimes, the Cleveland midget who weighs 400 and odd pounds, will have a partner to share the gaze of the public next season. Lozier & Co. have found another featherweight and will have him go the rounds with Grimes on a Cleveland tandem.

ROUND BOSTON.

Boston, Nov. 16.—Edward Plows, London manager of the Fowler Cycle Company, was in the city last week on a visit to Manager Larson, of the Boston branch of the firm. Mr. Plows is one of the tried and true men of the Fowler Company, and one who is making the Fowler popular across the pond. In reference to the talk of the English manufacturers regarding the importation of so many American wheels into that country, he says that the English have discovered that the Americans are beating them on making bicycles and that the English manufacturers are doing all they can to injure the sale of American wheels in Great Britain. He speaks very encouragingly of the outlook for the business in England for the coming season.

Harry F. Johnson is in the city to represent the Morgan & Wright tires for the coming season. He was for nine years prominently connected with the "Chicago Tribune," and was cashier of the Chicago Athletic Association.

W. L. Chaffee is here with the '97 model of the Quaker wheel, made by the Penn Manufacturing Company, Erie, Penn. He says that it is not the plan of the Quaker to "play Quaker" during 1897, and that New Englanders will soon discover the truth of the statement.

Among other trade visitors here are G. Y. Patterson, representing the Richmond (Ind.) Bicycle Company, and Frank T. Fowler, of Chicago.

W. L. Abbott, president, and Henry Crowther, manager of the Duquesne Bicycle Company, of Pittsburg, Penn., were also here last week. Possibly the object of their errand will be learned when the season is real lively and the Duquesne wheel is brought to the notice of Bostonians.

CYCLE SKIRT INJUNCTION.

Lynn, Mass., Nov. 14.—Mrs. Ellen M. Hoey, of this city, who filed an interference in the case of Mrs. Bygraves, of England, for a patent on a cycling skirt, has received information from her attorney that her claims have been allowed, and she is admitted to be the inventor, having perfected the device some two years before the application of Mrs. Bygraves. The Englishwoman, it will be recalled, made a flying trip to this country some month ago and disposed of her American rights to Hulbert Brothers & Co., of New-York.

Mrs. Hoey is about to file another application for a patent on a device that will entirely do away with the use of bloomers.

COUPLE OF TIGERS COMING.

It is fairly certain that not a few wheelmen will next season be riding Tigers, not the four-footed kind, of course, but the two-wheeled article being manufactured by the Stoddard Manufacturing Co., of Dayton, O. Both high and medium grades will be made, and the reputation of the concern in other lines warrant the belief that they will do well in their cycling venture. There will be a Tigress, too.

MIXED UP.

C. M. Fairchild, manager of the New York Tire Company's Chicago office, who has been confounded with another gentleman of the same name interested in the Standard Tube Company, Toledo, desires it known that he is still talking New York tires at the same old stand, No. 345 Dearborn street. He is not in any way connected with the Toledo concern.

One-armed riders, strange to say, are much less numerous than one-legged ones.

TELLS THE STORY OF DISTANCE.

While people are prone to marvel at the change—at the wonderful improvement which has been wrought in bicycles within the last few years—they are equally prone to overlook entirely the manner in which most of the accessories have kept pace with the bicycles themselves. Saddles, lamps and bells are included in this category, but of all the accessories the Veeder cyclometer of to-day splendidly typifies the point here made.

Five or six years ago all mileage recorders were big, heavy, cumbersome instruments as large as a child's hand and approximating three pounds in weight; they were suspended from the axle of the wheel, and the dial was balanced or held face up by a weight or pendulum which weighed some two pounds. They cost from \$5 to \$10. Alongside of one of those old-timers the Veeder is comparatively microscopic. It is not quite as large as the average man's thumbnail and weighs but one ounce. It is a dainty little creation, and tucked on its perch on the fork-side is inconspicuous as can be. The movements are direct and positive. The reducing mechanism is a very simple and ingenious compound differential combination of gears which has no small or delicate parts, and yet occupies a small space. The figures are large enough to be read from the saddle. They register 1,000 or 10,000 miles, and then repeat. The right hand ring shows fractions of a mile, divided into eights by figures and into thirty-seconds by graduations on the edge of the ring. But, if preferred, this ring is divided decimally like the other rings.

Each cyclometer is numbered and a record kept of its sale as faithfully as if it was a \$100 bicycle, instead of an article listing at \$1.50. A great number have been shipped abroad, not only to Great Britain, but to those countries in which the metric system prevails, and, not content with the kilometre register, the Veeder Manufacturing Company is now at work on an instrument that will record Russian versts. The factory in Hartford, Conn., has a capacity of from 2,000 to 3,000 cyclometers per day. Two hundred hands are employed.

TEMPLE'S PETS.

They are neither dogs or cats or horses, but bicycles, as those who know the Ralph Temple Bicycle Company, of Chicago, might suspect. The "pets," as Temple affectionately calls them, constitute his line of wheels for juveniles, the Messengers, as their name plates inscribe them. In introducing them the Temple Company voices a sentiment which only last week THE WHEEL exploited editorially, that is, "the dearest experiment in the world is a cheap wheel for boys and girls." As they say, handle a juvenile line of the right sort and "every child in town will be talking about them; it is one of the best advertisements that can be obtained."

NOT GENERALLY KNOWN.

In cataloguing their wood handle bars the Fairbanks Wood Rim Company say:

"It will be of pleasing interest to members of the League of American Wheelmen to know that Mr. Sterling Elliott, president of their organization, is the originator to whom cyclists are universally thankful for this addition to their comfort." An item of interest that is not generally known.

A WASHINGTON BOARD.

The Washington (D. C.) Board of Trade has reorganized with L. B. Graves, president; J. Hart Brittain, vice-president and treasurer; John Werner, secretary. A local cycle show is in prospect.

OLD, HONORED AND PROSPEROUS.

In the first flush of youth business institutions, like individuals, are prone to make over-enthusiastic claims for their product. Some of them, indeed, seem to have taken to heart the Election Day admonition of a political leader to his lieutenants, "Claim everything," and to fight it out on that line forever and aye. Usually, however, firms and corporations, like individuals, see the folly of it as their years increase, and tone down their bugle blasts. Such claims as they then make are the more respected because of it. This is leading up to the claim of the Gendron Wheel Company. "We claim to have produced," they assert, "not only the easiest running bicycle on the market, but the one in which the bearings are the longest lived."

The Gendron is a concern both old and honored, long since past the boastful age. It is not for any publication to pass judgment on

their claims, but it is fair to say that their age and position entitle them to every consideration.

"We have for years made an exhaustive study of ball bearings," they explain, "and as a result of experience and experiments have adopted such a pitch of cones and such an angle of balls as give not only a purely rolling contact to the balls, but eliminate all wedging of the balls between cups and cones when under pressure. The line of pressure in our bearings is so near the perpendicular as to give the same result, and at the same time afford free and delicate adjustment."

Of course these bearings will be a feature of the '97 Gendrons, which will also have the distinction of having wood handle-bars as the stock bar. These are the specifications in detail:

Frame—Depth to centre of crank shaft, 24 or 26 inches in men's wheels, 20 or 22 inches in ladies' wheels; seat base, 44 inches in both;

centre of crank shaft, 1½ inch below hub centre; seamless steel tubing throughout; head tube, 1½ inch; centre tubes, 1½ inch, except the upper bar in ladies' wheels, which is 1¼ inch; rear forks, ¾ inch; D shaped, rear stays, ¾ inch; telescoping reinforced and flush head connections. Fork—Double steel plate crown with wide seamless blades. Wheels—28 inches in both models; Gendron new barrel hubs; all bearings are ball-retaining. Tires—Fitted regularly with Morgan & Wright quick repair tires or Hartford single tube tires. Pedals—The King pedal. Gear—Men's wheels geared regularly to 70, ladies' wheels geared regularly to 66½. Tread—5 inches. Chain—¼-inch hardened solid block, highly finished chain. Saddle—Sager's best saddle. Handle-bar—Fitted regularly with adjustable wood bar or ram's horn wood bar if desired, or option on up-turned, down-turned or ram's horn steel bar. Weight—As shown in cut, men's wheel, 23 pounds; ladies' wheel, 25 pounds. Finish—Regularly in black enamel, with delicate gold ornamenting and striping, or option on maroon with gold or orange, with silver ornamenting and striping.

TO REVIVE THE PREMIER.

Bridgeport, Conn., Nov. 14.—Within a month it is safe to predict that the now idle factory of the Premier Cycle Company, on South avenue, will have been placed again among the live industries of the city. Negotiations are now in progress and rapidly going forward toward a successful conclusion, which will have the effect of opening the factory and giving employment by the middle of December to probably 150 persons. Times have improved since election, for the change for the better in the affairs of the company is ascribed to nothing else.

J. C. Cassidy, of New-Jersey, who was appointed receiver of the company, readily acknowledged that an effort was being made to effect a reorganization of the concern. He said that it had been in progress for some time, but that for weeks prior to election, no headway had been made. Now, however, a number of moneyed men had been interested, and he expected that in a week a meeting would be held and his purpose of reorganizing carried through. Immediately after this the courts would be asked to discharge him and the company would resume business activity. This would be about December 15, he thought.

HELP FROM HATCH PATCH.

Since the inception of pneumatic tires the puncture repairing problem has been the hardest with which the inventor has had to grapple. Many devices have been offered, some of them very ingenious and some that never went beyond the Patent Office. As a handy contrivance the Hatch Bicycle Patch easily ranks as one of the good things. It consists of a steel spring clamp and a rubber washer that slips over the tire in its deflated state. On inflation the action of the tire is such that it causes the clamp to bind itself tightly over the puncture, closing it securely with a rubber washer. In connection with a repair compound such as Vimoid it is invaluable, affording the means of continuing the ride no matter what the size of the puncture or cut might be. The price is 25 cents, and the address of the maker the Hatch Bicycle Patch Company, No. 135 Summer street, Boston, Mass.

WHERE JAMES WAS GOING.

Mrs. Percival was known to her neighbors as a person very religiously inclined. She labored hard to bring up her son James, twenty-two years old, to follow the straight and narrow path.

The crisis in the affairs of the Percival household came with the purchase of a bicycle by James. On the first Sunday after he had learned to ride he donned his suit. Mrs. Percival remonstrated, but in vain.

A little later the elder Percival came into his wife's room and found her in tears.

"Where is James?" he asked.

"I don't know," replied the fond mother, between her sobs. "The last I saw of him he was going down the road bound for Hell on a bicycle."

GROWN UP IN GRAPHITE.

The Joseph Dixon Crucible Co., Jersey City, N. J., miners, importers and manufacturers of graphite, plumbago and blacklead since 1827, have better stock and better appliances for making all kinds of cycle chain graphite than any other company, is the way the Dixon people make their annual bow. Sticks of special lengths are supplied to manufacturers of wheels and to repairers at reasonable prices. Goods are also specially prepared with firm's labels for wholesale dealers.

TOLD IN TOLEDO.

Some of the Things Going on in One of the Greatest of Trade Centres.

Toledo, Ohio, Nov. 16.—Word has been received here that Fred Peters, who left here recently for Australia, is dangerously ill in Honolulu. Mr. Peters was with the Viking company last season and made an enviable reputation as assistant business manager. This year he was offered a lucrative position in Australia, under the France company. It seems that Mr. Peters contracted a severe fever on shipboard and was carried off the boat when the Sandwich Islands were reached. He is now lying in a very critical condition in the hospital at Hawaii.

The Toledo Cycling Club is considering the feasibility of holding a cycle show one week after the close of the New York show. The club, which is the oldest cycling organization in this town of wheels, gave Toledo its first cycle show last season, at Memorial Hall. It is probable that the same location will be utilized for the show to be held next February.

Superintendent of Agencies W. L. Laskey, who also has charge of the travelling men for the Yost Manufacturing Company, has been getting his tourists in shape, loading them with samples and models of the Gold Crank Falcon for 1897. Work on the new machine will not start up on a very large scale until the return from Europe of Mr. Yost.

The Yost people were early missionaries, and were early on the ground in Europe and Australia. At the present time they have an agent who is systematically "doing" Central and South America. He left San Francisco very quietly last summer, and, sailing southward, began a journey that will embrace every capital and important town in the divisions mentioned.

The amalgamation of the Kirk-Young and the Toledo Manufacturing Company has created an exceptionally strong company here, that at once takes rank with the largest. It will be remembered that the Kirk-Young Company made the popular Yale wheel last year, while the Toledo confined its attention to the Ouida, a wheel for ladies. It also supplied an enormous number of forksides to other wheel-makers. The good qualities of the two machines will be combined and retained by the Kirk-Young Company, strengthened by additional capital and aided by a good season's experience.

The '97 Viking is practically a new machine in everything but its graceful lines. The new flush joints, hubs and other changes, however, give the '97 model new elements of beauty. Two grades of Vikings will be marketed. The first grade will carry the well-known Viking nameplate in gold, while silver will be used for a slightly cheaper quality.

Taking all in all, it may be doubted whether any concern in Toledo had as profitable a season in 1896 as the Gendron Wheel Company. It is reported that by means of its excellent foreign mercantile channels, it successfully marketed its product when the midsummer slump came, and was in splendid shape for next season, while many other makers were mournfully looking at overflowing warehouses. This pioneer company also put out its accustomed quota of wheels for the American trade, and its six-pointed star will doubtless cover still greater territory in 1897.

The success of the Toledo Metal Wheel Company with its Rugby wheel last season was a pointer to its wide-awake managers on the growing importance of the juvenile trade. The company will therefore increase its efforts along this line during the coming season.

In the allied trades Toledo will make a much

greater showing next season than she has during this year. The Snell Cycle Fittings Company resumed work promptly after election, and now has some 700 men at work. The concern is working full time in all its departments. This season the Toledo Drop Forge Company has trebled its working force of 1895-6, and has all the orders it can look after at present.

A full complement of men is at work at the plant of the Brewer Seamless Tube Company, and the concern is rushed with orders.

The American Weldless Steel Tube Company managers report to THE WHEEL that they felt the result of the election very favorably, and orders came in with a rush. The working force has been largely augmented in consequence.

The Toledo Tube Company, which makes rolled tubing only, reports a surprising activity in its line, which would indicate that sheet-steel tubing is a factor that the cold-drawn tubing companies must soon reckon with.

The Standard Tube Company, which is turning out an excellent brazed tubing, also is a very busy place, whose product seems to have "caught on."

The Toledo Handle Bar Company, which began making wooden handle-bars last season

TELLS YOU THE DISTANCE.

Oliver, Straus & Co., No. 23 Park Row, this city, have added the Haney cyclometer to their line, and the merits of this article and the quotations to dealers should assure a large sale.

The instrument registers 10,000 miles, and weighs but one ounce. It retails for \$1.50. The illustration is the actual size of the cyclometer.

as an experiment, discovered it to be an extremely practical scheme, and expects to greatly increase its output during the present working season.

In addition to the above the trade will hear a great deal from Toledo's two well-known specialty company. Arlington U. Betts's "Red Cross" specialties were shipped to almost every civilized country on the face of the earth last season, and he is preparing for a greatly increased trade this year.

SOUTH AMERICAN POSSIBILITIES.

H. R. Gilbert, of E. C. Sterns & Co., who journeyed to South Africa as a member of the commission of American manufacturers which visited South America upon the invitation of the various Republics, under the auspices of the National Association of Manufacturers, has returned home. He reports having found that there is less known about North American bicycles and bicycling in South America than in any section of the world where wheels are ridden. He found the field in most respects very unpromising at the present time, but in several of the South American cities he noticed a progressiveness which augurs well for the future. This is particularly true of Buenos Ayres, in the Argentine. Mr. Gilbert found an extensive club of wheelmen there, the Club de Velocipedistas, Avenida de Mayo 644. In this club are a number of English-speaking riders.

WOOD WISDOM.

What Many People Do Not Know Regarding How Wheel Rims Are Made of Wood.

Undenably the wood rim is a dry subject, dry from whatever standpoint it might be viewed, it would appear. But the catalogues of the principal makers of wood rims are proving how thought and money can give lustre to a seemingly prosaic subject. Of this there is no better or fresher illustration than the printed spokesman of the Fairbanks Wood Rim Company, of Bradford, Penn., which is little more than off the press. The spokesman is well dressed; everything about it is high grade and in good taste. The cover is a white, soft-grained hand-made paper, with a cream-colored embossing of the title piece. The letterpress is on enamelled paper. There is a generous margin around each page of type matter, and on the margin appear those delicately tinted little sketches about which there is such a charm. Like the full-page "half-tones," they depict different phases of woodcraft and wood-rim manufacture. The letterpress is well written and dignified; exceeding care has been given its grammatical construction, and, withal, it is so plainly worded that all may understand. After one has read the book he cannot but have learned much of the manner of making the rims, and of the effect on the wood of such processes as cutting, kiln-drying and steaming, none of which are employed on the Fairbanks laminated rim. He was a clever man who wrote the catalogue. He indulges in a fine flight in the chapter on "Pennsylvania Maple—Its Habitat." Here it is:

"The touch of the glamour of mystery and romance which has always been thrown about forestry and the craft of the woodsman and the charm which surrounds the wooded wilderness are so closely interwoven with the origin of one of the most wonderfully perfect productions which have ever come from the hands of the workers in wood that it may not prove uninteresting to the users of the rims which bear our name to know something of their history, a story which begins so many years before the process of the mechanical construction is brought to bear upon the great logs of the finest maple which the earth produces.

"As the Fairbanks Wood Rim Company enters upon the fifth year of its successful business history, its management takes great pleasure in the announcement of its holdings in lumber territory, which amount to fully 150,000 acres of the noblest virgin forests of rock maple, etc., which have ever echoed to the ringing blows of the woodsman's axe. For almost centuries have these trees solidified into the flawless lumber of unswerving grain which the saw reveals, and thus, instead of depending upon the chance purchase of the ordinary lumbers of commerce in the open market, this company possesses practically exhaustless forest acreage from which to select the material best calculated to enhance the absolute and unchanging uniformity of our rims."

The catalogue compiler makes out a strong case for the Fairbanks laminated rim. He tells exactly why this built-up article is superior to the one-piece rim, and in another chapter, and as cleverly, tells why the Fairbanks one-piece rim is better than others of the kind. He does it in a clean, clear, convincing style. There is no unwholesome braggadocio or bluster in his work. It covers some thirty-one pages. It is worth reading. It is instructive. It handles the subject thoroughly and well. It is a work that redounds to the credit of the Fairbanks people.

COMPARISONS.

How the Horse Show Caused Them to Be Made Between Horse and Cycle.

Up the Boulevard, separated only by the width of the street, directly opposite each other, are the largest cycle academies in New-York and the swellest equestrian educational institute. It stands to reason that horse versus cycle arguments are not difficult to stir up in that immediate vicinity. Sunday, after the Horse Show, a dozen wheelwomen stood on the grass midway between the two establishments, and this resulted:

"Did you all go to the Horse Show?" asked a broad-shouldered girl in a Princeton sweater.

"Of course," answered all of them in chorus.

"It's the only thing to do," added a frill-looking girl in a long skirt, "though I must confess I found the horses most uninteresting this year. I do wonder why it was. Ever since I came out!"

"And that was four years ago," interrupted one of her companions, with a malicious laugh.

"I've always enjoyed the Horse Show more than anything else, except the opera season, of course," she went on, not noticing the other.

"That's easy enough to explain," said the Princeton champion. "Since bicycles have come into universal use the horse's day is over. No true wheelwoman could feel any interest in the beast after having known the joy of taking a fifty-mile run on a bicycle over a first-class road such as they have in some parts of Jersey. Now, I went to the Horse Show just because it was the proper thing to do, you know, but I assure you I didn't take the slightest interest in the horses. When I used to ride one myself I was wild over what went on in the ring, and I spent hours at a time with the horses in their stalls as well, and used to talk with the grooms and make them tell me all of the good points of their horses. But, dear me! this year I merely promenaded around three or four times, barely glancing at the ring. And as for the people! Why, I looked at one woman all togged out in velvet and sables, and thought: 'Oh, if you only could know how much better you would feel in a short skirt and sweater!' and at a man in his stiff shirt front and carefully creased trousers, wondering if he knew the comfort of golf stockings and knickerbockers. Really, I think the Horse Show will pass into history in a few years."

"What nonsense you do talk," put in a slender girl in an imported suit. "Now, I'm very fond of cycling, but I wouldn't give up my horse for anything. The wheel cannot be compared in the same breath with the horse, and the horseless age is by no means upon us and never will be so long as man reigns over the earth. Think what this animal has done for us. It has led nations to great victories against each other. It has brought health to thousands of men and women, and it has carried thousands from some plague or other. It has put the very food in our mouths, for how could the farmers till the field without horses? Can a man plough with a bicycle? I rather think not, and when it comes to pleasure the horse can certainly bring pleasure and sunshine and air to the countless multitude of invalids who couldn't think of getting into an electric or steam car, much less mount a bicycle. I went to the Horse Show, too, and I must say that I was more carried away with it than ever. The sight of a dozen

saddle horses prancing around in the ring brought back all my love for this wonderful animal and made me long for its companionship. And then I couldn't help noticing the riders. Not only their minds but their hands were also occupied in mastering the horses under them; but still they looked so free from care, so full of life, health and happiness, even those who didn't take a prize. There is no such thing as a horse face, you know. There is no reason for anybody saying that cycling will take the place of riding or driving. Such a thing is absurd. People who can afford to keep horses generally own a wheel, too, and I'll be willing to wager a good deal that they are fonder of their horses than their wheels. The horse will never be laid on the shelf until the millennium. That's coming when all the earth is at peace, I believe, and until then there will be war, and so long as nations fight each other the horse will continue king over the wheel."

"Your argument is rather interesting," spoke up a girl in a blue sweater, set off with a large bow of Yale ribbon, "but did you women ever stop to think that the cobble

generally take up a thing as they are taking up cycling, it is pretty sure to become universal. Now I don't mean to say that the time is coming when we won't see some horses in use, but I rather fancy that in a few years a man or a woman on horseback will be as much an object of comment as a person, especially a woman, on a wheel was ten years ago. It will be a great day when wheels become a universal means of locomotion where no great distance is to be travelled, and I believe that that day will come in the woman's century, which is the next, so wise men and women say."

"Oh, the horse isn't in it any more, notwithstanding society made such a fuss over the show which ends to-day. Society didn't do this because it is interested in horseflesh, but because it had its new fall clothes and wanted to show them. Officials in all of the principal cities of this country are beginning to look out for the cyclists, and their efforts, combined with those of the cyclists themselves, will soon bring about such road reforms that nobody will ever think of climbing up on a horse's back or into a vehicle drawn by one

MAKING THE PUNISHMENT FIT THE CRIME.

Radfahr Humor's Idea of How the Military Cycle Record Could Be Broken By Employing Convict Pacers.

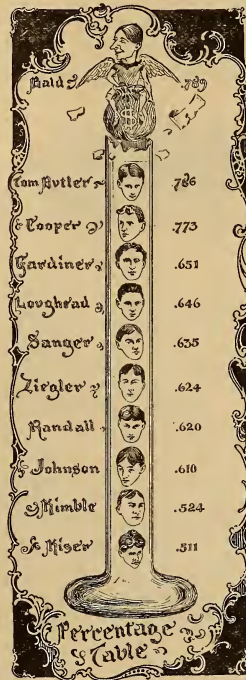

stones, Belgian blocks, and horrid dirt roads in this city are here for the benefit of the horse? When you are awakened from your early morning nap by the wagons of the butchers, bakers and milkmen rattling over the cobble stones in front of your house, say, to yourself, 'If it was not for having to keep those stupid horses from slipping and stumbling the street would be smooth and noiseless.' When you get into a stuffy, crowded street car some morning console yourself with the thought that as soon as the horse has passed out of use you won't have to ride in cars. There will be proper ways and paths provided for safe locomotion on wheels. Electricity, the cable, steam and the bicycle are driving the horse to the wall."

"You are right," interrupted a stout woman in home-made bloomers. "It is the middle class that rules the world, and the middle class says that the horse must go. Very few people in this class can afford to keep a horse, but most of them are able to own wheels, and, furthermore, working people are beginning to use bicycles, both for pleasure and for business, right along nowadays. When people

of these stupid, untrustworthy animals. A great deal has already been done for those owning horses; and I think that an asphalt road should be laid especially for cyclists, on which they could ride in the Park without endangering life and limb by being mixed up with other vehicles. An engineering friend of mine suggests such a road fifteen or eighteen feet wide on the Eighth avenue side of the Park or on the reservoir walls. That would be charming, because a road could be made to lead from there out on the aqueduct."

"And let me tell you something else," put in a jolly little girl. "I tell you, we wheel people are getting to be big bugs, and my brother says that the politicians are all anxious to make up to wheelmen's organizations. That shows what a power the wheel is getting to be. Did any of you ever hear of horseback riders being a political power?"

"Nit, nit," said the girl in the Princeton sweater. "It's no use to waste more time talking about this subject. The horse's day is almost done, and he will probably pass into sausage meat during the first half of the coming century."

Facts and figures cannot be made to lie.

The juggling of the returns won't win the coveted position.

Races can be won on the path, but not on paper.

Others do the talking, but Bald, the White Flyer, wins nevertheless.

THE BARNES CYCLE CO., Syracuse, N. Y.

Kindly mention The Wheel.

STATEN ISLAND

If in the Metropolitan district there is a wheelman who is not familiar with the perfect roads and charming views of land and sea to be found on the nearby and historic Staten Island, he is, indeed, an oddity.

There is nothing monotonous about Staten Island. Do you like sandy beaches? You will find them there, with a modest little surf breaking on the shore under favorable winds. Do you admire thickly wooded hills with old, time-worn and moss-covered bowlders? They are to be found a mile or two from the shore. Are you an enthusiast over old, picturesque, historical houses? Staten Island is rich in them. Do you care only for fine roads? They abound on Staten Island. Are you lazy in your riding? There are places along the Narrows where you can spend a day in one spot with your pipe and something to read without being bored, and every time you look out upon the water, a hundred feet below, your eye is delighted

launches plying back and forth between them and the shore.

Not the least pleasant feature of a trip to Staten Island is the ride down the Bay. It is five miles from the Battery to St. George. If you are fortunate in the rush from the ferryhouse to the boat, you have secured one

Billtop House, Tottenville.

of the campchairs and can, with your pipe and in comfort, enjoy the breeze and the rapidly changing pictures, as the boat swings out into the river and points for the Bay. To the left is the antiquated Castle William, nicknamed "The Cheesebox."

Then comes the more modern Statue of Liberty, which some may not know is a Government lighthouse. Clustered below the statue are vessels from every portion of the globe, dirty-looking schooners, trim, handsome ships and dingy tramp steamers, the latter looking so low in the water and so frail that one wonders how they can weather a really severe storm. The ride is so interesting that before you know it you have passed Robbins Reef light and the mournful-sounding bell buoy, and the high, green hills of Staten Island are before you.

Landing at St. George there is a choice of routes. Taking the road to the right, a slight climb will bring you to the Richmond Terrace Road, lately damaged, alas, by that necessary means of locomotion for unfortunate without bicycles—the trolley. After a few minutes' riding past old hotels which have long since seen their prime, and a few old Colonial houses, which appear so comfortable and homelike, one of which is shown in an illustration, Sailor's Snug Harbor is reached—the most interesting feature of the North Shore Road. Founded early in the century, and located in what is now the retail section of New-York City, the founders awoke one morning, many years ago, to find the property so valuable that the income was more than sufficient to pay all expenses of

Black Horse Inn, New Dorp.

Colonial House, New Brighton.

with a new picture. A schooner, with all sail set, comes majestically up from the Lower Bay; an ocean greyhound follows, hovering for a few minutes at Quarantine, almost at your feet. Small sail and steam yachts are constantly coming and going. From the excursion boats bound to or from Coney Island and Rockaway, come faint strains of music. Luckily for you, they are faint, if you have a musical ear.

Further up the Bay, almost where you landed from the ferry, several of the White Squadron ride at anchor, with busy little

Sailor's Snug Harbor.

the institution, and still leave a handsome surplus. Removal to the Staten Island site followed.

Lucky is the sailor to-day who thinks he is slightly incapacitated for work, and can prove that he has sailed under the American flag for five years or more! He can spend the balance of his life at ease, free to come and go at will. From this point, the road continues fair, and one catches frequent glimpses of

lowing the shore you pass through Stapleton. A short distance past the station you will see on the right the Marine Hospital, surrounded by an extensive lawn and magnificent trees. At the further end of these grounds a road leads to the right. This is Vanderbilt avenue, a favorite route for wheelmen bound for points along the main thoroughfare of Central Staten Island, the Richmond and Amboy roads. Continuing along the shore road, you pass through Clifton and Rosebank, and, turning to the left, enter the gates of Fort Wadsworth. You are stopped by the sentry at the gate and politely requested to leave your camera in his charge, as for obvious reasons Uncle Sam does not wish photographs taken of his means of defence. This fort is well worth visiting, if only on account of the grand view of the Narrows from the promenades on top of the earthworks.

the road, and the most southerly point of New-York State. From here a ferry will land you at Perth Amboy, if you wish to continue the ride into New-Jersey. In Staten Island Sound, at this point, is the "ships' graveyard." Old, ghostly looking hulks, in all stages of ruin and dismantledness, give a

At Huguenot Park.

Kill von Kull and the opposite shore, provided the wind is not blowing the dense smoke from Constable Hook in his direction. At Port Richmond a ferry connects the island with Bayonne and the Hudson County Boulevard. From this same point a fine stretch of macadam, the Clove Road, will serve as a short cut, if you have come to the island via the Bayonne ferry and are bound for Garretson's or points beyond. If you intend to be thorough in your investigations you retrace your way to the starting-point, St. George. Passing below the new Hotel Castleton, you gradually climb slight rises until a beautiful view of the Bay and the Narrows delights you.

Continuing your way, you fly down the steep hill into Tompkinsville. As the road at the bottom of the hill turns sharply to right and left, have your wheel under control. A cyclist was killed there this summer through carelessness in this particular. Fol-

Returning to the gate and reclaiming your camera, you can ride back by the same road, New-York-ave., to the Marine Hospital, and take Vanderbilt avenue, previously mentioned. Vanderbilt avenue in about a mile joins the Richmond Road, and from here to Tottenville there is no mistaking the route, for at doubtful crossroads the welcome signboards give you mute but pointed directions.

Every mile is interesting, with charming scenery, picturesque old houses and a road so smooth that your entire attention may be given to the passing landscape. There is small need of discomfort from thirst or hunger, as there is an abundance of inns on this old road. Some of them are quaint and weather-beaten, their sleepy old bonifaces attending your demands in a perfunctory fashion. Others are more up to date, with signs supposed to have irresistible attractions for cyclists, and conveniences in the way of stands for wheels. Tottenville is the end of

most forlorn aspect to their immediate neighborhood, and very fruitful subject for the camera. If you have taken your time in the ride to Tottenville, and find yourself in a hurry to return to New-York, the railroad will give you and your wheel good care. M.

RUINING LITERATURE.

Another "industry" is being totally ruined by the bicycle. This time it is the blood-and-thunder literature foundries. The new departure of cycle-mounted American District Telegraph boys for the prompt and expeditious delivery of messages has proved very satisfactory to customers, the managers of the office say, and has, moreover, had the effect of making quite a salutary change in the methods pursued by some of the boys.

It has been a standing joke for many years—since, in fact, the establishment of the district service—that a considerable part of the delay in the delivery of messages sent by hand was due to the propensity of the uniformed messenger boys to play marbles, pitch pennies, participate in street fights or read dime novels.

The introduction of the wheel into the messenger service has pretty thoroughly done away with even the pretext for this charge, for a messenger having in his custody a bicycle which he is under a bond not to lose cannot with any degree of safety tarry on his course either for the purpose of perusing stories of hairbreadth escapes or bloody Indian encounters, or to put to a practical test his dexterity in the handling of miggs and alleys.

On the contrary, it now sometimes happens that the emulation between two cycle messenger boys going in the same direction with messages for different persons leads to tests of speed, with the result that such messages are delivered in an almost incredibly short space of time, judged by former standards.

The sale of dime novels of the blood-and-thunder variety has been somewhat on the wane of late, and dealers in these literary commodities ascribe the falling-off to the decreased demand of the district messengers, who were among their most steady and profitable patrons. The gratuities given to district messengers kept them usually supplied with small sums of cash, and these items of revenue could be devoted to the purchase of cheap literature.

SCORCHED THEN CHUTED.

Saint Peter was sitting outside the partly gates, dictating a letter to the recording typewriter angel, while two of the cherubs were playing jackstones in the road.

Suddenly there appeared a figure bent almost double over the handlebar of a bicycle, and fairly making the pedals hum. Before they had time to move the scorcher was upon them; he barely missed running over the cherubs, startled Saint Peter so that he dropped his halo, and scared the recording angel into swallowing her chewing-gum.

Alighting from his wheel, he glanced at his watch, smiled to himself, muttered something about "record," and then demanded admittance.

Saint Peter picked up his halo, dusted it off, rang the bell and called out: "Front, show this gentleman how to shoot the chute!"

Then, as the speedster was led away, Saint Peter turned to the recording angel and remarked: "Down below is the one place where he can 'scorch' without being a nuisance to any one."

WASN'T UP ON "PERENNIAL."

"Are they perennial bloomers?" he asked of the pretty florist, as he selected some flowering plants.

"Sir!" she said indignantly, "this is no bicycle shop!"

And it took him some time to explain matters.

Experience does take dreadfully high school-wages, but he teaches cycling like no other instructor can.

TAKE NO CHANCES.

All wheelmen, traffic riders in particular, however, might do well to recall the words of a fine old sea captain who one day had a party out in a catboat in Newport harbor. Sailing there at the same time was another catboat, which was steered by a man who has since come to high rank in the United States Navy. The retired commander was not steering, but felt himself in command. It was a friendly race, and quite a close one; but on a certain long tack the old captain directed the steersman not to cross the Bouncer's bow, but to go astern of her. The party on board were rebellious, as undoubtedly their boat had speed and headway enough to cut across the other. But the edict was maintained, "We take no risk when sailing for fun."

Now, this small percentage of risk is what every good rider does take, while the wobbling brigade take even greater and more alarming risks. It is a matter of pride, of course, to the traffic rider never to dismount. Yet there are dozens of occasions in the crowded street when the best of riders should dismount, if only to show the others just what that old sea captain did. In his profession the old salt would take every risk; but on a pleasure sailing, none!

All wheelmen are taking their pleasure, even when riding to and from business. They are simply out for exercise or for getting home in an agreeable and exhilarating way. Hence they should not take chances of dangerous collisions because of a false pride which will not permit them to dismount when safety demands it.

"WHERE WARM BLOOD FLOWS."

A Memphis newspaper gives the following advice:

As the number of cyclists in Memphis increases, the necessity for a strict compliance with the rules of the road becomes more urgent. Always turn to the right with your wheel just as you would were you driving a horse. If you turn to the right and a driver runs you down, select from the street a large round stone and plant it exactly in the centre of the offending driver's features. After you have done this, have the driver arrested for assault and battery, and swear him into the workhouse.

In this beloved Southland, where warm blood flows in muscular bodies, a reckless driver must be prepared to whip the cyclist he disturbs before the law is invoked, and right here, be it parenthetically stated, that a chromo of James Corbett, Samson, Michael Angelo, or any other great man desired, will be given by the bicycle editor of this paper to any and every cyclist who whips in a square up-and-up fight a driver who runs him down or causes him to fall from his wheel.

TRYING THE CHEVAL CURE.

"I think," said the weary-looking man, "that I have found a way to cure my wife of the bloomer habit."

"Indeed! That's pretty hard to do in most cases."

"I know it is. It's a delicate undertaking; one that has to be conducted with the utmost discretion. Of course, if I let her know what I am trying to do it will make her angry and spoil everything. It took a great deal of study, but I have found something that will do the business. It's a little expensive, but it will be worth it."

"What are you going to do?"

"Buy her a cheval glass, so she can see herself as others see her."

A puncture means considerable when it come to a water cycle.

THE NOVELIST AND THE NATIVE.

Robert Barr, the novelist, is having a serious quarrel with fate; or, rather, he is not doing the quarrelling, but some mysterious evil genius does it for him. If there is any planet whose influence inflicts the most outrageous practical jokes upon a man, then that star has been in the ascendant during the last year or two of Mr. Barr's life. His recounting of each fresh misadventure brings tears of sympathy—and laughter—to his friends' eyes every few weeks. He has been utterly innocent of offence or even of contributory negligence in all his misfortunes.

Even when he was arrested for stealing a bicycle in Switzerland he had done his best to come to a proper understanding with the owner before riding off on the machine. Barr thought he was bargaining with the man in excellent French for the hire of the wheel for the afternoon, and he understood the price to be five francs. The native thought Barr was expressing his admiration of the bicycle in very bad French, and had responded politely that it had cost him 500 francs.

He was so dumfounded when Barr suddenly mounted and spun off that he hadn't even breath enough to call to him to stop. The man's astonishment was still greater two or three hours later when, while the country was being scoured by the police and a volunteer Vigilance Committee, Barr calmly rode up, handed him a five-franc piece, remarked that it was a good machine, and walked away.

This evidence of good faith, however, by no means cleared the culprit. It was plain to the astute natives that the return of the stolen property was only a bold bluff. The thief had been hard pressed by his pursuers, he knew escape was impossible, and he had resorted to a clever ruse to turn the tables in his favor. So Barr was arrested, and it required a great deal of argument and corroborative evidence to convince the magistrate of the innocence of his simple mistake.

WHAT IS IN A NAME?

"A good name is preferred above riches."

"Well, until recently, I was inclined to regard a good name and riches as things of equal value. For a good name is usually associated with a good bank account. It is the 'open sesame' to the cashier's till. Thinking so, I chose a good name. I took, for an example, a good and wealthy cycle-maker; faithfully strove to copy his ways, practising his peculiarities until I fondly imagined I had thoroughly taken the lesson to heart.

"The pity of it is that, just as I was beginning to reap the reward of my earnest endeavors, a harsh and unappreciative world wrested it from me."

The pale young man glanced hopelessly about the bare walls of the narrow room.

"Yes," he said, with a sigh, "I must admit that the saying is right. If I hadn't fooled with that cycle magnate's name, I'd have escaped ten years for forging it."

MINISTERS CAN SWAP.

A Baptist minister in Newark, N. J., came near losing his pastorate last week, because he was charged with the awful offence of dealing in bicycles and wearing a bicycle cap.

Upon trial before the Baptist Council he was enabled to prove that he only swapped off a couple of wheels, making a clear gain on each trade. This seemed to be well within ministerial rights, according to the Council's ideas thereof, and the minister was forthwith acquitted.

HOW WAS YOUR BALANCE

AT THE CLOSE OF THE PAST SEASON?

JUSTIFYING HIMSELF

"Yes, I am learning to ride a wheel," remarked a prominent citizen the other evening, who stood with a wheel on the asphalt in front of his Boulevard residence. The street was aglow with many-colored lanterns, dodging hither and thither, resembling in the dusk huge fireflies out for an airing.

Bells of all kinds were filling the air with their warning notes, and the street was one conglomeration of movement, light and sound. All this was passing under the very nose of said citizen, and just a moment ago a small section of it had passed over his prostrate body; so that our friend might have been said to be "strictly in it."

However, he looked unhappy, and didn't smile when a good-natured-looking neighbor approached and rallied him on his dejected appearance. "For a man who has turned a cycle enthusiast so suddenly, and learned to ride in one evening, it strikes me you look rather sad."

The person addressed sighed deeply. "This morning," he said, with a look of smothered anguish and a scornful glance at his new machine, "I was one of the few New York citizens who did not ride a wheel. I presume there were others, but I can not say so to a certainty."

The kind-hearted neighbor, who was also learning, regarded his new knickerbockers with an apologetic air and spun the pedals of his machine abstractedly.

"Yes, sir," the citizen proceeded, with a tinge of bitterness.

"It seems to me that every man, woman and child in this place has gone stark, staring mad on the subject of bicycles. At first, I was inclined to regard the thing with some degree of sympathy, and enjoyed seeing an occasional rider skim along the smooth streets; but now everything is different. The whole course of my life is changed, and you behold a middle-aged business man, with grown children, who has hitherto prided himself on his common sense (at least), forced—yes, actually forced—to make a fool of himself, and such a fool—such a portly fool." The unhappy man regarded his begoiled limbs with an air of unutterable disgust, and wiped the perspiration from his bald head.

"Let me justify myself," he continued. "My course may seem inconsistent to my neighbors, after my long aversion to the wheel; but I wish to go on record as the man who purchased a bicycle in sheer self-defence. I have been tormented for a long time with people who could talk nothing else—have been mixed up in any number of hairbreadth escapades—have been knocked down time after time in the middle of the street, only to see my scorching assailant mount his wheel and sail off with a sneer, leaving me to recover as best I could. However, the climax came to-day."

At this juncture the conversation was interrupted rather unwillingly, it must be confessed, by a large, healthy-looking lady in tan colored costume, who rode very unceremoniously and with many protests, into the curb on which the gentlemen sat. The intruder proved to be an aunt of the wheel cynic, who smiled resignedly as he assisted her to mount.

PAINT AND POWDER AND RAIN.

Her face fell.

There was a blinding flash of lightning and a deluge of rain.

"Sacre!" she exclaimed, then turned her wheel and fled.

After the shower some workmen found traces of her face on the ground, where it had fallen.

She was French, and her makeup was not waterproof, hence the fall.

BENDING AND BRAKE FIXING.

Since the introduction of wood for rims, handle-bars and other parts, repairers have had more or less to do in the line of straightening, warping and bending wood. Wood-bending is more of an art than many suppose. In bending the hard woods for handle-bars, for example, the grain is very likely to be broken unless some skill is employed. Shops that are equipped with expensive and latest improved wood-bending machinery can, of course, accomplish good results with comparatively little work. The ordinary repair shop, however, is seldom thus fitted, and therefore the following descriptions of easy methods to bend hard woods with home-made appliances may be of value:

To plank B secure woodblock A, the desired shape, as shown in fig. 1. Then fix the upright C in place, and having wooden pin F in it at the top. Next secure a checkblock D as

shown. The wood to be bent to handle-bar shape is marked E. The curve is maintained as presented. To prevent the grain breaking at the ends, the steel clasps A are bolted on as in fig 2. A centre clasp will strengthen the stick.

As regards the steaming chamber, such a one can be readily made as exhibited in fig. 2, in which B is the stand, and C, D, and E the sides, bottom and top. These are practically airtight. A false bottom E should be built inside. The size of the chamber will be governed to suit. The main steam supply pipe is signified by F, in which should be a valve as shown. The distributing pipes are best arranged as signified by H and G. It has been found better to have a pipe feed from the side as well as from the bottom, and for various reasons many steaming chambers are built that way now. Of course the selection of the wood forms an important part of the process, as in-

ferior or unqualified wood will bother. If too dry, even excessive steaming will not fit it to bend. Cracked wood should always be avoided.

Of late, owing to the cycle-parade mania, there has been some work to do by repairers in the line of fitting up wheels to carry torches. The custom of strapping or tying a torch handle to the frame of the wheel is not advisable. A number of paraders have brought their wheels to the shop and had substantial fixings put on as shown in fig. 4, in which A represents a combined cast-iron clamp and socket. These can be cast at any nearby foundry, a hole bored through the shoulder so as to hide the clamp over the tubing to the position shown, where it is held in place by either the clasp or set screw method. The manner in which the end of the torch-stick sets in the socket is shown at B. To hold the stick down firmly, and also to aid in keeping it straight, the leather strap is used at C.

They tell us the brake is to be popular again owing to the number of accidents caused by wheelmen being unable to back-pedal hard enough to stop or check their speed. But few wheels of recent make are being fitted with parts for brakes, various types of clamps will evidently be needed to attach a brake to such wheels. Those brought to the shop this season for this purpose have been satisfactorily fitted with brakes by using clamps as shown in fig. 5, in which A is the tube, B the clamp half, and C the stud. If the set-screw plan is used as in fig. 6, and it is necessary to attach it to a hollow tube, a solid piece cut from a steel rod can be inserted inside the tube marked F. This will prevent the point of the screw D indenting the tube E.

GEORGE D. RICE.

WEDDING BELL LAP.

The old gentleman—he wasn't so very old either, since he was the mile champion less than twenty years ago—was somewhat surprised to see his daughter sitting on young Mr. Wobblesome's lap.

The young people were surprised, too.

The old man was the first to recover his equanimity, and as his daughter found her feet he remarked:

"Ah, Lucy! I see your race for a husband is nearly over."

"What makes you say that, papa?" asked the girl, blushing painfully.

"You seemed to be on the last lap."

Notice of the wedding followed.

QUESTION OF SHORTENING.

The American people are beginning to see that modesty in dress is a matter of adaptation to the purposes for which the dress is worn, and the manner in which it is worn. Where a healthy amusement or a desirable method of locomotion, like cycling, calls for the shortening of the skirts, there is no necessary impropriety in the abbreviation, and it will be but a comparatively short time before this is recognized almost universally.

GET THEM RIGHT.

When all is said and done, a great many of the saddle miseries which people complain of are in a large measure due to improper adjustment. So long as riders are too diletante to use a wrench, so long will the saddle question remain unsolved. The eighth, even the sixteenth, of an inch too high or too low, too far front or too far back in the position of a saddle makes all the difference between perfect comfort and acute discomfort.

GENEROSITY'S LIMIT.

A man may be generous to a fault, but you never see him making off with the poorest wheel in the rack when he mistakes one for his own, all the same.

READING THE SIGNS.

How the Professor Sized Up the Second-Hand Sellers from the Letters They Wrote.

I wanted a wheel bad.

Not a bad wheel, you know, for I wanted a good wheel, but I wanted it very much. That's what I mean.

But I thought I couldn't stand the price of a new wheel of the high grade, so wished to get a second-hand one.

But my confidence in the human race was small after a slight (Oh, a very slight!) experience with this object in view. In fact, I doubted if there were any decent second-hand wheels or decent owners of second-hand wheels; so in that state of mind you may believe I was interested to read the poster announcement of a Professor Fuller, A. M., P. M. D., to the effect that he could read character in handwriting.

Just what I'm after, I thought. I'll advertise for high-grade, second-hand wheels and let him size up the character of the writers of my responses, and from the best I can easily select an honest offer and thus get a genuine bargain, after all.

I did it. The next day's mail was quite large and contained many alluring offers of wheels. The first one opened read like this:

"If you're after a Jimdandy high-grade wheel, see me at once. It's a restive racer built to order four weeks ago, and never ridden but once. It won the race so easy that I can't get into another race now."

I didn't want a racer, so I put that aside and opened another answer, which read like this:

"I have a good honest old roadster that cost me \$100, cash; but, owing to illness in the family, I must sell it. The wheel is all right in every respect but one—it hasn't Zip tires on; but if you will make a trade I'll have them put on at your expense or mine, according to the price you pay."

That sounded honest and straightforward and impressed me. Still, I looked at the rest, and the last one said:

"Got a Blanc wheel to offer at \$75; cost \$100. That's all I'll say about it. The only blowing I do is with the tire pump. Call and see it."

Now, the signature of those two correspondents should settle the matter. I would leave the character of their owners to the wise skill of the Professor, and at once asterisks.

Ushered into the august presence of the Professor, I felt somewhat awed by his owl-like appearance and evidence of profound knowledge as indicated by the various angles at which his whitened locks stood out.

Timidly I handed him the two signatures—"Robinson Rattleback," "Silas Groob"—and explained my mission.

"Oh, yes. Um—ah! Yes indeed," said the Owl, as he scratched his head with his claw—so to speak—and frowned at the names before him.

"Robinson Rattleback," murmured the Professor softly, as if he were mesmerizing a snake or something. Then, glancing up at me, he remarked shortly: "Want a heavy machine?"

Not particularly, I replied, in a non-committal way.

"Because this Rattleback fellow rides a heavy machine. His writing is heavy—see? His is a strong fist. He must be an old rider to have gotten so much strength into his hands. But that upward slope of the writing—that indicates too much hope."

"Hope? What has that to do with the case, pray?"

"A good deal. He has Hope so abnormally

large that he is surely hoping to sell you this wheel. Hoping so hard that he'll force a point in order to do it, which he wouldn't otherwise do. Ah, my young friend, if you were a student of graphology you'd see a great many things that cannot be discerned. Yes indeed; um, yes indeed."

And the Owl swayed back and forth on his bough—that is, his office chair—gently and thoughtfully.

"But he's careless. Even you, sir, must see by his writing that he's confounded careless. The wheel that he's been using so long is in bad condition; though, with high hope of selling it, he has doubtless polished it up well, just as he has bought a sheet of clean paper to write this letter on instead of using the back of an old envelope, as is his wont—the rascal!" And the Professor doubled his fists as he made this last plunge into Robinson's Rattleback.

"Don't buy that fellow's wheel," he concluded, grimly, and then, smiling as a Puck contributor might, he added: "If he sends it to you let it Rattleback."

I sighed. "But Groob—Silas is O. K., isn't he?"

that signature would select a wheel for the nickelplate and enamel there was on it. I can't give you the name of the wheel, but you might tell it by a beautiful bow of baby-blue on the handle-bar."

And the Owl hissed "Bah!" And I added meekly: "If you know of one in the neighborhood I'll say it for two soft drinks." And I did.

I am thankful to graphology and the Professor for the tips given me, which led to the purchase of a new wheel at a fair price, and now I'm happy.

HOW TO FEED A FLYER.

The doctor who has been responsible for Morin, the French crack's success, has this to say regarding the preparation of a racing man for a race:

"One can scarcely imagine how contrary the actual rules of training are to the laws of hygiene. This contrariety is due entirely to the views of the trainer. What a mistake, for instance, to make young men eat rare meat, such as cutlets, beefsteak, mutton,

Starting at the initial letter S, the Owl's eyes rolled along the signed ink-road till it had coasted the fancy flourish at the end, and there, putting on brake, paused to say: "He's an artist. But he's not sincere. He's trying to appear honest and get your attention. He'd set fancy borders around any advertisement he constructed, if 'twas a funeral notice, he would; but he's got too much money to make it worth your while to trade with him."

"Why! If he's got money why can't he better afford to make a big concession?"

"Can. But won't. Don't have to. Any man who has a \$100 wheel to sell and asks \$75 for it these times doesn't have to sell it. And he won't."

I felt a trifle sarcastic at the statements so positively made. "Can you judge—Old Bird, I was about to add, but restrained myself—can you judge as to the make of this man's wheel?" And I smiled a cold smile as I thus rebuked him.

But he didn't rebuke worth a cent. Simply replied:

"Yes; I see the wheel in my mind's eye, as I look at this writing. The man who wrote

etc., for the purpose of increasing their strength. There is nothing more opposed to the teachings of physiology. Notice the beasts of draught and burden, the horse and the ox, for example; they do the most exhausting muscular work, and have no need of flesh.

"Vegetables are much better than meat for the racing men. Again, even in observing the strictest rules of hygiene, training ought to be moderate. That is the way to remain a long time in the field and escape the fate of the champions of the past, who could not battle three successive years. The body of a rider is a locomotive, but an infinitely sensitive locomotive. If you heat it too much, if you burn too much coal, it explodes."

DON'T HEAD HER OFF.

Nay, let ye young girl ride ye wheel,
For truly it is said,
A wheel's all right, except it go
Unto ye young girl's head.

The men who want but little here below generally get a good deal less than they want in the purchase of bargain-counter wheels.

DON'T THINK WE ARE BLUFFING

For nothing is further from our minds; and frankly, when we win the test suit now in the courts, against a manufacturer of bicycles who has used some of the imitations of our saddle, we will proceed to collect our just dues from others in the trade, in a way that will be as little obnoxious to all concerned as possible. In the meantime we are doing everything in our power to obviate the necessity of annoying you by continuing the manufacture of our 1896 model, so as to have a saddle the same in style as the imitations, which we can furnish at the same price, for the best of them are all poor copies of our '96. At the same time we have largely increased our plant, so as to take care promptly of the wants of the trade for our

'97 MESINGER.

Success is due to **RATTAN** and the peculiar way we weave... **RATTAN** is the secret...

London	12,021
Mexico	102
New Zealand	910
Rotterdam	1,368
Santo Domingo	88
Southampton	5,475
United States of Colombia	494
Venezuela	739
Total	\$47,166

ROCKAWAY COMPONENTS.

Robert Perkins, the former superintendent of the Liberty Cycle Company, who was a prime factor in the formation of the new Cycle Components Company, of Rockaway, N. J., has not allowed grass to grow under his feet. Samples of the concern's products are already in evidence, and travellers are on the road. Chains, pedals and a general line of parts are being made, the former Liberty plant being utilized for the purpose. Incidentally, Mr. Perkins has served notice that he is the owner of the patent on single-piece fork crowns, and intends to get after infringers with a legal prod. The officers of the Component company are: Alvin L. Strasberger, president; W. H. Cahn, vice-president; Robert Perkins, superintendent. A New York office has been established at Nos. 16-18 Maiden Lane.

RIDING ON A RAIL.

"A rail fence is a hard thing to sit upon, but no harder than the common run of bicycle saddles," is a leading assertion made in the catalogue of the Harden Saddle and Specialty Company, of Toledo, Ohio. The catalogue illustrates some seven of the Harden saddles, which, of course, are claimed to be not of "the common run." They are of the hygienic type, and seem to cover the field very thoroughly; there are saddles not only for men and women, but for children, as well, and several different patterns of each to select from.

DID YOU?

Have you never tried to save a little money for your very own, and buy some things you have long wanted in cycling, and then been compelled to spend it on something else?

Storekeepers are now divided into two classes—those who sell bicycles and the few who do not, but are going to sell them.

SAMSON was a strong man.
His strength was in his hair.

The **S**amson Tire is a strong tire. Its strength is in the Fabric, and Fabric makes the tire.

THE NEW YORK SEAMLESS SINGLE-TUBE TIRE

for 1897 is better and handsomer than ever, which is saying a great deal. You will see them on nearly all makes of high-grade wheels during the coming season.

Order your wheels fitted with the

Samson Seamless Single-Tube Tire.

NATIONAL CYCLE SHOWS.

Under the Auspices of the National Board
of Trade of Cycle Manufacturers.

January 23-30—Chicago, Coliseum, A. E. Pattison, Auditorium Hotel, Chicago.

February 6-13—New York, Grand Central Palace, Ernest R. Franks, 271 Broadway, New York.

February 20-27—Boston, Mechanics' Building, C. W. Pourdrinier, 34 Stanhope-st., Boston.

February 20-27—Philadelphia—Local Cycle Board of Trade.

February 20-27—Pittsburg—Local Cycle Board of Trade.

FOREIGN CYCLE SHOWS.

November 20-28—Stanley; Agricultural Hall, Islington, London, N.; E. A. Lamb, secretary, 57 Chancery Lane, W. C. Telegraphic address: "Insuppressible, London."

December 4-12—London, National Show, Crystal Palace; Frank Peach, secretary, 48 Holborn Viaduct, London.

December 12-27—Paris, Palais d'Industrie, Champs Elysees; M. Bivort, manager.

January 2-9—Manchester, England.

January 12-16—Liverpool, Eng.

January 16-23—Dublin, Ireland; Royal Dublin Society Building, Balls Bridge; R. Wilson, secretary, 14 D'Olier street.

January 23-30—Glasgow, Scotland; A. G. Rennie, secretary, 49 Lilybank Gardens.

Jan. 22-30—Birmingham, Eng.

February 27-March 6—Leeds, Eng.

February 1-7—Edinburgh, Scotland; Waverly Market, A. K. Dempsey, secretary, 82 Leith street.

TRADE CHANGES.

CONNECTICUT.

Derby—D. N. Clark attached, \$10,000.

ILLINOIS.

Chicago—Receiver appointed for American Wheelmen's Protective Association.

Chicago—Fowler Cycle Manufacturing Company, Lyman E. Crandall; sued for \$7,500 by Sarah F. Beall and for \$15,000 by Martin McKershaw.

Chicago—Moller Bros. sued for \$600.

Chicago—Schlessinger & Yeomans Manufacturing Company name changed to Schlessinger Manufacturing Company.

Chicago—March-Davis Manufacturing Company incorporated. Capital, \$100,000.

Rock Island—Mutual Wheel Company increased capital to \$75,000.

MICHIGAN.

Benton Harbor—Hinkle & Baushke, new store and repair shop.

Greenville—Kemp & Cole reported succeeded by E. A. Kemp.

MISSOURI.

St. Louis—The St. Louis Cycle Company incorporated by H. G. Wolzendorf, president; E. L. Morgan, secretary; Eli Silverberg, treasurer, and others.

St. Louis—Norman Cycle Company has reduced capital stock from \$25,000 to \$10,000. Liabilities, \$3,058; assets, \$5,411.

St. Louis—The Tidd-Rugg Cycle Company has assigned.

NEBRASKA.

Kearney—The Kearney Cycle Manufacturing Company will probably move their business to Denver, Col.

Lincoln—E. Rohlf, bicycles, chattel mortgage for \$946.

NEW JERSEY.

Trenton—Standard Rubber Tire Company. Articles filed in Atlantic County. Incorporators: Senator William H. Skirm, of Trenton; John C. Snyder, of Buffalo, N. Y., and E. H. Ingersoll, of Atlantic City, N. J. Capital stock, \$10,000.

NEW YORK.

Brooklyn—J. Ling; bill of sale to J. H. Rauch, nominal.

Brooklyn—L. C. & G. F. Dunham; judgment for \$123.32.

Brooklyn—Albert E. Sykes has sold his interest in the Michaux Cycle Company and opened a store at No. 315 Seventh avenue.

Elmira—Frank S. Phelps arrested on the charge of grand larceny.

Kingston—Chas F. Winkler, reported given bill of sale for \$1,000; conveyed real estate for \$1.

New York—Hodgman Rubber Company; two additional judgments vs. George F. Hodgman aggregating \$10,078.09.

Syracuse—American League Cycle Association. Machinery attached while being placed on car for Springfield, Mass. Judgment, \$191. Additional suits, \$71.35 and \$135. Syracuse—The Frazer-Jones Manufacturing Company will begin the manufacture of juvenile bicycles

Poughkeepsie—James H. Tracey assigned.

OHIO.

Akron—H. H. Crowther sued for \$1,373.42 by the Foster Bicycle Company, who ask that transfer of real estate to wife be set aside.

Toledo—Toledo Cycle and Repair Company (not incorporated) discontinued.

Toledo—Toledo Manufacturing Company has transferred real estate to Kirk-Young Manufacturing Company for \$22,000.

PENNSYLVANIA.

Allentown—F. T. Koons & Co; judgment for \$650. Execution issued.

Meadville—Peter Kress assigned. Judgments previously entered aggregating \$3,183.

Philadelphia—Hilliard Cyclometer Company. Judgment, \$40.

Royersford—Royersford Machine Company. Judgment, \$18,580.

RHODE ISLAND.

Woonsocket—E. R. Darling mortgages real estate for \$2,000.

TENNESSEE.

Nashville—J. Dunn, bicycle repairer, reported damaged by fire.

TEXAS.

Galveston—Galveston Cycle Company reported sued for \$1,129.

READY FOR THE SEASON.

Like a released bird, the cycle business has assumed unusual activity since the outcome of the political struggle has been decided, and the resultant restoration of business confidence bodes well for the immediate future of the industry of cycle-making.

As an instance of this may be taken the firm of R. H. Wolff & Co., Ltd., whose mammoth factories are located in New York City, running from 116th street to 118th street, on the East River. This firm, one of the best-known in commercial circles, has been engaged in the manufacture of the finest quality of steel and steel wire for twenty-five years, and since the earliest stages of cycling, made a specialty of high-class cycle material, supplying many of the leading manufacturers in the country for many years. Their plant is now in full operation, and preparations are now under way for next season's output.

As in the past, quality will be paramount in 1897 models, and every endeavor will be made not to maintain, but rather increase the reputation of the Wolff-American bicycle as a machine which is the triumph of mechanical skill. The warm reception recorded the Wolff-Americans in the past justifies its makers in anticipating a large sale during the season close at hand, and to judge from the many additional exclusive features promised, there seems little doubt but what their expectations will be realized. Besides the self-oiling bearings, eccentric chain adjustment and spring-tempered frame, a number of other improved patented devices will be introduced. Their tandem, they believe, will be one of the sensations of the year, being a combination of single frames joined in an original manner, typical of the aggressiveness of its maker. It will be furnished in double-diamond and combination patterns. The standard price of \$100 was announced some time ago, and this amount will be required in order to possess a Wolff-American High Art Cycle.

Wolff & Co. are firm on the price question, and have made provisions for the immediate decapitation of any agent who attempts to sell below the list price.

ADJUSTABLE TENSION.

Joseph N. Smith, of Joseph N. Smith & Co., Detroit, Mich., has essayed the role of vibration killer. An adjustable spring saddle post is the invention with which he hopes to do the business.

"It is entirely new," he says, "and just as good as it is new. It has all the practical features required to make such an article fully satisfactory. It has the regular 'T' post with square shank bearing, supported in the rear with a strong, well-arranged steel roller, carrying the load of the rider and preventing all of the friction that would naturally come on an ordinary spring saddle post, a feature entirely new. It has a coil spring with screw plug in the lower end to adjust the tension of the spring to the weight of the rider as may be required. This is a long felt want, and can be fully supplied. It is not only comfortable, pleasant and agreeable for the rider but is also a great saving on repairs of the frame of the bicycle, which is just as essential to a bicycle as a spring would be to a buggy."

THREE-STAR BRAND.

Situation as travelling salesman for bicycles, tires, rims, or parts. Three months' engagement desired. Have had twelve years' experience in cycle trade. Am well acquainted with jobbers and factories. References furnished.

* *, care of THE WHEEL.

Patents have been granted for a complete pneumatic frame for a bicycle.

CYCLOMETER TESTING.

On account of variation in the air pressure and in the actual diameter of tires which are nominally of a certain size, there will be more or less variation in the number of times the wheel will revolve in going a given distance, says the catalogue of the Veeder Manufacturing Company of Hartford, Conn., who make the well-known Veeder cyclometer.

A twenty-eight-inch wheel with an incompressible tire will revolve 720 times per mile. If the tire compresses one-quarter inch, that is, if the diameter is equivalent to 27½ inches, it will revolve 733 times per mile. We have chosen as our standard 728 revolutions per mile, which we believe to be a fair average. The wheel will then move ahead eighty-seven inches for every revolution.

To test your wheel, place your bicycle on a smooth floor with a rider in the saddle; mark the tire and the floor under the centre of the wheel; then carefully push the bicycle ahead in a straight line until the mark on the tire again comes under the centre of the wheel; mark the floor again opposite the mark on the tire. If the distance between the two marks on the floor is eighty-seven inches, the cyclometer will register correctly.

SEEKING TIDE-WATER.

Hartley & Graham, who operated the Remington Arms Works at Ilion, N. Y., are contemplating removing the plant from that town to Bridgeport, Conn.

All the world's a stage, and a good many of the men and women who are riding bicycles in it are merely stage robbers.

WHEN SNOW COMES.

Now that snow-fly is nearing, Hamblin & Russell, extensive wire goods manufacturers in Worcester, Mass., are introducing this home trainer, the Yankee, they term it. It

is light and simple, as may be seen, and affords an element of road friction that is lacking in many devices of the sort. The discount to the trade is health-inviting.

CUSHIONED RICHMONDS.

A cushioned frame Richmond will be an addition to the Richmond (Ind.) Bicycle Co.'s '97 line. They confidently expect an unprecedented demand for it.

ONE HIGH-GRADE SADDLE MARK.

Chicago, Nov. 14.—V. H. Muller, of the Muller Manufacturing Co., New-York, has been gunning for saddle-orders here in the West for some time. He jumped back to New-York to vote but returned immediately to clinch several large deals that were made good by the election of Mr. McKinley. Mr. Muller states that he is catering only to high-grade cycle manufacturers. "The mark of a really high-grade wheel is a Muller High-Grade Saddle," is the way he puts it. A number of contracts shown THE WHEEL representative prove that his words are not mere noisings. The sales thus far in the West amount to more than all of last year's sales in the same territory. Mr. Muller leaves to-day for a flying trip through Canada.

ONE THOUSAND DAILY FOR MONTHS.

Some idea of the magnitude and capacity of the Boston Wood Rim Company may be gained from the fact that on closing a large contract with the Western Wheel Works they began shipping within forty-eight hours 1,000 rims, which shipment will be continued daily for four months to complete the contract—and this without interfering with the regular shipments to other manufacturers. Their factory will soon be placed on a twenty-four-hour-schedule—having run full ten-hour-time during the past dull season. It is a notable fact that the Boston Wood Rim factory has not been shut down for two years, but kept steadily at work in and out of season, turning out a minimum of 1,000 pairs per day. The output of the Bedford factory alone will be not less than 500,000 for the 1897 trade.

CATALOGUE CONSIDERATION.

Points on the Makeup of the Annual Trade Announcements of the Makers.

If the catalogues in existence devoted entirely or in part to manufactures or sale of bicycles, parts and appurtenances thereof could be brought together, the wonder would be that enough paper-mills could have been found to supply the printing material. But doubtless it would also occur to a few minds that some of this paper had been wasted through injudicious or mistaken ideas in the preparation of the catalogues, whereby they had failed of any good results.

The main object of a catalogue is to give the best possible idea of the goods advertised by it. It is not to amuse people—for there are comic papers enough—or to introduce startling effects in printing and engraving. The right sort of catalogue has little room in it for fine writing for the sake of show, but the best of English is not too good for explaining the merits of anything really worth buying. Brevity and conciseness should be studied. A small catalogue is better than a large one, other things being equal, and the best of all the one that most promptly makes its business known. Those whose patronage is most desirable are busy people—who are pressed for time and who care only for business in business hours.

It should first be decided what classes of people a catalogue is intended for, that they may be kept in mind in compiling it. For example, a catalogue for wholesalers or jobbers may be less ornate than one for the retail trade—the general public. The former are concerned chiefly to know what is for sale and at what price. But the latter, and especially women and young people, are impressed by bright and artistic effects, so that it may pay to make catalogues for them as attractive as is possible within the appropriation for the purpose.

A catalogue ought to be a work of constant growth. The pages of a new catalogue might be pasted into a blank book, leaving ample margin, and every one connected with the factory encouraged to contribute ideas on its revision until the time for a new edition. A catalogue thus revised would represent the experience of the wheel-maker for a year or for several years, and should be freer from errors or omissions than if the whole work had been delayed until the last moment. But the final arrangement ought to be that of one responsible person—the head of the catalogue department, so to speak.

Like other salesmen, catalogues should be of good address. Cheap printing on poor paper will discredit goods with all people of taste. Whoever is competent to prepare a catalogue can easily master enough printing-office secrets to be able to judge of materials and workmanship. But one who feels at a loss in such matter might collect good-looking specimens of printing done for other houses, and engage a printer to do similar work, on condition of paying for nothing else. Special paper is needed for special kinds of engraving, and much depends upon the ink. If economy in cost be an object, it is well to have in mind an estimate from reputable printers while preparing the catalogue. Better a small one, attractively gotten up, than one twice as large but slovenly in appearance.

Pictures are the strongest features of a catalogue when the articles described are such that the pictures will need little explanation. But only good pictures are worth the cost. Their purpose should be to illustrate as nearly as possible the articles advertised. It does not pay to make engravings more attractive than the goods. Otherwise, the buyer is liable

to compare the goods with the pictures, to the disadvantage of the former. Photographs more correctly represent most lines of goods than any drawing could do, and "half-tone" engravings are unsurpassed for illustrating catalogues, but they must be well made, and printed on suitable paper by men who know how.

Oddities in size and shape had better be avoided in making a catalogue. It lowers the dignity of a business house to bid for attention by such cheap tricks as eccentricity in printing. But there is a more practical objection. A catalogue should be designed for preservation by the recipient, and one of peculiar size or shape may prove troublesome to handle, and, therefore, be speedily thrown away. For this reason, the more important makers of catalogues ought to lend their aid to bringing about greater uniformity in sizes.

Often a catalogue can be rendered more useful for reference by the addition of some facts other than descriptions and prices of bicycles and parts thereof. Whatever tends to the preservation of a catalogue is likely in the end to result in benefits to the house issuing it, in the way of more orders. It is a good thing, then, if such a catalogue can be made that it will be opened frequently for a figure to save computation, for a formula or record,

or some other item helpful to its recipient. But such matter should be carefully chosen. If a catalogue is original and likely to be of permanent value, other people can be prevented from copying it by getting it copyrighted at Washington.

CASE OF PALE-HORSE.

There was a man who liked to ride these nice cool evenings insufficiently clad. Death happened to be riding along on his white horse one day, and he didn't do a thing to that man but take him riding.

When it comes to a question of which spread the average rider would prefer, the one on the dining-table completely outdistances the one on the record table.

The newest fad, the rest cure, may be all right, but the trouble with it is that few wheelmen have time to try it, except in rainy or snowy weather.

There is one good thing about the American wheelwoman. She does not call herself a wheel lady.

Where there's a wheel there's a way.

NOT A NECESSITY.

And Because It Is Not the Minor Has to Pay for the Instalment Wheel.

Judge Cady, of Syracuse, on Tuesday decided another of those infant cycle contract cases, which have become quite numerous. This one was brought by Benjamin Cohen, by guardian ad litem, against William D. Andrews, to recover \$28 which had been paid on a bicycle. Cohen had returned the wheel, and claimed that, because he was an infant, he should receive his money back. The defendant held that the amount paid would not reimburse him for the wear and tear of the wheel. Judge Cady decided for the defendant.

Judge Cady's opinion is a lengthy and careful review of the law on the question. The General Term or the Court of Appeals have never decided it, but there is one case in the Superior Court of New-York holding that the infant cannot recover. One in Vermont holds that he can. Judge Cady thought that he should go according to the law in New-York, although he was not sure that the Appellate Court might not reverse him.

Judge Cady says:
"The cases are numerous when the rights and disabilities of infants have been passed upon so that many of the questions involved have become well settled, but the real question at issue here has not yet been fully and conclusively determined. In the different cases where it has been under discussion contrary views have been taken, so that it can be fairly said that the question is still an open one, and, in view of the large number of cases that are likely to arise, it is important that a proper determination of the question be made by the courts.

"In the case at bar no claim was made that the bicycle sold was necessary for the infant. So that in the discussion of the case that element of the law is applicable in the contracts of infants will not be considered. In fact, it has been held that a bicycle used to go to and from home to work was not necessary."

Referring to the case of Gray vs. Lessington, which was heard in the Superior Court, Judge Cady says:

"While the reasoning of that case may not seem to me to be in harmony with the general principles governing the contracts of infants, I follow the law therein laid down, particularly as it would seem that the equities are all in favor of such a determination of this action.

"I therefore conclude that judgment should be rendered in favor of defendant."

PROVED HER CLAIMS.

"I am a-weary, mother, dear,
Enfeebled and o'er-worn;
I cannot wield a broom, I fear,
Nor pull and husk the corn.

"'Twould jeopardize my health to make
The beds or can the fruit,
Or help you dust, or sew, or bake,
Ere I my strength recruit."

Thus spake the maiden, gave a cough,
To strengthen her appeal,
Then donned her bloomers and rode off
Ten miles upon her wheel.

Opportunity to win in a race does not travel by a time schedule.

The wheelwoman's name is misery, because she likes company.

The leaves of Eve's costume were the first bloomers ever worn.

A dead soft thing—a punctured tire.

VOL. XVIII., No. 15.

NEW YORK AND CHICAGO, NOVEMBER 27, 1896.

WHOLE NO. 451.

WHERE WINDLE WAS

Now Fowler Is—Plans of the Irrepressible Western Wheelmaker and Boomer.

Frank Fowler is again in harness.

After several meteoric flights across the cycling firmament, in each of which he left a train of to-be-exploded sensations, he finally found his harness in Worcester, Mass.

As THE WHEEL stated last week, he unexpectedly turned up in that busy New England town, and made an offer for the plant of the defunct Windle Cycle Company. Just after the paper went to press, his offer was accepted, and the deal closed. He took immediate possession of the property and straightway advertised for help. The next morning some 700 applicants responded to his call. Thirty of them were engaged and put to work setting things to right. Fire was started and the machinery given a preliminary whirl. The next day more men were employed, and in a short while some 200 will be at work. Several old Fowler employes will be brought from Chicago and placed at the heads of the several departments.

C. H. Larsen, manager of the Fowler Cycle Mfg. Co.'s Boston branch, and Edw. Plows, once foreign representative of the company, and both close personal friends of Mr. Fowler, have already become associated with him in his new venture.

Fowler's purchase, which was a spot cash transaction, included all of the Windle material in stock, and this will be immediately put together, after which he will begin the manufacture of a wheel of his own. What he will title it he has not decided. He has been wavering between "Regal" and "Trinity."

The factory is three stories high, 75 by 130 feet, and has a capacity of 10,000 or 12,000 wheels. Its equipment is modern and practically new. Mr. Fowler is already talking of building additions.

AN OHIO AFFAIR.

The Federal Court in Chicago denied Gormully & Jeffery's petition for an injunction against the National Metal Polishers' Union, restraining that organization from ordering a strike. Service had been made on the president of the local union, but Judge Crossup ruled that as the National Union was an Ohio corporation, service must be made on a National officer in that State.

REORGANIZED AND READY.

Place Kensingtons in the \$100 column, likewise in the \$75 and \$60 lists. The reorganized Martin & Gibson Manufacturing Company, Buffalo, N. Y., who make them, will next year market three different models at the prices stated. The \$100 Kensington is a particularly handsome flush-jointed wheel.

CANADIAN COLUMBIAS.

Rumor states the case this way: The Pope Manufacturing Company are arranging to open a branch factory in Canada for the manufacturer of Columbia wheels. George Pope, treasurer of the company, was in Ottawa last month, and had an interview with the Comptroller of Customs in regard to bringing in a lot of machinery to equip the factory. It is understood that the entry of the machinery will be facilitated by the Government. Toronto is likely to get the factory. Mr. Pope visited that city before returning to Hartford.

For once rumor was very nearly right, only a few corrections in the foregoing being necessary to bring report and fact in harmony. What the Pope company has applied to the Canadian Government for is a rating on parts of Columbias which are to be brought into Canada, and there assembled, plated and enamelled. The idea is that by this means the large Pope following across the border can be more quickly and cheaply served than is possible under the existing methods of doing business. American cycle factories in Canada are getting to be quite a feature in Dominion finance of late.

DISMISSED THE BILL.

Judge Holmes, of the Massachusetts Supreme Court, has dismissed the bill in equity brought by Everett L. Cole against Emerson H. Stoddard and J. Fannie Stoddard, of Brookfield, and others, to set aside a decree of the Worcester Insolvency Court authorizing the assignees of the Greyhound Bicycle Company, whose plant is at East Brookfield, to sell the property of the concern to the defendant, J. Fannie Stoddard, for \$8,000. The plaintiff claimed that the sale to Mrs. Stoddard was brought about by fraud, and alleged that he bid \$10,000 for the same property, the money to be paid in thirty days.

FIRST OF THE GREAT SHOWS.

London, Nov. 20.—There are no novelties of particular merit or startling innovations to be seen at the Stanley show, which opened tonight. The Earl of Warwick presided at the inaugural luncheon. In the course of his address he wished the American visitors a very pleasant visit and a happy return to their native land. The British manufacturers present heartily cheered the latter part of the remark. Discussing the American exhibits the "Daily News" expresses itself as being satisfied that American wheels are only suitable for park work. Nevertheless they are attracting great attention at the show.

ANOTHER HUNDREDDITE.

In 1897 Spaldings will list at \$100, the same price as in the past. A. G. Spalding & Brothers have made the announcement.

TIRE MAGNATES MEET.

They First Dine and Then Propose a Number of Important Trade Changes of General Interest.

At a meeting of the Rubber Tire Association, held Tuesday night last at the Arena, this city, several matters of moment to the manufacturer, the agent and the rider were thoroughly discussed. The meeting went into session at 10 o'clock and lasted until 1:30 a. m. Fifteen members were present, among them Colonel Theodore A. Dodge, Kirk Brown, John F. Palmer, George F. Hodgman, Frank White, J. E. Davis, H. C. Morse, B. G. Work, also Messrs. Parker, Kelly and Spaulding.

After considerable argument the following resolution was adopted: It is the opinion of this meeting that the cutting of tires by rims, being the result of causes over which the tire-maker has no control, does not come under the guarantee offered by this association.

It was also resolved that when tires attached to the bicycle itself are returned to a manufacturer, thereby necessitating the removal of the wheels by the manufacturer, and their replacement after repair has been made, a charge of 50 cents be made.

A standard form of application for the repair or replacement of tires was drawn up and adopted. The terms of this application will be made public later.

It was resolved that after the expiration of the guarantee, when offered for repair, tires that needed vulcanizing will be charged for at the rate of 50 cents. Those not requiring vulcanizing, 25 cents.

The resolutions adopted by the meeting are not binding, but are simply suggestions to be acted on by all members of the association. However, they will all probably be generally adopted.

ROBERT READY TO RETIRE.

D. W. Robert, the St. Louis member of the Racing Board, upon whose head a heap of abuse was hurled during the Murphy-Cabanne-Titus expulsion imbroglio, has announced that under no circumstances will he again act as a member of the board. Furthermore, he has resigned from all his local positions in connection with cycling, and will retire to the privacy of an every-day cyclist.

WILL GO WITH THE PEERLESS.

L. Fawcett, for the past few years with the Eclipse Bicycle Company, will succeed D. J. Post as manager of the Peerless Manufacturing Company, Cleveland. Mr. Fawcett was formerly engaged in the cycle business in Cleveland, and has experience in almost every branch of it.

ACROSS THE OCEAN.

What Dunlops Are Doing—Racers Who Are Coming Here and Their Plans.

London, Nov. 14.—The great law case between the Dunlop and Scottish Tire companies is in progress, having commenced yesterday.

As before stated, it will be a bitter and prolonged struggle, unless a very startling rumor, which has recently reached me, turns out to be correct. The leading counsel at the English bar are engaged four deep on each side. Such eminent patent experts as Sir Frederick Bramwell (Scottish) and Sir William Thompson, now Lord Kelvin (Dunlop), are retained at huge fees to give opposing views on vital points, but I believe that the chief struggle will be made over the question of disconformity between the original and final specifications of C. K. Welch, which embodied the patent under which the Dunlop Company claim royalties on all wired on tires. The ground being covered at present is much the same as that traversed early in the year when the Dunlop-Crowell case was being tried, and not until Monday or Tuesday can we expect fresh developments. The rumor to which I have referred is to the effect that the Dunlop Company have been preparing for defeat to such an extent that they will be prepared to take Justice Romer's decision without going to appeal. They will then fall back on a patent which they have been possessed of for years, which covers the Welch type so completely that their position will be stronger even than at present, because a failure to uphold the Dunlop-Welch patent will invalidate all the licenses which have been issued under that patent, and leave the whole market once more at the mercy of the Dunlop Company. I give the information with all reserve, and will probably have some further information in my next letter.

The Simpson chain team for America is fixed up, and the party will start on Saturday next from Southampton in charge of W. Plummer, of the "Sporting Life," who will act as Mr. Simpson's representative throughout the tour. At present those certain of starting are Tom Linton, Platt-Betts, J. D. Lumsden and Jules Dubois or Teddy Hale. A. A. Chase and eight others have been invited, but have not yet made up their minds. Linton, like Michael, is a Welshman, Platt-Betts is an Englishman, Lumsden a Scotchman and Dubois a Frenchman, so you can see that an international idea has pervaded the selection to some extent. C. Chappel and a crowd of pacers with quints, quads, trips and tandems will also cross, and Dunlop tires will be used exclusively. Linton and Platt-Betts ride Gladiators, Lumsden an Osmond, Hale a Humber and Chase a Swift.

The first engagement takes place at Madison Square Garden on December 7, where Linton expects to compete in a one-hour race. Lumsden will compete in a twelve-hour race at the same place, but I doubt if Platt-Betts can mount, as he is even now suffering from the effects of a spill at Catford some weeks ago. The tour may ultimately extend to Australia, all the principal racing centres being taken en route—Chicago, Memphis, Nashville and New Orleans being touched before making for the Pacific slope. Linton is going out specially to meet Michael and Platt-Betts to meet J. S. Johnson. If Australia is to be taken in the arrangements will be to match both men to ride in the Austral Wheel Race at Sydney on January 20, so there will be a good deal of energetic moving about, which, of course, will make the men's form rather unreliable.

We are still on the record racket—only tandems, of course, but still world's records. Last Monday the Chase brothers went back to Catford and took the mile record to 1:48 3-5, and on Friday had got so far acclimated as to attempt the hour, but owing, I am told, to some peculiar vagaries on the part of a section of the pacers they failed in this, but going on made mince-time of the fifty-mile time. Their principal times were: One mile, 1:55; five miles, 9:27 4-5; ten miles, 19:01 3-5; twenty miles, 38:29 3-5; thirty miles, 58:13 4-5; forty miles, 78:07 3-5; fifty miles, 98:14 2-5. The previous best was 1:47.08 2-5 by Magregor and Nelson, while Huret's world's record on a single is 1:42:42 1-5. Thirty miles 1,605 yards were covered in an hour despite the wintry cold and fog.

The flotation of the week has been the Australian Cycle and Motor Company, which came out under the auspices of a syndicate of West Australian gold mining and company developing promoters. The capital asked is £75,000, while I cannot see that the properties offer anything to the subscribers more tangible than a promise of good trade, which starts with orders received for delivery amounting to 2,500 machines from the factories of the Premier, Bayliss-Thomas and Calcott companies. In addition, the Australian rights of the Kane-Pennington motor has been secured and sole rights for the Incandescent Sunlight Gas lamps. I believe that Ernest Leitch, the ex-racing man, and now private secretary to Mr. Rucker, is managing director of Humber's limited.

The Osmond Cycle Company has declared a 15 per cent dividend and carried £2,000 to reserve, and the Star Cycle Company have gone a bit better with one of 50 per cent. Still the near approach of the shows has caused comparatively little interest to be taken in these matters, and the only balance sheets awaited with general interest are those of Humber & Co. and the John Griffiths Company—the latter of whom, I am now informed, have had such a good year that a big dividend is probable, while the sale of the Australian business to Mr. Hooley for £100,000 is definitely stated as having been completed.

A new firm to take over the handling is that of Bagshawe Bros, No. 4a Upper Thames street, E. C., at whose place I saw a very nice specimen of the Sterling, and also a Waltham this week. The former will be pushed as a leading line, and will be exhibited at the National Show. The firm is well known in the hardware world, and should be able to do good business.

FOREIGN TRADE OPENING.

Cycle exporters will be interested in the Commercial Agency recently organized to carry on business on a large scale at Barbadoes, West Indies, P. O. Box 107. Besides other matters, they are manufacturers' agents, making a specialty of bicycles. They are thoroughly posted on West Indian trade, and from Barbadoes they can reach the various markets of the West Indian islands, the Guianas, Spanish Main, etc.

HALF GONE ALREADY.

Although the Boston show will not be held until February, seventy-five of the 150 spaces have already been applied for. The expectations of the management that exhibitors at the New-York show will transfer their exhibits and electrical displays to Boston will probably be realized. Many of the applications received are from manufacturers who will have large exhibits at the New-York show.

FROM HANNA'S HOME.

Organized for Trade Protection and Benefit—An Accident—Ran Against a Patent.

Cleveland, Ohio, Nov. 23.—The organization of the Cleveland Cycle Board of Trade was effected at a meeting in the Hollenden. These officers were chosen: President, George Collier, of Collier & Sayle; vice-president, James W. McNair, of Likly & McNair; secretary, C. J. Lovejoy, of the Prospect Cycle Company; treasurer, N. A. Quilling, of the Euclid Bicycle Company.

A painful accident happened a short time ago to Robert Norderer, of the Norderer Manufacturing Company, well-known sundry makers, from the effects of which he nearly lost the use of his right arm. Coming suddenly upon a huge kettle of boiling cement, which was just about to run over, and thinking to avert a fire he started to rake away the fire from under the kettle to reduce the heat. He was too late, however, as the hot liquid boiled over, and, bursting into flames, scorched the hair and skin from one side of his face and broiled his arm from the elbow down to a turn. Mr. Norderer is out again, but will think twice before again tackling a kettle of boiling cement.

I. Lewis, of the firm of Lewis & Booth, builders of the L. & B. bicycle, has bought out his partner's interest, and will hereafter go it alone. The factory started up a week ago, though not running full handed as yet. It is the intention to build 1,000 wheels for the '97 trade. Mr. Booth expected to go into the hub manufacturing business, but received an unexpected setback on Saturday last, which has changed his plans materially. The hub that he expected to put upon the market was to be made with a sprocket wheel upon each end, but with a different number of teeth, so that by reversing the wheel in the frame the gear would be changed. The setback was a message from the patent office, which gave the information that the Pope Manufacturing Company owned a patent upon the device. Mr. B., so your correspondent was informed, had even gone so far as to locate his establishment and contract for machinery.

BOLTE BOOMING.

Within a few days the Bolte Cycle Manufacturing Company, Milwaukee, Wis., will be in possession of its new factory. It is now practically completed. The three floors and basement will afford facilities for a considerably increased output. Pending removal, however, the Bolte people are not resting on their oars. Both the bicycle and specialty departments are working full time. The former last week made shipments of wheels to Germany, Holland and England. The specialty branch is filling orders for their one and two piece crank shafts, the new hub, bored from the solid metal, their pedals, wood handlebars, and frame-filing vise. Some changes in the personnel of the Bolte Company were made last week. Secretary Donlevy and Superintendent Connell being retired. The former has been succeeded by A. F. Schult. The position of superintendent is yet unfilled.

CULMORE NO MORE.

Charles Culmore, the picturesque Teuton who aspired to be chief consul of the Texas Division, L. A. W., was found to be snowed under when the ballots were counted. The vote stood: For chief consul, R. K. Earnest, 260; Charles Culmore, 132; for vice-consul, W. S. Kirsch, 271; George M. Courts, 174; for secretary-treasurer, C. H. Thacker, 200; E. R. Covey, 87.

CHANCE FOR SWISS TRADE.

A first-class concern in Geneva, Switzerland, is desirous of taking on additional American lines. Address F. B., care THE WHEEL. Status of concern believed to be first-class.

REPREHENSIBLE JOURNALISM.

IT is seldom that THE WHEEL departs from its policy of being purely impersonal; seldom indeed that THE WHEEL fails to particularly mind its own particular business. There are occasions, however, when a well-defined and fixed policy may be departed from, and one of these occasions is furnished by our contemporary, the "Bearings," of Chicago. This paper, in its issue of November 19, publishes an editorial entitled "G. & J. Advanced Prices," an editorial which is amazingly brutal and absolutely uncalled for, and which has excited a wholesome disgust in the minds of the principal members of the trade, and even in the minds of those who are not in love with the firm of Gormully & Jeffery.

The silly season is not now with us, yet a sillier production never emanated even in the dog days. We say silly, because the editorial can be looked at from a dozen different standpoints, can be carefully read, discussed and digested, but no process will shed upon it the light of reason. We feel certain that every bicycle paper will take pains to record their opinion of this emanation.

Briefly, the editorial carries out the sarcastic strain implied in the heading. G. & J. really reduce their price from \$100 to \$80, whereupon the "Bearings" claims that Ramblers have not been worth \$100 "for a number of years"; that the public have been misled for years by the Gormully & Jeffery \$100 price; that the alleged cut in prices by Gormully & Jeffery is "an incident that need disturb no one"; that Gormully & Jeffery really are what they have just declared they are, "big fish in the medium grade pond."

We will assume that the "Bearings" people believe their editorial utterance to be a sample of cycling journalism of the fearless style. We will assume that their motive is to protect the high-grade makers from the bad influence which the Gormully & Jeffery cut might have with the trade and with the public. Fearlessness is a very suitable garment for journalistic wear, and the protection of the trade is a good cornerstone in the foundation structure of any bicycle paper. At the same time, in pursuing the one or the other, one frequently does more harm than good, and in this case, the "Bearings" distinctly does a great deal of harm.

The facts are these: It is inane for any newspaper to tell a merchant at what price he should or should not sell his goods. This journal might as well take up every firm in the bicycle business, have their wheels analyzed by experts, and print the bald facts, and take them to task for varying a hairline as regards the value of the wheel offered to the public. In other words, the "Bearings" would have to become a universal censor of goods and prices.

The "Bearings" has published, during its existence, many paragraphs regarding the merits of Rambler bicycles. Its office is located in the same city, not far from the Gormully & Jeffery factory. It apparently should have been the duty of the "Bearings" several years ago to analyze the make-up of the Gormully & Jeffery bicycles, and to refuse the Gormully & Jeffery advertisements; and certainly it seems ludicrous that they should have published so many laudatory paragraphs about the concern that Gormully & Jeffery could very easily make a book of them. There is no bicycle manufactured that has not its traducers and its partisans. The Rambler is no exception to the rule, but we opine that did its makers so elect they could effectively disprove the belittlements of the Chicago journal.

Another, and possibly the most vital point, is that the Gormully & Jeffery Manufacturing Company could prepare a strong defence, a defence which would delve into the secrets of the bicycle trade, that would expose the inmost figures, as all exposures of that kind necessarily must. Whenever the public are let behind the scenes, whether in the theatre, the factory, or elsewhere, damage must result, and it does result. When attacked, it is the nature of man to hit back. Were G. & J. to follow this impulse, the trade would have cause to rue the "Bearings's" folly.

It would, indeed, seem curious if the Gormully & Jeffery Company should ask the "Bearings" why they raised their subscription price to \$3 from \$1, jumped it back to \$2, then down to \$1, then 50 cents, then gave away many copies for nothing. It would be equally curious if the Gormully & Jeffery Company should censure the "Bearings" for changing its paper from the full size of the ordinary bicycle paper to the magazine form. It would be equally curious, and it would also be impertinent. A man who is in business has a birthright to manage his own business. If his money, his bread and butter, and outside interference is nothing more or less than silly impertinence,

It is pleasing to know that the trade generally resent the "Bearings" editorial. They know that it is an uncalled for slap at an old and honored concern, a concern which has done much for the business, a concern which has ever conducted its business with conservatism and decency. But beyond that, the trade realizes that the Chicago editorial will do considerable general harm, and each man also wonders whether he or some other fellow will be the next victim of editorial misjudgment.

SANGER AND HIS SHOW.

THE trade this week has heard from Manager Sanger in the form of pamphlets and diagrams of his show, which contains 169 spaces, as against 769 spaces at the National Cycle Show. The launching of this show is an impertinence which we are certain the trade will resent. The trade has from time to time been gulled and gouged in many ways. In its early days the frauds were barefaced; in later years there have been fewer of these, and they have been of a more diplomatic character. The trade is now more alert to blackmail, to needless expenditure and extravagance than it ever was. The Sanger Show has not a leg of necessity to stand upon. It is extraneous, superfluous, and it is not wanted. We believe the trade will voice this verdict in a manner which Sanger will not fail to hear and remember.

In July, Sanger's circulars promised to give a rebate to all exhibitors; in November, his circulars say nothing about that. In July, Sanger promised to reduce the cost of spaces 33 1-3 per cent; in November, the prices fixed on his forthcoming show do not show that result. They are only a shade lower than the prices charged for space at last year's show. THE WHEEL has repeatedly pointed out reasons why the National Board of Trade could not contract with the Madison Square Garden Company. Sanger's terms were prohibitory. His chief demand (and this was the principal snag in the way of negotiation) was an ultimatum to the Board of Trade to the effect that, if the rate on space was reduced, the Board of Trade was to pay the Garden Company 25 per cent of such reduction. The Board of Trade is expected to protect the trade. Yet, in order to protect its own trade and its own show, which that trade itself creates, they were asked to pay 25 per cent of any contemplated reduction to an unnecessary third party.

At last year's Garden Show, the Garden received \$39,000 out of the show, whereas their building for one week is not worth over \$7,000 to \$10,000. The Board of Trade would have been without backbone and stamina to have submitted to the imposition another year, and it is to their credit that they did not submit. They cut Sanger's \$39,000 down to a possible \$15,000—a very good price for a week—and they also cut considerably into Mr. Sanger's vanity. Hence, the row.

At last year's show the trade were overcharged for everything they needed—electric

light, carpentry work and all the rest of it. Mr. Gormully has so stated in a published letter, and it is a matter of wonderment that the trade should ever have accepted the committee's report. Every time anybody winked throughout the entire week, something dropped into the coffers of the Madison Square Garden Company.

The Sanger circulars show much misrepresentation. They have no right to the word "Fourth" Annual, because, of the three previous Shows, the first was held by the Garden Company, and the second and third were held by the National Board of Trade. Hence, in using the words—"Fourth" Annual Show we believe they are subjecting themselves to legal action; and we believe the Board of Trade will not fail to be so advised by their counsel.

The Sanger Show managers talk about "strong support from all sections of the trade," whereas, it is known that the 300 biggest concerns in the cycle trade have signed to exhibit at the Board of Trade official show, and not one of them will be seen in the Garden. The trade last year spent, probably, \$100,000 in decorations. Sanger cannot afford to spend this out of his own pocket; hence, we cannot expect to find in the Garden the brilliancy of last year, nor can we expect to find there the influential people of the trade and their connections, and these are the people who go to make up a bicycle show. That certain wheels will be shown there we have no doubt, and part of the public will filter into the building, but a cycle show such as we know the National Shows to be is not possible.

THE WHEEL takes this stand because the managers of the Sanger Show have started a crusade on the public, the earmarks of which are that they will attempt to mislead the public into the belief that the Sanger Show is the Board of Trade Show, such as the public have been used to and has flocked to see. THE WHEEL will take pains, in its own sphere, to prevent such misrepresentation. There is also reason to believe that untruths have been resorted to by representatives of the Sanger Show. These representatives state plainly, notwithstanding the signed contracts, that some of the biggest people—Pope among the others—will show in the Garden by hook or crook. One of the Garden's representatives has already been taken to task by the Pope Company, and has been pertinently informed that that company would take action against him unless he ceases his misrepresentations. As with the Pope Company, so with all of the other big firms. To a man they will stand behind their organization, and there is reason to believe that not one of the really influential firms in the bicycle trade will be seen at the Sanger Show.

As an incident in this connection, the Sanger circular informs us that Mr. Kennedy-Child will act as secretary at the unnecessary function. It is indeed gratifying to have Child's position stated. Petted for years by the bicycle trade, made much of and aided

on all sides, his present position is not enviable. It will make impossible for him a resumption of that niche in the bicycle trade which he once occupied.

MERELY BUTTERFLIES.

IT WOULD be interesting to know how large a percentage of the riders in New York and Brooklyn think their dream of cycling happiness realized when they can develop energy and skill enough to get up to Grant's Tomb or down to Howe's, to contemplate the beauty surrounding the one and to carefully study the menu card at the other. For them, the accomplishment of either of these facts entitles them to class as cyclists, although in the eyes of all wheelmen who know the beauties of country riding they are nothing but butterfly cyclists. They know nothing of the beauty of the sidepath, they do not know how much livelier is the claypath than macadam and how much livelier macadam than the dead, sticky asphalt. As for a hill it causes them a delirium. Every touring wheelman and wheelwoman should perpetuate condemnation, seasoned with advice, for these butterfly riders. They should be advised and even appealed to, to go out into Nature, where they can do less of the "seeing and be seen" act, and where they cycle for cycling's sake and not for the amusement of the curbstone population.

Some of them, however, are scarcely to be blamed. The way they sit their machines would make a country tour impossible for them. Their handle-bars almost obstruct their view; their reach causes a toe extension which is painful, and their general position, from several different points of view, is altogether impossible. It makes country cycling impossible. Perfect adjustment of the wheel we hear much of, but as applied to the rider the phrase is not enough in use.

The happiest reflection on an anniversary, such as Thanksgiving, Christmas, or a birthday, is not that we have done a great many foolish things during the year and repented; not that we have left undone the things that we ought to have done and been sorry for it; not that we are twelve months older, for age is only a comparative matter, but that we have a year more of experience.

The knowledge of life is the most valuable of human possessions. Nor does it matter whether that wisdom is to be put to practical use in action or omission. The thing is to have it. It is consoling to think that none of us shall reach the last Thursday of November of next year without accumulating some more of it. If we have nothing else to be thankful for, here is something.

People now steal water, electricity, votes and bicycles. The world must be growing worse. They never used to steal these things in the Middle Ages.

If people would just tell us how not to make a mistake in cycling instead of how not to have made a mistake, we'd get along better.

ABSENTEES THEY WILL BE.

Milwaukee, Nov. 20.—Julius Andrae & Sons Company and the Bolte Cycle Manufacturing Company have been barred from the Chicago and New York cycle shows. The cause of action is that they exhibited their wheels at the Milwaukee Industrial Exposition, which was not sanctioned by the National Cycle Board of Trade. Charges of unjust discrimination are made by the local companies.

Both of the barred firms are members of the organization which is causing the trouble. On September 2, according to M. Fichtenberg, of the Bolte Company, a letter was sent out by the National Board of Trade to cycle manufacturers, warning local companies not to exhibit their wheels at the exposition in this city, because the board had not sanctioned the cycle exhibits. The letter reached local dealers on September 9, after they had contracted for their space at the Milwaukee Industrial Exposition. The firms so notified the National Board, and at the same time informed the board that the exposition was not a cycle show, but an industrial display of purely a local character and that under the circumstances they were obliged to patronize it, as all contracts had been closed for floor space. Later the two local firms made application to the National Board for floor space at the two great cycle shows, and when the list of floor space that had been sold was announced, to the surprise of the local manufacturers, they found that no space had been allotted to them. Inquiry was made, and they were informed that had been refused on the grounds that they had violated the rules of the organization in showing at the exposition.

ROOM FOR ALL.

When the National Cycle Board of Trade issued its diagram of show spaces for 1897, 451 spaces were provided; but, owing to the wonderful demand for spaces, it was found necessary six weeks ago to provide an additional 100 spaces, which were taken by intending exhibitors as rapidly as were the spaces originally provided. This grand total of 550 is, however, totally inadequate, and President Coleman, of the Cycle Board of Trade, has been compelled to lease the fourth floor of Grand Central Palace. Here 200 additional spaces will be carved out, bringing the total up to 750. It is believed that with this added room all applicants can be taken care of. The rush for space in the Chicago show is nearly as great. One hundred additional spaces have been provided.

ANTI KID-CARRYING ORDINANCE.

A proposed ordinance was brought up before the New York Board of Aldermen last week, making it unlawful for any person to carry or transport on a cycle any child under the age of five years in the City of New York. The matter was referred to the Law Committee. The previous action of the Board on this subject proved inefficient, and it was therefore decided necessary to pass an ordinance making it a misdemeanor to use a child-carrier. On Tuesday the ordinance was adopted. The penalty is a fine of \$10 for each offense.

PERMITS FOR CLUB RUNS.

Attention has just been brought to the fact that club runs held in New York without a permit are against an ordinance relating to gatherings in public places. In accordance with this, the New York Athletic Club last week applied to the police for a permit before holding a moonlight run. The permit was granted.

NOT FAVORABLE.

Weather, Wind and One Thing and Another Against the Western Time Killers.

Denver, Col., Nov. 20.—The record-breaking season in this Western city has been a limited one in 1896. The weather has been most unpropitious, one storm wave following another so rapidly that riders have been unable to get in good condition and remain so. C. R. Coulter's unpaced mile in 1:50 1-5 was made on an excellent day, thrown in as a sort of dessert after a disagreeable meal of wind puddings.

Almost every event advertised for record work has been a failure because of atmospheric movement or lack of heat. W. W. Hamilton has about gone out of training and has embarked in the coal business with W. B. Scott. Harry C. Clark, who won the M. & W. brick last year for the fastest unpaced mile on M. & W. tires, is out of it. A fractious and vicious horse aimed his heels at Clark's head, missing the occiput, but breaking the young man's right arm. The fracture is a bad one, being a diagonal break, not a square one. A. B. Hughes, who gathered in the Rambler mile in competition before being boosted from the amateur ranks to the professional, has proven unequal to unpaced work. W. F. Sager has taken the unpaced three and four miles records, but has failed in the others. O. B. Hachenberger has been training for the unpaced mile, but has not made his attempt. In practice he has jostled 2:02, without quite pushing it aside. Once he reeled off 2:02 1-5, and at another time 2:02 2-5. Other local men have not been equal to any short distance work. Sager's marks are: Three miles, 6:59 1-5; four miles, 9:27 2-5. W. F. Sager and E. W. Swanborough reduced the tandem unpaced two miles to 3:59 4-5, and three miles to 6:07 1-5.

At the longer distances A. L. Hachenberger, brother of O. B., has tried for amateur long distance marks. He rode twenty-five miles in 1:04:20, which is an amateur record and is faster than his famous brother has ever done. That the latter has never been pushed in any of his races may account for this, and he has never tried the distance against time. A. L. is a new man on the track, having commenced to ride last June. He is remarkably fast, but lacks a head for racing. Experience may give him this. He was entered in one track race during the year, and his poor handling of his machine gave him a fall and put him out of the running. An attempt was made to laugh him off the track, but it was unsuccessful. He is older than O. B. and still an amateur, though he will probably ride professionally next year. Great game was made of him because he said to his brother, "Say, Ben, you take what records you want. I'll get the rest." But he seems to have meant what he said. His ten miles in 25:24 is also the amateur record.

Arthur Gardiner reached Denver to-day on his way to San Francisco, where he goes to race Wells, Foster, McFarland and other Coast cracks. Manager Pelot is with him. Gardiner will remain in Denver about two weeks and will put in his time training. He has one eye cocked toward the unpaced mile and possibly other records. But his advent is of interest to local bicycle enthusiasts, by reason of his recent challenge to Bald and Cooper for match races. Gardiner is a claimant for National championship honors for the year, on the strength of his showing on the circuit. The Bald-Cooper claims have been plentifully aired, and Gardiner now steps in with his list of performances. But

in Denver he meets the assertion of O. B. Hachenberger's backers that he can have a series of unpaced races of one, three or five miles if he wants them. Gardiner does not seem to care to talk about anything over one or two mile races, and there it stands. As he will remain in Denver two weeks or more, there is just a chance that some sort of a series of races may be arranged.

Word from Walter Sanger at Milwaukee, is that he is still waiting to hear from Hachenberger's backers regarding that proposed five-mile race. He says he received a telegram from one P. I. Aldrich, asking if he would make the match, and replied that he would be glad to do so. That has ended the matter, but he stands ready to make the race at any day or hour. He is dead sure he can beat Hachenberger at the distance.

CONSULATE IS ACTIVE.

Numerous plans and ideas for the welfare and comfort of cyclists of New York City were discussed at the meeting of the New York Consulate of the League last week. A committee of three was appointed to endeavor to have three macadam strips laid along Jerome avenue in order to furnish a good outlet to Yonkers. An effort will also be made to secure the Circle in Central Park for the exclusive use of cyclists. It was also resolved that the Committee on Rights and Privileges should be asked to communicate with the Board of Police Magistrates as to the advisability of increasing the amount and time of punishment meted out in cases where the lives and limbs of cyclists have been in imminent danger. A. H. Curtis, of the New York A. C., suggested that the Consulate might also request the Park Commissioners to asphalt two strips on 110th street, between Manhattan avenue and Amsterdam avenue, making a connecting link between Central Park and Riverside Drive.

ROTIER ROUTS MORAWETZ.

In the Wisconsin Division's election the vote was the largest ever cast, 1,216 out of 1,651 members voting. Of this number M. C. Rotier, Milwaukee, received 826, against 389 for F. J. Morawetz in the contest for chief consul. George K. Mead, Sheboygan, was elected secretary-treasurer without opposition. Dr. S. McArthur, La Crosse, secured the vice-consulship, polling 937 votes, against 252 for H. M. Baldwin. The newly elected secretary-treasurer, George K. Mead, will be unable to serve in that capacity, so his successor will be appointed by the chief consul.

HAIL TO CHIEF PATEE!

Illinois cyclists appear to be extremely apathetic toward the League. The total membership of the State is only about 3,200, and of this number but slightly over 1,200 took enough interest in the recent election to vote. Fred Patee was elected chief consul over A. C. Jaquish, the present incumbent, by a vote of 1,024 to 252. W. H. Arthur, Chicago, was elected vice-consul; G. D. Locke, Jerseyville, secretary-treasurer.

HE WAS ELECTED.

E. Kostomlatsky has been re-elected chief consul of the Iowa Division, under whose reign last year the membership was doubled. J. A. Gallagher, Jefferson, was elected vice-consul; A. C. Miller, Des Moines, secretary-treasurer.

STOPPING A PETTY ANNOYANCE.

All New England railroads have agreed to abolish the release heretofore required by passengers shipping cycles as baggage under the reduced schedule of prices adopted October 1.

POTTER'S TURKEY.

The League Furnishes Some Agreeable Stuffing for Mr. Potter's Thanksgiving Bird.

Chief Consul Isaac B. Potter can spend a joyful Thanksgiving Day for more reasons than one. Apart from his coming nuptials, his long-standing claim against the League for alleged unpaid salary in connection with the defunct "Good Roads Magazine" was settled last week, and under the decision rendered by the referees he will receive from the organization \$4,277 50. The referees in the case were Conway W. Sams, representing the L. A. W.; George E. Miner, representing Mr. Potter, and George F. Alexander, selected by these two gentlemen. Six hearings were held, and a total of sixty witnesses heard.

Mr. Potter's claim is based on a contract made under the administration of President Burdette. When the magazine "Good Roads" was started Mr. Potter, was engaged by the Executive Committee to edit it, at a salary of \$4,000 a year, on a three years' contract, with the privilege, however, that either party could terminate it upon ninety days' notice being given to the other party. In the contract it was specified that the League Executive Committee should "use all proper efforts" to secure advertising for the new publication. From the outset the magazine was a flat failure, and after considerable money had been lost the Executive Committee gave Mr. Potter notice of their decision to discontinue the publication, which was done.

Mr. Potter claimed that the League officers had never really tried to influence advertisers to patronize the magazine, and upon this assertion the suit was based. Through the witnesses called by Mr. Potter, largely manufacturers, it was tried to show that, had manufacturers generally been asked by the President of the League to help the magazine, they would have done so by advertising in it, and in this endeavor Mr. Potter has apparently been successful.

MICHIGAN MUDDLE ENDED.

A. B. Richmond, the official candidate for the chief consulship of the Michigan Division was defeated by seventy votes, according to the official count made on Friday last. E. N. Hines, of Detroit, who ran on the independent ticket, received 432 ballots and Richmond 362. The fight between the two factions in the division has been long fought and bitter, and resulted in a close and exciting election. The independent ticket was backed by the Detroit Wheelmen, which organization controlled the vote of almost one-half of the division's membership, and all but two of their nominees were elected. The exceptions were Leo A. Caro, Grand Rapids, who was elected secretary-treasurer by 67 majority, and one of the representatives, Frederick Wells. E. F. Kemp, Grand Rapids, secured the vice-consulship by a majority of 15. The election of Hines, although distasteful to a portion of the membership, will result in the settlement of the Bressler feud, and the restoration of \$800 to the division's treasury. This pledge was made before the election.

THE ONLY "BOB."

Robert Holm, who has achieved satisfactory results during his long service as chief consul of the Missouri Division, was unanimously renominated and, as a matter of course, re-elected to that position, at the recent election. Secretary-Treasurer W. M. Butler was also re-elected.

CORCORAN'S CONTEMPLATED COMBINE.

A movement is being agitated by W. J. Corcoran, manager of the Charles River Park track, Boston, to induce the owners of the leading tracks throughout the country to organize under the title of the National Cycle Racing Association. The idea is to govern the professional riders without interfering with the League's jurisdiction, and to protect the interest of the race-promoters and track owners, with the object of placing professional racing on a sound foundation. All restrictions and rules deemed advisable would be subject to the approval of the Racing Board, and it is thought that the association could greatly lessen the Board's work.

One of the main ideas is to make a pool, which will be used for the importation of foreign riders, assuring them of a certainty for their appearance on American race tracks, and to run them over the three circuits during the season. This, it is believed, would greatly increase the interest in the sport of cycle racing, and give to the public what it is ever demanding—something new in a racing line.

Another department would be the creation of three distinct circuits—two short and one long one. They would be known as the East, West and Grand circuits. The West circuit would be started early in the season at some distant point in the West, and the East a few weeks later, the two being so arranged as to meet at the opening of the Grand circuit, about August 1. The Grand circuit could travel in the East until the middle or latter part of September, and then go west, as it did this season, and, if need be, continue right along to the Pacific coast.

Corcoran says that the Massachusetts Athletic Association, the Springfield Bicycle Club, the owners of the Manhattan Beach track, and the owners of the Willow Park Grove track, in Philadelphia, have signified their intentions of entering such an association.

BIDDING FOR ECKSITES.

The San Francisco Velodrome has failed up to the present time to close the proposed deal for a ten weeks' appearance in that city of the Eck string, and the team will probably disband, scattering to the various homes, to attend the New-York Madison Square Garden meet later or go to San Francisco, which city will give a positive answer late this month.

GETTING THE MONEY.

Rivierre, the famous French long-distance rider, is putting in his time during the off season by travelling through rural France giving cinematographic exhibitions, the whole show and himself journeying solely by means of a motor carriage.

COURSE DE SURPRISE.

What is called a course de surprise has been instituted at Paris. The competitors in this event do not know the length of the race, and are kept anxiously on the lookout for the last lap bell.

ENTER EARLY.

Rivierre, one of the winners of this year's Bordeaux-Paris race, has already entered for the '97 race. An Englishman and a German have also sent in their names for the next contest.

STUCK ON HIM.

Jacquelin is at present the idol of the Parisian racegoers, and their idolatry extends so far that when he is beaten they hiss and jeer his victors.

J. W. Stocks declares that by the aid of wind shields forty miles will be ridden within the hour in '97.

RACING BOARD'S BULLETIN.

PROFESSIONALIZED.

Virgil Hall, Omaha, Neb., clause (c).
H. B. Weise, Philadelphia, Pa., clause (b).
Harry Johnson, Newton, Kan., clause (f).
W. Shillingford, Newton, Kan., clause (f).
Dan Gracey, Newton, Kan., clause (f).
John Paecher, Newton, Kan., clause (f).
W. A. Talbert, Hamburg, Ia., clause (a).
Harry Holtzinger, Hamburg, Ia., clause (a).
Hugh T. Whitehead, Memphis, Tenn., clause (d).
William H. Whitehead, Memphis, Tenn., clause (c).
Horace Slater, Phoenix, Ariz., clause (a).
Walter Daniels, Butte, Mont., clause (a).
C. H. Kerr, Butte, Mont., clause (a).
Harry Day, Butte, Mont., clause (a).
W. O. Ferguson, Butte, Mont., clause (a).
W. B. Lasswell, Butte, Mont., clause (a).
— Pierce, Butte, Mont., clause (a).
B. B. Stevens, Philadelphia, Pa., clause (f).

SUSPENDED.

Until July 1, 1897, unsanctioned races: Walter Daniels, C. H. Kerr, Harry Day, W. O. Ferguson, W. B. Lasswell, — Pierce, E. A. Law, — Hensley, — Walter, C. A. Southwick, C. W. Reber, — Keefe, Butte, Mont., J. F. Kennedy, D. J. Davis, A. B. Dudley, L. La Fontaine, H. Lemke, Thomas Leonard, James Lyons, R. Ryan, J. Kauffman, A. S. Church, Louis Copius, C. R. Morgan, B. J. Morgan, Anaconda, Mont.; Kent Clark, Hugh Clark, C. W. Chatin, Thomas Hathaway, Floyd Hyde, George Wall, Ike Leiser, Missoula, Mont.; — Milburn, — Schwartz, — Ireland, — Lambertine, — Brown, — Taylor, — Harmlon, — Harrington, — Babcock, — Butler, Miles City, Mont.

SUSPENDED PENDING INVESTIGATION.

Thomas W. Eck and John S. Johnson, Minneapolis, Minn.

"ME TOO," SAYS JOHNNIE.

Johnson's record-breaking trials at Memphis came to a sudden termination on Friday last. A telegram was received from Chairman Gideon announcing the suspension of both Johnson and Eck, until they paid \$200 damages to the Portland, Me., Association, with whom they failed to keep an engagement in August, which put an end to their calculations. As a consequence Eck watches the work of Michael from a seat in the grandstand and Johnson packed his grip and started for Minneapolis to spend Thanksgiving Day with his family.

JAY AND TEDDY.

Jay Eaton and "Teddy" Goodwin have arranged a match for a purse of \$100, to take place in Madison Square Garden on December 5. The distance will be one mile, best three in five heats. The winners will be matched to ride against one of the foreign riders during the following week.

HURET'S HIGH PRICE.

When the team of Simpson Chalmers, which is to race in America this winter, was being made up, Huret, the French crack, was asked his terms to join it. One thousand dollars per week and all expenses of himself, trainer and valet was his price. Huret will not be a Simpsonian just yet a while.

ON THE BRINY NOW.

Linton, Platt-Betts, Lumsden, Chapelle, the Chase brothers and a dozen other foreign riders sailed from Southampton on the St. Paul Saturday last for New-York, to compete in the Madison Square Garden tournament.

THEN COMES THE FROST.

Oh, it's great to be a racer, and to see one's name in print.
Or to be a record breaker, spending money without stint;
There's a subtle joy in knowing that you are the cause of talk;
But the glory isn't fillin' if the Ghost Don't Walk!

THEN HIS LEG CRAMPED.

Memphis, Nov. 19.—Frank Waller, the Dutch Carolinian, who hails from London and drifts about the country in clothes loud enough to be heard, started to knock the spots out of the twelve-hour record of 280 miles to-day, merely as a warming up for the coming six-day plug in New-York. He had eight tandems and a triplet to pace him, and he began the ride with the intention of covering twenty-six miles each hour. He adhered strictly to his schedule for the first three hours, riding 26 1-3 in the first, 26 1/2 in the second, and 26 2-3 in the third. At 100 miles, when he was well inside the record, he dismounted for four minutes for nourishment. Shortly after remounting he complained of cramps in his left leg, above the knee, and at 106 miles he was forced to dismount and give up the ride.

Waller rode the 100 miles in 3:52:14 1-5, lowering the indoor record of 4:00:15, by Miller at the Chicago Coliseum. He also set up new marks from 40 to 106 miles, as follows:

30.....	1:08:31	75.....	2:51:20
35.....	1:19:55	80.....	3:03:12 1-5
40.....	1:31:08	85.....	3:15:33
45.....	1:42:12	90.....	3:30:37
50.....	1:53:18	95.....	3:39:41 3-5
55.....	2:04:45	100.....	3:52:14 1-5
60.....	2:16:12	105.....	4:06:29 2-5
65.....	2:27:41	106.....	4:12:04
70.....	2:39:21		

MEMS FROM MELBOURNE.

Melbourne, Australia, Oct. 22.—J. W. Parsons is home again. His return was not as auspicious as his departure. He was a conquering hero when he left. His laurels were pretty well plucked ere he returned, and his reception was rather frigid in consequence. There is considerable feeling against him because of his failure to compete in England, for which purpose, it may be recalled, a popular subscription was raised.

The entries for the great Austral Wheel race on January 20 total 180—a record.

Tom Linton and his brother Sam are among the entrants, as are Colombo and Boidi, of Italy; McDonnell and Martin, of America; Gerster, of South Africa, and all the Australian flyers. The total entries for Austral Day races are 720.

ON TANDEMS.

Denver, Col., Nov. 23.—With a flying start, W. F. Sager and E. W. Swanbrough on a tandem cut the unpaced professional record for five miles by 16 seconds, putting the mark at 10:10.37. Henry Watts and Percy Smith, on a tandem, tied the unpaced amateur one-third mile record of 37 seconds, and, continuing to two miles, put up the following new figures: two-thirds mile, 1:17; mile, 1:59 2-5; two miles, 4:12 3-5.

BUNNELL'S INDOOR BOOM.

Philadelphia will probably have an indoor track next season. A German singing society is about to build a large structure for a singing festival to be held in June, and a syndicate headed by O. S. Bunnell intends leasing the building after the festival and converting it into an amphitheatre for cycle racing.

GOING TO STAY AWHILE.

Michael received word last week from his lawyers in England that "Chappy" Warburton's suit against him had been abandoned, and that there was no necessity for his immediate presence across the pond. Michael immediately sent for his wife and expressed himself favorable to remaining in this country indefinitely.

and TWENTY-FIVE CARBON Steel will last only so long

Kindly mention The Wheel.

NOT WHAT THEY SEEM.

While Chairman Gideon Was Compiling These Figures the Record-Wreckers Were Upsetting Them.

Chairman Gideon has just tabulated the records as they appeared last week on the books of the L. A. W. Racing Board. They are interesting, but of small value. Even while they were being compiled, Michael, Johnson, Waller and others were engaged in upsetting them, so that professional figures at least must not be accepted at even their face value.

AMATEUR RECORDS.

Table of amateur records with columns for time, name, and location. Includes entries like '0:24 1/5 - J. S. Johnson, October 31, 1893' and '0:53 - A. W. Porter, Waltham, Mass., November 2, 1894'.

Table of amateur records with columns for time, name, and location. Includes entries like '0:29 1/5 - A. B. Simons, Deming, N. M., May 26, 1896' and '0:59 - Harry C. Clark, Denver, Col., November 20, 1895'.

Table of amateur records with columns for time, name, and location. Includes entries like '0:25 4/5 - G. F. Royce, Paterson, N. J., July 4, 1894' and '1:01 - Frank M. Byrne, San Jose, Cal., September 9, 1895'.

Table of amateur records with columns for time, name, and location. Includes entries like '1:25 1/5 - W. C. Farland, San Jose, Cal., July 4, 1895' and '2:00 2/5 - Frank F. Desmond, jr., Denver, Col., August 8, 1896'.

Table of amateur records with columns for time, name, and location. Includes entries like '45:49 - A. A. Hansen, Minneapolis, Minn., August 15, 1895' and '48:08 1/5 - A. A. Hansen, Minneapolis, Minn., August 15, 1895'.

PLUMS FOR M. & W. RIDERS.

To be eligible for an award, Morgan & Wright announce that all who are contesting for their '96 prizes must give notice of the fact before December 26. As is fairly well known, these are the M. & W. "plums".

For Fastest Unpaced Mile on Regulation Track—Prize, trophy equal in value to the one awarded in 1895, and containing over 90 parts of 24-kara gold. A smaller face-simile to each breaker of the record.

For greatest mileage made on one set of Morgan & Wright tires during 1896. Rider to make his own repairs—First prize, cost value, \$100; second prize, overcoat, \$45; third prize, one set M. & W. tires.

CENTURY SURVIVORS.

The following road records have been allowed by the Century Road Club of America: Club century survivors' record, Century Wheelmen, Philadelphia, Pa., 194 survivors—June 13, 1896. American record, A. E. Smith, 10 miles, 12 hours—August 29, 1896. Illinois State and American record, A. E. Smith, 200 miles, 14:43:00—August 29, 1896. Illinois State record, A. E. Smith, Chicago to Milwaukee, 5:00:00—October 9, 1896. Course record.

THE PALMER
PNEUMATIC TIRE CO.
CHICAGO, ILL.

To Bicycle Dealers

You are selling bicycles to make money. There isn't any fun in handling wheels unless you at least get a decent living from the business.

Your capital must return a certain percentage to produce a profit. Profit is a result of sales. Sales include money paid for wheels and sundries, renting and repairing. In selling high-grade wheels, you can get any equipment you want. You can get your wheels fitted with Palmer Tires just as readily as with tires of the second grade.

Wheels fitted with Palmer Tires run more easily than wheels fitted with other tires. Palmer Tires are so fast that almost one-half the pedal energy is saved to the rider.

Wheels fitted with Palmer Tires do not make their riders walk. Palmer Tires are too easily mended when punctured.

Wheels fitted with Palmer Tires produce the least vibration. Palmer Tires are perfect cushions. They make smooth the rough places.

Palmer Tires are well advertised. Their merits are so well known that dealers do not have to spend fruitless hours talking and explaining them.

It will please your riders, Mr. Dealer, if you give them Palmer Tires. You will make friends by doing so. Your friends will bring other customers.

And that means more bicycles sold—more profit.

The Palmer Pneumatic Tire Company

MIKE AND RECORD.

They Come Together in the Dark at Memphis and the Latter Is Knocked Out.

Memphis, Tenn., Nov. 21.—It seems to be utterly impossible for human beings to pedal multicycles around the track at sufficient speed to appease the unsatiable thirst for fast going possessed by little Jimmie Michael, of Wales. To-day he boosted the American hour record, established by himself at Manhattan Beach, by almost two miles, despite the fact that half the ride was made in semi-darkness. Even under this most unsatisfactory condition he continually shouted for more pace, although each pickup was made at great risk of a collision. Had the trial been made by daylight, it is thought that he would have given the world's record a close rub.

At the start of Michael's trial it was believed that the electric lights were in proper order, but when they were turned on it was found that one of the circuits was not complete.

One row of lights was in order, but these were outside of the posts, and cast such a shadow over the track that it was thought it would blind the men. The pacemakers were but twenty in number, five triplets and two tandems, and some of these men rode double, getting upon a triplet after finishing half a mile with a tandem. Changes were made each half mile, and in the dark it was one of the most wonderful performances that could be seen to witness the neatness of the changes, as the men flew round the little six-lap track. It was raining in the centre of the track inclosure, but the heavy air did not seem to hinder the men.

After the tenth mile Michael was continually calling for more pace, but the five triplets and the two tandems were doing all that they thought safe to do in the dark. At the twenty-first mile he had averaged 2:01 to the mile, and was continually shouting for faster pace. This could not be given by all the teams, but some of the pacemakers pulled him under that time.

At the finish he dismounted fresh, and said that had he known he was so near the thirty miles in the hour he would have forced the pacemakers to carry him in 1:50 the last miles. He rode in this hour the greatest distance by some yards that he has ever ridden. The League representative, with a full corps of officials, was on hand, and with the sanction placed on the ride by Chairman Gideon, it will stand as official.

Michael got under his Manhattan Beach time at eleven miles, and cut all figures from there on. Summary:

Miles.	Time.	Record.	Former Record.
11:56 2-5		
21:57 3-5	3:54	_____
32:02	5:56	_____

292:00 3-5	58:36	_____

Twenty-nine miles, 1,283 yards in the hour, former record 27 miles, 1,630 yards.

Previous to the ride of Michael, Henry Bradis, of Chicago, went against the five-mile unpaced record of A. F. Senn, and broke the two, three, four and five mile unpaced mark in the one ride. His first mile was made in 2:08 1-5, the two miles in 4:27, lowering the mark of 4:27 2-5; three miles in 6:52, lowering the mark of 7:11; four miles in 9:17, cutting the mark of 9:36 4-5, and the five miles in 11:42, cutting the mark of 11:51 1-5. This was the first attempt of Bradis at record breaking, and great things are expected of him.

AN IDOL OF THE PUBLIC.

Jacquelin, the French crack, was defeated by both Parbly, English, and Arend, German, in a series of three races at the Seine track, Paris, Sunday, November 8. It was his farewell appearance before leaving for military service, and he was presented with a magnificent bouquet and other gifts. The dual defeats cost him the Brassard prize, which he has held the greater part of the season. The Brassard brings to the holder a daily income of about \$4.50. Jacquelin took the first heat by half a wheel from Parbly, Arend being a bad third. In the second heat Parbly made a sudden sprint on the back stretch, after the bell. Arend made a desperate effort to catch him, but failed, while Jacquelin was left hopelessly behind. The final heat resulted in a loaf until the last half lap, when Parbly again tried to get away. After a desperate struggle the German caught him and won by half a wheel. By points Parbly won, Arend second, Jacquelin third. The spectators jeered the foreign riders when Jacquelin won, and hissed them each time the popular Frenchmen was beaten.

COOPER TELLS OF HIS PLANS.

Tom Cooper is at his home in Detroit, where he intends to spend the winter, having declined a proposition to go abroad. When interviewed as to his future plans, he said:

"I will rest easy on my oars until spring. Of course, I will ride for the concern that pays me the most money. A good many changes are liable to happen between now and spring. My present contract has until next March to run, so there is no reason for my worrying. I propose to keep in good condition. That does not mean that I will train constantly. Too much training is not beneficial. It is not good for a rider to keep himself on edge all of the year. I have had six months of hard and steady work. While I propose to do some skating, it is not at all likely that I will make any matches with Johnson or any of the other fast skaters of the country." He expects to start for the Pacific coast about the middle of February.

CON BAKER AND CON PRIZES.

Con Baker registered a long and vigorous kick against Manager Prince, of the Memphis Coliseum, last week. He was led to believe that a trip to Memphis would prove remunerative, being told that prizes as large as those hung up in the North would be offered. So with his trainer he journeyed to the Southern city at his own expense, accumulated hotel bills, and at the last minute found that the first prizes were \$20 and \$15. It was impossible to win sufficient cash with such prizes to make both ends meet, hence the protest. He insisted that a good-sized purse be put up for a match race against Johnson or Michael, but Johnson's suspension killed the matter. Baker is now a poorer but wiser man.

Record is money in the sense that it cannot be long held.

WAITED PLENTY OF TIME.

Neither Eck nor Johnson has grounds for any complaint against the Racing Board on account of his recent suspension. The claim of the Maine association has been hanging fire for at least five months, and repeated letters from Chairman Gideon relative to the matter have either been ignored or the question evaded. With the '96 record-breaking season about over, there would be little probability of the matter being adjusted before next spring. The meet promoters have offered to compromise the matter for a sum of \$200.

TO BECOME A BLOOMIN' FRENCHMAN.

"Choppy" Warburton, the famous English trainer, who until recently looked after Michael, has decided to turn Frenchman. He is sour on the English N. C. U. for "taking the bread out of his mouth," and has applied to the French Ministry of Foreign Affairs for his letters of naturalization. He has secured the position of official trainer to the new Humber, Clement & Gladiator Company, and will get together a team of Frenchmen for the avowed purpose of wiping out every English rider who visits France.

ENGLISH ALONE GENUINE.

The English Cyclist is sceptical of the records made in this country by Michael and Johnson, and avers that the marks put up in that country should remain on the world's record sheets, where the work of the men was correctly timed and authenticated. It infers that no one but the official English timekeepers is capable of correctly clocking a record trial.

PLAYING CASINO.

A fifty-mile paced match race was run at the Casino, Saratoga, N. Y., November 22, between C. G. Carpenter, of Rahway, N. J., and E. C. Smith, of Saratoga. The conditions were \$50 a side. At thirty-three miles Carpenter's tire burst, and he withdrew. Smith finished in 2:10:45. Shock and Golden competed in a five-mile unpaced race. It was won by the former in 13:15.

DEFEATS THE VILLAIN.

Joe Harrison, of Asbury Park, who is one of the speediest amateurs in the Metropolitan District, will ride as a professional next season. He intends to become identified with the stage in the part of a racing man during a race scene in which he defeats the villain of the play. This step will force him into the professional ranks.

TOUCHED AND SPILLED.

The English racing team which is to race this winter is a joint venture of the Simpson Chain and Dunlop Tire companies. Unfortunately Platt-Betts is suffering from a spill sustained at Catford by "touching" a pacing quad, but his place may be filled by A. A. Chase, who will thus have Linton and Lumsden for companions.

BEATS FARMING ALL HOLLOW.

Tom Cooper has been telling his fellow townsmen just how much there is in the racing game. According to Cooper he has bagged about \$6,680 for his last season's work, made up from the following: Winnings, \$1,780; salary, \$3,000; tire money, \$1,200; chain retainer, \$200; "appearance money," \$500.

Although time is money in racing, the latter is the more apt to come to a sudden stop.

WAKING UP AGAIN.

The League Meet Town Getting a Move On
Once More—Election and Racing
Matters.

Louisville, Ky., Nov. 20.—Louisville has appeared to be very much asleep since the big events of August, but little news being on the wing, except when viewed through the magnifying glasses of the space writer. However, all this might have been expected, and was by those who have time and again watched the effect of a big event and the reaction.

The Kentucky Division election was, in comparison with former years, not so interesting, and about the only reason ballots were sent out was that there is no provision for otherwise deciding it when there is no contest. The secretary-treasurer will propose measures looking to the simple arrangement of a single ballot, cast by the secretary as a mere form, to settle all similar contests (?) in the future.

The Executive Committee of the '96 Meet Club met on October 1 and proceeded to bring the affairs of the club to a close, in accordance with the statutes of the State.

Messrs. Brigman, Colgan and Jenkins were appointed a committee to audit the books of the club. On November 12, at another regular meeting, the committee approved the treasurer's accounts. The cash on hand, \$3,200, was not all available for dividend, and after the last few bills were paid the dividend of 58 per cent, which was ordered was represented by the sum of \$3,176.46.

J. W. Brigman is liquidating agent at the Germania Safety Vault and Trust Company's office, No. 103 West Market street, Louisville, Ky.

Louisville is in the early throes of cycle path agitation. G. M. Allison, James Speed, Jr., and John E. Castleman are interested and have petitioned the stockholders of the '96 Meet Club to turn over the dividends on their investments to a cycle path fund which is being raised.

the people who object to using the Sabbath for such purposes. Prince Wells expresses himself mildly but firmly in this way, and as a judge of the public pulse professionally and as a business man few men can speak with any greater degree of knowledge born of absolute experience, and that, too, right along this especial line. Mr. Wells says the public may expect racing at Fountain Ferry during the next season from the time the curtain is rolled up until the last ball is pitched. It is expected three or four days each month will be the average number of racing days.

The Louisville branch of the Hay & Willets Manufacturing Company will be made the distributing point for Southern territory next season. Mr. George Wilcox has just returned from a trip on the road in the interests of the Outing.

Martin & Martin is its name now. It was Martin & Dressing. This firm has recently moved a few doors farther south from its old location, and is preparing a "campaign of education" for the Louisville people. They

REMARKABLE RESULT OF A REAR-END COLLISION.

Charley Pedalslinger is somewhat of a scorcher

—and is consequently rather "stuck up."

Chairman of the Election Committee M. J. Fleck announces the result of the canvass of the division vote as follows:

Chief Consul, John W. Clendening (re-elected), Covington, 329; Vice-Consul, Newton G. Crawford, Louisville, 333; Secretary-Treasurer, Owen Lawson (re-elected), Louisville, 338; Representatives (five to be elected), E. W. Ledman, Louisville, 313; R. F. Pelouze, Louisville, 311; E. H. Croninger, Covington, 310; Thomas B. Dewhurst, Lexington, 308; J. W. Brigman, Louisville, 304; W. R. Pratt, Madisonville, 302; scattering, 4. The total vote is only about one-fourth of the membership.

Chief Consul Clendening has requested the secretary-treasurer to call a meeting of the Division Board for December 6, at 2,510 West Jefferson street, Louisville.

Thomas B. Dewhurst, the Lexington member of the Board, is in England with his bride. He is visiting his relatives there and will prolong his stay for some time.

Compared with this time in the season two years ago, and even a twelve month since, Fountain Ferry track seems to be forgotten by all but home people. The last week has been record weather, and all the track needed was a record man to dislocate Father Time's pet figures at any distance. "Jocko" and "Dido," the Fountain Ferry monkeys, continue to fight their championships, a la Cooper and Bald, while Lum does a loafing pace on his own hook, especially when that hook happens to be entwined around a limb. "Mac" is now engaged in the railroad business, while the man with the dirty sweater continues to walk a few blocks "around the farm" each week.

Nearly every Louisville dealer is opposed to Sunday racing, even though his personal objections may not partake of that view on account of any exceedingly strong tendency toward the pious. The general opinion is that Sunday racing in one city elsewhere will affect the attendance in every other city among

will continue to handle the Henley and Overland.

R. F. Pelouze has received but little credit for the remarkable work he did as State Chairman of the National McKinley and Hobart Wheelmen's Club. With practically little assistance, he worked day and night, and the fact that Kentucky's majority is so close leads many of the riders here to think that with Dick Pelouze and his fine sense of organization, on the other side, the result would have been the other way. It is not unreasonable to suppose that McKinley could not have carried Kentucky without Pelouze, for he did the work effectively.

COSTUME, HARMONY AND CONTRAST.

It is considered good form nowadays when a lady mounts a tandem in company with a "mere male," to let her costume either match his in color or form a note of harmonious contrast. The effect upon the eye of the public is pleasing, and it is to be hoped the fashion will continue.

BOULEVARD BITS.

Seen and Heard Upon the Great Cycle
Parade-way of New York's
Wheeling Army.

"Bloomers; shocking with their—78 gear and barrel hubs—and red rims on his—teeth of the sprocket twisted—but I'm going to ride—two broken wheels with—fourteen yards in the skirt— She rode a century, but—Mamie Smith wore—a twenty-five-pounder with ball bearings on—her face," and so the crowd babbled on, not in an insane asylum, but on the Boulevard Sunday, watching the wheels go round.

Crash, smash, bang, and two important-looking men, with uptilted cigars, mowed down the wheelman with their buggy.

"No cop in sight, Jim," spoke one of them; "hit her up and get out."

But there were; four of them—two going on duty and two just relieved. Off went the buggy, but in fifty feet the four policemen had the drivers who were going off without seeing what damage they had done. Luckily neither wheelman nor wheel was hurt, and the two, who were driving on the wrong side of the asphalt, were let off, as the policeman remarked, "What's the good of takin' 'em in? All they'd get would be a \$3 fine, anyway."

It was 9 a. m., and she looked so fresh and prim in her dainty pink waist, tall Eton collar and starched butterfly bow, black skirt, trim jacket and smart hat, pedalling up the Boulevard.

"Say, there's a peachorine," observed one of those afoot, and the wheelwoman smiled slightly.

It was 5 p. m., and she was homeward bound. Her hat was all awry; her tall collar and the encircling tie were guiltless of starch or uprightness; her skirt was drab-colored with dust, and her face was, oh, so red!

"Say, Dick," exclaimed a creation in a café au lait, with hat to match, who walked, "if I looked that fright I'd keep a mile between me and a wheel."

And the girl awheel gritted her teeth as she heard it and pedaled on.

"Scorching on the Boulevard fills my heart with glee;

Coppers on the Boulevard cut no ice with me." Hand grabbed at his shoulder; off his wheel he fell, And the scorcher scorched no longer, for they led him to a cell.

"Hey, Henny, see de freaks!" bawled one urchin to another, pointing at the roadway. "Dey mus' have gotter way from Barnum's."

He had fallen on the car tracks at Eighty-sixth street, and one wheel was hopelessly smashed, the forks bent and the sprocket minus a tooth or two. He eyed his damaged mount ruefully, and so did a sympathizing crowd. Suddenly a man on a wonderful green enamelled machine pushed his way through the crowd to the dismantled one.

"Say, young fellow, if you'd ridden a Neverfall you'd be riding yet. Look at mine; a railroad train's went over it, but it's still on deck."

"Don't mind what he says; why didn't you buy a Gittenquick? They're the stuff," put in a rider whose mount was enamelled a la barberpole.

The unfortunate listened in amazement at all this free advice.

"Tshaw!" commented one in the crowd,

"these men are paid to boom wheels this way. No man gets a smash but some of 'em are right in to tell how their machines would have stood it."

"It's a graft," said the cycop, "I really declare; This scorching for scorchers is sport, sure, for fair."

He wobbled, he tumbled, for fast was his pace; And the cop on the sidewalk laughed in his face.

They swept by, fifty of them, all in snuff-colored suits, out for a club run, and the crowd admired. The captain, with plenty of gold on his shoulder straps, and the lieutenants, with almost as much, came in for lots of wonder, and so did the two flag-bearers, with silken guidons clamped to their handle-bars. In the rear rode the ambulance corps, with boxes of surgical appliances strapped to their wheels and red crosses sewed on their arms.

"Gee, ain't they fine!" The standard-bearers turned to look, collided and took beautiful headers, which snapped the flagsticks off short.

The ambulance corps tumbled off their wheels, grabbed their boxes and rushed up,

"Where are you going my Turkey maid?"

"I thought I'd go cycling, sir," she said.

"You'd better be careful, my Turkey maid."

On some one will see you, miss," he said.

armed with lint, bandages and splints.

"Say, young fellow," observed a cynic on the curb, "try yer splints on the flagpoles. The boys is all right."

And the crowd was unfeeling enough to laugh.

Blowing a whistle frantically, the negro scorcher scorched, hands off and eyes glued to the rim of his front wheel.

"You want to look out!" yelled a small boy. "Say, honey," was the reply, "you can't fool dis chile. I'se got wings on mah feet."

Perhaps he had, but half an hour later he languished in a cell, lamenting that the charge for his hired wheel was piling up 25 cents an hour.

He looked at peace with the world, in a red sweater of no uncertain hue, ecru stockings, light blue trousers and a cap of an 1840 model. He pulled at a huge cigar and labored up a slight hill on a 56-inch ordinary, holding the handles as if he had a yoke of oxen in front of a plough, and bending his back in a cycloidal curve.

"Ah there! Bygone days!" shrilled a girl, but the old man smiled contentedly and pedaled on, to the crowd's delight,

"Say, I wonder which 'un wears the pants at home," asked the fat man, as a red tandem whizzed by. Two pairs of red legs incased in knickerbockers propelled it, and two faces poked out from under two long-peaked caps.

"Give it up," replied the thin man.

There was a craning of necks. "There come the French scorchers!" Two girls with skirts that made no pretence of reaching to the knees, and served as a foil to shapely limbs incased in silk stockings, dashed along.

"Ah there, baby," cried one of the cycle policemen.

"I had to lock 'em up the other night," said he, "and, my, they swore awful for ladies."

Big man,
Shiny wheel.
"Oh, how
Good we feel!"
Small tack
In the dust.
"Great Scott!"
Tire's bust!"

Down the asphalt came the novice, wobbling like a ship in distress. He swerved, piroouetted, circled, dipped and did everything but fall of. He persevered. He gained a block. He smiled at his prowess.

"Ricketty, racketty, bang!" went the wheel. "!!! *** !!! *** !!!" went the novice.

He had caught his toe between the chain and the sprocket wheel, and was so tangled up that two bystanders had to unravel him. He limped away, leading a squeaking wheel.

THE BOULEVARDIER.

HAD FRESH AIR ENOUGH.

He was sick, or at least said that he was, and the other day he entered the office of a well-known physician uptown and sank into a leather-covered armchair in the ante-room waiting his turn on the list. At last it came, and the doctor examined his tongue critically, felt of his pulse, inquired as to the symptoms of his illness and then looked wise.

Taking a pad from the table, he wrote a prescription calling for bread pills and distilled water or something of that sort. Then, turning in his chair, the physician said: "I cannot see that anything serious is the matter with you. What you need is plenty of air."

The patient smiled a broad, bland smile, but said nothing.

"Take this prescription regularly every night, but above all things get plenty of air. Good, wholesome outdoor atmosphere, that is what you need more than anything else."

"Ha! ha! ha! I need air, do I?" shouted the man. "Well, that is funny."

"Why, what do you mean?" inquired the doctor.

"Mean? Why I have been six months steady in the business of breaking the New York-Philadelphia bicycle record."

He is laughing yet.

MIGHT BE WORSE.

Take the weather as it comes, and don't worry. You must not expect dandelions in November, and if the wind comes from a snow bank, just put on your best underwear, go riding and be happy. Here are some lines which fit the case exactly:

Don't growl about cold weather! Suppose you were to land On Greenland's icy mountains, on Norway's freezing strand? Suppose they were to send you as a missionary where The Eskimo makes fire out of whale oil half the year?

ADVISED BY THE LANDLORD.

"Say, all these alleged funny pictures and these yarns, accompanying them, which pretend to show how the broncho-buster of the Southwest is forsaking the cayuse for the cycle, make me tired."

The man who thus detailed his feelings had sold bicycles ever since the day when ability to straddle a sixty-inch ordinary was everywhere accepted as a patent of cycling nobility. "I don't know how it is just now," he said, resuming his conversation, after he had satisfactorily lighted a cigar, "but just a little while after the safety was introduced, and we had all made up our minds that she was going to be a go, the people I was working for got stuck on a lot of wheels, and thought it would be a great scheme for me to run down into the Southwestern country and sell them. The boom was on in that section, and one night I landed in one of the boomiest towns with a ample wheel and a grip full of catalogues.

"After I had worried down some dog-fodf which the landlord was polite enough to call and charge for as supper, I thought I'd get the lay of the land and learn from him what my chances of selling some bicycles were.

"Jest a lysickle, eh?" he remarked between expectorations, as he looked the sample wheel over.

"Yes, a bicycle, but it is the best wheel ever built."

"Orter be a wheel of fortune or sunthin' of that kind to be a go, but mebbe you kin hit some of 'em. That's a dog-fight and a horse race to-morrer, and it'll be a good day fur you."

"Are there any peculiarities to look out for?"

"Wall, yes, a few. You'd better begin bizness by callin' up all hands to take a drink."

"I see."

"If you hev to talk any more, tell 'em thar's another drink ahead."

"I understand."

"If the old man Jones comes in with his boys, thar'll be a row on the street. They ar' bad folks and shoot on sight. Keep your eye peeled, and if you see any signs of a row ask the hull crowd to drink."

"Yes, but—"

"Look out for dog-fights. If one takes place on the street, you can't hold the boys a minit. If you see a yaller purp begin to bristle up to a bob-tailed brindle, yell to the crowd and step over and moisten."

"Yes, but by that time the whole crowd will be half drunk," protested the agent.

"Sartin it will, and that's what you want, of course. That will give you a chance to skip out and take your life with you, and if you make a stop anywhere within a hundred miles I'll send on the masheen—purvided thar's anything left to send. Nuthin' like knovin' how to handle one of these crowds, my friend. Did you ask me to take sunthin' in advance of to-morrer?"

MARY MINUS SKIRTS.

A facetious devotee of the wheel, who claims that cycling dissipates all dyspepsia and morbid fancyings, asks: "Would Marie Bashkirtseff have diarrhea and died had she been able to turn into a Marie Dividedskirtseff, or even a Knickerseff, and witch the world with noble wheelwomanhood?" Apropos of this sad Russian girl, memorial services were held for her with most elaborate ceremony recently in Paris.

TAKING TRADE EASY.

A perambulating Philadelphia scissors grinder has succeeded in combining the bicycle he rides when looking for trade with the emery wheel and grindstone he needs in his business. If he doesn't do any business he secures plenty of exercise anyway.

YOUNG MAN AND THE GAME.

Remember, son, that cycling is older than you are by several years; that for years it has been so full of smarter, better and younger men than yourself that their feet stuck out of the dormer windows, but when they died the old game went rolling right along, and not one person in ten millions went to the funeral, or even heard of their death.

Be as smart as you can, of course. Know as much as you can about a wheel and the riding of it without blowing the packing out of your cylinder heads. Shed the light of your wisdom abroad, but don't dazzle people with it. And don't imagine a thing is so, simply because you say it is so. Don't be too sorry for your father because he knows so much less about cycling than you do. Cycling has great need of young men,

PREPARING FOR BUSINESS.

"Well, my man, I hope you have been making good resolutions to be acted upon when you regain your liberty?"

"I intend to learn ter ride a bicycle, I does."

"A truly laudable desire for a manly exercise."

"Yes, ef I'd ha' only knowed how to ride, I could have got away on de blame' wheel I got sent here for pinchin'."

but no greater need than the young men have of it.

Your clothes fit you better than your father's fit him—they cost more money; they are more stylish; your mustache is neater, the cut of your hair is better and you are prettier, oh, far prettier than "pa." But stop a moment, young man and reflect. The old gentleman gets the bigger salary and his homely, scrambling signature on the business end of a check will drain more money out of the bank in five minutes than perhaps your handsome autograph can do during the balance of your mortal life.

Young men are useful and they are also ornamental, and everybody in cycling likes them—but they are no novelties, son—oh, no, nothing of the kind; they have been here before. Don't be so modest as to shut yourself clear out, but don't be so fresh that you will have to be put away in a cooler to keep from spoiling. Don't be afraid that your merit will not be discovered. Manufacturers all over the world are looking for you, and if you are worth finding they will find you.

KID'S SHORTER CYCLE CATECHISM.

EXERCISE I.

See the man!

Why does the man walk as though he were ri-ding a bi-cy-cle?

And yet I do not see a bi-cy-cle anywhere in sight.

Why does he use the air to walk on instead of the pave-ment?

H-s-s-s-s-h!

The man knows a great many sa-loon-keepers and he has been to see them all.

They have been very kind to him.

Will the man get home?

Oh, yes; with the aid of a friend-ly po-lice-man he will get home by and by.

What will the man's wife say?

H-s-s-s-s-h!

EXERCISE II.

See the lit-tle boy with the look of great pain on his lit-tle face!

Why does the lit-tle boy hold his lit-tle hands over his lit-tle sto-mach and say "Boo hoo, boo hoo?"

Is it not pit-i-ful to see the tears drip-ping off his nose?

Has some-body been cru-el to the lit-tle boy?

Oh, no.

He has just finished his thanks-giv-ing dinner and he ate tur-key, cel-ery, po-ta-toes, tur-nips, cran-ber-ries, par-snips, beets, pickles, slaw, more turkey, more po-ta-toes, more pick-les, plum pud-ding, pump-kin pie, ice-cream, nuts, cake and more cake. Now he wants to ride his bi-cy-cle and finds he can't.

He will be able to after a while. Let us go a-way and leave him a-lone.

He pre-fers to be a-lone just now.

EXERCISE III.

Do you see the man with his face all wrea-thed in smiles?

Has he not a hap-py ex-pression on his coun-ten-ance?

Why does he stop every now and then to give thanks for some-thing?

Don't let on and I shall tell you. He has just sold his best friend a sec-ond-hand wheel for twice what he would ask any other man for it.

No, you must not blame the poor man, because you may have a second-hand wheel to sell some day your-self.

EXERCISE IV.

Why does the man look so mel-an-choly?

Is it not per-fect-ly dread-ful to see that ex-pression of re-gret on his pale face?

Why does he throw those large rocks at him-self?

I will tell you. You see, he has been to a raffle for a fine new bi-cy-cle, and he threw forty-four, the first dash out of the box. He was so over-joy-ed that he treated every-body in the place. Then some-body offered him \$2 for his throw and he re-fused with scorn. By and by another man threw forty-six and this poor man went out in the middle of the street and had a fit.

Is it not dread-ful to have fits?

It cer-tain-ly is.

EXERCISE V.

Do you see that strange thing com-ing this way?

It is push-ing a high col-lar and a man's neck-tie, and a man's hat, knickerbockers and an en-or-mous pair of sleeves ahead of it.

That is a new wo-man going for a cycle ride.

Let us go away.

NOT OUT OF MIND.

"You used to think a great deal of the bloomer girl; what do you think of her now?"
"She is out of sight."

HAD TO RIDE.

Everything Conspired to Drive Him Into Cycling, So He Determined to Get Even.

"Oh, I know what you are thinking!" exclaimed the portly and pompous elderly gentleman, as he partly fell and partly dismounted from his wheel and came to a standstill where his neighbor on the sidewalk was looking at him with an amused sort of smile upon his face. "I know you are just laughing to yourself to see me on a bicycle after all I have said against them. I don't know but what I ought to be laughed at. But I was driven into it, sir; yes, actually driven into riding a bicycle.

"I know you don't believe it, but hear my story and then see if I could do anything else. This morning I started down to my office about 8 o'clock, as usual. There wasn't a vehicle in sight. I had barely taken three steps across the Boulevard, when there was a furious ringing of bells; and I glanced up just in time to hear a muttered exclamation, and see—stars. Gradually I disentangled myself from a maroon sweater and a pair of gray trousers, while the other chap did the same in regard to my new business suit and best black silk hat. I am not naturally a profane man, but was preparing to discharge my righteous indignation in the way that any self-respecting man would, when I suddenly became aware that the base intruder was none other than my highly esteemed pastor, who had only the morning before admonished me, with great dignity, to 'pray for them which despitefully use you and persecute you.'

"Curses, not loud, but deep, were my refuge, as I wiped the oil off my new hat and politely assisted my religious adviser to mount his wheel. I had a malicious satisfaction, however, in recalling the fact that his profession prevented him from giving vent to his feelings in words. Mine didn't. Then, too, I observed a long, jagged cut in a knee of his trousers. When I finally reached the office another surprise awaited me. I found my partner in the hall with a bicycle agent.

"I caught enough of the conversation to know that the rash man was about to commit the greatest mistake of his life, and remarking in some heat to this effect glided into my private office, hoping to lose myself in work. I closed the transom, but for the next hour there floated through the cracks bits of discussion on 'sprocket wheels,' 'single tubes,' 'hose pipes,' 'cork grips,' etc., until I was almost distracted.

"It was beyond the usual hour for my stenographer to arrive, and as she did not appear I rang up her residence, only to find that while riding on her wheel the night before she had been run into by an ice wagon, and was now lying at her home at the point of death. This was too much. I seized my hat and made a mad rush for the door—not even attempting to reason with my partner, who was prancing idiotically around the office in a pair of new bicycle shoes.

"I bounded down the stairs and started in the direction of my home—reflecting with anguish on the immediate dissolution of the well-known law firm of which I am a member. There was at least one human being, I remembered, who was not wheel-mad. I felt that I needed my wife's soothing influence, and, incidentally, a dose of bromide. Besides, I had frequently heard her express her contempt for cycling, and I wanted sympathy. As I neared home a sight met my eyes which I shall never forget.

"There, on the asphalt directly in front of the house—perched on a wheel and clad in a short skirt and leggings—sat—my wife! When my astonished gaze met hers she forgot her-

self for a moment—being new to the exercise and also conscience stricken—and neglected to move the pedals. Here was another scene—the worst of all. I assisted my wife into the house, and passed into the library in silence—my disgust and disappointment too deep for words. Every hope of congenial sympathy was blasted. All my friends had joined the procession of fools. There was but one course for me to pursue. I rushed downtown, and, in sheer self-defence, made this purchase.

"Mark my words, my first ambition is to get revenge—on any one—every one. I must even up with the world for what it has made me suffer. I will learn to 'scorch' and strike terror to the heart of the absent-minded pedestrian. I will get a gong big enough to send a sensitive person into hysterics the first ring and make life miserable for people generally. I will sit up nights until I have mastered the technical language of the wheel, and will forever spring my knowledge on the poor, defenceless wretch who doesn't ride a bicycle, and who doesn't care anything about it."

With this remark the reckless sufferer mounted his wheel after a desperate effort and rode it into a street-scraper, where he was lost to view.

GUILTY ANYWAY.

"Here now! It is agin the law to ride that wheel ahn the sidewalk."

"But I'm not riding. I'm only trying to."

"Be jabbers, thin, Oi will run yes in fer givin' an akkrobatic exhibition without a license."

HOW HE CONQUERED THE WHEEL.

Few Catholic priests are seen on the bicycle, but some in this diocese have taken to the wheel, and one noted for his hearty good fellowship with men of all sorts made a shocking confession to a layman of different faith. "I had struggled with the thing all the week in vain," said the father, "and finally last Sunday afternoon, when there was nobody on the premises, I took the wheel from my house into the basement of the church and gave two hours to a lesson that left me master of the thing."

IN DAYS TO COME.

Miss Neuwoman—I saw Cholley De Cadent riding on the Boulevard yesterday, and, guess what?—he had on bloomers.

Pan De Siècle—The brazen thing!

MONKEY WRENCHEDNESS.

How the Forgetting of the Spanner Caused the Forgetter to Be Called an Indian.

"My, but I was glad I didn't wear that new riding suit of mine yesterday afternoon," said the girl in brown in the cable-car this morning. And the girl in blue wanted to know why. "Well, you must know that when I started out I forgot to put my monkey-wrench in my pocket."

"I thought your monkey-wrench went in the toolbag," interrupted the girl in blue.

"So it does," said the girl in brown, "but one of the first things that every wheel-woman learns is to leave the toolbag at home. Yes, I know it sounds queer. When I first heard it I said, 'Well, what is the use of having a tool bag if you never have it with you, but I soon became converted to the thing, and joined the noble army of those who never think of going out with any other tool than a wrench and a tire pump.

"Well, yesterday I forgot even my wrench. I went out in a great hurry and not until I was way up the Boulevard did it suddenly flash across me that if anything came loose on the machine I had nothing to fix it with. After that I was simply on pins and needles for fear something would come loose. When I reached the rendezvous I got off and squeezed every nut and bolt on the wheel to see if there was any danger. But there wasn't; at least, nothing was loose then.

"I rode out Riverside Drive, however, in no peaceful frame of mind, for I was so afraid something would happen before I got back. The joke of it was, too, that if I had had the wrench I don't believe I would have known how to use it.

"All the way home along the Drive my mind still dwelt upon the fearful possibilities of my situation, which, perhaps, accounts for the fact that at about Ninety-seventh street, with the entire road at my disposal, I banged straight into a wheelman. It was a plain case of thinking of something else, the 'something else' being in my case a money-wrench—but the results were just the same as though it had been a case of plain awkwardness. My wheel went flying across the road, while I sat down disgracefully in the dust.

"Well, madam," observed my victim, as I scrambled to my feet, 'you are an Indian.' 'A what?' asked I, vainly trying to brush the tell-tale dust from my clothes. 'An Indian,' repeated my victim, 'don't you know that riders are divided into four classes? Beginners, wobblers, Indians and scorchers. The first two are afraid of everybody else, while of the last two everybody else is afraid. And of these last two the Indian is really worse than the scorcher. As I say, madam, you are an Indian.'

"All of which, of course, made me feel perfectly awful—why, it was only the other day that I boasted that I never yet had a collision. But nothing was quite so dreadful as the dust all over my clothes. I shook and patted and did my level best to get rid of it all, but it was no use, and I pedalled home with some of New York's most valuable real estate upon my leggings and shoulders.

"That's why I'm glad I didn't wear my new suit. If I had it would have been simply ruined. Fortunately, I had on my old one. If I had just had a whisk with me, though, I would have avoided much embarrassment. I mean to always carry one after this. For a woman, it's of more use than a monkey-wrench. And by the way, I got home safely after all, not a screw nor a bolt loose. I'm never going to bother about a monkey-wrench again. But I mean always to take a whisk."

Springs in a Cyclometer

are not desirable factors. Every child knows how easily they are disturbed and disordered. It is well to observe, therefore, that there are *no* springs and very few parts in the Haney Cyclometer. It is simplicity itself—the invention of the gentleman responsible for the bond-numbering machine used by the United States Government.

SPROCKETS AND GEARING.

Ratio and Relation of These Two Important Portions of a Safety's Make-up.

In the ordinary cycle nomenclature of to-day, the word "geared" or "gear" refers to the equivalent size of driving wheel; a wheel "geared to 70" or "70 gear" is equivalent in rate of travel to one of 70 inches in diameter. This is governed by the relative size of the sprockets, and is not affected by either throw of crank or actual size of wheel. For instance, if the front sprocket is twice the size of the rear one, the travel is 2 for 1, a 28-inch wheel running as a 56, a 30-inch as a 60, and so on. In other words, to say that a wheel is geared to 60 means simply that for each complete revolution of a pedal it travels as far as an actual 60-inch wheel would travel for one pedal revolution, if it were attached directly to the pedal. The word "geared," although not strictly inaccurate, is rather infelicitous in this use of it; "speeded to" would be better, just as "chain case" is a better term than "gear case."

Simple as this seems, many intelligent but non-mechanical people, among them not a few bicycle riders, have indefinite and inaccurate notions about it. For example, women sometimes ask for a low-geared wheel, "because I like a low seat," thus showing that they mistake the word "low" as meaning near the ground. So it is proper to say that neither height of seat nor position of crank bracket affects the ratio of gearing. And when we find men who are said to be regarded as authorities writing in the trade press that if a certain cycle with $6\frac{1}{2}$ crank is geared to 65 to change the crank to $6\frac{3}{4}$ would reduce the gear to 62%, we see it is well to state again emphatically that crank length has nothing whatever to do with the rate of gear; the crank may be 2 inches long, or 2 yards, and the ratio of gearing is the same.

The old Ordinary, or high machine, almost unknown to the majority of present riders, was a perfect example of a direct-driven or "level-geared" cycle. The rider bestrode his wheel, and drove it by crank and pedal without any intermediate device, the length of his leg determining the size. This inflexibility was often very disadvantageous. The short and strong man, although slow pedalling was best suited to him and he had power to drive a large wheel, had to take a small one in order that he might reach his pedal; the tall and slim man, although perhaps able to pedal rapidly without becoming "winded" and lacking muscle for a powerful thrust, had to straddle a large wheel or have his legs so cramped that they could not work. This level gearing was, indeed, very "level" in effect, for the usual range of size, compelled by the usual leg, was 50 to 54 inch; it took rather a little or a "sawed-off" man to manage a 48; a "split-up" could use 56 and 58, a rare tall man could get on a 60, and now and then a 61 or a 62 wheel was built, for show on parade.

By the way, a few new terms are much needed. In that day the bicycle was commonly spoken of as a "machine," the proper word not being either euphous or convenient, nor is it to this day; and one of the incidents of the fight for the possession of the right to the highway, in 1879-81, was that the Anti party seized upon the unlucky word, "It's plainly a toy and no vehicle," said they; "why, the young fellows themselves call it a machine." We still greatly need a new word for it, "wheel" sometimes meaning one of its rolling parts and sometimes the entire construction as a whole.

Following the high wheel came the Facile, the first small bicycle ever known in America, and the pioneer of the machine of to-day.

The level gear continued in this, but as the pedal was borne on a lever and placed below the axle, having also considerable adjustability in height, a long leg could manage a small wheel, and vice versa, and each leg length did not require its own size of wheel. The same may be said of the American Star of that time, which should not be passed without mention; but that machine had a ratchet action and no crank, and its construction was such that it cannot strictly be said to have had any gearing ratio at all. Then came the present type, which, by variations in height of frame and position of saddle, fits all riders; it is also geared or speeded over a wide range, as explained in the first paragraph.

The Facile was the "easy" thing its name declared it; but it had the disadvantage, shared somewhat by the high machine, of being too much so. For speed of travel and slowness of pedalling were sacrificed to lightness of action, although not so by intention; the power of the body was not sufficiently drawn upon in either case. But evolution has proceeded until the level-geared 50 to 56 of the Ordinary and the 40 to 46 of the Facile are succeeded by wheels of 60 to 84 and even 120 inches of equivalent diameter.

Looking backward the question arises, How did the Ordinary of a given size compare, in point of power consumed, with the present type speeded to that size? This question interests nobody now except students of mechanics, and it is not easy for old-timers to remember well enough to make a positive comparison; but we venture the opinion that the old level 52 did not drive more easily than a properly made and adjusted 66 or 70 of to-day. There are reasons for this, as there are for the well-known progression in the speeding ratio, which, beginning in the present type of rear-driver with 54 and 56, has worked along until in this year its average is perhaps 66 and—even aside from the coming larger sprocket—it has not yet reached its limit. The human race has not physically improved much in eight years, but roads have. As above stated, the size of the Ordinary wheel was imposed by necessity, not chosen; with the later type, choice has been open, and we have been gradually finding out what muscle and lung can do. The air tire and better construction have helped enormously; moreover, the truth is that the Ordinary was of very unmechanical design. Its lines of stress were weak; its application of power was bad, and the bicycle of to-day, as a piece of design and construction for the special purpose is a prodigious advance upon it. The driving power thus saved from wasteful expenditure in various ways is directed to coping with a higher ratio of gearing; that is, to working through a more unfavorable leverage.

As already stated, this ratio of gearing depends on the relative size of the sprockets; that is, to their relative number of teeth. The effect is the same as if the sprockets meshed directly together; so, as each tooth in the large sprocket pulls a tooth in the smaller, if they have twenty-four and eight teeth each eight teeth (or one-third) of the large one will pull eight (or the whole) of the small one, thus revolving it 3 to 1; a twenty-eight-inch wheel will run as an 84, a thirty-inch will run as a 90, and so on. Computing the ratio is an application of the rule of three, thus: As the number of teeth in the small sprocket is to the number in the large, so is the actual to the equivalent diameter of wheel. Or, multiply wheel diameter by the number of teeth in the large sprocket, and divide by the number of teeth in the small one. Or, for each size of small sprocket, multiply the number of teeth in the large one by a certain number (which is a constant factor), and the result is the ratio or equivalent of gear. With the usual

twenty-eight-inch wheel this multiplier is 4 for a seven-tooth sprocket, since 28 is just 4 times 7; for all other sprockets the factor is a mixed number, and the results involve may fractions. Following is a table of gear equivalents:

12	56	7							
13	60 $\frac{1}{2}$								
14	65 $\frac{1}{2}$	56							
15	70	60	8						
16	74 $\frac{1}{2}$	64	56						
17	79 $\frac{1}{2}$	68	59 $\frac{1}{2}$	9					
18	84	72	63	56					
19	88 $\frac{1}{2}$	76	66 $\frac{1}{2}$	59 $\frac{1}{2}$	10				
20	93 $\frac{1}{2}$	80	70	62	56				
21	98	84	73 $\frac{1}{2}$	65	58 $\frac{1}{2}$				
22	102 $\frac{1}{2}$	88	77	68	61 $\frac{1}{2}$				
23	...	92	80 $\frac{1}{2}$	71	64				
24	...	96	84	74	67 $\frac{1}{2}$				
25	...	100	87 $\frac{1}{2}$	77	70				
26	...	104	91	80	72 $\frac{1}{2}$				
27	...	108	94 $\frac{1}{2}$	84	75 $\frac{1}{2}$				
28	...	112	98	87	78 $\frac{1}{2}$				
29	...	116	101 $\frac{1}{2}$	90	81 $\frac{1}{2}$				
30	...	120	105	93	84				
31	...	124	108 $\frac{1}{2}$	96	86 $\frac{1}{2}$				
32	...	128	112	99	89 $\frac{1}{2}$				
						11			
						56			
						58 $\frac{1}{2}$			
						61 $\frac{1}{2}$			
						63 $\frac{1}{2}$			
						66 $\frac{1}{2}$			
						68 $\frac{1}{2}$			
						71 $\frac{1}{2}$			
						73 $\frac{1}{2}$			
						76			
						78 $\frac{1}{2}$			
						81 $\frac{1}{2}$			
						84			
						87			
						89 $\frac{1}{2}$			
							12		
							56		
							58 $\frac{1}{2}$		
							61 $\frac{1}{2}$		
							63 $\frac{1}{2}$		
							66 $\frac{1}{2}$		
							68 $\frac{1}{2}$		
							71 $\frac{1}{2}$		
							73 $\frac{1}{2}$		
							76		
							78 $\frac{1}{2}$		
							81 $\frac{1}{2}$		
							84		
							87		
							89 $\frac{1}{2}$		

The column at the left is the number of teeth in front sprocket; the figures above the other columns are the number of teeth in rear sprocket; at the intersection of the columns is the ratio of gear. Following are the multiplying factors mentioned above:

	28-inch wheel.	26-inch wheel.	24-inch wheel.	30-inch wheel.
5-tooth rear sprocket..	5 $\frac{3}{4}$	5 $\frac{1}{2}$	4 $\frac{3}{4}$	6
6-tooth rear sprocket..	4 $\frac{3}{4}$	4 $\frac{1}{2}$	4	5
7-tooth rear sprocket..	4	3 $\frac{3}{4}$	3 $\frac{3}{4}$	4
8-tooth rear sprocket..	3 $\frac{3}{4}$	3 $\frac{1}{2}$	3	3 $\frac{3}{4}$
9-tooth rear sprocket..	3 $\frac{1}{2}$	2 $\frac{3}{4}$	2 $\frac{3}{4}$	3 $\frac{1}{2}$
10-tooth rear sprocket..	2 $\frac{3}{4}$	2 $\frac{3}{4}$	2 $\frac{3}{4}$	3
11-tooth rear sprocket..	2 $\frac{1}{2}$	2 $\frac{1}{2}$	2 $\frac{1}{2}$	2 $\frac{1}{2}$
12-tooth rear sprocket..	2 $\frac{1}{2}$	2 $\frac{1}{2}$	2	2 $\frac{1}{2}$

The number of teeth in small sprocket being known, multiply the number in front sprocket by the multiplier given here, and the product is the gear. The table above applies to twenty-eight-inch wheels only, but for completeness we add multipliers for 26, 24 and 30.

If a belt carried the power the sprockets could be varied in relative size indefinitely, and hence any desired ratio could be had. But, as the numbers of teeth determine, we start with a rear sprocket of a fixed size and adjust the size of the front one to that. The gears given in makers' catalogues are not always exact, and the purchasers who select and order a ratio sometimes call for what is impossible, so that the tact of the shoe dealer who fits a small shoe to a large foot has to come into play. For instance, an exact 66 cannot be applied to a twenty-eight-inch wheel, yet there is ample range of choice and exactness is immaterial. Nor is exactness possible in any case. A heavy rider, or a soft tire, slightly lowers the rate of gear, just as it slightly raises the reading of a cyclometer—in each case by slightly reducing the actual diameter of the wheels—and there are other considerations which preclude complete exactness.

We may be allowed to say here that since writing on the bevel gear we have seen a number of devices for transmitting power over the gap by spur gearing. Some of these propose several toothed wheels, to be borne on the rear fork, and one would engage a pinion with a row of teeth on the rim of the driving wheel, thus making that wheel itself a gear wheel of large size. As these teeth must be on the side of the rim it is easy to see what must happen as soon as the rim gets out of centre by the wheel's being out of "true"; moreover, the driving wheel is so

large that, in order to get any pace out of the bicycle, the pinion which works on the rim must be enormously geared up, and the resistance on the bearing of this pinion will bring the whole contrivance to balk; it would not be easy to devise anything more absurdly impracticable. One man, whose machine we had opportunity to try briefly, hangs his large sprocket up on one of the back stays, running a long chain down to the small sprocket, and completes his contrivance by a pair of huge levers. Another called upon us recently for aid to build a machine, admitting that the bicycle makers gave him no encouragement; nor could we, and he went away indignant, declining to leave his drawing for further examination. At his request, we refrain from describing his plan, but it involves levers, spur gears, a slotted yoke with cam movement, and claims absence of dead centre. Another, returning to the Broncho type of frame and seat, attaches his crank to a large internally toothed wheel, driving therewith a small pinion on rear axle; either his contrivance is on each side, with pedals connected only through the gears, or he offers the phenomenon of a driving wheel with a crank shaft passing through it—the cut does not clearly show which. These people think it is in the air that gearing is the coming mode, and they are trying to get in along that line. They start with the proposition that a chain is an unmitigated evil, and they conclude that any combination which abolishes it is improvement. Neither the proposition nor the conclusion is correct, yet they go on, proposing to hang gears on studs carried on the rear forks and to replace the exaggerated chain friction by a friction elsewhere which would be simply destructive. They want assistance, not counsel; praise and agreement, not expert opinion. They do not look into the state of the art, or so much as inquire

whether their own suggestion has not already been tried and abandoned. Even if they are mechanics, they are not designers; many are evidently not familiar with bicycle construction and some are not even riders. One of those above-mentioned is described as not in mechanical pursuits, but as manager of a grocery, who has designed and constructed his wheel in leisure evenings. So they push ahead, wasting time and money on impracticable contrivances, sowing disappointment for themselves, increasing Patent Office lumber and adding to the long list of bicycle abortions.

This paragraph is written out of regret and pity, in the hope (though not in much expectation) of holding back some of these would-be improvers.

The important question about large sprockets is whether they will be a passing fad, a change to meet the public desire for novelty or have real practical value. That question divides into two: What will be the result, if any, as to durability of the structure, and how the rider will be affected. The large sprocket, without change in the gear ratio, might increase both durability and comfort; or it might allow higher gear and still increase both. This we are firmly convinced it does do.

Practice, not theory, is to decide. The thing is to determine, experimentally, what are the facts; the reasons come afterward, if they can be found. Testing experiments, as by weighing power against load, are valuable as suggestive and confirmatory; but in such a matter the conclusive evidence must be found by actual riding. So we took for the purpose a Wolff-American road racer and fitted it with sprockets of nine and twenty-six teeth, and have also used a Humber roadster fitted with 10x25 sprockets by the Humber people, who have been experimenting for themselves

in the same direction; the Wolff is geared to 81 (80 8-9), the Humber is geared to 70 only, the regular 6½-inch crank being retained in each case. Riding these two—the trial extending over nearly two months—has been done on familiar roads, thus allowing comparison with usual sprockets and gear ratios; the tests have been directed to every point in practice; others than ourselves have used these wheels more or less, and all who have tried them agree in approval and upon each point of test. It has happened that Mr. Wilcox has done more of this riding than his associate, and for convenience his experience is given in the first person singular.

I took up this question in an open-minded way, without any prepossession, except that, for mechanical reasons, I have always condemned the seven-tooth sprocket. Not having tried a higher gear than 68, the jump to 81 somewhat appalled me, and I really did not suppose my rather slight physique would be equal to it. But surprise was followed by amazement, gratification and delight, until—although slow about new things, and very cautious about haste in conclusions—I firmly decided my comfort greater than ever before, and I conceived such an affection for that 81 Wolff that I should almost have a sense of personal loss if it should come to wreck. One cannot ride two at the same time and thus compare driving; the best attainable test is to change from one to another, and to make repeated tests over the same roads and under the same conditions. There seems no unusual difficulty on hills and against winds, and as there is no way of putting comparisons into precision, as in figures of weight and measures, I can only say that I personally prefer this combination of gear and sprocket to a 68 or a 63 as heretofore made.

We regard the large sprocket as the greatest single improvement since the air tire, with possibly the exception of the wood rim. The gear ratio, however, is a matter by itself; that undefinable thing, the personal equation, is also a large factor, and there are some other considerations yet to be mentioned.

JULIUS WILCOX,
ALEX. SCHWALBACH.
(To be Concluded.)

NEWTON TIRES

SINGLE AND DOUBLE TUBE.

EASY RIDING, SERVICEABLE.

Our DOUBLE-TUBE TIRES for JUVENILE WHEELS
have no equal and are FULLY GUARANTEED.....

RECORDS COUNT.

At Paterson, N. J., October 24th, Charles Stewart, on a Lyndhurst wheel and NEWTON SINGLE-TUBE TIRES, won the Union Club 25-mile road race.

At Passaic, N. J., November 3d, Thomas Adamits, on a

Spaulding wheel with NEWTON SINGLE-TUBE TIRES, won time prize, 5-mile road race of the Riverside Athletic Association.

NEWTON SINGLE-TUBE TIRES also got 1st, 2d and 3d places.

THE NEWTON RUBBER WORKS, Newton Upper Falls, Mass.

New York Office, No. 103 Reade Street.

London Agency, No. 7 Hatton Garden.

"LAW OF THE ROAD."

How the Lawmaker Stands in His Attitude to the Rider of the Wheel.

The term "Law of the Road" relates chiefly to the passage of travellers on the public roads, and the object of its rules is to prevent collisions and to facilitate travel on the highways. In England this branch of the law had its origin in custom, which has been incorporated into judicial decision, while in the United States it is largely the result of legislation. In the former country the rules of the road are just the reverse of the American law. For instance, in meeting in the old country, each party shall bear to the left, in passing the passer shall do so on the right, in crossing from a side street the driver shall bear to the left and pass behind the other vehicle. The law in this country broadly is "keep to the right, pass to the left, in crossing use discretion as to best course."

The English rules apply to horses as well as to carriages, while in the United States a horseback rider may exercise his own notion of prudence and turn to the right or the left. In the absence of statute, it seems that the last would be a reasonable rule to apply to cyclists when meeting other and heavier vehicles on a country road—the wheelman yielding the travelled track when safety permits.

It is the law in most States that when one is ahead he need not, unless he chooses, turn out at all to let a man pass, if there is room enough on either side. If, however, there is not sufficient room, he must turn out. There seems to be no redress in most States for one who is prevented from passing another on the road, unless special damage or injury result.

The statute of Michigan regulating the conduct of travellers on the highways fairly represents the average road law when it says: "Whenever any persons shall meet each other on any bridge or road, travelling with carriages, wagons, carts or other vehicle, such person shall seasonably drive his carriage or other vehicle to the right of the middle of the travelled part of such road or bridge, so that the respective vehicles may pass each other without interference. Every person offending against the provisions of this statute shall be fined not exceeding \$20, and shall be liable to the party injured for all damages sustained." It has been held in Massachusetts that parties do not "meet" when one is travelling along and another comes into the road from a crossroad at right angles to the first man.

The word "road" in this statute applies to streets as well as highways. Streets are public roads, and while the Legislature confers upon municipalities power to regulate their use and to control the highways in their boundaries, they can only pass laws which are not contrary to the road laws of the State.

The language of the statute includes bicycles, and while it is not probable that it was intended to embrace the wheel, and no doubt the very legislators who framed the law would object strenuously to turning out of the road and sharing it with a bicycle, such is the law of Michigan, and being the only statutory right that wheelmen enjoy, when necessary to their safety and convenience they should enforce it and demand part of the road.

By the term "seasonably drive" is meant that travellers shall turn to the right in such season that neither shall be retarded in his progress by reason of the other occupying his half of the way, when he may have occasion to use it in passing.

In addition to this statute it is a customary law that in cities vehicles shall travel only on

the right-hand side of the street, and unless this rule were observed in crowded districts accidents would be the rule rather than the exception. Public safety would be increased were this rule put into the form of an ordinance and strictly enforced.

It is true that a man who drives on the wrong side of the road is not liable to prosecution, but he is bound to stricter care and must keep a closer lookout, and Angell, in his work on highways, tells us that if a man, not on his own side of the road, suddenly meets another and injury results, he who is voluntarily in the wrong must answer all damages, unless the other individual could have avoided the accident.

QUESTION OF SALUTING.

Accidents are no respecters of persons. The Emperor of Russia, who in his cycling excursions wears the uniform of a colonel in the Russian army, recently met with some misfortune to his wheel, and, dismounting, proceeded to correct it. While doing so an old general from the provinces passed. Not receiving the salute due to him, the general walked up to the wheelman he thought was an ordinary colonel, and requested an explanation of the omission. The Emperor politely informed the irate general that he had not had the honor of becoming acquainted with him during his short reign; otherwise he would, of course, have saluted the general as befitted his rank.

FROM THE FRENCH.

A Tow-Headed Girl.

MAUD, MUD, MAD.

Maud Smithers on a summer day
Went for a ride on her wheel, they say.
Under her cycling hat of brown
Her lovely hair came tumbling down
In a tangled mass of sunburnt curls,
The especial envy of all the girls.
Over the road she proudly flew,
In a bright shirt waist of crimson hue;
And a pair of bloomers that she had made
From a pair of sleeves and a yard of braid.
And as she merrily rode along,
Humming the air of a Bowery song,
Filling her lungs with the rich ozone,
All of a sudden she struck a stone,
Off from her wheel with a sidelong pitch,
Upside down in a muddy ditch.
There she lands with an awful thud,
Bruised and lame and covered with mud,
Down the road on his horse of brown
Came a man on his way to town.
Quickly she strove to hide behind
The bushes with which the road was lined:
But all in vain, for he saw her there,
And stopped his horse with wondering stare;
For a moment gazed in mute surprise
At the startling sight that met his eyes,
And then his laugh through the meadows rings,
As he suddenly grasped the state of things.—
"A form more fair, a face more sweet
"Ne'er hath it been my lot to meet."
And saying thus with a manner light,
He whipped up his horse and was lost to sight,
And when the twilight shadows fell
Over the meadow, plain and dell.
A form stole noiselessly down the road
Till it reached the shelter of its abode,
And of all the strong words that e'er were said
Hers were the strongest, on the dead.

BULL AND BICYCLE.

They Get Mixed Up in a Way Unpleasant to All Save the Bull.

The bicycle, which has crept into almost every path of human life, has at last found its way to the bull-fighting ring. There are not many bicycles as yet in Mexico. The people of the neighboring Republic are inclined to regard the riding of a wheel as very similar to work, and a good many of them are opposed to that sort of thing. Still, there are a number of Americans down there who ride, and a few Mexicans who have the imitative faculty sufficiently developed in them to follow suit and enough human nature in them to like it, once having done so.

A few days ago Manuel Garcia, who has been one of the champion bull-fighters of the domain, and who felt his pride had suffered recently because of a falling off of the attendance when he performed his daring feats, determined to begin a new epoch in the history of the ring and to become the hero of it.

He had fought bulls on foot and on horseback. He had killed everything in sight with horns in both ways. He felt that he could repeat the thing blindfolded almost, but all that was an old story. So he made up his mind to introduce the bicycle in the ring. He knew well how to ride. There was no better rider in Mexico, and if he could kill a bull while seated on the saddle of a bicycle, he felt certain of wearing a new crown of glory.

The City of Mexico was touched here and there with flaming red and yellow posters from end to end. In big letters the bills told the story. It was a simple one. Manuel Garcia, famous for years as the bravest and shrewdest bull fighter of Mexico, while mounted on a bicycle was to meet the biggest and wildest animal in the capital city in the present generation.

The great day arrived. Thousands gathered in the great amphitheatre and waited until the bovine giant was driven in. He looked big enough and mad enough to eat a man. One of the lesser lights rode in and prodded the bull once or twice. Then a few darts were fixed in his quivering flesh, and he rushed madly up and down, while Manuel, looking very handsome in his bright costume, rode in on a glittering wheel. The bull eyed it and then rushed for it. Manuel dodged once. There was almost a punctured tire, but the horn just missed the wheel, and no damage was done. The bull went far past the bicycle, and, turning at the other side of the ring, watched it for a moment. Then the old fire came back into his eye, and he moved toward the uncanny thing again, as though shot from a gun. The torador rode slowly along with his sword ready, and as the bull approached, prepared to strike him in the side.

But bicycles do not dodge like horses. They have not that keen, personal interest in their work that a horse has. The front wheel struck some light impediment and the machine stopped just long enough to get a horn in each wheel. He lifted bicycle and rider high in the air, and still rushing madly on, pitched both far over the fence among the spectators and the fight was over. The torador looked, after it was over, as though he had passed through a printing press, and the bicycle reminded the onlookers more of a tangle in a wire factory than anything else. The bicycle will probably not be used further in this way.

The liberal professions are represented more in cycling than they are in all other sports combined.

ADMIRATION.

Your friends will all admire you,
And you will better feel,
If you only use the famous
IDEAL TIRES on your wheel.

IDEAL TIRES ARE RIBBED.

QUESTION OF COSTUME.

The sturdy contention for bloomers and the strange, bulbous apparitions on the Boulevard are not to be regarded lightly, as an amusing spectacle, but seriously, as an ultimate conclusion which may be reached. It is noticeable, however, that there are fewer bloomers than last year. The argument remains the same. Liberty of leg can be defended from a dozen different views, yet most women have retired themselves behind a seeming continuity of cloth. It is the period of compromise. All the great tailors have their wits employed in devising skirts which shall practically be divided, while deceiving the critical person on the sidewalk, and the small cry of unchastened speech.

The unprejudiced mind would suggest that the object of bifurcation is that the bifurcated might ride a diamond-framed wheel, preferably by reason of its lightness. On the contrary, the compromise skirt, a most ingenious combination of the two great sartorial principles, has its bifurcation in the rear, while presenting a deceitful appearance in front of the orthodox skirt. This, of course, prevents its usefulness on a diamond frame, which demands frank separation, and obvious recognition of the fact that women, as men and chickens, are bipeds. Another costume is lined with black satin, and this lining is cleverly constructed into bloomers, otherwise uniting with the exterior in the stitched rows of the bottom. Nor does this meet that element of danger which is pleaded for what is called rational dress.

But if women are to use the drop framed wheels the contention for bloomers falls to the ground. No one will regret this. They are an epicene garment that deserve no standing, even at the price of women's lives. No woman of good taste would be satisfied to be found dead in them. It is regrettable that this, which is a calm statement of fact, should sound like slang. Between them and the knickerbockers worn by men there is no choice. It is a striking fact and worth mentioning that women look perceptibly younger in men's clothes, and in knickerbockers have the air of sisters to their sons. This makes a husband very lonely in the accumulation of years.

No costume will appeal to women that is not attractive to the eye. Neither reason nor persuasion can seclude or reveal them in costumes they regard as unbecoming. It is clearly observed among the haunts of the cyclists that the skirts not only prevail, but have been lengthened since last year. Natty leggings were too much of a novelty not to show them.

The newest skirt is a triumph of cut. It hangs without a fold and falls in the back in two straight lines, concealing the saddle. It is a man's invention, and women admire, applaud and wonder how they can imitate. It is apparent from the new skirt that the ethical significance of divided garments which the bicycle seemed to bring to its conclusive end has distinctly lost ground. With practice, and a high saddle on a drop frame, and in the latest skirt, women show so little evidence of their propelling power that the whole matter of bloomer-wearing seems thrown back further, than at any time since it first came up.

SHOULD BE MATES.

"Stockings and short skirts in place of leggings and long skirts?" she said. "Why not? I have a perfect right."

"And the left?" some one asked her, hesitatingly.

But she preserved a dignified silence, deeming the question in the nature of a personality.

WILL HOLD UP WHEELS.

At a casual glance the construction of a stand to hold a bicycle seems an easy matter, yet many inventors have found to their sorrow that to make an article of this kind much more was required than was at first thought. There are so many points that are absolutely necessary to be considered before the thing can be a success. It must be light, it must be slightly, it must occupy but little room, it must hold the machine firmly so that it will not topple over, be easy of transportation, and, above all, be marketed at a figure that will make it a good seller.

The New England Cycle Supply Co., of Keene, N. H., are offering "The Wizard" stand, which in many ways fills these requirements. It is made of wood, finished in natural color, is substantially constructed, and presents a handsome appearance. The clamp

holding the crank-hanger is adjustable to width, and will firmly hold a hanger having an adjustable lug on the bottom, there being a little depression into which the lug firmly fits. The No. 2 stand has an extra adjustment for fastening the frame of a bicycle to a bracket. For shipment the stands can be taken apart and sent in a very small package, as the various parts are easily assembled.

Many other bicycle specialties are manufactured by the New England Company, among them being a wheel truing machine and an apparatus which marks the spoke holes for drilling wood rims, doing the work in thirty seconds, which task sometimes requires as many minutes to accomplish.

COMES THE SAGAMORE.

From the ashes of Porter & Gilmour has risen a new concern, the Sagamore Manufacturing Company, with headquarters at No. 16 Warren street, New York. On December 1 the certificate of incorporation will be filed, the incorporators being James M. Gilmour and Mary Gilmour, of New York, and E. J. Dunn, of Paterson, N. J. The new corporation have purchased all the tools and machinery of the Porter & Gilmour Co., used in making Sagamore bicycles, and will practically succeed the old concern, being located at the old address, and producing practically the same bicycle.

GIVING AWAY WHEELS.

In the way of an advertisement, McAfee & McMaster, Nashua, N. H., dealers, offered a Sterling tandem to the purchaser of a wheel at their store making the greatest mileage from April 1 to November 15, and a gold watch to the lady covering the greatest distance under the same conditions. Seventeen cyclists competed for the prizes, the winner of the tandem being H. F. Marshall, who rode 11,561 miles. This included thirty-seven century runs. Mrs. Brooks Manchester won the watch by riding 6,757 miles.

NO ACCOUNTING FOR FASHIONS.

A New-Yorker who returned recently from Paris and had been for several years an enthusiastic wheelman here told a "Sun" reporter that there were still many more cyclists to be seen in Paris than in New-York, even when the greatest number turns out here, and that there had apparently been no diminution in the number of riders there during last year, according to the testimony of persons who had seen cycling there assume its present extensive proportions.

But, according to the accounts of this New-York observer, there are some phases of cycling which have not yet reached the riders here, and evidently never will. "It is considered the 'smart' thing for men," he said, "to ride on the Bois not in cycle costume, but in ordinary clothing, with long trousers, and quite as a man would dress for an afternoon walk."

"The only difference lies in the fact that the trousers are turned up very high, until they show the sock above the shoe. The socks were always elaborate, and if the shoes worn were not low patent leathers they were of tan with white canvas tops, or of patent leather with tan tops—combinations very dear to the hearts of Frenchmen, although they have never become popular here among well-dressed men.

"A conspicuous feature of the costume is the cane, which is carried in the hands, parallel to the handlebars of the machine. The cane is not merely ornamental, but is used for a very practical purpose. If a rider wants to stop and speak to an acquaintance on one of the walks along the road, he keeps the wheel upright by sticking the cane into the ground. This is regarded as the proper fashion for afternoon riding, but only by the dandies. Most of the Frenchmen who ride are quite as enthusiastic and earnest about it as we are here.

"Most of the women who wear bloomers now are of a class that is very distinct from those who have returned to skirts. A year ago bloomers were very general among all classes of women riders. But now they have practically been given up only to those who have no objection to attracting the sort of attention which the bloomers do even in Paris. It has become very general, too, to see women in this costume about the streets at night, and the Moulin Rouge, Bullier's and other similar resorts usually show their share of women in that get-up. Their excuse always is that they have just gotten off the bicycle, which is common enough in all classes of Paris to make the explanation seem plausible."

LOOKING FOR A FACILE.

Mr. Julius Wilcox, well known as an old-timer and as the introducer of the Facile Safety (which it is believed was the first small bicycle ever known in America), is desirous of procuring a specimen of that machine, formerly imported and sold by him, in fair condition, either level-driving or geared, or both. Anybody who has one of these machines which he is willing to part with, or can name somebody who perhaps has one, will confer a favor on Mr. Wilcox by communicating with him at his office. As Mr. Wilcox's salesbooks have disappeared from sight in the lapse of years, he is unable to reproduce the addresses of former customers.

WANTED TO KNOW.

"Excuse me," he said, "if I seem to be a little impertinent, but my curiosity has gotten so much the best of me that I must venture a question."

"What is it?"

"Are you a gentleman going golfing or a lady going cycling?"

HAIL COLUMBIA!

Here's the New Things the Pope People Offer for the Year to Come.

Samples of the '97 Columbias and Hartfords reached the Pope Manufacturing Company's New-York branch on Monday of this week.

THE WHEEL was last week enabled to briefly but exclusively touch on the most prominent changes in mechanical detail, but until the wheels were publicly exhibited this week particulars were not possible.

In general appearance the new Columbia does not differ materially from that of previous years.

The lines of the frame remain about the same; the wheel base is 42 inches, and the frames 22, 24 and 26 inches in height; flush joints have been used for the first time however. In tubing, 1 1/4 inch is used for the main frame, while the head is 1 1/4 inches; the upper rear stays are 9-16, and the lower rear stays

are tapered from 7/8 at the crank-hanger to 3/4 at the rear. They are flattened ovally, beginning at about 2 inches back of the crank-hanger, where they are bent or offset. In last year's wheel the lower rear stays were perfectly straight.

The fork crown is of the double plate variety, but flush with the fork sides, and is made handsomer in appearance by the insertion of a nickel piece, in the space between the plates usually left open, thus making it possible to use this as a personal name-plate. The crank-hanger has a one and seven-eighths inch drop, a trifle more than in the past.

In the construction of the wheels proper there are some radical departures; the hubs are tubular, and, instead of the usual spoke

flanges, are fitted with studs, in which the spokes radiate in a perfectly straight line, thus avoiding bending of the spokes. These studs are rivet-headed, inserted from the inside and held in place by a supplementary collar; the distance between the spokes is narrowed down to 2 1/2 inches. Twenty-eight spokes are used in the front wheel, and thirty-six in the rear, and are set a little more tangent, and are made of slightly heavier gauged wire than was heretofore used on the light Columbia wheels. The handle-bar clip is about the same shape as was seen on the '96 wheel, but the detached triangular dog has been done away with, and the point of contact with the bar threaded, which allows of very much more rigid adjustment than in the past.

A noticeable feature is that a wider section of wood rim has been used; heretofore an unusually narrow rim has been employed by the Pope Manufacturing Company.

The chain adjustment is very neatly devised; it is practically hidden from view, being on the inner side of the rear fork end, and instead of binding on the axle, as is usually done, the adjusting screw touches on a slight offset from the cone itself. The oiling is done, as in last year's wheels, through the side of the cone, thus making the surface of the hub perfectly smooth, and without the usual oil cup or spring clip. The same pattern of chain used by the Pope Company for the last five years is still retained.

It is in the crank-bearing, however, that the most improvement is apparent. Their two-piece crank has been retained, but it has been vastly improved. The left crank and left part

of the axle are forged in one piece, while the right crank and right section of the axle are forged together with a drum, to which the sprocket-wheel is screwed, doing away with the customary sprocket spider. This drum is dished in such a way that it brings the sprocket-wheel directly in a line with the balls of the bearing, and at the same time allows the sprocket-wheel to be screwed on, and held in place by means of a lock nut. The sleeve that holds the crank-axle together is practically the same form as heretofore used, but the bearing itself is made in such a manner that the cases can be screwed from the bottom bracket, and the balls retained. This year both cranks screw into the sleeve with a left-hand thread, instead of one left and one right, the left-hand axle being split diagonally, so that screwing on the sleeve and jamming it

spreads the axle, making sleeve and axle practically one piece.

Felt washers are used this year in the bearings, which, from a theoretical standpoint, at least, should be dustproof. No bolt is used in clamping the bearing case, a lock nut taking its place. The tread is 4 1/4 inches, measuring from centre to centre of cranks.

The wheel weighs 23 pounds, without the toolbag. The nameplate is practically the same, but has been greatly elaborated, being chased, and made of oxidized silver.

The '97 Hartford wheel to a certain extent resembles last year's Columbia. It has the double fork crown and frame connections used in last year's Hartfords. The lower rear stays are tapered and bent for crank clearance, but are left round. The hubs are of the usual flanged pattern, barrel, of course, and the regulation tangent spokes are used. The crank-bearing is made in two pieces, the left crank and axle being in one piece, while the sprocket is attached by screwing on, the same as in the '97 model Columbia. The crank-bearing resembles practically the bearing on

last year's wheel, with the difference that the sleeve is forced on to the left crank and axle forging, and simply slipped in and adjusted in the usual way.

The tubing used in the frame is 1 1/4 inch for the head, 1 1/4 for the main tubes, 9-16 for the rear upper stays, the lower being tapered from 7/8 to 5/8; the tread is 4 3/4 inches. The wheel weighs 25 pounds. The new nameplate is a very pretty design, not cut out, and is made of oxidized silver.

An innovation is that the sprocket-wheel, chain and wheel cones and bearing cases are interchangeable to both the high grade Hartford and the '97 model Columbia. By this method, much of the confusion relative to different parts will be avoided.

REVOLUTION IN TOOL BAGS.

C. E. Goodspeed, of Brooklyn, is the inventor of the "Kansoo" tool bag, designed to relieve the bicyclist of the trouble and annoyance of having to remove the entire contents

of his kit whenever he seeks any particular tool. The new revolving bag is cylinder shaped, and occupies the same space, or, if anything, less than the ordinary tool bag. The tools are divided by partitions on the inside on a revolving frame. Each revolution exposes the contents. Separate compartments are reserved for the wrench, the pump, oiler, and, in fact, everything that is wanted by the cyclist. Each compartment adapts itself to the size and shape of the tool, which fits snugly and does away with all rattling. The bag will be handled by A. G. Spalding & Brothers.

HARD TO ECLIPSE THESE.

Every Eclipse bicycle turned out of the Eclipse Bicycle Company's factory in Elmira, N. Y., will bear the Eclipse nameplate. This applies to the \$100 special, of course, and to the \$50 juvenile as well, for be it known the Eclipse people will next year considerably enlarge their line, listing this complement of wheels:

	Inches.	
Eclipse special, model 44, diamond frame.....	28	\$100
Eclipse special, model 46, drop frame.....	28	100
Eclipse, model 34, diamond frame.....	28	75
Eclipse, model 36, drop frame.....	28	75
Eclipse, model 35, diamond frame.....	28	60
Eclipse, model 37, drop frame.....	28	60
Eclipse, model 40, juvenile diamond frame.....	26	50
Eclipse, model 41, juvenile drop frame.....	26	50

Each model, they say, will be strictly high-grade in every sense of the word. The \$100 wheel will be a "special" in all that the term implies and will embody a number of new and exclusive mechanical features.

ALL SERENE HERE.

The interests of the Chicago Stamping Company, of Chicago, manufacturers of the United States bicycles, have been represented in the East during the past few days by J. D. Lasley. This company will make a determined effort to greatly increase their reputation and interests in the East during the coming season. In New-York they will be represented by Stephen Moen & Co.; in Philadelphia by George F. Foley, No. 911 Market street; in Baltimore by R. A. Banning. Mr. Lasley is well pleased with the result of his Eastern trip.

STANDARD THREADS ONCE MORE.

President Parmelee, of the Wire Goods Co., Worcester, Mass., is leading a commendable undertaking, which merits the earnest consideration of the whole trade.

Among other things Mr. Parmelee's concern manufactures bicycle axles in considerable quantities, and his experience has prompted him to agitate the adoption of a standard thread. He has already interested a number of manufacturers, and states the case so well that it can scarcely be improved on. He says:

"We have given much attention to the subject and have noted wide differences in the size of rod, shape and pitch of thread, varieties of thread, etc., in the axles commonly used. Some axles alleged to be $\frac{3}{8}$ of an inch in diameter have varied from .008 small to as many thousandths large, and the pitch of the thread has run from 20 to 32 on the same size rod. It has been made apparent that there is great call for uniformity and for a standard of size and thread which should make parts interchangeable, and should settle the manufacturers upon a standard to which we may all direct our energy, and which, in time, will become recognized everywhere.

"To manufacture axles cheaply and to make prompt shipments and to have last year's parts agree with this year's parts and with other prominent manufacturers' parts, it is evident that a standard gauge must be established. In many other lines like master car-builders, plumbers, etc., standard threads have been adopted, and the entire trade has been benefited. Our endeavor is to have bicycle manufacturers agree upon a standard for bicycle axles. We have already succeeded in establishing a standard for threads on spokes, nipples, etc., which is now almost universal.

"We have been in consultation with many of the largest manufacturers in the country, and with the leading authorities on matters of threads, and we have taken counsel of our own experience of many years in this direction, and we ask your concurrence in the following plan:

"For axles in common use we propose the following United States standard:

Inch	%	5-16	$\frac{3}{4}$
Threads	24	28	30

"These sizes, number of threads and style of thread we find to be best for the purpose for which they are used.

"Those who conform to this suggestion will then have a $\frac{3}{8}$ -axle that is always $\frac{3}{4}$, and that always runs 24 threads to the inch on this size, and always conforms to the United States standard, and hence must interchange with anything else that is made to the same standard.

"The Pratt & Whitney Co., of Hartford, Conn., are in full sympathy with us in this effort.

"If the axles are made in one place and the cones in another, and both parties work to these gauges, there can never be any failure to correspond.

"It was necessary for some one to move in this matter, and we have already put a great deal of time and labor upon it. We ask your co-operation with the full assurance that if what we suggest is not accomplished at once, we shall still all make progress in that direction, and in a short time the standard gauges will be universal."

WANT A WESTERN WHEEL.

The Burke-Roberts Company, No. 343 Broadway, desire the New-York agency for a Western wheel. The concern are acting as manufacturers' agents and cycle exporters. Status unknown.

FOWLERS TO THE FRONT.

Among the makers now showing their new models is the Fowler Cycle Manufacturing Company, Chicago. The models being exhibited are the diamond drop frame, in both the truss and straight bar patterns, here illustrated. The truss is the same as has been used heretofore, except that it is much handsomer. The straight frame is the same in all respects, except that the truss is omitted. The drop frame models are the same in construction, and are so made that a gear case may be fitted if desired. The mud guard fastenings will be appreciated by those having had experience in that line. The hubs are of special Fowler design, and dustproof. The cones are on the inside, and screwed on the axle up against the shoulder, the cups being screwed into the hub. In making the adjustment it is not necessary to disturb the axle nuts. The adjusting cup has a small flange extending beyond the hub, and this is screwed in or out as

the occasion demands, and the locking effected by a jam nut working on the outside of the hub and shoulder. All bearings have ball retainers. The oiling devices are very neat; the cups project but very slightly beyond the surface of the hubs, and hanger, and the oil passes through these cups into a tube which carries the oil directly to the balls. The arch crown is a feature of the new wheel. It is of tubular construction. A piece of tube is drawn oval, and is then bent to the required shape, after which it is drilled at the top and a machine steel bushing shaped to fit the in-

side of crown brazed in. The hole is then drilled for the head stem, and after that is thoroughly reinforced it is brazed to the crown, making one of great strength.

The forksides are then inserted, $1\frac{1}{4}$ inches, giving assured strength and retaining the Fowler feature of last year, namely, the outside reinforcement on the fork. The crank-hanger, with bearings, is one of the most important changes which has been made, and differs materially from anything yet produced. The crank-hanger is very large, admitting of the cups being screwed in either side until they are flush. The cones are placed upon a sleeve, which sleeve is threaded on either end, and the cones screw up against the shoulder. This sleeve and cup once in the hanger, they remain, and the rider can remove his crank and crank-shaft at will, never disturbing the adjustment, the adjustment being affected by clamping the cup through compression of the hanger. Into the sleeve above mentioned the shaft and cranks are in-

serted, which are in two pieces, joining together in the centre of the shaft with a taper fit. In the right side of this shaft is inserted a stay bolt, which passes through and out the other half of the shaft, and a small nut screwed on. As the nut is tightened the shaft comes together, with the taper expanding it against the sleeve, making the sleeves, cones and shaft practically solid. When everything is in place there are no nuts or other fastenings visible; the entire arrangement is as simple and as clean as a whistle.

The seatpost connection is radically different to that used on last year's models, the rear stays being brazed instead of being secured with a bolt as last year. The hanger is dropped $1\frac{3}{4}$ inches, and all braces used in the frame are rounded to conform with the crown, which is of the arch pattern, but of a strictly original design. No bolt is employed to clamp the seatpost, a patented collet device is used. The head clamp is something after the old pattern, but has a hole countersunk in the seat for the head of the bolt, the latter being eccentric to the line of the bolt. This makes flush surface on the side of the clamp, and also prevents the bolt from turning. The nut used upon this bolt is something unique. The clamp is countersunk and the nut is rounded on the inner side, giving it a perfect seat in the countersunk and permitting the bolt to adjust itself to any angle.

LOOKS LIKE A SUCCESS.

H. L. Millner is heading the Washington-Baltimore cycle path project. He says he has ample backing and will have the forty miles of path completed by May next, but as all interested save McMillner appear anxious to keep their names from the public, the whole scheme assumes a somewhat dubious aspect. Things have progressed so far, however, that the Washington Loan & Trust Company, of Washington, and the Guardian, Security, Trust & Deposit Company, of Baltimore, will receive deposits of \$1, and hold the same subject to conditions expressed upon the certificates of deposits, which assures the depositor five round-trip tickets, or their equivalent in sectional tickets over the completed road, or a return of the deposit in case the road is not ready for use by May 1, 1898.

PREACHING HIGH ART.

Two more of the Wolff-American travelling staff started out to preach the gospel of High Art Cycles last Monday. Mr. Charles Newman and Mr. George C. Bartow are going through New-England and New-York State and will visit the entire eastern trade before their return. Mr. Newman is an old Wolff-American traveller, but Mr. Bartow is a recent acquisition to the Wolff-American forces, having been previously connected with O. J. Faxon, of Boston. Next week Perry Chamberlain will visit Ohio on a similar mission. Another one of their staff, J. H. Toole, who is now passing through the West and South in the interests of Wolff-American cycles, reports encouraging business from all points in the territory which he has already visited.

COST MORE, BUT FAR HANDSOMER.

Through the introduction of one cycle sundry, the Buescher Manufacturing Company, Elkhart, Ind., have gradually become more interested in cycle equipment, until their line is now of commanding length. To their pumps, toe clips, lamp brackets and cycle stands they have added the Dyer saddle and a full complement of forgings and stampings. Just now they are making a drive on their new aluminum bronze crank-hangers and other connections. They are more expensive than the usual forging, but the Buescher folks point out that this is offset by the lessened cost of finishing and the handsomer finish which is obtained.

On Election night, when it seemed certain that McKinley had carried Indiana, the Bellis Cycle Co., of Indianapolis, conceived the idea of so notifying the President-elect, at Canton, Ohio, by cycle couriers. Within twenty-four hours the relays had been organized and the event was under way. It was perfectly carried out. Despite two severe rainstorms which marred the roads, slowed the time, and necessitated considerable walking. Mr. McKinley received the couriers graciously, gave an hour of his time to listening to the story of their ride, presented them with souvenirs, and personally penned a reply to the Bellis Co. The picture shows the Bellis riders and managers who shared the glory of an achievement which excellently typified the American spirit.

Garford Saddles
are scientifically
made in styles to fit all

Send for Catalog. GARFORD MFG. CO., Elyria, O.

The advertisement features several diagrams of saddle components and styles:

- TRUSS**: A trapezoidal shape with a central slot.
- ROADSTER**: A similar trapezoidal shape with a different slot design.
- MEN'S PAD**: A small, rounded rectangular pad.
- LADIES' PAD**: A larger, more rounded rectangular pad.
- LADIES' PAD - NARROW Pommel**: A pad with a narrower front edge.
- MEN'S PAD "T" FRAME**: A pad with a T-shaped cutout.
- SPRING**: A curved, saddle-shaped component.
- ROADSTER**: A saddle-shaped component with a central slot.
- EASY**: A saddle-shaped component with a different slot design.
- RAWHIDE**: A saddle-shaped component with a textured surface.
- JUVENILE**: A small, simple saddle-shaped component.

BODE UNBUKENS HIMSELF.

E. C. Bode was among the week-end trade visitors to New York. He was bubbling over with enthusiasm concerning the '97 World and its prospects. It will again be listed at \$100, he says, and some of the new features, notably the crank-bearing group, will open the eyes of the trade. The '97 catalogue, too, will be distinctly superfine. It will differ in shape and style from the usual catalogue, the name of the wheel having afforded great play for the artist's fancy.

While here Bode delivered a strong essay on the value of racing teams as an advertisement. As is well known, his firm, Arnold, Schwinn & Co., backed the record-wrecking campaign of Michael, Johnson and Eaton in the South. As some thirty men comprise the party, the expense of the campaign may be easily imagined. Asked if he thought it paid, Mr. Bode declared himself in this fashion:

'97 World.

"Does it pay? Of course it does. The very fact that you ask the question tends to prove it. It has excited unlimited inquiry. We're a new firm, yet we are far better known than most of the concerns that had ten years the start of us. They have spent, say, an average of \$10,000 per year in advertising for ten years; in one year we have spent some \$40,000. You can judge for yourself whether it is worth the money to more than make up such an advantage. Every newspaper in the country has chronicled the doings of Michael and Johnson, and there is hardly a person who reads who had not wondered and asked the name of the wheels they are riding; there are few wheelmen or agents who cannot answer the question. It is good advertising."

EVERYONE ADJUSTABLE.

Adjustable die stocks under the latest and best patents are the specialties of the Oster Manufacturing Company, Cleveland, Ohio. The stocks are made of a new secret process metal of great strength, and the dies are made of the best brand of tool steel. Taps, reamers, screwplates and numerous machinists' specialties are also manufactured by this company, all of which are fully described and illustrated in a neatly prepared brochure which will be sent to any address on application.

IN AND AROUND BOSTON.

Boston, Mass., Nov. 23.—THE WHEEL representative was shown through the plant which Frank T. Fowler has purchased at Worcester, and can testify that the machinery is new and modern. The Windle people had a large amount of stock on hand when they became embarrassed, and the material is of the best. Fowler thinks that he will name his new wheel "The Trinity." He expects to soon have upward of 200 men at work. He informed THE WHEEL that he will put \$200,000 in the business at once. As a "Thanksgiving" for the kindness of the newspapers of Worcester, he has placed at the disposal of the Worcester people two \$125 '97 model Windles, to be contested for in any manner thought best, the funds received to be devoted to charitable purposes. Mr. Fowler has a skilled mechanic in the factory, a man who has been associated with Mr. Fowler in the manufacture of bicycles for five years.

Walter Woods, of the American Waltham Manufacturing Company, will soon pack his trunk and sail across the billowy to boom the Comet in England, where this firm is finding a call for its bicycles. Eddie McDuffee, who is now in London training for the bigger cycle races, will mount a Comet.

The Humber people have opened their cycling academy. It bids fair to prove a paying venture in further bringing the Humber wheel to the notice of the public. The riding school is under the tutorage of Miss Grimm, a bright young lady who came from Copenhagen, and who has been a competent teacher of gymnastics and cycle riding.

Without doubt the New-England Cycle Show to be held in the Mechanics' Institute in February will be most successful. There are 300 spaces, and already nearly all of them have been leased. Many of the exhibitors at the New York show will move direct to Boston and exhibit.

HANDLE-BAR HEADQUARTERS.

Accustomed though he be to great varieties of handle-bars, the average wheelman would be staggered could he but see in its entirety the great array of bars being made by the Chicago Handle-Bar Company. As the title of the concern implies, they make a specialty of those articles, and a grouping of their thirty different patterns with their varying curves is a lesson in itself. There is scarcely a whim that is not catered to. Owing to its great output the Chicago Company assert that they are able to sell bars cheaper than any bicycle manufacturer can make them. To prove it, all they desire is an opportunity to submit quotations. They can figure on either wood or metal bars and guarantee their work. They are also in position to quote favorable figures on frames, seat posts and rear forks.

CONVENIENT COMPARTMENTS.

The Congdon & Carpenter Company, of Providence, R. I., who are New England selling agents for the Dayton bicycle, are putting on the market an extension tool bag that seems to merit the consideration of the trade. As the illustration shows, it resembles the ordinary bag to a certain degree, but on releasing the strap which binds the bottom an extension fold drops down, revealing the tools neatly clamped and thoroughly protected from each other. Of course, any number of compartments can be made, but in the regulation bag spaces have been provided for pump, oil-can, wrench and repair outfit, while a neat pocket at the bottom offers plenty of room for such little nicknacks as the

rider may want to carry. These bags are offered in various finishes, the ones shown THE WHEEL man were made of patent leather, sealskin, alligator, plain-calf and pig-skin, and looked what they were claimed—strictly high grade bags. The price is reasonable for goods of this kind, and the bag certainly commends itself to the buyer of high grade sundries.

AN ALL-AROUND MAN.

H. B. Gleezen has been added to the Keating staff. Gleezen is widely known because of his handling of a circuit-following racing team, but comparatively few are aware that he has engaged in nearly every phase of the cycling game, as repairer, builder, salesman and racing manager. The Keating people believe he will prove a desirable acquisition.

CAN YOU FIGURE?

Any one versed in mathematics and graphics who doesn't mind an expenditure of gray matter and pencil and paper has a chance to secure a Racycle without additional cost. The terms of the contest are fully stated in the advertisement of the Miami Cycle and Manufacturing Company in this issue.

TOLEDO TRADE TOPICS.

Toledo, Ohio, Nov. 23.—Eighteen Gendron salesmen left the city last week, each with a section of the broad United States figuratively carved out for him. The house called all the men together in order that they might swap experiences for the good of the cause. After the confab each man left with two new trunks containing four wheels, the trunks and men being grouped for a big photograph before their departure. President Fischer says the company will this year make 17,000 bicycles. These will include the Gendron and Reliance and the new ball-bearing juvenile, the Signal. Sample shipments were made by the Gendron last week to Spain, Melbourne and Australia.

Toledo continues to contribute her quota of "good men" to Australia. The latest recruit for the Antipodes is Barney Oldfield, who made such an excellent record last season, and was for a long time Ohio's premier Class A man. Oldfield will travel as a Stearns emissary.

The Yost Manufacturing Company has begun to spread its travelling men over the land, under the direction of Superintendent of Agencies Laskey. Up to date this company has distributed its couriers as follows: F. S. Hodgman, New England; T. P. Anderson, New York and Pennsylvania; G. W. Madison, Minnesota and Wisconsin; Alfred H. Gallagher, Michigan and Indiana; A. C. Hyde, Ohio and Kentucky; C. P. Stacy, the late solid South, and F. D. Hartman, the Western territory, working from Denver. Other men will soon be added to the list. The Yost Company will market only three models next season—one for ladies, one for gentlemen and a racer. It will deal direct with dealers, instead of through jobbers, and anticipates a good trade. In the Falcon wheels one and one-eighth tubing will be the largest used. A new idea will be the crank-yoke arrangement, which does away with the crank key. The chain will be three-sixteenths, and the large balls, for which the Gold Cranks have always been noted, will be continued as a feature.

Alvin Peter's health has materially improved in the last week, and it is more than likely that he will give up his contemplated year's rest and trip abroad.

A shipment of 200 Vikings was made from the Union Factory last week, and a small force is at work on samples, etc. Mr. Peter says that this force will be increased from time to time, and the factory will soon be running with a full complement in every department.

The Toledo Metal Wheel Company is seriously considering changing the name of its juvenile wheel, the Rugby. It is likely that this favorite in the juvenile trade will henceforth be known as the Pastime.

Albert K. Hoff, who was for a long time the downtown manager for the Yost Manufacturing Company, has accepted a position with the Maume Cycle Company as superintendent of agencies. This concern has decided to change the name of its single wheel, put out last season as the Volant. The new name has not yet been announced.

W. G. Alexander has foreclosed the stock of the Toledo Novelty Company, which will enable him to put together a few hundred '97 model wheels of his own, in addition to his line of Barnes and other wheels for which he has the Toledo agency.

FOR PUZZLE PURPOSES.

Now that some of the American makers are producing cyclometers which register miles and kilometers, a few dyed-in-the-wool cranks are equipping their wheels with each style of the instrument.

WITH PNEUMATIC EDGES.

While engaged in the sale of cycles and sewing machines in Canton, N. Y., the inventive faculty of G. Ernest Sims has been at work with such good results that the Sims cycle saddle and the Sims Saddle Company are now in being. The saddle, which was patented October 16 last, and which is illustrated herewith, appears to reasonably combine the good features of felt and pneumatics. Its sale will be pushed energetically. Mr. Sims "states his case" in this wise:

"The base is constructed of veneers glued up with the grain running crosswise. On top of this is secured a felt pad 1½ inches in thickness, which terminates short of the front edge of the base. A hollow space or cavity is thus left at the front edge of the saddle, and on each side of the centre thereof, at the points where the thighs of the rider would bear.

Within this space or cavity is arranged an inflated rubber tube or sack. The leather cover of the saddle is left full at the front edge, so that when the tube of the sack is inflated the cover will be projected ¾ inch in advance of the front edge of the base, thus receiving the pressure of the thighs, and therefore prevent their bearing against the edge of the base. By means of this construction there is no pommel to chafe or otherwise injure the rider. A firm, broad, padded support is provided for the tuberosities or pelvic bones.

"The saddle is also provided with a pneumatic edge, which relieves the pressure against the thighs. The objection to pneumatic saddles has been, while they were soft and comfortable, the rider was still allowed to wobble from side to side, thus interfering

with the proper management and guiding of the machine. In this saddle the pneumatic feature is placed just where it is most needed, and at the same time gives the rider a steady and firm seat. Special attention is called to the automatic feature of this pneumatic edge. When the tube is proportionately inflated (quite lightly), the air will alternate from one end to the other with the motion of the leg, thereby relieving the pressure on the one side, while building up the seat on the other. It will also be noticed that what little projection there is in front of the saddle is all pneumatic, and that at no time can this projection be on any higher plane than that portion of the saddle where the tuberosities or pelvic bones rest."

BRAZING SOLDER SPECIALTY.

The North American Smelting Company, No. 1,012 Spring Garden street, Philadelphia, are making a specialty of brazing solder, and are seeking the favor of the cycle trade. They have been engaged in the business since 1865.

TUBE-TESTING EXTRAORDINARY.

An interesting test of Mannesman seamless steel tubing was made for Charles G. Eckstein & Co., New York, last week at the works of Watson & Stillman Company, No. 204 to 210 East Forty-third street, New York. The specimen used was 5½ feet long, 9¼ inches in diameter outside, and 5-16 of an inch thick, of low carbon steel.

The test was for the purpose of ascertaining its resistance to internal pressure, and was effected by means of ordinary hydrant water forced into the tube by a hydraulic pump. At the first trial, with a pressure of 2,700 pounds per square inch, an increase of 1-64 of an inch in circumference was observed; at the second, with 4,000 pounds, there was an increase of 1-32 of an inch over the original measurement, and at the third, at 4,350 pounds pressure, the increase was 1-14 of an inch. No perceptible permanent set was observed until the fourth test, when the increase in diameter over the original was 3-16 of an inch, the pressure being 4,550 pounds.

Previous to this the tube resumed its original measurement upon the pressure being removed. Tests were made at 5,000, 5,280 and 5,730 pounds. At a pressure of 5,760 pounds per square inch the tube burst, the fracture being a clean split, extending from the end of the tube at which the water had been introduced for about one-third of its length. The appearance of the metal was excellent. The tubing was calculated to resist a pressure of 5,550 pounds, which was exceeded in the actual test. The test was made by Professor D. S. Jacobus, of Stevens Institute.

ON THE HARD HIGH ROAD AGAIN.

Another unfortunate concern has pluckily drawn itself out of the slough of despond, and is again on the high road. This time it is the Oswego Tool Company, manufacturers of the Ontario bicycle, Oswego, N. Y., who expect to have their receiver discharged this week. When investigated by the court, the affairs looked so well that the assignee was authorized to run the factory and pay all claims. This has been done, and a full settlement having been obtained by all creditors, the company will continue business as in the prosperous days in the past.

DEATH OF C. H. CLARKE.

C. H. Clarke, president of the Aladdin Cycle Company, agents for Temple bicycles at Kansas City, Mo., died in Chicago at 7:30 o'clock Wednesday evening of last week at the Richardson Private Hospital. Typhoid fever, the immediate cause being complication of stomach trouble, was the cause of death. Mr. Clarke was well and favorably known throughout the West as an enterprising cycle dealer, and he was also identified as manager for the Western branch of the Hall Safe and Lock Company for a number of years.

CYCLE SHOW SOUVENIRS.

Polishing cloths are gradually gaining favor. As an advertising souvenir they should be of value to the cycle firms who first make use of them. The importing house of Markt & Co., this city, evidently realize this, as they are offering cloths in quantities for the purpose at attractive figures.

READY FOR BUSINESS.

The McCool Tube Company, of Beaver Falls, Penn., state that their new plant will be the largest tube mill in the country. Their seamless tubing will be known as the Eagle Brand. It will be made by a patent process and without the use of acid.

A league of soldier cyclists has been formed in France.

1897 MODELS.

The BARNES Flush Joint has been
tried and can be trusted.

We are extremely flattered when
we see the leading bicycle manu-
facturers copying our FLUSH
FRAME JOINT in their 1897
models.

That's Right--It's a Good Thing.

But beware of the "Buzz Saw."
The BARNES Frame Joint is patented.

THE BARNES CYCLE CO., Syracuse, N. Y.

Kindly mention The Wheel.

THE CYCLE, THE BEND AND THE ALLEY.

The bicycle has not spared Mulberry Bend and Bottle Alley. Wheels of all sorts, sizes and shapes, from the home-made wagon-wheeled affairs of the McGinleys and Caszas of the Bend to the 1896 full-nickeloned ones, owned by the Levys and Cohens of Baxter street, have appeared by the hundred. Benders and Baxterites who haven't got machines yet stand around the corners and curbs and comment on the appearance of the wheels and riders, and talk about cycling. They are in the incipient stages of the sport, and there is no hope for them. One feature of the fever is that since it has struck the Bend the porters and longshoremen around there have new excuses for black eyes and bruised faces on Monday mornings.

There are no swell cycle academies around the Bend, but the denizens were never distanced by the 400 in a craze where sport was concerned, and the four asphalted blocks in Centre, White, Franklin, and Elm streets around the Criminal Courts Building are good enough. This region was quiet and deserted after business hours until the bicycle struck the Bend. Now it bustles like a merry-go-round.

Everything in the shape of a cycle goes in this Mulberry Bend academy, and no cycle exhibition could get up such a show. Even the wan scraps of humanity who spend all the year in anticipation of "going to the country with a fresh air fund" have got the fever. They have got cast-iron velocipedes and made them over into bicycles.

Two alert Italians have started a cycle renting place in Leonard street, and are official purveyors of wheels to the patrons of the Bend's cycle academy. The sign in the place reads: "Tony and Joe, bicycles rented." Underneath in small letters is "P. Delany, professor." In the old days of the Bend P. Delany might have been the proprietor and Tony and Joe the instructors. The young Italians who run the place are togged up in fantastical cycle rigs, and are as busy as bees repairing and renting bicycles. There is always an extensive demand for wheels, and the stock of second-hand machines is warranted sound, kind and well broken. The charges are 25 cents an hour with \$1 deposit. Tony and Joe, in dealing with their customers, have ideas at variance with those prevailing in the Boulevard establishments uptown.

For example, the Italian proprietors will, one or both, pull out a watch, glance at a book, whisper something to a strapping young fellow, and a few moments later the young man will enter the store, holding a youngster by the ear with his left hand, and wheeling a bicycle with the other. The youngster had stayed out over his time limit. He is usually let off with a threat to confiscate his deposit if it occurs again.

To any one who doubts that the bicycle is firmly established as the horse of the democracy, a short visit to the neighborhood of the Bend or Bottle Alley will instantly remove all doubt in the matter.

THE MARCH OF PROGRESS.

Algy—What is this I heah about using bicycles instead of horses at the hunt?

Cholly—Gweat impvovement—deah boy—gweat impvovement! The man with the anise-scented bag will take the best roads, and there won't be any twouble with nabstly fences.

MILK IN THE COCOANUT.

Sally Skirtless—I don't see why men should object to our wearing bloomers, do you?

Dolly Ditto—Pure selfishness. They want to wear them themselves, that's why.

TIRE AND SPOKE REPAIRING.

Trouble is sometimes experienced in repairing a leaky inner tube valve. A handy way to do the work is illustrated in Fig. 1, in which A designates a section of the inner tube, B the rubber ring and D the point where leaks usually occur. Ordinarily the repairer undertakes to place prepared glue or cement beneath the ring with a brush or other instrument. This answers well enough in many cases, but for difficult jobs in which the parts are hard to reach the writer has found that a common syringe is handy to inject the glutinous matter to all points. The manner of using is shown in the view, C being the syringe.

Another bother when repairing a leak in a tube with a patch is that the application of the cement to the patch will cause it to wrinkle up and make it difficult to apply the cement evenly. To overcome this, procure a smooth block, such as is marked A in Fig.

2. Arrange straps BB as shown, and keep the rubber patch taut by placing it beneath the straps as indicated. Then apply the cement, allow to stand a few minutes, after which the rubber patch will keep smooth. Benzine will loosen the tube from the tire if it is necessary to remove the tube.

In Fig. 3 is a drawing of a type of drill for small bicycle work. It may be built cheaply on a stand A, with an upright of wood B, as shown. Attach firmly the arms CC, and to these bolt the bearings for the upright drill shaft D. A regular socket drill or other type may be fixed at E. Put in a shaft with bevelled gear to engage with the gear at E. Put the belt pulleys F at the other end of the shaft as signified. To the under table should be attached an ordinary elevating and depressing plate G, governed by the cam H, and the latter by the handle I. Such a drill is convenient for boring many things related to cycle work.

In boring flanges for spokes considerable care is required to do the work correctly. The form of the hole has more to do with the future running of the wheel than many suppose. In the first place, the angle of the spoke must be right, then a hole to conform therewith is next essential. Supposing that the holes are bored straight through and left in that condition, as shown in Fig. 4. The result is that a sharp edge remains at the point designated by the arrow A, and this edge will cut the spoke.

This is known by many, and an attempt to remedy the defect is made by boring the hole partly with a larger sized drill, thus leaving the hole with what is practically another sharp edge as is signified by B in Fig. 5. The best way to finish off the holes is shown in Fig. 6. Here the holes are rounded off, as pointed out at C, leaving no shoulder, but being smooth and rounding. In Fig. 7 we show a spoke in position at D. It will be noticed that the bend fits the rounded form of the hole.

A common handle-bar may be changed to "ball" type by inserting a ball socket B in the bar A as shown in Fig. 8. Rivets will hold the two together firmly. A stud with a ball end, C, will be required, and A can be attached to the interior of the handle E in the manner shown at D. These ball handles are not common, but occasionally a wheelman wants them. GEO. D. RICE.

CYCLING AND THE CHIROPODIST.

A chiropodist who numbers among his patients many of the wealthiest and most fashionable people declares he is glad of the spread of cycling. When asked why this was so, he answered:

"In the first place, the majority of women ride in shoes entirely too tight and too narrow for them, and this causes great irritation, and you may be sure that the sufferer is glad enough to rush to a chiropodist. If women would only learn to ride in broad-toed, thick-soled shoes, a trifle too large for them, so they could bring down their weight on the foot, wheeling would strengthen their feet and ankles instead of getting them out of gear. I believe that after a while cycling will bring about a revolution in women's shoes."

When the chiropodist's ideas were repeated to a dealer in shoes, he said:

"Cycling has already caused one department in women's footwear. Women still cling to the pointed toes, but they call for much thicker soles than formerly, even in dress boots. So far that is the only change, but there is no telling what others the wheel and time will work."

THE BENEVOLENT AND THE BOOHOOR.

Little boy with a small tire puncture and a large cry. Benevolent old gentleman stops to console the weeper, and opened the ball with:

"Come, my little man, you mustn't cry like that!"

And the boy, replying, said:

"Gorn wid yer! How am I to cry, then?"

Benevolent vanishes without further discussion.

FAT AND LEAN.

"Seems like a pretty heavy wheel, that one you are riding."

"'Tis; the man who sold it to me on the instalment plan is a very hard chap."

"What's that got to do with the wheel's weight, I'd like to know?"

"He has a lien upon it."

The trouble about the pensive sort of novice is that you can never tell whether he is thoughtful or only ashamed.

SPLENDID LINE.

McKee & Harrington are going strong on tandems next season. They will have several models, among them one of the convertible type, for which there is an undoubted demand. The removable top bar of this machine is so made that it may be detached within two minutes; when in place the connections are not noticeable, the tandem then appearing exactly like the double diamond pattern. All Lyndhurst tandems will be double-braced and on eye-pleasing lines. They will be listed at \$150. The Lyndhurst singles will, as heretofore, sell for \$100, and the full nickeled racer for \$125.

The general lines of the '97 frames will be unaltered. They will be constructed in three heights: 23½, 25½ and 27½. The ladies' frame, 21½ and 23½. The same diameter of tubes will be used as in '96, the main tubes 1¼, head 1¼, and rear stays tapered at each end from ¾. The bottom runs of the back legs will be built of ¾ tube tapered to ⅝ at the back ends, flattened on the inside to admit of the use of a larger tire, without increasing the width of tread; these tubes are round at the connections at the bracket, insuring a good joint. The Lyndhurst joints at the crank-bracket will be "flush," with inside connections of improved form, and wide brazing surface. The bottom brackets will be, as they have been for the past four years, 2 inches below a line drawn from hub to hub.

The front fork sides will be of heavy, wide, oval tapered tubing, with tapered gauge; and for those who wish it, we have an open socket steering gear, with the fork sides running up on the outside of the head to the top, with a crown top and bottom, making the stiffest head ever seen.

The crank axle will be of the divided pattern, cranks and axle in two pieces; the connection is made with a key, by an entirely new method. The axle is entirely without threads, and is the simplest device yet shown. The cones for the crank bearing consist of an untempered steel centre, with tempered tool steel cones on each end, fitting over the axle like a sleeve. The two cones, being ground and polished in their places on the axle, must necessarily be true, one with the other. Outside shells will be used in the hubs as well as in the crank-axle bearing. By the method adopted, shells, cones and balls may be removed without disturbing the arrangement of either, so the bearings may be easily cleaned.

MOST POWERFUL LAMP.

Markt & Co., the well-known importers, with New York offices at No. 194 West street, have issued their illustrated price list of bicycle lamps, which vary in price from 90 cents to \$5.50. The list, of course, includes the German-made World, recently illustrated in THE WHEEL, and which is beyond doubt one of the most powerful lamps ever marketed. It throws what may be fairly termed a flood of light.

DEFYING THE UNION.

The Gormully & Jeffery Manufacturing Company has applied to the courts for an injunction against the Metal Polishers' National Union, restraining that organization and its officers from ordering a strike in its factory as was threatened.

HAS SHOW ASPIRATIONS.

About all the cycle dealers in Minneapolis met last week and formed a local Board of Trade. The chief object is to hold a cycle show and keep outsiders from conducting shows as a speculation.

SOME SLIGHT FRICTION HERE.

Although the Cycle Board of Trade of Brooklyn was organized to advance the interest and good fellowship of the local trade, there was a small-sized fracas at the meeting held on Thursday night of last week. Harmony was quite an unknown factor. The trouble arose over the adoption of a new constitution. After drafting an original one, the constitution of the New York Board of Trade was adopted, and this led to a war between Alex Schwalbach and G. W. Bennett, during which some very hot language was exchanged. After several squabbles, the election was finally decided. G. W. Bennett, local manager of Gormully & Jeffery Manufacturing Company, was elected president over W. B. Osgood, of the Brooklyn Cycle Co. F. N. Bruner was chosen vice-president, A. M. Franklin secretary, and

READY IN BUFFALO.

One of the firms that has not dilly dallied nor "stood shivering on the bank," fearful of the future, is the Buffalo Cycle Company, Buffalo, N. Y. Proprietors Atherton and Punnell had faith, and as a result are in position to take care of their trade very much earlier than in years past—that is to say, they have produced something more than travellers' samples of '97 Fleetwings and Envoys. They can meet any reasonable demand and are already filling export orders and impressing home agents with the advantage of having in stock a line of '97 wheels in time for the holiday trade and the early worms—a point which the average dealer may well take to heart.

The Buffalo people anticipate that 1897 will prove the best year which they ever experienced. Much of the belief is based on what must have occurred to other far-sighted folk, that the quality and financial standing of the cycle agents as a class have been improved by the business depression. It has acted as a purgative. Only the fittest have survived, and as a result the profit and loss accounts should hereafter be very considerably curtailed.

During 1897 they will market two lines, one at \$75 and one at \$60. The former will be a thoroughly up-to-date and high-grade wheel in every particular; the latter will be fully guaranteed and constructed with the same care, but without the beauty of finish which will characterize the \$75 line. The \$60 wheel will practically be equivalent to the \$75 '96 model.

The \$75 line will have patented one-piece shaft and cranks with a peculiar adjusting device which is extremely simple and effective; flush joints will also be adopted in the entire construction, giving to the wheels an extremely light and graceful appearance. The ladies' wheels will be made in 20, 21 and 23-inch frames, and the gentlemen's in 22, 24 and 26 inch, a choice of height calculated to suit the requirements of the trade.

The ladies' wheels will be fitted with continuous chain guards, an improvement of importance.

All \$75 wheels will be furnished in black, maroon or olive green, at the option of purchasers, the latter two colors being beautifully striped in gold.

The \$60 line will comprise two sizes of ladies' frames, 19 and 21 inches, and three sizes of diamond frames, 22, 24 and 26. Option of but two finishes will be given, black and maroon.

TROUBLE IN A CYCLE SHOW.

Among the 130 exhibitors at this year's Salon du Cycle in Paris are seven English and six American firms. There is trouble in the show committee, several of whom have resigned, among others Messrs. Clement and Darracq. This, it is said, is due to the selection of Comte de Dion as president, as he is a motor vehicle-builder, and not a cycle-maker.

GOOSE AND THE GOLDEN EGGS.

The Irish Cyclist declares that American wheels are selling at retail in London for as low as \$22.50 each, and at auction for prices correspondingly low. As the Irish Cyclist wisely remarks, "This is hardly the way to create confidence"; nor to make exporting pay, might be added with equal truth.

A British magistrate has given it as his opinion that wheelmen should not serve as jurors in cases of cycling interest.

"Hands Off."

W. B. Osgood treasurer. In the first ballot more votes were cast than there were members present. A letter was received from the secretary of the National Board of Trade, asking Long Island dealers not to exhibit in the Madison Square Garden show, and threatening that if they did so they would not be allowed to exhibit in the Brooklyn show. The suggestion was adopted.

HAS TWO DIALS.

H. R. Hamilton, No. 67 Lake street, Chicago, is marketing the Record cyclometer, an instrument having two dials, one registering 10,000 miles and the reverse, or trip dial, recording 100 miles. The latter may be set back at the beginning of a day's ride without in any way affecting the other. It retail for \$1.50.

STORY OF BEN HUR.

How the Success of the Book Was Repeated
in the Bicycle of Like
Name.

Pretty much everybody knows of the Ben Hur and its history. How the Central Cycle Manufacturing Co., of Indianapolis, were making the wheels; how the famous Lew Wallace, himself an Indianapolis man, wrote a book which was an inspiration from first to finish; how he called it "Ben Hur," and how it sold as no other work of an American novelist had sold. But to the analogy. L. M. Wainwright, president of the Central Co., was looking for a name for his wheel of the following season. The Ben Hur came to him, and it was a happy thought. A name should possess dignity, individuality, ease of pronunciation, and shortness; Ben Hur had them all. Since then the company have worked on the drawing of the famous chariot race so well described by Wallace, in conjunction with the name, in their advertising, and have achieved an equal reputation for both.

So much for the Ben Hur name. The Ben Hur man is L. M. Wainwright, president and manager of the Central Co., a veteran in the trade, and one of the best known figures in cycling.

THE WHEEL man called on President Wainwright the other day, and asked for news.

"News," queried Wainwright, "for publication or otherwise?"

The newspaper man answered that he wasn't particular.

"Well, sir, I can give you a lot of news, but as yet you can only publish it in a general way, not in its details. Is it a go?"

"I think you'll admit that the Ben Hur has always been a pretty good bicycle, won't you? Not a perfect wheel, of course, for none of 'em have been, but a strong, trusty and good-looking mount, and as skilled a job in its vitals as money could make it. You admit that, do you not?"

THE WHEEL man said yea to the impeachment.

"Well, sir, my news is this: As good a wheel as was the '96 Ben Hur, it's '97 offspring is as superior to it as the sun is greater than an electric light. I'll show you the model and let you judge for yourself."

And the '97 Ben Hur is a wonder. There are twenty-five mechanical features about it which are different from anything yet produced in a bicycle. One is not at liberty to enter into the details of construction here at present, but can merely touch upon some of the results achieved in the wheel, without explanation of how they are arrived at.

The crank bracket is of tubing, and contains fifteen $\frac{3}{8}$ -inch balls in each case, retained in large tool-steel adjusting cases; the left and right cases are precisely alike, and interchangeable, and the adjustment is held by a device entirely on the inside, operated, however, by pressing a projecting oil cup, thus doing away with the usual split-lug.

The cranks are square and half hollow, the right crank and shaft proper being one piece and arranged to drive a sleeve, on which are mounted the two cones, exactly alike. The sprocket is slipped in the axle and is held in place by a tapered shoulder. All being held by one nut, the entire crank-bracket group can be disassembled, the sprocket changed, and reassembled in less than two minutes.

The hubs are conspicuous for the same features that characterize the crank-bracket bearings. The axles are hollow, and the cups and cones are of one size, exactly similar, and interchangeable. The tool steel cases are

ball retaining, and fit either side of the hubs. Front hub has $\frac{1}{4}$ balls and the rear 5-16 balls. In adjusting the hub bearings there is no disturbing the axle nuts, as the adjustment is controlled by a dog on the inside and located entirely within the hub.

The Ben Hur reversible handlebar is a novel and clever thing. A patented device holds both the bar and the slot part, and is positive in its action.

The front fork is one of the most artistic bits of cycle construction that the business has brought to light. It is made of three pieces of tube, is arched at the crown, is half nickel, half enamel, and has a very distinctive as well as handsome appearance.

Flush joints are another point. An eccentric chain adjustment, controlled by one nut, is another.

In a short time THE WHEEL will publish a detailed description, with cuts, of the mechanical features of the new Ben Hur, and it can be safely predicted that no wheel will produce greater comment.

CHEAP STICKING.

The Royal Cement Company, Broad and Race streets, Philadelphia, are offering cycle cement at from 9 cents to 15 cents per pound, according to quantity.

QUALITY ALWAYS WINS.

To aspire to the best is a laudable ambition. To ever strain for improvement means a safe return; eventually quality will win. Spaulding & Pepper, Chicopee Falls, Mass., have earned, in a comparatively short career, a name in the tire-market that places them in a very enviable position. The mere brand of "S. & P." stamps the tire at once as an article as good as can be produced, and their success in this line has more than strengthened them in the belief that their policy of making strictly high-grade goods was the right one. A visit to the factory at once impresses even the most casual with its extreme neatness and business air. Carelessness is unknown. On every side are evidences of painstaking system.

The Humber tire, which was made by Spaulding & Pepper last year, is a splendid example of what this concern can accomplish. In every way it has given good satisfaction, and while being a road tire, its record in coasting contests is not to be underestimated. While the quantity of tires turned out, when compared with other concerns, is comparatively small, yet by conservative business tactics they have brought their name well to the top of the heap.

DOWN SOUTH.

One of the Chief Gateways to the Southern
Cycle Trade Leads Through
Baltimore.

Baltimore, Md., Nov. 23.—For the first time the trade of Baltimore is united. It was the cycle show question that brought the dealers together.

The only show Baltimore ever had was given last year by the Young Men's Christian Association just after the organized Board of Trade had declared against it. That affair had the effect of pointing out to the trade the possibilities of such functions, and ever since then they have been preparing for the organization which they have just completed. The title of the Baltimore organization is "The Associated Cycle Trade of Baltimore." The first step was the appointment of Fred B. Eisenbrandt, Columbia agent; J. J. McElroy, Tribune representative, and O. H. Harvey, America agent, a Board of Managers, to have sole charge of the show.

These gentlemen have already had an experience that has altered the plans with which they started the work of preparation. They started with the idea that the show was to be purely of local character, but after the receipts of letters from a number of manufacturers, indicating that the Baltimore show should be known as the Southern Cycle Show. These letters intimate that Baltimore has before it a fine future as a point for distribution throughout the South. The great success in the southern territory of the Black Manufacturing Company, Eagle Bicycle Company and Crawford Manufacturing Company, seems to have drawn attention to Baltimore's value as a place for handling the Southern market. Some of the Southern States are dominated commercially by Baltimore merchants. This is emphatically the case with such extensive merchandising as represented by the dry goods, clothing and hardware trades. The three manufacturers who have had marked success in the South have conducted their affairs for that section through wholesale hardware houses, with connections in the South. It was the method of these houses, however, to entirely divorce their hardware and bicycle branches. The cycling end is on an independent footing with them as the managers of those departments, and the salesmen who travel the South with bicycles for them, having nothing to do with the hardware end.

The advantages proven to be with Baltimore in the competition for the Southern trade are: Quickness with which orders can be executed, reduced transportation expenses by shipping by carloads to Baltimore and then reshipping, better knowledge of the Southern people and customs by travellers already familiar with that section, and the long time habit of the people of the section in dealing with Baltimore. The letters received by the Baltimore show's Board of Managers indicate that the manufacturers are awake to these advantages, and think well enough of Baltimore to warrant them in bringing their exhibits here for a show for Southern people. The date of the show will probably be February 20 to 27. Special rates will be made with the Southern railroads so as to induce the merchants of that section to visit this city and the show. The managers are now dickering for one of the largest halls in the city.

CONTINENTAL LIGHTMAKER.

Reukauf & Schillinger, No. 304 Race street, Philadelphia, are making and marketing a new lamp, the Continental, "the best in the world by actual test," they assert.

LOTS OF WHEELS.

For the National Show, London, 3,155 cycles are entered, while the managers can only find space for 2,110, including the gallery annex.

Mr. Curiosity—"Aha! I see a '97 Mesinger Saddle on it."

—Apologies to the *New York Evening Telegram*.

NATIONAL CYCLE SHOWS.

Under the Auspices of the National Board
of Trade of Cycle Manufacturers.

January 23-30—Chicago, Coliseum, A. E. Pattison, Auditorium Hotel, Chicago.

February 6-13—New York, Grand Central Palace, Ernest R. Franks, 271 Broadway, New York.

February 20-27—Boston, Mechanics' Building, C. W. Foudrinier, 34 Stanhope-st., Boston.

February 20-27—Philadelphia—Local Cycle Board of Trade.

February 20-27—Pittsburg—Local Cycle Board of Trade.

FOREIGN CYCLE SHOWS.

December 4-12—London, National Show, Crystal Palace; Frank Peach, secretary, 48 Holborn Viaduct, London.

December 12-27—Paris, Palais d'Industrie, Champs Elysees; M. Bivort, manager.

January 2-9—Manchester, England.

January 12-16—Liverpool, Eng.

January 16-23—Dublin, Ireland; Royal Dublin Society Building, Balls Bridge; R. Wilson, secretary, 14 D'Olier street.

January 23-30—Glasgow, Scotland; A. G. Rennie, secretary, 49 Lilybank Gardens.

Jan. 22-30—Birmingham, Eng.

January 23—Vienna, Austria; Steiner Hoenicks, Mgr.

February 1-7—Edinburgh, Scotland; Waverly Market, A. K. Dempsey, secretary, 82 Leith street.

Feb. 3-6—Nottingham, Eng., Albert Hall; B. Richards, secretary Nottingham Athletic Social Club.

February 27-March 6—Leeds, Eng.

TRADE CHANGES.

ARIZONA.

Phoenix.—F. H. Knowlton and William Rhodes, business consolidated.

DISTRICT OF COLUMBIA.

Washington.—Temple Cycle Agency removed to No. 603 E street, N. W.

ILLINOIS.

Chicago.—John Grant Company, Judgment \$200.

Chicago.—Gordon M. Richardson. Offering 26 per cent.

Chicago.—Smith, Sieb & Co. Sued \$350.
Elgin.—Elgin Sewing Machine and Bicycle Company. Court authorizes receiver to complete 400 bicycles.
Fairbury.—C. E. Amster, closed by Sheriff. Liabilities, \$10,000.

INDIANA.

Indianapolis.—C. G. Fisher & Co. Incorporated. Capital stock, \$5,000.

South Bend.—Carlisle Manufacturing Company incorporated to manufacture bicycles, by Meade W., Addison A. and Robert E. S. Carlisle; capital stock, \$10,000.

KANSAS.

Salina.—John Jeffries, judgment for \$12.

KENTUCKY.

Louisville.—Griffiths & Semple succeeded by J. C. Semple & Co.

Louisville.—Kessler-Smith. Discontinued.

Louisville.—Edward H. Miller. Removed to Grand Rapids, Mich.

MASSACHUSETTS.

Cambridge.—William E. Furness reported recorded chattel mortgage for \$700.

Springfield.—M. D. Stebbins & Co. Sold out.

MICHIGAN.

Menominee.—Dunning Bros. & Co. Closed by Sheriff.

MISSOURI.

Kansas City.—Welch-Hutchinson Cycle Co., chattel mortgage for \$200, and reported attached.

NEW JERSEY.

Elizabeth.—Evans Cycle Company. Chattel mortgage, \$1,600.

Jersey City.—G. W. Anderson. Chattel mortgage, \$76.

NEW YORK.

Albany.—Eugene Sanders. Gave judgment for \$417. Gave bill of sale.

Buffalo.—Niagara Top Company. Sued \$40.

Lockport.—Imperial Cycle Company. Discontinuing.

New York.—Hodgman Rubber Company. Additional judgment vs. George F. Hodgman, \$20,107.91

New York.—Zimmerman-Castle Wheel Company. Judgment \$32.28.

Tonawanda.—Tonawanda Bicycle Company. Assignee files reports, showing liabilities, \$37,706.71; nominal assets, \$15,428.57; actual assets, \$3,652.84.

Troy.—W. J. McAllister & Son. Judgment \$168.

OHIO.

Akron.—The Ranney Cycle Company assigned to F. E. Whittemore.

Cincinnati.—William Hulvershorn. Judgment \$25.

Cincinnati.—Rubber Tire Wheel Company against the Victor Rubber Tire Company. Depositions taken on behalf of complainants received by mail from Columbus, O.

Columbus.—Columbus Company, bicycles and sundries, mortgagee's sale of entire stock of goods.

Sandusky.—W. A. Gilcher & F. Donahoe, new store.

OREGON.

Astoria.—W. E. & M. S. Warren reported to have given real estate mortgage for \$500.

PENNSYLVANIA.

Allentown.—Koons & Wolle. Sold by Sheriff.

Philadelphia.—Penn Bicycle Company Confessed judgment \$6,500 to Warwick Cycle Manufacturing Company. Execution issued.

TEXAS.

Denison.—The Leeper Hardware Company. Assigned to John Waples.

VERMONT.

Rutland.—Coolidge & Morse. Succeeded by Coolidge Cycle Company. (Not incorporated).

"IS BEYOND COMPETITION."

It will be well to keep the Demorest Special in mind. It will not make its formal debut until show time, but it is already casting its shadow before. In speaking of it Manager Hugh McDonald, of the Demorest Manufacturing Company, impresses one with the belief that the factory at Williamsport, Penn., will do itself unusually proud on this particular wheel. "We mean that it shall be far ahead of anything on the market," says McDonald, "and mean that the trade shall be compelled to say that it is beyond competition so far as workmanship and material are concerned. We will realize our expectations if the wheel costs us \$10 more than we receive for it." There is a determined ring in Mr. McDonald's words that compels respect and arouses keenly curious anticipation.

A SUCCESSFUL CAMPAIGN.

Harry G. Rouse, W. J. Bowman and J. A. Wright, of Rouse, Hazard & Co., Peoria, Ill., have been swinging around the circle in the East. Their campaign has resulted in establishing some desirable connections, none of them more valuable than that with Baldwin, Robbins & Co., No. 113 Milk street, Boston, who will control Sylphs and Overlands in all the New England States. The firm is an old wholesale hardware concern, who have some thirteen travellers working in the territory.

A PRICE-TOLD STORY.

In Massachusetts two men who bought stolen bicycles for a low price have been convicted of the offence and sentenced to State Prison for nine months. The only proof in the case of guilty knowledge was the insignificance of the price paid, the Court holding that they must have known the property was stolen when it was offered at such a sacrifice.

READING TRADE CHIEFS.

New officers have been elected by the Cycle Board of Trade of Reading, Pa., as follows: President, Harry O. Koller; vice-president, M. T. Killmer; recording secretary, John W. Spangler; financial secretary, L. D. Douglass; treasurer, Charles G. Wilson. Application has been made for a cycle show sanction.

The Wheel

and CYCLING TRADE REVIEW

Copyright 1896, by F. P. PRIAL Co.

VOL. XVIII., No. 16.

NEW YORK AND CHICAGO, DECEMBER 4, 1896.

WHOLE No. 458.

CRAWFORD CUTS.

What the Big Marylander Will Offer for Less Money Than Last Season.

Crawfords for '97—the 28-inch adults' wheel—will list at \$50.

This is in the nature of a reduction of \$25. Last season the same wheels were catalogued at \$75. The vigorous cut will prove a general surprise. The Crawford Manufacturing Company was one of the "Big Four" who made \$75 wheels. Whether their action will affect any of the others is for the future to decide.

The prices of the other Crawfords have also been reduced, but the reduction is not so generous. The 28-inch has been lowered from \$50 to \$45, the 24-inch to \$40, and the 20-inch to \$35.

The tandems are listed at \$100.

Although the prices are announced this week simultaneously with the issuance of the catalogue and the presence in New York of President Crawford, the Crawford people have been able to keep their figures dark until now. Only a favored few were prepared for the reduction.

The catalogue incorporates a twelve months' guarantee.

These specifications of the men's 28-inch wheels, which are furnished in three heights, will give a fair idea of the entire line:

Frame—Improved diamond pattern; weldless steel tubing throughout; upper and lower reach and upright, 1½ inch, 20 gauge; rear fork, ¾ inch, 20 gauge; rear braces, ½ inch, 20 gauge; barrel bracket; hollow seat-post; clamped seat-lug; height of frame, 24 inches. Wheels—28 inch; fitted with Hartford single-tube or M. & W. quick-repair tires. Spokes—Tangent; standard swaged; 15 gauge; nickel-plated. Hubs—Barrel, turned from steel bar. Sprockets—Detachable; front, nickel-plated. Rims—Wood, "Plymouth." Brake—Direct-plunger pattern; fitted with improved bearings and detachable clip. Bearings—Ball throughout; positively oil-retaining and dust-proof. Head—10-inch ball bearing, with hardened steel cones cut from the bar. Handle-bar—¾-inch weldless steel tubing, 19 gauge; 16½ inches wide; adjustable. Chain—¾-inch Indianapolis; hardened centres. Chain adjustment—Rear, with set screws. Front fork—Tubular; drop-forged crown and weldless steel crown tube. Cranks—Drop-forged and hardened; round; 6½ inch. Gear—70 inch. Pedals—Crawford. Saddle—Sager Hygienic. Wheel base—44 inch. Weight—25 pounds.

What the average freak tire inventor needs is an alarm clock that will wake him from his dreams of making millions out of wind.

COTERIE TO THE BAR.

That coterie of Chicago newspaper men who composed the Chicago Exhibition Company which last year, under the auspices of the National Board of Trade, conducted the Chicago Cycle Show, will shortly taste some of the doubtful sweets of adversity. For nearly a year the Board of Trade has been endeavoring to reach a satisfactory settlement of the finances of the function. Their efforts, however, have been in vain, and the Chicago gentlemen have fenced to such good purpose that a suit at law has been decided the only recourse. Counsel Redding and Stimson, of the Board of Trade, got together last week and decided to take that action. A suit in equity for a full accounting will be at once instituted, and it is probable that the far from modest charges made by the Chicagoans will soon be amply aired.

TOOK IT ALL BACK.

Chicago, Nov. 27.—The bill asking for a receiver for the American Wheelmen's Protective Association, which was filed a short time ago by P. H. Barker, a stockholder in the concern, has been dismissed on the motion of the complainant. Barker made serious charges in his bill against the corporation, alleging that E. D. Sniffen, the secretary, had expended, on his personal account, funds belonging to the concern, and that it was in an insolvent condition, because of this and other acts of its officers.

CHANGE OF OWNERSHIP.

Cleveland, Ohio, Nov. 30.—Quite an important deal was consummated a few days ago by which the Dangler Stove and Manufacturing Company becomes the owners of the Kelly Handle-bar Company, manufacturers of the Kelly adjustable handle-bar. The firm name will be retained, and Mr. Kelly, the inventor of the bar, and vice-president of the company, will retain his connection under the new management. The Kells Saddle Company is also owned by the Dangler Company.

UNDER THE RED FLAG.

The once prosperous Plymouth Cycle Manufacturing Company, whose Smalley bicycles were the pride of many, has found it impossible to recover from its financial ailment. Its end will be sounded by the tattoo of an auctioneer's hammer on December 10. The receiver's sale will occur on that date at Plymouth, Ind. The property includes a deal of machinery and cycle material and a number of completed and uncompleted.

A Vienna cyclist was recently fined 15 florins for riding "hands off."

SCENE SHIFTING.

Sanger Replaces "Cycle Show" with Something Called "Grand Military Bicycle Tournament."

From January 11 to January 16 inclusive the Madison Square Garden will be given over to a "Grand Military Bicycle Tournament," from which it is expected that \$20,000 or \$30,000 will be realized, the net sum to be expended to establish rooms in the Hannemann Hospital, New York, to be used exclusively by members of the National Guard. The Ladies' Association of the Hannemann Hospital, a committee of militiamen, distinguished citizens, the Mayor of New York, the Madison Square Garden Company, and "The New York Herald" are the supporters of the tournament. Exactly what the military tournament is going to be has not yet been stated; it is, however, intended to make it a fashionable function. To a pressman Mr. Sanger stated that there were going to be exhibits "all round the arena." The more suspicious suspect that there may be a "nigger in the fence," and that Mr. Sanger has abandoned an unsanctioned show in order to hold a sanctioned show. It is fair to presume, however, that President Coleman (who is a Southerner) will be able to scent any Ethiopian, no matter how carefully he may be concealed in the woodpile.

Again, although it is ungracious to fly in the face of charity, the Board of Trade, in accordance with its rules, cannot sanction any exhibit for the shows held before the National shows are held; thus, technically, it cannot sanction the exhibits at the military tournament. However, no trouble need be expected on this score. There is a spirit of compromise, common sense and decency within the Board of Trade. If it should develop that a noble charity will be aided, and that the coherence of the Board of Trade will not suffer, a proper consideration of this particular show may be expected from the Board.

BACK TO THE FOLD.

Chicago, Nov. 28.—The Fulton Machine Works, of Chicago, manufacturers of the Thistle bicycle, will reopen their plant on Monday. They will run full force on their '97 machines, and expect to have models out within ten days. One of the officials of the company stated to THE WHEEL man that something like \$100,000 new capital had been added, and that they were settling all their claims in full. This will no doubt be good news to the bicycle trade in general, as it will be remembered that the Thistle was one of the high-grade bicycles that stuck to high-grade methods and the \$100 list throughout the season.

"The life-saving apparatus of a cycle," is an English definition of a brake.

HOME AND ABROAD.

What One Concern Has to Offer American Riders and Those of Foreign Lands.

Fresh from a Western trip, Fred Johnson and E. H. Wilcox, were in evidence in New York on Saturday last. With them and on exhibition at the showroom of C. J. Godfrey, were samples of the Iver Johnson '97 bicycles, which are not only good looking, but show lavish and painstaking attention to details.

The Iver-Johnson people are strong on forgings and weak on brass; that is to say, they are intense believers in the one and do as little brazing as possible. The result of this is that no reinforcements, lapped joints or sheet-metal connections are employed in the wheel, although all joints are flush. By their method of construction the long brazing surfaces themselves act as reinforcements. There are but twelve brazed joints in the wheel, about one-half of the number, it is asserted, that are to be found in wheels of other makes. Brass wire, but no spelter, is used in brazing these joints, the construction of which is such that while brazing as a rule is largely a blind process, in the Johnson wheel it can readily be seen when it is right or wrong. The head and head lugs are in one piece, machined out, and the fork-crown and shaft are also one forging, similarly treated. The crank axle is of the two piece variety, one of the cranks only being detachable. The brake is of the interior type; the spoon is split and grips the sides and not the thread of the tire. The pedals, which, like the chain, are made in the Johnson factory, are of new design and have flush spring oilers that will convey the oil directly to the balls. All other bearings are constructed with this object in view.

Fred Johnson, who, despite the fact that he is not yet out of his twenties, is the head of the enormous Iver-Johnson Arms and Cycle Works, was among the most recent American tradespeople to visit foreign shores. He little more than reached New York when he left for the West. He was so well satisfied with his trip abroad that he expects to make another visit in March. He believes there is ample room for the best class of American goods—for wheels that cannot be "hawked," as he expresses it. This sort of wheel, he states, is far more numerous than the average American imagines. They have been unloaded on the English markets in great quantities and are sold at all manner of prices; the more astute English dealers affixing a name-plate or transfer of their own. Mr. Johnson believes it sheer folly for any American to attempt educating the English public. His trip convinced him that to be a success the American wheel must meet English ideas and must be fitted with steel rims and mud guards and Dunlop tires, which in Europe enjoy a monopoly which is not even faintly appreciated on this side of the water. As to square cranks, the size of bolts and nuts and such minor details, he found no criticism whatever.

Mr. Johnson found that the English trade has one admirable trait—no one manufacturer can stamper the trade; that is to say, if any one of the leaders brings out a striking pattern or striking novelty, his competitors do not find it necessary or incumbent upon them to follow his lead. The result is that there are a number of distinctive wheels, each on their own lines, and each with their exclusive features, and each with a substantial following.

Asked as to the future of the export trade, Mr. Johnson remarked that he believed it would prove profitable for many years to

come. In England the American wheel might not prove a considerable factor, but there is a sufficient colony of Americans to make their patronage worth cultivation.

As an item of some interest Mr. Johnson stated that in catering to the English trade it should be borne in mind that their season begins later—it does not open until March—and lasts longer than ours; in this country he believes the bulk of the business will be over by May 1st.

HOW THE '97 HUMBER APPEARS.

As the oldest wheel and one which has ever been one of the world's leaders, the Humber is always an object of interest. Its makers have contributed so very many of the ideas now accepted as standard by the cycle trade that wide awake people are usually anxious to learn what innovations are incorporated in the new models of each successive year. The American Humber is, of course, essentially an American wheel, but in a measure it reflects the English notion. The 1897 model was brought to New York on Monday last and is now on exhibition at their stores, No. 318 Broadway, Fifth ave. and Forty-second st., N. Y., and No. 545 Fulton st., Brooklyn. No impressive alterations are apparent. The most important is the adoption of barrel hubs. The reason for their adoption, the firm states, was to enable the use of the same type of bearing that has been successfully used in the crank hanger since the present form of safety cycle was made by Humber & Co. This was the invention of Thomas Humber, the founder of the house, the principle being that the cones are fixed on the axle and the cups are adjustable. This necessitated the adoption of barrel hubs in order to get the axle with the cones attached in the same.

Another important change is in the adoption of the flanges on the sprockets, which have been used so successfully on the Beeston Humber cycles. This, together with the regular equipment of a 25-tooth front sprocket and a 10-tooth rear, making a 70-gear, will add very materially to the well-known, easy running qualities of the cycle. They will also fit 8 and 9 tooth rear sprockets, and give choice of gears from 56 to 87½ inches.

The frame is of the same size tubing and is not changed from the 1896 model, the only feature being the placing of a second transfer upon the seat post tube.

The adjustment of the crank hanger bearings is somewhat improved upon. In addition to the regular method of fastening the cup has been added a dog which fits into recesses in the cup, making the same absolutely immovable except by the removal of the dog.

The pedals are on the same lines as those on the 1896 model, with the addition of a dust cap covering the adjusting cone, and the rounding of the end of the outer plate instead of its being square, the plate being a trifle thinner, and it giving the same strong and easy running pedal as before, but appearing lighter and more graceful to the eye. Another improvement which will be greatly appreciated by the rider is the adoption of two sizes of nuts. One spanner about five inches long is furnished, which will fit every nut on the cycle necessary for adjustment on the road.

In other respects the cycle remains the same as in 1896. Humber & Co. have found that the Humber saddle which they introduced last year, and the Humber tires which were also adopted by them last year, have given universal satisfaction, and continue the same for 1897. The finish of the cycle is as before, black with royal purple wood rims, Humber hose pipe tires with red tread.

Suitable clothing adds much to the enjoyment of a ride.

SIX FIGURES NOW.

This Number Needed to Express the Fowler Capitalization—Won Out on Merit.

Until Saturday last it required but five fingers to express the capital stock of the Fowler Cycle Manufacturing Company. On that day the annual meeting of the stockholders and directors occurred in the Chicago headquarters, and when it adjourned the Fowler concern had placed itself in the six-figure column, the capital stock having been increased from \$50,000 to \$400,000. Of this increase, \$250,000 was declared a stock dividend; the remaining \$100,000 is treasury stock, that is, merely paid in by W. S. Warfield and his son, John D. Warfield, both of Quincy, who, ipso facto, secured a considerable interest in the business. The senior Warfield is president of the First National Bank of Quincy, and naturally a most desirable acquisition.

At the annual election, which followed the distribution of stock, Frank M. Sproehle was elevated from the vice-presidency to the presidency, John D. Warfield was chosen vice-president, and James M. Davis re-elected secretary-treasurer.

On the eve of its new year, it is simple justice to say that the Fowler company fairly earned its spurs during the season just closing. During the panicky days of the summer, no concern was more persistently or more cruelly assailed by rumor. As a result, creditors made several wild rushes on its treasury, but each rush was met manfully and with the necessary grace and cash. In August, on the very day when some of the Chicago papers stated that the factory had been closed, and that its sides were bulging with overstock, and when the report was current gossip in the trade, a WHEEL man went through the plant and found some 200 men at work and some 100 wheels in course of the assembling process. The stockroom showed no perceptible evidence of a surplus of parts. "I'd show you the storage room," remarked Mr. Slusser, who acted as the press man's pilot, "but we have none, and have never found need for one. Our wheels have been shipped as fast as they have been put together."

MAY BE RIVALS.

Considerable difficulty is being experienced by the Minneapolis Cycle Board of Trade in securing the support of the jobbers. They are of the opinion that they will receive no practical benefit from the organization, and contemplate forming an association of their own. The Board of Trade has promulgated a rule to govern the sale of wheels on the installment plan, and a schedule of repair prices is being prepared. Officers were last week elected as follows: President, W. L. Harris; vice-president, C. D. Velle; secretary-treasurer, Horace M. Hill; directors, J. B. Kennedy, W. K. Morrison, A. Bloomquist, F. L. Darrow, L. H. Fawkes, J. A. Wirtensohn, J. E. Harper, S. M. Davis, E. E. McMasters.

ADDED TO THEIR LINE.

The Gillam Manufacturing Company, Canton, Ohio, has added a number of new saddles to its line. Among them is an invitingly easy-appearing hygienic saddle on rational lines, and another of the coil-spring variety so popular in England.

POTTER'S IDEA ABROAD.

It is proposed that the Austrian Union should only look after touring, and give up entirely the supervision of racing. Who is the Austrian Potter? This is exactly what our own I. B. wants the L. A. W. to do.

FOR THIS, MUCH THANKS!

OVER and beyond ordinary things, for which we must always be thankful, there is a special reason for joy this week. Mr. Frank W. Sanger has abandoned his cycle show. It appears he must give up his Garden to charity—to a noble charity indeed; a benevolence which will provide military cotrooms in the hospitals. This indeed is most worthy of him, and bespeaks a kind heart.

On the other hand, it is much more of a credit to Sanger's sense than to his heart that the trade is thus relieved of two Eastern shows, one legitimate and one illegitimate. Sanger had published his prices and drawn his diagrams, and was all ready for business; but no business came. The trade stood firm to a man. The big houses who were to exhibit "by hook or crook" were not in evidence. A request for the list of exhibitors drew out the fact that only one concern had agreed to take space in the Garden, and that concern was one which will not be represented at the National Cycle Show. This list of exhibitors totalling one firm after many days of canvassing was not increased to two. Hence, the project was dropped.

Congratulations are in order for R. L. Coleman, president of the Board of Trade, for the Board of Trade executive, which gave him so much power and so much support, and for the cycle trade generally. They have not won a big victory, because the victory was not difficult; the game was not big. But they have shown a power of clinging together; they have shown a disposition to attend to their own business in their own way. They have signl-

fied, above all other things, that, as a trade, they will refuse to be held up by every passing showman, by every windblown scheme. Having beaten off the biggest combination that could oppose them—that is, Sanger, the Madison Square Garden Company, and, above all, the Madison Square Garden, which is a more potent factor than its managers or owners, the Board of Trade need fear no more trouble. In future, if shows are held, they will be held by the Board of Trade.

Incidentally, it may be remarked that the \$39,000 which the Garden Company received last year will be largely augmented through this year's shows, and the sum total net will give the Board of Trade a handsome capital with which to pursue its legitimate work.

POTTER OR ELLIOTT?

THE gleaners for news in the daily cycling column and in the weekly cycling journal are eye-startled with "Potter or Elliott?" headlines, of large proportion and singular prominence. It is supposed to be an interrogative knockout to the average man. It is supposed to be an important issue as to whether Potter or Elliott should occupy the presidential chair during the approaching year. The merits of the men are discussed with erudition and ponderance. The works of the one and the deeds of the other are carefully reviewed. Hung on to the main hooks of comparison is a lot of balderdash.

Students of League politics and those who are familiar with League presidential history know that the question as to what person will occupy the chief chair in that organization is a matter of the smallest importance. It is not half as important to the average bicycle rider, even if he be a League member—which only about one-twentieth of them are—as the purchase of the proper tire or the most effective plug, or the easiest saddle; in fact, any one of the 888-10 per cent of the League members would gladly exchange his presidential preference for an easy seat.

We assert that the position is of no importance, for many reasons. Look over the story of those men who have been elevated to the froth throne, and you will look over a history of failure, chagrin, obscurity and insult. Who knows of Kirk Munroe, who started the League, or of Charles E. Pratt, its first president? Or of Kirkpatrick, twice its president, and a wonderful worker? And to what Hole-of-Calcutta-like obscurity has Burdett retired? To what obscurity Luscomb? How Willison was drubbed out last January! And Beckwith, four times a president, what of him? How many League members even know that he has passed over the Great Divide? This is only one light on the question; there are many sidelights. The position is one with small glory, with no profit. Most of its incumbents have sacrificed their private business in order to bathe in the political bath for a year, some of them for two years. After that they were shunted out, most of them covered with execration. Assuming, then, that the matter is of little importance, candidature can be reviewed without much heat.

THE WHEEL asserts that Elliott should be re-elected, not Potter. Most League presidents have served more than one term; no League president can get familiar with his work, can inaugurate it and make it fruitful, materialize, and reach its logical and practical result in one term. The first year is largely of sowing; the second, largely of reaping. Elliott has been an impartial and clean president. He has attended to his business, and, though the League has tied itself into an unprofitable contract, he has rebated to the organization some several thousand dollars. He is capable, he is enthusiastic. Even from the standpoint of letting well enough alone, it is good policy, good politics and good business to re-elect him.

On the other hand, Potter's position is "that he will not oppose Elliott." Nothing has occurred up to the present time to switch that position. Privately he is on a hard run after the office. His official statement to a WHEEL staff man is: "I am not a candidate, but do not say I will not run." This remarkable utterance, by the way, is the keynote of Potter's political character. THE WHEEL admits and admires his capacity and his unlimited perseverance; yet, at the same time, it recognizes that his work is, like that of most other men, largely for self-advancement and profit. All the time he is half Mephistopheles, half Hamlet.

No substantial reason can be advanced as to why Potter should oppose Elliott's candidacy, or why he should permit his friends to attempt what they have in view, the "stamping" of the National Assembly for him, which is evidently their intention. Potter is the pivot and orbit about which a group of newspaper men revolve, and he furnishes them ample material for space filling. Journals which have in the past opposed Potter and Potterism are now filled with laudation and with ingenious argument in support of his candidacy. One Western cycling journal states that, because Potter refused a cool \$10,000 from the railroads, he is worthy of the presidential nomination. This paper claims that no offer was made, because said offer "would have been refused with scorn." The intimation is one which Potter will scarcely relish. The fact of a man being guilty of common honesty does not entitle him to wear a blazing diadem. It is something that is expected of him, and there is no need of showering bouquets on the gentleman in question, because he was not bribed, or because of the assumption that, in case he were offered a bribe, he would have refused it. Such circumlocutive laudation almost approaches censure.

Then again we have columns of twaddle about Potter's extreme honesty, his martyrdom, on the supposition that he has injured his private business. THE WHEEL is not in a position to analyze Potter's private financial matters, nor would it do so, if it were in such a position. THE WHEEL does, however, make the general assertion that Potter has not sacrificed himself or his finances in his League work. He is one of the best known "good roads" men in Amer-

ica, and is even now in the light of a promotion, should there be a vacancy in a Governmental position of any importance. He is familiar and personally admired by the "good roads" people. He is one of the best known men in his State and in his city, and preferment is probably even now awaiting him, should he choose to take it. We do not say that he has been offered political preference, but by a mere turn of his hand he could have it. He is in a position, even without making a definite statement or taking a definite position, to be named for a high office in his political party—whatever it may be—because of the unmeasured, indefinable influence which he would have as the head of the League in his State.

Mr. Potter has, in other words, created a reputation which is not without great value. He has accomplished in a few years, through his League connection, what many lawyers only achieve late in life. He is a well-known public man. Could he have foreseen the growth of cycling, and had had the talents of a prophet, he could not have selected any better means to have quickly advanced himself in his profession. It is also true that his law business has been carried on, because his firm has always been a partnership affair, and he has directly and indirectly obtained revenues which have at least kept him from the verge of starvation, even though he may have suffered a limited and much regretted martyrdom.

Again, Mr. Potter's work in New York State is not extraordinary, though it appears so to those who have not closely studied the question. Mr. Potter has done no more than circulation managers or the heads of subscription bureaus do. He has spent a great deal of money to achieve an admirable result. The League membership of New-York represents a business campaign. The majority of its members are not drawn to the League through sheer love of cycling, through belief in the League's work and through knowledge of what the League has done and is doing. They have been drawn there by the work of the "machine," if one may unbelittlingly use that much used term and apply it to Mr. Potter, his consuls and his newspaper friends. New-York's League membership has cost a great deal. We believe the expense of the State Division last year showed that it cost \$19 (estimated) to obtain each League member. The New York State membership would not outlive Potter, that is, in its present proportion. It is his creation; it is his entire work, and it has been accomplished by a liberal expenditure of time and money. It is not extraordinary, though it is worthy of praise.

Turn to Elliott, and we find a man who is not garmented with partisanship. He is not political. He is a simple, sincere and enthusiastic worker, and if space would here permit, THE WHEEL believes it could readily show that Elliott has in his time accomplished a far greater and more lasting work for cycling than has Potter. In his own State, Elliott's work has not been less radical and far-reaching, and we believe it has been of a more intelligent and permanent character. Elliott is

the centre of a body of intelligent and enthusiastic cyclists. In his work he represents the best and most advanced ideas as applied to cycling, because Boston was the home of cycling, and the men who are behind Elliott—the majority of them—know the sport from its initial day up to the present time, know its needs and know its possibilities.

Briefly, the comparison is not worth spinning out at further length. The office in question is an evanescent, directly unprofitable business. Every man who has ever occupied it has been victimized and cudgelled out of office, leaving it with small honor and with few friends, for his temporary adherents during his term usually show their elasticity by turning quickly to the new king. Potter, standing on the pinnacle which he at present occupies, should be content to leave well enough alone. The presidency of the League will not make him any greater or bigger than he is.

We may also state, confidently, that the operation of "stamping the convention," which seems to be the only way in which Potter can be nominated, may not be as easy as the Potter adherents think. In the rank and file of the League and in the rank and file of the National Assembly, Potter is not held in unmitigated belief and love. He is, in fact, watched with suspicion. It was only his native brilliancy which saved him at Baltimore, last January, from complete obscurity. He went to Baltimore a beaten man, with no strength behind him; but on his Good Roads Day, he made such use of his histrionic ability that he soon became the chief figure, and on the second day he had become a force. But the inherent "Potterism" is still there, and at the National Assembly Potter will meet men who have been in League politics as long as himself, and an oratorical stampede need not be expected. Without Potter's New York strength, which is his own strength, since he created it, he would not be considered a dangerous candidate. At large he is neither loved nor feared nor hated.

Charity covers a multitude of sins. The Hannemann Hospital charity, which is to be substituted for the private cycle show at Madison Square Garden, is serving as a cover for not only Frank W. Sanger, but for the New York Herald, whose kind offices in "exposing the outrageous profits of bicycle magnates" contributed no little of the cycle trade's recent distress.

We would not take ourselves so seriously if we considered that what are tragedies to-day will only be comedies when we remember them.

There are some persons in cycling who will never go to heaven except they go at excursion rates.

Prosperity is one of the things we don't think we have until we lose it.

The fool at twenty was probably an infant prodigy at four.

BEST OF ITS KIND.

Perseverance and undoubted merit are beginning to tell in the case of the Spencer Brake Company, and when the '97 wheels are assembled at the cycle shows, it will probably surprise not a few people to note the progress which the brake has made. It will be part of the equipment of several of the most prominent wheels. The leaven being now in good working order in this country, the company is about to devote a share of its attention to the foreign field. One of their representatives, W. E. Gilbert, left on Wednesday with some seventeen wheels equipped with their brake, which are to be exhibited at the Paris and other Continental cycle shows. On the other side, where brakes are in more extensive use, the Spencer's success should be even more immediate than here at home. That it will prove a most desirable option, its construction, its invisibility and its method of application, by a mere twist of the wrist, leave no reason for dispute.

WORKING UP THE GAME.

Tom Eck has been heard from. He declares that Michael is mad all through, and that he will deposit \$5,000 next week to bind a match with Tom Linton, the contest to be the best two in three races, Linton to select one distance, Michael another, and, if a third race be necessary, it is to be fifty miles. All races to be paced. The Linton party, when seen at the Hotel Bartholdi by a WHEEL man, hailed with delight the prospect of the match. They will agree to all Eck's propositions, and are ready to post their money at any moment. Those who recall Eck's wrath and how he could not post \$500 for a Michael-Starbuck match will smile at his \$5,000 talk.

WATCH THE CABLE.

Elliott Burris, manager of the American Humber Company, quite unexpectedly left for Europe on Wednesday last. The story promptly got abroad that he had been called to London to consider the proposition to take charge of the Humber's English works. It is known that Chief Director Rucker thinks very highly of Burris, and the report is possible, of course, but not probable. No one connected with the Humber interests in this city knows aught of the alleged offer.

SALVE FOR A COLLAR BONE.

All the riders training at Saratoga took part in a benefit race meet for Frank Albert, who recently broke his collar bone, at the Casino on Tuesday night. Bald rode an exhibition half mile in 1:05, lowering the track record a second. Hadfield won the mile professional in 2:11, winning a purse of \$50. Jay Eaton rode an exhibition mile in 2:09. The match race between B. W. Pierce and W. J. Hufstetter resulted in a dead heat.

SANCTION SEEKERS.

The Long Island Board of Trade will apply for a sanction for a cycle show in Brooklyn to be held during the second week in March. The Providence (R. I.) Board has also voted to hold a local show immediately following the Boston function.

SILENT, BUT SATISFIED.

A. L. Collins, Sieg & Walpole's Eastern sales agent, is in New York. He is not talking for publication, but it is plain that he has been immensely tickled over certain deals which have gone through.

GREYHOUND COURSING.

A meeting of the creditors of the defunct Greyhound Bicycle Manufacturing Company has been called for December 9. It will be held in the office of Assignee R. F. Herrick, No. 40 Water street, Boston.

TWENTIETH STANLEY.

England's Great Cycle Show Opens in a Blaze of Glory—American Exhibitors Present.

London, Nov. 21.—The twentieth Stanley Show is with us, and the general verdict is greater, grander and more magnificent than any predecessor.

Could I but imagine that the sombre pillars and balconies, the sunless alcoves and bays were the creeper-enfested columns of the Crystal Palace, that the refrigerator-like atmosphere was tempered like the Palace draughts to the worn reporter, and that the evil-smelling cement floor was the knot-studded arena of Sydenham, I would unhesitatingly assert that it is the grandest of any English cycle show. The Stanley Club has striven hard with paint pot and bunting and paper garlands to bring the dingy Agricultural Hall within measurable distance of the rival venue, but for all the streamers, the lightsome colors, Japanese umbrellas and imitation wreaths, the effort is not a success. Still, apart from that one point, the twentieth Stanley Show is lord of all its line and lineage.

If I cannot assert that competition has been keen in devising novelties to be embodied in machine designs for '97, I can at least bear testimony to the keen rivalry evident in the matter of stall design and decorations. The magnificence of some of the appointments dwarfs all previous efforts, and has caused me to roughly turn over in my mind the cost of the present Stanley Show to the trade. I do not think that I am far out in placing the figures at £20,000, that is, including advertising. For such a conservative country as England, this is something to wonder at.

The chaste effect secured last year by the Columbia white and gold decorations has caused quite a run on this combination. Humber & Co., with a colossal design resembling a temple in the Italian style, literally wipes the floor with all its competitors—and the rules laid down for the government of the show also, this causing much heartburning. The Rudge-Whitworth stand is an exquisite production, somehow reminding one of a gondola in its curves and tracery. The Royal Enfield and Elswick are more severe in tone, as is the Simpson lever chain stand; but turn where you will, the same magnificence is evident.

America's contribution to the general effect is creditable alike to the taste of the managers and enterprise of the firms. The Columbia is a reproduction of last year's design. The Crescent is an unique embodiment in ruby plush and gold of the Crescent symbol. The Dayton is equally handsome in blue plush and silver. The Fowler affects a pale sea green, with draperies that must have absorbed a lot of effort to devise. The Waltham is more simply displayed, as is the Ben Hur and Envoy, but effect is not wanting in either. The Columbia and Crescent have been the most generously treated so far as position goes, they being in the main body of the hall, while the America and Fowler are quite hidden from view under the galleries.

When I suggested in a recent letter that there would be few innovations in English models, I was absolutely correct. Glancing over the whole array, I cannot find any really radical alteration of pattern in a standard machine which can compare with the adoption on Humber machines of the double chain stay on Beeston & Wolverhampton models. This duplex arrangement is fitted only to the chain side of the machine, and is simply a doubling of the ordinary $\frac{3}{4}$ -inch round tube, which, starting from above and below the crank-hanger, converge toward the rear axle

lug, in which they meet. Of course the result is a strong frame, but it also looks a trifle awry. Beyond this one cannot look for alterations toward the minutiae of fitments—pedals, brakes, handle-bars, etc. In the latter the curving forward so popular on your side has been abandoned in favor of a T-piece not unlike the forward L pin of a saddle, to which is affixed the handles in shape approaching to those of a year ago. This arrangement gives clearance for the riders' knees, with a forward position, while permitting considerably more freedom in steering, and a stiffer handle-bar.

Perhaps the machine in which the most inside work (coat inside) has been devoted is the Dunlop. In this machine a new pattern

VERY LIGHT ON HIS FEET.

Now comes the gay inventor who tells the world it is all wrong in its present idea of how its way should be lighted. In proof that the inventor believes this, he has sweated his brain and depleted his bank ac-

count by inventing and patenting the foot lantern here shown.

According to the inventor, who must be light-headed, the rider of a bicycle must be light-footed, hence he places him behind the footlights as above. It is worthy of remark that the inventor expects to make considerable money out of this invention, in which expectation he, of course, differs greatly from his kind, and of every one else.

bracket is fitted, which, I think, gives the nearest approach to absolutely perfect alignment that has yet been secured in bicycle bearings. American ideas have been freely absorbed in matters of detail, such as chain adjustments, and the most trivial detail has not been thought too trivial to command an effort toward improvement. I will describe some of these details in a later communication, so will pass them here and go on to the American exhibits. The American exhibitors are: Buffalo Cycle Company (Stand 59); Benetink & Co. (Stand 14); British-American Ball Nozzle Company (Stand 56); British Hunter Cycle Syndicate (Stand 289); Central Cycle Manufacturing Company (Stand 58); Eclipse Cycle Company (Stand 70); Fowler Cycle Manufacturing Company (Stand 37);

Hawthorne, Sheble & Co. (Stand 150); Morgan & Wright (Stand 210); Overman Wheel Company (Stand 136); Pope Manufacturing Company (Stand 121); Roslin Cycle Company (Stand 152); Vertical Feed Company (Dayton cycles) (Stand 54); Western Wheel Works (Stand 120); Wolff-American Cycle Company (Stand 99); Waltham Manufacturing Company (Stand 139).

Where so many clever brains have been devising artistic stands, and succeeding, it would be invidious to distinguish in the matter of criticism.

On Stand 59 the Buffalo Cycle Company show a host of Envoy and Ben Hur cycles. The Envoy has been Anglicised considerably to meet the English trade, but they have succeeded in retaining sufficient of their American raciness to preserve their distinctiveness. Six models are shown with, however, very little difference between them. The cone adjusting saddle-bracket is retained, and though of course it is excellently designed and fitted, I cannot help regarding this as a disadvantage in appealing to English buyers, who insist above all things on disk-adjusting bracket.

Side by side with the Envoy is shown the Ben Hur. Here again we have the cone-adjusting bracket, although I must confess in other ways the Ben Hur goes very far to meet our ideas. A double crown is fitted, and steel mudguards.

The America, shown on Stand 150, is quite out of sight, and practically speaking, all the efforts of Messrs. Hawthorne & Sheble have been lost so far as stand decoration goes. The America also, I think, makes a mistake of fitting cone-adjusting bracket for the English market.

On Stand 56 the American Ball Nozzle Company are showing the Stearns, side by side with the Syracuse Cycle Company, which are on Stand 55. These are considerably better off than the America people, because they have at least some light, and a look in at the general body of the hall. The chief object of interest on the Stearns stand is the sextette, which attracts a great deal of interest. It is a magnificently staged machine, and though I am by no means enraptured with the idea of such mammoth machines, I can conceive from the design that the Stearns sextette should be a working machine, which is more than we have found some of these to be. The Stearns design is one which should attract the English public, and in matters of detail it has not needed a tith of the alterations which most of its fellow-competitors from America have found necessary. The Syracuse has met English ideas in so far as fitting Dunlop tires, steel rims, brake, etc., and is a very good-looking, attractive machine, although the glaring crimson rim, which forms the basis of most of its advertisements, is just a trifle too loud for trading purposes here. The Eclipse, on Stand 70, is a nice machine, but it has not been materially altered for the English market. The Fowler, on Stand 37, is like the America, quite lost under the shadow of the balcony, and yet it shows a determined attempt to meet English views: a Humber bracket is fitted, and well-fitted disk-adjusting hubs are included; the advertising effect of the Fowler sextette is called in to assist. The American Warftek makes a good show, as does the Overman Wheel Company, on Stand 136. The Wolff-American, on Stand 99, have a very artistic show, enlivened by such means as stuffed wolves, palms and things of that kind. On the gallery Morgan & Wright hold their court. The Columbia models this year are certainly magnificent, and while Colonel Pope has, as he has stated, preserved his own ideas, their application is such as leaves no room to cavil. Columbia is certainly a magnificent wheel; the Crescent has been largely developed to suit the English trade, and in the hands of Mr. Copping it is likely to considerably enhance its popularity.

WELSH RABBITS.

Two of Them Have Been Imported for American Racing—Linton's Plans and Prospects.

The American liner St. Paul, which steamed into port last Saturday, landed the biggest aggregation of cyclists that has yet invaded this country. The party consists of ten men: Two Welshmen—Tom and Sam Linton; two Frenchmen—C. Chapple and Alf Hunter; two Englishmen—James Warburton and Dudley Marks; a Scotchman—J. D. Lumsden; an Irishman—Teddy Hale, and a Swede—Antone Johnson, brother of John S. and the same who left these shores with the Eck party early in the year. Eddie McDuffie was also abroad. He left with the Butlers, and his return was unexpected. It is stated that the climate was too much for him. Of course, Tom Linton is the bright, particular star. Those on the dock who had been informed of the former collier's great prowess, were disappointed when a small, slim, quiet-looking chap was pointed out as the man who had ridden 31 miles and 582 yards in an hour.

Part of the baggage which came with the party was five crates of cycles. When these crates were deposited on the dock they were immediately surrounded by a curious crowd, who gazed with astonishment on the enormous gears and the peculiar Simpson chain with which each machine was equipped. The invaders and their machines were driven to the Bartholdi, where they are now staying.

When seen at the hotel by a representative of THE WHEEL, the foreign cyclists were lounging in the corridors. All wore sweaters, or dark-colored flannel shirts, those who wore the flannel shirts being bedecked with white neckties.

In answer to THE WHEEL man's questions, Ed Plummer, who is in charge of the party, stated that they would strive to lower the colors of any one who chose to meet them and proposed to wipe clean the American record slate and fill it with new figures. He said: "In Tom Linton I have the gamest and fastest man that ever rode a wheel. I will take the team to Pennsylvania, somewhere in the mining district, where Welshmen predominate, and show Linton to his countrymen. A match between Michael and Linton would draw an enormous crowd in that locality, but I do not think that Michael would ride against us."

The machines that the party brought with them, with one exception, are all made by the Simpson Lever Chain Company, the exception being Linton's mount, a "Gladiator," a French wheel. All are geared over 98 and all are equipped with Simpson's chain. In fact, the enterprise is practically a Simpson lever chain advertisement.

When Michael's name was mentioned to Linton, he forgot his passive, quiet attitude, and leaned forward eagerly asking rapid questions concerning Michael's popularity, his work, time and the conditions under which they were made. He seems to be as eager as Plummer for a match with Michael.

Tony Johnson, the Swede, or American, as you choose to call him, "wears a broad grin continually. The other members of the team, being entirely strange to the country, make "funny breaks," as he expresses it, every minute in the day. One morning at breakfast Lumsden, seeing some fried hominy on the bill of fare, asked the waiter to bring him "some of that fried'errin." He got it, but said it didn't taste nor look like fish.

Tuesday morning, notwithstanding the snowy condition of a portion of the streets, the clear, cool weather attracted all of the party to try the asphalt surface of the Boulevard

and the macadamized drive, on which they hope to do their training.

It is practically impossible to ride slower than twelve miles an hour with such high gears, and they were at once called down by the first cycle policeman they passed. The policeman mounted his wheel and turned on behind them. Plummer soon made his acquaintance, and the conversation ran on cycling and cycling races generally. The cycle cop was a little sarcastic (being a patriotic American), which did not please the foreigners. In order to escape from it, they commenced quietly to dig on their high gears. When they had ridden a mile and a half the cycle cop's conversation had dwindled to short, disconnected, breathless sentences, and he cried out to the tandem, "Let up a little bit there! You are going too fast!" There being nobody on the Boulevard, and realizing that they had ridden themselves into the good graces of the policeman, the foreigners let

TOM LINTON.

The band on his left sleeve signifies that he is the holder of the Middle-distance Brassard, which nets an income of \$4.50 per day.

themselves out, and when three blocks had passed the bluecoat discovered that he had business up a side street.

Linton, Lumsden, Hale, Chapple and Warburton will start in the coming six-day race at Madison Square Garden, but it is unlikely that more than one will attempt to finish. The Simpson people expect Teddy Hale to win the big race. He has had a long and special preparation, and says he is as fit as a fiddle. When asked where he was going with his team after leaving here, Plummer replied: "Anywhere I can cop a few quid."

GOT EVERYTHING IN SIGHT.

Morgan & Wright's thorough and persistent campaign against Father Time has reaped its reward. Their tires now hold all world's records, $\frac{1}{4}$ to 10 miles; all world's records, unspaced, $\frac{1}{4}$ to 50 miles; all American records, $\frac{1}{4}$ to 100 miles, and all American hour records, from one hour to twenty-four.

TRIED IT AGAIN.

Muscle Matched Against Steam, with a Break-down for a Finish of the Race.

Philadelphia blossomed out with a bicycle vs. locomotive story last week that put to shame some of the previous yarns on this subject, which have been widely circulated in the newspapers. The "race" was well advertised and attracted a large crowd to the road at Haddon Heights, N. J., along the tracks of the Atlantic City branch of the Philadelphia and Reading Railroad. The locomotive's contestant was a sextuplet manned by six members of the Kenilworth Wheelmen of Philadelphia. The riders were attired in knickerbockers, stockings and red sweaters and dispensed entirely with wind shields, respiratory devices and ear protectors, such as their predecessors at the game have been pictured as using.

When the train was heard approaching the men were shoved off. Just as they were getting well under way and the train was fast overhauling them there was a snap and a rattle and the rear chain hung limp and broken. The train went by with a roar and was out of sight before the riders could dismount. The race no doubt would have proved mighty interesting but for the unfortunate accident. The locomotive was one of the fastest that haul the Atlantic City express trains, averaging 43 seconds to the mile on the runs to the seashore. The engineer had been posted on the proposed race, and felt confident of being able to give the riders all they wanted, so he, too, bemoaned the accident to the sextuplet, as he desired to see what the six riders really could do if they remained in his sight at all.

But the story was too good for a true narrative of the event. So it was telegraphed about the country as follows:

The riders of the sextuplet wheel met with an accident this afternoon in their race with the Reading Railroad flyer, below Pleasantville, N. J., on the Atlantic line, and had it not been for this it is believed that the wheel would have beat out the engine and created a new world's record.

The race was for one mile and flags were used to mark the course. At 2:10 the whistle of the approaching engine warned the wheelmen of the proximity of their contestant. The sextet had started about a quarter of a mile up the road, and by easy riding reached the start just as the cowcatcher of the engine stuck its prow toward the line.

The engineer pulled the throttle out further and all steam was piled on. The racers on the left were straining every nerve, but they were slowly losing ground. On the train the excitement was intense. The passengers were on the platforms and standing on the seats of the cars, waving handkerchiefs and other articles frantically, all to encourage the cyclists.

The race was anybody's at this point, but at the half mile the bicycle was seen to be gaining. A little further the wheel had gained a length. The boys let out a couple of links more and gained more. Inch by inch they increased their lead, until at the three-fourths mile mark, they were two lengths ahead, as near as could be estimated in such an exciting moment. Just at this point the chain of the bicycle snapped and the race was over and the train won, for it reached the milepost first.

Before the sextet could be stopped, it, too, had reached the end of the mile, but the Royal Flyer by that time was a few miles further on its way to the champion seaside resort. But it was a good race while it lasted and showed to some extent what the bicycle is capable of. With experienced racing men, under the same conditions, the bicycle can beat the express train in a mile race. This was the opinion of many well-known cyclists and sporting men who witnessed to-day's trial.

The telegraph operator at Haddon Heights is authority for the statement that the train to-day was travelling at the rate of a mile a minute.

Single-Tube Tire, made of the best
material and fully guaranteed.

The "Common Sense"

Single-Tube, made with the greatest care,
and especially adapted for hard road use.

WRITE FOR SAMPLES AND PRICES.

The Eastern Rubber Mfg. Company,

102 Chambers St., New York.

Kindly mention The Wheel.

THE CZAR RIDES ONE OF THESE.

Of course, '97 Daytonos will be constructed of large tubing. Naturally, practically every other wheel on the market will be similarly constructed, but in the instance of the Dayton, made by the Davis Sewing Machine Company, Dayton, Ohio, the fact is worthy of remark, because that wheel was one of the very first in which the "swell tube" was incorporated. In fact, it was used on the very first Dayton that was turned out, at the time when, to the unpractised eye, inch-and-a-fourth tubing seemed awkward and cumbersome, while it now appears eminently eye-pleasing and the proper thing.

'97 Dayton.

Of course, the Dayton has been in the re-nery during the last year. The results are apparent in the '97 model, although, as a matter of fact, no very radical alterations have been made. It is in the construction of the bearings that the most important departure has been made, one which it is confidently asserted will add materially to the running qualities of the wheel, as well as to the durability of those vital parts. The alteration is the adoption of three-point bearings which are three-point in the strictest sense of the term, both theoretically and practically. The surface of the cones being a perfect plane from circumference to apex, this construction, the Dayton people assert, furnishes the only absolute three-point gearing obtainable. The cones are made of the finest tool steel, and are proof against cutting and wear. A two-piece crank-axle has also been adopted, the crank-axle, right crank and sprocket-flange being forged in one piece, a particularly clever bit of work. The left crank is detachable, the fastening device therefor being an adaptation of the '96 tapered shaft and key, which method of securing is completed by means of a nut on the end of the shaft, which takes the place of the screw used in past years, while a nut between the crank and bottom bracket acts as a lock-nut for the adjusting cone and has a draw-nut for ready removal of the crank from the axle. Drop steel forgings are used for all frame connections, including the rear fork ends. The Dayton double fork crown is changed only in width, having been narrowed to one and three-quarter inches between the fork sides, adding materially to the strength and beauty of the fork. The hubs also have been changed only in the width between spoke-flanges, the enlarged bearings admitting of the addition of two balls to each bearing. Blind nuts are used on front and rear axles and in handle-bar and seat-post bolts. The same painstaking care in minor details and in finish that has ever characterized the output of the Davis factory will be apparent in the new wheels.

RINGING THE CHANGES.

With thirty-six different styles of bells to choose from the dealer who cannot find something to his liking in the Corbin line will be hard to please. The line includes electric, double and single stroke bells and the range

of prices is such as assures a look in at the contents of any purse. P. & F. Corbin, New Britain, Conn., who make the bells, are so large and so well known, that little more need be said.

The electric stroke bells, it is emphasized, are on the rotary principle, as illustrated in the open view. The double strokes are on an entirely new principle, and decidedly novel in construction. The single stroke are the same as last season.

The chief features are improved mechanism for electric double stroke, a cage-gear thumb-wheel for those desiring that style of a bell, and a lock Lund-clamp quickly and easily adjusted to any size handle-bar, not necessitating removing of screw for adjustment, which will be appreciated.

POPE MFG. CO.'S '97 MODELS.

Men's Hartford.

Columbia Tandem.

HONOR IN THE VERY NAME.

Please observe that "there is honor in the name Frontenac." The Syracuse (N. Y.) Specialty Manufacturing Company are anxious that that slogan be impressed on the minds of all who use, or are likely to use, bicycles. They make the Frontenac bicycle. It is a catch phrase, full of meaning, and sounding pleasantly to the ear. Although but one year old, the Syracuse people are well satisfied that nowhere is the force of it better appreciated than where Frontenacs are in actual use. This sphere, they have good reason to believe, will be considerably enlarged during the year 1897. They are directing their energies that way, and the '97 Frontenac itself is the sort of wheel that will render very material assistance. It will list at \$100, of course, and, among other features, will have reinforced flush-joints, flush oiling devices, ball-retaining cases, new detachable sprockets, eight-tooth rear and twenty front, and an adjustable handle-bar with an internal fastening which clamps the adjustment of the bar and secures it within the head at one operation. The use of the double tubular-fork crown will be continued. The angles of the frame have not been disturbed, the only change having been an increase in the size of the head to 1½ inches. The tubing in the upper and lower bars and seat-mast of the main frame is 1½ inches; rear upright forks, ¾ inch; rear bottom forks, ¾ inch, D-shaped tubing. Flat cranks, with a new and particularly simple method of attachment, are included in the alterations.

BACK TO GOTHAM.

Many of the old-timers in cycling will be interested in learning that Mr. Fred Jenkins—Fred Jenkins—has taken an important position with The Wheel Press (THE WHEEL'S printing plant). Mr. Jenkins has been connected with the cycling trade since the very first days of the sport in New York, being at one time one of the king-makers in the L. A. W. Lately he has had charge of the Pope Manufacturing Company's printing plant at Hartford. By the way, the cycle trade generally does not know the size and extent of THE WHEEL'S printing plant; an entire floor is devoted to a composing room, one to a press room and one to a bindery. The plant being practically new has obvious advantages. Already a great deal of printing for the cycle trade has been turned out of the plant.

TWO GOOD THINGS TOGETHER.

P. & F. Saddles have been so much advertised and written about that the P. & F. tool-bags have been rather obscured. The P. & F. Manufacturing Company, Reading, Penn., are now, however, vigorously gunning for the tool-bag trade, and as they know how to use their ammunition to advantage, there is small doubt that they will fill their order bag. They afford purchasers a great variety of patterns to choose from.

THE PALMER
PNEUMATIC TIRE CO.
CHICAGO, ILL.

VALUE

VS.

CHEAPNESS.

It would be folly to make a bicycle of nickel-steel tubing and put cast-iron cranks on it. The most inexperienced manufacturer would know better than to do such a thing—a scamp would be afraid to.

Yet some makers will cause riders more trouble and annoyance by equipping wheels with cheap tires than would happen with cast-iron cranks. The maker excuses himself with the plea that the tire man is responsible for the poor tires. So he is.

But the rider suffers just the same.

And he curses wheel and tires.

If you are making high-grade bicycles, let every part and equipment be high-grade. Don't consider first cost; consider value.

The highest type of value in tires is Palmer value.

The Palmer Pneumatic Tire Company

CHICAGO

DOWNED THE CYCLE TAXERS.

After a six months' fight, the wheelmen of Mobile, Ala., have gained a signal victory over the local authorities, who last March placed a tax of \$1 on each wheel owned by a resident of the city. The cyclists after vigorous protests secured the services of a prominent lawyer, the Hon. J. C. Rich. The first suit brought by him was thrown out of court on technical grounds. In the second suit a temporary injunction against the Tax Collector to prevent him collecting the tax was obtained.

When the matter of perpetuating the injunction came up in the Chancery Court the Chancellor held that an injunction would not apply in the case, and that the remedy sought could be had at law. Mr. Rich took an appeal from the ruling of the Chancellor and carried the case to the Supreme Court, his contention being that an injunction is the proper remedy to prevent the collection of an improper license tax. In the decision rendered the Supreme Court sustained the contention of Mr. Rich and has made the injunction perpetual.

NOT A PERFECT HIGHWAY.

Jerome avenue, that is Central avenue, has been widely announced within the last few weeks as a desirable wheelway for cyclists desiring to leave the haunts of the town and make their way up into the north country. True, the avenue has been doctored and raised and lowered and altered, but it is by no means a pleasant experience, although the papers tell us it is. The avenue runs through a picturesque country, but there is a deadness to it. It is muddy, dusty, rutty, lifeless; besides it has been set aside for use as a horse-speedway, which is enough to condemn it in the eyes of the cyclist. So, despite all announcements to the contrary, Jerome avenue is a place to be given the wink and the go-by.

ONLY FOUR THOUSAND NEEDED.

Columbus, Ohio, is after the next League meet in earnest. A joint meeting of local wheelmen and the directors of the Business Men's League was held last week at which it was decided to organize at once a large League meet club, and a committee was appointed to arrange for a mass-meeting. Perry D. Gath acted as chairman and J. E. Miser as secretary in the preliminary formation. Efforts will be made to have every rider in Columbus join the organization. It was the consensus of opinion that \$4,000 would be as large a guaranty fund as would be required. The members of the Business Men's League expressed great confidence that there would be no difficulty in raising this amount.

FOUR YEARS FOR FLEEING.

It doesn't pay to fleece wheelmen in Maryland. A false pretender by the name of Caldwell, who went about the State claiming to be a League member and victimized cyclists in various ways, was arrested through the efforts of the Division's officials, and by the evidence obtained was sentenced to the penitentiary for four years.

RAISING CYCLE THIEF LIMIT.

Plans are being arranged by the Massachusetts Division to endeavor to have the next Legislature pass a law which will call for the confinement of every convicted bicycle thief for at least a year in the penitentiary.

NO LYNDBURST TEAM.

McKee & Harrington say that reports that they are organizing a Lyndhurst team for next year's national circuit is unauthorized and unfounded.

MIGHT HAVE USED A DONKEY.

A Chicago cyclist was forced to ride fifty miles on a high wheel last week as a penalty for betting on Bryan. He was a party in an election bet necessitating a fifty-mile high-wheel ride in case Bryan was defeated on his part, against a 100-mile ride on a safety in case McKinley was defeated on the part of the other enthusiast. The Bryan upholder rode over a mile circuit in one of the parks with a placard on his back announcing the mission of the rider and required until after dark to fulfil the term of the wager. At twenty-five miles he was stopped by a park policeman who insisted he was advertising some one contrary to the park rules, and he gladly dismounted and prepared to return home. But it was quickly discovered that the policeman had been bribed by friends of the rider to stop the ride, so he was immediately compelled to remount and continue the weary grind.

10,000 MILES FOR \$1.

It is really possible to buy 10,000 miles for 100 cents, that is to say, it is possible to purchase an instrument which records that mileage; the Tripometer it is called. It is manufactured by the Supply Specialty Company, New London, Ohio, and is unlike all other cyclometers in mechanical construction. The illustration shows its general appearance.

pearance. It records short trips without affecting the total mileage, and has no glass crystal to break. It was introduced too late this season to become widely known, but the New London concern has been so well pleased with its reception where it was introduced that they propose pursuing an aggressive policy in the seasons to come.

FOREIGN PENN POINTS.

The Penn Manufacturing Company, of Erie, Pa., have closed a contract with The American Trading Company, head offices Liverpool, England, which gives to that great distributing and trade-controlling agency the exclusive sale of the Quaker bicycles in Great Britain and South Africa.

WORTHY OF ITS AUTHORS.

Morgan & Wright did themselves proud on their November issue of "Wheel Talk." It is fairly bulging with good things, and is well worth the postal card that will obtain a copy.

VICTORIA WANTS AMERICAN GOODS.

The Victoria Cycle Supply Company, No. 115 Victoria street, London, Eng., desires American cycle novelties and sundries. Address direct.

DOING A WHEEL DIVE.

What appeared to be a perilous bit of riding was performed by Frank Davis at a carnival at Atlanta, Ga., last week. Mounted on an ordinary, with his feet over the bars, he rode down a board chute, two feet wide, erected from the top of the Agricultural Building into a lake.

Davis made the descent in the most unconcerned manner in the world. Four men held the wheel while he mounted it. At the word "go" they released the wheel and away went the rider. In a single instant, it seemed, like a flash, he covered the distance between the starting point and the end of the boards, and, like a charge from a catapult, shot into the water, going over the handlebars of the bicycle.

For an instant bicycle and rider were buried beneath the waters, then, covered with mud, Davis rose to the surface, caught hold of the bicycle and brought it to the bank.

WITH AN ORNAMENTAL FENCE.

A prospectus of the proposed path between Washington and Baltimore has been issued, setting forth the plans expected to be realized in the construction of the road. The path will conform to the contour of the country, except where reduction of grades are made, and will be protected by an ornamental fence. It will be built for the use of cyclists except for the round trip, the rate being in proportion for intermediate distances.

It is proposed to establish midway between the two cities a clubhouse, athletic park and bicycle race track, free to all users of the path. The clubhouse will be fitted with every appliance, including gymnasium, bathrooms, reading-rooms, parlor and a dining-room. At intermediate sections sub-clubhouses will be erected.

STUMPED THE TAX-GATHERERS.

Judge Stump, of Talbot County, Maryland, has rendered a decision that is of interest to all wheelmen. The Commissioners of Easton had passed an ordinance compelling owners of bicycles to pay \$1 license, and to have a number corresponding to the number of the license attached to the wheel.

The wheelmen of the State fought this ordinance, which the court declared invalid because the town had no right to raise revenue without permission of the Legislature. If they could tax bicycles they could tax vehicles driven through the town, baby carriages propelled by nurses, and could tax and tag every pedestrian who walked through the streets.

LONG TIME TO WAIT.

A peculiar case was decided by a justice at Newry, Ireland, the other week. A girl who was knocked down by a cyclist and rendered permanently deaf in one ear through the drum being broken, instituted a suit for the modest sum of \$100 damages. The rider being a minor, the suit was lodged against his father. The judge held that the boy's father was not liable for the accident, but gave a decree against the boy for the amount asked, enforceable at any time during the next six years.

MEANS OF LOCOMOTION.

The German Imperial Insurance Office announces that it no longer considers the cycle an article of sport, but a means of locomotion; therefore, those who use it for business purposes are entitled to receive compensation in case of injury.

WHAT HE LEARNED.

Parsons, Returning to His Australian Home, Narrates His Adventures and Opinions.

There were no hands playing "See the Conquering Hero Comes!" to welcome J. W. Parsons on his return home to Australia. As a conqueror and a hero Parsons had not been the success his friends had predicted he would be when, several months ago, they sent him to knock out the champions of France, England and America. One true friend there was when Parsons landed who struck up on a mouth-organ that doleful melody "When Johnnie Comes Marching Home Again," and to the music thereof Parsons repaired to a neighboring café, where he was interviewed on his failure to knock the spots out of foreign champions. He said in part:

"You see, it was this way. I landed in London fifteen days after Megson, Lewis and Payne. I was there a week, and nobody took any notice of me, nor did they care whether I was there or not. I tried to do something for myself, so I saw a firm about riding their machine, but they wanted me to do a great deal for very little. I met Johnson, the American crack, and Tom Eck, his trainer and manager. They lent me a machine and I had a five-mile go. I did it under ten minutes, and then Eck offered me a good thing to join the World team."

"You accepted the offer?"

"Yes, I didn't fancy going to France or Scotland to race, as I couldn't see anything before me. So when I got such a good offer to go to America I took it. I can tell you that things looked a bit gloomy before I had that offer. Megson and the others jumped at \$25 a week and expenses, but I couldn't fancy accepting that. The company that made the offer wanted me to ride a certain tire, a certain chain and a certain machine. They wanted all the best of it. Then when Johnson was going to America I went with him, and was soon in Chicago. There I fixed up to ride a World with Morgan & Wright tires, under excellent terms."

"What are the American racing men like?"

"Socially, they are a grand lot of fellows. And they can sprint! There are quite a dozen men there who can knock spots off the Englishmen."

"Who did you pick as the best man?"

"Eddie Bald. He is like Zimmerman in appearance and rides like him. Cooper is a great rider, too."

"What other good men are there?"

"Butler is a fine rider, but very in and out. Sanger, who weighs about fourteen stone, is a wonderful sprinter, but he's like me, too slow off the mark. Sometimes there are thirteen in a mile scratch. Sanger is always at the back, and 200 yards from home he makes a marvellous sprint. He picks them out every yard, but he is generally just beaten on the tape. There is no champion. No man shines out like Zimmerman does. Ziegler and Ray McDonald are very good men, and they are all really good fellows."

"What about Johnson and Michael coming to Australia?"

"They want to come badly. But if they get good offers to stay there they won't come."

"What do you think of Johnson?"

"I was a bit surprised when I saw him. He is short—about my height—but very much stouter."

"You met Eck, the renowned trainer?"

"Yes. I'll tell you who he's like. He's a second Greenwood. He can't tell a fairy yarn at all. He's a very cute fellow, and besides

being a grand trainer is a fine business man. He's the man to arrange terms with a manufacturer or a sports promoter."

"What do Americans think of Australia?"

"They have a funny idea of the place and think it very small. The racing men fancy there is plenty of money to be made here, just because Martin has made a lot. But Martin could shake any of them up. They cannot think that he has greatly improved since he left America. They could hardly believe that he beat me fair and square."

"Asked as to his future intentions, he said: 'I have not made my mind up yet, but as far as I can see now, I will go back to England and America again next season.'"

VERY VELODROMATIC.

San Francisco, Cal., Nov. 27.—Ever since the opening of the new Velodrome track the attendance has been large and enthusiastic, and the sport of the highest order. On the opening day over 4,000 people passed through the gate, although it looked as though rain would fall at any moment. The event of the day was the three match races between the old-time rivals, Foster and Wells. Although Foster won the honors, he did so only after the most terrific of struggles, the result in every instance being in doubt until the tape was crossed. Foster won the mile race in 2:17, the five miles in 11:13 4-5, and finished a dead heat in the two miles in 4:37 3-5. W. A. Terrill took the big open event, the mile invitation, in 2:08 1-5.

On Thanksgiving Day 5,000 spectators occupied the grandstands, although the weather was chilly and disagreeable. W. F. Foster, paced by a quad, rode a half-mile in 56 2-5 seconds and a mile in 1:59.

The match tandem race resulted in a victory for Vincent and Krafts, who won both heats. The men started from opposite sides and rode unpaced. The times were 2:08 2-5 and 2:10. The principal events resulted as follows:

Two-thirds mile scratch; professional—1, H. N. Owning, San Jose; 2, C. S. Wells, San Francisco; 3, D. E. Whitman, Los Angeles. Time, 1:41.

One-mile amateur; handicap—1, J. R. Kenna (scratch); 2, C. Birdsall (45 yards); 3, E. C. Raynard (60 yards). Time, 2:27 2-5.

Two-mile handicap; professional—1, D. E. Whitman, Los Angeles (75 yards); 2, P. Metcalf, San Francisco (80 yards); 3, A. M. Boyden, Oakland (140 yards). Time, 4:50.

MARTIN AND MAC MEET.

News from Australia via San Francisco states that at a meet in Adelaide October 19, Martin and McDonnell, the American riders, got into an altercation resulting in Martin being disqualified for two months by the League of South Australian Wheelmen. McDonnell won a half-mile race in 1:04. The mile international scratch was captured by Lewis in 2:24. At this meet, Walker lowered the quarter-mile record to 27 1-5 seconds.

At Sydney, N. S. W., on October 24, W. L. Kerr, the amateur champion, established new Australian records for quarter, half and one mile. He was paced by a triplet. The quarter was lowered to 26 4-5 seconds, and the mile was covered in 1 minute and 57 seconds.

McCann, of Tasmania, established a new Australian 25-mile road record on October 18. He lowered the figures to 1 hour and 17 minutes.

DISLIKE HIS YELLOWISM.

Feeling in Paris is so strong against Morin for not keeping his word and riding against Jacquelin, that he has deemed it advisable to leave Paris until the storm blows over. Almost every paper in Paris has condemned his action in no measured terms.

HOW BRITISH RECORDS ARE MADE.

E. A. McDuffee classes the record-breaking attempt of Chinn and Colliver for a quarter of a mile, which he witnessed at the Catford track, London, as the worst exhibition of record-breaking he ever heard of. This is the way he puts it:

"According to the usual custom in England, they started from the top of the bank, and had two men to push them off. There were also several others who assisted the starters to prevent them from slipping down the high bank when the start was made.

"Armstrong, Barden's tandem mate, was there, and he discovered something that made me smile; he shouted 'take your foot from the rear of that tandem,' and as I looked up I was surprised to see a young man sitting on the track, with his right foot braced against the rear stays of the tandem, in order to give the team an extra start. Armstrong's discovery put a stop to the job, and the young man got up with a disappointed expression on his face.

"Then again, when the starter fired the pistol, he took his turn, and I am of the opinion that he did a good job. He first asked 'Are you ready?' Then he raised his hand above his head, and the riders, seeing this, started, and the starter fired his gun. All hands laughed, some said it was a poor start, and others said it was fair; but I can say that the tandem team gained at least 20 feet on the pistol. Anyway, the timer said they made the distance in 29 4-5s, which was outside the record; then every one claimed that with a good start they should have at least equalled it."

DISBANDING ECKSTERS.

Tom Eck's record-breaking troupe disbanded at Chicago last week. Johnson, Michael and the Jallu brothers went to Minneapolis, where they were entertained over Thanksgiving Day at Johnson's home. Their plans for the future are uncertain. Michael has expressed a willingness to meet Tom Linton in an hour's race on even terms.

The trip of the team in the South netted 25 world's records and 119 American records, all by handsome margins. All the world's records, from a quarter of a mile to ten miles inclusive, with the exception of the two-thirds and the mile, are held by Johnson and Michael. The unpaced world's records, from the two miles to five miles inclusive, are held by Bradis, and the unpaced world marks, from twenty-six to fifty miles inclusive, by Lawson. Tandem, triplet and quadruplet marks for the world were lowered. The American records from eleven to twenty-nine miles and the hour record are held by Michael, and the two, three and four-hour records and from thirty to 106 miles by Waller.

NO MERCY TO MERCER.

A quietus has been put on the claim of the Mercer County Wheelmen, of Trenton, N. J., to the century survivors' record of 347 riders by the Century Road Club. Last week it accepted the Century Wheelmen's (Philadelphia) record of 194 survivors. The run was held last July. The Trenton club's claim of having 347 of its members finish was hotly disputed by the Philadelphians, it being alleged that many of the riders who carried the club's colors were not bona fide members of the organization. The Century Road Club threw out the Mercer County Wheelmen's figures under the rule that each participant must be a member of his club for at least thirty days previous to the date of the run, each survivor being required to sign an affidavit to that effect.

BICYCLES

Kindly mention The Wheel,

WILLIAM AND HIS WOBBLING.

The whole world views with no slight degree of trepidation the announcement from Germany that Kaiser William has for the nonce stopped riding his hobbies and is now practising on a bicycle.

The young Emperor is inclined to be impulsive at all times, and even under the smoothest, easiest kind of circumstances his hand is ever ready to push the war button.

All must shudder for the peace of Europe and turn aghast from the picture which is conjured up when they think of the Emperor's wheel balking and tossing His Imperial Nibs into a rocky ravine with chill, cold mud on the side.

It is a well authenticated fact that bicycles are no respecters of royal personages, or any other kind of a personage for that matter.

In the mind's eye one can see the irritated Kaiser rising up, his Imperial form wrapped in a portion of barbed wire fence, a stone bruise on his bulging brow, and his newly acquired bicycle face full of tan bark polka dots. In the mind's ear one can hear him shriek, "Spitzboopen teufels! Gotterdammerung und Havoc, ein, zwei, drei times Havoc, und let slip the dogs of war!"

Truly, in the Kaiser's new safety lies the safety of old Europe, for that ancient philosopher spoke wisely when he said, "Uneasy bumps the crowned head that falls from a bicycle!"

THE CHILDREN'S FRIEND.

"It is better to be master of one trade than Jack of all." We make the point that as we manufacture only juvenile bicycles we are master of that particular trade."

It is in these words that the Fay Manufacturing Company, Elyria, Ohio, score a point, which is at least fairly well taken. The concern is an old hand at the game. Ten years ago they began the manufacture of children's tricycles. As cycling expanded they expanded, turning out during 1896 some 8,000 machines. They have just doubled their capacity and will naturally be in better shape than ever before. The 1897 models of

AND THE CALF STOOD STILL.

The young woman and the wheel were bowling merrily along one afternoon, when she came to the top of a Westchester hill, which offered a fine opportunity for a coast. Accordingly the young lady's feet went up on the rests, and the wheel started for an untrammelled cruise down the incline.

The coast was clear, with the exception of a calf standing inoffensively in the road about half-way down the hill. Had it been a mouse in all probability the fair rider would have at once dismounted and gone around by another route, or stopped into some house for assistance; but being only a harmless calf, that would in all probability make room at once at the approach of the young lady and her wheel, the latter kept steadily on.

The calf, however, apparently had different views concerning the right of way, and calmly

TEMPLE'S \$100 WORTH.

The Temple Scorcher, the Ralph Temple Cycle Company's \$100 wheel, will be built with 1 1/4-inch tubing, 1-inch fork sides, double crown, upper stays 3/4-inch, lower rear forks seven-eighths at the crank-hanger, tapered to three-quarters at chain bracket, with the tubing gracefully bent around the wheel to allow the use of large tires and narrow tread. The tread will be 4 3/4-inch, 2-inch crank hanger, 3/4-inch balls, square cranks, patent detachable sprocket-wheel, a new device for showing the bearings without taking the crank or chain off, adjustable handle-bar, any style saddle, Record pedals, Morgan & Wright Quick Repair or Pebbler Tread Diamond single-tube tires. The Ladies' Scorcher will have a semi-gear case.

Every man thinks his own estimate of the wheel he rides is quite conservative.

their Williams juveniles are already in circulation. They are fetching looking mounts, embodying all up-to-date features, 1 1/4 inch seamless steel tubing, wood rims, wood handle bars, double fork crowns, barrel hubs, combination Grothe pedals, Garford saddles, Hartford tires, etc. They are made with 20 and 24 inch wheels, which have 20 and 14 1/2 inch frames respectively. They weigh 17 and 18 1/2 pounds and list at \$40. A. L. Garford, the well-known saddle maker, is president of the company. H. C. Williams is the managing director.

NEVER SLOPS OVER.

A street sprinkler in Calcutta, who sprinkles the streets from a water skin carried on his shoulders, is paid six cents a day. Calcutta cyclists never complain of muddy streets.

stood his ground. The wheel had now gained quite an impetus, and despite the frantic efforts of its rider, it struck the astonished calf with a vim, and in some unaccountable manner the young lady brought up on her hands and knees, with her head between the calf's fore legs. This was too much for the latter, as well as for the fair rider; and the calf moved off in double-quick time, leaving the wheel and its owner to reorganize and continue.

HIS ARGUMENT WAS GOOD.

Some anti-progressionists in a Belgian city went before the Mayor and demanded a communal tax be levied upon cycles, on the ground that they were pleasure vehicles and luxuries. The Mayor declined to order such a tax, declaring that the disgraceful condition of the city's streets made the use of them by bicycles neither pleasant nor luxurious. Solomon himself could have done no better than that.

ONE VIRTUE IT HAD.

"This wheel I bought of you, Isaacs, is the poorest machine ever built."
"But, mein freint, see how nice and heavy it vas."

THE SLIDING SCALE.

How This Form of Testing the Merits of a Bicycle Works and Was Originated.

Early last summer two members of the New York Athletic Club sat with their feet upon the window-sill talking bicycle. One of them was telling the other how greatly he was impressed with the easy-running qualities of his wheel; quite naturally, the other thought, he, too, had a very easy-running wheel. They related incidents of their wheels' coasting qualities, and the outcome of their conversation resulted on a challenge. A day was set and, the match becoming known around to other members, a number professed a desire to participate.

The interest became so great that the Racing Committee of the bicycle section of the club took the matter in hand. The date was post-

poned, another date set and an open contest for all members of the club was arranged. A hill near Mamaroneck, N. Y., was chosen and the contest was held, the details of which are a matter of history.

poned, another date set and an open contest for all members of the club was arranged. A hill near Mamaroneck, N. Y., was chosen and the contest was held, the details of which are a matter of history.

The New York Athletic Club was therefore parent of coasting contests. Of the several matches that have been held since that time, a table is herewith given, showing where they were held, the number of contestants, and how the matches were conducted.

Of course there was a set of rules governing each event which differed from the other, but it will be seen from the table that there was only one actual coasting contest, that being the first one at Mamaroneck. In this, as in all the others, the rider was started by one of the judges from the top of the hill from a standstill. He rode as far as he could until he fell off, measurements being taken from the point where he started to the point where his foot touched the ground. In this contest there was but one chance to ride. Each rider was started a minute apart, the one going the furthest winning the prize.

In nearly all the other events the twelve farthest had to go back and coast again, then the six furthest, then the three furthest, thus making a tournament of the event.

At Baltimore the conditions were still different. All had three coasts or three trials. The rider going the furthest did not have to coast again unless his mark was beaten. It so happened that the winner set his highest mark in the first coast, and then looked on while the others made further endeavors.

At Trenton, Syracuse and Springfield the matches were run off under practically the same rules, the prizes being awarded to the men as they finished in the final heat regardless of their previous riding. The prizes were, of course, the most coveted by the riders themselves, but in reality the greatest interest

was among the manufacturers, the contests largely determining which wheel ran the easiest.

The prizes, therefore, cut very little figure. It was the highest average that counted, and a rider who was interested in the trade was doubly interested, and these largely constituted the entry lists.

The Montclair match could neither be called a match nor a tournament. The writer would prefer to call it a tournament race. It was conducted on tournament rules, but the riders were started two at a time, which gave an element of competition to the affair. The hill was a long, gradual descent over a mile and a quarter long, with ups and downs, good and bad pieces of road and various other conditions. In some cases one rider would pass his neighbor two or three times during the coast, by reason of one being able to be paced by the other. Nothing more demonstrated the value of pacing than this coasting event.

The question has often been asked of those who have won, "How did you do it?" and we think the question comes as far from being answered to-day as it did before any of the matches were held.

Briefly, the writer would say that perfect riding on a perfect machine will only and alone accomplish the desired results.

Perfect riding means many things. It means, first, the least possible atmospheric resistance. Second, that the rider shall have his weight properly distributed over the machine. Third, that he shall ride as nearly perfect and straight as possible, avoiding obstacles, wobbling, turning corners abruptly and bad road.

Fourth, that at his finish he will not fall until he has ridden to a standstill.

A perfect machine means many things. The mechanical perfection of bearings, rigidity and perfect alignment of the frame and the resiliency of the tires are qualities that tell.

The tires used with best success have been the regular 1 1/2-inch racing weight. By this we mean a delicate tire, but at the same time a very toughly made tire. In the various matches tires were inflated differently in accordance with the conditions of the different hills on which they coasted. Inflatons differ all the way from 30 to 75 pounds to the square inch, and the exact hardness to inflate is still to be determined by study.

Everything in the shape of bearings has been used in these contests, but the 5-16 inch balls, two-point contact, have been the most successful, the same bearing that has been principally used for a number of years.

Gear cuts no figure in coasting. At least it could not alter the length of a man's coast more than a few inches. In the Trenton match, however, a rule was inserted disqualifying all gears over 80, and the actual winner, who

coasted on an 84 gear, was disqualified, notwithstanding that the referee sanctioned his gear before the event.

Of all the matches held, the one at Baltimore appears to have been the fairest from a tournament point of view, yet if another match were to be held the writer would suggest that a set of rules be devised, making the event purely a tournament, whereby the prizes would be awarded to the men doing the highest average coasting, and that all riders have three or four trials at the coveted result. This would give every man an equal chance, whereas the best rider on the hill might meet with a little bad luck in his first coast and be thrown out entirely.

In the early part of the season of course each contest was taken as a lesson in advanced coasting by the different contestants, and from personal observation made at each contest, each rider would go into the next under different conditions, thinking that he had studied out the exact theories on which to win. For instance, the chief result of the contest at Montclair was that weight counted, Mr. Woodward weighing 200 pounds and Mr. Janeway weighing 226 pounds. Therefore, when the Trenton contest took place, a rule was enforced handicapping all men who weighed over 160 pounds.

This theory was exploded, however, in the match, as the winner weighed only 150 pounds, and beat his nearest competitor four times, not considering the handicap of the competitor; in this contest it was also thought by many that the position of the rider on the wheel was now the real advantage.

In the Syracuse contest men weighing over 200 pounds were barred, but, strange to say, the contestants were permitted to weight themselves up to 200 pounds, and, stranger still, none of the Syracuse riders took advantage of this weighting until after the general coast had been run off. In the succeeding trials several of them then made a wild scramble for bags of shot or almost any old thing, that they might achieve better results in the finals, it having been demonstrated, as they thought, that weight counted.

It has never been definitely determined as yet whether these men who carried weights had any actual advantage, as the rider who made the highest average carried only his natural weight, 150 pounds.

The rules governing the contest at Syracuse were, to use the words of the referee, "very ambiguously worded." One rule specified that no wheel should be entered that had been specially built, assembled, or in any way prepared for the match. This, according to the rule, should it be enforced to the letter, held a man subject to disqualification for even oiling his chain before the contest or from changing his sprockets or tires. As a result there was a

lot of protesting after the contest, which, however, was not sustained by the referee.

The match held at Springfield was probably the most open of any as regards rules. It even allowed special wheels to be built or changes to be made during the contest. In fact, a rider had about all the privileges he could ask for. It has always been contended, among car-builders and racing men, that a vehicle of long wheel base travels over obstacles more easily. One enterprising firm evidently banked very heavily on this theory, as in the Springfield contest they had three machines, ridden by riders in their own employ, in fact, from the mechanical department of their concern, that had very long wheel bases, apparently specially prepared for this contest. But their efforts came to naught.

Recently several enterprising writers have been filling space, giving their ideas as to how and why certain wheels won in the various contests. One energetic writer at Syracuse, referring to the contest there, sets forth that "it was all on account of the large tires." The winners of the first and third prizes did ride large tires, but the writer evidently lost sight of the fact that the winner of the second prize, who also made the highest average, rode 1 1/2-inch tires. He also claimed that he thought these tires were specially selected, as they ran perfectly true. Again, he lost sight of the fact that the second highest coast in the first trial was made by a man on tires that had been ridden over four thousand miles this season.

No sooner does a new theory crop out than it is exploded, and therefore we think that next season will be a very interesting one from a coasting point of view.

The distinction of having the highest averages has fallen to the writer, as the records show, he having ridden in four contests and making highest averages in three of them. He attributes his success to profound study of the subject together with the assistance rendered by his friend, Eugene F. Russell, master mechanic of the Overman Wheel Company.

It is hoped that the coming season will develop a set of rules on such lines as to make coasting one of the most popular of sports.

J. E. WHITTLESEY.

MR. HOLMES' CHANGE OF ADDRESS.

J. S. Holmes, jr., once the Chief Consul of the New Jersey Division L. A. W., and until recently vice-president and general manager of the Waltham Manufacturing Company, will hereafter talk "Remington" instead of "Orion," having engaged with the Remington Arms Company.

Wanted—A Man capable of securing audiences with and selling to the largest Western manufacturers. No boys or wine-supper men need apply. Good salary and commissions. W. E. C. ENERGY, Care The Wheel. **

LOOK OUT FOR THE TIGER.

Permit the Tiger tire to enter into your considerations. The Mechanical Rubber Company, formerly the Chicago Rubber Works, are making it and have some splendid reasons for seeking to instill the tire in your calculations. The concern state that it has ever been their policy to make high-grade goods that would appeal to high-class trade, and this guiding idea has attained in the

The tire is made by placing two piles of Sea Island tire fabric between thick walls of pure rubber, and for unusual hard service the Tiger "A," which has an extra ply on the tread, is recommended. The tandem tire is known as the Tiger "B," and is constructed with two additional piles of fabric. Samples of the '97 tires are ready for distribution. The increasing sales have justified enlarged facilities, and the outlook for next

production of the tire, which should be sufficient to interest any one concerned in goods and trade of the sort. The company has long been engaged in the general rubber business and is no novice in tire-making, having for years manufactured tires for a number of bicycle concerns. The Tiger is, however, the first they have brought out under their own name and it is natural that they should have done their very best.

season's trade is encouraging. In addition to the Tiger tire, they manufacture and have a large trade in sundries, such as tire tape, patching rubber, repair outfits, plugs, pump tubing, etc.

The office of the company is located at 230 Randolph street, where all those interested in the trade will be made welcome, and the factory is at the corner of Grand avenue and Rockwell street.

SPOT CASH VULCANIZER. It Works Automatically.

LIST PRICE, \$10.00.

THIS Vulcanizer has been specially designed to meet the requirements of that portion of the trade that are not thoroughly versed in the manner of operating a Vulcanizer. It is neat, simple, and just as effective as the most expensive machine on the market. The manner of operating is exceedingly simple, and the most effective work can be done by the ordinary novice. In fact, you merely start the machine, and we do the rest. It is as near automatic as anything of this sort can be perfected. Does not need watching, will not burn the tires, and will not vulcanize a tire out of shape. After the tire is prepared you merely clamp it in the machine and start it. As soon as the tire is finished, the heat ceases and the tire can be removed from the machine at your leisure. We have placed this machine on the market to meet the great demand there is at present for a very effective Vulcanizer that can be operated by a novice, and to do away with the present great danger of burning tires during vulcanization. The heat is generated through the use of alcohol. A sufficient amount of material accompanies each machine for 25 repairs. Knowing that it is exceedingly late in the season, we have decided to place the price on this machine within reach of the poorest man in the trade. The price at which we offer it is so fabulously low, that the first half-dozen jobs on the machine will pay for it. It takes up no room, is very simple and light in construction, nothing to get out of order, and with ordinary care will last for years. This machine is now ready for shipping, and can be shipped to any part of the United States at a very small cost. The machine packed complete for delivery only weighs 12 pounds.

Write for prices to the trade.

ARLINGTON U. BETTS & CO., Manufacturers, TOLEDO, OHIO.

Patented October 1, 1895.

SEE THAT SCREW?

C. W. MORGAN,
JAMESTOWN, N. Y.

The only adjustable bar that never slips.

Absolutely satisfies every rider—all shapes.

The price is very low.

NATIONAL CYCLE SHOWS.

Under the Auspices of the National Board of Trade of Cycle Manufacturers.

January 23-30—Chicago, Coliseum, A. E. Pattison, Auditorium Hotel, Chicago.

February 6-13—New York, Grand Central Palace, Ernest R. Franks, 271 Broadway, New York.

February 20-27—Boston, Mechanics' Building, C. W. Fourdrinier, 34 Stanhope-st., Boston.

February 20-27—Philadelphia—Local Cycle Board of Trade.

February 20-27—Pittsburg—Local Cycle Board of Trade.

February 20-27—Baltimore Local Cycle Board of Trade.

FOREIGN CYCLE SHOWS.

December 4-12—London, National Show, Crystal Palace; Frank Peach, secretary, 48 Holborn Viaduct, London.

December 12-27—Paris, Palais d'Industrie, Champs Elysees; M. Bivort, manager.

January 2-9—Manchester, England.

January 12-16—Liverpool, Eng.

January 16-23—Dublin, Ireland; Royal Dublin Society Building, Balls Bridge; R. Wilson, secretary, 14 D'Olier street.

January 23-30—Glasgow, Scotland; A. G. Rennie, secretary, 49 Lilybank Gardens.

Jan. 22-30—Birmingham, Eng.

January 23—Vienna, Austria; Steiner Hoeknicks, Mgr.

February 1-7—Edinburgh, Scotland; Waverly Market, A. K. Dempsey, secretary, 82 Leith street.

Feb. 3-6—Nottingham, Eng., Albert Hall; B. Richards, secretary Nottingham Athletic Social Club.

February 27-March 6—Leeds, Eng.

TRADE CHANGES.

Ottumwa.—Wheeler & Odenwalder. Dissolved.

Ottumwa.—Wheeler & Odenwalder; partnership dissolved.

KANSAS.

Topeka.—W. F. McHenry gave chattel mortgage for \$150.

MASSACHUSETTS.

Boston.—W. J. Dinsmore & Co. Receiver appointed.

Springfield.—Hubbard & Adams. Dissolved. F. A. Hubbard, retiring; L. H. Adams continues.

MINNESOTA.

Owatonna.—Belina Bros. New store.
St. Paul.—Wm. R. Burkhard assigned to J. H. Lawrence. Estimated assets, \$2,500; liabilities, not stated.

Directors, John Sanderson, Brooklyn; Edward B. Conant and Edward H. Miller, New York. Geneva.—J. N. Willys & Co., succeeded by A. S. Hitchcock.

New York.—Mathews Bros., removed to No. 105 West 125th street.

OHIO.

Columbus—Cushion Tire Wheel Company, incorporated by J. L. Dann, J. A. Burrows, E. W. Dann, T. F. Smith and E. N. Huggins, to manufacture and deal in cushion tires for vehicles and to sell bicycles. Capital stock, \$10,000.

Granville.—W. H. Edwards. Removed to Columbus.

Springfield.—J. W. Lucas. Out of business.

OREGON.

Salem.—Joseph H. Albert. Receives mortgage release, \$500.

PENNSYLVANIA.

Blommsburg.—The Cycle Tube Company, organized by L. S. Winterstein, W. D. Beckley, E. A. McKillip and W. H. Brooke, to operate the Shickshiny Tube works.

SOUTH CAROLINA.

Columbia.—Richard & Mixson. Offering 25 per cent in settlement.

TEXAS.

Fort Worth.—Day Cycle Company. Give deed of trust.

Austin.—Petmesky & Co., dissolved. Fred Petmesky will continue.

WASHINGTON.

Seattle.—Dingley-Hardwick Company. W. F. Dingley dead.

Tacoma.—Rambler Bicycle Company. Foreclosure suit vs. William Ryder, \$2,500.

SEE IS OF GOOD FAMILY.

The Union Crackajack is to have a sister. The "Crackajack's Sister" is its baptismal title, and both will be listed at \$75. This does not mean that the Union Cycle Manufacturing Company, of Highlandville, Mass., have reduced their list price, but that they have added to their line. The Union Special and Union Ladies' Special will be catalogued at \$100, as heretofore, and the Racer at \$125. All of the wheels will be high grade, the Special in particular having been vastly improved, embodying all of the up-to-date features, flush joints, single piece crank and axle, ball cup adjustment, etc. In the words of the company, "It will be a thoroughbred."

MET AND PARTED.

Representatives of the Shapleigh Hardware Co., St. Louis, and the Monarch Cycle Manufacturing Co., Chicago, "got together" last week; when they separated all hands were in a pleasant frame of mind. The meeting resulted in the placing of a Shapleigh contract for several thousand wheels, G. A. Fleus engineering the deal for the St. Louis firm.

"PRICES ARE RIGHT."

Although not much has been heard of them, the Topfliff & Ely Company, Elyria, Ohio, have for years been making to order quantities of saddles. Recently they elected to let their light shine forth, and to makers and jobbers generally they are now nodding in an unmistakable manner and whispering alluringly "Prices are right."

KINDLY OFFERED.

If any firm is unable to obtain space at the New York show, the Tinkham Cycle Company say they can afford accommodation in their main salesroom, at No. 306-310 West Fifty-ninth street. The room is 115x90 feet, and can stage 300 wheels.

FOR RENT,

In THE WHEEL Building,
88 West Broadway and 72
Warren Street, Model, Well-
Lighted Lofts; Steam Heat,
Electric Light, Electric Power.

IN THE HEART OF THE CYCLING DISTRICT.

NEW-JERSEY.

Jersey City.—Brownell & Lockwood Cycle Company. Meeting called December 4 to dissolve corporation.

Long Branch.—T. W. Vanderveer. Chattel mortgage, \$161.

Newark.—C. M. Theberath, dead.

Newark.—Power Manufacturing Company incorporated, to make and sell bicycles. Capital stock, \$50,000. Incorporators: William Henry Power, Henry Power, William M. Power, all of Montclair, N. J.

NEW YORK.

Batavia.—Keller & Son. Moses A. Keller dead.

Buffalo.—The D. H. Lewis Company, directors, A. H. & Agnes M. Higgins and D. H. Lewis; capital, \$8,000.

New York.—The Montauk Manufacturing Company. Organized to manufacture oils and cements for bicycles. Capital, \$5,000.

IN TO STAY.

"In entering the field of tire manufacturers we are actuated by the belief that there is a demand for a thoroughly first-class tire, which can be sold at a price compatible with the reductions made in the other departments of cycle construction," say the Weaver Cycle Material Company in their advance circular.

The Kennedy and Pickwick tires are manufactured by the Weaver company by the United States Rubber Company, one of the largest rubber organizations in the world, and the broad guarantee under which the tires will be sold will be carried out to the letter by the producer, the Weaver people assert.

The peculiar features of the Weaver tires are the inner coating and the reinforced valve stem—a process known only to the superintendent of the Weaver factory, by which the inner surface of the tire is continually adhesive and retains firmly in position a plug drawn against its surface, whether it be deluged with cement or not.

In the Kennedy and Weaver tires the valve stem is attached to the inside of the air tube and reinforced by two long oval strips of rubber, extending two inches each way from centre of valve. This makes it impossible to tear out the valve stem without destroying the tire. A round buffer is placed on the opposite side of the tire from the valve, which prevents the foot of the valve from penetrating the under side of the tire when deflated. Of their facilities the Weaver company say: "We have at our command a plant sufficiently large to manufacture 25,000 pairs of hose-pipe tires per month. Should this be found insufficient, we have ten other factories at our command, which may be utilized from time to time should our requirements demand. This we submit as fair evidence of our capacity."

RIGID AS CAN BE.

To whomsoever a rigid saddle appeals, the Richards saddle should be of interest. There is no need to accept its makers' claims with equivocation. The very nature of the saddle proves the soundness of their assertions. It is positively rigid and simply cannot sag or wrinkle or get out of shape. It retains its shape under any and all conditions. The Richards is a metallic saddle, nickel plated on copper and made by the Zinc Collar Pad Company, Buchanan, Mich. J. L. Richards, its inventor, is the controlling factor in the company and the most prominent man in Buchanan, having served the town in various capacities and being its present Mayor.

ALLEGED WRONGFUL CONVERSION.

J. G. French, a former agent of the March-Davis Cycle Company, Chicago, has been sued for the recovery of certain bicycles which it is alleged that the defendant wrongfully converted. The value of the wheels is placed at \$3,765.79. The attorney for the cycle company has made an affidavit, upon application for the arrest of French, setting forth that he collected money without authority from P. J. Steiger, of Petaluma, in the sum of \$110; of C. F. Sadowski, at Oroville, \$74.54; of Crocker & Co., at Sacramento, \$965.73.

READY FOR THE BOW.

From Shelbyville, Ind., comes the pleasing news that the Century Cycle Co., who made the Arrow bicycle, have freed themselves of the financial entanglements which tied them up several months since, and are preparing to operate their factory once more.

INGENIOUS AND EFFICACIOUS.

Rudolph & Krummel, of Chicago, continue to add to their line of ingenious presses and machinery. One of their latest productions is the straight spoke-header, with which any

style of head may be made on wire up to $\frac{3}{8}$ inch in diameter at the rate of 20,000 and over per day.

PINLESS CRANKED OLIVES.

"Not the lightest wheel that is made, but the most substantial and durable," is one of the attractive assertions made by the Olive Wheel Company, Syracuse, N. Y., in their advance catalogue. The catalogue contains much in support of the assertion and is a neatly printed and well-compiled publication. The concern is new, but appears to have lost no time in getting its best foot forward. They are listing four models of the Olive—three at \$100, and the racer at \$125. They also list a medium-grade wheel, Enterprise, at \$65. Features are being made of their pinless cranks, and of the Gridley-Weed changeable gear.

WILL HOLD FAST.

It is not surprising that Dann Brothers & Co., of New Haven, Conn., have produced a wood handle-bar and clamp. Their trade in wood rims and their longer established trade in high-class carriage-woodwork makes it

seem almost a matter of course. The illustration shows exactly what the bar and clamp are like, and their reputation and commercial standing should quickly win favor for the new productions.

SILENTLY SUCCESSFUL.

Without noise or bluster, the Graten & Knight Company, Worcester, Mass., have quietly been casting an anchor to windward; that is to say, in Europe. A full line of their saddles is being exhibited at both of the English shows, and will be given due prominence on the Continent. Being distinctly different from anything made over there, it is quite reasonable to suppose that they will command instant attention.

BETTER EVEN THAN BEFORE.

It is repetition, not news, to state that the '97 price of the Fenton will be \$100. The Fenton Metallic Manufacturing Company, Jamestown, N. Y., who make the wheel, made the announcement last August. The wheel itself, however, has but just made its appearance.

The size of the tubing and the angles of the frame have not been altered, other than the rear forks. These are D-shaped, heavily reinforced, and tapered from $\frac{7}{8}$ to $\frac{3}{4}$ inch. The main tubes are $1\frac{1}{4}$ -inch, and the head tube $1\frac{1}{2}$ -inch. The wheel base of all single machines is $43\frac{1}{2}$ inches, and the tread $4\frac{3}{4}$ inches. The leading Fenton, Model 32, as well as the woman's bicycle and tandems, has the crank-hanger dropped $1\frac{1}{2}$ inches. The hanger on the racer is dropped 2 inches. A ranger with parallel bearings is also offered.

The new Fenton has special barrel-pattern hubs and bearings, on the adjustment of which patents have been applied for. The crank-hanger bearings have been widened without increasing the tread. Triplex, or three-point bearings of large diameter for large balls, and retainers in all the bearings. Nothing but the best quality of tool steel is used throughout, hardened, tempered and ground. Larger sprockets of a distinctive design will be used, and the crank-axle, to which is attached the spider, is forged in one piece. The cranks are flat, and are attached to the axle by the same principle as last year, though slightly improved. Instead of triangular axle-ends, the ends are partially oval, and fit into corresponding holes in the cranks, which, being split, are fastened by a parallel bolt. The handle-bar and seat-post binders are also unaltered in principle, but simplified and strengthened, a combination of inside and outside sleeves working in conjunction with each other. Since 1895 no pinch-binds, split rims or other cotter pins have been used. Great attention has been of course given to the details of construction and to the finish.

WIRE, NOT WOOD.

When, in the issue of November 20th, THE WHEEL noticed the Tonk Manufacturing Company's Old Hickory bicycles, it was stated that the entire bicycle, wheels, frame and all, were of wood, which is not, however, exactly the case. The Tonk people state that the utility of wooden wheels has never been proven. There are some serious objections to them, such as inability to tighten the rims, and the great resistance to the wind which they offer. For that reason, the wheels of Old Hickory are of the wire spoke suspension variety, exactly like those in general use.

FOR CLASSES AND MASSES.

A line of wheels at prices to suit all classes is what the newly incorporated Martin & Gibson Manufacturing Company, Buffalo, N. Y., offer for next season. Kensingtons will be made in three grades for both men and women, listing at \$100, \$75, \$60. The company's staff of travellers has been increased by the addition of P. A. Haines, formerly with the Eclipse Bicycle Company, who is well known in the hardware trade throughout the country. He will look after the interest of the Kensington in the West and South, as well as in Europe.

SURE TO BE RIGHT.

No dealer in bicycle locks can go wrong if he but obtains the '97 catalogue of the Slaymaker, Barry Company, Connellsville, Pa., for whom J. H. Graham & Co., this city, are sole sale agents. The booklet illustrates some twenty odd different styles of locks, made of aluminum, brass, and steel, of course. Prices are within the reach of all.

TOLD IN TOLEDO.

Americans' Foreign Chances the Coming Season—Making Toledo a Trade Centre.

Toledo, Ohio, Nov. 30.—A personal letter to THE WHEEL from a well-known manufacturer who is taking a look around abroad would indicate that American wheelmakers are not going to have very easy pickings on the other side next season. England is said to be still overstocked with cheap American bicycles which were unloaded during the flurry of the '96 season, and as you can get a fairly good wheel for from \$40 to \$50, there does not seem to be much encouragement for any but the standard makes. My correspondent says that a high-grade wheel with an established reputation need not fear this sort of competition, but that American makes of medium grade will never sell as well again in Holborn Viaduct as they did last season.

The situation in France, according to this observer, is still less encouraging. The French have learned the cheap-wheel lesson from this side of the water, and propose to go America a few points better. My correspondent was informed that some French manufacturers are of the opinion that they can turn out a good, standard-made wheel for about \$25, and propose to make the experiment this season. A part of the plan is to induce the French Government to levy an import duty of 100 francs on all foreign-built wheels. This amounts to nearly \$20 in American money, and would consequently be equal to a prohibitory tariff under the circumstances.

The first addition to the long list of Toledo manufacturers for the coming season is the Hudson (Michigan) Bicycle Company. This concern will shortly remove to this city. As it represents a paid-in capitalization of \$75,000, it will be a most desirable addition.

At a meeting of the Toledo Chamber of Commerce, held a few nights ago, Peter Gendron, of the Gendron Wheel Company, made a most characteristic remark. The Chamber was discussing the advisability of inviting certain mercantile investments to Toledo, whose coming was far from being welcomed by a certain firm which now holds a monopoly in its particular line here. Mr. Gendron characterized such actions as this firm is showing as being narrow-minded in the extreme, and pointed to Toledo's bicycle interests in proof of his argument.

"I would be glad to see twenty more bicycle factories in Toledo," said Mr. Gendron, "and they would not hurt our business one iota. It is for Toledo's interest to be known as a trade centre in every line. Buyers will then come here knowing that they can get an assortment. Perhaps one will come here that does not like the Gendron wheel. That is his privilege, I am sure. At the same time he may find some other wheel in Toledo that he does like, and while I have not made anything out of his trip directly, another Toledoan has, and I am certainly interested in seeing just as much money brought to this city as possible. Toledo is now known the country over as a great wheel market, and twice the present number of factories would increase our reputation just that much more."

The Toledo Tube Works will soon remove to a more commodious building on Monroe street, opposite the plant of the Milburn Wagon Works. This company remained at its old location after the fire in its building last spring, and was soon at work again. It recognized the fact at that time that its quarters were too cramped, and it will be greatly benefited by taking the new location.

Samuel Snell, of the Snell Cycle Fittings Company, returned from Europe last week, and will personally attend the organization of the force for this working season. It is expected that the place will be fully as busy as during the winter of 1895-'96.

After many weary days of waiting, the Ohio L. A. W. road book will soon be ready for distribution. Advance pages of this work were placed in the hands of Toledo officials last week for comment and consideration. The book will be a much more pretentious volume than has ever been issued before by the Ohio division.

John H. Hunter, of this city, made his 100th century run for this season yesterday. Mr. Hunter now leads every other century rider in the State, and is the only man in Toledo and its vicinity who has a triple century to his credit.

A committee has been appointed from the membership of the Toledo Cycling Club to take charge of the Toledo Cycle Show, which will probably be held under the auspices of the cycling club, beginning one week after the close of the New York show next February.

THE PIERCE POSTER.

George N. Pierce & Co., Buffalo, N. Y.

Toledo presents the remarkable phenomenon of a large city, which might have a 1897 State L. A. W. meet for the asking declining the offer with thanks.

Barney Oldfield stated last week that he is not so sure that he will accept the Stearns offer to go out to Australia in the interest of "the Yellow Fellow." It would seem from the terms of the offer aforesaid that the company thinks that money should be very little of an object to Oldfield, while the young racing man says he has no desire to take the trip for his health.

NO DOUBT ABOUT HIM.

"Do you believe there is such a thing as sincerity in lying?"

"Certainly I do. Have you never heard an agent telling a prospective customer that the wheel before them is the best bicycle built?"

CASE OF SAMPLES.

Owing to a Disagreement About Sundries, Boyer Has Trouble and Goes to Reading.

Cleveland, Ohio, Nov. 30.—Quite a ripple of excitement was caused among our cycle dealers by the arrest of G. A. Boyer, sales agent of the Acme Manufacturing Company, at the instance of Rosenblatt & Co., of Philadelphia. The story, as learned at Boyer's office, is that the arrest was inspired by revenge. Boyer at one time sold sundries of Rosenblatt manufacture, and later engaged with the Reading firm, at the same time notifying R. & Co. of the fact. This was, of course, quite displeasing, and an effort was made to have Boyer alter his decision, but to no purpose. Finally, a few days ago, Boyer received a bill for about \$60, the value of Rosenblatt's samples in his possession. This Boyer refused to pay, claiming that the goods in question were samples and offering to return them. Rosenblatt & Co. tried to compel payment of the bill, but Boyer refused to settle and again offered to return the goods. Then a warrant was sworn out, the necessary requisition papers obtained, and his arrest followed. Taken to Reading, the Acme people promptly furnished cash bail for his appearance in Philadelphia when wanted, and he returned home Saturday. He was the centre of a chaffing group of travelling men in the rotunda of the Hollenden Hotel Saturday night, but refused to discuss the report that he would bring suit for damages.

KEEP THEM STRAIGHT.

One of the minor but really valuable improvements in the Iver-Johnson wheel is worthy the attention of the whole trade, i. e., the effective means by which the handle-bar is prevented from turning when loosened from any cause. In the handle-bar stem is a narrow elongated depression, and in the head of the wheel is a projection or flange, so to speak, which corresponds and fits into the depression. Not only does it prevent the bar from turning, but it assures a quick, sure and perfectly straight adjustment of the bar at all times. The same idea might profitably be applied to the seat post and stem. It is a small reform, which can be readily appreciated by the veriest tyro. On tandems particularly would it prove of value.

TO SAVE THE ANKLES.

Nicol & Co., No. 57 West Washington street, Chicago who do a considerable business in nickel-plating and cycle fittings, are showing some new designs in flush joints and seat-post clamps. They are also introducing a new push-and-pull chain adjustment and fork end and a pedal and crank shield, this latter is a metal disc fitting between crank and pedal designed to prevent the rider from "barking" his ankles. The shields list at 50 cents per pair. The firm's trade discounts are generous.

GENEROUS "OPTIONS."

The Syracuse Cycle Company will adhere to the \$100 list. In their '97 wheel the crank-hanger will be dropped a trifle and the front fork given more rake. Other improvements are matters of detail. The company will be generous in its "options." They will afford the choice of Vim, M. & W., Hartford, New York, Dunlop and G. & J. tires and Syracuse, Duguid, Messenger and Sager saddles, also of wood or steel handle-bars and seven, eight or nine-toothed sprockets.

TO CURE FATIGUE.

With the aid of a slight knowledge of anatomy and a common-sense application of it, riders may avoid much of the fatigue that very often makes wheel trips of greater than customary length anything but pleasurable. Fatigue is a necessary evil, even on a perfectly adjusted wheel, that moves like the wind at the touch of the foot, and particularly is this true of young and inexperienced riders. Complete freedom from it is only gained by keeping in constant physical training, a condition which few persons in these busy days are able to fulfil.

But much relief may be gained by a study of one's muscles and an adjustment of the position of the body and limbs, so as to distribute the strains and change the form of action demanded of the muscles.

The wrist is the place where weariness is soonest felt, and this may be quickest relieved by changing the grip so as to catch the handles with the palms up. Another way is to raise or lower the shoulders so as to change the angle at which the wrists are bent. This will be found to afford instant relief.

If the pain runs into the elbow, as it often will when the road is rough, all that is necessary is to sit up straight, so as to straighten the arm, and, when this becomes tiresome, to again lean forward.

The pectoralis major, or great chest muscle, is often the source of considerable pain after a long ride. But the remedy is always at hand. Pain follows upon the unnatural bending of the back for a long period, the muscle being contracted. Straighten your back and the pain will disappear.

But the muscle that is most subject to painful fatigue is the rectus femoris, the great, straight muscle of the thigh.

No other muscle in the body does half as much work on the wheel as this, for it not only straightens out the leg when the foot goes down, but pulls the knee up again, in the next movement. It is the great pushing muscle in cycling.

Some relief can be got from weariness in this great muscle by temporarily shifting one's position on the saddle, backward or forward, as much as possible, so as to change the angle of the thigh and leg. Resting one leg at a time, with the knee bent at a different angle as you travel over easy spots in the road, will also bring great relief. But when this muscle cries out for relief the most effective plan is to dismount and walk until the pain disappears, as it will in a few moments under this change of locomotion.

Fatigue in the tibialis anticus is relieved by changing the gearing of the wheel so as to work the ankle as little as possible. It is the same fatigue that is felt in fast walking for a considerable time. Fatigue at the ankle joint is also relieved by changing the gearing,

GIVING HIM A JOLLY.

"Afraid to coast? Why, I didn't think you American riders were afraid of anything!"

"Well, you see, this wheel of mine hasn't any brake, and blame me if I'm going to take the chances of its getting away from me on this hill, and before I could stop it have it run clean off your little island with me!"

SOUND SENSE.

No, my son, neither loud talk nor rapid speaking is argument, but many there be in cycling who think that it is, and who act accordingly.

There is some hope for the man who admits the wheel he rides is of last year's model. Most men wouldn't own it.

SOME NOVEL CYCLE MOTORS.

I give some sketches in the accompanying diagrams of two new applications of automatic motions for propelling bicycles. The first is shown as a working model, in which an upright A supports a bearing for the cylinder B. This cylinder is of odd construction and divided at E with a specially prepared metal. The side D is a magnet, while C is of the same stock, but covered with a composition which cuts off the attraction.

The parts H and I are also magnets and are drawn inward to the magnetized half of the cylinder alternately as the cylinder revolves. There being a movement of the same kind on the other side of the support A, and each worked in harmony, a motion is developed and utilized by connecting the parts H and I with the rod J, as shown. The latter gives the motion to the arm M, and through the agency of a lever K a revolving motion is

FIG I

FIG II

FIG III

given to the wheel and shaft, since the lever is studded to the crank L. Of course, the cylinder B must be turned constantly so as to present first the magnetized and then the non-magnetized side to the parts H and I.

This is accomplished by means of the eccentric rod connection, G, which is strapped at F. This rod, working in unison with the related rod on the opposite side, keeps the cylinder revolving. A great power may be developed in this way and applied to a wheel by attaching the necessary parts to the frame. The wheel shown in the sketch is the same as the rear wheel of the bicycle. The drawback in the past to imparting magnetic power to wheels has been the seeming impossibility of cutting off the attraction of the magnets, the power being so strong that wood divisions, etc., would not answer. A compound, however, is now used on the surfaces of the magnet at the sides which it is desired shall not

draw. In this case, the side C of the cylinder B is coated with the composition, also the sides and all but the front of parts I and H, the composition serving to retain the power of charged magnets.

I have constructed in my shop a bicycle to work somewhat on the plan of the steam turbine. Figure II is a view of the bicycle with the air-device attached to the frame at A. There is a copper cylinder or reservoir at B, and this is charged with compressed air at the start, or, if the cyclist desires, he can pump the cylinder full of air by revolving the rear wheel of the bicycle, as there is an attachment by which the reservoir is kept charged for a long time by the motion of the rear cycle wheel.

The arrangement of the driving mechanism is something after the differential transmission of power from a central shaft to a shaft arranged as shown in Figure II, which is an enlarged view of the principal parts. The air is driven through the pipe A in Figure II into the buckets of the secondary wheel, as shown at B. The buckets are encased, but the wheel is shown in sectional shape in the drawing, so that the buckets may be seen.

The force of the air striking the buckets turns the outer wheel rapidly and easily, as the arrangement of gearing is such that the actual power needed to turn the shaft of the rear wheel of the bicycle is very little. This out-wheel is toothed, as shown at C, and the cogs engage with the cogs of the intermediate wheel D, and this in turn imparts the motion to the wheel E. The latter is keyed to the rear-wheel shaft of the bicycle and of course propels the machine forward.

Without a means to keep the air reservoir charged the supply of power would be exhausted after a few revolutions of the wheel. So motion is taken from the shaft of the rear wheel with the eccentric-cam F, and is utilized like a pump, as illustrated in Figure II, in which the rod operated by the cam is marked G. There it enters the force pump cylinder, H, and the air pumped is passed through I into the convert B.

In this same figure the pipe that leads to the outer wheel buckets is designated C, the wheel itself D, the intermediate gear E, and the shaft gear F.

Thus is power constantly being developed by the motion of the bicycle itself, while that same power is being expended in propelling the bicycle forward. Experiments indicate that, with proper adjustments and with a few more improvements, the system will work without the aid of foot-power at all. At present the device only assists in propelling the wheel.

GEORGE D. RICE.

IN DAYS TO COME.

He was leaning against a building and gazing at a drinking fountain for horses.

"It is very creditable to have all these fountains for horses," he said thoughtfully, "but—"

"But what?" asked the policeman.

"What good will they be when we all use motor vehicles or bicycles?"

The policeman looked at him scornfully.

"You're behind the times," he said at last.

"Why?" asked the man who was leaning against the building.

"They'll use 'em for storage tanks for gasoline, with air tanks on the side, of course."

WHAT FAMILIARITY BREEDS.

The scorcher is a monster of such frightful mien That to be hated, needs but to be seen; Yet seen too oft, familiar with his pace, We first endure, then welcome and then chase.

SPROCKETS AND GEARING.

Ratio and Relation of These Two Important Portions of a Safety's Makeup.

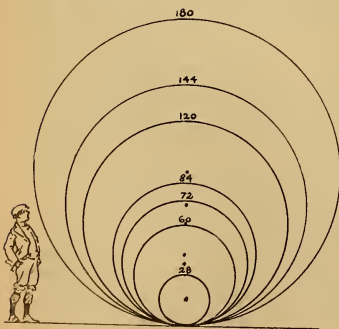

(Continued from issue of November 27.)

The chain has settled into a standard pitch of one inch. The pitch line is not the circle, bounded by the bottom of the depressions between the sprocket teeth, nor the circle bounded by the ends of the teeth; it is a circle through the centres of the teeth, very nearly passing through the centres of the rivets as they dispose themselves around the sprocket. The distance between the centres of two adjacent teeth, of from centre to centre of two adjacent spaces between the chain blocks, is therefore one inch. A chain is said to be "out of pitch" whenever—because of original bad construction of either sprocket or chain, or because of wear upon either or of "set" on the chain—the pitch on one does not match that on the other; this may occur temporarily, as by mud falling in and partly filling up the spaces, but whenever chain and sprocket do not fit each other there is a quarrel, with a consequent noise and a waste of power. Therefore, as already emphasized, it pays to look after chain and sprockets.

On the inch pitch each tooth represents approximately 5-16 of an inch in sprocket diameter; expressed decimally, the sprocket runs very nearly 0.318 of an inch diameter per tooth. So we may construct a table thus:

No. Teeth in Sprocket.	Diameter of Sprocket.	No. Teeth in Sprocket.	Diameter of Sprocket.
4	1.272	20	6.360
5	1.330	21	6.573
6	1.403	22	6.996
7	1.496	23	7.314
8	1.594	24	7.632
9	1.702	25	7.950
10	1.810	26	8.268
11	1.928	27	8.586
12	2.046	28	8.904
13	2.164	29	9.222
14	2.282	30	9.540
15	2.400	31	9.858
16	2.518	32	10.176
17	2.636		
18	2.754		
19	2.872		

The following diagram, drawn to scale, will show to the eye the actual twenty-eight-inch wheel and some sizes to which it is or may be speeded, as already explained; this equivalent size (or ratio of forward movement to the rate of pedalling) is as if the rider actually be strode a wheel of the equivalent size and pushed it around directly with his feet, the length of crank throw and of the circle traversed by the foot having nothing to do with this particular matter.

As stated in our last article, the question of larger sprockets divides into two—the effect upon the construction itself and the effect upon ease and comfort of the rider. In a measure, these two are distinct questions, and yet

they run much together. High gear and gearing by large sprockets are also matters which are not just the same, and yet these, too, get together. While we feel entirely sure of the advantage of larger sprockets, we frankly admit that we find some difficulty in satisfactorily giving the reasons. Yet facts are always or more—or of more immediate—consequence than the reasons for them; for example, electricity is cheerfully put to service without waiting for insight enough to explain its nature or even one of its phenomena.

The seven-tooth sprocket has had large use, because a high-speed ratio (see table) can be obtained by it with front sprockets of very moderate size; it is commonly put on racing wheels, is considerably used, and it may continue a while for racing purposes. But the smaller the number of teeth the greater will obviously be the wear on each one; hence the front sprocket always outlasts the other, and hence the seven-tooth is too small. If the total wear is represented by 100, then the wear per tooth is 14 2-7 of the total, on the seven-tooth sprocket, and 12 1/2 per cent on the eight-tooth. But this statement does not cover the whole; the practical difference by adding a tooth is much greater, for other causes enter into the case.

The following diagram represents two pairs of sprockets, of 7x21 and 9x27 teeth, the two speeding up at the same ratio, three for one or 84 equivalent. Suppose the number of teeth in the small sprocket reduced, and the radius GE shortened until it becomes zero; then the

line GD would join line HE, and the pull would be wholly expended upon the axle. Shorten GE considerably (which could be done by reducing the pitch of chain) and shorten CD accordingly; both sprockets would be reduced in proportion, so that the leverage would remain unchanged, and yet the pull at G would be so near E as to drag heavily on the axle. Within limits, as diameter is increased or diminished, making line GE longer or shorter, the drag on axle becomes less or more, and tendency of the wheel to turn easily is greater or less, irrespective of the size of the other sprocket; this is true of all wheels and pulleys driven from their peripheries. A very small rear sprocket, therefore, tends to tear the wheel to pieces, and the severer the road surface and the grades the greater this destructive tendency. The seven-tooth sprocket wears itself rapidly; hub flanges and spokes are more liable to give out with it; it also makes the strain on chain and frame especially severe. The six-tooth has been used a little, and we believe it is still put on juveniles, but it is still worse. We recall one instance in which a bungling designer actually commenced fitting racers of one of the first-class makes with a five-tooth, his notion being that he would score a point on lightness and neatness; he accomplished that in a small degree, but at the expense of sprocket, hub flanges, spokes and chain, which cheerfully went to pieces. As for the seven-tooth, we do not hesitate to pronounce it a mistake from the first; it is a mechanical heathen Chinese that "must go."

The radius GE, on the seven-tooth, is 1.113 of an inch; the radius on the nine-tooth is 1.431. This difference of 0.318 is not large, ab-

solutely; relatively, it must be like a little on the end of one's nose, of great importance because of its place. This 0.318 of an inch is 28 1/2 per cent increase on the radius of the seven-tooth, and we cannot now offer any other explanation, mechanically speaking, of the better operation of the large sprocket than as above, except that the pull on the chain is more favorable. Chain friction is on the blocks and teeth, where and when (only where and when) they pass out of or come into contact with each other, and also on the pins when and where (again when and where only) the chain bends. The more teeth the larger the number of "rubs" per actual wheel revolution; but, within limits, the lighter the pressure and friction. The more teeth the more bends in sprocket per actual revolution; but the extent of the bending lessens as the sprocket is enlarged, and this considerably reduces friction. Drag on chain and friction pressure rise and fall as the load and the consequent pressure on pedal rise and fall. The initial strain—that is, the strain of overcoming inertia in getting the start—and also the strain under frequent conditions which compel the rider to shove for all that is in him, in order to push along, are far worse with a small sprocket. A characteristic of the seven-tooth—which users of it know, provided they have had opportunity to make comparisons or are among the people who notice things—is the anchor-like drag it imposes at times; this we have just tried to explain. The large sprocket, on the contrary, tends to lessen drag

and to minimize chain friction especially, under all conditions.

It may be objected that enlarging front sprocket must put increased strain on the crank bracket and its bearing. Granting this, we need not stop at present to consider how far disadvantage on the crank bearing offsets the advantage on rear axle, since our tests on the road prove conclusively the practical effectiveness of large sprockets.

As to the extent of the coming step forward, we expect to see eight and nine the usual sizes of rear sprocket, with the ten a good second; these three, with eighteen to twenty-seven for the front, will give a variety of ratios from G3 to 84, and ought to satisfy all wants during at least the next season. As between 9x27 and 10x30, each giving three for one (3:4) we do not as yet know which is the better. Theory would indicate that the ten-tooth must have some advantage over the nine; but large sprockets are just now very difficult to procure, being still in advance of the market and even beyond the commercial comprehension of a good many makers, and therefore our tests have not gone far yet to found an opinion as between these two combinations; we might guess, but we prefer to leave guessing to others. Possibly eleven, or even twelve, teeth are still better, but the gear table shows limitations; 11x25 comes under G4, and 12x26 gives only 60 2-3. Bicycle evolution has accepted many changes which

at first seemed monstrous; yet the great size required in the front sprocket by adding a few teeth to the rear one will doubtless hold back this reform from getting wild.

We look to see the demand for replacing sprockets now in use with larger ones; this will give repairmen something to do, and the makers of parts may profitably take notice, using care also that they do not get their front sprocket too skeleton-like, and thus too weak. We are aware of only two makers who have committed the constructional blunder of making rear hub and sprocket in one piece, imagining that they gained thereby in strength and simplicity; owners of these makes will find trouble in effecting the change. In other cases there need be very little trouble, since even forks which run straight without offset may allow a front sprocket as large as twenty, depending on dish of rear wheel and other variations in the lines. Makers will do well, by and by, to so shape their rear forks as to take front sprockets up to thirty teeth if required, on singles as well as on tandems. Moreover, to follow the English method and drop the crank-hanger 1½ to 2½ inches below the line of the wheel axles would facilitate the running of larger sprockets and be advantageous otherwise.

We have been asked how many teeth must be added in front for each tooth in the rear, in order to retain the old ratio. A pair 7x17 (68) could be changed to 9x22 (68 2-3), or to 8x20 (70). The question is not answerable in the form of a rule, there being no constant factor in the change; but the ratio table will easily determine this.

Some may like to compare the distances run per revolution of pedal and the numbers of revolutions per mile, and we give the figures below for certain ratios:

Gear.	No. of feet No. of Pedal Run Per Revolution. Per Mile.	
	Revolutions.	Per Mile.
52.....	13.61	357.8
56.....	14.66	369.3
60.....	15.70	380.8
64.....	16.75	392.3
68.....	17.80	403.8
70.....	18.33	408.0
72.....	18.85	412.2
76.....	19.89	423.7
80.....	20.94	435.1
84.....	21.99	446.6
96.....	25.13	510.1

We wish to make it clear that larger sprockets and higher gears do not necessarily go together; they are distinct matters, and they should neither be confounded nor too closely connected. We unhesitatingly recommend the former, in all cases and conditions, and for all persons; we do not so recommend the latter, nor yet do we advise the contrary. Observe that we have refrained from even implying that a high gear with large sprockets requires no more power than a lower one with small sprockets, and nobody should assume that he can raise gear and slow pedalling without, in some manner and extent, paying for it. As the gear rises (leaving for the moment the size of sprockets out of account) the leverage becomes more unfavorable; so high gear will always require more pedal pressure. But this is not exclusively a mathematical question, or, perhaps, even a mechanical one. From the side of the rider, the practical question is not whether he must press harder with the foot, under a certain mechanical combination, but whether, under that combination, he can go faster, more agreeably, and with less fatigue than with some other. Whether a higher gear is expedient depends on several things, and here comes in the undefinable "personal equation." Slow pedalling is certainly a boon, and there is a delight in the swift rush of a wheel while the legs work

slowly; on the other hand, some people would not feel that they were going fast and having exercise and fun unless they were kicking away like a squirrel in his cage. For some, quick movement is natural and easy; for others, the slow and heavy suits. Some riders are "winded" on hills unless they rush; others find the best satisfaction in a firm and slower climb. The roads and the chief sort of use should be considered, as well as the personal characteristics; but we certainly should not advise novices to be hasty in attacking the higher gears. It is better to acquire a good pedalling and get that into a fixed habit before yielding to ambition in this direction; nor is it certain yet that rapid motion is not best for strictly racing purposes.

We must also distinctly point out that the higher gears are harder than the lower; to spurt with and to pull up. Racing men, when about to undertake a short course, are aware of this fact, and take it into consideration when selecting a mount. Mr. Wilcox is satisfied that continued use of the SI Wolff is steadily increasing his control of it, and he does not fear to run it in any crowd of traffic where it is not too rash to venture at all; yet something of controllability (i. e., ease in quickly changing the pace) is necessarily sacrificed to high gear, and this is of especial consequence in the frequent hindrances in crowded city streets.

To sum up—while still distinguishing large sprocket from high gear—we would say to the rider who wants to try the latter, as we might say to a bachelor friend who talks of taking a wife: "It is a charming thing, dear boy, and we wish you a happiness cup running over; but don't imagine you can get this addition without giving up something of what you already have."

JULIUS WILCOX.
ALEX SCHWALBACH.

LOCOMOTIVE MILEAGE.

After studying the equipments of the large number of bicycles it has carried in its baggage-cars, the Maine Central road is experimenting with a cyclometer for its locomotives with the idea of learning the exact distance each engine travels a year.

GROUND JAVA.

Java now has a wheel pair, called the "De Indisco Velo." A vavelavodravomave—that is Javanese for racetrack—is about to be built in one of the largest towns.

DRAWING THE TAPE-LINE.

The city fathers of San Francisco, the very home of the bloomer, not long since undertook to regulate the wearing of bloomers by an ordinance prescribing that "No person shall appear in a public place in a dress not belonging to his or her sex"; and it is said are now once more "ontemplating another and more determined attack upon the garment of advancement. The difficulty seems to be in such a law's interpretation, for while even the city fathers themselves acknowledge that bloomers are a useful and, occasionally, an ornamental feminine garment, no two expounders of the law can be found who will agree as to what really constitutes the line of demarkation between feminine bloomers and masculine knee-breeches.

One subtle legislator suggested to his California constituents that the point in dispute might easily be determined by fixing the knee-measure limit of knickerbockers at fifteen inches, all garments in excess of that measurement to be designated as bloomers; but an opponent promptly squelched him by remarking that not only would that prove a hardship to many worthy masculine citizens, who, being burdened with too much flesh, might be arrested for wearing feminine garments, but that the ordinance, thus framed, would not prevent mature ladies, ambitious to pose as new women, from presenting a really shocking appearance should they choose to do so.

But the council seem to realize that something must be done, for, as the San Francisco ordinance now stands, each petty justice is his own interpreter, and the only safe garments for cyclists to wear are full-dress evening suits and Mother Hubbards. Although the wheelwomen who do not possess Mother Hubbards may prove themselves equal to the emergency by donning their ball gowns, their scorching brethren are not so fortunate. Many of these do not possess the conventional swallow-tail, and those who do are not pleased with the prospect of recklessly coasting down the Golden City's hills, with raindrops playing checkers on their horizontal coat-tails.

The city fathers offer a reward for the solution of the problem, and this paper modestly suggests that the obnoxious crinnee be repealed, and that all citizens be allowed to don such garments as may best please the wearers, for it is a matter that the good common-sense of every community may be trusted to regulate.

ON A SEXTETTE—CYCLING.

STERRSIAN—Gosh! What a stunning girl that is.

THE CREW—Where?

SOME SOUTHERN ITEMS.

Louisville, Nov. 27.—Ament the League presidency the chances are that the Southern vote will be largely for Mr. Elliott, unless Mr. Morrison is in the fight, when it will be divided. Expressions from Southern members of the assembly indicate this to be a fact, and also that with Mr. Elliott, Mr. Potter and Mr. Morrison as the contestants that Mr. Morrison will get the almost solid Southern vote, as he has many friends in the South who regard him with affection.

A. L. Ray, manager of the Louisville branch for Hay & Willett's Manufacturing Company, said to a WHEEL correspondent in answer to a query: "Our people at Indianapolis are highly pleased with the result of the work of the Louisville store. Our business has been highly satisfactory, and this is gratifying to me, and especially as we got into the field late. I shall have charge of the entire South in 1897."

The general impression among the dealers regarding 1897 business is that the tandem is to play a very important part. With this in view orders will be made early for large shipments of the double machines and more of the wheels than formerly will be added to the rental list.

Ed Rolle and Chauncey Foote, of Atlanta, Ga., have gone to Caracas, Venezuela, via City of Mexico. They expect to open a business in some city in Mexico or South America. Bicycles will form a prominent part of their stock.

THE EMINENT AND THE INVENTOR.

The eminent manufacturer smoked his cigar thoughtfully.

"They may talk about cycle inventors," he said, "but I wonder how many of the inventions that now make cycling so easy would ever have got before the people if some fellow like myself had not gone to work and convinced the gear public that it needed the improvement?"

"I tell you," he continued, "we cycle makers never have received half the credit we deserve. People who ride a bicycle can't find too much to say in praise of the fellows who invent a new thing for their comfort, after it has proved to be useful, yet in nine cases out of ten the riders never would have heard of the inventor or got a chance to use his invention if some manufacturer had not spent his time and risked his money in introducing it. And I'll tell you another thing. The manufacturers have to keep pushing a thing along all the time, no matter how useful it may be, in order to make the public use it."

Then the eminent's cigar was extinguished and he ceased to converse.

IN CASE THEY FAIL TO "DEFY."

One prominent English firm gives an accident policy to every purchaser of their bicycle. In case of disablement it entitles the rider to 10 shillings per week; in case of death the assigns will receive £100. The firm removes the unpleasant inference that may be drawn from the offer by remarking that their cycles "defy destruction."

RARE AS A PINK MOON.

"Git an extr'!" yelled the newsboy. "All 'bout no bisickle records being made yesterday. Git an extr'!"

ONCE MORE IN THE TRADE.

The Eastern Rubber Mfg. Co., of Trenton, N. J., once a big fish in the tire pool, is preparing to renew its activity. The well-known and experienced S. V. L'Hommiedue has been engaged as manager and will direct things from the New York office, No. 102 Chambers Street. Two single-tube tires will be offered the trade—the Rugby and the Common Sense. Price and quality are reported particularly pleasing.

CUTTING A GEAR.

Now that all this smoke surely betokens the existence of a certain amount of the fire of fact in this bevel-gear bicycle, anything appertaining to the cutting of the gears, the cost of which, by-the-way, is said to be one of the greatest drawbacks to this form of driving a bicycle, becomes of interest to the trade and to the student of the possibility of supplanting the chain on a bicycle by some other form of applying power. The Boston Gear Works, No. 37 Hartford street, Boston, certainly should know something regarding the cutting of such gears, and this is their verdict:

Criticisms of bevel gears when the teeth are cut with a rotary cutter are general. The principal fault is the lack of accuracy of curve the whole length of the teeth. A bevel gear should have all parts of the teeth radiating to a common centre. It is impossible to accomplish this when the teeth are cut with a rotary cutter, which only cuts with a fixed curve, and it is obvious that, as the tooth of the gear decreases in size and depth as it approaches the common centre, the curve of a tooth is constantly changing to a smaller radius. The cutter selected with a curve correct for the outer or longer end of the tooth cannot cut a smaller curve on the inner end of the tooth because the depth is shallower. Only a fractional part of the cutter is employed; therefore the curve on the small end of the tooth, which is usually much straighter, is very much different from the curve on the outer end of the tooth. This can

Fig. 1—Rotary Cut Teeth.

Fig. 2—Planed Teeth.

readily be seen by observing the engraving, Fig. 1. It will be noticed that the tops of the teeth are wider at the smaller end than at the larger end. To obviate this error in shaping the teeth it is customary then to round them off by filing where the curve is required for their free running.

On all bevel gears cut with a rotary cutter or a tool with a fixer curve and size, it is necessary to cut through twice in order to cut the teeth of correct thickness at their largest ends. The cutter is always selected thin enough to cut the small end of the teeth, as it is obvious that the pitch is much finer at one end. This requires great skill, and it often takes years to acquire the desired proficiency. For small bevel gears, where the pitch is fine and the face is narrow, it is found that it is practicable to cut gears in this way; but those gears should have planed teeth which transmit considerable power, or run at high speed, or have teeth of coarse pitch or long faces, or which must run with a little more than ordinary accuracy and demand durability and economy of friction and power. Gears with planed teeth are not cut with a tool of fixed curve, but with a point of a planer tool, which tool is governed not by the skill of the workman, but by the mathematical and mechanical precision of a special automatic bevel gear planer. Most of the skill necessary in operating this machine is in simply mounting the blanks properly and in setting the index to the correct number of teeth. In planing bevel gears the tool, which is held securely on the tool post of a special

shaping machine or crank planer, is constantly moving back and forth in a conical plane or on the surface of a frustum, which is a portion of the theoretical pitch cones on which beveled gears are always calculated.

The curve of a tooth constantly changes to a smaller radius as the tool approaches the common centre, inasmuch as the tool is gradually moved from the top to the bottom of the teeth while still retaining its reciprocal motion, as mentioned above. This tool is guided by a fixed form made with a perfectly correct curve with special tools. The form is many times the size of the tooth that is being planed. It is obvious that there can be practically no error and that all parts of teeth must be of correct form. As the tool is constantly radiating to a common centre, as above described, it is clear that two gears running together will have one or more teeth bearing the whole length of the face of the teeth at any point of contact or position of the gears.

NEVER OUT OF ORDER OR LIGHT.

It was a happy thought that suggested "Neverout" as a name for a bicycle lamp, and if the name indicates the character of the lamp a bright future can be predicted for this new-comer to the trade. Nothing is so annoying as to carry a lamp that can do almost anything but stay lighted, and while perfection is impossible, the Rose Manufacturing Company, 311 and 313 North Third street, Philadelphia, Penn., make claims for the Neverout, which they are putting on the market, that make it a very desirable addition to the line of American-made lamps.

From a mechanical standpoint the Neverout Patent Insulated Kerosene Safety Lamp, to give it its title in full, is a splendid example of the brass-workers' art; of a graceful design and highly nickelled, it presents a handsome appearance. It is intended to be attached to the fork side with a rigid bracket, and the construction of its clamps is such that the lamp can be put on or removed from the wheel without the use of any tools save the fingers. A properly focused, double convex photo lens, backed by a powerful reflector, throws a surprisingly steady light of great intensity. The reflector is pierced and backed with a red Bohemian jewel, allowing a danger signal from the rear, while two green faceted jewels are used as side lights.

The method of attaching the oil reservoir is decidedly novel. Instead of clamping it to the bottom of the lamp, it is slipped into a sleeve and then tightly held in place by means of a collar which, being closed at the bottom, also performs duty as a drip pan; at the same time the pressure from underneath acts as an automatic wick lock, making the jarring down of the wick impossible.

Accessibility for cleaning has been amply provided for, and, as no springs are used, it is perfectly noiseless, while weighing but twelve ounces. Kerosene sufficient for sixteen hours can be carried, and, having a cotton-packed reservoir, the oil cannot "slop."

The lamp is the result of two years' experimenting, and shows in every detail the care that has been devoted to every point. It has been fully patented in the United States and the principal countries of the world, and branch offices are being established in London, Berlin, Paris and many large cities of this country. The roster of the company contains the names of Angelo Myers, president; S. B. Blumenthal, vice-president and H. C. Rosenbluth, secretary and treasurer. They are all seasoned business men of wealth and influence.

It is easy to learn something about any wheel, but difficult to learn everything about any wheel.

Why the Crescent Agency Is in Demand.

Because we make absolutely high-grade wheels at a price within the reach of the masses.

We compel the strict maintenance of our list prices.

We absolutely protect our agents in the territory assigned them.

Our line of twenty-one models is comprised of wheels of every size and price.

Crescent construction is unequalled, and the wheels stay sold.

We can well afford to guarantee our wheels for six months or six years, as the wheels "stand up."

Our agents are assured of a certain profit on their investment in Crescent Bicycles.

We treat all our agents fairly and our policy is an honest one.

No agent can cut prices on Crescents and continue to represent us.

Every valuable improvement is employed in our wheels as soon as our tests prove it worthy of adoption.

Crescents given an honest and equal representation, *will outsell any other high-grade bicycle on earth.*

WESTERN WHEEL WORKS, Makers.

Factory,
CHICAGO, ILL.

Eastern Branch,
No. 36 WARREN ST., NEW YORK.

NOTE-BEARING WHEELS.

Beware of the instalment plan of cycle purchase, unless you are so secure of income that meeting the notes you give will not worry you. When you blanket a thing so fragile as a bicycle, or the income of a man forced to buy a wheel upon time payments, with a mortgage, you subject both of the blanketed to the strongest possible test of their respective weight-carrying capacities. Study well what a mortgage really is, then slowly go.

A mortgage is a strong incentive to action, and a wholesale reminder of the fleeting months. It is fully as symbolical in its meaning as the hour-glass and scythe that mean death. A mortgage represents industry, because it is never idle, night or day.

It is like a bosom friend, because the greater the adversity the closer it sticks to a fellow. It is like a brave soldier, for it never hesitates at charges, nor fears to close in on the enemy. It is like the sandbag of the thug—silent in application, but deadly in effect. It is like the hand of Providence—it spreads all over creation, and its influence is everywhere visible.

It is like the grasp of the devil-fish—the longer it holds the greater its strength. It will exercise feeble energies, and lend activity to a sluggish brain; but no matter how debtors work, the mortgage works harder still. A mortgage is a good thing to have on a wheel—provided, always, it is on somebody else's wheel.

NO STILL ALARM, THIS.

Night riding contains, to a certain degree, an element of risk, and especially in districts where the use of lamps is not compulsory it is absolutely necessary to use an alarm of some description. In considering the subject, the "Sure Alarm," made by Heffelfinger & Vail, of Philadelphia, is entitled to notice. It consists of three small bells attached to a metal collar that by means of adjusting screws can be fastened to the hub of the front wheel; it can be put on or taken off in a moment, and its use insures an automatic and continuous ring. Special attention has been given to the tones of the bells, and, while being loud enough to serve as a warning, they are in no way annoying.

TELLING AN INTERESTING STORY.

Although neither ornate nor "spread-eagley," the catalogue of the Forsyth Manufacturing Company, Buffalo, N. Y., just to hand, is attractively neat and well ordered, and worthy of a place in the files of all who are interested in cycle stampings. The booklet illustrates the various articles made by the Forsyth people, their triangular pedal, detachable handbrake, lamp brackets, brake, chain and dress guard connections, sprocket guards, fork-side caps and washers of all sorts. In addition to these articles, the company is in position to make special stampings of any nature.

WHAT "RENOVATING" MEANS.

A Parisian rider brought suit for \$6,000 damages against a maker for injuries received in consequence of the front forks of a bicycle made by the maker giving way. The cycle had been sent to the maker to be renovated, and the defence was that this meant only enamelling and plating, but not examining the parts. The court found for the defendant.

SAMPLE SUITED.

The New Castle (Pa.) tube mill has recently shipped a large order of bicycle tubing to England. The order was unsolicited, the English firm writing first for samples and prices, and afterward placing their order.

OUTLINED 100 FEET AHEAD.

Tubular hubs, tubular crank brackets, tubular everything, is pretty much the order of the day in cycle construction, and now comes the tubular lamp. The C. T. Ham Manufacturing Company, Rochester, N. Y., make it. "Ham's Diamond Lamp" will be its catalogue title. It is a kerosene burner made of steel plate, nickel plated, and its originators claim that neither roads nor wind can affect its

light. They further say: "Having made repeated tests of this lamp during the last six months, we have no hesitation in saying that there is no other lamp on the market from which so large a volume of light is obtained. One can ride with perfect safety with this lamp in the darkest of nights. Can see 50 to 75 feet distinctly and objects are outlined at least 100 feet ahead."

INSTANTANEOUS HOLE-CLOSERS.

This is a pneumatic tire patented originally in England, and assigned by Hugh Faulkner to Morgan & Wright, and by them patented here. For it the patentee makes these two claims:

First—A pneumatic tire containing within the air-chamber small pieces of puncture-closing material and a liquid, the puncture-

closing pieces being free to move in the liquid and to distribute themselves automatically, substantially as set forth.

Second—A pneumatic tire having the inner wall of its air-chamber lubricated, and enclosing loose puncture-closing pieces within such air-chamber, said puncture-closing pieces being free to shift about, substantially as set forth.

WHEN THE BUTTON IS PRESSED.

England, not satisfied with mounting district messenger boys upon bicycles, has now inaugurated a system by which cyclists may be relieved of all trouble of taking care of their machines. By paying a small extra fee subscribers will, at any hour of the day or night, on turning the handle of the cycle callbox in the hall or room, have their machines brought to the door within a few minutes, and on returning from their rides boys will quickly appear to take the machines away. The cycles will be kept in perfect order, and always ready for use.

PASSING OF A GOOD REPUTATION.

It is almost pitiful to see the usually decent English Cyclist turn bigot and persistently go out of the way to attack and belittle American goods. No opening seems too small for it to deliver a spiteful jab. It was generally supposed that Editor Sturmev was too big and too broad to descend to such practices.

STILL SENDING THEM ABROAD.

Exports of cycles and cycle material at the port of New York for the week ending November 24:

FREE, GRATIS, FOR NOTHING.

Since the Dunlop people began building bicycles they have gone into the "inducement" idea on a wholesale basis. When you buy a Dunlop bicycle the company presents you with a \$500 accident policy, good for one year; a guarantee of the machine which covers all repairs for twelve months, even those resulting from "wilful misusage"; an insurance against the wheel ever being stolen, and a free lamp, bell, toolbag, tools, inflator and repair outfit. If the buyer feels he isn't getting enough for his money, it is said the Dunlop people are willing to add to the list of "free, gratis, for nothing" features of their machines.

HOLLOW BILLET BOOM.

Cleveland capitalists have been in New Castle, Penn., the last week consulting with John Stevenson, Jr., of that city, in regard to building an open hearth steel plant to manufacture hollow billets, such as makers of cycle tubing require. It is possible that the new open hearth steel plant at Sharon, Penn., may manufacture these hollow billets also. By the erection of the new tube mill at Greenville the last summer there will now be a big demand for hollow billets which the Sharon plant would be in the best position to supply.

THE DAY OF ALL DAYS.

"Give me time."

As Wobblesome spoke, he looked beseechingly at his wife, and, rising rapidly from his chair, hurriedly paced the floor, his brow contracted, his whole attitude indicating that he was endeavoring to grasp some difficult mental problem.

"Time!" echoed his wife, scornfully; "do you mean to tell me that you have so soon forgotten what this day means to me—a day that stands out in my life compared with which all other days are puny and insignificant—that it has slipped from your memory as a mere nothing, a day that has not even risen enough above the dead level of all other days to impress itself in the slightest manner on your mind. But then," she continued, with a slight touch of scorn, even while the hot tears forced themselves into her eyes, "I might have known that such would be the case. You are, after all, like all other men. Feverishly excited over an event at the time, your enthusiasm knows no bounds, your—"

"My dear," said Wobblesome, suddenly pausing in his walk, while a look of exaltation came over his face, as he turned affectionately and clasped his wife's hand in his, "say no more. Pardon me. I've been so occupied with business that it went away from me entirely. What a fool I was not to remember that this is the day on which we were married."

"Married!" almost shrieked his wife, as she rose and faced him, while a look of deep pity came into her eyes. "I believe, sir, that we were married in June, and here it is autumn. Will you try again?"

Wobblesome sat down and buried his face in his hands.

"Never!" he replied, brokenly.

"Then," said his wife, seating herself back in her chair with a hard, set look in her face, "I shall never expect anything from you again. I shall never dare to think that you have one touch of romance left in you. But I must confess," she added resignedly, "that it comes as a great shock to me, my dear, to think that you have so soon forgotten that this is the anniversary of the day I made my first century run."

NO RIGHT TO ASSUME.

The right of a wheelman to pass on the right-hand side in meeting a truck which is turning toward that side to the curb of the street is held by the Connecticut Supreme Court to be not absolute, and the rider is held not to have the right to assume that the driver must turn out for him, but is bound to exercise the same degree of care which is required of the driver in order to avoid a collision.

BRED IN THE BONE.

The scorcher had bowled over the man who is always fond of his joke. Explanations were in order and being made by the scorcher, who said:

"I hope, sir, you will pardon me for the accident. Are you hurt?"

"No!" gasped the disciple of fun; "just a trifle run down, that's all."

CLOTHES AND THE MAN.

"They quarrelled about a wheelwoman, didn't they?" asked the police magistrate.

"I don't know, Your Honor," replied the policeman.

"Don't know?"

"No, Your Honor. It had the face of a woman, an' the togs of a man. It's hard guessin' these days."

TUBE AND FORK REPAIRS.

A novel way to repair a tube which has broken off at the union as illustrated by A or B in figure, consists in substituting solid shaft work for the usual shells. The process is exhibited in Fig. 2, in which a sectional view of a repaired fracture of the tube is shown. A solid piece of steel rod, about five inches long and of correct diameter to correspond to the size of the interior of the tube should be secured first, and a hole drilled into it near the centre, in which to cut a thread for a cross piece of same material.

When the two pieces are combined, the shape presented is seen in Fig. 2, the one rod being marked C, the other D, and the connection by thread E. Of course the piece D cannot be screwed to the piece C until the latter is in place inside the tube. The next move consists in drilling small rivet holes at F, F, F. The rivets serve to hold the tubing firmly to the rods, thus affording

means for attaching broken frames securely.

When the balls in straight cup and cone bearings begin to wear a channel around the circumference or either the cone, as illustrated at A in Fig. 3, or in the cup, B of the same figure, a remedy can be found by concaving the parts.

This method is exhibited in Fig. 1, in which another sectional drawing of one end of the bearing is shown. The process of concaving is not difficult if proper tools are at hand. The bearing must first be taken apart, then the cone C turned down in a lathe until all grooved and other worn or defective portions are removed, leaving the shape concaved as shown. The cup D treated in the same manner, care being taken to have the curve conform in its outline to that of the cone, so that all will work in harmony.

It is necessary that a perfectly smooth surface be left upon the turned parts, otherwise the balls will grind and give considerable bother through heating and wearing. Ordinarily it will be found that the cone and cup are so thoroughly hardened that the putting tools will not touch them. This can

be readily overcome by drawing the temper after which it must be put back.

A wheelman came to us not long ago with a fork broken off at E, as indicated in Fig. 5. This is a peculiar place for the fork to break, and special operations were required to fix the fracture. The upper part of the fork was hollow, gradually tapering down to solidity at the bottom. We secured a piece of wrought iron rod the right size to fit the interior of the tube, heated it and shaped it to fit the circle described by the fork in the manner indicated by Fig. 6, which shows a cut off view.

Several rivets inserted through the casing and wrought iron rod severed to strengthen the work. We countersunk the ends of the rivets, brazed the job, applied a coat of enamel and varnish, and the fracture could hardly be detected. G. D. RICE.

WHAT HE GOT FOR HIS DOLLAR.

George H. Carter, of Philadelphia, has a positive opinion that membership in the League is a good thing. Some weeks ago Carter, with a party of friends, was riding over the Willow Grove Turnpike, when a gate tender pulled him off his machine, the excuse being that he had not paid his toll. It was proven that another member of the party had delivered the ticket for all. The wheel was badly damaged and Carter was more or less bruised, so, as a member of the League, he entered complaint against the Turnpike Company with Chief Consul Boyle for damages. The company settled the matter without going to court as soon as the exact amount of damage was ascertained, \$76.30.

SORRY SHE SPOKE.

The German Empress has had to consult the doctors about the rapidity with which she is putting on flesh. They all recommend her to take to the bicycle as a remedy. There is a degree of irony in the situation, as only recently she issued a command that no lady who was a cyclist should be allowed to appear at court. There will also be a certain lack of dignity in her hasty descent from this lofty position of disapproval to the humiliating wobbles of the beginner. It may be a lesson against the exhibition of unreasonable prejudice for the future, however.

FATAL POLITENESS.

"There was another fatal cycle accident yesterday."

"Man killed?"

"Yes; you see, a scorcher ran into and knocked him galleyst; then the rider dismounted, said he was to blame and begged the pedestrian's pardon. The Coroner said it was heart disease."

CABBIES AND CYCLE BAGGAGE.

For a long time the railroads have refused to look upon a bicycle as baggage, and now the English cabbies are beginning to follow suit. A London magistrate has decided that a cabdriver may refuse to carry both the cyclist and his bicycle for the same price.

VEAL THAT WAY STILL.

The heathen of old worshipped the golden calf. Put yellow tights on a short-skirted, good-looking wheelwoman, and the moderns are not much different from the ancients in their calf adoration.

EASY OF ANSWER.

"Why is a wheel like a cycle paper?"

"That's an easy one. Because every man should have one of his own, and not borrow his neighbor's. Good day!"

Kindly mention The Wheel.

BRIEF BITS FOR BUSY MEN.

The police force at Perak, Malay Peninsula, have been mounted on bicycles.

The Russian import duty on bicycles amounts to \$12.50 per machine.

Paper telegraph poles are the latest use to which that material has been put.

Two bells for each cycle are required by the authorities of Florence, Italy; one bell for long and the other for short signals.

At Munich, Bavaria, in 1898 there will be an exhibition of machinery, to which American manufacturers are invited.

The British Postoffice Department has advertised for bids on 10,000 bicycles with which it is proposed to equip British postmen.

Melbourne, N. S. W., is all torn up because the workmen in a cycle plant think that \$3.75 per week is not sufficiently high wages.

A bill advocating a tax of 75 cents on every bicycle in the State is pending in the Vermont House, the receipts to be used for constructing cycle paths.

Again the bicycle! A Brooklyn blacksmith has killed himself because he declared the bicycle had ruined his trade, so he could no longer earn a living at it.

A ball-bearing has now been applied to the mounting of eye-glasses, preventing the rigid contact of glass and metal, and rendering them less liable to fracture.

Under the new customs tariff in Victoria, N. S. W., lugs for bicycles, tricycles and similar vehicles, not being brazed or joined with any other part, will be admitted free of duty into the colony.

It has been pointed out that if illuminating gas be burned in a gas engine to drive a dynamo much more light is produced if incandescent lamps are used than can be produced by burning the same quantity of gas in burners in the usual way.

A German cycle firm, Hoyer & Glahu, has just patented a process by which, it is said, frames can be substantially put together without being brazed. It is claimed that connections made under this patent stood a weight of 3,600 kilos, although the tubes themselves split.

A new illuminating gas, made from petroleum, has been produced in Germany, it is asserted, and can be supplied of a quantity equal to the best existing photometric standard at a cost of 25 cents a thousand feet. The generative plant is simple. One able to keep up 100 lights can be built for \$159.

A new gearing has been invented and patented by Mr. J. Shaw, of Roschill, Wellington Quay, England, for cycles and other machines. The idea is to do away with the chain. The gearing consists of three wheels of a new design. There are no teeth, and the wheels are so constructed that they will always be in gear.

In 1896, it is estimated, 1,500,000 sets of tires were made in this country. On an average, it takes three pounds of crude rubber to each set, which means for the tire trade alone a consumption of 4,500,000 pounds of rubber, or 2,250 tons. The annual import of Para rubber to this country averages about 10,000 tons, so it is safe to say that the tire makers now use one-quarter of all the Para rubber which comes to America.

The French Trades Ministry, interviewed upon the liability of another increase in the duty levied upon foreign machines imported into France, declare the rumor of further advance untrue. It is the opinion of the Ministers that the present duty of 220 francs per 100 kilos is amply sufficient to protect the French maker.

A machine has been designed for affixing stamps to letters and circulars with extraordinary rapidity. The motions of detaching, damping and fixing are all performed by one revolution of a small wheel attached to the machine. From 4,000 to 5,000 letters an hour can be stamped, and the machine will register the number of letters thus treated. Around catalogue time the office boy will be much interested in this machine.

W. S. Fielding, Canadian Minister of Finance, in an interview recently stated that the Canadian Government is earnestly contemplating the establishment of reciprocity with the United States and that representatives will be sent to Washington after McKinley's inauguration to negotiate a reciprocity treaty. News which will be more acceptable to American cycle makers than it will be to Canadian ones.

Nov 24, '96.

MORGAN & WRIGHT TIRES
ARE GOOD TIRES

The Hanover Gunmi Kamm Co., of Hanover, Germany, have lately introduced a new form of rubber brake, which they claim will not cause any damage to the outer cover of the tire. The rubber on the brake spoon is of special form, having a series of corrugations on the side which comes in contact with the tire.

Exporters of cycles to Australia should take pains to keep in touch with the prosperity in that country. Gold mining is growing with wonderful rapidity. Upward of \$15,000,000 is about to be expended in railroad building into the Coolgardie district, and incidentally bicycles will have an opportunity to find broader use. The same observation applies to South Africa, though perhaps with less force.

Some one who is familiar with the cycle trade in Mexico says there is no middle class in Mexico like here, to buy bicycles and cheap vehicles, and that it will be some time before the farmers are rich enough from agriculture to buy much in either line. Those who are able lean to the old English coach idea. The time is probably not as remote as it might look, when the cycle will supplant the coach.

The City of Mexico has ten cycle agents. One of the earliest to introduce cycling there was Hilario Meenen, who popularized Humber with the Mexican folk.

Two Italians have discovered and sold to an American syndicate, a new process of tanning which may eventually be of value to the saddle-makers. The process is said to produce leather from skin in forty-eight hours, and of a quality much superior to that hitherto made. It is also a great saving of labor, because one man can manipulate the machine in which the skins are treated and a two-horse power machine can turn out 550,000 pounds of leather per year, at a cost of about \$400. Acids, electricity, pressing, turpentine, etc., are no longer needed.

Three commercial organizations of San Francisco, viz., the Chamber of Commerce, the Board of Trade and the Manufacturers and Producers' Association, have combined to create a Bureau of Foreign Commerce, for the purpose of investigating commercial possibilities in the Orient, Central and South America, Australia and South Africa. The San Francisco merchants and manufacturers are quick to catch the idea thrown out by the National Association of Manufacturers, whose committee has recently returned from South America on a commercial errand. The sum of \$15,000 is to be raised to defray expenses. A big programme is laid out.

In a factory the different portions of which are connected with call bells, many of which are far from the point at which the push-button is pressed, a person is often in doubt as to whether the bell has or has not been sounded. Batteries will sometimes give out at unexpected moments, and other interruptions of the action of the current are apt to arise. A novel but exceedingly simple arrangement for denoting whether electric bells have rung, or are in proper ringing order, is a new indicating bell push, which, when the bell rings at the other end, tells the operator so by means of an oscillating indicator just above the push-button. This indicator is actuated by the same current that rings the bell.

Under a new law just passed by the Mexican Congress the owner of a Mexican patent is obliged to prove to the Department of Encouragement at the end of each period of five years of the life of the patent that, with a view of maintaining it for another five years, he has paid into the general Treasury of the Federation the sum of \$50 at the close of the first five years, or \$75 at the expiration of ten years and \$100 at the expiration of fifteen years. All these payments have to be made in Mexican dollars. The term within which these payments have to be proved shall be two months after the conclusion of each period of five years. This term cannot be extended.

In Deseronto, Canada, a local industry consists in sifting a considerable portion of sawdust and mixing it with an equal quantity of clay, working the same into a building material known as porous terra cotta brick. This brick possesses some remarkable qualities of adaptation as a substitute for what has ordinarily been used for structural purposes. Among the merits enumerated in its favor is its absolutely fireproof character, the fact also of its having a marked deadening effect when employed for partition walls in factories and such places, is very warm and dry, and, though very light in weight, will stand a prodigious crushing strain; the material can be sawn into convenient shapes as desired, nails can be driven into it after the manner with wood, and, when heated even to a white heat, sudden immersion in water produces no cracks.

DESIGNS.

26,336. Toe clip for bicycles. Herman A. Elsbach, Rockford, Ill. Filed March 16, 1896. Serial No. 586,485. Term of patent 7 years.

26,337. Thread-piece for bicycle pedals. Arthur Sidwell, Waltham, Mass. Filed October 12, 1896. Serial No. 608,659. Term of patent 14 years.

26,338. Elastic tire. Jesse Lyman Dann, Columbus, Ohio. Filed October 12, 1896. Serial No. 608,656. Term of patent 14 years.

26,339. Handle-bar. Luther G. Billings, Clifton, N. Y. Filed August 28, 1896. Serial No. 604,223. Term of patent 14 years.

26,340. Handle-bar. Robert W. Murphy, New York, N. Y. Filed September 18, 1896. Serial No. 606,300. Term of patent 7 years.

26,341. Crank-axle hanger for bicycles. Irvin D. Lengel, Reading, Penn., assignor to the Packer Cycle Company, same place. Filed September 22, 1896. Serial No. 606,682. Term of patent 3 1/2 years.

26,342. Bicycle brake or fork. Charles L. Travis, Minneapolis, Minn., assignor to the Hygienic Wheel Company, Philadelphia, Penn. Filed January 21, 1896. Serial No. 577,621. Term of patent 14 years.

26,343. Bicycle saddle. Frederick Mesinger,

New York, N. Y., assignor to the Mesinger Bicycle Saddle Company, same place. Filed October 12, 1896. Serial No. 608,660. Term of patent 7 years.

26,344. Bicycle saddle. Frederick Mesinger, New York, N. Y., assignor to the Mesinger Bicycle Saddle Company, same place. Filed October 12, 1896. Serial No. 608,661. Term of patent 7 years.

26,345. Felly or wheel rim. Jesse Lyman Dann, Columbus, Ohio. Filed October 12, 1896. Serial No. 608,657. Term of patent 14 years.

PERRY TRADE PLUMS.

In a quiet way, the Perry Cycle Saddle Company, Leicester, Mass., are gathering in their share of the trade plums, domestic as well as foreign. Twelve models will constitute their '97 line.

FROM THE DUST OF DISASTER.

Bystander to Fallmore as the latter picks himself up from a particularly bad fall: "My dear sir, how is it possible that you have not hurt yourself?" "Practice makes perfect," sighed Fallmore as he prepared to mount once more.

FOR FOUR TWO-CENT STAMPS.

The Victor pad calendar for 1897 is already in circulation. It is in the usual handy shape, the leaflet for each day containing a euphonious text and blank space for memoranda. Four two-cent stamps mailed to the Overman Wheel Co., Chicopee Falls, Mass., will obtain a copy.

RECENT PATENTS.

571,915. BICYCLE-PATH EXCAVATING MACHINE. CHARLES L. BARRETT, ALLEGAN, MICH. Filed Mar. 30, 1895. Serial No. 585,383. (No model.)

Claim.—A path cutting machine, comprising a central beam, provided in its end with a normal pivoting point or cutting edge, and a foot on one side of the beam, a plate secured along its longitudinal center to the under side of said beam, its front edge being beveled and inclined away from the beam, and an edge-plate at the outer end of each cutting edge, substantially as described and shown in the drawings.

571,941. BICYCLE. JOHN RAU, CHICAGO, ILL. ASSIGNOR TO FRANK L. SALISBURY, JOHN E. SALISBURY, AND CLARENCE E. BRINKERHOFF, SAME PLACE. Filed Jan. 28, 1895. Serial No. 536,405. (No model.)

Claim.—In a bicycle, the combination with the frame thereof and the driving shaft, of cylindrical guide-ways on the side of the said shaft, annular rings secured to the frame intermediate the said guide-ways, said rings being arranged eccentrically to the driving shaft and being provided with grooves in their outer face, the rollers passing slidably through the guide-ways and having their ends, opposite to those which carry the pedals, bent inwardly, a chain mounted upon said bent end of each lever and secured to correspond with the serratures of the grooves in the rings, and a locking wheel said grooves, said blocks being provided with means for their opposite faces and adjacent to their opposite ends, anti-friction rollers of steel in said recesses and bearing upon the walls of the grooves of the rings, the said anti-friction rollers being secured to the opposite ends of each lever and bearing upon the pedals, respectively.

571,961. BRAKE FOR BICYCLES. FRED A. GARDNER, Rochester, N. Y. Filed May 1, 1895. Serial No. 560,790. (No model.)

Claim.—In a free-power mechanism, the combination of a hollow shaft A, a driving shaft B, a crank C, of links B, C, attached to said shaft within said housing and rotatable therewith and from the interior surface of said housing, a rod within said shaft, and mechanism thereon for operating said brake-blocks and connections between said rod and a crank.

571,979. BICYCLE-LEG. HENRY OTTO, BLOOMINGTON, ILL. Filed Dec. 26, 1895. Serial No. 573,394. (No model.)

Claim.—The combination of a top and end clamping plate, connecting screw, the inclined jaw on the bottom plate, the screw rear wall in the jaw, and a leg with a convex-shoulder flange the eccentric top end pivoted to the jaw, substantially as and for the purpose specified.

571,777. BICYCLE-BELL. HARRY LUCAS, BIRMINGHAM, ENGLAND. Filed May 15, 1895. Serial No. 591,720. (No model.)

Claim.—A bell comprising a dome, a base beneath the same adapted to be fast to a support, hanger mechanism between the base and dome, and a spring-support between the dome and hanger, formed from said base up within the dome, substantially as described.

571,439. WHEEL. WILLIAM F. B. HAYES, ROCHESTER, N. Y. Assignor to John W. Layton, John Brown, and James Giffney, same place. Filed Feb. 15, 1895. Serial No. 573,338. (No model.)

Claim.—In a wheel, the combination with the axle, the sleeve secured thereto having cylindrical recesses in the ends and exterior screw threads, and formed with triangular ribs, the braided ring formed of the ribs and grooves on its inner and outer sides the ribs formed with corresponding ribs and grooves, and of greater length than the ribs, the screw-threads cut engaging with said ribs and the washers located in the spaces between said ribs and the ends of the screw-threads, substantially as described.

571,941. BICYCLE. FRANK H. BOLTE, MILWAUKEE, WIS. ASSIGNOR TO THE BOLTE CYCLE MANUFACTURING COMPANY, SAME PLACE. Filed Sept. 28, 1895. Serial No. 563,973. (No model.)

Claim.—A bicycle axle hanger that results from engagement of two tubes differential as to length, the lower one being shorter than registered as its outer end with an end of the other, a spring together of both tubes for a distance from their registered ends less than the length of said lower one, and a longitudinal slotting of the blank between the spring operation.

571,890. SPEED-GEAR FOR BICYCLES. JAMES P. STEFFENS, CHICAGO, ILL. ASSIGNOR TO THE PACKER CYCLE COMPANY, SAME PLACE. Filed June 1, 1896. Serial No. 606,682. (No model.)

Claim.—In a bicycle or similar vehicle, the combination of an annular gear-wheel C rigidly attached to one end of the pedal-shaft (journal and provided internally formed in its rim with a race member and internally with a race member, a hubless sprocket-wheel receiving said gear and provided with a race member and a threaded end of one edge of its rim, a disk D provided with a threaded flange secured upon said sprocket-wheel and with a pinion D' rigid with the flange, the motion of which the latter is revolved, said parts being provided with anti-friction bearings, a pedal-shaft E provided with a rigidly-attached arm F pivoted toward the other end of a wrist-pin A and at its base to the race member corresponding with the member B, and a pinion G loosely engaged upon said wrist-pin meshing with said annular gear and operative to turn the sprocket-wheel through the medium of the pinion D, substantially as described.

571,460. POWER MECHANISM FOR BICYCLES. AUGUST BRAUER, INDEPENDENCE, MO. Filed June 20, 1895. Serial No. 597,468. (No model.)

Claim.—A power mechanism for vehicles comprising a suitable framework, a shaft journaled therein a wheel upon said shaft, cap and arranged eccentrically thereto, and provided externally with ratchet-teeth, vertical annular surrounding said ratchet-teeth and suitably journaled, ratchet-actuated pawls carried thereby and engaging said ratchet-teeth, several inclined guide-tubes carried by the framework, sliding blocks therein and projecting through said slots, the screw-threads cut engaging with said blocks, and a spring to govern the amount and to said sliding blocks, and a hubless gear secured to the upper and lower ends of said guide-tubes, substantially as described.

571,983. BICYCLE. WALTER W. SHAW, TEXARKANA, ARK. Filed Dec. 3, 1895. Serial No. 570,889. (No model.)

Claim.—In combination with a bicycle, substantially as shown and described, the reaches a, c, provided with lower bifurcated ends; braces d provided with a bifurcated lower end having bearings of crank shafts e, having the adjustable h level d, journaled in bearings f, adjustable pins a', having one end secured to the sleeve a' and the other at the joint d, on the rod g, and rod h, adjustably secured between the areas of substantially as shown and described and for the purpose set forth.

572,062. BICYCLE-SADDLE. FREDERICK MESINGER, LEICESTER, MASS. Filed Oct. 12, 1896. Serial No. 608,661. (No model.)

Claim.—In a bicycle-saddle, the combination with a main rest-section, of auxiliary sections hinged to the front edge of the main rest-section and adapted for alternate movement.

572,003. BICYCLE-BEARING. EDWARD A. GREEN, BATTLE CREEK, MICH. Filed Nov. 7, 1895. Serial No. 568,198. (No model.)

Claim.—A bicycle-bearing, having a chamber formed around the exterior of its cone, and a spring-controlled valve contained in the top of the bearing, as and for the purpose set forth.

571,433. BICYCLE-SUPPORT. EMIL FALKENBERG, MINNEAPOLIS, MINN. Filed Apr. 3, 1895. Serial No. 568,111. (No model.)

Claim.—The combination with a bicycle of a support-bearing one end thereof bifurcated so as to engage the frame of the bicycle and the spokes of the wheel and means for fastening the support to the frame substantially as shown and described.

VOL. XVIII., No. 17.

NEW YORK AND CHICAGO, DECEMBER 11, 1896.

WHOLE No. 459.

OUTLOOK BRIGHTER.

Two Concerns Whose Future Seems Safer— Pope After the Howard Chainless.

Newark, N. J., Dec. 5.—An offer has been made to John R. Hardin, receiver for the Liberty Cycle Company, for the plant, other property and good will of the company.

John Holden, of New York, a director of the old company, is the gentleman who would like to buy. He bid \$126,116. This covers the debts owned by the concern. In addition Holden is willing to pay the expenses of the receivership.

Mr. Hardin got this morning an order to show cause why the sale should not be made. It is returnable on December 12.

The Liberty Cycle Company's plant is at Rockaway. The directors attempted to remove the business to Bridgeport, Conn., in spite of an injunction, and prosecution of them was begun. Its property was valued at something like what Mr. Holden has offered for it.

Before Vice-Chancellor Emery, in the Chancery Chambers, Newark, N. J., last week, the troubles of the Howard & Nichols Cycle Manufacturing Company, manufacturers of the Howard chainless cycles, were again aired. Elwood C. Harris, the receiver, suggested that the company should assign its rights to make the chainless wheel to the Pope Manufacturing Company and receive in return a license from it. This, he declared, would be to the advantage of the embarrassed company, which has preferred debts amounting to about \$1,700. The Court decided to adjourn the case until a prospective buyer was heard from.

BACK TO THE FOLD.

After considerable correspondence the trouble between the Julius Andrae & Sons Co. and the Bolte Cycle Manufacturing Company, of Milwaukee, with the National Board of Trade, has been adjusted. The Board ruled some time ago that neither of these firms could exhibit at either the New York or Chicago cycle shows because they had displays at an unsanctioned exposition in Milwaukee. The ruling has been reversed by the National body and the firms notified that they may exhibit at the big shows.

MORE POWER TO THEM.

Philadelphia's Police Board is so well pleased with the work of the bicycle squad during the past season that \$3,500 has been appropriated for the purchase of new wheels next spring. Last year only \$500 was appropriated for this purpose.

OFFICE AND THE MAN.

Isaac B. Potter is not a candidate for the presidency of the L. A. W. He has orally made the statement several times; his latest declaration is, however, in writing and over his own signature. Among other things, Mr. Potter says: "The office of president requires the performance of duties which I cannot at this time undertake. A due attention to my personal business and to the official work now demanded of me within my own State will consume my full measure of time and energy for another year. We are about to attempt the passage of a Good Roads bill at Albany, and to the accomplishment of this object every member of our State Division is expected to lend his best zeal. Under these conditions, and while the promise of success is apparently so bright, it would be an act of doubtful loyalty for any officer to abandon his post in the division, or to divert his energies by the acceptance of another office."

Whether Mr. Potter would run if nominated is, however, another question.

A boom for First Vice-President Charles F. Cossum, of Poughkeepsie, N. Y., one of the levelest-headed men in the League, has developed in the West, but Mr. Cossum, like Mr. Potter, affirms that he is not a candidate, but will not say that he will not run if nominated.

DIFFERENCE OF OPINION.

An alleged dispute over a contract resulted in a writ of replevin being served against the Whitman Saddle Company, No. 118 Chambers street, New York, makers of the Whitman cycles, last week. The writ was for \$16,277 worth of bicycles, sundries, etc., in favor of the Combination Cycle Company, Jamestown, N. Y. William C. C. Mehlbach, treasurer of the Whitman Company, when seen in regard to the matter said:

"The replevin suit brought by the Combination Cycle Company against us does not affect our business in any way, the bicycle business being merely a side issue. We have a contract with the Combination Cycle Company which we have kept in every respect, and to our surprise to-day they have commenced an action to replevin their goods which we have on hand to sell under that agreement. This breaks the contract on their part, and we intend to hold them for damages. The matter does not affect our regular business."

WANTS TO BE DISCHARGED.

Milwaukee, Dec. 5.—Max Ascher, assignee for the Moore Cycle Company, has petitioned Judge Johnson for his discharge. The receipts from the sale of the property were \$9,032 22. Labor claims amounting to \$2,192 52 have been paid. The assignee asks \$1,300 for his compensation, and \$1,200 for his attorneys. He has paid the creditors a dividend of 10 1-5 per cent.

CHANGE MADE.

Anglo-American Turns Over Its New York Business to Treasurer C. M. Rice.

C. M. Rice, treasurer of the Anglo-American Cycle Fittings Company, has purchased the New York business of the concern. Hitherto the main offices of the company were at No. 107 Chambers street, New York, where they sold the output of their factory which is located at Waterbury, Conn. They also deal largely in sundries. The company in New York will be incorporated under another name, but at this hour the name had not been decided upon.

The Anglo-American Cycle Fittings Company will operate their factory at Waterbury, and will sell to the large trade. The concern in New York, of which Mr. Rice is the proprietor, will handle New York and vicinity, and sell their regular line of jobbing goods throughout the country, such as bells, handle-bars, etc. Mr. Rice will still remain the treasurer of the Anglo-American Cycle Fittings Company. He has been connected with this concern for about eighteen months, and has been very successful. The New York concern starts out under favorable auspices. License to make the celebrated Southard twisted crank has been obtained, and this will be a notable addition to their '97 stock.

CARELESS DRIVING COMES HIGH.

Careless drivers of high-spirited horses were last week shown that in the future it will be "no joke" to run down cyclists for the fun of the thing, if the precedent set by the Long Island courts is worth anything. The case just decided was that of Frances Dougherty, twelve years old, against William Thorne, the son of a hotelkeeper at Roslyn, Long Island, who ran down the girl at Mineola on September 12 last.

Sheriff Henry Dohr and his jury, of Queens County, which has just been investigating the case, have given Miss Dougherty a verdict of \$10,000 for the damages which she received.

The injuries to the young woman were the result of extreme carelessness on the part of Thorne. He drove his horse at an excessive rate of speed, and struck the girl without any warning whatever, throwing her from her wheel and breaking her leg in two places, besides inflicting other serious bodily injuries, which have kept her confined at home ever since.

CONVICT CONSTRUCTION BARRED.

The Canadian customs officials have issued orders prohibiting the importation of prison-made wheels. All such will be seized and forfeited.

BATTLE OF BULL RUN.

Opening Skirmish with Elliott Wounded—New York Division Explodes Several Bombs and Torpedoes.

Unless it were studded with splinters, it is very doubtful if Sterling Elliott, president of the L. A. W., and William Sheldon Bull, secretary-treasurer of the New York Division, would permit the other to slide down his particular cellar door.

They have "had words" and are very much on the "outs." Unreconcilable business differences are at the bottom of the trouble. They will season the presidential stew now simmering. Bull has declared positively that he will not support Elliott under any circumstances. He is dallying with the Potter boomlet, which refuses to collapse with the Chief Consul's announcement that he is not a candidate. Bull has rallied around him a number of local consuls and League workers who frequent his office, and these are playing politics in the amusing fashion of the little-lamented Cyclists' Federation, in which most of them were schooled. M. M. Belding, one of the most active, went to the New York Division caucus on Sunday with a pocket filled with blanks which pledged the signers to do all they could to defeat Sterling Elliott and to compel a change in his Bulletin contract. These were passed around to the "workers," on Sunday and on Monday, when the meeting proper occurred in the Grand Union Hotel, this city, the petitions were circulated guardedly and were "numerously signed," it is stated.

Another shot, openly, however, was fired at Elliott's administration by Auditor George E. Blackham. In presenting his report Dr. Blackham related how National Secretary Bassett had inconvenienced Division Secretary Bull. He had lumped remittances, had sent several undated and unitemized statements, and, to cap the climax, had, in error, remitted \$500 too much.

"If the New York Division had a dishonest secretary-treasurer," asserted Dr. Blackham, he could have appropriated the money to his own use, and none would have been the wiser.

In conclusion, the Doctor recommended the investigation of Mr. Bassett's office and conduct of affairs. He did not mean to impute dishonesty, but he thought the bookkeeping might be faulty. Of course, the recommendation was adopted.

A laugh had previously been created at Mr. Bull's expense when the watchful Cossum, following the reading of the report, had found an error of several thousand dollars in one of the footings. Mr. Bull explained that his office had been full of delegates during the day.

The clever of the anti-Elliott men did not intend that their underground workings should be exposed. Dr. M. L. Rhein, a Federation graduate, and a blond-mustached, deliberate speaker, could not contain himself, however. He arose unexpectedly, upset everything and created a sensation by moving that the delegates to the National Assembly be instructed to vote against Elliott.

"I believe in fighting in the open, not in the dark," manfully declared Rhein.

He then sang the burden of his song, that Elliott's position as president and as publisher of the official, was little short of shameful. Articles concerning it, he said, had been circulated all over the country and done much harm to the League. Nothing else was brought against Mr. Elliott. "Dual capacity," "dual relationship" were terms that invariably floated to the top of the Rhein-wine.

Delegate Rosenfeld asked if such instructions were usual.

"None such have been made in the history of the New York Division," responded Chief Consul Potter.

A motion to table the resolution followed. Dr. Blackham said that, while he was aware that Mr. Elliott had not been an especially efficient president, he considered the Rhein resolution practically one of censure, and did not believe in it. Chief Consul Potter also took a whack at the Rhein wine concoction. He remarked that he did not think it wise to do anything calculated to turn the National Assembly into a bear garden, under the very nose of the New York Legislature, from whom favors were to be asked. Nothing worse could be done, he maintained, than to send the delegates bound and shackled; it was impossible to foresee the future, and such a proceeding might cause great embarrassment. "Let your delegates go to Albany as a family party," urged Mr. Potter. "Do not say we lack confidence in them before they go." Dr. Rhein, very much flushed and looking thoroughly uncomfortable, maintained that the motion was for the benefit of the whole League, not particularly for the good of the New York Division; it was not meant as condemnation. But Elliott's "dual relationship" was really awful. The resolution was tabled.

The delegates to the National Assembly were nominated by Walter S. Jenkins, of Buffalo, on behalf of the caucus committee. Mr. Jenkins prefaced the reading of the names with an apology for being unable to put everybody on the ticket. It transpired that every member of the Nominating Committee was among the nominations. Mr. Jenkins stated how averse he was to such a proceeding, but had been outvoted. Delegate Riggs created quite a ripple of amusement by asking if there was any reason why a member of the Nominating Committee who was averse to having his name on the ticket should not be excused. The delegates elected were as follows:

First District—E. F. Hill, A. H. Curtis, G. A. Heaney, T. T. Eckert, jr., F. L. Rodewald, Dr. F. A. Myrick, F. M. Frohisher, M. M. Belding, Jr., Matthew Gibb, Oscar R. Meyer, Dr. Seneca D. Powell, C. B. Benson, J. B. Townsend, William Travers Jerome, Dr. L. C. Le Roy, Will R. Pitman, G. C. Fennell, J. W. Walters, M. T. Wilber and G. E. Scheffer.

Second District—N. S. Cobleigh, Andrew Peters, A. P. Black, Edward H. Walker, Charles F. Cole, H. B. Fullerton, George T. Stebbins, G. A. Rouiller, Alexander Balmann, Walter M. Meserole and L. P. Coleman.

Third District—De Witt C. Becker, William J. Bond, Robert W. Evans, William M. Honig, Everett Smith and A. D. Walt.

Fourth District—William Plerson Judson, Edward Leonard and Charles W. Wood.

Fifth District—William W. Bullard, George W. Millsaps and Frederick W. Ogden.

Sixth District—Walter S. Jenkins, J. Stuart Kelley, Thomas Cary Welch, the Hon. W. W. Armstrong, Edward R. Wilson, Dr. George E. Blackham and Charles H. Brown.

On motion of Mr. Cossum, an appropriation of \$2 per diem and railroad fare for the delegates was made.

Vice-Consul Underhill moved that it be the sense of the meeting that the dates of the National Assembly be changed so as not to conflict with those of the Cycle Show, and that the Executive Committee be so advised. Mr. Cossum stated that the contracts for the use of the hall in Albany had been made and deposits given, and Mr. Potter added that a number of influential Good Roads men had been invited to speak, and any change of dates would be apt to cause confusion, and might endanger the success of the whole thing. The motion fell flat.

A committee to inquire into the possibility of incorporation was appointed.

Just before the close of the meeting an immense white box was carried in and placed on

the official table in front of Mr. Potter. It contained two massive pieces of silverware, the gift of a number of the Board of Officers. Walter S. Jenkins made the presentation speech, recounting Mr. Potter's many good works, and remarking that his approaching marriage made the gift the timelier. Mr. Potter responded feelingly.

Some sixty odd delegates were in attendance.

Secretary-Treasurer Bull's financial report was of k-en interest, as showing the cost of running "Excelsior Division," as Bull termed it. It ran from December 30, 1895, to December 1, 1896, and was as follows:

RECEIPTS.	
Balance on hand as per report December 30, 1895.....	\$1,361 62
Membership fees and dues.....	20,442 40
Badge account—Sale of cap pins and badges	216 45
Road book account—sale of Books and maps	75 75
Repair shop account—Registration fees.....	104 10
Division meet, Buffalo, Sept., 1895.....	66 60
Division meet, Brooklyn, Sept., 1896.....	130 87
Armstrong Baggage law account (Contributions)	1,164 50
M. M. Belding, jr. (contributions).....	25 00
	<hr/>
	\$22,375 67

Total receipts	\$23,737 29
----------------------	-------------

DISBURSEMENTS.	
Division Headquarters:	
Office rent	\$501 67
Clerks and stenographers.....	1,420 96
Printing, stationery and supplies.....	2,793 90
Postage	911 18
Telegrams	32 54
Express, freight and cartage.....	76 61
Office furniture.....	533 45
	<hr/>
Total	\$6,270 31

Chief Consul Potter earned his allowance of \$1,250 and spent but \$66 in travelling. The auditor expended \$79.42, of which \$71.75 was travelling expenses. Secretary-Treasurer Bull drew his salary of \$2,500, and spent \$106.75 in travelling. The Road Books Committee spent \$4,140.63, of which \$2,560.22 was for printing and engraving and \$599.30 for postage. The Rights and Privileges Committee cost \$227.00, of which \$200 was a retainer. Ten dollars for postage was all the Highway Improvement Committee spent; the Racing Board's bills totalled \$10.85. The Badge Account read: Cap pins and button badges, \$346.80; express, \$2.35; mailing boxes, \$25.14; honor badges, pins and stars, \$608.50; total, \$983.79. The cost of the mail vote was \$298.68. The passage of the Armstrong Baggage law entailed an expense of \$2,267.67. The travelling expenses of delegates to the National Assembly at Baltimore were \$694.74. The Division Meet at Utica in June, 1895, cost \$11, and the Division Meet at Brooklyn, September, 1896, \$35.25. The Chief Consul spent \$140.91 during 1895, which was included in this report. The prizes for the recruiting competition of 1895 cost \$950. The Division meet at Brooklyn, June, 1895, cost \$15.

Total disbursements.....	\$19,448 66
Balance on hand December 1, 1896.....	3,555 57
	<hr/>
Total	\$23,004 23
Long Island Road Improvement Trust Fund	633 06
	<hr/>
Total	\$23,737 29

The report was preceded by a report of the membership totals and the estimated income of the Division for the coming fiscal year.

Cash on hand December 1, 1896.....\$3,555 57

Estimated receipts from renewals and applications as follows:

15,000 renewals (75 per cent of 200,000) at 35 cents.....	\$5,250 00
13,000 applications at \$1.35.....	17,550 00
	<hr/>
Total	\$26,455 57

LUCK AND LABOR.

WHENEVER reference is made to the success attained by the pioneers in the cycle trade, it is not unusual to hear Envy attempt to belittle Merit by claiming that the successful ones were only lucky. The assertion then follows that any one who began at the beginning of American cycle trading and manufacturing could not possibly have failed; was bound to have gotten rich, etc. All this, too, with the fact proven that many who were in at the start fell by the wayside, beaten and broken before the race was even fairly under way.

The quicker this luck idea is forever removed from the minds of newcomers in the trade the better it will be for them, and the more likely will the latter-day tradesman and the young man just entering the trade be to rely upon labor rather than luck for their success.

'Luck whines, labor whistles,' said some one long ago, and therein lies more philosophy than you ever dreamed of, Horatio. This wheel world of ours is largely a superstitious world, after all; at least, there are many superstitious people in it. There are numerous men who dissipate in wistful visions the energy that would make their dreams come true.

Labor will win battles where luck trusts to the shadowy battalions of its hopes. Luck is the hare—the March hare—labor is the tortoise that wins the six-day race while the other is asleep. Luck belongs to the days of the chariot; labor to the era of the cycle. Labor solves the problem while luck holds its slate-pencil in its mouth and wishes

for the "answer." Luck is a caprice. Labor something sure.

Luck puts on its racing colors, parades in shouting squadrons and hopes "our boys" will win; labor dons the riding uniforms, scores the wins and breaks the record, with many a tired muscle, but with many a victorious heart. Luck sits in the grandstand and hopes for a record; labor connects with the pedal and sends the men around the track. Luck waits for a good start; labor starts and wins by three lengths.

This is an age of labor, not of luck. Things don't go by chance in this world any more; they go by hard knocks, and lots of them. Luck is a back number; labor is *fin de siècle*. Luck sighs; labor sings. Luck lolls in bed and longs for windfalls; labor looks with glad and happy eyes upon the first dollar it ever earned, and the eagle on it—though the eagle is not much of a songster—sings him to sleep, from which he wakes with fire in his heart and determination in his soul.

Luck trusts to chance; labor to his good right arm. Luck woos the future, mistress fickle; labor wins the present, mistress true. Luck shades his eyes with white and useless hands and looks down the years to be for the rising sun of fortune; labor labors with a song upon his lips and as he sings the dawn-burst shines around him. Luck stands on the mount of hope and gazes across the waters for his ship to come in; labor casts his nets and lo, they break with the great number of the fishes—among them many pearls. Luck is a laggard, labor a hero; luck dwindles, labor does; luck wishes, labor wins; luck asks, labor acts; luck prophesies, labor makes his dreams come true.

AGENTS' ADVERTISING.

DEMAND, when it comes to bicycles, especially to any particular make thereof, depends largely on notions people take. As a rule cycle agents do too little advertising. Their argument is: "We are known; if people want a wheel they know where to find us." This is an error and poor logic.

And right here is found the true cause of the bargain-counter wheel's cut into the trade of dealers. Bargain-counter wheels are advertised.

Demand is a curious thing. It has its minimum limits at zero and its maximum limits at highest earning capacity. Take a given community, who shall say whether, by proper and judicious effort, the general use of bicycles could be increased 10, 25 or 50 per cent, and the sales of a specially well-advertised wheel made to exceed that of any or all others?

The makers and jobbers have their salesmen and admirable selling system, but when we come to the retail trade there is a lacking. How much genuine soliciting is done by the average retailer and dealer in bicycles within the territory he is supposed to cover? Each dealer thinks, perhaps, he gets all the trade there is for him and his machine without greater exertion than he has been in the habit of putting forth. Herein he is in error.

Custom and customers sometimes have to be created, so to speak, and it often requires genius and commercial pluck and energy to do it. Such ability belongs to the highest order of business talent. To make a man think and feel he wants a bicycle and ought to and must have only the one you are selling is no small job. There are many such chances to make business in every dealer's district, but it takes work, time, tact, shrewdness, suavity and many other qualities to take the raw man and transform him into a customer.

There is not enough of this work done. Too little hard, enterprising work is done by those who stand between wholesaler and ultimate rider. In short, by proper effort the number of bicycles and sundries that could be unloaded on a given community could be increased sufficiently to make trade better. If some of the push exhibited habitually by the agricultural implement dealer, for example, could be grafted onto the average bicycle dealer, business would be better in good times and not so bad in bad times.

However, it is not our purpose, nor is it our business, to rail at the retail dealers, who are supposed to understand how to best conduct their own affairs. We think, however, that if some of the everlasting persistence of the manufacturer's travelling salesmen could be infused into the retail dealer, to make him a more energetic drummer in his own field, it would be better for trade all around.

PUBLICITY IS PROFIT.

WHEN a concern is in the heyday of its prosperity, when business is good and competition is not felt, it is no unusual thing for the advertising solicitor to be informed that the concern is so well known and its business already so extensive that advertising is a useless expenditure of money. We have known a number of tool and machinery makers to argue in this way, and more than one cycle concern, as well.

In almost every instance where this has happened we have seen younger competitors, by judicious advertising and push, pass them in the race for business. Then these concerns that were too well known to advertise would awaken to the situation and their advertisements would again appear; but while they were sleeping their wide-awake competitors must necessarily have made inroads into their business, which, with fair treatment and businesslike methods, they will hold.

The recent Hilton, Hughes & Co.'s failure in this city is a striking example of an immense house, probably known all over the country, but, presuming on their name, they reduced their advertising and paid little attention to it. Their competitors kept their names prominently before the masses, and told what they had to offer, and gradually trade began to drift from the larger house to those enterprising firms who let the people know that they were after their trade.

The manufacturer's advertisement bears the same relation to his business that a drummer or outside salesman does. He pleads the

maker's cause, and offers his wheels to an audience which he in no other way could reach. His work is to bring the people. The wheel must do the rest. It is his business to paint the truth as rosily as he can and yours to see that the rider and the agent are given honest value for their money. Once you have won the public confidence do not abuse it, for you will be the greatest loser in the end.

Remember there are other wheels, just as good as yours, for sale, at the same price, too. Your only advantage—and it is yours if you take it—is to have better advertising than they. This does not necessarily mean larger advertising or more costly, for it is not always the size of the space that tells, but what is said and how it is said, that attracts notice and excites curiosity.

The well-written advertisement, with a proper amount of legitimate wind in it, is the pied-piper's pipe whose dulcet strains draw the wheels advertised out of the factory and into the hands of the agent and the rider. The wise manufacturer is a hypnotist. His trade eye, the advertisement, constantly staring at the agent and the rider from its fixed place in the trade paper. The two similes don't combine very well, but the same kernel of truth is present in both instances.

Let the largest house in any line stop advertising, and note in what incredibly short space of time a larger business will be built up by somebody who works while they sleep.

Are you sleeping?

As in other days all roads led to Rome, nowadays every avenue to success or failure in the cycle trade leads to having one's picture published in the trade papers. And, moreover, if a man be hired by or related to the pictorially distinguished individual, his picture will be published, too. It is not too much to surmise that the day is not far distant when some paper, anxious to boom its advertising patronage, will publish the portrait of every man, alien resident and casual stranger within the gates of the trade. Then everybody will be famous and happy and the millennium will be announced exclusively in the columns of every cycle paper in the land.

The ordinary round of social entertainment becomes a weariness and a monotony. Persons who are in it as an occupation, professional fashionables, seize upon any event outside the common that can be made fashionable. Little as most of them care for a bicycle, caring as little as they know about it, riding a wheel is wild dissipation compared with the inanity of much that is fashionable. The multitude of "smart" people now in cycling is a melancholy proof of the dreariness of that exacting life of fashion, to lead which is the highest ambition of nearly everybody who manages to achieve a fortune.

We have the bicycle and the tricycle, and the motor-cycle driven by a kerosene lamp. Keely declares that he will drive a steamer across the Atlantic with force generated from

a glass of ice-water, and Maxim assures us that the flying machine is close at hand. Maxim is in earnest, however, but Keely is a practical joker. So the world wags along, and by and by we shall have ice cream saloons a mile up in the air for the hot August days. What a pity we can't imitate Methuselah, or even Old Parr, and personally observe the glorious cycling that will come in the near future of cycles.

Too many people judge the value of a "trade note" by its length. The wiser ones, however, know that as a matter of fact a ten line notice will be generally read while one ten times as long will be "skimmed" or passed over.

Although people write from "the top of their voices" and talk above the moon of our cycling progress, it is easy to be seen that we simply whizz around in a circle, just as the old earth has done since the beginning.

Thrift, generally speaking, is a good thing; but the kind whose only result in this world is a bargain counter wheel, an elaborate tombstone and a probated will does not do its possessor much good.

If everybody who used the public highways could have just what they wanted, it would make nearly everybody else who used them uncomfortable.

A cent can roll just as far under the bed as a \$5 gold piece, but in an advertisement the penny purchaser doesn't roll with the five-dollar one.

The trouble about the novice in cycling is that he has a way of winding up his tongue, setting it going, and then leaving it.

The practical wheel designer laughs at the theorist of to-day, and carries out the plans of the theorist of yesterday.

The merits of many people in the trade are greatly discounted by the fact that we only hear of their mistakes.

When the "rattling speech" at a club dinner or trade banquet is dissected, it is often found to be nothing but rattle.

To-morrow, in the cycle trade, is the time when the fool is going to be wise and the lazy man industrious.

Most of the things we think we know about cycling we ought to know we only think about it.

Storms of applause are the things that wreck most navigators among the shoals of speed-making.

There are lots of good things in cycling without any one to push them along.

Second thoughts about a wheel are not best when they are second-hand thoughts.

CYCLE-PATH VERDICT.

A Louisville judge has handed down a decision which may make the users and builders of cycle paths less sure of their right to enjoy the paths without regard to the rights of pedestrian trespassers thereon. In the case in question an old man was walking on the path built by wheelmen for their exclusive use under a law and ordinance which forbid the use of the path by any other travellers than wheelmen. While thus walking a wheelman ran into the old man, breaking his aged arm and otherwise severely bruising him.

The pedestrian sued the wheelman for damages. After all the evidence was introduced, the court held that, notwithstanding the pathway was originally built for the use of wheelmen and the street was impassable for a bicycle, the footman had the right of way, and therefore fined the wheelman \$20 and placed him under \$1,000 bond for thirty days.

CHANGED FOR THE BETTER.

The wisdom of getting next year's models in the hands of the retailer in time for the holiday trade must be obvious to every one. Not so very long ago if a father wished to give his son a bicycle on Christmas Day it was either necessary to give him a wheel made during that year or else to present him with an order on a factory for the next year's model, the subsequent delivery of which often meant a delay of several months. To a young man or young woman, even if out of their teens, a present in the shape of an order is not a very tangible thing, and it will be a great satisfaction to get a '97 wheel on Christmas of '96.

HE IS A "WHITE MAN."

Arthur Flavell, one of the "whitest" Englishmen who ever crossed the Atlantic, sailed for his native heath, Coventry, on Saturday last. He has engaged with the Dunlop interests on the other side. Flavell took up residence in America some years ago and readily adapted himself to the altered conditions. He was liked because he made himself liked and was ever conscientious and decent. Few if any of his countrymen have left a better impression.

STILL THE SAGAMORE.

Because a Sagamore Manufacturing Company was incorporated in this State in 1888, the particular Sagamore Manufacturing Company which was to succeed to the property of the defunct Porter & Gilmour corporation has been obliged to change its title to the Gilmour Manufacturing Company. Their wheel, however, will still be termed the Sagamore and be made at No. 16 Warren-st., this city, as in the days of yore.

SEE THE GENTLE FARMER.

Cycle path builders in the neighborhood of Rochester, N. Y., and Sacramento, Cal., have simultaneously come forth with a grievance against teamsters and farmers. Paths built by cyclists in both districts have been ruined by unprincipled drivers, who have deliberately left the road and permitted the wheels of their vehicles to cut the paths in such a manner as to unfit for cycling.

TAR AND FEATHERS NEEDED.

Watertown, N. Y., has developed a new species of anti-cycling crank who has been dubbed "Jack the Nipper." He steals bicycles, and, evidently from spite, utterly destroys them by cutting and twisting the spokes with nippers, removing the hubs, etc., all within a short distance from the place where he finds the wheel.

HERE THEY ARE AGAIN!

The Merry-Go-Rounder Makes His Annual Bid for Plunks and Plaudits of the Public.

New York is being amused and instructed this week by a six-day "Grand International Championship of the World" race—a go-as-you-must, all-day-and-all-night. On Sunday last, shortly after midnight, pistol-firer Champion Bald sent the men on their long and gruelling journey. Some 5,000 people were in the Garden. Previous to the start the men had the usual immemorial parade of all nations, in which one English rider was dressed in green, because by no means could the Irish be neglected in a New York six-day race. Hale had a costume as green as the shamrock, though he looks English all over the face.

The feature of the first hour was a well-sustained burst of speed by Linton and Lumsden. The young Welsh rider made pace all the way, riding on the outside of the track, and when the sixty minutes had been told he had ridden twenty-three miles and two laps, or practically twenty-four miles. Outside of Linton the next figure to jump into prominence was Lumsden, the swift pedalling Scotchman. He also covered the same distance as Linton; in fact, he hugged his wheel all the way. Pierce, the Boston road-rider, put in twenty-one miles and kept plugging along. Major Taylor, the black-hued Munger mascot, was humorously picked out by the crowd. He pedalled along quietly, and would have attracted no attention had it not been for his mahogany tint. Rice, a Wilkesbarre rider, made a fine showing. He is of stocky

tronzed. The inner ring was fairly well-crowded, for this year a 50-cent admission will entitle you to walk all over the Garden, and this privilege is treasured by many, especially those who enjoyed it during the old six-day go-as-you-please contests. The band played and the crowd waited. In fact, it seemed remarkable that fully 5,000 people should wait till midnight to see such an event started.

On Monday night there were no short races, and the race seemed rather monotonous. Waller and Van Emberg had a bad tumble during the day, and were put out of the race, Van

appearance of a so-called "black and white tandem team," the front rider being black and the rear one white. Bald also made some attempts at record, doing one mile in 2:09 4-5, and a second mile during the evening, paced by a tandem, in 2:08 1-5.

The race is being managed by P. T. Powers, of the New York Baseball Club, and James Kennedy, well known as a manager of boxing tournaments. Both men well know how to cater to the New York sporting public. They have the entire New-York press with them, Mr. Kennedy being an old press man, and judging from the public interest in the race and the great public interest in cycling, it is probable that the race will be an emphatic success.

SCORE OF THE FIRST HOUR.

Tom Linton, Wales.....	23	2
William Lumsden, Scotland.....	23	2

build, and on prizefighting lines, and seems gifted with any amount of strength. Conklin, the local road rider, did not perform brilliantly. Van Emberg, once the "Boy Wonder," although he covered over twenty miles in the first hour, could scarcely be picked out of the ruck. Maddox, the Asbury Parkian, was a great favorite. Golden was cheered by the old-timers and plugged around the track in his usual patient fashion. Hale was only noticed because of his cadaverous appearance and of a straggly blond beard. As a railbird said, he looked more fit for a hospital than for a six-day event. One man whom no outsider would possibly pick out as having any ability was Ashinger; he never sprinted, never rode on the outside. He rides around the track on the extreme inside edge, taking no hills and enjoying no toboggan slides on the curves. He never varies a hairline from his course, and his mile is probably not an inch over the mile.

The Garden commenced to fill up about 9 o'clock on Sunday evening. It was a curious gathering. It differed from other six-day crowds because of the injection into it of the pugilistic element, with which some of the managers of the race are closely identified. There were also a number of remarkably well-dressed people, people who had pretensions, no doubt, to considerable style and social position. The restaurant was well pat-

Emberg permanently, and Waller temporarily, but even on his return he could only hobble around the track, and his chance for honors appeared to have been weakened.

Owing to the absence of the short events, which have always made these contests so interesting, there was no enthusiasm, although there was a fair attendance, perhaps about 4,000 people being present. The six-day men rode around at a weary pace, most of them with drawn faces, some of them wearing goggles for eye-protection purposes. There seemed to be no item of interest about the affair, and one wondered why the crowd held their seats so long. For the rest of the week a series of short races are announced.

The only side shows on Monday were the

In the first hour Lumsden supplanted Berlo's old record of 21 miles 9 laps. The first man will win \$1,300, and will probably break Schock's old record of 1,600 odd. Billy Young is in charge of him.

Linton and Lumsden will compete in the short races throughout the week. Glick, of Detroit, once covered 563 miles in a go-as-you-please pedestrian race. Cartright is also an old-time pedestrian.

Those among the audience who remember the old six-day sawdust grinds will have them recalled by Ed Plummer, who comes back to this country with the English contingent. Plummer was the chief cook and bottle-washer of such events ten and twenty years ago, and is well preserved.

The track is practically the same as that which has been previously seen in the Garden, ten laps to the mile, highly banked and very fast. The scoring process is the same as was used last year. The scheme of using electric lights for scoring purposes was invented on the necessity of the moment by Mr. Smith, electrician of the Madison Square Garden Co. It is a very ingenious system, and will in time be in universal use in contests of that kind.

The trainers' division is, as usual, a feature of interest. Here all the attendants gather; here also is the canned and other food which is fed to the men, the gas stoves and lubri-

CURTAIN RAISER.

Merry-Go-Round Prelude Proves Exciting in a Neck-Risking, Cuticle-Losing Fashion.

Neither those who handed out the coin of the realm to enter Madison Square Garden on Saturday evening last nor those who passed in on "paper," augmenting a crowd of about 5,000, labored under the hallucination that Barnum & Bailey held forth in the big building. Yet they witnessed acrobatic feats and miraculous tumbling tricks that many a circus star might well envy. For flying midair leaps, tortuous gyrations, original gymnastic feats, exhibitions of unpremeditated dismounts and as a benefit for the worker on dismantled bicycles, the meet, the curtain-raiser to the six-day race, was in every way successful.

The Garden took on its customary dashing race-meet appearance. The thousands of

tators were permitted to swarm into the enclosure in the centre of the track and line up against the inner rail. As a consequence none but those who were fortunate enough to secure seats near the tape were able to view the finishes. Those occupying the boxes on the far side of the track might as well have been in Alaska. They would have been just as wise regarding the winners.

But the enthusiasm was infectious. Each telling sprint and during each final lap, the cheering was continuous and drowned the music of the band. In the handicap the contestants rode to win, each one of them, and on the ten-lap track their speed seemed even greater than it was.

As in all metropolitan meets, the amateurs were out in droves. Heat after heat had to be run to dispose of the dross, and those who escaped a fall and rode in the finals were lucky indeed. The opening event, the half-mile amateur, finally narrowed down to a battle between Owen, Henshaw and Latham, a promising Saratoga, N. Y., rider, and to the dismay of the Metropolitan rooters the latter got the best of the race. The professionals were as susceptible to spills as the diamond-winners. The final of the mile scratch brought Goodman, Starbuck, Murphy, Eaton, Hadfield and Weing to a tape. Murphy rode off the bank and disappeared among the spectators. Hadfield pedaled with the abandon of a dare-devil and landed second-money. Weing, of Buffalo, squeezing in ahead at the tape, with Starbuck a close third. None of the foreigners who started qualified. They claimed that they were crowded at the finals. The Eaton-Goodman match was almost a walk-over for Eaton. He set the pace in both heats and won without over-exerting himself.

Bald's essay at an exhibition mile terminated ingloriously. After following the "black and white" tandem at good speed for several laps, he slipped at the east turn and landed on his side. He quickly remounted, but retired at the end of a half-mile. The hit of the night was the final of the half-mile professional handicap. Bald took the first heat from scratch; Murphy got the second, and "Major" Taylor, a dusky negro, who once acted in the capacity of valet to "Birdie" Munger and is now known as the South Brooklyn Wheelmen's mascot, took the third from thirty-five yards. Sam Linton and Lumsden failed to qualify. In the final Taylor circled the track like a black streak, and none of the back-mark men could touch him. Once Bald attempted to close the gap, but the track was too dangerous to take chances, and the "Major" won as he pleased. His victory was decidedly pleasing to the crowd, if the frantic cheering which arose when he crossed the tape was indicative of approval. The "Major" was well pleased with himself also. The fact that Bald did not pass him sent his stock up 100 per cent, and he is now branded as a world-beater. Summary:

Half-mile—Heats won by W. J. White, N. Y. C. W.; C. S. Henshaw, R. W.; W. H. Owen, S. B. W.; A. J. Latham, Saratoga, N. Y.; J. W. Judge, R. W., and Wilbur L. Losee, S. B. W.

Final—A. J. Latham; 2, W. H. Owen; 3, C. S. Henshaw, Time—1:30 1-5.

One-mile professional (final)—Al Weing; 2, Charles Hadfield; 3, J. F. Starbuck, Time—2:22 1-5. Won by two lengths. Murphy and Eaton fell.

One-mile handicap—The winners of heats were W. C. Roome (scratch), A. J. Latham (scratch), Saratoga, N. Y.; C. F. Ludin (60 yards), N. Y. C. W.; W. H. Cane (35 yards), Hackensack; T. J. Bell (30 yards), R. W.; Wilbur Losee (30 yards), S. B. W.; C. H. Tomlinson (50 yards), R. W., and C. S. Henshaw (20 yards), R. W.

Final—1, C. S. Henshaw, R. W.; 2, Wilbur Losee, S. B. W.; 3, C. H. Tomlinson, R. W. Time—2:22 1-5.

Half-mile handicap professional—Final heat—1, "Major" Taylor, S. B. W.; 2, A. C. Melkwell, Philadelphia; 3, E. C. Bald, Time—1:38 1-5.

LOST THE COMBINATION.

"Help! help! Take your dog away. He is biting my leg."
 "All right; don't be in a hurry."
 "Well, call him away."
 "I have only just bought him, and forgot to ask his name. Just wait a minute while I go to the dog store to inquire."

lights, brilliant decorations, the wild hurrah of the crowd and the dense canopy of smoke from hundreds of cigars, pipes and cigarettes, which hovered under the roof like a halo, kept the most blasé rounder interested for awhile. During each heat and final there would rise in the air a resonant dull thud, sounding the death-knell to some eager rider's ambition. Then the crowd would rise in their seats to watch some luckless wight skim undignified along the track to the bottom of the banking or land slap-bang against the upper railing, or perchance take a header over the edge of the track and come to a stop in the lap of some box occupant. The falls were as numerous as they were exciting. That no one was seriously injured was a puzzle to the spectators unacquainted with the remarkable acrobatic abilities of racing men as a whole and the wonderful ways they have of escaping unscathed from all sorts of spills, entirely through good luck. The spec-

cants, the thirst-quenchers, and all the rest of it.

E. C. Moore is an old-time go-as-you-please pedestrian.

Hale is thirty-four years old. He was the first man to cover 100 miles in less than six hours, and is chiefly noted for his great work on long-distance racing on the Great North Road, in England.

Waller and Van Emberg collided early on Monday morning, Van Emberg being internally hurt, and he was advised by his physicians to keep out of the races. Waller badly injured his right eye, so that leeches had to be applied to it. Van Emberg's fall was due to the breaking of his chain.

Linton lowered the five-mile record to 12:14 2-5, a figure which gives an idea of the awful pace the men cut out. He also rode ten miles in 26:36, fifteen miles in 39:01 2-5, and twenty miles in 51:42 2-5.

The Simpson chain and the big sprocket wheels came in for a big share of comment. Hale is the only man using a Simpson chain, and at the end of several hours he was ahead and easily kept some twenty miles ahead of his nearest competitor. It is stated that he is riding a gear considerably over 100.

A. A. Hansen, the famous Minneapolis rider, retired at the end of 190 miles and two laps.

Reading rode 240 miles without dismounting, a record.

Twenty-Four Hours Score.

Taylor529	0 McLeod370	6	6

Early on Tuesday morning Conklin, Van Steeg and Golden dropped out. Van Steeg had been hurt in a collision on Monday; Conklin had no experience in a contest of the kind, and Golden surrendered to a tired feeling.

Hale continued in the lead up to Wednesday, but began to show signs of weariness. He completed 500 miles in 30 hours and 20 minutes, which is a record for the Garden. His 700th mile was finished in 44 hours and 55 minutes. Schock continued to ride up to his schedule, and by his steady plugging began to pull down the lead of Hale and Rice. The retirement of Golden, Von Steeg and Conklin left sixteen riders in the race. The score at 1 A. M. Wednesday follows:

Hale772	0 Taylor684	2	4
Rice762	5 Ashinger642	4	8
Schock724	1 Maddox635	8	8
Reading716	9 Cassidy599	8	8

Moore683	6 McLeod473	5	5

Tuesday night Bald rode a half-mile paced in 1:09 3-5. Latham and Roome met in a match race at a mile, best two in three heats. Latham won the first two in 2:12 4-5 and 2:55 1-5. Goodman and Macdonald also met in a half-mile match. Macdonald was so badly beaten in the first heat that he refused to ride the second. Goodman's time was 1:10.

BALD

... ON A ...

Barnes White Flyer

reduces the Madison Square Garden track record for one mile to 2.08 1-5, which is also record for a ten-lap indoor track.

Schoch and Forster, on WHITE FLYERS, are well toward the front in the six-day race which is being held at Madison Square Garden, New York.

The Old, Old Story of Good Wheels and Good Men.

THE BARNES CYCLE CO., Syracuse, N. Y.

Kindly mention The Wheel.

NEAR THE ROCKIES.

Gardiner Shaking the Record—Plum Bush for Some Late Speed Fruit—News Items.

Denver, Col., Dec. 5.—Arthur Gardiner has commenced his campaign for records, and has placed two to his credit. Finding himself able to attain great speed on the Denver track, he has ceased to talk about going on the California circuit, and allows the plain acknowledgment that he came to Denver to get all short distance untraced records.

His first real trial was Thursday morning. At that time George M. Scott, president of the Denver Wheel Club, was on hand as official referee and L. A. W. representative. Timers were O. E. Boles, T. A. Bothrill, and J. W. Davis; judges, George A. Green, George W. Hare, and Samuel F. McGrew. There was a wind sweeping across a portion of the track, and after carefully finding when it had the least effect, Gardiner went to the last twelfth pole, and started the wrong way of the track. By this means he marked off a quarter-mile where the wind had little interference. He made the quarter in 0:26 2-5, a most remarkable performance for a day that was really not favorable. Looking over the lists of official records, it was found that the half-mile un-paced professional had never been claimed, and there was no mark for that distance. Gardiner tried for it, again going the wrong way of the track, but could do no better than 1:00 flat, the wind being stronger and his own muscles not in the best of condition.

Friday morning Gardiner again tried the half-mile, and this time with greater success. The officers were the same as on the preceding day. There was a trifle of wind, but not enough to seriously handicap the rider. Gardiner took the right way of the track, and made the half in 0:57 2-5. After the ride Gardiner complained of soreness in the lungs. The air was very heavy when he rode, a wind storm coming up immediately afterward, and he thinks this condition of things hurt his breathing apparatus. W. P. Stanton, his trainer, says Gardiner is doing so well that in another week he will be able to cut under Coulter's mile of 1:59 1-5.

C. B. Whitney, who has been connected with the Overman Company's local store for the past year, has been called to Chicago to take charge of the Overman sporting goods department. Whitney was not only one of the most popular and most trusted salesmen in the city, but is an amateur rider of ability, a baseball pitcher, and a leader in all amateur sports. He was connected with the Spalding house in Chicago and Denver for many years. The Overman Company will intrust to him the general charge of the making and selling of all sporting goods made by the firm.

The Cycle Board of Trade of Denver has taken up the matter of a cycle show in this city during the winter, and at a meeting held Tuesday evening in M. W. Gano's store set the ball rolling. Last year's show was managed by G. A. Wahlgreen as a private enterprise. The same manager will be in the saddle this year, but he will have the backing and countenance of the Cycle Board of Trade. What date can be secured is not now known, though as early as can be conveniently awarded will be asked.

SUSPENSION CONTAMINATION.

Chairman Gideon has announced that if Michael or any one else is managed or trained by Tom Eck before he settles his bill with the Maine association he will be liable to suspension, the same as though he competed in a race with a racing man under suspension.

HOW THE STEERSMAN FEELS.

William Saunders, of Boston, who was helmsman of the sextuplet which paced Michael in his record-breaking trials, tells an interesting story of his experience with the record-breaker. This is Saunders' third year at the pacing game, and he thinks he has got it down almost to a science. He first helped man a tandem; the following year he was on a triplet, and this season he guides a sextuplet.

"In comparing the machines, Saunders thought the most difficult job of all was handling the big fellow. It is much steadier than a tandem, but the work is harder; and when the riders get down to a 1:40 clip, he can feel an awful pressure on his chest. He says:

"As a usual thing the work commences to tell on a fellow at the half, and there is a tired feeling in your legs, your heart beats like a trip-hammer, and you notice a great difference in your breathing. By the time the two-thirds is reached you commence to realize what you are doing; your feet seem to weigh a ton, and it is only when you have dismounted that you know how thoroughly tired and pulled out you are.

"It's harder than riding any other multiple machine, and is faster in record work than any yet devised. When manned it weighs almost 1,200 pounds, and you can imagine what a spectacle it must be to see that ponderous machine travel a mile in 40 seconds, as we made it do at Nashville."

Speaking of Michael, he says that what amused the Americans most about the little Weishman was the fact that he skipped a rope about 3,000 times before retiring each evening, and generally covered the distance between the hotel and track, before and after a record trial, on a dog trot.

FOR PARBOILING SPEEDSTERS.

What, it is said, will be the finest training quarters in the world will be erected at the Garfield Park cement track, Chicago, unless the present plans fail. The scheme originated with Trainer McClaire, who will be supported, it is announced, by Morgan & Wright and possibly one of the largest Chicago clubs. The plan as outlined by McClaire is to erect a two-story building on a site to the south of the track. It will be supplied with every convenience necessary in the training of racing men. On the first floor will be placed the lockers, dressing and wheel rooms, all complete with the latest appliances. On the second floor will be the long rubbing tables, shower baths, tubs, steam, alcohol and supply rooms, and everything that could be desired to further the welfare of the young riders. The steamroom will be furnished with appliances that will do away with the use of hot cloths and the tired and bruised muscles will be worked and kneaded under the most favorable circumstances. The plant will be modelled after the training quarters of several of the big universities, and will be, if the plans carry, complete in every detail.

DOING TIME IN DENVER.

Denver, Dec. 5.—On the Denver Wheel Club's track to-day, Sager and Swansborough cut six professional un-paced tandem records. They first rode three-quarters of a mile in 1:25 1-5, two-fifths of a second better than the record of Evans and Hatton made at San Jose last May. They then went for the ten-mile record and broke all records from six miles up. They rode six miles in 13:22 2-5, seven in 15:30 4-5, eight in 18:51 3-5, nine in 20:06 and ten in 22:16 2-5, three-fifths of a second under Evans and Hatton's record of 22:17, made at San Jose. Sager and Swansborough now hold all tandem professional records up to ten miles, with the exception of those for one and four miles.

DOWN IN MEXICO.

Racing Under Conditions Which Must Prove Attractive to the Pleasure-Loving Dons.

Betting is a feature of the race meets held on the Mexican tracks. Pool rooms are run in connection with all the paths, where a half-dozen bookmakers sell mutuals and straight tickets on all the races. The track at the City of Mexico, about three miles from town, is beautiful beyond any idea one could form without having seen it, according to a St. Louis cyclist, who is touring through that country.

It is a third of a mile, with a surface composed of cement and ground lava. It is exceedingly fast, and the "good" men down here, the American writes, think nothing of doing miles on it behind a tandem in better than 2:06 in training. There are two grandstands, first and second class. The first-class stand is located about like those in the United States. It is a handsome structure, and the national colors, green, white and red, predominate in the decorations. Its seating capacity is about 3,000. The second stand is built at the head of the stretch, and while not as pretentious in appearance and decorations is a very pretty structure. There is a difference of about 50 per cent in the price of admission to the two stands. The most unique part of the track arrangement is the dressing-rooms. They are on the other side of the track, opposite the big stand. Instead of having one large room, as is customary in the States, each racing man of any pretensions has a separate room or house. There is a row of about fifteen or twenty buildings, each painted and decorated with the colors of its owner. From the stand they look like little playhouses with fancy porches and steps in front. Inside is to be found every accommodation necessary for the most fastidious track man. There are lockers for clothing, towels and other necessary accoutrements.

The infield is covered with a beautiful lawn, and it is proposed to build a miniature lake in the centre. The entire track is surrounded by a high wall and there is no chance for the ambitious Mexican urchin to get into the meets except through the turnstile. The lawn adjacent to the grandstand is dotted with tables and chairs, which are occupied during the races by the sweller set of the National Capital. A first-class buffet is maintained under the stand, and refreshments of all kinds are served on the grounds.

LEARNED SOMETHING.

"No foreigner can go to Paris and beat the Frenchmen on their own tracks," said one of the English riders now at Madison Square Garden on Saturday night, and evidently Tom and Nat Butler will echo the sentiment. A cablegram announces that they sailed from Southampton on the steamer New-York Saturday last, bound for New York. It is stated that neither of the riders could get acclimated and that a physician advised them to stop racing for the present. Neither of the Butlers won a race while abroad. Their non-success abroad, following close on the sorry exhibitions made by Johnson, Kiser, Macdonald and Murphy in Paris, is well calculated to make the Frenchmen eulogize their riders. Since Zimmerman and Banker visited the French capital no American rider has met with success on the Parisian tracks.

VOTING PRIZE MONEY.

An annual contribution of 2,000 francs toward the Grand Prix de Paris has been voted by the municipal authorities of Paris.

PALMER TIRES

What Is the Price?

A natural instinct makes a buyer ask that question. It is his first thought. Unfortunately some buyers consider only price.

A bicycle manufacturer who is proud of his wheels—who is truly anxious to keep his agents and his riders well satisfied the season through—will first consider value.

The price of Palmer Tires is greater than that of other tires, but the buyer gets a proportionate increase in value.

The wheel is useless unless the tires hold up. Palmer Tires can always be depended upon.

Often riders of other tires complain that high-grade wheels do not run easily. A change to Palmer Tires usually removes that difficulty.

A wheel that is always in service and running well delights its owner. He is continually talking about it.

Mr. Maker, this year will be a crucial one. He who gives his riders the best, *regardless of price*, will get the business. You cannot afford to ignore Palmer Tires. They will be the cheapest in the end.

THE PALMER PNEUMATIC TIRE COMPANY
CHICAGO

INDOOR CIRCUITING.

Manager Prince, of the Memphis Coliseum, is endeavoring to arrange a Southern circuit for next season, taking in Memphis, Birmingham, Nashville and Atlanta. It will be operated somewhat after the methods of running a baseball league. In this respect it is entirely original, and will prove an innovation in bicycle racing. The circuit will begin in Memphis, for example. There will be two nights of racing there. Birmingham will be the next place where the circuit-chasers meet. Two more nights' racing will be the programme and then the riders will proceed to the next place, which will be Nashville or Atlanta. After giving two nights' racing at the place where they started out they will go over the same route again, and so on until the closing of the season.

SANCTIONED OUTLAWS.

Although the Seventh Regiment A. A. is outlawed by the Amateur Athletic Union, the three cycle events run at their games in this city on Saturday night last were sanctioned by the Racing Board. This was done in accordance with an understanding between Chairman Gideon and President Sullivan, and not as a slap at the A. A. U., as has been intimated. R. W. Butler won the mile scratch race in 3:03 4-5, while R. MacLea won the mile handicap, 75 yards, in 2:40 4-5, and the two-mile handicap, 120 yards, in 5:41.

THEY'RE FAST IN GAY PAREE.

Tom Butler did not ride in the form shown at Louisville and Springfield while in Paris. Jaap Eden had no difficulty in disposing of him in the match race which took place on November 22. The match was for 2,000 metres (about a mile and a quarter), best two out of three heats. Eden took the first heat in 4:02 by three lengths. The second heat was more exciting, but Eden again finished to the good by about a length. In a handicap race which followed Butler was not placed in his heat.

BAD FOR THE BOARD FLOORERS.

Indoor meets will probably be few and far between in Brooklyn this winter. General McLeer, commanding the regiments stationed in Brooklyn, has issued an order prohibiting the use of the armories for cycle races. Several clubs of Brooklyn were arranging to hold indoor meets in the 13th Regiment Armory, but the order from headquarters will cause them to be abandoned.

KILLS CITY ROAD RACING.

The collision between a spectator and contestant in a road race at New Orleans on Thanksgiving Day, resulting in the death of the spectator, will probably put an end to road racing within the city limits of that city. The accident was due to the onlookers crowding into the middle of the street and leaving but a narrow lane for the riders to pass through.

GOOD-BYE IRVINGTON-MILLBURN!

The long-heralded end of the Irvington-Millburn course has at last arrived. The work of laying tracks for a trolley line on each side of the road is now in progress, and when completed, the far-famed stretch of road over which so many hard-fought battles have been won and lost will be unsafe for future contests.

KNOCKING AMATEUR BESTS.

At the Velodrome, San Francisco, December 6, Dixon and Kraft, of the Bay City Wheelmen, lowered the five-mile amateur tandem record from 11:35 to 11:09. They rode unpaced with a flying start.

ILL-ADVISED AND POORLY TRAINED.

Referring to the Eden-Butler match, the Paris correspondent of "Wheeling" writes: The announcement of the debut of Tom Butler in a match against Jaap Eden, the "burly" Dutchman, failed to draw anything like a fair crowd—why? Because all those initiated in cycle sport in France knew that Butler ran completely out of "form." If new comers would only "wait a bit" before riding, the prestige of foreigners would be ever so much better sustained; as it is, they are all like a flock of sheep who follow the leader. To say that it was a race between Jaap and Butler is out of the question, it was nothing more or less than an "exhibition," the American lad suffering from the intense cold that usually pervades the Velodrome d'Hiver.

CASE OF COLD FEET.

A 100-mile match race between Milton Brown and Thomas Leeper was run over the Garfield-Ridgewood, N. J., course on December 2. The weather was extremely cold, and the wind strong, but the men rode well together until the ninety-fourth mile, when they collided. Brown was thrown heavily to the ground and injured his back. Leeper remounted and finished the distance, but the referee declared it no race. Leeper's feet were badly frostbitten.

CLAIMING TIRE GLORY.

Huret's successful attempt at the twenty-four-hour record at Bordeaux in September has resulted in an interesting lawsuit. The day following the ride the makers of the Gallus tire inserted advertisements, claiming that the victory was won owing to Huret using their tire. As, however, Dunlops were used on the occasion, the Dunlop people have now brought an action for the recovery of 100,000 francs damage against the Gallus Company.

LIKE OUR GEORGE TAYLOR.

Huet, the Belgian sprinter, declares that he is thoroughly disgusted with racing, that he will give up the track, and devote himself entirely to his profession of dentist. Lots of men do this when they find they are not quite so fast as of yore, and Huet is not the first racer who has forsaken leg-pulling for the same performance in the tooth line.

CATFORD CHASED RECORDS.

A. A. and F. W. Chase made an attempt upon the hour tandem record November 18, at the Catford track. Owing to the cold wind they were unsuccessful, covering 31 miles 200 yards. Records were cut from six to ten miles. The new figures are: Six miles, 11:09 3-5; seven miles, 13:05 1-5; eight miles, 15:02; nine miles, 16:55 3-5; ten miles, 18:54 1-5.

NEW THREE-SEAT FIGURES.

New triplet records were established from eleven to thirty-four miles at the Crystal Palace track, London, November 21, by Litchfield, West and Frazer. They covered eleven miles in 23:32 3-5, twenty miles in 43:35 2-5, twenty-five miles in 55:25 3-5, thirty miles in 1:07:25; thirty-four miles in 1:18:09 4-5.

SOMETHING LIKE A MIRACLE.

Some one took 300 florins last week out of the Belgian crack Luyten's dressing-room while he was racing, but two days after Luyten received a money order for the amount anonymously.

RAIN IN THE FACE.

Rain caused the final meet at the Memphis Coliseum to be declared off, and the building has been closed for the balance of the winter.

RACING BOARD'S BULLETIN.

SUSPENDED.

For entering races and failing to appear or pay entry fees:

Mose Oshinsky, Decatur, Ill.
P. D. Fitzpatrick, Chicago, Ill.
Will Frappe, Lincoln, Ill.
W. H. Sass, Streator, Ill.
J. H. Ritchie, Waverly, Ill.
Bert Harding, St. Louis, Mo.
William Spinker, Lincoln, Ill.
Frank Wing, Ottawa, Ill.
H. A. Canfield, Terrill, Tex.
Frederick Thompson, Canton, Ill.
H. Linnewrth, St. Louis, Mo.
Jesse Curry, Aurora, Ill.
P. W. Houser, Lincoln, Ill.
H. C. Woods, Chicago, Ill.
Edwin Edwards, Chicago, Ill.
Len H. Conklin, Chicago, Ill.

PROFESSIONALIZED.

A. G. Harding, St. Louis, Mo., Clause B.
W. W. Wuerschmidt, Des Moines, Iowa, Clause A.
W.-J. Cunningham, Fremont, Neb., Clause A.
M. Taylor, Brooklyn, N. Y., own request.

HALL-MARKED CENTURIONS.

The following road records have been allowed by the Century Road Club of America: C. Arnold Wescott, Chicago-Libertyville-Waukegan Century Course, 5:04, August 9, 1896; course record.

Mrs. A. E. Rinehart, 200 miles, 16:18, September 27, 1896; Colorado State record.

C. O. Lasley, Toledo-Clyde Century Course, seven hours, October 11, 1896; course record.

Arthur E. Smith, 235 miles, 264 feet, twenty-four hours, October 24, 1896; Illinois State and American record.

A. W. W. Evans, 50 miles, 2:30:34, August 10, 1896; New Jersey State record.

A. Peischer, New York to Philadelphia, 8:15, November 1, 1896; course record.

A. Peischer, New York to Philadelphia and return, 18:17, November 1, 1896; course record.

LEVIED, THEN LEVANTED.

There is not an extremely bright outlook for the completion of the proposed elevated cycle path over the meadows from Atlantic City to Pleasantville, N. J. The man who conceived the idea, incorporated the company and collected the money on the stock that was sold, has mysteriously disappeared. Those who invested in the enterprise are anxious to learn of his whereabouts. A few pillars were sunk in the meadow marsh and the work came to an abrupt halt for the reason, as stated, that the funds had been exhausted. The projector departed for Philadelphia to interest the Quaker City wheelmen in the project. Since leaving Atlantic City nothing has been heard of him.

RELATIVE GLORY.

"Foh some racers," said Uncle Eph, "win'n' a picnic championship am de top er de ladder ob fame; foh others it am only de fus' roun'."

TRYING AND MISSING.

"Record chasing is a difficult pursuit," remarks the wise man on a daily paper. Perhaps he meant that record is a hard thing to catch.

When hard luck strikes a racer and he gets on his uppers his enemies quit knocking him, but his friends begin.

No successful racer is lucky who has not the ability to be so.

“What Is Reputation!”

exclaimed IAGO.

The REPUTATION of the STERLING makes it easy to sell it at \$100.00, and one sale is always followed by another.

SEMI-PNEUMATIC HYGIENIC.

A prominent physician in an address before the Sanitarium Institute Congress, held recently in England, truthfully said: "The saddle is a very important part of the bicycle, and if badly designed and badly adjusted it makes all the difference between pleasure and pain in riding. Every saddle should be adjusted to suit the person who is to ride, and no two persons like the same position, and ignorance of some of the most common-sense rules on this subject is the great cause of so many complaints of saddle sores and discomfort."

And this is exactly what is claimed by the P. & F. Manufacturing Co., Reading, Pa., for what they call their semi-pneumatic hygienic saddle. In looks it differs little from the saddles offered by any number of makers, but on investigation it can readily be seen that its construction embodies many features that are used for the first time.

The most important claim is for what they call the semi-pneumatic pommel, which, while really containing no air, acts from a mechanical standpoint exactly like an inflated device. It consists of a piece of rawhide, bent into tubular form, one end being attached to the nose of the saddle and the other end to the rawhide lacing in such a way that the weight on the lacing governs entirely the tension of the rawhide pommel. To illustrate: Should a heavy person sit on the main body of the saddle, the tension on the lacing things will tend to make the tubular rawhide pommel harder as the weight increases, making a perfect support, while vice-versa, should a light weight rider occupy the saddle, the pommel immediately adjusts itself to the lessened weight.

The rawhide strings are fastened at their other end to the cantle, affording a lacing that gives perfect ventilation, and at the same time producing a saddle that overcomes the objections of an ordinary pneumatic saddle, there being no rolling motion nor heating, and while the semi-pneumatic feature is entirely mechanical, yet to the touch the pommel feels like an air cushion. The saddle is covered with a leather top, heavily lined with the best saddle felt, and reinforced with additional thicknesses of felt where it is most needed; it is being furnished in a variety of colors, and attracts the eye.

The device is entirely new, and while to the uninitiated at first glance there seems to exist but little difference, yet in actual use it has been demonstrated that it has many points that heretofore have been lacking. The retail price is \$3.

HANDSOME AS ITS NAMESAKE.

Judging from specifications, the "Apollo," made by E. K. Tryon, Jr., & Co., of Philadelphia, will be particularly handsome value at \$75. The frame will be of 1 1/4-inch Mannesman tubing, flushed joints being the rule throughout. Cups and cones will be turned from Singer & Nimick bar steel, and both seat-post and handle-bar will be held in place by a patent expander. Barrel hubs, a two-piece crank-hanger and detachable front and rear sprockets, will also be features.

Each wheel will be finished with four coats of enamel, each coat carefully rubbed to insure a high finish.

The standard hue will be myrtle green, striped in gold, but black, maroon and royal blue will be furnished when desired.

Choice of M. & W., Vim, Hartford and League tires, and of Record and Brandenburg pedals is offered.

Tryon & Co. will, of course, continue to list the Vesper at \$50, and Cycloe and Falry, their juvenile wheels.

A good many people cast their bread upon the waters of the wheel trade, and then go the next day and try to fish it out.

LOOKS A GOOD THING.

It looks not unlike a milkcan, but, as a matter of fact, it has the earmarks of an article that may meet a cycling want—a foot pump, which can be carried in the pocket or toolbag. It is made of rolled brass, is four inches long, two inches in diameter, and weighs six ounces. It is operated by pres-

sure of the sole of the foot, and, it is claimed, will pump six cubic inches of air at every stroke. The article was patented October 27 last, and is being marketed by the Browne Bicycle Pump Company, of this city. The firm has not yet established offices, its address being P. O. Box 372. E. W. Austin is president of the company.

EIGHT MILES A MINUTE.

One of the busiest factories which a pressman enters is the Veeder Mfg. Co., at Hartford, Conn., of which D. J. Post is the moving spirit. They employ about 130 girls and also a number of men in the manufacture of the Veeder cyclometer. The cyclometer was placed upon the market last year, and was well received. The main parts of it are made from a solid bar of steel, milled out, and, as a consequence, a substantial cyclometer is the result. Before leaving the factory the cyclometers are run at a speed of eight miles per minute, in order to test their accuracy and strength.

TIPS CAN NOT COME OFF.

W. B. Jarvis, of Grand Rapids, Mich., has contributed to the cork grip market. His contribution is pictured herewith. It will be noticed that the tips are part of the wood core or bushing, the former being enamelled

in different colors resembling hard rubber. The advantage of this mode of construction is claimed to be the impossibility of the tips breaking or being pulled off. As a starter Mr. Jarvis reports an order for 40,000 pairs from A. Featherstone & Co.

LIGHTING LONDON'S FOG.

W. P. Crary, vice president and manager of the Betts Patent Headlight Company, is at present in London looking after their exhibit at the National Cycle Show, which is being held at the Crystal Palace. While the Betts company's sales in this country have been enormous, their foreign trade has been almost as large.

GONE OVER THE OCEAN.

Exports of bicycles from the port of New York for the week ending December 1:

Antwerp—48 cases bicycles, \$1,303; 12 packages bicycle material, \$401.

Argentine Republic—13 cases bicycles, \$2,008. Bremen—6 cases bicycles, \$395; 5 cases bicycle material, \$500.

British Australia—3 cases velocipedes, \$75; 1 case bicycle material, \$25; 174 cases bicycles, \$11,536.

Brussels—1 case bicycle material, \$13.

British East Indies—1 case bicycles, \$150.

British West Indies—92 packages bicycles, \$4,838; 23 packages bicycle material, \$433.

Cuba—3 cases velocipedes, \$43; 3 cases tricycles, \$51.

Central America—5 cases bicycles, \$420.

China—2 cases bicycle material, \$36; 2 cases bicycles, \$170.

Chili—2 cases bicycles, \$400.

Copenhagen—8 cases bicycle material, \$925.

Dublin—2 cases bicycles, \$275.

Dutch West Indies—2 cases bicycles, \$110.

French possessions in Africa—1 crate bicycles, \$56.

Genoa—2 boxes bicycle material, \$50; 4 bicycles, \$240.

Hull—5 cases bicycles, \$125.

Havre—1 box bicycle material, \$159.

Hamburg—6 cases bicycles, \$445; 35 cases bicycle material, \$3,128.

Liverpool—7 cases bicycle material, \$587; 12 cases bicycles, \$363.

London—49 cases bicycles, \$6,195; 106 packages bicycle material, \$3,708; 4 cases cyclometers, \$175.

Marseilles—1 case bicycles, \$60.

Mexico—1 case tricycles, \$20.

Naples—3 cases bicycles, \$75.

New Zealand—18 cases bicycles, \$1,479.

Southampton—1 case bicycle material, \$11; 99 packages bicycles, \$4,500.

St. Helena—1 case bicycle, \$75.

Santo Domingo—3 cases bicycles, \$160.

St. Petersburg—3 cases bicycle material, \$150.

United States of Colombia—1 case bicycles, \$35.

Venezuela—3 cases bicycle material, \$29; 7 cases bicycles, \$310; 1 case velocipedes, \$10.

Bombay—1 case bicycles, \$55.

Glasgow—1 crate bicycles, \$75.

NEW MAIL'S MERITS.

Eighty-five dollars will continue to be the price of the New Mail.

William Read & Sons, Boston, so announce. The wheel will, of course, embody all the up-to-date improvements.

The frame, upper and lower saddle-post tubes have been increased from 1 1/4 inches to 1 1/2 inches, with 1 1/4-inch head tubes; chain tube stays seven-eighths inch, and rear upper stays three-quarters inch; reinforced flush joints, making an extremely symmetrical, strong and light machine.

Special seamless tubing of a high carbon only is used.

Their two-piece crank-shaft and cranks combined is a new device. By removing a nut on the right side of the hanger, the crank, shaft and sprocket can be removed without change of adjustment or unbolting the chain; the bearings are all fitted with ball retainers.

Their barrel hubs have a new oiling device whereby the balls are always oiled, and dust proof, which is one of the features for 1897.

Adjustable handle-bars, either metal or wood, will be supplied.

Their medium line embraces six styles of machines—24, 26 and 28 inch wheels, with seamless drawn tubing, drop-forging, and all the 1897 improvements, all colors and ornamented.

WOOD-FRAME WANTED ABROAD.

A Holland concern wants a guaranteed low-priced, wood-frame bicycle, exclusive agency for Holland and Belgium. Address C. W. O., care of THE WHEEL.

SEEN AT STANLEY.

What the Britishers Exhibited in England's Opening Cycle Show—Freaks and Novelties.

London, Nov. 25.—More leisure for the inspection of the American exhibits at the Stanley Show has, of course, resulted in the discovery of some points which are worth commenting on. For instance, the Columbia people have a crank-hanger bearing lock nut not shown in their '97 catalogue which is a step toward the direction in which English ideas are trending. In this the bracket face (into which the bearing caps adjust) is recessed to a slight depth, to admit of a ring nut, working on the adjusting disc, jamming against the recessed portion of the bracket end. This, of course, is a locking which demands the use of two spanners to work satisfactorily, but which nevertheless is all right in practice. It has been adopted in principle by the Ormond, Centaur, Elswick, Humber-Goddard and Rudge-Whitworth firms. I commented in my previous letter on the new Columbia spoking system and double plate fork crown. No tandems are on view. Columbia prices on this side range from 24 guineas for Models 45 and 46 to 18 guineas for Models 40, 41, and 42. Hartfords run from 16 to 14 guineas.

One of the most interesting novelties in the Show is the Eadie brake, elevations of which I give here.

Figure 1 is an elevation of the crank and chain wheel as they appear when viewed from the right hand side of a bicycle fitted.

Figure 2 is a sectional elevation taken on a vertical line through the centre of the mechanism in figure 1.

Figure 3 is an elevation of the same parts as shown in figure 1, showing them as they appear when viewed from the opposite side of the bicycle to that from which Figure 1 is viewed.

A is a tempered spring steel band, one end being fastened by the screw D to the web of sprocket wheel, the other end of the band being fastened to the crank by the stud H passing through the web of the sprocket wheel by means of the slot M.

B is a cylindrical drum fastened rigidly to the lower bracket of the bicycle frame.

The drum B is faced with material C, such as leather, for the purpose of taking the friction generated by the band A.

The chain wheel is secured to the crank by the stud H, and the two screws E E having large heads F F, and moving in the slots N N.

Figure 1 shows the crank on the forward movement, as indicated by the arrow. The stud H and the screws E E are respectively bearing against the ends of the slots M and N N.

The action of back-peddalling puts the brake into action, moving the crank in the direction of the arrow in Figure 3. As the crank carries one end of the band with it and the other end remains stationary, the band is reduced in diameter and forced against the face of the drum, thereby reducing the speed of the machine. On removing the pressure exerted in back-peddalling, the band, by rea-

son of its elasticity, will immediately recover its original shape, leaving the clearance gap between A and C, as shown in the drawings.

I give here the Royal Enfield tandem for two ladies. It is self-explanatory in its gen-

eral lines, but the front frame is worth illustrating, as showing a new line in multi-

cycle front forks. As is seen, it is a duplex elliptical fork.

A distinct tendency to adopt the pneumatic brake by the best makers is noticeable. Even Humber & Co. have half a dozen specimens on their stand. As an adjunct to a light machine, it is invaluable, I think.

Another fitting of this kind which is attracting some considerable attention is the Hollis concealed brake.

Figure 4 is a sectional view. A is the handle-bar upon which the sleeve b turns. Sleeve b carries the handle. The end of the handle-bar is provided with the inclined surface d, upon which the bearing pieces d, as shown inside the handle, bear. The bearing pieces are attached to the sleeve b, so that when the handle is turned by the rider the connecting piece e, which is pivoted to the lever f, will operate on the brake-block g through the medium of rod h. The rod h is dropped into plunger tube, the former being fitted with lock nuts, which can be adjusted so as to allow the handle-bar to be raised or lowered. The connecting-rod n is also made adjustable by nut m, so that all parts are adjustable. A loose cap is provided at end of handle to take off, so as to allow for adjustment. A hole is also provided at top of handle-bar to allow for manipulating the quadrant f, such hole being neatly fitted with a screwed-on cap. It will be seen the stalk

p is screwed into handle-bar lug o. The handle-bar is held secure from turning round by thumbscrew q, thus when the said screw is unscrewed three turns the handle-bar can be reversed so as to allow the machine to take less room.

A feature about the brake is, by turning the handle a little further round the brake will remain on, thus preventing the machine from creeping when left standing. Another feature which is novel is that, no matter how far the handle-bar is turned round, it does not disconnect the brake.

"New wrinkles" of English origin there are, of course, but they are not particularly numerous, and ferreting them out is no small task.

The Crescent system of sheet steel stamping for lugs, etc., is very interestingly shown by means of sections. The Crescent No. 30 is one of the tandems of the show.

The Crescent chain adjustment is a very neat affair, consisting of a circumferentially ratchetted washer carrying the axle end rolling along a plate fitting against the outside of the back fork lug. The upper cage of the plate is turned over and ratchetted to correspond. The teeth at the top of the washer engage with this while the lower edge engages with an endless screw working in a socket fastened to the stationary plate. A light cap fits over the whole and gives a neat finish to the device.

The Dayton people have been treated in a rather shabby manner by the steamship Fuerst Bismarck, which seized on midocean as a suitable place to change its crankshaft pattern from single piece to a split section. Unfortunately this has occasioned such delay to the Dayton '97 patterns that those on exhibition at the Stanley Show up to date of writing are '96 stock.

The Ben Hur is a machine which impressed me very favorably. I cannot say that it has any strikingly novel points to recommend it to English eyes, but it has better than mere novelties—a clean, handsome design and a very fine finish. The Envoy, like the Columbia, has flush joint connections which, though undoubtedly neat in appearance, have scarcely any other recommendation.

The Waltham arrests considerable attention because of its huge bearing boxes. The Syracuse is not content to rely on its evident good looks, for the agents furnish visitors with a leaflet stating that the Syracuse Special can be bought for £32—a rather tough figure. The racer is placed at the same figure, and a lady's machine at £28.

The Hunter Arms Co., of Fulton, N. Y., make a modest display about which no attempt at booming has been made.

"Baby" Bliss is the cause of great commotion at the America stall, and women in particular seem to find much satisfaction in surveying his enormous bulk.

This is a very neat eccentric chain adjustment, fitted by the Crown Cycle Mfg. Co., of Birmingham. A is the back for K lug, hold-

ing the eccentric B, which is open in the centre and split at a point underneath the bridle C. C is hinged to the eccentric and is split so as to allow it to swing vertically. D is the internal locking stud working through the hollow end of C by means of the key E. Thus if you want to slacken your chain, D is unwound to allow C to swing upward through the rear wheel, not toward the crank hanger. When the proper degree of tension is secured by screwing D home, F is forced into the split in the eccentric, locking it externally and internally at the same time.

The same people adopt this method of locking their disc adjusting bracket and hubs. B is a spring steel duplex washer. Its inner ring has two flat sides to engage with corresponding flats on the adjusting disc. The outer ring is free and carries B, which in turn carries a pin A. To adjust the bearing B is merely sprung back until the pin A is clear of the pinhole it is engaged with. It is

then turned with the fingers until the required amount of adjustment is secured and B is released, A finding its way out one of the pinholes marked in the flange which forms part of the bracket. It is ingenious, but by no means an 'deal method of fixing bearing discs.

This is an illustration of a machine fitted with the Hollis chain. The chain consists of

arches of sheet steel linked together at the buttress ends so that the chain forms a succession of hinged arches. These engage with sprocket wheels the teeth of which are rollers working on minute adjustable ball bearings as shown. It is claimed that chain friction is minimized by this device, but the specimen shown did not convince me of this.

I do not know whether you have so far progressed in the matter of tube drawing as to be using cold drawn crank hangers and lugs, but to me and a great many more people who visited the Standard Tube Co's stand these articles which I illustrate were absorbingly

novel. The crank hanger shown is drawn, by hydraulic pressure, I believe, from a weldless steel tube of requisite dimensions. The illustrations are not true in so far as the lugs shown should taper away to a knife edge. This was the case in the hundreds of specimens shown to me. The hubs are made

by "jumping" back the tube to form the flange. These parts are claimed to be lighter, cleaner to fit, cheaper, inasmuch as all machinery is dispensed with, and stronger than ordinary stampings or forgings. I confess that I was much impressed with the fittings, and so was every man in the trade to whom I spoke.

One of the most interesting tools in the show is a wheel-building machine exhibited by Churchill, the Birmingham toolmaker. In this machine the rim is put on a plate or chuck, from which radiate clamps which seize the rim concentrically to its centre and in such manner as to be clear of the spokes. The hub, with spokes threaded, is placed in the centre and the free ends of the spokes are engaged with nipples set through the rim. When all are engaged a flexible key working on the same principle as the flexible drill is placed in contact with the nipple heads, and in less than a second each is firmly screwed into its bed. The immovability of the rim insures a correct wheel and equal tension on each spoke. It is not such a labor-saving tool as the hub-forming machine, but it serves its purpose equally well.

"Freaks" are, as usual, in evidence. Here is one, the brilliant conception of some one

who fixes a Crypto gear to the rear wheel of a badly designed safety and kicks backward like a tickled mule.

This is supposed to be a new type of frame

which is going to supersede all others. Content is quite needless.

The inventor of this imagines that by driving off the right side of the crankhanger to

the top of the frame behind the seat lug and transmitting the power from here by a second

chain working on the left side of the driving hub he gets increased power and less friction.

CLOSED FOR ANOTHER YEAR.

London, Nov. 27.—The Stanley Show closes to-day after eight days of bumping gates and good business all round. I have been asking the managers of the various American firms who are exhibiting how they have done in this way, and all express themselves as more than satisfied with their results. A factor toward this improved state of matters has been the presence of Continental buyers, who have come over specially to fix up American agencies. I will not go into figures, although some were given me. From what I saw personally and what I gathered in conversation with Charles S. Sumner, the bright young Continental manager of the Columbia, I should say that the Pope Manufacturing Company has got about the cream of these orders.

BULLING THE PRICE OF EARLS.

The plunging of the now famous "Boom Terah" Hooley in the British tire and bicycle market, has run up the prices of everything connected with English industrial speculation. To such an extent is this so that the market price of British Earls, for figurehead purposes, has risen to almost a prohibitive figure.

A London broker who recently obtained a couple of Earls as directors in a cycle company received \$25,000 as his commissions. As he kept the money himself instead of turning it into his firm's account his partners have brought the case before the committee of the Stock Exchange, thus making public the market price of the commodity.

When you come to consider what American heiresses pay for even damaged specimens of British noblemen, renting them for \$25,000 per pair isn't really such a very steep figure after all.

CANNOT CREEP.

One difficulty that has been found by a number of tire manufacturers is that after a tire has been cemented on the rim it has often crept or slipped, the cement not holding it firmly enough. This creeping has resulted in damage to the tire. The Ideal Rubber Company, No. 28 Rodney street, Brooklyn, who make the American Ideal and Brooklyn Ideal tires, claim that they have overcome this difficulty by the discovery in their laboratory of a new combination which when used to cement a tire on the rim will make creeping an absolute impossibility.

WILL STICK TO HUDSON.

An announcement in a Toledo paper to the effect that the Bean-Chamberlin Company, makers of the Hudson cycles at Hudson, Mich., intended to remove their plant to Toledo, has been emphatically denied by the head of the firm. "There is absolutely nothing in the report, nor any foundation for the same," are the words used in the denial.

To find any other gear, multiply the diameter of driving wheel in inches by the number of teeth in large (front) sprocket, and divide by number of teeth in small (rear) sprocket. This will give the gear in inches.

The above may interest you. It is true that it doesn't advertise Windsor Bicycles, but that isn't what we are trying to do. Our output is sold, and we are just using this space to be good fellows and to keep our name before the public. We are now supplying most of the largest jobbers in the United States with bicycles.

You Find Windsors
Among the Leaders.

HERE ARE THE PIERCE PETS.

George N. Pierce & Co., the well-known Buffalo manufacturers, have their travellers moving and announce their prices as follows:

Pierce Special, three models, seven sizes, \$100; models 34 and 40, in five sizes, \$75; models 10 and 16, in five sizes, \$60.

The firm will make a leader of their \$75 line as of old, and believe they have a winner. The lines are new throughout, the tubing and front forks being of slightly larger diameter, and the whole frame beautifully proportioned.

The Pierce special has flush joints, of the firm's own device, the brazing surface of which makes the joint actually stronger than the tubes they connect.

The bottom bracket is dropped two inches on the racer; wheel base, 43½ inches; tubing of main frame is 1¼ inches; head, 1½ inches; rear stays, ¾ inch, tapered. Perry Humber chain will be fitted on specials.

The Pierce special has new screw cup bearings throughout, of the three-point principle, and the cones adjusting through small openings in the cups, and this opening is sealed against entrance of dust by a thick felt washer. Ball-retaining washers are provided in crank-shaft bearings. The Pierce special hub is of the flangeless pattern, with the Pierce patent T-head spoke, with which spokes may be readily replaced. Oil is applied through self-closing oil cups and carried directly to bearings. An improved detachable sprocket, with the well-known Pierce "L" crank-shaft, having crank-axle and left crank forged in one piece, will be used. The right crank and sprocket-arm are one solid forging. The new handle-bar clamp is cleanly designed and looks reliable. An unusually fine finish characterizes the Pierce special, and the regular finish will include full nickel front forks. The Pierce special will include Garford padded, Christy anatomical, and Mesinger saddles in saddle equipment. As usual, the firm will use the best materials obtainable.

The Pierce \$75 models are of the same design as the special, and are precisely the same in design of frame. Pierce patent bottom bracket, rear fork-end forgings, saddle post cluster, head clamp, adjustable handle-bar, fork crown, sprockets and cranks. The bearings, however, are different and of the Pierce two-point straight-line system. The cones are of smaller angle than last year, and the flanges are flush with end of hub, where oil is applied. Crank-shaft adjustment is made by means of cup, and locked by bolt underneath bottom bracket. The Pierce bottom bracket with its peculiarity of brazing walls inside the bracket will be retained in improved form. This device has been used by the Pierce company the last four years with perfect success.

The \$60 models include men's in three sizes and ladies' in two sizes, with options in equipment. Main frame, 1½ inch, head, 1¼ inch, and single or double fork crown.

A new and distinctive name-plate will be used on all models.

To better serve their extensive Eastern interests, the New-York branch will carry a complete stock and make shipments direct to customers in that section, and their important New-England trade will be well supplied from a large stock carried at the Boston branch.

GENTLY NOTIFIED.

Gentle warnings are being conveyed to makers of flush jointed bicycles by the Barnes Cycle Company. The Barnes joint is patented and will be protected.

The rider whose wheel causes him to go to the repairer often gets broken at last.

WINS ON ITS MERITS.

While other changeable or two-speed gears have come and gone after having attained temporary prominence or created fitful comment, the good old Bi-Gear has pursued an even tenor and would surely smile serenely if gears could smile. It alone remains permanently before the public, which means that it has attained a profitable degree of popularity. Its makers, the Brown-Lipe Gear Co., Syracuse, N. Y., has followed the "keeping everlastingly at it" policy, which deserves success, and seldom fails to score. They have kept the gear constantly abreast of times, and kept pace with cycle improvement generally. The '97 Bi-Gear, which is now being shown the trade, shows this very nicely.

Dustproof bearings were called for by a good many users of the Bi-Gear during the past season, and the Brown-Lipe Co. has met the demand, the most important of the new features being, perhaps, the enclosing of the ball-bearing on the sprocket side of the hub. Heretofore this bearing was exposed when the low gear was in use. Now all ball-bearings are as dustproof as those in the ordinary bicycle hub. A neat spring oil cup has been placed midway between the

The Bi-Gear will be made in any width of hub desired, drilled for any number of spoke holes, with sprockets to match any of the 15 to 20 makes of chains in general use, either in 3-16, ¼, 5-16, or ¾ inch widths, in 7, 8 or 9 tooth, with the necessary length of axle, made to fit the numerous sizes of slots in fork ends; also flatted at the proper angle of the fork end it must fit; with shifting rod to match the height of frame desired, and clip to enclose the size of tubing used in the top tube of the frame. In fact, what the bicycle manufacturer has to do for his own rear hub, the Brown-Lipe Gear Co. has to do for all of the hundreds of kinds of bicycles made. The possibility of fitting all makes of wheels without necessitating any alteration of the latter is the result of exact calculation and a perfect system of construction.

The company makes nothing else in the bicycle line at its factory in Syracuse, and its changeable gear, which is now thoroughly well known, is entering upon its fourth year in the market.

NEVER SUIT.

There are two things that it's never safe for one woman to recommend to another—a bicycle and a dressmaker.

Brown-Lipe Bi-Gear Parts.

spoke flanges, conveying the oil into a brass tube surrounding the axle, and thence directly upon the balls. Another most important improvement is the different construction of the axle. Last season the stationary cone in the axle and locking lugs were made in one piece and slipped on over the axle. The consequence was that when the cone was sufficiently tempered to stand the wear, the locking lugs were made too hard and occasionally were brittle. This was found to be the only weak spot in the gear, though it was rarely that one of these lugs were broken. For '97 the lugs will be made a part of the axle, out of tool steel. The cone alone will be made separate, so that it may be hardened to any degree necessary. The shape of the step end of the hub has been altered by making the edge square instead of round or bevelled, thereby improving its looks. The principle of the gear will, of course, remain the same, for its makers believe that nothing simpler can be produced. In high-speed position there is no more gearing than is contained in any bicycle hub and in low speed there is only a "two point contact," which is next to no gear at all, and produces the least possible friction in a gear.

AMERICAN ALL THROUGH.

Since the McCool Tube Company came into possession of the old Eclipse bicycle factory at Beaver Falls, Penn., the property has undergone considerable change and been materially added to. One building, 336x60 feet, is among the additions, which will give a fair idea of the capacity of the plant. A new turbine water-wheel of 150 horse-power has been added to the motive force. This connects with a large Westinghouse electric generator that is capable of delivering 20,000 horse-power, and the power is distributed among twenty draw benches, which are fitted with separate motors, so that, instead of the customary shafting and miles of belting, electricity in its most modern form is used. The McCool product is made entirely from American stock, and much is claimed for it. A piece of 17-gauge is shown that has stood a Government test of 10,000 pounds pulling strain before it broke, also a piece of 21-gauge which resisted a water pressure of 4,200 pounds to the square inch before it developed a fracture. The tubing is very finely finished both inside and out, and makes one marvel how it is accomplished.

These be volcanic and troublous
times, but Public Confidence in

LOOKS, RUNS AND RIDES WELL.

"Runs like a palace car" is one of the leading claims made by the Invulnerable Tire Manufacturing Company, Northville, N. Y., for their new tire, the Invulnerable. They might with reason add "and built on modified

principles thereof." The illustration conveys this idea. Springs take the place of air and, of course, the tire cannot be affected by punctures or "blow outs."

GONE HOME HAPPY.

One Englishman who will eat his Christmas dinner abroad is Edward Warwick, of the famous Warwick family, who sailed on Saturday last aboard the Campania. Mr. Warwick has been in this country for several months and has made a pleasant impression socially, but in a business way he carries back with him a splendid testimonial, presented to him before he sailed, by the officers and directors of the American Weldless Tube Company, of Toledo, Ohio. Mr. Warwick founded and built this plant.

RED-HOT SUPPLIES.

To an extensive line of fire pots, torches and the like the Union Heater Supply Company, Detroit, Mich., has added a gasoline forge, a brazer and an enamelling oven, which are worthy of the consideration of the cycle trade.

COMBINED EXCELLENCE.

"Kenzoline," an oil suitable alike for illuminating or lubricating purposes, is produced by the Kenzoline Oil Company, No. 621 Rialto Building, Chicago. It is worth a trial.

WILL HANG ON.

Cheap, where the word is used to express inferior, wrenches have long been intimately and unfavorably known to wheelmen. The accompanying cut is a little less than one-half the actual size of a wrench the Anchor Wrench Company, of Milldale, Conn., have turned out to take the place of these cheap and unsatisfactory wrenches.

Three things aside from its design, say the Anchor Company, enter into the construction

of this wrench and combine to make it the satisfactory tool that it is. These are high grade steel, skilled workmen and modern tools. Further, the makers point out the strength of the wrench is increased by the sliding jaw with long bearing surface; that the adjustment is rapid and positive; that it includes a large and small wrench in one; that it is made of high grade steel, case hardened, and that it is polished and heavily nickelled.

SIMPLE AND SATISFACTORY.

It is difficult to conceive how anything of the sort could be simpler than the Snow bicycle holder or wall bracket, made by the Snow Wire Works, Rochester, N. Y. The

illustration speaks for itself. As will be seen the Snow holder when not in use may be "turned toward the wall" and thus be out of the way.

SUIT FOR SADDLE INFRINGEMENT.

H. A. Christy has commenced suit against the Hygeia Bicycle Saddle Company, through his attorneys, Butterworth & Dowell, of Washington, D. C., for infringement of patent No. 532,444, dated January 15, 1895, on the Christy Anatomical Saddle. The case will be tried in the Circuit Court of the United States for the District of Maryland. Mr. Christy has filed a bill in equity with the usual prayers for an accounting and damages and that the defendants be enjoined against the further manufacture, use or sale of the alleged infringing device. Appearance has been entered for the defendants in the suit and the case is now awaiting the filing of the defendant's answer.

Conqueror Hose-Pipe Tires.

No better Hose-Pipe Tire made than the Conqueror. For easy, luxurious riding, combined with the advantage of quick repair, it has no equal.

Flexifort Double-Tube Tires.

Handsome, durable and low priced. This is the third year for the Flexifort. It has stood the test of time, and is unequalled for its splendid wearing qualities. The patented circular, seamless, woven fabric used in its construction increases strength while reducing weight, and minimizes chances of punctures.

Inner Tubes for all makes of Tires.

We confidently assert that our Tubes are unquestionably the best on the market.

OHIO.

Akron.—Ranney Cycle Company. Assignee files report showing assets, \$5,141 60; liabilities, \$4,883 78.

Cleveland.—The Corcoran Sprocket Wheel Company, incorporated by Otis Southworth, Richard M. Corcoran, A. W. Foote, E. B. Baker and Benjamin C. Starr, to manufacture and deal in bicycle supplies; capital stock \$1,000.

Cleveland.—The Kelley Handle Bar Company increased capital from \$12,000 to \$25,000.

Toledo.—White & Ashley. Dissolved.

OREGON.

Portland.—H. P. Goering & Co. Sued for \$192.

PENNSYLVANIA.

Allentown.—Earle B. Douglass, new store at No. 618 Hamilton street, February 1.

Philadelphia.—Penn Bicycle Company, reported judgment for \$6,695.

Philadelphia.—Penn Cycle Company (H. D. Le Cato), No. 1,343 Arch street. Now operated as Warwick Cycle Manufacturing Company, Springfield, Mass., with John Le Cato as manager, having been bought in by them under execution on one-day judgment note, \$6,500, in their favor.

QUEBEC.

Montreal.—Wilson, Matthews & Morris, dissolved.

SOUTH CAROLINA.

Columbia.—Richard & Mixson. Assignee advertised sale for December 5.

TEXAS.

Galveston.—Galveston Cycle Company reported sued for \$946.

VERMONT.

Rutland.—Coolidge & Morse dissolved. Coolidge continues.

WASHINGTON.

Seattle.—Seattle Cycle Company. Meeting of creditors and change of assignee petitioned for.

WISCONSIN.

Janesville.—F. Randal & Son will establish a bicycle factory.

LaCrosse.—Holte & Steves, repairers, dissolved. Steves continues.

LaCrosse.—J. C. Holte purchased and reopened the Krebaum bicycle surgery and factory at No. 227 N. Third street.

Milwaukee.—Elmwood Cleyde Manufacturing Company, incorporated by George F. Cramer, P. J. and J. N. Salentine, to manufacture bicycles, water bicycles and pleasure boats. Capital, \$20,000.

Milwaukee.—Chapman Manufacturing Company incorporated to manufacture and sell bicycles, by E. M. P. and J. A. Chapman and Lindley Collins. Capital, \$5,000.

THE WHOLE THING.

The "Thomas family," fathered by the Thomas Mfg. Co., Springfield, Ohio, are figuratively making their salute this week. The "family" includes wheels for the boy and girl as well as for the heads of the house, and some interesting information is promised all who seek an introduction.

HAS THE BEST OF BACKING.

The plant of the Albany (Ind.) Manufacturing Company, in which R. L. Coleman, Charles F. Smith, R. Philip Gormully and others equally prominent are interested is practically completed. An excursion from Indianapolis is on tapis, that the Hoosiers may witness the process of tube-making.

WORTHY OF THEIR NAME.

After passing through the Sterling refinery the '97 Sterling is now in evidence. No radical alterations are noted, but it is plain that painstaking effort has been made to maintain the high standard and keep the wheel true to its name.

The Sterling Cycle Works have summed up the improvements and general features in this concise fashion:

Sprockets—Rear detachable; front formed of spider and ring, enabling rider or agent to change gear without removing pedal or crank. The spider fits over crank shaft, its lugs engaging with the lugs on the latter; the spider is forced on and held firmly by outside lock nut. The sprocket ring is fastened to spider by screws and nuts.

Gears—Run from 68 to 84 on road models, 80 to 96 on racers, 60, 65 and 65 on ladies. Rear sprockets, 7, 8 and 9 tooth; front, 20, 21, 22, 23 and 24.

Chain—The Morse roller bearing, considered to be the nearest approach to perfection and most expensive in construction.

Cranks—Fastened as in '96. Shaft eye, half round, half square. Square in design instead of the usually accepted flat construction; are tapered to pedal end, light and extremely graceful in appearance.

Spokes—Four more in each wheel, direct tangent, pull from the well known Sterling corrugated hub. The lines of the corrugations have been changed somewhat, making a decidedly

improved and graceful outline to the hub flanges.

Front hub—Increased in diameter to a full barrel, with automatic oiling device.

Pedal—Special new dust proof device at crank end.

Oiling—The jewel oiler in crank shaft of '96 has been carried to the pedal pin, making all oiling connections on the Sterling of automatic construction, doing away entirely with oil caps or clips.

Bearings—Are ground to a perfect circle and polished to a jeweller's finish. Specially gauged balls are used throughout. Felt washers throughout, but may be removed at option of rider without affecting wheel any. The hanger bearings are equipped with ball retainers of simple but effective construction.

Handle bars—Both metal and wood in latest and most popular shapes.

Rear stays—Upper tubes increased to 11.16 and lower to 3.4. Lower also of the "D" tube construction, allowing the use of larger tires when desired.

Saddles—Hunt, "X," "XX," "5X"; Garford, "V" and "T"; Brown Road and Racing.

Rims—The Boston laminated. Gear cases—Clearance has been made for gear cases so that agents may be able to fit them when desired.

Fork—We believe we are the originators of the arch-crown construction. Our fork has been so well known as to need little description. The fact that it is being so universally copied attests its value. We manufacture it of one piece of tubing, drawn and tapered to its delicate lines, reinforced by outside sleeve of tubing at the crown point, connected to stem by a solid drop forging, forming collar at connecting point, the strongest construction known to this specie of fork. Having originated and made certainty out of experiment, we retain it as a valued part of our '97 model. Patent pending.

Racer—Will not be exhibited until Cycle shows; will be a distinct model for racing purposes solely; will have three inch deep to hanger; shorter wheel base; low frame and other features not ready for announcement.

Material—No single item of expense is spared in the '97 model. The best has been secured in every instance regardless of cost. Our reputation on these lines is already well established.

LOOK OUT FOR BONE SELLERS.

Rogers & Hubbard, who make granulated raw bone for case-hardening, are mad. Some one has been visiting the trade and offering the material for less than they are wont to sell it. This particular raw bone is the result of eighteen years of experimenting and experience, and the concern did not relish the imposition. They have no travelling agents selling the article. It is sold directly from the Middletown, Conn., factory, and any agent who claims to represent the concern or to be in position to book orders, is a fraud pure and simple, and should be treated as such.

SHOULD PAY WELL.

The St. Louis Cycle Co., No. 1,111 Olive street, St. Louis, Mo., starts well. Their line includes such wheels as the Ben Hur, Viking, Falcon and Caesar. The business has been incorporated and the company will issue 5,000 shares of stock at \$10 per share. Six per cent is guaranteed to subscribers on preferred stock for the first year. Subscriptions have been invited.

Although under another name, the business is under the management of the Beck & Corbitt Iron Co., for more than fifty years one of St. Louis's best known concerns.

READY FOR BUSINESS.

"Bicycle Works" has been added to the title of Snyder & Fisher, the well-known manufacturers of Little Falls, N. Y., whose '97 product is already in evidence. The Swell Newport is again listed for \$100, and the concern will also manufacture a \$75 and \$50 wheel; also, a line of juveniles at \$35. It is not generally known that Snyder & Fisher have long been expert manufacturers of knitting machinery, an industry calculated to imbue attention to the smallest details.

WITH TRIANGULAR REINFORCEMENT.

J. R. Boice, Toledo, Ohio, is marketing the Boice non-puncturable tire, "the tire that takes," it is heralded. It is a single tube with an almost triangular reinforcement of non-puncturable material, the rounded apex of the triangle being the tread. It does not appear in the least freakish and the catalogue creates a favorable impression. Mr. Boice offers a pair of his tires free to the first person supplying the missing word in the phrase, "The — Tire."

NEW PATENTS.

572,137. Bicycle brake. Clinton W. Terpening, Bedford, Iowa. Filed February 11, 1896. Serial No. 578,894. (No model.)
 572,163. Bicycle saddle. Mary F. Henderson, Washington, D. C. Filed May 18, 1896. Serial No. 591,972. (No model.)
 572,164. Bicycle saddle. Mary F. Henderson, Washington, D. C. Filed June 8, 1896. Serial No. 594,741. (No model.)
 572,208. Bicycle. William A. Lorenz, Hartford, Conn., assignor, by mesne assignments, to the Pope Manufacturing Company, same place and Portland, Me. Filed April 25, 1894. Serial No. 508,954. (No model.)
 572,226. Bicycle handle. James C. Spiegel, Middletown, N. Y. Filed October 25, 1895. Serial No. 566,814. (No model.)
 572,273. Sliding Saddle Support for Bicycles. Oscar Peterson, Paterson, N. J. Filed May 21, 1896. Serial No. 592,434. (No model.)
 572,288. Umbrella Attachment for Bicycles. Mary A. Hicks, Hartford, Conn. Filed February 26, 1896. Serial No. 590,916. (No model.)

572,355. Bicycle Tire Cleaner. William H. Clark, Providence, R. I. Filed August 3, 1896. Serial No. 601,491. (No model.)
 572,376. Machine for Finishing Spoke-Nipples for Bicycles. Charles E. Roberts, Oak Park, Ill. Filed January 27, 1896. Serial No. 577,056. (No model.)
 572,379. Bicycle Bell Clamp. Frederick A. Scranton, East Hampton, Conn., assignor to the Bevin Brothers Manufacturing Co., same place. Filed January 6, 1896. Serial No. 574,490. (No model.)
 572,385. Ball Bearing. Harry A. Stephens, Missoula, Mont. Filed June 17, 1896. Serial No. 595,839. (No model.)
 572,398. Bicycle Propelling Mechanism. Thos. J. Armstrong, Cleveland, Ohio. Filed November 8, 1895. Serial No. 568,268. (No model.)
 572,423. Bicycle Skirt. Julius N. Lewinson, New York, N. Y. Filed February 4, 1896. Serial No. 577,984. (No model.)
 572,430. Electric-lighting Mechanism for Bicycles. Francis E. Magee, Brooklyn, N. Y. Filed March 25, 1896. Serial No. 584,852. (No model.)

572,432. Saddle for Bicycles. James A. Maloney, Washington, D. C. Filed June 20, 1896. Serial No. 596,333. (No model.)
 572,450. Bicycle Bell Clamp. Edward D. Rockwell, Bristol, Conn. Filed September 12, 1896. Serial No. 605,603. (No model.)
 572,463. Bicycle Tire. Robert S. Williams, Merchantville, N. J. Filed June 8, 1896. Serial No. 594,725. (No model.)

DESIGNS.

26,360. Thimble for Bicycle Fork Ends. Charles F. Mellink, Toledo, Ohio, assignor to the A. L. Moore Company, Cleveland, Ohio. Filed September 8, 1896. Serial No. 605,193. Term of patent fourteen years.
 26,361. Clamp for Bicycle Handles. Lewis P. Halladay, Marion, Ind. Filed May 9, 1896. Serial No. 590,950. Term of patent three and one-half years.

GOOD GUARDS WANTED.

The Frank T. Fowler Manufacturing Company, of Worcester, Mass., are in the market for a first-class chain guard for their "Ladies' Trinity Safety," also for mud guards for both ladies' and gentlemen's "Trinity."

The Cyclers' Delight.

Wanted—All cyclers, who contemplate going South this winter, to write to E. M. Mallette, Thomasville, Ga., for information, interesting and valuable to wheelmen. Thomasville, "the Great Southern Winter Resort Among the Pines," has an endless number of miles of varied and beautiful bicycle roads. Any other information about the place will also be cheerfully furnished.

Kindly mention The Wheel.

OUR '97 GRIP

Is MADE RIGHT and STAYS RIGHT.

It has a wood bushing extending through the cork, and far enough to receive the tip at each end, thus obviating the danger of the handle breaking off at the tip, a nuisance and expense so often experienced in other makes.

A, or first quality, 50c.; B, or second quality, 40c. per pair, postpaid.

Special Discount to Dealers and Manufacturers.

The Grand Rapids Bicycle Grip Co.

153-155 CANAL STREET,

GRAND RAPIDS, MICH.

Kindly mention The Wheel.

SPECIAL NOTICE.

WE have succeeded, after many careful experiments, in producing a Tire Cement which will make the CREEPING OF TIRES A THING OF THE PAST. ❀ ❀ ❀ ❀ ❀

We will be pleased to mail samples upon application. ❀ ❀ ❀ ❀ ❀

IDEAL RUBBER CO.,

...Manufacturers of...

AMERICAN IDEAL and
BROOKLYN IDEAL TIRES.

OFFICE:
28 Rodney Street,

FACTORY:
631-637 Kent Avenue,
BROOKLYN, N. Y.

Kindly mention The Wheel.

DEATH FROM COMPLICATIONS.

A. W. Gans, of Fairchance, Penn., sustained a hard fall while competing in a road race in October, the result of which caused his death last week. While descending a steep hill his foot slipped from the pedal and caught in the wheel, throwing him to the ground. His knees and elbows were severely cut and blood poisoning set in. Typhoid fever and rheumatism followed, resulting in death.

SEEKING POLE PRIVILEGES.

French wheelmen are endeavoring to obtain from the French telegraph authorities the same privileges which were granted to the Italian Union, namely, that boards for the guidance of cyclists may be placed on telegraph poles. France has something over five millions of such poles.

FOR CENTURIONIZING SOLELY.

Five hundred and six centuries were ridden by the members of the Century Cycling Club, of Baltimore, this year against 210 last year. S. M. Warns heads the list with 116 century riders to his credit. Apart from an annual dinner the club's only apology for existing is to promote 100-mile rides.

HAD EXCELLENT TEACHERS.

Manager—You've learned to fall in that death scene much better than you did two weeks ago.

Leading Lady—Yes. I've been practising crossing the Boulevard on Sundays when the sorchers own it.

AN IMPROVED PIONEER.

The Christy saddles, the pioneers of the anatomical pattern, have not only undergone considerable improvement during the season,

but several new patterns have been added to the line. The most noteworthy improvement or addition, perhaps, is the spiral spring seat shown by the cut. It is made for both gen-

tlernen and ladies, that for the latter having practically no pommel. The flat spring patterns will, of course, be continued, and, as ever, A. G. Spalding & Bros., New York and Chicago, will market them.

PLACING HIMSELF HISTORICALLY.

Amid the smoke of cheap cigars, the blare of a zim-boom band, and the screeches of a host of callow, beer-frothed kids, a colored professor won a professional race in Madison Square Garden.

Prouder than any peacock the smoke-colored victor was interviewed and congratulated. Figuratively removing the laurel from his brow the proud winner thus summed up his victory.

"Yes, sah, I'se jés' like de celebrated Mr. Napoleon, who, after de battle of Bunker Hill said, 'Sic senper tomatius;' I came, I saw, I got there."

FOR PINE TREE PEDALING.

Thomasville, Ga., "the great winter resort among the pines," wants wheelmen and wheelwomen to winter within its gates. The Business League elsewhere in this issue extends the invitation. Specially built cycle paths and driveways abound, and the balmy and salubrious climate permits cycling the year round. Thomasville, too, is within easy distance of the more expensive Florida resorts.

NO CRIMSONITE TEAM.

There will be no Crimson Rlm racing team next year. The Syracuse Cycle Company will withdraw entirely from the racing field. Instead of racing men, President Bowe states that travelling salesmen will be employed. Already fourteen of them are on the road, and sixteen more will follow.

WHERE CYCLISTS RISK THEIR LIVES.

This is a scene that occurs several hundred times each day in the premier city of the New World—New York—on Eighth avenue, between Forty-ninth and Fiftieth streets. Few cyclists there are who do not know the spot too well and to their great inconvenience and bodily discomfort. The Eighth avenue railway car stables are located there, and, as if the odor that ever fills the air was not sufficient, the railway company, through some indefinable influence, is able to maintain the only block of rough pavement in nearly seven miles of asphalt. The stones are insected and bisected by a multiplicity of tracks, are uneven in the extreme, and in damp weather

treacherous to the limb-imperilling point. They rack the body and extinguish the lamp. Car horses are being changed there almost constantly, which adds to the danger; artful dodging on the cyclist's part is a prime necessity. The picture is not overdrawn. Time and again have the railway officials been appealed to to lessen the evil, but although promises have been made they have never been even

partly fulfilled. It is now understood that the L. A. W. consulate is considering a proposition to have the place condemned as a public nuisance. It is to be hoped that the suggestion will not die a-borning. The place is a nuisance, an unmitigated nuisance of the worst type, and decisive action is sadly needed. Forbearance has well long ceased to be a virtue. If any of the "great dailies" which are so keenly competing for cycling favor desire to strike a popular chord, an attack on this pest-spot is respectfully and earnestly recommended. It will meet with quick and hearty response. Perhaps 2,000,000 cyclists and carriage drivers pass the place annually, which, as THE WHEEL once before remarked, means 2,000,000 years of discomfort within each twelvemonth.

WAVERLEY WAYS AND PRICES.

One hundred dollars will be the price of the Waverley bicycle, that is, the leader, during the year 1897. In the past \$85 was the price. The increase was not suspected or foreshadowed, and will prove a genuine surprise. The Indiana Bicycle Company will, however, also market a Waverley at \$60, "a price lower than ever before quoted for a bicycle of equal quality"; in fact, it is the \$85 wheel of the current year, considerably improved.

The Indiana people state their case and give an insight into their new features in these terms:

"In fixing our prices we have not been governed by the action of others or influenced by the competition of goods which bear no relation to the mechanical excellence of our splendid new models. We have rather given due consideration to the present cost of all materials entering into the make-up of bicycles of highest quality, and more particularly to the expense of our new construction, which is materially increased over ordinary methods by the necessity of securing extreme nicety of fit in all vital parts, and which we consider fully justified by results, and which we believe will at once be evident to every mechanic and appreciated by every rider who examines our work.

"List prices have generally borne little relation to actual value. It is as easy to catalogue a bicycle at one price as at another. The public is learning to discriminate, however, between real values and the fictitious values indicated by many price-lists which are never maintained and are only published to deceive.

"We have always endeavored to fix a fair price for Waverleys, and in announcing our price we desire to express the opinion that it is impossible, in the present state of the bicycle building art, for any establishment, however well equipped with modern machinery and facilities for economical work, to construct a bicycle from such material and with such methods as have been found necessary through the introduction of our improved devices, and sell it to the rider for less than \$100, still leaving a reasonable profit for both maker and dealer.

"Without attempting a complete description of the changes embodied in our new construction, we will state that we introduce a principle in our crank-bracket and hubs by which all threaded cones are replaced by sliding shells, hardened and then ground true, thus securing absolute alignment and concentricity. The new Waverleys may be said to be actually ground together, and this process, as opposed to the old method of lathe-turning, we believe is destined to bring about a radical change and improvement in shop methods.

"By the use of an ordinary screw-driver the crank-shaft combination can be dropped apart in a few seconds, freeing every piece, including the sprocket, and leaving both rings of balls, which are retained in place, accessible for cleaning. The chain can be adjusted or the wheels entirely removed from the frame without interference with the bearing adjustment. The bearings are more nearly dust-proof than anything yet produced, and the tread has been reduced to 4 1/4 inches, with ball races separated to the extreme limit. This construction must be seen to be fully appreciated. The machines are well worth waiting for, and will repay careful study.

"All Waverley frames will in future be constructed of Albany tubing, the product of the Albany Manufacturing Company.

"Our leading machines have 1 1/2-inch tubing and smooth frame joints throughout. They will be regularly equipped with the new Record extension pedals, and wide options will

be given in tires, saddles and handle-bars of the latest and most approved patterns. The same care will be given to finish that has always characterized the Waverley, and the modest silver name-plate that has been typical of the general elegance of Waverley finish in the past will be retained.

"We designate our standard machines as Waverley No. 10 for men, and No. 12 for ladies, and supply the No. 10 in three heights of frame—23 inches, 25 inches and 27 inches—while No. 12 has two heights of frame—20 inches and 22 inches.

"Our second line will be designated as Waverleys Nos. 14 and 15. They are the Scorcher and Belle of 1896, brought up to date by such minor improvements as a season's experience has suggested, but not materially changed. They are fitted with new two-point bearings so constructed that the balls are retained when parts are removed, new saddles and adjustable wood handle-bars. They are built of the best material, carefully inspected, and will compare favorably with most of the higher-priced 1897 machines on the market."

SIDE MOTION IMPOSSIBLE.

Parkhurst & Wilkinson, Chicago, are marketing a new hygienic saddle, the invention of Lewis T. Cornell, which has been christened the University Anatomical Saddle. It is made in six styles designated Chicago, Cornell, Yale, Harvard, Vassar and Northwest-

ern. The saddle is so constructed that the respective sides move with the limbs. When one side is pressed down the other must be up, preventing the rider from sliding forward. Side motion is impossible and the rider using it, it is claimed, has a feeling of security as well as comfort. It is made of

either wood or aluminum, plain and padded, presenting a handsome appearance. The wood saddle can be enamelled to match the frame of the wheel. The pads are so adjusted that they can be removed if a hard saddle, which many find the most comfortable, is desired.

FROM MILK TO MANUFACTURING.

O. B. Hachenberger, Denver's crack rider, has entered the cycle trade. Last week he acquired an interest in the Denver Cycle Manufacturing Company, and will hereafter devote most of his time to making bicycles and on general repair business. The wheel will be called the Denver.

LETTING THEIR LIGHTS SO SHINE.

In no department of the cycle trade has more improvement been shown than in the construction of cycle lamps. Competition has increased rapidly by the advent of new lamp firms in great number during the last year. Most of these firms had been long established in other branches of the brass and lamp trade and they were able to build and put on the market a lamp which at once became a serious competitor of the best cycle lamps.

The Manhattan Brass Company, No. 338 East Twenty-eighth street, New York, have been building cycle lamps for several years,

and in showing their '97 line, which consists of four models, the Dazzler, the Improved Cyclops, the Unique and the Frontlight, they prove that their work and experiments during the last season have not been thrown away. Their Unique is a lamp of novel shape. It is built in two separate pieces, body and front, and opens and shuts like a watch and is thoroughly dust proof. All the lamps show larger lens-holders, larger reflecting surfaces, new sliding jewel side lights, a patent spring in the wick tube which prevents the wick from dropping, and a number of other improvements.

POLISHED AT THE FACTORY.

The Bloomsburg (Penn.) Tube and Copper Company, who recently made their best bow to the cycle trade, are well pleased at the reception accorded the fruits of their labor. The finish of their tubing is a feature. All stock is highly polished before shipping, which, in addition to its attractive qualities, serves an even better purpose; it reveals the grade of the material and makes apparent any defect that may exist.

FAT-HEADED WIT.

"No man who rides a bicycle," observed the fat-headed man, "is ever more than half right."

"Oh, come now," began the man with howling checked golf suit.

"The other half," continued the first speaker, "is left."

Then they all drank at the golf-clothed one's expense.

KNOWS THE GAME.

W. H. Reuf and the Fenton Metallic Manufacturing Company are now closely related. Mr. Reuf having lately engaged with that company as superintendent of their factories at Jamestown. He has had previous experience in a similar capacity and knows the game thoroughly.

WALKING SPANISH.

A Spanish judge, according to a foreign contemporary, has just fined a cyclist for knocking over a seven-year-old boy, although the cyclist proved that he rode slowly, rang his bell and used his brake. The judge decided that a cyclist must dismount when the pedestrian could not or would not get out of the way.

BRIEF BITS FOR BUSY MEN.

Queer people the French! The Paris Cycle Show opens on Christmas Day.

The only planoid level gear cutting machine at present in existence is in use at the Philadelphia Gear Works.

Under the new Victoria (N. S. W.) tariff regulations lamps and bells for cycle use have been placed on the free list.

Bicycles are carried by the Belgian State railways as baggage for any distance at the uniform charge of 15 cents for singles and 30 cents for tandems and triplets.

Of the \$2,745,000 worth of bicycles Americans exported during the nine months last reported by the Treasury, \$1,020,000 went to the United Kingdom of Great Britain.

The parts makers are enjoying quite a foreign trade just now. Parts to the value of over \$30,000 have been exported within two weeks, principally to Australia, England, Belgium and New Zealand.

If cycle manufacturers contemplate exhibiting at the Brussels International Exhibition, 1897, they should lose no time in communicating with the Executive Commissioner of the exhibition in Brussels.

In exporting machines and parts, where rust and tarnishing must be avoided, the use of specially prepared pitch paper for case lining will be found as effectual as metal for preserving goods, and is lighter and more convenient.

At the recent meeting of patent agents in London Mr. J. Sinclair Fairfax said that the cycle industry now gives employment to nearly 33,000 workpeople in Birmingham and Coventry alone, and that the total output in England is about 750,000 wheels per annum.

When a bank pays a forged check without requiring identification or preserving any evidence of the identity of the person to whom it was paid and indorses and sends it to the bank on which it is drawn, the latter upon discovering the forgery after having paid the check can recover the amount from the former bank.

The certification of a check by a bank is in effect merely an acceptance, and creates no trust in favor of the holder, and gives no lien on any particular portion of the assets of the bank; but, if done after delivery, it takes the amount of the check out of the hands of the maker and any loss from insolvency of the bank falls on the holder.

During 1895 Austria exported 1,800 machines and imported 2,300; in 1894 the import was 3,646; nearly one-half of the imports of 1895 came from England and a similar number from Germany, leaving a small number of French-made machines to make up the total. During the present year the imports have been still further diminished, and the exports increased.

A novel boat was launched recently at the wharf of the National India Rubber Company, at Bristol, R. I. The boat is made of large pneumatic tires, and is about twelve feet in length. It is fitted with rowlocks for two sets of oars. It is owned by a man named Layman, and has just been completed at the works of the National India Rubber Company. It was tried and worked well.

Recent official reports from Austria enumerate nearly twenty cycle manufacturing concerns in that empire, the largest being the Austrian Small Arms Company, of Steyr, which in 1895 produced about 8,000 machines and this year has probably doubled this output. The next in importance are Juch & Co., of Gratz, Moravia, and R. Gregor, of Vienna. The mere assemblers are not included under the term of manufacture.

One of the most annoying things hitherto about the wheel trade with Mexico was the intricate system of State tariffs. Not only were bicycles required to pay the Federal tariff at the frontier, but each State made its own tariff laws on pretty much any basis it saw fit. Now these interstate tariffs have all been abolished the past month, and only the Federal tariff is collected at the point of entry into Mexico.

The cycle trade in Italy is not in a flourishing condition just at present. Owing to very bad weather which prevailed there during the last months of the season, the crops have been seriously damaged, so that money is very scarce, Italy being mostly an agricultural country. Some important firms have

One of the great advantages claimed for hollow forgings over solid is that by boring out the centre of the ingot the metal is reduced to less than one-half the thickness of the solid forging. By using the press, the action being slow, the ends of the forging are convex. This shows that the force of the press had reached the centre of the metal, while the hammer strikes a quick and sharp blow, affecting the outside of the metal to a much greater extent than the inside or centre. Consequently the end of the forging is concaved, showing at once the superiority of the press over the hammer.

The tire-makers no sooner get rid of one demand on the part of the riders and agents than the maker is met with other and more difficult requests from these gentlemen. An English manufacturer recently received an order from India for a number of bicycles, which order was only to be filled if the manufacturer could guarantee to equip the machines with ant-proof tires. It appears that these industrious Indian sluggard-shamers extract much nourishment out of the rubber casing and tire, and are not content till they have eaten it right through and thus destroyed the tire's usefulness as an air container and restrainer.

The trouble workmen in cycle factories have from foreign substances lodging in their eyes is one they share in common with all other metal workers. Some interesting statistics regarding this form of accident come from the steel-working district of Prussia. Of the 3,723 metal workers treated for eye injuries, 2,805 were for the left eye and only 1,638 for the right, or a relative proportion of 56 to 44; and, as a similar proportion held good in each of five separate years, the conclusion arrived at is that in such work the danger to the left eye is really greater than that to the right. Even more marked, in fact, was the proportion in respect to the severe cases, the left eye being quite lost in seventeen cases, the right in seven.

White light metal alloys, into the construction of which aluminum largely enters, are again being exploited in connection with cycle construction. There were several samples of this form of metal shown at the Stanley Show, one of which, alcolite, into which it is admitted aluminum largely enters, is said to be one-third the weight of steel, and to possess a tensile strength of about 16½ tons to the inch, and considerable resistance to transverse strain. Alcolite, so its exploiters claim, can be welded or brazed without the slightest difficulty or special knowledge. This being so, the metal ought to come largely into demand for cycle construction. A bicycle made up entirely of alcolite tubing, was shown at the Stanley Show, weighing seventeen pounds.

The Supreme Court of Minnesota has held that where a servant has knowledge of the defective instrumentality furnished for his use by the employer, and gives him notice thereof, and the employer promises that it shall be remedied, but neglects to do so, and induces the servant to remain in his employ, and the servant is subsequently injured by reason of such defect within the time fixed when such defect was to be remedied, or within which time it might reasonably be remedied, the employer is liable if the instrumentality was not so imminently and immediately dangerous that a man of ordinary prudence would have refused to longer use it, and that the question of contributory negligence by reason of such use by the servant after such notice and promise to repair is not one of law, but of fact to be settled by the jury.

MORGAN & WRIGHT

MORGAN & WRIGHT TIRES
ARE GOOD TIRES

dismissed a number of their employes, while others have failed. A proof of this crisis is found in the discontinuance of the three leading Italian trade papers.

In England it is now only necessary to attach the words "pneumatic tire" to anything to at once give it a golden and inflated value. As an example of this it is noted that the highest fee on record for an English lawyer's opinion was recently paid in one of the numerous tire litigations now so prominent in British courts. In this case the lawyer was paid \$5,500 to simply pass an opinion upon a point of law, the whole performance of which did not take a full hour of his valuable time.

From time to time there appear wonderful mixtures of various substances which will restore "burned" steel. Once for all, however, nothing will restore "burned" steel—oxidized steel—but the blast furnace. Sometimes overheated steel, that is, steel which is coarse-grained from too high heat, is termed "burned steel." This overheated steel can be restored by heating it through carefully and uniformly to a medium orange color, and laying it down in a warm, dry place to cool slowly. This is a great deal quicker, simpler and cheaper than the nostrum treatments so frequently suggested.

FIXED FOR FLUSHES.

The almost universal adoption of flush joints has shown how quickly the various manufacturers of cycle fittings can rise to an occasion. As may be readily understood, the making of a frame connection that permits a flush joint is a far more difficult matter than under the old method; a reinforcement must be used, and this must be so gauged that the outside diameter of the frame tubes corresponds exactly with the fitting.

The Spaulding Machine and Screw Company, Buffalo, N. Y., are among those who have demonstrated their aptitude. They are marketing a line of stamped sheet-steel connections and parts that seem to thoroughly fill the bill. All are fitted with tubular reinforcements that are shrunk on at one end, leaving the main body of a diameter that allows the use of any gauge of tubing and yet forms a perfectly smooth joint; the reinforcement is left plain, that each manufacturer may follow his own ideas in the method of forcing a perfect flow of brazing material.

This Spaulding '97 line includes some very ingeniously devised stamped fittings at prices that cause wonderment.

THANKS TO THANKSGIVING.

Atlanta, Ga., Dec. 5.—The stock of the Southern Cycle Fittings Company, a corporation which has been doing business in the Electric Building, in Marietta street, consisting of bicycle fittings and parts, has been seized on a distress warrant taken out by the Georgia Electric Light Company, owners of the building in which the company's store was located, for rent for the month of December.

The Cycle Fittings Company was formed in September, with a capital stock of \$20,000, of which 10 per cent. was paid in. N. H. Eggleston was the projector and organizer of the company, and was made president.

The company began business in Broad street and for a time prospered. Then they moved into their present quarters in the Electric Building.

Mr. Eggleston then became interested in a track scheme, and on Thanksgiving Day promoted a race meet that practically wrecked him. It was a financial failure. Mr. Eggleston was unable to pay all of the prize money, although striving hard to do so. No figures are given, but he claims his stock on hand exceeds his liabilities, and that he will pay dollar for dollar if given time.

CAREFULLY MADE SADDLES.

Among the new and improved designs of saddles for the '97 market manufactured by H. M. Rosenblatt & Co., Philadelphia, is a padded-top saddle which they have every reason to believe will prove a "good thing" next year. The saddle is carefully made from the finest quality of material, and from a hygienic point of view has several characteristic points. The opening under the pads permits the latter to conform to the shape of the pelvis, doing away with any possible pressure or soreness. The saddles are made in four shapes, styled Stella B, Florence B, Jerome B and H. M. R. B. Each style of saddle is made in three different qualities, the variation being in the grade of leather tops. They are supplied with a new patent-applied-for spring, and the metal parts are of steel heavily nickelled. Increased facilities, long experience and skilled workmen lead the firm to ask for the closest inspection of their '97 line.

How did people manage to exist fifty years ago when there wasn't a bicycle in the whole world?

THREE GOOD THINGS.

For the first time the Hay & Willetts Manufacturing Company, of Indianapolis, Ind., will list three different lines of Outings—at \$100, \$75 and \$50 respectively. The wheels are reputed to be particularly fetching, and those who know the personnel of the concern will readily believe it. Composed of an aggregation of shrewd, cordial and energetic young Americans, their factory has emulated the acorn, and the concern is now well entitled to be placed in the front rank. Each year has seen an enlargement of their scope, and the year 1897 will be no exception to the rule. Heretofore, they have made small effort to secure business in the far East or extreme West, but they are already augmenting their force of travellers, who will cover the country from coast to coast.

They also propose to use printing ink even more liberally than in the past, having engaged the well-known F. W. Van Sicken to direct that department.

PRICES SEEM RIGHT.

X Rays are to be made in Binghamton, N. Y.—not by the Roentgen process, but in the plant of Blanchard & Hooker. These particular X Rays are bicycles that will list at \$75, \$60 and \$45, according to the grade. Not a great many will be built during 1897; the firm will feel its way and, unless plans go awry, they will be factors during the year following. Mr. Hooker has been designing and building special wheels for several years, while Mr. Blanchard has been engaged in the sales department.

REGULAR RUST DEFIER.

Rust-proof nickel-plating will be a feature of the '97 Racycle. Originality is one of the big claims made by its makers, the Miami Cycle and Mfg. Co., and people who are of an inquiring turn will find a rich field in the company's advertisement in this issue.

A BIT OF ART.

From the Fay Mfg. Co.'s Catalogue.

NO HARD TIMES HERE.

With orders already on their books for every one of the 30,000 wheels that their factory can possibly produce is it any wonder that the Sieg & Walpole Manufacturing Company are in high feather? Yet that is exactly the state of affairs in the Kenosha concern. It is no day dream either, but an actuality. They had '97 stock in evidence as early as August, and as they made a direct bid for the jobbers' patronage, large contracts were the rule. Within the last two weeks the firm has withdrawn a number of quotations and been compelled to say "nay" to several late comers. In this connection it is not generally known that the American News Company is marketing bicycles. They are among Sieg & Walpole's largest patrons.

TWO GOOD THINGS IN TOW.

W. E. Gilbert, who was last week reported to have sailed for the Continental cycle shows in the interest of the Spencer Brake Co., is really the European representative of the Fenton Metallic Mfg. Company. The seventeen wheels which he took with him were Fentons, each fitted with a Spencer invisible brake. In addition to advancing the Fenton interests abroad Mr. Gilbert also has commissions from the Spencer people.

YOU SEE THEM EVERYWHERE.

Belgium has the cycle show complaint almost as bad as America and England. Already announcements are made for shows to be held next spring at Brussels, Antwerp, Ghent, Liège, and probably at several smaller places besides.

THE BRITON, THE BICYCLE AND THE BEAR.

He was English. There was no disguising this; in fact, he did not try to do so as he followed his boxes and luggage down the gangplank from an ocean liner, carefully leading a gear-cased, mud-guarded, light, English thirty-five-pound wheel.

He had read all about this country; he knew all about the famous before-breakfast run of New-York's wheelmen through Central Park to Pike's Peak and return. He did not intend taking this little scamper until he had returned from his journey to Kansas, where he was bound on business of importance regarding some funds his people had invested there and were having the usual trouble of investors in Kansas to get back.

Steamer-made friends had filled him up with wild yarns of how as soon as he got west of the Mississippi River he entered a region infested with Indians, buffaloes and bears. In time he was dropped off a K. P. train at a little Kansas city, just as it was beginning to grow dark. Luggage, traps, hat-boxes, bicycle, rugs, gun cases, umbrellas, canes and the thousand and one other things an Englishman always thinks it necessary to travel with were loaded into a waiting bus and eventually deposited in his room at the foremost hotel in the place.

After he had eaten his supper, or rather partaken of his "tea," he brought forth the trusty gear-cased thirty-five-pounder and started out for a ride. By the time all of this had taken place, most of the stores were closed, but the moon was shining, the roads fairly good and the bold Briton afraid of nothing. He rode around the place for an hour or more, and then started down the main business street for the hotel.

Suddenly he saw before him a big bear, sitting on its haunches, with mouth wide open and paws extended, awaiting his coming. In a moment he jumped from his machine, shinned up a convenient tree, and was crying for help, but no one heard him and the bear sat and watched him. All night long he stayed there, trembling for fear Bruin would climb the tree, but comforting himself with the idea that it was too small to be used by a bear.

At daybreak some men came along, and one of them wheeled the bear back to the doorway with the remark: "I wonder who put that sign in the middle of the road." The tourist descended from the tree, mounted his machine without detection, and had he not subsequently enjoyed the story so much that he told it himself it would never have been known.

LITTLE LATE IN JAPAN.

The Japanese are an imitative race, but their distance from the civilized people they seek to imitate occasionally causes their imitations to be slightly out of date. For instance, news has just reached Japan that certain doctors in America have declared against the use of the bicycle. Forthwith, the imitative Japanese physicians, with a me-too spirit, declare they are opposed to cycling.

WHAT THE WEATHER WILL BE.

Official Weather Forecast.—In the event it does not rain Sunday it will be dry, but should it rain there will be showers. Indications for the twenty-four hours ending at midnight—Dry and slightly warmer and occasional showers if it fails to be dry.

JILTED.

Other fellow's.

WON ON HIS MERITS.

Sixteen years ago the cycle pie wasn't a large one; but, small as it was, the subject of this sketch had a finger in it. Pioneers will remember him as the rider who, in 1883, successfully coasted Mt. Washington on a Star roadster, regularly equipped. As a result, the "Jersey Coffee Mill" immediately jumped into favor throughout Mr. Corson's territory, and until the advent of the chain-gear safety he did a thriving business with that much abused machine. It was during his connection with the Star that he made his most notable rides and tours, covering well nearly all New England and penetrating localities where bicycles had never been seen. Being of an inventive turn of mind, he, about this time, brought out several valuable cycle accessories, chief among them a saddle for the Star, not unlike the most popular saddles of to-day, and a filtering drinking tube called the "Tourists' Delight," which even now commands a considerable sale.

In order that he might more rapidly educate the people of his wooden country up to the point of buying cycles, he published the most

E. H. Corson.

convincing little sheet, the "Star Advocate," later styled the "Cycling Courier," and under this latter caption it now makes an occasional appearance. Several of the leading cycle firms of the country have, since the "old days," enlisted his services as their general agent in Maine, New Hampshire and Vermont. At the present time he serves the Western Wheel Works in that capacity.

Late in 1894, in a little factory of his own at East Rochester, N. H., Mr. Corson brought out a high-grade wheel of his own design which met with such a flattering reception that he determined to devote a share of his attention to its manufacture, and in 1895 installed a modern plant in leased quarters at Nashua, N. H. Last August the Corson Cycle Manufacturing Company was organized and incorporated, with E. H. Corson as president and secretary, and at this writing a spacious factory is being erected at East Rochester for the manufacture of "Nashua" and "Faultless" bicycles, which list at \$85 and \$100 respectively.

The past season, with headquarters at Nashua and branch stores at Concord, Manchester, Dover, Portsmouth, East Rochester and Portland, Mr. Corson has done a good business in Crescents and the products of his factory. Next season he will represent the Western Wheel Works and the Corson Cycle Manufacturing Company in the territory he

knows so thoroughly, and expects a largely increased business.

Starting in life without a dollar, he has by hard work, perseverance, rigid economy and strict attention to details, accomplished that in which many have failed.

LIKE A STEEL SPRING.

It seems scarcely necessary to remark that frames made of spring-tempered steel will continue to be a feature of the Wolf-American wheels, made by R. H. Wolf & Co., this city. It has proved to be a valuable talking point and a feature of the wheel, the glamor of mystery which surrounds the process adding to its importance. The process is a great secret, the Wolf people merely stating that the tempering of the tubing is the same as that of spring-tempered steel of any kind, and adds 25 per cent to the strength of the metal. Their advance catalogue, just off the press, is an attractive publication, replete with specifications of their '97 model. The wheels are attractive-looking, although showing no particularly-radical alterations. The tandem is new, has a double diamond frame, built on new lines, with proper regard for steering room between both front and rear riders, and is particularly well braced. The Duplex, as of yore, comes in for due prominence. It has been improved wherever possible. The price of the Wolf singles, as was announced last July, will be \$100.

WORLD IS FULL OF THEM.

"Well, what is it now?"
"Jes' a bite o' suthin' to eat, please, mum. Ye see, it's dis way: I"—
"Oh, I know. Out of work. Sick child"—
"No, mum; I'm de s'ciety editor on a big New York pape, 'n' I bet five thousand bones wid me frien' Iwerbilk dat I'd ride me bysickle around de worl' widout"—
"You're de third loafer that's told that yarn. Now get out!"
"Yes'm. Anyting t' blige. Needn't call de dog. You'll get a inwite t' de nex' Wan, derbilk weddin', I don't t'ink."

CALLED DOWN.

"Put that fellow in one of the basement rooms," remarked Satan, carelessly.
"Fellow! Basement!" sputtered the new arrival. "I would have you to know, sir, that I was a prominent citizen in my lat home, sir. I was a scorecher for fair, I was, and my name is known everywhere among wheelmen who go in for century runs."
Satan smiled. "That may have been," he said, "but you won't cut any ice down here."

EARLY INFORMATION.

"Johnny," said the boy's father, "I suppose that you are going to hang up your stocking next Christmas."
"No, I'm not," was the reply after some thought.
"Why not?"
"Because," he answered, looking his father straight in the eye, "you couldn't put a bicycle in my stocking."

THEY NEVER THINK.

She was one of the few of her kind that still exist.
"No, I don't think that anything could induce me to ride a bicycle. It is so common."
"Did you ever stop to think, Lucille, that nothing is so common as riding in a street-car?"
"They were in a streetcar at the time."

Unlike some of the wheelmen he attacks, the average bull dog chews more than he can bite off.

WOULD ALL SADDLE MAKERS

Large and small, run the risk of the consequence of infringing our patents, even though they erroneously felt that the chance of sustaining our patent was small, if, and a great big IF, they could by hook or crook sell their own designs? Is it natural for a man to run any risk if he does not have to? And is the fact that they are all running that risk not the greatest compliment that was ever paid to any saddle? Does it not prove that the MESINGER principle is right? But they all lack the vital point of our saddle, the rattan, and peculiar weaving of it, which makes our saddle what it is. Don't be a party to this "piracy" of our ideas. We are doing everything possible to have you buy the genuine

MESINGER

and you will avoid any trouble from patent litigation. Our patents are good as gold.

PULSE OF TRADE.

How It Beats in the Patent Office in the Shape of Cycle Patents.

The pulse of trade is quickly felt in the United States Patent Office. Increased demand for any article of manufacture immediately starts inventors at work seeking to improve it in the hope of reaping a large reward by taking advantage of the popular want. Just now the pulse of the cycle trade is beating very strongly, as indicated in the Patent Office. The number of applications that flood the office for improvements on cycles is unprecedented. No other single class of invention has displayed such activity since the patent system was adopted. Fortunately perhaps hardly one-sixth of all the applications filed eventuate in patents, otherwise between 3,000 and 4,000 cycle patents would be poured out upon the country annually.

Approximately 4,500 patents have been issued by the United States in this single class—not including motor vehicles and various cycle accessories—and about as many more have been granted by foreign countries. These 9,000 patents indicate how closely the field of cycle invention has been worked over, and how small a margin there is for patentable ideas relating to cycles. Nevertheless, inventors will doubtless continue to cull ideas out of this margin, and patents based on them will continue to be issued for some time to come.

The Patent Office classifies all vehicles that are propelled by the muscular power of the rider as "velocipedes." All cycles that are propelled by motors—gasoline, electric, spring, etc.—are classed as motor vehicles. This classification is a reminiscence of the "velocipede mania" of 1869, when it became necessary to establish the class.

The first United States patent for a velocipede was issued in 1804, and was signed by Thomas Jefferson, then Secretary of State, the Patent Office having been at that time a bureau of the State Department. It was for a heavy, four-wheeled vehicle, driven by crank and toothed gears. The second patent was granted in 1819 to one Clarkson, and is supposed to have been for the famous "hobby horse"; all vestiges of it were destroyed in one of the disastrous conflagrations that has befallen the Patent Office. Up to the date on which Lallement patented his crank-driven bicycle—November 20, 1866—only twenty patents for velocipedes had been issued by the United States. The celebrated Hanlon brothers obtained a patent in 1868, and by their skillful performances on the machine, helped to spread the interest in the new two-wheeled vehicle. By January 1, 1869, forty-three patents had been granted. In 1869 the mania was upon us, and in that year close upon 200 patents for velocipedes were obtained.

To all appearances the cycle industry in the United States died with the year 1869. In 1870 the issue of cycle patents fell to twenty-five. In 1874 they could be counted on the fingers. In fact, no patents were taken between 1869 and 1876, except for what may be considered toy velocipedes, cantering horses, children's tricycles and the like.

Up to 1876 approximately 300 patents for cycles had been issued by the United States. In 1876 invention revived on account of the excellent exhibit of English cycles at the Centennial Exhibition. Since 1876 over 4,000 cycle patents have been granted in this country, and nearly or quite one-half of this number have been issued since 1890. In 1890 one assistant examiner of patents was able to dispose of all applications that were filed. In November, 1896, it required the

labor of eight expert assistant examiners to handle the applications for cycles, and even with this expert force working at them, there have been lately 1,000 velocipede applications constantly on hand awaiting action.

Until within comparatively recent years cycle invention was confined to England, France and the United States. The history of its progress in England and France has been very similar to its history in this country. In France the first velocipede patent was that of the Baron Drais in 1818; and in England, in the same year, that for the "pedestrian curriole" of Denis Johnson. During the next half century fewer patents were issued abroad than in the United States. In 1868 and 1869 France granted numerous patents for cycles, and in 1869 English inventors were affected by the velocipede mania. At the close of 1869 England had granted 118 patents for cycles. After the craze of '69, France, like the United States, practically ceased to patent them, while England, on the contrary, continued to nourish the industry until it reached really important proportions, and was again taken up by other countries.

At the present time no country in the world is granting so many patents for cycles as the United States—and this, in spite of the fact that no patent can be obtained here except after a rigid examination as to novelty; while in England, on the other hand, no search as to novelty is made, and a patent usually issues as a matter of course upon application.

E. D. S.

A FOUR-IN-CAN.

Any article that will do four things is certainly entitled to notice; the "Big 4" compound, manufactured by Horton & Woolson, New Haven, Conn., merits attention. To quote their circular, "Big 4" cleans thoroughly all dust and dirt from either enamel or nickel; is a lubricant for both chain and bearings, and is warranted not to gum; is a preventive against rust caused by perspiration, salt air or water, and will also remove rust from all parts, restoring them to their former brightness. It is claimed that any article treated with the compound may be permitted to remain in the rain on dampness and not be affected. The firm also offers the H. & W. Enamel Polish, which imparts a permanent lustre on enamel, wood rims, wood handlebars, etc. One of the advantages claimed for the polish is that it leaves no oily residue. The price of each is 25 cents per bottle, with attractive discounts to jobbers and retail dealers.

WELL REPRESENTED.

The Old Fort Manufacturing Company, of Fort Wayne, Ind., have obtained excellent representation in Chicago. In future their line will be handled by Gordon D. Beckley & Co., of No. 152 Lake-st., Chicago, for that city and vicinity. This concern is well fixed to do the goods justice. It has warehouse space, and will always keep on hand a large stock.

NOW WITH WEED.

A. J. Leach, for several years with H. C. Martin, has now charge of the extensive bicycle department of the Weed Hardware Co., Buffalo, N. Y. Mr. Leach brings to his new position a thorough knowledge of the bicycle business, and should prove a valuable acquisition.

Too many people enjoy cycling as though it were a dose of castor oil they were taking.

Bloomers are like an expected kiss—a deal of pucker for lots of disappointment.

A Story of Success.

THE history of the Monarch is an interesting story—it's a story of success. In 1891 the Monarch Cycle Mfg. Co. was a lusty infant. In that year 35 men were employed and 150 bicycles were made and sold. This good seed of an excellent product, planted in the fertile soil of unlimited capital and unsurpassed facilities, nurtured by sound judgment, progressive business methods and a policy of liberal and judicious advertising, has in the short period of six years multiplied three hundredfold. The infant of but yesterday is the giant of today. The experiment of 1891 is the unparalleled success of 1896. The 35 men and 150 wheels have this year been increased to 1200 employees and 40,000 high grade bicycles which have been marketed in every civilized country in the world, aggregating a business of \$2,000,000.⁰⁰.

This growing greatness enables us to give still better value to our patrons. Our new models are nearer perfection than ever, the best the trinity of mechanical skill, excellence of material and the finest equipped bicycle factory in the world can produce. Mr. Dealer, in 1897 you should handle the Monarch, a standard wheel with a recognized value and a known success. Don't sell the indifferent product of a probable failure whose guarantee is not worth the paper on which it is written. Sell the Monarch, guaranteed by our immense success, unequalled and unapproached, and backed up with a paid-up capital and surplus of a million dollars.

Ride a Monarch and Keep in Front.

Toronto.

IN BETTER SHAPE THAN EVER.

Peoria, Ill., Dec. 5.—The results of the Ide fire were not half so bad as were generally supposed. The reports that the factory was totally demolished are untrue; in fact, its serviceability is but slightly marred. THE WHEEL man was shown through the plant to-day by Mr. Ide, and saw things as they are.

There is no damage whatever to the machinery. It was neither scorched nor soaked. But now that a certain amount of work was rendered necessary in the refixing of things, it is all being rearranged so as to increase its productiveness, ease of handling, etc., to the maximum. It may be said that outside of the scorching of certain parts of the building itself there exists but one sort of damage; and that the smoking up of various lots of nickelled stock, as handle-bars, pedals, etc., necessitating rebuffing to put in marketable shape.

It is fortunate for the Ide folks that an account of last year's slump they shut down early. This gives them a considerable stock of frames and parts from which to assemble early orders. Thus the Ide clientele will not suffer in the matter of deliveries. Probably an even 5,000 wheels will be the '96 product.

A general rearrangement of machinery is in process. Trade men who have visited the Ide factory will recall that a considerable portion of the big plant was used by the Horological Institute. From now on the Ide Company will work the entire plant, thus adding a third more room. By December 15 all alterations will be complete, and the company will be in better shape for work than ever.

BID DEFIANCE TO NAMELESS WHEELS.

A number of changes are observable in the 1897 models of the Defiance Bicycle Company, Defiance, Ohio, but they are changes which relate to the fashion of the machine rather than to its general efficiency. Included in the changes are a somewhat different crank, inch forksides instead of seven-eighths, a forged crown and an improved pedal; 1½ inch tubing will be used, and a large crank-hanger. For '97 privilege of any style of finish will be offered, with plain black as standard.

The Defiance Company are of the sort that saw wood while the other fellow is braying, and trade in the extreme sections is hardly aware of the importance of the concern.

They are at home in an excellent factory, built especially for cycle making a couple of years ago by Clark, Holgate & Co., whom the present company succeeded; it is a two-story brick building in the very heart of Defiance, and has a capacity of 5,000 to 7,000 wheels.

This year the company will continue its policy of ignoring the jobbing trade, and will see to the dealer exclusively. Its wheels, of which perhaps double the number that were marketed last year will be built, will in every instance bear their own name, "The Wheeler." No Wheelers will go forth under misleading titles or devoid of nameplate. While the company is a comparative youngster in the arena, it has the advantage of having built bicycles that stood up. Its mechanical creators are well equipped for their positions.

It is a fact that practically every part of the Wheeler is built in its own tone. Pedals are included. In fact, tires and saddles and the only parts of the wheel which are bought in a finished state.

HAVE PEALS THAT APPEAL.

In the matter of price, the New Departure Bell Company, Bristol, Conn., appeal to all classes. Their price list, just issued, illustrates thirty-two different bells, ranging in price from 20, 25 and 30 cents to \$2.

OIL ON A TROUBLED BEARING.

While no one knows just who the real Adam of cycling was, it is a safe bet, at odds of a Raines law sandwich to a Waldorf dinner, that he carried and cursed a leaky oilcan. Most oilcans such as wheelmen use seem made for no other purpose than leaking when they should be dry, and drying when they should leak.

All this, and perhaps more, was known to the Waterbury Manufacturing Company, Waterbury, Conn., when they began the not altogether easy task of turning out a compact, light and leakproof oiler, suitable for carrying in the rider's pocket or toolbag. These new oilers, Acme by name, are all provided with a special arrangement for preventing leakage, which is so essential for pocket oilcans. The tops of the spouts in the illustrations are cut away to show arrangement, which consists of a spout cover with an extra long cushion of cork, into which the tapering spout of the can forces itself, being guided and kept clear by a pin passing through the cork, the point of which en-

ters the spout. This is designed to prevent clogging of the spout, and to insure a tight bearing against the cork packing. The pin projecting beyond the lower end of the spout cover is a convenience in cleaning out the oil holes from accumulated dust, etc.

The corrugated style of cans shown in the cuts are stiffer than the others, and can be more readily held by the fingers, and are more particularly for pocket and toolbag use. The oilers all have spring bottoms and are guaranteed not to leak by the manufacturers, either from the oiler proper or through the spout into the outer cover.

NEW PICTURE TAKER.

The Adams & Westlake Company, Chicago, known to every wheelman through their unique advertising of the bicycles and lamps they had turned out, are about to make another departure of interest to many wheelmen and wheelwomen. The company will shortly put on the market a camera of special design particularly adapted to use on cycles.

Sweet are the uses of adversity; but most riders have no use for sweets of this description.

When too much cycling brings a man to grief it isn't the fault of cycling.

DOWN ON THE OHIO.

Louisville, Dec. 3.—Quite a little surprise will be manifested, locally, at least, when it is known that Harry C. Montgomery, who has presided over the destinies of the Columbia for W. C. & S. M. Nones, will not be with that firm in 1897. Mr. Montgomery is an old rider and a popular gentleman, and his change will be on account of his desire to again enter the retail jewelry trade, in which he was remarkably successful for sixteen years. It is known that at least one large cycle manufacturer offered a flattering position to Mr. Montgomery, but, since his retirement from the cycle trade is entirely voluntary, and is occasioned by greater opportunities for permanent betterment, he declined to consider the offer.

The "Outing" people have a blacklist and on it appears the names of a number of well-known young men who hold championship honors in the persistency with which they "infest" (so Manager Ray calls it), the office and workshop of the "Outing" headquarters. Threats, p'eas and other arguments having failed, except in a few instances, Mr. Ray has under way an invention for their total extermination. He thinks there is a fortune in such a machine.

Among recent travellers in Louisville have been George Kehew, for the Columbia people; Frank Bunting, Adlake, and C. M. Fairchild, New York tires.

The streets, torn up and impassable during the meet, are now complete, and the ride down Chestnut street to Shawnee and Fountain Ferry is uninterrupted.

The Bicycle Path Association scheme has been dropped for the present. But little interest was shown.

ACKNOWLEDGING THE CORN.

The formerly accurate, conservative and usually fair-minded British Cyclist is at present suffering from an intense bilious suffering, brought on by an unusually rich banquet of advertising, the sole outcome of the American manufacturers' invasion of the British cycle trade. In place of being thankful to the Americans for the money they have been the direct cause of flowing into its coffers, the Cyclist has mouthed at, sneered at and did what was in its power to injure in every way American machines abroad.

Despite the Cyclist pretended sneering at Americans, and its often repeated boast that Americans were in no wise to be considered rivals of British makers, the following thoroughly British hedge finds space in the last issue of the Cyclist: "No manufacturer, machine tool maker, or designer who can realize that keen competition in the cycle trade from without or within is well above the horizon should miss seeing the American automatic machines which are working at Churchill & Son's stand at the Stanley Show this week. If England is to hold her own in this great branch of manufacture in the near future, the trade must recognize at once that they must not only produce the best, but produce the best cheapest."

SOME WELSH WONDERS.

Wales now bobs up with an inventor who claims to have discovered a revolutionary device whereby a speed of a mile a minute can be obtained by even a tyro at the art of pedalling. The inventor, D. Williams, is stated by a Welsh paper, recently rode eight miles over a rough and muddy road in sixteen minutes, and afterward travelled a mile in a minute and twenty seconds. The inventor, it is announced, has been working to perfect the device for three years.

THEY STAND THE TEST.

Rational Weight—Diamond Frame, 23 pounds; Drop Frame, 24 pounds.
Mechanically Correct—As near perfection as possible.
Flush Joints Throughout.
The Crown—A combination of the square and oval.
D Tubing—in rear fork—allowing narrow tread and large tire.
New Style Chain Adjustment.
Dustproof Bearings Throughout—As near "dust-proof" as it is possible to attain.

A New Hub—Using T head spokes; direct pull; no bending; spoke will break in centre before head will give, as proven in actual tests.
One-Piece Cranks.
One-Piece Crank Axle Cones—Adjustment from the shell—perfect alignment.
Cyclodial Tooth Sprockets.
Laminated Rims.
Wood Handle-Bar—With new style clamp, allowing any adjustment.

THIS IS JUST A FEW OF THE MANY "TALKING POINTS" ON THE

'97 SPECIAL ECLIPSE BICYCLE

LIST \$100.

Advance Catalogue ready soon.

ECLIPSE BICYCLE COMPANY,

Kindly mention The Wheel.

ELMIRA, N. Y.

You don't judge a man by his coat nor a watch by its case.

DUSTPROOF
1,000 MILES
ACCURATE

You can't judge a Cyclometer by its outward appearance. Accurate and positive mechanism is what you want.

THE VEEDER

is being imitated in outward appearance, but U. S. Patent Laws protect its mechanism.

WATER-PROOF
10,000 MILES
POSITIVE

The dealer who desires to satisfy his customers does not SPECULATE in EXPERIMENTS. He buys and sells that which he knows to be the BEST

THE VEEDER

has been tested for over one year, and found not wanting.

THE VEEDER MFG. CO., HARTFORD, CONN.

Watch these corners each week and note what customers who have sold the VEEDER for a year say.

HARTFORD, CONN., May 16th, 1896.
 THE VEEDER MANUFACTURING CO.,
 Hartford, Conn.

Gentlemen:—Your Cyclometer is giving us better satisfaction than any other that we are handling this year, and we do not know of a single one of these having been returned to us as defective. We are now selling the VEEDER as our leading Cyclometer.

Yours truly,
 POPE MANUFACTURING CO.
 A. E. Pattison, Secretary.

SAN FRANCISCO, Nov. 18th, 1896.
 MESSRS. BOSTON WOVEN HOSE CO.,
 Western Rubber Co., Selling Agents,
 Nos. 14-16 Fremont St., City.

Gentlemen:—In reply to your request concerning our sales and the merits of the Veeder Cyclometer, would say we have sold quite a large number of them this year, and they have given universal satisfaction, being neat, compact and accurate. We shall, no doubt, next year double our sales, as the Veeder will be our leader.

Hoping that your customers have had as good success as ours, I remain, Yours respectfully,

GEO. WELLS ALEXANDER,
 Per C. Walts, Manager.

EUROPEAN AGENTS—MARKT & CO., LONDON, PARIS, HAMBURG.

FLANGED SPROCKET WHEELS.

The great difference between the English and American riding public, and makers as well, is apparent to all who have reflected upon the matter. The former follow in the wake of a successful competitor like a flock of sheep, while we are apt to prefer a machine or point of construction simply because it is different from others. If we judged by a casual glance at the transfers on English machines we would suppose that they were all of one make, while with us the usual aim is to have a nameplate different from all others. With English makers the effort is made to so copy the lines of other machines as to render it impossible to distinguish any difference; but with us a certain rise of the top tube, a different slant to the head and top forks, or a variation in the shape of the fork crown is made in order that the machine in question will not be confused with others.

For years it has been the custom for English cycle builders, almost without exception, to use flanged sprocket wheels, that is, to leave an edging on the wheels at the bottom of the teeth. Consequently, the great majority of American makers used plain sprocket wheels, and no amount of argument could convince them that there was any merit in the flanges. The advocates of flanges, however, were unstinted in their praises of the advantages, and I will remember hearing the mighty Zimmerman assert that he could instantly detect their presence or absence by merely riding a machine; and the introduction of this argument in any discussion invariably awed the opponents of flanges into silence.

It was claimed for flanges that they formed a support for the side plates of the chains, thereby doing away with the friction that would be caused if the chain hugged the teeth of the wheels. Scoffers might hint that there could not be much difference between the friction on the teeth and the friction on the flanges, to say nothing of the greater nicety required in cutting the chain wheels to have the flanges perform their duty properly, but no attention was paid to such irrelevant remarks. To clinch the matter it was sometimes said that flanges stiffened the sprocket wheels, which was undoubtedly true in the case of the front one.

Several weeks ago the English "Cyclist" actually had the temerity to insinuate that flanged sprocket wheels were not all they were "cracked up" to be; concluding by expressing the opinion that they were an "unnecessary refinement." This brought on a wordy discussion, in which cycle makers, chain makers and riders took part, and although there were some dissenting voices, yet the sentiment was against flanges, or "shrouds," as the technical term for them is across the water. The remarkable part of the occurrence is that "shrouds" should have held the boards for so many years, with none so bold as to decry them. S. W. M.

HER AWFUL ALTERNATIVE.

"I speak plainly, I believe," said Mrs. New-
un decisively, "when I say that in riding a
wheel I shall wear bloomers or nothing, de-
spite your objections."

"You do speak plainly," replied Mr. N. in the
voice of one who has given up, "and I have
nothing more to say. I prefer the bloomers to
the alternative."

DECADENCE.

Time was when woman quite easily found
Some man to adore and pet her,
But that was before she went scorchin' around
In bloomers, a cap and a sweater.

GONGS, LUBRICATING AND HUBS.

In the large cities lately wheelmen have taken to attaching a gong to their wheels, substituting it for the regulation bicycle bell. The reason given for this is that teamsters and others make way quicker when they hear a gong. The tinkle of the average cycle bell is so familiar now that not much attention is paid to it on crowded thoroughfares of a city. Usually when the wheel is brought in for gong equipment, the gong will be found attached to the frame of the wheel with wires, strings or in some other crude fashion, while a cord will run from the gong to the hand of the rider, who pulls the cord when gong action is needed.

FIG 1

FIG 6

FIG 7

If gongs are to be used to any extent, they should be systematically fixed to the frame of the wheel. A good way is shown in Fig. 1, in which two clamps (A) are bolted to the frame as shown. These serve as supports for the bracket of the gong (B). Three other clamps are needed for the handle-bar. Clamp F is fitted with a small pulley. Clamp E has an eye. Clamp D an elbow arrangement to one end of which is fastened the cord (G) from whence the cord goes through the eye of clamp E, through the pulley to clamp F, thence to the pull-bar (C) of the gong. To ring the rider presses the elbow with his forefinger. Any repair shop can readily attach a gong to a wheel according to this plan.

A bicycle must be liberally oiled in its bearings to run well. So long as the ball oil-cup is in good condition, the bearings are effectively lubricated. A cup in good shape is marked Fig. 2, in which A is the spring and

B the ball. Sometimes foreign matter gets into the oil-channel. A few days since a wheelman brought in a machine complaining that a bearing constantly heated regardless of free oiling. An examination showed that a piece of leather scrap (C) blocked the channel, as shown in Fig. 3. In another case the spring was found to be broken, as represented by D in Fig. 4, thus preventing the oil from passing freely. In another instance the oil-channel was filled with dirt, as indicated at F in Fig. 5. These ball-spring oil-cups are good and reliable, but like other parts of a bicycle, will not give effective results if neglected. They should be examined and cleaned out occasionally. Often foreign matter works in with the oil.

Every season brings forth new types of spokes, hubs and adjustments for repairers to handle. In replacing the spokes of the corrugated style, as shown at A in Fig. 6, care should be taken to preserve the harmonious setting, which may be done by drawing a centre line (C) from the middle of the hub to the rim. Spokes B and D will cross on this centre, as shown. The relative position of each spoke should correspond with the degree of bevel of the corrugation to which it is secured. An odd type of spoke, as shown by E, comes to hand once in a while. There is a shoulder on the spoke between which and the flange of the hub is the spring G, thus giving ease of motion. If the springs are properly tempered, good results follow. To replace these spokes, draw the line (H) from hub centre to rim, and head up the spoke in the flange in such a way that it will not bind, keeping it parallel with the line. Broken springs can be wound from steel wire, tempered, cut the right length and applied.

In Fig. 7 is a plan of a tank just erected for enamelling purposes. Drip boards AA should be arranged to catch drippings from the frames in process of treatment. The frames are hung to the rack B, which is supplied with hooks (C) for the purpose. Build the tank in a room where there will be no dust, as flying particles adhere to the enamel and spoil the job. GEO. D. RICE.

SURVIVAL OF THE FITTEST.

Of all the electric bicycle lamps on the market at the beginning of the year the Ohio Electric Works, of Cleveland, assert that theirs is the only one left, and believe that mere mention of the fact conveys its own story. Their \$3-lamp, they say, has been so vastly perfected that when the new models are shown, there is likely to be a concealment of illuminating oils.

STILL SECRETARY POST.

Although L. Fewsmith has succeeded D. J. Post as manager of the Peerless Manufacturing Company of Cleveland, Mr. Post has not severed his connection with that company, but is still with them as secretary. He will reside at Hartford, from which point he will handle Peerless wheels throughout New England and some of the Middle States.

THREE ROWS AND A STAGE.

Philadelphia's show will be held at the armory of the Second Regiment. A diagram of spaces has been prepared and sent broadcast among the trade. The spaces, of which there will be 173, will be 7 feet 2 inches by 9 feet 2 inches, divided in three rows. A stage will also be erected for entertainment purposes.

CRY OF THE UNFORTUNATE.

"Dear me! Is there anything cheap in cycling?"

"Oh, yes; advice."

THE KELLY HANDLE=BAR

THIS IS THE ONLY . . .

PRACTICAL ADJUSTABLE HANDLE-BAR . . . ON THE MARKET . . .

Any position, from a drop to an upturned bar, may be obtained, always keeping the correct pitch of grips. The adjustments secure and simple, and will not work or wear loose.

The dealer or manufacturer handling the Kelly Bars saves extra expense and annoyance of carrying a large assortment of different styles, and at the same time furnishes a handle-bar that will please all classes of riders.

All Kelly Handle-Bars thoroughly guaranteed.

We will furnish the manufacturer with bars complete, in parts, or the stubs only.
We solicit your correspondence, and will submit samples and quote prices on application.

The Kelly Handle-Bar Co.,
CLEVELAND, OHIO,

Kindly mention The Wheel.

Keep up your regular exercise during the winter months upon your own wheel and in your own apartments by means of

The Ray Home Trainer.

Any wheel can be used. Any desired pressure can be applied to the rear wheel by means of the roller brake without injury to the tire.

Price, \$16.00 each. With Pressure Scale, \$17.50.

Home Trainers may also be rented by the week, \$2.00.
By the month, \$5.00.

RECENT PATENTS.

572,361. CLAMP FOR BICYCLE-HANDLEN. LEWIS H. HALLAGAN, Merion, Ind. Filed May 9, 1894. Serial No. 390,695. Term of patent 14 years.

Claim.—The design for a clamp for bicycle-handle, substantially as shown and described.

572,463. BICYCLE TIRE. ROBERT S. WILLIAMS, Meridenville, N. J. Filed June 1, 1894. Serial No. 394,723. (No model.)

Claim.—The combination of an inflatable main tire, with a supplementary tire, having ribs on its inner surface so constructed that when the main tire is inflated there will be permanent channels between the outer face of the inflated tire and the inner face of the supplementary tire, substantially as specified.

572,379. BICYCLE-BELL CLAMP. FREDERICK A. SCRANTON, West Kingston, Conn., assignor to the North Brothers Manufacturing Company, same place. Filed Aug. 6, 1894. Serial No. 374,600. (No model.)

Claim.—In combination, a base, a bracket U-shaped in cross-section secured to the base and having side parts with curved sockets in the sides thereof, angular sockets in the side parts of the bracket located opposite each other, a clamp provided at one end to rest between the side parts of the bracket, a clamp-screw in engagement with the base and with one end of the clamp, the other end secured to the opposite end of the clamp, extending through the side parts of the bracket, and in engagement with the angular sockets, all substantially as described.

572,398. BICYCLE-FRONT-LEVER MECHANISM. THOMAS L. ALLEN, Stevens, Cleveland, Ohio. Filed Nov. 4, 1893. Serial No. 568,268. (No model.)

Claim.—In a machine of the character indicated, the combination of the relatively stationary frame, and driving crank-shaft provided with two cranks at opposite sides, respectively, of the two forwardly-extending pedal-bearing levers operatively connected at their rear ends, with the different cranks, respectively, two vertically-arranged sway-bars pivoted at one end to the aforesaid frame adjacent to the different pedal-bearing levers, respectively, a link operatively connecting the other end of each sway-bar with the rear end of the adjacent pedal-bearing lever, and another link connecting together each of the pedal-bearing levers, and connected sway-bar a suitable distance from the first-mentioned connection between said bar and lever, substantially as and for the purpose set forth.

572,450. BICYCLE-BELL CLAMP. EDWARD D. BOWWELL, Erie, Pa. Filed Sept. 12, 1894. Serial No. 605,628. (No model.)

Claim.—In a clamp, the combination with a frame provided with parallel sides, and opposite key-holes, of a band-clip, means for securing it to the frame, a wire coil, and a winding-key at its free end, adapted to enter the key-hole in the frame, substantially as set forth.

572,355. BICYCLE TIRE CLEANER. WILLIAM H. CLARK, Providence, R. I. Filed Apr. 3, 1894. Serial No. 601,931. (No model.)

Claim.—In a cleaning device for bicycle-tires, the following combination of instrumentalities: a case or box fitted to go between the bars of the fork and having one end open and shaped to fit the tire, a stationary block placed in the lower part of said case, a shaft held in bearings in said stationary block and carrying a roll having sharp points on its surface, a movable block of rubber or other yielding material placed on said stationary block and in contact with the points on the roll, a screw fitted in the top of the case to screw down on the roll, a screw fitted in the top of the case to screw down on the forward bars of the bicycle, substantially as described.

572,326. BICYCLE HANDLE. JAMES C. SHERIDAN, Middletown, N. Y. Filed Oct. 25, 1893. Serial No. 568,814. (No model.)

Claim.—The combination with the handle-bar of a bicycle, of the device described and adapted to be connected therewith at any point thereon, consisting of a pneumatic cushion or pad C, segmentally upon the under surface to receive the convex portion of the handle-bar and being provided at each end with loops through which pass straps carrying buckles through which means the device may be secured to the handle of a bicycle as set forth.

572,308. BICYCLE. WILLIAM A. LOREN, Hartford, Conn., assignor, by mesne assignments, to the Pope Manufacturing Company, same place and Portland, Me. Filed Apr. 23, 1894. Serial No. 508,854. (No model.)

Claim.—In combination with the frame of a bicycle or like vehicle, a crank-bracket including a ball and socket case composed of a socket-section containing near-sockets and a crank-bearing, and a cover-section having a crank-bearing centrally therethrough, and a cover-connection having a screw-thread fitting the screw-threaded interior surface of the socket-section, and projections or sockets for the attachment of the several members of the frame, all substantially as described.

572,432. SADDLES FOR BICYCLES. JAMES A. MARGOT, Washington, D. C. Filed June 20, 1894. Serial No. 590,330. (No model.)

Claim.—A bicycle or other saddle having four quadratically-arranged pads or cushions forming between them a cruciform opening, substantially as specified.

572,164. BICYCLE SADDLE. MART F. HERRMANN, Washington, D. C. Filed June 23, 1894. Serial No. 594,741. (No model.)

Claim.—A frame for a bicycle-saddle comprising two approximately elliptical loops, one forming the contour of the seat and the other the contour of the girth, and a contracted and depressed connection or bridge between the two loops, substantially as described.

572,163. BICYCLE SADDLE. MART F. HERRMANN, Washington, D. C. Filed July 15, 1894. Serial No. 594,742. (No model.)

Claim.—A bicycle attachment consisting of a padded seat with a double cross-bar and means for applying and securing the same to the saddle, substantially as herein set forth.

572,350. DEVICE FOR ACTUATING BRAKES. EDWARD S. HALL, New York, N. Y. Filed Feb. 17, 1894. Serial No. 579,773. (No model.)

Claim.—A brake-operating device comprising a reversible handle provided with a screw having an initial quick pitch, and a following slow pitch of thread, a movable part actuated by the screw, and connections from said movable part to the brake device.

573,150. PROTECTOR FOR PNEUMATIC TIRES. EDWARD DAVIES and ARTHUR RAZZANO, Adelaide, South Australia. Filed July 16, 1894. Serial No. 583,614. (No model.)

Claim.—A protector for pneumatic and other similar tires, composed of two bands having serpentine folds of any desired pitch, interwoven or interlocked substantially as herein described.

572,137. BICYCLE BRAKE. CLAYTON W. TERRYSON, Bedford, Iowa. Filed Feb. 11, 1894. Serial No. 573,824. (No model.)

Claim.—A bicycle brake, consisting of a suitable frame, adjustable front fork with shoulders intermediate their ends and having a threaded connection with the brake-frame and adapted to engage sockets in the fork of the machine, a brake-shoe attached to said frame, and means for adjusting the brake-fram, substantially as described.

572,273. SLIDING SADDLE-SUPPORT FOR BICYCLES. OSCAR FETTERSON, Paterson, N. J. Filed May 21, 1894. Serial No. 575,424. (No model.)

Claim.—The combination with the frame of a bicycle, of the saddle-pat, removably arranged in the diagonal seat frame, a fore or rear projecting front saddle-post, a clip connecting the forward portion of said tube or bar with the top tube of the frame, a sleeve on said tube or bar and adapted to slide thereon, the saddle carried by said sleeve, a lever fulcrumed on the top tube and in front of the clip, and an arm pivoted secured at one end to the sliding sleeve and at the other end to said lever, all said parts, substantially as and for the purpose described.

572,385. BALL-BEARING. HENRY A. STURM, Milwaukee, West. Filed June 17, 1894. Serial No. 590,673. (No model.)

Claim.—The combination of a hub, an annular bearing inwardly in each end of the hub, each bearing having an inwardly-extending flange axially offset and each bearing also having an inwardly-facing shoulder located inward of the respective flanges and forming ball-ways, an axle having reduced ends respectively passed through the apertures of the flanges, the axle having at the inner extremity of each reduced portion an outwardly-facing shoulder forming ball-seats, a fork in which the terminals of the axle are mounted, a nut on each terminal against which nuts the outer side of the flanges respectively bear, two rings contained within the hub and respectively located adjacent to the flanges of the bearings, each ring having a peripheral groove and an internal groove, one wall of each groove being of increased height to oppose the corresponding shoulder respectively on the bearings and the axle, and a sufficient ball-distributed throughout the grooves of the rings and respectively bearing on the seats formed by the shoulders of the axle and bearings, substantially as described.

The Wheel

and
CYCLING TRADE REVIEW

Copyright 1896, by F. P. FRIAL CO.

VOL. XVIII., No. 18.

NEW YORK AND CHICAGO, DECEMBER 18, 1896.

WHOLE No. 4 o.

GOOD ENOUGH FOR US.

We Will Keep the Ownership of the
"Good Tire" in this
Country.

Morgan & Wright have not disposed of any part of their interests to a foreign syndicate or to any one else.

Frank W. Morgan and William Herrick returned from abroad on Monday last, and made the statement without equivocation, forever settling the much bruited report.

Mr. Morgan was averse to being seen, but finally authorized the following interview which amply covers the ground:

"Last spring," he said, "we received a proposition relative to the purchase of our business by an English syndicate. The proposition was couched in businesslike terms and made upon a basis which would appeal to the consideration of any individual, firm or corporation engaged in a commercial enterprise. In my long business experience I have never yet found a business which was not for sale provided a sufficient consideration was offered. I thought it best to go to London and personally investigate the offer. While there I gained a good deal of new knowledge on the subject of promoting and floating as practiced in England. This information I am willing to place at the disposal of any manufacturer in this country. After getting well posted I decided that it would be a sound policy for Morgan & Wright to continue business at the old stand and upon the old basis.

"I wish to contradict the report which has been in circulation in this country to the effect that I had negotiated for the sale of Morgan & Wright's business with the interest which controls the Dunlop tire abroad. No proposition was considered from any one connected with that company either directly or indirectly, and the report is false in every particular.

"While in England I used all possible means to keep fully informed of the doings of the cycle trade in this country and plans for our 1897 business have been carefully made and will be duly carried out. The Morgan & Wright policy of looking after the interests of every one using Morgan & Wright tires, whether manufacturer, dealer or rider, will be adhered to in the future as in the past."

TO KEENE MAY GO.

Frank T. Fowler is dickering with Messrs. Lane & Batchelder, from whom he bought the Windle plant at Worcester, for the removal of the property to Keene, N. H., where the two gentlemen reside. It is stated that this was one of the conditions of the purchase, conditional, however, on Keene's raising a certain large sum of money.

PALMERS BY PALMER ONLY.

Hereafter Palmer tires will be sold by the Palmer Tire Company only. This means that the Columbia Rubber Works Company, who formerly marketed the well-known Palmer production, have ceased to be their selling agents, and that makers and dealers generally must hereafter deal with the Palmer Company direct. In the past the former arrangement led to no little confusion and delay, but under the new order of things, it is believed that the change for the better will be instant and universally noted.

For some time the Palmer people have maintained an office and repair department in this city at No. 66 Reade street, which, under the new regime, will be extensively improved and altered, as the Eastern trade will be supplied from New-York as heretofore, insuring the continuation of prompt shipments at the lowest freight rates.

The Western business will be looked after by the Chicago house, where the headquarters of the company will also remain. No changes are contemplated in the executive staff of the concern, but a number of additions have been made to their travelling and clerical force. In the tires themselves, no great change has been made or found necessary. Slight alterations have been effected in one or two of the patterns, but the principle of the construction has not been affected in any way. A tire specially adapted for use on tandems will be an addition to the line. In the matter of price the company is not yet prepared to make an announcement, and will not yet say whether their figures of previous years will be reduced.

VICTOR VALUES VARIED.

For the first time in its history the Overman Wheel Company will place upon the market a \$75 Victor. Their Model 30, which will be listed at that figure, is practically their '96 Victor. The only difference is in the tires and in the rims. The gray tires enamelled rim (in maroon) are provided on the Model 30.

When seen by a WHEEL man at the New York headquarters, W. C. Overman said: "As you know, the greatest expense in producing a new model wheel from year to year is in the manufacturing of new tools, appliances and models that are made necessary by the changes and improvements in the new wheel over its predecessor. We have concluded this year to try an experiment; instead of discarding the '96 tools which are useless for the '97 wheel, we will continue to use them for the production of a wheel. Since we do not have to make new tools the cost of production for Model 30 is very much reduced, and the price of \$75 corresponds in reduction from \$100 with the reduction in the cost of product."

BACK TO THE FOLD.

Once More the Liberty Takes Its Place
in the Cycle Trade
List.

If you know the sweet song of Liberty—the Liberty, let it be heard. For, be it known, the Liberty will once more skim o'er "the roads of the free and the tracks of the brave."

Stockholder John Holden has obtained possession of the property, has fired the bunkers with fresh capital, and the Liberty Cycle Company is once more a thing of life. The Bridgeport factory is in operation, and as this was long foreseen, matters and '97 models are already well advanced. Treasurer William F. Wilson will, as formerly, direct affairs from New York headquarters, No. 4 Warren street. He reports a number of orders in hand, and anticipates no difficulty in disposing of the entire output.

The '97 Liberty will be listed at \$100, and embody all up-to-date wrinkles. A Liberty tandem will be made for the first time.

The company will be as conspicuous as ever at the cycle shows. Eight spaces have been engaged at the New York function.

CASE OF "FREEZE OUT."

There's trouble in the Warwick & Stockton Company, the well-known cycle fittings concern in Newark, N. J.

Warwick has endeavored to settle the matter diplomatically, but these efforts failing, on Monday last he applied to the court in Jersey City for the appointment of a receiver, and to obtain an accounting and a winding-up of the concern. Mr. Warwick made a number of serious allegations in his petition. He accuses Dr. Stockton of substituting inferior stock for that formerly used to the detriment of the concern and the reputation of Warwick. The Court has the matter under advisement.

SALON DU CYCLE.

Paris, Dec. 12.—The Cycle Show was opened to-day in the Palais de l'Industrie and attracted immense throngs of people. There were 550 exhibitors, including twenty-three Americans, who scored a great success, owing to the originality of the arrangement of their exhibits.

WHERE THEY ARE.

H. Smalley Daniels, representing the Hamilton-Kenwood Company, of Grand Rapids, Mich., was in Gotham last week and placed their New England agency with the Home Rubber Co., Reade street, New York.

Some of the improved saddles have altogether too many good points to suit most users.

IN ELLIOTT'S BOROUGH.

J. Emory Tippett, the newly elected Chief Consul of the Massachusetts Division, formally grasped the helm of that division at the annual meeting held in Boston last week. In taking the chair he referred to the division membership, and announced that he would follow the rules laid down by his predecessor, Sterling Elliott, in this and other lines. He thought the membership could easily be increased to 20,000.

Secretary-Treasurer A. D. Peck announced that in the past year the division membership had increased by 3,673. There is a balance of \$2,189 62 on the right side of the ledger.

The spring meet cost the division \$1,042 93; the Cottage City meet, \$541 75, and the fall meet at Springfield, \$157 55.

The Committee on Rights and Privileges during the year received seventy-three applications for advice on legal matters pertaining to cycling law.

Henry W. Robinson reported that 173 sanctions had been granted in the division, an average of over one meet a day. On July 4 there were twenty-one meets. Professional racing has given but little trouble, and he advised the delegation to the National Assembly to support the amendment making professionals eligible to League membership.

It was voted to offer a reward of \$25 for the arrest and conviction of any person stealing a bicycle from a League member, and also to establish headquarters at the New England Cycle Show to be held in Mechanics' Building, February 20, 22 to 27.

The delegates elected to the National Assembly were: J. J. Fecitt, L. H. Adams, R. S. Swan, Leo Abraham, J. S. Dean, Spencer T. Williams, A. K. Peck, H. E. Morine, N. W. Starbird, A. G. Frothingham, W. S. Doane, Warren Dow, A. R. Keltie, W. C. Dill, F. I. Gorton, W. S. Lloyd, F. S. McCuseland, Ralph A. Moses, George W. Dorntee, C. G. Percival, J. C. Pason, J. W. Porter, H. J. Collins.

During the counting of the ballots the Board voted to expend something like \$2,650, as follows: For maintenance of an office for the chief consul, \$1,000; salary for secretary-treasurer, \$1,000; retainer to J. S. Dean, \$100, with another \$100 for services rendered; prizes for League membership, \$200; expenses of the midwinter meet, \$250.

A resolution, which passed without a dissenting voice, was to the effect that in case Mr. Gideon declines a reappointment as chairman of the Racing Board, the name of Mr. Henry W. Robinson be brought forward and pushed for that position.

OPEN TO CONVICTION.

Delegates to the annual meeting of the Illinois Division at Peoria last week left the convention unpledged as to the division's vote for the presidency. The secretary's report showed the membership to be 3,204. A balance of \$473 is in the treasury. Fred Patee, the new chief consul, was installed in office. Delegates elected to the National Assembly are as follows: Fred Patee, Peoria; W. H. Arthur, Chicago; George D. Locke, Jerseyville; Thomas F. Sheridan, Chicago; W. A. Connelly, Danville; H. C. Morse, Peoria; Charles H. Robinson, Springfield; Fred Gerlach, Chicago; C. E. Randall, Chicago; S. A. Miles, Chicago; Harry M. Gardner, Chicago.

COLUMBUS CHOSEN.

Columbus, Dec. 14.—The Board of Officers of the Ohio State Division yesterday decided to hold the State meet in this city. J. A. McGee, of Dayton; J. A. Griffith, of Steubenville; F. L. Ghafter, of Fostoria; W. G. Saxton, of Canton, and Dr. A. B. Hawson, of Chillicothe, were chosen as delegates to the National Assembly.

"LEGAL ADVISER" BOYLE.

After Chief Consul Boyle read his report showing the great advancement made by the Pennsylvania Division during the past year, at the annual meeting held in Philadelphia on Monday last, it was voted to increase the sum paid him as legal adviser from \$500 to \$1,000. Seventy representatives were in attendance when the roll was called.

Secretary-Treasurer Collins reported that during the year the State membership had increased from 4,435 to 10,878, a percentage of increase which has not been equalled by any other State in the country. He also reported the treasury to be in a prosperous condition, having net assets amounting to \$3,676 40.

Numerous plans for still further increasing the membership and generally advancing the interests of the division were suggested and discussed by the various members and committees, and a resolution was adopted expressing the appreciation of the organization of the action of those railroads in the State which carry bicycles as baggage.

It was voted to authorize the Executive Committee to donate the sum of \$500, in the event of the National meet being held in Philadelphia.

About an hour during the afternoon session was devoted to listening to an interesting address by Professor John Hamilton, Assistant State Secretary of Agriculture, on the matter of improved highways.

WHERE YOU CAN FIND THEM.

Nos. 143 and 145 Lake street will be the Chicago address of the New York Belting and Packing Company. Their branch house has been established at that location. Ashley P.

A. P. Peck.

Peck is in charge. Mr. Peck gained profitable experience during his connection with the New York Tire Company in the West, and as he is widely known, should be able to do material service in advancing the interests of the League tires.

The following delegates to the National Assembly were elected: H. B. Worrall, Thomas Hare, A. H. Allen, George H. Loes, W. W. Randall, H. McAllister, J. J. Gesselman, C. A. Dimon, F. X. Quinn, W. R. Tucker, Robert J. Brinkworth, Jr., James S. Larzelere, all of Philadelphia; Anson P. Dare, Harrisburg; Charles G. Willson, Reading; C. H. Olreiter, Lancaster; W. P. Swartz, York; A. B. Dunning, Scranton; A. D. Knapp, Williamsport; H. C. Mason, Wilkesbarre; B. F. McCreight, Du Bois; Trevor F. Myler, Pittsburg; C. V. McLean, McKeesport; C. W. Huston, Pittsburg; J. B. Taylor, Allegheny; William S. Cook, McKeesport, and C. D. du Shane, New Castle.

WANT SUNDRIES.

Hartley & Graham, No. 315 Broadway, New York, are open to purchase sundries and novelties. This concern handles a large line of sundries and has a large selling capacity.

KIND OF A RIM KING.

Where W. W. Stall will next break out remains to be seen. As the result of his several visits across the border, it is announced that the four-story brick factory of C. W. Hurndall & Co., in Toronto, has passed into the possession of his concern, the Boston Wood Rim Company. The Hurndall plant has for some years been engaged in the manufacture of both laminated and one-piece wood rims, and it is consequently a desirable piece of property. By the terms of the contract the services of Mr. Hurndall himself are assured to the Boston people for a number of years. He will continue the direction of the plant. He spent several days of last week at the Bedford, Mass., mill, and when he left, carried to Toronto machinery and tools that will add materially to the Canadian plant. In addition to this factory, the Boston Wood Rim Company has also established a lumber depot at Buffalo, where George F. Bishobrick, one of their recent acquisitions, will have his headquarters. A rim plant in Chicago is also being projected, and it is quite possible that it will be in active operation before another season. Mr. Stall has the plans well under way.

CONGESTED TRAVEL CURE.

With the intention of relieving congested travel on the drives in Fairmount Park, Philadelphia, \$25,000 has been asked for with which to construct cycle paths. Three propositions have been submitted for approval to the superintendent. The plan which, from present indications seems most likely to be accepted is to construct on the gutter line of already constructed drives on either side of the roadway tramways of smooth, vitrified brick, say six feet in width, with the side inlet drains thrown back in the footway bordering the drive, thus giving two clear widths of six feet, with a hard, smooth surface, on either side of the roadway.

STRUCK ON THE MUD.

A decided novelty in the line of a strike took place in Milwaukee last week. The messengers of the Postal Telegraph Company quit work because the officials insisted that the boys must use bicycles in delivering messages. The messengers declined to ride their wheels, on the ground that the streets were too wet and muddy. Boys who came to take the places of the strikers were assaulted, and police protection was asked for. Later some of the strikers returned to work.

NO MORE FIRE GONGS.

Baltimore's Park Board has framed a new set of rules regarding riding in the parks. Coasting is prohibited, bells, it is stipulated, shall not be more than three inches in diameter, and no cycle shall have attached any device capable of producing an unusual or objectionable sound. Riding crosswise and removing the hands from the handle-bars is also forbidden. Lights on all vehicles are required, except on roads lighted by electricity.

EXTRA HAZARDOUS.

In the annual meeting of the Iowa State Travelling Men's Association the medical examiner of the insurance department of the organization reported in favor of wheelmen being placed in the extra hazardous class of members, owing to the numerous accident claims from the cycling portion of the association's membership.

GOES ECLIPSING NOW.

W. H. Ellis has engaged to travel in the West in the interests of the Eclipse. Mr. Ellis was formerly a Remington traveller and did good work in the South and West.

A SORRY SPECTACLE.

SATURATED with the fumes of stale and cheap tobacco, another six-day bicycle race has been embalmed in history. "Records" of every kind have been beaten both by miles and hours. The winners have become briefly "famous," temporarily flush with prize money, and permanently injured in health, for a short time pictorialized by boiler-plate product, and a week hence will be as forgotten as the name and virtues of Pharaoh's second cousin.

Doubtless such performances as these call for a certain amount of grit, for a brutelike defiance of outraged nature, for the same "sand" that marks the winner of a long-fought mill in the ring, but the element of sport, the essential principle of true racing, is wanting. No amount of press work, hurrah and brassbandery can make the spectacle of that endless procession of half-blinded, pallid, bedraggled creatures, with hollow eyes and the "all gone" expression of the spent swimmer, aught but a spectacle to excite pity, not admiration.

It is not sport to bribe a man to tax his physical powers to the point of exhaustion. That ceases to be exercise which compels the body to respond to the tremendous strain of long-sustained nervous muscular exertion these six-day affairs demand. Thus such exhibitions have no claim upon public support save through the medium of their brutality, and yet were brutes, horses for example, subject to identically the same treatment as these six-day riders, pulpit, press and laws would all combine to forever make such exhibitions impossible.

That a wheelman should ride 1,911 miles in six days to perform some acts of self-sacrifice or heroism would be a legitimate application of his bodily strength. But that he should do so simply for the sake of the few dollars he may receive in payment smacks of the foolhardiness of the man who shoots Niagara in a barrel. In neither feat is there anything to challenge our admiration or command our respect.

The six-day riders perform one service in that they have established a limit of physical endurance on a wheel. It is valuable for us to know this, just as it is valuable to know the limit of speed in a trotting horse or in an eight-oared crew over a four-mile course; but that men who ride for pleasure or exercise should always ride at top speed, or that all oarsmen who row for exercise should "hit her up" to a racing gait, is no more absurd than that any one should fancy it is sport or exercise to ride in six-day races. Let wise riders treat their bodies as humanity teaches them to treat those of horses. Let them regard the wheel not as a record-smashing space-annihilator, but as an instrument of easy and gratifying motion, which, if rightly used, is a cheap and beneficial aid to good health and a source of great enjoyment.

BRITISH "FAIR PLAY."

STUDIED at close range your average Britisher is not a lovable object. Great Britain's "splendid isolation" to-day among the nations of the world is proof of this. Ever since America has become a factor in cycling, either from a trade or a sporting aspect, the lovely traits in the British character have constantly cropped up. With page after page of American advertisements the Cyclist dismisses the paper's foreign advertisers with: "Among the poorest specimens of cycle building in this year's Stanley show were American machines." Further along this same ultra-British bluff-maker advocates the non-acceptance of any American records at the making of which English timers were not present. In the two claims above the Cyclist virtually declares its American advertisers are swindlers, and all American racers, timers and officials are either inaccurate or dishonest.

All of this would be a source of regret were the world not thoroughly aware of what a sham England's boasts of fair play and fearlessness are. The Englishman, in sporting as well as in larger matters, has at heart a profound contempt for any alien. He will take a beating from another Englishman with equanimity, but at the same time, within the rigid laws of sport, will seize every conceivable advantage of his adversary that he is permitted under the laws. He does not feel called upon to be generous. His assumption is that the other man should equip himself with thorough knowledge of the game before entering upon it, and he concedes nothing to the other's ignorance. The history of every international contest which has taken place between England and America, whether on

land or water, proves this.

But he is overbearing with aliens. He does not consent that these latter shall measure him by his own rules. He expects and tries to exact concessions from them which he would not extend to his peer on his own soil. He does not expect defeat from outside, and when it comes to him he finds refuge in abusing the alien antagonist for strict construction and for not being "generous" or "sportsmanlike."

He has no sense of the humorous aspect of his inconsistency. All this extends to larger matters. The Englishman cries out against the seizure of alien lands by a foreign government while offending in precisely the same way himself, and he is indignant, comically so, with criticism of his own offense.

This inconsistency and disregard of outside comment are probably the salient reasons for the splenic utterances of the Cyclist in its present crusade against American cycle manufacturers, whose persistent and successful attack upon British trade supremacy in the home markets of Great Britain, has aroused every instinct of English "fair play" in the hearts of that by no means limited class of British citizens whose definition of "fair play" is based upon the dictum of win, tie, or wrangle whenever Britons may be called upon to meet competition from abroad.

TWEEDLEDEE AND TWEEDLEDUM.

A LEADER of the New York Bar, a lawyer famous for his knowledge of the law, in short one of our "foremost citizens," forsooth, seated in his brougham, is driven rapidly through the city streets with the lamps upon his carriage unlighted. Hailed by a policeman and by him notified that he was violating a city ordinance, this leader of the bar, this expounder and exponent of the law, this "foremost citizen" orders his coachman to proceed unmindful of the policeman and his demand for lighted lamps.

Escaping with his life from the coachman's attempt to obey, the policeman finally lands his coach-driving antagonist in court. Thereupon the bench, seated beside the Magistrate and in close converse with him, was the employer of the law-defying coachman. Case heard, the famous lawyer pleaded the baby plea of I didn't know there was any such law, promised he would not again try to drive dark-lanterned over citizens and policemen, and the Magistrate fined him the crushing sum of one whole dollar.

At the same time, in another courtroom, two drivers who were not great lawyers and "foremost citizens" were charged with identically the same offence. They, too, pleaded ignorance of the law, but it was of no avail; their fines were \$5 each. Two wheelmen followed them to the bar and outraged justice taxed one \$3 and the other \$5 for the heinous offence of an unlighted lamp.

What kind of law, to say nothing of justice, is this? Why has a lawyer, even if he is rich and famous, the right to occupy a seat upon the bench when in the person of his

servant he is brought before it as a criminal? Why should such a violator of the law escape with a fine of \$1, when culprits less guilty and less influential are mulcted five times as much for the same offence?

Why is a wheelman without a lighted lamp five times more dangerous to the public welfare than an influential lawyer in a brougham guilty of the same offence? Can any one, not even excepting a New York Magistrate, tell?

LEARNED BETTER.

IN years gone by some of the daily papers were wont to occasionally make flings at the trade press. They have not done so recently, because the trade press has become so powerful that even the dullest representative of the daily press has come to recognize the importance and strength of the former's position.

It used to be one of the standing jokes in a daily newspaper office, which was resuscitated and forced to the front at frequent intervals, that of all forms of journalism none succeeded in giving its readers so much absolute dullness as the average trade journal.

This was, of course, because the editors of the trade journals recognized, as they do, the wisdom of confining themselves very largely or solely to the discussion of trade subjects, which are naturally of no interest to if not entirely beyond the comprehension of those not engaged in the industry represented, including the wise editors of the daily papers.

However, as we have said, all this has largely been changed, and to-day in the case of the wheel papers they each week supply columns upon columns of "original" cycle news to the daily papers, which news never would be seen there if the editors of the dailies did not in this case hold a good opinion of the trade press and its ability to correctly deal with matters appertaining to cycling.

STIGMA STILL STAYS.

PROFESSIONALISM is the bar sinister in the athletic world. The racer who wears it is regarded by some people much in the same light as they regard a cart horse. Sometimes they stoop to admire his performances, but they have no admiration for the being. Society fawns upon or lionizes the amateur, but scorns the professional.

Some people who are not willing to be led, who will not see with the crowd, who have a love of justice that rises superior to any dictate of society, have wondered why this should be so. All efforts to induce society to change its view of the matter have been futile.

There are some, however, who do not believe that a man shall be tabooed because he accepts money for the performance of some feat which is due either to some peculiar natural ability or hard labor, or, as most often happens, a combination of both. The man who rises to a position of prominence in racing or

any department of athletics must have some natural ability in the line which he has adopted, and to achieve success he must back this natural ability up with hard work. This much is granted, but there it all ends, usually.

One lesson we believe newcomers and old in the wheel trade have paid expensive tuition bills to learn during the past six or eight months is that the cutting of prices will not increase sales when there is no demand. The effort to force wheels upon an unwilling market by cutting prices is the worst sort of business policy. In the face of so self-evident a proposition some manufacturers would, and did, cut prices below the actual cost of production, after being repeatedly warned that such action, however privately and secretly done, would react unfavorably on them whenever demand and consumption reached normal conditions, which every one knew was bound to occur some time or other, so long as the wheel has now become virtually a necessity and will wear out.

There is this to be said for the seller of bargain-counter bicycles: He usually puts his money to better use than his customers do theirs.

The bicycle shares with electricity the honor of being one of the two youngest children of commerce. Neither has yet reached its maturity.

It is a noticeable thing that people who borrow trouble about the wheel they ride are always generous about sharing the loan with others.

A woman with views upon the morality of cycling is like wine with quinine. A tonic may be necessary, but it is not nectar.

The amateur lamb and the professional lion may lie down together, but the lion will be the only one to get up.

Just attempt to sell a man "his choice" between two wheels, and see how quick you will sell neither.

A stitch in the side is often Nature's hint that the rider should mend his ways.

The best of us do something, now and then, to retard the millennium of the wheel.

A peculiar person is one whose views of cycling do not coincide with your own.

The wise rider is he who does not make a fool of himself twice in the same way.

No wonder wheelwomen are vain; all men, even the photographers, flatter them.

Many a man exhausts himself doing uphill work after he has reached the top.

The rider who is wrapped up in himself has a very chilly garment.

A FEW POTTER "WHEREASES."

The Press Cycling Club, of Boston, has taken issue with the Massachusetts Division in regard to the indorsement of Sterling Elliott for re-election to the presidency of the League. It comes out for I. B. Potter, in a resolution worded as follows: Whereas, The vote whereby the delegates were instructed to vote for Mr. Sterling Elliott as president for the ensuing year does not represent, in the opinion of the Press Cycling Club and many members of the division with whom the members of this club have conversed, the sentiment of the division at large; and as there is a largely expressed sentiment in favor of I. B. Potter, of New York, who has done such wonderful recruiting work in his own division as Chief Consul.

LOOKS NICE ON PAPER.

A scheme to erect a large cycling academy in the Back Bay district, Boston, is being discussed by the local Board of Trade. The plans embody an indoor cycle track, an arena for horse shows and indoor racing, a riding school, skating rink, cafe, etc.

To meet the expense, capital is to be secured by issuing a popular subscription of stock at \$10 a share. Such men as Francis Peabody, Jr., Frank Seabury and Ned Hodges are behind the movement. Plans for the building have been already prepared and show a central building flanked by two tall towers, between which will be a handsome arch, spanning the main entrance.

LAMPS FOR ALL.

Chicago cyclists are almost unanimous in favor of the proposed ordinance to tax bicycles and other vehicles, and a universal lamp law, which goes hand and hand with the tax ordinance, if the money thus secured is used for the improvement of Chicago streets. One dollar is the tax proposed on bicycles. It is doubtful, however, if the tax can be legalized.

WHEN THE PRICE WILL LOWER.

When high-grade bicycles can be made, marketed and sold continuously the year round without depreciating in value if carried over from one year to another the prices will come down. Before that date reductions will be temporary and brought about by unexpected causes and will be applicable to individual machines rather than the trade as a whole.

FELT SOMEWHAT SORE.

Columbus, Ohio, workers for the '97 League meet are aggrieved over an article in a Cleveland cycle paper belittling their chance for success. At a meeting of cyclists and business men interested in the matter last week a series of resolutions were passed denouncing the paper's attitude, which have been sent to all cycling papers.

AGAIN THE AFRICAN.

The Albany correspondent comes out with the announcement that the colored cyclists of the country are now prepared to carry on a war against the League for barring them from membership, and will fight the ruling at the next Assembly meeting.

PATTISON PANTS FOR POSTERS.

Manager Pattison, of the Chicago Cycle Show, expects to make the "poster exhibit" quite a feature of the function. He is anxious to secure samples of all cycle posters in existence, and hopes the whole trade will interest itself.

As the flower is before the fruit, so is amateurism before professionalism.

HOW IT ENDED.

When the Finish of the Game of Merry-go-round Came, All This Had Happened.

FINAL SCORE.

	Miles.Laps.		Miles.Laps.
Hale	1,910 8	Taylor	1,732 2
Rice	1,882 6	Ashinger	1,673 3
Reading	1,855 3	Moore	1,661 7
Forster	1,829 4	Maddox	1,644 3
Schock	1,766 2	Gannon	1,366 8
Pierce	1,758 1	McLeod	1,350 2
Smith	1,754 7	Glick	1,096 3

Hale's record of 1,910 miles 8 laps beats Schock's record of 1,600 miles 1 lap, made in Madison Square Garden in 1893, by 310 miles and 7 laps.

"Say, w'at is dis, a bloomin' skin?" remarked a gentleman from the neighborhood of the Bowery Saturday night, as he crowded up to the rail surrounding the track at Madison Square Garden at 9:58 o'clock. "Here I coft up a plunk an' dere ain't er bloody bloke plavin' his slippers. Watter dey 'ink I am ter give up me dough fur, say?" and he started back for the box office.

And although put in inellegant language, it was a fact. For two minutes before the pistol was fired at 10 o'clock on Saturday night at the close of the six days' race not a rider was

and stated that inasmuch as there were but eleven prizes, Messrs. Cassidy, Gannon, McLeod and Glick would be liberally rewarded by the management for their plucky work, whereat the crowd cheered lustily and shouted "What's the matter with Powers?"; "He's all right!" and similar remarks.

Then the cry went up for Rice, and Rice was trotted out. He attempted to outdo Hale by running around the track, pale and tottering, while the crowd again went deaf.

The race had been a remarkable exhibition of human endurance, and despite the raise of the admission price to \$1, fully 12,000 spectators were present at the finish. It appeared as though every foot of the big building was covered by a human being. The Bowery divided honors with the Four Hundred; Murray Hill, Cherry Hill, Harlem and Hoboken el-

position, which pushed up Smith, Pierce, Taylor, Ashinger and Maddox each one notch and increased the amount of their checks.

Hale and Rice had a nip and tuck game all day long. Hale would allow Rice to gain, but always held his own score safe. He was so far in advance of the Wilkesbarre rider that he could easily have afforded to let him gain three or four miles an hour, but he took no chance of letting him get so close that a slight accident would probably prove fatal to his gathering in the first money. Rice hardly left his saddle until late in the afternoon, when every rider consented to leave the track for one hour, during which time the extra attractions in the shape of sprint runs were decided. This was done more for safety than anything else, as the sprinters have some very dangerous tumbles at times which might jeopardize the chance of one or more of the six-day men.

Rice and Reading did the best work during the last day. Rice having to protect second place, while Reading was after it. Hale's business was watching both men.

Floral tributes were presented in abundance. Every rider at some time or other circled around bearing either a bouquet of roses, a horseshoe, a wreath or a basket. Hale came in for the largest share.

The men who held on through the last

Taken Two Days After the Race.

on the track, despite the statements to the contrary in the daily papers. Hale, the winner, completed his 1,900th mile shortly before 9 o'clock, and retired. Pierce, of Cambridgeport, and Taylor, the Brooklyn colored rider, collided a half hour before the finish, and the son of Ham retired. Pierce kept at it for a while longer, with Moore. About ten minutes before the end of the 142 hours, Hale came on, but they all left the track two minutes before the pistol sounded at 10 o'clock. And then there was pandemonium, and a melodramatic windup that was truly ludicrous, as it was sensational. Manager Plummer of the foreign contingent brought out Hale and, with Marks, his trainer, attired in citizen's dress and a high hat, looking as though he was prepared for a walk in the park, they paraded around the track supporting Hale between them, who could scarcely drag one foot after the other, and looked like a ghost.

The crowd cheered as though bereft of senses. The band struggled bravely to be heard, but unsuccessfully, and the police had to use force to keep the spectators off the track.

Behind this trio walked two men carrying floral harps, which had been presented to Hale in honor of winning the big race. The band played "The Wearing of the Green" and other Irish airs, and everybody hurrahed and shouted "Hale!" "Hale!" "Hale." The announcer previously introduced Edward Hale as "champion of the world,"

bowed together. There were bankers and bartenders, prize-fighters and lawyers, and hundreds of clerks and clubmen. It was a crowd such as only a large cosmopolitan city like New-York can turn out. The newspapers during the week had devoted columns to the race, inserted cuts galore, and scare heads by the yard, so that there was scarcely a man, woman or child who was not interested in the event.

Hale's remarkable riding and Rice's game-ness caused excitement to run high during the closing hours. The Irish contingent rooted for Hale while the other half of the spectators cried encouragingly to Rice, causing a perfect bedlam of voices and a continuous uproar.

The only change in the positions of the men during the last twenty-four hours was caused by Moore dropping down to eleventh

days were human wrecks. Some were quite out of their heads.

Hale began to get a little cranky on Friday. He stopped riding and claimed that he believed there was a scheme on foot to run him down. He was persuaded differently and men were stationed to watch for anything that might occur to excite suspicion.

Rice pulled up on the Twenty-sixth street side of the track in the evening and began abusing some of the spectators. He claimed they were throwing stones at him. It was fancy, of course. He was having a heated argument, when his trainers ran to him and coaxed him away. Rice's mind was troubled many times, but he was easily pacified and regained his senses after a few minutes' rest.

At 4 o'clock in the afternoon all the men left the track while the sprint races were on. They were shaved, shampooed and bathed, and came on looking infinitely better.

Maddox then started a tremendous pace in his effort to pass Moore. Rice and Hale rode weakly. After five miles the Wilkesbarre man was scarcely able to move. At 7 o'clock Maddox had gained greatly on Moore, and at 8 o'clock he was riding at sprinting speed. Maddox made three laps to every two made by the other riders. He rode with as much

vim' as he did at the beginning of the race, and every time he passed the other riders the crowd yelled itself hoarse.

About 8:30 o'clock the race was practically ended, although some of them remained on the track. Hale was one of them, and between 9 and 10 o'clock he made a few laps at a 2:40 pace, which seemed impossible for a man who had ridden 1,900 miles in 141 hours.

Toward the end Hale showed signs of breaking down. His face was shrunken away till his cheekbones stuck out. His complexion was like putty, and he worked his pedals with apparent effort. His limbs were stiff, and he was saddle-sore. For the first time that morning his trainer evinced some anxiety and encouraged his charge in every possible way.

None of the riders were in much better condition, and no one can describe their feelings and sufferings during the long race. Not one had strength enough to help himself, and the majority hardly recognized their friends and surroundings. Vitality had spent itself. There were one or two who could stand erect, but the majority floundered around, weak kneed, sore and limp, with scarcely enough ambition to speak.

Physicians assert that they will never recover from the strain, but on Monday, when seen by a WHEEL man, they were in fairly good shape. Hale, while appearing somewhat hollow-eyed, complained of nothing but saddle soreness, numbness of the hands and feet, and hoarseness. In fact, he was unable to wear shoes. After the race he was taken to a Turkish bath and afterward allowed to sleep. His appetite since the race has been tremendous. Rice finished in a worse physical condition than Hale, but recuperated quickly. He slept but ten hours during the week. Reading was found to be in a bad way on Monday, and was taken to Bellevue Hospital for proper treatment. Forster was also in bad shape.

Of the twenty-seven starters fifteen were well enough to go through the trying ordeal. Linton, Lumsden and Chapple never intended to go the entire time. They were entered more as pacemakers for Hale than anything else. Linton went out after about two hours' riding. Lumsden continued until he had paced Hale into the lead, after going a little over 100 miles. Chapple was not prepared for the race, and was missing after going eighty-three miles.

Waller and Van Emburgh had a nasty spill early on Monday morning, and both were so badly bruised that they were unable to continue. Cartwright also fell and was unable to continue. Hansen, Golden, Conklin, Von Steeg and Wilson fell out at intervals, either through lack of condition or accident. Elkes, who came from Saratoga to compete, was the last of the men to give up, after going 622 miles. He tried hard to continue, but nature rebelled.

Throughout Saturday Rice tried his utmost to gather up Hale, but the Irishman would have none of it, and moved with Rice every time he made an effort to get away.

Eleven prizes were offered for the race, which were distributed as follows:

Hale	\$1,300	Pierce	\$150
Rice	800	Taylor	125
Reading	500	Ashinger	100
Forster	350	Maddox	100
Schock	300	Moore	75
Smith	200		

This is not all the winner will derive from his work. He will be in receipt of a goodly sum from the maker of the wheel he rode, as well as for the tires, chain and other parts used. He also secured a week's engagement at Proctor's Theatre, where he rides exhibitions on a home-trainer, beginning work on Monday afternoon. Reading received an additional prize of \$50 for riding 245 miles without leaving the saddle.

His money was attached by a deputy sheriff on a judgment secured against him in Omaha. This was the first six days' race participated in by either Hale or Rice, and the latter's friends immediately began talking of a match, but Hale asserts that once is enough for him. It is claimed for Rice that had he received better handling at the start he could have covered 2,000 miles. He is a machinist and electrician from Wilkesbarre, Penn., and made both the machines he rode.

Hale started on a 104-gear wheel and late in the week changed to 84-gear. Rice changed from 92-gear to 84-gear and Reading used 88, 84 and 80 gears.

Hale beat the record by 310 miles and twelve other riders finished to the better of previous figures. The records went by the board from the start, the previous best being made at the six-day race in 1893. In the first hour in that race Berlo covered twenty-one miles, against Linton's twenty-three miles. The remarkable change of figures can be seen from the following table:

Hours.	Miles.	Hours.	Miles.
10 Hosmer	173	10 Forster	192
20 Waller	337	20 Hale	359
50 Schock	756	50 Hale	789
100 Schock	1,277	100 Hale	1,401
142 Schock	1,600	142 Hale	1,910

(The Chainless Wheel on Which Starbuck Defeated Linton.)

Hale has all records after the nineteenth hour, the records up to twenty hours being held as follows:

Hours.	Miles.	Hours.	Miles.
1 Linton	2811	Hale	213
2 Lumsden	4412	Hale	230
3 Lumsden	6415	Reading	244
4 Lumsden	8314	Reading	261
5 Hale	9915	Reading	277
6 Hale	11816	Reading	294
7 Hale	13717	Reading	309
8 Pierce	15618	Reading	325
9 Hale	17619	Reading	341
10 Foster	19220	Hale	359

During the week short distance racing enlivened the treadmill monotony of the all-week pluggers. On Wednesday Lefferson, of Asbury Park, defeated Owen and Losee in a mile race, winning in 2:19.

"Teddy" Goodman won the first and third heats in his mile race with Al Weing, Weing fell in the second heat and won it on the runner. Best time, 2:37 3-5.

On Thursday afternoon there was a half-mile race for amateurs, divided into four heats of one mile, and the winners rode a half-mile in the final or deciding heat. The first heat was won by L. R. Lefferson; A. S. Jungkind was second, and A. S. Lee, of Cohoes, was third. Time—2:22 2-5. C. H. Tomlinson, of the Riverside Wheelmen, won the second heat in 2:25½, W. L. Losee, of the South Brooklyn Wheelmen, the third in 2:34, and A. J. Latham, of Saratoga, the fourth in 2:46. In the final heat Jefferson led nearly all the way, and won by a length; C. H. Tomlinson was second, and W. L. Losee third. Time—1:09 4-5.

During the intermission between the preliminary and final heats, Bald rode an exhibition mile, paced by a tandem, in 2:19 3-5.

During the evening there were more sprint races, and Bald rode another exhibition mile. The most prominent event, however, was a ten-mile race between Tom Linton and J. F. Starbuck. The men were started on opposite sides of the Garden, and had scarcely covered two laps when Starbuck fell at the Madison avenue end. Linton stopped riding, and the men were started again. Starbuck drew up rapidly on Linton, and caught him on the seventeenth lap. From here until three laps from the finish Starbuck trailed behind Linton, and then ran away from him in a sprint, beating him nearly three-quarters of a lap. Linton complained of the track. Starbuck's time was 24:40, Linton 25:02. The race caused intense excitement, and Starbuck received an ovation.

On Friday Lefferson was again victorious, winning a mile invitation race from Tomlinson and Granger in 2:21 1-5.

The evening attraction was a half-mile invitation handicap for professionals. Bald, the scratch man, in the first heat fell, leaving Weing, Buffalo (20 yards) to win easily in 1 minute 10 seconds. Con Baker (20 yards), won the second heat from J. Eaton (10 yards) in 1 minute 7 4-5 seconds. The third trial was captured by C. G. Carpenter (20 yards), Teddy Goodman (10 yards) being second, in 1 minute 28 4-5 seconds.

Baker won the final by a length from Weing, Eaton finished third. Time, 1:08. Bald then turned out for a mile against time, paced by the "black and white" tandem, and stirred up the enthusiasm. He reeled off his ten laps in 2 minutes 17 4-5 seconds and went away from the pacemakers on the last lap.

After the extraordinary demonstration that marked the finish was over, a 25-mile professional race was started. The contestants were Jay Eaton, F. F. Goodman, A. E. Weing, "Conn" Baker, T. Thompson, E. C. Acker, Frank Waller, C. G. Carpenter, W. J. Hoffstetter and C. E. Kluge. The race narrowed down to a duel between Eaton, Carpenter and Weing and was one of the hottest ever run on an indoor track. Goodman led at the end of the fifth mile, the time being 12:11 1-5. Weing led at ten miles, with time 10:24 40. Carpenter led at twenty miles, with Eaton second and Weing third. The time was then 50:12 4-5. Baker lost a lap in a fall, which also put Goodman out of the race. He tried to make up the lap, but failed.

After passing the twenty-four miles Eaton shot to the front like a rocket, followed by Weing. The pace was too fast for Carpenter, who fell back. In the last lap the pace was terrific, and Weing passed Eaton. The people were then on their feet shouting madly. Eaton drew on even terms with Weing half a lap from the finish, and gained steadily. He won by three lengths. Carpenter was third and Baker fourth. The time was 1:03 35 2-5.

STICKLER FOR EXACTNESS.

She—But we are only getting back to first principles. It is pretty well established that Eve wore bloomers.

He—Beg pardon, but you are mistaken. The Book mentions leaves, not blossoms.

WATERED DIAMOND STOCK.

"I wonder if that big diamond Coopald wears is of the first water?"

"I doubt it. It has been soaked so many times it must be tenth or eleventh water by this time."

LOOK ALIKE.

Daily papers everywhere are trotting out their old campaign cuts of Altgeld, labeling them "Ted Hale, winner six-day bicycle race," and the public is none the wiser.

RACING BOARD'S BULLETIN.

PROFESSIONALIZED.

J. T. Daneker, White Haven, Pa., Clause A.
Kennedy M. Currie, Galveston, Texas, Clause I.

E. H. Simper, Galveston, Texas, Clause I.
Joe Campbell, Jr., Galveston, Texas, Clause I.
Dave Ford, Galveston, Texas, Clause I.

SUSPENSION REMOVED.

Jesse Curry, Aurora, Ill.
SUSPENDED PENDING INVESTIGATION.
Steve Sgitcovich, Galveston, Texas.
Mike Ballich, Galveston, Texas.

SUSPENDED.

For entering races and failing to appear or pay entry fees:

Thomas Coburn, St. Louis, Mo.
Farragut Guhl, Chicago, Ill.
W. E. Dutton, Geneva, N. Y.
F. A. Kellar, Pigeon, Pa., until prize wrongfully kept by him is returned, and for six months thereafter.

RECORDS ACCEPTED.

Two-third mile, paced, standing, competition, professional, 1:21 1-5, C. R. Coulter, Denver, Col., October 3.

Two to twenty-five miles, standing start, competition, paced, amateur, by Forest H. Wilson, Chicago, Ill., September 22, 1896. Two miles, 4:15 2-5; three miles, 6:22 3-5; four miles, 8:34 3-5; five miles, 10:48 2-5; six miles, 12:58 2-5; seven miles, 15:07 2-5; eight miles, 17:24 3-5; nine miles, 19:34 3-5; ten miles, 21:47 4-5; eleven miles, 24:01 4-5; twelve miles, 26:07 4-5; thirteen miles, 28:18; fourteen miles, 30:24 2-5; fifteen miles, 32:40 1-5; sixteen miles, 34:39; seventeen miles, 36:54 1-5; eighteen miles, 39:07 1-5; nineteen miles, 41:21 3-5; twenty miles, 43:37; twenty-one miles, 45:53; twenty-two miles, 48:03 3-5; twenty-three miles, 50:13 1-5; twenty-four miles, 52:24 1-5; twenty-five miles, 54:35.

One-quarter mile amateur, tandem, unpaced, flying start, against time, :24 4-5, by L. E. Rodgers and J. F. Faries, Decatur, Ill., October 27, 1896.

SOUNDS LIKE FRANK HALL.

Chicago, Dec. 14.—Six-day racing is to be tried in this city during February. The success of the New York event has prompted the movement, and all arrangements have been completed except as to the place and exact date. The promoters of the event, who style themselves the Chicago Cycle Racing Association, will use the available building in which the largest track can be constructed. About \$5,000 will be offered in prizes, of which \$1,200 will go to the winner. Five hundred dollars extra will be given if Hale's record is broken. It is planned to start the long race on a Sunday night, as in New York, and to hold a series of short-distance races on the preceding Saturday night. All the contestants in the Madison Square Garden race have been asked to compete, and efforts will be made to arrange a match between Linton and Johnson.

The scheme is being discussed of building two tracks, one above the other, in order to permit almost any number of competitors to ride. The week commencing February 22 has practically been decided on.

LOOKING FOR REVENUE.

According to a Paris correspondent, a great many people are agitating in France for the establishment on the French tracks of the "Pari-mutel," or the betting-machine, which is everywhere known as the "Totaliser" in Australia. They point out that with the exaggerated fees which it is necessary to pay nowadays to the great professional cracks, it is impossible for a track to pay, even if run on the strictest of commercial lines. It is doubtful, though, if the other plan goes through.

DIAK OFF THE AMATEUR LIST.

Djakoff, the Russian champion, who won several of the English championships this year, has decided to join the professional ranks.

SOME GENTLE ARMORY CHASERS.

Bad blood cropped out during the indoor meet at the Arsenal, Buffalo, N. Y., on Saturday night last. At one time it looked as though there would be an exchange of blows. W. D. Cleland, who last year swept everything before him on indoor tracks, and John Penseyres figured in the unpleasant happenings of the evening. In the two-mile race Cleland won the heat in which Penseyres also rode. After the race Penseyres attempted to pull Cleland from his wheel, but failed. In the final, Penseyres claimed he was fouled by Cleland, but it was not allowed. Cleland declared that he had proof that Penseyres was the ringleader in a conspiracy to down him. When they came together in a five-mile race they were both boiling over with wrath. Cleland was a lap behind at three miles, when they came together with a crash at one of the turns, and both fell. Penseyres jumped up and made a pass as though intending to strike his rival, but the penalty that would follow the deed probably flashed through his mind and he desisted. Both riders were hustled off the track, vowing vengeance against each other. Ray Duer won the two principal events of the night, which caused his admirers to proclaim him the indoor champion of the city.

Summary:

One-mile lap—1, W. D. Cleland, 23 points; 2, Ray Duer, 21 points; 3, E. H. Gill, 14 points. Time—2:44 1-5.

One mile, 2:40 class—1, Duer; 2, McHaddon, 3, Cleland. Time—2:51 1-5.

Two miles—1, E. D. Stevens; 2, Benj. Cleland; 3, Gill. Time—5:35 2-5.

Five miles—1, Ray Duer; 2, Benj. Cleland; 3, E. D. Stevens. Time—14:15.

ONE MILE IN THIRTY SECONDS.

It is given out that H. E. Maslin, of E. C. Stearns & Co., believes a mile in thirty seconds within the range of possibility. He is reputed to have explained his belief in this wise:

"Incredulous as the statement may seem, I have faith in the theory that if Anderson can move at a 1:03 gait, certainly a machine mounted by six riders can reduce these figures fully thirty seconds. Now I will tell you what we propose doing, and you will readily comprehend the logic of my statement. Near Syracuse, on the boulevard that skirts the west end of Onondaga Lake, is a level stretch five miles in length. Very often during the fall of the year brisk winds sweep down from the northeast, and at times the velocity of the wind is terrific. Suppose a sextuplet with two sails, fore and aft, were cut across this breeze. Of course it could not be done with the wind directly behind, for everybody understands the theories upon which the boats are controlled. Running before the wind they attain a rate of speed thirty miles to the hour, but this speed is much greater when the boat is cutting across the wind. So it would be with a sextuplet. I anticipate a trial of this character at some future date."

AND "BILL" WASN'T IN IT.

William Martin's disqualification for two months by the League of Victoria Wheelmen was indorsed by the other governing organization of Australia, the League of South Australia Wheelmen. He was therefore barred from the great Austral Wheel Race, the final of which was run on December 5. Over 160 men were entered in the race with Lewis, Boidi and Parsons on scratch. A. B. McDonnell was allowed 10 yards. Martin, it is stated, holds all the Australian records from two miles to one hour.

MAY TRY IT AGAIN.

Tom and Nat Butler arrived in New York on the steamer St. Louis on Sunday. Like all the other American racing men who have visited Paris, this year, they returned ingloriously and without the coveted French gold. Trainer McLeish, who accompanied the riders, confirms the cable reports that Tom was unwell and unable to get into condition to do himself credit against foreign riders. "He only started in one race," said McLeish, speaking of the trip, "and was so badly beaten that I did not think it well to enter him again for some time, and thought the better way was to return home, and possibly take him abroad again next summer. Nat started in two handicap races and finished second in one heat and third in the other heat from scratch. The handicaps were too big for him to overcome, and as only one man qualified in each of these heats he did not have a chance to ride in the final heat of either race. The report that we had trouble with the track managers in Paris is without foundation.

"We left France the best of friends with the track people, and it is not unlikely that we shall go abroad again next summer, when I hope to see both the Butler brothers make a better showing than they did on their first visit."

SOME AUSTRALIANETTES.

The fastest mile ever made in Australia was negotiated on the Hampden track, Sydney, on October 23. Wally Kerr, an amateur, set the mark. He was paced by a triplet and singles, and with a flying start finished in 1:57. The previous best was Parson's 1:58 4-5.

Ken Lewis, at the South Australia League's spring meeting at Adelaide, October 21, won the five-mile international scratch race in 12:21; C. Boidi, Italy, was second; A. B. McDonnell, America, third.

At the same meeting two days after, Lewis also captured the first-class mile handicap, in which he started off the 10-yard mark with McDonnell, and gave 5 yards to Don Walker. Time, 2:17 2-5.

At the Charity Cycling Carnival at Melbourne, October 27, J. W. Parson, paced by a triplet from a flying start, covered a quarter of a mile in 29 seconds, and the half-mile in 59 1-5 seconds, which is 41-5 seconds better than Parson's previous record and a world's time for a grass track.

TOO TOUGH FOR GERMANY.

Arend, the German crack, has returned to his native land disgusted with the managers of the Velodrome d'Hiver, the winter track of Paris. On a recent Sunday he sustained a severe fall and injured his ankle, but nevertheless won the race. When he went to collect the prize of 400 francs the next day, the cashier withheld 75 francs on some pretense or other. Arend became indignant and demanded the whole amount. He had an engagement to ride on the following Sunday, but his ankle bothered him so greatly that his physician instructed him not to ride again for two weeks. Upon hearing this the managers refused to pay any part of the prize, on the ground that he had broken his contract.

EXPENSIVE EXHIBITIONS.

They are still killing the golden-egg-laying goose in Parisian cycle racing circles. For example, Morin recently demanded and received \$700 in cash to ride in one race at the Seine track.

MACARONI CRACKS.

Italy's crack rider, Pontechhi, intends to try his luck on the Paris tracks during the winter, and will also ride in England. Eros, another speedy Italian, will accompany him,

DONE IN DENVER.

Coulter in Defense of His Record—Monte a Westerner—Back Pedaling Chainless.

Denver, Col., Dec. 12.—Ever since Clint R. Coulter was given credit for an unpaced mile in 1:59 1-5, there has been a violent discussion regarding the record in Denver. There have not been wanting those who have declared that Coulter never made the ride, and cannot do so again—just as was said of Barrows's wind and gravel mile in 0:58 3-5. The facts regarding the trial and the starting of the reports seem to be this: John A. McGuire, once Chief Consul of the L. A. W. of Colorado, was referee and L. A. W. representative. There were three timers and three judges. The claim for a record was made out in the old way, and when submitted to W. I. Doty, representative of the Racing Board, the claim was returned with information as to the proper way of making it out. At first the timers refused to certify to the correctness of the record, not understanding the new law. When it was explained to them, they signed and made the necessary affidavits. But the delay led to some ugly rumors getting afloat and into the local newspapers. C. R. Coulter then offered to wager from \$200 to \$500 that he would make the ride and better the time. The newspaper in which the defiance was made did not fall into the hands of George E. Hannan, a local bicycle dealer. Early in the present week he was discussing the record with some local men, and made the remark that he was willing to bet that Coulter could not repeat the performance, that he had always doubted its accuracy, and his money was ready to bet the feat could not be done over. "If you mean that," said a bystander, "you can make or lose lots of money. Coulter bet he could better the performance at any time." Mr. Hannan immediately looked up the matter and found that Coulter had been credited with the statement. He notified Coulter's friends at once that \$200 was in the hands of the bicycle man of the "News" that Coulter could not again make such a record. "I will do better than Coulter himself suggests," said Mr. Hannan. "I will give him three months in which to wait for favorable days, and will allow him three trials. All I ask is that the L. A. W. local officials or the officers of the Associated Cycling Clubs of Denver select the officers of the race."

Of course, back of this is the fact that Mr. Coulter is expected to return to Denver as the agent of another bicycle, and to make a bid for the Denver business.

A careful investigation of all the facts surrounding Mr. Coulter's trial gives that gentleman the best of the argument, as far as the authenticity of his ride and the actual fact of the time made is concerned. Every official on the track at the time is a man whose word can be trusted. Mr. Doty thoroughly investigated the record before he forwarded the claim, and local L. A. W. officials have looked carefully over the whole transaction for signs of a flaw, or for some reason to think the record is not a genuine one, but so far without result. Jack Davis, who trained Coulter, says his watch caught even faster time than the official watches. Davis is wrothy with Hannan for waiting until December to accept the challenge, but the latter says he never heard of the same until within a week, and as soon as he did he arranged to take it up. Coulter's challenge did not specify any time in which it was to be accepted, but he has drawn his money. He is at present in Lafayette, Ohio, and some word is expected from him shortly regarding the challenge.

In denouncing Mr. Hannan Davis offered to bet him that no rider can go on the D. W. C.

track at this season, unless there is great improvement in the weather and do better than 2:10.

Monte Scott has concluded to locate in Denver. He has also concluded not to accept the McDuffie challenge, issued some time ago. McDuffie wishes to use pace-makers, and Scott has confined himself to unpaced work. The advantage of pacemaking would be, he thinks, too much in McDuffie's favor, and he would be going up against a surer game than when he met Hachenberger. Scott will leave this evening for Texas, and meditates a trip to the West Coast. W. W. Hamilton did talk of going with Scott, but has abandoned the plan for a time.

The Denver Cycle Board of Trade has concluded to give a cycle show. The earliest date to be secured is in February, and the Board has applied for the dates from February 20 to 26. The show given last winter was in the hands of a private individual, G. A. Wahlgreen, and he will have charge again

brought to bear to get Mr. Scott to act another year, but he positively declined to allow his name to be used.

The report comes that the chainless gear is not yet a success. But the sight of a Denver rider on a bicycle operated by side levers or rods just like a locomotive has made some people think that the new models are all a mistake and the houses are holding back something. Louis Rothschild, a repairer and worker on wheels, has built for himself a bicycle on which no chain is employed and on which he daily rides the Denver streets. But there is a peculiarity about it which strikes the observing passer-by with surprise. Mr. Rothschild back-pedals to go forward. The arrangement of his cogs and piston bars produces this necessity. A funny sight on the street a couple of days ago was when E. O. Boles, Monte Scott, C. E. Stratton and other old riders tried to make the thing go. Back pedalling to go forward fooled every one of them, and it was only with the greatest difficulty that they could hold the seat. But Mr. Rothschild is used to it and back-pedals about the city with the greatest ease. He says he can make a mile in much less than three minutes on his wheel.

MORGAN & WRIGHT
CHICAGO

this winter, but under the direction of the Board of Trade. Though the date is more than two months away prospective exhibitors are already applying for space. The show last winter was a great success, the Coliseum being crowded every night and breathing space being almost impossible of attainment.

The Kearney Bicycle Works have been moved to Denver, bringing about twenty-five skilled mechanics and their families to this city. The firm has taken possession of a large four-story building in the very heart of the city, and will turn out its 1897 wheels in that factory. One order of 100 from California has already been scheduled, with another of the same size from Leadville. The company hopes to secure an immense State trade, as Colorado is great for buying home products.

The Denver Wheel Club will be conducted by members not in the trade next year. The directorate of 1896 was headed by George M. Scott, agent for the Orient, and with him were several other trade men. The administration of the year was a most successful one, a great hole being made in the debt of the club, but the members raised the cry of the trade influence being too strong on the Board, and all the members who sell bicycles refused a nomination. Great pressure was

WHY CYCLES WERE NOT TAXABLE.

Judge Stump, in handing down the decision that the town of Easton, Maryland, exceeded its authority when it sought to tax bicycles \$1 per annum, said:

"The Commissioners of Easton unquestionably have the right to regulate the matter of using bicycles, to prohibit their use on the sidewalks, to reasonably limit the rate of speed, to require lights at night, etc., but this particular ordinance is most unreasonable, the opposite of beneficial to the town and inconsistent with the laws and policy of the State.

"The general policy of the State is that the citizens of a town and all strangers who may happen to pass through or reside therein shall at their pleasure have the right of free passage over the streets of said town either on foot or in ordinary private vehicles. A bicycle is a vehicle in general use. As such it has received legislative recognition and protection.

"When it was desired to make the owners of dogs running at large in the streets of Easton take out licenses it was deemed necessary to obtain special authority from the Legislature. But it is contended that no such special grant of power is necessary to authorize them to require a lady to take out a license before she can ride a bicycle in the same streets.

"If they have the power to pass the ordinance under consideration, then it must logically follow that they have power to require the owners of all private vehicles drawn by horses or pushed by the mother or nurse to take out license before the vehicle can pass through Easton, and also have the power to require every person who walks in or through the town of Easton to take out a license and have painted on its, his or her person or permanently and conspicuously attached to his or her person or clothes a number corresponding to the license."

COMBINING PLEASURE AND UTILITY.

An ingenious Parisian has devised an arrangement whereby he can figuratively kill two birds with one stone. In order to keep himself in training, he has improved an arrangement whereby his machine not only acts as a home-trainer, but drives a small dynamo, which charges a small storage battery for the electric lighting of part of his house.

PALMER TIRES

A Change of Policy

Buyers prefer to buy direct. They think they get better prices and better treatment if they deal with the manufacturer.

For a long time we have disposed of Palmer Tires through the Columbia Rubber Works Company, who have been our exclusive agents. Hereafter we shall sell the goods ourselves.

We have established two selling stations—Chicago in the West, New York in the East—and we shall be delighted to give your orders prompt attention.

A new schedule of prices has been adopted. We can give you full particulars by mail or we can send one of our salesmen to you. We shall esteem it a favor to do either, or both.

We shall endeavor to make the new arrangement both satisfactory and profitable to bicycle manufacturers and dealers, and we have no doubt we shall succeed in doing so.

Now is the time to buy.

ADDRESS ALL CORRESPONDENCE TO

SHOW FINALS.

England Winds Up Her Season of Cycle Exhibitions—Some So-Called Novelties.

London, Dec. 4.—“Out of the frying pan into the fire” is an ancient simile which aptly illustrates the condition of your correspondent. The Stanley show with its 350 exhibitors was a high trial to analyze, but what can be said of a larger exhibition in which every standholder has a known and recognised position in the cycle trade and not a mere assembler of parts as many of the exhibitors at the Agricultural Hall were? I do not mean to say that I merely saunter through the palm-embowered vistas of the Crystal Palace, and here assert that I am bored to death with my task. It is my duty to report every individual stall in this show, and my last batch of copy must be dispatched by to-morrow evening—Hinc illae lachrymae. But this labor, while well-nigh distracting at the time, puts me in possession of everything worth noting in these exhibitions, and on that account is more cheerfully undertaken than would otherwise be the case.

My peregrinations around the Crystal Palace are not yet ended nor have my observations been completed, but I fancy that I have seen quite enough to cause me to write down the present as the most extensive exhibition of cycles ever held in this Old World of ours. Space has been allotted for about 380 exhibitors, and the amount claimed has been so much in excess of previous years that for the first time in the history of any cycle show held here the gallery has been absorbed for stall purposes.

The gallery, at the best, is not a very gay place, but America, as it is represented here, has or should have some reason to be thankful for its existence, otherwise the Waverley, Adlake, Yost Falcon, Crawford, Sterling and Kenwood bicycles must have been consigned to the outer darkness, for they have all found a haven in the newly absorbed space. The Rambler is something better off, being stowed away in the midst of the very popular tire section, although I am inclined to think it a shame that such a telling and really original stand as Mr. Kitto has erected at considerable expense should have been comparatively lost by being crowded out of the main transept. The Spalding, Monarch, Miami, Cleveland and Pierce bicycles are quite as much out of it, as, though they have escaped the lost-under-the-gallery position, they have not been placed where their status and the quality of their goods warrant them. If, as I believe was the case, the lot of the ballot decided the respective positions occupied (after the main transept had been parcelled out among the members of the show executive), I can only say that Fortune has been most unkind to America. Some people go further and wink significantly when they meet an American exhibit tucked away out of sight almost in the gallery.

As a spectacular display the National cannot be compared to the Stanley, and as a show for American cycles it does not permit of any comparison whatever. There are some really fine stalls in the Palace, but I don't think that I could honestly say that any one of them comes up to the Humber, Rudge-Whitworth, Dunlop or Gladiator form at the Stanley. The Centaur, Swift, Rover, New Rapid, Triumph and Osmond stands are very fine, but they do not stand out as the ones I have mentioned did. But when we leave the matter of stall decoration all comparison ceases, and the National show goes right

away. Such machines as the Centaur, Osmond, Raleigh, Swift, Sunbeam and a score of rising young firms exhibited machines which the Stanley could only approach in a few instances, while the American division, though a trifle less numerous, is scarcely less meritorious.

The main feature in bicycles is the more general adoption of curved tube designs for ladies' machines, and a general tendency toward disk adjusting hubs, is obvious, quite a score of firms having adopted this fitting. Of tandems and tilting handle-bars there are many less than were observable at the Agricultural Hall, the whole strength of the trade being apparently expended on ladies' machines, of which more are on view than those intended for mere men. The Dolittle brake is fitted on almost half a dozen machines in various stalls, and has been adopted by the Swift as a standard pattern.

I give here a few notes of the novelties which I have come across up to the present. The first is a new cone adjusting hub of

Messrs. Bayliss & Thomas. A is the driving tooth wheel, which carries one bearing cup at the centre; C a tube fastened to A, and passing through the shell D. The second bearing cup B is screwed on the tube C, and suitable projections upon A and D prevent any motion between these parts, so that the whole driving strain is transmitted to the wheel. It will at once be seen that the whole of the wearing parts are readily detachable. There is no liability of any part loosening by backpedalling.

This is a seat pillar, whose mission is self-explanatory. As will be seen, it prevents any

degree of forward or backward or a vertical position to be adopted with complication.

Here is a disk adjusting hub of a neat and simple description fitted to the Royal Progress—a racing Coventry machine.

The spindle shown is made of soft tough steel, the cones, cups and ring being made from the finest quality of cast steel. The adjusting side of the hub is tapped out for the cup right handed, and the outer edge of the hub is then bored out a larger size and tapped with a left-handed thread. The cup is made with a conical back, and is screwed into the back of the cup and the left-handed thread in hub. This is fitted with a split ring, which is bored out conical to fit cone part of

cup; when this is screwed into the hub, by means of the left-handed thread, the conical recess in the rings fits upon the cone which forms the back part of cup, and grips it tightly. It will thus be seen that the tighter the two surfaces are forced together the more the ring will try to expand, thus gripping the thread in the hub.

FOR WEARY WOBLERS.

A London correspondent wires a Chicago daily paper to the effect that the numerous accidents which have occurred in that city by fast bicycle riding through the crowded thoroughfares have caused the suggestion to be made that the Government might find itself compelled to introduce a bill enlarging the powers of the police and their authority over riding, and probably prohibit entirely the use of wheels in the sections of the city where traffic is congested from morning until night. As a result a number of inventors have been devoting their energies to the evolution of some safety appliance that would effect an immediate decrease of speed or stoppage of the wheel while in motion.

A private view has been given in Agricultural Hall of an addition to bicycle mechanism upon which patent papers have just been issued, and which it is believed, according to the correspondent, who evidently is not a cyclist, will soon come into general use. By a touch on a spring in the handle-bar two small wheels are instantaneously released and drop to the ground, giving a decided check to the momentum of the wheel. By touching another spring the wheels are forced apart and afford a substantial support to the wheel, enabling the riders to keep their seats when the wheel is not in motion and giving to it all the stability of a tricycle. With equal rapidity the springs and wheels are lifted back into their place, and the bicycle is again free to pursue its course. The invention can be attached to any wheel at a cost of about two guineas.

WORTHY OF NAME AND MAKER.

It was hardly to be supposed that the America Cycle Manufacturing Company, of Chicago, would fail to be up to date. Nor are they. Like nearly all of their competitors, they will, next season, market three different lines of wheels, having added \$60 and \$80 patterns as companions to the \$100 truss-frame America. The cheaper priced wheels will be of the straight frame pattern, the \$80 machine being exactly like the \$100 America, except that it will not embody the well-known truss. Flush joints, two-piece crank-axes, in which no cotter pins are employed, a new fork crown and a grooved handle-bar stem, which prevents the handle from working sidewise should it become loose from any cause, are among the improvements. A ladies' truss-frame America is listed for the first time.

ONE ON HIM.

Husband—I suppose you are satisfied, now that you have made an exhibition of yourself on the Boulevard in those hideous bloomers. Wife—Oh, John, I had the loveliest ride. You can't—

“Um-huh! Everybody stared, I suppose?”

“Oh, everybody!”

“I only wish you might have heard their remarks.”

“Why (innocently, I did—two or three—but they weren't about the bloomers.”

“What, then, pray?”

“They simply said I probably had a fool for a husband!”

NOT HIGHWAY ROBBERY.

Dora—Did you meet any accidents learning to ride the wheel?

Cora—I was held up several times.

“BUILT
LIKE A
WATCH.”

Disparagement by a competitor—next to Imitation—is the Sincerest Flattery.

Those who cannot imitate our '96 fork now endeavor to depreciate it.

Our '97 fork will be the same as our '96.

WHY?

Because Perfection cannot be made more perfect.

FEATHERSTONE'S ROYAL FAMILY.

Of course, the Road King and Road Queen will remain the leaders of the Featherstone line, and as naturally they have been brought up to date in all respects. The specifications attest it. The same is true of the Duke and Duchess and of the Featherstone juveniles, the Prince and Princess. They make a formidable line of sellers, and Featherstone & Co.'s well-known abilities in the matters of price and prompt deliveries leave little to be desired.

ROAD KING.

Frame.—Depth, 24 and 26 inches; wheel base, 41 inches; head for 24 inch frame, 10½ inches; head for 26 inch frame, 11¾ inches; main tubes, 1¼ inches; rear fork tubes, ¾ inch; large barrel crank hanger; narrow tread; made from best quality cold drawn seamless steel tubing; flush joints. Steering Fork—All cold drawn seamless steel tub-

ing; one-inch fork sides; double truss crown, nicked; fork ends nicked top and bottom. Wheels—28-inch; Keene laminated wood rims; large, tubular hubs; swaged and nicked tangent spokes, tied at intersection; fitted with M. & W. Quick-Repair tires. Handle Bars—Wood, hickory; ram's horn or semi-ram's horn; adjustable; cork handles, with ferrules to match color of finish; furnished with steel bar, drop, upturned, adjustable or ram's horn pattern, when so ordered. Bearings—Tool steel, oil tempered and removable; dust proof. Cranks—Round pattern; 6½-inch throw. Pedals—Entirely new design; rat trap or rubber; made from cold rolled sheet steel and steel drop forgings; will be furnished with rat trap pedals unless otherwise ordered. Chain—¼-inch; beveled sides; hardened links and rivets. Gear—Sprocket wheels and crank shaft, drop forged steel; both sprockets detachable; nicked; regular gear, 70 inches; option, 63, 66½, 73½, 77, 80½, or 84 inches. Seat Post—Tubular, with ½-inch tubular T. Saddle—Garford TT. Black or russet top; tool bag, with pump, oiler and necessary tools. Finish—Enamelled in black, maroon or olive green, beautifully striped; all bright parts nicked in the best possible manner. This wheel will be furnished with entirely detachable brake when so ordered.

DUKE.

Frame—Depth, 24 inches; wheel base, 43 inches; head, 10½ inches; main tubes, 1¼ inches; rear fork tubes, ¾ inch; barrel crank hanger;

WHERE HE PAUSED.

"Now," said the eminent politician to his secretary, "let's draft a sort of personal platform for my campaign. In the first place we're in favor of the bloomer. Got that written?"

"Yes, sir."

"We believe in good roads and cycling."

"Yes, sir. Anything about the currency?"

"Sh-h! Don't mention the currency yet. We want to cover all the ground we can, of course. But we can't go clear through the whole encyclopaedia, you know."

Life being a span, and all the world a stage, there ought not to be any difficulty in riding over the ground in some way.

Other riders don't think near as much about you as you wonder what they think about you.

narrow tread; made from cold drawn seamless steel tubing and steel drop forgings; flush joints. Steering Fork—Cold drawn steel tubing; improved pattern double crown, nicked; fork ends nicked. Wheels—28 inch; wood rims; large tubular hubs; nicked tangent spokes; fitted with M. & W. Quick-Repair tires. Handle Bars—Wood, hickory; adjustable; cork handles,

with ferrules to match finish; furnished with steel bar, adjustable, drop or upturned pattern, when so ordered. Bearings—Highest-grade steel, carefully tempered; dust proof. Cranks—Round pattern, 6½-inch throw. Pedals—Entirely new design; rat trap or rubber; made from cold rolled sheet steel and steel drop forgings; will be furnished with rat-trap pedals unless otherwise ordered. Chain—¼-inch, with hardened links and rivets. Gear—Sprocket wheels, drop forged steel; both sprockets detachable; nicked; regular gear, 70 inches; option, 63, 66½, 73½, 77, 80½

DUCHESS.

or 84 inches. Seat Post—T. pattern; hollow; ¾-inch top bar. Saddle—Hunt's Hygienic, No. 10; black or russet top; tool bag, with pump, oiler and necessary tools. Finish—Enamelled in black, maroon or olive green, beautifully decorated in gold; all bright parts finely nicked; this wheel will be furnished with entirely detachable brake when so ordered.

ROAD QUEEN.

Frame—Depth, 22 inches; wheel base, 41 inches; head, 10½ inches; main tubes, 1¼ inches; rear fork tubes, ¾ inch; large barrel crank hanger; narrow tread; made from best quality cold drawn seamless steel tubing; flush joints. Steering Fork—All cold drawn seamless steel tubing; one-inch

fork sides; double truss crown, nicked; fork ends nicked top and bottom. Wheels—28-inch; Keene laminated wood rims; large tubular hubs; swaged and nicked tangent spokes, tied at intersection; fitted with M. & W. Quick-Repair Tires. Handle Bars—Wood; hickory; adjustable; cork handles, with ferrules to match finish; furnished with steel bar, upturned pattern, when so ordered. Bearings—Tool steel, oil tempered and removable; dust proof. Cranks—Round pattern, 6-inch throw. Pedals—New design; made from cold rolled sheet steel and steel drop forgings; moulded rubbers. Chain—¼-inch; bevelled sides; hardened links and rivets. Gear—Sprocket wheels and crank shaft, drop forged steel; both sprockets detachable; nicked; gear, 66½ inches. Seat Post—Tubular, with ½-inch tubular T. Saddle—Garford, V; black or russet top; tool bag, with pump, oiler and necessary tools. Guards—Maple, chain guard and rear mud guard only, finely finished on the natural wood, faced with cord to match finish; easily detached; furnished with front mud guard when specially ordered. Finish—

Enamelled in black, maroon or olive green, beautifully striped; all bright parts nicked in the best possible manner.

PRINCE.

Frame—Depth, 20 inches; wheel base, 38 inches; head, 9 inches; main tubes, 1¼ inches; rear fork tubes, ¾ inch; barrel crank hanger; narrow tread; made from cold drawn seamless steel tubing and steel drop forgings; flush joints. Steering Fork—Cold drawn steel tubing; improved pattern double crown, nicked; fork ends nicked. Wheels—26-inch; wood rims; large tubular hubs; nicked tangent spokes; fitted with M. & W. Quick-Repair tires. Handle Bars—Wood, adjustable; cork handles; furnished with steel bar, drop or upturned pattern, when so ordered. Bearings—Highest grade steel, carefully tempered; dust proof. Cranks—Round pattern, 6-inch throw. Pedals—Entirely new design; rat trap or rubber; made from cold rolled sheet steel and steel drop forgings; will be furnished with rat-trap pedals, unless otherwise ordered. Chain—¼-inch, with hardened links and rivets. Gear—Sprocket wheels, drop forged steel; both sprockets detachable; nicked; gear, 61½ inches. Seat Post—T. pattern; hollow; ¾-inch top bar. Saddle—Garford, O-4; tool bag, with pump, oiler and necessary tools. Finish—Enamelled in black, maroon or olive green; all bright parts finely nicked. This wheel will be furnished with an entirely detachable brake, when so ordered.

WOULD NOT WORK IN HIS CASE.

"Begin at the bottom and work up, my boy," said the old gentleman. "That's the way to succeed in life."

"Yes," replied the young man thoughtfully, "but it doesn't work in the immediate instance."

"Why not?"

"I'm inventing a new attachment for a bicycle to add to the speed and safety of coasting on it."

HIT HIM HARD.

"What struck you most in your wheel tour abroad?"

"People who wanted tips!"

Misfortune is a blessing so well disguised that sometimes we have to wake in another world to know it.

BOUGHT IT AT AUCTION.

At the auction sale last week, the plant of the Plymouth (Ind.) Cycle Mfg. Co. was bid in for \$15,000 by J. H. Bass and R. T. McDonald, of Fort Wayne, who will remove it to that city and establish a cycle factory there. The Plymouth Company formerly built the Smalley Bicycle.

HEATED ARGUMENT.

"Your Majesty," said Lucifer, "that century riding bicycle fellow still replies that it is not hot enough for him."

The Prince of Evil was visibly irritated. "Apply the forced draught," he commanded.

"We have already done so, Your Majesty," answered the trusty subordinate.

"Well, then, have the mechanical bureau explain the theory of bevel-gear versus chain-driven bicycles to him. That will make it seem hotter, anyway."

SOFT AS SUMMER ZEPHYRS.

The Craig Cycle Saddle Company, of Lawrence, Mass., announce that they shall make no material changes in their saddles the coming season. In their new catalogue they will more fully illustrate the construction of their famous air cushions, so that prospective buyers may know the difference between the Craig Automatic Pneumatic saddles and the various imitations that they claim are being offered by numerous manufacturers as 1897 saddles.

This company was late in getting started, and September 1 found them without a single finished saddle in stock of the class known as Class "A." The accompanying cuts illustrate this class. The airbags, B, are of peculiar construction; the two chambers being connected together by the small cross pipe, A. The air conduit through this small pipe is so small that the air cannot pass from one chamber to the other only very slowly. It is claimed that this is the feature that has made the "Craig" saddle so popular the past season.

Fig. 1 shows the saddle ready for use. Fig. 2 shows it with the leather covering removed. Fig. 3 shows a rear view, with the nickel-plated binding strips removed, and the back of the leather cover turned upward showing the chambers that hold the airbags. It is said that ten minutes' time is all that is required to remove the airbags and replace them again through these openings here shown. It is claimed that this is the only pneumatic saddle that does not have to be all made over to renew the air chambers. These chambers have been in use through the season of '95 and '96, and ridden thousands of miles, and are good yet, none having yet worn out.

In Fig. 2, A is the air equalizing pipe. B the rubber airbag or cushion. E the hardwood bar running the entire length of the saddle. C

is the soft felt edge to keep the air chambers in place, and forms a comfortable seat when

Fig. 1.

the airbag is deflated. D is the soft wood plate 7-16 of an inch thick, the grain of the wood

Fig. 2.

crossing the hardwood bar. Bolts pass through this bar and plate, and when the steel

Fig. 3.

fastening is made on the under side, it is said to be indestructible. The company claims that

there was not a single break reported of this class of saddle in the past season.

It will be seen that by removing the airbags these cushions may be filled with soft felt, curled hair or sponge rubber in a few moments. Mr. Craig says that he has tried all of these substitutes, and knows their value. He says that there is nothing that will fill the place of these peculiarly constructed air chambers. He claims that it is this feature that has made them so popular of themselves, and will continue to make them the leaders of health and comfort saddles. The price will be reduced to \$5.

SETTLING THE "FIRST" DISPUTE.

In order to relieve any doubt in the minds of those who are uncertain as to the time of beginning and the origin of the bicycle industry in America, the Pope Company supply the following data, which they are in position to vouch for: In 1877 the Pope Manufacturing Company imported the first bicycles placed on the American market, and on March 13, 1878, made the first sale to a customer. The first bicycle ever manufactured in America was built by the Pope Manufacturing Company, Hartford, Conn., in 1877, and was sold to Mr. W. D. Swan, of Boston, September 23, 1878.

SAVES MONEY.

"I don't see how you economize by letting your wife have a bicycle."

"I do. She rides so much she has no time to wear her other clothes out."

Wheelmen in Vienna feel that they have just cause for complaint when the police arrest them at midday for riding without a lamp.

There's not
an Agent
in the land

who will not find the...

HANEY * CYCLOMETER

One of the handsomest sellers of the '97 season. In all the world there is no more reliable mileage recorder made. It is simple and positive in action. Has few parts and no springs.

Nor is there . . .
a Rider . . .

who will not be
pleased with the

INDIA * TIRE,

Especially with the famous non-slipping Arrow Tread. The India Rubber Co., Akron, Ohio, make it, which should commend it to all who desire good goods. And the old reliable **Straus Tires**—we handle them, too, and they are better than ever.

And it is well worth your while to get figures on the **Cilley Chain**. They are interesting. . .

OLIVER, STRAUS & CO., 23 Park Row, New York.

Kindly mention The Wheel.

QUICK TRAVEL FOR PATEETES.

Peoria, Ill., Dec. 14.—Travelling men who visit the manufacturing trade in Peoria know full well the unique, romantic trip necessary to reach the factories of the Peoria Rubber and Manufacturing Company and Rouse, Hazard & Co. With motor car and steam engine and a bit of walk across fields, the trip is a varied one, but time-consuming. All that will soon be changed.

The directors of the Peoria Rubber and Manufacturing Company have formed a new company—the Glen Oak and Prospect Heights Railway Company—with Monroe Seiberling, president; J. H. Seiberling, vice-president; Fred Patee, secretary; A. G. Siebling, treasurer; F. L. Knyder, assistant treasurer, and C. J. Butler, general manager, and an electric line is even now in course of construction. The ties and rails are mostly laid, and by February 1 the new road will be in working shape. The route will be from the Union Depot direct to the door of the factory, where Patees are made, passing the leading hotels coming and going. The time will be just twenty-five minutes each way.

Relative to listing their '97 Luthy cycles at \$150, Luthy & Co. say, almost as if by way of apology, "the Luthy wheel is intended for ladies and gentlemen." The price named, it is stated, is not sufficiently high to deter purchasers who are satisfied after an examination that the wheel possesses all the points of superiority claimed for it. Among other features they claim absolutely unequalled material, wrought out in the most thorough manner regardless of cost, making every wheel one that is practically built to order. Riders not content with a \$100 mount can turn their attention to this \$150 wheel, which the makers claim is the only one that is "best all through."

BROOKLYN WILL BOOM THESE.

While special vehicles of the sort have been built to order, it is only recently that the Gendron Wheel Company decided to make a systematic effort to popularize the pneumatic tired baby carriage. The effort is now well under way, and the Gendron people report splendid results. The carriages are particularly luxurious looking affairs.

WITH PATENTE DVEICES.

A number of leading business men of Cheyenne, Wyo., have organized a company to be known as the Wyoming Cycle Manufacturing Company, for the purpose of manufacturing a limited number of high-grade cycles. The machines will be made of the best material on the market, and will be equipped with several patented devices.

OPENING FOREIGN EYES.

H. F. Frevert has just returned from a five months stay in Europe, in the interests of the Garvin Machine Company. He states that he found manufacturers generally very willing to receive him, and that he did a particularly good business in Germany and Austria.

WILL PREACH "CURVE."

One of the best-known cyclists in Philadelphia, John E. Doughty, who, for the last year, has been located at the Quaker City branch of the Keating Wheel Company, will shortly travel through New Jersey and Pennsylvania with a full line of Keating samples.

SIGNED, SEALED AND DELIVERED.

Baker & Hamilton, of San Francisco, have contracted with the Acme Manufacturing Company for the sale of Stormer bicycles on the Pacific Coast. The contract was sealed with a fat order.

HERE IS SOMETHING NEW.

Probably the most radical '97 feature which has yet been brought to light is being shown by the American Waltham Manufacturing Company, of Waltham, Mass. It was incorporated in their Waltham Comet bicycle, which was exhibited in the city during last week. The novelty is practically a revolution in bearings. They term it their "three-ball bearing," which term practically explains it. The illustration shows its man-

ner of construction. Reduction of friction is the main claim made for it. The Waltham people make this explanation.

"The separator shown in the cut does the whole business, by keeping the balls apart. In the old style bearing the balls turn in the direction the cone is running, that is, the side to the right is going down while to the left it is coming up, while the second ball is going down the same way as the first ball it meets the first ball coming up in the opposite direction, thereby causing considerable friction. The separator in our bearing reduces this friction to a minimum. Again, there is no possible chance for the balls to slip, for the cup and cones being made of the best tool-steel, hardened and ground perfectly true, makes it possible to have a bearing that will run true when properly adjusted. Therefore the cone touches the balls at all three points at once and the taper of the cone keeps the balls pressed against the circumference of the cup, making it impossible to slip. The two balls in the bottom of the cup govern the separator and the separator governs the top ball."

The company is also prepared to manufacture hubs fitted with this three-ball bearing.

GREAT ON NINES.

This is the newest cyclometer brought out by the American Clock Company, of Boston. Model 3 they term it. It is quite small, the illustration showing its actual size. It weighs but 1 1/4 ounces. The feature, as will be seen, is its double register, the upper dial of which

records 9,999 miles and the lower ninety-nine miles, each registering independently of the other. The lower dial is intended as a trip register, and can be set back to naught by the mere turning of a screw on the under side of the instrument.

WHALEBONE WHEELS.

The Whalebone Buggy Company, an extensive vehicle concern at No. 198 South Meridian street, Indianapolis, Ind., are about to add bicycles to their interests. They will confine their efforts to a jobbing trade.

UNDER THE RED FLAG.

Geo. B. Spearin & Co., who handled Cleveland cycles in Jersey City and Bayonne, N. J., have assigned. The receiver appointed is Geo. C. Tennant. The business will be sold out by the Sheriff to-day.

COMES THE CLIPPER SAILING.

Full of floating bubbles and naked cherubs—that is, pictures of bubbles and cherubs—the catalogue of the Grand Rapids (Mich.) Cycle Company forms the first fluke in the great heap of catalogues which will grow and grow in THE WHEEL office during the succeeding weeks. The Grand Rapids publication made its appearance late last week. It shows the Clipper bicycles to advantage; its other contents, the reading matter, has been well "boiled down," and is written in terse, common-sense fashion. It contains "nothing particularly startling," the preface states, "but what we say is true."

A \$100 Clipper bicycle is no longer listed—\$80 is the price of the most expensive singles, the Light Roadster and the Ladies' Single Tube. The Full Roadster and the Ladies' Double Tube sell for \$90, and the Business Clipper for \$50. The price of the double diamond tandem is \$100; the combination tandem, \$115.

On the subject of price, the Grand Rapids people say: "Our aim is to give the rider and dealer the kind of a bicycle they want at the price they ought to pay. We could make cheaper bicycles than we do, but they would not be so good. We could ask more than we do, but they would be no better. The price of a Clipper bicycle is based upon its cost to produce, with the cost of selling and a legitimate maker's profit added. The different prices are the result of a difference in the methods of production. Our highest priced wheels cost the most to make; they embody every up-to-date feature of bicycle construction. It is nonsense to pay more than the price we ask for our best Clippers. No bicycle need cost more than these wheels; no bicycle can be better made. If the pleasure of saying a bicycle cost more is worth the difference in price, it may be right to pay the money."

RAWHIDE ROTATORS.

At first blush the use of rawhide in the manufacture of a bicycle chain would not impress one favorably, but when it is understood that the commodity is used for the bearings of some the heaviest machinery, the first impression would speedily disappear. The rawhide cycle chain is, like the rawhide bearing, an accomplished fact. It was given a test during the six-day race last week, and with such excellent results that the inventor, F. W. Barker, No. 253 Broadway, this city, has interested capital and hopes shortly to place the chain on the market in quantity. Strictly speaking, rawhide forms but a small part of the Barker chain. It obtains its name from the fact that the centre blocks are composed of raw-hide, which lie between the metallic sideplates. The rawhide serves as the major pivotal bearing for the pins, and reduces the frictional contact to a minimum besides requiring no lubrication. The rawhide projects slightly beyond its flanking plates at the ends and thus receives the impact of the sprocket teeth, thereby entirely obviating the clicking or rattle which occurs with the use of the ordinary metal blocks. Thus the chain is rendered entirely noiseless in its operation. As no graphite need be used with the rawhide chain, it is always clean and will not collect dust or mud.

Schock, Moore and "Major" Taylor were the riders who used the chain during the six-day race. Schock did not obtain one until the middle of the week, but expressed himself as sorry he had not obtained it sooner.

If you've a temper hang on to it; and if you've a bad one don't lose it, if you possess any idea of being popular as a tour companion.

LIKE A PARROT.

Toes of Wheelmen Are Thus Turned, According to the Learned Doctor's Ideas.

"Yes," said the Learned Doctor as he dismounted from his bicycle, "it is true."

He addressed himself to no one in particular. He gave utterance to the words as one speaks when profoundly impressed with a truth. Unconsciously he spoke aloud, as though he had been trying to convince a friend instead of holding an argument with himself. His brows knitted, and he looked steadily at his feet. He thrust one foot forward, still keeping his eyes fixed upon his feet.

"I say," he continued, still talking to himself, "it is true."

"And pray, Doctor, what is so true that you must converse with yourself about it in the presence of such good company?" asked the Beautiful Young Woman.

"Eh? What? I beg your pardon," returned the Learned Doctor.

"Dear me, I should say that you were preoccupied," said the Beautiful Young Woman. "But you haven't answered my question. If it is not impertinent, suppose you tell me what it is that is so true."
